Glossary of Judicial Claim Constructions in the Electronics, Computer and Business Method Arts

Compiled and Edited by:

David Garrod, Ph.D., Esq.
Senior Litigation Counsel
PUBLIC PATENT FOUNDATION, INC.
Benjamin N. Cardozo School of Law
55 Fifth Avenue
New York, New York 10003
garrod@PUBPAT.org
"ANI"; "calling number identification data" — "a signal that identifies the calling number, i.e. the number from which a call originated." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).\(^1\)

"a" — "one or more." Goff v. Harrah's Operating Co., 412 F. Supp. 2d 1090 (D. Nev. 2005).\(^2\)

"a computer" — "a system of interconnected electronic components that receive, process, and present data according to instructions, but not a network system of two or more computers." Quickview Systems, Inc. v. Belo Interactive, Inc., 2005 U.S. Dist. LEXIS 19444 (N.D. Tex., Sept. 7, 2005).\(^3\)

"a contact" — "one or more paths for charge to flow to and from the charge sink means." Loral Fairchild Corp. v. Victor Co. of Japan, Ltd., et al., 906 F. Supp. 798 (E.D.N.Y. 1995).\(^4\)

"storing password data and trade details in a database" — "A plain reading of the claim term 'a' demonstrates that the '647 patent claims one database in which the password data together with trade details data is stored. ... even if 'a' is interpreted as meaning one or more, the presence of 'and' in the claim language requires that each of the one or more database(s) contain both password data and trade details data." PostX Corp. v. Secure Data In Motion, Inc., 2003 U.S. Dist. LEXIS 25755 (N.D. Cal., Sept. 29, 2003).\(^5\)

"a first clock signal to said analog circuitry for controlling the sampling" — "does not require a single clock signal to control sampling." Crystal Semiconductor Corp. v. Tritech Microelectronics International, Inc., et al., 246 F.3d 1336 (Fed. Cir. 2001).\(^6\)

"a first computer"; "said first computer" — "requires the 'first computer' to be one and the same computer." PostX Corp. v. Secure Data In Motion, Inc., 2003 U.S. Dist. LEXIS 25754 (N.D. Cal., Nov. 25, 2003).\(^7\)

"[selection of one of the coding modes as] a function, at least in part, of periodicity [of the speech signal]" — "The Board reversibly erred in ... (2) construing Claim 1 to require only the provision of a plurality of coding modes wherein at least two of the coding modes 'correspond to substantially voiced input speech signals,' where the claim also requires that a coding mode be selected based on the periodicity of the speech signal." In re Gerson, 1996 U.S. App. LEXIS 23421 (Fed. Cir., Sept. 6, 1996) (unpublished).\(^8\)

"a multi-unit memory system" — "is 'a' (that is to say, one, or a single) system that uses two or more data storage memory units. Of course, the fact that the patent claims 'a' system does not mean that IBM or some other party would escape liability for infringement by constructing two or three or even more such multi-unit memory systems and somehow linking them together or causing them to operate together." TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999).\(^9\)

"a program running on a computer" — "one or more computer software programs in operation on one or more computers." Aircraft Technical Publishers vs. Avantext, Inc., 2009 U.S. Dist. LEXIS 105623 (N.D. Cal., Nov. 10, 2009).\(^10\)
"disposed over a portion" — "disposed over at least one portion." Crystal Semiconductor Corp. v. Tritech Microelectronics International, Inc., 246 F.3d 1336 (Fed. Cir. 2001). 11

"a rasterization process which operates on a floating point format" — "one or more' of the rasterization processes (e.g., scan conversion, color, texture, fog, shading) operate in floating point format." Silicon Graphics, Inc. v. ATI Technologies, Inc., et al., 2010 U.S. App. LEXIS 11457 (Fed. Cir., Jun. 4, 2010). 13

"a tunneling diffusion region" — "is not limited to processes that create only a single tunneling diffusion region." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998). 17

"about one quarter wavelength of the center of ..." — "about the result of the center of ... divided by four." Raytheon Co. v. Indigo Systems Corp., 2010 U.S. Dist. LEXIS 3530 (E.D. Tex., Jan. 18, 2010). 18

"an electrically isolated first conductive gate disposed above said substrate between said first and second doped regions" — "requires only that the gate be located somewhere in between the source and the drain." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998). 20

"first abbreviated information" — "an amount of information found in the first information that is shorter or briefer than that which is found in the second information." BarTex Research, LLC v. FedEx Corp., et al., 2009 U.S. Dist. LEXIS 117609 (E.D. Tex., Dec. 14, 2009). 21

"absorbs"; "absorbing" — "to retain wholly, without reflection or transmission, that which is taken in." MacDermid Printing Solutions, L.L.C. v. E.I. Du Pont De Nemours & Co., 2010 U.S. Dist. LEXIS 23746 (D.N.J., Mar. 15, 2010). 22

"an AC powered DC charger for powering said radio and charging a removable DC voltage power source" — "a direct current charger powered by alternating current that is capable of powering the radio and is capable of charging the removable direct current voltage power source." Black & Decker Inc., et al. v. Robert Bosch Tool Corp., 389 F. Supp. 2d 1010 (N.D. Ill. 2005). 24
"an AC powered DC power supply disposed in said enclosure for powering said radio and generating a first DC output voltage having a magnitude sufficient to power said radio" — "a direct current power supply in the enclosure powered by alternating current that generates a direct current output voltage sufficient to power the radio." Black & Decker Inc., et al. v. Robert Bosch Tool Corp., 389 F. Supp. 2d 1010 (N.D. Ill. 2005). [25]

"accepting television (TV) broadcast signals, wherein said TV signals are based on a multitude of standards" — "accepting television (TV) broadcast signals, wherein said TV signals are based on numerous standards." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005). [27]

"accessed by any one of the authorized plurality of media player devices" — "retrieved or obtained, including for use, by each of the authorized 'media player devices.'" Zapmedia Services, Inc. v. Apple Inc., 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010). [29]

"acting on the signal from said receiver" — "restoring a modified signal received from the receiver to its unmodified condition." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). [32]

[i] "activates the call pod"; [ii] "automatically activate"; [iii] "automatically deactivate"— [i] "powers on the call pod"; [ii] "to automatically power on the call pod during a call"; [iii] "to automatically power off the call pod upon the termination of the call." Callpod, Inc. v. GN Netcom, Inc., et al., 2009 U.S. Dist. LEXIS 51103 (N.D. Ill., Mar. 6, 2009). [33]

"activation amount" — "a value used to establish the total value of goods or services that the user may obtain upon the prepaid account being made functional for use." Alexsam, Inc. v. IDT Corp., 2010 U.S. Dist. LEXIS 64478 (E.D. Tex., Jun. 29, 2010). [35]

"active electrode" — "a stimulating electrode ... applied to tissue for stimulation and distinguished from [a return electrode] by having a smaller area of contact, thus affording a higher current density." Arthrocare Corp. v. Smith & Nephew, Inc., 2003 U.S. Dist. LEXIS 5976 (D. Del., Apr. 9, 2003). [36]
"active layer" — "the layer in which both types of carriers (electrons and holes) are simultaneously present in significant numbers compared to an intrinsic semiconductor at room temperature." Seoul Semiconductor Co. Ltd. v. Nichia Corp., et al., 596 F. Supp. 2d 1005 (E.D. Tex. 2009).

"accelerator board" — "a printed circuit board made of insulating material that has an upgraded microprocessor mounted thereon and is adapted to connect into the socket of a computer board system." All Computers, Inc. v. Intel Corp., 2005 U.S. Dist. LEXIS 43968 (E.D. Va., Feb. 9, 2005).

"accepting bid submissions only during a predetermined time period" — "allowing for transmission of bids to the issuer only up until a fixed time on a fixed sale date." Muniauction, Inc. v. Thomson Corp., 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006).

"access" — "shall be given its plain and ordinary meaning." Leader Technologies, Inc. v. Facebook, Inc., 2010 U.S. Dist. LEXIS 21100 (D. Del., Mar. 9, 2010).

"access" — "to gain entry to a computer system and make use of its resources." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).

"access code" — "a sequence of characters used as a password which an authorized user must enter to gain access to the controller means." Medtronic MiniMed Inc. v. Smiths Medical MD Inc., 2005 U.S. Dist. LEXIS 10583 (D. Del., Jun. 1, 2005).

"user remote access device"; "remote access device" — "a device that can gain access to voice messages stored on the telephone answering device from a remote location." Klausner Technologies, Inc. v. Vonage Holdings Corp., et al., 2007 U.S. Dist. LEXIS 57604 (E.D. Tex., Aug. 7, 2007).

"access information" — "a combination of numerals, letters, and/or characters that can be transmitted from a phone to a call processor, which identifies one, and only one pre-paid calling card account." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).

"access information defining a specification of said operation mode in combination with said external control input defining said operation mode" — "information defining a specification for an operation mode, which, together with external control input, defines the specifics of the operation mode." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007).

"access threshold value" — "a value used to determine whether the subscriber station is authorized to access the common telecommunications channel." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).

"selected ones of a plurality of target objects and sets of target objects characteristics that are accessible via an electronic storage media" — "selected ones of a plurality of physical or electronic objects and/or sets of their characteristics available for access by the user, that are capable of being obtained, used, seen, or known, by means of electronic storage media." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).

[i] "accessing"; [ii] "system for accessing" — [i] "any suitable form of solely computer-executed data transfer including exchanging data directly between software modules, uploading a data file, or using a common memory, and may utilize a local area network or wide area network such as the Internet to transfer data"; [ii] "software or any hardware device programmed to access inventory information of multiple stations. A 'system' does not include a human being attempting to perform the task or function manually." Grantley Patent Holdings, Ltd. v. Clear Channel Communications, Inc., et. al., 2008 U.S. Dist. LEXIS 1588 (E.D. Tex., Jan. 8, 2008).

"accessing" — "gaining or obtaining the ability to enter or make use of files. The Court further concludes that the term 'accessing' in the context of the Katz patents does not delineate or restrict the types of functions that may be performed on the files once they are accessed, such as updating files, creating new files, or deleting files." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).

"accessing the master data base, performing a compatibility comparison, and selecting each option of the third plurality of options from the first plurality of options as a function of each option's compatibility with the selected choice" — "accessing the master data base to perform a compatibility comparison of each of the first plurality of options and all previously selected choices in order to select for inclusion in the third plurality of options those options that are compatible with all previously chosen options. The compatibility comparison must be performed using compatibility tags and cannot be performed using relationship tables." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).
"account number unique to the consumer"; "consumer account number"; "unique account number" — "Aside from the term 'consumer,' which the court has already construed, these terms may be understood according to their plain and ordinary meaning. No further construction is needed." *Source, Inc. v. American Express Co.*, 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006).56

"accounting data" — "any combination of data associated with the number of users, number of interactions, and, for service requests to perform transactions, the commissions based on such transactions." *Yodlee, Inc. v. CashEdge, Inc.*, 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).58

"accumulating" — "the invention gathers error flags, however few there may be, to indicate whether a slide is suitable for processing. Thus, 'accumulating' may encompass one or more error flags." *Cytyc Corp. v. Tripath Imaging, Inc., et al.*, 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005).60

"accumulating a count of bytes of data arriving at a node per interval" — "maintaining a count of bytes that have arrived at a node over a period of time." *Lucent Technologies, Inc. v. Newbridge Networks Corp., et al.*, 168 F. Supp. 2d 181 (D. Del. 2001).63

"accumulating the payments until a predetermined amount is reached" — "accumulating the payments until a predetermined monetary amount is reached." *AdvanceMe, Inc. v. Rapidpay, LLC, et al.*, 2006 U.S. Dist. LEXIS 92444 (E.D. Tex., Dec. 21, 2006).64

"means under control of the accumulator ..."; "accumulator" — "Coinco has not convinced the Court that the general term 'accumulator' on its own describes sufficient structure for an individual skilled in the art to understand the claim."; "the term 'accumulator' ... is also a means-plus-function term despite lack of the word 'means.'" *Mars, Inc. v. Coin Acceptors, Inc.*, 2007 U.S. Dist. LEXIS 20094 (D.N.J., March 20, 2007).67

"acting as a router"; "acting as a bridge" — "operating at the network layer to forward a message"; "operating at the data link layer to forward a message." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).\textsuperscript{71}

"an intrusion detection system coupled to the firewall ... and acting on the data representing text identified as hostile in order to prevent an attack" — "the claim term 'acting on the data representing text identified as hostile in order to prevent an attack' consists of a method step in an apparatus claim. This impermissibly mixes more than one class of patentable subject matter and fails to define for the person of ordinary skill in the art what the scope of the claim is. This claim term is therefore indefinite." Deep Nines, Inc. v. McAfee, Inc., et al., 2010 U.S. Dist. LEXIS 79420 (E.D. Tex., Aug. 4, 2010).\textsuperscript{72}

"repeatedly substantially simultaneously activating" — "there is nothing in the record to suggest that 'activating' means other than what its dictionary definition would suggest, i.e., starting the operation or turning on." Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002).\textsuperscript{74}

"the controller activates the activity counter" — "the controller increases the number of the activity counter." Good Sportsman Marketing LLC v. Testa Associates, LLC, et al., 440 F. Supp. 2d 570 (E.D. Tex. 2006).\textsuperscript{75}

"activation information" — "the data transmitted that initially makes it possible to associate a dollar amount with a particular calling card account." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).\textsuperscript{76}

"active area" — "the area bounded by the field oxide layer." UniRAM Technology, Inc. v. Monolithic System Technology, Inc., 2006 U.S. Dist. LEXIS 21661 (N.D. Cal., March 30, 2006).\textsuperscript{77}

"active call authorization amount" — "a monetary amount to be used to pay for call service." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).\textsuperscript{78}

"active relationship" — "a relationship in which all elements on the left-hand side of the relationship are selected." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005).\textsuperscript{79}

"activity counter" — "a device for counting and displaying the number of triggering signals received by the controller from the motion detector." Good Sportsman Marketing LLC v. Testa Associates, LLC, et al., 440 F. Supp. 2d 570 (E.D. Tex. 2006).\textsuperscript{80}

"actuating" — "activating or putting into motion." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).\textsuperscript{81}
"adapted to create and send a communication that includes a then current dynamic public IP address (publicly addressable) or dynamic LAN IP address (publicly un-addressable) of the personal computer" — "the claimed data communication facility has the ability to create and send a communication that includes the current dynamic IP address of the personal computer. This dynamic IP address may be publicly addressable or unaddressable." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).82

"adapted to initiate the display of said video image and initiate a countdown" — "Nothing in the intrinsic evidence indicates that the initiation of the display of the video image and the initiation of the countdown must occur simultaneously. Instructing the jury that simultaneity is required would be error." Probatter Sports, LLC v. Joyner Technologies, Inc., 518 F. Supp. 2d 1051 (N.D. Iowa 2007).83

"adapted to supplement" — "means the claimed network interface must be capable of supplementing a node; there is no requirement that it actually supplements the node." Intel Corp. v. Broadcom Corp., 2001 U.S. Dist. LEXIS 23106 (D. Del., Dec. 6, 2001).85

"adapter" — "a device for transforming the contact configuration of a battery pack so as to connect parts that will not otherwise mate." Black & Decker Inc., et al. v. Robert Bosch Tool Corp., 389 F. Supp. 2d 1010 (N.D. Ill. 2005).86

"adaptively selecting one of a plurality of operating parameter scaling options" — "making a selection from among a set of options, each of which has different values for one or more operating parameters." Agere Systems, Inc. v. Broadcom Corp., 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004).89

"adding the current requested website page to the traffic path analysis data and thereby showing the complete path of website pages requested during the current website visit" — "use of Netratings' proposed terms 'appending' and 'link' would impermissibly rewrite claim language and improperly limit the claims. ... the acquired meaning of this disputed phrase is: 'Adding the current requested website page to the traffic path analysis data in the website cookie and thereby showing the complete path of website pages requested during the current website visit.'" Websidestory, Inc. v. Netratings, Inc., 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007).90
"additional information" — "refers to any information beyond that which identifies data stored in the first storage system but not yet copied to the second and which is about the copy of data stored in the second data storage system." EMC Corp. v. Hewlett-Packard Co., Inc., 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003). 81

"additional processor outside any e-mail system" — "a processor or information source which originates electronic information without executing electronic mail programming." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002). 82

"an address in a format designating at least one mass memory storage block"; "a mass memory storage block address" — "may specify either a physical or a logical address for the mass memory system." Sandisk Corp. v. Zotek Electronic Co., Ltd., et al., 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010). 83

"address-data bus" — "a bus that carries both address information and data." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006). 84

"an FDDI or ethernet MAC address for a nonfunctioning router" — "an FDDI or ethernet MAC address that is assigned to a router not functioning in the network." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 85

"address information" — "an Internet Protocol address, an E-mail address or a telephone number." eBay Inc. v. IDT Corp., et al., 2009 U.S. Dist. LEXIS 56469 (W.D. Ark., Jun. 10, 2009). 86

"address information" — "at least a portion of an address." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006). 87

"address information" — "characters, numbers or bits used to represent an address." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007). 88

"address set" — "a set of one or more bits in a message specifying the address of one or more devices connected to a bus." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007). 89

"located adjacent to said battery" — "'located adjacent to' is properly construed as 'close to,' as in 'located close to the battery so that it may sense the temperature of the battery.'" Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006). 93

"an adjustment input operable, in response to receiving an adjustment action, to adjust the magnitude of the lamp current by way of adjusting the frequency of the alternating lamp voltage" — "As with the other claim elements that have failed to avoid the impact of Paragraph 6, the claim element now at issue 'will be construed to cover the corresponding structure… described in the specification and equivalents thereof' (the statutory prescription)." Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000).105

"advertising data" — "data representing one or more advertisement or data representing one or more characteristics of an advertisement." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).106

"aesthetically pleasing" — "'Aesthetically pleasing,' as it is used in the only independent claim of the '137 patent, fails to 'particularly point[] out and distinctly claim[] the subject matter which the patentee regards as his invention.' See 35 U.S.C. § 112, P2. We therefore affirm the district court's grant of summary judgment of invalidity of all claims of the '137 patent." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342 (Fed. Cir. 2005).107

"a cyclic redundancy checker for detecting errors in said assembled data after correction of said data by said correction circuitry" — "we agree with the Commission, which found that the device claimed in the '715 patent first performs error correction on an entire Sector of data, and then performs error detection with a cyclic redundancy checker on the entire corrected Sector of data." Oak Technology, Inc. v. International Trade Commission, et al., 248 F.3d 1316 (Fed. Cir. 2001).108

"after the subscriber terminates the incoming call attempt" — "has a plain meaning and needs no interpretation." In re Cygnus Telecommunications Technology, LLC Patent Litigation, 481 F. Supp. 2d 1029 (N.D. Cal. 2007).109

"accumulator agency" — "a non-state, third-party entity that collects payments and payment information from an individual or entity for a fee and passes along those payments and payment information either directly to a state's bank, a state agency's bank, an individual, or an individual's bank or indirectly to a state, state agency, or an individual." Pay Child Support Online, Inc. v. ACS State & Local Solutions, Inc., 2004 U.S. Dist. LEXIS 6011 (D. Minn., Apr. 5, 2004).110

"agglomerated silicon self-interstitial intrinsic point defects" — "defects caused by the reaction in which self-interstitials agglomerate to produce dislocation loops and networks, and other such self-interstitial related defects." MEMC Electronic Materials, Inc. v. Mitsubishi Materials Silicon Corp., et al., 2006 U.S. Dist. LEXIS 9353 (N.D. Cal., Feb. 24, 2006).111

"agglomerated vacancy intrinsic point defects" — "defects caused by the reaction in which vacancies agglomerate to produce D-defects, flow pattern defects, gate oxide integrity defects, crystal originated particle defects, crystal originated light point defects, and other such vacancy related defects." MEMC Electronic Materials, Inc. v. Mitsubishi Materials Silicon Corp., et al., 2006 U.S. Dist. LEXIS 9353 (N.D. Cal., Feb. 24, 2006).112

"aggregate" — "gathered in to a mass or sum so as to constitute a whole." Lucent Technologies, Inc. v. Extreme Networks, Inc., et al., 367 F. Supp. 2d 649 (D. Del. 2005).113

"algorithm" — "a set of instructions that can be followed to carry out a particular task." *Uniloc USA, Inc., et al. v. Microsoft Corp.*, 447 F. Supp. 2d 177 (D. R.I. 2006).119

"alignment structure, in said computer" — "the combination of hardware and software within the computer that provides for alignment." *PolyVision Corp. v. Smart Technologies, Inc., et al.*, 501 F. Supp. 2d 1042 (W.D. Mich. 2007).121

"allotting a plurality of numbers from the predetermined range of numbers" — "giving to the player two or more numbers from a range of numbers. The range of numbers must be determined before the beginning of the first main game. Each number in the predetermined range need not be available for allotment." *Aristocrat Technologies, et al. v. International Game Technology, et al.*, 2009 U.S. Dist. LEXIS 40975 (N.D. Cal., May 14, 2009).123

[i] "allowing the one or more merchants to select at least one of the localized geographic areas and at least one of the topical categories"; [ii] "allowing the one or more merchants to input information into the system" — [i] "permitting one or more merchants to choose or pick at least one localized geographic area and at least one topical category"; [ii] "permitting one or more merchants to create and post information to the system." *Shopntown, LLC v. Landmark Media Enterprises, LLC*, 2009 U.S. Dist. LEXIS 62936 (E.D. Va., Jul. 22, 2009).126
[i] "allowing ... to assume a second voltage level"; [ii] "forcing ... to a first voltage level" — [i] "requires only that the transistor be turned OFF, or kept turned OFF (i.e., kept in a nonconducting state), so that the voltage stays at a high ('1') logic level for the relevant time period"; [ii] "requires only that the transistor be turned ON, or kept turned ON (i.e., kept in a conducting state), so that the voltage is held at a low ('0') logic level for the relevant time period." U.S. Philips Corp. v. Atmel Corp., et al., 2004 U.S. Dist. LEXIS 5832 (S.D.N.Y., Apr. 2, 2004).127

"wherein said identification encoder allows entry of a popularity code" — "an identification encoder assigns an optional popularity code." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2004 U.S. Dist. LEXIS 13415 (C.D. Cal., Jul. 12, 2004).129

"alterable" — "able to be modified or changed in the field." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).133

"altering" — "one or more techniques selected from the group consisting of adding, removing, isolating and shielding a known fraction of said initial amount." Travanti Pharma, Inc. v. Iomed, Inc., 2006 U.S. Dist. LEXIS 2646 (D. Minn., Jan. 11, 2006).136

"altering the threshold" — "the court declines to construe the term 'altering.'" 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007).137

"altering under the control of both sets of said data and a programmed digital computer the configuration of said first facial display to produce substantially the configuration of the second facial display" — "requires that the new lip configuration be calculated according to lip position data and control point data." Bloomstein v. Paramount Pictures Corp., et al., 1996 U.S. Dist. LEXIS 22260 (N.D. Cal., May 6, 1996).138

"alternately connected to a [said] first node and a [said] second node" — "strips in a given layer of the capacitor structure are connected to either the first node or second node in a manner such that adjacent strips of the capacitor structure are not connected to the same node." *Lonestar Inventions LP v. Nintendo of America, Inc.*, 2009 U.S. Dist. LEXIS 31753 (E.D. Tex., Apr. 14, 2009). 141

[T]he district court's construction of 'aluminum and aluminum oxide' in claim 1 was correct." *Id.*, 215 F.3d 1281 (Fed. Cir. 2000). 143

"amplifier" — "a circuit (or a device when connected in a circuit) that draws power from a source other than the input signal and provides an output signal that reproduces the essential features of the input signal." *Avocent Huntsville Corp. v. Clearcube Technology, Inc.*, 443 F. Supp. 2d 1284 (N.D. Al. 2006). 145

"amplifier circuit" — "is not 'functional' language that would overcome the presumption against the application of P 6." *Agere Systems, Inc. v. Broadcom Corp.*, 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004). 146

"a corresponding plurality of amplifiers for amplifying the plurality of filtered RF signals" — "two or more devices for strengthening two or more radio frequency signals, each device associated with one or more filters." *Isco International, Inc. v. Conductus, Inc., et al.*, 2002 U.S. Dist. LEXIS 20832 (D. Del., Oct. 30, 2002). 147

"amplitude modulator" — "is [] not limited to a variable attenuator." *Trilithic, Inc. v. Wavetek U.S., Inc.*, 64 F. Supp. 2d 816 (S.D. Ind. 1999). 149

"an illumination apparatus"; "illuminating" — "encompass one or more illumination sources." *Scanner Technologies Corp. v. ICOS Vision Systems Corp., N.V.*, 365 F.3d 1299, 1304 (Fed. Cir. 2004). 152
"analog and digital signals" — "the phrase 'analog and digital signals' has a common meaning which require[s] no further construction." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006).153

"analog signal" — "a continuously variable, measurable, physical quantity or impulse by which messages or information can be transmitted." Diagnostic Group, LLC v. Benson Medical Instruments Co., 2005 U.S. Dist. LEXIS 5030 (D. Minn., Mar. 28, 2005).155

"analog-to-digital converter"; "ADC" — "the ADC will be construed as a separate element from the CPU." P3 International Corp., et al. v. Unique Products Manufacturing Ltd., et al., 2009 U.S. Dist. LEXIS 43751 (S.D.N.Y., May 21, 2009).158

"analyzer" — "software in the shim that analyzes monitors the properties or characteristics of a computing device." Widevine Technologies, Inc. v. Verimatrix, Inc., 2009 U.S. Dist. LEXIS 102768 (E.D. Tex., Nov. 4, 2009).159

"analyzing a property of the data file to be transferred" — "studying the data file itself but does not include referencing destination information. The data file may be transmitted in any of various formats (a data file, data packets, encapsulated packets, or data streams)." ConnecTel, LLC v. Cisco Systems, Inc., 428 F. Supp. 2d 564 (E.D. Tex. 2006).160

"analyzing each frame of samples to extract a set of variable frequency components having individual amplitudes" — "analyzing each frame of samples and extracting therefrom a set of variable frequency components that have individual amplitudes, without regard to voiced/unvoiced decisions." Massachusetts Institute of Technology v. Lockheed Martin Global Telecommunications, Inc., et al., 242 F. Supp. 2d 58 (D. Mass. 2003).161

"analyzing ... to determine a resulting indication" — "does not require that the resulting indicator need be one of the two calculation results. It can, for example, be an average of the two results. Additionally, the process of analyzing includes, but is not necessarily limited to 'studying, comparing, or breaking down.' No further construction is required." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003).162
"and" — "the Court agrees with Orion that 'and,' in context, is used in the disjunctive."  
Orion IP, LLC v. Staples, Inc., et al., 406 F. Supp. 2d 717 (E.D. Tex. 2005).164 "The Staples Defendants took the same position, which the Court rejected and instead construed the term as a disjunctive--i.e., the questions (or answers) must relate to either features or uses."  

"an electrical operating unit and a pair of spaced-apart electrically exposed conductive probe networks" — "the clear implication of the claim language is that the pair of probe networks is a distinct component, separate from the electrical operating unit of the claimed invention."  
Dr. Harry Gaus v. Conair Corp., 363 F.3d 1284 (Fed. Cir. 2004).165

"utilizing said decode control key and said transmitted control signal to generate a pseudo-random signal at said receiver station" — "requires that both the signal and the key participate in generation of the pseudo-random signal, but does not limit the way in which the signal and key participate in the generation."  

"first animated facial display"; "second animated facial display" — "a depiction of a face in a cinematic work speaking one 'language'"; "a depiction of second face, an actor's, speaking a different 'language.' Neither display must appear on a 'monitor device.'"  

"annotated web page" — "a web page modified by the addition of thumbnail visual images."  

"annular" — "a surface area defined by two concentric polygons."  
International Rectifier Corp. v. IXYS Corp., 361 F.3d 1363 (Fed. Cir. 2004).169

"answer data" — "responses from callers to vocal questions or prompts."  

"antenna" — "that part of a transmitting or receiving system that radiates or receives electromagnetic waves."  

"antenna means" — "a means for radiating or receiving radio waves."  

"recording any errors" — "to set down for preservation all errors."  

"light transmitting aperture" — "a hole, window, port, or opening in the tip of the probe through which laser energy passes."  

"apparatus"; "system" — "computer hardware running with the required software program, including at least a computer, display screen, input device (e.g., keyboard, mouse), and associated printer."  
Intell-a-Check Corp. v. Autoscribe Corp., et al., 346 F. Supp. 2d 698 (D.N.J. 2004).175
"apparatus for producing a fixed code signal and for combining said fixed code signal with a rolling code signal" — "a processor programmed to 1) produce a message carrying information indicative of a non-changing code and also 2) combine that message with a message carrying information indicative of a rolling code."  

"an apparatus for selectively increasing the voltage on one or more of a plurality of conductive lines having inherent distributed capacitance disposed in a semiconductor circuit" — "A conductive line is any line that is capable of conducting electrical current. A conductive line having inherent distributed capacitance is a conductive line in a semiconductor circuit that has capacitance distributed along its length that must be accounted for in the operation of the claimed circuit, and includes word lines, y-lines, write lines, and select lines."  

"individual ones of the redundancy codes being appended to ends of the user data from which they are generated" — "requires the redundancy code to be attached immediately adjacent to the user data."  

"appending" — "attaching to the end of."  

"remote interface"; "applicant interface"; "remote applicant interface" — "dedicated computer equipment, meaning equipment supplied by the entity providing the financial account or service, such as but not limited to equipment housed in a kiosk, which allows the applicant ... to provide information to and receive information from a data processing system and which facilitates completion of all steps of the claim involving interaction between the applicant ... and the data processing system."  

"applicable pricing adjustment(s)"; "applicable price adjustment(s)"; "pricing information applicable"; "applicable pricing information" — "the court gives the above terms their plain meanings."  

"application events" — "an event in an application program."  

"application generator" — "a software tool used to develop data collection applications and libraries."  

"application program" — "software that performs tasks for an end user."  

"application program" — "software that performs tasks for an end-user."  

"application programs" — "sequences of machine-level instructions capable of execution on a processor."  

"Application Program Interface (API) calls" — "a set of formalized software calls that can be referenced by an application platform to access underlying services." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).188

"application service provider (ASP)" — "a party that provides authenticated access information to a user through the network to enable the user to access one or more NSPs." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).189

"application software for ... transmitting said second menu to a wireless handheld computing device or Web page" — "application software, which is capable of transmitting to both wireless handheld computing devices and Web pages, transmitting the second menu to a wireless handheld computing device or Web page." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010).190

"applying a rules engine continuously to at least two patient data elements stored in the database" — "applying a rules engine repeatedly and automatically to at least two patient data elements stored in the database." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009).192

"applying an approximately constant bias voltage to the conductive shield of the coaxial cable" — "this court [] declines to further construe the phrase." Monster Cable Products, Inc. v. Quest Group, 2005 U.S. Dist. LEXIS 4213 (N.D. Cal., Mar. 17, 2005).193

"applying one or more test methodologies to the collected information" — "using a computer to perform calculations for one or more test methodologies using the data collected from the testing of the pavement construction material." Atser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009).194

"applying FECC (forward error correcting code) coding and codeword interleaving differently to signals of different data channels to produce encoded data signals having different delays" — "the FECC coding and codeword interleaving are applied in a way that differentiates among the data channels which results in the production of encoded data signals with different delays." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).195

"another portion of said third doped region extends appreciably under the edges of said field stop regions which define the sides of said channel" — "means that the third doped region must extend far enough under ... so that the edges of the third doped region are not exposed to the thin portion of the first insulating layer." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998).196
"appropriate application software" — "software that allows for 'normalized transactional processing,' or, specifically, for the addition and reporting of database record sets." Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al., 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006). 197

"approximately constant" — "nearly constant or constant." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 198

"arcs" — "lines that connect the nodes in a data flow diagram and represent that data produced by one node is used by another." National Instruments Corp. v. Mathworks, Inc., 2002 U.S. Dist. LEXIS 27577 (E.D. Tex., May 24, 2002). 200

"storing a set of definitions of architecture independent actions and conditions" — "storing a set of instructions of actions or conditions to which a circuit could be subjected that are not dependent on any particular arrangement of hardware cells to perform the actions or create or maintain the conditions." In re Ricoh Company Ltd. Patent Litigation, 2009 U.S. Dist. LEXIS 103775 (N.D. Cal., Oct. 23, 2009). 201

"architecture independent actions and conditions" — "functional or behavioral aspects of a portion of a circuit (or circuit segment) that does not imply a set architecture, structure, or implementing technology, but excludes the use of register-transfer level descriptions as taught in Darringer." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005). 202

"a requirements area" — "an area (i.e., one or more areas) for displaying one or more requirements (i.e., at least one requirement)." iRise v. Axure Software Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 102160 (C.D. Cal., Sep. 11, 2009). 203

"area of said single substrate"; "area of said substrate" — "the top surface area of the substrate." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 204

"display areas"; "background area" — "display areas include any illuminated pixel anywhere on the display device, other than background area pixels in defined background regions. The background area pixels substantially surround the illuminated display area pixels. Display area pixels may be illuminated in the background color, but background area pixels may not be illuminated in the display color." Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002). 205

"arithmetic comparison mechanism coupled to the plurality of correction values, and wherein the motion signals are not output to the computer system whenever a correlation surface described by the plurality of correlation values fails to exhibit a selected curvature" — "a device that executes an algorithm which determines a surface shape by plotting the multiple correlation values and that blocks the transmission of motion data to the computer system if the result of the algorithm is that the surface shape is not a suitable curvature. ... to the extent that the parties interpret the Court's use of 'plotting' in its previous construction as 'forming an actual graphical representation of the correlation values,' such 'plotting' is not required by the specification. At a rudimentary level, the Court understands the equation \( y = 2x \) to be a linear equation without using graph paper and a ruler. The Court declines to further construe the phrase." Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp., 2006 U.S. Dist. LEXIS 62700 (N.D. Cal., Aug. 18, 2006).

"around the receiver front end" — "so as to pass, bypass, or avoid the receiver front end." Isco International, Inc. v. Conductus, Inc., et al., 2002 U.S. Dist. LEXIS 20832 (D. Del., Oct. 30, 2002).

"the modulator is arranged to allocate bits of encoded data signals having relatively less interleaving to carriers carrying relatively fewer bits in each symbol period" — "the modulator is configured in a way such that it allocates bits of encoded data signals with relatively less interleaving to carriers with relatively fewer bits in each symbol period." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).

"programmable FECC coder arranged to be programmed by the control unit" — "programmable FECC coder configured in a way that enables it to be programmed by the control unit." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).

"arrangement for reactivating" — "a processor connected to a transceiver and programmed to formulate and send messages to reactivate the link, if the handover is unsuccessful." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).

"array" — "DBI argues that the plain meaning of the word 'array,' as evidenced by its dictionary definition, does not require the data contained therein to be digital. ... The intrinsic evidence clearly indicates that the applicant distinguished between analog 'frames' and digital 'arrays.' Because the intrinsic record is clear we do not give weight to an inconsistent dictionary definition." Digital Biometrix, Inc. v. Identix, Inc., et al., 149 F.3d 1335 (Fed. Cir. 1998).

"an array of EEPROM cells" — "need not be 'contiguous' or contain 'dedicated row and column decoders.'"  Sandisk Corp. v. Zotek Electronic Co., Ltd., et al., 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010).217

"array of non-volatile floating gate memory cells" — "a group of memory cells on one or more memory chips. Multiple chips in the same array are connected through objects such as a common interface and/or common logic and resistor circuits. An array may contain components that are not memory cells, such as an interface."  Sandisk Corp. v. Memorex Products, Inc., et al., 2007 U.S. Dist. LEXIS 15393 (N.D. Cal., Feb. 21, 2007).218

"array state bits" — "bits that identify either the missing or replacement member disk or the state of the array."  Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).220

"a method of screening the data as it is being transferred" — "a method of screening the data while it is being moved or copied and before the data is stored to the computer storage medium."  Symantec Corp. v. Computer Associates International, Inc., 2005 U.S. Dist. LEXIS 46912 (E.D. Mich., Mar. 16, 2005).221

"defining and loading, as required by the formation of the particular monochromatic images, at least some of the font patterns in the font memory" — "as new characters are encountered in the image, new font patterns (or monochromatic characters) can be formed and stored in the font memory."  OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).222

"as the interrupt signal" — "the signal to the host processor from the device that may cause the host processor to temporarily suspend other tasks while addressing the device."  PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).223

"ascertaining a georeferenced map that contains the geographic coordinates" — "determining a georeferenced map that includes the geographic coordinates."  Sourceprose Corp. v. Fidelity National Financial, et al., 2006 U.S. Dist. LEXIS 10151 (E.D. Tex., Feb. 23, 2006).224

"ascertaining as a function of an outcome of a comparison whether an access of the at least one subscriber station to the at least one telecommunication channel is enabled" — "comparing an access threshold value to a random or pseudo-random number to determine whether access to the common telecommunications channel is allowed or whether the subscriber station (cell phone) must wait for and check the next transmission."  HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).225

"asks" — "one or more asks each of which comprises an ask quantity and an ask price."  Flash Seats, LLC v. Paciolan, Inc., 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010).226
"assembling said second code module having said service response" — "putting together a second code module (which, as you already know, is a computer program) that includes, as part of the program, a service response (which I have previously defined for you)." *Modavox, Inc. v. Tacoda, Inc.*, 607 F. Supp. 2d 530 (S.D.N.Y. 2009). 227

"assign"; "assignment" — "the scope of the terms is limited to the present transfer of a property right." *H&R Block Tax Services, Inc. v. Jackson Hewitt Tax Service, Inc.*, 2009 U.S. Dist. LEXIS 114208 (E.D. Tex., Dec. 8, 2009). 228

"assigned in buckets" — "assigned to areas in which items are stored or contained, such as partitions or sectors of a placement area." *Synopsys, Inc. v. Magma Design Automation, Inc.*, 2005 U.S. Dist. LEXIS 46882 (N.D. Cal., Aug. 23, 2005). 229

"assigning" — " 'Assigning' is a commonly used and widely understood word. It means 'to set aside for a particular purpose' or 'designate.' It is clear upon review of the specification that the patent uses the term in a manner consistent with its ordinary meaning without providing a more specialized meaning." *800 Adept, Inc. v. Murex Securities, Ltd., et al.*, 2006 U.S. Dist. LEXIS 53696 (M.D. Fla., Aug. 3, 2006). 232

"assigning a secret code to activate the multi-function card" — "The user assigns a secret code by entering a code through a separate electronic device or through an alphanumeric keyboard or keypad on the card." *E-Pass Technologies, Inc. v. 3COM Corp., et al.*, 177 F. Supp. 2d 1033 (N.D. Cal. 2001). 234

"assigning a UID to each license file" — "the act of specifying a correspondence between each license file and respective UIDs, where 'license file' is an area of memory on a disk capable of storing at least one license." *Globetrotter Software, Inc. v. Elan Computer Group, Inc., et al.*, 1999 U.S. Dist. LEXIS 22482 (N.D. Cal., Oct. 22, 1999). 235

"assigning the process steps to the machines" — "designating the fundamental operation or operations that a machine will carry out during manufacturing." *Information Technology Innovation, LLC v. Motorola, Inc., et al.*, 391 F. Supp. 2d 719 (N.D. Ill. 2005). 238

"song associated pictorial graphics" — "visual images associated with songs." *Rowe International Corp. v. Ecast, Inc.*, 500 F. Supp. 2d 891 (N.D. Ill. 2007).\(^{241}\)

"associated therewith"; "having" — "the Court construes 'associated therewith' or 'having' as logically related to or logically connected, but not necessarily embedded." *Intergraph Corp. v. Intel Corp.*, 2002 U.S. Dist. LEXIS 27117 (E.D. Tex., Jun. 3, 2002).\(^{242}\)

"associated with" — "identified with or having a connection to." *Stambler v. JPMorgan Chase & Co., et al.*, 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010).\(^{243}\)

"associated with" — "is given its plain and ordinary meaning." *Stanacard, LLC v. Rebtel Networks, AB, et al.*, 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010).\(^{244}\)

"a given object of a participating content provider is associated with an alphanumeric string" — "a particular object of a participating, content provider is associated with an alphanumeric string that includes the URL used to identify the object in the absence of a content delivery network." *Akamai Technologies, Inc., et al. v. Limelight Networks, Inc.*, 494 F. Supp. 2d 34 (D. Mass. 2007).\(^{245}\)

"associated with at least one patron" — "in an identifiable relationship with at least one patron." *PalmTop Productions, Inc. v. LO-Q PLC, et al.*, 450 F. Supp. 2d 1344 (N.D. Ga. 2006).\(^{246}\)

"at least one data storage assembly associated with said local processor assembly" — "the local processor assembly includes at least one structure for holding data." *Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al.*, 491 F. Supp. 2d 1105 (S.D. Fla. 2007).\(^{247}\)

"said auxiliary site data being associated with said primary site data" — "auxiliary site data is capable of interacting with the primary site data." *Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al.*, 491 F. Supp. 2d 1105 (S.D. Fla. 2007).\(^{248}\)

"a plurality of media player devices associated with the user account"; "a plurality of media player devices as being authorized with the user account" — "two or more media players specified in the user account, whereby referenced media assets can be copied and/or used by the aforementioned media players." *Zapmedia Services, Inc. v. Apple Inc.*, 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010).\(^{249}\)

"associates the valid logon command with the remote computer unit" — "to connect or bring into relation a valid logon command with a particular computer unit that is to be remotely controlled from a remote location using an interface unit." *Automated Business Cos. v. ENC Technology Corp., et al.*, 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009).\(^{250}\)

"associating a UTID with the electronic transaction" — "the party originating the transaction connecting or linking up the unique transaction identifier created by the originating party to the transaction." *Starpay.com L.L.C., et al. v. Visa International Service Association, et al.*, 514 F. Supp. 2d 883 (N.D. Tex. 2007).\(^{251}\)
"associating an active call authorization amount with the particular pre-paid calling card account" — "means that as part of the activation process, and not before, the active call authorization amount is linked in the remote location database, to the pre-paid calling card account." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).252

"associating, at the host computer, an amount of call authorization to a security number" — "means that as part of the activation process, and not before, the amount of call authorization is linked in the host computer database to a security number for that card." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).253

"associating the roles with individual metadata elements" — "for each of a plurality of metadata elements, assigning a plurality of roles to the metadata element." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009).255

"associating with said packet an identifier" — "covers both an implicit or an explicit approach. The district court, by construing it to cover the explicit approach alone, read an additional limitation into the claim." Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615 (Fed. Cir. 1995).256

"associating users who will access the image with roles" — "for at least two roles, assigning a plurality of users who will access the image to the roles." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009).257

"association" — "the state of being joined or connected together such that communication is possible as between the joined or connected components." Globetrotter Software, Inc. v. Elan Computer Group, Inc., et al., 1999 U.S. Dist. LEXIS 22482 (N.D. Cal., Oct. 22, 1999).258

"associative crossbar"; "associative crossbar switch" — "a crossbar in which the data being routed includes the routing instructions." Intergraph Corp. v. Intel Corp., 2002 U.S. Dist. LEXIS 27117 (E.D. Tex., Jun. 3, 2002).259

"to assume a proper configuration" — "to assume a proper hardware configuration." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).260

"asynchronous communication" — "Vonage's argument that the court should construe the claim term 'asynchronous communication' to mean ATM communication is essentially an attempt to limit the claim term to one particular type of packet communication and, in particular, to the exclusion of the IP packet technology used in the Vonage system." Sprint Communications Co., L.P. v. Vonage Holdings Corp., et al., 500 F. Supp. 2d 1290 (D. Kan. 2007).261

"at a later timepoint determined by a fixed period of time predefined at a beginning of a handover" — "when the time, which has been preset and initiated before handover, expires." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).262
"each of said plurality of student terminals provides said responses to said student tasks at a pace that is under the control of the teacher" — "the teacher may set a time limit or control the pace by starting, stopping, or advancing to the next instructional activity, question, or set of questions which the students may provide responses to on their student terminals." Better Education, Inc. v. eInstruction Corp., et al., 2010 U.S. Dist. LEXIS 40972 (E.D. Tex., Apr. 27, 2010).\textsuperscript{263}

"at a time requested by the user" — "at the output time specified by the user when the user makes the request to the transmission system to transmit information." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006).\textsuperscript{264}

"at a time when" — "the Court accepts Mars' interpretation, and the patent does not cover the situation where actuation of the switch means energizes the first portion regardless of whether or not the amount accumulated at least equals the vend price." Mars, Inc. v. Coin Acceptors, Inc., 2007 U.S. Dist. LEXIS 20094 (D.N.J., March 20, 2007).\textsuperscript{265}

"at all times not admit for storage in said buffer any cells on said virtual channel connections for which since the previous indication of said end of transmission on said virtual channel connection there has been any rejection of cells for storage" — "at all times, if there has been any rejection of cells on a virtual channel connection since the receipt of a cell on that virtual channel connection that contains an end of transmission indication, not admit any cells arriving on the virtual channel connection for storage in said buffer." QPSX Developments 5 Pty. Ltd. v. Juniper Networks, et al., 2007 U.S. Dist. LEXIS 1991 (E.D. Tex., Jan. 10, 2007).\textsuperscript{266} "at all times, if there has been any rejection of cells from a particular frame on a virtual channel connection since the receipt of a cell on that virtual channel connection that contains an end of transmission indication, not admit any other cells from that particular frame arriving on the virtual channel connection for storage in said buffer." Id., No. 2:05-CV-268 (E.D. Tex., April 17, 2007).\textsuperscript{267}

"at least approximately 600 tpi" — "defines an open-ended range starting slightly below 600." Quantum Corp. v. Rodime, PLC, 65 F.3d 1577 (Fed. Cir. 1995).\textsuperscript{268}

"at least one light source" — "cover[s] a device that has only one light source or a device that has more than one light source." Rhine v. Casio, Inc., et al., 183 F.3d 1342 (Fed. Cir. 1999).\textsuperscript{269}

"at least one of ... and ..." — "in connection with a list of items [] mean[s], 'one or more of one or more of the items contained in the list.'" Joao, et al. v. Sleepy Hollow Bank, et al., 348 F. Supp. 2d 120 (S.D.N.Y. 2004).\textsuperscript{270}

"the song record including song identity data comprising at least one of a song title, a song category, song address, song size, graphics address, graphics size, and play count" — "the conjunctive language in this claim term requires that the song record include at least one of each of the categories of information listed." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010).\textsuperscript{271}

"at least one of program start time, program end time, program service, and program type for a plurality of television programs" — "the district court correctly interpreted this phrase as requiring that the user select at least one value for each category; that is, at least one of a desired program start time, a desired program end time, a desired program service, and a desired program type." SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870 (Fed. Cir. 2004).\textsuperscript{272}
"content profiles indicating at least one of the presence and the degree of" — "content profiles indicate either the presence or the degree of predetermined characteristics." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004). 373

"wherein the routing means comprises at least one of: means for ...; means for ...; and means for ..." — "Defendants construe 'at least one of' in this clause to mean 'each and every' of the following three 'means.' Plaintiff construes 'at least one of' to mean 'at least one of.' The Court agrees with Plaintiff." DealerTrack v. Huber, et al., No. 06-CV-02335 (C.D. Cal., Sept. 27, 2008). 374

"at least one of [A] and [B]" — "The critical distinction for purposes of this case is between the performance of both functions simultaneously and the capability to perform both functions. The Court finds that this conjunctive construction is most consistent with the language and scope of the Patents-in-Suit." Inventio AG v. ThyssenKrupp Elevator Americas Corp., et al., 2010 U.S. Dist. LEXIS 59020 (D. Del., Jun. 14, 2010). 375

"at least one of ... [followed by an enumerated list]" — "only requires that one of the categories be selected." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007). 376

"at least one spare read/write memory unit that is similar in operation to an individual read/write memory unit of said plurality of read/write memory units" — "The phrase 'at least one' does not, as IBM urges, mean 'one and no more than one.' Rather, as TM notes, it means 'one or more than one.'" TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999). 377

"at least one switch operable to optically couple the second optical line interface to (a) the first optical line interface through at least the optical demultiplexer, and alternatively (b) the second transponder" — "at a minimum, one switch can at least both: (a) optically couple the second optical line interface to the first optical line interface through at least the optical demultiplexer; and alternatively (b) optically couple the second optical line interface to the second transponder." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 378

"ATA register address" — "the ATA register address of claim 3 is not required to receive both single-byte and multi-byte commands from the host computer." Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34454 (N.D. Cal., Sept. 9, 2005). 380

[i] "attaching"; [ii] "detaching" — [i] "making physically or logically available such as by producing a ready state"; [ii] "to make physically or logically unavailable such as by producing a not ready state." EMC Corp. v. Hewlett-Packard Co., Inc., 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003). 381

"attachment unit interface"; "AUI" — "the court construes AUI as defined by the 802.3 Standard: In a local area network, the interface between the medium attachment unit and the data terminal equipment within a data station." Level One Communications, Inc. v. Seeq Technology, Inc., 987 F. Supp. 1191 (N.D. Cal. 1997). 382
attachment unit interface port"; "AUI port" — "the court rejects both proffered definitions and construes AUI port just as it is defined in Claim 6, as having data out, data in, and collision presence circuits for coupling said attachment unit interface to said media attachment unit." Level One Communications, Inc. v. Seeq Technology, Inc., 987 F. Supp. 1191 (N.D. Cal. 1997).

"attenuated and filtered" — "reduced and removed." Nellcor Puritan Bennett, Inc., et al. v. Masimo Corp., 300 F. Supp. 2d 923 (C.D. Cal. 2004). “[W]e hold that the district court erred in its construction of that critical claim language and that 'attenuated and filtered from the composite waveform' means 'reduced in comparison to the desired information.'” Id., 402 F.3d 1364 (Fed. Cir. 2005).

"VAN ... attesting to the authenticity of the instrument" — "including the VAN with the instrument for subsequent use in verifying that the information in the instrument has not changed and verifying that the instrument originated from the first party." Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010).

"the VAN being used for attesting to the authenticity of the payor and document information" — "The VAN being used to verify that the instrument originated from the payor and that the at least a portion of the document information used to create the VAN has not changed." Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010).

"auction" — "a process over a trusted network, or with a trusted intermediary." MercExchange, L.L.C. v. eBay, Inc., 401 F.3d 1323 (Fed. Cir. 2005).

"an auctioneer in control of the auction event" — "an auctioneer in complete control of all changes in the state of the auction, including which bids are accepted and rejected." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).

"the auctioneer manages the psychology and pace of the auction"; "the auctioneer manages the ... pace of the auction and the psychology of the auction" — "the auctioneer uses a variety of techniques to exert influence over the emotion, enthusiasm, and excitement of remote and onsite bidders and over the speed of bidding to play bidders off each other so that they are more likely to bid on auction items and make larger bids." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).

"audio and/or visual selection" — "audio and/or visual content of a stream made available to user(s)." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007).

"audio/video source information" — "an audio and/or video work that can be received from one or more sources and that has a temporal dimension." Apple Computer v. Burst.com, Inc., 2007 U.S. Dist. LEXIS 33863 (N.D. Cal., May 8, 2007).

"authentication data" — "information indicating a system user or ownership of a ticket, such as a credit card number, a cell phone number, a digital encryption on a personal digital assistant, or a single- or multi-dimensional bar code." Flash Seats, LLC v. Paciolan, Inc., 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010). 298

"authorization code" — "we hold that: (1) an authorization code must authorize copying but need not provide decoding information; (2) the term 'authorization code' is not to be construed to require that it include an IMM code or that it be transmitted electronically; and (3) an authorization code is separate and distinct from a request reproduction code." Interactive Gift Express, Inc. v. CompuServe, Inc., et al., 256 F.3d 1323 (Fed. Cir. 2001). 300

"entering an authorization code through the keypad for having the computer initiate communication with a host data processor" — "a series of numbers and/or letters, or a combination thereof, entered via the keypad to establish a communication link with a host data processor." Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010). 301

"an authorization procedure" — "process which determines whether access should be granted." Digital Reg of Texas, LLC. v. LFP Internet Group, LLC, et al., 2009 U.S. Dist. LEXIS 59610 (E.D. Tex., Jul. 13, 2009). 303

"authorization request" — "a query sent to the central processing computer via a communications medium, seeking approval or disapproval of a transaction or activity." Joao v. Sleepy Hollow Bank, et al., 418 F. Supp. 2d 578 (S.D.N.Y. 2006). 304

"authorized by the subscriber" — "elected by the subscriber after the subscriber is presented with a choice among multiple options." Media Queue, LLC v. Netflix, Inc., et al., 2009 U.S. Dist. LEXIS 118896 (N.D. Cal., Dec. 1, 2009). 305

"automated method, performed by a computer-based auction system"; "computer-implemented method of conducting Internet-based auctions" — "the district court was correct in holding that not all steps had to be performed by way of an automated process." MercExchange, L.L.C. v. eBay, Inc., 401 F.3d 1323 (Fed. Cir. 2005). 307

"automated modification" — "a change by the system without a request or instruction to change from a user." LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al., 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010). 308
"automated negotiations engine for analyzing terms"— "[s]pecial purpose software that performs the functions necessary to implement multiple rounds of bargaining which allows for an offer and multiple counteroffers between two participants where each round is related to prior rounds without human intervention." Sky Technologies, Inc. v. Ariba, Inc., 491 F. Supp. 2d 154 (D. Mass. 2007). 307

"automated" — "working with little or no human actuation." Intell-a-Check Corp. v. Autoscribe Corp., et al., 346 F. Supp. 2d 698 (D.N.J. 2004). 308

"automatic"; "without human intervention"; "without human assistance" — "These terms mean a system which is fully automated and completed without human involvement (other than by the applicant). This construction does not exclude systems that allow human involvement after all steps described as being performed without human assistance are completed." Decisioning.com, Inc. v. TD Ameritrade Holding Corp., Inc., et al., 484 F. Supp. 2d 426 (D.S.C. 2007). 310

"automatic bridging device" — "is not a means-plus-function limitation but rather a limitation that suggests sufficient structure to one ordinarily skilled in the art to avoid the application of 112 P 6." In re Cygnus Telecommunications Technology, LLC Patent Litigation, 481 F. Supp. 2d 1029 (N.D. Cal. 2007). 311

"automatic call distributor"; "ACD" — "a device that receives incoming telephone calls and automatically distributes those calls, which is comprised of an integrated telephone switch and computer apparatus, in communication with one another through a specialized proprietary software interface." Rockwell Electronic Commerce Corp., et al. v. Apropos Technology, Inc., 2002 U.S. Dist. LEXIS 272 (N.D. Ill., Jan. 9, 2002). 312

"automatic ion output current adjustment circuit" — "a circuit used to increase or decrease the ion output current of the positive and/or negative high voltage power supplies based on the result of the comparison performed by the comparator." Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003). 313

"automatic message distribution system" — "a system that processes information received in message format that is able to route messages based on message content." eBay Inc. v. IDT Corp., et al., 2009 U.S. Dist. LEXIS 56469 (W.D. Ark., Jun. 10, 2009). 314

"automatic operation" — "movement of the camera base that is not directly responsive to input from a monitoring person (other than initiation of the automatic operation)." Lectrolarm Custom Services v. Vicon Industries, Inc., et al., 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005). 315
"an automatic steering and isolation diode network for supplying voltage to said radio from either said AC powered DC power supply or said removable DC power supply, and also for automatically supplying charging voltage from said AC powered DC power supply to said removable DC power supply" — "a group or system of at least two diodes that supplies voltage to the radio from either the alternating current powered direct current power source or the removable direct current power supply and also supplies the removable direct current power supply with a voltage from the alternating current powered direct current power supply."  

—  

"automatically" — "once initiated, the function is performed by a machine, without the need for manually performing the function."  Collegenet, Inc. v. ApplyYourself, Inc., 418 F.3d 1225 (Fed. Cir. 2005). 318

"automatically" — "the district court did not err in construing the term 'automatically' to mean that the claimed apparatus is 'capable of performing multiple, autonomous east-west changes in position over a substantial period of time without ground transmissions concerning the parameters of such movements.'"  Space Systems/Loral, Inc. v. Lockheed Martin Corp., 2000 U.S. App. LEXIS 21414 (Fed. Cir., Aug. 23, 2000). 319

"automatically" — "a method that automatically performs all of the steps in the project management cycle, without the need for manual intervention or supervision, based only on messages sent to the computer."  Enpat, Inc., et al. v. Microsoft Corp., et al., 26 F. Supp. 2d 806 (E.D. Va. 1998). 322

"bus master configuring the bus automatically" — "the bus master, without manual user intervention, is able to (i) control access to the bus by newly connected stations, and (ii) cease controlling stations disconnected from the bus, without interruption of the operation of the system in either situation. The Court does not define 'without manual user intervention' to exclude, for instance, the possibility that a person connected a device to the bus."  Karl Storz Endoscopy-America, Inc. v. Smith & Nephew, Inc., 2010 U.S. Dist. LEXIS 85036 (W.D. Tenn., Aug. 18, 2010). 323
"automatically"; "automatically establishing"; "automatically dialing" — "'automatically' as used in the phrase 'automatically establishing voice communications,' requires that the step of establishing voice communications between a called party and a calling party is initiated and performed without human intervention, i.e., without manual dialing, manual activation or other manual activity. For example, establishing voice communications by manually dialing or manually activating a connection using a button (such as on a phone, mouse, keyboard or other device) to initiate a call is not 'automatically establishing voice communications.' Additionally, ... as used in the patent, 'automatically dialing' requires that the step of dialing a telephone number be performed without human intervention, i.e., without manual activity. For example, initiating a call by manually dialing the digits or manually activating a connection using a button (such as on a phone, mouse, keyboard or other device) to initiate a call is not 'automatically dialing.'"

"automatically adjusting" — "changing at least one of the high voltage power supplies in a manner independent of external influence or control." Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003) \textsuperscript{325}

"automatically administering credit on a unilateral basis" — "Keeping track, without user intervention, of whether each trading floor extends credit to the other trading floors, on a one-way basis." EBD Dealing Resources, Inc. v. Intercontinental Exchange, Inc., 379 F. Supp. 2d 521 (S.D.N.Y. 2005) \textsuperscript{326}

"automatically and simultaneously displaying at the programmed computer in real time the current status information of at least a portion of the delegated instructions received from each two-way communication device" — "the current status information for one instruction and some current-status information for another instruction may be simultaneously displayed." Papyrus Technology Corp. v. New York Stock Exchange, Inc., 581 F. Supp. 2d 502 (S.D.N.Y. 2008) \textsuperscript{327}

"automatically answering incoming telephone calls" — "does not require construction." Klausner Technologies, Inc. v. Vonage Holdings Corp., et al., 2007 U.S. Dist. LEXIS 57604 (E.D. Tex., Aug. 7, 2007) \textsuperscript{328}

[i] "automatically apply or compare the internet media venue design or style standards to the information input by the seller or the advertisement"; [ii] "automatically apply or compare the internet media venue distribution factors to the information input by the seller or the advertisement"— [i] "execute a systematic sequence of mathematical and/or logical operations to apply or compare the internet media venue's design or style standards to the information input by the seller or to the advertisement"; [ii] "execute a systematic sequence of mathematical and/or logical operations to apply or compare the internet media venue's distribution factors to the information input by the seller or to the advertisement." Function Media, L.L.C. v. Google, Inc., 2009 U.S. Dist. LEXIS 94340 (E.D. Tex., Oct. 9, 2009) \textsuperscript{329}
"automatically computing at least one interest cost value based at least in part on said inputted data, said automatically computed interest cost value specifying a rate representing borrowing cost associated with said at least one fixed income financial instrument" — "calculating, without further action by the user, an interest cost value, representing borrowing cost associated with a original issue fixed income financial instrument, based at least in part on the information put into a bidder's computer in the previous step." Muniauction, Inc. v. Thomson Corp., 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006).

"automatically denoting" — "is limited to a non-continuous currency evaluation device that has only one output receptacle." Cummins-Allison Corp. v. Glory, Ltd., et al., 2003 U.S. Dist. LEXIS 2151 (N.D. Ill., Feb. 10, 2003). "[T]he Court construes the phrase 'automatically denoting' to mean automatically determining the denomination of bills by any method known to those skilled in the art at the time the '806 patent application was filed." Cummins-Allison Corp. v. Glory, Ltd., et al., 2005 U.S. Dist. LEXIS 6150 (N.D. Ill., Mar. 28, 2005). "[T]he Court agrees with the '806 Opinion that 'automatically denoting' includes any method for automatic denomination known to those skilled in the art at the time the '806 Patent was filed." Cummins-Allison Corp. v. Glory, Ltd., et al., 457 F. Supp. 2d 843 (N.D. Ill. 2006).

"automatically deriving a respective dealable price message" — "Deriving a message sent to a trading floor (a potential taker) and indicating a bid or offer originating from another trading floor (a potential maker) with whom the potential taker has credit remaining." EBD Dealing Resources, Inc. v. Intercontinental Exchange, Inc., 379 F. Supp. 2d 521 (S.D.N.Y. 2005).

"in response to the consumer selecting a displayed icon corresponding to an expert from the list, automatically establishing a telephone connection" — "the plain meaning of the words in claim 1 is that clicking on or selecting a displayed icon corresponding to an expert results in an immediate telephone connection between the expert and the consumer, without a series of intervening manual steps." Keen, Inc. v. InfoRocket.com, Inc., 2002 U.S. Dist. LEXIS 13640 (S.D.N.Y., Jul. 26, 2002).

"automatically provided by a communications network" — "supplied by either the telecommunications network or the telecommunications network via the message originator's device without manual entry by the message originator." Intellect Wireless, Inc. v. Kyocera Communications, Inc., et al., 2010 U.S. Dist. LEXIS 64726 (N.D. Ill., Jun. 29, 2010).

"automatically receiving and integrating reports of suspicious activity" — "without user intervention, receiving reports of suspicious activity and combining those reports into a different end product; i.e., something more than simply collecting and reiterating data." SRI International, Inc. v. Internet Security Systems, Inc., et al., 2006 U.S. Dist. LEXIS 75355 (D. Del., Oct. 17, 2006).
"automation boot sequence data" — "a particular value assigned to the system ID byte of the first partition which indicates to the custom boot loader that the computer should boot in automation mode." Altiris, Inc. v. Symantec Corp., 160 F. Supp. 2d 1274 (D. Utah 2001).341

"automation code" — "the code in the automation partition which loads an operating system, LAN drivers for the resident NIC, and a program for reading a database on the network server to ascertain the automation commands to be executed." Altiris, Inc. v. Symantec Corp., 160 F. Supp. 2d 1274 (D. Utah 2001).342

"autonomous" — "the module operates independently of the host device and does not incorporate any of the device's functionality." Digi International, Inc. v. Lantronix, Inc., 402 F. Supp. 2d 1041 (D. Minn. 2005).343

"auxiliary device" — "the source of substitute video material, where such material may include messages, information, advertisements or other video programs." Sony Electronics, Inc. v. Guardian Media Technologies, Ltd., 2009 U.S. Dist. LEXIS 79716 (S.D. Cal., Aug. 31, 2009).345

"auxiliary site data" — "data that supplements or aids the claimed primary site data." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).346

"AV path" — "a route or course over which audio and/or video (commonly abbreviated 'AV') information travels for real-time delivery." Collaboration Properties, Inc. v. Tandberg ASA, et al., 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006).347

"available for receiving [transmitting] a packet" — "The district court construed 'available for receiving [transmitting] a packet' as requiring that the virtual connection exists when setting up a bypass pipe. ... we hold that the intrinsic and extrinsic evidence both indicate the virtual connection must exist when setting up a correspondence relationship. We therefore find no error in the district court's construction." Toshiba Corp. v. Juniper Networks, Inc., 2007 U.S. App. LEXIS 21288 (Fed. Cir., Sept. 6, 2007) (unpublished).348

"average consumer" — "an individual that purchases supplies for a home improvement task from a retail outlet and performs the home improvement task himself or herself, regardless of whether the individual has any training in that task." Romala Stone, Inc. v. Home Depot U.S.A., Inc., 2007 U.S. Dist. LEXIS 73098 (N.D. Ga., Sept. 28, 2007).350

"averaging the resulting indication ... over time"; "averaging over a time window" — "mean that more than one resulting indication, each of which is derived at a different time, is averaged. Additionally, 'time window' means a 'period of time.'" Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003).351

"avoids transfer" — "the controller, at times, avoids the transfer of a particular information block during a host rewrite request." Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005).352
"an award wherein the amount of said award is independent of the number of registered bingo cards on which a winning bingo pattern is formed" — "An award of any type in which the value of the award is not based upon how many cards have a winning pattern." The HomeBingo Network, Inc. v. Multimedia Games, Inc., 2006 U.S. Dist. LEXIS 93632 (N.D.N.Y., Dec. 28, 2006).

"a first axially symmetric region" — "a region that is symmetric about the central axis of the wafer." MEMC Electronic Materials, Inc. v. Mitsubishi Materials Silicon Corp., et al., 2006 U.S. Dist. LEXIS 9353 (N.D. Cal., Feb. 24, 2006).

- B -

"backlight unit" — "[t]he layers of the flat-panel display device which illuminate the flat-panel (or liquid crystal) display from behind." LG Philips Co., Ltd. v. Tatung Co., et al., 2007 U.S. Dist. LEXIS 43557 (D. Del., June 15, 2007).

"banking network" — "a set of interconnected computers used by banks and financial institution for purposes of conducting and processing financial transactions, and which incorporates and utilizes a processing hub." Alexsam, Inc. v. IDT Corp., 2010 U.S. Dist. LEXIS 64478 (E.D. Tex., Jun. 29, 2010).

"banking transaction" — "an activity affecting a deposit account, such as a deposit of funds or a withdrawal." Joao, et al. v. Sleepy Hollow Bank, et al., 348 F. Supp. 2d 120 (S.D.N.Y. 2004).

"base map" — "a map on which information may be placed." Sourceprose Corp. v. Fidelity National Financial, et al., 2006 U.S. Dist. LEXIS 10151 (E.D. Tex., Feb. 23, 2006).

"base secret cryptographic value corresponding to said internal secret state" — "an initial value sought to be kept secret which is used in the cryptographic method disclosed in Claim 1." Cryptography Research, Inc. v. Visa International Service Association, et al., 2007 U.S. Dist. LEXIS 76502 (N.D. Cal., Sept. 28, 2007).

"based on" — "The term is not a scientific phrase and can be easily understood. Substitution of the word 'dictate' for the term 'based on' is unwarranted and needless. Accordingly, the Court does not construe this term." *Sklar v. Microsoft Corp.*, 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007).

"the toolbar being displayable based on a location of a cursor in relation to a hyperlink in a first page in a first window of an application" — "the Court holds that the proper construction of Claim 26 is one in which the toolbar is 'automatically displayed' upon the placement of the cursor in proximity to a hyperlink with no further action on the part of a user." *iLOR, LLC v. Google, Inc.*, 2007 U.S. Dist. LEXIS 88835 (E.D. Ky., Nov. 30, 2007).

"[determining or measuring] an elapsed time period based on a time at which the characteristic appeared in the signal" — "using the point at which the characteristic appears to determine or measure an interval of time." *Nike, Inc. v. Adidas America, Inc., et al.*, 2006 U.S. Dist. LEXIS 91011 (E.D. Tex., Dec. 18, 2006).

"capable of dynamic partitioning based on the elemental width of data received from the data path, the elemental width being equal to or narrower than the data path" — "capable of dividing width-wise into a variable number of elements no wider than the data path, based upon the size of the data elements received from the data path." *Microwin Systems Engineering, Inc. v. Dell, Inc., et al.*, 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).

"based upon the order of the list": "based upon the desired order" — "allows for some deviation from the exact order of the list." *Netflix, Inc. v. Blockbuster, Inc.*, 477 F. Supp. 2d 1063 (N.D. Cal. 2007).

"interrogation beacon" — "a signal, transmitted from a fixed wireless router, containing information representative of the communication limitations imposed by a jurisdiction governing the location of the wireless router." *Harris Corp. v. Federal Express Corp.*, 2010 U.S. Dist. LEXIS 3424 (M.D. Fla., Jan. 12, 2010).378

"beam path configuration signal" — "a detectable message indicating the physical properties of the beam, as well as the course upon which the beam is moving." *Optivus Technology, Inc., et al. v. Ion Beam Applications S.A.*, 2004 U.S. Dist. LEXIS 30314 (C.D. Cal., Aug. 31, 2004).380

"before completing the subsequent launch, processing the final log file to move the memory blocks specified in the final log file into a RAM cache" — "during the subsequent launch, reading each log entry in the final log file and copying those memory blocks specified in log entries that are not already in the RAM cache, from the secondary storage device to the RAM cache." *Computer Acceleration Corp. v. Microsoft Corp.*, 516 F. Supp. 2d 752 (E.D. Tex. 2007).381

"causes said lower layer to vaporize before said upper layer vaporizes" — "causes said lower layer to convert into vapor before said upper layer converts into vapor." *EMI Group North America, Inc. v. Cypress Semiconductor Corp.*, 68 F. Supp. 2d 421 (D. Del. 1999).382

"before storage" — "before data is entered in memory from which it may be retrieved at a later time." *General Electric Co., et al. v. Sonosite, Inc.*, 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).383

"being capable of being represented by a defined bit width which is equal to said defined bit width of said operands" — "able to be represented by a data field of the same size as the floating point operands." *Microunity Systems Engineering, Inc. v. Dell, Inc., et al.*, 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).386

"being delivered" — "has a plain meaning that is already readily understood by lay jurors; thus, the Court does not construe 'being delivered.'" *Accolade Systems LLC v. Citrix Systems, Inc.*, 634 F. Supp. 2d 738 (E.D. Tex. 2009).387
"being electrically connected in a first polarity" — "connected such that, during discharge, current will flow from the energy source through the patient in only one direction." Koninklijke Philips Electronics, NV, et al. v. Defibtech LLC, et al., 2005 U.S. Dist. LEXIS 39859 (W.D. Wash., Dec. 21, 2005). 388

"said information being reproduced by projecting a light beam via an objective lens" — "the information on the disc is capable of being reproduced by projecting a light beam via an objective lens." Toshiba Corp. v. Imation Corp., et al., 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010). 389

"the adequacy of the funds in the first party's account being verified after the instrument is issued" — "The words 'after the instrument is issued' refers back to the 'creating step' and the choice of the gerund 'being' as opposed to the verb 'is' suggests that the verification of the adequacy of funds is not a separate method step." Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010). 390

"bid/offer system state"; "system bid/offer state" — "a state during which participants may enter into the system bids and offers for an item at select prices and volumes." eSpeed, Inc., et al. v. BrokerTec USA, L.L.C., et al., 2004 U.S. Dist. LEXIS 20589 (D. Del., Sept. 9, 2004). 392

"bill value" — "a value related to a credit value that is billed to a merchant's account or to a third party." Source, Inc. v. American Express Co., 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006). 394

"billing authorities" — "the different entities which track billing costs associated with a personal identification number (as construed herein)." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006). 396

"billing authorities maintaining a service profile for the mobile user" — "more than one billing authority (as construed herein) maintaining a service profile (as construed herein) for the mobile user." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006). 397

"billing code" — "a code, separate from a personal identification number (as construed herein), identifying a particular billing authority (as construed herein)." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006). 398

"billing for access to the service"; "generating a bill for the service" — "indicating an amount due for operation of a remote computer unit of a split personal computer system." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009). 399
"billing information" — "includes the billing data for all customers, and includes for each user: (1) information about the transactions that are to be billed to that user, and (2) identification information for that user. This limitation would not cover any equipment that telecommunicates only an individual user's bill(s) from the supplier to the user." Databurst, LLC v. Checkfree Corp., 2003 U.S. Dist. LEXIS 3852 (N.D. Ill., Mar. 17, 2003).

"binary code" — "a code in which each code element may be either of two distinct kinds of values, which code may represent various kinds of letters and numbers including, but not limited to, a representation of a base 2 number." Chamberlain Group, Inc. v. Lear Corp., 2006 U.S. Dist. LEXIS 68899 (N.D. Ill., Sept. 11, 2006). "Lear's central argument is that we erred in relying on dictionary definitions in construing 'binary code,' in contravention of Phillips. We disagree." Chamberlain Group, Inc. v. Lear Corp., 2007 U.S. Dist. LEXIS 12004 (N.D. Ill., Feb. 20, 2007).

"binary code generator" — "a processor programmed to respond to the enabling device to generate a binary code that is different for each activation of the enabling device." Chamberlain Group, Inc. v. Lear Corp., 2006 U.S. Dist. LEXIS 68899 (N.D. Ill., Sept. 11, 2006).

"binary tree" — "an arrangement of nodes where each node has a single parent and two children nodes, except the root node, which has no parent, and the leaf nodes, which have no children." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010).

"binary tree configuration" — "an arrangement of nodes where each node has a single parent and two children nodes, except the root node, which has no parent, and the leaf nodes, which have no children." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010).

"bingo operator" — "A person or entity, or a machine or the software in it, that operates a bingo game." The HomeBingo Network, Inc. v. Multimedia Games, Inc., 2006 U.S. Dist. LEXIS 93632 (N.D.N.Y., Dec. 28, 2006).

"bit line" — "Because Hynix's construction is problematic and Hynix has not provided any reason why the ordinary meaning of 'bit line' does not suffice, the court declines to construe this term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006).

"blend information" — "the specification impliedly defines 'blend information' as 'pressure information.'"  QuanTel Ltd. v. Adobe Systems Inc., 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997).

"blending" — "combining at least a first image or video frame with a second image or second video frame such that the result includes all or part of both."  Sportvision, Inc. v. Sportsmedia Technology Corp., 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).

"generating the tool path by blending between the isoloops" — "producing a smooth tool path based on a process that produces intermediate values from the isoloops being connected."  Surfware, Inc. v. Celeritive Technologies, Inc., et al., 2009 U.S. Dist. LEXIS 51620 (C.D. Cal., Jun. 3, 2009).

"block" — "erasable storage for one or more sectors; ... erasable storage for a plurality of sectors."  Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005).

"modify block" — "a contiguous portion of text that can be selected by word processor commands to be deleted, moved or copied."  Hyperphrase Technologies, LLC, et al. v. Microsoft Corp., 2003 U.S. Dist. LEXIS 24591 (W.D. Wis., Jun. 18, 2003).

"an error correction code generation circuit which generates for each block of data to be stored in said memory system an error correction code"; "each block of data comprising a first plurality of digits and each error correcting code comprising a second plurality of digits from which at least one digit of error may be detected and corrected in the block of data" — "A block of data, as used in this phrase, means a group of data bits which may be corrected by another group of bits called error correction bits. The data is information to be stored in the computer."  TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999).

"block size" — "information that specifies the total amount of data that is to be transferred on the bus in response to a transaction request."  Rambus Inc. v. Infineon Technologies AG, et al., 2001 U.S. Dist. LEXIS 10990 (E.D. Va., Mar. 15, 2001).

"block size information" — "information that specifies the total amount of data that is to be transferred on the bus in response to a transaction request."  Hynix Semiconductor Inc., et al. v. Rambus Inc., 2004 U.S. Dist. LEXIS 23230 (N.D. Cal., Nov. 15, 2004).

"operating individual blocks of memory cells with non-overlapping portions thereof storing at least user data and overhead information" — "must include multiple erase blocks and is limited to a single user data and a single overhead portion."  Sandisk Corp. v. Zotek Electronic Co., Ltd., et al., 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010).

"a device layer having ... a bonded surface ... being bonded generally in its entirety to the oxide layer" — "means that the surface is joined to the oxide layer by bonds created by heat, not by the growth of or formation of a layer."  S.O.I.T.E.C. Silicon on Insulator Technologies, S.A., et al. v. MEMC Electronic Materials, Inc., 2010 U.S. Dist. LEXIS 109667 (D. Del., Oct. 13, 2010).
"bonus" — "a reward or payment in addition to any payout specified by the normal gaming device pay table." *IGT v. Bally Gaming International Inc., et al.*, 610 F. Supp. 2d 288 (D. Del. 2009).\(^{423}\)

"bonus play period" — "the period during which the bonus promotion is active." *IGT v. Bally Gaming International Inc., et al.*, 610 F. Supp. 2d 288 (D. Del. 2009).\(^{424}\)

"bonus points" — "additional points awarded beyond those given in an actual football game for unusual scoring plays, such as when a player scores in a manner not typically associated with his position." *Fantasy Sports Properties, Inc. v. Sportsline.com, Inc., et al.*, 287 F.3d 1108 (Fed. Cir. 2002).\(^{425}\)

"Boolean . . . mathematical operation" — "A Boolean operation is an operation that applies formal logic (for example, AND, OR, NOR, etc.)." *Microunity Systems Engineering, Inc. v. Dell, Inc., et al.*, 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).\(^{426}\)

[i] "boot portion"; [ii] "program portion"; [iii] "data portion" — [i] "the part of the non-volatile memory containing the boot or startup code"; [ii] "the part of the non-volatile memory containing program code"; [iii] "the part of the non-volatile memory containing stored data." *Square D Co., et al. v. E.I. Electronics, Inc.*, 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010).\(^{427}\)

"mounting means for said conducting member to permit movement thereof between a first position, wherein said pair of contacts are in respective, circuit making engagement with said pair of terminals, and a second position, wherein both of said pair of contacts are in spaced, circuit-breaking relation to said pair of terminals" — "requires that each of the contacts moves from its first position into a spaced, circuit breaking relation with respect to each of its respective terminals." *Pass & Seymour, Inc. v. International Trade Commission, et al.*, 2010 U.S. App. LEXIS 17899 (Fed. Cir., Aug. 27, 2010).\(^{430}\)

"the telephone wiring network includes a branch network which couples one of the plurality of telephone devices to the telephone network telephone network" — "the branch network is part of the telephone wiring network." *Inline Connection Corp. v. AOL Time Warner, Inc.*, 2007 U.S. Dist. LEXIS 6209 (D. Del., Jan. 29, 2007).\(^{432}\)

"bridge" — "component(s) for communicating between two or more buses each using different interface standards." *DisplayLink Corp. v. Magic Control Technology Corp.*, 615 F. Supp. 2d 1051 (N.D. Cal. 2009).\(^{433}\)

"bridging node" — "a non-terminal node that relays messages in an interconnected network." *Agere Systems, Inc. v. Broadcom Corp.*, 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004).\(^{434}\)

"broad band information" — "information that requires high bandwidth for transmission relative to the available bandwidth of the transmission channel or medium considering temporal requirements." *OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al.,* 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 436

"browser-based subscriber" — "a person who pays for access to a service that allows the user to access, view, and enter remotely-stored data utilizing a software application that locates and displays web pages." *Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al.,* 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006). 439

"a buffer"; "a data buffer" — "memory used to store data temporarily to compensate for differences between the rate in the flow of data between the data transmit/receive device and the host device." *In re Papst Licensing GmbH & Co. KG Litigation,* 624 F. Supp. 2d 54 (D.D.C. 2009). 441

"message buffer" — "IBM argues that the 'message buffer' must have sufficient capacity to store an entire message, claiming that it would be a misnomer to call anything smaller a 'message buffer.' This is hardly a persuasive argument. While it might be desirable to have an amply-sized buffer, there is absolutely nothing in the claim language that requires it." *TM Patents, L.P., et al. v. International Business Machines Corp.,* 72 F. Supp. 2d 370 (S.D.N.Y. 1999). 444

"a buffer, coupled to the first port, storing received packets" — "a temporary storage device connected to the first port for received packets." *3COM Corp. v. D-Link Systems, Inc., et al.,* 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007). 446

"means for ... causing an execution of buffered write requests" — "LGE contends that the trial court erred in construing system claims 1 and 23 as requiring all write requests to be executed after a match is detected, as opposed to executing any number of write requests until the write request corresponding to the matching read request is executed. We agree. The claim language does not require all write requests to be executed after a match is detected. ...Because the recited function is clear on its face, it was improper to incorporate the additional functional limitation of executing 'all' buffered write requests."  LG Electronics, Inc., et al. v. Bizcom Electronics, Inc., et al., 453 F.3d 1364 (Fed. Cir. 2006). 448

"building at least one long-term and at least one short-term statistical profile from at least one measure of the network packets" — "generating at least two separate data structures, one a statistical description representative of historical network activity, and one a statistical description of recent network activity, where the statistical descriptions are based on at least one measure of the network packets and are generated through the use of statistical analysis; i.e., something more than simply collecting and retrieving data."  SRI International, Inc. v. Internet Security Systems, Inc., et al., 2006 U.S. Dist. LEXIS 75355 (D. Del., Oct. 17, 2006). 449

"buried within said semi-conductor material ... while beneath the surface of said semiconductor material" — "the claim language clearly defines a charge sink means completely surrounded by semiconductor material. The claim describes a charge sink means 'buried,' 'within,' and 'beneath the surface of said semiconductor material.' Standing alone, the single term 'buried' or the single term 'within' might describe something only partially submerged and still in contact with the surface of the substrate. The use of 'within' in conjunction with 'buried,' however, leaves no question that this claim describes structure completely surrounded by semiconductor material. The addition of 'beneath the surface' further clarifies that the charge sink means is completely submerged and does not contact any surface of the device."  Loral Fairchild Corp. v. Victor Co. of Japan, Ltd., et al., 906 F. Supp. 798 (E.D.N.Y. 1995). 450 "The district court properly construed the claim."  Loral Fairchild Corp. v. Sony Corp., et al., 181 F.3d 1313 (Fed. Cir. 1999). 451

"burst mode" — "a mode for sequentially accessing memory locations in which the memory receives the address of one memory location and provides in response the contents of a plurality of consecutive memory locations."  Advanced Micro Devices, Inc., et al. v. Samsung Electronics Co., Ltd., et al., 2009 U.S. Dist. LEXIS 91536 (N.D. Cal., Sep. 17, 2009). 452

"burst mode signals" — "low-frequency PWM signals which regulate the power to a load based on the pulse width of the PWM signals."  O'Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006). 453

"burst state" — "the camera takes a pre-determined number of pictures in rapid succession in response to one or more signals from a motion detector. ... Defendants argue 'in rapid succession' requires a more precise definition. ... It is a phrase potential jurors will be familiar with, and the Court will not place additional limitations on the claim language based on such weak support."  Good Sportsman Marketing LLC v. Testa Associates, LLC, et al., 440 F. Supp. 2d 570 (E.D. Tex. 2006). 454

"bus" — "carries its ordinary meaning as a set of signal lines to which a number of devices are connected, and over which information is transferred between devices." Rambus Inc. v. Infineon Technologies AG, et al., 318 F.3d 1081 (Fed. Cir. 2003).456

"bus" — "a multiplexed set of signal lines used to transmit address, data and control information." Rambus Inc. v. Infineon Technologies AG, et al., 2001 U.S. Dist. LEXIS 10990 (E.D. Va., Mar. 15, 2001).457

"bus" — "a set of signal lines to which two or more devices may be connected and over which information is transferred between those devices." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004).458

"bus" — "a set of signal lines." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).459

"bus" — "a signal line or set of signal lines used by an interface system to connect a number of devices and to transfer information between the devices." Computer Cache Coherency Corp. v. Via Technologies, Inc., 2007 U.S. Dist. LEXIS 81121 (N.D. Cal., Oct. 22, 2007).460

"communication bus" — "a signal line or set of lines that may be used by an interface system to connect a number of devices and to transfer information." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).461

[i] "source bus"; [ii] "gate bus" — [i] "the conductor used to transmit an electrical signal or power to the source regions"; [ii] "the conductor used to transmit an electrical signal or power to the gate." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).462

"bus controllers" — "controllers that transfer instructions and data from the host computer to the connected processing elements and data from the connected processing elements to the host computer over a bus." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010).463

"bus master" — "the device which initiates a data transfer on a bus." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).464

"business relationships of the client" — "business relationships that may affect the fulfillment of the client's order request, including business relationships between the client and the order servicing organization, or between the client and the fulfillment partner." Versata Software, Inc., et al. v. SAP America, Inc., et al., 2009 U.S. Dist. LEXIS 45751 (E.D. Tex., May 19, 2009).466

"by at least one computer" — "If automation was absolutely necessary to the invention, the words 'automatically' and 'without manual intervention' should have appeared in the claim itself. Accordingly, I do not construe any of the disputed terms to include the words 'automatically' or 'without manual intervention.'" Investment Technology Group, Inc., et al. v. Liquidnet Holdings, Inc., 2010 U.S. Dist. LEXIS 3588 (S.D.N.Y., Jan. 19, 2010).467
"by determining the then current location of the personal computer" — "by determining a current address or communication session for communicating with the personal computer." Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).

[information encoded] "in said bit areas by the presence or absence of printing" — "to those skilled in the art at the time of the patent's filing, the phrase 'presence or absence of printing' did not include variable width encoding." Datastrip (ION) Ltd., et al. v. Symbol Technologies, Inc., 15 Fed. Appx. 843 (Fed. Cir., Jul. 2, 2001) (unpublished).

- C -

"CPE"; "customer premises equipment" — "customer side equipment in a wireless communication system that transmits data to and/or receives data from a base station." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010).

"cache" — "temporary memory storage operating in conjunction with computing instructions to perform various functions." Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006).

"cache data storage modes" — "strategies for writing data to cache and to primary memory." Intergraph Hardware Technologies Co. v. Toshiba Corp., et al., 508 F. Supp. 2d 752 (N.D. Cal. 2007).

- 44 -

"cache memory"; "cache memory means" — "LGE disputes the trial court's construction of 'cache memory means' ... and 'cache memory' ..., which were construed as 'one of at least two high speed memories located close to the CPU of a computer to give the CPU faster access to blocks of data than could be taken directly from the larger, slower main memory and never using valid/invalid bits.' ...We agree with LGE that the trial court erred in reading the limitation of at least two high speed memories into claims 1 and 14. ...We also agree with LGE that the trial court improperly read the limitation of never using valid/invalid bits into the claims." LG Electronics, Inc., et al. v. Bizcom Electronics, Inc., et al., 453 F.3d 1364 (Fed. Cir. 2006).481

"cache memory configured to store texture mapping data"; "storing texture mapping data on a cache memory" — "the court construes the phrase 'cache memory' ... to mean a cache memory configured to store a complete texture mapping." Silicon Graphics, Inc. v. nVIDIA Corp., 58 F. Supp. 2d 331 (D. Del. 1999).482

"caching policy identification information" — "storing information that identifies and is used to retrieve a separately cached instance of network policy." Storage Technology Corp. v. Cisco Systems, Inc., et al., 2001 U.S. Dist. LEXIS 25876 (N.D. Cal., Nov. 26, 2001).484 "According to its plain language, the limitation construed by the district court, 'caching policy identification information,' requires only the identification information, not the instance of network policy, to be cached." Id., 329 F.3d 823 (Fed. Cir. 2003).485

"calculating": "determining" — "to determine by mathematical equation." Transonic Systems Inc. v. Non-Invasive Medical Technologies Corp., 1999 U.S. Dist. LEXIS 22687 (D. Utah, Dec. 13, 1999).488 [W]e conclude that the terms 'calculating' and 'determining' must use at least one of the equations set forth in the specification of the '989 patent, i.e., 'Q=V/S', but that the claims also cover the use of indicators other than saline. In other words, the elements of the equation, 'V' and 'S', may be altered to account for the characteristics of different indicators, such as saline, temperature, etc., so long as the relationships set forth in the equations in the specification are still expressed." Id., 75 Fed. Appx. 765 (Fed. Cir., Aug. 26, 2003) (unpublished).489 "The asserted claims do not require 'producing a dilution curve.' Instead, 'calculating' in claim 1, and 'determining' in claim 9, means solving or estimating shunt blood flow, using at least one of the equations set forth in the '989 patent. A method or device 'uses' an equation in the '989 patent when it solves for shunt blood flow by combining measured parameters according to a particular relation specified in a relevant equation from the '989 patent." Id., 143 Fed. Appx. 320 (Fed. Cir., Jul. 25, 2005) (unpublished).490

"calculating a price": "calculate a price" — "computing a fee or credit (that may be zero) for modifying or entering into a credit account, based on the credit or account parameters." Walker Digital, LLC v. Capital One Services, LLC, et al., 2010 U.S. Dist. LEXIS 56429 (E.D. Va., Jun. 8, 2010).491

"calculating at the programmed computer a remaining quantity of unfilled orders to fill using current-status information transmitted to the programmed computer" — "mathematically processing the current-status information to expressly determine a number of unfilled orders to be completed." Papyrus Technology Corp. v. New York Stock Exchange, Inc., 581 F. Supp. 2d 502 (S.D.N.Y. 2008).492

"calculating costs involved in moving such product to said destination based upon said destination and such product" — "determining all applicable costs of moving the selected product to said destination." DE Technologies, Inc. v. Dell Inc., 2006 U.S. Dist. LEXIS 5459 (W.D. Va., Feb. 14, 2006).493

"calculating ... for the selected drug treatment" — "We agree with Lextron that the claims require that the recited calculation be performed with respect to the withdrawal period for a specific drug selected for a particular animal." Micro Chemical, Inc. v. Lextron, Inc., et al., 1998 U.S. App. LEXIS 12905 (Fed. Cir., Jun. 17, 1998) (unpublished).494

"calculating ... from the relative maximum ... and minimum" — "mean[s] that both the relative maximum and relative minimum of the red and infrared waveforms must be 'mathematically' used in the oxygen saturation calculation. In addition, ... the minimum must be part of the composite, meaning that it must be determined after the composite waveform is generated." Nellcor Puritan Bennett, Inc., et al. v. Masimo Corp., 300 F. Supp. 2d 923 (C.D. Cal. 2004).495 "[W]e believe that 'calculating the amount of blood constituent from the relative maximum and minimum amplitude of the composite periodic waveforms of the detected wavelengths' means only that both the relative maximum and the relative minimum of the red and infrared waveforms must be mathematically used in the oxygen saturation calculation." Id., 402 F.3d 1364 (Fed. Cir. 2005).496
"calculating the reaction parameter" — "calculating a result that constitutes a measurement of the extent of the reaction. However, this construction encompasses more than a display of a mere number to indicate the measurement of the extent of the reaction, and can include other user understood or convenient formats as described in the patent."  

"calculating said glucose concentration in said sample from one of said reflectance readings" — "calculating the amount of glucose contained per unit volume in the sample from the reflectance reading taken at the expiration of the predetermined time period."  

"calibration code circuitry for transmitting a desired calibration code" — "requires a calibration code that is a value that indicates known wavelength(s) of light. the value must be a single known quantity. further, the calibration code circuitry must be a part of the sensor probe."  

"call authorization amount"; "amount of call authorization" — "a monetary amount to be used to pay for call service."  
TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).  

"received call-back number" — "a telephone number associated with a page sender."  

"call cost register means, including a digital display, for providing a substantially instantaneous display of cumulative call cost in dollars and cents" — "When the claim itself is considered in its entirety, it becomes clear that the call cost register means has two separate and equally important functions: (1) it provides the caller with real time, accurate information about the cost of the call via digital display as the long distance charges accrue during the call; and (2) it reflects the total cost of the call via the same digital display after the call has been terminated. Phonometrics argues that only the second function is claimed, or that only this second function is important for determining infringement. We disagree. Both functions are claimed explicitly in the [ ] patent, and both are significant for construction."  

"call distributor" — "hardware and/or software to receive and have the capability to direct calls."  

"call having a first message" — "a call having a signaling message that is distinct from the second message."  

"call pod" — "a portable device which forms conference calls among a plurality of call participants."  

"a call state, being at least one of the group consisting of active and hold states" — "a call state, which is 'active,' 'hold,' or both 'active' and 'hold' simultaneously." *Collaboration Properties, Inc. v. Tandberg ASA, et al.*, 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006). 509

"calling card" — "a card, which may be made of various materials and in various shapes, which has associated with it a combination of numerals, letters, and/or characters (sometimes called a security number or code) that can be entered at a telephone to obtain access to the telephone network or system." *TGIP, Inc. v. AT&T Corp., et al.*, 512 F. Supp. 2d 696 (E.D. Tex. 2007). 513

"calls" — "Even if the preamble were limiting, the Court would still elect not to construe 'calls' because the plain and ordinary meaning of the term is consistent with its meaning within the patent. Accordingly, the Court will not construe the term 'calls.'" *Fenner Investments, Ltd. v. Juniper Networks Inc., et al.*, 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006). 512

"electronic camera"; "digital camera" — "a self-contained, portable electronic camera, with the capability to take still pictures, the components of which are contained in a single housing." *St. Clair Intellectual Property Consultants, Inc. v. Matsushita Electronic Industrial Co., Ltd., et al.*, 2009 U.S. Dist. LEXIS 106697 (D. Del., Nov. 13, 2009). 511

"processing frequency capability" — "the speeds at which the CPU can operate." *Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al.*, 514 F. Supp. 2d 916 (E.D. Tex. 2007). 519
"refractory metal forming a cap to prevent evaporation of said fuse portion when said fuse portion is exposed to a directed energy source to increase the vapor pressure under the cap to produce an explosive removal of said fuse portion" — "The cap does not include a passivation layer, as the claim recites that it is the refractory metal that forms the cap. ... No judicial construction is required for the term 'to prevent evaporation ... to increase the vapor pressure under the cap to produce an explosive removal.'" EMI Group North America, Inc. v. Cypress Semiconductor Corp., 68 F. Supp. 2d 421 (D. Del. 1999).520

"data transmission device capable of connecting directly to a communication network" — "a device that transmits data and is capable of connecting to a communication network without requiring a separate data processor." PHT Corp. v. Invivodata, Inc., 2005 U.S. Dist. LEXIS 9577 (D. Del., May 19, 2005).521

"an electronic display displaying information regarding the activities and state of operation of said injector, said display capable of displaying information in at least a first and a second orientation" — "an electronic display displaying at least some information regarding the activities and state of operation of said injector head, said display capable of displaying at least some information in at least a first and a second orientation so that said information is oriented properly for reading." Tyco Healthcare Group LP, et al. v. E-Z-EM, Inc., et al., 2010 U.S. Dist. LEXIS 15664 (E.D. Tex., Feb. 22, 2010).522

"plurality of radio transceivers capable of communicating on the plurality of communications channels and capable of providing paging signals for mobile units" — "The transceivers can be commanded to provide any one of several functions upon receipt of instructions from the central control station, including the function of establishing a communication connection between a mobile unit and the central control station." MLMC, Ltd. v. Airtouch Communications, Inc., et al., 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001).523

"card key" — "a unique identifier that is created at the time the card is sent and which is the information required for retrieving the electronic postcard data from a card database and an image database." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009).525

"electrically cardioverting the heart by discharging said selected magnitude of stored energy through said delivery electrodes into the heart of the wearer" — "The clause 'by discharging said selected magnitude of stored energy through said delivery electrodes into the heart of the wearer' sufficiently describes how the heart is cardioverted. Thus, 35 U.S.C. § 112 P 6 does not control this element." Cardiac Pacemakers, Inc., et al. v. St. Jude Medical, Inc., et al., 2000 U.S. Dist. LEXIS 17352 (S.D. Ind., Nov. 29, 2000).526

"carrier signal such as a television or commercial radio signal"; [ii] "broadcasting data ... using a carrier signal such as a television or commercial radio carrier signal"; [iii] "data stream broadcast over a carrier signal"; [iv] "receiving data ... using a carrier signal such as a television or commercial radio carrier signal"; [v] "broadcasting the data stream within the carrier signal" — [i] "a signal modulated to carry data"; [ii] "transmitting data by means of a signal modulated to carry data"; [iii] "a data stream broadcast by means of a signal modulated to carry data"; [iv] "receiving data broadcast by means of a signal modulated to carry data"; [v] "broadcasting a data stream by means of a signal modulated to carry data." *Broadcast Innovation, LLC v. Echostar Communications Corp.*, 240 F. Supp. 2d 1127 (D. Colo. 2003).

"carrier wave" — "Consistent with the IEEE Dictionary, the court defines 'carrier wave' as 'a continuous wave, of sinusoidal or non-sinusoidal form, capable of being modulated or impressed with a signal.'" *Lectrolarm Custom Services v. Vicon Industries, Inc., et al.*, 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005).

"carrying out processing operations in response to said position information" — "does not ... mean[] using higher-resolution position information generated by the pen-tablet unit." *Quantel Ltd. v. Adobe Systems Inc.*, 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997).

"cash value" — "a value accumulated in an account that is (i) personal to each consumer, (ii) determined by accumulating credit values, (iii) to which the consumer receives access and (iv) measured in dollars transferred to the consumer directly or placed in the consumer's account." *Source, Inc. v. American Express Co.*, 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006).

"catalog"; "product catalog" — "an organized collection of items and associated information, published by a vendor (which includes suppliers, manufacturers, and distributors), which preferably includes a part number, price, catalog number, vendor name, vendor ID, a textual description of the item, and images of or relating to the item." *ePlus, Inc. v. Lawson Software, Inc., et al.*, 2010 U.S. Dist. LEXIS 42609 (E.D. Va., Apr. 30, 2010).
"catalog file" — "a file that includes information identifying a song and the location of the digital data representing the song in the computer memory." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).

categorization label" — "label indicating a category or categories to which a page is assigned." Iconfind Inc. v. Yahoo! Inc., 2009 U.S. Dist. LEXIS 115923 (E.D. Cal., Dec. 14, 2009).

"causing a quantity of digital data resident on a source storage medium to be transferred to a computer system having a destination storage medium" — "effecting by command, authority, or force, the transfer of digital data resident on a source storage medium to a personal computer or workstation having a computer storage medium which is the target of the transfer of data as a result of the 'causing' step." Symantec Corp. v. Computer Associates International, Inc., 2005 U.S. Dist. LEXIS 46912 (E.D. Mich., Mar. 16, 2005).

"cell" — "a group of one or more digital words." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).

"cell analysis instrument" — "a device, not including a microscope station, that performs measurement or analysis of at least one cell feature on a specimen preparation, such as a specimen slide." Cytyc Corp. v. Tripath Imaging, Inc., et al., 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005).

"cellphone"; "cellular telephone" — "a device capable of communicating wirelessly via a cellular or satellite network and including an antenna, a transmitting/receiving section, a memory, a dialing pad, a microphone, and a speaker." Minerva Industries, Inc. v. Motorola, Inc. et al., 2010 U.S. Dist. LEXIS 9329 (E.D. Tex., Feb. 3, 2010).

"center conductor [of a coaxial cable]" — "a conductive material which is enclosed by the conductive shield of a coaxial cable and which carries the voltage varying electrical signal." *Monster Cable Products, Inc. v. Quest Group*, 2005 U.S. Dist. LEXIS 4213 (N.D. Cal., Mar. 17, 2005). 550

"central channel" — "a radio frequency channel assigned to carry control signals to establish, as opposed to maintain, communication connections between the central control station and the mobile units." *MLMC, Ltd. v. Airtouch Communications, Inc., et al.*, 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001). 551

"central computer" — "a computer capable of communicating, either directly or indirectly, with a local computer and a remote computer." *Anthurium Solutions, Inc. v. Medquist, Inc., et al.*, 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 552

"a central computing device" — "a single server or higher-end machine at the top of the hierarchical relationship which stores, processes and transmits information to and from multiple remote computing devices." *B-50.com, LLC v. Xfromity, Inc.*, 2006 U.S. Dist. LEXIS 6852 (N.D. Tex., Feb. 23, 2006). 554

"central control manager" — "hardware and/or software that is separate from the conferencing control and that is capable of establishing and managing video and data connections for multiple workstations" *Collaboration Properties, Inc. v. Tandberg ASA, et al.*, 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006). 555

"central controller operatively connected" — "one or more 'central controllers,' which are construed as 'computers.' The Court also construes this term as teaching that the 'central controllers' are 'operatively connected to the communication interface circuits and the surgeon's control panel.'" *Karl Storz Endoscopy-America, Inc. v. Smith & Nephew, Inc.*, 2010 U.S. Dist. LEXIS 85036 (W.D. Tenn., Aug. 18, 2010). 556

"central processing location" — "a single transmission system, as previously defined, from which compressed, digitized data, representing a complete copy of the at least one item of audio/video information, is transmitted at a non-real time rate to at least one of a multiple of local distribution systems." *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.*, 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007). 560
"central processing means" — "does not invoke § 112, P6, as one skilled in the relevant art would understand 'central processing means' to be 'a central processing unit.' Thus, 'central processing means' is construed to be 'a central processing unit.'" Genlyte Thomas Group LLC v. Lutron Electronics Co., Inc., 2004 U.S. Dist. LEXIS 5311 (N.D. Tex., Mar. 31, 2004).

"a central processing section coupled to said laser transmitting and receiving sections for determining a distance to said target based on a time of flight of said transmitted and returned laser pulses" — "a processor that determines a distance to the target using time-of-flight information from the received laser pulses." Laser Technology, Inc. v. Nikon, Inc., et al., 215 F. Supp. 2d 1135 (D. Colo. 2002).

"a central processor section ... for determining a range to said target derived from said flight time of said laser pulses to said target and said flight time of said reflected laser pulses from said target" — "a processor compares time-of-flight information stored in memory to locate the times-of-flight that occur with the greatest frequency, and uses the most frequent times-of-flight to determine a range to the target. Neither a specific microcomputer nor anything that puts received laser pulses in a 'stack' is required." Laser Technology, Inc. v. Nikon, Inc., et al., 215 F. Supp. 2d 1135 (D. Colo. 2002).

"central server" — "a computer system that is dedicated to communicating over a network with the processing station at each of the plurality of remote sites." Southwest Efuel Network, L.L.C. v. Transaction Tracking Technologies, Inc., 2009 U.S. Dist. LEXIS 103395 (E.D. Tex., Oct. 23, 2009).

"central server" — "a device through which the remote terminal accesses the internet and stores userID/password and configuration information for future use by the user." Logiclink, Inc. v. Keylink Service Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 22962 (C.D. Cal., Mar. 19, 2009).

"central station" — "one or more computers or other data processing devices operated together in order to transmit a single, continuous stream of digital data that includes both the video product and data used to limit viewing of the video products." American Patent Development, Corp., LLC v. MovieLink, LLC, 604 F. Supp. 2d 704 (D. Del. 2009).

"change in membership" — "a change in status resulting from an act affecting a member of the set, such as a member being added or removed from the set." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).572

"for changing the flow of said data collection application" — "changing the next question presented from the data collection application depending on the response to the previous question." Typhoon Touch Technologies, Inc., et al. v. Dell, Inc., et al., 2009 U.S. Dist. LEXIS 64013 (E.D. Tex., Jul. 23, 2009).573

"changing the hardware configuration" — "changing the physical arrangement of non-programmable structures." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).574

"changing the stored sound waveform in accordance with changes made in the visually displayed waveform by the step of editing" — "overwriting the stored waveform stored in the computer RAM memory to reflect a change in the sound characteristics of the waveform in accordance with changes made in the visually displayed waveform." Adobe Systems Inc. v. Macromedia, Inc., 200 F. Supp. 2d 309 (D. Del. 2002).575

"first channel"; "second channel" — "an amount of bandwidth isolated for communications that may be either unidirectional or bi-directional." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., et al., 92 F. Supp. 2d 483 (E.D. Va. 2000).577 "[A]lthough the term 'channel' may encompass both unidirectional and bi-directional communications, it is clear that the first and second data channel limitations in claims 1 and 21 support only unidirectional communications. ... the '786 patent specification defines the first and second channels, by implication, as amounts of bandwidth, and thus, communication paths separated by frequency." Id., 262 F.3d 1258 (Fed. Cir. 2001).578

"channel estimator" — "a device that estimates the effect of the channel on the transmitted signals." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010).579

"channel forming region" — "the region of a semiconductor device in which the channel may form." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006).580

"channel-free region"; "channel free zone" — "refer to areas where there is no channel. In other words, ... when the transistor is turned off, a channel-free region exists between the source and drain." Advanced Micro Devices, Inc., et al. v. Samsung Electronics Co., Ltd, et al., 2009 U.S. Dist. LEXIS 91536 (N.D. Cal., Sep. 17, 2009).581

"channel region" — "an area that includes but is not limited to the channel." *Semiconductor Energy Laboratory Co., Ltd. v. Samsung Electronics Co., Ltd., et al.*, 2010 U.S. Dist. LEXIS 45107 (W.D. Wis., May 7, 2010). 583

"channel select designation" — "refers to a control signal for picking a channel tuning designation which may be programmed into memory by a viewer, or by someone else, such as the cable service operator." *Beery v. Thomson Consumer Electronics, Inc., et al.*, 2004 U.S. Dist. LEXIS 17173 (S.D. Ohio, Aug. 18, 2004). 584

"character-based output device" — "a device that processes data in the form of characters. It includes devices that process characters even though they may, at times, process data in the form of a bit map." *OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al.*, 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 586

"information of the characteristics of said first group of blocks"; "characteristics of the memory cell blocks" — "I conclude that both logical and physical addresses are 'characteristics of' user data blocks." *Sandisk Corp. v. Zotek Electronic Co., Ltd., et al.*, 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010). 591

"characterized as being a member of one category selected from a plurality of categories"; "characterized in the display as being a member of a category selected from a plurality of categories" — "one characteristic of an item is that it is a member of at least one category, where multiple categories exist." *Sklar v. Microsoft Corp.*, 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007). 592
"characterized by a first monitor for reproducing a real time image of the user as a background on the monitor screen, ... [and] a second monitor for displaying a composite of a user-created frozen real time image as a background and at least one user-selected computer-digitized image from the memory store as a foreground" — "requires only that the apparatus have a first and a second monitor, the first of which 'reproduces a real time image of the user as a background on the monitor screen' and the second of which 'displays a composite of a user-created frozen real time image as a background and at least one user-selected computer-digitized image from the memory store as a foreground.' Neither the claim language or the written description necessitates interpreting the claim to specify the simultaneous performance of these two functions." Kis, S.A., et al. v. Foto Fantasy, Inc., et al., 60 Fed. Appx. 319 (Fed. Cir., Feb. 28, 2003) (unpublished).593

"characterized in that the B-mode image is displayed within said blood flow display region while said blood flow display region is moved" — "characterized in that the B-mode image is always displayed in place of the blood flow image within the blood flow display region while the blood flow display region is moved, and the blood flow image is never displayed within the blood flow display region while the region is moved." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).594

"a first gate drive circuit for charge pumping a node" — "a first circuit that drives a power transistor by raising the electrical potential in an additive, charge transfer process in the manner of a pump." STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004).595

"a chassis comprising a front panel" — "a frame or housing including a front panel." Rackable Systems, Inc. v. Super Micro Computer, Inc., 2006 U.S. Dist. LEXIS 81432 (N.D. Cal., Oct. 27, 2006).598

"chip memory apparatus" — "a device that includes memory on a semiconductor chip that is adapted for use with a separate audio player." Sandisk Corp. v. LSI Corp., 2010 U.S. Dist. LEXIS 24973 (N.D. Cal., Mar. 17, 2010).599

"choosing a dynamic model for the plant from a group of specimen sequenced-dynamic-factory models" — "selecting a representation or simulation that is marked by change of a manufacturing plant from a group of such models." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005).600

"the chosen factory-specific model containing descriptions of the dynamic interactions of part lots and machines in the plant" — "the chosen model contains descriptions of changes in the way that groups of like parts and machines act upon one another." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005).601

"cinematic work" — "is not limited to an entire motion picture, but may be only a portion of a motion picture." Bloomstein v. Paramount Pictures Corp., et al., 1996 U.S. Dist. LEXIS 22260 (N.D. Cal., May 6, 1996).602

"message transfer circuit for ..." — "refers to a structure within the computer system. That this structure has a particular function to perform, and must therefore be capable of performing that function, does not transmute a structural component of a computer system into a means-plus-function claim to which Section 112, para. 6 applies." TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999).

"circuit means" — "the combination of a number of electrical devices and conductors that, when connected together to form a conducting path, fulfill a desired function." Nilssen v. Magnetek, Inc., 1999 U.S. Dist. LEXIS 16718 (N.D. Ill., Oct. 22, 1999).

"a circuit means connected between the inverter output terminals and the lamp terminals, thereby to provide lamp operating voltage to the lamp terminals; the circuit means having a pair of auxiliary output terminals at which is provided a cathode heating voltage" — "is also in means-plus-function form." Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000).

"an on-screen programming circuit that produces video signals for display on the video monitor" — "Because the term is not expressed in 'means plus function' language, there is a rebuttable presumption that § 112, P6 does not apply. Raritan has not overcome the presumption." Apex Inc. v. Raritan Computer, Inc., 2005 U.S. Dist. LEXIS 4017 (S.D.N.Y., Mar. 11, 2005).

"circuitry" — "electronic components that may include digital circuitry, analog circuitry, software, firmware, or a combination of these elements." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010).
"aesthetic correction circuitry" — "MIT urges that the term 'aesthetic correction circuitry' connotes sufficient structure to avoid 112 P6 treatment. We agree. In contrast to the term 'mechanism,' dictionary definitions establish that the term 'circuitry,' by itself, connotes structure." Massachusetts Institute of Technology v. Abacus Software, et al., 462 F.3d 1344 (Fed. Cir. 2006).\footnote{613} "I believe that in view of its specific language, 'aesthetic correction circuitry' was correctly construed as a means-plus-function claim limitation." Id. (Michel, C.J., dissenting).\footnote{614}

"processing circuitry ..."; "inverting circuitry ..."; "a cursor enable circuit ..."; "output circuitry ..." — "the Claim elements describe an apparatus and proper interpretation calls for electronic circuitry that performs the tasks as claimed in the invention, without limitation as to the type of electronic circuits." Compaq Computer Corp. v. eMachines, Inc., et al., 2002 U.S. Dist. LEXIS 13265 (S.D. Tex., Feb. 26, 2002).\footnote{615}

"call progress detector circuitry for detecting a call waiting signal" — "this Court rejects Defendants' argument that claim limitations involving the term 'circuitry' necessarily exclude so-called 'software based implementations'; ... no further construction ... is necessary." Kernius v. International Electronics, Inc., et al., 2007 U.S. Dist. LEXIS 24874 (D. Md., March 30, 2007).\footnote{616}

"circuitry for limiting transmission of the internal signal in the high frequency band from the telephone wiring network to the telephone exchange"; "circuitry for limiting transmission of signals in the high frequency band from the telephone wiring network to the telephone exchange" — "circuitry that prevents high frequency signals (i.e., frequencies above the telephone voice band between 0.25 MHZ and an undetermined upper limit) from traveling upstream from the signal interface to the telephone exchange." Inline Connection Corp. v. AOL Time Warner, Inc., 2007 U.S. Dist. LEXIS 6209 (D. Del., Jan. 29, 2007).\footnote{617}

"circuitry for performing a mute ... and transferring" — "no further construction of the claim language ... is necessary." Kernius v. International Electronics, Inc., et al., 2007 U.S. Dist. LEXIS 24874 (D. Md., March 30, 2007).\footnote{618}

"circuitry to recognize a first signal with a duty cycle or cadence coupled with frequency and level indication of a call waiting SAS signal or a distinctive call waiting SAS signal" — "circuitry specifically adapted for 'recognizing' the call waiting tone based on its duty cycle or cadence, frequency, and level." Kernius v. International Electronics, Inc., et al., 2007 U.S. Dist. LEXIS 24874 (D. Md., March 30, 2007).\footnote{619}

"circular storage buffer" — "a physical memory device that contains digital signal values and that is circular in the sense that when the last address is reached, the next address accessed is the first address location. While the digital input signal values are always stored in the same repeating physical addresses, these addresses do not have to be physically contiguous. The 'circular buffer limitation' requires that the circular buffer store the digital input signal values in continually advancing physical addresses." Pause Technology LLC v. TiVo Inc., 419 F.3d 1326 (Fed. Cir. 2005).\footnote{620}

"clamping" — "the act of adding a specific reference voltage level, which results in holding the panel capacitance at such reference voltage level.' Further, ... 'clamping' need not be accomplished through connection to an external power supply but rather, can be accomplished by adding any voltage reference, whether internally or externally generated." Competitive Technologies, et al. v. Fujitsu Ltd., et al., 286 F. Supp. 2d 1161 (N.D. Cal. 2003). 623

"includes classification" — "a classification in which a second set of one or more elements is included when all members of a first set of one or more elements exist in a configuration." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005). 624

[i] "classifying"; [ii] "sorting" — [i] "to 'organize or arrange' pit and particle defects according to 'class or category'"; [ii] "to arrange pit and particle defects 'according to class, kind, or size.'" ADE Corp. v. KLA-Tencor Corp., 220 F. Supp. 2d 303 (D. Del. 2002). 625

"classifying the specimen" — "[classifying the specimen] includes primary and secondary classifiers, but not a classifier, human or otherwise, that provides a final diagnosis." Cytyc Corp. v. Tripath Imaging, Inc., et al., 2005 U.S. Dist. LEXIS 29850 (D. Mass. Nov. 28, 2005). 626

"[I]nsofar as I have previously construed 'comprising' as describing a closed set or a whole, TriPath has convinced me that I was incorrect and I will correct this aspect of the Markman order. This correction, however, does not change my definition of 'classifying the specimen' as used in claims 11 and 16. I will continue to construe 'classifying the specimen' in those claims to exclude final classification." Id., 505 F. Supp. 2d 199 (D. Mass. 2007). 627

"clear" — "the district court correctly construed the term 'clear' to mean 'transparent or having the property of transmitting light without appreciable scattering so that bodies lying beyond are seen clearly,' and that nothing in the claims or the written description warranted giving the term 'clear' an expansive meaning that would cover 'translucent' holders." Terlep v. Brinkmann Corp., et al., 418 F.3d 1379 (Fed. Cir. 2005). 629

"clearinghouse means" — "any clearinghouse server(s) with software capable of storing and authenticating identity data." Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007). 630

"clerk system" — "software to control the sequencing of items to be sold and control the bidding process for each item to be sold." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 631

"clocking circuitry for a generating time related signal, said repository device for storing time related data associated with picture image data" — "the defendants' indefiniteness argument is rejected and the phrase means 'clocking circuitry for generating a time related signal, said repository device for storing time related data associated with picture image data.'" *SmartDisk Corp. v. Archos S.A., et al.*, 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).642

"the given name server that receives the DNS query being close to the client local name server as determined by given location information ... local name server" — "the particular name server that receives the DNS query is selected by the alternative domain name system and is close in Internet terms to the client." *Akamai Technologies, Inc., et al. v. Limelight Networks, Inc.*, 494 F. Supp. 2d 34 (D. Mass. 2007).643

"coaxial cable" — "a cable with two conductors that share an axis." Monster Cable Products, Inc. v. Quest Group, 2005 U.S. Dist. LEXIS 4213 (N.D. Cal., Mar. 17, 2005).646

"a code directed to" — "software code or instructions for." MedioStream, Inc. v. Microsoft Corp., et al., 2010 U.S. Dist. LEXIS 88716 (E.D. Tex., Aug. 27, 2010).648

"code which includes data indicating whether the player wins or loses" — "I will construe 'indicating,' in the context of 'code which includes data indicating whether the player wins or loses,' in accordance with its ordinary meaning to mean that the code 'shows the way to, points out, or makes clear in another way.'" Ingenio, Filiale de Loto-Quebec, Inc. v. GameLogic, Inc., 445 F. Supp. 2d 443 (D. Del., July 21, 2006).649

"coded embedding"; "hard coding" — "fixing within a given copy of the program the payee identification information." Intell-a-Check Corp. v. Autoscribe Corp., et al., 346 F. Supp. 2d 698 (D.N.J. 2004).650

"coded heading(s)" — "instructions in the reference file indicating what data to extract from the database." Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006).651

"coding said contributions at said electronic contribution accepting devices to obtain coded contributions; and decoding said coded contributions at a device other than said electronic contribution accepting devices" — "'Coding' means to put the information into computer-readable format, so that the information can be read by the intended recipient, but not readily read by other recipients, whether computers or people. 'Decoding' is the reverse of 'coding,' that is, reading the information by the recipient computer. Beyond that, this claim language does not require further definition." Ziarno v. American National Red Cross, et al., 2000 U.S. Dist. LEXIS 22508 (N.D. Ill., Aug. 16, 2000).653

"cold purge process" — "The district court correctly placed the term 'cold purge process' in the context of the state of the art when the '389 invention was made. This context requires construing the literal meaning of the claims as limited to the process wherein electrostatic contamination is formed and removed." Applied Materials, Inc. v. Advanced Semiconductor Materials America, Inc., et al., 98 F.3d 1563 (Fed. Cir. 1996).654

"a plurality of color pattern masks each corresponding to a color in said color image ... capable of providing ... visual discrimination" — "Each color in the color image has a corresponding separate and distinct color pattern. The claim is not limited to the particular pattern masks disclosed in the specification, and thus images may contain more than eight colors. The phrase 'visual discrimination' means that when the output image is displayed, the pattern masks provide visual discrimination between areas that were originally represented by different colors in the color image." *OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al.*, 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).

"information about said different color values" — "luminance information or chrominance information or both in a selected portion of an image." *Sportvision, Inc. v. Sportsmedia Technology Corp.*, 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).

"combining" — "encompasses any logical combination of the user selection criteria. However, the logical combination of the user selection criteria must occur prior to any search and does not include dependent, hierarchal searching where new user selection criteria are combined with prior search results." *Gemstar-TV Guide International, Inc., et al. v. International Trade Commission, et al.*, 383 F.3d 1352 (Fed. Cir. 2004).

"command" — "one or more words or instructions to initiate, terminate or otherwise control the execution of an operation." *EMC Corp. v. Hewlett-Packard Co., Inc.*, 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003).

"to the extent data responsive to said query is not available at said client computer, combining said query with at least one additional query associated with said application program, for simultaneous transmission from said client computer across said network" — "when data needed to respond to the data request of the application program is not stored in the client computer, combining that data request with at least one other data request of the application program, for sending to the server in a single request or package." *Hyperion Solutions Corp. v. Outlooksoft Corp.*, 422 F. Supp. 2d 760 (E.D. Tex. 2006).
"combining the associated value and the additional parameter to determine motion control commands" — "a computerized, mathematical combination of the associated value and the additional parameter to determine motion control commands provided to the machine tool to automatically adjust velocity or acceleration to achieve the desired quality of result." Omax Corp. v. Flow International Corp., 2006 U.S. Dist. LEXIS 81914 (W.D. Wash., Nov. 7, 2006).  

"command information" — "information relating to one or more commands for controlling a bus transfer, rather than to address or data." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).

"command specifying data to be transferred" — "a command sent from a host processor that identifies, names, or states explicitly or in detail which data is transferred from a first storage medium to a second storage medium." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).

"commercial access provider ..." — "a service provider that provides subscription-based services and uses a computer system commercially available to telephone users that acts to provide an interface to or from ..." eBay Inc. v. IDT Corp., et al., 2009 U.S. Dist. LEXIS 56469 (W.D. Ark., Jun. 10, 2009).

"commercial insert video signal" — "an analog video signal, distinct from the programmed channel signal and local video signal, that contains commercial content that is to be inserted into a local time avail in the programmed channel signal." Beam Laser Systems, Inc. v. Cox Communications, Inc., et al., 144 F. Supp. 2d 475 (E.D. Va. 2001).

"commercial invoice" — "an international shipping document that contains at least the information in the form required under the applicable laws of the jurisdiction[s] through which the selected product travels." DE Technologies, Inc. v. Dell Inc., 2006 U.S. Dist. LEXIS 5459 (W.D. Va., Feb. 14, 2006).

"common conduction region" — "the semiconductor material of the first conductivity type between the bases. ... The amount of spacing between the bases is not constrained. ... [T]he claimed 'common conduction region' is properly construed not to require any particular kind of interaction between the current flows emanating from the spaced bases." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001).

"wherein said vertical common conduction region is continuous and uninterrupted" — "A 'continuous and uninterrupted' common conduction region is properly construed to require that be possible to transit from any point to any other point within that three-dimensional structure while staying entirely within the common conduction region." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25712 (C.D. Cal., Jul. 16, 2001).

"common formats" — "allow[] for instruction sets to have more than one format, but requiring commonality." Data General Corp. v. International Business Machines Corp., 93 F. Supp. 2d 89 (D. Mass. 2000). 678

"common processing" — "processing in which the logic underlying certain of the content and/or sequence of steps of the formats are the same or shared." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003). 679

"common static price axis" — "a line comprising price levels that do not change positions unless a manual re-centering command is received and where the line of prices corresponds to at least one bid value and one ask value." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006). 680 "We need not alter our construction. And the extrinsic evidence presented -- in light of our construction, based almost entirely on intrinsic evidence -- will not change our construction." Id., 2007 U.S. Dist. LEXIS 12965 (N.D. Ill., Feb. 21, 2007). 681

"communicating a superseding signal to a bus coupled to said first computer and said at least one originally provided memory through a diagnostic/emulation port or harness coupled to said bus from an adapter module, said superseding signal to alter control of said engine by said first computer" — "communicating a superseding signal from an adapter module to a bus coupled to the first computer and the originally provided memory, with the result of altering control of the engine by the first computer." Adrain v. Superchips, Inc., 2006 U.S. Dist. LEXIS 25212 (S.D. Tex., March 14, 2006). 682 "This term means that a signal is sent to alter control of the vehicle's engine. The signal overrides the control signals that are otherwise being sent from 'a first computer' to the engine. As a result, control of the engine by the first computer is altered. As discussed above, the court agrees that the claims must be read as encompassing such an 'in transit' limitation. Thus, the control of the engine by the first computer can be altered while the vehicle is moving or stopped, but otherwise in normal operation." Adrain v. Hypertech, Inc., 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002). 683

"communicating at least one message associated with said submitted bid to said issuer's computer over said at least one electronic network" — "a message associated with the submitted bid is sent to the issuer's computer over at least one network for communicating data messages between said computers, including, but not limited to, the Internet." Muniauction, Inc. v. Thomson Corp., 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006). 684

"communicating frames containing data between all of the nodes at a common communication capability" — "requires that each and every node in the network have the ability to communicate with the medium and hence with each and every other node in the network at the common communication capability, and that each node would be expected to use this ability at some time in the operation of the network. This means that in actual network operation, each node at some time can be expected to place data frames on the medium at the common capability and receive data frames from the medium at the common capability." Datapoint Corp. v. Standard Microsystems Corp., et al., 31 Fed. Appx. 685 (Fed. Cir., Feb. 15, 2002). 685

"the central server communicating with said content provider" — "the central server providing information to or receiving information from said content provider." Logiclink, Inc. v. Keylink Service Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 22962 (C.D. Cal., Mar. 19, 2009).

"communication" — "has its ordinary and customary meaning and is not limited to calls. Because the plain meaning is sufficiently clear from the claim language, there is no need for construction of this term." Fortinet, Inc. v. Palo Alto Networks, Inc., 2010 U.S. Dist. LEXIS 102246 (N.D. Cal., Sep. 28, 2010).

"communication cable" — "any cable which carries any data or control signal from one point to another in a low voltage system -- i.e., that communicates between aspects or elements of a low voltage system." Erico International Corp. v. Doc's Marketing, Inc., et al., 2007 U.S. Dist. LEXIS 1367 (N.D. Ohio, Jan. 9, 2007).

"a first communication connection between a caller and a called party"; "a first communication connection between an institutional caller and an outside recipient" — "1. the telephone instrument of the caller, 2. the telephone instrument of the called party or outside recipient, and 3. all apparatus for maintaining an ongoing communication connection between the caller and the called party or outside recipient." T-Netix, Inc. v. Global Tel*Link Corp., 2003 U.S. Dist. LEXIS 27830 (E.D. Tex., Aug. 15, 2003).

"communication connection is provided between said option connector and said second processor" — "a two-way line of communication in which information may be sent from the option connector to the second processor or information may be sent from the second processor to the option connector." ABB Automation Inc. v. Schlumberger Resource Management Services, Inc., 254 F. Supp. 2d 475 (D. Del. 2003).

"communication device other than an Internet-connected device" — "a device that is not connected to the Internet at the time the device receives the notification." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).

"a communication facility" — "[c]omputer software associated with the remote computer." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007). 698

"communication facility" — "that part of a telephone network that enables a caller to connect to the Katz system." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999). 699

"communication interface" — "hardware having an output coupled to the first end of a communication line and an input coupled to a processor to transmit state data over the communication line." Ricoh Corp., et al. v. Pitney Bowes, Inc., 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006). 701

"communication interface" — "the point at which data is received by or sent from the jukebox from or to the central management station." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007). 702

"plurality of communication interface circuits" — "two or more circuits, each of which enables communication between a single piece of surgical equipment and the central controller." Karl Storz Endoscopy-America, Inc. v. Smith & Nephew, Inc., 2010 U.S. Dist. LEXIS 85036 (W.D. Tenn., Aug. 18, 2010). 703

"communication line" — "a telephone line, RS232 line, or any other suitable communication line used to transmit information and having two respective ends." Ricoh Corp., et al. v. Pitney Bowes, Inc., 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006). 704

"communication means for selectively establishing a communication link with each mobile phone unit" — "require[s] communications established by the host processor. As the district court concluded, the disclosed embodiments describing user-initiated communications could not provide the structure or equivalent structure for performing the claimed function in accordance with 35 U.S.C. § 112, ¶ 6." Telemac Cellular Corp. v. Topp Telecom, Inc., 247 F.3d 1316 (Fed. Cir. 2001). 705

"communication medium" — "a collection of connections (generally links between nodes) in a communication system over which information may be transmitted." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 478 (D. Del. 2001). 706

"communication pathway" — "a medium that carries a communication signal between components." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009). 708

"a plurality of communication ports, each supporting at least one of the group of switch connections consisting of video in, video out, audio in and audio out" — "at least two communication ports in the video conferencing system (at least one for each AV device), each port supporting one or more of audio in, audio out, video in and video out connections to an analog or digital AV switch, which may be physical or logical." Collaboration Properties, Inc. v. Tandberg ASA, et al., 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006).711

"communication receiver" — "a device that obtains and demodulates radio signals." Motorola, Inc. v. VTech Communications, Inc., et al., 2009 U.S. Dist. LEXIS 59226 (E.D. Tex., Jul. 6, 2009).712

"communication settings associated with the data communication facility" — "[s]ettings that control some aspect of how the data communication facility works." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).713

"communication system" — "a plurality of network elements and connections forming a network to transfer information." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007).715

"communication with the network" — "exchange of data over a connection to the network." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).718

"communications channel" — "a medium for transferring information. A communications channel can be a physical or wireless link." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).719
"communications channel storage means"; "storage means containing the identification of the network members" — "the better view is that ... storage means (including its use in communications channel storage means' is not in means plus function format, but refers to a specific structure - the computer's permanent and temporary storage." Source Search Technologies, LLC v. Lending Tree, LLC, et al., 2006 U.S. Dist. LEXIS 79651 (D.N.J., Oct. 16, 2006). 720

"plurality of communications channels" — "radio frequency communications channels, each channel including two distinct frequencies, one for communication to the mobile unit and the other for communication from the mobile unit." MLMC, Ltd. v. Airtouch Communications, Inc., et al., 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001). 721

"communications medium" — "a 'network for transferring data,' not including the internet." DealerTrack v. Huber, et al., No. 06-CV-02335 (C.D. Cal., Sept. 27, 2008). 723

"communications module" — "software routines or code that perform the task of communicating." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005). 725

"computer based communications network" — "Defendants urge that the proper construction ... is 'a computer network that does not include or use a central database that contains more information than is required to determine which network vendors should receive an RFQ.' The court has already rejected this construction in its rejection of Defendants' disclaimer contention." Source Search Technologies, LLC v. Lending Tree, LLC, et al., 2006 U.S. Dist. LEXIS 79651 (D.N.J., Oct. 16, 2006). 727

"a communications network electronically linking the computer workstations to the host computer network" — "hardware and software forming an electronic connection between the users' computers and the host computer network that enables data transfer via the X.25 protocol." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 729

"a compact, portable and interchangeable computer readable medium" — "[a] computer readable medium that is small, can be carried easily, and can be mutually substituted. Examples include a CD-ROM or a DVD. In contrast, the local processor assembly's hard drive is not a 'compact, portable and interchangeable computer readable medium.'" Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).  

"comparing a first of said selected pixels to at least a second of said pixels" — "taking the selected pixels of an image, and within the group of them, comparing a pixel of the original image to at least a second of the selected pixels." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006).  

"comparing bit patterns from a contiguous plurality of said output reconstructed bytes with bit patterns known to have comprised a like contiguous plurality of bytes of each of said contributory frames" — "means that two or more adjacent reconstructed bytes are compared with bit patterns known to have been present in two or more adjacent bytes in each of the contributory frames which have been multiplexed to form the bit stream. Each contributory frame must contain the bit pattern and each frame must contain the bit pattern within two or more adjacent bytes of the contributory frame." Bell Communications Research, Inc. v. Fore Systems, Inc., 113 F. Supp. 2d 635 (D. Del. 2000).
"comparing, by means of the data processing system, the response data with the offer data representing the overt and hidden terms of the offer to produce term compliance data indicating whether the response data are in compliance with the overt and hidden terms of the offer" — "comparing automatically, by means of the data processing system, the response data with the offer data to indicate whether the response data are in compliance with the overt and hidden terms of the offer." Tradecard, Inc. v. SI Corp., et al., 509 F. Supp. 2d 304 (S.D.N.Y. 2007).  

"comparing each of said assigned pulse values with other ones of said assigned pulse values ... continuing to perform said comparing step until a predetermined number of said assigned pulse values coincide within a specific precision ... determining said actual return signal to be represented by said ... values" — "comparison of pulse values--both noise and target--continually until a large enough number of pulse values is gathered that falls within a specific, limited degree of variation. The comparison is not necessarily an immediate one. The actual target signal represents the distance from range finder to target. It corresponds to the pulse values within that specified, limited degree of variation. The target signal is associated with the 'matching' pulse values that correspond within the specified limit." Laser Technology, Inc. v. Nikon, Inc., et al., 215 F. Supp. 2d 1135 (D. Colo. 2002).  

"comparing predictions obtained with the simulation using the model with observed manufacturing trends in the plant, and using the comparison to refine the model" — "using the comparison of predictions obtained from the simulation with observed manufacturing trends in the plant to improve upon the simulation." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005).  

"receiving said signal at said receiver, and comparing said received signal to an expected signal" — "mandates a receiver that performs encryption in order to compare received and expected signals." Lear Automotive Dearborn, Inc., et al. v. Johnson Controls, Inc., et al., 528 F. Supp. 2D 654 (E.D. Mich. 2007).  

"comparing the bid to the asks" — "examining a bid and one or more asks in order to note similarities and differences." Flash Seats, LLC v. Paciolan, Inc., 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010).  

"comparing the ion output current reference value to an actual ion output current value" — "using a non-hardware-based system to a) examine the actual ion current value and the ion output current reference value and b) note any similarity or difference between the two values." Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003).
"comparing the outlines of the outer surface of the lesion of the said at least one ultrasound image with the outline of the outer surface of the lesion of at least one of the diagnostic images, whereby the position of the lesion with respect to the radiation therapy device may be verified to conform to a desired position of the lesion in the radiation treatment plan" — "comparing the two-dimensional outlines of the outer surface of the lesion generated from the at least one ultrasound image (which has positional data regarding the third dimension), with the three-dimensional rendering outline of the outer surface of the lesion generated from the at least one of diagnostic images, whereby the position of the lesion with respect to the radiation therapy device may be verified to conform to a desired position of the lesion in the radiation treatment plan."

"comparing the UID of stored license file to record of assigned UID" — "1) asking the operating system for the UID for the license file (area of memory which contains a UID, which is on a disk and which is capable of storing at least one LICENSE) that the operating system caused to be stored in a record in the system memory at the local NODE; 2) decrypting the UID contained in the license file; 3) comparing the UID contained in the license file with the UID returned by the operating system. Equivalents of the process just described also are implicated." _Globetrotter Software, Inc. v. Elan Computer Group, Inc., et al.,_ 1999 U.S. Dist. LEXIS 22482 (N.D. Cal., Oct. 22, 1999).

"a plurality of comparison frames, each being a shifted version of one of the reference frame or the sample frame, is correlated with the other of the reference frame or the sample frame to produce a corresponding plurality of correlation values and ascertain motion in the directions along the first and second axes" — "at least two frames, each generated by shifting a sample frame or a reference frame, are compared with the other of a reference frame or a sample frame to provide the degree to which the frames are related. Such correlations produce numerical representations of the degree of similarity between the frames. Such correlations are also used to ascertain motion in the directions along the first and second axes. A frame refers to a single image in a sequence of images." _Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp.,_ 2006 U.S. Dist. LEXIS 62700 (N.D. Cal., Aug. 18, 2006).

"compatible with said scrambling means" — "require[s] that for each scrambling technique there is a single corresponding unscrambling technique." _Broadcast Innovation, LLC v. Echostar Communications Corp.,_ 240 F. Supp. 2d 1127 (D. Colo. 2003).

"completing the execution of said branch instruction" — "delivering the target address of a branch instruction so that the target instruction will be the next instruction fetched for execution." _Biax Corp. v. Intel Corp., et al.,_ 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).

"complex billing algorithm" — "a function that includes the means to store phone rates for local, long distance, international, and roaming calls. ... the algorithm includes means to identify the appropriate rate category and to selectively apply those rates to each call." _Telemac Cellular Corp. v. Topp Telecom, Inc.,_ 247 F.3d 1316 (Fed. Cir. 2001).

"a compliant layer"; "compliant material" — "a layer/material that is appreciably compressible in a direction perpendicular to its surface." Tessera, Inc. v. Micron Technology, Inc., 423 F. Supp. 2d 624 (E.D. Tex. 2006).757

"component" — "Because means-plus-function treatment is not appropriate, ... the Court concludes that 'component' means a computer-related entity, either hardware, a combination of hardware and software, software, or software in execution." Leader Technologies, Inc. v. Facebook, Inc., 2010 U.S. Dist. LEXIS 21100 (D. Del., Mar. 9, 2010).759

"component identifier" — "a device that identifies, recognizes, or selects, the type of component stored in a compartment with or without analyzing indicia of the component or compartment." Aguayo, et al. v. Universal Instruments Corp., 2003 U.S. Dist. LEXIS 27846 (S.D. Tex., Jun. 9, 2003).761

"composed image" — "is the image that results from compositing two images using a control image that has more than two values." Quantel Ltd. v. Adobe Systems Inc., 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997).763

"composite gesture action" — "a gesture action (as defined []) that involves movement of several joints." New York University v. Autodesk, Inc., 2007 U.S. Dist. LEXIS 26671 (S.D.N.Y., April 10, 2007).764

"comprehensive surveillance of a predetermined area" — "[u]sing at least two sensor appliances, and in some cases one or more conventional security sensors, to monitor or observe the area protected by the system, so that all parts of the area are monitored or observed, although some or all parts of the area may be monitored or observed by only one sensor appliance or sensor." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex. Aug. 4, 2006).765

"compression rate" — "compressor throughput as a measure of the amount of input data a compressor can compress and make available for storage per unit of time at a given compression ratio." Realtime Data, LLC v. Packeteer, Inc., et al., 2009 U.S. Dist. LEXIS 78459 (E.D. Tex., Jun. 23, 2009).766

"comprised of" — "Correctly construed, 'comprised of' does not of itself exclude the possible presence of additional elements or steps." CIAS, Inc. v. Alliance Gaming Corp., et al., 504 F.3d 1356 (Fed. Cir. 2007).767
"comprising" — "raises a presumption that the list of elements is nonexclusive. ... [However,] the presumption raised by the term 'comprising' does not reach into each of the six steps to render every word and phrase therein open-ended." Dippin' Dots, Inc., et al. v. Mosey, et al., 476 F.3d 1337 (Fed. Cir. 2007).\textsuperscript{768}

"comprising" — "including, but not limited to." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).\textsuperscript{769}

[i] "comprising"; [ii] "having" — [i] "When a patent claim uses the word 'comprising' as its transitional phrase, the use of 'comprising' creates a presumption that the body of the claim is open."; [ii] "The transition 'having' can also make a claim open. However, the term 'having' does not convey the open-ended meaning as strongly as 'comprising.' 'Having,' for instance, does not create a presumption that the body of the claim is open." Crystal Semiconductor Corp. v. Tritech Microelectronics International, Inc., 246 F.3d 1336 (Fed. Cir. 2001).\textsuperscript{770}

"the method comprising the computer-implemented steps of ..." — "adds a limitation to each element of the claims in which it appears in the preamble. 'Computer-implemented' will have its ordinary meaning, but will not be confined to the provider's computer." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007).\textsuperscript{771}

"... comprising the steps of ..." — "Since the claim is not foreclosed to additional steps, the steps themselves are not foreclosed from being carried out in a different order than stated in the claim." Lincoln National Life Insurance Co. v. Transamerica Financial Life Insurance Co., 2007 U.S. Dist. LEXIS 16822 (N.D. Ind., March 6, 2007).\textsuperscript{772}

[i] "computer"; [ii] "browser" — [i] "a device that processes data"; [ii] "a computer application for browsing a network, such as the internet." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009).\textsuperscript{774}

"computer"; "general purpose computer" — "a programmable machine that is operable to conduct a wide variety of tasks using a variety of applications programs that can be accessed and operated. The term does not include a microprocessor or microcontroller that is operable to conduct only a single, specific task." Quantum World Corp. v. Atmel Corp., et al., 2009 U.S. Dist. LEXIS 7936 (E.D. Tex., Jan. 30, 2009).\textsuperscript{775}

"computer readable medium" — "a storage device." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009).\textsuperscript{776}

"computer"; "computer system" — "we agree [] that the '353 patent uses the terms 'computer' and 'computer system' as synonyms. Although we would typically be inclined to give meaning to the word 'system,' rather than regard it as surplusage, ... the patent in this case provides no indication that the two terms mean different things. Instead, the patent uses the term 'computer system' in the specification and the term 'computer' in the claims; nothing in the patent itself explicates their relationship or indicates any difference in meaning." Pickholtz v. Rainbow Technologies, Inc., et al., 284 F.3d 1365 (Fed. Cir. 2002).\textsuperscript{777}

"computer" — "the Court construes 'computer' and 'attraction computer' as 'a computer system including a processing unit, random-access memory, disk storage, input and output devices, applicable wireless communication hardware and software, which may be implemented as: (1) a distinct processor or processing node within a computer system or group of computers; or (2) a separate computer physically disposed at or near its associated attraction.'" PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).780

"computer" — "either the external operation panel or the remote diagnostic station." Ricoh Corp., et al. v. Pitney Bowes, Inc., 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006).781

"computer" — "as used in claim 1, does not include peripherals." Pickholtz v. Rainbow Technologies, Inc., et al., 2000 U.S. Dist. LEXIS 21945 (N.D. Cal., Apr. 28, 2000).784

"a computer-aided design process for designing" — "a process that uses a computer to direct and control the design of an ASIC chip." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005).786

"user initiable computer ... being programmed to vary the temperature of said heating and cooling system and thereby to vary the temperature of said plurality of chambers in accordance with said polymerase chain reaction protocol upon initiation by a user" — "is not in means-plus-function form." Applera Corp., et al. v. MJ Research Inc., et al., 292 F. Supp. 2d 348 (D. Conn. 2003).788

"computer code that receives a first set of signals ..."; "computer code that performs a comparison ..."; "computer code that generates a base call ..." — "the Court finds that § 112, P 6 does not apply to the terms recited in the form, 'computer code that [performs x function]." Affymetrix, Inc. v. Hyseq, Inc., 132 F. Supp. 2d 1212 (N.D. Cal. 2001).789

"computer displaying, in response to the scanner sensing a document, a plurality of user-selectable options for processing image data from said scanner" — "A reference to a 'computer' provides no basis to distinguish the structure from any other general purpose computer; thus, 'computer' does not adequately describe a specific structure. ... Accordingly, these claims must be construed as means-plus-function claims." Soque Holdings (Bermuda) Ltd. v. KeyScan, Inc., 2010 U.S. Dist. LEXIS 60501 (N.D. Cal., Jun. 4, 2010). 791

"computer-implemented method" — "a method where the steps are performed using a computer." Atser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009). 792

"computer network"; "multinode computer network" — "a system of two or more interconnected computers; the computers are 'interconnected' if the computers are able to exchange information." Brooktrout, Inc. v. Eicon Networks Corp., et al., 2004 U.S. Dist. LEXIS 31054 (E.D. Tex., Jul. 27, 2004). 797

"computer software" — "While 'software' in the abstract might consist of only one instruction, the Court's obligation is to interpret terms in the claims of the patent as they are used in the patent, and not in the abstract. The expressed purpose of the '353 is to prevent the unauthorized use of computer software, that is, software that would require protection. As plaintiff conceded at the claim construction hearing, there is little practical value to protecting single instruction software." Pickholtz v. Rainbow Technologies, Inc., et al., 2000 U.S. Dist. LEXIS 21945 (N.D. Cal., Apr. 28, 2000). 798

"computer system" — "a system that includes at least one computer and that may contain a number of computers coupled in a network. Even where a computer system contains only one computer, that computer must be able to communicate via email or a modem connection or another communication channel to allow remote monitoring." Sun Microsystems Inc v. Network Appliance, 2009 U.S. Dist. LEXIS 48209 (N.D. Cal., May 29, 2009). 799

"computer system" — "an information handling system which can be designed to give independent computing power to one user or a plurality of users." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). 800

"computer system" — "one or more general purpose computing devices performing server and/or client functions, including a storage medium." Individual Network, LLC v. Apple, Inc., 2009 U.S. Dist. LEXIS 1645 (E.D. Tex., Jan. 12, 2009). 802

"computer usable medium" — "a tangible medium, such as a computer readable media (for example, diskette, CD-ROM, ROM, or fixed disk) or a medium for transmission to a computer system via a modem or other interface device using communications lines (for example, optical or analog communication lines) or wireless techniques (for example, microwave, infrared or other transmission techniques)." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004). 803

"concurrent processing" — "processing two or more calls at the same time or in parallel (simultaneously)." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003). 808

"concurrently" — "refers to a mode of operation wherein control of the CPU is alternated among executing threads of the same program at so rapid a rate that the multiple threads of execution appear to be executing simultaneously to the computer user." Reiffin v. Microsoft Corp., 2002 U.S. Dist. LEXIS 21690 (N.D. Cal., Apr. 30, 2002). 809

"concurrently, but independently, processing within said computer specific portions of invoked ones of said routines for each of a plurality of said processes" — "the independent performance of two or more specific portions of the invoked routines wherein at least one part of the two portions are run in an overlapping fashion." Gobeli Research, Ltd. v. Apple Computer Inc., et al., 384 F. Supp. 2d 1016 (E.D. Tex., Aug. 26, 2005). 811
"said processing being performed by said page server while said web server concurrently processes said other requests" — "said processing being performed by said page server while said Web server processes said other requests at the same time." EpicRealm, Licensing, LLC v. AutoFlex Leasing, Inc., et al., Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Aug. 15, 2006).813 "The Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court." Id., Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Oct. 30, 2006).814

"concurrently with at least one of the data unit transfers in said step of sequentially transferring" — "while at least one of the data units is moving from the secondary memory to the bus master." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).815

"condition proportional" — "mean[s] that the sensor must sense a condition that has some fixed relationship with the LEDs' light output, but would not understand the phrase to require a certain location for the sensor." Relume Corp. v. Dialight Corp., et al., 63 F. Supp. 2d 788 (E.D. Mich. 1999).816

"conditional analysis" — "a determination that generates a first result based on a first condition or data, and a second result based on a different condition or data." Verizon Services Corp., et al. v. Vonage Holdings Corp., et al., 503 F.3d 1295 (Fed. Cir. 2007).817

"conditionally interfacing" — "connecting a call to the selected format once any conditions associated with that format have been satisfied." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).818

"conditioning the signal for transmission to a remote receiver" — "converting the signal into a radio frequency (RF) signal to be transmitted to a remote receiver." MHL TEK, LLC v. Nissan Motor Co., et al., 2009 U.S. Dist. LEXIS 77578 (E.D. Tex., Aug. 28, 2009).819

"conducting a coarse frame synchronization over a plurality of said time slots which comprise a frame" — "controlling a first frame synchronizing process that utilizes a corrected phase course of a detected frequency correction burst to identify a range within which the beginning of a frame falls." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).820

"conducting a coarse frequency synchronization" — "having detected a carrier frequency, controlling a process to bring the mobile station's frequency into approximate step with the base station frequency, such as by tuning to a carrier frequency." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).821

"conducting a fine frame synchronization over said plurality of time slots which comprise a frame" — "controlling a second frame synchronizing process that achieves bit-precision frame synchronization by recognizing and evaluating the training sequence within the synchronization burst." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).822
"conducting a fine frame synchronization with fine frequency synchronization" — "controlling a process to monitor and maintain the frame timing in step between the mobile station and neighboring base station while also maintaining the frequency within a desired operating accuracy between the mobile station and the neighboring base station, by producing frame shift and frequency correction parameters when crossing a cell boundary." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).823

"conducting a fine frequency synchronization" — "controlling a second frequency synchronizing process to bring the oscillator frequency of the mobile telephone more precisely into step with the frequency of the base station, within a desired operating accuracy." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).824

"conducting a frame synchronization with fine frequency synchronization" — "controlling a process to monitor and maintain the frame timing in step between the mobile station and base station while also maintaining the frequency within a desired operating accuracy between the mobile station and the base station, by producing frame shift and frequency correction parameters." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).825

"conducting an initial synchronization by means of a frequency correction burst" — "controlling a process to achieve an initial synchronized connection between a mobile station and a base station through use of one or more frequency correction bursts and a synchronization burst." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).826

"conductive" — "capable of allowing a direct current or an alternating current of electricity to pass through it." MHL TEK, LLC v. Nissan Motor Co., et al., 2009 U.S. Dist. LEXIS 77578 (E.D. Tex., Aug. 28, 2009).827

"conductive connection means communicatively connected to said gel layer" — "a conductive lead or leads that are configured to enable electrical connection to the gel layer." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).828

"a plurality of conductive lines having inherent distributed capacitance" — "'conductive lines' refers not only to x-lines, but also to other lines that conduct current." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998).830

"conductive liquid-like medium" — "a medium sufficiently conductive to perform its function as a variable capacitor plate." Ekchian v. Home Depot, Inc., et al., 104 F.3d 1299 (Fed. Cir. 1997).831

"conductive shield [of a coaxial cable]" — "outer conductor that reduces the effect of external electrical interference on the voltage varying electrical signal transmitted on the center conductor." Monster Cable Products, Inc. v. Quest Group, 2005 U.S. Dist. LEXIS 4213 (N.D. Cal., Mar. 17, 2005). \n
"conductive wire portion of which contacts said gel layer" — "the conductive wire portion of the insulated wire that is in contact with the gel layer." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006). \n
"conductor" — "one or more conducting media." Travanti Pharma, Inc. v. Iomed, Inc., 2006 U.S. Dist. LEXIS 2646 (D. Minn., Jan. 11, 2006). \n
"conductor" — "those portions of the [lead frame] assembly that extend from inside the package to the outside, and connect the semiconductor device to an external circuit." Texas Instruments, Inc. v. Cypress Semiconductor Corp., et al., 1995 U.S. Dist. LEXIS 20328 (N.D. Tex., Aug. 28, 1995). \n
"conference controller"; "through a conference controller" — "a component that initiates, enables and/or establishes a conference call"; "the data packet transmissions of the IP data session pass through the conference controller." NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007). \n
"conferencing control" — "hardware and/or software at each workstation which is used to initiate and facilitate videoconferencing, data conferencing, and other collaborative sessions" Collaboration Properties, Inc. v. Tandberg ASA, et al., 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006). \n
"wherein the interface device is configured by the processor and memory to include a first command interpreter and a second command interpreter" — "the processor of the interface device runs a program from its memory to determine the data transfer parameters of the interface device for the first and second command interpreters." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009). \n
"configuration table" — "a structure organizing data that governs the interactions between logical units and host computing systems." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004). \n
"interacting with a graphical user interface to configure said imaging system" — "interacting with a graphical user interface to control the association with a first remote device." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).
"the second end configured for electrical interconnection to a defibrillator" — "the plain language of the claim merely requires that the second end of the insulated lead wire allows for electrical interconnection to the defibrillator."  Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006). 846

"configured to operate in either the presence or absence of a bandwidth encompassing modem signal" — "no further construction of this claim language is necessary."  Kernius v. International Electronics, Inc., et al., 2007 U.S. Dist. LEXIS 24874 (D. Md., March 30, 2007). 848

"configured to supply service channel optical signals" — "programmed to supply service channel optical signals."  Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006) 849

"to thereby confirm that said hardware key is connected to said subscriber client computer" — "to verify after initial authentication, but before session termination, that the hardware key remains connected to the subscriber client computer."  Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007). 852

"connected" — "electrically connected, directly or indirectly."  SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010). 856

"connected" — "in communication with, inserted in, or attached to."  Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007). 857

"connected" — "joined or linked with the capacity of transferring data."  ACTV, Inc., et al. v. Walt Disney Co., et al., 204 F. Supp. 2d 650 (S.D.N.Y. 2002). 859

"connected between transmit and receiver antenna means common to all of the channels" — "each transceiver is connected to a common receiver and transmit antennae." *MLMC, Ltd. v. Airtouch Communications, Inc., et al.*, 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001). ⁸⁶²

"connected directly" — "means a connection between two points that is unimpaired by an outside electrical force and uncompromised by any intervening physical structures other than a structure that connects the two points." *Quality Semiconductor, Inc. v. Pericom Semiconductor, Inc.*, 1998 U.S. Dist. LEXIS 22633 (N.D. Cal., Feb. 27, 1998). ⁸⁶³

"electrically connected directly between said busses" — "The bus and the capacitor are connected without any intervening active devices, such as transistors." *Advanced Micro Devices, Inc., et al. v. Samsung Electronics Co., Ltd, et al.*, 2009 U.S. Dist. LEXIS 91536 (N.D. Cal., Sep. 17, 2009). ⁸⁶⁴

"connected to" — "having a link to ... to send or receive data." *Soverain Software LLC v. Amazon.com, Inc.*, 2005 U.S. Dist. LEXIS 46872 (E.D. Tex., Apr. 7, 2005). ⁸⁶⁵

"connected to" — "the district court erred in construing the claim limitation 'connected to' as requiring two physically separate circuits that are electrically connected, thereby precluding a software-only implementation of the PID filter." *Animatics Corp. v. Quicksilver Controls, Inc., et al.*, 102 Fed. Appx. 659 (Fed. Cir., Jun. 8, 2004). ⁸⁶⁶

"connected to" — "connected without interposition of additional circuit elements, such as inductors, capacitors, or resistors." *Pulse Engineering, Inc. v. Mascon, Inc.*, 2009 U.S. Dist. LEXIS 26885 (S.D. Cal., Mar. 9, 2009). ⁸⁶⁷

"first and second receiving circuits connected to and energized by, respectively, the first and second feed circuits" — "The first receiving circuit is connected to and receives electricity or is capable of receiving electricity from the first feed circuit and the second receiving circuit is connected to and receives electricity or is capable of receiving electricity from the second feed circuit." *Hewlett-Packard Co., et al. v. EMC Corp.*, 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004). ⁸⁶⁹

"source electrode means connected to said source regions" — "does not require or preclude any particular structure for 'connecting' the source electrode to the annular source." *International Rectifier Corp. v. IXYS Corp.*, 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001). ⁸⁷⁰
"connecting each of said second gate electrodes to an individual adjacent first gate electrode to form a composite electrode for a charge coupled element" — "this limitation describes a process step which connects each second gate electrode to one, but not both, adjacent first gate electrodes." Loral Fairchild Corp. v. Victor Co. of Japan, Ltd., et al., 906 F. Supp. 798 (E.D.N.Y. 1995).871

"connecting device" — "a network connection, such as the Internet, used for transferring data between computers." Skyline Software Systems, Inc. v. Keyhole, Inc., et al., 421 F. Supp. 2d 371 (D. Mass. 2006).873

"connecting to the network"; "providing to the user a connection to the network." — "establishing the ability to communicate with the network." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).874

"connecting together the circles of adjacent families of circles having an identical index to form isoloops" — "selecting circles that have been assigned identical indexes and connecting those circles to form sets of loops consisting of pieces of the original circles and curves or lines joining those pieces." Surfware, Inc. v. Celeritive Technologies, Inc., et al., 2009 U.S. Dist. LEXIS 51620 (C.D. Cal., Jun. 3, 2009).875

"connectionless communications network" — "a network in which data packets are routed through devices independently, based on a destination address for the packet." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).876

"one or more connections for coupling to transmission media" — "at least one point of connection to a transmission media such as the PSTN that is different from the 'one or more connections for coupling to a telephony server and a local area network.'" Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).877

"connections over the telephone network" — "communications to a single intended recipient over the telephone network." USA Video Technology Corp. v. Time Warner Cable, Inc., et al., 2007 U.S. Dist. LEXIS 92578 (E.D. Tex., Dec. 12, 2007).878

"connections through the Internet" — "connection through an electronic communications network, known as the Internet, that further connects computer networks and organizational computer facilities around the world." Windy City Innovations, LLC v. America Online, Inc., 2005 U.S. Dist. LEXIS 15688 (N.D. Ill., July 29, 2005).879

"consisting essentially of" — "the invention necessarily includes the listed claim elements but is open to unlisted claim elements that do not materially affect the basic and novel properties of the claimed invention." Digital Angel Corp. v. Datamars, Inc., et al., 2006 U.S. Dist. LEXIS 32260 (D. Minn., May 22, 2006).881
"supports consisting essentially of electrically conductive interconnects" — "the court finds that this term does not need to be construed." Raytheon Co. v. Indigo Systems Corp., 2010 U.S. Dist. LEXIS 3530 (E.D. Tex., Jan. 18, 2010). 882

"consisting of a steady-state component and a transient component subsequent to said arbitrary time" — "consisting of, after the arbitrary time, a component in which one or more characteristics exhibit only negligible change over time (i.e., a steady state component) and a variable component that diminishes over a relatively short period of time (i.e., a transient component)." Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al., 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006). 883

"incrementing the count in the accumulator by a constant" — "encompass[es] a constant whose range is typically between 0 and 1000." Lucent Technologies, Inc. v. Newbridge Networks Corp., et al., 168 F. Supp. 2d 181 (D. Del. 2001). 885

"constant current" — "an exact, non-absolute numerically valued current, precisely metered through each transistor to operate the op-amps, and not required to be situated between the first power supply circuit and the power supply." Fiori v. Rockford Corp., 2006 U.S. Dist. LEXIS 41477 (E.D. Pa., June 21, 2006). 886

"constant electromagnetic signal with time"; "constant electromagnetic calibration signal with time" — "are uninterrupted signals over time. This necessarily excludes signals that are pulsed or on-off keyed." Digital Control Incorporated, et al. v. Charles Machine Works, 2003 U.S. Dist. LEXIS 27828 (W.D. Wash., Dec. 11, 2003). 887

"constant value" — "a value that does not change." PACid Group, LLC v. Apple, Inc., et al., 2010 U.S. Dist. LEXIS 70997 (E.D. Tex., Jul. 15, 2010). 888

"power or power-spectral-density constraint" — "an absolute limit in the transmitter power or a limit in maximum transmit power allowed at particular frequencies." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005). 889

"constructing a data representation of a lifetime of the telephone call using data regarding telephony events associated with the telephone call segments of the telephone call" — "does not require construction. The Court's construction of 'data representation of a lifetime of the telephone call,' in particular, obviates the need to further construe the disputed language." NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007). 890

"consumable participation key" — "a number or word that allows a caller access to a service or part of a service a predefined limited number of times and which cannot be refreshed or recharged." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999). 892

"consumer" — "a person or entity that acquires goods or services for direct use or ownership rather than for resale or use in production and manufacturing." Source, Inc. v. American Express Co., 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006). 893

"contact layer" — "the semiconductor material between the metal contacts and the voltage sustaining layer that is designed to perform two contacting functions: (a) permit ohmic contacts to be formed at the terminals (e.g., the source or emitter contacts) and (b) provide a connection between the metal contacts and the voltage sustaining layer such that the reverse voltage across the device terminals is sustained primarily across the voltage sustaining layer." Power Mosfet Technologies, L.L.C. v. Siemens AG, et al., 2001 U.S. Dist. LEXIS 25828 (E.D. Tex., Jan. 31, 2001). 896

[i] "contact region"; [ii] "semiconductor body"; [iii] "opening" — [i] "an electrically conducting space or area to which another electrical conductor may be connected so as to allow current to pass"; [ii] "any semiconductor material"; [iii] "a hole, void, or open space." Agere Systems Inc. v. Atmel Corp., 2003 U.S. Dist. LEXIS 9823 (E.D. Pa., May 23, 2003). 897

"contacting" — "[should] be defined in terms of its relationship with the term 'contact layer' as 'permitting or enabling contact.' Thus, 'contacting' is not limited to physical contact and can also include electrical contact." Power Mosfet Technologies, L.L.C. v. Siemens AG, et al., 2001 U.S. Dist. LEXIS 25828 (E.D. Tex., Jan. 31, 2001). 898

"a hard disk drive contained within said hand-held housing" — "this phrase requires no construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006). 900

"contains" — "describes a product in which the FM transmitter and the power supply/charging assembly are 'enclosed,' 'bound,' or 'kept within' the same housing unit." Netalog, Inc. v. Griffin Technology, Inc., 2006 U.S. Dist. LEXIS 39089 (M.D.N.C., June 12, 2006). 902

"content" — "any form of digital data stream that may be supplied or sent to a computing system such as a personal computer." CA, Inc. v. Simple.com, Inc., et al., 2009 U.S. Dist. LEXIS 25241 (E.D.N.Y., Mar. 5, 2009). 903

"content of information" — "information in a data source such as data values and information about structure." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006). 905
"content profiles for each data source of said data, said content profiles indicating the degree of content of said predetermined characteristics in data from each data source" — "data that describes the significant characteristics of a data source, indicating the degree to which predetermined characteristics are contained in the data from the data source." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).906

"context" — "information already existing within the system that becomes relevant upon the occurrence of an event." SFA Systems, LLC v. Infor Global Solutions (Michigan), Inc., et al., 2009 U.S. Dist. LEXIS 13705 (E.D. Tex., Feb. 23, 2009).908

"context free processor element" — "a processor element that retains no execution state information from prior operations." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).909

"contiguous" — "immediately preceding or following in time and sequence." Negotiated Data Solutions, LLC v. Dell, Inc., 596 F. Supp. 2d 949 (E.D. Tex. 2009).910

"continually detecting the instantaneous flow rate" — "without interruption, creating a signal corresponding to the flow rate at a particular point of time." Respironics, Inc. v. Invacare Corp., 2006 U.S. Dist. LEXIS 62233 (W.D. Pa., Aug. 30, 2006).911

"said lattice being continuous and uninterrupted" — "means that it is possible to travel from any point to any other point within the claimed lattice (the semiconductor material between the bases of the first conductivity type) while staying within the lattice." International Rectifier Corp. v. IXYS Corp., 2002 U.S. Dist. LEXIS 27248 (C.D. Cal., Mar. 5, 2002).912

"continuously" — "means that the tonal frequency changes constantly as the quantity being measured changes." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003).914

"coupled for continuously providing" — "continuously connected such that the first user can update the web site as new information becomes available." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).916

"continuously updating" — "bringing up to date as new information becomes available." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).917

"control" — "direct, guide or manage the transfer or delivery of electronic data." Network Commerce, Inc. v. Microsoft Corp., 260 F. Supp. 2d 1034 (W.D. Wash. 2002).918

- 85 -

"control apparatus" — "The phrase 'control apparatus' in the preamble merely gives a descriptive name to the set of limitations in the body of the claim that completely set forth the invention. Its use does not limit the claims, as Haas contends, to a control apparatus that is separate from the machine tool." IMS Technology, Inc. v. Haas Automation, Inc., et al., 206 F.3d 1422 (Fed. Cir. 2000).921

"control circuit" — "an electronic circuit that is located outside of the main case and that receives system control signals from the computing device and generates logical control signals for the image sensing module and motion mechanism." Plustek, Inc. v. Syscan, Inc., et al., 2009 U.S. Dist. LEXIS 122777 (N.D. Cal., Dec. 21, 2009).923

"control circuitry determining when the power MOSFET switches are turned on and off in a switching cycle at a switching frequency" — "is not a means-plus-function limitation governed by 35 U.S.C. § 112 P 6." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010).926

"control commands" — "commands that control the system." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005).927

"at least one control key for initiating the predetermined operations relating to said digital camera memory module" — "the terms are readily understandable and the court concludes that this phrase requires no construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).929

"control input" — "an I/O port of a computer, where the instruction initiating the control of that computer is input." Beam Laser Systems, Inc. v. Cox Communications, Inc., et al., 144 F. Supp. 2d 475 (E.D. Va. 2001).930

"control means" — "The 'control means' element ... is not governed by Section 112, paragraph 6." Gross International Americas, Inc. v. K&M Newspaper Services, Inc., 469 F. Supp. 2d 547 (N.D. Ill. 2006).931

"control means for automatically operating said valves" — "a bare statement that known techniques or methods can be used does not disclose structure. ... the judgment of the district court holding claims 13-17 and 40 of the '502 patent as invalid for indefiniteness is AFFIRMED." Biomedino, LLC v. Waters Technologies Corp., et al., 490 F.3d 946 (Fed. Cir. 2007).  

"control message" — "information that is intended to reconfigure or manage characteristics of a receiving unit, and does not include a subchannel identifying byte." Sutton Ltd. v. Nokia Corp., et al., 2009 U.S. Dist. LEXIS 69735 (E.D. Tex., Aug. 10, 2009).  

"a control module arranged to control deployment of said occupant restraint device" — "a control module that issues a command or commands to control whether to deploy or suppress the occupant restraint device, and if deployed, how to adjust the manner in which the occupant restraint device is deployed." Automotive Technologies International, Inc. v. Delphi Corp., 2009 U.S. Dist. LEXIS 83187 (E.D. Mich., Sep. 11, 2009).  

"control object" — "a collection of data and operations that receives commands from a user that control the flow of broadcast data." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005).  

"control program" — "a program within the operating system that controls the execution of other system resources." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004).  

"control store" — "A 'control store' is included within a single unified DRTST switching unit that includes a memory, processor, and operating software that determines (1) which data circulating on the network loop is to be selected and diverted to the TST switch of a given switching node; (2) how that data passes through the TST switch; (3) which data is output from the TST switch back onto the network loop; and (4) which data is to bypass the TST switch of that node." Southwestern Bell Telephone, L.P., et al. v. Arthur Collins, Inc., 454 F. Supp. 2d 600 (E.D. Tex. 2006).943

"control trading"; "control subsequent trading" — "to exercise authority to hold up a trade for as long as a participant continues to respond to its contra-party's size offerings." eSpeed, Inc., et al. v. BrokerTec USA, L.L.C., et al., 2004 U.S. Dist. LEXIS 20589 (D. Del., Sept. 9, 2004).944

"control unit" — "a combination comprising a CPU and a partitioned memory system capable of controlling the communication unit." LG Electronics, Inc., et al. v. Bizcom Electronics, Inc., et al., 453 F.3d 1364 (Fed. Cir. 2006).945

"controllably conductive device for adjusting the status of said electrical device" — "a controllably conductive device for altering the condition of the electrical device (such as, the on/off state or intensity level of the electrical device)." Lutron Electronics Co., Inc. v. Control4 Corp., 2009 U.S. Dist. LEXIS 3562 (D. Utah, Jan. 20, 2009).946

"controller" — "a device that actuates and/or directs the operation of other components, or is capable of making decisions with respect to the operation or actuation of those components, including being operable to selectively delay execution of the door operation commands." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009).947

"controller" — "a device that interfaces between a host and nonvolatile memory; ... a device that interfaces between a host and flash memory; ... a device that interfaces between a host and nonvolatile memory." Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005).949

"controller" — "a device that interfaces between a host and nonvolatile memory." Lexar Media, Inc. v. Fuji Photo Film USA, Inc., 2007 U.S. Dist. LEXIS 19983 (N.D. Cal., Mar. 1, 2007).951

"controller" — "The claim language does not merely describe a controller, but adds further structure by describing the operation of the controller. ... Accordingly, the description of the operation of a controller is sufficient to avoid section 112 P 6." 911EP v. Whelen Engineering Co., Inc., et al., 2007 U.S. Dist. LEXIS 20779 (E.D. Tex., March 23, 2007).952
"controller" — "while the patentee did not modify the term controller with the word single, the specification indicates that a single control system regulates the entire process." AutoMed Technologies, Inc. v. Microfil, LLC, et al., 2005 U.S. Dist. LEXIS 26032 (N.D. Ill., Oct. 26, 2005).953 "[W]hile we affirm the district court's initial construction of 'controller' to mean a 'single control system that regulates the entire process,' we clarify that the controller need not be limited to a single device, nor to any particular hardware or software." Id., 2007 U.S. App. LEXIS 16956 (Fed. Cir., July 16, 2007) (unpublished).954

"controller" — "something other than a general purpose CPU." Orenshteyn v. Citrix Systems, Inc., 265 F. Supp. 2d 1323 (S.D. Fla. 2003).955 "We agree with Orenshteyn that Citrix is not entitled to summary judgment of noninfringement of claim 1. The district court granted Citrix's motion because the MetaFrame product uses a CPU, in contrast to its construction of the '942 patent as referring to something other than a CPU. However, as we shall demonstrate, claim 1 of the '942 patent covers products that employ a CPU, and the district court's grant of summary judgment of noninfringement was therefore erroneous." Id., 2009 U.S. App. LEXIS 16403 (Fed. Cir., Jul. 24, 2009) (unpublished).956

"power supply controller"; "system controller" — "part of a distributed power control system that activates and at least partially programs and monitors a regulator and allows the output of the POL regulator to be transmitted to an external load circuit." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007).958

"controller adapted to provide selectively modulated illumination to the illuminated LEDs/light sources" — "controller adapted to provide illumination whose intensity is selectively varied to illuminate LEDs/light sources." 911EP v. Whelen Engineering Co., Inc., et al., 2007 U.S. Dist. LEXIS 20779 (E.D. Tex., March 23, 2007).960

"a controller computer" — "the computer programmed to perform certain functions in the Communication System. ... we decline to include a determination of whether the controller computer must perform the functions of 'connecting,' 'arbitrating,' and 'distributing' in the instant claim construction." Windy City Innovations, LLC v. America Online, Inc., 2005 U.S. Dist. LEXIS 15688 (N.D. Ill., July 29, 2005).961

"a controller, coupled to the visual display, for automatically determining when the terrain information is displayed on the visual display" — "is not a means-plus-function element under §112(6)." Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al., 264 F. Supp. 2d 135 (D. Del. 2003).962

"controlling a computer" — "taking over the functionality of the host computer that is responsive to an input device event received from a client computer." Accolade Systems LLC v. Citrix Systems, Inc., 634 F. Supp. 2d 738 (E.D. Tex. 2009).

"controlling the routing of the stream of packets" — "directing a portion of the routing path taken by the stream of packets from one of a group of intermediate computers located in a specific geographic area to the user." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007).

"the network management system controlling when the video program is forwarded to the display unit for display" — "the network management system determines the specific time or times at which the video program is forwarded and displayed at the display unit of each of the receiving sites." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006).

"convergence criterion based upon a partition size" — "condition for terminating an iterative process based on the number of cells contained in a partition or the total area of cells in a partition." Synopsys, Inc. v. Magma Design Automation, Inc., 2005 U.S. Dist. LEXIS 46882 (N.D. Cal., Aug. 23, 2005).

"converter for converting ..." — "because the claim element 'converter for converting...' does not use the word 'means,' there is a rebuttable presumption that § 112, P 6 does not apply. The Court finds that the Defendants have not met their burden to rebut the presumption." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010).

"converter means for converting" — "any firmware, software, and/or hardware that functions to carry complimentary color control signals." Texas Digital Systems, Inc. v. Telegenix, Inc., 2000 U.S. Dist. LEXIS 18360 (N.D. Tex., Dec. 6, 2000).

"converting data relating to a selected matching item and an associated source to data relating to an item and a different source" — "substituting data relating to a selected matching item and an associated source to data relating to an item and a different source." ePlus, Inc. v. Lawson Software, Inc., et al., 2010 U.S. Dist. LEXIS 42609 (E.D. Va., Apr. 30, 2010).975

"converting said set of three dimensional coordinates into a set of two dimensional positions" — "mathematically converting the set of three-dimensional coordinates (x, y, z) into a set of two-dimensional positions. The two-dimensional positions have x and y coordinates." Sportvision, Inc. v. Sportsmedia Technology Corp., 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).976

"converts the access as required for the register set and address assignment of the device" — "converts the request for accessing the register set and address assignment of a UART to a request for accessing the register set and address assignment of the device." PCTEL, Inc. v. Agere Systems, Inc., et al., 2006 U.S. Dist. LEXIS 25943 (N.D. Cal., March 20, 2006).977

"cooperating with said first optical filter element so as to form a band-pass optical filtering system" — "mean[s] the cooperation of the two band-pass filters, neither of which is itself a narrow bandpass filter. The two filters, one of which transmits light of wavelengths just below and above a predetermined wavelength, the other transmitting light of wavelengths just above and below the predetermined wavelength, cooperate to form a narrow band-pass optical filter which does not exist before the cooperation between the two filters." Metrologic Instruments, Inc. v. PSC Inc., 2003 U.S. Dist. LEXIS 26636 (D.N.J., Aug. 26, 2003).979

"coordinate" — "to harmonize, work together, or bring into a common action, effort or condition." Network Commerce, Inc. v. Microsoft Corp., 260 F. Supp. 2d 1034 (W.D. Wash. 2002).980

"coordinate" — "The plain language of the claims precludes the possibility that a coordinate can be a scalar." Vehicle IP, LLC v. General Motors Corp., et al., 306 Fed. Appx. 574 (Fed. Cir., Jan. 6, 2009) (unpublished).981 "I [] agree with VIP that a coordinate can be anything that describes a particular point on a line, on a plane or surface, or in space. This includes a numeric value (a scalar) describing an offset to a fixed point along a known curve." Id. (Mayer, J., dissenting).982

"x,y coordinate"; "x,y coordinate location"; "x and y coordinate" — "one or more points that designates the position of a package where the picking means selects, grabs and replaces packages." McKesson Automation, Inc. v. Swisslog Holding AG, et al., 2009 U.S. Dist. LEXIS 103665 (D. Del., Oct. 30, 2009).983 "While construing 'x,y coordinate' in terms of where the picking means can access packages has intuitive appeal based on the claim language and the specification (which demonstrate a relationship between x,y coordinates and the automated picking means), Judge Stark's proposed construction goes one step further and associates the 'x,y coordinate' with the location of the packages themselves. The court declines to adopt this construction for several reasons." Id., 2010 U.S. Dist. LEXIS 48742 (D. Del., May 18, 2010).984

"workspace coordinate framework" — "a static or immovable coordinate system centered in the workspace that must be re-established if one or more of the cameras are moved." Medtronic Navigation, Inc., et al. v. Brainlab Medizinische Computersystems GmbH, et al., 2007 U.S. App. LEXIS 2521 (Fed. Cir. 2007) (unpublished).\(^{986}\)

"a copy key for initiating the copying of the contents of a memory of a digital camera containing picture image data previously captured by said digital camera from said memory of said digital camera to said mass storage device" — "an exclusive copy button used only for copying the contents of a memory of a digital camera containing picture image data previously captured by the digital camera to the mass storage device." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).\(^{988}\)

"core" — "a longitudinally-extending element that separates the transmission media." Belden Technologies Inc., et al. v. Superior Essex Communications LP, et al., 2010 U.S. Dist. LEXIS 86833 (D. Del., Aug. 24, 2010).\(^{989}\)

"correct level required to turn on a selected memory cell access transistor" — "the ordinary and plain meaning of the 'correct level' claim term is 'a voltage level sufficient to fully turn on a memory cell access transistor but not so high that it will damage the transistor.'" Mosaid Technologies, Inc. v. Samsung Electronics Co., Ltd., et al., 2004 U.S. Dist. LEXIS 27636 (D.N.J., Mar. 23, 2004).\(^{991}\)

[ii] "correlated"; [ii] "correlated noise" — [i] "means two items that have a tendency to vary together"; [ii] "noise with 'correlation' among 'signal samples,' such as that caused by coloring by front-end equalizers, media noise, media nonlinearities, and magnetoresistive (MR) head nonlinearities." Carnegie Mellon University v. Marvell Technology Group, Ltd., et al., 2010 U.S. Dist. LEXIS 104891 (W.D. Pa., Oct. 1, 2010).\(^{992}\)

"correlating said images such that changes in location of characteristics of said region within successive images are computationally recognized" — "further construction of this term is unnecessary." Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp., 2006 U.S. Dist. LEXIS 62700 (N.D. Cal., Aug. 18, 2006).\(^{994}\)

"correlating the electrooxidized electroactive reaction product to the concentration of glucose in the blood sample" — "using a relationship between the electrooxidized reaction product and the concentration of glucose in blood." Roche Diagnostics Operations, Inc., et al. v. Abbott Diabetes Care, et al., 2009 U.S. Dist. LEXIS 84423 (D. Del., Sep. 15, 2009).\(^{995}\)
[i] "correlation"; [ii] "correlation sensitive branch metrics"; [iii] "a correlation sensitive metric computation update circuit" — [i] "the degree to which two or more items (here, noise in signal samples) show a tendency to vary together"; [ii] "branch metrics' that account for 'correlation' in the signal samples by using multiple signal samples from different time instances and including at least one term in the branch metric calculation that involves multiplying signal samples from different time instances together"; [iii] "a circuit that recalculates 'correlation-sensitive branch metrics' using statistics from the 'noise statistics tracker circuit.'" Carnegie Mellon University v. Marvell Technology Group, Ltd., et al., 2010 U.S. Dist. LEXIS 104891 (W.D. Pa., Oct. 1, 2010).996

"correlation coefficient" — "a value representing or corresponding to the degree to which two variables are similar." IP Innovation, LLC, et al. v. Google, Inc., 2010 U.S. Dist. LEXIS 987 (E.D. Tex., Jan. 7, 2010).997

correlator" — "a device that measures the degree of similarity between the modulated data symbols and a code." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010).998

"displaying pixels which correspond to" — "we conclude, as did the district court, that 'correspond to' means that an illuminated image of the object or part thereof is displayed." Vivid Technologies, Inc. v. American Science & Engineering, Inc., 200 F.3d 795 (Fed. Cir. 1999).999

"so that the memory locations correspond to different points on the screen"; "into the memory at locations corresponding to the position of the light pen on the screen" — "The issue before us is one of claim construction—viz., whether the claims require a one-to-one correspondence between particular memory locations and particular points on the display. We conclude that they do not." In re Beasley, 1999 U.S. App. LEXIS 16695 (Fed. Cir., July 20, 1999) (unpublished).1000

"corresponding" — "a relationship is maintained between each full size image and the reduced size image generated from that full size image." Ampex Corp. v. Eastman Kodak Co., et al., 460 F. Supp. 2d 541 (D. Del. 2006).1001

"corresponding time signal" — "a signal indicating the time when the sense signal is received." Arbitron, Inc. v. International Demographics Inc., et al., 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009).1002

"[information] corresponding to an alignment state" — "relating to the relative position of one layer on a semiconductor wafer as compared to another layer on the same wafer in a photolithography application." Advanced Micro Devices, Inc., et al. v. Samsung Electronics Co., Ltd, et al., 2009 U.S. Dist. LEXIS 91536 (N.D. Cal., Sep. 17, 2009).1003

"corresponding voice message" — "the voice message received by the telephone answering device with the first signal." Klausner Technologies, Inc. v. Vonage Holdings Corp., et al., 2007 U.S. Dist. LEXIS 57604 (E.D. Tex., Aug. 7, 2007).1004

"coup message" — "communication sent from one router to notify the active router that the router sending the message wishes to become the active router." *Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc.*, 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).  

"coupled" — "is not limited to a mechanical or physical coupling." *Johnson Worldwide Associates, Inc. v. Zebco Corp., et al.*, 175 F.3d 985 (Fed. Cir. 1999).  

"coupled" — "associated in such a way that power or signal information may be transferred from one to another." *Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P.*, 326 F. Supp. 2d 1060 (C.D. Cal. 2003).  

"coupled" — "two circuits are coupled when they are connected such that voltage, current or control signals pass from one to another. ... the Court's construction ... should not be read to imply or necessitate a direct connection, as the Court does not read the patent to require a direct connection or to preclude the use of intermediate circuit elements." *Power Integrations, Inc. v. Fairchild Semiconductor International, Inc., et al.*, 422 F. Supp. 2d 446 (D. Del. 2006).  

"coupled" — "the transfer of energy over a conductive or dielectric medium, such as an optical waveguide or wire." *CIENA Corp., et al. v. Corvis Corp.*, 334 F. Supp. 2d 598 (D. Del. 2004).  

"coupled" — "The court finds no reason not to apply the ordinary meaning of the term 'couple,' and determines that the ordinary meaning in this context is 'coupled or connected, directly or indirectly.'" *Silicon Graphics, Inc. v. nVIDIA Corp.*, 58 F. Supp. 2d 331 (D. Del. 1999).  

- 94 -
"coupled between" — "While the court cannot disagree with Hynix's tautological reasoning, Hynix has not provided any reason why its far more cumbersome construction would assist a jury perform its duties better than the simple term 'coupled between.' Accordingly, the court declines to construe this term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006). 1021

"a control coupled only to said preprogrammed memory for selectively communicating said preprogrammed memory to said electronic control module" — "a control coupled to the preprogrammed memory for the sole purpose of permitting the transfer of information from the preprogrammed memory to the electronic control module at different times and for different purposes." Adrain v. Superchips, Inc., 2006 U.S. Dist. LEXIS 25212 (S.D. Tex., March 14, 2006). 1022 "This term means that the external module includes a control circuit that is connected only to the preprogrammed memories and to nothing else. The control circuit is used to regulate or guide the operation of the vehicle. The control circuit regulates or guides the operation of the vehicle according to the additional program within the preprogrammed memory in lieu of, that is, instead of, the original program within the fixed system's memory." Adrain v. Hypertech, Inc., 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002). 1023

"coupled to" — "Any further construction at this point would be both unnecessary and unhelpful. The terms 'direct' and 'indirect' are themselves ambiguous. Thus, adopting one of the parties' constructions would only invite further debate at summary judgment regarding the meaning of those terms." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007). 1025

"coupled to" — "means an electrical communication between the two specified components, here being the memory portion and the logic portion of the integrated circuit." NeoMagic Corp. v. Trident Microsystems, Inc., 2003 U.S. Dist. LEXIS 8054 (D. Del., May 9, 2003). 1026

"coupled to" — "connected, not through an impedance matching network, but in a fashion that allows for the transfer of power." Applied Science and Technology, Inc. v. Advanced Energy Industries, Inc., 204 F. Supp. 2d 712 (D. Del. 2002). 1027

"coupled to" — "directly connected to or attached to." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2004 U.S. Dist. LEXIS 13415 (C.D. Cal., Jul. 12, 2004). 1028

"a drain electrode coupled to said drain conductive region" — "This 'coupling' is properly construed to indicate device current flowing through both the drain conductive region and the electrode." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001). 1029

"a data bus coupled to the computer system and the unit for transferring unit data information" — "a communications pathway connecting the computer system to one or more units that allows for the transfer of address, control and data information between the computer system and each of the units." Keystone Autonics, Inc. v. Sirius Satellite Radio Inc., et al., 2009 U.S. Dist. LEXIS 3195 (E.D. Tex., Jan. 16, 2009).1031

"a device coupled to the local bus" — "device directly connected to the local bus." PCTEL, Inc. v. Agere Systems, Inc., et al., 2006 U.S. Dist. LEXIS 25943 (N.D. Cal., March 20, 2006).1032

"coupled to receive" — "capable of receiving." In re Translogic Technology, Inc., 504 F.3d 1249 (Fed. Cir. 2007).1033

"coupling"; "coupled" — "refer[] to the direct connection of two or more circuits or systems in such a way that power or signal information may be transferred from one to the other." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).1034

"logic gates with a voltage supply having a coupling to said underlying substrate regions determined by a voltage of said underlying substrate regions" — "'coupling' requires a voltage potential in the substrate that is different than the voltage potential in the logic gates." NeoMagic Corp. v. Trident Microsystems, Inc., 98 F. Supp. 2d 538 (D. Del. 2000).1036 "We agree, and hold that, consistent with the specification, the term coupling requires that the voltage applied to the substrate be different from that applied to the logic circuit." Id., 287 F.3d 1062 (Fed. Cir. 2002).1037

[i] "covariance"; [ii] "covariance matrices"; [iii] "noise covariance matrices" — [i] "the expected (mean) value of the product of (r_i-m_i) and (r_j-m_j), where r_i and r_j are observed signal samples (at time i and j, respectively) and m_i and m_j are the expected (mean) values of the samples (at time i and j, respectively) (i.e., E[(r_i-m_i)(r_j-m_j)]); [ii] "arrays of covariance of pairs of signal samples, e.g.: [cov(r_{i+1},r_i) cov(r_{i+1},r_{i+1})]"; [iii] "covariance matrices of signal samples (where the signal samples include noise)." Carnegie Mellon University v. Marvell Technology Group, Ltd., et al., 2010 U.S. Dist. LEXIS 104891 (W.D. Pa., Oct. 1, 2010).1038

"creating a circle" — "involves not just 'calculating values that define' a circle, but specifying that those values comprise a circle, as opposed to some other figure." Surfware, Inc. v. Celeritive Technologies, Inc., et al., 2009 U.S. Dist. LEXIS 51620 (C.D. Cal., Jun. 3, 2009).1040

"creating a family of concentric indexed circles at each of two or more separate and distinct selected points within the region" — "practicing the step of selecting two or more centers, bringing into existence multiple circles that have the same center but where the circles are located at different distances from the center, and assigning each circle a number, or index." Surfware, Inc. v. Celeritive Technologies, Inc., et al., 2009 U.S. Dist. LEXIS 21913 (C.D. Cal., Mar. 9, 2009).1041
"creating an error detection code (EDC1) by coding" — "creating an error detection code (EDC1) by applying an algorithm to information in such a manner as to permit detection of changes but without complete recovery of the original information." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003).1042

"creating the instrument face with functional indicia thereon in the computer in electronic format" — "this court construes 'creating' to require more than simply using the computer as a conduit to convey information to the printer from a scanner or a CD ROM. Creating requires, rather, a substantive addition or modification of the artwork in the computer, such as when graphics software adds a design to an instrument face." Trintec Industries, Inc. v. Top-U.S.A. Corp., 295 F.3d 1292 (Fed. Cir. 2002).1043

"credential" — "a document or information obtained from a trusted source that is transferred or presented to establish the identity of a party." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003).1044 "This is one of those instances in which the interests of comity yield to this Court's view of its independent obligation to give the correct meaning to claim terms. The Court construes the term to mean, 'a document or information obtained from a trusted source that is transferred or presented for purposes of determining the identity of a party.'" Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010).1045

"credit" — "includes advanced credit as well as prepaid credit." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001).1046

"credit account" — "an account that allows a customer to buy goods or services without cash and pay the issuer of the account at a later date." Walker Digital, LLC v. Capital One Services, LLC, et al., 2010 U.S. Dist. LEXIS 56429 (E.D. Va., Jun. 8, 2010).1047

"credit rate"; "credit value" — "a rate used along with a purchase amount to determine a credit value"; "a value determined in connection with point-of-sale transactions." Source, Inc. v. American Express Co., 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006).1049

"cross-reference table" — "a table that links vendors items determined to be equivalent between two of more different vendors." ePlus, Inc. v. Lawson Software, Inc., et al., 2010 U.S. Dist. LEXIS 42609 (E.D. Va., Apr. 30, 2010).1050

"cryptographic operation"; "cryptographic processing operation"; "cryptographic processing"; "cryptographically processed" — "an operation within a class of techniques or algorithms used to secure data and avoid digital identity misrepresentations." Cryptography Research, Inc. v. Visa International Service Association, et al., 2006 U.S. Dist. LEXIS 79026 (N.D. Cal., Oct. 19, 2006).

[i] "cue"; [ii] "select code" — [i] "the listing in memory of the various programmed entries made by the viewer, wherein each select code is stored along with its corresponding channel code and display code"; [ii] "the channel designation chosen by the viewer for subsequent use in selecting a particular channel." Beery v. Thomson Consumer Électronics, Inc., et al., 2004 U.S. Dist. LEXIS 17173 (S.D. Ohio, Aug. 18, 2004).

"cumulative index of revisions" — "the list of all changes made to publications since the first change." Aircraft Technical Publishers vs. Avantext, Inc., 2009 U.S. Dist. LEXIS 105623 (N.D. Cal., Nov. 10, 2009).

"current bandwidth metric" — "the present calculation of a moving average of bandwidth over a predetermined time period." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).

"current website visit" — "a visit to a website in which the website cookie is not expired." Websidestory, Inc. v. Netratings, Inc., 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007).

"a storage device customary in a host device" — "a storage device that was normally present within the chassis of most commercially available computers at the time of the invention." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).

"customer" — "Although we agree with the district court that the Ross invention does not concern itself with whether the 'customer' reads the book or obtains it for resale, the focus of the Ross patent is immediate single-copy printing and binding initiated by the customer and conducted at the customer's site. The district court's definition of 'customer' cannot eliminate these constraints in order to embrace the remote large-scale production of books for publishers and retailers." On Demand Machine Corp. v. Ingram Industries, Inc., et al., 442 F.3d 1331 (Fed. Cir. 2006).

"entering a customer authorization code for authorizing access to a customer data base of a host data processor" — "a series of numbers and/or letters, or a combination thereof, which may be entered via the keypad by the customer or may be on the card itself, for authorizing access to a customer data base of a host data processor." Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010).

"customer profile for each eligible recipient of said data, said customer profile indicating the customer's preferences for data having predetermined characteristics" — "The court construes customer profile as 'a set of information related to a specific customer that describes significant characteristics of the customer'; indicating the customer's preferences for data having predetermined characteristics as 'the customer profile points out or shows indirectly the customer's preferences for certain kinds of information or items of interest'; and predetermined as 'the characteristics are established before the system practices the method claimed.'" Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).

"customer specified credit parameter"; "customer-selected account parameter" — "a term of a credit account that is chosen by a customer." Walker Digital, LLC v. Capital One Services, LLC, et al., 2010 U.S. Dist. LEXIS 56429 (E.D. Va., Jun. 8, 2010).
"customer terminal means" — "either a standard landline telephone unit, which has a standard commercial handset, a touchtone pad, a display unit and an audio unit, and which may have a cordless handset, or [] an interactive hookup with a touchtone telephone and a cable TV system to selectively display the requested catalog data and menu on a particular TV channel."

"The district court identified two means disclosed in the specification for performing the claimed function: a 'standard landline telephone unit' and a 'touchtone telephone' connected to a television for displaying catalog data. Furnace Brook asserts that the district court ignored as a disclosed means a device communicating over an 'online interactive communications network' (shown in figure 4 of the patent), which Furnace Brook defines as a device in 'connection to, or communication with, a computer.' The label 'online interactive communications network,' however, identifies no specific structure for performing the claimed function; it describes only a generic class of structures and was thus properly ignored."

"Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007)."

"customized proposal" — "for the reasons given in its Staples opinion, the Court construes 'proposal' as 'information intended for conveyance to a potential customer,' and 'customized proposal' does not require further construction."

"Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007)."

"customized software" — "executable software, delivered to and running on the client machine, which provides device-appropriate user interface and control operations."

"customized to characteristics of the device" — "the bytecode instructions are specifically customized or tailored to the characteristics of the device."

"cut-on filter" — "an optical filter that substantially blocks all wavelengths shorter than the cut-on wavelength and substantially transmits all wavelengths that are longer than the cut-on wavelength. The cut-on wavelength is that wavelength in the transition zone at which the transmission is 1%."

"cyclic redundancy checker" — "hardware, commonly available in June 1994, that performs the division of a CRC generator binary polynomial into a 16,000-bit EDC code word to produce a CRC remainder."

"Oak Technology, Inc. v. International Trade Commission, et al., 248 F.3d 1316 (Fed. Cir. 2001)."

- D -

"2D documentation package" — "software that operates on a two dimensional representation of a 3D object, and may support dimensioning, text, and other annotation features."

"Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004)."
"2D representation" — "the 2D geometric data that are projections of one or more features of a 3D model onto a viewing plane." *Hewlett-Packard Co. v. Intergraph Corp.*, 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).

"DS0 connection" — "a channel over which DS0 communication signals (a term of art meaning Digital Signal Level 0) are transmitted or received." *Sprint Communications Co. L.P. v. Big River Telephone Co., LLC*, 2009 U.S. Dist. LEXIS 58161 (D. Kan., Jul. 8, 2009).

"data acquisition unit" — "a structure or set of structures that includes at least the electronic positioning device and the physiological monitor." *Paragon Solutions, LLC v. Timex Corp.*, 566 F.3d 1075 (Fed. Cir. 2009).

"data being unrecognizable to the player" — "the player is not able to recognize from the data whether the player wins or loses the lottery game and amusement game." *Ingenio, Filiale de Loto-Quebec, Inc. v. GameLogic, Inc.*, 445 F. Supp. 2d 443 (D. Del., July 21, 2006).

"data block" — "a computer data structure containing the information needed by a machine tool to perform a single machining operation. As properly construed, a 'data block' is not limited to the specific set of variables and display sequence disclosed in the written description and does not preclude the use of G- and M-codes." *IMS Technology, Inc. v. Haas Automation, Inc., et al.*, 206 F.3d 1422 (Fed. Cir. 2000).

"data block describing three-dimensional terrain" — "a block or collection of data or digital information that represents or describes a section of three-dimensional terrain at a particular resolution level and that includes any additional data overlaid on the digital image of the terrain, such as altitude, labels or optional objects." *Skyline Software Systems, Inc. v. Keyhole, Inc., et al.*, 421 F. Supp. 2d 371 (D. Mass. 2006).
"data blocks belonging to a hierarchical structure" — "data blocks that are organized into multiple levels of resolution, whereby each level contains data blocks at the same resolution, and each successive level contains data blocks of a higher resolution than those in the preceding level." Skyline Software Systems, Inc. v. Keyhole, Inc., et al., 421 F. Supp. 2d 371 (D. Mass. 2006).

"data center" — "one or more operably connected data structures and computers used for processing or transmitting data." Flash Seats, LLC v. Paciolan, Inc., 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010).

"in data communication with" — "two or more devices connected such that data is being transferred between the devices in real time." Acacia Media Technologies Corp. New Destiny Internet Group, et al., 405 F. Supp. 2d 1127 (N.D. Cal. 2005).

"data communication with one or more of the plurality of data storages that may be different than the one or more of the plurality of data storages in communication with the other session modules" — "The court concludes that this phrase requires no additional construction other than those previously provided for 'data storage' and 'session module.'" Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).

"obtaining data concerning the fluid catalytic cracking unit in order to establish" — "obtaining data relating to the fluid catalytic cracking unit for the purpose of establishing (such as by trial and error)." Intercat, Inc. v. Nol-Tec Systems, Inc., et al., 2005 U.S. Dist. LEXIS 344 (D. Minn., Jan. 7, 2005).

"data corresponding to one or more thoroughfares" — "the X and Y coordinates corresponding to one or more thoroughfares." Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006).

"first and second data couplers, each coupled to a respective one of said first and second ports, and each having a data signal port operative to pass only a data signal" — "two data couplers, each coupled to a different port, where each such port transmits a data signal, but not a power signal." SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007).
"instruction does not have any data dependencies with preceding issued instructions which have not yet been completed" — "an instruction that is free of α and β dependencies." Cornell University, et al. v. Hewlett-Packard Co., 313 F. Supp. 2d 114 (N.D.N.Y. 2004). 1106

"data download circuit" — "the circuitry that downloads data corresponding to the frame segment descriptor." 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007). 1107

"data flow diagram" — "incorporates the following four semantic limitations: 1. the order of operations is not completely specified by the user; 2. the order of operations is implied by data interdependencies; 3. a node may only execute after all necessary inputs have become available; and 4. outputs are generated after a node completes execution." National Instruments Corp. v. Mathworks, Inc., 2002 U.S. Dist. LEXIS 27577 (E.D. Tex., May 24, 2002). 1109 "We agree with the trial court that the inclusion of 'necessary' was proper given that the ordinary meaning of 'data flow' and 'data flow diagram' does not limit the scope of the terms to await inputs that may be unnecessary for execution, and, likewise, the specification does not limit semantic limitation three to require 'all inputs' be available before execution." Id., 113 Fed. Appx. 895 (Fed. Cir., Sept. 3, 2004) (unpublished). 1110

"data for servicing and/or programming" — "data used to service and/or program one or more multimedia boxes." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007). 1111

"data gathering system" — "the Court believes that there is sufficient structure in claim 1 of the '910 patent to establish that the 'data gathering system' is software. Accordingly, the Court does not construe this claim in means-plus-function terms." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006). 1112

"data generating facilities" — "[c]omputer software that generates data, such as voice message reception, fax reception, e-mail retrieval, alarm monitoring facilities, child monitoring facilities and the like." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007). 1113

"data in digital form representing the configuration of the first facial display"; "data in digital form representing the configuration of the second display" — "include[s] both lip position data and control point data"; "include[s] only lip position data." Bloomstein v. Paramount Pictures Corp., et al., 1996 U.S. Dist. LEXIS 22260 (N.D. Cal., May 6, 1996). 1114

"data in packetized format from any of said sources is written into any available empty payload field of any of said frames" — "means that packets are only put in frames which are empty, i.e. which have zero data in their payloads." Bell Communications Research, Inc. v. Fore Systems, Inc., 113 F. Supp. 2d 635 (D. Del. 2000). 1115
"said advertisement data includes at least one time for said at least one advertisement to be run" — "data which permits a determination of a time within which, or event in relation to which, the advertisement will be run." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010).\footnote{1116}

"data loading mechanism for loading at least fact data from the relational data store" — "the court rejects Hyperion's proposed means-plus-function construction and declines to construe this term." Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006).\footnote{1117}

"data mart" — "an analytical database containing a subset of corporate information useful for decision support for an aspect of a business." Informatica Corp. v. Business Objects Data Integration, Inc., 2005 U.S. Dist. LEXIS 46869 (N.D. Cal., Aug. 1, 2005).\footnote{1118}

"data objects" — "data records and their linked manipulative programs." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).\footnote{1120}

"data packet" — "data in binary form, including address and control elements." Papyrus Technology Corp. v. New York Stock Exchange, Inc., 581 F. Supp. 2d 502 (S.D.N.Y. 2008).\footnote{1121}

"data path" — "a route or course over which information represented in a form suitable for processing by computer can travel, but such information does not include AV signals." Collaboration Properties, Inc. v. Tandberg ASA, et al., 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006).\footnote{1122}

"data path" — "the buses and circuit elements that convey data." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).\footnote{1123}

"data processing device" — "[a] mechanism or piece of equipment separate from the flat-panel display device that systematically performs operations upon data." LG Philips Co., Ltd. v. Tatung Co., et al., 2007 U.S. Dist. LEXIS 43557 (D. Del., June 15, 2007).\footnote{1125}

"data reference" — "a reference to a single, specific record which the created link retrieves." Hyperphase Technologies, LLC, et al. v. Google Inc., 2006 U.S. Dist. LEXIS 92195 (W.D. Wis., Dec. 20, 2006).\footnote{1126} "[T]he district court erred in its claim construction of the term 'data reference.' We hold that the correct construction is 'a unique phrase or word which may be used in a record to refer to another record or record segment;' and that a data reference may refer to one or more than one record." Id., 2007 U.S. App. LEXIS 29796 (Fed. Cir., Dec. 26, 2007) (unpublished).\footnote{1127}
"data reflecting a particular selection of dialysate to be circulated"; "data concerning a particular selection of dialysate to be circulated" — "The Court hereby rejects Baxter's narrow construction and finds that the phrase shall be given its plain and ordinary meaning." Fresenius Medical Care Holdings, Inc. v. Baxter International, Inc., 2006 U.S. Dist. LEXIS 36788 (N.D. Cal., May 25, 2006).1128

"data representing a complete copy of at least one item of information" — "a complete copy of information from items." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007).1131

"data representing text, a universal resource locator, an image, and a user-selected category" — "data representing text, a universal resource locator, an image, and a user-selected category." Graphon Corp. v. Autotrader.com, Inc., 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007).1132

"data representing the identity of each of said advertisements" — "data that identifies each advertisement." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).1133

"data representing when and number of times ..." — "data associated with an advertisement that provides a period of time within which, or event in relation to which, the advertisement will be run and permits a calculation of the frequency an advertisement will be run within a given period." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).1134

"data representing when and the number of times each of said advertisements is to be run" — "data which permits a determination of a time within which, or event in relation to which, the advertisement will be run and the frequency an advertisement will be run." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010).1135

"data scan codes" — "a code number that the keyboard generates whenever a key is depressed or released, said code number created by converting a pairing of a row signal and a column signal in the keyboard matrix." Samsung Electronics Co., Ltd. v. Quanta Computer, Inc., et al., 2006 U.S. Dist. LEXIS 66447 (N.D. Cal., Sept. 15, 2006).1136

"data set" — "a set of one or more bits in a message reflecting data that is read from or written to a device." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007).1137

"data set" — "any collection of information representing a particular single-purpose card which is necessary to allow the electronic multi-function card to act as a substitute, in both form and function, for that particular single-purpose card." E-Pass Technologies, Inc. v. 3COM Corp., et al., 177 F. Supp. 2d 1033 (N.D. Cal. 2001).1138

"data source" — "a collection of computer readable information such as a data file." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006).1140

"plurality of data sources" — "two or more different single-purpose cards, such as credit cards, check cards, customer cards, identity cards, documents, keys, access information and master keys, regardless of whether the single-purpose cards are from the same category or from different categories." E-Pass Technologies, Inc. v. 3COM Corp., et al., 177 F. Supp. 2d 1033 (N.D. Cal. 2001).1142

"data storage device" — "a computer disk drive, including all electronic and mechanical components, which receives shaped commands from a processor which may be integrated into the drive." Convolve, Inc., et al. v. Compaq Computer Corp., et al., 2005 U.S. Dist. LEXIS 16375 (S.D.N.Y., Aug. 9, 2005).1144

"data storage rate" — "maximum sustained rate at which data can be written to the data storage device, including, in the case of hard disk drives, seek time, rotational latency, and data transfer in a condition of steady state fragmentation of the disk drive." Realtime Data, LLC v. Packeteer, Inc., et al., 2009 U.S. Dist. LEXIS 109438 (E.D. Tex., Nov. 23, 2009).1146

"data storage system"; "data storage system controller" — "a 'data storage system' is a set of associated components working together to store data and a 'data storage system controller' is a device that controls data storage operations. Neither is required to include cache memory." EMC Corp. v. Hewlett-Packard Co., Inc., 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003).1147

"data structure" — "a data structure having the plurality of data packets present in the local computer-readable memory at the same time." Papyrus Technology Corp. v. New York Stock Exchange, Inc., 581 F. Supp. 2d 502 (S.D.N.Y. 2008).1148

"data structure" — "the logical organization of data such as table, columns, or rows." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006).1149

"data successfully received" — "data from the data file transferred from the server computer to the client computer." Ethos Technologies, Inc. v. RealNetworks, Inc., 462 F. Supp. 2d 131 (D. Mass. 2006).1150

"data terminal" — "a device that can transmit and receive data to a host computer to allow for charging and recharging a calling card or calling card account." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).1151

"data transfer circuitry for controlling the transfer of data stored in said digital camera flash memory module inserted into said memory input port to said hard disk drive" — "The court incorporates by reference its construction of 'port,' and concludes that the balance of the phrase requires no construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).  

"data transfer system" — "a system or mechanism that transfers data." Arbitron, Inc. v. International Demographics Inc., et al., 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009).  

"data transmission device of the portable unit" — "a device that transmits data and is part of a coherent group or whole that is capable of being carried." PHT Corp. v. Invivodata, Inc., 2005 U.S. Dist. LEXIS 9577 (D. Del., May 19, 2005).  

"data transmit/receive device" — "a device that is capable of transmitting data to and receiving data from the host device when connected to the host device by the interface device." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).  

"database" — "a collection of information organized in such a way that a computer program can quickly access desired pieces of data." Jardín v. Datallegro, Inc., et al., 2010 U.S. Dist. LEXIS 105502 (S.D. Cal., Oct. 4, 2010).  

"database" — "a collection of organized information accessible through computer software, distinguishable from a collection of information stored in a flat file form such as a spreadsheet." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006).  

"database" — "no construction of this phrase is required." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).
"database field" — "the space reserved in a database for storage of a particular type of data." 

"a database interface unit having inputs and outputs, for retrieving and storing data in the relational system"; "a database interface unit for retrieving and storing data and metadata in the relational system"; "a database interface unit for applying the statements on the relational system" — "these terms are not means-plus-function claims subject to interpretation under § 112 P 6." *Software Tree, LLC v. Red Hat, Inc., et al.*, 2010 U.S. Dist. LEXIS 53549 (E.D. Tex., May 28, 2010).  

"database synchronization process" — "updating configuration information that is stored by the network manager in one or more databases, based upon the values stored in the MIB of the network elements." *Cisco Systems, Inc., et al. v. Telcordia Technologies, Inc.*, 2007 U.S. Dist. LEXIS 58650 (E.D. Tex., Aug. 10, 2007).  

"de-configuring the computer system" — "functionally removing a faulted component from the computer system." *Hewlett-Packard Co., et al. v. EMC Corp.*, 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).  

"selectively deactivating" — "the customary meaning of 'deactivate' to a person of skill in the art is 'to make inactive.'" *Agere Systems, Inc. v. Broadcom Corp.*, 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004).  

"deactivating said generator only upon expiration of said predetermined time period or in response to a reset signal" — "the stopping of the activated generator either upon the expiration of the predetermined time period or in response to a reset signal. The activated generator can be deactivated only upon either of these two conditions (expiration of predetermined time period or in response to a reset signal) and the generator must be capable of being deactivated by both of these conditions." *Agrizap, Inc. v. Woodstream Corp., et al.*, 431 F. Supp. 2d 518 (E.D. Pa. 2006).  

"dealer interface" — "a hardware/software module used by a dealer to access the Data Center system." *Autobytel, Inc. v. Dealix Corp.*, 2006 U.S. Dist. LEXIS 3381 (E.D. Tex., Jan. 18, 2006).  

- 108 -

"debit purchase transaction" — "a purchase transaction made using a debit styled card,' with debit styled card construed as I have previously recommended." Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010). 1178

"debit/medical services card" — "a card that can function as both a debit card and a medical services card." Alexsam, Inc. v. Humana Inc., 2009 U.S. Dist. LEXIS 77553 (E.D. Tex., Aug. 28, 2009). 1180

"debiting"; "charging [] against" — "recording as a debt or financial obligation against the accessed account and not the actual transfer of funds from the account." BMC Resources, Inc. v. Paymentech, L.P., 2004 U.S. Dist. LEXIS 22536 (N.D. Tex., Nov. 4, 2004). 1181

"decoded data which has not been displayed" — "data that has been decoded, corresponding to pictures that have not been displayed." Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al., 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006). 1182

"decoder" — "a subsystem which can receive the output of the radio receiver and convert it into a form wherein the data contained in the received transmissions can be interpreted by the microprocessor." Chamberlain Group, Inc. v. Lynx Industries, Inc., et al., 2003 U.S. Dist. LEXIS 5091 (N.D. Ill., Mar. 31, 2003). 1183

"decoding" — "refer[s] broadly to extraction or retrieval of data from any data stream -- not necessarily a video or audio signal -- based on a predetermined format or encoding scheme." ACTV, Inc., et al. v. Walt Disney Co., et al., 204 F. Supp. 2d 650 (S.D.N.Y. 2002). 1184

[i] "decoding NFS requests"; [ii] "encoding NFS reply messages" — [i] "converting NFS requests from the format received from the network to another, decoded format"; [ii] "converting NFS reply messages from a decoded data format to the format used for transmission on the network." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004). 1185

"decoding said at least one instruction to determine said predetermined position" — "interpreting an instruction, in particular the portion therefor that signifies the operation to be performed, in order to identify a position relative to the beginning or end of the instruction group that includes the operand or instruction being accessed." Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 1186

"decoding said data establishing a limit" — "at the user site, extracting the data establishing a limit for authorized viewing of the video product from the downloaded digital data stream in order to separate the data establishing the authorized viewing limit from the video product." American Patent Development, Corp., LLC v. MovieLink, LLC, 604 F. Supp. 2d 704 (D. Del. 2009). 1187
"decoding said microcoded instruction into a LHS instruction having fields essentially compatible with a RISC architecture and a RHS instruction having fields to select a plurality of indirect registers pointing to emulated registers" — "requires 'redefining' or 'translating' the native instruction, identified in claim 1 as LHS of the instruction, using the fields of the RHS of the instruction to emulate the instruction of a target computer." TechSearch L.L.C. v. Intel Corp., 286 F.3d 1360 (Fed. Cir. 2002).\[1188]\n
"decomposed into a plurality of levels" — "broken down into two or more structured set(s) of information." Accenture Global Services GmbH, et al. v. Guidewire Software Inc., 2010 U.S. Dist. LEXIS 20087 (D. Del., Mar. 5, 2010).\[1189]\n
"clock decorrelator" — "a device that generates an internal clock signal that varies in a randomized way." Cryptography Research, Inc. v. Visa International Service Association, et al., 2006 U.S. Dist. LEXIS 79026 (N.D. Cal., Oct. 19, 2006).\[1190]\n
"decreases the visibility" — "decreases the visibility of a void in the displayed image relative to the original image." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006).\[1191]\n
"decreasing the time said shaped modulator drive signal is above threshold" — "The plain meaning of 'decreasing the time said shaped modulator drive signal is above threshold decreasing' is 'becoming less and less.'... Thus, as the district court recognized, the use of the word 'decreasing' indicates that the inventors intended to shorten the time the modulator drive signal is above threshold." Optical Disc Corp. v. Del Mar Avionics, et al., 208 F.3d 1324 (Fed. Cir. 2000).\[1192]\n
"decryption shim"; "shim" — "software that is downloaded to or pre-installed on the client machine and used to decrypt transparently incoming data stream from the encryption bridge on its way to the media player software." Widevine Technologies, Inc. v. Verimatrix, Inc., 2009 U.S. Dist. LEXIS 102768 (E.D. Tex., Nov. 4, 2009).\[1193]\n
"dedicated character memory in circuitry controlling said output device" — "must be part of the character-based output device and must be used exclusively for the purpose of storing a set of monochromatic characters." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).\[1194]\n
"dedicated memory" — "memory that is within the media processor that is accessible only through the media processor." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).\[1195]\n
"deducting from the initial prepayment amount the running cost of the call" — "means that the cost of the call is deducted from the initial account balance after the end of the call." Aerotel, Ltd. v. Telco Group, Inc., et al., 2010 U.S. Dist. LEXIS 47266 (S.D.N.Y., May 12, 2010).\[1196]\n
"defeating the effects of a video anti-copy process" — "circumventing a copy protection process to produce a watchable copy." Macrovision Corp. v. Dwight Cavendish Developments Ltd., 105 F. Supp. 2d 1070 (N.D. Cal. 2000).\[1197]\n
"defective floppy diskette controller" — "needs no construction, for its ordinary meaning is clear." Phillip M. Adams & Associates, LLC v. Dell, Inc., et al., 2010 U.S. Dist. LEXIS 68749 (D. Utah, Jul. 9, 2010).\[1198]
"define an updated form line" — "recompute a previously computed path across the area to be treated." *Trimble Navigation Ltd. v. RHS, Inc., et al.*, 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1199

"defining a second form line using positioning data derived from GPS data and a swathing offset" — "computing a second path across the area to be treated using geographical positions computed using GPS satellite data transmissions and a distance determined by the effective width of a towed implement." *Trimble Navigation Ltd. v. RHS, Inc., et al.*, 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1201

"defining an intensity distribution of the illumination light on the Fourier transform plane in the illumination optical system with respect to a pattern on the mask to have increased intensity portions apart from an optical axis" — "quantifying or shaping of increased intensity portions of the illumination light, as those portions appear on the Fourier transform plane, in the illumination optical system." *Nikon Corp., et al. v. ASM Lithography B.V.*, 308 F. Supp. 2d 1039 (N.D. Cal. 2004). 1202

"defining an updated second form line according to one or more deviations from said second form line while following said second form line" — "recomputing the previously computed second path across the area to be treated using new geographical positions computed while deviating from the previously computed second path across the area to be treated." *Trimble Navigation Ltd. v. RHS, Inc., et al.*, 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1203

"defining at least time and yield characteristics of each process step" — "determining at least the duration of, and the result or quantity produced by, each fundamental operation performed on a machine." *Information Technology Innovation, LLC v. Motorola, Inc., et al.*, 391 F. Supp. 2d 719 (N.D. Ill. 2005). 1204

"defining element" — "an element that can be used to calculate the essential information required to construct other elements." *Adobe Systems Inc. v. Macromedia, Inc.*, 201 F. Supp. 2d 309 (D. Del. 2002). 1205

"a set of relationships among the medical service codes defining whether selected ones of the medical service codes are valid when input with other selected ones of the medical service codes" — "a set of relationships specifying that if two or more particular medical service codes are input together as part of the same claim, then one or more of the input medical service codes are appropriate for payment." *McKesson Info. Solutions LLC v. Trizetto Group, Inc.*, 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006). 1207

"delineating a set of factory operating rules" — "setting forth with accuracy, or in detail, a group of prescribed guides for how a manufacturing plant works." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005).1209

"demodulated aural signal" — "an aural signal that has been amplitude demodulated or frequency demodulated." Comark Communications, Inc. v. Harris Corp., 1997 U.S. Dist. LEXIS 2067 (E.D. Pa., Feb. 24, 1997).1211

"demodulation circuitry"; "demodulator circuitry" — "circuitry used to reconvert a modulated data signal back into its original form by extracting the data from the modulated data signal on the loop." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010).1212

"demographic conditions" — "conditions used to limit a call based on the caller's geographic area." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).1213

"demographics information" — "characteristics of human populations and population segments, especially when used to identify consumer markets, that are created from the collection of first end user inquiries that identify distinct trends in interests or preferences." Keithley v. HomeStore.com, Inc., et al., 2007 U.S. Dist. LEXIS 71126 (N.D. Cal., Sept. 10, 2007).1215

"selecting a set of stored functions in dependence upon a received format identifier and said read user information" — "selecting one or more functions based upon a received format identifier and said read user information." Dow Jones & Co., Inc. v. Ablaise, Ltd., et al., 2007 U.S. Dist. LEXIS 49750 (D.D.C., July 11, 2007).1216

"sub-layers deposited successively during growth of said one layer, each of said sub-layer having ... inclusions" — "the layer is formed by growing sub-layers, each of which has inclusions, one at a time, with each sub-layer forming on the preceding sub-layer." Seoul Semiconductor Co. Ltd. v. Nichia Corp., et al., 596 F. Supp. 2d 1005 (E.D. Tex. 2009).1218

"depth parameter D" — "a system parameter used to determine which transformation function to use in the secret state transformation process, and a parameter whose value is greater than or equal to the number of transformation iterations in a transformation operation." Cryptography Research, Inc. v. Visa International Service Association, et al., 2007 U.S. Dist. LEXIS 76502 (N.D. Cal., Sept. 28, 2007).1219
"value derivable from said secret state" — "the Court finds that the plain and ordinary meaning
controls. Accordingly, the Court declines to construe the word 'derivable.'" Cryptography
(N.D. Cal., Sept. 28, 2007).

"derived element" — "an element which is calculated from the defining element(s) via a present
Del. 2002).

"deriving" — "to obtain something from another thing or source." Optivus Technology, Inc., et al.

"deriving a reference cell value" — "generating a value solely from the words comprising a cell,
which value represents the words of the cell." OKI Electric Industry Co., Ltd. v. LG Semicon

"a set of menus describing the database" — "a set of menus that, when taken as a whole (i.e.,
collectively), give an account, or convey an idea or impression, of the entire database." Command

"describing the parameters in terms of data structures of the chosen model" — "describing the
parameters using a table of data, including structural relationships or an organizational scheme,
such as a list, record, or array." Information Technology Innovation, LLC v. Motorola, Inc., et al.,

[i] "description of a product"; [ii] "data representing a plurality of products" — [i]
"information sufficient to identify a product or service"; [ii] "data sufficient to identify two or
more products or services." Performance Pricing, Inc. v. Google Inc., et al., 2009 U.S. Dist.

"a descriptor signal which corresponds to data stored within memory" — "a signal indicating
where the corresponding data are in the host memory." 3COM Corp. v. D-Link Systems, Inc., et
al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007).

"design or style standards" — "presentation rules which control the look and feel of an
Tex., Oct. 9, 2009).

"designating a combination of a plurality of but less than all of said multiple sectors to be
erased" — "requires the ability to designate 'any combination' of sectors for erase but does not
require setting a tag in a dedicated register for each sector to be erased." Sandisk Corp. v. Zotek
Electronic Co., Ltd., et al., 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010).

"designating at least one category" — "Any attempted construction will amount to defining the
word 'designate,' which is a common and simple enough term that a lay juror would easily
understand its meaning. Therefore, the Court does not construe this term." Sklar v. Microsoft

"designing" — "to prepare the plans for something such as a fire sprinkler system." First
"the spectral light distribution of a desired daylight" — "is not indefinite and does not limit the claim." Tailored Lighting, Inc. v. Osram Sylvania Products, Inc., 514 F. Supp. 2d 417 (W.D.N.Y. 2007).1232

"desired format" — "a user selected format for the display of the results of the search performed by the system." SuperGuide Corp. v. DirecTV Enterprises, Inc., et al., 169 F. Supp. 2d 492 (W.D.N.C. 2001).1233

"[inputting/receiving] a desired output media format based upon the first input" — "[inputting/receiving] one from among multiple available output media formats based upon a first input." MedioStream, Inc. v. Microsoft Corp., et al., 2010 U.S. Dist. LEXIS 88716 (E.D. Tex., Aug. 27, 2010).1235

"a plurality of despreading devices for detecting, at each receiver antenna of the plurality of receiver antennas, the first spread-spectrum signal and the second spread-spectrum signal, as a first plurality of detected spread-spectrum signals and a second plurality of detected spread-spectrum signals, respectively" — "a plurality of devices in the receiver that reverses the spreading operation that occurred in the transmitter for determining the presence of and recovering both the first multipath spread-spectrum signal and second multipath spread-spectrum signal received at each antenna port." Linex Technologies, Inc. v. Belkin International, Inc., et al., 2009 U.S. Dist. LEXIS 10905 (E.D. Tex., Feb. 12, 2009).1236

"destination address" — "Since Vonage's proposed construction was wrong by failing to account for the possibility that telephone numbers could be destinations, Vonage has failed to show error in the district court's failure to adopt it." Verizon Services Corp., et al. v. Vonage Holdings Corp., et al., 503 F.3d 1295 (Fed. Cir. 2007).1237

"destination processor" — "any one of the constituent processors in an electronic mail system to which information is transmitted by the system. Said processor is identified by an address, in order to initiate the transmission of the originated information from the originating processor." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002).1238

"destination signal" — "a data signal providing passenger conveying information that identifies the boarding floor and/or the destination floor." Inventio AG v. ThyssenKrupp Elevator Americas Corp., et al., 2010 U.S. Dist. LEXIS 59020 (D. Del., Jun. 14, 2010).1239

"detectable series" — "information in which a pattern, relationship, or arrangement may be detected through examination of a practical number of samples in the context in which the invention is used." CIAS, Inc. v. Alliance Gaming Corp., et al., 424 F. Supp. 2d 678 (S.D.N.Y. 2006).1241
"detected phase angle signal" — "the representation corresponding to the relationship between the phase angles present on different rotating shafts." General Kinematics Corp. v. Carrier Vibrating Equipment, Inc., 2009 U.S. Dist. LEXIS 65081 (N.D. Ill., Jul. 27, 2009).1242

"detecting that a first participant has disconnected from the online session"; "broadcasting a notification to existing participants of the online session over the communication network" — "The claim does not dictate whether a non-human system or online participants perform the 'broadcasting' or 'detecting' steps." In re Chatani, et al., 2007 U.S. App. LEXIS 26745 (Fed. Cir., Nov. 19, 2007) (unpublished).1244

"detecting the existence of concurrencies in instructions stored in said dispatch stack"; "detecting the existence of a plurality of instructions which are concurrently executable from those instructions stored in said dispatch stack" — "determining the existence of a plurality of dependency free instructions stored in the dispatch stack." Cornell University, et al. v. Hewlett-Packard Co., 313 F. Supp. 2d 114 (N.D.N.Y 2004).1245

"detecting whether buffer overflow is threatened by the storage of further cells arriving for, transmission on said virtual path" — "no additional construction of this phrase is appropriate." QPSX Developments 5 Pty. Ltd. v. Juniper Networks, et al., 2007 U.S. Dist. LEXIS 1991 (E.D. Tex., Jan. 10, 2007).1246

"detection means" — "is subject to means-plus function construction." Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al., 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006).1247

"detector" — "refers to a device for detecting the presence of electromagnetic waves and is not confined to the detection component of a laser interferometer." Applied Material, Inc. v. Tokyo Seimitsu, Co., 446 F. Supp. 2d 525 (E.D. Va. 2006).1248

"detector" — "The 'detector' claims are structural claims and their scopes are not limited by the leakage detector description in the specification." Trilithic, Inc. v. Wavetek U.S., Inc., 64 F. Supp. 2d 816 (S.D. Ind. 1999).1249

"detector operable to detect a fluorescence optical signal" — "it is unnecessary to construe this term." Applera Corp. v. Stratagene Corp., 2007 U.S. Dist. LEXIS 17154 (D. Conn., March 9, 2007).1250

"determinator for determining an output brightness level" — "logic, such as a circuitry, for determining an output brightness value." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 12969 (D. Del., Feb. 16, 2010).1251

"determine" — "to identify or ascertain, as after 'consideration, investigation, or calculation.'" Davis v. Speechworks International, Inc., 2006 U.S. Dist. LEXIS 71705 (W.D.N.Y., Sept. 29, 2006).1252

"to determine the individual caller's credit" — "to determine the caller's credit standing," and is not limited to determining whether a caller has sufficient account resources. *Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P.*, 326 F. Supp. 2d 1060 (C.D. Cal. 2003).1254

"the user's role is determined from the request" — "the user's role is determined from a user ID, class ID, group ID or information about access type contained in the request." *FotoMedia Technologies, LLC v. AOL, LLC, et al.*, 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009).1255

"if the at least a portion of the received funds transfer information and the VAN are determined to be authentic" — "if the at least a portion of the received funds transfer information is unchanged and the VAN is not fraudulent." *Stambler v. JPMorgan Chase & Co., et al.*, 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010).1256

[i] "determines the size of the pits and particles"; [ii] "groups the pits and particles based at least in part on the determination of size" — [i] "determines the physical magnitude or dimension of the pits and particles"; [ii] "groups the pits and particles based at least in part on the determination of physical magnitude or dimension." *ADE Corp. v. KLA-Tencor Corp.*, 252 F. Supp. 2d 40 (D. Del. 2003).1257

"determining a condition of the heart from among a plurality of conditions of the heart" — "We conclude that the district court erred in applying § 112 P6. Method claims necessarily recite the steps of the method, and the preamble words that 'the method comprises the steps of' do not automatically convert each ensuing step into the form of § 112 P6. Nor does the preamble usage 'steps of' create a presumption that each ensuing step is in step-plus-function form; to the contrary, the absence of the signal 'step for' creates the contrary presumption. The district court's claim construction is modified accordingly; the 'determining' step must be construed, as for all claim steps, in light of the specification and the prosecution history. We remand to the district court for that purpose." *Cardiac Pacemakers, Inc., et al v. St. Jude Medical, Inc., et al.*, 381 F.3d 1371 (Fed. Cir. 2004).1260 "Detecting which one of a number of heart arrhythmias exists, i.e., whether there exists, e.g., tachycardia, fibrillation, or bradycardia, or whether there exists a normal sinus rhythm. This step of 'determining' may merely analyze heart rate to determine the condition of the heart." *Cardiac Pacemakers, Inc., et al v. St. Jude Medical, Inc., et al.*, 418 F. Supp. 2d 1021 (S.D. Ind. 2006).1261

"determining a first position of a second imaging device with respect to the second coordinate system of the operation site" — "determining the position of the second imaging device (e.g., the ultrasound probe) relative to the second coordinate system." *NOMOS Corp. v. ZMED, Inc.*, 260 F. Supp. 2d 215 (D. Mass. 2002).1262
"determining a number of categories which are to be represented in a display"; "determining a number of categories which are to be represented in the display" — "The words are so common and simple that a lay juror would have no difficulty in understanding them. It is difficult to conceive of a more clear way to convey the meaning of these terms. Accordingly, the Court does not construe these terms." Sklar v. Microsoft Corp., 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007).1263

"determining a rescue stage from the measured resistance" — "measuring the impedance at the electrodes and comparing the measured impedance to stored impedance values to determine which stage the AED is at during a rescue procedure." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).1264

"determining a set of three dimensional coordinates using information identifying a position in said environment and a three dimensional model of at least a portion of said environment" — "determining a set of three-dimensional coordinates (x, y, z), using information identifying a position in the environment and using a three-dimensional model (represented in x, y and z coordinates) of at least a portion of the environment." Sportvision, Inc. v. Sportsmedia Technology Corp., 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).1265

"determining a subset of data having content profiles which are determined in said relating step to most closely match said at least one customer profile" — "finding the subset of data having content profiles that comprise the most suitable pairings to the customer profile." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).1266

"determining a total cost of the transaction that includes a price of the product" — "determining the total cost of the transaction borne by the buyer for obtaining a selected product at a selected destination that includes the price of the product." DE Technologies, Inc. v. Dell Inc., 2006 U.S. Dist. LEXIS 5459 (W.D. Va., Feb. 14, 2006).1267

"determining an initial benefit payment" — "the Court declines the Defendant's invitation to import ... the concept of pre-existing formulas." Lincoln National Life Insurance Co. v. Transamerica Financial Life Insurance Co., 2007 U.S. Dist. LEXIS 16822 (N.D. Ind., March 6, 2007).1269

"determining an instance of protocol data unit (PDU) network policy from a plurality of policies" — "selecting a particular network policy from a pre-programmed group of such policies." Storage Technology Corp. v. Cisco Systems, Inc., et al., 2001 U.S. Dist. LEXIS 25876 (N.D. Cal., Nov. 26, 2001).1270

"determining and depositing on a surface of the substrate adjacent the PN junction, a dose of the transition metal" — "ascertaining after consideration, investigation, or calculation and depositing a dose of the transition metal on a surface of the substrate near the PN junction." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).1271
"determining and generating motion instructions that are adjusted to compensate for lead or taper errors" — "creating movement directives that compensate for lead and taper errors. Adjusting does not require readjusting after the motion control commands have been determined and generated (e.g. after the program is built and sent for execution)."  Omax Corp. v. Flow International Corp., 2006 U.S. Dist. LEXIS 81914 (W.D. Wash., Nov. 7, 2006). 1272

"automatically determining at least the last-dialed number ..." — "is not drafted in 'step plus function' form."  Serrano, et al. v. Telular Corp., 111 F.3d 1578 (Fed. Cir. 1997). 1273

"determining how much of the display area would be left over area, if any, after display of category labels representing items" — "The term is so common and simple that a lay juror would have no difficulty in understanding it. It is difficult to conceive of a more clear way to convey the meaning of this term. Accordingly, the Court does not construe this term."  Sklar v. Microsoft Corp., 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007). 1274

"determining if the cookie ... has expired" — "meaning is readily apparent, and no construction is necessary."  Websidestory, Inc. v. Netratings, Inc., 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007). 1276

"determining that an operating characteristic of said method should be scaled from a first level to a second level based on said feedback signal received from said receiver" — "deciding whether an operating characteristic should be scaled from a first level to a second level based on the feedback signal from the receiver."  Agere Systems, Inc. v. Broadcom Corp., 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004). 1277

"determining the difference between image elements ... such surrounding image elements" — "calculating the difference between two or more surrounding image elements to determine their similarity."  IP Innovation L.L.C., et al. v. Sony Electronics, Inc., 2005 U.S. Dist. LEXIS 17962 (N.D. Ill., Aug. 18, 2005). 1278

"determining the duration of the color stripe burst" — "determining the duration of the color stripe burst, which may include obtaining an average phase signal from the color burst."  Macrovision Corp. v. Sima Products Corp., et al., 2006 U.S. Dist. LEXIS 75372 (S.D.N.Y., Oct. 12, 2006). 1279

"determining the position of the increased intensity portions" — "setting or ascertaining the spatial arrangement of increased intensity portions of light."  Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004). 1280

"determining the total delivery time ... to the user" — "Because an ordinary skilled person in the computer networking field would understand 'delivery' as the carrying and turning over of data, the Court rules that no construction is required on this disputed term."  Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007). 1281
"determining when the cruise control is engaged" — "one of ordinary skill in the art would know that a cruise control feature on a manual transmission vehicle could have six operational states: (1) activation switch off; (2) activation switch on; no vehicle speed set; (3) activation switch on and speed set, but the set speed is below a pre-programmed minimum set speed; (4) activation switch on and speed set above minimum, but operator pressed the clutch or the brake; (5) activation switch and speed set above minimum, but operator used throttle to exceed set speed; and (6) activation switch on, speed set above minimum, and operator neither presses brake or clutch, nor exceeds set speed through use of throttle. ... The cruise control is 'engaged,' i.e. controlling the vehicle speed, only in the final state." Caterpillar Inc. v. Detroit Diesel Corp., 961 F. Supp. 1249 (N.D. Ind. 1996). 1282

"determining whether the difference between the short-term statistical profile and the long-term statistical profile indicates suspicious network activity" — "using the result of the comparison to decide whether the monitored activity is suspicious." SRI International, Inc. v. Internet Security Systems, Inc., et al., 2006 U.S. Dist. LEXIS 75355 (D. Del., Oct. 17, 2006). 1283

"determining whether the DNS request transmitted in step (1) is requesting access to a secure web site" — "is not limited to being performed by the computer that receives the DNS request." VirnetX, Inc. v. Microsoft Corp., 2009 U.S. Dist. LEXIS 65667 (E.D. Tex., Jul. 30, 2009). 1284

"deterministic function algorithm" — "a formula or series of steps such that for a certain input there is always the same output, and that condenses, or hashes, the digital document." Surety Technologies, Inc., et al. v. Entrust Technologies, Inc., 74 F. Supp. 2d 632 (E.D. Va. 1999). 1285

"development support functions" — "functions in support of a development system to debug hardware and/or software of the data processor." STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004). 1287

"deviating from the previously computed form line to accommodate one or more terrain features" — "deviating from a previously computed path across the area to be treated in order to avoid at least one terrain feature." Trimble Navigation Ltd. v. RHS, Inc., et al., 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1288

"a repeater management device" — "no particular physical manifestation is articulated in the claim or the specification; therefore, the term 'device' is not limited to these physical manifestations." Intel Corp. v. Altima Communications Inc., 275 F. Supp. 2d 1236 (E.D. Cal. 2003). 1290

"device" — "an integrated circuit or similar item." *Nikon Corp., et al. v. ASM Lithography B.V.*, 308 F. Supp. 2d 1039 (N.D. Cal. 2004).1293

"device diagram" — "a graphical description of a control scheme, created using the device programming means, hence, [it is] a combined representation of the physical description [ ] and the logical definition of the facility ... with the caveat that the physical and logical information must appear on a single diagram." *Fisher-Rosemount Systems, Inc. v. Control Systems International, Inc.*, 2007 U.S. Dist. LEXIS 93125 (S.D. Tex., Dec. 19, 2007).1295

"a device for capturing the symbol, identifying the object from the symbol information" — "a device that captures symbol image and identifies an object upon which the symbol is affixed, attached, etched, and/or engraved from the information contained within the symbol." *Cognex Corp. v. VCode Holdings, Inc., et al.*, 2007 U.S. Dist. LEXIS 75364 (D. Minn., Oct. 9, 2007).1297

"device object" — "a 'device object' encapsulates device logic, device tag definitions, device diagram symbols and graphic screen symbols and dynamics. Hence, the encapsulation is the improvement, but it is also the limitation, providing the only access to the data set." *Fisher-Rosemount Systems, Inc. v. Control Systems International, Inc.*, 2007 U.S. Dist. LEXIS 93125 (S.D. Tex., Dec. 19, 2007).1298

"device-specific style" — "the format in which a particular type of output device receives and displays service output, consisting of values for a plurality of parameters." *Microstrategy, Inc. v. Business Objects, S.A., et al.*, 429 F.3d 1344 (Fed. Cir. 2005).1299

"diagnose an operation"; "diagnostic operation" — "to display or process state data received from the office machine system in order to identify or characterize the operational state of the office machine system." *Ricoh Corp., et al. v. Pitney Bowes, Inc.*, 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006).1301

"diagnostic processor" — "part of the Remote Diagnostic Station, which is remotely located from the office machine system and communicates interactively with the office machine system, via a communication line, to process data and then diagnose the office machine system." *Ricoh Corp., et al. v. Pitney Bowes, Inc.*, 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006). 1303

"dial-up network server" — "a server that is used to establish a communications link with the user's PC." *LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al.*, 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010). 1304

"dialing"; "calling" — "Defendants' proposed limitation based on the preferred embodiment is not warranted, and no further construction of 'dialing' or 'calling' is therefore necessary." *In re Cygnus Telecommunications Technology, LLC Patent Litigation*, 481 F. Supp. 2d 1029 (N.D. Cal. 2007). 1305

"differences" — "one or more distinctions between information or values contained in sets of data." *Visto Corp. v. Seven Networks, Inc.*, 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005). 1309

"different codes" — "factory-defined codes stored within the radio transmitters which uniquely identify each different transmitter and are not selectable or modifiable by the user of the garage door opener [] system." *Overhead Door Corp., et al. v. Chamberlain Group, Inc.*, 194 F.3d 1261 (Fed. Cir. 1999). 1310

"each of a different color" — "means that each colored material in a particular color printing system must be of a different color. ... Both magenta and light magenta are violet-reds, and therefore are not 'different colors' for purposes of the asserted claims." *Only the First, Ltd., et al. v. Seiko Epson Corp., et al.*, 2010 U.S. Dist. LEXIS 103988 (N.D. Ill., Sep. 29, 2010). 1311
"plurality of different data formats for different types of computer apparatus" — "a plurality of different data formats for different types of computer apparatus where: (1) a 'data format' is the arrangement of digital data in a file including image, audio, text or other data and includes, at least, MPEG, JPEG, GIF, TIFF, PICT, BMP, JFIF, DCF, TXT, DOC, WPD and WAV, and (2) a 'computer apparatus' is a computer and any operating system or application software loaded on the computer. Computer apparatus are of 'different types' within the meaning of the claim if they are loaded with different application software, even if they are otherwise the same." St. Clair Intellectual Property Consultants, Inc. v. Canon Inc., et al., 2004 U.S. Dist. LEXIS 17489 (D. Del., Aug. 31, 2004). Having reviewed the extensive prosecution history here, including especially the history generated during the reexaminations, I conclude that the 'plurality of data formats' terms should be construed in a manner so as to not require the one-to-one correspondence proposed by Defendants." St. Clair Intellectual Property Consultants, Inc. v. Matsushita Electronic Industrial Co., Ltd., et al., 2009 U.S. Dist. LEXIS 106697 (D. Del., Nov. 13, 2009).

"different distinct and independent games" — "the games are unique if they have a difference in the rules of play and random factors. Both the rules of play and random factors must contain a difference. A game with different rules of play and nonunique random factors would not be covered by the claim language. The two games can be of the same type and can use the same ball blower or random number generator so long as some other difference in the rules of play and random factors exists." FortuNet, Inc., et al. v. Melange Computer Services, et al., 412 F. Supp. 2d 1071 (D. Nev. 2006).

"a first predetermined wavelength" [and] "a second predetermined wavelength different from said first predetermined wavelength" — "mean[s] any difference in wavelength that allows for signal separation by optical couplers that existed at the time of the invention." Pirelli Cable Corp. v. Ciena Corp., 988 F. Supp. 424 (D. Del. 1997).

"differential light transmissivity" — "mean[s] the claimed ability of the beam splitter to 'reflect[] light entering the aperture and striking the outer surface of the beam splitter, while transmitting therethrough light that is projected from the concave mirror toward the aperture.'" Optical Products Development Corp. v. Dimensional Media Associates, Inc., 134 F. Supp. 2d 320 (S.D.N.Y. 2001).
"differentially thermally growing"; "relatively thicker"; and "relatively thinner" — "require three elements: 1) the grown oxide must be thick enough on top of the gate electrode to serve as a mask for the implant of step (d); 2) the grown oxide must be thick enough on the side of the gate electrode to block the implant of step (d), thereby making a 'gap;' and 3) the top oxide thickness must be in a proportion of at least 1.77 to 1 to the substrate oxide thickness." Thorn EMI North America, Inc. v. Intel Corp., 936 F. Supp. 1186 (D. Del. 1996).1320

"apparatus arranged for differently encoding a plurality of data signals" — "the apparatus implementing the encoding is configured in such a way that it encodes more than one data signal by using at least two types of encoding that are not the same." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).1321

"diffraction grating" — "[a]ny arrangement in the waveguiding structure that imposes a periodic variation of amplitude and/or phase on an incident wave." Corning Inc. v. SRU Biosystems, et al., 400 F. Supp. 2d 653 (D. Del. 2005).1322

"diffractive follow-on track" — "the groove in between the lands on a optical storage disc, which is narrower than a spot of radiation." U.S. Philips Corp. v. Princo Corp., et al., 361 F. Supp. 2d 168 (S.D.N.Y. 2005).1323

"digest"; "network protocol processing information" — "the parties have failed to show that any of these three terms would benefit from judicial construction." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).1324

"digital audio signal" — "does not include all types of computer software or, more specifically, MIDI. Rather, it includes only digital representations of sound waves." Sightsound.com Inc. v. N2K, Inc., et al., 185 F. Supp. 2d 445 (W.D. Pa. 2002).1326

"digital camera electronics" — "is not ambiguous or unexplained in the specification because it simply refers to 'digital camera components' which are thoroughly explained and referenced in the patent's specification." Good Sportsman Marketing LLC, et al. v. Non Typical, Inc., et al., 2009 U.S. Dist. LEXIS 69737 (E.D. Tex., Aug. 10, 2009).1328

"digital data file" — "a collection of digital data stored as a self-contained unit, either created by a user or copied by a user from another source, and containing a unique file name by which it can be accessed by a user." Timecertain, LLC v. Authentidate Holding Corp., et al., 2006 U.S. Dist. LEXIS 92789 (M.D. Fla., Dec. 22, 2006).1329

"digital signal processor" — "processor optimized to perform repetitive computations used in digital signal processing such as multiply-accumulates." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).1337

"digital signals" — "A digital signal or processed signal is a set of data representing frames of a video." In re Compression Labs, Inc. Patent Litigation, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006).1338

"digitally-encoded message" — "digitally-encoded information from a message sender to one or more message receivers that includes message content information, for example substantive content, mail header parsers, addressing parsers, marks, and the like, which may be used in making routing decisions, rather than simply an identification of the type of information, analogous to a caller dialing a number for customer service for a particular product line." eBay Inc. v. IDT Corp., et al., 2009 U.S. Dist. LEXIS 56469 (W.D. Ark., Jun. 10, 2009).1340

"digitized representation of the detected writing" — "digital data that represents the subject's writing." PHT Corp. v. Invivodata, Inc., 2005 U.S. Dist. LEXIS 9577 (D. Del., May 19, 2005).1341

"digitizing" — "the process of creating a digital representation of a non-digital signal by converting, or encoding, the non-digital signal into digital words." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).1344
"direct access to modify add or remove information" — "the ability to edit the information that the merchant previously created or posted into the system." *Shopntown, LLC v. Landmark Media Enterprises, LLC*, 2009 U.S. Dist. LEXIS 62936 (E.D. Va., Jul. 22, 2009). 1345

"direct inward dial telephone number" — "the last four or five numbers dialed by a subscriber which are passed to the system over a trunk line capable of carrying a direct inward dial number." *In re Cygnus Telecommunications Technology, LLC Patent Litigation*, 481 F. Supp. 2d 1029 (N.D. Cal. 2007). 1346

"direction of at least one of said ... thoroughfares"; "direction ... is determined from said retrieved cartographic data" — "I agree with plaintiff that the term 'direction' is clear and requires no judicial construction." *Garmin Ltd. v. TomTom, Inc.*, 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). 1348

"directly" — "the module interfaces or links the device control circuitry of a device to a client machine without the need of intermediate devices." *Digi International, Inc. v. Lantronix, Inc.*, 402 F. Supp. 2d 1041 (D. Minn. 2005). 1351

"directly"; "direct" — "the transfer of data without intervening processing." *Ampex Corp. v. Eastman Kodak Co., et al.*, 460 F. Supp. 2d 541 (D. Del. 2006). 1353

"directly accessing" — "communicating with the flash memory storage module using USB or IEEE1394 bus protocol without a communication protocol conversion such as a USB to ATA conversion." *Netac Technology Co. Ltd. v. PNY Technologies, Inc.*, 2007 U.S. Dist. LEXIS 91536 (E.D. Tex., Dec. 13, 2007). 1354

"directly connected" — "connected by non-switched connections not involving a local area network or wide area network." *Advanced Communication Design, Inc. v. Premier Retail Networks, Inc.*, 186 F. Supp. 2d 1009 (D. Minn. 2002). 1355

"directly connected" — "a connection that runs from the driver IC directly, without any intervening connections, to the center memory chip in the chip clusters on the memory module." *Sun Microsystems, Inc. v. Dataram Corp.*, 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997). 1356
"for directly controlling a recording device" — "event timer information sequences stored in an event timer are used to provide the information and generate the signals that are necessary to control a recording device." SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870 (Fed. Cir. 2004). 1357

directly from the body-worn tracking device to remote associated notification devices" — "In this context, ... 'directly' means without passing through a second piece carried by the offender." Pro Tech Monitoring, Inc. v. Satellite Tracking of People, LLC, 2010 U.S. Dist. LEXIS 458 (M.D. Fla., Jan. 4, 2010). 1360

directly manipulate" — "causing tasks to occur, such as querying, adding, or removing data, by commands sent to the client." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006). 1361

directly manipulate the associated client database" — "causing tasks to occur on a client database, such as querying, adding, or removing data from that client database, by commands sent to the client." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006). 1362

direction of the timing adjustment interval" — "means the timing adjustment control command signal is fed in a reverse direction from the data signal; that is, from a downstream digital switching unit to an upstream digital switching unit, in a direction opposite the data flow." Southwestern Bell Telephone, L.P., et al. v. Arthur Collins, Inc., 454 F. Supp. 2d 600 (E.D. Tex. 2006). 1363

directory" — "the Court rejects both parties' proposed constructions and finds that, since Optima acted as its own lexicographer." Optima Technology Corp. v. Roxio, Inc., 2004 U.S. Dist. LEXIS 30262 (C.D. Cal., Sept. 30, 2004). 1364

disable" — "to place into a condition which is not fully operational and performing its function." LunarEye, Inc. v. Independent Witness, Inc., et al., 2006 U.S. Dist. LEXIS 75808 (E.D. Tex., Oct. 3, 2006). 1365

disabling" — "to de-activate, or cut-off, not mere attenuation." DoorKing, Inc. v. Sentex Systems, Inc., et al., 1999 U.S. Dist. LEXIS 22925 (C.D. Cal., Feb. 22, 1999). 1367 "We construe 'disabling' as requiring that the visitor microphone be rendered incapable of: (a) transmitting a signal that is audible at the tenant location; and (b) preventing the tenant microphone from controlling the system. This construction is similar to but not identical to the district court's construction." Id., 19 Fed. Appx. 872 (Fed. Cir., Sept. 13, 2001) (unpublished). 1368

"disabling device that disables ..." — "Unlike the term 'indicator,' which is defined in technical dictionaries, the term 'disabling device' is not defined in standard or technical dictionaries in a way that connotes sufficient structure to avoid the application of section 112, P 6." Aguayo, et al. v. Universal Instruments Corp., 2003 U.S. Dist. LEXIS 27846 (S.D. Tex., Jun. 9, 2003). 1370

"disabling said EFM decoder" — "stopping the flow of EFM decoded audio data." Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al., 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006). 1371

"discovery interface" — "one or more software modules that receive information from a fabric driver and provide the information to an application." Sun Microsystems Inc v. Network Appliance, 2009 U.S. Dist. LEXIS 48209 (N.D. Cal., May 29, 2009). 1373

"discrete" — "[t]he term 'discrete,' as it is used in the claims of both patents, simply means that a color video signal (e.g., red) is separate or distinct from the other two color video signals (e.g., green and blue)." Avocent Huntsville Corp. v. Clearcube Technology, Inc., 443 F. Supp. 2d 1284 (N.D. Al. 2006). 1374

"discrete coded signal" — "there is nothing in the common meaning of the words ... which requires the use of a so-called 'button signature.'" Code Alarm, Inc. v. Directed Electronics, Inc., 919 F. Supp. 259 (E.D. Mich. 1996). 1375

"plurality of discrete switches" — "two or more distinct and separate manual or mechanically actuated devices for making, breaking, or changing the connections in an electric circuit." NCR Corp. v. Palm, Inc., et al., 120 Fed. Appx. 328 (Fed. Cir., Jan. 6, 2005) (unpublished). 1376

"disk platform" — "the specification requires that a disk platform includes its own computing capability and is not the 'dumb' controller of the prior art." Storage Computer Corp. v. Veritas Software Corp., et al., 2003 U.S. Dist. LEXIS 1181 (N.D. Tex., Jan. 27, 2003). 1377

"display"; "display device" — "an output device on which display images can be represented." Crystal Image Technology, Inc. v. Mitsubishi Electric Corp., 2010 U.S. Dist. LEXIS 48290 (W.D. Pa., May 15, 2010). 1379

"display" — "a device that can be attached to a computer in order to present images." IP Innovation, LLC, et al. v. Red Hat, Inc., et al., 2009 U.S. Dist. LEXIS 69682 (E.D. Tex., Aug. 10, 2009). 1381

"display area" — "an area of display that is defined prior to the step of determining how much display area would be left over."  Sklar v. Microsoft Corp., 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007).  

"display means" — "The Court here agrees with Nonin that the word 'display' as used in the '052 Patent is a structural term."  Nonin Medical, Inc. v. BCI, Inc., 2004 U.S. Dist. LEXIS 3824 (D. Minn., Mar. 8, 2004).  

"display of a plurality of bids and a plurality of asks"; "displaying the bid and ask display regions" — "a display of one or more bids and one or more asks.  eSpeed encouraged us to limit the display to information that is displayed in a single window.  We decline to do so."  Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006).  "We grant plaintiff's motion to reconsider.  We construe 'display of a plurality of bids and plurality of asks' as 'a display of more than one bid and more than one ask.'"  Id., 2007 U.S. Dist. LEXIS 12965 (N.D. Ill., Feb. 21, 2007).  

"display unit" — "a structure or set of structures, separate from the data acquisition unit, for displaying real-time data provided by both the electronic positioning device and the physiological monitor independently or over a common transmission path."  Paragon Solutions, LLC v. Timex Corp., 566 F.3d 1075 (Fed. Cir. 2009).  

"displaying a plurality of ... play lists"; "displaying a plurality of ... lists" — "the simultaneous display of at least the titles of two or more play lists."  Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007).  

"displaying an item label for each item in the at least one open category and other open categories, if any, and a category label for each unopen category" — "at least one category is designated as open and an item label is displayed for each item in this open category and any other open categories.  A category label is displayed for each unopen category."  Sklar v. Microsoft Corp., 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007).
"displaying in the second set of fields, the information identified by selection of fields of the first set of fields" — "the initial selection of fields defines information that is displayed in the second set of fields." **Accenture Global Services GmbH, et al. v. Guidewire Software Inc.**, 2010 U.S. Dist. LEXIS 20087 (D. Del., Mar. 5, 2010). 1395

"displaying, on said issuer's computer display, information associated with said bid including said computed interest cost value" — "showing information associated with the submitted bid, including the bid's previously computed interest cost value, on the issuer's computer display." **Muniauction, Inc. v. Thomson Corp.**, 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006). 1396

"displaying ... options and ... choices" — "construction of this language is unnecessary." **Merit Industries, Inc. v. JVL Corp.**, 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007). 1397

"displaying said combined order book to the traders" — "one of ordinary skill in this art would not limit the distributing and displaying limitations in the manner suggested by the district court. ... Rather, one of ordinary skill in the art would construe the distributing and displaying limitations as covering an embodiment that distributes and displays information for only a subset of the combined order book." **Lava Trading, Inc. v. Sonic Trading Management, LLC**, 445 F.3d 1348 (Fed. Cir. 2006). 1398

"displaying said monochromatic characters on said character-based output device" — "transmitting the monochromatic characters to a character-based output device for display." **OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al.**, 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 1399

"displaying the cartographic data" — "showing the cartographic data." **Garmin Ltd. v. TomTom, Inc.**, 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). 1400

"displaying the playlists" — "displaying the audiovisual content listed in the playlists." **STV Asia, Ltd. v. PRN Corp., et al.**, 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006). 1401

"displaying, with the base map" — "The court is persuaded that the term 'base map' is the key term which requires construction. The court defines the term to mean 'a map on which information may be placed.'" **Sourceprose Corp. v. Fidelity National Financial, et al.**, 2006 U.S. Dist. LEXIS 10151 (E.D. Tex., Feb. 23, 2006). 1402

"second conductive gate disposed above and insulated from said first conductive gate" — "although the second conductive gate must be 'above' and separated from the first conductive gate, it need not be perfectly aligned." **Atmel Corp. v. Information Storage Devices, Inc.**, 997 F. Supp. 1210 (N.D. Cal. 1998). 1403

"window disposed adjacent to the hole formed through the platen" — "encompasses windows that are both in and near the hole of the platen." **Applied Material, Inc. v. Tokyo Seimitsu, Co.**, 446 F. Supp. 2d 525 (E.D. Va. 2006). 1404

"a second gate electrode ... disposed entirely over said first gate electrode" — "requires that the second gate electrode must be located above the first gate, and that no portion of the second gate electrode may extend horizontally beyond the edge of the first gate electrode." **Atmel Corp. v. Information Storage Devices, Inc.**, 997 F. Supp. 1210 (N.D. Cal. 1998). 1405

- 129 -
"a plurality of pixel electrodes disposed on cross points" — "pixel electrodes atop the intersection of the signal and scanning lines." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006).\(1406\)

"computer means disposed remotely" — "a computer that is located apart from a terminal and connected to the terminal by a signal path." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).\(1408\)

"a first doped region disposed under the edge of the stacked gate" — "a part of the doped source region located beneath the edge of the stacked gate." Fast Memory Erase, LLC v. Spansion, Inc., et al., 2010 U.S. Dist. LEXIS 8658 (N.D. Tex., Feb. 2, 2010).\(1409\)

"disposing a continuous layer of transparent, passivating material atop said layer of opaque material and said light influencing material" — "placing a continuous, separate layer of transparent, passivating material atop the separate layer of opaque material and the light influencing material, where the passivating material is a material that performs at least two of the following functions: 1) levels the underlying filter and opaque layers to a continuous, flat surface to serve as a base upon which subsequent layers may be formed; 2) electrically insulates the light influencing element from any electrically conductive layers that may be disposed upon the passivating layer; and 3) provides a flat, level surface so as to assure a uniform thickness for any layer of liquid crystal material disposed thereon." Advanced Technology Incubator, Inc. v. Sharp Corp., et al., 2009 U.S. Dist. LEXIS 109173 (E.D. Tex., Jun. 26, 2009).\(1410\)

"distinct" — "we conclude that 'distinct' does not require storage in separate files. ... The closer question is whether 'distinct' requires independent manipulation of the metacode map and mapped content. Several of the embodiments in the '449 patent allow the user to manipulate only the metacode map or mapped content. However, based on our review of the claim language, the specification, and the prosecution history, we conclude that the claims are not limited to these particular embodiments." i4i L.P., et al. v. Microsoft Corp., 589 F.3d 1246 (Fed. Cir. 2009).\(1411\)

"said second microprocessor employs a second operating system distinct from said first operating system" — "'distinct' should be construed a[s] meaning a different instance, and not a different type." Storage Computer Corp. v. Veritas Software Corp., et al., 2003 U.S. Dist. LEXIS 1181 (N.D. Tex., Jan. 27, 2003).\(1412\)

"an alternative domain name system (DNS), distinct from the Internet domain name system and any client local name server" — "a domain name system, separate from the Internet DNS and the client's name server, that is controlled by a content delivery network service provider and includes control routines that are different from regular name servers." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007).\(1413\)

"said preprogrammed memory ... for use in controlling operation of said vehicle in a distinguishable protocol in addition to those provided by said originally provided program and in lieu of control provided by said originally provided program" — "means that the additional program within the preprogrammed memory not only controls the operation of the vehicle but it does so in a different manner than the original program." Adrain v. Hypertech, Inc., 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002).\(1414\)
"distributed along said buses" — "either multiple capacitance means located at various points along, and in a layer beneath, the buses, or a single capacitance means having plates whose long dimension is spread out along, and in a layer beneath, the buses. The Court does not read in any minimum fraction of the length a bus along which capacitance means must be deployed."  OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 82654 (N.D. Cal., Nov. 13, 2006). 1415

"distributed computer system" — the district court erred in requiring that each processor system 'stand-alone,' i.e., have a separate clock and power supply. 'Distributed computer system' should be given its ordinary meaning, which both parties agree is 'a computer system in which several interconnected computers share computing tasks assigned to the system.'  SeaChange International, Inc. v. C-Cor Inc., 413 F.3d 1361 (Fed. Cir. 2005). 1416

"distributed manufacturing plant" — "a factory that makes a variety of products using machines in workstations throughout the plant."  Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005). 1417

"distributed packet manager" — "a device, process or algorithm located within each packet data source, that controls how the packet data source accesses the time-division multiplexed bus."  Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007). 1418

"distributed switching network" — "a network in which the switching function is distributed over a number of switching or routing elements, components or devices."  Neutral Tandem, Inc. v. Peerless Network, LLC, et al., 2010 U.S. Dist. LEXIS 11248 (N.D. Ill., Feb. 8, 2010). 1419

"distributed Viterbi decoder" — "a Viterbi decoder having multiple Viterbi decoding processes operating on separate portions of a stream of data to be decoded."  Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007). 1420

"distributing the combined order book to the traders in the common system order book protocol" — "one of ordinary skill in this art would not limit the distributing and displaying limitations in the manner suggested by the district court. ... Rather, one of ordinary skill in the art would construe the distributing and displaying limitations as covering an embodiment that distributes and displays information for only a subset of the combined order book."  Lava Trading, Inc. v. Sonic Trading Management, LLC, 445 F.3d 1348 (Fed. Cir. 2006). 1421

"distribution interface" — "the connection that permits data to be conveyed from the central processor through the telephone network to the requesting customer."  USA Video Technology Corp. v. Time Warner Cable, Inc., et al., 2007 U.S. Dist. LEXIS 92578 (E.D. Tex., Dec. 12, 2007). 1422

"distribution stage" — "the stage that serves for retrieval of recorded information, providing it in a human recognizable form, and, in some instances, archiving the recorded information to removable storage."  NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007). 1423

[a memory cell array] "being divided into first and second row groups" — "is correctly understood as referring to two physically separated rows of word lines and hence includes only open bit line structures or architecture."  NEC Corp. v. Hyundai Electronics Industries Co., Ltd., et al., 30 F. Supp. 2d 546 (E.D. Va. 1998). 1424
"dividing said first image frame of pixel intensity data into a regular grid of kernels forming a plurality of rows" — "dividing the frame of image data acquired during the first scan of the subject into a ordered grid of curved or rectilinear zones arranged in one or more rows and columns, each zone containing multiple pixels of data of potentially varying intensity." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008). 1425

"dividing said selected portions of said information database into a prioritized set of tiers, wherein all the selected portions of said information database in each tier are transmitted at a corresponding repetition rate" — "placing each part of the information database selected for transmission into one or more groups of information, and transmitting each group at a chosen repetition rate." Finisar Corp. v. DirecTV Group, Inc., et al., 416 F. Supp. 2d 512 (E.D. Tex. 2006). 1426

"dividing said tracks into a plurality of concentric annular blocks" — "segregating the tracks into nonoverlapping, ring-shaped regions on an optical disk." Ricoh Co., Ltd. v. Quanta Computer, Inc., et al., 2007 U.S. Dist. LEXIS 34892 (W.D. Wis., May 11, 2007). 1427

"dividing the digitized broad band information" — "grouping, or segmenting, the digitized information into a predetermined cell structure where each cell contains the same pre-selected number of digital words." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 1428

"docking with the host computer" — "plugging or inserting into the host computer without the use of an intermediate bus structure." Inpro II Licensing, S.A.R.L. v. T-Mobile USA, Inc., et al., 2004 U.S. Dist. LEXIS 29773 (D. Del., Nov. 29, 2004). 1429

"domain name and path" — "a name or other identifier that defines a network connection to the embedded object at a content provider server and is used to retrieve the object in the absence of a content delivery network." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007). 1433

"door control system" — "an electronic system, that also includes a door motor and a driver, for controlling movement of a vehicle door." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009). 1435
"door operation commands" — "door control system specific signals sent to the controller that controls door functions, such as, open, close, lock and unlock." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009).1436

"having said third dopant concentration" — "intending to have the same dopant concentration as the second region." Micrel Inc. v. Monolithic Power Systems, Inc., et al., 2006 U.S. Dist. LEXIS 45860 (N.D. Cal., June 28, 2006).1437

"first doped region"; "second doped region" — "the 'first doped region' must be the drain, and the 'second doped region,' by extension, the source." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998).1438

"third doped region" — "need not be contiguous, but can be as depicted in Figure 1." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998).1439

"doping ... with ... atomic hydrogen" — "doping with atomic hydrogen (from any source)." Rothschild v. Cree, Inc., et al., 2007 U.S. Dist. LEXIS 48127 (S.D.N.Y., July 2, 2007).1440

"a double layered metal gate" — "a patterned structure of an electrically conductive material that includes two sequentially deposited metal layers and includes a portion that controls current flow through the channel between the source electrode and drain electrode." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010).1441

"down converter" — "a converter where the output voltage is lower than the input voltage." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010).1442

"download component"— "a file or program either sent to or received by a computer in response to a request for electronic data that 1) requests (or controls the download of) electronic data from a computer other than the computer from which the program was sent or received; 2) coordinates the download of electronic data; and 3) interacts directly with the operating system of the computer without another program mediating between it and the operating system." Network Commerce, Inc., et al. v. Microsoft Corp., 422 F.3d 1353 (Fed. Cir. 2005).1443

"downloadable code storage" — "a component or set of components on which instructions or software are kept, from which the instructions or software can be retrieved or accessed, and into which the instructions or software can be transferred." Lantronix, Inc., et al. v. Digi International, Inc., 2006 U.S. Dist. LEXIS 12032 (E.D. Tex., March 6, 2006).1444

"downloading ... if the provided block from the local memory is not at the indicated resolution level"; "downloading ... if the first block is not from the indicated level" — "downloading ... upon some determination that the block provided from local memory is not at the indicated resolution level"; "downloading ... upon some determination that the first block is not at the indicated level." Skyline Software Systems v. Keyhole, Inc., et al., 2006 U.S. Dist. LEXIS 83603 (D. Mass., Nov. 16, 2006).1447

"downloading into a memory storage device" — "transferring the desired data into a device capable of saving it for later access." Comcast Cable Communications Corp., LLC v. Finisar Corp., 2007 U.S. Dist. LEXIS 28994 (N.D. Cal., April 6, 2007).1448

"downloads into a memory storage device those of said received data packets which match said specified set of requested data packets" — "the data filter transfers into a memory storage device the data packets specified in the filter data." Finisar Corp. v. DirecTV Group, Inc., et al., 416 F. Supp. 2d 512 (E.D. Tex. 2006).1450

"a drain conductive region remote from said common region and separated therefrom by said relatively lightly doped major body portion" — "is properly construed to include any region carrying a substantial portion of device current that is separated from the common conduction region (between the bases) by the lightly doped layer." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001).1451

"drive bay slot" — "the relatively narrow opening in the housing of the computer that leads to the drive bay." Comaper Corp. v. Antec, Inc., 2006 U.S. Dist. LEXIS 67363 (E.D. Pa., Sept. 13, 2006).1452

"a drive circuit for the motor" — "the portion of a machine tool that receives motor commands and electronically controls motor functions. It may or may not include one or more controllers that interpret and adjust motor commands." Omax Corp. v. Flow International Corp., 2006 U.S. Dist. LEXIS 81914 (W.D. Wash., Nov. 7, 2006).1453

"drive controller" — "The court finds that the inventors disclaimed external translation circuitry. Thus, the proper construction of 'drive controller' includes translation circuitry but excludes circuitry necessarily located on an external adapter card." Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34454 (N.D. Cal., Sept. 9, 2005).1454

"drive signal" — "It is true that the term 'drive signal' is a fairly generic term of art. However, the language of the claims in the '659 patent limits the claimed 'drive signals' to those 'phase-related to said clock pulses.'" General Electric Co. v. Nintendo Co., Ltd., 179 F.3d 1350 (Fed. Cir. 1999).1455

"driver" — "the set of software routines used to direct a device, for example, an input/output device or a multi-purpose interface." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).1456

"driver" — "computer software which performs functions." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006).1457
"driver means in said computer for receiving said control signals and in response generating a command to a selected one of said applications programs for updating said screen video displays in accordance with said applied pressure to said touch-sensitive display screen" — "is a means-plus-function limitation." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007).1458

"driving current in the primary winding"; "driving the primary winding of the transformer with a current" — "mean the power supply producing alternating current that drives current in the primary winding and not through an impedance matching network." Applied Science and Technology, Inc. v. Advanced Energy Industries, Inc., 204 F. Supp. 2d 712 (D. Del. 2002).1459

"dropping packets when the detected congestion exceeds a predetermined severe congestion threshold" — "dropping packets after the detected congestion exceeds the predetermined severe congestion threshold." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).1460

"[noise] due to independent operation of said transistors" — "noise caused by operation of a plurality of on-chip transistors whose operation is not contingent upon operation of the memory array." STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004).1461

"dummy conducive patterns" — "conductive patterns in the specified region that are not in contact with any of the wiring." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 12969 (D. Del., Feb. 16, 2010).1462

"during delivery of the real-time information" — "the Court does not construe this claim." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007).1463

"during iterative processing" — "the claimed steps can be repeatedly performed by the automated negotiations engine while performing multiple rounds of bargaining involving an offer and multiple counteroffers between two participants where each round is related to prior rounds." Sky Technologies, Inc. v. Ariba, Inc., 491 F. Supp. 2d 154 (D. Mass. 2007).1464

"during variation of the number of channels in the WDM optical signal" — "while the number of channels in the WDM optical signal changes." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).1465

"multi-pulse portion having a given duty ratio \( z = t_2/(t_2+t_3) \)" — "the entire multi-pulse portion has a given ratio, \( z \), where \( z \) is the result of dividing (i) the pulse width at high power (\( t_2 \)), by (ii) the sum of the pulse width at high power (\( t_2 \)) plus the pulse width at low power (\( t_3 \))." Ricoh Co., Ltd. v. Quanta Computer, Inc., et al., 2007 U.S. Dist. LEXIS 34892 (W.D. Wis., May 11, 2007).1466

"dynamically" — "automatically and in response to the preceding event." Leader Technologies, Inc. v. Facebook, Inc., 2010 U.S. Dist. LEXIS 21100 (D. Del., Mar. 9, 2010).1467
"dynamic display"; "dynamically displaying" — "a display of a plurality of bids and asks that are updated in response to new market information such that the bids and asks change positions relative to the static display of prices when the market changes"; "updating the first (second) indicator in response to new market information such that the first (second) indicator changes positions relative to the common static price axis when the market changes." We construe "indicator" in its plain and ordinary meaning as "something that indicates." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006).

"dynamically adding information" — "[the] dispute is whether the 'dynamically adding information' language requires the addition of specific types of information, ... the court rejects the defendants' attempt to further limit this term." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).

"dynamically partition data received from the data path to account for an elemental width of the data wherein the elemental width of the data is equal to or narrower than the data path" — "dividing width-wise into a variable number of elements no wider than the data path, based upon the size of the data elements received from the data path." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).

"dynamically partitionable arithmetic unit" — "the arithmetic unit can be divided into a variable number of elements." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).

"dynamically receiving data relating to a portion of a particular thoroughfare in a route" — "receiving in real time data relating to a portion of a particular thoroughfare in a route." Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006).

- E -

"each" — "defendant seeks to replace the word 'each' with 'every.' The claim language is clear as written. Aside from construing 'thoroughfare,' I leave the claim language undisturbed." Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006).

"each channel having a separate control circuit that is adapted to control the operation of its associated transceiver to complete radio frequency communication paths to mobile units as instructed by the telephone switch" — "each channel is operated via a separate control circuit consistent with the instructions downloaded from the central control station." MLMC, Ltd. v. Airtouch Communications, Inc., et al., 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001).
"dividing a period of a clock in said master unit into a number of subframes, dividing each subframes into a number of slots, each corresponding to transmission times for one of said remote units, and assigning a slot to each of said application programs" — "[t]he court therefore construes 'each corresponding to transmission times' to mean 'each subframe corresponding to transmission times.' All other terms have their plain and ordinary meaning." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).1477

"for each message" — "Each is not synonymous with 'every.' Thus, had I been aware at the Markman phase that the parties disputed the meaning of the word 'each,' I would have given it a literal interpretation -- notwithstanding the fact that the preferred embodiment apparently does not establish and maintain a path to the output circuit for each message in a contention situation. The Markman decision is deemed amended accordingly." TM Patents, L.P., et al. v. International Business Machines Corp., 121 F. Supp. 2d 349 (S.D.N.Y. 2000).1478

"wherein each of said impurity diffusion layers of said buffer MOSFETs is separated from one of said impurity diffusion layers of said protection MOSFETs by at least 5 μm" — "requires that one of said separation distances be at least 5 μm, but that in no case should a field oxide film not be interposed between the impurity diffusion layers of buffer MOSFETs and protection MOSFETs, as required by the 'interposed field oxide film' limitation." OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 73144 (N.D. Cal., Sept. 21, 2006).1479

"each of said plurality of computers sharing the shared addressable memory space" — "two or more computers, every one of which of those two or more computers participating in the system has access to, and may contribute to, the shared addressable memory space." Mangosoft, Inc., et al. v. Oracle Corp., 2004 U.S. Dist. LEXIS 19357 (D.N.H., Sept. 21, 2004).1480

"each radio frequency channel including a separate transceiver" — "each channel is associated with a separate transceiver." MLMC, Ltd. v. Airtouch Communications, Inc., et al., 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001).1481

"echo returns"; "echoes"; "reflections" — "acoustic signals created when an acoustic pulse, encountering a discontinuity or surface, is reflected as it is transmitted through a medium." Echometer Co., et al. v. Lufkin Industries, Inc., 2003 U.S. Dist. LEXIS 13210 (N.D. Tex., Jul. 31, 2003).1482

"field stop regions in said substrate having edges defining the sides of said channel" — "the term 'edge' ... has its ordinary spatial meaning of 'the line where an object or area begins or ends.'" Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998).1483

"editing the appearance of the visually displayed waveform by manipulation of said visually displayed waveform" — "altering, adapting or refining how the displayed waveform looks on the computer screen, for example, by selecting a portion of the waveform by highlighting it, cutting, pasting or deleting a selected portion, displacing the waveform along the time axis, or overlaying the waveform with a sound characteristics control line and displacing the line." Adobe Systems Inc. v. Macromedia, Inc., 201 F. Supp. 2d 309 (D. Del. 2002).1485
"educational information" — "information that is entered, transmitted and displayed in a context in which there is a teacher/student or student/teacher relationship between a person who enters and transmits the information and a person who views the shared display of the information." Hamilton v. ComWeb Technology Group, Inc., et al., 2003 U.S. Dist. LEXIS 27832 (D. Md., Nov. 13, 2003). 1486

"effective index" — "a number that relates the propagation velocity of light guided in a waveguide to the speed of light in a vacuum." Corning Inc. v. SRU Biosystems, et al., 400 F. Supp. 2d 653 (D. Del. 2005). 1487

"effectively corresponds to the voice of the operator who is on-line with and services incoming calls" — "simply requires that the messages be recorded in the voice of the operator who is on-line with the caller." Golden Voice Technology & Training, L.L.C. v. Rockwell Firstpoint Contact Corp., et al., 267 F. Supp. 2d 1190 (M.D. Fla. 2002). 1488 "[T]he Court adopts the Magistrate's construction of the phrase." Id., 267 F. Supp. 2d 1190 (M.D. Fla. 2003). 1489

"machine processing effectiveness parameter" — "a predetermined value that is an indication of whether a machine has examined the specimen properly." Cytyc Corp. v. Tripath Imaging, Inc., et al., 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005). 1490

[i] "first plurality of egress queues"; [ii] "second plurality of egress queues" — [ii] "two or more queues consisting of the organization in memory of data generated from the egress traffic of a network"; [ii] "two or more queues, different from the first plurality of egress queues, consisting of the organization in memory of data generated from the egress traffic of a network." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 1491

"egress traffic of a network" — "traffic that has exited or is exiting a network operating at a faster data rate and directed towards a network operating at a slower data rate." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 1492

"either ... or" — "requires at least one, but does not exclude the possibility of both." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003). 1493

"a first electrical conductor connecting the ground mechanism to the utility box for electrically grounding the utility box" — "a structure (possibly including several elements such as grounding wire and a clamp), which can transmit electricity from the utility box to the ground mechanism so as to ground the utility box." Senior Industries, Inc. v. Thomas & Betts Corp., et al., 2001 U.S. Dist. LEXIS 16901 (N.D. Ill., Sept. 27, 2001). 1494

"electrical instructions are sent thereto for interpretation by the loaded program" — "electrical signals are sent to the circuitry and are acted upon by the loaded program." Lantronix, Inc., et al. v. Digi International, Inc., 2006 U.S. Dist. LEXIS 12032 (E.D. Tex., March 6, 2006). 1496
"electrical outlet" — "a point on the wiring system at which current is taken to supply utilization equipment." SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007). 1497

"electrical parameters" — "the measurable attributes of electricity and the attributes that can be calculated from such attributes and other data." P3 International Corp., et al. v. Unique Products Manufacturing Ltd., et al., 2009 U.S. Dist. LEXIS 43751 (S.D.N.Y., May 21, 2009). 1498

"electrical potential" — "the relative voltage at some point in an electric circuit or field with respect to some reference point in the same circuit or field." Dicon Global Inc. v. Senco Sensors, Inc., et al., 2004 U.S. Dist. LEXIS 23758 (N.D. Ill., Nov. 18, 2004). 1499

"electrically conductive fibers" — "We are not here modifying the district court's claim construction to limit its scope to stainless steel fibers. We only modify it to exclude carbon fibers from the scope of the '879 patent claims." Honeywell International, Inc., et al. v. ITT Industries, Inc., et al., 452 F.3d 1312 (Fed. Cir. 2006). 1500

"an electrically conductive layer embedded in said first contact hole up to a level higher than the gate electrode such as to be contacted with said electrically conductive layer" — "the court finds that the present term is not indefinite and declines to construe the term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006). 1502

"a first strip formed of a first electrically conductive material having a resistance, ... the first material being carbon" — "carbon plus some adhesive, filler or other material, so long as carbon is the primary conductive material." Stowe Woodward, L.L.C. v. Sensor Products, Inc., 2005 U.S. Dist. LEXIS 16479 (W.D. Va., Aug. 11, 2005). 1503

"electrically connected" — "directly coupled to the primary winding, not through an impedance matching network, such that power is transferred by electrical current flow." Applied Science and Technology, Inc. v. Advanced Energy Industries, Inc., 204 F. Supp. 2d 712 (D. Del. 2002). 1505

"electrically controlled birefringence type"; "electrically controlled birefringence effect" — "a category of liquid crystal cells distinguished from the helical nematic type (i.e., the twisted nematic type) in which the molecules have a homeotropic direction when no voltage is applied between the electrodes." Commissariat a l'Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007). 1506

"electrically coupled" — "electrically connected, but not requiring a direct electrical connection or the same voltage." Vanguard Products Group, Inc., et al. v. Diam USA, Inc., et al., 2007 U.S. Dist. LEXIS 95710 (N.D. Ill., May 16, 2007). 1507
"electrically distinct contacts" — "contacts along the edge of a printed circuit board in which the contacts on the first side of the printed circuit board and the contacts on the second side of the printed circuit board are not connected across the printed circuit board edge but may be electrically connected away from the edge." Sun Microsystems, Inc. v. Dataram Corp., 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997). 1508

"electrically separated from" — "the 'second layer of conducting strips' is separated from the 'first layer of conducting strips' by a nonconducting layer." Lonestar Inventions LP v. Nintendo of America, Inc., 2009 U.S. Dist. LEXIS 31753 (E.D. Tex., Apr. 14, 2009). 1510

"electro-optical conversion" — "the conversion of an electrical signal into an optical signal and/or the conversion of an optical signal into an electrical signal." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 1511

"electrode" — "any conductive surface, including a metal chamber wall or other surface except a spike, coupled to the plasma, and having an electric potential or source coupled to it." Tegal Corp. v. Tokyo Electron America, Inc., 257 F.3d 1331 (Fed. Cir. 2001). 1512

"electrode" — "any piece of conductive material through which an electric current enters or leaves a medium such as a liquid solution." Roche Diagnostics Corp. v. Inverness Medical Technology Inc., et al., 186 F. Supp. 2d 914 (S.D. Ind. 2002). 1513

"electrode means comprising a source/drain" — "a region or regions embedded in a semiconductor substrate that forms an interface with the lower capacitor plate, which is the doped region embedded in the substrate that lies beneath the gate electrode, and the region or regions electrically connect the lower plate to one of the buses." OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 82654 (N.D. Cal., Nov. 13, 2006). 1515

"electrode terminal" — "one or more active electrodes." Arthrocare Corp. v. Smith & Nephew, Inc., 2003 U.S. Dist. LEXIS 5976 (D. Del., Apr. 9, 2003). 1517

"electronic access" — "the ability to gain entry to or use a computer." Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al., 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006). 1519

"electronic chip" — "The district court provided the jury with the following construction ...: 'Chip' is not used in whatever technical sense it may have; here, it means the same thing as an electrical component, whether it is a complex integrated circuit of several subparts or a single resistor. A resistor itself is made of two leads, case, and resistant core, at a minimum, making it a packaged electronic component.' Although we do not agree with the district court's construction, for it appears from the definition given to the jury that the district court was confusing a 'packaged electronic component' (i.e., the claimed invention as a whole) with an 'electronic chip' (i.e., an element of the claimed invention), this aspect does not appear to have been material to the result, and any error appears to have been harmless." Strattec Security Corp. v. General Automotive Specialty Co., Inc., et al., 126 F.3d 1411 (Fed. Cir. 1997).1522

"electronic display means" — "As the plaintiff has not overcome the § 112, P 6 presumption, the court will treat electronic display means as a means plus function limitation." Better Education, Inc. v. elInstruction Corp., et al., 2010 U.S. Dist. LEXIS 40972 (E.D. Tex., Apr. 27, 2010).1528

"electronic element" — "a device or thing that has distinct characteristics related to electricity, and that also has terminals at which it may be connected to other distinctly electrical devices or things in order to form a circuit, in which electrons move through devices called semiconductors."  

"electronic mail message" — "a digital text message that is sent over a communications network from one device to another."  

"electronic mail message" — "a formatted text message that is transmitted over a communication system. As originally inputted to an electronic mail system by the sender, the electronic mail message includes the following characteristics: (a) a destination address identifying the person(s), place(s) or object(s) to which the message is directed; (b) an indication of the sender (which may be added automatically by the electronic mail programming); (c) a subject field (which maybe blank); and (d) the inputted message text. The term 'electronic mail message' encompasses all forms of the message as it moves through the communication system (information may be added or deleted to facilitate further transmission as it proceeds through the system)."  

"electronic mail programming" — "an application program specially designed to create, send, access and manage electronic mail messages. Electronic mail programming may operate on a variety of different types of processors (e.g., desktop computer, email server, handheld device, mainframe computer)."  

"electronic mail system" — "a type of communication system which includes a plurality of processors running electronic mail programming wherein the processors and the electronic mail programming are configured to permit communication by way of electronic mail messages among recognized users of the electronic mail system. The various constituent processors in the electronic mail system typically function as both 'originating processors' and 'destination processors.'"  
**NTP, Inc. v. Research In Motion, Ltd.,** 418 F.3d 1282 (Fed. Cir. 2005).  

"electronic market" — "we agree with the district court's definition of electronic markets as markets in which the participants, in addition to browsing and searching, may either buy or sell or do both."  
**MercExchange, L.L.C. v. eBay, Inc.,** 401 F.3d 1323 (Fed. Cir. 2005).  

"electronic marketplace" — "an electronic destination that (1) receives and processes non-binding indications, (2) allows for the matching of non-binding indications with their contra interests and for the negotiation and execution of trades, and (3) has the capacity to record trades if and when they are executed."  

"electronic medium" — "an electronic medium that can be used to update the up-dateable memory of the microcontroller."  

"electronic navigational aid device" — "any electronic device designed to provide information used for in-vehicle navigation."  
"said computers being coupled to at least one electronic network for communicating data messages between said computers" — "said computers being connected to at least one network for communicating data messages between said computers, such connection being at least partially via the Internet." Muniauction, Inc. v. Thomson Corp., 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006). 1539

"electronic sourcing system" — "an electronic system for use by a prospective buyer to locate and find items to purchase from sources, suppliers or vendors." ePlus, Inc. v. Lawson Software, Inc., et al., 2010 U.S. Dist. LEXIS 42609 (E.D. Va., Apr. 30, 2010). 1541

"electronic storage media" — "memory configured to store information in a format that an electronic device can read. The term 'electronic' does not exclude magnetic or optical media such as hard drives, floppy disks, or compact disks." Diego, Inc. v. Audible, Inc., 2006 U.S. Dist. LEXIS 22715 (W.D. Wash., March 27, 2006). 1542

"electronic tax return" — "a completed computerized statement of tax liability or tax-related information ready for submission to a governmental tax agency." Simplification, LLC v. Block Financial Corp., et al., 593 F. Supp. 2d 700 (D. Del. 2009). 1543

"electronically" — "performed on a computer without manual intervention from the user." Simplification, LLC v. Block Financial Corp., et al., 593 F. Supp. 2d 700 (D. Del. 2009). 1544

"electronically communicate with each other as desired and communication between the connected devices as desired" — "transmission and/or receipt of electronic information between linked devices in a manner that the information can be utilized by the receiving device." Lantronix, Inc., et al. v. Digi International, Inc., 2006 U.S. Dist. LEXIS 12032 (E.D. Tex., March 6, 2006). 1545

"electronically providing" — "the court declines to construe this term, other than to reject the defendant's construction that 'providing' requires 'transmission.'" Source, Inc. v. American Express Co., 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006). 1547

"electronically specifying information identifying a plurality of parts and specifications for the parts" — "information identifying a plurality of parts and specifications for the parts that is in an electronic form." Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007). 1548

"electronically updating" — "changing based on information received from the customer via the Internet using an electronic device. 'Electronic' is given its plain-language meaning." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007). 1549
"electronics means for at least reading the signals of said electricity manipulating devices";
"electronics means further for reading said at least one of said electricity manipulating devices including means for creating an On/Off signal exclusively as an On/Off switch";
"electronics means is further for reading at least one of said electricity manipulating devices exclusively as an On/Off switch"; "electronics means also is for outputting to a game console information representing the signals"; "active electronic means for interpreting the analog output of said pressure-sensitive variable-conductance sensor"; "active electronic means for at least interpreting the outputs of said pressure-sensitive variable-conductance sensor"; "active electronic means for interpreting the electrical conductivity of said sensor" — "Because the four terms that begin with 'electronics means . . .' do not recite limited and definable structure, the court concludes that they are means-plus-function limitations. ... [However,] as with 'baffle' in Envirco, 'active electronic' imparts structure. The three claims that include 'active electronic means' are not means-plus-function clauses." Anascape, Ltd. v. Microsoft Corp., et al., 2007 U.S. Dist. LEXIS 88248 (E.D. Tex., Nov. 30, 2007).1550

"the electrotherapy device can provide at least six electrical shocks to the patient before the battery is depleted" — "when the battery low warning is given, the battery is able to deliver at least six therapeutic electrical shocks to the patient." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).1551

"image element" — "the smallest element of an image that can be assigned independent characteristics." Crystal Image Technology, Inc. v. Mitsubishi Electric Corp., 2010 U.S. Dist. LEXIS 48290 (W.D. Pa., May 15, 2010).1552

"element substrate" — "the substrate having a matrix circuit and a peripheral drive circuit driving said matrix circuit." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006).1553

"elements" — "a shape together with its graphical attributes, such as color, line width, fill properties, and line properties." Adobe Systems Inc. v. Macromedia, Inc., 201 F. Supp. 2d 309 (D. Del. 2002).1554

"embedded in a series of interrelated screens" — "providing graphical elements (i.e., individual pictures or screens) with corresponding instructions (i.e., command code) in a single file for each graphical element, such that all of the control codes for a given graphical element are directly accessible on the consumer screen." IP Innovation, L.L.C. v. eCollege.com, et al., 2005 U.S. App. LEXIS 26138 (Fed. Cir., Nov. 29, 2005) (unpublished).1556

"Web page including a first code module embedded therein" — "Embedded means contained within the programming architecture (technically known as its 'HTML code') of a computer-readable program (the technical name for which is 'code module')." Modavox, Inc. v. Tacoda, Inc., 607 F. Supp. 2d 530 (S.D.N.Y. 2009).1557

"embodied in a housing" — "This phrase does not involve technical terms and can be understood through its plain and ordinary meaning. It does not require construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).1558
"at least one user interface key embodied in said housing" — "at least one user interface key permanently attached to the housing." *SmartDisk Corp. v. Archos S.A., et al.*, 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).\(^{1559}\)

"at least one of which is not embodied in the housing" — "this phrase requires no construction." *SmartDisk Corp. v. Archos S.A., et al.*, 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).\(^{1560}\)

"empty payload field" — "a payload field that is empty of source data, but includes bit signals of some kind." *Telcordia Technologies, Inc. v. Cisco Systems, Inc.*, 2010 U.S. App. LEXIS 13692 (Fed. Cir., Jul. 6, 2010).\(^{1562}\)

"emulation" — "a process in which one computer X behaves identically to another computer Y, as X executes the instructions of Y, where the internal architectures of computers X and Y are different." *TechSearch L.L.C. v. Intel Corp.*, 286 F.3d 1360 (Fed. Cir. 2002).\(^{1563}\)

"a UART emulation which" — "software that responds to the operating system as a hardware UART would respond, with respect to UART control and register data, which." *PCTEL, Inc. v. Agere Systems, Inc., et al.*, 2006 U.S. Dist. LEXIS 25943 (N.D. Cal., March 20, 2006).\(^{1564}\)

"enable" — "to place into a condition which is fully operational and performing its function." *LunarEye, Inc. v. Independent Witness, Inc., et al.*, 2006 U.S. Dist. LEXIS 75808 (E.D. Tex., Oct. 3, 2006).\(^{1565}\)

"to enable the second end to be interconnected to a defibrillator" — "the lead wire extends from the package in a manner that allows for interconnection to the defibrillator prior to use of the electrode." *Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al.*, 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).\(^{1567}\)

"enabling caching operations" — "permitting the storing and reading of data on the cache" *SuperSpeed Software, Inc. v. Oracle Corp.*, 447 F. Supp. 2d 672 (S.D. Tex. 2006).\(^{1569}\)

"enabling dynamic assignment of one of said RIMs to supply paging commands" — "any channel, with its associated RIM, transceiver and voice circuit, can function as the central channel in response to separate commands from the central control station." *MLMC, Ltd. v. Airtouch Communications, Inc., et al.*, 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001).\(^{1571}\)
"enabling said EFM decoder" — "restarting the flow of EFM decoded audio data." *Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al.*, 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006).\textsuperscript{1572}

[i] "encapsulates the point-to-point link level session in a forwarding protocol header"; [ii] "encapsulates the point-to-point protocol session in the layer 2 forwarding protocol header" — [i] "placing a communication connection between a source and destination pair using the point to point link level protocol in the initial information fields of a packet operating according to a layer 2 forwarding protocol"; [ii] "placing a communication connection between a source and destination pair using the point to point protocol in the initial information fields of a packet operating according to a layer 2 forwarding protocol." *Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc.*, 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).\textsuperscript{1573}

[i] "enciphered"; [ii] "unenciphered" — [i] "transmission of information in a secure mode; i.e., the transmitted output is encoded (as by logically scrambling the signal)"; [ii] "transmission of information in a clear, not secure mode; i.e., the transmitted output is unencoded." *MLMC, Ltd. v. Airtouch Communications, Inc., et al.*, 172 F. Supp. 2d 557 (D. Del. 2001).\textsuperscript{1574}

"an enclosed lamp envelope" — "an enclosure." *Tailored Lighting, Inc. v. Osram Sylvania Products, Inc.*, 514 F. Supp. 2d 417 (W.D.N.Y. 2007).\textsuperscript{1576}

"encrypt" — "to encipher or encode by altering information." *Diego, Inc. v. Audible, Inc.*, 2006 U.S. Dist. LEXIS 22715 (W.D. Wash., March 27, 2006).\textsuperscript{1579}

"to encrypt the payload portion of the packet" — "to encrypt only the payload portion of the packet." *Widevine Technologies, Inc. v. Verimatrix, Inc.*, 2009 U.S. Dist. LEXIS 102768 (E.D. Tex., Nov. 4, 2009).\textsuperscript{1580}

"encrypted event data" — "event data coded to be unintelligible without decoding information, commonly a key or a password." *Accolade Systems LLC v. Citrix Systems, Inc.*, 634 F. Supp. 2d 738 (E.D. Tex. 2009).\textsuperscript{1581}

"encryption" — "describes a method wherein parts of the signal are rearranged relative to other parts. 'Encryption' does not include the method of inversion." *IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al.*, 146 F. Supp. 2d 498 (D. Del. 2001).\textsuperscript{1582}
"end of access control signal"; "end of access system bus control signal" — "a signal generated by the requesting agent and transmitted over the system bus to indicate completion of memory access. It need not occur at the end of the memory access as long as it indicates when the memory access is to be complete."; "a signal transmitted over the system bus to indicate completion of memory access. It need not occur at the end of the memory access as long as it indicates when the memory access is to be complete." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).1583

"said end user inquiries being the retrieving and viewing of test and/or graphic data from a database" — "said end user inquiries being requests for information that are passively monitored." Keithley v. HomeStore.com, Inc., et al., 2007 U.S. Dist. LEXIS 71126 (N.D. Cal., Sept. 10, 2007).1584

"energy delivery surface" — "the outer surface of the energy delivery device through which energy is delivered toward the patient." Thermage, Inc. v. Syneron Medical, Ltd., et al., 2004 U.S. Dist. LEXIS 19993 (N.D. Cal., Sept. 27, 2004).1586

"energy signal" — "a signal representative of the electrical energy determination made by the first processor, such as watthour delivered/received, volt amp reactive hour delivered/received, or volt amp hour delivered/received." ABB Automation Inc. v. Schlumberger Resource Management Services, Inc., 254 F. Supp. 2d 475 (D. Del. 2003).1587

"energy source" — "The claimed 'energy source' is one capable of delivering a therapeutic shock. Determining which sources of energy meet this requirement is a question for another day." Koninklijke Philips Electronics, NV, et al. v. Defibtech LLC, et al., 2005 U.S. Dist. LEXIS 39859 (W.D. Wash., Dec. 21, 2005).1588

"enhanced drift region" — "the Court will not define 'enhanced drift region' beyond how it is already described in Claim 1." Micrel Inc. v. Monolithic Power Systems, Inc., et al., 2006 U.S. Dist. LEXIS 45860 (N.D. Cal., June 28, 2006).1589

"entering a clerk authorization code for initiating a debit purchase transaction" — "the clerk enters a series of numbers and/or letters, or a combination thereof, which permits the initiation of a debit purchase transaction." Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010).1590

"entering said secret code into the multi-function card to activate the same" — "The user activates the electronic multi-function-card by entering the secret code. 'Activated' means the point at which the user has entered in the secret code so that she is able to access a data set." E-Pass Technologies, Inc. v. 3COM Corp., et al., 177 F. Supp. 2d 1033 (N.D. Cal. 2001).1591
"entering the data concerning the FCC unit into a programmed computer in order to determine" — "inputting the data relating to the FCC unit into a programmed computer for the purpose of fixing, by way of a computer calculation of the data or a computer implementation of an individual's calculation of the data." Intercat, Inc. v. Nol-Tec Systems, Inc., et al., 2005 U.S. Dist. LEXIS 344 (D. Minn., Jan. 7, 2005). 1592

"an entire ring oscillator variable speed system clock in said integrated circuit" — "a ring oscillator variable speed system clock that is located entirely on the same semiconductor substrate as the CPU and does not directly rely on a command input control signal or an external crystal-clock generator to generate a clock signal." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 1596

"alert envelope" — "The claim itself explains that 'alert envelope' encompasses 'an at least two dimensional region whose boundaries are determined as a function of the flight path angle, look ahead distance and terrain floor boundary.' ... one of skill in this art would agree that the claim defines this term adequately without additional limitations." Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al., 488 F.3d 982 (Fed. Cir. 2007). 1599

"equal peers" — "mean[s] that nodes must have direct access to all other nodes in the network so that all data frames transmitted by each node are 'heard' by all other nodes." Datapoint Corp. v. Standard Microsystems Corp., et al., 31 Fed. Appx. 685 (Fed. Cir., Feb. 15, 2002). 1601

"said second clock signal is generated to have a clock period such that the time to provide said plurality of destination pixel data is equal to a period to receive said source pixel data in said source image frame" — "require[s] an equality of the periods to receive the source image frame and to provide the destination image frame." MStar Semiconductor, Inc. v. International Trade Commission, et al., 183 Fed. Appx. 957 (Fed. Cir., May 25, 2006) (unpublished). 1602

"erasing said video product" — "at the user site, removing or obliterating the downloaded and stored video data; this does not include scrambling or other methods of limiting access to the video product." American Patent Development, Corp., LLC v. MovieLink, LLC, 604 F. Supp. 2d 704 (D. Del. 2009).1604

"an error code correction and detection subsystem" — "a subsystem capable of performing error correction and detection on two different data formats." Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34422 (N.D. Cal., Sept. 9, 2005).1605

"generating ... error correcting codes" — "Although one skilled in the art may view the reference to 'correcting' instead of 'detecting' as an obvious error, the claim cannot be rewritten by the Court to correct this error." Intel Corp. v. Altima Communications Inc., 275 F. Supp. 2d 1236 (E.D. Cal. 2003).1606

"scan processing error flags" — "These flags, measures, and tests mentioned in the written description are indeed signals. However, they are particular types of signals used for a particular purpose. A computer conducts the image processing and slide suitability scoring, so the signals must be electronic. The thirteen suitability tests are, at their essence, computer software mechanisms that indicate when an error has been detected. To construe 'scan processing error flags' to include any other type of signal, is inconsistent with the specification and the claims." Cytyc Corp. v. Tripath Imaging, Inc., et al., 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005).1608

"error indicator" — "a device that indicates if a compartment has not been placed in a location, or if the compartment has not been placed in a location within a predetermined amount of time." Aguayo, et al. v. Universal Instruments Corp., 2003 U.S. Dist. LEXIS 27846 (S.D. Tex., Jun. 9, 2003).1609

"having an output providing an amplified signal that has essentially the same wave shape as the input signal" — "The parties dispute whether this functional language necessarily requires that the claims only cover devices that achieve fine modulation of the output signal or whether the language merely states the normal function of any amplifier, i.e., creating an output signal that is similar to, but larger than, an input signal. We conclude that it is the latter." Thomcast A.G. v. Continental Electronics Corp., 1997 U.S. App. LEXIS 30444 (Fed. Cir., Nov. 5, 1997) (unpublished).1610

"establish a communication link between said remote home base and said plurality of various job sites" — "establish communication connections between the remote base and each of the various job sites." Key Energy Services, Inc. vs. C.C. Forbes, LLC, et al., 2010 U.S. Dist. LEXIS 67292 (E.D. Tex., Jul. 7, 2010). 1613

"establish[ing] patient-specific rules associated with each of the geographically dispersed hospitalized patients" — "establish[ing] patient-specific rules for each of the individual, geographically dispersed hospitalized patients." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009). 1613

"establishing the spatial relationship" — "Such a minimal dropping of an unenabled reference to an undeveloped system does not support a claim to it. We accordingly conclude that the court did not err by excluding an optical tracking system from its claim construction." Medtronic Navigation, Inc., et al. v. Brainlab Medizinische Computersystems GmbH, et al., 2007 U.S. App. LEXIS 2521 (Fed. Cir. 2007) (unpublished). 1614

"subcarrier-indexed estimates of transmission quality" — "does not require that the measurements of the estimates be determined by any of the four factors enumerated in the preamble." Globespanvira, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005). 1615

"etch" — "a process or processes for removing one or more materials using chemical and/or physical means." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 1616

"etching" — "the process for removing material in a specified area through a wet or dry chemical reaction, or by physical removal, such as by sputter etch." Agere Systems Inc. v. Atmel Corp., 2003 U.S. Dist. LEXIS 9823 (E.D. Pa., May 23, 2003). 1618

"etching the exposed portion of the second semiconductor film" — "removing the entire exposed portion of the second semiconductor film." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006). 1620

"evaluating" — "encompasses determining for each bill whether that bill's value can be determined." Cummins-Allison Corp. v. Glory, Ltd., et al., 457 F. Supp. 2d 843 (N.D. Ill. 2006). 1622
"an automatic operation position wherein the comb moves toward the discharge position automatically upon the occurrence of a predetermined event" — "On its face, the claim does not limit the predetermined event to a cat exit." Lucky Litter LLC v. International Trade Commission, et al., 2010 U.S. App. LEXIS 20621 (Fed. Cir., Oct. 6, 2010) (unpublished). 1623

"event timer" — "at least nonvolatile memory and logic for storing 'event timer information sequences' that are used to control the recording of a television program." SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870 (Fed. Cir. 2004). 1627

"non-time based events" — "changing states when prompted by events that are not based on time and excluding the use of delays, buffers and time windows to control bid acceptances in order to control the amount of processing." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 1630

"every node coupled to the communication medium" — "is meant to refer only to nodes that are included in the 'plurality of nodes' that is called for by the claim language. Characteristics of other nodes on the network that are not included in the 'plurality of nodes' are irrelevant to the claimed 'computer communication system.'" Intel Corp. v. Broadcom Corp., 2001 U.S. Dist. LEXIS 23106 (D. Del., Dec. 6, 2001). 1631

"exact geographic location" — "a position in longitude and latitude, not determined using signal strength or cellsite location location techniques, having a degree of accuracy and precision typical of GPS and LORAN systems available at the time of invention." EMSAT Advanced Geo-Location Technology, et al. v. MetroPCS Communications, Inc., et al., 2010 U.S. Dist. LEXIS 62196 (E.D. Tex., Jun. 23, 2010). 1632

"examination data" — "the Court construes 'examination data' to mean 'information that is the actual physical examination by the physician and any tests or procedures ordered or provided that becomes the basis for the patient's medical record and required documentation.' ... [U]sing the verb conjugation 'becomes' here helps ensure that the patient's medical record and required documentation are based on all the information that makes up examination data, not merely the tests or procedures." Prompt Medical Systems, L.P. v. McKesson Corp., 2006 U.S. Dist. LEXIS 54808 (E.D. Tex., July 21, 2006). 1633
"first examination results"; "second examination results" — "the term 'examination results' ... mean[s] 'information regarding one or more workspace elements obtained by examining those workspace elements.' The terms 'first' and 'second' require no construction." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).\footnote{1634}

"examining the payload portion of the packet data" — "examining at least the payload portion of the packet data." Widevine Technologies, Inc. v. Verimatrix, Inc., 2009 U.S. Dist. LEXIS 102768 (E.D. Tex., Nov. 4, 2009).\footnote{1635}

"excess cash" — "an amount selected by the payor beyond the total amount owed at the point of sale." Every Penny Counts, Inc. v. American Express Co., et al., 563 F.3d 1378 (Fed. Cir. 2009).\footnote{1636}

"excessive bandwidth packet" — "a packet transmitted at a rate greater than the subscribed rate." Lucent Technologies, Inc. v. Extreme Networks, Inc., et al., 367 F. Supp. 2d 649 (D. Del. 2005).\footnote{1637}

"exchanging" — "giving up something for something else." Flash Seats, LLC v. Paciolan, Inc., 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010).\footnote{1638}

"excitation" — "as a noun [] mean[s] 'an input signal of a system or apparatus without additional values,' and as an adjective [] mean[s] 'relating to an input signal of a system or an apparatus without additional values.'" AT&T Corp. v. Microsoft Corp., 2003 U.S. Dist. LEXIS 10716 (S.D.N.Y., Jun. 23, 2003).\footnote{1639} "Upon reconsideration, this Court reconstrues the term 'excitation' when used as a noun to mean 'an input signal of a system or apparatus that does not require use of voiced/unvoiced coded signals and a noise generator,' and when used as an adjective to mean 'relating to an input signal of a system or apparatus that does not require use of voiced/unvoiced coded signals and a noise generator.'" Id., 2004 U.S. Dist. LEXIS 2394 (S.D.N.Y., Feb. 19, 2004).\footnote{1640}

"excludes relationship" — "a relationship that causes the elements of the right-hand side of the relationship to be excluded when all elements of the left-hand side are already included." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005).\footnote{1641}

"exclusion" — "a color range or a color range in combination with pixel locations that determines which pixels are not to be enhanced." Sportvision, Inc. v. Sportsmedia Technology Corp., 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).\footnote{1642}

"executable application" — "any computer program code, that is not the operating system or a utility, that is launched to enable an end user to directly interact with data." Eolas Technologies, Inc., et al. v. Microsoft Corp., 399 F.3d 1325 (Fed. Cir. 2005).\footnote{1643}

"executable code" — "a type of software that a processor or hardware device can directly execute." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).\footnote{1644}
"associating an executable file with the part number of the selected choice, the executable file for use during manufacture of the computer system" — "associating a program that is ready to run on a computer with the part number of the selected choice which program is used during manufacturing of the computer system and cannot be a macro (i.e., a symbol, name, or key that represents a list of commands, actions, or keystrokes) or query (i.e., a request for information from a database)." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).1645

"executable play list" — "a play list that can be played automatically." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007).1646

"executable program instruction" — "a computer program that directs a client or server to perform certain operations." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009).1648

"execute concurrently" — "play simultaneously, i.e. at once, through a multitasking operating system where each task is a game. One of those games could operate in the background while the other is played with human interaction." FortuNet, Inc., et al. v. Melange Computer Services, et al., 412 F. Supp. 2d 1071 (D. Nev. 2006).1651

"a window object executes within ... said web browser client" — "means that the window object runs inside the client." CA, Inc. v. Simple.com, Inc., et al., 2009 U.S. Dist. LEXIS 25241 (E.D.N.Y., Mar. 5, 2009).1652

"executing a trade of the security based on information contained in the offer for consideration specified in the reply to the offer, whereby the security is traded efficiently between the first [offering] individual and the second [replying] individual" — "changing a memory location to indicate that an agreement had been reached between the two [trading] individuals." Minton v. National Association of Securities Dealers, Inc., et al., 336 F.3d 1373 (Fed. Cir. 2003).1653

"executing an installation process that generates at the client a permission that is locked uniquely to the client and that may be found by a later execution of the access checking process" — "running an installation program that creates a permission locally, which permission is (1) locked uniquely to the client and (2) capable of being found locally by a later execution of the access checking process." Digital Reg of Texas, LLC. v. LFP Internet Group, LLC, et al., 2009 U.S. Dist. LEXIS 59610 (E.D. Tex., Jul. 13, 2009).1654

"executing said student tasks" — "performing student tasks." Better Education, Inc. v. eInstruction Corp., et al., 2010 U.S. Dist. LEXIS 40972 (E.D. Tex., Apr. 27, 2010).1655
"executing the play list"; "presenting the works on a ... play list" — "automatically playing the works in the play list." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007). \textsuperscript{1656}

"said opening further causing the execution of the executable software to initiate automatic generation and transmission of said return receipt to said first computer" — "requires that the executable software itself actually generate and transmit the return receipt." PostX Corp. v. Secure Data In Motion, Inc., 2003 U.S. Dist. LEXIS 25754 (N.D. Cal., Nov. 25, 2003). \textsuperscript{1658}

"existing routing mechanisms" — "the routing mechanisms used by the underlying network." Cable & Wireless Internet Services, Inc. v. Akamai Technologies, Inc., 272 F. Supp. 2d 912 (N.D. Cal. 2003). \textsuperscript{1659}

"existing schedule" — "an association of financial card term data with the applicant ratings established by the financial institution as necessary to become eligible for those particular financial card terms." Block Financial Corp. v. LendingTree, Inc., 2007 U.S. Dist. LEXIS 72332 (W.D. Mo., Sept. 27, 2007). \textsuperscript{1660}

"exit station" — "a portion of the processing machine where wafers are moved after processing and from which said wafers exit the processing machine." Nova Measuring Instruments, Ltd. v. Nanometrics, Inc., 2006 U.S. Dist. LEXIS 90736 (N.D. Cal., Dec. 1, 2006). \textsuperscript{1661}

"expanded instruction decoder" — "a decoder that 'redefines' or 'translates' the native instruction identified as N bits of the expanded RISC instruction, using M bits of the expanded RISC instruction, thereby enabling the instruction set of the microprocessor of the computer to emulate the instructions of a target computer." TechSearch L.L.C. v. Intel Corp., 286 F.3d 1360 (Fed. Cir. 2002). \textsuperscript{1662}

"expanding the received set of reference cell values" — "means a process for generating a complete set of values for the digital words based on the reference cell values that have been received up to that point in time." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). \textsuperscript{1663}

"expert system" — "a software program operating on a set of rules which can be automatically updated based upon successful sales approaches." SFA Systems, LLC v. Infor Global Solutions (Michigan), Inc., et al., 2009 U.S. Dist. LEXIS 13705 (E.D. Tex., Feb. 23, 2009). \textsuperscript{1664}

"expert system knowledge base" — "the Court defines 'expert system' and 'knowledge base' separately. 'Expert system' should be defined as software that solves problems through selective application of rules in the knowledge base. 'Knowledge base' should be defined as a portion of an expert system software having a set of rules and embodying expert knowledge of highly skilled VLSI designers." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005). \textsuperscript{1665}

"exposure apparatus" — "a structure used in the photolithographic projection processes to form or to transfer a pattern of a semiconductor integrated circuit, or a liquid crystal device, or the like onto a substrate." *Nikon Corp., et al. v. ASM Lithography B.V.*, 308 F. Supp. 2d 1039 (N.D. Cal. 2004).1667

"an extended mathematical element coupled to the data path and programmable to implement additional mathematical operations at substantially peak data throughput" — "a programmable unit coupled to the data path that performs additional mathematical operations other than addition, subtraction, multiplication, division, and other floating point operations at substantially peak data throughput." *Microunity Systems Engineering, Inc. v. Dell, Inc., et al.*, 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).1670

"extending laterally from said contact toward said light sensing element" — "the charge sink means, as interpreted by the court, must extend parallel to the top surface and perpendicular to a contact toward the light sensing element." *Loral Fairchild Corp. v. Victor Co. of Japan, Ltd., et al.*, 906 F. Supp. 798 (E.D.N.Y. 1995).1671

"external memory device" — "external memory is memory that is connected to the computer (as 'computer' is used in claim 1), that is, it is external to the computer, not external to the casing in which the computer is housed. Thus a disk drive or CD ROM which is 'housed' in the same casing as the computer would still be external memory under the Court's interpretation since it is not part of the computer, but rather is accessible to the computer." *Pickholtz v. Rainbow Technologies, Inc., et al.*, 2000 U.S. Dist. LEXIS 21945 (N.D. Cal., Apr. 28, 2000).1674

"external modulator" — "a modulator that acts on the optical carrier signal output from a signal emitter, as opposed to acting on the signal emitter itself." *CIENA Corp., et al. v. Corvis Corp.*, 334 F. Supp. 2d 598 (D. Del. 2004).1675

"externally coupled to said bus" — "externally coupled to said bus via either the diagnostic port or the wiring harness." *Adrain v. Superchips, Inc.*, 2006 U.S. Dist. LEXIS 25212 (S.D. Tex., March 14, 2006).1676 "The plain language of this term means that the module is physically connected to the bus of the fixed system by a direct connection from outside of the fixed system." *Adrain v. Hypertech, Inc.*, 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002).1677
"extract" — "to select and obtain nontextual electronic information from a hard copy document (e.g., scanning a hard copy document) and/or to convert nontextual electronic information into a textual form." Eon-Net, L.P. v. Flagstar Bancorp, Inc., 2009 U.S. Dist. LEXIS 24080 (W.D. Wash., Mar. 4, 2009). 1678

"extracting a correction condition" — "creating a value or data set to be used to affect the determination of a current working condition." Advanced Micro Devices, Inc., et al. v. Samsung Electronics Co., Ltd, et al., 2009 U.S. Dist. LEXIS 91536 (N.D. Cal., Sep. 17, 2009). 1680

"extracting information from said magnetic field variation measure as a function of time utilizing said functional relationship being employed" — "extracting information from the measure of the variation in the magnetic field as a function of time utilizing the association being employed, wherein the association functions to relate a variation in the magnetic field with an item of information." Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al., 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006). 1681

"extraction circuit outputting a plurality of data segments, each of which being selected from a respective one of said plurality of data frames"; "extraction circuit selecting each of a plurality of data segments from a respective one of said plurality of frames" — "a circuit extracting a data segment from each of a plurality of data frames." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006). 1682

"extracts data" — "no reasonable person, and certainly not someone with ordinary skill in the art, would think that the term 'extract' as used in the patent involves erasure. This term need not be construed." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006). 1683

- F -

"facsimile"; "facsimile protocol" — "image data transmitted using facsimile protocol on the switched telephone network"; "the standardized procedure that governs the transmitting and receiving of facsimile messages over the switched telephone network." Catch Curve, Inc. v. Venali, Inc., 2007 U.S. Dist. LEXIS 93667 (C.D. Cal., May 11, 2007).[1686] "[E]ven if the district court's claim construction was unduly restrictive with respect to the use of fax protocol in every phase of the communication process, it was not in error with respect to the requirements that the communications take place over a switched telephone network and that the fax messages be delivered to a traditional fax machine or a proxy for such a machine by fax protocol over a switched telephone network." Id., 2010 U.S. App. LEXIS 1401 (Fed. Cir., Jan. 22, 2010) (unpublished).[1687]

"facsimile transceiver" — "A facsimile transceiver is used which includes a scanner that scans a printed image on a piece of paper and turns the image into digitized information. The facsimile transceiver also has a printer which allows the facsimile transceiver to take digitized information, such as a digitized picture or words, and print the picture or words on a piece of paper." Kirsch, et al. v. AOE Ricoh, Inc., et al., 2004 U.S. Dist. LEXIS 31070 (E.D. Mich., Oct. 8, 2004).[1690]

"fault-monitoring data" — "data concerning the status or operating condition of one or more POL regulators used to determine if there is a fault." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007).[1692]

"feedback signal" — "a signal that is indicative of feedback." O2 Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006).[1695]

"a feedback signal indicative of an electrical condition at a cold cathode fluorescent lamp load" — "an electrical signal that can be used to determine an electrical condition at a cold cathode fluorescent lamp load." O2 Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006).[1697]

"ferromagnetic" — "a material that exhibits ferromagnetism, but, in the absence of an applied external magnetic field, is not magnetized." Fargo Electronics, Inc. v. Iris Ltd., Inc., 2005 U.S. Dist. LEXIS 34493 (D. Minn., Nov. 30, 2005).  

"objects fetched from said clients" — "has only one plain meaning to those of skill in the art: that clients are the source of the objects." Teknowledge Corp. v. Akamai Technologies Inc., 2004 U.S. Dist. LEXIS 18779 (N.D. Cal., Sept. 11, 2004).  

"field of view information from a camera" — "information from at least one field view sensor, which can be used to determine what the camera sees." Sportvision, Inc. v. Sportsmedia Technology Corp., 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).  

"field stop regions in said substrate having edges defining the sides of said channel for said memory device and for separating each of said memory cells from others of said memory cells in said array" — "the field stop regions ... need only define the sides, and not necessarily the ends, of the memory cell. ... The patent requires that there must be field stop regions ... that completely separate cells from at least some other cells." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998).  

"field view sensors" — "sensors that provide information about the area being viewed by the camera." Sportvision, Inc. v. Sportsmedia Technology Corp., 2006 U.S. Dist. LEXIS 8995 (N.D. Cal., Feb. 17, 2006).  

"plurality of data input fields" — "data input fields, occurring at various locations, as requested by the computer application or program." SP Technologies, LLC, v. Garmin International, Inc., et al., 2009 U.S. Dist. LEXIS 94953 (N.D. Ill., Oct. 9, 2009).  

"file" — "electronically stored or transmitted information or data." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009).  

"file retrieval requests prepared"; "preparing reply messages" — "are unambiguous and need not be construed by the court." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004).1712

"file server means for receiving data from said media means, receiving data inquiries and transmitting data in response to said data inquiries" — "Because the 'file server means' element does not qualify for section 112(6) treatment, it is not limited to the structure corresponding to the claimed function as 'described in the specification and equivalents thereof.' 35 U.S.C. § 112, P 6. Instead, this Court construes the term in accordance with standard claim construction rules." Keithley v. HomeStore.com, Inc., et al., 2007 U.S. Dist. LEXIS 71126 (N.D. Cal., Sept. 10, 2007).1713

"fileservr" — "a networked device or program that manages access to one or more separately stored files." Diego, Inc. v. Audible, Inc., 2006 U.S. Dist. LEXIS 22715 (W.D. Wash., March 27, 2006).1714

"filing electronically" — "submitting or transmitting to a taxing authority by means of a computer without manual intervention from the user." Simplification, LLC v. Block Financial Corp., et al., 593 F. Supp. 2d 700 (D. Del. 2007).1716

"film" — "a thin layer of material. A film may have voids, cracks, or other discontinuities." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).1720

"filter conditions" — "limitations or conditions that determine which of the network vendors will receive a buyer's request for quotation and/or which buyers will receive a response from a network vendor." Source Search Technologies, LLC v. Lending Tree, LLC, et al., 2006 U.S. Dist. LEXIS 79651 (D.N.J., Oct. 16, 2006).1721
"filter means" — "a computer programmed to apply or compare specified conditions to an item(s) of information to determine if the condition is met or not by the item(s) of information."  Source Search Technologies, LLC v. Lending Tree, LLC, et al., 2006 U.S. Dist. LEXIS 79651 (D.N.J., Oct. 16, 2006).

"final results file" — "a file that includes one or more records or fields from the first intermediate results file and one or more records from the second intermediate results file."  Jardin v. Datallegro, Inc., et al., 2010 U.S. Dist. LEXIS 105502 (S.D. Cal., Oct. 4, 2010).

"financial card" — "a tangible piece of plastic or similar material issued by a financial institution that authorizes the cardholder to purchase goods and services on credit or by debiting a bank account, for example, a credit card or debit card."  Block Financial Corp. v. LendingTree, Inc., 2007 U.S. Dist. LEXIS 72332 (W.D. Mo., Sept. 27, 2007).

"financial card terms" — "terms that relate to a financial card offer, e.g., type of offer, interest rate, fees, APR, credit limit, incentive programs, etc., that are pre-set by the financial institution and presented to consumers for consideration in deciding whether to accept the offer."  Block Financial Corp. v. LendingTree, Inc., 2007 U.S. Dist. LEXIS 72332 (W.D. Mo., Sept. 27, 2007).

"financial schedule" — "a kind of document (whether a paper document or electronic file) that data comes from."  Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006).

"financial transaction" — "The electronic transfer of funds, or the electronic inquiry as to funds, using an electronic funds transfer (‘EFT’) system such as an ATM system or a point of sale (‘POS’) system. Such electronic transfer of funds, or electronic inquiry as to funds, being characterized by both a transaction type and a plurality of transaction parameters."  IPXL Holdings, L.L.C. v. Amazon.com, Inc., 333 F. Supp. 2d 513 (E.D. Va. 2004).

"firewall" — "software and/or hardware for protecting an organization's network against external threats, such as hackers, coming from another network, such as the Internet. A firewall prevents computers in the organization's network from communicating directly with computers external to the network and vice versa by routing all communications through a proxy server outside of the organization's network for a determination whether a particular message or file will be permitted to pass through to the organization's network."  Visto Corp. v. Sproqit Technologies, Inc., 413 F. Supp. 2d 1073 (N.D. Cal. 2006).

"firewall" — "software and/or hardware for protecting an organization's network against external threats, such as hackers, coming from another network, such as the Internet."  Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).

"firing time information" — "intelligence used to indicate when a given instruction may be executed."  Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).
"first"; "second" — "the terms 'first' and 'second' are used to distinguish repeated instances of the same element or limitation." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010).1732

"first ... and [] second light beam" — "two beams of light that are, for some portion of their paths, separate and discrete." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004).1734

"first clock signal" — "the [] patent does not limit 'a first clock signal' to only one clock." Crystal Semiconductor Corp. v. Tritech Microelectronics International, Inc., 246 F.3d 1336 (Fed. Cir. 2001).1735

[i] "first external clock signal"; [ii] "second external clock signal" — [i] "a periodic signal received by the memory device from an external source to provide first timing information"; [ii] "a periodic signal received by the memory device from an external source to provide second timing information that is different from the first timing information." Rambus Inc. v. Infineon Technologies AG, et al., 2001 U.S. Dist. LEXIS 10990 (E.D. Va., Mar. 15, 2001); Hynix Semiconductor Inc., et al. v. Rambus Inc., 2004 U.S. Dist. LEXIS 23230 (N.D. Cal., Nov. 15, 2004).1736

"a first fraction of a clock pulse interval" — "the term 'first' does not refer to the beginning of a clock pulse interval. Instead, it refers to the first 'fraction,' that is, before another 'fraction' in time." U.S. Philips Corp. v. Atmel Corp., et al., 2004 U.S. Dist. LEXIS 5832 (S.D.N.Y., Apr. 2, 2004).1737

"first-order low-pass filter section"; "second-order low-pass filter section" — "are not indefinite and they do not require specific construction by the court." Pulse Engineering, Inc. v. Mascon, Inc., 2009 U.S. Dist. LEXIS 26885 (S.D. Cal., Mar. 9, 2009).1740

"first/second response unit means" — "While the claim language requires two functionally distinct response units, the claim language does not appear to require that the first and second response unit means reside in physically separate structures." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003).1741

"a first signal part and a second signal part" — "to separate the unmodulated optical signal into at least two parts." Cheetah Omni LLC v. Samsung Electronics America, Inc., 2009 U.S. Dist. LEXIS 119541 (E.D. Tex., Dec. 21, 2009).1742

"a first addressable memory area ... a second addressable memory area ... a second addressable memory area" — "requires three separate addressable memory areas." Quantel Ltd. v. Adobe Systems Inc., 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997). 1746

[i] "first command interpreter"; [ii] "second command interpreter" — [i] "a software program for interpreting an inquiry from a host device and sending a signal to the host device in response to the inquiry, which signal tells the host computer that the interface device is an input/output device customary in a host device regardless of the type of transmit/receive device attached to the interface device"; [ii] "a software program for translating data request commands from the host device into data transfer commands understandable by a plurality of dissimilar data transmit/receive devices." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009). 1747

[i] "first connecting device"; [ii] "second connecting device" — [i] "a physical socket or plug for permitting a user to attach and detach the interface device to and from a host device/computer"; [ii] "a physical plug or socket for permitting a user readily to attach and detach the interface device with a plurality of dissimilar data transmit/receive devices." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009). 1748

"first data processing element, coupled to the system bus [means], for processing data from primary memory" — "Because this issue has been resolved via the construction of 'system bus,' no construction of 'first data processing element' or 'first data processing element coupled to the system bus for processing data from the main memory' is necessary." Intergraph Hardware Technologies Co. v. Toshiba Corp., et al., 508 F. Supp. 2d 752 (N.D. Cal. 2007). 1749

"first header having parameters stored therein for use by said audio player in decoding said digitally encoded music stored in said memory" — "a single data structure that includes information used by the audio player to decode digitally encoded music stored in memory." Sandisk Corp. v. LSI Corp., 2010 U.S. Dist. LEXIS 24973 (N.D. Cal., Mar. 17, 2010). 1750

"first layer to be etched" — "a layer of a semiconductor device from which some amount of material is removed in order to create a pattern in the layer. The first layer may consist of any type of material and need not be present in the completed device." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 1751

"first message" — "a signaling message that is distinct from the second message." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007). 1752
"a first metallization layer comprising aluminum being defined overlying said gate region" — "a metallization layer that includes aluminum, at least a portion of which is specifically deposited overlying at least a portion of the polysilicon layer directly above either the channel or field region."  IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).  

"a first metallization layer comprising aluminum having portion overlying said polysilicon layer"; "a first metallization layer comprising aluminum having a portion overlying a portion of said polysilicon layer" — "a metallization layer that contains aluminum at least a portion of which is overlying at least a portion of the polysilicon layer."  IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).  

"first state of circuit operation"; "second state of circuit operation" — "the first state of operation can be linked to high load currents, and the second state can be linked to low load currents, although the states of operation do not necessarily have to be linked to a high or low load current."  Linear Technology Corp. v. International Trade Commission, et al., 566 F.3d 1049 (Fed. Cir. 2009).  

"fixed frequency" — "is not a technical term and can be understood according to its plain and ordinary meaning. Accordingly, the Court declines to construe this term."  Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).  

"fixed level control signal" — "a constant level, that is, one which does not vary according to external temperature; and a signal simply means an electrical characteristic that carries information."  Control Resources, Inc. v. Delta Electronics, Inc., et al., 133 F. Supp. 2d 121 (D. Mass. 2001).  

"flat panel display device" — "a display device having at least a flat display panel sandwiched by the first and second frames."  LG Philips Co., Ltd. v. Tatung Co., et al., 2007 U.S. Dist. LEXIS 43557 (D. Del., June 15, 2007).  

"flight management computer" — "a computer capable of receiving flight critical data from navigation databases files."  Harris Corp. v. Federal Express Corp., 2010 U.S. Dist. LEXIS 3424 (M.D. Fla., Jan. 12, 2010).  

"floppy diskette controller" — "The claims of the '002 and '222 patents are not limited to a system or method in which the FDC [floppy diskette controller] is controlling a 'floppy diskette' as that term was defined for '414 patent; other types of spinning storage media may be employed."  Phillip M. Adams & Associates, LLC v. Dell, Inc., et al., 2010 U.S. Dist. LEXIS 68749 (D. Utah, Jul. 9, 2010).  

- 163 -
"flowing process fluids sequentially and continuously" — "means that process fluids flow past the wafers one after another and that the term 'continuously' requires an uninterrupted flow of the process fluids." *CFMT, Inc., et al. v. YieldUP International Corp.*, 92 F. Supp. 2d 359 (D. Del. 2000).\(^{1763}\)

"following a previously computed form line having been defined using positioning information derived from earlier received GPS data and a swathing offset" — "following a previously computed path across the area to be treated, where the path was computed using geographical positions computed from earlier received GPS satellite data transmissions and a distance determined by the effective width of a towed implement." *Trimble Navigation Ltd. v. RHS, Inc.*, *et al.*, 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007).\(^{1764}\)

"maintaining the first channel signal separate and apart from the second channel signal following the step of altering the amplitude and shifting the phase" — "requires the two signals to be maintained separate and apart beginning immediately after the amplitude is initially altered and the phase is initially shifted." *Desper Products, Inc., et al. v. QSound Labs, Inc.*, 157 F.3d 1325 (Fed. Cir. 1998).\(^{1765}\)

"for" — "There is no need to inject verbiage into such a straightforward and ordinary term." *PageMelding, Inc. v. Feeva Technology, Inc., et al.*, 2009 U.S. Dist. LEXIS 80886 (N.D. Cal., Aug. 19, 2009).\(^{1766}\)

"a statistical decoder coupled to said I/O port for decoding variable-length-encoded compressed video signals"; "I/O circuitry coupled to said I/O port, for providing processed video signal to said I/O port, and for accepting a processed video signal from said I/O port"; "a pixel interpolator for generating values representing pixels interstitial to pixel values represented by said processed video signal" — "The court finds that the 'statistical decoder,' 'I/O circuitry,' and 'pixel interpolator' of claim 10 are not means-plus-function elements." *Intel Corp. v. Broadcom Corp.*, 172 F. Supp. 2d 516 (D. Del. 2001).\(^{1768}\)

"for electrical connection" — "any combination of contact arm(s) and/or the spring makes the electrical connection with the first terminal of the battery." *Invisible Fence, Inc. v. Perimeter Technologies, Inc.*, 2006 U.S. Dist. LEXIS 33792 (N.D. Ind., May 25, 2006).\(^{1769}\)

"for increasing bandwidth said first colors are gradually replaced with a single second color until, at large bandwidths, only said single second color is assigned to the display" — "as bandwidth increases continuously or in regular steps, said first colors are replaced continuously or in regular steps, with a single second color until, at large bandwidths, only said single second color is assigned to the display." *General Electric Co., et al. v. Sonosite, Inc.*, 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).\(^{1770}\)

"includes data for locating the personal computer" — "includes data from which it can determine how to direct communications to the personal computer." *01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al.*, 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).\(^{1771}\)
"a variable speed wind turbine controller, responsive to the sensed signals indicative of generator speed and generator electrical power output, for providing a generator torque command signal for commanding maneuvers" — "the variable speed controller must be responsive to sensed signals of generator velocity and electrical power output for the purpose of providing torque command signals." Gamesa Eólica, S.A. v. General Electric Co., 359 F. Supp. 2d 790 (W.D. Wis. 2005). 1772

"category for providing information" — "a category for network pages that have as a purpose the provision of information, for example, network pages that contain articles, journals, or publications." Iconfind Inc. v. Yahoo! Inc., 2009 U.S. Dist. LEXIS 115923 (E.D. Cal., Dec. 14, 2009). 1773

"signal conditioning units ... for receiving electronic signals produced by the keyboard and mouse and for creating a serial data packet that includes the electronic signals" — "I conclude that there is sufficient structure so as to avoid the application of § 112, P6." Apex Inc. v. Raritan Computer, Inc., 2005 U.S. Dist. LEXIS 4017 (S.D.N.Y., Mar. 11, 2005). 1774

"for storing the received programs, and for subsequently playing the video programs" — "for storing the entire received program and for playing the video program after storage is complete." USA Video Technology Corp. v. Time Warner Cable, Inc., et al., 2007 U.S. Dist. LEXIS 92578 (E.D. Tex., Dec. 12, 2007). 1775

"for use in transferring data between a flash memory module and a user's computer" — "the court concludes that this phrase requires no construction and rejects the defendants' proposed limitations." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006). 1777

"form line" — "a path across the area to be treated." Trimble Navigation Ltd. v. RHS, Inc., et al., 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1778

"form line following information corresponding to the updated form line" — "the recomputed path across the area to be treated that is to be followed." Trimble Navigation Ltd. v. RHS, Inc., et al., 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1779

"form line having been defined" — "path across the area to be treated that has been computed." Trimble Navigation Ltd. v. RHS, Inc., et al., 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 1780

"form set" — "According to the trial court's construction, 'form set' includes 'single-ply' form sets. The government argues that 'form set' must be interpreted to exclude 'single-ply' form sets because, it says, the claim language itself recites and the specification discloses more than one 'sheet' in every form set described. ...We agree with the trial court." Paymaster Technologies v. United States, 2006 U.S. App. LEXIS 11325 (Fed. Cir. 2006) (unpublished). 1781

"format" — "a data transmission characteristic that is defined in terms of 'data architecture' and/or the 'rate of data transmission.' The 'rate of data transmission' is defined in the specification as 'the rate at which data bits are transmitted from source node to destination node.' 'Data architecture' is defined in the specification 'by one or more of the following data transmission characteristics: encoding, encryption, compression, and protocol.' Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 478 (D. Del. 2001).1783

"format set" — "a collection of individual formats for a node consisting of at least one format." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 478 (D. Del. 2001).1784

"a format specified by the institution" — "In sum, in its determination that 'a format specified by the institution' requires an unlimited number of formats, the district court defined 'format' too narrowly by limiting it to any 'file format' and erroneously imported the term 'any' into the claim language, ignoring the ordinary meaning of the term 'a.'" Collegenet, Inc. v. ApplyYourself, Inc., 418 F.3d 1225 (Fed. Cir. 2005).1785

"type of formatting" — "a layout or presentation of text and/or graphics on a page." Dow Jones & Co., Inc. v. Ablaise, Ltd., et al., 2007 U.S. Dist. LEXIS 49750 (D.D.C., July 11, 2007).1786

"formatting data" — "HTML tags, which specify the location of text and/or graphics on a page." Dow Jones & Co., Inc. v. Ablaise, Ltd., et al., 2007 U.S. Dist. LEXIS 49750 (D.D.C., July 11, 2007).1787

"is formed" — "The plain language of the claim requires that the step of encoding is performed, not simply that the values have the characteristic of having been encoded-phrase [5] requires that 'a first code value is formed' and phrase [6] requires that 'a second code value is formed.' Accordingly, the Court concludes that phrases [5] and [6] are limiting and, thus, that claim 38 requires both encoding and decoding." In re Compression Labs, Inc. Patent Litigation, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006).1790

"a plurality of memory cell transistors and a plurality of select transistors formed in said plurality of element regions" — "a plurality of memory cell transistors and a plurality of select transistors, each transistor of which is formed in one of said plurality of element regions." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006).1791

"formed of" — "the court gives the term 'formed of' its plain and ordinary meaning and finds no specific construction of this term is required." Pulse Engineering, Inc. v. Mascon, Inc., 2009 U.S. Dist. LEXIS 26885 (S.D. Cal., Mar. 9, 2009).1792

"a first strip formed of a first electrically conductive material having a resistance ..., the first material being carbon" — "The 'first material' refers to the first electrically conductive material, not to the entire first strip which may also include adhesives, fillers, or other materials, so long as they are not the primary conductive material." Stowe Woodward, L.L.C. v. Sensor Products, Inc., 2005 U.S. Dist. LEXIS 16479 (W.D. Va., Aug. 11, 2005).1793

"forming a contact plug comprising a conductive material which substantially fills said contact holes and which is in contact with said barrier layer" — "The hole is plugged and thereby substantially filled with a conductive material. This plug is in contact with the barrier layer." OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 15254 (N.D. Cal., Feb. 14, 2006).

"forming a first insulation layer over said plurality of first gate electrodes; forming implanted barrier regions in said semiconductor substrate in the intervals between said plurality of spaced-apart first gate electrodes, the edges of said implanted barrier regions being aligned with the vertical edges of the insulation layer on the respective first gate electrodes" — "By the literal language of the claim, the edges of the implantation barrier regions are aligned with the edges of the insulation layer; hence, the insulation layer must already be in place in order to align the barrier regions with it during ion implantation." Loral Fairchild Corp. v. Sony Electronics Inc., et al., 181 F.3d 1313 (Fed. Cir. 1999).

"forming a monochromatic image from a digital representation of a color image" — "converting, or transforming, a digital representation of a color image into a monochromatic image as described by the steps of the method." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).

"forming an adhesion and contacting layer of titanium at least in said holes, including along said walls, in contact with the underlying doped region" — "Titanium [must] be deposited in the contact holes so as to form an adhesion and contacting layer. This layer runs along the walls of the holes and contacts the underlying doped regions." OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 15254 (N.D. Cal., Feb. 14, 2006).

"to the extent data required to render said at least one spreadsheet has not been previously stored by said cache, said cache formulates a single query for transmission from said client across said network to said server" — "when data needed to generate the spreadsheet is not stored in the cache, combining requests for data into one package before sending it to the server." Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006).
"forward channel protocol"; "high speed downstream channel protocol" — "a set of rules for transmission of high speed data addressed to a remote link adapter." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).

"Fourier transform plane" — "a mathematically calculable plane generally corresponding to or substantially near the pupil plane of a projection optical system." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004).

"frame" — "a spatially complete image with respect to how it is displayed on the display device and an incomplete fractional image of the image to be displayed with respect to the image seen by the viewer." Crystal Image Technology, Inc. v. Mitsubishi Electric Corp., 2010 U.S. Dist. LEXIS 48290 (W.D. Pa., May 15, 2010).

"data frame"; "frames containing data" — "refers to frames formulated at or above the physical layer including both a source and destination address and comprising data communication between the nodes and not other physical layer signals that may exist on the network." Datapoint Corp. v. Standard Microsystems Corp., et al., 31 Fed. Appx. 685 (Fed. Cir., Feb. 15, 2002).

"frame segment descriptor" — "a descriptor identifying where the corresponding segment is in the host memory." 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007).

"frame store means for storing a frame" — "a store that is capable of storing data representing an entire frame of video and supplying pixels in the order in which they are scanned by the electron gun for display on the monitor at a rate sufficient to satisfy the refresh rate of the display monitor." Quantel Ltd. v. Adobe Systems Inc., 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997).

"data frames"; "frames" — "these terms do not require construction." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006).

"to freeze in said still frame buffer an image obtained by said at least one input device, and to receive a save command and in response thereto to save in said memory a frozen image" — "means what it says." Luma Corp. v. Stryker Corp., et al., 2005 U.S. Dist. LEXIS 40884 (S.D. W. Va., July 27, 2005).
"processing frequency" — "the speed at which the CPU operates." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).

"frequency jittering" — "varying the switching frequency of a switch mode power supply about a target frequency in order to reduce electromagnetic interference." Power Integrations, Inc. v. Fairchild Semiconductor International, Inc., et al., 422 F. Supp. 2d 446 (D. Del. 2006).

"frequency variation signal" — "an internal signal that cyclically varies in magnitude during a fixed period of time and is used to modulate the frequency of the oscillation signal within a predetermined frequency range." Power Integrations, Inc. v. Fairchild Semiconductor International, Inc., et al., 422 F. Supp. 2d 446 (D. Del. 2006).

"a signaling message ... from a narrowband communication system" — "the prosecution does not contain anything which could be construed as a clear disavowal of claim scope or an explicit characterization of an aspect of the invention to overcome prior art that 'from a narrowband system' means 'received in a format sent from a narrowband system.' ... no further claim construction is required." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007).

"read and process data in the identified packets from the buffer" — "the court construes 'from the buffer' to mean 'while the packets are in the buffer.'" 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007).

"fuel injection system component" — "is limited to a fuel filter." Honeywell International, Inc., et al. v. ITT Industries, Inc., et al., 452 F.3d 1312 (Fed. Cir. 2006).

"a full band broadcast signal" — "because the claim term 'full band broadcast signal' in Claim 13 has no meaning to one of skill in the art and is not defined in the '534 Patent, Claim 13 cannot be construed and is therefore indefinite." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).

"full-width data path" — "a data path on the memory module that is at least as wide as the path used by the central processing unit of the computer into which the module is installed." _Sun Microsystems, Inc. v. Dataram Corp._, 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997). 1827

"fully enabled mode"; "full version run" — "a mode/version that allows full use of the digital data or software in accordance with the license." _Uniloc USA, Inc., et al. v. Microsoft Corp._, 447 F. Supp. 2d 177 (D. R.I. 2006). 1828

"fully folded array" — "a memory storage array in which the level of organization of data is non-redundant and which contains regenerated data from a failed disk in the place of previously existing parity data corresponding to that regenerated data." _Hewlett-Packard Co., et al. v. EMC Corp._, 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004). 1829

"fundamental frequency detector" — "a mechanism that receives an input signal and, using a low-pass filter, generates a modified output signal representative of the fundamental frequency." _Square D Co., et al. v. E.I. Electronics, Inc._, 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010). 1834

- G -

"gallery" — "a representation of one or more items." _ADE Corp. v. KLA-Tencor Corp._, 220 F. Supp. 2d 303 (D. Del. 2002). 1835

"gaming machine" — "gaming device which is not limited to any particular type of game such as poker." Aristocrat Technologies, et al. v. International Game Technology, et al., 2009 U.S. Dist. LEXIS 40975 (N.D. Cal., May 14, 2009).  

[i] "gate electrode"; [ii] "source electrode" — [i] "a patterned, electrically conductive material that controls current flow through the channel between the source electrode and drain electrode"; [ii] "a patterned, electrically conductive material formed over the source region. Current flows through the channel between the source electrode and the drain electrode under the control of the gate electrode." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010).  

"gate electrode means on said gate insulation layer means and overlying said first and second channel regions" — "is properly construed to embrace any aluminum, polysilicon or other gate electrode." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001).  

"gate insulation layer means on said first surface, disposed at least on said first and second channel regions" — "is properly construed to embrace any gate insulation layer." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001).  

"gate line" — "a conductor that connects a plurality of gate electrodes." Sharp Corp. v. AU Optronics Corp., et al., 2005 U.S. Dist. LEXIS 44745 (N.D. Cal., Jun. 20, 2005).  

"gateway switch" — "[a] processor in an electronic mail system which connects other processors in that system and has additional functions for supporting other conventional aspects of the electronic mail system such as receiving, storing, routing, and/or forwarding electronic mail messages." NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282 (Fed. Cir. 2005).  

"gathering software agents" — "a software component and/or related data that once processed can be employed to locate and retrieve information from Internet destinations based on user or enterprise request." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).  

"gatherer" — "[because] 'gatherer' is a 'coined term lacking clear meaning,' the Court finds that the above element is written in means-plus-function form." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).
"a general coupon template" — "a generic form for a coupon which includes no site specific information with respect to the specific location where the site specific coupon is to be printed." Southwest Efuel Network, L.L.C. v. Transaction Tracking Technologies, Inc., 2009 U.S. Dist. LEXIS 103395 (E.D. Tex., Oct. 23, 2009). [1850]

"general purpose computer" — "The district court accepted the definition of "general purpose computer" that had been agreed by the parties; the court found that a RISC microprocessor does not meet that definition ... We do not discern error in this finding, for the term 'general purpose computer' was added to Hutchins' claims during prosecution in order to distinguish the '685 invention from prior art that showed similar devices with dedicated microprocessor units. This produced an estoppel against reading the term 'general purpose computer' to include a dedicated microprocessor such as a RISC." Hutchins v. Zoll Medical Corp., 2007 U.S. App. LEXIS 15809 (Fed. Cir., July 3, 2007). [1852]

"general purpose media processor"; "general purpose programmable media processor"; "media processor"; "programmable media processor"; "general purpose [multiple precision parallel operation] programmable media processor" — "a processor having an execution unit capable of operating on different media types and data sizes." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). [1853]

"general synchronization module" — "software routines or code that perform the task of determining whether a workspace element and/or an independently modifiable copy thereof has (or have) been modified, based on one or more criteria." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005). [1854]

"to generate" — "is commonly defined as 'to bring into being' or 'produce as a result of a chemical or physical process,' and in the context of computer science it is defined as 'to produce (a program) by instructing a computer to follow given parameters with a skeleton program.' ... This definition is consistent with the discussion of the term in the '961 patent." ResQNet.com, Inc. v. Lansa, Inc., 2002 U.S. Dist. LEXIS 16667 (S.D.N.Y., Sept. 5, 2002). [1857]

"generate a display" — "create a representation of an image that comprises graphics and/or text." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009). [1858]

"generate a fill signal" — "to generate a signal which fills voids by varying the input signal without solely modifying the on and off times of the signal carrying the image." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006). [1859]
"generate a message"; "generating a message" — "assemble/assembling information to create a message." *Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al.*, 518 F. Supp. 2d 1306 (D. Kan. 2007).\(^{1860}\)

"generate device control signals" — "to generate signals that control the device." *Digi International, Inc. v. Lantronix, Inc.*, 402 F. Supp. 2d 1041 (D. Minn. 2005).\(^{1861}\)

"wherein said second clock signal is generated to have a clock period such that the time to provide said plurality of destination pixel data is equal to a period to receive said source pixel data in said source image frame" — "requires only that a second clock signal be generated so as to be consistent with an equality of the source image frame and destination image frame periods." *MStar Semiconductor, Inc. v. International Trade Commission, et al.*, 183 Fed. Appx. 957 (Fed. Cir., May 25, 2006) (unpublished).\(^{1862}\)

"generating a bit stream" — "encompasses the creation of either serial or parallel bit streams." *Bell Communications Research, Inc. v. Fore Systems, Inc.*, 113 F. Supp. 2d 635 (D. Del. 2000).\(^{1865}\)

"generating a high voltage charge when a shockable rhythm is detected" — "initiating a charge in the high voltage generation circuit at the time that the device detects a shockable rhythm (or recognizes fibrillation)." *Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al.*, 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).\(^{1866}\)

"generating a signal based on the measured pressure in said chamber and providing said signal to said control module" — "generates a signal based upon the measured pressure in the chamber and provides that signal to the control module." *Automotive Technologies International, Inc. v. Delphi Corp.*, 2009 U.S. Dist. LEXIS 83187 (E.D. Mich., Sep. 11, 2009).\(^{1867}\)

"generating a transaction ID corresponding to the database entry"; "generating a unique transaction ID corresponding to the database entry" — "mean 'generating a unique identifier for a particular database entry'; the 'generating a transaction ID' step of the method [need not] occur[] before the 'creating a database entry' step." *Graphon Corp. v. Autotrader.com, Inc.*, 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007).\(^{1868}\)

"generating at least one reservation request" — "bringing into existence at least one reservation request." *PalmTop Productions, Inc. v. LO-Q PLC, et al.*, 450 F. Supp. 2d 1344 (N.D. Ga. 2006).\(^{1870}\)

"generating one or more reports from the test methodologies" — "using a computer to generate one or more reports based on the results of the test methodologies." Aser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009). 1872

"generating via said projector means a plurality of alignment images onto said display screen at predetermined locations" — "The alignment images are generated and projected onto the display screen at locations that are predetermined relative to the image being projected." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007). 1874

"generator of a voting session identifier for each voting session" — "a component of the voting machine (such as a processor, random number generator, processor with a random number generator) provides a random or pseudo-random, unique identifier for each voting session." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007). 1875

"geographic vicinity" — "The summary of the invention provides the following: 'Geographic vicinity,' and 'map' are used to denote a geographic region which includes and surrounds selected items of interest. ... I find that the '525 patent's definition of 'geographic vicinity' is sufficiently clear, deliberate, and precise, and therefore ... controls." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000). 1876

"geometric address information" — "refers to (1) address information which represents or characterizes the physical geometry of a particular hard disk system and (2) address information in binary form which represents the geometry of a hypothetical or imagined hard disk system having a binary number of heads, cylinders and sectors." Database Excelleration Systems, Inc. v. Imperial Technology, Inc., 1998 U.S. Dist. LEXIS 19038 (N.D. Cal., Jul. 23, 1998). 1877

"given flow temperature" — "is the temperature at which a particular ternary doped silicon oxide, heated for a specific period of time, and in a given atmosphere, will flow across the semiconductor body to form the insulating layer." Harris Corp., et al. v. Atmel Corp., 14 F. Supp. 2d 821 (E.D. Va. 1998). 1879

"less than a given level" — "less than a given power level to satisfy federal regulations." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010). 1880
"given observation plane" — "a plane perpendicular to the screen which corresponds to the most probable position of a screen reader, i.e., a vertical plane extending perpendicularly from the screen." *Commissariat a l'Energie Atomique v. Samsung Electronics Co., et al.*, 524 F. Supp. 2d 498 (D. Del. 2007). 1881

"given one of the content servers" — "a particular one of the content servers distinct from the content." *Akamai Technologies, Inc., et al. v. Limelight Networks, Inc.*, 494 F. Supp. 2d 34 (D. Mass. 2007). 1882

"global control system" — "a control system that sends commands to other devices in a system (e.g. local control systems)." *WesternGeco LLC v. ION Geophysical Corp.*, 2010 U.S. Dist. LEXIS 71875 (S.D. Tex., Jul. 16, 2010). 1885

"global repository" — "an abstraction for a database that stores metadata that can be shared with other linked repositories." *Informatica Corp. v. Business Objects Data Integration, Inc.*, 2005 U.S. Dist. LEXIS 46869 (N.D. Cal., Aug. 1, 2005). 1887

"graphical object" — "a graphical object is a symbol and pertains to pictorial representations of data. Graphical objects are not text. Text is not a graphical object. A graphical object may include text. Text alone is not a graphical object." Luma Corp. v. Stryker Corp., et al., 2006 U.S. Dist. LEXIS 7905 (S.D. W.Va., Feb. 3, 2006). 1893

"said one or more visual representations comprising graphical objects" — "one or more visual representations comprising graphical objects. A graphical object is a symbol and pertains to pictorial representation of data. Graphical objects are not text. Text is not a graphical object. A graphical object may include text. Text without a graphical object is not a graphical object." Luma Corp. v. Stryker Corp., et al., 2005 U.S. Dist. LEXIS 40884 (S.D. W. Va., July 27, 2005). 1894

"graphical user interface" — "computer environment wherein an application program presents graphical representations of data on a computer display screen and enables a user to make selections of the graphically represented data." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010). 1895

"graphics" — "images on a computer screen." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010). 1897

"ground proximity warning system" — "the district court properly declined to limit the term 'ground proximity warning system' to any particular system, whether approved or designed to use particular factors in warning of ground proximity." Honeywell International, Inc., et al. v. Universal Avionics Systems Corp., 493 F.3d 1358 (Fed. Cir., July 3, 2007). 1899

"group" — "refer to a subset of all subscribers." Irdeto Access, Inc. v. EchoStar Satellite Corp., et al., 383 F.3d 1295 (Fed. Cir. 2004). 1902

"skill group" — "one or more agents, each agent having a particular sub-combination of skills." IEX Corp. v. Blue Pumpkin Software, 2002 U.S. Dist. LEXIS 27707 (E.D. Tex., May 29, 2002). 1903 "[T]he district court declined to accept the Magistrate Judge's 'one or more' construction and instead determined that 'skill group' referred to 'a group of agents.'... 'skill group' correctly interpreted includes a group of one or more agents, and the district court erred when it construed 'skill group' to require more than one agent." Id., 122 Fed. Appx. 458 (Fed. Cir., Feb. 2, 2005) (unpublished). 1904

- 176 -

"group of collaboration types" — "a group of types of collaboration, such as telephone, videophone, email, snapshot sharing, application sharing, computer-integrated telephony, and computer-integrated fax" Collaboration Properties, Inc. v. Tandberg ASA, et al., 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006).1908

"groups/sets of individual instructions" — "a collection of one or more individual instructions that can be executed simultaneously (i.e. can be dispatched to parallel pipelines simultaneously)." Intergraph Corp. v. Intel Corp., 2002 U.S. Dist. LEXIS 27117 (E.D. Tex., Jun. 3, 2002).1909

"guaranteeing predetermined individual minimum bandwidths" — "guaranteeing individual minimum amounts of data that can be sent per unit of time, determined beforehand." Lucent Technologies, Inc. v. Extreme Networks, Inc., et al., 367 F. Supp. 2d 649 (D. Del. 2005).1912

"guard" — "the term 'guard' is a 'coined term' that was not known in the art. The Court therefore finds that it is subject to 35 U.S.C. § 112 P 6." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).1913

"outer electrostatic discharge guard ring" — "a closed or open ring, or open L or C-shaped line, outside the active matrix display to provide protection from electrostatic discharges." L.G. Philips LCD Co., Ltd. v. Tatung Co., et al., 434 F. Supp. 2d 292 (D. Del. 2006).1914

- H -

"a hard disk drive ... operatively coupled to receive and store" — "The court agrees with the plaintiff that the terms used in this phrase are readily understandable and concludes that this phrase requires no construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).1917

"hardware key data security system" — "a security system which locks the network until it is unlocked by a hardware key." Citec, Inc. v. Romtec, Inc., 2003 U.S. Dist. LEXIS 27833 (D. Md., Dec. 5, 2003).1918

"hardware operating parameter" — "an operating parameter (such as 'line impedance' or 'transmit line signal level') that when changed requires a change in hardware configuration not simply a change in the use of the hardware provided." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).1919

"headers" — "need not identify the computer data packets' type and length or whether the voice data packets contain speech or silence." Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340 (Fed. Cir. 2004).1921

"heading of the aircraft" — "the angular direction of the aircraft from a point on a runway." Honeywell International, Inc., et al. v. Universal Avionics Systems Corp., 493 F.3d 1358 (Fed. Cir., July 3, 2007).1922 "In my view, the patent in this case falls far short of anything that suggests a clear redefinition of the term 'heading.' ... This is not a case like Bell Atlantic in which the patentee implicitly redefined a claim term by using it throughout the written description in a manner consistent with an unconventional meaning." Id. (Plager, J., dissenting).1923

"heading signal" — "the ordinary and accustomed meaning of 'heading' connotes only direction, rather than being limited to the direction of the trolling motor. ... We therefore agree with the district court that the ordinary and accustomed meaning of 'heading signal' controls." Johnson Worldwide Associates, Inc. v. Zebco Corp., et al., 175 F.3d 985 (Fed. Cir. 1999).1924

"heating station" — "a slide support and heating element capable of directly heating at least one microscope slide by conductive heating, e.g., direct contact of a heating surface to a portion of the microscope slide to be heated." Cytologix Corp. v. Ventana Medical Systems, Inc., 424 F.3d 1168 (Fed. Cir. 2005).1925

"hello message to notify other routers" — "a message intended at least in part to notify other routers that the sending router is operational." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).1926

"help access window" — "a window that contains one or more controls for accessing help information from a help system or database that has been loaded on the central processing unit (CPU)." Apple Computer; Inc. v. Articulate Systems, Inc., 234 F.3d 14 (Fed. Cir. 2000).1927

"heterogeneous computer system" — "should be restricted to encompass only systems in which at least two host computers use a different operating system as the district court held." Global Maitech Corp., et al. v. I/O Concepts, Inc., 2006 U.S. App. LEXIS 11017 (Fed. Cir. 2006) (unpublished).1928

"hierarchically arranged set of indices" — "the indices are placed in some order based upon logical relationships between or among the indices." Finisar Corp. v. DirecTV Group, Inc., et al., 416 F. Supp. 2d 512 (E.D. Tex. 2006).

"hierarchically arranged set of indices for referencing data in said information database" — "a set of ranked indices used to reference data within the database, with the higher-level indices giving access to the lower-level indices. An index within the hierarchy may contain a single item." Comcast Cable Communications Corp., LLC v. Finisar Corp., 2007 U.S. Dist. LEXIS 28994 (N.D. Cal., April 6, 2007).

"hierarchical tree format" — "a format having one or more sublevels branching from a common root." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010).

"hierarchy of primitive elements which represent said system" — "a set of primitive elements arranged in a ranked or ordered series that represent the designed system." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).

"a high band of frequencies above a telephone voice band of frequencies"; "high frequency band"; "high band of frequencies" — "frequencies above the telephone voice band between 6 MHz and an undetermined upper limit." Inline Connection Corp. v. AOL Time Warner, Inc., et al., 347 F. Supp. 2d 56 (D. Del. 2004).

"high bandwidth bus" — "a bus having a bandwidth capable of transmitting the collective isochronous data streams arriving from all nodes connected to a hub, e.g., a time slot interchange, "TSI" ring, FDDI-II, and P1394." Negotiated Data Solutions, LLC v. Dell, Inc., 596 F. Supp. 949 (E.D. Tex. 2009).

"high bandwidth external interface" — "an interface between the media processor and external sources of data that is capable of operating at or near the peak data throughput rate of the execution unit of the media processor." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).

"high contrast" — "no construction of this term is necessary." Commissariat a l'Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007).
"a voltage converter for receiving a low voltage from a system source and converting it to a high DC output voltage" — "means that the voltage converter produces a high DC output voltage to some value relatively greater than the converter input." Lucas Aerospace, Ltd. v. Unison Industries, L.P., 899 F. Supp. 1268 (D. Del. 1995). 1940

"high density memory array" — "a memory array having a large number of memory cells for a given area." STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004). 1941

"material having a high electrical resistance" — "because its ordinary and customary meaning is clear to one skilled in the art, the Court declines to construe the phrase." Joyal Products, Inc. v. Johnson Electric North America, et al., 2007 U.S. Dist. LEXIS 79522 (D.N.J., Oct. 25, 2007). 1942

"high frequency" — "encompasses a range of 3-30 MHz, based on the intrinsic evidence as confirmed by the extrinsic evidence." Intellectual Property Development, Inc., et al. v. UA-Columbia Cablevision of Westchester, Inc., et al., 2002 U.S. Dist. LEXIS 17 (S.D.N.Y., Jan. 3, 2002). 1943 "[T]he district court correctly construed 'high frequency' as including only any frequency between 3-30 MHz." Id., 336 F.3d 1308 (Fed. Cir. 2003). 1944

"a high frequency band of frequencies above the highest frequency of the telephone voice band"; "high frequency band"; "high band of frequencies" — "frequencies above the telephone voice band between 0.25 MHz and an undetermined upper limit." Inline Connection Corp. v. AOL Time Warner, Inc., et al., 347 F. Supp. 2d 56 (D. Del. 2004). 1945

"a high-frequency power MOSFET device" — "a power MOSFET device which operates between 1 MHz and 900 MHz." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004). 1946

"high impedance" — "a mathematically sufficient term of degree for providing a constant current power supply circuit coupled to said first stage to increase electrical isolation between the first stage and the at least one return reference signal." Fiori v. Rockford Corp., 2006 U.S. Dist. LEXIS 41477 (E.D. Pa., June 21, 2006). 1947

"high order commands" — "commands which provide access to selected manipulative programs which cause the performance of operations on the designed system." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004). 1951
"high repetition rate" — "The light pulses produced by the laser are repeated at a rate high enough so that a fluorophore normally excitable by a single high energy photon having a short wavelength will absorb two long wavelength photons from the laser source simultaneously to produce fluorescence and an image may be acquired in a practical amount of time." Carl Zeiss Jena GmbH, et al. v. Bio-Rad Laboratories, Inc., et al., 2002 U.S. Dist. LEXIS 1729 (S.D.N.Y., Feb. 4, 2002).  \(^{1952}\)

"high speed" — "an aggregate data transmission rate of 10 or more megabits per second." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).  \(^{1953}\)

"high speed manufacture of a single copy" — "The district court's instruction that the preamble in this case does not limit the claim was incorrect, for the entirety of the claim implements the preamble's high speed manufacture of a single copy, upon customer review of the stored sales information, promptly printing and binding the single copy in response to the customer's selection. The preamble embraces the totality of these limitations, and limits the claim to the subject matter of the preamble." On Demand Machine Corp. v. Ingram Industries, Inc., et al., 442 F.3d 1331 (Fed. Cir. 2006).  \(^{1954}\)

"highest h\(_{\text{max}}\) and lowest h\(_{\text{min}}\)" — "require[s] only an apparatus that shows the highest and lowest points of the terrain within the portion of terrain displayed." Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al., 488 F.3d 982 (Fed. Cir. 2007).  \(^{1955}\)

"highly collimated projected scanning pattern" — "a scanning pattern of scan lines that is columnar in nature, or as columnar as possible, given practicable design constraints." Metrologic Instruments, Inc. v. PSC Inc., 2003 U.S. Dist. LEXIS 26636 (D.N.J., Aug. 26, 2003).  \(^{1956}\)

"highly faithful digital representation" — "the representation that is virtually perfect, with no effect of any interference or noise in the transmission process." Digital Technology Licensing, LLC v. Cingular Wireless, LLC, 2007 U.S. Dist. LEXIS 57492 (E.D. Tex., Aug. 7, 2007).  \(^{1957}\)

"having hills and valleys" — "describes the physical appearance of the hemisphere polysilicon particle layer. 'Hills' refers to the raised, rounded polysilicon particles. 'Valleys' refers to the areas in between the raised, rounded polysilicon particles, whether or not polysilicon material forms in these areas." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).  \(^{1958}\)

"historical data" — "the Court construes the term 'historical data' to mean 'information consisting of the patient's current health and, optionally, any previous medical history and any related family or social problems that becomes the basis of the patient's medical record and required documentation.' This construction more precisely captures the '443 Patent's expression of 'historical data.' The commas that bound 'optionally' clarify that the adverb is to be distributed both to 'any previous medical history' and 'any related family or social problems.' Retaining the verb conjugation 'becomes' clarifies that the patient's medical record and required documentation are based on all the information that makes up 'historical data,' not merely information pertaining to related family or social problems. Finally, the Court opts to use the phrase 'consisting of' as opposed to 'that consists of' to avoid repetitive and possibly confusing use of the word 'that.'" Prompt Medical Systems, L.P. v. McKesson Corp., 2006 U.S. Dist. LEXIS 54808 (E.D. Tex., July 21, 2006).  \(^{1959}\)

[i] "holding in reserve"; [ii] "initially causing the resources of the first base station to remain held in reserve" — [i] "causing a first base station to preserve resources for a link"; [ii] "causing a first base station to continue to hold link resources while a handover to a second base station is attempted." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).1963

"home page" — "the Court construes 'homepage' of a website, therefore, to mean 'entry page' of a website." Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al., 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006).1964

"home position data" — "information identifying one or more home positions that is set through use of the structure of the second input means. 'Home position' is a stored position." Lectrolarm Custom Services v. Vicon Industries, Inc., et al., 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005).1965

"homeotropic direction"; "homeotropic structure" — "the direction substantially perpendicular to the to the adjacent surfaces of the substrates." Commissariat a l’Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007).1966

"hook flash signal" — "a temporary interruption of loop current at the remote telephone, for example, caused by briefly depressing and releasing the hook switch or rotary dial, consistent with an attempt to initiate a three-way call." T-Netix, Inc. v. Global Tel*Link Corp., 2003 U.S. Dist. LEXIS 27830 (E.D. Tex., Aug. 15, 2003).1967

"host" — "interfaces, through the controller, with nonvolatile memory." Lexar Media, Inc. v. Fuji Photo Film USA, Inc., 2007 U.S. Dist. LEXIS 19983 (N.D. Cal., Mar. 1, 2007).1969

"host computer" — "a computer that is connected to and controls the binary tree of bus controllers." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010).1971

- 182 -
"host computer network" — "a network having attached thereto one or more remote access servers providing command-response services to computers connecting to the network from remote locations." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).

"host computing device" — "a processor or computer, connected to the data collection terminals through a network, that performs the comparison of the epidermal topographical pattern for a presented individual with the stored epidermal topographical patterns on behalf of a data collection terminal." Accu-Time Systems, Inc. v. Zuccetti U.S.A., et al., 486 F. Supp. 2d 165 (D. Mass. 2007).

"host device" — "a general purpose computer that connects to and directs the operation of peripherals, including drivers for input/output devices customary in a host device and a multi-purpose interface." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).

"host mode" — "the particular or idiosyncratic operational state of a host or group of hosts." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).

"host platform" — "interface circuitry to which a CPU is connected by a CPU or host bus and to which peripheral devices are connected by a peripheral bus." OPTi, Inc. v. Advanced Micro Devices, Inc., et al., 2009 U.S. Dist. LEXIS 68378 (E.D. Tex., Aug. 5, 2009).

"host platform" — "a bus controller to which a CPU is connected by a CPU or host bus and to which peripheral devices are connected by a peripheral bus." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).

"host processor" — "a processor that can send a command to a storage medium or requests for access that are received by a shadow set." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).

"host processor" — "a computer that communicates with one or more users to provide services such as transaction processing or database access." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).

"host signal processing modem/communication system" — "a modem/communication system that utilizes the processing power of the central processing unit of a host computer to process communication signals rather than including a dedicated digital signal processor." \textit{PCTEL, Inc. v. Agere Systems, Inc., et al.}, 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).

"hostname" — "a name or other identifier that can be translated by a client machine's local DNS server into the IP address of a content server." \textit{Akamai Technologies, Inc., et al. v. Limelight Networks, Inc.}, 494 F. Supp. 2d 34 (D. Mass. 2007).

"a housing connectable to both a user's notebook or desktop computer" — "the defendants' indefiniteness argument is rejected and the phrase is construed to mean 'a housing connectable to both a removable flash memory module and a user's notebook or desktop computer.' The court incorporates by reference its definition of 'connectable.'" \textit{SmartDisk Corp. v. Archos S.A., et al.}, 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).

"a housing of a size to be held in the palm of a user's hands" — "The phrase requires no construction and the court rejects the defendants' indefiniteness argument." \textit{SmartDisk Corp. v. Archos S.A., et al.}, 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).

"HTTP-compliant device" — "a device that is compliant with the communication protocol known as HyperText Transport Protocol (HTTP)." \textit{EpicRealm, Licensing, LLC v. AutoFlex Leasing, Inc., et al.}, Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Aug. 15, 2006). "The Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court." \textit{Id.}, Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Oct. 30, 2006).
"HTTP port and SSL port" — "any port that is used to transfer information or communicate using Hyper Text Transfer Protocol (HTTP) and any port that is used to transfer information or communicate using Secure Sockets Layer (SSL) protocol." Visto Corp. v. Seven Networks, Inc., 2006 U.S. Dist. LEXIS 91453 (E.D. Tex., Dec. 19, 2006).

"processing hub" — "a computer which provides front-end point of sale device management and message processing for card authorizations or activations." Alexsam, Inc. v. IDT Corp., 2010 U.S. Dist. LEXIS 64478 (E.D. Tex., Jun. 29, 2010).

"hybrid access system" — "a system for managing upstream and downstream communications between a host computer and one or more remote clients." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).

"hyperlink phrase" — "is equivalent to 'keyword phrase,' which is a recognized text string that serves as the hypertext link." Hyperphrase Technologies, LLC, et al. v. Microsoft Corp., 2003 U.S. Dist. LEXIS 24591 (W.D. Wis., Jun. 18, 2003).

"an I/O port for coupling said integrated circuit to memory means" — "the court finds that the term 'memory means' is to be accorded its ordinary meaning and defined as memory or device where information can be stored and retrieved. ... With respect to the functional phrase 'for coupling,' the court finds that this phrase indicates only that the I/O port must be capable of being connected to an off-chip memory means and not that it is actually connected to such memory means." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 516 (D. Del. 2001).

"I/O request" — "commands, such as reads and writes, used to transfer data among various components or portions of the components of the computer system." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).

"ID information [stored on the debit card]" — "encrypted data, excluding the card number, stored on the debit card in the form of merchant ID, store ID, or terminal ID." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).

"ID information [stored on the terminal]" — "data stored on the terminal in the form of merchant ID, store ID, or terminal ID." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).

"IP address" — "a fixed, unchanging, and unique identifier of a connection to the internet represented by a series of numbers that has no internal structure to suggest network connection location." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006).

"ISA command information" — "information correlating to one or more of the commands recognized in the Industry Standard Architecture bus standard." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).

"ISA-compatible computer" — "Defendant Arima invites the court to adopt a construction that would specify that an ISA-compatible computer must include an ISA bus as one of its components. However, the court finds no legal justification for carrying its claim construction to that level of specificity." Samsung Electronics Co v. Quanta Computer, Inc., et al., 2006 U.S. Dist. LEXIS 54538 (N.D. Cal., July 25, 2006).
[i] "input variable-icon"; [ii] "output variable-icon" — [i] "a graphical image that represents a symbol whose value is entered into the system by the user for processing"; [ii] "a graphical image that represents a symbol whose value is the product of processing by the system." National Instruments Corp. v. Mathworks, Inc., 2002 U.S. Dist. LEXIS 27577 (E.D. Tex., May 24, 2002).

"identical" — "as used throughout the '287 claims is not incapable of being understood on its own." Faroudja Laboratories, Inc., et al. v. Dwin Electronics, Inc., 76 F. Supp. 2d 999 (N.D. Cal. 1999).

[i] "identification information"; [ii] "address information" — [i] "specific information from the user communication device that identifies that specific device, its user and where the device is located, that is stored in the VPS and that is used by the VPS to determine if the data and voice communications received by the LAN or telephony server, respectively, are intended for the remote user and used by the VPS to route such data and voice communications to the remote user"; [ii] "a designation of the identify of the user communication device sufficient to indicate where the user communication device can be contacted. The information is typically a telephone number." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).

"a second identification number" — "a personal identification number, associated with only one metered account, which provides access to services and debiting of that metered account." Barry Fiala, Inc. v. Stored Value Systems, Inc., 2005 U.S. Dist. LEXIS 20068 (W.D. Tenn., Mar. 31, 2005).

"identification of a position" — "coordinates defining a location using the positional coordinates of the vicinity as a reference." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000).

"identified profile"— "data that identifies a given subject, such as a component or components." Aircraft Technical Publishers vs. Avantext, Inc., 2009 U.S. Dist. LEXIS 105623 (N.D. Cal., Nov. 10, 2009).

"identifier" — "because the plain and ordinary meaning of the term 'identifier' is easily understood, no construction of this term is necessary." Aloft Media, LLC v. Microsoft Corp., et al., 2009 U.S. Dist. LEXIS 24124 (Mar. 24, 2009).

"identifier" — "a unique label that serves to distinctly identify each one of a plurality of input object types and, if any, each one of a plurality of group identifier types." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).

"identifying anomalies" — "means just that-to identify the presence or absence, as the case may be, of anomalies on the surface of a silicon wafer or similar article." ADE Corp. v. KLA-Tencor Corp., 220 F. Supp. 2d 303 (D. Del. 2002).

"identifying from among them a benchmark from which may be determined the beginning of each of such contributory frames and, thereby, the boundaries of such frames" — "requires that (1) a benchmark must be determined for each instance of higher-level frames, (2) from the benchmark the first byte of each distinct and complete higher-level frame must be determined, and (3) from that first byte, the boundary of each distinct and complete higher-level contributory frame must be determined." Bell Communications Research, Inc. v. Fore Systems, Inc., 113 F. Supp. 2d 635 (D. Del. 2000).

"number-of-recording planes identifying information" — "information whose purpose is to identify the number of recording planes on the recording medium." Toshiba Corp. v. Imation Corp., et al., 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010).

"the selection identifying information from a second set of fields" — "the selection identifying the contents of one or more other components of a record not in the first set of such components." Accenture Global Services GmbH, et al. v. Guidewire Software Inc., 2010 U.S. Dist. LEXIS 20087 (D. Del., Mar. 5, 2010).
"recording-plane identifying information that uniquely identifies that recording plane" — "information whose purpose is to identify the recording plane being reproduced." *Toshiba Corp. v. Imation Corp., et al.*, 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010). 2045

"identifying which phenomena in the manufacturing plant are stochastic in nature" — "determining which events or things in the manufacturing process occur randomly." *Information Technology Innovation, LLC v. Motorola, Inc., et al.*, 391 F. Supp. 2d 719 (N.D. Ill. 2005). 2046

"identity data"; "part of said identity data" — "data sufficient for the patented system to determine whether a person, organization, and/or computer is authentic and/or is entitled to assess said selected computer resources"; "some, but not all, of the identity data of the subscriber client computer." *Prism Technologies LLC v. Verasign, Inc., et al.*, 512 F. Supp. 2d 174 (D. Del. 2007). 2047

"family of concentric indexed circles" — "two or more complete circles with the same center point but whose points are located at different distances from that center, with each such circle identified according to its position." *Surfware, Inc. v. Celeritive Technologies, Inc., et al.*, 2009 U.S. Dist. LEXIS 51620 (C.D. Cal., Jun. 3, 2009). 2048

"an ignition system having the ability to diagnose the state of health of an igniter plug"; "a diagnostic circuit responsive to the exciter and igniter plug detectors for reporting a failure of the igniter plug only when ... the sparks are not being produced at the igniter plug, the diagnostic circuit including an output for reporting the state of the health of the ignition system"; "an igniter plug detector for detecting whether the high energy pulses produce sparks at the igniter plug" — "these claims [] mean that the diagnostic system must only detect an open circuit failure at the plug and need not detect all plug failures." *Lucas Aerospace, Ltd. v. Unison Industries, L.P.*, 899 F. Supp. 1268 (D. Del. 1995). 2049

"image" — "a two dimensional representation of a scene, that depending on the context, may refer to the image to be displayed or to the image on the display device that is to be interleaved to recreate the image to be displayed." *Crystal Image Technology, Inc. v. Mitsubishi Electric Corp.*, 2010 U.S. Dist. LEXIS 48290 (W.D. Pa., May 15, 2010). 2050

"image" — "the actual printed image (i.e., a scene or picture) excluding registration marks." *Quad Tech, Inc. v. Q.I. Press Controls B.V., et. al.*, 2010 U.S. Dist. LEXIS 33559 (E.D. Pa., Apr. 1, 2010). 2051

"ballot image"; "image of the ballot"; "image of each paper ballot"; "image thereof" — "an electronic representation of all or a portion of a paper ballot, including a representation of the jurisdiction identifier and at least one voting selection, which representation is stored in a pixilated or bitmapped format." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).2055

"image display device" — "a device for providing an image that may be viewed by a viewer." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006).2058

"image server" — "a computer server that stores image files and provides them, via the internet, to one or more web browsers." Girafa.com, Inc. v. IAC Search & Media, Inc., et al., 2009 U.S. Dist. LEXIS 84405 (D. Del., Sep. 15, 2009).2059

"image element" — "The Court therefore accepts IPI's definition of 'image element' as encompassing complete pixels, as well as sub pixels, and other elements of images that are not pixel related." IP Innovation L.L.C., et al. v. Sony Electronics, Inc., 2005 U.S. Dist. LEXIS 17962 (N.D. Ill., Aug. 18, 2005).2061

"image source" — "a device, such as a video monitor or projector, that can generate screen-borne images." Optical Products Development Corp. v. Dimensional Media Associates, Inc., 134 F. Supp. 2d 320 (S.D.N.Y. 2001).2062

"an image source attribute that specifies a website traffic path analysis data location" — "the named location for the graphical element that specifies a website traffic path analysis data location." Websidestory, Inc. v. Netratings, Inc., 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007).2063

"impedance matching network" — "a lossless network placed between the power supply and the discharge to ensure maximum transfer." *MKS Instruments, Inc., et al. v. Advanced Energy Industries, Inc.*, 204 F. Supp. 2d 720 (D. Del. 2002). "The Court concludes that its previous construction should be clarified ... to mean 'a lossless network placed between the power supply and the discharge to ensure maximum power transfer by matching, although not perfectly, the impedance of the power supply and load.'" *Id.*, 303 F. Supp. 2d 510 (D. Del. 2004).

"implanted region"; "source/drain region" — "regions of opposite polarity as compared to the substrate surrounding them." *EMI Group North America, Inc. v. Intel Corp.*, 157 F.3d 887 (Fed. Cir. 1998).

"filtered samples having improved resolution" — "samples that are each represented by a larger number of bits than were the original samples generated by the sampling section." *Technology Licensing Corp. v. Videotek, Inc.*, 2002 U.S. Dist. LEXIS 26803 (N.D. Cal., Nov. 14, 2002).

"an improvement in a vehicle" — "a module that becomes part of a vehicle and is intended to remain part of the vehicle during use." *Adrain v. Superchips, Inc.*, 2006 U.S. Dist. LEXIS 25212 (S.D. Tex., March 14, 2006).

"an improvement in a vehicle having a predetermined combination of operational elements for controlling vehicular operation ..., said predetermined combination of operational elements being defined in a fixed system having a bus ..." — "The plain language of this term means the following: The invention is an improvement to a vehicle. That improvement includes a predetermined combination of operational elements. These operational elements control the vehicle according to at least one originally provided program. These operational elements define a fixed system that includes a bus. That bus includes a predetermined operable design for operation of the vehicle. The operational elements of the fixed system are controlled by an ECM, in accordance with an originally provided program. The ECM is coupled to the bus and is accessible to the outside at least for diagnostic purposes." *Adrain v. Hypertech, Inc.*, 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002).

"improving the apparent resolution" — "improving the original image to make it appear to have a higher resolution when displayed, without increasing the number of elements in the image carried on the signal originally input into the processing circuitry device." *IP Innovation L.L.C., et al. v. Sony Electronics, Inc.*, 2005 U.S. Dist. LEXIS 17962 (N.D. Ill., Aug. 18, 2005).
"improving the apparent resolution of the image without requiring an increase in the number of image elements originally making up the image" — "improving the original image to make it appear to have a higher resolution when displayed without actually increasing the number of image elements originally making up the image."  *IP Innovation L.L.C. v. Lexmark International, Inc., et al.*, 424 F. Supp. 2d 1078 (N.D. Ill. 2006). 2076

"in a format specified by the institution" — "the institution chooses from a third party one or more data formats that allow the institution to use the data without having to convert it."  *CollegeNET, Inc. v. Xap Corp.*, 442 F. Supp. 2d 1036 (D. Or. 2006). 2077

"formed in a plural number" — "two or more plug electrodes are formed."  *Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd.*, 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 2078

"each in a time on the order of the logarithm of the number of processing elements ..." — "the broadcasting operation is capable of being performed in one clock cycle, multiplied by the base 2 logarithm of the number of processing elements in the binary tree; the priority is capable of being determined in two clock cycles, multiplied by the base 2 logarithm of the number of processing elements in the binary tree."  *Fifth Generation Computer Corp. v. International Business Machines Corp.*, 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010). 2079

"paying in accordance with [the command or message]" — "the command or message makes the bonus available. The claims do not require that the bonus is paid 'automatically' or without any subsequent withdrawal steps upon receipt of the pay command."  *IGT v. Bally Gaming International Inc., et al.*, 610 F. Supp. 2d 288 (D. Del. 2009). 2081

"a 10Base-T MAU comprising an AUI port in accordance with proposed standards of IEEE supplement (P802.31/D10) for LANs" — "Seeq urges the court to interpret the claim such that the MAU must meet the referenced IEEE standards, and Level One argues that only the AUI port claims to be in accordance with those standards. ... the court concludes that both the MAU and the AUI port of Claim 12 must meet the referenced IEEE standards."  *Level One Communications, Inc. v. Seeq Technology, Inc.*, 987 F. Supp. 1191 (N.D. Cal. 1997). 2082

"in-band telecommunications signal" — "signaling that is sent on the same communications path as that used for voice and/or data."  *Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al.*, 518 F. Supp. 2d 1306 (D. Kan. 2007). 2083

"in communication with the personal information provider" — "[The] Court [] declines to construe this phrase."  *Yodlee, Inc. v. CashEdge, Inc.*, 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006). 2085

- 192 -
"in data communication with" — "a reception system connected to subscriber selectable receiving stations such that data can be transferred between the devices in real time."  *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.*, 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007).  

"in parallel with" — "mean[s] that the two data storage systems are attached to correspond to one another in time such that a mirroring relationship is established whereby the two data storage facilities receive data from the first application concurrently."  *EMC Corp. v. Hewlett-Packard Co., Inc.*, 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003).  

"in relation to the credit value" — "This term may be understood according to its plain and ordinary meaning. No further construction is necessary."  *Source, Inc. v. American Express Co.*, 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006).  

"circuit interrupter coupled to the actuator assembly, the circuit interrupter being configured to disconnect the first conductive path from the second conductive path in response to the actuator signal in the reset state" — "The plain language of claim 1 of the '386 patent requires that the circuit interrupter be configured to trip in response to an actuator signal in the reset state. The wiring state detection circuit and the actuator assembly claim elements do not contain limitations as to the circuit state. These components of the device must therefore generate their respective signals at least once, without regard to the state of the device (i.e., reset or tripped)."  *Pass & Seymour, Inc. v. International Trade Commission, et al.*, 2010 U.S. App. LEXIS 17899 (Fed. Cir., Aug. 27, 2010).  

"a controller ... generating said control signal in response to the output of said power supply" — "the controller generates the control signal based a direct reaction from the second winding."  *ABB Automation Inc. v. Schlumberger Resource Management Services, Inc.*, 254 F. Supp. 2d 479 (D. Del. 2003).  

"in response to a user selecting one of the entries' universal resource locator" — "mean[s] that information is presented to the user after the user selects one of the search results displayed as a result of the search."  *Graphon Corp. v. Autotrader.com, Inc.*, 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007).  

"in response to the stored compressed, digitized data" — "transmitting a representation of the at least one item which is initiated by the commencement of storing compressed, digitized data or by the completion of storing compressed, digitized data."  *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.*, 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007).
"each controlled rectifier being turned on and off in synchronization with the voltage waveform across a primary winding" — "each controlled rectifier being turned from on to off or from off to on at the same time as a change of the voltage waveform across a primary winding." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010).

"in the desired order" — "refers to the precise order the customer selected." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007).

"inaudible" — "a sound signal that is too faint, meaning that it is approximately 50dB to 60dB below the level of its accompanying sound signals or a sound signal whose frequency is outside the range of audible frequencies, meaning that it is approximately below 40 Hz." Arbitron, Inc. v. International Demographics Inc., et al., 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009).

"memory includes an audio recorder in said housing"; "memory including an audio recorder mounted in said housing" — "the memory comprises an associated device in the housing for recording sounds." Minerva Industries, Inc. v. Motorola, Inc. et al., 2010 U.S. Dist. LEXIS 9329 (E.D. Tex., Feb. 3, 2010).

"a scrambled television program signal that includes an identification code" — "does not require that the identification code be placed in the vertical retrace interval. The plain language of the claim makes clear that the program signal, and not the specific video signal, includes the identification code." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001).

"includes relationship" — "a relationship that causes the elements on the right-hand side of the relationship to be included in the configuration when all elements of the left-hand side of the relationship are already included." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005).

"including a web page at the web site having customized information from the first user point for users at the second user point" — "no construction of this claim term is required." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).

"inclusion"; "three-dimensional inclusion" — "island of semiconductor material grown by three-dimensional nucleation buried in a layer of a different semiconductor material that has a larger bandgap." Seoul Semiconductor Co. Ltd. v. Nichia Corp., et al., 596 F. Supp. 2d 1005 (E.D. Tex. 2009).

"independent" — "performed by a computer algorithm(s) at least partially distinct from the
algorithm(s) for computing the collective mass information, and where the computation of
spiculation information is performed separately from the computation of the collective mass
7436 (D. Del., Apr. 30, 2003).\(^{2107}\)

"independent calibration operations" — "calibration operations that are separate from one
another but are not necessarily unrelated."  Storage Technology Corp. v. Custom Hardware
Engineering & Consulting, Ltd., et al., 2006 U.S. Dist. LEXIS 43690 (D. Mass., June 28,
2006).\(^{2108}\)

"independent communication" — "communication among a pair of devices that does not effect
nor preclude the communication of any other communicating pair of devices."  SercoNet Ltd. v.
NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007)\(^{2109}\)

"independent forward and return channels"; "upstream channel that is independent of the
downstream channel"; "independent upstream channel" — "the downstream channel is
different from the upstream channel, either in the same or a different medium."  Hybrid Patents
Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4,
2007).\(^{2110}\)

"means, independent of the one computer-related application, for forming link data linking a
portion of the audio data to at least one of the recognized words independently of the one
computer-related application"; "means, independent of the one computer-related
application, for updating position identifiers in response to changes in positions of the
recognized words within the one computer-related application" — "the claim term
'independent of' means that the interface must maintain its own position data, in its own data
structures, but still have the ability to receive positional information from the application."  AllVoice Computing PLC v. Nuance Communications, Inc., 504 F.3d 1236 (Fed. Cir. 2007).\(^{2111}\)

"external clock is operative at a frequency independent of a clock frequency of said oscillator"
— "an external clock wherein a change in the frequency of either the external clock or oscillator
does not affect the frequency of the other."  Technology Properties Ltd., et al. v. Matsushita
Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).\(^{2112}\)

"second clock independent of said ring oscillator ... system clock"; "second clock independent
of the ring oscillator system clock" — "a second clock wherein a change in the frequency of
either the second clock or ring oscillator system clock does not affect the frequency of the other."  Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp.
2d 916 (E.D. Tex. 2007).\(^{2113}\)

"independent processes" — "the part of the devices or device subsystems external to the computer
that independently generate interrupts."  Gobeli Research, Ltd. v. Apple Computer Inc., et al., 384
F. Supp. 2d 1016 (E.D. Tex., Aug. 26, 2005).\(^{2114}\)

"the user can request viewpoint motion and point of interest motion independently" — "the
user can individually request viewpoint motion and point of interest motion."  IP Innovation,
"independently connected electrically" — "each gate electrode segment is connected through a separate electrical path, or paths, that are not shared by any other gate electrode segment." *Advanced Micro Devices, Inc., et al. v. Samsung Electronics Co., Ltd., et al.*, 2009 U.S. Dist. LEXIS 91536 (N.D. Cal., Sep. 17, 2009).2116

"independently modifiable copy" — "a copy of a workspace element capable of being modified independent of the workspace element. The copy of the workspace element does not have to be in the same format as the workspace element." *Visto Corp. v. Seven Networks, Inc.*, 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).2117

"a layer acts independently of other content within a particular HTML document" — "mean[s] that the activity associated with a layer, such as moving or resizing, does not depend on other content within a particular HTML document." *CA, Inc. v. Simple.com, Inc., et al.*, 2009 U.S. Dist. LEXIS 25241 (E.D.N.Y., Mar. 5, 2009).2118

"at least one of said signal processors in said plurality operates independently of other signal processors" — "at least one signal processor can operate without being interrupted by any of the two or more other signal processors." *Saxon Innovations, LLC v. Nokia Corp., et al.*, 2009 U.S. Dist. LEXIS 67019 (E.D. Tex., Jul. 30, 2009).2119

"circuitry operable independently of the operation of said memory array" — "circuitry whose operation is not contingent upon operation of the memory array." *STMicroelectronics, Inc. v. Motorola, Inc.*, 327 F. Supp. 2d 687 (E.D. Tex. 2004).2120

"independently modifiable copy" — "For the '192 and '131 patents, ... a copy of a workspace element capable of being modified independent of the workspace element."; "For the '708 patent, ... a copy of a workspace element capable of being modified independent of the workspace element. A copy of a workspace element is a complete replication of all the information comprising the workspace element unless the copy and workspace element are in different formats. In that case, there may be some differences between the copy and workspace element are in different formats, but those differences are due to formatting only." *Visto Corp. v. Sproqit Techs., Inc.*, 445 F. Supp. 2d 1104 (N.D. Cal. 2006).2121

"an index" — "an organized collection of information which may be contained in one or more data structures, including but not limited to tables, lists or directories, which contains the requisite indicators providing an indication about the validity of predetermined data elements. Because the terms 'a' or 'an,' in the context of patent claim language, mean at least one, the subject patents will be construed to include at least one index having the characteristics described above." *EMC Corp. v. Hewlett-Packard Co., Inc.*, 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003).2122

"index parameter" — "a parameter used to derive another value. For purposes of the process disclosed in Claim 1, a transaction counter can be used as an 'index parameter.' However, an 'index parameter' is not limited to a transaction counter." *Cryptography Research, Inc. v. Visa International Service Association, et al.*, 2007 U.S. Dist. LEXIS 76502 (N.D. Cal., Sept. 28, 2007).2124
"indexed by tunnel identifiers" — "mean[s] that each tunnel identifier is used to access an entry in the tunnel table directly."  UTStarcom, Inc. v. Starent Networks, Corp., et al., 2009 U.S. Dist. LEXIS 93869 (N.D. Ill., Sep. 16, 2009). 2125

"indexed memory sized and structured to store cash values for a multitude of consumer accounts" — "a computer memory associated with an index that is sized and configured to store cash values for a multitude of consumer accounts."  Source, Inc. v. American Express Co., 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006). 2126

"said input voice command indicating a desired movement" — "the voice command input to the system by the surgeon indicates a desired movement of the surgical instrument."  Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002). 2129

"indicating an operating status of a defibrillator" — "providing a visible or audible alert of whether the defibrillator is capable of treating a patient and possibly other indications of operational status."  Koninklijke Philips Electronics NV, et al. v. Defibtech LLC, et al., 397 F. Supp. 2d 1257 (W.D. Wash. 2005). 2130

"indicating in the computer readable data file at least one implementation operation required for the implementation of the selected choice in the computer system during manufacturing of the computer system" — "indicating in the computer system readable data file at least one operation required for the implementation of hardware components and software programs on a computer system including, but not limited to, installation programs, hard-disk-drive formatting operations, testing operations and other similar operations."  Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). 2131

"indicating the occurrence of the second game trigger condition if one of the allotted numbers matches the selected random number" — "two numbers 'match' under the claim language when they are 'identical.' … 'indicating the occurrence' as used in the claim means indicating to the player."  Aristocrat Technologies, et al. v. International Game Technology, et al., 2009 U.S. Dist. LEXIS 40975 (N.D. Cal., May 14, 2009). 2133  "The court will clarify[y] its previous claim construction as follows: If one of the allotted numbers is identical to the selected random number, alerting the player that a second game will appear after the first game is complete. This indication is different from and precedes the appearance and display of the second game."  Id., 643 F. Supp. 2d 1165 (N.D. Cal. 2009). 2134
"said remote object indicating to said interrogator its ability to receive and store transmitted data by the existence of writable semiconductor memory within said object" — "The plain and ordinary meaning of the claim supports that the remote object indicates its ability to perform the functions stated through or 'by the existence of writable semiconductor memory,' not, as Plaintiffs contend, that the remote object signals to the interrogator 'the presence of writable semiconductor memory.'" Single Chip Systems Corp., et al. v. Intermec IP Corp., et al., 2006 U.S. Dist. LEXIS 96537 (S.D. Cal., Dec. 5, 2006). 2135

"indication" — "a communication to the audience member." Arbitron, Inc. v. International Demographics Inc., et al., 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009). 2136

"indication of the condition of the defibrillator" — "indication of whether the defibrillator is capable of treating a patient, and possibly other defibrillator status." Koninklijke Philips Electronics NV, et al. v. Defibtech LLC, et al., 397 F. Supp. 2d 1257 (W.D. Wash. 2005) 2138

"providing an indication of a virus from said searching step" — "the computer provides an alert to the user if a virus has been detected during the searching step." Symantec Corp. v. Computer Associates International, Inc., 2005 U.S. Dist. LEXIS 46912 (E.D. Mich., Mar. 16, 2005) 2139

"indications" — "something that represents the physiological parameters. Such a representation can be in the form of a number, a word, a symbol, or any other marker with established meaning." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003) 2141

"indicative of" — "the patent uses the terms 'indicative of' and 'representing' interchangeably ... We agree ... that the intrinsic evidence indicates that the patentee meant for those two terms to be interchangeable and to carry the same meaning within the claims." Tehrani v. Hamilton Medical, Inc., et al., 331 F.3d 1355 (Fed. Cir. 2003) 2143

"indicative of" — "I do agree with plaintiff, however, that the words 'indicative of' are unnecessary. Accordingly, I construe 'displays images indicative of said thoroughfares' as 'shows the thoroughfares.'" Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006) 2144

"signals indicative of ... generator electrical power output" — "The word 'indicative' in preceding element four makes it clear that the signals would convey the amount of power sensed." Gamesa Eolica, S.A. v. General Electric Co., 359 F. Supp. 2d 790 (W.D. Wis. 2005) 2145

- 198 -
"a sensor incorporated into said inductive device" — "any inductive device incorporating a sensor 'providing a diagnostic signal having electrical characteristics that represent the electrical and magnetic events occurring at the gap of the ignitor plug during the period of energy transfer to spark across a gap of the ignitor plug' that is placed in the ignition system in accordance with the requirements of the claim." *Lucas Aerospace, Ltd. v. Unison Industries, L.P.*, 899 F. Supp. 1268 (D. Del. 1995). 2146

"indicator" — "something that indicates,' which means points out or points to, or to be a sign, symptom, or index of." *Hewlett-Packard Co., et al. v. EMC Corp.*, 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004). 2147

"indicator" — "information which provides a fairly certain sign or symptom of the validity of a predetermined data element. An indicator can include information about data located at a particular storage location on a storage device, such as a track, or about data stored in an entire storage device via a device-level indicator." *EMC Corp. v. Hewlett-Packard Co., Inc.*, 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003). 2148

"PIC indicator"; "indication which has a particular value" — "requir[e] a design that indicates, at a minimum, whether a specific IXC is the PIC of the terminating subscriber at the time the call is made." *AT&T Corp. v. Excel Communications, Inc., et al.*, 1999 U.S. Dist. LEXIS 17871 (D. Del., Oct. 25, 1999). 2149

[i] "indicia arranged on the template and located in a plurality of groups, one group of each corresponding to one predetermined, selectable item of said main menu"; [ii] "at least a second plurality of indicia, each of which corresponds to a predetermined selectable item of a sub-menu corresponding to an item of said Main Menu"; [iii] "said pointing device can select a working function with a single movement of the said button" — [i] "at least two groups must appear on a template, where one group corresponds to a Main Menu item and the other corresponds to another Main Menu item"; [ii] "at least two indicia contained in the second set of indicia contained within one of the "at least two groups of indicia" described in Claim 1(b) must correspond to an item of the first sub-menu of the Main Menu item to which the group corresponds"; [iii] "the single movement of the pointing device's button can, but need not, select a working function." *Baystate Technologies, Inc. v. Bowers*, 81 F. Supp. 2d 152 (D. Mass. 1999). 2150 [i] "this court agrees with the district court's interpretation"; [ii] "at least one of the main-menu indicia groups include at least two indicia associated with the same sub-menu of the main-menu"; [iii] "each of the indicia associated with the sub-menu of a main-menu group must represent a working function accessible with a single movement of the pointer button (e.g., as opposed to access through further selection via a drop-down menu)." *Id.*, 302 F.3d 1334 (Fed. Cir. 2002). 2151 [i] "this court agrees with the district court's interpretation of paragraph b"; [ii] "paragraph c requires that at least one of the main-menu indicia groups include at least two indicia associated with the same sub-menu of the main-menu"; [iii] "paragraph d requires that all indicia below that sub-menu must represent working functions." *Id.*, 320 F.3d 1317 (Fed. Cir. 2003). 2152

"indirectly issuing" — "the Board properly concluded that the broadest reasonable interpretation of 'indirectly issuing' requires 'only that a request from the host computer go through some other component before it is sent to the database.'" In re American Academy of Science Tech Center, 367 F.3d 1359 (Fed. Cir. 2004).  

"individual" — "Defendants argue that 'individual' excludes all persons who are brokers acting in any capacity. ... [T]he explicit language of the claims places no restriction or limitation on the identity of the traders." Minton v. National Association of Securities Dealers, Inc., et al., 197 F. Supp. 2d 699 (E.D. Tex. 2001).  

"individualized rule set" — "elements or conditions for a particular user ID that apply during a user's session." LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al., 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010).  

"an inductor"; "the inductor" — "allow for more than one inductor. However, the claims that describe both charging and discharging through 'said' inductor make it clear that the same inductor must be used for both charging and discharging the panel capacitance. ... The Court defines an inductor as follows: A device consisting of one or more associated windings for introducing inductance into a circuit. Windings are 'associated' for the purposes of this definition only if they share coupled magnetic field lines." Competitive Technologies, et al. v. Fujitsu Ltd., et al., 286 F. Supp. 2d 1161 (N.D. Cal. 2003).  

"inductor means" — "a coil of wire wound on magnetic material." Nilssen v. Magnetek, Inc., 1999 U.S. Dist. LEXIS 16718 (N.D. Ill., Oct. 22, 1999).  "For a second time this opinion has parted company with Judge Kennelly's MagneTek opinion. But that opinion makes no reference to Nilssen's PTO representations referred to here in the text--and in the absence of that factor, this Court would also have reached the same conclusion as Judge Kennelly." Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000).  

"inferring" — "a logical process by which a factual conclusion is derived from known facts by the application of logical rules." SFA Systems, LLC v. Infor Global Solutions (Michigan), Inc., et al., 2009 U.S. Dist. LEXIS 13705 (E.D. Tex., Feb. 23, 2009).  

"information" — "facts contained in or describing some or all of a data source." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006).  

"information" — "anything that can be represented in electronic form, including text, sound recordings, and images." Diego, Inc. v. Audible, Inc., 2006 U.S. Dist. LEXIS 22715 (W.D. Wash., March 27, 2006).  

"first information" — "first data that can be processed." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010).
"creating a database entry containing information accepted from a user" — "creating a database entry containing information accepted from a user over a public computer network wherein the information content and classification is entirely controlled by the user." Graphon Corp. v. Autotrader.com, Inc., 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007). 2167

"information bearing optical signal" — "an optical signal which has been coded with any type of information; any optical signal that has been modulated constitutes an information bearing optical signal." CIENA Corp., et al. v. Corvis Corp., 334 F. Supp. 2d 598 (D. Del. 2004). 2168

"information block" — "a plurality of sectors that are logically associated with a group of LBAs for erasure." Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005). 2169

"information characterizes said strata"; "characterizing information of said strata"; "characterizing information" — "mean[s] data produced by logging methods conventional in the industry." Union Pacific Resources Co. v. Chesapeake Energy Corp., et al., 236 F.3d 684 (Fed. Cir. 2001). 2171

"information database" — "a collection of computerized information which can be accessed." Finisar Corp. v. Directv Group, Inc., et al., 416 F. Supp. 2d 512 (E.D. Tex. 2006). 2172

"information database" — "a dynamic, structured collection of digitized data capable of being held in computer storage." Comcast Cable Communications Corp., LLC v. Finisar Corp., 2007 U.S. Dist. LEXIS 28994 (N.D. Cal., Apr. 6, 2007). 2173

"information describing the associated/selected attraction" — "preset static information, such as cycle capacity, estimated throughput, and operating hours, and dynamic information, such as current status and current staff, for a particular attraction." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006). 2174

"information from items" — "refers to audio information, video information or both audio and video information, which is derived by the transmission system from a physical item such as a tape, a film, or a computer storage disk." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006). 2175

"information for identifying the first/second account of the first/second party" — "information that is used to identify an account of the first/second party." Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010). 2176

"storing information identifying the selected programs, said stored information identifying broadcast schedule times, channels, and program titles" — "'information identifying' includes the storage of either the actual 'broadcast schedule times, channels, and program titles' data or separate references, such as addresses or software pointers, to the location of the actual data. If references are used, there must be separate references for the broadcast schedule time, channel, and program title parameters." Gemstar-TV Guide International, Inc., et al. v. International Trade Commission, et al., 383 F.3d 1352 (Fed. Cir. 2004). 2177
“wherein said audible information comprises information indicating undesired movement of the distal end of the surgical instrument” — "requires synthesized speech indicating that the distal end of the surgical instrument has moved in an undesired way." Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002).

"information management and synchronous communications system" — "a computerized system having multiple devices in which a change to data made on a central server is updated on client devices and vice versa." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010).

"information manufacturing machines" — "an IMM must contain one or more components for performing at least the functions of: (1) storing information to be reproduced; (2) receiving a request reproduction code; (3) transmitting a request reproduction code to a device remotely located from the IMM; (4) receiving an authorization code from the device remotely located from the IMM; and (5) reproducing the requested information in a material object in response to receiving the authorization code. An IMM need not contain the four separate and distinct components of the preferred embodiment." Interactive Gift Express, Inc. v. CompuServe, Inc., et al., 256 F.3d 1323 (Fed. Cir. 2001).

"information pertaining to the item being auctioned"; "information about the item being auctioned"; "information regarding the item being auctioned" — "facts or data pertaining to the item being auctioned other than information regarding the acceptance or rejection of bids and the live audio and video of the auction." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).

"creating a database entry containing information received from a user" — "creating a database entry containing information received from a user in which the user entirely controls the information content of a database entry and the manner in which the information is classified." Graphon Corp. v. Autotrader.com, Inc., 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007).

"information segments" — "simply referring to parts into which information on the Internet is commonly divided." ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082 (Fed. Cir. 2003).

"information source" — "a place or thing which originates electronic information concerning particular subjects without executing electronic mail programming." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002).
"creating a database entry containing the information submitted via the entry form" —
"creating a database entry containing information submitted by a user via an entry form displayed to the user over a public computer network wherein the information content and classification is entirely controlled by the user." *Graphon Corp. v. Autotrader.com, Inc.*, 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007). 2187

"information transmitter"; "recognition device" — "the district court construed ... 'information transmitter' to mean 'a device that communicates with a recognition device via electromagnetic waves, after being actuated by that recognition device, without requiring any sort of personal action by the passenger.' It construed 'recognition device' to mean 'a device that actuates and reads data transmitted by an information transmitter without requiring any sort of personal action by the passenger.' ... We modify the district court's construction of 'information transmitter' and 'recognition device' by striking the phrase 'without requiring any sort of personal action by the passenger' from each construction." *Schindler Elevator Corp. v. Otis Elevator Co.*, 593 F.3d 1275 (Fed. Cir. 2010). 2188

"information uniquely descriptive of an intending licensee" — "[i]nformation that is uniquely associated with a person who intends to become a licensee so as to access full functionality of the digital data." *Uniloc USA, Inc., et al. v. Microsoft Corp.*, 447 F. Supp. 2d 177 (D. R.I. 2006). 2190

"inhibiting said triggering step once activation of said generator is triggered, until said reset signal is detected" — "the triggering step is inhibited upon each and every activation of the triggering of the generator until the power on reset signal is detected; each time the high voltage generator is activated, further triggering cannot take place, at least until the power on reset signal is detected." *Agrizap, Inc. v. Woodstream Corp., et al.*, 431 F. Supp. 2d 518 (E.D. Pa. 2006). 2192

"an initial set of traffic path analysis data for the current website" — "an initial set of traffic path analysis data for the current website, which includes at least the current website page requested." *Websidestory, Inc. v. Netratings, Inc.*, 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007). 2195
"initialization NSP"; "initialization log-in data"; "initializing set of identification information" — "an NSP used the first time the user contacts the ASP"; "log-in data used the first time the user contacts the ASP"; "a set of information used the first time the user contacts the ASP."  

"host computer is initially accessed by said client computer through a web page" — "does not require construction."  

"initiates" — "begins."  

"initiates a diagnostic operation in the office machine system" — "a command sent from the diagnostic processor to the office machine system causes the office machine system to begin a diagnostic operation."  

"initiating a next-line inquiry" — "sending a command to snoop the next line."  

OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).  

"initiating a next-line inquiry ... to determine whether an N+I'th byte line of said secondary memory is cached in a modified state in said first cache memory" — "initiating a next-line inquiry to determine whether the next-line of data in the secondary memory is different from the corresponding data in the cache."  

OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).  

"initiating communication between the business office device and a computer, by the business office device"; "initiating communication between the printer and the computer by the printer" — "the business office device/printer itself starts or establishes communication with the computer."  

"initiator group (igroup)" — "a logical named entity that may have a human friendly name assigned to one or more addresses associated with one or more initiators. As used in the patent, 'human friendly name' means an arbitrary label selected by the user or administrator that may be a spoken name, a path designation or include a hierarchical naming convention."  

"initiator peripheral device command" — "a command sent by the operating system to a peripheral device in response to an initiator peripheral device request sent by an application program to the operating system, and which causes the peripheral device to enter a waiting state ready to receive new microcode."  

"ink permeates through the sheet from said printed front surface to said back surface to provide the indicia in mirror image form on said back surface" — "We agree with the trial court's construction that ink must reside on or at the back surface of the sheet - but does not have to permeate through the back surface of the sheet." Paymaster Technologies v. United States, 2006 U.S. App. LEXIS 11325 (Fed. Cir. 2006) (unpublished).

"input" — "information that is delivered to the system from outside the system." Convolve, Inc., et al. v. Compaq Computer Corp., et al., 2005 U.S. Dist. LEXIS 16375 (S.D.N.Y., Aug. 9, 2005).

"an input and an output port" — "an input port and a separate output port." Ampex Corp. v. Eastman Kodak Co., et al., 460 F. Supp. 2d 541 (D. Del. 2006).

"input entries" — "features displayed on a web page that allow a user to enter information into the page, like text entry fields, menu items, and check fields." MShift, Inc. v. Digital Insight Corp., et al., 2010 U.S. Dist. LEXIS 107946 (N.D. Cal., Oct. 8, 2010).

"input key" — "a user-actuated input device, which allows the user to choose one of two options, e.g., select or deselect, such as a keyboard key, for changing the value of one of the hue, lightness, and saturation values." American Video Graphics, L.P. v. Microsoft Corp., 2005 U.S. Dist. LEXIS 46858 (E.D. Tex., Jun. 30, 2005).

"an input keyboard" — "a hardware device consisting of a number of mechanical buttons (keys) which the user presses to input characters to a computer." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).

"input portion" — "This Court does not find that 'input portion' is a means-plus-function limitation under 35 U.S.C. § 112 (6)." Fiori v. Rockford Corp., 2006 U.S. Dist. LEXIS 41477 (E.D. Pa., June 21, 2006).
"providing at least one Input Section, wherein said Input Section converts said specific program to an Moving Pictures Experts Group (MPEG) formatted stream for internal transfer and manipulation" — "providing at least one portion of a device that receives inputs, wherein said portion of the device that receives inputs converts said specified frequency range to an Moving Picture Experts Group (MPEG) formatted stream for internal transfer and manipulation." *TiVo Inc. v. EchoStar Communications Corp., et al.,* 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005).

"input terminal pin"; "output terminal pin" — "are not indefinite and they do not require specific construction by the court." *Pulse Engineering, Inc. v. Mascon, Inc.,* 2009 U.S. Dist. LEXIS 26885 (S.D. Cal., Mar. 9, 2009).

"an optical coupling means having an input, an input/output and an output"; "a first optical coupler having an input, an input/output and an output" — "may, but need not, be bidirectional." *Pirelli Cable Corp. v. Ciena Corp.,* 988 F. Supp. 424 (D. Del. 1997).

"inputting an item having information into the transmission system" — "putting physical items containing audio information or video information or both into the transmission system." *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.,* 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007).

"inputting contributions at said contribution accepting devices in response to said request" — "To 'input' means to provide computer-readable information to the system. Here, the contribution information is input to the contribution accepting devices." *Ziarro v. American National Red Cross, et al.,* 2000 U.S. Dist. LEXIS 22508 (N.D. Ill., Aug. 16, 2000).

"inputting data associated with at least one bid for at least one fixed income financial instrument into said bidder's computer via said input device" — "putting information, in a form suitable for processing by a computer, associated with a bid to buy a fixed income financial instrument into a computer used by a bidder to access an electronic auction via any input device used to prepare or submit bids." *Muniauction, Inc. v. Thomson Corp.,* 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006).

"inputting in the data processing system response data representing a response from the at least one party to the transmitted overt terms data" — "inputting into the data processing system the response of a party to whom the offer data has been transmitted." *Tradecard, Inc. v. SI Corp., et al.,* 509 F. Supp. 2d 304 (S.D.N.Y. 2007).

[i] "inquiry"; [ii] "inquiring" — [i] "an instruction seeking information concerning the type of the device attached to a computer"; [ii] "sending an instruction seeking information concerning the type of the device attached to a computer." *In re Papst Licensing GmbH & Co. KG Litigation,* 624 F. Supp. 2d 54 (D.D.C. 2009).
"insert locator data" — "identifies the 'predetermined storage locations' at which the digitally formatted local video signals have been stored." Beam Laser Systems, Inc. v. Cox Communications, Inc., et al., 144 F. Supp. 2d 475 (E.D. Va. 2001).2227

"insertable storage medium having information stored therein" — "require[s] that the storage medium is a physical device which itself stores information; and that the storage medium is itself inserted into the machine (rather than being connected in some other manner) in order to operate it." Rackman v. Microsoft Corp., 102 F. Supp. 2d 113 (S.D.N.Y. 2000).2228

"inserting a category identification signal into the scrambled program signal at the remote location for transmission thereof with the program signal" — "there is no reason to modify the plain meaning of 'insert,' which means 'to set (something) in.' Thus, the court will construe 'inserting . . . into' as requiring the identification signal to be placed inside the program signal." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001).2230

"inspecting" — "examining or measuring to verify whether an item or activity conforms to specified requirements." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006).2231

"inspecting" — "to conduct an appraisal of at least two of the partially surrounding image elements provided by the neighboring element means in order to determine the presence of a void at a particular position in the image." IP Innovation L.L.C., et al. v. Sony Electronics, Inc., 2005 U.S. Dist. LEXIS 17962 (N.D. Ill., Aug. 18, 2005).2232

"inspecting a plurality of said at least partially surrounding image elements of the image to determine the presence of the void" — "inspecting two or more of the at least partially surrounding image elements of the group from the original image for the purpose of determining the presence of a void at the particular position." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006).2233

"instigating the analysis circuit simultaneously to the actuation of the charging circuit" — "performing analysis at the same time as the high voltage capacitor begins to charge." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).2235

"instruction" — "either a stack-based instruction that is to be translated into a register-based instruction, or a register-based instructions that is input to the CPU pipeline. In either case the 'instruction' must be upstream of the decode stage of the CPU pipeline. As used in the claims of the patent, 'instruction' cannot mean the control signals that are the output of the decode stage." Nazomi Communications, Inc. v. Arm Holdings, PLC, et al., 2006 U.S. Dist. LEXIS 66354 (N.D. Cal., Sept. 6, 2006).2236
"instruction" — "an expression that specifies one or more operations and identifies the applicable operands." Cornell University, et al. v. Hewlett-Packard Co., 313 F. Supp. 2d 114 (N.D.N.Y. 2004).2237

"instruction cycle" — "the period of time between the issuing of two successive instructions." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).2238

"a site instruction file" — "an electronic file containing instructions which tell the data processing system at each remote location which general coupon templates to download and which site specific information files to download." Southwest Efuel Network, L.L.C. v. Transaction Tracking Technologies, Inc., 2009 U.S. Dist. LEXIS 103395 (E.D. Tex., Oct. 23, 2009).2239

"instruction firing time" — "intelligence used to indicate when a given instruction may be executed." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).2240

"instruction groups" — "sets of from 1 to a maximum number of sequential instructions, each set being provided to the instruction register as a unit and having a boundary, and in which any operand that is present must be right justified." Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).2241

"said instruction groups include at least one instruction that, when executed, causes an access to an operand or instruction or both" — "the instruction being executed causes the CPU to use an operand or execute a second instruction." Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).2243

"instructions" — "mean[s] 'S-Instructions' which are a level below high-level language instructions and a level above conventional machine language instructions." Data General Corp. v. International Business Machines Corp., 93 F. Supp. 2d 89 (D. Mass. 2000).2244

"executable instructions for building a displayable inventory of works" — "computer instructions for automatically creating an inventory of works that can be displayed." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007).2247

"instructions for automatically contacting an authorized representative ... to communicate registration information and obtaining authorization for continued operation" — "The district court ... construed the term to mean 'instructions (i.e. a computer code) that enable a user's computer to contact an authorized representative of the software.' ... the district court correctly rejected Microsoft's attempt to exclude any user interaction from the claims, and we affirm its construction of this term." z4 Technologies, Inc. v. Microsoft Corp., et al., 507 F.3d 1340 (Fed. Cir. 2007).2248
"executable instructions for creating at least one play list by selecting works in accordance with a predetermined criterion" — "computer instructions for automatically creating at least one play list based on a user-selected criterion." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007). 2248

"instructions for effecting royalty payments to appropriate recipients" — "computer instructions that automatically cause royalty payments to be made to appropriate recipients." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007). 2250

"the circuitry includes instructions for selecting works to be included in the displayable list in accordance with a selected characteristic" — "computer instructions for automatically selecting works to be included in the displayable list based on a user-selected characteristic." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007). 2251

"microcontroller set of instructions signals received from the call progress detector circuitry" — "the call progress detector circuitry outputs a signal corresponding to the call waiting signal to recognition circuitry." Kernius v. International Electronics, Inc., et al., 2007 U.S. Dist. LEXIS 24874 (D. Md., March 30, 2007). 2252

"instrument"; "payment instrument" — "document (including paper or electronic) that is used to transfer funds to a recipient party"; "a document (including paper or electronic) that is used to transfer funds to a recipient party in connection with a payment." Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010). 2253

"an insulating film covering the surface of said substrate on which the MOSFET is formed" — "because the language for this term is both sufficiently clear and is in fact superior to the proposed constructions, the court declines to construe this term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006). 2256

"insulating housing" — "a covering which has a high electrical resistance and which can serve to prevent a short circuit between components." Murata Manufacturing Co., Ltd. v. Bel Fuse Inc., 445 F. Supp. 2d 938 (N.D. Ill., July 28, 2006). 2257

"insulating layer" — "a layer made of one or more materials that are poor conductors of electricity." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 2258

"insulating material" — "a material with poor electrical conduction that acts to suppress switching noise generated by a pulse width modulation control of the direct driving motor, thereby suppressing the video screen and audio noise caused by electrical noise produced by the capstan motor." Funai Electric Co., Ltd. v. Daewoo Electronics Corp., et al., 2010 U.S. App. LEXIS 18237 (Fed. Cir., Sep. 1, 2010). 2259

"insulator member" — "a single piece of material surrounding all or a portion of the conductor in the female connector passageway that inhibits or prevents the flow of electricity between the conductor and the female connector." Arrow Communication Laboratories, Inc., et al. v. John Mezzalingua Associates, Inc., 2009 U.S. Dist. LEXIS 8512 (N.D.N.Y., Feb. 5, 2009).

"integrated aggregation module" — "because the meaning of 'integrated aggregation module' is sufficiently clear based on the claim language, the court declines to construes this term." Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006).

"integrated circuit"; "integrated circuit means" — "any complex set of electronic components and their interconnections that are etched or imprinted on a chip and are capable of performing the functions stated in the claims, including storing an identification code, detecting an interrogation signal, outputting the identification code upon reception of an interrogation signal by said coil means, and generating a transmission frequency signal by dividing the frequency of the interrogation signal." Digital Angel Corp. v. Datamars, Inc., et al., 2006 U.S. Dist. LEXIS 32260 (D. Minn., May 22, 2006).

"integrated computer software application" — "software codes or instructions that are compatible and operate as a unit." MedioStream, Inc. v. Microsoft Corp., et al., 2010 U.S. Dist. LEXIS 88716 (E.D. Tex., Aug. 27, 2010).

"integrated data and video storage" — "the memory module has memory elements configured to store bits representing data and memory elements configured to store bits representing video information." Sun Microsystems, Inc. v. Dataram Corp., 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997).

"integrated whole" — "means that the data lines encode data to be read as a unity, in contrast to information stored in particular positions that can be read or searched for individually." *Datapstrip International Ltd. v. Intacta Technologies, Inc.*, 253 F. Supp. 2d 1308 (N.D. Ga. 2003). [2274]

"integrating the received ORMS data from the ORMSs of the fulfillment partners";
"integrate the received ORMS data from the ORMSs of the fulfillment partners" — "storing in the same database, or otherwise combining, received ORMS data to provide a single source of information." *Versata Software, Inc., et al. v. SAP America, Inc., et al.*, 2009 U.S. Dist. LEXIS 45751 (E.D. Tex., May 19, 2009). [2276]

"the thickness of the layer and each polarization means are intended to bring about a compensation of the birefringence of the liquid crystal layer in its homeotropic structure so that the cell has a high contrast for said structure in the case of an oblique observation performed in a given observation plane" — "The claimed thickness of the liquid crystal layer is 2e[o]. This thickness, 2e[o], is defined as twice the thickness of the liquid crystal layer at which the polarization ellipse that is the result of an obliquely incident light wave traveling in the observation plane through a circular polarizer has its major axis rotated by the birefringence of the liquid crystal layer to align with the observation plane." *Commissariat a l’Energie Atomique v. Samsung Electronics Co., et al.*, 524 F. Supp. 2d 498 (D. Del. 2007). [2277]

"intensity" — "the area under the spectroscopic graph of reflectance (percent) versus wavelength occupied by the specified color." *Only the First, Ltd., et al. v. Seiko Epson Corp., et al.*, 2010 U.S. Dist. LEXIS 103988 (N.D. Ill., Sep. 29, 2010). [2278]

"interactive network sessions"; "interactive asymmetric communication in a session"; "interactive session"; "interactive communication" — "an established communication connection where information or commands are exchanged between a host server and a remote client in real time." *Hybrid Patents Inc. v. Charter Communications, Inc., et al.*, 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007). [2279]
"interactive operating process format" — "a call process flow implemented by at least one computer program that sets forth the content and sequence of steps to gather information from and convey information to callers through pre-recorded prompts and messages. The call process flow ... may be implemented by several linked or independently -- executable computer programs." *Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P.*, 326 F. Supp. 2d 1060 (C.D. Cal. 2003).

"interactive voice prompting" — "audible prompts provided to a user that enable the user to perform network services." *Foundry Networks v. Lucent Technologies, Inc.*, 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).

"intercepting said request at said web server"; "intercepting said request at said http-compliant device" — "intercepting the handling of a request at a web server"; "intercepting the handling of a request at a said http-compliant device." *EpicRealm, Licensing, LLC v. AutoFlex Leasing, Inc., et al.*, Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Aug. 15, 2006). "The Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court." *Id.*, Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Oct. 30, 2006).

"interchangeable with other cards" — "mean[s] that a user card that unscrambles a signal scrambled according to a particular scrambling technique can be readily exchanged with at least one other user card that unscrambles a signal scrambled according to a matching scrambling technique." *Broadcast Innovation, LLC v. Echostar Communications Corp.*, 240 F. Supp. 2d 1127 (D. Colo. 2003).

"interconnecting" — "connecting, which includes connecting physically, through the use of a cord, adaptor or wireless connection." *Callpod, Inc. v. GN Netcom, Inc., et al.*, 2009 U.S. Dist. LEXIS 51103 (N.D. Ill., Mar. 6, 2009).

"interconnecting said transceiver and one of said voice circuits for supplying paging signals" — "a single RIM connected to a single voice circuit and a single transceiver is downloaded with instructions from the central control station for operation as the central channel." *MLMC, Ltd. v. Airtouch Communications, Inc., et al.*, 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001).

"telephone network interface" — "a shared boundary between a telephone network and another system or device across which information is passed." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).

"interface engine" — "an interface module located outside of the main case that houses the image sensing module and the motion mechanism." Plustek, Inc. v. Syscan, Inc., et al., 2009 U.S. Dist. LEXIS 122777 (N.D. Cal., Dec. 21, 2009).

"interface for applying said binary true random sequence of signals to said general-purpose computer"; "true random number generator circuit interface" — "software, firmware, and/or hardware to directly or indirectly convey the binary true random sequence of signals to a bus in a general purpose personal computer." Quantum World Corp. v. Atmel Corp., et al., 2009 U.S. Dist. LEXIS 7936 (E.D. Tex., Jan. 30, 2009).

"interface in the form of a plurality of menus" — "a connection that provides a user with one or more screens with two or more menus (but not icons, pictures or symbols) to permit the user to make selections from the menus in order to enter script instructions." Rockwell Electronic Commerce Corp., et al. v. Apropos Technology, Inc., 2002 U.S. Dist. LEXIS 272 (N.D. Ill., Jan. 9, 2002).

"interface means for transferring a control program and control parameters from an external medium into said alterable memory and for recording the control parameter contents of said memory onto an external medium" — "is subject to § 112, P 6." IMS Technology, Inc. v. Haas Automation, Inc., et al., 206 F.3d 1422 (Fed. Cir. 2000).

"communications interface means" — "the term 'interface' does not stand alone, but is modified. The term 'communications interface' identifies a structure sufficient to perform the claimed function. This claim element is not a means-plus-function element requiring interpretation under § 112, P 6; it will be construed under the ordinary rules of claim construction." Microsoft Corp. v. Multi-Tech Systems, Inc., et al., 2002 U.S. Dist. LEXIS 15960 (D. Minn., Aug. 16, 2002).

"telephone line interface means" — "telephone line interface' is a specific reference to a type of interface, namely a 'telephone line' interface, that identifies a structure sufficient to perform the claimed function of connecting the invention to a telephone line. Therefore, this claim element is not a means-plus-function element requiring interpretation under § 112, P 6." Microsoft Corp. v. Multi-Tech Systems, Inc., et al., 2002 U.S. Dist. LEXIS 15960 (D. Minn., Aug. 16, 2002).

"telephone voice interface means" — "the reference to 'telephone voice interface' identifies a structure sufficient to perform the claimed function of receiving local voice signals and conveying remote voice signals. Therefore, this claim element is not a means-plus-function element requiring interpretation under § 112, P 6." Microsoft Corp. v. Multi-Tech Systems, Inc., et al., 2002 U.S. Dist. LEXIS 15960 (D. Minn., Aug. 16, 2002).

"interface ports for interprocessor communication" — "channels through which data is allowed to be transferred between two separate processing units." *Matsushita Electric Industrial Co., Ltd., et al.*, 514 F. Supp. 2d 916 (E.D. Tex. 2007). (2304)

"interface switch"; "interface" — "a device or system, which includes a processor, that transmits electronic mail messages to a wireless system for delivery to a mobile processor." *NTP, Inc. v. Research In Motion, Ltd.*, 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002). (2306)

"first interface to the computer system" — "software that enables the internet media venue user to interact with the computer system." *Function Media, L.L.C. v. Google, Inc.*, 2009 U.S. Dist. LEXIS 94340 (E.D. Tex., Oct. 9, 2009). (2307)

"second interface to the computer system" — "software that enables the seller user to interact with the computer system through which the seller user is prompted to enter information to select one or more internet media venues." *Function Media, L.L.C. v. Google, Inc.*, 2009 U.S. Dist. LEXIS 94340 (E.D. Tex., Oct. 9, 2009). (2308)

"interfacing said binary true random sequence of signals to a general purpose personal computer"; "interfacing said binary true random sequence of signals to a computer" — "directly or indirectly conveying the binary true random sequence of signals to a bus in a general purpose computer." *Quantum World Corp. v. Atmel Corp., et al.*, 2009 U.S. Dist. LEXIS 7936 (E.D. Tex., Jan. 30, 2009). (2310)

"first inter-layer insulating film" — "a first insulating film that is located between layers and that is separate from and not a part of an insulating film covering the surface of said substrate on which the MOSFET is formed." *Toshiba Corp. v. Hynix Semiconductor Inc., et al.*, 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006). (2311)

"second interlayer dielectric film" — "cover nonuniform second interlayer dielectric films in the common contact portion of the matrix." *Semiconductor Energy Laboratory Co. Ltd. v. Chi Mei Optoelectronics Corp., et al.*, 485 F. Supp. 2d 1089 (N.D. Cal. 2007). (2312)

"an intermediary disposed between adjacent pairs of said plurality of magnet elements" — "the term 'intermediary' can embrace magnetic substances, albeit only if the additional term requirement of 'alternating polarity' allows for it." *Intamin, Ltd. v. Magnetar Technologies, Corp.*, 2007 U.S. App. LEXIS 8791 (Fed. Cir., April 18, 2007). (2313)
"an intermediate memory ..." — "electronic storage media is included in the jukebox to temporarily store musical selections received from the central music store over the data telecommunications line." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007). 2314

"interconnecting each one of said processor systems through a network for data communications with each other one of said processor systems" — "mean[ ]s establishing data communication between every pair of processor systems in the distributed computer system using any kind of network." SeaChange International, Inc. v. nCube Corp., 115 F. Supp. 2d 473 (D. Del. 2000). 2317

"interface circuit" — "any circuit that links one type of logic system with another." Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364 (Fed. Cir. 2003). 2319

"interface module" — "interface engine located outside of the main case that houses the image sensing module and motion mechanism." Syscan, Inc. v. Portable Peripheral Co., Ltd., et al., 2006 U.S. Dist. LEXIS 47824 (N.D. Cal., July 5, 2006). 2322

"an interface module coupling ... to a computing device and receiving ... from the computing device" — "the court agrees that the previously agreed upon construction unduly limits claim 1. Plaintiff will not be bound by that construction. But aside from the term "interface module," which has already been construed, the court sees no reason to construe the remainder of the phrase." Syscan, Inc. v. Portable Peripheral Co., Ltd., et al., 2006 U.S. Dist. LEXIS 47824 (N.D. Cal., July 5, 2006). 2323

"interleaving"; "interleaved" — "the merging of two different frames of an image, with or without overlap, such that a given line of the merged image includes alternating image elements from each frame."  Crystal Image Technology, Inc. v. Mitsubishi Electric Corp., 2010 U.S. Dist. LEXIS 48290 (W.D. Pa., May 15, 2010).  

"storing the FECC codewords in an interleaved manner, the interleaving being different for the codewords of the different data channels" — "storing the FECC codewords such that interleaving is different for the codewords of the different data channels."  Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).  

"intermediate nodes" — "network connection points that have additional functionality for exploiting overlay routing, and that cooperate to provide forwarding to paths overlaid over the underlying network."  Cable & Wireless Internet Services, Inc. v. Akamai Technologies, Inc., 272 F. Supp. 2d 912 (N.D. Cal. 2003).  

"intermediate results file" — "a file that includes one or more records or fields used to respond to the query."  Jardin v. Datalegro, Inc., et al., 2010 U.S. Dist. LEXIS 105502 (S.D. Cal., Oct. 4, 2010).  

"the I/O connectors including the one or more data transmission ports and to all components requiring intermittent access provided for the computer" — "the court concludes that 'the I/O connectors including the one or more data transmission ports and to all components requiring intermittent access provided for the computer,' is indefinite under 35 U.S.C. § 112 based on its use of the term 'intermittent.'"  Rackable Systems, Inc. v. Super Micro Computer, Inc., 2006 U.S. Dist. LEXIS 81432 (N.D. Cal., Oct. 27, 2006).  

"intermittent power" — "power generated at irregular or regular intervals."  Excellent Inventions LLC v. FKA Distributing Co., et al., 2005 U.S. Dist. LEXIS 36174 (S.D. Tex., July 15, 2005).  

"international shipping information" — "any information, including at least shipping options and associated costs, related to shipping a product internationally from its point of origination to its point of destination."  DE Technologies, Inc. v. Dell Inc., 2006 U.S. Dist. LEXIS 5459 (W.D. Va., Feb. 14, 2006).  

"internet" — "a group of networks that have been connected by means of a common communications protocol."  Civix-DDI, LLC v. Cellco Partnership, 387 F. Supp. 2d 869 (N.D. Ill. 2005).
"Internet" — "the publicly accessible network capable of relaying information via Internet Protocol, either alone or in conjunction with one or more other protocols, but not including a wholly self-contained private network of devices communicating only with each other." Skyline Software Systems v. Keyhole, Inc., et al., 2006 U.S. Dist. LEXIS 83603 (D. Mass., Nov. 16, 2006). 2337

"Internet address" — "is simply a reference to a location of the information segment on the Internet. There is no support for the district court's added requirements that the 'Internet address' be a particular host or that it be unique. A URL, then, as defined by the language and context of the claims, is something that identifies the location of relevant information segments. This can include web pages, audio clips, images, and the like. It can be an absolute URL or a relative URL, as long as it specifies one or more Internet addresses of information segments relating to Internet content." ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082 (Fed. Cir. 2003). 2339

[i] "a published compilation of preselected Internet locations"; [ii] "a predetermined published Internet location" — [i] "a publicly accessible collection of information which corresponds to preselected Web sites (or to any other type of preselected data found on the Internet) which have unique URL addresses, the URL addresses being associated with diverse individuals or entities"; [ii] "a predetermined Web site (or any other type of data found on the Internet): (a) which has a unique URL address included in the published compilation; and (b) which serves to provide access to other preselected Internet locations." Internet Media Corp. v. Dell, Inc., et al., 2009 U.S. Dist. LEXIS 2187 (D. Del., Jan. 14, 2009). 2340

"second user Internet point" — "a terminal connected to the Internet through which the second user accesses the web site." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). 2341

"Internet portal"; "portal server" — "a website, requiring user authentication, used to connect with Internet destination on behalf of end users [and retrieve personal information]." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006). 2342

"Internet protocol (IP) address for identifying a mobile" — "the IP address (as construed herein) identifies the mobile for routing purposes." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006). 2343

"interpretation by the local computer" — "processing the job instructions to produce a set of computer readable job processing requirements." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 2346
"interpreting"—"refers to any kind of analyzing and translating utilized to enable the browser to effectively retrieve the relevant Web page." ACTV, Inc., et al. v. Walt Disney Co., et al., 204 F. Supp. 2d 650 (S.D.N.Y. 2002). 2347

"interrupt"—"a hardware signal which literally interrupts the computer and causes control to be transferred to the interrupt handler." Gobeli Research, Ltd. v. Apple Computer Inc., et al., 384 F. Supp. 2d 1016 (E.D. Tex., Aug. 26, 2005). 2349

"interrupt"—"requires: (1) providing electrical current to a device up to a preset threshold so that auxiliary components may continue to operate; and (2) completely shutting off electrical current to the device when the electrical current exceeds the preset threshold." Boss Control, Inc., et al. v. Bombardier Inc., et al., 410 F.3d 1372 (Fed. Cir. 2005). 2350

"interrupting"—"temporarily stopping a formatting operation, which may occur at any time." Ricoh Co., Ltd. v. Quanta Computer, Inc., et al., 2007 U.S. Dist. LEXIS 34892 (W.D. Wis., May 11, 2007). 2351

"intervention"—"an action by a health care provider to manage the care of an individual patient." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009). 2353

"intra-oral radiological sites"—"icons or sites, included in the representation of an intra-oral radiograph holder, that designate respective anatomical regions of the dental arch." Board of Regents of the University of Texas System, et al. v. Eastman Kodak Co., et al., 2006 U.S. Dist. LEXIS 7997 (W.D. Tex., Jan. 26, 2006). 2356

"first user intranet point"—"a terminal on a private network through which a web site provider accesses a site." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). 2357

"introducing"—"has an ordinary meaning and does not require construction." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). 2358

"invalidate data"—"to indicate previously cached data has been modified." SuperSpeed Software, Inc. v. Oracle Corp., 447 F. Supp. 2d 672 (S.D. Tex. 2006). 2360
"an inverter circuit connected between the DC terminals and the lamp terminals; the inverter circuit being operable to supply an alternating lamp voltage across the lamp terminals" — "Nilssen is bound by his assertion before the Patent and Trademark Office that the quoted element is a means-plus-function limitation." Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000).

"an inverter-type power supply that is connected with the DC output terminals and operative to provide a high-frequency AC voltage between a first inverter output terminal and an inverter reference terminal" — "the prosecution history reveals that Nilssen himself limited his claim to a 'full-bridge inverter.'" Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000). "This Court now holds that the phrase 'inverter-type power supply' ... is not limited by the specification. Instead the phrase is given its well-known meaning in the relevant art." Id., 130 F. Supp. 2d 976 (N.D. Ill. 2000).

"invoicer billing information" — "information relating to the customer's obligations to the invoicer, which may include the due date, amount due, list of goods and services, late charge." Emergis Technologies, Inc. v. Midwest Energy, Inc., 2006 U.S. Dist. LEXIS 65854 (D. Kan., Sept. 14, 2006).

"isolation"; "isolating"; "isolated" — "the absence of an electric path permitting the flow of DC current (other than a de minimus amount) between an input and an output of a particular stage, component, or circuit." *SynQor, Inc. v. Artesyn Technologies, Inc., et al.*, 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010). 2376

"issue"; "issued"; "issuing" — "remove or decouple the tangible medium from the means that stores the information therein, so the tangible medium provides an independent record of a voting session." *Avante International Technology Corp. v. Diebold Election Systems, et al.*, 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007). 2378

"issuing multiple instructions and non-sequential instructions within a given processor cycle when the existence of concurrencies is detected"; "issuing multiple instructions and non-sequential instructions within a given processor cycle when said plurality of concurrently executable instructions are detected" — "issuing multiple and non-sequential instructions when the dispatch stack has detected a plurality of concurrently executable (i.e. data dependency free) instructions." *Cornell University, et al. v. Hewlett-Packard Co.*, 313 F. Supp. 2d 114 (N.D.N.Y. 2004). 2379

"first code module issues a command to retrieve a second code module" — "the first code module performs a program instruction contained within the first code module to request the downloading of a second code module from a location on a network." *Modavox, Inc. v. Tacoda, Inc.*, 607 F. Supp. 2d 530 (S.D.N.Y. 2009). 2381

"item" — "the term 'item' has its plain ordinary meaning and does not require construction." *Sklar v. Microsoft Corp.*, 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007). 2382

"item"; "movie" — "As these are commonly-understood English words, they need no clarification." *Netflix, Inc. v. Blockbuster, Inc.*, 477 F. Supp. 2d 1063 (N.D. Cal. 2007). 2383

"item/movie rental queue" — "the sequence from which the provider selects movies or items to be rented." *Netflix, Inc. v. Blockbuster, Inc.*, 477 F. Supp. 2d 1063 (N.D. Cal. 2007). 2384

"items containing information" — "physical items, such as video tapes, film, or computer disks, which contain audio information, video information or both." *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.*, 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006). 2385
- J -

"job input" — "data received from the authorized user that is to be transcribed, translated, entered, or assembled." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 2386

"job instructions" — "communication(s) providing information for performing the job." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 2387

"job packet" — "one or more electronic files associated with a job." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 2388

"job request" — "data from an authorized user to a local computer asking for performance of a job." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 2390

"job steps" — "the series of actions that defines the job." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009). 2392

"junction" — "an intersection or interface between two different semiconductor regions, the place where two regions contact each other or come together." Semiconductor Energy Laboratory Co., Ltd. v. Samsung Electronics Co., Ltd., et al., 2010 U.S. Dist. LEXIS 45107 (W.D. Wis., May 7, 2010). 2393

"junction" — "the specification provides no support for defendants' attempt to limit the claimed device to only three layers." Magil Corp., et al. v. Seagate Technology, et al., 2010 U.S. Dist. LEXIS 18086 (D. Del., Mar. 1, 2010). 2394

- K -

"Kaufman-type ion beam source" — "any ion beam gun with the four stated components: a hot-wire cathode, an anode, grids, and magnets." Litton Systems, Inc. v. Honeywell, Inc., 140 F.3d 1449 (Fed. Cir. 1998). 2395

"kernel" — "a portion of the host operating system facility that resides in memory at all times." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004). 2396
"key" — "a unique sequence used to create or verify a digital signature." Timecertain, LLC v. Authentidate Holding Corp., et al., 2006 U.S. Dist. LEXIS 92789 (M.D. Fla., Dec. 22, 2006).

"hardware key" — "the Court concludes that the specification requires that the hardware key be an external hardware device." Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007).

"keyboard controller" — "a component, electronically or functionally distinct from the keyboard, that activates interrupt signals in response to receipt of data scan codes from the keyboard, and, upon request, transmits data scan codes to the computer." Samsung Electronics Co., Ltd. v. Quanta Computer, Inc., et al., 2006 U.S. Dist. LEXIS 66447 (N.D. Cal., Sept. 15, 2006).

"a keypad for both dialing out and programming said ringer" — "a telephone keypad in which the same keypad is used for both dialing out and programming a ringer." Motorola, Inc. v. VTech Communications, Inc., et al., 2009 U.S. Dist. LEXIS 59226 (E.D. Tex., Jul. 6, 2009).

"keystoning caused by planar misalignment between said projector means and said display screen" — "[i]mage distortion that occurs when the projection axis deviates from a 90 [degree] angle (i.e., is non-orthogonal) with the plane of the display screen." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007).

"knowledge-based access to, and management of" — "access based on knowledge of the user, and control, which includes any and all changes to the database including but not limited to the creation, deletion, and modification of content." Aircraft Technical Publishers vs. Avantext, Inc., 2009 U.S. Dist. LEXIS 105623 (N.D. Cal., Nov. 10, 2009).

"known anthropometric data" — "should not be limited to patient specific data, but should be construed more broadly to include anthropometric data that is compiled in a database and applies generally to a population." Healthport Corp. v. Tanita Corp. of America, 499 F. Supp. 2d 1179 (D. Or. 2007).

"language" — "programming used to couple network sites and mobile devices." MShift, Inc. v. Digital Insight Corp., et al., 2010 U.S. Dist. LEXIS 107946 (N.D. Cal., Oct. 8, 2010).

"large-screen display surface" — "although the Court believes that this is a close question, it concludes that a person skilled in the art would understand the term 'large-screen display surface.'"  *PolyVision Corp. v. Smart Technologies, Inc., et al.*, 501 F. Supp. 2d 1042 (W.D. Mich. 2007). 2411

"periodically forming largely overlapping images of a field of view of said array" — "The Court does not find 'largely' to be indefinite simply because there is no specific quantity by which the images must overlap. ...Based on the Court's determination that the device ... is one which may operate in a three-dimensional environment, the Court declines to further construe this phrase."  *Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp.*, 2006 U.S. Dist. LEXIS 62700 (N.D. Cal., Aug. 18, 2006). 2412

"larger than said simple geometric figure" — "having a greater area than the area of the simple geometric figure of the first planarizing pattern."  *Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al.*, 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006). 2413

"laser piloting means connected to said converting means and to said second transmitter for controlling said second transmitter by said electrical signals within said operating parameters of said optical amplifier" — "The dispute between the parties as to this term is whether the 'laser piloting means' must operate through direct modulation or whether the claim language also covers 'laser piloting means' that operate through external modulation. ... The Court is persuaded that, as a matter of law, the function of the 'laser piloting means' cannot include external modulating devices, but only includes direct modulation devices."  *Pirelli Cable Corp. v. Ciena Corp.*, 988 F. Supp. 424 (D. Del. 1997). 2414

"a laser source of subpicosecond laser light pulses, ... producing in the region of said focal point a two photon excitation energy level" — "definite structure and material is recited, thus making § 112, P 6 inapplicable. For example, the term 'laser source' by itself recites a structure, that is, a laser."  *Carl Zeiss Jena GmbH, et al. v. Bio-Rad Laboratories, Inc., et al.*, 2002 U.S. Dist. LEXIS 1729 (S.D.N.Y., Feb. 4, 2002). 2415

"last synchronization signature" — "a record computed by the general synchronization module from which the most recent synchronization may be determined."  *Visto Corp. v. Seven Networks, Inc.*, 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005). 2416

"latching level shifter" — "a level shifter including a feedback loop that will indefinitely retain at least one data state in the absence of any new control signal to change the state."  *Mosaid Technologies, Inc. v. Samsung Electronics Co., Ltd., et al.*, 2004 U.S. Dist. LEXIS 27636 (D.N.J., Mar. 23, 2004). 2417

"layer" — "a thickness of material, which may be made up of sub-layers, but does not refer to a substrate in a device unless the substrate is an electronically active portion of the device." Seoul Semiconductor Co. Ltd. v. Nichia Corp., et al., 596 F. Supp. 2d 1005 (E.D. Tex. 2009).  

"layer 2 forwarding protocol"; "the forwarding protocol"; "virtual dial-up protocol" — "rules for enabling a remote client to communicate information with a home network through an intermediary, containing the following features: packaging data at the link level frames of higher protocols; enabling multiplexing (and demultiplexing) multiple remote clients within a single tunnel; encapsulating and packaging data configured in a particular protocol (such as PPP) without regard to the information content of the encapsulated data; structuring packets of data by a layer 2 forwarding protocol header (containing information relating to the layer 2 forwarding protocol operation) and a payload containing the encapsulated data; changing none of the encapsulated data during transmission; obviating the need for authentication or address assignment from the internet service provider; containing no requirement that the remote client be queried a second time; and supporting an arbitrary request/response exchange, in that the network access server can detect the apparent identity of the user and establish a tunnel connection to the home gateway, where the arbitrary exchange can occur." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).  

"LCD panel" — "a panel of material whose reflectance or transmittance changes when an electrical field is applied to it." O2 Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006).
[i] "lead frame"; [ii] "paddle"; [iii] "external mounting frame" — [i] "the metal piece, initially flat, to which a semiconductor integrated circuit chip is mounted, and which comprises the external mounting frame, the paddle, the paddle support arms, and the fingers"; [ii] "the surface upon which a semiconductor integrated circuit chip is mounted"; [iii] "the exterior portion of the lead frame to which the paddle support arms and fingers are initially attached." Agere Systems Inc. v. Atmel Corp., 2003 U.S. Dist. LEXIS 9823 (E.D. Pa., May 23, 2003).

"lead wire extending from the package" — "the insulated wires or leads start inside the envelope and extend from the inside to the outside of the envelope." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).

"Lempel-Ziv encoders" — "encoders which implement a compression methodology for dictionary-based lossless data compression, where the dictionary contains any data sequence that has already been used to build the dictionary contents; a pointer to an earlier entry in the dictionary contents indicates a data sequence; and either a combination of address to already coded dictionary contents and sequence length is stored or only an index to the dictionary is stored." Realtime Data, LLC v. Packeteer, Inc., et al., 2009 U.S. Dist. LEXIS 78459 (E.D. Tex., Jun. 23, 2009).

"lens" — "a body that has two opposite regular surfaces, at least one of which is curved, that is structured and positioned to form an image by focusing a beam of electromagnetic radiation." International Automated Systems, Inc. v. Digital Persona, Inc., et al., 2008 U.S. Dist. LEXIS 445 (D. Utah, Jan. 2, 2008).

"pricing information that is less restrictive for the same pricing type" — "pricing information that is less specifically applicable to an organizational group or a product group for a given pricing type." Versata Software, Inc., et al. v. SAP America, Inc., et al., 2009 U.S. Dist. LEXIS 45751 (E.D. Tex., May 19, 2009).

"library" — "The district court defined 'library' as a 'collection ... of places that store information, and you can have a single control or common handling system.' ... we conclude that the district court erred." Odetics, Inc. v. Storage Technology Corp., et al., 1997 U.S. App. LEXIS 15254 (Fed. Cir., Jun. 25, 1997) (unpublished).

"virtual media asset library" — "a repository of media assets to which the user is licensed and functionality that allows synchronization and replication of the user's licensed assets with each of the user's media player devices." Zapmedia Services, Inc. v. Apple Inc., 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010).

"a license pool" — "one or more license(s) collected together, as in a license file." Globetrotter Software, Inc. v. Elan Computer Group, Inc., et al., 1999 U.S. Dist. LEXIS 22482 (N.D. Cal., Oct. 22, 1999).

"licensing component" — "a part that coordinates or requests the licensing of information or products. The phrase implies action or the presence of an active constituent part. In computer programming, such an active part is an executable file or program. Thus, based on the claim language, the Court finds that the 'licensing component' must include an executable file or program." Network Commerce, Inc. v. Microsoft Corp., 260 F. Supp. 2d 1034 (W.D. Wash. 2002).

"in lieu of control provided by said originally provided program" — "in place of or instead of control provided by all or part of said originally provided program." Adrain v. Superchips, Inc., 2006 U.S. Dist. LEXIS 25212 (S.D. Tex., March 14, 2006).

"light" — "the spectrum of electromagnetic radiation which can be seen by the human eye and is not limited to lasers." Applied Material, Inc. v. Tokyo Seimitsu, Co., 446 F. Supp. 2d 525 (E.D. Va. 2006).

"a light transmission element attached to the light device" — "a part of a composite entity that allows light to pass or be conveyed to the light device." Yanova, Inc., et al. v. Johnson, et al., 2005 U.S. Dist. LEXIS 497 (S.D.N.Y., Jan. 11, 2005).

"limit on use" — "a control that limits a caller's access to a service based on some predetermined method of measuring the level of use. The term 'limit on use' is not restricted to a specific method of measuring use, such as a limited number of accesses into the Katz system." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).  

"limiting the voltage applied to said transformer and to said components" — "ordinary meaning; no further construction is necessary." ABB Automation Inc. v. Schlumberger Resource Management Services, Inc., 254 F. Supp. 2d 475 (D. Del. 2003).  

"limits" — "end point values delineating the range of angular motion for a particular joint for a particular gesture action (as defined [])." New York University v. Autodesk, Inc., 2007 U.S. Dist. LEXIS 26671 (S.D.N.Y., April 10, 2007).  

"a line activity monitor coupled to the telephone line to record information indicative of usage of the telephone line" — "an apparatus for monitoring activity or information indicative of how the telephone line is being used. All types of line activity or modes of line use need not be monitored and recorded, so long as at least some information indicative of usage is recorded." Octel Communications Corp., et al. v. Theis Research, Inc., et al., 1999 U.S. App. LEXIS 30066 (Fed. Cir., Nov. 18, 1999) (unpublished).  

"line-powered, serially connected intelligent cells"; "PSICs" — "SICs wherein one SIC receives power directly from the power source and other SICs are fed power from network wiring and may feed power to other connected SICs if capable." SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007).  

"linear combination" — "means the sum or difference of a transmission function and a scatter function, with each function depending on a single input variable." American Science and Engineering, Inc. v. Autoclear, LLC, et al., 2009 U.S. Dist. LEXIS 25954 (E.D. Va., Jan. 30, 2009).  

"bi-directional communications link coupled between the futures and options computers"; "a bi-directional communications link coupled between the options computer and principal market maker computer"; "communications link" — "(1) 'link' means 'a unit in a communication system'; and (2) 'coupled' means 'to join for combined effect.'" Chicago Mercantile Exchange, Inc., et al. v. Technology Research Group, LLC, 2010 U.S. Dist. LEXIS 65002 (N.D. Ill., Jun. 28, 2010).2462

"link data" — "data describing the identity and features of the mobile station and the call in which the mobile station is engaged." HTC Corp., et al. v. IPCom GmbH & Co., KG, 2010 U.S. Dist. LEXIS 87585 (D.D.C., Aug. 25, 2010).2463

"link layer" — "the second lowest layer of the Open Systems Interconnect (OSI) seven layer model, providing the functional and procedural means to transfer data between modems, and to detect and correct errors." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).2464

"link said memory to a remote home base" — "establish a communication connection between a device that stores digital data and a 'remote home base.'" Key Energy Services, Inc. vs. C.C. Forbes, LLC, et al., 2010 U.S. Dist. LEXIS 67292 (E.D. Tex., Jul. 7, 2010).2465

"linked" — "associated with, related to, or connected to." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).2466

"linked to" — "requires no construction." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).2467

"linking the address of such unusable blocks with addresses of other blocks that are useable" — "need not take the form of a map or table, but must be something more than simply storing a pointer in the unusable block that points to a usable block." Sandisk Corp. v. Zotek Electronic Co., Ltd., et al., 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010).2468

"liquid crystal display"; "LCD" — "[a] display device including a LCD panel and a device backlight unit both of which are sandwiched by the first and second frames." LG Philips Co., Ltd. v. Tatung Co., et al., 2007 U.S. Dist. LEXIS 43557 (D. Del., June 15, 2007).2469

"a liquid crystal layer which can have a homeotropic structure" — "the liquid crystal layer having molecules substantially oriented in a homeotropic direction." Commissariat a l'Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007).2470

"live operator stations with prompting capability" — "operator stations with the capability of providing prompting data, which may or may not be related to prompts used in automated formats." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003).2472
"the second level name server includes a load balancing mechanism that balances loads across a subset of the set of servers" — "a mechanism in the second level name server monitors the loads on a group of content servers in a content delivery network and distributes requests for objects among them to avoid overloading any single content server." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007).

"being selected according to a load sharing algorithm enforced across the subset of the set of content servers associated with the given name server" — "being selected by a procedure that distributes requests for objects among a group of content servers in a content … delivery network associated with the particular name server to avoid overloading any single content server." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007).

"having a loadable font memory for storing a library of up to a predetermined maximum number of font patterns" — "means that the character-based output device must contain a dynamically changeable storage area for storing a limited number of monochromatic characters." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).

"loan application" — "a request for an extension of credit in a format that contains sufficiently detailed information to enable a lender to grant or deny the request." IMX, Inc. v. LendingTree, LLC, 405 F. Supp. 2d 479 (D. Del. 2005).

"local area network" — "a plurality of computers located nearby to one another that are interconnected so they can exchange information." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).

"local area network" — a network that switches hardware and software, a construction that is consistent with both the patent language and the prosecution history." Advanced Communication Design, Inc. v. Premier Retail Networks, Inc., 186 F. Supp. 2d 1009 (D. Minn. 2002).

"local area network"; "LAN" — "a short distance communications network (typically within a building or campus) used to link computers and peripheral devices (such as printers, CD-ROMS, modems) under some form of standard control." SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007).

"communicatively linking said contributions accepting devices in a local area network" — "A 'local area network' is a group of computers and other devices over a relatively limited area connected by a communications link that enables any device to interact with any other on the network." Ziarno v. American National Red Cross, et al., 2000 U.S. Dist. LEXIS 22508 (N.D. Ill., Aug. 16, 2000).

"local area network that is further connected to the server" — "needs no construction." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).

"a local calling area of the caller" — "a calling area where a caller does not incur long distance or toll charges when making a call." Stanacard, LLC v. Rebtel Networks, AB, et al., 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010).
"local computer" — "a computer system from which an authorized user can initiate a job, either directly or indirectly, that includes an information system that stores databases of information used to process jobs." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009).2483

"local control system" — "a control system located on or near the streamer positions devices (e.g. birds)." WesternGeco LLC v. ION Geophysical Corp., 2010 U.S. Dist. LEXIS 71875 (S.D. Tex., Jul. 16, 2010).2484

"local digital data processing system" — "a digital data processing system restricted to a particular area and physically and logically distinct from any other local digital data processing system if one exists." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).2485

"local distribution system" — "a reception system, as previously defined, located geographically close to subscriber receiving stations which are coupled to the reception system." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007).2486

"local memory" — "memory easily accessible to the user's processor, either because it is physically part of the processor or is attached directly thereto, and distinct from the memory of the remote server from which data must be downloaded." Skyline Software Systems, Inc. v. Keyhole, Inc., et al., 421 F. Supp. 2d 371 (D. Mass. 2006).2487

"local memory device" — "the word 'local' is used to describe computer devices that are directly attached to a single computer's processor (by, for example, the computer's bus), without the need for an intervening communication channel." Mangosoft, Inc., et al. v. Oracle Corp., 2004 U.S. Dist. LEXIS 19357 (D.N.H., Sept. 21, 2004).2488

"local port" — "a point of physical interface." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).2489

"local processor assembly" — "a computer at the user's location; in contrast to a 'remote' server assembly, the user can access data on the claimed 'local' processor assembly without an on-line connection." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).2490

"one or more local server computers" — "The plain language of the patent makes clear that caching is critical to the function of a local server, and that unless there is caching, the device cannot be considered a local server for purpose of this patent." Netword, LLC v. Centraal Corp., 1999 U.S. Dist. LEXIS 1957 (E.D. Va., Jan. 12, 1999).2491 "We conclude that the district court correctly construed claim 1 as requiring a local server computer that has a limited database of aliases and that may request updates from a central registry computer. The district court's construction of the claimed element 'local server computer' as requiring performance of these functions is affirmed." Id., 242 F.3d 1347 (Fed. Cir. 2001).2492 "[T]he file history and the specification, as demonstrated above, actually teach that claim 1 does not carry the limitations imposed on it by the district court and the majority." Id. (Clevenger, J., dissenting).2493

"localized wireless gateway system" — "require[s] that the system be limited to an operating range of a few feet and perform compression and packetization functions." Verizon Services Corp., et al. v. Vonage Holdings Corp., et al., 503 F.3d 1295 (Fed. Cir. 2007). 2495

"locally generated video signal" — "a video signal that is generated at the headend, i.e., locally to the switching system." Beam Laser Systems, Inc. v. Cox Communications, Inc., et al., 144 F. Supp. 2d 475 (E.D. Va. 2001). 2496

"located in the computer" — "located in the CPU, main memory, the CPU or main memory circuit boards, or qualifying peripherals." Pickholtz v. Rainbow Technologies, Inc., et al., 284 F.3d 1365 (Fed. Cir. 2002). 2497

"locating said predetermined position" — "locating the operand or instruction within the instruction group that includes the operand or instruction being accessed at the predetermined position." Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 2501

"location" — "the place in the memory where information is stored." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007). 2502

"location facility" — "computer software associated with the locator server." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007). 2505

"location on the internet being defined by a static IP address" — "requires no construction." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007). 2507
"predetermined locations"; "point-of-sale locations" — "a business establishment or kiosk which may be automated or staffed by one or more persons." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007).2508

"locator server computer"; "server computer" — "[a] computer with unrestricted access to an interconnected network of computers, such as the internet." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007). 2509

"log entry" — "a set of data items, treated as a unit, which concern transactions or activities that take place on a computer and which is placed into a set of related records concerning such transactions or activities." Computer Acceleration Corp. v. Microsoft Corp., 516 F. Supp. 2d 752 (E.D. Tex. 2007). 2510

"log file" — "the set of log entries, which, if the log file for a program does not already exist on the computer system, are, upon launch of that program, generated in sequence for each access during the launch sequence to a physical address block at which a portion of the computer program is stored." Computer Acceleration Corp. v. Microsoft Corp., 516 F. Supp. 2d 752 (E.D. Tex. 2007). 2511

"logic circuit" — "a circuit outside of the memory device that performs some processing or controlling function." UniRAM Technology, Inc. v. Monolithic System Technology, Inc., 2006 U.S. Dist. LEXIS 21661 (N.D. Cal., March 30, 2006). 2513

"logic circuit" — "the software and/or hardware that provides pre-programmed, or preset, responses dictated by the test subject's inputs." Diagnostic Group, LLC v. Benson Medical Instruments Co., 2005 U.S. Dist. LEXIS 5030 (D. Minn., Mar. 28, 2005). 2514

"second logic coupled with the buffer, and responsive to the packet filter to read and process data in the identified packets from the buffer, and to produce a data value dependent on contents of the packet prior to transfer of the identified packets to the second port by the first logic" — "§ 112(6) does not apply." 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007). 2515

"logic gates" — "refers to the logic circuitry that makes up the graphics engine and manipulates video data on a computer screen." NeoMagic Corp. v. Trident Microsystems, Inc., 98 F. Supp. 2d 538 (D. Del. 2000). 2517

"logic means" — "does not recite sufficient structure to overcome the presumption that it is in a means-plus-function format." St. Clair Intellectual Property Consultants, Inc. v. Matsushita Electronic Industrial Co., Ltd., et al., 2009 U.S. Dist. LEXIS 106697 (D. Del., Nov. 13, 2009). 2519

"logical address" — "a fixed, unique, and unchanging identifier assigned within a network of interconnected computers for source to destination packet delivery." Fenner Investments, Ltd. v. Hewlett-Packard Co., et al., 2009 U.S. Dist. LEXIS 102765 (E.D. Tex., Nov. 4, 2009). 2521

"logical address" — "a fixed, unique, and unchanging identifier assigned within a network of interconnected computers for source to destination packet delivery." Fenner Investments, Ltd. v. 3Com Corp., et al., 2009 U.S. Dist. LEXIS 44842 (E.D. Tex., May 26, 2009). 2522

"logical block address" — "address provided by the host to the controller for identifying blocks which contain a plurality of N sectors." Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005). 2523

"logical page address" — "is not limited to a 'logical block number plus logical page offset.'" Sandisk Corp. v. Zotek Electronic Co., Ltd., et al., 2010 U.S. Dist. LEXIS 99500 (W.D. Wis., Sep. 22, 2010). 2525

"logical processor number" — "a number correlated by the hardware to an actual physical processor element." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). 2526

"logical resource driver" — "a hardware device which provides a data cache and instruction selection support system for a given user. The LRDs receive execution sets, store the instructions, and deliver the instructions to the processor elements." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). 2527

"logical unit" — "is synonymous with the term 'volume' or 'virtual disk.'" Storage Computer Corp. v. Veritas Software Corp., et al., 2003 U.S. Dist. LEXIS 1181 (N.D. Tex., Jan. 27, 2003). 2528

"logging accesses to ..." — "placing in a log file, information about the obtaining of data from ..." Computer Acceleration Corp. v. Microsoft Corp., 516 F. Supp. 2d 752 (E.D. Tex. 2007). 2529

"logon command" — "identifying information, such as a name or data, associated with and enabling operation of a remote computer unit, and which is checked for validity by the [remote system controller, network control computer, website]." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009). 2530 "Contrary to the court's prior claim construction ruling with regard to the term 'logon command,' with respect to the '943 patent, the court concludes that a logon command is not limited to being associated with or enabling the operation of only one particular remote computer unit." Id., 2009 U.S. Dist. LEXIS 101031 (S.D. Tex., Oct. 30, 2009). 2531
"long wavelength spectral range" — "The light produced by the laser is of such a wavelength that the fluorophore in the target material will not fluoresce in response to the absorption of one photon, but will fluoresce when the energies of two photons of that wavelength are absorbed and combined. Long wavelength means longer than the short wavelength spectral range light of claim element 1[a] or the predetermined wavelength of claim element 7[a]. The specific wavelengths depend on the particular fluorophore used in the target material." Carl Zeiss Jena GmbH, et al. v. Bio-Rad Laboratories, Inc., et al., 2002 U.S. Dist. LEXIS 1729 (S.D.N.Y., Feb. 4, 2002).

"look ahead distance" — "a distance along the ground track of the aircraft that marks the outer limit of each alert envelope that is a function of aircraft speed and time to complete an evasive maneuver." Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al., 488 F.3d 982 (Fed. Cir. 2007).

"the lottery game and an amusement game" — "a game which amuses the player, which can be combined with or be separate from the 'actualization' game which reveals the result of the lottery game." Ingenio, Filiiale de Loto-Quebec, Inc. v. GameLogic, Inc., 445 F. Supp. 2d 443 (D. Del., July 21, 2006).

"low level current" — "a current sufficient to cause the access device to start up, but not sufficient to sustain the start up." Network-1 Security Solutions, Inc. v. D-Link Corp., et al., 2006 U.S. Dist. LEXIS 84510 (E.D. Tex., Nov. 20, 2006).

"low-power state" — "state of operation brought about by shutting off or reducing power to the unnecessary sections of circuitry." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010).

"low temperature oxide" — "an oxide in which deposition, densification, or curing occurs at temperatures less than approximately 450 ° C." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).

"lower speed return channel protocol"; "upstream channel protocol" — "a set of rules for transmission of lower speed data addressed to a host computer or server." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).

"lower substrate"; "conductive layer formed over said ... substrate" — "'lower substrate' refers to the base or foundation on which the rest of the structure is built, and 'conductive layer formed over' the substrate means that the conductive layer covers the surface of the substrate." Laser Diode Array, Inc. v. Paradigm Lasers, Inc., et al., 114 F. Supp. 2d 167 (W.D.N.Y. 2000).

-M-

"MAC address" — "physical address used by the media access controller (MAC) level defined by standards such as Ethernet, token ring, or FDDI." Fenner Investments, Ltd. v. 3Com Corp., et al., 2009 U.S. Dist. LEXIS 44842 (E.D. Tex., May 26, 2009).

"machine-readable code elements" — "individual parts of a code (1) that can be separated into parts and (2) that can be automatically obtained from objects." CIAS, Inc. v. Alliance Gaming Corp., et al., 424 F. Supp. 2d 678 (S.D.N.Y. 2006).

"[the needle] is rendered magnetic at [or to] a level that enables detection of the magnetism of the needle"; "the needle is magnetized to a level which enables detection of the magnetism of the needle" — "either prior to injecting the living animal or while in the flesh of the animal after slaughter, the needle is magnetized to become a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time, to a level that makes it possible for the magnetism of the needle to be detected by a metal detector or magnetic detector." Ideal Instruments, Inc. v. Rivard Instruments, Inc., et al., 498 F. Supp. 2d 1131 (N.D. Iowa 2007).

"magnetic or magnetizable" — "is or is capable of becoming a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time." Ideal Instruments, Inc. v. Rivard Instruments, Inc., et al., 498 F. Supp. 2d 1131 (N.D. Iowa 2007).

"main case" — "a compact case that houses the image sensing module and the motion mechanism." Syscan, Inc. v. Portable Peripheral Co., Ltd., et al., 2006 U.S. Dist. LEXIS 47824 (N.D. Cal., July 5, 2006).
[i] "a main computer including a main memory for storing variable data, constant data and a main revision status related to at least one product, the main revision status indicating the revision level of the constant data stored in the main memory"; [ii] "a remote computer including a remote memory for storing constant data and a remote revision status related to the at least one product, the constant data being a subset of information data related to the at least one product, the remote revision status indicating the revision level of the constant data stored in the remote computer" — [i] "a computer that has a memory in which variable data, constant data, and a main revision status indicating the revision level of the constant data is stored" [ii] "a computer that has a memory in which constant data and a remote revision status indicating the revision level of the constant data is stored." Charles E. Hill & Associates, Inc. v. Compuserve Inc., et al., 2003 U.S. Dist. LEXIS 19218 (S.D. Ind., Aug. 29, 2003).

"maintain ... at a predetermined level" — "charge[s] the invention of claim 1 with the task of keeping, or preserving from decline, the luminous output of its LEDs at an amount chosen beforehand." Relume Corp. v. Dialight Corp., et al., 63 F. Supp. 2d 788 (E.D. Mich. 1999).

"maintaining a currently displayed frame"; "maintain a currently displayed frame" — "continuing to display the same picture frame that is being displayed when the manually inputted signal is detected." Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al., 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006).

"maintaining said encoded information" — "keeping the encoded information such that it is readable when the disc is subsequently played back." *Ricoh Co., Ltd. v. Quanta Computer, Inc., et al.* 2007 U.S. Dist. LEXIS 34892 (W.D. Wis., May 11, 2007).2563

"maintaining updated sums of said coefficients" — "far from reciting a function without specific acts, appears to delineate an act ('maintaining updated sums of said coefficients') that helps achieve the desired purpose of 'forming a seamless DWT.' We therefore hold that the claim limitation at issue does not, as a matter of law, implicate section 112, paragraph 6." *LizardTech, Inc. v. Earth Resource Mapping, Inc., et al.* 35 Fed. Appx. 918 (Fed. Cir., May 22, 2002) (unpublished).2566

[i] "the majority of the unscrambling circuit"; [ii] "essential portion of the unscrambling circuit" — [i] "either the amount of circuitry or the portion of the circuitry that performs the majority or most important part of the unscrambling function"; [ii] "the indispensable portion of the entire circuit that restores a modified signal to its unmodified condition." *Broadcast Innovation, LLC v. Echostar Communications Corp.* 240 F. Supp. 2d 1127 (D. Colo. 2003).2567

"making a first image of the organ with respect to a first coordinate system using a first imaging device" — "making a three-dimensional rendering of the organ of interest. This may be done by use of a CT or a MRI device. The rendering is taken with respect to a first coordinate system." *NOMOS Corp. v. ZMED, Inc.* 260 F. Supp. 2d 215 (D. Mass. 2002).2568

"making a second image with said second imaging device, the second image corresponding to a cloud of points of the surface of the organ or skin region" — "using the second imaging device (e.g., the ultrasound probe that takes two-dimensional images) to make a three-dimensional rendering showing the organ." *NOMOS Corp. v. ZMED, Inc.* 260 F. Supp. 2d 215 (D. Mass. 2002).2569

"making a wager" — "mean[s] betting, which is an act performed by the player." *Aristocrat Technologies, Australia PTY Ltd., et al. v. International Game Technology, et al.* 2010 U.S. Dist. LEXIS 47290 (N.D. Cal., May 13, 2010).2570

"making at least one 3D first image of an organ of a patient having a first coordinate system and of a surface of the organ or skin region with a first imaging device while the patient is in a pre-operation site without fixing any mark to the patient" — "making a three-dimensional rendering of the organ of interest. This may be done by use of a CT or a MRI device. The image is taken with respect to a first coordinate system while the patient is in a pre-operation site and without fixing any mark to the patient." *NOMOS Corp. v. ZMED, Inc.* 260 F. Supp. 2d 215 (D. Mass. 2002).2571
"making telephone calls from any available telephone" — "means that the calling telephone must be capable of (1) dialing the special exchange; (2) transmitting a special code to the exchange; and (3) transmitting a phone number to be called to the exchange." Aerotel, Ltd. v. Telco Group, Inc., et al., 2010 U.S. Dist. LEXIS 47266 (S.D.N.Y., May 12, 2010). 2572

"the auctioneer manages the acceptance and rejection of bids" — "the auctioneer has complete control over which bids are accepted and rejected." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 2573

"managing the efficient routing of transit traffic between said plurality of tandem access points and said switch" — "managing transit traffic into, out of and throughout the claimed network by reducing the customer carriers' reliance on the RBOC/ILEC network." Neutral Tandem, Inc. v. Peerless Network, LLC, et al., 2010 U.S. Dist. LEXIS 11248 (N.D. Ill., Feb. 8, 2010). 2575

"manipulating component fields" — "rearranging the data fields received from the data path in different ways." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 2577

"manipulating the client database by commands received from the gateway computer" — "The only phrase that needs construction is 'manipulating the client database by commands,' and the court incorporates by reference its previous construction of 'directly manipulating the client database' as the definition for that term." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006). 2578

"manipulating the client database with the session module" — "The court concludes that 'manipulating the client database' means 'causing tasks to occur on the client database, such as querying, adding, or removing data, by commands sent to the client database.' The balance of the phrase requires no construction." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006). 2579

"the adjustment being performed in a manner which causes the actual ion output current value to become equal to the ion output current reference value" — "the actual ion output current value is either increased or decreased until it equals the ion output current reference value." Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003). 2580

"manual reset" — "This Court will construe 'manual reset' to be the same 'power on reset signal' present in Claim 1(d) and (e)." Agrizap, Inc. v. Woodstream Corp., et al., 431 F. Supp. 2d 518 (E.D. Pa. 2006). 2581

"manually modified" — "effecting a change as a result of a user's input or request." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010). 2582

- 238 -
"many-to-many functionality" — "two or more users able to access two or more data files." Leader Technologies, Inc. v. Facebook, Inc., 2010 U.S. Dist. LEXIS 21100 (D. Del., Mar. 9, 2010). 2583

"map" — "a visual representation of the location of pit and particle defects on the surface of a scanned workpiece that includes the underlying electronically stored data corresponding to said visual representation." ADE Corp. v. KLA-Tencor Corp., 252 F. Supp. 2d 40 (D. Del. 2003). 2584

"map image" — "a representation of a flood map, such as a FEMA flood map, stored as a grid of pixels." Sourceprose Corp. v. Fidelity National Financial, et al., 2006 U.S. Dist. LEXIS 10151 (E.D. Tex., Feb. 23, 2006). 2585

"determining whether or not the data packet is marked as being transmitted at an excessive rate" — "determining whether the packet is marked in a network environment where marking is being performed to designate those packets that are transmitted at excessive rates." Lucent Technologies, Inc. v. Newbridge Networks Corp., et al., 168 F. Supp. 2d 181 (D. Del. 2001). 2588

"marker value" — "a value or number associated with a channel select designation." Beery v. Thomson Consumer Electronics, Inc., et al., 2004 U.S. Dist. LEXIS 17173 (S.D. Ohio, Aug. 18, 2004). 2590

"principal market maker" — "an entity required to provide the following functions: (1) continuously maintain a two-sided bid/offer market of specified size and spread for its designated product(s); (2) maintain a public order book with respect to these assigned products; and (3) give priority to customer order execution over personal trading. As compensation for the fulfillment of these responsibilities, this entity is to receive priority volume benefits." Chicago Mercantile Exchange, Inc., et al. v. Technology Research Group, LLC, 2010 U.S. Dist. LEXIS 65002 (N.D. Ill., Jun. 28, 2010). 2591

"market reports routine" — "a portion of a program that performs the particular task of allowing the user to search the auction data and display on the user workstation information about prior sales including the sale prices for different vehicle types that have been sold at an auction in the system." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 2592

"market-specific segment" — "individual audiovisual segments designed for specific markets within the network." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006). 2593

"marking that one customer's data packets as being transmitted into the network at an excessive rate" — "monitoring the transmission of a customer's data packets and marking those packets that are being transmitted at an excessive rate." Lucent Technologies, Inc. v. Newbridge Networks Corp., et al., 168 F. Supp. 2d 181 (D. Del. 2001).  

"mask" — "an item, in a semiconductor integrated circuit, on which a circuit pattern is placed." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004).  

"mass information" — "the computation of all mass features. Masses are lesions within the breast characterized by density, margin definition, shape, texture, or asymmetry." R2 Technology, Inc. v. Intelligent Systems Software, Inc., 2003 U.S. Dist. LEXIS 7436 (D. Del., Apr. 30, 2003).  

"mass storage means" — "is a proper mean-plus-function limitation because, while there, are endless ways to store information, the claim language, itself provides none of that structure." Catch Curve, Inc. v. Venali, Inc., 2007 U.S. Dist. LEXIS 93667 (C.D. Cal., May 11, 2007).  

"master data base of a first plurality of options that may be implemented on a computer system" — "a file containing a collection of entries for every option offered that may be implemented on a computer system." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).  

"matching"; "matched" — "determining whether ID information stored on the debit card and corresponding ID information stored on the terminal are equal or identical." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).  

"matching relationship" — "the Court finds that no construction is necessary because a proper understanding of 'matching relationship' may be reached from a plain reading of the term in context of the surrounding claim language." Konami Corp. v. Roxor Games, Inc., et al., 445 F. Supp. 2d 725 (E.D. Tex. 2006).  

"matching the at least one 3D first image and the second image where the at least one 3D first image is located with respect to the first coordinate system of the patient" — "aligning the at least one three-dimensional first rendering, which is located with respect to the first coordinate system, with the three-dimensional second rendering." NOMOS Corp. v. ZMED, Inc., 260 F. Supp. 2d 215 (D. Mass. 2002).
"material object" — "a tangible medium or device in which information can be embodied, fixed, or stored, other than temporarily, and from which the information embodied therein can be perceived, reproduced, used or otherwise communicated, either directly or with the aid of another machine or device. A material object must be offered for sale, and be purchasable, at point of sale locations where at least one IMM [information manufacturing machine ] is located. Further, a material object must be separate and distinct from the IMM, removed from the IMM after purchase, and intended for use on a device separate from the IMM either at the point of sale location or elsewhere. 'Material object' does not encompass the hard disk component of a home personal computer. Finally, a material object need not be offered for sale independently from the information that may be reproduced onto the material object, that is, as a blank." Interactive Gift Express, Inc. v. CompuServe, Inc., et al., 256 F.3d 1323 (Fed. Cir. 2001).  

"maximizing throughput of said memory requests to the synchronous DRAM so that use of the data slots by the synchronous DRAM is maximized" — "scheduling memory requests to the synchronous DRAM to maximize throughput so that the use of data slots is maximized." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).  

"a maximum dose of the selected transition metal that can be fully dissolved into the substrate at a temperature in a range between a eutectic temperature of the substrate and an annealing temperature of the substrate" — "the upper limit to the dose of selected metal that can be fully dissolved within the semiconductor material at subsequent processing temperatures. When the selected metal is platinum, this maximum dose is about 2 x 10^{16} \text{atoms/cm}^2." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).  

"the maximum dose sufficient to effect lifetime control without substantially increasing leakage current of the device" — "the upper limit to the dose of transition metal that can be applied to the device that will be sufficient to effect lifetime control but will not cause the leakage current to increase by three orders of magnitude or more when compared with a similar device that has not had transition metal added. For Pt, this upper dose limit is between 10^{16} and 6.5 \times 10^{16} \text{atoms/cm}^2." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).  

"means" — "as a whole it is clear that the terms using the 'means' language are used in their ordinary and customary meaning throughout the patent to mean 'circuit' or 'portion' of the chip. As such Claim 1 provides sufficient structure and section 112, paragraph 6 does not apply to the analysis." Sanyo Electric Co., LTD v. Mediatek, Inc., 2006 U.S. Dist. LEXIS 96191 (C.D. Cal., Aug. 17, 2006).  

"card reader means" — "a device, included as part of a terminal, used for retrieving ID information from a debit card." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).  

"communication means" — "[corresponding structure:] a modem or a signal path." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).
"mater network timing means" — "is not governed by § 112 P 6." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).\(^{2614}\)

"means (at a merchant) for accepting a customer identifier as payment from the customer and means for electronically forwarding information related to the payment to a computerized merchant processor" — "The parties have addressed this single 'means-plus-function' claim limitation as two separate limitations, one being 'means for accepting' and the other being 'means for forwarding.' However, the claim, as written, clearly sets forth dual functions and requires the corresponding structure to perform both." AdvanceMe, Inc. v. Rapidpay, LLC, et al., 2006 U.S. Dist. LEXIS 92444 (E.D. Tex., Dec. 21, 2006).\(^{2615}\)

"means for [performing computer-implemented functions]" — "the specification of the '156 Patent does not point to some undefined software implemented on a general purpose computer as the corresponding structure for its functional claim limitations. Rather, the specification describes various types of modules and their equivalents as the corresponding structure for the means limitations. ... As a result, the WMS Gaming line of cases is inapplicable, and the means limitations of the '156 Patent are not indefinite." Stanacard, LLC v. Rebtel Networks, AB, et al., 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010).\(^{2616}\)

"means, coupled with the buffer memory and including a host system alterable threshold store for storing a threshold value, for monitoring the transferring of data of a frame to the buffer memory to make a threshold determination of an amount of data of the frame transferred to the buffer memory" — "While the claim is somewhat unusual in form, it does appear that the language set off by commas does define structure. ... Accordingly, the court holds that 'coupled with the buffer memory and including a host system alterable threshold store for storing a threshold value' should not be interpreted according to § 112(6)." 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007).\(^{2617}\)

"means for ascertaining whether the at least one claim contains a plurality of medical service codes" — "is a means-plus-function limitation. The function is ascertaining whether the at least one claim contains a plurality of medical service codes. The structure is hardware and software capable of ascertaining whether the at least one claim contains a plurality of medical service codes." McKesson Info. Solutions LLC v. Trizetto Group, Inc., 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006).\(^{2618}\)

"means for associating ... [vs.] means for authorizing ..." — "TGIP cannot 'have its cake and eat it, too.' If Claim 7 is so different from Claim 1, then what is the corresponding structure? TGIP proposes only the same structure ... without reconciling, or accounting for, how the same structure would perform these different functions. There is no evidence that one skilled in the art would be able to determine that the structure suggested by TGIP corresponds to the authorizing function. The court concludes that this claim is indefinite and so invalid." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 727 (E.D. Tex. 2007).\(^{2619}\)
"means for assigning a plurality of numbers representing said angular positions of said reel, said plurality of numbers exceeding said predetermined number of radial positions such that some rotational positions are represented by a plurality of numbers" — "Although we fail to find anything in the Telmaes patent that limits the 'means for assigning' limitation to a microprocessor or computer, where, as here, the parties agree to a claim construction that is adopted by the district court, and neither party disputes that construction on appeal, we decline to raise an issue sua sponte that the parties have not presented"; "the disclosed structure is a microprocessor programmed to assign a plurality of single numbers to stop positions such that: 1) the number of single numbers exceeds the number of stop positions; 2) each single number is assigned to only one stop position; 3) each stop position is assigned at least one single number; and 4) at least one stop position is assigned more than one single number."  

WMS Gaming, Inc. v. International Game Technology, 184 F.3d 1339 (Fed. Cir. 1999).
[1] "means for authorizing medical service codes which are valid in response to the means for determining"; [2] "means for rejecting medical service codes which are invalid in response to the means for determining"; [3] "means for revising the at least one claim to delete invalid medical service codes"; [4] "means for informing a user why the at least one claim was revised"; [5] "means for requesting further information from a user regarding the at least one claim"; [6] "means for determining whether one of the medical service codes in the at least one claim is included in any other medical service code in the at least one claim"; [7] "means for authorizing medical service codes which are not contained in any other medical service code"; [8] "means for rejecting medical service codes which are contained in any other medical service code"; [9] "means for revising the at least one claim to not include a rejected medical service code"; [10] "means for determining whether one of the medical service codes in the at least one claim is medically exclusive with any other medical service codes in the at least one claim"; [11] "means for authorizing medical service codes which are not medically exclusive with any other medical service codes in the at least one claim in response to the means for determining"; [12] "means for rejecting medical service codes which are medically exclusive with any other medical service codes in the at least one claim in response to the determining step"; [13] "means for determining whether any medical service code contained in the at least one claim is not present in the predetermined database"; [14] "means for informing a user that a medical service code is not contained in the predetermined database"; [15] "means for determining whether one of the medical service codes in the at least one claim is mutually exclusive due to non-medical criteria with any other medical service code in the at least one claim"; [16] "means for authorizing medical service codes which are not medically exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining"; [17] "means for rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining"; [18] "means for authorizing the at least one claim in response to the means for determining"; [19] "means for rejecting the at least one claim in response to the means for determining" — [1] "This is a means-plus-function limitation. The function is authorizing medical service codes which are valid in response to the means for determining. The structure is hardware and software capable of authorizing medical service codes which are valid in response to the means for determining." [2] "This is a means-plus-function limitation. The function is rejecting medical service codes which are invalid in response to the means for determining." [3] "This is a means-plus-function limitation. The function is revising the at least one claim to delete invalid medical service codes. The structure is hardware and software capable of revising the at least one claim to delete invalid medical service codes." [4] "This is a means-plus-function limitation. The function is informing a user why the at least one claim was revised. The structure is hardware and software capable of informing a user why the at least one claim was revised." [5] "This is a means-plus-function limitation. The function is requesting further information from a user regarding the at least one claim. The structure is hardware and software capable of requesting further information from a user regarding the at least one claim." [6] "This is a means-plus-function limitation. The function is determining whether one of the medical service codes in the at least one claim is included in any other
medical service code in the at least one claim. The structure is limited to the disclosed algorithm in the patent specification." [7] "This is a means-plus-function limitation. The function is authorizing medical service codes which are not contained in any other medical service code. The structure is hardware and software capable of authorizing medical service codes which are not contained in any other medical service code." [8] "This is a means-plus-function limitation. The function is rejecting medical service codes which are contained in any other medical service code. The structure is hardware and software capable of rejecting medical service codes which are contained in any other medical service code." [9] "This is a means-plus-function limitation. The function is revising the at least one claim to not include a rejected medical service code. The structure is hardware and software capable of revising the at least one claim to not include a rejected medical service code." [10] "This is a means-plus-function limitation. The function is determining whether one of the medical service codes in the at least one claim is medically exclusive with any other medical service codes in the at least one claim. The structure is limited to the disclosed algorithm in the patent specification." [11] "This is a means-plus-function limitation. The function is authorizing medical service codes which are not medically exclusive with any other medical service codes in the at least one claim in response to the means for determining. The structure is hardware and software capable of authorizing medical service codes which are not medically exclusive with any other medical service codes in the at least one claim in response to the means for determining." [12] "This is a means-plus-function limitation. The function is rejecting medical service codes which are medically exclusive with any other medical service codes in the at least one claim in response to the determining step. The structure is hardware and software capable of rejecting medical service codes which are medically exclusive with any other medical service codes in the at least one claim in response to the determining step." [13] "This is a means-plus-function limitation. The function is determining whether any medical service code contained in the at least one claim is not present in the predetermined database. The structure is limited to the disclosed algorithm in the patent specification." [14] "This is a means-plus-function limitation. The function is informing a user that a medical service code is not contained in the predetermined database. The structure is hardware and software capable of informing a user that a medical service code is not contained in the predetermined database." [15] "This is a means-plus-function limitation. The function is determining whether one of the medical service codes in the at least one claim is mutually exclusive due to non-medical criteria with any other medical service code in the at least one claim. The structure is limited to the disclosed algorithm in the patent specification." [16] "This is a means-plus-function limitation. The function is authorizing medical service codes which are not mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining. The structure is hardware and software capable of authorizing medical service codes which are not mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining." [17] "This is a means-plus-function limitation. The function is rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining. The structure is hardware and software capable of rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining." [18] "This is a means-plus-function limitation. The function is authorizing the at
least one claim in response to the means for determining. The structure is hardware and software capable of authorizing the at least one claim in response to the means for determining."

[19] "This is a means-plus-function limitation. The function is rejecting the at least one claim in response to the means for determining. The structure is hardware and software capable of rejecting the at least one claim in response to the means for determining." *McKesson Info. Solutions LLC v. Trizetto Group, Inc.*, 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006).

"means for comparing the counter to the threshold value in the alterable storage location and generating an indication signal to the host processor responsive to a comparison of the counter and the alterable storage location" — "The court finds that § 112(6) applies to 'generating' for two reasons." *3COM Corp. v. D-Link Systems, Inc., et al.*, 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007).

"means for executing programs which make calls to a general purpose operating system"; "means for executing pro-grames which make calls to a UNIX operating system" — "defendant's proposed claim limitations are little more than a laundry list of applications that run on the host processor. Rather than describing a 'means for executing programs'-in functional terms or otherwise-this list of programs merely describes the functional attributes of the programs that are executed by those means. This is not sufficient to disclose 'structure' for purposes of applying section 112 P 6. ... The court therefore holds that the structure corresponding to the 'means for executing programs which make calls to a general purpose [or a Unix] operating system' is 'a SunOS Unix processor.'" *Network Appliance, Inc. v. BlueArc Corp.*, 2005 U.S. Dist. LEXIS 16732 (N.D. Cal., Jan. 5, 2005).

"means for operating on a predetermined database" — "is a means-plus-function limitation. The function of the claim is operating on a predetermined database. The structure corresponding to this function comprises data processing capabilities, memory and software capable of managing a database." *McKesson Info. Solutions LLC v. Trizetto Group, Inc.*, 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006).

"means for receiving at least one claim" — "is a means-plus-function limitation. The function is receiving at least one claim. The structure is hardware and software capable of receiving the at least one claim." *McKesson Info. Solutions LLC v. Trizetto Group, Inc.*, 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006).

"a global positioning receiver means for receiving signals indicative of the apparent position of the receiver means using the global positioning satellite system"; "memory means for storing the position of the golf cup"; "display means for displaying the distance" — "none of these three limitations is subject to § 112, paragraph 6." *Optimal Recreation Solutions, LLP v. Leading Edge Technologies, Inc.*, 6 Fed. Appx. 873 (Fed. Cir., Apr. 6, 2001) (unpublished).

"In this case, there is no specific, definite structure that is well understood in the art corresponding to the claim terms 'memory' or 'display.'" *Id.* (Gajarsa, J., dissenting-in-part).

"measuring the effective index and effective index change" — "means: 'determining the effective index' and 'determining the effective index change.'" Corning Inc. v. SRU Biosystems, et al., 400 F. Supp. 2d 653 (D. Del. 2005). 2631

"measuring levels of carbon dioxide and oxygen of the patient" — "does not require that the respirator itself measure the carbon dioxide and oxygen levels of the patient." Tehrani v. Hamilton Medical, Inc., et al., 331 F.3d 1355 (Fed. Cir. 2003). 2632

"measuring variable parameters" — "ascertaining the measurements of said variable parameters for each of said paths at or about the time of transfer." ConnecTel, LLC v. Cisco Systems, Inc., 428 F. Supp. 2d 564 (E.D. Tex. 2006). 2633

"colorant selection mechanism" — "We agree with the district court's conclusion that the presumption here is overcome and that the phrase 'colorant selection mechanism' should be construed as a means-plus-function limitation." Massachusetts Institute of Technology v. Abacus Software, et al., 462 F.3d 1344 (Fed. Cir. 2006). 2634

"a mechanism that interfaces with software supplied by the customer" — "[a] mechanism (as construed above [see construction of 'payment mechanism']) that interacts with software made available to the vending machine by the customer." PowerOasis, Inc., et al. v. Wayport, Inc., 2006 U.S. Dist. LEXIS 42505 (D. Mass., June 26, 2006). 2635

"media asset" — "any media that is digitized and suitable for electronic distribution." Zapmedia Services, Inc. v. Apple Inc., 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010). 2637

"media attachment unit" — "a 10Base-T MAU comprising an [attachment unit interface] port, a twisted pair port and an auto-engage means, each of these as defined in Claim 6 and as further construed below." Level One Communications, Inc. v. Seeq Technology, Inc., 987 F. Supp. 1191 (N.D. Cal. 1997). 2638

"a plurality of media data streams" — "two or more different types of media data streams." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 2639

"media header information" — "information contained in the header of a PDU that provides details about the PDU. The information can be ISO Layer 2 (data link) information or ISO Layer 3 (network) information." Storage Technology Corp. v. Cisco Systems, Inc., et al., 2001 U.S. Dist. LEXIS 25876 (N.D. Cal., Nov. 26, 2001). 2642
"providing a Media Switch, wherein said Media Switch parses said MPEG stream, said MPEG stream is separated into its video and audio components" — "providing hardware and/or code that mediates between a microprocessor CPU, hard-disk or storage device, and memory, wherein said device, portion of a device, or code analyzes said MPEG stream, said MPEG stream is separated into its video and audio components." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005). 3643

"media unit" — "computer system capable of receiving analog or digital real estate and real estate related information, and transmitting said real estate and real estate related information." Keithley v. HomeStore.com, Inc., et al., 2007 U.S. Dist. LEXIS 71126 (N.D. Cal., Sept. 10, 2007). 3644

"a media writing device ... whereby ... works ... can be written to a removable medium"; "a media write unit ... for writing items ... to a removable medium" — "a media writing device for writing works to a medium removable from the media writing device." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007). 3645

"medical service code" — "code representing a particular medical service or procedure, e.g., CPT-4 codes, CVS codes, and similar medical service or procedure codes." McKesson Info. Solutions LLC v. Trizetto Group, Inc., 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006). 3647

"meet" — "We agree with DirecTV that SuperGuide waived its right to assert a construction other than 'matches or equals' for the term 'meet.'" SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870 (Fed. Cir. 2004). 3648

"membership signatures" — "information that identifies physical mass storage devices or portions of physical mass storage devices as members of a set and which substantially matches the global identifier of the set." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004). 3649

"memory" — "a commonly used internal computer component (here, within the voting machine or system) which is capable of storing the voting record and the [unique randomly assigned identifying number or unique identifier] and interacts with the processor." Avante International Technology, Inc. v. Premier Election Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 95047 (E.D. Mo., Oct. 13, 2009). 3650

"memory" — "is entitled to its ordinary meaning, and no further definition is necessary." IP Innovation, LLC, et al. v. Red Hat, Inc., et al., 2009 U.S. Dist. LEXIS 69682 (E.D. Tex., Aug. 10, 2009). 3651

"memory"; "a memory" — "storage elements other than column latches." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 3653

"memory" — "any form of volatile or non-volatile computer memory, including random-access memory (RAM) and hard disk drive space." Board of Regents of the University of Texas System, et al. v. Eastman Kodak Co., et al., 2006 U.S. Dist. LEXIS 7997 (W.D. Tex., Jan. 26, 2006). 2655

"memory cell" — "refers to a cell with a single select and memory device." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998). 2660

"sales random access memory chip"; "incoming random access memory chip"; "playback random access memory chip" — "covers any RAM in a system which is configured to perform the function described, whether or not that is the only function it is configured to perform." Sightsound.com Inc. v. N2K, Inc., et al., 185 F. Supp. 2d 445 (W.D. Pa. 2002). 2662

"a memory coupled to said processor for storing the voting record and the unique voting session identifier for each voting session"; "memory for storing a voting record of each one of a number of voting sessions" — "a commonly used internal computer component (here, within the voting machine or system) which is capable of storing the voting record and the voting session identifier and interacts with the processor." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007). 2663

"MOS memory device" — "refers to a cell with only a single select and memory device." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998). 2664

"a memory input port sized to receive a digital camera flash memory module" — "the court incorporates by reference its construction of 'port', and concludes that the balance of the phrase requires no construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006). 2665

"a memory insertion section for receiving a first digital flash memory module, and for receiving a second flash memory module" — "this phrase requires no construction." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006). 2666
"memory means" — "As in Lutron and Lucent, the Court finds that PCTEL has not overcome the presumption that 'memory means' is a means-plus-function limitation." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).2667

"memory means" — "is written in means plus function language, and the claim does not recite structure definite enough to rebut the presumption that it is a means plus function situation." Genlyte Thomas Group LLC v. Lutron Electronics Co., Inc., 2004 U.S. Dist. LEXIS 5311 (N.D. Tex., Mar. 31, 2004).2668

"memory means" — "A physical memory system, in the absence of a mechanism to convert logical addresses into physical addresses, could not perform the function stated in Claim 10. Thus, § 112(6) applies." Data General Corp. v. International Business Machines Corp., 93 F. Supp. 2d 89 (D. Mass. 2000).2669

"memory means" — "would have connoted sufficient structure to one of ordinary skill in the art at the time of the Katz patents such that it is not subject to analysis under 35 U.S.C. § 112, P 6." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).2670

"memory means for storing predetermined operating parameters defining one of said plurality of features to be performed at each type of said port circuits connected to said system" — "is a means-plus-function element." Lucent Technologies, Inc. v. Newbridge Networks Corp., et al., 168 F. Supp. 2d 181 (D. Del. 2001).2673

"memory portion" — "refers to the circuitry required for a working memory, including the memory cells that store data and the circuitry associated with reading, writing, addressing and refreshing data in the memory cells." NeoMagic Corp. v. Trident Microsystems, Inc., 98 F. Supp. 2d 538 (D. Del. 2000).2674

"memory requests" — "requests from an external device, such as a processor, to a memory device." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).2675

"memory selection second switch means being adapted to select a first position ... and ... a second position" — "the district court properly held 'memory selection second switch means' is a means-plus-function element under 35 U.S.C. § 112, P 6." Overhead Door Corp., et al. v. Chamberlain Group, Inc., 194 F.3d 1261 (Fed. Cir. 1999).2676

"memory store" — "a section used primarily for storing information. It includes all of the addressable storage in a processing unit and other internal storage that is used to execute instructions."  *Foundry Networks v. Lucent Technologies, Inc.*, 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005). 2680

"memory subsystem" — "a shared memory for all controller subsystems, but the memory subsystem need not be at the same location as all controller circuitry."  *Zoran Corp., et al. v. Mediatek, Inc., et al.*, 2005 U.S. Dist. LEXIS 34422 (N.D. Cal., Sept. 9, 2005). 2681

"whereby the meniscus provides a constant flow of said chemical onto said substrate surface" — "The meniscus, i.e., the curved surface of the chemical created by the surface tension of the chemical when the chemical contacts a solid, supplies a constant flow of the chemical onto the substrate. The meniscus exists between the nozzle and the substrate. The meniscus cannot form unless the nozzle is positioned sufficiently close to the spinning coated wafer."  *OKI America, Inc., et al. v. Advanced Micro Devices, Inc.*, 2006 U.S. Dist. LEXIS 15254 (N.D. Cal., Feb. 14, 2006). 2682

"menu key" — "a user-actuated input device, which allows the user to choose one of two options, e.g., select or deselect, such as a keyboard key, for displaying on the screen a set of selectable colors."  *American Video Graphics, L.P. v. Microsoft Corp.*, 2005 U.S. Dist. LEXIS 46858 (E.D. Tex., Jun. 30, 2005). 2687

"video game menu options" — "video games that can be selected in the programming mode to be video game menu choices playable in the menu choice selection mode."  *Merit Industries, Inc. v. JVL Corp.*, 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007). 2688

"merchant database" — "a database of or related to a merchant."  

"merchant-selected credit rate" — "a credit rate selected by a particular merchant."  

"merchant-specific credit rate" — "a credit rate associated with a particular merchant."  

"merchant-specific credit value" — "a credit value associated with a particular merchant."  

[i] "message"; [ii] "message address" — [i] "an electronic notice"; [ii] "an electronic address used to send a message."  

"message" — "information received by the selective call receiver."  

"message" — "a reconfiguration message that includes a reconfiguration command."  

"message" — "a data packet."  

"message" — "a unit of information sent electronically."  

"message" — "an intended communication."  

"shopping cart message"; "payment message"; "access message"; "transaction detail hypertext link"; "product request message" — "including a cryptographic key in these terms' constructions is contradicted by the claim language."  

"message center" — "a computer, server, or other device suitable for receiving and transmitting messages."  

"metadata" — "shall be given its plain and ordinary meaning."  

"metadata elements for an image" — "a plurality of data elements relating to an image, other than the image itself."  

"metal interconnect layer" — "refers either to pure elemental metals or to alloys."  

"metallization" — "a deposited metallic material."  
"metering cycle" — "a series of recurring events that occur on a meter, including, in this order, the collection of data, the performance of updates/calculations, the execution of user programmed metering logic, and the performance of secondary functions."  

"metering logic programmed by a user" — "program or procedure written by a user to perform functions other than those included by the meter manufacturer."  

"a method for adjusting a noise threshold of said laser light receiver to a level at which said laser light receiver produces a noise light pulse output having a constant pulse firing rate" — "This claim language does not recite a 'function.' The purpose for which the adjusting ultimately is done—the why and what for—is noticeably absent from the disputed language. Therefore, this is a step without a function, and § 112 P 6 does not apply."  

"a method of preventing the spread of computer viruses to a computer having a storage medium" — "a method of preventing the spread of malicious computer code, including but not limited to self-replication code, to a personal computer or workstation having a 'storage medium', i.e., having any storage medium such that the data, when stored on the medium, are accessible to the operating system or other programs such that viruses in the data can spread and infect the computer system."  

"a method of processing a computer file request" — "no construction is necessary."  

"microcircuit device" — "a single imaged layer on a single die. A large microcircuit device is a single imaged layer on a single die which has a diagonal longer than the diameter of the image field of the reduction lens."  

_Ultratech Stepper, Inc. v. ASM Lithography, Inc._, 2001 U.S. Dist. LEXIS 25729 (N.D. Cal., Dec. 20, 2001). 2712 "[T]he term 'microcircuit device' refers to the pattern exposed in the photo-resist on the wafer, as the result of the practice of the method claimed by the '996 patent. The pattern exposed on the wafer will necessarily mirror the pattern on the mask. A 'large microcircuit device,' then, refers to a pattern on the wafer which, when measured in the diagonal, exceeds the diameter of the image field of the reduction lens."  

"microcode" — "one or more programs for a peripheral device that can be stored in the non-volatile memory of the peripheral device and executed by a peripheral device's resident processor."  

"microcontroller" — "During the hearing, the parties agreed 'microcontroller' does not require construction. The Court agrees."  

"microcontroller" — "the electronics including input/output interfaces, a microprocessor, and an up-dateable memory comprising at least a random access memory which is capable of being updated via an electronic medium and which is capable of storing updated information including at least television programming information. The microcontroller is not limited to a single integrated circuit." SuperGuide Corp. v. DirecTV Enterprises, Inc., et al., 169 F. Supp. 2d 492 (W.D.N.C. 2001).2716

"a microprocessor responsive to a program resident therein" — "an integrated circuit that contains a central processing unit (CPU) on a single chip, that responds to a software program resident in memory." Bed-Check Corp. v. Ultimate Safety, Inc., 2003 U.S. Dist. LEXIS 27845 (N.D. Okla., Nov. 24, 2003).2719

"microscope station" — "equipment, not including a cell analysis instrument, at which a human operator performs analysis." Cytac Corp. v. Tripath Imaging, Inc., et al., 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005).2720

"minimum bandwidth" — "smallest amount of data transmission capacity over a predefined period of time." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).2723

"mining the image data stored in the sensor memory" — "searching the still frame images and the motion video images stored in those sensor appliances which retain such images." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006).2725

"mobile processor" — "a processor which can be carried by a person outside of a home or office and which executes electronic mail programming to function as a destination and/or source of electronic mail." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002).2726

"a mode selector switch" — "does not require an activation switch that initiates the operation of the recording circuit in the selected mode and is distinct from the mode selector switch." Howes, et al. v. Zircon Corp., 992 F. Supp. 957 (N.D. Ill. 1998).2729

"modem" — "a connection between components that allows communication from one component to the other that includes a device that modulates and demodulates signals." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).2730

"said reader operating in at least one of a plurality of modes, said modes being characterized by mode control data" — "the reader operating in at least one of two or more modes, each mode being characterized by data describing one or more parameters associated with the mode of operation." Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al., 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006).2732

"modifiable tree structure including elements in a fixed hierarchical relationship";
"modifiable static tree" — "a tree structure comprising elements, which does not vary according to the system being monitored, and which can be changed to add or delete elements representing hardware or software components on a computer system." Sun Microsystems Inc v. Network Appliance, 2009 U.S. Dist. LEXIS 48209 (N.D. Cal., May 29, 2009).2733

"modification of the connection" — "altering the connection such that information can move through the connector." Lantronix, Inc., et al. v. Digi International, Inc., 2006 U.S. Dist. LEXIS 12032 (E.D. Tex., March 6, 2006).2734

"modified set of log-in data" — "a set of log-in data that has been changed." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).2736

[i] "modifier menu"; [ii] "sub-modifier menu" — [i] "a list of choices or options that may modify a menu item"; [ii] "a list of choices or options that may further modify a modifier." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010).2737

"modifying a characteristic of said display of said derived elements in accordance with said accepted at least one new parameter without respecification of all said parameters, said characteristic selected from a group consisting of display shape and display color of said derived elements"; "monitoring said at least one defining element for changes thereto"; "maintaining an internal reference between said derived elements and said at least one defining element"; "editing at least one of said defining element in one operation without the regeneration of said derived elements until all of said at least one defining element has been modified"; "using said internal reference to identify and discard all derived elements associated with a modified defining element" — "The Court has reviewed each of these five phrases in the context of their respective claims and concludes that they are not drafted in means-plus-function form. Accordingly, 35 U.S.C. § 112 P6 does not apply, and the Court will construe these phrases in accordance with the standard principles of claim construction." *Adobe Systems Inc. v. Macromedia, Inc.*, 201 F. Supp. 2d 309 (D. Del. 2002). 2739

"modifying a phase of a selected portion or portions of said duration of the color stripe burst in chosen lines of the selected lines to be the phase of the normal color burst" — "modifying the phase of the abnormal color stripe bursts to match normal color bursts." *Macrovision Corp. v. Sima Products Corp., et al.*, 2006 U.S. Dist. LEXIS 75372 (S.D.N.Y., Oct. 12, 2006). 2740

"modifying the digital values of selected pixels in accordance with the sets of said data" — "requires that the digital values representing the colors and intensities of selected pixels of the first facial display be modified in accordance with the lip position data of both the first and second facial displays and the control point data of the first facial display." *Bloomstein v. Paramount Pictures Corp., et al.*, 1996 U.S. Dist. LEXIS 22260 (N.D. Cal., May 6, 1996). 2743

"modulate" — "The IEEE dictionary does not exclude the process of encoding digital data as a series of electrical pulses from the definition of modulation. ... Therefore, the court will not use the Defendants' proposed definition." *Lectrolarm Custom Services v. Vicon Industries, Inc., et al.*, 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005). 2744

"modulating the energy" — "varying the energy of at least one of the frequency components in accordance with the message to be encoded." *Arbitron, Inc. v. International Demographics Inc., et al.*, 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009). 2745

"modulation onto a carrier wave" — "'modulation onto a carrier wave' includes encoding digital data onto a pulse waveform in a format such as non-return to zero, return to zero, Manchester, or bi-phase." *Lectrolarm Custom Services v. Vicon Industries, Inc., et al.*, 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005). 2746

"a modulator arranged to modulate bits of the encoded data signals onto multiple carriers of the transmission system, different numbers of bits in each transmission symbol period being allocated to different carriers" — "a modulator configured to modulate bits of encoded data signals such that different numbers of bits are allocated to different carriers in each symbol period." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005). 2748

"modular type adaptor design" — "no specific construction of this term is required." Pulse Engineering, Inc. v. Mascon, Inc., 2009 U.S. Dist. LEXIS 26885 (S.D. Cal., Mar. 9, 2009). 2749

"computing module"; "computer module" — "an assembly for providing a computing function within a computer system as recited in a particular claim." ACQIS LLC v. Appro International, Inc., et al., 2010 U.S. Dist. LEXIS 77548 (E.D. Tex., Aug. 2, 2010). 2750

"originating telephone number module"; "telephone number detection module"; "call connection module" — "§ 112, P 6 is not invoked." Stanacard, LLC v. Rebtel Networks, AB, et al., 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010). 2751

"a multiple purchase order generation module, said purchase order generation module creating multiple purchase orders from a single requisition created with said user-generated criteria and said search-module criteria" — "the term 'module' connotes sufficient structure. Because the patents deal with computer software, and module carries a special meaning in that field, the term 'module' as used in the patent defines a structure. Therefore, Lawson has not overcome its burden, and 'module' will not be construed as a means-plus-function term." ePlus, Inc. v. Lawson Software, Inc., et al., 2010 U.S. Dist. LEXIS 42609 (E.D. Va., Apr. 30, 2010). 2754

"modular jack" — "the female portion of a modular connector in which wires of a circuit are connected at one end and into which a plug is inserted at the other end." Murata Manufacturing Co., Ltd. v. Bel Fuse Inc., 445 F. Supp. 2d 938 (N.D. Ill., July 28, 2006). 2755

"modulator" — "a device that varies one or more of the amplitude, frequency, or phase of each data symbol." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010). 2756

"monitoring patient data elements of patients in a plurality of geographically dispersed ICUs" — "monitoring at the remote command center data elements of patients who are located in a plurality of geographically dispersed ICUs." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009). 2767

"monitoring payments made by the customer to maintain the customer's access to the service" — "any process of various persons or devices for checking on whether payment has been made, and terminating access to the service if payment has not been received." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009). 2768

"monitoring the current to the load" — "We agree with Linear that the Commission improperly narrowed this claim limitation to exclude indirectly monitoring current through the measurement of voltage. The claim limitation does not state directly monitoring current. Rather, it simply reads 'monitoring the current to the load.' As such, this limitation should be accorded a scope commensurate with the '258 patent's specification. In this case, the '258 patent not only discloses monitoring current directly by using a current comparator, but also indirectly by some other means." Linear Technology Corp. v. International Trade Commission, et al., 566 F.3d 1049 (Fed. Cir. 2009). 2769

"monitoring the reception of the packets by the users and accumulating records that indicate which streams were received by which users"; "monitoring the reception of the stream of information by the users and accumulating records relating to the reception of the stream of information by the users" — "no construction is necessary." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007). 2770

"motion" — "movement of body tissue which causes erratic noise, that, in the absence of a filter, would cause the ratio of red to infrared signals to not accurately reflect the arterial oxygen saturation." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003). 2771

"movable" — "in the operation of the assembly, the terminals are capable of being displaced relative to the chip by external loads applied to the terminals, to the extent that the displacement appreciably relieves mechanical stresses, such as those caused by differential thermal expansion which would be present in electrical connections absent such displacement."  Tessera, Inc. v. Micron Technology, Inc., 423 F. Supp. 2d 624 (E.D. Tex. 2006). 2774

"moving said electronic record via EMF communications links from point to point" — "transmitting the electronic record electronically to at least one point and, where necessary and where feasible, between or among other points along the route of passage for the selected product."  DE Technologies, Inc. v. Dell Inc., 2006 U.S. Dist. LEXIS 5459 (W.D. Va., Feb. 14, 2006). 2775

"moving ... between ... cells" — "it was error for the ITC to limit the broad 'moving ... between ... cells' claim language to encompass only irregular movement in the time dimension. ... 'Moving said visual identification ... between ... cells' includes both regular and irregular movement of the 'visual identification,' and requires only that the visual identification be capable of moving relative to the cells in the grid guide in either dimension. There is no requirement that the 'visual identification' must move relative to the television screen."  Gemstar-TV Guide International, Inc., et al. v. International Trade Commission, et al., 383 F.3d 1352 (Fed. Cir. 2004). 2776

"MPEG decoder" — "hardware and/or software that can decode compressed audio and video data in accordance with any of the standards established by the Moving Picture Experts Group."  Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34422 (N.D. Cal., Sept. 9, 2005). 2777

"a transmission system using multicarrier modulation" — "a transmission system using modulation of more than one carrier."  Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005). 2778

"multi-component task" — "an overall task that is made up multiple individual tasks."  Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006). 2779

"a unique predetermined multi-digit jump code" — "a unique predetermined code consisting of more than one number. There is nothing in the specification, however, to warrant ... limiting the code to just numbers, so long as the code has more than one number."  Internet Media Corp. v. Dell, Inc., et al., 2009 U.S. Dist. LEXIS 2187 (D. Del., Jan. 14, 2009). 2780

"multi-function image sensor appliance" — "a sensor appliance, as defined above, that can generate more than one type of image signal."  E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006). 2781

"multi-level information" — "the information inputted to the web site from the first user intranet point which is organized or grouped into more than one level of user access."  Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). 2782
"multi-level managed information" — "the information inputted to the web site from the first user intranet point which is organized or grouped into more than one level of user access." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).

"multi-level user access" — "the court concurs, that no construction of this claim term is required." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).

"multi mega bit per second" — "an aggregate data transmission rate of 10 or more megabits per second." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).

"multi-mode operation to treat a detected arrhythmia" — "two or more different modes of therapy capable of being used in sequence to treat a single arrhythmia." Cardiac Pacemakers, Inc., et al. v. St. Jude Medical, Inc., et al., 2000 U.S. Dist. LEXIS 17352 (S.D. Ind., Nov. 29, 2000).

"multi-precision execution unit" — "a unit that receives instructions and executes the instructions to perform simultaneous parallel operations on the plurality of media data streams, each of a width up to the width of the data path." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).

"multi-purpose interface" — "a communication interface designed for use with multiple devices that can have different functions from each other." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).

"in a multi-tasking environment" — "requires no construction"; if construed, it means "performs or appears to perform more than one task at a time." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007).

"multi-tasking interface" — "software that is tailored to each operating system peer-level facility that supports direct communication with other peer-level facilities and capable of managing at least two concurrent or interleaved tasks." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004).

"multiple non-regulating isolating step down converters providing plural non-regulated, isolated DC outputs, plural of the non-isolating down-converter switching regulators receiving power from one of the non-regulated, isolated DC outputs" — "two or more non-regulating isolating step down converters, each providing a non-regulated, isolated DC output, wherein two or more of the non-isolating down-converter switching regulators receives power from one of the non-regulated, isolated DC outputs." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010).
"multiple operands in partitioned fields of operand registers" — "more than one object upon which operations are performed, each object being stored in a separate and distinct field of a register." *Microunity Systems Engineering, Inc. v. Dell, Inc., et al.*, 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 2784

"multiplexed"; "multiplexed manner" — "individual signal lines carry more than one type of specific information in a time interleaved manner (i.e., one specified type of information is carried at a first time and a second specified type is carried at a second time). In addition, each specified information type must be carried on a signal line that also carries at least one other specified type of information." *OPTi Inc. v. nVidia Corp.*, 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006). 2795

"the information is multiplexed over a number M of levels" — "the information is multiplexed over a number M of levels, where M is the number of levels each symbol can take using differential modulation." *WI-Lan, Inc. v. Acer, Inc., et al.*, 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010). 2797

[i] "multiplexer"; [ii] "time-multiplexed data"; [iii] "time-division multiplexing data" — [i] "circuitry for processing data from one or more inputs into a repeating series of frames or templates"; [ii] "data that has been processed into a repeating series of frames or templates"; [iii] "processing data into a repeating series of frames or templates according to time intervals." *Negotiated Data Solutions, LLC v. Dell, Inc.*, 596 F. Supp. 2d 949 (E.D. Tex. 2009). 2798

"multiplexing" — "the term 'multiplexing' does not include the limitations of detecting and discarding silence packets and transmitting computer data packets during periods of silence." *Microsoft Corp. v. Multi-Tech Systems, Inc.*, 357 F.3d 1340 (Fed. Cir. 2004). 2799

"multiplexing address signals being transferred to said second bus by said access means and said controller means, together with data signals being transferred to said second bus" — "Address and data signals are being transferred to the second bus by the access and controller means. In this step, those address and data signals are combined for transmission over the second bus." *OKI America, Inc., et al. v. Advanced Micro Devices, Inc.*, 2006 U.S. Dist. LEXIS 15254 (N.D. Cal., Feb. 14, 2006). 2800

"a multitasking operating system" — "an operating system that permits the user to execute two or more application programs at the same time." *Intermec Technologies Corp. v. Palm Inc.*, 2010 U.S. Dist. LEXIS 96247 (D. Del., Sep. 14, 2010). 2804
"multithreading" — "shall be construed in each patent as explicitly defined in that patent. To the extent there is any material difference between these definitions, the patents shall be considered to be working with different definitions of multithreading." Reiffin v. Microsoft Corp., 2002 U.S. Dist. LEXIS 21690 (N.D. Cal., Apr. 30, 2002).

"multivariate negotiation system"— "[a] system of hardware and software that enables participants to perform multiple rounds of bargaining over multiple terms. The multiple rounds of bargaining (i.e., the 'negotiation') must allow for an offer and multiple counteroffers between two participants where each round is related to prior rounds and is more than a simple bid submission system." Sky Technologies, Inc. v. Ariba, Inc., 491 F. Supp. 2d 154 (D. Mass. 2007).

"music device controlled by a computer"; "computer responsive music device"; "computer controlled music device" — "a device capable of playing music that is controlled by and responsive to a computer." Contois Music Technology, LLC v. Apple Computer, Inc., 2006 U.S. Dist. LEXIS 50822 (D. Vt., July 24, 2006).

"mutual fund" — "a company that pools money from many investors and invests the money in a group of securities of other companies." Boyle v. Molson Coors Brewing Co., et al., 2007 U.S. Dist. LEXIS 67296 (D.N.J., Sept. 11, 2007).

"NSM-packet signal" — "as expressly defined by the specification, an 'NSM packet-signal' includes more than just 'NSM data'; it also includes a header, footer, and message identifier information." Itron, Inc. v. CellNet Data Systems, Inc., 34 F. Supp. 2d 1135 (D. Minn. 1999).

"Nx1 switch"; "Nx1 optical switch" — "device to receive an optical signal from one of N inputs and route the optical signal to one output, or to receive an optical signal from one input and route the optical signal to one of N outputs." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).

"name translation request" — "a query for translation of a name into routing information for a public packet data network." Verizon Services Corp., et al. v. Vonage Holdings Corp., et al., 503 F.3d 1295 (Fed. Cir. 2007).

"narrow band transmission medium" — "an information channel capable of handling a relatively low bandwidth or data rate with respect to the information being sent across the medium." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).

"natural concurrences" — "mutually independent instructions that can be executed in parallel." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).
"a navigational receiver for providing a location of the remote unit" — "a receiver in a remote unit that receives navigational information, and that provides a location of the remote unit, to a radio transmitter." Zoltar Satellite Alarm Systems, Inc. v. Motorola, Inc., et al., 2007 U.S. Dist. LEXIS 95521 (N.D. Cal., Dec. 21, 2007). 2814

"negative optical anisotropy" — "a characteristic of a birefringent material wherein the values of two of the three principal optical indices (called the ordinary indices) are equal to each other and the third optical index (called the extraordinary index) is less than the other two." Commissariat a l’Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007). 2815

"negative with respect to" — "requires only that the voltage supplied by the second power supply be negative relative to that provided by the first power supply." NeoMagic Corp. v. Trident Microsystems, Inc., 287 F.3d 1062 (Fed. Cir. 2002). 2816

"neighbor" — "two nodes are neighbors when they have a link between them; a link is a bi-directional communication path that terminates at a single node on either end." Lucent Technologies, Inc. v. Extreme Networks, Inc., et al., 367 F. Supp. 2d 649 (D. Del. 2005). 2817

"net position error" — "[The first modulating step is performed] in order to minimize a net position error without initially detecting said net position error." Space Systems/Loral, Inc. v. Lockheed Martin Corp., 2006 U.S. Dist. LEXIS 70712 (N.D. Cal., Sept. 19, 2006). 2819

"a netlist defining the hardware cells which are needed to perform the desired function of the integrated circuit" — "a description of the hardware components (and their interconnections) needed to manufacture the ASIC as used by subsequent processes, e.g., mask development, foundry, etc." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005). 2820

"network" — "one or more wired or wireless communication networks." Zapmedia Services, Inc. v. Apple Inc., 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010). 2821

[i] "network"; [ii] "communications network" — [i] "interconnected computers or devices that transfer and exchange information between the service providing computational system and the node of the network"; [ii] "interconnected computers or devices that transfer and exchange information between the service providing network accessible node (‘SPNAN’) and the first and second network accessible nodes." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010). 2822

"network" — "system of interconnected computers that have the ability to communicate." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005). 2823

"network" — "communication facilities that link points at which computers or devices may be connected." SuperSpeed, L.L.C. v. International Business Machines Corp., 2009 U.S. Dist. LEXIS 10124 (E.D. Tex., Feb. 11, 2009). 2824

"network" — "an interconnected set of devices which communicate with each other." Negotiated Data Solutions, LLC v. Dell, Inc., 596 F. Supp. 2d 949 (E.D. Tex. 2009).

"network access manager" ; "network access module" — "a device, process or algorithm for controlling the assignment of synchronous and packet data portions on a TDM bus, and for passing data between the bus and a network." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).

"a network code that identifies a network element to provide egress from the packet communication system" — "a logical address identifying a network element which network element provides an exit from a packet communication system." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007).

"network control computer" — "a computer that stores a list of access codes for individuals authorized to use the remote computer units, checks the validity of logon commands, and interfaces the local computer unit with the local computer unit to permit the local computer unit to operate the remote computer unit, but excluding passive devices that merely forward data packets without regard for their content." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009). 2837

"network data communications" — "The phrase 'network for data communications' is limited to networks in which every processor system is connected to every other processor system via direct, point-to-point, two-way channel interconnections." SeaChange International, Inc. v. C-Cor Inc., 413 F.3d 1361 (Fed. Cir. 2005). 2838

"network management site" — "a single location from which the network is managed." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006). 2840

"network management system" — "a combination of interacting hardware and software components that manage the network from a single distribution center." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006). 2841

"network management system"; "a control system common to the downstream and upstream channels" — "a common network management system that is separate and apart from upstream and downstream routers for controlling paths in both the upstream and downstream channels of hybrid interfaces." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007). 2842

"network member" — "a network member is anyone or any company which has registered as a user by completing an application." Source Search Technologies, LLC v. Lending Tree, LLC, et al., 2006 U.S. Dist. LEXIS 79651 (D.N.J., Oct. 16, 2006). 2843

"network monitors" — "software and/or hardware that can collect, analyze and/or respond to data." SRI International, Inc. v. Internet Security Systems, Inc., et al., 2006 U.S. Dist. LEXIS 75355 (D. Del., Oct. 17, 2006). 2844

"network operational activity" — "contemplates 'a need for valid network activity sensed throughout the network to maintain some aspect of the network functionality.' Moreover, ... it must not be 'a fleeting or transitory event.'" Datapoint Corp. v. Standard Microsystems Corp., et al., 31 Fed. Appx. 685 (Fed. Cir., Feb. 15, 2002). 2845

"Network Service Provider (NSP)" — "a party that provides a connection to the network and authenticates users for access to the network." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005). 2847 "In light of the specification's teachings and MyMail's admissions below, the district court's claim construction must be affirmed." Id., 476 F.3d 1372 (Fed. Cir. 2007). 2848
"network that is further connected to the gateway computer" — "The court defines 'network' to mean 'a plurality of computers that are interconnected so they can exchange information.' The balance of the phrase needs no construction." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).2849

"network-wide" — "requires distribution to the entire network." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006).2850

"network-wide program"; "network-wide video program" — "a preassembled audiovisual program that is sent to every store location in the media distribution network." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006).2851

"values for said updated secret cryptographic value are never recreated more than a fixed number of times" — "identical secret cryptographic values are never recreated more than a fixed number of times. The number of times is determined by the transformation operation algorithm and the initial parameters." Cryptography Research, Inc. v. Visa International Service Association, et al., 2007 U.S. Dist. LEXIS 76502 (N.D. Cal., Sept. 28, 2007).2852

"next-line" — "the line immediately following the line being transferred." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).2853

"next operation information" — "information that specifies the particular type of operation to be performed by the network forwarding device. The information is added to the media header information and must include information to accomplish forwarding of the PDU in the communication network." Storage Technology Corp. v. Cisco Systems, Inc., et al., 2001 U.S. Dist. LEXIS 25876 (N.D. Cal., Nov. 26, 2001).2854

"node" — "a processor or computer with a memory." Jardin v. Datallegro, Inc., et al., 2010 U.S. Dist. LEXIS 105502 (S.D. Cal., Oct. 4, 2010).2856

"node" — "a point of connection into a network, such as a computer." eBay Inc. v. IDT Corp., et al., 2009 U.S. Dist. LEXIS 56469 (W.D. Ark., Jun. 10, 2009).2857

"node" — "any data processing device, including, but not limited to, a computer, a file server, a bridge, a gateway, a co-processor, modem server, memory, or printer, that includes a network interface, through which it is coupled to the communication medium." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 478 (D. Del. 2001).2859

"node" — "a point on a network where information can be sent, received, or forwarded." Lucent Technologies, Inc. v. Extreme Networks, Inc., et al., 367 F. Supp. 2d 649 (D. Del. 2005).2861

"in accordance with a noise model" — "I conclude that both proposed constructions are flawed and will decline to adopt either construction." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).  
"painting with an electronic brush ... to paint in inherently non-aliased strokes" — "the court shall construe 'inherently non-aliased strokes' in a manner based on the parties' usage: natural-appearing lines that blend smoothly into a background image in the process of being created." Quantel Ltd. v. Adobe Systems Inc., 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997).  
"non-binding indications" — "non-binding purchase or sale offers that allow traders to enter into negotiation to trade securities, which cannot be executed without a further, affirmative action by a trader." Flash Seats, LLC v. Paciolan, Inc., 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010).  
"in a non-fixed pattern" — "in such a way that the redundant information can be placed within the stripe on unallocated blocks in any order." Sun Microsystems Inc v. Network Appliance, 2009 U.S. Dist. LEXIS 48209 (N.D. Cal., May 29, 2009).  
"non-interactive electronic message" — "an electronic message in which the sender does not provide any additional information after the message has been received." Bright Response, LLC v. Google Inc., et al., 2010 U.S. Dist. LEXIS 60361 (E.D. Tex., Jun. 18, 2010).  
"non-personalized cardholder name"— "a name that does not identify the purchase card as belonging to a specific cardholder and that is used by a retailer to complete a purchase transaction." PrivaCash, Inc. v. American Express Co., et al., 2010 U.S. Dist. LEXIS 29313 (W.D. Wis., Mar. 26, 2010).  
"non-public personal information" — "information that is personal to a specific end user and not accessible to the general public." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).  
non-single crystal semiconductor material" — "a semi-amorphous semiconductor, an amorphous semiconductor or a mixture thereof." Semiconductor Energy Laboratory Co., Ltd. v. Samsung Electronics Co., Ltd., et al., 2010 U.S. Dist. LEXIS 45107 (W.D. Wis., May 7, 2010). 2875

non-telephone actuation signal" — "an activation signal sent via something other than the telephone system." Brooktrout, Inc. v. Eicon Networks Corp., et al., 2004 U.S. Dist. LEXIS 31054 (E.D. Tex., Jul. 27, 2004). 2876

non-transmissive" — "an optical structure that reduces the transmission of radiant light to the greatest degree practicable consistent with the intended purpose." Koninklijke Philips Electronics N.V., et al. v. Cinram International, Inc., et al., 2010 U.S. Dist. LEXIS 43764 (S.D.N.Y., May 4, 2010). 2877

non-volatile configuration memory" — "data or memory storage, located within the module, that persists when the module is powered down." Digi International, Inc. v. Lantronix, Inc., 402 F. Supp. 2d 1041 (D. Minn. 2005). 2878

non-volatile memory sector" — "is the basic unit of erase for the non-volatile memory. It is not limited to 512 bytes of user data and 64 bytes of overhead data." Sandisk Corp. v. Memorex Products, Inc., et al., 2007 U.S. Dist. LEXIS 15393 (N.D. Cal., Feb. 21, 2007). 2880

normal operation" — "a normal mode of operation that excludes start-up, shutdown, and fault conditions such as over-current conditions." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010). 2881

the normal operation ... is interrupted to convey" — "the regular, standard, or natural function or working... is stopped so that it can be resumed at a later time, in order to convey..." Joao v. Sleepy Hollow Bank, et al., 418 F. Supp. 2d 578 (S.D.N.Y. 2006). 2882

normally"; "conventional"; "traditionally"; "standard" — "are governed by their ordinary and customary meanings, and [], in view of their implicit time-dependence, the district court did not err in construing the literal scope of the claim limitations qualified by those terms as being limited to technologies existing at the time of the invention." PC Connector Solutions LLC v. Smartdisk Corp., et al., 406 F.3d 1359 (Fed. Cir. 2005). 2883

transformer that is not driven into saturation" — "transformer that is connected in a manner such that the transformer's magnetic flux density level is less than its saturation flux density level." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010). 2884

optical demultiplexer through which the first optical line interface is not optically coupled to the first transponder" — "The first optical line interface does not send optical information to the first transponder through the optical demultiplexer. Alternatively, the first optical line interface does not receive optical information from the first transponder through the optical demultiplexer." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 2885
"whereby said caller is **not required to be within a particular network for making calls**" —
"this limitation excludes from claimed material any system that restricts the caller to a specific network, of any type, when dialing the assigned incoming telephone number and placing a call into the claimed system. Because the claim language conveys the meaning of this limitation, no construction is required." *Stanacard, LLC v. Rebtel Networks, AB, et al.*, 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010).

"**notification alert system**" — "there is no evidence before the Court that would rebut the presumption against means-plus-function construction. Accordingly, the Court finds that this term is not subject to 35 U.S.C. § 112 P 6." *Yodlee, Inc. v. CashEdge, Inc.*, 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).

"**said selected number**"; "**one of said ... numbers**" — "refers to single numbers, as opposed to combinations of numbers." *WMS Gaming, Inc. v. International Game Technology*, 184 F.3d 1339 (Fed. Cir. 1999).

"**number(s) [of consecutive first values]**" — "[a] count of consecutive first values-**i.e., a run length**." *In re Compression Labs, Inc. Patent Litigation*, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006).

---

- **O** -

"**objectionable interference or distortion**" — "the modification made to a signal during scrambling." *Broadcast Innovation, LLC v. Echostar Communications Corp.*, 240 F. Supp. 2d 1127 (D. Colo. 2003).

"**obligation**" — "an amount owed by a merchant that is independent of any costs or fees arising out of the use of customer identifiers as payment." *AdvanceMe, Inc. v. Rapidpay, LLC, et al.*, 2006 U.S. Dist. LEXIS 92444 (E.D. Tex., Dec. 21, 2006).

"obtain access" — "the court declines to construe the term." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004). 2899

"obtain ... information about the data structure ... [by] accessing content of information" — "accessing the information in a data source to obtain information about the logical organization of the data in the source." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006). 2898

"obtaining a current position of at least a part of a seat on which the occupant is situated" — "detecting the current position of at least a part of the seat on which the occupant is situated with respect to a reference position. In other words, detecting how far forward or backward the seat is." Automotive Technologies International, Inc. v. Delphi Corp., 2009 U.S. Dist. LEXIS 83187 (E.D. Mich., Sep. 11, 2009). 2900

"obtaining a proportionality constant for said given transmitter and said given receiver" — "the Court reads this to be a step plus function claim element, and the phrase 'obtaining a proportionality constant' must be limited to the acts described in the specification for achieving the function of the step." Digital Control Incorporated, et al. v. Charles Machine Works, 2003 U.S. Dist. LEXIS 27828 (W.D. Wash., Dec. 11, 2003). 2902

"obtains a buffer" — "obtains memory where data can be temporarily stored for transfer." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005). 2903

"a display screen occupying substantially an entire broad side of the processing module" — "a display screen that occupies the entire surface of the largest face, except for a small border, as shown in figure 9." Intermec Technologies Corp. v. Palm Inc., 2010 U.S. Dist. LEXIS 96247 (D. Del., Sep. 14, 2010). 2904

"odds" — "a ratio of two numbers, represented by the total wager amount divided by an individual wager, creating a range from which a random number may be generated." Goff v. Harrah's Operating Co., 412 F. Supp. 2d 1090 (D. Nev. 2005). 2905

"off" — "the lowest power state of the monitor or circuit that can be achieved by the power management system where the monitor is still able to reactivate itself." In re: Elonex Phase II Power Management Litigation, 2002 U.S. Dist. LEXIS 18724 (D. Del., Oct. 3, 2002). 2906

"offer data" — "data representing a presentation of provisions for a proposed trade in goods or services, including two or more overt terms and one or more hidden terms, the presentation being made in anticipation of a reply."  Tradecard, Inc. v. SL Corp., et al., 509 F. Supp. 2d 304 (S.D.N.Y. 2007).2909

"office machine system" — "a business office device, such as a copier, printer or facsimile, connected to but separate from an external operation panel."  Ricoh Corp., et al. v. Pitney Bowes, Inc., 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006).2910

"OLAP server" — "[t]he court declines to construe further the term 'OLAP server' given that its meaning is clear in the relevant claims."  Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006).2911

"depositing a titanium film containing nitrogen atoms on a semiconductor substrate";
  "forming a titanium nitride film on the semiconductor substrate" — "The titanium film containing nitrogen atoms must be deposited directly on a semiconductor substrate."; "The titanium nitride film must be directly on the titanium silicide film, which in turn must be directly on the semiconductor substrate."  OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).2912

"the processor causing the display to display on a single screen stored transaction information" — "the presentation of stored transaction information to a user on one screen, without the user having to first encounter any preliminary screens that would require the user to select a transaction type or a transaction parameter."  IPXL Holdings, L.L.C. v. Amazon.com, Inc., 333 F. Supp. 2d 513 (E.D. Va. 2004).2913

"on and in contact with" — "in a layered device formed on a substrate, above and touching or in immediate proximity to."  IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004).2914

"in which energy is transferred from a primary winding to a secondary winding of a transformer during the ON period of a primary switch" — "The important question in construing this language is whether the 'ON period' is defined in terms of voltage across the primary switch (Unitrode's proposed construction) or in terms of that switch's capacity to carry current (Vicor's proposed construction).  ... Although the question is close, I conclude that Vicor's interpretation is the better."  VLT Corp., et al. v. Unitrode Corp., 130 F. Supp. 2d 178 (D. Mass. 2001).2915

"a source electrode and a drain electrode on said semiconductor layer" — "a source electrode and a drain electrode above and in contact with the semiconductor layer."  LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010).2916

"one first capacitor ... and one second capacitor ..." — "a first capacitor operative to store electrical energy, and a second capacitor operative to store electrical energy." *Square D Co., et al. v. E.I. Electronics, Inc.*, 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010).  

"one of a selection of formats" — "one of several arrangements of data on a printed page or display screen or in a record, data file, or storage device." *Broadcast Innovation, LLC v. Echostar Communications Corp.*, 240 F. Supp. 2d 1127 (D. Colo. 2003).  

"only a single tournament game is playable for each sequence" — "each sequence of tournament games consists of two or more repetitions of the same tournament game." *Merit Industries, Inc. v. JVL Corp.*, 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).  

"only four elements" — "to literally infringe ... an accused device must have only four elements." *Strattec Security Corp. v. General Automotive Specialty Co., Inc., et al.*, 126 F.3d 1411 (Fed. Cir. 1997).  

"only if" — "this term needs no construction and will be understood by a jury." *O2 Micro International Ltd. v. Samsung Electronics Co., Ltd., et al.*, 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006).  

"a feedback control loop circuit receiving a feedback signal indicative of power being supplied to said load, and adapted to generate a second signal pulse signal for controlling the conduction state of said second plurality of switches only if said feedback signal is above a predetermined threshold" — "'only if' means that, during all times, including start-up, steady state, and shut-down of the device, the feedback circuit must not control the conduction state of the second plurality of switches unless the feedback signal is above a predetermined threshold. If the feedback signal is not above the predetermined threshold, then the feedback circuit must not control the conduction state of the second plurality of switches." *O2 Micro International Ltd. v. Beyond Innovation Technology, et al.*, 2009 U.S. Dist. LEXIS 33697 (E.D. Tex., Apr. 22, 2009).  

"filter means responsive to said second voltage clamping means for filtering noise or transients signals from said voltage signals only when said voltage signals exceed said second predetermined voltage potential"; "means connected in series between said first and second means for filtering noise or transients signals from said first and second conductors only while said second means is at a voltage greater than or equal to said second breakdown voltage" — "So long as the frequency response of the alleged device changes when the threshold voltage of the second element in the claim is reached so as to attenuate, or increase attenuation, of the undesired high frequencies within the relevant frequency range, the device incorporates [this] third element of claim 1 or claim 11." *Oneac Corp. v. Raychem Corp.*, 20 F. Supp. 2d 1233 (N.D. Ill. 1998).  

"open category" — "a category for which an item label is displayed in the display area for each item in the category." *Sklar v. Microsoft Corp.*, 2007 U.S. Dist. LEXIS 51253 (E.D. Tex., July 16, 2007).
"open lamp condition" — "a condition in which the lamp is not connected to the converter."  O2 Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006). 2928

"an opening to expose the channel and via" — "an opening in the second soft mask where the channel and via are to be formed."  Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 2930

"operable to perform unique operations on each component symbol" — "capable of performing a distinct operation on each component of a data unit."  Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 2931

"operably connecting" — "connecting in a manner that allows a signal to flow from one point to another point."  Callpod, Inc. v. GN Netcom, Inc., et al., 2009 U.S. Dist. LEXIS 51103 (N.D. Ill., Mar. 6, 2009). 2932

"operand" — "an input to a single operation specified by an instruction that is encoded as part of the instruction where the size of the input can vary."  Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 2933

"the actuating mechanism is operated remotely by sending signals from a communication device" — "the actuating mechanism receives signals from a communication device that is not in contact with the actuating mechanism."  Graham-White Manufacturing Co. v. Ellcon-National, Inc., 2007 U.S. Dist. LEXIS 89126 (D.S.C., Dec. 4, 2007). 2934

"operating data" — "data that controls the automatic operation of the camera base, and that is set through use of the structure of the input means."  Lectrolarm Custom Services v. Vicon Industries, Inc., et al., 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005). 2935

"wireless communication system/network operating in accordance with the GSM standard" — "system/network that transmits data between a mobile station and a base station over a 200 kHz radio channel using time-division multiple access (TDMA) in accordance with the Global System for Mobile communications specifications existing as of October 29, 1997."  WiAV Solutions LLC v. Motorola, Inc., et al., 2010 U.S. Dist. LEXIS 30711 (E.D. Va., Mar. 29, 2010). 2936

"operating mode" — "a functional status which the controller can be placed in by the user or automatically without user intervention."  Good Sportsman Marketing LLC v. Testa Associates, LLC, et al., 440 F. Supp. 2d 570 (E.D. Tex. 2006). 2937

"operating session" — "a period of communication between the subscriber client computer and the first server computer that follows successful initial authentication and ends upon termination of authorized access, such as upon a log-out or time-out due to prolonged inactivity."  Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007). 2939
"operating system peer-level facility" — "a major functional subsystem of the operating system constituted as a separately executed software entity." Network Appliance, Inc. v. BlueArc Corp., 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004). 2940

"operation code" — "one or more bits to specify a type of action." Hynix Semiconductor Inc., et al. v. Rambus Inc., 2004 U.S. Dist. LEXIS 23230 (N.D. Cal., Nov. 15, 2004). 2941

"operation panel" — "an input/output device that can input commands and display information that is separate and external from the business office device." Ricoh Corp., et al. v. Pitney Bowes, Inc., 2006 U.S. Dist. LEXIS 22453 (D.N.J., April 20, 2006). 2943

[i] "operational data for the scanhead"; [ii] "operational data unique to the transducer scanhead" — [i] "data that is used in the operation of the scanhead"; [ii] "data that is used collectively in the operation of a particular model of the transducer scanhead." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008). 2944

"operational state signal" — "a signal that indicates the operating state of device." Arbitron, Inc. v. International Demographics Inc., et al., 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009). 2945

"operations of an interface" — "the processes, activities, or functions of the interactive connection between the processors upon which the Katz system is running, the communication facility, and the callers." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999). 2946

"operational" — "the device must, as the district court held, be capable of testing both the sensing circuitry and the trip mechanism in order to determine whether the circuit interrupter is operational." Shanghai Meihao Electric, Inc. v. Leviton Manufacturing Co., Inc., et al., 2007 U.S. App. LEXIS 736 (Fed. Cir., Jan. 10, 2007) (unpublished). 2947

"operational position" — "the relay position in which the high voltage delivery system can deliver shock to the patient, although the defibrillator can perform other relay self-tests in this position as well." Koninklijke Philips Electronics, NV, et al. v. Defibtech LLC, et al., 2005 U.S. Dist. LEXIS 39859 (W.D. Wash., Dec. 21, 2005). 2948

"a graphics computer sub-system operatively connected to said host computer sub-system" — "The district court construed the operatively connected limitation to mean 'the graphics computer subsystem communicates with the host computer subsystem through an unmediated mechanism.' To the contrary, the broad language 'operatively connected' does not require communication through an unmediated mechanism." IP Innovation, L.L.C. v. eCollege.com, et al., 2005 U.S. App. LEXIS 26138 (Fed. Cir., Nov. 29, 2005) (unpublished). 2951
"operatively connecting" — "must be construed to require a direct source-drain electrical connection, for only then would the object of the invention be accomplished, namely, 'to provide a memory circuit capable of operation without the need for applying a reference voltage to one input of the output sense amplifier.'" NEC Corp. v. Hyundai Electronics Industries Co., Ltd., et al., 30 F. Supp. 2d 546 (E.D. Va. 1998).2952

"operatively coupled to said communication pathway" — "connected to the communication pathway to send and receive signals on the communication pathway." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009).2953

"operator group" — "one or more jukeboxes managed and serviced by one entity." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).2955

"operator terminal" — "an input-output device, for use by a human operator, capable of transmitting data to and obtaining input from the system to which it is connected." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003).2956

"presenting on said remote contribution accepting devices symbols representing operators for inducing the making of monetary contributions, said symbols comprising said request for a contribution data packet" — "An 'operator' is the device by which a person triggers the action, usually by means of a button, switch, or similar triggering device. The operator, in this case, has marks or symbols specifying contribution amounts." Ziarno v. American National Red Cross, et al., 2000 U.S. Dist. LEXIS 22508 (N.D. Ill., Aug. 16, 2000).2957

"optical arrangement" — "a collection comprising two or more mirrors, lens, prisms, or other optical devices, placed in some specified configuration, which reflect, refract, dispense, absorb, polarize, or otherwise act on light. That definition allows for a combination of two or more different optical devices. Also, a mirror whether it is motorized or not, is an optical device." Erchonia Medical Inc., et al. v. Miki Smith, et al., 2006 U.S. Dist. LEXIS 38498 (D. Az., June 8, 2006).2958

"optical channel selector" — "device that selects a single optical channel from a wavelength division multiplexing input signal." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006).2959

"an optical coupling means having an input, an input/output and an output" — "because there is a detailed recitation of structure and there is an absence of any mention of function in the claim, the Court finds the mean-plus-function limitations of section 112, P6, are not implicated." Pirelli Cable Corp. v. Ciena Corp., 988 F. Supp. 424 (D. Del. 1997).2960

"optical demultiplexer" — "a device that receives a plurality of wavelengths multiplexed together as an optical signal and outputs each of the plurality of wavelengths as at least one of the following: (a) individual wavelengths, (b) bands of wavelengths or (c) a combination of bands and individual wavelengths." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).

"optical elements in a telescope" — "this Court rejects plaintiff's definition limiting the term 'optical elements in a telescope' to 'mirrors,' in favor of a broader definition which includes 'mirrors,' 'lenses,' and 'prisms.'" Lasermax, Inc. v. Glatter, 2005 U.S. Dist. LEXIS 17136 (S.D.N.Y., Aug. 17, 2005).

"optical line interface" — "an interface that can carry a plurality of wavelengths multiplexed together as an optical signal." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).

"bidirectional optical line interface" — "an interface for sending and receiving a plurality of wavelengths multiplexed together as an optical signal." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).

"optical reader means for effecting the input of optical information" — "Here, 'reader' does not provide sufficient structure for performing the function of effecting the input of optical information. ... Therefore, plaintiff has failed to overcome the presumption that this term is subject to § 112 P 6." Intermec Technologies Corp. v. Palm Inc., 2010 U.S. Dist. LEXIS 96247 (D. Del., Sep. 14, 2010).

"an optically absorptive refractory transition metal" — "Because the dictionary definition of the term 'transition metal' does not indicate that this term refers to alloys, and because nothing in the intrinsic evidence suggests otherwise, the court concludes that the term 'an optically absorptive refractory transition metal' refers only to pure elemental metals, and does not include alloys. ... Since the plain language of the claim suggests no limitation on the degree of absorptivity of the transition metal layer, the court declines to construe the specification's description of the high relative absorptivity of this layer as a claim limitation." EMI Group North America, Inc. v. Cypress Semiconductor Corp., 68 F. Supp. 2d 421 (D. Del. 1999).

"optically coupled to" — "requires that optical information can be sent or received between two different components." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).
"is optically coupled to ... through at least"; "optically couple ... to ... through at least" — "mean[s]: (Component A) can send optical information to (Component B) through at least (Component C). Alternately, (Component A) can receive optical information from (Component B) through at least (Component C)." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 2973

"optimization" — "providing performance with respect to a given characteristic (e.g. speed or flexibility of output) that is superior to the performance of some other possible configuration with respect to that characteristic." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006). 2975

"optimizing the threshold" — "changing the threshold value to make it as perfect, effective or functional as possible." 3COM Corp. v. D-Link Systems, Inc., et al., 2007 U.S. Dist. LEXIS 3754 (N.D. Cal., Jan. 8, 2007). 2976

"optional relationship" — "a relationship in which a number of elements may be chosen from a second set of elements on the right-hand side of the relationship when all elements of the left-hand side are already included." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005). 2979

"opto-electric componentry" — "relates to an optical-to-electrical or an electrical-to-optical transducer extending from the sensor to the cable." High Tech Medical Instrumentation, Inc. v. New Image Industries, Inc., 1995 U.S. Dist. LEXIS 9215 (N.D. Cal., May 24, 1995). 2980 

"or" — "The prosecution history requires that 'or' means the operator's choice between search for the strongest or fastest target speed, but not both." Kustom Signals, Inc. v. Applied Concepts, Inc., et al., 264 F.3d 1326 (Fed. Cir. 2001). 2982

"location of the point of origin, or angle of rotation, or scale" — "requires that the device performing the claimed method need only have the ability to translate one of the three attributes of the coordinate system." Schumer v. Laboratory Computer Systems, Inc., et al., 308 F.3d 1304 (Fed. Cir. 2002). 2983
"OR circuit means operative to generate an output signal substantially equal to the greatest of any input signal" — "a circuit that makes a choice. In this case, it makes the choice whether to run the fan at a temperature, at a fixed temperature speed or at a speed that is dependent on the temperature, that is, which runs faster as the temperature rises, or slower as the temperature drops." Control Resources, Inc. v. Delta Electronics, Inc., et al., 133 F. Supp. 2d 121 (D. Mass. 2001).  

"with years being represented by at least one of two-digit, three digit, or four-digit year-date representations" — "or' in element 6 of claim 16 must be construed to include the ability to convert only two-digit, only three-digit, only four-digit, or any combination of two-, three- and four-digit date-data. This interpretation of 'or' is within the ordinary meaning of the term." Brown v. 3M, et al., 2000 U.S. Dist. LEXIS 21630 (D. Ariz., Aug. 9, 2000).  

"-order" — "has no independent significance and does not require specific construction by the court." Pulse Engineering, Inc. v. Mascon, Inc., 2009 U.S. Dist. LEXIS 26885 (S.D. Cal., Mar. 9, 2009).  

"trade order" — "a single, electronic message in executable form that includes at least all required parameters of a desired trade. ... however, if the computer must perform additional steps or route the order through a router or gateway, such would still fall within the ambit of 'trade order,' as construed herein." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006).  

"order entry region" — "a location within the trading display where a user sends and not simply initiates an order." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006).  

"ordered list" — "the term 'ordered list' will be given its plain meaning. The ordered list may be, but is not required to be, ordered precisely according to the customer's preferences; it could also include some other default order." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007).  

"an ordered sequence of process steps" — "specification of the order in which process steps take place." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005).

"ordering the converted analog signals and the formatted digital signals into a sequence of addressable data blocks" — "in the transmission system placing the converted analog signals and the formatted digital signals into a sequence of data blocks, such that the ordering of the data blocks permits the retrieval of portions of information from items." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006).

"ordering the interest cost values associated with said inputted data" — "placing the interest cost values in some order before transmission to the issuer's computer." Muniauction, Inc. v. Thomson Corp., 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006).

"originated information" — "the message text of an electronic mail message." NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282 (Fed. Cir. 2005).

"originating processor" — "'Originating processor' is not an umbrella term referring to all of the processors that add data into the system, but rather would be understood to one skilled in the art to be the first processor, or the initial source of the 'originated information' or email message text. ... the 'originating processor' is the sole processor that initiates the transmission of the electronic mail message text into the electronic mail system and is separate from the gateway or interface switches." NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282 (Fed. Cir. 2005).

"originating telephone number assigned to the caller" — "telephone number given to a caller from which the caller initiates a call." Stanacard, LLC v. Rebtel Networks, AB, et al., 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010).

"oscillator ... clocking" — "an oscillator that generates the signal(s) used for timing the operation of the CPU." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).

"out-of-band telecommunications signaling" — "signaling that is sent on a separate channel from that used for voice and/or data." *Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al.*, 518 F. Supp. 2d 1306 (D. Kan. 2007). 

"outlining the outer surface of the lesion in at least one of said ultrasound images" — "using computer software either to draw a line around the image of the surface of the lesion manually or through image processing algorithms that automatically identify the surface of the lesion, in at least one of said ultrasound images." *NOMOS Corp. v. ZMED, Inc.*, 260 F. Supp. 2d 215 (D. Mass. 2002).

"output device" — "a device for using images obtained by the input device to enable image data to be communicated to a user of the system. Examples may include but are not limited to: cathode ray tube displays; television monitors; LCD panels and screens; EMM memory and disk memory; digital film recorders; post script color printers, raster driven film recorders and fast-driven printers." *Luma Corp. v. Stryker Corp., et al.*, 2005 U.S. Dist. LEXIS 40884 (S.D. W. Va., July 27, 2005).

"output device for outputting a rhythmic piece" — "the Court will not construe 'output device for outputting a rhythmic piece,' and additionally finds MadCatz proposed construction to be inappropriate." *Konami Corp. v. Roxor Games, Inc., et al.*, 445 F. Supp. 2d 725 (E.D. Tex. 2006).

"output means" — "does not present any issue regarding the application of § 112, P6, for the claim element does not include any language describing the function of the output means." *Nilssen v. Magnetek, Inc.*, 1999 U.S. Dist. LEXIS 16718 (N.D. Ill., Oct. 22, 1999).

"output portion" — "a physical structure, specifically defined as op-amp 65, which is separate, independent and isolated from the input operational amplifier and recited as generating a destination signal and a corresponding destination reference signal." *Fiori v. Rockford Corp.*, 2006 U.S. Dist. LEXIS 41477 (E.D. Pa., June 21, 2006).
"Output Section" — "the portion of a device that decodes data from memory and produces output signals." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005).

"[output voltage] slew rate data" — "data provided to a POL regulator specifying the desired slew rate (i.e., rate of change of output voltage) for the POL regulator." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007).

"outside agent" — "interpreting 'outside agency' to include persons or entities in the same company as the originator of the document is not inconsistent with the patent's goal of providing a reliable evidence that a document existed in a particular form at a particular time." Surety Technologies, Inc., et al. v. Entrust Technologies, Inc., 71 F. Supp. 2d 520 (E.D. Va. 1999).

"overlay"; "overlaid" — "to superimpose one graphic image over another." Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364 (Fed. Cir. 2003).

"override criteria" — "two or more preemptive rules that alter the operation of the system based upon the 'exact geographic location' of the mobile unit." EMSAT Advanced Geo-Location Technology, et al. v. MetroPCS Communications, Inc., et al., 2010 U.S. Dist. LEXIS 62196 (E.D. Tex., Jun. 23, 2010).

"overt term" — "provision for a proposed trade in goods or services which is designated for transmission by the data processing system to the party or parties from whom an acceptance is elicited and which if compared to a response conforming to such overt term will result in a meeting of the minds as to that term." Tradecard, Inc. v. SI Corp., et al., 509 F. Supp. 2d 304 (S.D.N.Y. 2007).

- P -

[i] "packet"; [ii] "payload"; [iii] "non-payload" — [i] "a block of data used for transmitting information that may include payload and non-payload portions"; [ii] "data of interest"; [iii] "the packet data that is not payload data, such as routing or configuration information." *Widevine Technologies, Inc. v. Verimatrix, Inc.*, 2009 U.S. Dist. LEXIS 102768 (E.D. Tex., Nov. 4, 2009). 3036

"packet" — "a collection of information, including a data field which may be preceded and/or followed by non-data information, such as preamble information, housekeeping information and data destination information." *Negotiated Data Solutions, LLC v. Dell, Inc.*, 596 F. Supp. 2d 949 (E.D. Tex. 2009). 3031

"packet" — "a group of bits, including data and control limitations, which is switched and transmitted as a unit; the data is arranged in a specific format." *Lucent Technologies, Inc. v. Extreme Networks, Inc., et al.*, 367 F. Supp. 2d 649 (D. Del. 2005). 3033

"data packet transferring computer network" — "a computer system by which a block of computer information is broken into smaller information units called 'packets.' These packets are sent over a computer network over a variety of paths. The packets are automatically reassembled into their proper order at the receiving end." *Ziarno v. American National Red Cross, et al.*, 2000 U.S. Dist. LEXIS 22508 (N.D. Ill., Aug. 16, 2000). 3037

"pickup pad" — "the Court concludes that no further construction of the term 'pickup pad' is necessary." *L.G. Philips LCD Co., Ltd. v. Tatung Co., et al.*, 434 F. Supp. 2d 292 (D. Del. 2006). 3040

"page" — "the unit of data, consisting of a plurality of bytes, programmed to and read from the memory at the same time; ... the unit of data, consisting of a plurality of bytes, written to and read from the memory at the same time." Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 5213 (N.D. Cal., Jan. 24, 2005).

"page file" — "a Web page file, such as an HTML file." PageMelding, Inc. v. Feeva Technology, Inc., et al., 2009 U.S. Dist. LEXIS 80886 (N.D. Cal., Aug. 19, 2009).

"page mode type of memory access" — "a type of memory access where blocks of memory cells in the same row are accessed by the assertion of the row address strobe signal followed by multiple assertions and deassertions of the column address strobe signal while the row address strobe signal remains asserted." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).

"The Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court." Id., Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Oct. 30, 2006).

"to pan" — "to move an entire display image in such a manner that new data appears within the screen as old data disappears, to give the impression of movement of the image." Inpro II Licensing, S.A.R.L. v. T-Mobile USA, Inc., et al., 2004 U.S. Dist. LEXIS 29773 (D. Del., Nov. 29, 2004).

"to partition said memory" — "to divide a memory into multiple locations recognized by the operating system as separate sections of memory for storing data." Typhoon Touch Technologies, Inc., et al. v. Dell, Inc., et al., 2009 U.S. Dist. LEXIS 64013 (E.D. Tex., Jul. 23, 2009).

"partitioning the cells into a plurality of partitions" — "subdividing cells in one region into multiple groups of cells." Synopsys, Inc. v. Magma Design Automation, Inc., 2005 U.S. Dist. LEXIS 46882 (N.D. Cal., Aug. 23, 2005).
"partly enabled or demonstration mode" — "a mode that allows partial use of the digital data or software." Uniloc USA, Inc., et al. v. Microsoft Corp., 447 F. Supp. 2d 177 (D. R.I. 2006).3055

"parts relationships" — "an association that exists between a first set of parts and a second set of parts, the association having a left-hand side and a right-hand side. The first set of parts represents the left-hand side of the relationship and the second set of parts represents the right-hand side of the relationship." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005).3056

"printing on paper pages" — "When this clause is correctly construed, no reasonable jury could find that it reads on a process of printing on large sheets or webs of paper that require the further processing step of cutting into pages after printing." On Demand Machine Corp. v. Ingram Industries, Inc., et al., 442 F.3d 1331 (Fed. Cir. 2006).3057

"parallel interface" — "a plurality of data lines that transmit both formats of information to the MPEG decoder." Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34422 (N.D. Cal., Sept. 9, 2005)3058

"parameter" — "an element of a trade order, including, but not limited to, quantity, price, type of order and the identity of the commodity." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006)3059

"credit parameter"; "account parameter" — "a term or provision of a credit account. For example, the interest rate may be one of several parameters of a credit account." Walker Digital, LLC v. Capital One Services, LLC, et al., 2010 U.S. Dist. LEXIS 56429 (E.D. Va., Jun. 8, 2010)3060

"parameter values" — "constants that are assigned to variables." Roche Diagnostics Corp., et al. v. Apex Biotechnology Corp., et al., 455 F. Supp. 2d 840 (S.D. Ind. 2005)3061

"parses video and audio data from said broadcast data" — "analyzes video and audio data from the broadcast data." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005)3062

"particular user" — "a user who may be authenticated." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009)3063

"products carrying participation numbers" — "a physical item sold or exchanged in a commercial setting which carries a number allowing participation in the Katz system." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999)3064

"patient-specific rules" — "a rule tailored to the medical condition of the patient." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009)3065

"partitioned" — "refers to either logically dividing or physically dividing the memory into a plurality of sectors." Sandisk Corp. v. Lexar Media, Inc., 1999 U.S. Dist. LEXIS 2682 (N.D. Cal., Mar. 4, 1999)3066
"partitioning first and second registers into a plurality of floating point operands, said floating point operands having a defined bit width, wherein said defined bit width is dynamically variable" — "dividing a first and a second register width-wise into a variable number of floating point operands based upon a variable width of the floating point element." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 3067

"partitioning the memory cells within the individual sectors into at least a user data portion and an overhead portion" — "the non-volatile memory sectors contained within an array of non-volatile floating gate memory cells include at least one user data portion and one overhead portion. Memory sectors are not limited to only one user data portion and one overhead portion." Sandisk Corp. v. Memorex Products, Inc., et al., 2007 U.S. Dist. LEXIS 15393 (N.D. Cal., Feb. 21, 2007). 3068

"party" — "an entity, whether a corporation or real person, possessing and/or controlling the stated structure, or performing the necessary steps for the claims. One skilled in the art would understand that a party can act through another. Thus, although the term 'agent' will not be added to the term party, the term will not be construed so as to require that a party act on its own behalf for purposes of the claims in suit, i.e., a party may, as in all other matters, act through others it authorizes to do so for purposes of the claims in suit." Sightsound.com Inc. v. N2K, Inc., et al., 185 F. Supp. 2d 445 (W.D. Pa. 2002). 3070

"a plurality of filters at the local color display including ... (3) a third filter for filtering the red color band of the local source of light and passing a narrowband of the red color band" — "We conclude that the proper construction of local color display is that it must emit perceptible red light." Honeywell International, Inc. v. United States, et al., 2010 U.S. App. LEXIS 3199 (Fed. Cir., Feb. 18, 2010) (unpublished). 3071

"telephone wiring network used for passing telephone signals in a telephone voice band between a plurality of telephone devices and a telephone exchange"; "circuitry for limiting transmission of signals in the high frequency band from the telephone wiring network to the telephone exchange and for passing signals in the telephone frequency between the telephone a telephone wiring network and the telephone exchange" — "the telephone wiring network (as defined above) is used for passing telephone signals in the telephone voice band (as defined above) to the telephone exchange." Inline Connection Corp. v. AOL Time Warner, Inc., 2007 U.S. Dist. LEXIS 6209 (D. Del., Jan. 29, 2007). 3072

"passing the video signal unchanged at other times" — "passing at least some portions of the video signal without changes or modifications. This step does not exclude replacing normal sync pulses with normal sync pulses." Macrovision Corp. v. Sima Products Corp., et al., 2006 U.S. Dist. LEXIS 75372 (S.D.N.Y., Oct. 12, 2006). 3073

"telecommunications path"; "communications path"; "data path" — "a transmission medium (a network type such as POTS, leased lines, mobile cellular networks, digital links, fiber optics, satellite links, and private and public packet switching networks such as the Internet)." ConnecTel, LLC v. Cisco Systems, Inc., 428 F. Supp. 2d 564 (E.D. Tex. 2006). 3078

"path name in a uniform resource locator" — "a sequence of zero or more elements that follows the host address in a URL." Soverain Software LLC v. Amazon.com, Inc., 2005 U.S. Dist. LEXIS 46872 (E.D. Tex., Apr. 7, 2005). 3079

"pattern" — "a design or series of marks in a semiconductor integrated circuit that is to be transferred to a photoresist layer of a substrate." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004). 3084

"pattern recognition system" — "a system that receives and compares signals from vehicle sensors to patterns characteristic of normal or abnormal behavior through pattern recognition technology or technologies, such as, for example, neural networks, sensor fusion, or fuzzy logic, in order to diagnose the state of the vehicle." Automotive Technologies International, Inc. v. Delphi Corp., 2009 U.S. Dist. LEXIS 83187 (E.D. Mich., Sep. 11, 2009). 3085

"patterning" — "performing the process of lithography (producing a pattern that covers portions of the substrate with resist) followed by etching (selective removal of material not covered by resist) or otherwise transferring the pattern into the substrate." Agere Systems Inc. v. Atmel Corp., 2003 U.S. Dist. LEXIS 9823 (E.D. Pa., May 23, 2003). 3086

- 286 -
"patterning the continuous layer of transparent conductive material" — "patterning the continuous layer of transparent conductive material on the second substrate, wherein the patterning is performed before the second substrate is spacedly disposed from said first substrate and arranged so that the layer of transparent conductive material of the second substrate faces the layer of transparent conductive material of the first substrate."  *Advanced Technology Incubator, Inc. v. Sharp Corp., et al.*, 2009 U.S. Dist. LEXIS 109173 (E.D. Tex., Jun. 26, 2009). 3087

"payment-due data representing a seller's fulfillment of a sale-of-goods transaction between the seller and a buyer" — "electronically transmitted data representing that (a) a seller has satisfied its obligations under a sale-of-goods transaction or (b) that a buyer has otherwise accepted the seller's performance, and that a buyer's obligation to pay for the goods is due."  *Tradecard, Inc. v. S1 Corp., et al.*, 509 F. Supp. 2d 304 (S.D.N.Y. 2007). 3091

"material peculiarly responsive to a particular form of radiant energy not normally present in ambient light in amounts sufficient to cause said material to discolor" — "a substance which darkens or changes color when exposed to radiant energy (as previously defined by the court) of a type or intensity (or both) that is not ordinarily present in sunlight or normal indoor lighting."  *Flashmark Technologies, LLC, et al. v. GTECH Corp., et al.*, 2007 U.S. Dist. LEXIS 65317 (E.D. Tex., Sept. 2, 2007). 3096

"pending message list" — "a notification to the roaming terminal that it needs to request transmission of its pending messages." Agere Systems, Inc. v. Broadcom Corp., 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004).

"not including a display object that is perceptible as the same tool" — "not including a display object that is recognized as the same display object, even if the objects have some different display characteristics, including different positions, sizes, and contexts." IP Innovation, LLC, et al. v. Red Hat, Inc., et al., 2009 U.S. Dist. LEXIS 69682 (E.D. Tex., Aug. 10, 2009).

"performance report" — "I am inclined to agree with defendants that the claims require the performance report generated by the graphics rendering pipelines to include information about the length of time required for processing." Silicon Graphics, Inc. v. ATI Technologies, Inc., et al., 2007 U.S. Dist. LEXIS 61997 (W.D. Wis., Aug. 20, 2007).

"peripheral management station" — "a computer that is used to manage and service jukeboxes." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).

"periodic" — "reach[es] only project management programs which perform their functions at fixed intervals, rather than intermittently or on request." Enpat, Inc., et al. v. Microsoft Corp., et al., 26 F. Supp. 2d 806 (E.D. Va. 1998).

"periodic fee" — "will have its ordinary meaning, a fee charged or collected at regular intervals, based on time, and not calculated per item rented." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007).3112

"periodic interrupts" — "a signal that recurs or repeats, at time intervals that are not necessarily precise or the same, that suspends other tasks on the host processor while the processor addresses the device." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).3113

"periodic save code" — "code that is operative to periodically transfer at least a portion of the working data from volatile memory to non-volatile memory." Square D Co., et al. v. E.I. Electronics, Inc., 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010).3114

"periodically asserts a first signal while operating in the first mode" — "the assertion of a first signal that recurs or repeats at regular intervals while operating in the first mode." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).3115

"periodically forming largely overlapping images of a field of view of said array" — "Acquiring optoelectric signals from an array of photosensors and, using circuitry, converting the signals to values which represent the field of view to which the array is being exposed at discrete points in time. The substep of forming an image is not otherwise limited to any particular process. This substep includes processing of the signals from acquisition up to but not including storing as a frame." Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp., 2007 U.S. Dist. LEXIS 45828 (N.D. Cal., June 13, 2007).3116

"periodically forwarding" — "forwarding at an interval other than upon every payment." AdvanceMe, Inc. v. Rapidpay, LLC, et al., 2006 U.S. Dist. LEXIS 92444 (E.D. Tex., Dec. 21, 2006).3117

"peripheral region of the semiconductor chip" — "region outside the area of the semiconductor chip in which the internal circuit is formed." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007).3120

"a permission" — "information which grants access." Digital Reg of Texas, LLC. v. LFP Internet Group, LLC, et al., 2009 U.S. Dist. LEXIS 59610 (E.D. Tex., Jul. 13, 2009).3121

"a permission that is locked uniquely to the client" — "information which grants access, said access being confined to the client." Digital Reg of Texas, LLC. v. LFP Internet Group, LLC, et al., 2009 U.S. Dist. LEXIS 59610 (E.D. Tex., Jul. 13, 2009).3122
"wherein a voice recognition system further permits the surgeon to select commands or operating modes from menus" — "the voice recognition system of the robotic surgical system permits the surgeon to select commands or operating modes from displayed menus." Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002).3123

"permitting access" — "permitting the subscriber client computer to access said selected computer resources." Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007).3124

"persistent connection" — "a connection that exists the entire time the application is used." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).3125

"non-persistent connection" — "an occasional connection that does not exist for the entire time an application is used." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).3126

"persistently unique sequence numbers" — "unique sequence numbers used to ensure that all objects using the particular named sequence generator (i.e., whether newly created or already persisted in a database) will have different identification numbers." Software Tree, LLC v. Red Hat, Inc., et al., 2010 U.S. Dist. LEXIS 53549 (E.D. Tex., May 28, 2010).3127

"personal communication device" — "a portable hand-held device capable of receiving and transmitting information -- that includes a CPU or microprocessor, a data storage device, a display screen, input device, output device, and wireless communication hardware and software." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).3128

"personal computer"; "PC" — "a computer capable of operation without additional equipment, independent of a mainframe or other computer, and designed for use by one person." Timecertain, LLC v. Authentidate Holding Corp., et al., 2006 U.S. Dist. LEXIS 92789 (M.D. Fla., Dec. 22, 2006).3129

"personal computer"; "general purpose personal computer" — "a computer designed for use by one person at a time, such as a desktop PC or a laptop." Quantum World Corp. v. Atmel Corp., et al., 2009 U.S. Dist. LEXIS 7936 (E.D. Tex., Jan. 30, 2009).3130

"personal computer" — "a stand-alone computer (not sharing the processing or disk resources of another computer) designed for use by one person at a time, and excludes mainframe computers or mini-computers." Microsoft Corp. v. Multi-Tech Systems, Inc., et al., 2002 U.S. Dist. LEXIS 15960 (D. Minn., Aug. 16, 2002).3132

"personal identification number" — "a number, separate from a billing code (as construed herein), identifying an individual system user." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006).3134
"personalized page"; "stored personal pages"; "personalized web page" — "the Court agrees with Yodlee that these terms need not be construed." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).3135

"phantom power" — "operating power transmitted over the data signaling pairs." Network-1 Security Solutions, Inc. v. D-Link Corp., et al., 2006 U.S. Dist. LEXIS 84510 (E.D. Tex., Nov. 20, 2006).3136 "[T]he Court adopts its construction in the D-Link case and Defendants' construction and construes the term 'phantom power' to mean 'operating power transmitted over the data signaling pairs.'" Network-1 Security Solutions, Inc. v. Cisco Systems, Inc., et al., 2010 U.S. Dist. LEXIS 12938 (E.D. Tex., Feb. 16, 2010).3137

"phase shifted burst mode signals"; "phased burst signals/phased burst mode signals" — "a burst mode signal that is shifted in phase with respect to another burst mode signal." O2 Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006).3138

"physical interface connection elements" — "elements such as electrical pins and socket connections that link the connector to a discrete external electronic device." Lantronix, Inc., et al. v. Digi International, Inc., 2006 U.S. Dist. LEXIS 12032 (E.D. Tex., March 6, 2006).3140

"physical layer" — "the lowest layer of the Open Systems Interconnect (OSI) seven layer model, concerned with establishing the mechanical, electrical, functional, and procedural connection between two modems." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).3141

"physical layer modulation" — "a protocol that is concerned with establishing the mechanical, electrical, functional, and procedural connection between two modems." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).3142

"physical media path" — "a physical route or path which allows the transfer of data packets to and from the node." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006).3143

[i] "central picture element"; [ii] "surrounding picture elements"; [iii] "neighboring pixels" — [i] "a sample of picture information being noise reduced"; [ii] [iii] "the Court will construe 'surrounding picture element'--and, by extension, 'neighboring pixels'--to mean one or more pixels sufficiently near the central pixel in time or space to be useful for the purpose of noise-reducing the central pixel." Technology Licensing Corp. v. Videotek, Inc., 2002 U.S. Dist. LEXIS 26803 (N.D. Cal., Nov. 14, 2002).3144

"pipeline identifier" — "a designation indicative of a processing pipeline." Intergraph Corp. v. Intel Corp., 2002 U.S. Dist. LEXIS 27117 (E.D. Tex., Jun. 3, 2002). Intergraph expressly defined the term 'pipeline identifier' during prosecution of the '028 patent. In light of that prosecution history, as well as the claim language and the specifications, we hold that, for both the '028 patent and the '003 patent, a 'pipeline identifier' must identify the specific processing pipeline to which an instruction will be dispatched. Id., 89 Fed. Appx. 218 (Fed. Cir., Feb. 11, 2004) (unpublished).

"pit" — "depression in the surrounding land area, where the depth is the principal factor creating a difference in reflected light intensity for encoding information." Toshiba Corp. v. Imation Corp., et al., 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010).

"pit" — "an area which creates a difference in reflected light to represent information." Toshiba Corp. v. Imation Corp., et al., 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010).

"pixel interpolator" — "a device that calculates spatially interpolated pixel values, from the pixel values of a previous image, which approximate the values of fractionally offset pixels between pixels." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 516 (D. Del. 2001).

"pixelated or bitmapped format" — "a collection of data elements representing the individual pixels of the ballot image such that the darkness of each pixel may be determined. The images are typically stored in formats such as .BMP, or .TIFF, or other bitmapped format." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).

"a step of placing an amount of liquid crystal on plural locations on the first substrate" — "depositing an amount of liquid crystal material in multiple locations on a substrate." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006).
"placing the FCC unit under control of a computerized control device and thereby" — "placing the FCC unit under control through the addition or withholding of catalyst additive by a valve regulated by a computerized control device and thereby." *Intercat, Inc. v. Nol-Tec Systems, Inc., et al.*, 2005 U.S. Dist. LEXIS 344 (D. Minn., Jan. 7, 2005).\(^{3159}\)

"planar filters" — "two or more non-cavity resonator, essentially flat surface, film devices for separating, according to radio frequency, signals received on the communication pathways, each communication pathway having a pre-assigned radio frequency." *Isco International, Inc. v. Conductus, Inc., et al.*, 2002 U.S. Dist. LEXIS 20832 (D. Del., Oct. 30, 2002).\(^{3160}\)

"plasma" — "a charged collection of particles, generated by the high and/or low frequency electric fields established between the electrodes, excluding arc or spike discharges such as would emanate from a spiked electrode." *Tegal Corp. v. Tokyo Electron America, Inc.*, 257 F.3d 1331 (Fed. Cir. 2001).\(^{3163}\) "We see no reason to deviate from the construction we applied on appeal in the TEA litigation, and therefore we adopt the construction of 'plasma' set forth in that opinion." *Tegal Corp. v. Tokyo Electron Co., Ltd.*, 2002 U.S. App. LEXIS 1992 (Fed. Cir., Feb. 1, 2002) (unpublished).\(^{3164}\)

"plasma etching" — "refers to a chemical process without excluding the non-chemical process of ion bombardment." *Northern Telecom Limited v. Samsung Electronics Co., Ltd., et al.*, 1996 U.S. Dist. LEXIS 21786 (N.D. Cal., Sept. 13, 1996).\(^{3165}\) "[W]e hold that the district court's claim construction of ... 'plasma etching' was correct." *Id.*, 215 F.3d 1281 (Fed. Cir. 2000).\(^{3166}\)

"play list" — "a list of works that can be played sequentially." *Premier International Associates v. Apple Computer, Inc., et al.*, 512 F. Supp. 2d 737 (E.D. Tex. 2007).\(^{3167}\)

"playing back the stored copy of the information using the receiving system" — "using the receiving system to output the stored copy of the information in real time." *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.*, 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006).\(^{3168}\)

"playlist" — "a particular program sequence requested by a user who is located in the distribution center." *STV Asia, Ltd. v. PRN Corp., et al.*, 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006).\(^{3169}\)

"game playable in the non-tournament mode" — "is clear and no construction is required." *Merit Industries, Inc. v. JVL Corp.*, 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).\(^{3170}\)

"plug electrodes are connected respectively to both sides which are positioned across a part of said fuse portion where cutting off is to be performed" — "at least one plug electrode connected to the fuse portion on each side of the region where the fuse may be cut." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 3172

"pluggable memory key means" — "a removable and/or reinsertable read-only-memory ('ROM') chip and/or module." Roche Diagnostics Corp., et al. v. Apex Biotechnology Corp., et al., 455 F. Supp. 2d 840 (S.D. Ind. 2005). 3173

"plural protective transistors" — "multiple transistors which provide a discharge path for current to flow between the first power supply wire and the second power supply wire when activated." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 3175

"a plurality of active MOS regions within a semiconductor substrate" — "at least two distinguishable, active MOS regions within a semiconductor substrate." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004). 3176

"a plurality of calibration images including a calibration marker"; "a plurality of alignment images including an alignment marker"; "a plurality of calibration marks" — "more than one individual mark or target serving as touch points for the calibration process." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007). 3178

"plurality of coordinates being included in a plurality of respective distinct blocks" — "Several coordinates, where each set of coordinates is contained within one block in a set composed of data blocks that are distinct from one another." Skyline Software Systems v. Keyhole, Inc., et al., 2006 U.S. Dist. LEXIS 83603 (D. Mass., Nov. 16, 2006). 3179

"receiving a plurality of demands ... and ... receiving a plurality of settlement offers" — "require[s] the receipt of at least two demands and at least two settlement offers." Cybersettle, Inc. v. National Arbitration Forum, Inc., 243 Fed. Appx. 603 (Fed. Cir., July 24, 2007). 3180
[transceiver that operates in a] "plurality of different modes"; "ADSL/AVR transceiver" — "a transceiver that operates by dividing available bandwidth between two channels in at least two of the following ways, (1) where the first channel is smaller than the second ('conventional ADSL' mode); (2) where the two channels are of 'roughly' equal size ('bi-directional' mode); and (3) where the first channel is larger than the second ('reversible' mode)." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., et al., 92 F. Supp. 2d 483 (E.D. Va. 2000).3181 "[T]he patentees defined the term 'mode' by implication, through the term's consistent use throughout the '786 patent specification. Given this definition, the three modes described in the Detailed Description of the Preferred Embodiments describe the three possible modes of the invention, and the claims are not entitled to any broader scope." Id., 262 F.3d 1258 (Fed. Cir. 2001).3182

"plurality of optical communication channels" — "two or more optical communication channels; each optical communication channel providing an optical signal path separated in frequency from other optical signal paths." CIENA Corp., et al. v. Corvis Corp., 334 F. Supp. 2d 598 (D. Del. 2004).3184

"a plurality of photo detectors each having an output, a memory containing a reference frame of digitized photo detector output values" — "a device in which the voltage from each photo detector is converted to a binary number, which number is stored in memory in an array." Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp., 2007 U.S. Dist. LEXIS 45828 (N.D. Cal., June 13, 2007).3185

"plurality of pre-determined values" — "at least two values that are set prior to that comparison." BorgWarner, Inc., et al. v. New Venture Gear, Inc., 237 F. Supp. 2d 919 (N.D. Ill. 2002).3186

"plurality of pulse amplitude and location coded signals" — "two or more pulse amplitude values having a formatted representation and two or more pulse location values having a formatted representation." AT&T Corp. v. Microsoft Corp., 2003 U.S. Dist. LEXIS 10716 (S.D.N.Y., Jun. 23, 2003).3187

"plurality of specific screen identifying information" — "must be construed based upon the specification. ... That specification describes an algorithm that identifies a screen of data in order to match it to a GUI. The specification incorporates by reference the '961 patent. Thus, the 'information' which was defined by reference should be consistent with the use of that term in the '961 patent, insofar as all fields on the screen are utilized." ResQNet.com, Inc. v. Lansa, Inc., 2002 U.S. Dist. LEXIS 16667 (S.D.N.Y., Sept. 5, 2002).3188 "As previously noted, 'plurality' ordinarily means 'at least two'; thus, 'a plurality of specific screen identifying information' means 'at least two pieces of specific screen identifying information.' Moreover, the presence of 'specific' connotes selected or particular. This phrase does not equate to 'all.'" Id., 346 F.3d 1374 (Fed. Cir. 2003).3189

"point-of-load [POL] regulator" — "a dc/dc switching voltage regulator designed to receive power from a voltage bus on a printed circuit board and adapted to power a portion of the devices on the board and to be placed near the one or more devices being powered as part of a distributed board-level power system." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007).3191 "The intrinsic record supports the district court's construction, and despite Artesyn's contention, the terms 'adapted to' and 'near' are not facially vague or subjective." Id., 2010 U.S. App. LEXIS 6487 (Fed. Cir. 2010).3192

"point of sale location" — "a location where a consumer goes to purchase material objects embodying predetermined or preselected information. This construction permits a home to be a point of sale location. A point of sale location need not have more than one blank material object and it need not have any material objects separately for sale as blanks." Interactive Gift Express, Inc. v. CompuServe, Inc., et al., 256 F.3d 1323 (Fed. Cir. 2001).3193

"point-of-sale": "point-of-sale transaction": "point-of-sale terminal" — "the physical location where a consumer enters a sales transaction with a merchant"; "the sales transaction occurring at the point of sale"; "an electronic device at the point-of-sale for entering a point of sale transaction." Source, Inc. v. American Express Co., 2007 U.S. Dist. LEXIS 68248 (E.D. Tex., Sept. 14, 2006).3194

"pointer memory" — "a memory for storing variables that indicate the memory location of some data, such as by an address." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).3196

"policy information indicating a permitted neighboring node/network from which a packet transfer by the label switching is to be permitted" — "the district court construed the term as requiring the policy information to relate to an upstream node/network. ... We [ ] affirm the district court's construction." Toshiba Corp. v. Juniper Networks, Inc., 2007 U.S. App. LEXIS 21288 (Fed. Cir., Sept. 6, 2007) (unpublished).3197

"polygon" — "a region defined by a finite number of straight line segments at the first semiconductor surface, which lines could deform slightly during diffusion or other processing steps resulting in a region only generally polygonal in configuration when viewed from the device surface." International Rectifier Corp. v. IXYS Corp., 2002 U.S. Dist. LEXIS 27248 (C.D. Cal., Mar. 5, 2002).3199
"base region being a cellular polygonal region" — "this limitation is properly construed to require the base shape, at the surface, to be generally but not perfectly polygonal -- i.e., the surface expression of the base will be a closed figure with generally (not necessarily perfectly) straight sides." _International Rectifier Corp. v. IXYS Corp._, 2001 U.S. Dist. LEXIS 25711 (C.D. Cal., Jul. 16, 2001).3208 "The correct construction of the term 'polygonal,' consistent with the written description, is simply 'a closed plane figure bounded by straight lines.' The patentee, being fully aware of the effects of the doping process, could have claimed the regions more broadly but chose to use the word 'polygonal' without modification or qualification. The district court was not free to attribute new meaning to the term or to excuse the patentee from the consequences of its own word choice." _Id._, 361 F.3d 1363 (Fed. Cir. 2004).3209

"popularity" — "information indicative of the number of times a particular work has been downloaded or played back, indicating how popular the particular work is." _Premier International Associates v. Apple Computer, Inc., et al._, 512 F. Supp. 2d 737 (E.D. Tex. 2007).3203

"port" — "a terminal, e.g., a personal computer with a modem, from which a user of the invention can access the database storing the information about the items of interest." _Civix-DDI, LLC v. Celco Partnership_, 387 F. Supp. 2d 869 (N.D. Ill. 2005).3204

"port" — "a defined physical or logical connection where data enters or leaves a network device." _Utstarcom, Inc. v. Starent Networks Corp._, 2005 U.S. Dist. LEXIS 40520 (N.D. Cal., Dec. 6, 2005).3206

"port" — "an abstraction for describing the inputs and/or outputs of sources, targets or transformation objects." _Informatica Corp. v. Business Objects Data Integration, Inc._, 2005 U.S. Dist. LEXIS 46869 (N.D. Cal., Aug. 1, 2005).3207

"portable computer"; "portable computer microprocessing system" — "a computer without a built-in display or keyboard that is capable of being moved or carried about." _Computer Docking Station Corp. v. Dell Inc., et al._, 2006 U.S. Dist. LEXIS 58388 (W.D. Wis., Aug. 16, 2006).3210

"a portable point of sale terminal" — "a portable computer terminal that is capable of handling a sales transaction." *Symbol Technologies, Inc. v. Janam Technologies LLC*, 605 F. Supp. 2d 618 (D. Del. 2009). 3213

"portal" — "a computer server or group of servers that stores media assets and transmits and receives media assets to and from media players over a communications network." *Zapmedia Services, Inc. v. Apple Inc.*, 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010). 3216

"the portion of the IP data session" — "all the data packets transmitted between the first and second participants during the part of the IP data session being recorded." *NICE Systems, Inc., et al. v. Witness Systems, Inc.*, 528 F. Supp. 2d 470 (D. Del. 2007). 3218

"portion of the [predefined] bandwidth" — "the part, but less than all, of the data transfer capacity of the bus that is assigned to a group of data sources." *Rembrandt Technologies, L.P. v. Comcast Corp., et al.*, 512 F. Supp. 2d 749 (E.D. Tex. 2007). 3219

"portion of the stored information"; "part of the stored information" — "The phrases ... are synonymous. The Court does not find it necessary to further construe these phrases." *Acacia Media Technologies Corp. v. New Destiny Internet Group, et al.*, 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006). 3220

"wherein a portion of the patterned second semiconductor film is exposed" — "part of the second semiconductor film is made subject to etching." *Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al.*, 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006). 3221

"portions of the first layer beneath the valleys of the hemisphere polysilicon particle layer" — "the portions of the first layer that are removed, i.e., the portions of the first layer between the raised, rounded polysilicon particles." *OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al.*, 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 3222

"positional coordinates" — "a set of coordinates defining a single reference point within a corresponding geographic vicinity which operates to determine the corresponding geographic vicinity." *CIVIX-DDI, LLC v. Microsoft Corp., et al.*, 84 F. Supp. 2d 1132 (D. Colo. 2000). 3224
"positive optical anisotropy" — "a characteristic of a birefringent material wherein the values of two of the three principal optical indices (called the ordinary indices) are equal to each other and the third optical index (called the extraordinary index) is greater than the other two."  Commissariat a l'Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007). 3225

"a positive supply voltage" — "a voltage at an external source to the gate drive circuits that has a positive potential relative to a reference potential." STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004). 3226

"potential first parties" — "individuals who can place a telephone call but have not yet done so." 800 Adept, Inc. v. Murex Securities, Ltd., et al., 2006 U.S. Dist. LEXIS 53696 (M.D. Fla., Aug. 3, 2006). 3227

"power" — "the rate at which energy is transferred, calculated by multiplying electric current times voltage." Symbol Technologies, Inc. v. Janam Technologies LLC, 605 F. Supp. 2d 618 (D. Del. 2009). 3228

"a power conditioning circuit ... being functional ..." — "this Court construes claim 32 ... to be in means-plus-function form." Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000). 3229

"power mode setting for setting the emitter module in one of a plurality of different operating power modes" — "a setting that defines the type or width of the high voltage signal that supplies power." Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003). 3234

"power regulating signal" — "a signal for controlling power to a load." O; Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006). 3235

"said power source" — "The district court ... concluded that 'said power source' must power the entire apparatus. This ruling is erroneous because it imported an extraneous limitation into the claim." Clearwater Systems Corp. v. Evapco, Inc., et al., 2010 U.S. App. LEXIS 18222 (Fed. Cir., Aug. 30, 2010) (unpublished). 3236
"power source" — "mean[s] only parts of the patch that generate power, and parts of the patch that merely regulate the provision of power to the patch, but do not individually generate power, are not part of the 'power source.'" Travanti Pharma, Inc. v. Iomed, Inc., 2006 U.S. Dist. LEXIS 2646 (D. Minn., Jan. 11, 2006). 3237

"power supply" — "a source of electrical energy, such as a battery, that requires at least two power supply lines to deliver power in an electrical circuit." NeoMagic Corp. v. Trident Microsystems, Inc., 98 F. Supp. 2d 538 (D. Del. 2000). 3239 "The court has revisited the issue of the proper definition of the words 'power supply' and has decided the court was correct to reject NeoMagic's proposed construction that a power supply is a source connection or line that may be at a particular voltage level." Id., 129 F. Supp. 2d 689 (D. Del. 2001). 3240 "[W]e vacate and remand for further proceedings that portion of the court's summary judgment holding that the 'power supply' limitation requires a constant voltage supply." Id., 287 F.3d 1062 (Fed. Cir. 2002). 3241 "To be considered a second power supply, the split-bias device must be able to deliver power to an electrical circuit at a voltage to enable the junction between the well and the substrate to remain reverse-biased. A split-bias device is simply a BIAS signal line that controls the current in the digital-analog-converter at a constant level, not a power supply, as held by Judge McKelvie in his previous decisions." Id., 2003 U.S. Dist. LEXIS 25760 (D. Del., Jul. 30, 2003). 3242

"personal computer power supply" — "a device that receives AC current and provides DC current to the components of a personal computer, and expressly excludes redundant power supplies." Streak Products, Inc. v. Antec, Inc., et al., 2010 U.S. Dist. LEXIS 114458 (N.D. Cal., Oct. 19, 2010). 3243

"power supply circuit" — "a first stage preamplifier circuit that does not respond to changes in the potential of the supply pins of the op-amps [] so that the first stage is able to track the input reference signal without inducing any corrupting noise variations in the preamplifier circuit or in the return input reference signal current pathway." Fiori v. Rockford Corp., 2006 U.S. Dist. LEXIS 41477 (E.D. Pa., June 21, 2006). 3245

"power supply controller"; "system controller" — "part of a distributed power control system that activates and at least partially programs and monitors a regulator and allows the output of the POL regulator to be transmitted to an external load circuit." Power-One, Inc. v. Artesyn Technologies, Inc., 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007). 3247

"a power supply coupled to the first power signal port and to at least one of said modems to be powered by the power signal and for powering said modem" — "the device receives a power signal and allows the transfer of the power signal with the modem and the power coupler." SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007). 3248

"with each user being capable of having predefined characteristics indicative of multiple predetermined roles in the system" — "discrete roles and their associated characteristics to which a user can be multiply assigned are set in advance within the system." *Blackboard, Inc. v. Desire2Learn, Inc.*, 2007 U.S. Dist. LEXIS 56680 (E.D. Tex., Aug. 3, 2007).

"predefined query language"; "predetermined query language" — "a query language that must be determined prior to the 'generating a query' step, but not necessarily prior to the associating step. Furthermore, the 'predefined [or predetermined] query language' must support the functions and operators contained in the associating step's SELECT clause." *Business Objects, S.A. v. Microstrategy, Inc.*, 393 F.3d 1366 (Fed. Cir. 2005).

"predesignated sites such as consumer stores" — "requires that the location of the terminal be pre-established in a specific location at the point of sale." *Catalina Marketing International, Inc. v. Coolsavings.com, Inc.*, 2001 U.S. Dist. LEXIS 3781 (N.D. Ill., Mar. 27, 2001).

"predetermined condition" — "the occurrence of a current imbalance from an actual or artificially induced ground fault."  

"predetermined data element" — "a part or unit of data, including the data on an entire storage device, which identity is determined beforehand and which is stored in the first or second data storage system."  

"predetermined database" — "a set of decision-making rules that incorporate a medical code classification system and expert medical clinical judgment and that are not programmed to be modified by the user."  

"predetermined digit sequences" — "the set of all signals which are used for international dialing."  

"predetermined digital identification" — "digital data whose value is known in advance or calculated at the moment."  

"time interval of predetermined duration" — "the time interval of the recorded signal must be of a fixed duration determined prior to operation."  
Pause Technology LLC v. TiVo Inc., 419 F.3d 1326 (Fed. Cir. 2005).

"a timer circuit ... for providing a time-out sequence of a predetermined duration" — "a timer circuit ... that measures a time period having a duration determined beforehand."  

"predetermined length of time" — "a length of time within a known time period."  

"providing a predetermined level of access and control" — "the level of access and control is set in advance within the system."  

[i] "predetermined match weight"; [ii] "predetermined mismatch weight" — [i] "a predetermined factor that arithmetically increases a stored case model's match score when a feature from the stored case model matches text and attributes from the presented case model"; [ii] "a predetermined factor which arithmetically decreases a stored case model's match score when a feature from the stored case model does not match text and attributes from the presented case model."  

"predetermined maximum peak-to-peak value" — "a predetermined value that the peak-to-peak voltage produced by the resistive divider will not exceed."  
"predetermined number of digital bits" — "Each digital word in the digitized image consists of one or more bits of information, where the number of bits in each word is preselected and constant for a given set of broad band information." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).3275

"a predetermined number of random bingo numbers" — "The specific and predesignated quantity of random bingo numbers that will be played during a complete bingo game after which the game will end." The HomeBingo Network, Inc. v. Multimedia Games, Inc., 2006 U.S. Dist. LEXIS 93632 (N.D.N.Y., Dec. 28, 2006).3276

"predetermined operations"; "predetermined expected response" — "reading 'predetermined' to mean 'determined beforehand' and 'expected' to mean 'predicted' is entirely consistent with the purpose of the method and the specification." Thomson Consumer Electronics, Inc. v. Innovatron, S.A., 43 F. Supp. 2d 26 (D.D.C. 1999).3277

"predetermined parameters" — "parameters of the paths that are stored in memory and not measured." ConneTel, LLC v. Cisco Systems, Inc., 428 F. Supp. 2d 564 (E.D. Tex. 2006).3278

"said operand or instruction being located at a predetermined position from a boundary of said instruction groups" — "the operand or instruction is accessed at a position defined in relation to the boundaries of the instruction group that includes the operand or instruction being accessed." Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).3279

"predetermined region" — "a region stored in the user station and determined prior to use by the user[,] subject, however, to new information loaded into the base station memory, by the system developers, from time to time." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000).3282

"predetermined response" — "responses prepared prior to the receipt of the electronic message. The responses may be modified and/or altered based on the interpretation of the electronic message." Bright Response, LLC v. Google Inc., et al., 2010 U.S. Dist. LEXIS 60361 (E.D. Tex., Jun. 18, 2010).3283

"predetermined sequences [signals] which are used for international dialing" — "the set of all digits which are used for international dialing." Gammino v. Southwestern Bell Telephone, L.P., et al., 2007 U.S. Dist. LEXIS 20881 (N.D. Tex., March 23, 2007).3284

"predetermined severe congestion threshold" — "a predetermined number of queued data units, which is greater than the predetermined mild congestion threshold." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).3285

"a predetermined time" — "a time ... that is set or otherwise determined before the ball is propelled toward a target." *Probatter Sports, LLC v. Joyner Technologies, Inc.*, 518 F. Supp. 2d 1051 (N.D. Iowa 2007).3287

"connecting at a predetermined time and date via a data transfer line the call rating device to a rate provider having billing rate parameters for a plurality of calling stations" — "encompass[es] a method in which the time and date for calling the rate provider are selected a substantial period in advance of the call, and in which each call to the rate provider need not be initiated by the individual user." *Mediacom Corp. v. Rates Technology, Inc.*, 4 F. Supp. 2d 17 (D. Mass. 1998).3288

"said triggered generator being activated for a predetermined time period" — "the time period between activation and deactivation of the generator that has its length programmed prior to the triggering of the generator. ...while the 'predetermined time period' is a definitive time period, it is not of definitive length until it is programmed prior to triggering." *Agrizap, Inc. v. Woodstream Corp., et al.,* 431 F. Supp. 2d 518 (E.D. Pa. 2006).3289

"said predetermined time period being the time required for the transient associated with turning on said reversing magnetic field to decrease to a level where said magnetic field variation is distinguishable from said transient" — "the predetermined period of time being substantially equal to the time required for the transient associated with the generation of the reversing magnetic field to decrease to a level sufficient for the reader to distinguish the transient from the variation in absorption of power." *Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al.*, 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006).3290

"applying a positive direct current to said distal tip for a predetermined time period" — "applying a positive direct current to the distal tip for a time period determined in advance of the initiation of the detachment process." *Regents of the University of California v. Micro Therapeutics, Inc., et al.*, 2007 U.S. Dist. LEXIS 20511 (N.D. Cal., Mar. 2, 2007).3291

[i] "predetermined value"; [ii] "predetermined measure"; [iii] "threshold value" — [i][ii] "a value or measure determined before the signals are compared"; [iii] "a numerical quantity 'above which something is true or will take place and below which it is not or will not.'" *ADE Corp. v. KLA-Tencor Corp.*, 252 F. Supp. 2d 40 (D. Del. 2003).3292

"preempted" — "a thread is 'preempted' when control is taken away from it." *Reiffin v. Microsoft Corp.*, 2002 U.S. Dist. LEXIS 21690 (N.D. Cal., Apr. 30, 2002).3295

"with a preference for avoiding the particular portion of the thoroughfare in the route" — "with the possibility of avoiding the particular portion of the thoroughfare in the route." *Garmin Ltd. v. TomTom, Inc.*, 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). 3298

"preference information" — "information preferred by a user of the system or information related to a preferred procedure or both." *Luma Corp. v. Stryker Corp., et al.*, 2005 U.S. Dist. LEXIS 40884 (S.D. W. Va., July 27, 2005). 3299

"preliminarily" — "The plain meaning of 'preliminarily' is 'at first' or 'prior to.'" *Combined Tactical Systems, Inc. v. Defense Technology Corp. of America, et al.*, 426 F. Supp. 2d 140 (S.D.N.Y., April 4, 2006). 3300

"pre-paid calling card account" — "a record maintained in a database which, when activated, allows a user with the access information for that account to obtain access to a phone system or network." *TGIP, Inc. v. AT&T Corp., et al.*, 512 F. Supp. 2d 696 (E.D. Tex. 2007). 3301

"preparing first and second substrates provided with active elements" — "preparing the first and second substrates such that at least one substrate has active elements." *Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al.*, 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006). 3303

"preparing to transmit the data packet" — "accessing the header of a packet to make a decision on where to send the packet and to obtain the marking field." *Lucent Technologies, Inc. v. Newbridge Networks Corp., et al.*, 168 F. Supp. 2d 181 (D. Del. 2001). 3304

"prepayment amount" — "the exact amount of money deposited to obtain a special code. It may be deposited by anyone." *Aerotel, Ltd. v. Telco Group, Inc., et al.*, 2010 U.S. Dist. LEXIS 47266 (S.D.N.Y., May 12, 2010). 3305

"prepayment amount less deductions for the running cost of the call" — "the exact amount of money deposited to obtain a special code, ... less the running cost of the current call." *Aerotel, Ltd. v. Telco Group, Inc., et al.*, 2010 U.S. Dist. LEXIS 47266 (S.D.N.Y., May 12, 2010). 3306

"prepending given data to a content provider-supplied URL to generate an alternate resource locator (ARL)" — "generating an alternative resource locator (ARL) by adding a name or other identifier that can be translated by a domain name system into the IP address of a content server to the beginning of the URL of an embedded object supplied by a content provider." *Akamai Technologies, Inc., et al. v. Limelight Networks, Inc.*, 494 F. Supp. 2d 34 (D. Mass. 2007). 3307

"pre-programmed logic" — "software and/or hardware that provides preset responses dictated by the test subject's inputs." *Diagnostic Group, LLC v. Benson Medical Instruments Co.*, 2005 U.S. Dist. LEXIS 5030 (D. Minn., Mar. 28, 2005). 3308

"prescribed set of reverse control channels" — "a predetermined range of frequencies that transmit control information in only one direction, from a cellular telephone to a cell site."  TruePosition, Inc. v. Andrew Corp., 2007 U.S. Dist. LEXIS 62702 (D. Del., Aug. 23, 2007). 3310

"preselected condition" — "a parameter of the voltage on the signaling pair that indicates whether an access device is able to accept remote power from the data node."  Network-1 Security Solutions, Inc. v. D-Link Corp., et al., 2006 U.S. Dist. LEXIS 84510 (E.D. Tex., Nov. 20, 2006). 3311 "[T]he Court construes the term 'preselected condition' to mean 'a parameter of the voltage on the signaling pair that indicates whether an access device is able to accept remote power from the data node.'"  Network-1 Security Solutions, Inc. v. Cisco Systems, Inc., et al., 2010 U.S. Dist. LEXIS 12938 (E.D. Tex., Feb. 16, 2010). 3312

"presenting ... a link corresponding to the personal information stored on the personal information provider" — "No construction is necessary."  Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006). 3314

"said apparatus ... presenting information to the user ..." — "the Court agrees with Meade that the presentation of information need not occur via an overlay on the field of view."  Meade Instrument Corp. v. Yamcon, Inc., 2005 U.S. Dist. LEXIS 43396 (C.D. Cal., July 27, 2005). 3315

"presenting to a form user over a computer network by a third party forms servicer a form" — "the limitation ... as to 'presenting' a form means to provide the form to a form user via the form user's web browser."  CollegeNET, Inc. v. Xap Corp., 442 F. Supp. 2d 1036 (D. Or. 2006). 3316

"presenting to the user via the user interface, the list of the third plurality of options" — "displaying to the user only those options that are determined to be compatible with all previously selected choices."  Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). 3317

"presettable level" — "means that threshold levels of attenuated and backscattered radiation can be preset before the scan of the object."  Vivid Technologies, Inc. v. American Science & Engineering, Inc., 200 F.3d 795 (Fed. Cir. 1999). 3318

"pressure-sensitive variable-conductance analog sensor"; "pressure-sensitive variable-conductance sensor"; "pressure-sensitive analog sensor"; "pressure-sensitive variable-conductance structural arrangement"; "pressure-sensitive variable-conductance structure"; "pressure-sensitive variable sensor"; "pressure-sensitive ... button sensor" — "an electricity manipulating device that uses pressure-sensitive variable conductance material to vary electrical output as varying physical force is applied."  Anascape, Ltd. v. Microsoft Corp., et al., 2007 U.S. Dist. LEXIS 88248 (E.D. Tex., Nov. 30, 2007). 3319

"pressure-sensitive variable conductance material" — "a substance that changes in conductivity to allow a greater flow of electric current through it, as pressure is applied to it."  Anascape, Ltd. v. Microsoft Corp., et al., 2007 U.S. Dist. LEXIS 88248 (E.D. Tex., Nov. 30, 2007). 3320
"pressure-sensitive variable conductance of one of said buttons" — "the conductivity of a pressure-sensitive variable-conductance sensor associated with one of said buttons." Anascape, Ltd. v. Microsoft Corp., et al., 2007 U.S. Dist. LEXIS 88248 (E.D. Tex., Nov. 30, 2007).3321

"a configuration which would prevent unauthorized reproduction of the ... signals" — "Plaintiff's definition of 'prevent' ..., i.e., 'presenting a technical obstacle sufficient to impede the ordinary customer from duplicating the purchased digital audio signal' is appropriate to the facts of this case." Sightsound.com Inc. v. N2K, Inc., et al., 391 F. Supp. 2d 321 (W.D. Pa. 2003).3322

"[send] a message preventing [an external program from running when there are no available licenses for the requesting program]" — "require[s] only a message that results in the program's being prevented from running; active prevention is not required." Globetrotter Software, Inc., et al. v. Elan Computer Group, Inc., et al., 362 F.3d 1367 (Fed. Cir. 2004).3323

"preventing intelligible viewing" — "scrambling the video signal of the chosen program transmission such that the video signal displays in an incomprehensible form and transmitting the descrambling signal related to said transmission only to requesting viewers' receivers" In re: VTRAN Media Technologies, LLC, Patent Litigation, 2009 U.S. Dist. LEXIS 61328 (E.D. Pa., Jul. 17, 2009).3324

"price determining activity" — "any form of competition or entertainment activity or combination of such activities that is used to determine the price paid for the product or service and is not otherwise part of a sales transaction." Performance Pricing, Inc. v. Google Inc., et al., 2009 U.S. Dist. LEXIS 71264 (E.D. Tex., Aug. 13, 2009).3326

"price for a credit account"; "price for a proposed credit account" — "a fee or credit (that may be zero) for modifying or entering into a credit account, based on the credit or account parameters." Walker Digital, LLC v. Capital One Services, LLC, et al., 2010 U.S. Dist. LEXIS 56429 (E.D. Va., Jun. 8, 2010).3327

"price selection switch" — "a 'price selection switch' actuable by a customer must mean that the customer is choosing one price from among more than one price. This is separate from a 'product selection switch' which differentiates between different products." Mars, Inc. v. Coin Acceptors, Inc., 2007 U.S. Dist. LEXIS 20094 (D.N.J., March 20, 2007).3329

"pricing adjustment(s)"; "price adjustment(s)" — "a denormalized number that may affect the determined price." Versata Software, Inc., et al. v. SAP America, Inc., et al., 2009 U.S. Dist. LEXIS 45751 (E.D. Tex., May 19, 2009).3330

"pricing information" — "any information relating to price other than an adjustment to price that is not a denormalized number." Versata Software, Inc., et al. v. SAP America, Inc., et al., 2009 U.S. Dist. LEXIS 45751 (E.D. Tex., May 19, 2009).3331

"primary circuit"— "the circuitry that performs the primary task for which the semiconductor chip
is designed and excludes the auxiliary circuitry that is added to furnish the identification
"primary router address" — "address associated with the router as a principal identifier of the
(C.D. Cal., Aug. 27, 2002).3333
"primary site data" — "data at a location on the remote server assembly." Rothschild Trust
"primary voltage" — "a base or initial voltage" Power Integrations, Inc. v. Fairchild
"printed board" — "a generally flat piece of material typically fabricated from insulating material
that provides support and structural integrity for a plurality of electrically interconnected
components comprising a circuit, with some or all of the conducting interconnection pattern
(N.D. Ill., July 28, 2006).3336
"printed paper" — "a reviewable printout of the voters' voting selections or choices or a
corresponding voting session identifier that is retained by the voter." Avante International
Technology, Inc. v. Premier Election Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 95047 (E.D.
"printer" — "a printer that retains no record of the data printed (including but not limited to
conventional printers such as a thermal printer, a dot matrix printer, an ink-jet printer, a bubble jet
printer, or a laser printer)." Avante International Technology, Inc. v. Premier Election Solutions,
"printer" — "printer that retains no record of the data printed (including but not limited to a
thermal jet printer, a dot matrix printer, an ink-jet printer, a bubble jet printer, a laser printer, and
the like)." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S.
"prior to" — "means 'before' and requires a delay during which neither the primary nor the
auxiliary switch is enabled to conduct current that it could otherwise block." VLT, Inc. v. Artesyn
court's construction of the 'prior' limitation as requiring a small delay between the opening of the
auxiliary switch and the closing of the primary switch that is useful to allow the magnetizing
current to charge and discharge parasitic capacitances associated with the switches and windings.
We also agree with the district court that the delay should be long enough to reduce switching
losses and that it includes delay that eliminates or greatly reduces such losses." Id., 103 Fed.
"prior to any attempted use of the defibrillator" — "prior to any attempted use of the
defibrillator to treat a patient, and possibly other uses as well." Koninklijke Philips Electronics

- 308 -


"said first and second channels being maintained separate and apart prior to being fed to the two transducers" — "Because the public has the right to rely on the applicants' remarks in seeking allowance of their claims, ... we agree with the district court that 'prior to' should be construed to mean after the altering of the amplitude and shifting of the phase has begun." Desper Products, Inc., et al. v. QSound Labs, Inc., 157 F.3d 1325 (Fed. Cir. 1998). 3345

"prior to said reading and for each of a plurality of voters, producing by a voting machine a paper ballot including voting selections made by a voter" — "Before the reading step, a ballot is produced with the voter's choices printed thereon. The entire process is then repeated for multiple voters." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007). 3344

"prior to storage" — "Hilgraeve also argued before that court that the phrase 'prior to storage' must be construed from the ordinary user's perspective, i.e., that whether or not VirusScan screens before or after storage, it will infringe if the user perceives that screening occurs before storage. ... The district court correctly found nothing in the intrinsic evidence to support Hilgraeve's argument based on the perception of the program's operation." Hilgraeve Corp. v. McAfee Associates, Inc., 224 F.3d 1349 (Fed. Cir. 2000). 3345

"stored thereon prior to the transaction" — "stored on the terminal prior to the consumer presenting the debit card to the merchant." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007). 3346

"a prioritized set of tiers" — "a set of levels ranked by expected or actual customer usage possibly together with other allocation factors, wherein each successively lower level of information contains a larger amount of information than the next higher level. The root information described in the specification is part of the top tier." Comcast Cable Communications Corp., LLC v. Finisar Corp., 2007 U.S. Dist. LEXIS 28994 (N.D. Cal., April 6, 2007). 3348

"priority bit" — "a bit that is used to convey the relative importance of the communication." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007). 3349

"private branch exchange network" — "a private telecommunications exchange network that includes access to a public telecommunications exchange. It may be on the user's premises and may provide a switching facility for telephones on extension lines within the premises and access to the public telephone network." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005). 3350

"said private branch exchange services including providing substantially real-time voice communications" — "this phrase requires no construction." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005). 3351

"probability density function estimation"; "PDFE" — "a finite data set large enough to approximate a function of a continuous variable whose integral over a region gives the probability that a random variable falls within the region." Wavetronix v. EIS Electronic Integrated Systems, 573 F.3d 1343 (Fed. Cir. 2009). 3353

"procedure routine specifications" — "stored values from which time values can be determined for controlling a sense means during execution of an algorithm." Roche Diagnostics Corp., et al. v. Apex Biotechnology Corp., et al., 455 F. Supp. 2d 840 (S.D. Ind. 2005). 3354

"process auction bids"; "processing auction bids" — "perform operations on bids other than receiving, accepting, or transmitting bids"; "performing operations on bids other than receiving, accepting, or transmitting bids." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 3357

"process ... to select"; "processing ... to select" — "process/processing to participate in the selecting." Sprint Communications Co. L.P. v. Big River Telephone Co., LLC, 2009 U.S. Dist. LEXIS 58161 (D. Kan., Jul. 8, 2009). 3359

"process ... travel along a route" — "monitor ... travel along a route." Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). 3360

"processed"; "processing" — "redirect[ing], allow[ing], or block[ing] data traffic." LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al., 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010). 3361

"processed signals" — "a digital signal or processed signal is a set of data representing frames of a video." In re Compression Labs, Inc. Patent Litigation, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006). 3362

"processing" — "manipulating the data access operation requests into a format usable by the external storage device." Netac Technology Co. Ltd. v. PNY Technologies, Inc., 2007 U.S. Dist. LEXIS 91536 (E.D. Tex., Dec. 13, 2007). 3364

"processing" — "manipulation of data which performs some operation or sequence of operations on the data." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999). 3366

"processing chamber" — "processing chamber should be interpreted to encompass the entire interior of the processing vessel." Semitool, Inc. v. Dynamic Micro Systems Semiconductor Equip. GmbH, 444 F.3d 1337 (Fed. Cir. 2006). 3368

"processing electronically" — "performing the appropriate computations (e.g., addition, subtraction, multiplication, and division) without manual intervention from the user." Simplification, LLC v. Block Financial Corp., et al., 593 F. Supp. 2d 700 (D. Del. 2009). 3370

"processing hub" — "a computer which provides front-end POS device management and message processing for card authorizations." Alexsam, Inc. v. Humana Inc., 2009 U.S. Dist. LEXIS 77553 (E.D. Tex., Aug. 28, 2009). 3371

"time domain processing means for ..." — "the district court erred in holding that claims 1, 2, and 33 can cover systems that implement either a one-step or two-step process. The corresponding structure limits the 'time domain processing means' to a two-step algorithm in which the processor calculates generally nondiscrete estimates and then selects the discrete value closest to each estimate, or structural equivalents thereof." Harris Corp. v. Ericsson, Inc., 417 F.3d 1241 (Fed. Cir. 2005). 3372

"user response processing modules for ..." — "components or units of a computer program that process information received by a user." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010). 3373

"processing qualified calls" — "requires that the calls be qualified prior to execution of common processing operations." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003). 3374

"processing station" — "the transmission system as previously defined by the Court." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007). 3375

"processing system" — "the court rejects Vonage's proposed claim construction and finds that the parties have not demonstrated that further construction of the claim term 'processing system' is warranted." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007). 3376

"processing ... the electronic advertisement ... in compliance with the presentation rules of the internet media venue" — "executing a systematic sequence of mathematical and/or logical operations upon the customized electronic advertisement to make it comply with the presentation rules of the internet media venues." Function Media, L.L.C. v. Google, Inc., 2009 U.S. Dist. LEXIS 94340 (E.D. Tex., Oct. 9, 2009). 3377
"processing time parameters" — "a set of values that determine the duration of one or more of a series of actions in manufacture." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005). 3378

"processing ... to select" — "these claim terms do not require further construction." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007). 3379

"processor" — "The Court adopts the Special Master's claim construction as follows: no limitation requiring a CPU that is separate from the FDC and that controls the interpretation of instructions and their execution should be applied to the term 'processor' in the asserted claims of the '002 and '222 patents or in the '858 patent. Further, the Court agrees with and adopts the Special Master's finding that '[t]here is absolutely no warrant for construing the claims of these patents in a way that would exclude redesigned FDCs that nonetheless incorporate the claimed solutions.'" Phillip M. Adams & Associates, LLC v. Dell, Inc., et al., 2010 U.S. Dist. LEXIS 68749 (D. Utah, Jul. 9, 2010). 3380

"processor" — "the CPU along with its peripheral circuitry." Fenner Investment, Ltd v. Microsoft Corp., et al., 632 F. Supp. 2d 627 (E.D. Tex. 2009). 3381

"processor element" — "the Court finds sufficiently definite such that §112, P6 does not apply." Motorola, Inc. v. VTech Communications, Inc., et al., 2009 U.S. Dist. LEXIS 59226 (E.D. Tex., Jul. 6, 2009). 3386

"processor element" — "a device that is capable of interpreting and executing instructions." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). 3387

"said processor elements being connected to said plurality of sets of shared resources" — "The question is whether this limitation is drafted according to § 112 P 6. The court holds it is not." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). 3388
"processor executing detection executables effective to determine an underrun error undetected by a floppy diskette controller" — "The term 'processor' means an element capable of controlling the interpretation of instructions and their execution; this element need not be the CPU nor need it be outside the FDC. The term 'executables' means software that can run on the processor. The term 'software' is used in its broadest sense, and includes high-level applications, portions or 'modules' of programs, and so-called 'firmware' (instructions or data that are embedded in a particular hardware device)." Phillip M. Adams & Associates, LLC v. Dell, Inc., et al., 2010 U.S. Dist. LEXIS 68749 (D. Utah, Jul. 9, 2010).3389

"processor includes a computing device" — "[t]he term 'processor includes a computing device' is indecipherable. As Ingenio points out, the patent describes 'a home computer or an interactive TV system' as examples of 'a computing device.' Because a processor itself must be a part of a computing device to function, it cannot also include 'a computing device,' as that terminology is used in the patent. Ingenio attempts to avoid this conclusion by arguing that the computing device in this claim is simply 'a component device that can perform computations.' The patent's own description of what a 'computing device' is, as cited by Ingenio, does not comport with this construction. Therefore, I find that the term 'processor includes a computing device' is indecipherable in the context of this patent." Ingenio, Filiale de Loto-Quebec, Inc. v. GameLogic, Inc., 445 F. Supp. 2d 443 (D. Del., July 21, 2006).3390

"processor means" — "§ 112(6) applies to the term 'processor means' in the '797 Patent. ... [I]t is not inconsistent for this Court to apply § 112(6) to the term 'processor' in the '797 Patent while declining to apply that statutory provision to the identical term used in the '603 Patent." Data General Corp. v. International Business Machines Corp., 93 F. Supp. 2d 89 (D. Mass. 2000).3392

"processor means for performing the calculating function" — "a microprocessor programmed to perform an anlyte testing procedure using variable values from a pluggable memory key means or, for glucose values specifically, a microprocessor programmed to compare measured current values to a calibration curve defined by values from a pluggable memory key means." Roche Diagnostics Corp., et al. v. Apex Biotechnology Corp., et al., 455 F. Supp. 2d 840 (S.D. Ind. 2005).3393

"processor system" — "must have a CPU but it need not be capable of running application-type software." SeaChange International, Inc. v. C-Cor Inc., 413 F.3d 1361 (Fed. Cir. 2005).3394

"processor systems" — "at least one central processing unit capable of running application type software, and at least one mass storage subsystem." SeaChange International, Inc. v. nCube Corp., 115 F. Supp. 2d 473 (D. Del. 2000).3395

"processor within a computing device" — "the same thing as 'a processor.' The language 'within a computing device' adds no additional limitation to the term 'a processor,' as a processor must be within a computing device to perform the functions it is required to perform in claim 1 of the '082 patent." Ingenio, Filiale de Loto-Quebec, Inc. v. GameLogic, Inc., 445 F. Supp. 2d 443 (D. Del., July 21, 2006).3396
"producing" — "is used in the claims in accordance with its ordinary meaning, and no construction is necessary." *Websidestory, Inc. v. Netratings, Inc.*, 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007).

"producing desired tooth position signals containing digitized data of desired positions of a plurality of the patient's teeth"; "a computer programmed ... to calculate finish positions of the teeth of the patient"; "determining treatment positions of the teeth"; "a computer programmed to apply at least some automated tooth position criteria to produce a digital model of the teeth of the scanned shapes in desired positions"; "a computer ... programmed to select geometric parameters on the patient's teeth from the digitized data by operator-interaction and to produce a digital model of the teeth in desired positions" — "require automatic computer determination of the finish positions of the teeth without human adjustment of the final results." *Ormco Corp., et al. v. Align Technology, Inc.*, 498 F.3d 1307 (Fed. Cir. 2007).

"I would reverse the district court's grants of summary judgment, and remand with direction that the claim language at issue be construed and that a record supporting that construction be developed." *Id.* (O'Malley, J., dissenting-in-part).

"producing payment guaranty data in the data processing system in response to the term compliance data, the payment guaranty data representing a payment guaranty to the seller for payment under the contract" — "furnishing or providing, upon or in reaction to the production of term compliance data, data which reflect an obligation by the buyer to assure payment to a seller, for example a letter of credit." *Tradecard, Inc. v. SI Corp., et al.*, 509 F. Supp. 2d 304 (S.D.N.Y. 2007).

"product identification data" — "information displayed to and/or submitted by a potential buyer that identifies a product sought to be purchased." *Autobytel, Inc. v. Dealix Corp.*, 2006 U.S. Dist. LEXIS 3381 (E.D. Tex., Jan. 18, 2006).

"product name" — "is not limited to a 'generically known name'. It may include an 'alphanumerical designation,' a 'product code,' or a 'vendor name and description,' or any other designation by which the software programs may be recognized for the purpose of reporting on their use." *Isogon Corp. v. Amdahl Corp.*, 47 F. Supp. 2d 436 (S.D.N.Y. 1998).

"product pictures" — "Nothing in the claim language, specification, or prosecution history supports Defendants' proposed limitations. Thus, the Court does not adopt them. Without these limitations, Defendants' proposed construction of 'product pictures' is 'more than one picture, each of which is of a product.' This is no different than how 'product pictures' would ordinarily be understood. Accordingly, 'product pictures' does not require construction." *Orion IP, LLC v. Staples, Inc., et al.*, 406 F. Supp. 2d 717 (E.D. Tex. 2005).

"Hyundai reurges the Staples Defendants' position that the product pictures [images] and product environment pictures [images] must be separate, i.e., they cannot contain the same content. ... [T]he Court rejects Hyundai's exclusivity requirement and its proposed constructions." *Orion IP, LLC v. Mercedes-Benz USA, LLC, et al.*, 516 F. Supp. 2d 720 (E.D. Tex. 2007).

"product relationship" — "an association between a product and one or more parts, the association having a left-hand side and a right-hand side. The product represents the left-hand side of the relationship, and the set of elements represents the right-hand side of the relationship." *Trilogy Software, Inc. v. Selectica, Inc.*, 405 F. Supp. 2d 731 (E.D. Tex. 2005).
"product record" — "is not limited to the 'product ID,' the 'product name' and the 'vendor ID,' and is not required to contain a 'product name,' but may contain whatever information is necessary to identify the software product." Isogon Corp. v. Amdahl Corp., 47 F. Supp. 2d 436 (S.D.N.Y. 1998). 3406

"said customer profile including a profile of data previously accessed by said customer" — "the customer profile includes data that describes the significant characteristics of the data previously accessed by the customer." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004). 3407

[i] "program"; [ii] "application program" — [i] "a sequence of coded instructions that can be loaded into a mechanism such as a computer"; [ii] "a software program that performs substantial useful functions for a user (e.g., electronic mail programming, word processors, spreadsheets, personal calendar programs, games) as opposed to software that primarily controls the allocation and use of computer resources (e.g., memory, display, storage devices, modem)." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002). 3408

"programmable controller" — "[a] control device, normally used in industrial control applications, that employs the hardware architecture of a computer and a relay ladder diagram language. Also known as programmable logic controller." Probatter Sports, LLC v. Joyner Technologies, Inc., 518 F. Supp. 2d 1051 (N.D. Iowa 2007). 3412

"programmable controller" — "a control device that is capable of being programmed to perform specific tasks." Rosen's, Inc., et al. v. Van Diest Supply Co., et al., 2004 U.S. Dist. LEXIS 5435 (D. Minn., Mar. 30, 2004). 3413

"programmable switch": "crosspoint switch" — "a programmable device capable of forwarding packets from one computer/workstation/server to another." Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364 (Fed. Cir. 2003). 3414

"programmed" — "programmed with algorithms which process the lip position data and control point data, resulting in data representing the new pixel configuration of the altered first facial display." Bloomstein v. Paramount Pictures Corp., et al., 1996 U.S. Dist. LEXIS 22260 (N.D. Cal., May 6, 1996). 3416
"programmed channel signal" — "any video signal carried by a programmed channel. A 'programmed channel' would be understood by a person of ordinary skill in the art to be a cable channel or network such as CNN and MTV. Additionally, it is an inherent limitation of the claim that the programmed channel signal must include time slots for local advertising insertion; otherwise, there would be no need for switching between the programmed channel signal and the commercial insert signal. Because programmed channel signals typically include cue tones to signal upcoming local avail, a person of ordinary skill in the art would so understand the term 'programmed channel signal' to include this limitation." Beam Laser Systems, Inc. v. Cox Communications, Inc., et al., 144 F. Supp. 2d 475 (E.D. Va. 2001).

"programmed response mode" — "the surveillance sensor appliance responds to the condition in accordance with predetermined instructions which are, or previously have been, received from the server." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006).

"programming" — "a data stream containing video signals, audio signals, and/or uniform resource locators, with no requirement that all the signals be contained in a single data stream." ACTV, Inc., et al. v. Walt Disney Co., et al., 204 F. Supp. 2d 650 (S.D.N.Y. 2002).

"programming mode" — "a mode in which video game menu options are selected to be video game menu choices." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).

"progressive prize" — "A prize that starts at some value then is incremented as wagers are placed on gaming devices linked to the prize. The increment value is the result of multiplying the value of the wagers made by a contribution percentage." Goff v. Harrah's Operating Co., 412 F. Supp. 2d 1090 (D. Nev. 2005).

"project manager" — "an individual assigned to carry out and be responsible for construction of all or a specified portion of a project." Atser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009).

"projection data information" — "the data necessary to permit a particular 2D representation of a 3D model to be reproduced." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).

"projector means connected to said one or more computers for receiving and projecting said screen video displays onto said display screen" — "is a means-plus-function limitation." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007).

"prompting said first application server" — "giving a cue to a server running the service application." Pixion, Inc. v. PlaceWare, Inc., 2004 U.S. Dist. LEXIS 15808 (N.D. Cal., Aug. 2, 2004). 3430

"generating a signal proportionate to the denomination of each validated bill" — "creating an electrical communication that indicates the value of the bill as read by the bill receiving apparatus." Arbitron, Inc. v. International Demographics Inc., et al., 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009). 3432

"proposal" — "has its ordinary meaning and it is a term that would be familiar to a lay juror." Walker Digital, LLC v. Capital One Services, LLC, et al., 2010 U.S. Dist. LEXIS 56429 (E.D. Va., Jun. 8, 2010). 3433

"proposed reservation time" — "a time reflective of a position in the virtual queue that can be accepted or rejected by the patron." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006). 3435

"prospective wagerer" — "a subscriber who then goes on to access the system to enter one or more wagers." Lottotron, Inc. v. Gtech Corp., 2007 U.S. Dist. LEXIS 82579 (D.N.J., Nov. 7, 2007). 3436

"protection MOSFET" — "a MOSFET connected to a circuit in such a way that it tends to prevent one or more circuits from undergoing electrostatic breakdown." OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 73144 (N.D. Cal., Sept. 21, 2006). 3439
"protective MOS transistor" — "a MOS transistor that provides a discharge path for current to flow from the first power supply terminal to the second power supply terminal when activated by a voltage on the drain that exceeds a predetermined level."  Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 3440

"protective transistor" — "a transistor which provides a discharge path for current to flow between the first power supply wire and the second power supply wire when activated."  Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007). 3441

"protocol" — "a set of rules governing the communication and/or transfer of data."  Karl Storz Endoscopy-America, Inc. v. Smith & Nephew, Inc., 2010 U.S. Dist. LEXIS 85036 (W.D. Tenn., Aug. 18, 2010). 3442

"protocol data unit (PDU) network policy" — "a filtering or auditing rule which determines if and why a PDU should be forwarded."  Storage Technology Corp. v. Cisco Systems, Inc., et al., 2001 U.S. Dist. LEXIS 25876 (N.D. Cal., Nov. 26, 2001). 3443  "The district court erred in its claim construction of the terms 'caching policy identification information' and 'protocol data unit (PDU) network policy' in the '040 patent."  Id., 329 F.3d 823 (Fed. Cir. 2003). 3444

"provide different prompts" — "I agree with plaintiff that the phrase is clear and unambiguous and no judicial construction is necessary."  Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). 3446

"provide power to said meter" — "[does not] require a specific or threshold amount or level of power, other than as specified in the plain language of the claims."  Square D Co., et al. v. E.I. Electronics, Inc., 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010). 3447

"the speech synthesis system provides a message to the surgeon stating information about the movement of the surgical camera" — "requires synthesized speech informing the surgeon about the movement of the surgical camera."  Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002). 3448

"providing" — "is an everyday word used in its ordinary, everyday sense and, thus, it needs no construction."  CollegeNET, Inc. v. Xap Corp., 442 F. Supp. 2d 1036 (D. Or. 2006). 3449

"providing" — "supplying."  
Girafa.com, Inc. v. IAC Search & Media, Inc., et al., 2009 U.S. Dist. LEXIS 84405 (D. Del., Sep. 15, 2009).[[13045]] "Upon additional review [], the court believes that 'providing' cannot be isolated from the remainder of the relevant phrase. The terms 'providing to a user a visual image or a web page' and 'providing [to a user] a thumbnail visual image' require definition commensurate with the disclosure of the '904 patent. ... 'Providing to a user a visual image or a web page' [] contemplates the use of a web browser (and display screen). ... The term 'providing [to a user] a thumbnail visual image' is construed [] as 'displaying to a user a thumbnail visual image.'"  

"providing"; "provides" — "generating"; "creating."  

"providing ..."; "searching ..."; "selecting ..." — "I find no reason here to limit Claim 5's terms by 35 U.S.C. 112 P 6."  
CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000).[[13045]|2]

"providing a communications link" — "providing customers access to the internet."  
Netcraft Corp. v. EBay Inc., et al., 2007 U.S. Dist. LEXIS 91806 (W.D. Wis., Dec. 10, 2007).[[13045]|2]

"providing a decode control key to the receiver station" — "the court concludes that 'providing' includes permanently storing in a memory at the receiving station."  

"providing a driver" — "supplying or making available a driver."  

"providing a level of service to the traffic associated with the particular customer of the packet-based network independent of all other traffic on the packet-based network outside of the virtual private network's logical domain" — "is plain on its face and requires no further construction."  

"providing a plurality of indications" — "providing more than one communication."  

"providing a readout of the glucose concentration in the blood sample" — "displaying the blood glucose concentration on a device that can be read by the user."  
"providing a second substantially transparent substrate member having a continuous layer of transparent conductive material disposed on one surface thereof, said second substrate being spacedly disposed from said first substrate and arranged so that the layer of transparent conductive material of said second substrate faces the layer of transparent conductive material of the first substrate" — "providing a second substrate having a continuous layer of transparent conductive material placed on one surface. The substrates are assembled so that the first and second substrates are spaced apart from each other and the layer of conductive material of the first substrate and the layer of conductive material of the second substrate face each other." Advanced Technology Incubator, Inc. v. Sharp Corp., et al., 2009 U.S. Dist. LEXIS 109173 (E.D. Tex., Jun. 26, 2009).3461

"providing a signal based on the measured pressure in the chamber to a control module" — "providing a signal based upon the measured pressure in the chamber to a control module." Automotive Technologies International, Inc. v. Delphi Corp., 2009 U.S. Dist. LEXIS 83187 (E.D. Mich., Sep. 11, 2009).3462

"providing access to a personal computer ... from a remote computer" — "requires no construction." 01 Communique Laboratory, Inc. v. Citrix Systems, Inc., et al., 2007 U.S. Dist. LEXIS 17955 (N.D. Ohio, March 13, 2007).3463

"providing access ... to each component provided for the computer selected from the group consisting of" — "providing the user or operator of the computer with access to each of the following parts of the computer if present: removable power supplies, removable drives, removable media drives, one or more plugs for external drives and devices, and ports for switches." Rackable Systems, Inc. v. Super Micro Computer, Inc., 2006 U.S. Dist. LEXIS 81432 (N.D. Cal., Oct. 27, 2006).3464

"providing fabrication sequences" — "providing a series of operations for the manufacture of a part or parts." Information Technology Innovation, LLC v. Motorola, Inc., et al., 391 F. Supp. 2d 719 (N.D. Ill. 2005).3466

"providing an indication of the simultaneous presence of two fingers in response to identification of said first and second maxima" — "does not require that the 'indication' of two fingers be returned to the host. However, the limitation does require that infringing methodology perform some affirmative step to provide an indication of multiple fingers." Elantech Devices Corp. v. Synaptics, Inc., et al., 2007 U.S. Dist. LEXIS 82017 (N.D. Cal., Oct. 26, 2007).3467

"providing said at least partially surrounding image elements in respect to said particular position" — "making at least some of the image elements of the original image that surround the particular position available for inspection." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006).3468

"DNS proxy server" — "a computer or program that responds to a domain name inquiry in place of a DNS. ... [T]he 'DNS proxy server' does not have to be separate from the client computer." VirnetX, Inc. v. Microsoft Corp., 2009 U.S. Dist. LEXIS 65667 (E.D. Tex., Jul. 30, 2009).3469
"proxy server" — "server that mediates communication between a client application, such as a Web browser, and a real server. It handles requests to the real server to see if it can fulfill the requests itself; if not, it forwards the requests to the real server. The proxy server can serve as a firewall component." SRI International, Inc. v. Internet Security Systems, Inc., et al., 2006 U.S. Dist. LEXIS 75355 (D. Del., Oct. 17, 2006). 3470

"pseudo-random" — "refers to output that is repeatable and predictable to anyone who knows the function's input but appears to be totally random to those without such knowledge." PaCid Group, LLC v. Apple, Inc., et al., 2010 U.S. Dist. LEXIS 70997 (E.D. Tex., Jul. 15, 2010). 3471

"pseudorandom number generator device including a sealed casing" — "indicates that hardware must be involved. At the claim construction hearing plaintiff conceded that the sealed casing would cover the hardware, although he contended that software could also be included. His concession, however, demonstrates that his proposed definition -- which would allow the pseudorandom number generator device to consist of only software -- is contrary to what is claimed." Pickholtz v. Rainbow Technologies, Inc., et al., 2000 U.S. Dist. LEXIS 21945 (N.D. Cal., Apr. 28, 2000). 3473

"publishing the electronic advertisement to one or more of the selected internet media venues" — "placing or making available the customized electronic advertisement within the framework of and at each internet media venue so that it is accessible by the end users, consumers, viewers, or buyers." Function Media, L.L.C. v. Google, Inc., 2009 U.S. Dist. LEXIS 94340 (E.D. Tex., Oct. 9, 2009). 3476

"pulse value" — "a value identifying time-of-flight data, including noise and signals reflected from the target, that provides information sufficient to permit correlation of the received signal with other received signals to determine which of the received signals represents the actual return or target-reflected signal, as opposed to random noise signals." Laser Technology, Inc. v. Nikon, Inc., et al., 215 F. Supp. 2d 1135 (D. Colo. 2002). 3477

"pulse width" — "the time interval between the beginning and the end of the pulse." Ricoh Co., Ltd. v. Quanta Computer, Inc., et al., 2007 U.S. Dist. LEXIS 34892 (W.D. Wis., May 11, 2007). 3478

"ON/OFF pulses" — "does not limit the shape of the pulses' wave form but instead requires that a switching power supply create the pulses by turning a switch on and off." Relume Corp. v. Dialight Corp., et al., 63 F. Supp. 2d 788 (E.D. Mich. 1999). 3479
"at least one application operative to punch through a firewall" — "an application that has the ability to communicate through a firewall." Square D Co., et al. v. E.I. Electronics, Inc., 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010).\footnote{3480}

"purchase request" — "the Court does not construe purchase request with the limitation that it must travel directly from a potential buyer to the Data Center system." Autobytel, Inc. v. Dealix Corp., 2006 U.S. Dist. LEXIS 3381 (E.D. Tex., Jan. 18, 2006).\footnote{3481}

"purchasing value of a card in response to card use" — "a value stored on a card itself or a value in an account associated with a card (but not limited to situations where the card holder has a business arrangement with the host data processor)." Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010).\footnote{3482}

- Q -

"quality of result"; "desired quality of result" — "quality of result refers to any number of features or characteristics of a cut, including but not limited to surface finish, uniformity of cut surface, precision and dimensional accuracy. A user specifies his or her desired quality of result using an associated value." Omax Corp. v. Flow International Corp., 2006 U.S. Dist. LEXIS 81914 (W.D. Wash., Nov. 7, 2006).\footnote{3485}

"quality of service"; "QoS" — "a quantifiable measure of service provided." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007).\footnote{3486}

"quality value" — "a value that indicates the value of a wireless communications link." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010).\footnote{3487}

"at least one of the halogens Cl, Br or I is present in a quantity" — "I construe 'quantity' to mean a concentration--the amount per unit volume." U.S. Philips Corp. v. Iwasaki Electric Co., et al., 2006 U.S. Dist. LEXIS 106 (S.D.N.Y., Jan. 3, 2006).\footnote{3488}

"a quantity between 10^{-6} and 10^{-4} \text{\mu mol/mm}^3" — "means that the halogen is present in the envelope or bulb in a quantity between 1 divided by 1,000,000 and 1 divided by 10,000 micromoles per cubic millimeter." U.S. Philips Corp. v. Iwasaki Electric Co., et al., 2006 U.S. Dist. LEXIS 106 (S.D.N.Y., Jan. 3, 2006).\footnote{3489} "The claim construction that we affirm today is 'between 1 \times 10^{-6} and 1 \times 10^{-4} \text{\mu mol/mm}^3', not 'between 1.0 \times 10^{-6} and 1.0 \times 10^{-4} \text{\mu mol/mm}^3'." Id., 505 F.3d 1371 (Fed. Cir. 2007).\footnote{3490}

"quantity or intensity" — "the specification confirm that the patentee elected to use the term 'intensity' as a synonym for the term 'quantity' meaning the areas under the spectroscopic graph." Only the First, Ltd. v. Seiko Epson Corp., 2009 U.S. Dist. LEXIS 57994 (N.D. Ill., Jul. 8, 2009).\footnote{3491}

"query processing mechanism for processing a given query statement, wherein, upon identifying that the given query statement is on said user-defined reference, communicates with said aggregation module over an interface therebetween to retrieve portions of aggregated fact data pointed to by said reference that are relevant to said given query statement" — "the court rejects Hyperion's proposed means-plus-function construction and declines to construe this term." Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006). 3493

"query servicing mechanism, operatively coupled to the aggregation module, for servicing query statements generated in response to user input" — "the court rejects Hyperion's proposed means-plus-function construction and declines to construe this term." Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006). 3494

"responding to queries" — "replying to requests to a database for information." Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al., 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006). 3495

"questions" — "there is no need to construe the term, much less to stringently limit the meaning of 'questions' as Defendants would like." Orion IP, LLC v. Staples, Inc., et al., 406 F. Supp. 2d 717 (E.D. Tex. 2005). 3496 "Since there is evidence that the applicant did not limit the meaning of "questions" to exclude menus, the Court rejects Hyundai's proposed construction. As there is no other dispute about the term's meaning, the term does not require further construction." Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007). 3497

"queue" — "a queue must have some sequence or order; it cannot merely be a group of things." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007). 3498

"queuing" — "placing data into a structure in which items are removed in a first in, first out (FIFO) manner." Hamilton v. ComWeb Technology Group, Inc., et al., 2003 U.S. Dist. LEXIS 27832 (D. Md., Nov. 13, 2003). 3499

- R -

"RF information transmission network"; "RF information network"; "RF information transmission system"; "RF transmission system" — "a combination of circuits and devices for transmitting data, which combination includes a plurality of RF transmitters for transmitting RF signals carrying data and one or more RF receivers for receiving data. Each RF transmitter has a substantial geographic RF coverage area and is interconnected with other RF transmitters. [The combination may include pluralities of local, lata and hub switches]." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002). 3500
"RF receiver" — "a device for receiving radio frequency electromagnetic signals, for demodulating the radio frequency electromagnetic signals, and for recovering data that is carried by the radio frequency electromagnetic signals. The RF receiver can be carried by a person outside a home or office and can receive data while being carried."  NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002).

"an RF section for receiving instructions from said microcontroller and for receiving radio frequency information from the mixer and a television station and properly converting the information into video signals which may be sent to said television for viewing" — "the electronics for (1) receiving radio frequency signals from a source external to the invention; (2) receiving instructions from the microcontroller internal to the invention; (3) making a channel selection pursuant to the instructions received from the microcontroller; (4) receiving and converting signals received from the mixer or a television station into video signals capable of being received by the television set; and (5) transmitted the converted signals to the television for viewing."  SuperGuide Corp. v. DirecTV Enterprises, Inc., et al., 169 F. Supp. 2d 492 (W.D.N.C. 2001).

"a radiation absorbing material with a sheet resistance providing at least 50% absorption in said spectral range" — "a layer of material that absorbs, through its sheet resistance, at least 50% of incident radiation in the specified spectral range."  Raytheon Co. v. Indigo Systems Corp., 2010 U.S. Dist. LEXIS 3530 (E.D. Tex., Jan. 18, 2010).

"radio frequencies" — "the frequencies in the portion of the electromagnetic spectrum that is between the audio-frequency portion and the infrared portion."  Commonwealth Scientific Industrial Research Organization v. Buffalo Technology (USA), Inc., et al., 2006 U.S. Dist. LEXIS 26977 (E.D. Tex., May 8, 2006).

"radio frequency information" — "modulated or unmodulated analog signals containing television programming and video information received either from the mixer internal to the system or from a television station. It does not include digital television signals." SuperGuide Corp. v. DirecTV Enterprises, Inc., et al., 169 F. Supp. 2d 492 (W.D.N.C. 2001).3511

"radio interface module"; "RIM" — "electrical circuitry connected to individual transceivers in order to provide the various control functions (data or communications) involved in the operation of each channel." MLMC, Ltd. v. Airtouch Communications, Inc., et al., 2001 U.S. Dist. LEXIS 18472 (D. Del., Nov. 1, 2001).3512

"a radio receiver for receiving a command" — "The plain and ordinary meaning of 'radio receiver' is a receiver that receives radio signals. ... the Court construes the word 'command' to mean: a signal representing an instruction to perform an operation." Zoltar Satellite Alarm Systems, Inc. v. Motorola, Inc., et al., 2007 U.S. Dist. LEXIS 95521 (N.D. Cal., Dec. 21, 2007).3513

"radio receiver for receiving radio signals and generating audio output signals responsive thereto" — "a portion of the radio for receiving radio signals and converting the signals to audio output signals." Black & Decker Inc., et al. v. Robert Bosch Tool Corp., 389 F. Supp. 2d 1010 (N.D. Ill. 2005).3514

"radio receiver means for receiving radio signals and generating electronic audio output signal responsive thereto" — "a § 112, P6 claim term where the claimed function is 'receiving radio signals and generating electronic audio output signals responsive thereto' and the claimed structure is 'the radio circuit board disclosed as item 33 in Figures 6 and 7, and any equivalent structure thereof.'" Black & Decker Inc., et al. v. Robert Bosch Tool Corp., 389 F. Supp. 2d 1010 (N.D. Ill. 2005).3515

"a radio transmitter connected for receiving the remote unit location, the at least one switch output, defining a switch status, and transmitting the remote unit location and the switch status" — "a radio transmitter that is connected to the navigational receiver and receives the remote unit location from the navigational receiver; and to at least one manually operated switch and receives switch output, defining the state of the switch. The radio transmitter transmits the remote unit location and information on the state of the switch." Zoltar Satellite Alarm Systems, Inc. v. Motorola, Inc., et al., 2007 U.S. Dist. LEXIS 95521 (N.D. Cal., Dec. 21, 2007).3516

"random access memory" — "The court construes 'random access memory' as 'synonymous with the term 'RAM' as that term was used in 1988, but not including "ROM" as that term was understood in 1988. It is a volatile memory that permits access to any of its address (storage) locations in any desired sequence with similar access time to each location. ROM includes masked ROM, PROM, EPROM, and EEPROM.'" Lectrolarm Custom Services v. Vicon Industries, Inc., et al., 2005 U.S. Dist. LEXIS 32752 (W.D. Tenn., Sept. 2, 2005).3517

"random access storage means" — "the court is satisfied that 'random access storage', unlike 'storage', connotes sufficient structure to one ordinarily skilled in the art. Section 112(6) does not apply to this term." Apple Computer v. Burst.com, Inc., 2007 U.S. Dist. LEXIS 33863 (N.D. Cal., May 8, 2007).3518
"randomly selected" — "true and not pseudo-random selection." CIAS, Inc. v. Alliance Gaming Corp., et al., 424 F. Supp. 2d 678 (S.D.N.Y. 2006). \(3519\) "We discern no error in the district court's construction of the scope of the '422 claims." Id., 504 F.3d 1356 (Fed. Cir. 2007). \(3520\)

"range" — "the set of values between the highest and lowest value that a quantity or function may assume." 01 Micro International, Ltd., v. Rohm Co., Ltd., 2007 U.S. Dist. LEXIS 84979 (E.D. Tex., Nov. 16, 2007). \(3522\)

"range value" — "a name associated with certain data that is used to extract that data from the database." Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006). \(3523\)

"raster clock signal" — "a periodic signal used to synchronize a display device in response to a program clock reference." Mediatek, Inc. v. Sanyo Electric Co. Ltd., 513 F. Supp. 2d 778 (E.D. Tex. 2007). \(3524\)

"rate adapting said Ethernet frame based data by adapting an Ethernet data frame to at least one bit stream, each bit stream having a data rate which can be multiplexed into a synchronous digital network virtual container" — "converting Ethernet frame based data and the data rate into one or more bit streams, each bit stream has a data rate which can be multiplexed into a synchronous digital network virtual container, the bit stream is not encapsulated in an intermediate format." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006). \(3525\)

"rating" — "a value or measure assigned to the applicant." Block Financial Corp. v. LendingTree, Inc., 2007 U.S. Dist. LEXIS 72332 (W.D. Mo., Sept. 27, 2007). \(3526\)

"ratio" — "a result of dividing two values." Zircon Corp. v Stanley Works, 2010 U.S. Dist. LEXIS 47958 (N.D. Cal., May 14, 2010). \(3527\)

"a reaction force caused by movement of the mask stage and the object stage" — "an equal and opposite counterforce created by the shifts and vibrations of the mask stage and the object stage." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004). \(3528\)

"read" — "the Court rejects Symbol's argument that the '971 patent defines the term 'read' to mean 'decoded.'" Metrologic Instruments, Inc. v. Symbol Technologies, Inc., 2006 U.S. Dist. LEXIS 68287 (D.N.J., Sept. 22, 2006). \(3529\)

"read" — "to extract data from memory or a storage medium and [usually] transfer it to another area of memory or other medium for use or extraction at a point in time." LaserDynamics Inc. v. Acer America Corp., et al., 2003 U.S. Dist. LEXIS 27826 (S.D. Tex., Jun. 12, 2003). \(3530\)

"the compatibility comparison including reading a characteristic of each option" — "no construction of this claim term is required. The ordinary meaning suffices." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006). \(3532\)
"reading the code by a processor" — "receiving input of the code from some source, which may include a computer program/software source." *Ingenio, Filiale de Loto-Quebec, Inc. v. GameLogic, Inc.*, 445 F. Supp. 2d 443 (D. Del., July 21, 2006).

"reading the command from a user interface" — "the defendants' indefiniteness argument is rejected and the phrase is construed to mean 'reading a command initiated by a user through a user interface.'" *SmartDisk Corp. v. Archos S.A., et al.*, 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006).

"real time" — "as instantaneously as possible, limited by the ability of the reporter to transcribe text, the ability of the CAT system to convert the transcribed text into readable text, and the ability of the software/hardware that is directly connected to the transcription means to display the converted text." *Engate, Inc. v. Esquire Deposition Services LLC, et al.*, 2003 U.S. Dist. LEXIS 573 (N.D. Ill., Jan. 13, 2003).

"in real time" — "the receiving system receives the data in the same electronic time frame as the transmission system sends the data." *Acacia Media Technologies Corp. New Destiny Internet Group, et al.*, 405 F. Supp. 2d 1127 (N.D. Cal. 2005).

"real time" — "immediately, as it happens; in the context of a system that processes data, it means processing the data as it is received (as against storing the data as it is received and processing the data later on)." *Rockwell Electronic Commerce Corp., et al. v. Apropos Technology, Inc.*, 2002 U.S. Dist. LEXIS 272 (N.D. Ill., Jan. 9, 2002).

"displaying real-time data" — "displaying data without intentional delay, given the processing limitations of the system and the time required to accurately measure the data." *Paragon Solutions, LLC v. Timex Corp.*, 566 F.3d 1075 (Fed. Cir. 2009).

"real-time video" — "non-buffered video transmitted and displayed to the remote users without perceived delay between the events as they occur and the events depicted in the video." *Auction Management Solutions, Inc. v. Adesa, Inc.*, 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).
"realized" — "the 'initial intended delay' is 'realized' if 'the delay obtained is less than or approximately equal to the initial intended delay.'" *Synopsys, Inc. v. Magma Design Automation, Inc.*, 2005 U.S. Dist. LEXIS 46882 (N.D. Cal., Aug. 23, 2005).3546

"reallocating processing resources unused by said specific portions to other specific portions" — "with respect to processing resources that were previously allocated to, but unused by, specific portions of defined routines, reallocating those unused resources to other specific portions of defined routines." *Gobeli Research, Ltd. v. Apple Computer Inc., et al.*, 384 F. Supp. 2d 1016 (E.D. Tex., Aug. 26, 2005).3547

"receive ... purchase and sale trades and orders"; "receive the commodity bids and offers" — "Plaintiffs ask the Court to insert the word 'directly' before the claim term 'receive.' ... The Court finds Plaintiffs' arguments unconvincing as they improperly seek to import a claim limitation from the specification and patent figures." *Chicago Mercantile Exchange, Inc., et al. v. Technology Research Group, LLC*, 2010 U.S. Dist. LEXIS 65002 (N.D. Ill., Jun. 28, 2010).3550

"the live audio and video being received along with the reception of information regarding the an item being auctioned at the live auction site and information regarding acceptance and rejection of onsite and remote auction bids over an IP network" — "audio and video streams travel on the same channel as the data stream containing information about the item being auctioned and information about the acceptance and rejection of bids." *Auction Management Solutions, Inc. v. Adesa, Inc.*, 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).3552

"receiver" — "a device that can receive video signals and playlists either together or independently." *ACTV, Inc., et al. v. Walt Disney Co., et al.*, 204 F. Supp. 2d 650 (S.D.N.Y. 2002).3556

"message receiver" — "one of skill in the art would have understood receiver to connote specific structure such that the term is not drafted according to 35 U.S.C. § 112 P 6." *Brooktrout, Inc. v. Eicon Networks Corp., et al.*, 2004 U.S. Dist. LEXIS 31054 (E.D. Tex., Jul. 27, 2004).3557
[i] "heterodyne receiver circuit"; [ii] "common heterodyne receiver"; [iii] "receiver" — [i] "A person of ordinary skill in the art would understand 'heterodyne receiver circuit' as it is used in claim 1 to mean that such a circuit must be connected to both the cable signal level and the leakage antenna inputs, and the circuit must have greater sensitivity for the leakage antenna input. Accordingly, a person of ordinary skill in the art would know that a certain combination of oscillator and mixers must be used in order to make one side of the circuit more sensitive. Implicit in this understanding is knowledge concerning the use of dual conversion or single conversion front ends and IF stages. A person of ordinary skill in the art would also know what combination of oscillators, mixers and circuitry are required to get either of those two signals from the input of the cable signal or leakage to the point of becoming input for the detector. Because the claim specifically provides that the input from the heterodyne receiver circuit is separate from the detector, the person of ordinary skill in the art will know that the detector is not part of the receiver."; [ii] "a person of ordinary skill in the art would understand that the common heterodyne receiver begins with a single input to the heterodyning circuitry, providing a point where the cable signal input and the leakage input come together to share circuitry. The common heterodyne receiver includes whatever components are necessary to complete the heterodyning process, and whatever components are necessary to produce an output that can then be demodulated. A person of ordinary skill in the art should know what components those processes encompass."; [iii] "the term 'receiver' in claim 35 encompasses all the circuitry that is attached to both the CATV signal level meter input and the CATV leakage antennas that is needed to move the signals from the inputs to and through the detector." Trilithic, Inc. v. Wavetek U.S., Inc., 64 F. Supp. 2d 816 (S.D. Ind. 1999). 3558

"receiver incorporating an unscrambling circuit" — "an apparatus for receiving television broadcasts which includes a circuit that restores a modified signal to its unmodified condition." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). 3559

"receiver means" — "§112, P6 was found to apply." Motorola, Inc. v. VTech Communications, Inc., et al., 2009 U.S. Dist. LEXIS 59226 (E.D. Tex., Jul. 6, 2009). 3560

"receiving" — "'receiving' is a widely recognized term and does not require further construction." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006). 3561

"receiving a command for performing an operation with said picture from image data" — "the phrase requires no construction and the defendants' indefiniteness argument is rejected." SmartDisk Corp. v. Archos S.A., et al., 2006 U.S. Dist. LEXIS 85999 (E.D. Tex., Nov. 28, 2006). 3562

"receiving a request for retrieval of stored data"; "retrieving stored data"; "transferring the retrieved data" — "Witness contends that the intrinsic evidence and the claim structure support its proposal that all three steps, 'receiving,' 'retrieving,' and 'transferring,' are performed by the Web server. ... The Court construes the disputed terms to include the language 'Web server' but not 'digital logger.'" NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007). 3564
"receiving an indication of a speed" — "to acquire a value indicating speed, such as supplied by a computer system." Omax Corp. v. Flow International Corp., 2006 U.S. Dist. LEXIS 81914 (W.D. Wash., Nov. 7, 2006). 3565

"receiving, at a financing institution-accessible facility" — "receiving, transmitted data within a computer system accessible by a financing institution." Tradecard, Inc. v. SI Corp., et al., 509 F. Supp. 2d 304 (S.D.N.Y. 2007). 3567

"for receiving exclusively therethrough USB based display signals" — "means that the USB controller receives all of the USB display based signals." DisplayLink Corp. v. Magic Control Technology Corp., 615 F. Supp. 2d 1051 (N.D. Cal. 2009). 3568

"receiving data to be stored in memory in an alterable fashion ... said alterable data being permanently stored until purposely altered" — "receiving data to be stored in memory in a manner such that the data can be changed ... the alterable data being stored in a non-volatile manner until it is purposely altered." Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al., 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006). 3569

"receiving from the renderer"; "receives from the renderer" — "Something distinct from the renderer receiving from the renderer"; "Something distinct from the renderer that receives from the renderer." Skyline Software Systems, Inc. v. Keyhole, Inc., et al., 2006 U.S. Dist. LEXIS 83603 (D. Mass, Nov. 16, 2006). 3570

"receiving information identifying a customer's parts requirements for the equipment" — "does not require further construction." Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007). 3572

"receiving means for receiving said video signals and said first code signals" — "Because this limitation uses 'means for' there is a presumption that the claim invokes 35 U.S.C. § 112, P 6. Neither party contends that the presumption has been rebutted; we agree that it has not." Elbex Video, Ltd. v. Sensormatic Electronics Corp., 508 F.3d 1366 (Fed. Cir. 2007). 3573

"receiving station" — "a device which answers a telephone call and accepts a telephone address signal." Brooktrout, Inc. v. Eicon Networks Corp., et al., 2004 U.S. Dist. LEXIS 31054 (E.D. Tex., Jul. 27, 2004). 3574

"receiving system" — "an apparatus which directly receives information from the transmission system. The apparatus comprises the following interconnected components: transceiver means, receiver format conversion means, storage means, decompressing means and output data conversion means, as illustrated in Figure 6. The corresponding structure for each means is the structure identified in the specification for performing the recited function." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006). 3575
"a receiving terminal" — "one or more devices that receive a WDM optical signal." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 3576

"reception system at a second location" — "a reception system at one particular location separate from the location of the transmission system." Acacia Media Technologies Corp. New Destiny Internet Group, et al., 405 F. Supp. 2d 1127 (N.D. Cal. 2005). 3577

"recharge information" — "data transmitted that makes it possible to associate a dollar amount with a particular previously activated calling card account." TGIP, Inc. v. AT&T Corp., et al., 512 F. Supp. 2d 696 (E.D. Tex. 2007). 3578

"recipient" — "is [] given its plain and ordinary meaning." Stanacard, LLC v. Rebtel Networks, AB, et al., 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010). 3579

"recognition of identification codes of passengers" — "the passenger identification codes are associated with each individual passenger's identity as well as that passenger's destination floor." Inventio AG v. ThyssenKrupp Elevator Americas Corp., et al., 2010 U.S. Dist. LEXIS 59020 (D. Del., Jun. 14, 2010). 3581

"recognizable relationship" — "These [proposed] constructions are not incorrect. In fact, they are both fairly accurate characterizations of the disputed term, but the Court declines to adopt any construction because a proper understanding of this term may be reached from the ordinary and accustomed meaning of these terms in the context of the claims. Accordingly, the Court elects not to construe 'recognizable relationship.'" Konami Corp. v. Roxor Games, Inc., et al., 445 F. Supp. 2d 725 (E.D. Tex. 2006). 3582

"reconstructed bytes"; "reconstructing said data bytes" — "refers to bytes that have been aligned, latched and converted from serial to parallel format." Bell Communications Research, Inc. v. Fore Systems, Inc., 113 F. Supp. 2d 635 (D. Del. 2000). 3583

"record"; "multiple records" — "a Collection of related data items stored in named data fields"; "multiple Collections of related data items stored in named data fields." CollegeNET, Inc. v. Xap Corp., 442 F. Supp. 2d 1036 (D. Or. 2006). 3585

"record of an input channel"; "record of a communication channel" — "stored voice and/or call information received from an input channel"; "stored voice and/or call information received from a communication channel." NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007). 3587
"record structure" — "is not subject to 35 U.S.C. § 112, P 6 because the term would have connoted sufficient structure to those of ordinary skill in the art." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999). 3588

[i] "recording"; [iii] "storing" — [i] "writing information to the CD"; [ii] "copy[ing] (data) into memory or onto a storage device, such as a hard disk." Optima Technology Corp. v. Roxio, Inc., 2004 U.S. Dist. LEXIS 30262 (C.D. Cal., Sept. 30, 2004). 3590

"recording plane" — "construction of this term is unwarranted." Toshiba Corp. v. Imation Corp., et al., 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010). 3592

"circuit means for recording time of energy use" — "a circuit for use with standard electric meters capable of recording information regarding the amount of energy used or consumed and the time of day, week or year when the energy was used or consumed." Cellnet Data Systems, Inc. v. Itron, Inc., 17 F. Supp. 2d 1100 (N.D. Cal. 1998). 3593

"records recovered from the data stream"; "records recovered from the broadcast database records" — "records received from the transmission and decoded so as to restore the transmitted data to its former condition." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). 3595

[i] "rectifier circuitry connected with the AC terminals and operative to provide a substantially constant DC supply voltage across a pair of DC terminals"; [ii] "rectifying and filtering circuitry connected with the AC terminals and operative to provide a substantially constant DC supply voltage across a pair of DC terminals" — [i] "does not trigger means-plus-function treatment"; [ii] "Once again Paragraph 6 does not come into play." Nilssen v. Motorola, Inc., et al., 80 F. Supp. 2d 921 (N.D. Ill. 2000). 3596

"recycling the magnetizing energy stored in said transformer to reset it" — "require[s] that all of the magnetizing energy (except for energy loss attributed to the non-ideal nature of circuit components) in the transformer be recycled to reset the transformer." VLT Corp., et al. v. Lambda Electronics, Inc., 238 F. Supp. 2d 347 (D. Mass. 2003). 3597 
"[W]e affirm the district court's construction of the phrase 'recycling the magnetizing energy stored in said transformer to reset it' as requiring that all of the magnetizing energy removed from the transformer's core be returned to the transformer to reset it." Id., 103 Fed. Appx. 356 (Fed. Cir., May 24, 2004) (unpublished). 3598

"redirection server" — "a server logically located between the user's computer and the network that controls the user's access to the network." LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al., 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010).

"redirector string" — "one or more contiguous domain labels, including a top level domain that was not part of the originally entered domain name, which identify the domain name server responsible for resolving the transformed compliant domain name." IDN Technologies, LLC v. VeriSign, Inc., 2004 U.S. Dist. LEXIS 20173 (N.D. Cal., Sept. 24, 2004).

"redirects the client computer to a post login page on the personal information provider" — "Construing this claim is thus unnecessary, and would needlessly complicate jury instructions at trial." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).

"reference" — "a reference represents an abstraction for pointing to the contents of a shared folder within the same repository or in the global data mart repository." Informatica Corp. v. Business Objects Data Integration, Inc., 2005 U.S. Dist. LEXIS 46869 (N.D. Cal., Aug. 1, 2005).

"reference file" — "modified worksheet that includes computer instructions that tell the computer how to extract data from a database and where to place that data in a spreadsheet." Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006).

"reference generating mechanism for generating a user-defined reference to aggregated fact data generated by the aggregation module" — "the court reject Hyperion's proposed means-plus-function construction and declines to construe this term." Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006).

"the payment-duē data reflecting a result of automatically comparing delivery data with delivery obligation data representing a delivery obligation of the seller in accordance with the sale-of-goods transaction" — "which reflects a comparison made automatically by the computer system showing that (a) the seller's performance has conformed to the parameters set by the buyer or (b) the buyer has otherwise accepted the seller's performance, and that a buyer's obligation to pay for the goods is due." Tradecard, Inc. v. S1 Corp., et al., 509 F. Supp. 2d 304 (S.D.N.Y. 2007).

"reflecting surface" — "surface that internally reflects essentially all of the incident electromagnetic radiation that is communicated by the waveguide toward the tip, where 'internally reflects' means the electromagnetic radiation is reflected because it is incident on the reflecting surface at an angle greater than the critical angle." American Medical Systems, Inc., et al. v. Laser Peripherals, LLC, 2009 U.S. Dist. LEXIS 95387 (D. Minn., Oct. 13, 2009).
"said content profiles reflecting the customer profiles of those customers who have previously accessed said data from each data source" — "content profiles contain data that results from the customer profiles of those customers who have previously accessed data from each data source." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).

"reflector means" — "encompass[es] either a totally reflective reflector, a partially reflective reflector, as well as a partially light transmissive reflector, with or without apertures or openings in the reflector itself, where the reflector is capable of radiating light through or out of the reflector in all directions, including both laterally and upwardly." Sportlite, Inc. v. Genlyte Thomas Group, LLC, et al., 2006 U.S. Dist. LEXIS 96638 (D. Ariz., Sept. 13, 2006).

"regardless of the presence of markers, frame boundaries, and other boundaries that may occur within said data" — "the download restarts at any point within the data file heedless of markers, frame boundaries, or other boundaries that may occur within the data." Ethos Technologies, Inc. v. RealNetworks, Inc., 462 F. Supp. 2d 131 (D. Mass. 2006).

"substantially a same informational content regardless of which of said advertising presentations are combined therewith" — "informational content that is not substantially changed based on which of said advertising presentations are combined therewith." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010).

"registering at least one bingo card" — "Assigning each card an identify that will differentiate that card from all the others in play." The HomeBingo Network, Inc. v. Multimedia Games, Inc., 2006 U.S. Dist. LEXIS 93632 (N.D.N.Y., Dec. 28, 2006).
"registering use" — "refers to recording, indicating or making note of the amount of use of the shuffler. The claim term is not limited to the number of times the shuffler has completely shuffled a stack of cards as VendingData argues." *Shuffle Master, Inc. v. VendingData Corp., et al.,* 2004 U.S. Dist. LEXIS 27945 (D. Nev., Mar. 31, 2004).3623

"registry" — "in a 'registry database' [is] a collection of data that describes either (A) a registrant, an event, and the products and/or services that the registrant would like to acquire in celebration of the event; or (B) a registrant and a wishlist of products and/or services that the registrant would like to acquire." *WeddingChannel.com, Inc. v. Knot, Inc.,* 2005 U.S. Dist. LEXIS 991 (S.D.N.Y., Jan. 26, 2005).3624

[i] "regularly received television signal"; [ii] "radio frequency information"; [iii] "mixer" — [i] "video data that is customarily received by the television viewing public and not video-on-demand. The form of the television signal is irrelevant; it could be an analog signal, a digital signal, some combination of the two, or another format."; [ii] "the information received from the mixer, microcontroller, and/or a television station that is carried on or derived from a radio frequency signal."; [iii] "the electronics that receive the 'regularly received television signal' and a signal generated by the microcontroller, and that combine those two signals as instructed by the microcontroller. The mixer is not limited to any particular electronics because the claim language does not so limit the scope of the mixer." *SuperGuide Corp. v. DirecTV Enterprises, Inc.,* 358 F.3d 870 (Fed. Cir. 2004).3625 "In my view, the expert evidence briefly summarized above establishes that a person of ordinary skill in the art in 1985 would have read the critical claim term ([ii]) to mean only the analog television signals that were being regularly transmitted at the time, and not the later-developed, later-transmitted digital signals. I therefore cannot extend the literal scope of the claims to systems for receiving signal technology that was not then in use by the television industry, nor even conceived of and reduced to practice by these inventors, much less described and enabled in their '578 patent application filed in 1985." *Id.* (Michel, J., concurring).3626

"said second party control integrated circuit and said first party control integrated circuit regulate the transfer of the desired digital video or digital audio signals" — "the phrase 'regulate the transfer' is construed to mean that the first party and second party integrated circuits control the transfer of the digital signals, i.e., control the transmitting and receiving of such signals." *Sightsound.com Inc. v. N2K, Inc., et al.,* 185 F. Supp. 2d 445 (W.D. Pa. 2002).3627

"generating regulated voltage" — "mean[s] that claim 1's 'converter means' is designed to produce stabilized voltage at its output despite fluctuations in its input voltage." *Relume Corp. v. Dialight Corp., et al.,* 63 F. Supp. 2d 788 (E.D. Mich. 1999).3629
"related to" — "encompasses both a direct and indirect relationship, with the indirect relationship being limited to information that can be directly used in the computation of the various syringe properties without reference to some other source of information." Liebel-Flarsheim Co. v. Medrad Inc., 2002 U.S. Dist. LEXIS 4046 (S.D. Ohio, Feb. 19, 2002). 3630 "Because both the plain language of the claims and the prosecution history do not support a claim construction limiting the relationship between the physical indicia and the syringe properties to a direct relationship, the district court erred in so ruling." Id., 358 F.3d 898 (Fed. Cir. 2004).

"related to each fields of the second set of fields based on the selected fields" — "the predefined text area 'has text which is predefined on the basis of the contents of the second set of fields, which in turn are based on the fields selected from the first set of fields.'" Accenture Global Services GmbH, et al. v. Guidewire Software Inc., 2010 U.S. Dist. LEXIS 20087 (D. Del., Mar. 5, 2010).

"relates ... in a predetermined manner" — "prior to a transaction, ID information stored on the debit card and ID information stored on a terminal are capable of being matched." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).

"relating said at least one customer profile with the content profiles for the data available from each data source to the customer" — "establishing a logical connection between the customer profile and content profiles for the available data." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).

"relative movement" — "the Court finds that this term's ordinary and accustomed meaning controls, and no construction is necessary." Konami Corp. v. Roxor Games, Inc., et al., 445 F. Supp. 2d 725 (E.D. Tex. 2006).

"indicative of the relative position between the tool and the workpiece" — "must be construed to include systems that measure the location of the workpiece from some fixed point on the machine tool table." IMS Technology, Inc. v. Haas Automation, Inc., et al., 1998 U.S. Dist. LEXIS 22820 (E.D. Va., Sept. 23, 1998).

"relative to" — "denotes the concept of relative positioning as opposed to absolute positioning." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000).

"differentially thermally growing an oxide to serve as an implant mask having controlled thickness on both the top and sides of the gate electrode whereby a relatively thicker layer of oxide is developed on the top and sides of the gate electrode and a relatively thinner layer of oxide is developed on the intended source and drain regions of the substrate" — "Although we agree with EMI that the 1.77 to 1 ratio is not the only way of defining 'relatively thicker,' it was presented to the examiner, in distinguishing the Steinmaier reference, as a ratio below which differential thermal growth is not deemed to be achieved. It was not incorrect for the district court to construe the claims as requiring at least the relative thickness that was invoked to distinguish the '943 method from the prior art. In all events, it is clear that the oxide grown on top of the gate must be thick enough to serve as a mask for the gate during the implant step (d), for this was the basis on which EMI overcame the final rejection on the Cohen and Steinmaier references." EMI Group North America, Inc. v. Intel Corp., 157 F.3d 887 (Fed. Cir. 1998).
"relay having an operational position and a test position" — "a single relay with only an operational position and a test position, where 'operational position' and 'test position' have the meanings the court provided above." Koninklijke Philips Electronics, NV, et al. v. Defibtech LLC, et al., 2005 U.S. Dist. LEXIS 39859 (W.D. Wash., Dec. 21, 2005).

"relaying" — "nothing in the claim language requires or even suggests the use of pneumatically operated valves in performing the relaying step." Varco, L.P. v. Pason Systems USA Corp., 436 F.3d 1368 (Fed. Cir. 2006).

"said page server receiving said request and releasing said web server to process other requests" — "said page server receiving said request and said page server performing an act (separate from merely receiving the request) to free the web server to process other requests." EpicRealm, Licensing, LLC v. AutoFlex Leasing, Inc., et al., Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Aug. 15, 2006). "The Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court." Id., Nos. 2:05CV163, 2:05CV356 (E.D. Tex., Oct. 30, 2006).

"relieving the institution of the administrative burden of processing forms and payments" — "the described acts of the third party eliminate the administrative burden to the institution of processing forms and payments." CollegeNET, Inc. v. Xap Corp., 442 F. Supp. 2d 1036 (D. Or. 2006).

"remote"; "remotely" — "'separated by an interval or distance' with 'separated' meaning 'to be set or kept apart.'" Civix-DDI, LLC v. Cellco Partnership, 387 F. Supp. 2d 869 (N.D. Ill. 2005).

"remote command center" — "a dedicated location for monitoring and managing the care of hospitalized patients, which location is apart from the geographically dispersed ICUs." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009).

"remote link adapters"; "RLA devices" — "a device that has a unique address and includes a hybrid interface, a user interface, a microprocessor, and memory to detect data at a rate of 10 or more megabits per second." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).

"remote computer" — "a computer associated with a scribe that includes an information system that stores databases of information used to process jobs." Anthurium Solutions, Inc. v. Medquist, Inc., et al., 2009 U.S. Dist. LEXIS 9129 (E.D. Tex., Feb. 9, 2009).

"remote flight operations control center" — "a location, distinct from the airport base station, supporting a variety of airline operations including flight safety, flight operations, engineering, maintenance, passenger service, a system controller segment and FOQA workstations, where analysts can evaluate aircraft data files conveyed from the airport base station." Harris Corp. v. Federal Express Corp., 2010 U.S. Dist. LEXIS 3424 (M.D. Fla., Jan. 12, 2010).
"remote locations" — "positions or sites distant in space from some identified place or places.
"Positions or sites distant in space from the transmission system." Id., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006).

"remote payment card network"; "remote payment network" — "a third party processor that will process the transaction for a fee, providing connectivity to either the financial institution that issued the payment card number, or another payment card network that has the capability to connect with the financial institution that issued the payment card number." BMC Resources, Inc. v. Paymetech, L.P., 2004 U.S. Dist. LEXIS 22536 (N.D. Tex., Nov. 4, 2004).

"remote server" — "a computer system that provides services to other computers on a network and may be accessed by the central server over the network." WeddingChannel.com, Inc. v. Knot, Inc., 2005 U.S. Dist. LEXIS 991 (S.D.N.Y., Jan. 26, 2005).

"remote server assembly" — "a computer that is in a network usually shared by multiple users; it is separate from the user and local computer assembly, but is accessible to the user and the local processor assembly via an online connection." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).

"remote site(s)"; "remote locations" — "end-user locations, such as homes, offices, or schools, that have end-user equipment and a remote link adapter." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007).

"remote system controller" — "a computer or controller that checks the validity of logon commands and interfaces the local portion/computer unit with the remote computer unit to permit the local portion/computer unit to operate the remote computer unit, but excluding passive devices that merely forward data packets without regard for their content." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009).

"remote terminals" — "a device or instrument for connecting callers to the telephone network for voice and digital communication, including, but not limited to, conventional telephones." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).

"remote user" — "the remote user may either be a telecommuter or a road warrior, or may be a resident in a branch office, also referred to as a remote small office who accesses a corporate office from a physically distant location over a transmission media." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).

"remote vendor network site" — "the location of information regarding a particular vendor that is remote to the local user and that may include real vendor sites, real internet vendor sites, or virtual internet vendor sites, including sites that have no connection on the internet but have information loaded onto, accessible from and local to the database." Harrington v. Shop.com, et al., 2006 U.S. Dist. LEXIS 43660 (D. Colo., June 27, 2006). 3663

"remotely located" — "at a different location." Extreme Networks, Inc. v. Enterasys Networks, Inc., 2007 U.S. Dist. LEXIS 86568 (W.D. Wis., Nov. 21, 2007). 3665

"remotely-located" — "means that there are more than two stations that use different central processing units. Thus, two stations in the same physical room, each served by a different CPU, would be 'remotely located' while two stations in two different cities using a common CPU (wherever the CPU might be located) would not be." Hamilton v. ComWeb Technology Group, Inc., et al., 2003 U.S. Dist. LEXIS 27832 (D. Md., Nov. 13, 2003). 3666

"removed relationship" — "a relationship that causes the elements of the right-hand side of the relationship to be removed when all elements of the left-hand side are already included." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005). 3667

"removing a defective image element to produce a void at said particular position" — "eliminating a defective image element from the image to produce, at the specific position, a location with no image information." IP Innovation L.L.C., et al. v. Sony Electronics, Inc., 2005 U.S. Dist. LEXIS 17962 (N.D. Ill., Aug. 18, 2005). 3668

"removing added pulses occurring after normal sync pulses" — "removing one or more added pulses such as added AGC pulses and/or added pseudo-sync pulses." Macrovision Corp. v. Sima Products Corp., et al., 2006 U.S. Dist. LEXIS 75372 (S.D.N.Y., Oct. 12, 2006). 3669

"removing said fuse portion from said interconnect line by exposing said optically absorptive refractory metal to directed energy source that explosively removes said fuse portion without damaging the substrate" — "needs no clarification, as it is clear on its face." EMI Group North America, Inc. v. Cypress Semiconductor Corp., 68 F. Supp. 2d 421 (D. Del. 1999). 3670

"removing said outer guard ring and row and column intersections" — "physically disconnecting said guard ring and row and column interconnections." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010). 3671

"renderer" — "software and/or hardware object that performs at least the following functions: (1) determining and providing to another object the required coordinates in the terrain along with a respective resolution level; (2) receiving the data blocks corresponding to the specified coordinates; and (3) using the received data blocks to display a three-dimensional image." Skyline Software Systems, Inc. v. Keyhole, Inc., et al., 421 F. Supp. 2d 371 (D. Mass. 2006). 3672
"re-ordering packets from different conversations on said common link when the detected congestion exceeds a predetermined mild congestion threshold while maintaining the order of transmission for each conversation" — "arranging packets from different conversations and preparing them for transmission on the common link without affecting the sequencing of packets within such conversation when the number of packets queued on a common link exceeds a predetermined mild congestion threshold." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).\(^\text{3673}\)

"repetitive sequentially varying relationship" — "a video signal produced such that the ratio of video fields to film frames changes between different ratios within the video signal in a predetermined repetitive pattern." Faroudja Laboratories, Inc., et al. v. Dwin Electronics, Inc., 76 F. Supp. 2d 999 (N.D. Cal. 1999).\(^\text{3674}\)

[capable of] "replaying the recorded information upon demand" — "does not ... require that a covered device record upon demand." Howes, et al. v. Zircon Corp., 992 F. Supp. 957 (N.D. Ill. 1998).\(^\text{3675}\)

"image, replicating a control interface" — "a replica of the control panel/faceplates." Karl Storz Endoscopy-America, Inc. v. Smith & Nephew, Inc., 2010 U.S. Dist. LEXIS 85036 (W.D. Tenn., Aug. 18, 2010).\(^\text{3676}\)

"relying agent" — "an agent that performs a transfer operation with the bus owner." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).\(^\text{3677}\)

"report algorithm" — "a set of rules followed by the system to determine what data is to be extracted by the data gathering system and how that data is to be processed by the report processor in response to a report request." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).\(^\text{3678}\)

"report control means" — "In light of these statements and disclosures, which inextricably link the comparison of new requests against previously submitted requests with the asynchronous submission of requests to the OLAP, the district court did not err when it construed the requests handled by the report control means to be the asynchronously submitted requests mentioned in the preamble of the claim." Microstrategy Inc. v. Business Objects Americas, 2007 U.S. App. LEXIS 15100 (Fed. Cir., June 27, 2007).\(^\text{3679}\)

"report processor" — "The Court finds that the meaning of this term is clear in light of the surrounding claim language and the construction of 'reports' and 'report algorithm' and declines to construe 'report processor.'" Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).\(^\text{3680}\)

"report request"; "user request" — "the Court declines to construe th[ese] term[s]." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).\(^\text{3681}\)

"reports"; "presenting reports from the data" — "presenting calculated and solution-oriented results derived from data." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).\(^\text{3682}\)
"repositioning the spraying device relative to the conveying device to the relative synchronized position based upon the stored positions" — "moving the spraying device, the conveying device, or both to reestablish the correlation between the spraying device and the conveying device based upon the stored positions." Durr Systems, Inc v. Fanuc Ltd., et al., 463 F. Supp. 2d 663 (E.D. Mich. 2006).

"representation of an intra-oral radiograph holder" — "a representation or image of a dental film holder (a device for mounting two or more dental x-rays)." Board of Regents of the University of Texas System, et al. v. Eastman Kodak Co., et al., 2006 U.S. Dist. LEXIS 7997 (W.D. Tex., Jan. 26, 2006).

"representative" — "one that in some way symbolizes, represents, replaces, or is equivalent to something else." AT&T Corp. v. Microsoft Corp., 2003 U.S. Dist. LEXIS 10716 (S.D.N.Y., Jun. 23, 2003).

"having at least one representative child node represent a subset of the child nodes" — "at least one representative child node represents a subset of the child nodes located on the same level of the hierarchy." Cisco Systems, Inc., et al. v. Telcordia Technologies, Inc., 2007 U.S. Dist. LEXIS 58650 (E.D. Tex., Aug. 10, 2007).

"said data items include ordinary unresolved pointers, each one of said ordinary unresolved pointers representing a represented address of said addresses" — "'said addresses' refer to the addresses in memory commands specifying a location in memory means and 'represented address' is the address derived from the ordinary unresolved pointer." Data General Corp. v. International Business Machines Corp., 93 F. Supp. 2d 89 (D. Mass. 2000).

"representing" — "We agree ... that the ordinary meaning of 'representing' is broad enough to include 'symbolizing' or 'to stand for,' and that the '268 patent did not assign the term a narrower meaning. On the other hand, the statement that one item 'represents' another cannot be interpreted so broadly as to include any case in which the two items are related in some way. Rather, the first item must be directly related to and stand for, or be a reasonable proxy for, the latter item." Tehrani v. Hamilton Medical, Inc., et al., 331 F.3d 1355 (Fed. Cir. 2003).

"a width of said pulse representing a coordinate position of said joystick device" — "the width of the pulse, as assessed in time or distance, provides all the information necessary to determine a coordinate position of the joystick device." Fenner Investment, Ltd v. Microsoft Corp., et al., 632 F. Supp. 2d 627 (E.D. Tex. 2009).

"request" — "an act or instance of asking for something. In the context of misdirection, a request is made by the client computer." Ethos Technologies, Inc. v. RealNetworks, Inc., 462 F. Supp. 2d 131 (D. Mass. 2006).

"a request" — "a communication, message or directive that asks a remote computer for a response, including the download of electronic data. 'To request' is to send such a message." Network Commerce, Inc. v. Microsoft Corp., 260 F. Supp. 2d 1034 (W.D. Wash. 2002). 3695

"read request"; "write request"; "transaction request" — "a series of bits used to request a read of data from a memory device where the request identifies what type of read to perform"; "a series of bits used to request a write of data to a memory device"; "a series of bits used to request performance of a transaction with a memory device." Rambus Inc. v. Infineon Technologies AG, et al., 318 F.3d 1081 (Fed. Cir. 2003). 3696

"a request for access to the metadata" — "a request to access one or more metadata elements apart from a request for the image." FotoMedia Technologies, LLC v. AOL, LLC, et al., 2009 U.S. Dist. LEXIS 62542 (E.D. Tex., Jul. 21, 2009). 3697

[i] "read request"; [ii] "write request"; [iii] "transaction request" — [i] "a series of bits transmitted over the bus that contain multiplexed address and control information needed to request a read of data from a memory device"; [ii] "a series of bits transmitted over the bus that contain multiplexed address and control information needed to request a write of data to a memory device"; [iii] "a series of bits transmitted over the bus that contain multiplexed address and control information needed to perform a transaction over the bus with a memory device." Rambus Inc. v. Infineon Technologies AG, et al., 2001 U.S. Dist. LEXIS 10990 (E.D. Va., Mar. 15, 2001). 3699

"request for quotation"; "RFQ" — "a request for the price and other terms of a particular transaction in sufficient detail to constitute an offer capable of acceptance." Source Search Technologies, LLC v. Lending Tree, LLC, et al., 2006 U.S. Dist. LEXIS 79651 (D.N.J., Oct. 16, 2006). 3701

"request interface [that] receives requests for video programs made over the telephone network" — "the connection that permits data to be conveyed from the telephone network to the central processor." USA Video Technology Corp. v. Time Warner Cable, Inc., et al., 2007 U.S. Dist. LEXIS 92578 (E.D. Tex., Dec. 12, 2007). 3703
"request processor" — "hardware and associated software application of computer system that receives requests and determines a proposed reservation position in the virtual queue." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).3704

"request signal" — "a single electronic representation of a user's selection of at least one category and at least one geographic vicinity." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000) (emphasis in original).3705

"requested" — "programmed for retention in the subscriber's filter." Comcast Cable Communications Corp., LLC v. Finisar Corp., 2007 U.S. Dist. LEXIS 28994 (N.D. Cal., April 6, 2007).3706

"a requested time"; "a viewer-requested time" — "a specific time of day chosen and scheduled by the viewer where at the time the choice is made the viewer can choose from any time of day." In re: VTRAN Media Technologies, LLC, Patent Litigation, 2009 U.S. Dist. LEXIS 61328 (E.D. Pa., Jul. 17, 2009).3707

"requesting a response of approval or disapproval from the host data processor" — "requesting that the host data processor approve or disapprove a debit purchase transaction." Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010).3708

"requesting agent" — "an agent that has entered into the arbitration function for bus access." LG Electronics, Inc., et al. v. Bizcom Electroncs, Inc., et al., 453 F.3d 1364 (Fed. Cir. 2006).3709

"requesting agent" — "an agent that has entered arbitration for bus access, where arbitration is the process by which agents attempt to gain exclusive access to the parallel system bus." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).3710

"required data" — "all data necessary to create a spreadsheet that is not contained in the cache." Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F. Supp. 2d 760 (E.D. Tex. 2006).3711

"requires choice relationship" — "a relationship in which a number of elements must be chosen from a second set of elements on the right-hand side of the relationship when all elements of the left-hand side are already included." Trilogy Software, Inc. v. Selectica, Inc., 405 F. Supp. 2d 731 (E.D. Tex. 2005).3713

"requiring a seller to establish a seller's account, the seller's account being based at least on the seller's identity and a financial instrument associated with the seller" — "a seller's account must be established based at least on the seller's identity and a financial instrument associated with the seller." MercExchange, L.L.C. v. eBay, Inc., 401 F.3d 1323 (Fed. Cir. 2005).3714

"requiring assistance from a human operator" — "requiring that a manual reviewer review the electronic message or information derived from the electronic message, or review, revise or compose the response to be delivered to the source." Bright Response, LLC v. Google Inc., et al., 2010 U.S. Dist. LEXIS 60361 (E.D. Tex., Jun. 18, 2010).3715

"reservation request" — "a data message that initiates the processing of a reservation that includes at least a patron or PCD identification." *PalmTop Productions, Inc. v. LO-Q PLC, et al.*, 450 F. Supp. 2d 1344 (N.D. Ga. 2006).\(^{3717}\)

"reservation request generator" — "a device or process that adds to a message a request for additional time slots." *Rembrandt Technologies, L.P. v. Comcast Corp., et al.*, 512 F. Supp. 2d 749 (E.D. Tex. 2007).\(^{3718}\)

"reservation request processor" — "a device or process for receiving and processing requests for additional time slots from a reservation request generator." *Rembrandt Technologies, L.P. v. Comcast Corp., et al.*, 512 F. Supp. 2d 749 (E.D. Tex. 2007).\(^{3719}\)

"reserving a portion of transmission bandwidth available for said transmitting step for transmitting portions of said information database requested by subscribers" — 
"'Transmission bandwidth' is 'reserved' by setting aside part of the transmission capacity for transmitting portions of the information database that are requested by subscribers." *Finisar Corp. v. Directv Group, Inc., et al.*, 416 F. Supp. 2d 512 (E.D. Tex. 2006).\(^{3720}\)

"reset lock-out" — "We are not persuaded. Leviton's argument is essentially that the district court's construction requires 'or' to be replaced with 'and.'" *Shanghai Meihao Electric, Inc. v. Leviton Manufacturing Co., Inc., et al.*, 2007 U.S. App. LEXIS 736 (Fed. Cir., Jan. 10, 2007) (unpublished).\(^{3721}\)

"deactivating said generator only upon expiration of said predetermined time period or in response to a reset signal" — "the power on reset signal." *Agrizap, Inc. v. Woodstream Corp., et al.*, 431 F. Supp. 2d 518 (E.D. Pa. 2006).\(^{3723}\)

"resetting said CIRC decoder" — "restoring the CIRC decoder to a state at which it is ready to receive a data frame." *Matsushita Electric Industrial Co., Ltd. v. Mediatek, Inc., et al.*, 2006 U.S. Dist. LEXIS 84399 (N.D. Cal., Nov. 9, 2006).\(^{3724}\)

"resign message" — "a message, sent by the active router to inform other routers that the active router will be resigning from its status as active router, which is unicast by the active router in response to the active router's receipt of a coup message, and is otherwise broadcast." *Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc.*, 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).\(^{3725}\)

"resistance" — "a circuit component that has a specified resistance to the flow of electric current and is used to minimize the current surge from an electrostatic discharge." *LG Display Co., Ltd. v. AU Optronics Corp., et al.*, 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010).\(^{3726}\)

"resistance" — "a circuit component that has a specified resistance to the flow of electric current and is used to minimize the current surge from an electrostatic discharge." *L.G. Philips LCD Co., Ltd. v. Tatung Co., et al.*, 434 F. Supp. 2d 292 (D. Del. 2006).\(^{3727}\)

"resistive component" — "a resistance in an integrated circuit that arises due to the nature or layout of the other materials used to implement the other elements of the integrated circuit." OKI America, Inc., et al. v. Advanced Micro Devices, Inc., 2006 U.S. Dist. LEXIS 15254 (N.D. Cal., Feb. 14, 2006).3729

"a resistive switch coupled between said high voltage electrode and said reference electrode, said resistive switch further comprising a trigger circuit having a trigger output and an arm/disarm input" — "a switch that is physically connected across the electrodes. The switch includes a distinct trigger circuit with a trigger output and an arm/disarm input." Agrizap, Inc. v. Woodstream Corp., et al., 431 F. Supp. 2d 518 (E.D. Pa. 2006).3730

"resistor(s)" — "component(s) of an electric circuit used to offer resistance to the flow of an electric current." Raytheon Co. v. Indigo Systems Corp., 2010 U.S. Dist. LEXIS 3530 (E.D. Tex., Jan. 18, 2010).3732

"resizing" — "changing the size (height/width) of the video." MedioStream, Inc. v. Microsoft Corp., et al., 2010 U.S. Dist. LEXIS 88716 (E.D. Tex., Aug. 27, 2010).3733

"resolution" — "the fineness of an image, as measured by the number of image elements or pixels making up the image." Crystal Image Technology, Inc. v. Mitsubishi Electric Corp., 2010 U.S. Dist. LEXIS 48290 (W.D. Pa., May 15, 2010).3735

"the alphanumeric string is resolved without reference to a filename for the given object" — "the alphanumeric string is translated into an IP address without reference to the name of the object." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007).3738

"each data storage unit storing in parallel a respective one of said multi-bit data portions for each data word" — "The patent claim specifies that each data storage unit stores 'a respective one' multi-bit word portion. 'A respective one' means exactly one, no more and no less. That means there must be an equal number of data storage units and multi-bit word portions in a system covered by the '979 patent." TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999).\textsuperscript{3740}

"respectively" — "requires a one-to-one relationship." Mars, Inc., et al. v. Coin Acceptors, Inc., 2007 U.S. Dist. LEXIS 34436 (D.N.J., May 9, 2007).\textsuperscript{3741}

"responding to the first indicating signal when said one of said first plurality of bus masters is reading data by placing the generated second address and SNOOP signal on the second bus" — "responding to the indicating signal from the first bus when one of the bus masters connected to the first bus is reading data by placing the generated second address and SNOOP signal on the second bus." Computer Cache Coherency Corp. v. Via Technologies, Inc., 2007 U.S. Dist. LEXIS 81121 (N.D. Cal., Oct. 22, 2007).\textsuperscript{3743}

"in response to step b), redisplaying all data fields not having an item selected therefrom with data related only to the at least one item selected in step b)" — "The patent does not address the timing of the redisplay of data fields in response to the selection of an item, either in the claims or the written description. Contois has therefore not persuaded the Court to add 'automatically' or 'immediately' to the plain meaning of the words at issue. The phrase is construed as 'in response to the step b) selection, redisplaying all data fields not having a selected item with data related only to the selected item(s)." Contois Music Technology, LLC v. Apple Computer, Inc., 2006 U.S. Dist. LEXIS 50822 (D. Vt., July 24, 2006).\textsuperscript{3744}

"first response unit means" — "is not subject to means plus function analysis." Katz, et al. v. AT&T Corp., et al., 63 F. Supp. 2d 583 (E.D. Pa. 1999).\textsuperscript{3745}

"responsive to" — "based on." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).\textsuperscript{3746}

"responsive to" — "in response to." Board of Regents of the University of Texas System, et al. v. Eastman Kodak Co., et al., 2006 U.S. Dist. LEXIS 7997 (W.D. Tex., Jan. 26, 2006).\textsuperscript{3747}

"responsive to a potential of" — "Because Hynix's construction is flawed and Hynix has not provided any reason why this seemingly simple term must be construed, the court declines to construe 'responsive to a potential of.'" Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006).\textsuperscript{3748}

"[issuing a] command ... responsive to a predetermined event" — "issuing a command in reply or reaction to the occurrence of one or more conditions chosen in advance." IGT v. Bally Gaming International Inc., et al., 610 F. Supp. 2d 288 (D. Del. 2009).\textsuperscript{3749}
"selectively adding a current to [a signal] wherein the amount and/or polarity of said current is responsive to [another signal] ..." — "is sufficiently clear as it stands, and that is the construction it will be given. ... TLC is correct that a method that adds a current in a fixed amount would not infringe this claim." Technology Licensing Corp. v. Gennum Corp., 2007 U.S. Dist. LEXIS 35521 (N.D. Cal., May 4, 2007).3750

"responsive to the rate of inflation"; "as a function of a rate of inflation"; "based on a rate of inflation" — "The Board did not err in concluding that the broadest reasonable interpretation of the term 'responsive to the rate of inflation' (and related terms) is not limited to a continuous, one-to-one relationship but also includes a delayed relationship, in which adjustments are made in one percent increments." In re Trans Texas Holdings Corp., 498 F.3d 1290 (Fed. Cir. 2007).3751

"image data resulting from a number of previous processing operation[s] during the stroke" — "cannot be image data precisely as it existed before the initial processing operation because such data is modified during the processing operation. This construction does not exclude the possibility that some of the original image data may be part of the 'image data resulting from a number of previous processing operation[s] during the stroke.'" Quantel Ltd. v. Adobe Systems Inc., 1997 U.S. Dist. LEXIS 16918 (D. Del., Aug. 1, 1997).3754

"reticle image"; "reticle pattern" — "one of a series of lines, dots or crosshairs, capable of serving as a reference for centering or otherwise adjusting an optical element in a telescope." Lasermax, Inc. v. Glatter, 2005 U.S. Dist. LEXIS 17136 (S.D.N.Y., Aug. 17, 2005).3756

"retrieving via the terminal" — "locating and returning, by means of the terminal, ID information and a card number stored on the debit card." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).3758

"return electrode" — "an electrode having a larger area of contact than an active electrode, thus affording a lower current density." Arthrocare Corp. v. Smith & Nephew, Inc., 2003 U.S. Dist. LEXIS 5976 (D. Del., Apr. 9, 2003).3759

"reverses at least one of the magnetization directions" — "mean[s] a turning or change of the magnetization direction of at least one of the electrodes or film layers, towards an opposing alignment, to such a degree as necessary to achieve at least a 10% change in resistance." *Magsil Corp., et al. v. Seagate Technology, et al.*, 2010 U.S. Dist. LEXIS 18086 (D. Del., Mar. 1, 2010). \[3763\]

"revision selection list" — "a list of revised publications from which individual revisions to publications can be selected." *Aircraft Technical Publishers vs. Avantext, Inc.*, 2009 U.S. Dist. LEXIS 105623 (N.D. Cal., Nov. 10, 2009). \[3764\]

"rise time" — "the time it takes a signal to rise to substantially its final steady value." *Sun Microsystems, Inc. v. Dataram Corp.*, 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997). \[3767\]

"roaming terminal/device" — "a terminal/device that is free from cable connections and designed to be able to be moved while receiving or transmitting signals." *Agere Systems, Inc. v. Broadcom Corp.*, 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004). \[3769\]

"rolling spot system"; "rolling spot future trade system" — "the term will be construed in accordance with how CME's Rolling Spot Currency contracts were defined at the effective filing date of the patent application." *Chicago Mercantile Exchange, Inc., et al. v. Technology Research Group, LLC*, 2010 U.S. Dist. LEXIS 65002 (N.D. Ill., Jun. 28, 2010). \[3771\]

"root bus controller" — "the bus controller at the highest order position of the binary tree computer system that connects the binary tree to the host computer and which has no parent bus controller." *Fifth Generation Computer Corp. v. International Business Machines Corp.*, 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010). \[3772\]

"rotating" — "is to be given its ordinary meaning. ... therefore ... the ITC was correct in interpreting the term 'rotating' to mean merely a phase shift in the desired waveform." Enercon GmbH, et al. v. International Trade Commission, 151 F.3d 1376 (Fed. Cir. 1998).

"rotating the reference waveform" — "the ITC was correct in interpreting the term 'rotating' to mean merely a phase shift in the desired waveform." Enercon GmbH, et al. v. International Trade Commission, et al., 151 F.3d 1376 (Fed. Cir. 1998).

"route" — "a course or pathway that is capable of changing based on received transportation requests." IAP Intermodal, L.L.C. v. Northwest Airlines Corp., et al., 2005 U.S. Dist. LEXIS 46838 (E.D. Tex., Sep. 7, 2005).

"the router will attempt to become the active router"; "the physical router will attempt to become the active router"; "the ability to issue coup messages can be disabled at least temporarily"; "disable, at least temporarily, the router's ability to issue a coup message" — "these terms are plain on their face and do not require additional construction." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).

"routes" — "to choose an appropriate destination from two or more possibilities and to direct based on that choice." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).

"routine" — "Plaintiff maintains that it means 'software instructions or algorithm.' Defendant defines it as 'a set of procedures or programmed instructions.' The term is not defined in the specification. However it is clear from the claim language itself that it means 'a set of procedures for providing route guidance' and I construe it in this manner." Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006).

"accepting said request for a contribution data packet at said remote contribution accepting devices by way of a routine, said remote contributions accepting devices utilizing a routine for accepting at least one contribution" — "A 'routine' is a computer program or a portion of a computer program designed to accomplish a defined task. In this case, the contribution data packet is accepted by the physically separated contribution-accepting devices, using a routine which allows it to accept information representing one or more contributions." Ziarno v. American National Red Cross, et al., 2000 U.S. Dist. LEXIS 22508 (N.D. Ill., Aug. 16, 2000). 3785

"routing" — "sending or forwarding by a particular route." DealerTrack v. Huber, et al., No. 06-CV-02335 (C.D. Cal., Sept. 27, 2008). 3786

"routing" — "(1) specifying the path for a subscriber's incoming message according to a characteristic of the incoming message; and (2) transmitting the incoming message on the specified path." Lottotron, Inc. v. Scientific Games Corp., 2003 U.S. Dist. LEXIS 15507 (S.D.N.Y., Sept. 8, 2003). 3787

"routing information" — "information indicating the next physical media path (as construed herein) for the data packet to take." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006). 3788

"routing such stream to one or more users" — "the disputed language in the claim needs no construction." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007). 3789

"a set of cell selection rules" — "a set of rules embodying the expert knowledge of highly skilled VLSI designers, each rule having an antecedent portion (e.g., IF) and a consequent portion (e.g. THEN)." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005). 3793

"run-time executor" — "a software program invoked during execution of a data collection application to manage the various tasks involved in executing the data collection application." Typhoon Touch Technologies, Inc., et al. v. Dell, Inc., et al., 2009 U.S. Dist. LEXIS 64013 (E.D. Tex., Jul. 23, 2009). 3794

"running time" — "the period of time during which a program is being executed." Bed-Check Corp. v. Ultimate Safety, Inc., 2003 U.S. Dist. LEXIS 27845 (N.D. Okla., Nov. 24, 2003). 3795
"safety switch mechanism ... for connecting a pre-qualified release of a defibrillation shock to patient electrode terminals" — "the safety switch does not close until after the processor receives the defibrillation shock release request and pre-qualifies release of the defibrillation shock." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006). 3796

"safety switch mechanism ... separately responsive to the defibrillation shock release request signal" — "the safety switch responds to the signal from the rescue/trigger switch without input from the monitoring and analysis circuit." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006). 3797

"said"; "the" — "Where subsequent uses of a claim term within a claim make reference to the first usage as an antecedent (through the use of introductory definite articles such as 'said' or 'the'), the claim term must be interpreted consistently across all such uses." Microprocessor Enhancement Corp., et al. v. Texas Instruments Inc., 2007 U.S. Dist. LEXIS 23768 (C.D. Cal., Feb. 8, 2007). 3798

"a system for minimizing the storage ... requirements of digital representation of analog signals comprising a means for converting an analog signal to said digital representation ... first means for detecting the complete absence of said analog signal, second means for detecting the duration of said absence of said analog signal ..." — "'Said analog signal' refers only to 'analog signal.' The district court was correct that ... the first and second detecting means as operate[ ] only on analog input signals." Moll v. Northern Telecom Inc., 1997 U.S. App. LEXIS 17607 (Fed. Cir., Jul. 15, 1997) (unpublished). 3799

"said assembled data" — "refers to an entire Sector of CD-ROM data as it is stored in random access memory." Oak Technology, Inc. v. International Trade Commission, et al., 248 F.3d 1316 (Fed. Cir. 2001). 3801

"storing a plurality of covers for books to be printed in said computer" — "does not require that the covers be stored in the same computer as the text of the books to be printed." On Demand Machine Corp. v. Ingram Industries, Inc., et al., 2003 U.S. Dist. LEXIS 27127 (E.D. Mo., Jul. 8, 2003). 3802

"said http server" — "the same http server that received the request from the http client." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009). 3803

"taking a first reflectance reading from a dry first surface of said porous matrix" — "The district court held that the claims can not be literally infringed when the dry reflectance reading is not taken from the same test strip that is used in the test, but is measured in advance at the factory. We conclude that the district court correctly interpreted the claims." Lifescan, Inc. v. Home Diagnostics, Inc., 76 F.3d 358 (Fed. Cir. 1996). 3805
"a memory for storing characteristic signal samples produced by scanning said preselected segments of bills of different denominations with said scanning head" — "the characteristic signal samples must be produced and stored by the specific scanning head that is present in the device." Cummins-Allison Corp. v. Glory, Ltd., et al., 457 F. Supp. 2d 843 (N.D. Ill. 2006).

"said uppermost surface of said at least one insulating layer" — "requires formation of the second gate electrodes between the first gate electrodes on the upper surface of the same continuous insulation layer upon which the first gate electrodes were formed." Loral Fairchild Corp. v. Victor Co. of Japan, Ltd., et al., 906 F. Supp. 798 (E.D.N.Y. 1995).

"said zinc anode" — "Neither the Commission nor the Intervenors argued that they did not understand the intended scope because of the absence of an antecedent. The Commission erred in holding that the need to construe a claim, or the proffer of alternative constructions, renders the claim indefinite." Energizer Holdings, Inc., et al. v. International Trade Commission, et al., 435 F.3d 1366 (Fed. Cir. 2006).

"sale calendar module which allows the user to search the auction data and to display on the video monitors at the workstations a list of one or more auctions by date, by location, and by vehicle sale type" — "a portion of a program which performs the particular tasks of allowing the user to query a motor vehicle auction database for auctions matching a user-selected parameter, wherein the parameters available to the user must include date, location, and vehicle sale type, and displaying the results of that search on the video monitors at the user workstations." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).

"sale catalog review routine" — "a portion of a program that performs the particular task of allowing the user to search the auction data and display on the user workstation information about minute and distinct aspects of the vehicle, where such information may include options, status, dates, charges, notes, and condition information." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007).

"sales information" — "We agree with the defendants that 'sales information' requires that promotional information is stored in the computer that is made available to the customer. The ISBN or the title and author are file identifiers, not promotional information. The jury instruction, if read to mean that identifying information alone can satisfy the 'sales information' term, is incorrect." On Demand Machine Corp. v. Ingram Industries, Inc., et al., 442 F.3d 1331 (Fed. Cir. 2006).

"sample well" — "a container or reservoir for the sample." Roche Diagnostics Corp., et al. v. Apex Biotechnology Corp., et al., 455 F. Supp. 2d 840 (S.D. Ind. 2005).

"saturation" — "the state in which the ratio of collector-current to base-current is forced lower by excess base current." Linear Technology Corp. v. Micrel, Inc., 2006 U.S. Dist. LEXIS 96860 (N.D. Cal., June 9, 2006).
"in saturation" — "the working of the covered invention consistently at a state of forced current gain." Linear Technology Corp. v. Micrel, Inc., 2006 U.S. Dist. LEXIS 96860 (N.D. Cal., June 9, 2006). 3816

"price being ... scaled to the performance of the buyer" — "price being adjusted by a ratio, table, or algorithm, wherein a lower price always corresponds to a better performance or better performance level in the PDA and a higher price always corresponds to a worse performance or worse performance level in the PDA." Performance Pricing, Inc. v. Google Inc., et al., 2009 U.S. Dist. LEXIS 71264 (E.D. Tex., Aug. 13, 2009). 3817

"scanner" — "The district court concluded that the scanner must have 'relative movement between the scanning element and the object being scanned.' We agree." Massachusetts Institute of Technology v. Abacus Software, et al., 462 F.3d 1344 (Fed. Cir. 2006). 3819 "The district court also concluded that the 'scanner' ... must involve placing the 'color original ... on or in close proximity to the scanner.' We conclude that the term scanner in 1982 should be construed to include a requirement of close proximity." Id. 3820

"image document scanner"; "document image scanner" — "The document image scanner includes, but is not limited to, optical readers, commercial imaging scanners, and all or part of conventional ballot readers, (excluding non-imaging conventional ballot readers which employ sensors positioned on a fixed grid pattern) conventional office equipment such as copiers, scanners, facsimile (fax) machines, and other commercial imaging and/or scanning devices, and the like." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007). 3821

"scanning a symbol comprising of a data field of information data cells and orientation means for indicating an orientation of the field" — "scanning a symbol." Cognex Corp. v. VCode Holdings, Inc., et al., 2007 U.S. Dist. LEXIS 75364 (D. Minn., Oct. 9, 2007). 3822

"scanning process" — "the process by which the bar code is read." BarTex Research, LLC v. FedEx Corp., et al., 2009 U.S. Dist. LEXIS 117609 (E.D. Tex., Dec. 14, 2009). 3823

"scanning the surface of the workpiece" — "mean[s] that the entire surface of the workpiece is inspected through relative motion of the incident beam of P-polarized light and/or the workpiece being inspected." ADE Corp. v. KLA-Tencor Corp., 220 F. Supp. 2d 303 (D. Del. 2002). 3824

"groups of software scheduled instructions"; "sets of software scheduled instructions" — "sets of one or more instructions that have been identified by software as being capable of being processed in parallel." Intergraph Corp. v. Intel Corp., 2002 U.S. Dist. LEXIS 27117 (E.D. Tex., Jun. 3, 2002). 3825
"each subscriber station calling at a scheduled time a rate provider having billing rate parameters for each calling station, wherein the scheduled time for each call is such that the calls from each calling station are substantially spaced apart from each other" — "encompass[es] a method in which the time for calling the rate provider is determined and planned in such a way as to ensure that there are substantial intervals of time between each call received by the rate provider from all users." Mediacom Corp. v. Rates Technology, Inc., 4 F. Supp. 2d 17 (D. Mass. 1998). 3826

"scheduling" — "is entitled to its ordinary meaning and needs no construction." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). 3827

"scrambling transmitter" — "a transmitter that includes a scrambling circuit." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). 3829

"scroll sequence" — "refers to one or more channel tuning designations, which are retained in the memory means." Beery v. Thomson Consumer Electronics, Inc., et al., 2004 U.S. Dist. LEXIS 17173 (S.D. Ohio, Aug. 18, 2004). 3832

"scrolling" — "moving viewable element from a first displayed location to a second displayed location in a continuous manner." Konami Corp. v. Roxor Games, Inc., et al., 445 F. Supp. 2d 725 (E.D. Tex. 2006). 3833

"sealing structure" — "a structure, made after the second substrate is laid on the first, which may help to contain the liquid crystal material within the cavity between the two substrates or to keep impurities out." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 13243 (N.D. Cal., March 27, 2006). 3834

"to perform a search" — "any examination of the program listings stored in RAM to find those that meet a user's search criteria." SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870 (Fed. Cir. 2004). 3835

"second circuit"; "third circuit" — "We agree with the Commission's construction of 'second circuit' and 'third circuit,' defining the terms broadly to not require entirely separate and distinct circuits." Linear Technology Corp. v. International Trade Commission, et al., 566 F.3d 1049 (Fed. Cir. 2009). 3838

"a second control signal … to cause both transistors to be OFF" — "requir[es] the second control signal to neither directly cause both transistors to be OFF nor be entirely distinct from the first control signal." Linear Technology Corp. v. International Trade Commission, et al., 566 F.3d 1049 (Fed. Cir. 2009). 3839

"second information indicative of said total traffic load constituted by communication packets belonging to communications handled by the switching module" — "information indicative of the accumulated traffic load for all of the communications flowing through at least one output of the switching module." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 3840

"a second memory associated with the scanhead and outside of the console and communicating with the console through a second connector, the second memory storing software and data necessary for use of the transducer scanhead in the ultrasound diagnostic instrument"; "the second memory storing software and data necessary for the use of the transducer scanhead in the ultrasound diagnostic instrument" — "Because I conclude that both parties have failed to propose an appropriate construction, I will decline to construe [these terms]." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008). 3841

"second portion of the dose" — "that portion of the dose which is diffused after the first portion." IXYS Corp. v. Advanced Power Technology, Inc., 301 F. Supp. 2d 1065 (N.D. Cal. 2004). 3842

"second telecommunications network" — "a telecommunications network over which the switch system at the local cable headend receives from a remote control center the commercial insert video signal and the switch commands, and, in the '825 Patent, the insert locator data. Additionally, it would be understood that the second telecommunications network is distinct from the 'first telecommunications network,' over which is sent the programmed channel signal." Beam Laser Systems, Inc. v. Cox Communications, Inc., et al., 144 F. Supp. 2d 475 (E.D. Va. 2001). 3843

"secondary power source" — "the Court construes the claim as requiring the secondary source to be physically separate." Network-1 Security Solutions, Inc. v. D-Link Corp., et al., 2006 U.S. Dist. LEXIS 84510 (E.D. Tex., Nov. 20, 2006). 3844 "[T]he Court adopts its previous construction in the D-Link case and Defendants' construction and construes the term 'secondary power source' to mean 'a source of power connected to provide power between the data node and the access device using the data signaling pair. The secondary power source is physically separate from the main power source.'" Network-1 Security Solutions, Inc. v. Cisco Systems, Inc., et al., 2010 U.S. Dist. LEXIS 12938 (E.D. Tex., Feb. 16, 2010). 3845

"secret key of the credential issuing entity" — "a key that is known only to the credential issuing entity and those intended to know it and that exists beyond the duration of a particular transaction." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003). 3847

"secret key of the first party" — "a key that is known only to the first party and those intended to know it and that exists beyond the duration of a particular transaction." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003). 3848

"secret key of the originator" — "a key that is known only to the originator and those intended to know it and that exists beyond the duration of a particular transaction." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003). 3849

"secret key of the payor" — "a key that is known only to the payor and those intended to know it and that exists beyond the duration of a particular transaction." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003). 3850

"secret state" — "one or more parameters, the attributes, conditions or values of which are secret, which are stored in computer-readable memory of the device." Cryptography Research, Inc. v. Visa International Service Association, et al., 2007 U.S. Dist. LEXIS 76502 (N.D. Cal., Sept. 28, 2007). 3851

"a precision timing section coupled to said laser transmit section and said laser receive section for determining a flight time of said laser pulses to said target and said reflected laser pulses from said target ... based upon a flight time of a pulse" — "recites sufficiently definite structure to resist application of 112 P 6." Laser Technology, Inc. v. Nikon, Inc., et al., 215 F. Supp. 2d 1135 (D. Colo. 2002). 3852

"sector" — "the basic unit of erase." Sandisk Corp. v. Memorex Products, Inc., et al., 2007 U.S. Dist. LEXIS 15393 (N.D. Cal., Feb. 21, 2007). 3853

"sector" — "a subdivision or subsection, which may or may not relate to a particular industry." American Stock Exchange, LLC, v. Mopex, Inc., 250 F. Supp. 2d 323 (S.D.N.Y. 2003). 3855

"secure access" — "the ability to gain entry to and make authorized use of, such that unauthorized entry and use is prevented." Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al., 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006). 3856

"secure computer network address" — "a network address that requires authorization for access and is associated with a computer capable of virtual private network communications." VirnetX, Inc. v. Microsoft Corp., 2009 U.S. Dist. LEXIS 65667 (E.D. Tex., Jul. 30, 2009). 3857

"secure domain name" — "a domain name that corresponds to a secure computer network address." VirnetX, Inc. v. Microsoft Corp., 2009 U.S. Dist. LEXIS 65667 (E.D. Tex., Jul. 30, 2009). 3858
"secure domain name service" — "a lookup service that returns a secure network address for a requested secure domain name." *VirnetX, Inc. v. Microsoft Corp.*, 2009 U.S. Dist. LEXIS 65667 (E.D. Tex., Jul. 30, 2009). 3860

[i] "secure hash operation"; [ii] "secure hash algorithm"; [iii] "secure hash computer program" — [i] "a deterministic operation that produces a fixed output bit length regardless of input bit length such that it is practically impossible to determine (a) the input from the output, and (b) two inputs that produce the same output and where if a single bit of the input is changed, on average at least approximately 50% of the output bits are changed"; [ii] "an algorithm that implements a secure hash operation"; [iii] "a computer program that implements a secure hash operation." *PACid Group, LLC v. Apple, Inc., et al.*, 2010 U.S. Dist. LEXIS 70997 (E.D. Tex., Jul. 15, 2010).

"secure web site" — "a web site that requires authorization for access and that can communicate in a VPN." *VirnetX, Inc. v. Microsoft Corp.*, 2009 U.S. Dist. LEXIS 65667 (E.D. Tex., Jul. 30, 2009). 3862

"security indicia" — "a mark printed on a document that can be used to verify the authenticity of the document." *Kara Technology Inc. v. Stamps.com Inc.*, 582 F.3d 1341 (Fed. Cir. 2009). 3863

"security measures" — "measures taken to preclude the generation of drafts payable to someone other than the payee, including at least coded embedding of the payee identification information." *Intell-a-Check Corp. v. Autoscribe Corp., et al.*, 346 F. Supp. 2d 698 (D.N.J. 2004). 3864

"security module" — "a module that performs the task of preventing unauthorized access to data, including encryption, authentication or firewall components." *Square D Co., et al. v. E.I. Electronics, Inc.*, 2010 U.S. Dist. LEXIS 11204 (N.D. Ill., Feb. 9, 2010). 3865

"select" — "the plain language of the claim when read in light of the specification is clear that the term 'select' does not merely require a 'preference' for certain signals. Signals are to be specifically chosen based on whether or not they pass through irregularities in the container." *National Recovery Technologies, Inc. v. Magnetic Separation Systems, Inc., et al.*, 166 F.3d 1190 (Fed. Cir. 1999). 3866

"selectable categorical information" — "information related to a type of music that can be used to select individual tracks of music." *Sandisk Corp. v. LSI Corp.*, 2010 U.S. Dist. LEXIS 24973 (N.D. Cal., Mar. 17, 2010). 3868

"selected" — "the Court finds that the term 'selected' is used in accordance with its plain and ordinary meaning and requires no construction." *Agere Systems, Inc. v. Broadcom Corp.*, 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004). 3870
"selected computer resources of at least a first server computer" — "computer services, applications, or content that can be accessed by (either directly or indirectly) said first server computer." Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007). 3871

"selected content"; "selected displayed content" — "this term can be easily understood by a jury and [] no construction is necessary." Aloft Media, LLC v. Yahoo!, Inc., et al., 2009 U.S. Dist. LEXIS 59599 (E.D. Tex., Jul. 13, 2009). 3872

"selected from a group of ID information" — "chosen from one of the following ID information." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007). 3873

"at selected higher and lower pressure magnitudes" — "at a higher pressure magnitude and a lower pressure magnitude that have been chosen prior to operation of the computer circuitry that is used to determine whether the patient is inhaling or exhaling." Respironics, Inc. v. Invacare Corp., 2006 U.S. Dist. LEXIS 62233 (W.D. Pa., Aug. 30, 2006). 3874

"selecting" — "In sum, claim 14 does not suggest that the selecting step requires a two-part manual process as interpreted by the district court. Moreover, the specification and prosecution history confirm that the two-part manual process relied upon by the district court is distinct from the claimed selecting step. Thus, the district court's interpretation of the selecting step was unduly narrow." Varco, L.P. v. Pason Systems USA Corp., 436 F.3d 1368 (Fed. Cir. 2006). 3878

"selecting" — "includes selecting all lines simultaneously." Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210 (N.D. Cal. 1998). 3879

"selecting" — "the meaning of 'selecting' in claims 40 and 67 is identical to that of 'sorting' in claims 1, 19, 87, and 93." Clintec Nutrition Co., et al. v. Baxa Corp., 988 F. Supp. 1109 (N.D. Ill. 1997). 3880

"selecting a floor broker to whom a further instruction is to be transmitted" — "the operator selects, based on the displayed current status information and number of unfilled orders calculated above using current status information, the identity of a floor broker to whom a further instruction is to be transmitted." Papyrus Technology Corp. v. New York Stock Exchange, Inc., 581 F. Supp. 2d 502 (S.D.N.Y. 2008) 3881
"responsive to a DNS query, selecting a given one of the name servers in the content delivery network"; "responsive to a DNS query received from a client local name server, selecting a given one of the name servers in the content delivery network" — "in response to a DNS query, the content delivery network's domain name system selects a particular name server"; "in response to a DNS query received from a client local name server, the content delivery network's domain name system selects a particular name server." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007). 3882

"selecting a timing parameter from a plurality of predetermined timing parameters in response to said timing control bit" — "no further construction is required because the phrase may be understood according to its plain and ordinary meaning." Juniper Networks, Inc. v. Toshiba America, Inc., 2007 U.S. Dist. LEXIS 29660 (E.D. Tex., April 23, 2007). 3886

"selecting an item from the table" — "a choice made by the customer and then input into the computer by the salesperson, or possibly by the customer in the case of an on-line purchase." Grantley Patent Holdings, Ltd. v. Clear Channel Communications, Inc., et. al., 2008 U.S. Dist. LEXIS 1588 (E.D. Tex., Jan. 8, 2008). 3887

"selecting at least one mode of operation of the implantable heart stimulator which operation includes a unique sequence of events corresponding to said determined condition" — "involves matching the currently determined heart condition to the unique set of instructions that have been programmed to treat the detected condition. The treatment operation selected by the device is determined exclusively by the currently determined condition of the heart." Cardiac Pacemakers, Inc., et al. v. St. Jude Medical, Inc., et al., 2000 U.S. Dist. LEXIS 17352 (S.D. Ind., Nov. 29, 2000). 3888

"selecting from said stored data for each of the specified definitions a corresponding integrated circuit hardware cell" — "mapping the specified stored function to a corresponding stored hardware cell." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005). 3889

"selecting the number of game credits to be associated with a deposit of one coin for each of the different coin types" — "does not require construction." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007). 3890

"selecting the total number of currency units to be associated with each coin type" — "does not require additional interpretation." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007). 3891
"selecting ...; selecting ...; selecting ..." — "the claim language is sufficiently clear that ..., ..., and ... are selected in three separate steps." Orion IP, LLC v. Staples, Inc., et al., 406 F. Supp. 2d 717 (E.D. Tex. 2005).\[3892\] "It is clear, as the Court concluded in the Staples Markman opinion, that both claims 1 and 11 require selecting at least three separate items, namely (1) a product picture, (2) a product environment picture, and (3) a text segment." Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007).\[3893\]

"selection" — "audio and/or visual content of a stream made available to user(s)." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007).\[3894\]

"transmission power level selection circuit being responsive to the received command for selecting the transmission power level" — "a circuit in a remote unit that is responsive to an instruction from a base station to select a power level at which the radio transmitter in the remote unit transmits." Zoltar Satellite Alarm Systems, Inc. v. Motorola, Inc., et al., 2007 U.S. Dist. LEXIS 95521 (N.D. Cal., Dec. 21, 2007).\[3895\]

"item selection criteria"; "movie selection criteria"; "game selection criteria" — "the characteristics used by the customer to select items." Netflix, Inc. v. Blockbuster, Inc., 477 F. Supp. 2d 1063 (N.D. Cal. 2007).\[3896\]

"selection keys" — "keys that allow a user to select a song." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007)\[3897\]; TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010).\[3898\]

"selection logic" — "Because 'selection logic' is not governed by § 112, P 6, the Court finds that no further construction of the term is necessary." PCTEL, Inc. v. Agere Systems, Inc., et al., 2005 U.S. Dist. LEXIS 34288 (N.D. Cal., Sept. 8, 2005).\[3899\]

"selection signals received from the users" — "signals from users selecting a stream." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007).\[3900\]

"selective communication link" — "a dial-up connection through a telephone exchange or a private branch exchange to a telephone network." Furnace Brook LLC v. Overstock.com, Inc., 2006 U.S. Dist. LEXIS 73422 (S.D.N.Y., Sept. 27, 2006).\[3902\]

"selective coupling"; "selectively couple"; "selectively coupling" — "coupling under some circumstances and not others." 02 Micro International, Ltd. v. Rohm Co., Ltd., 2007 U.S. Dist. LEXIS 84979 (E.D. Tex., Nov. 16, 2007).\[3903\]

"selective reception of the signals incorporating the differing scrambling techniques" — "reception of a signal modified in accordance with a scrambling technique." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003).\[3904\]

"selective voltage" — "voltage difference used to select a cell to be lit during the display period." Hitachi Plasma Patent Licensing Co., Ltd. v. LG Electronics, Inc., et al., 2009 U.S. Dist. LEXIS 38738 (E.D. Tex., May 7, 2009).\[3905\]
"selectively accessing ... from a remote location" — "the court concludes that initiation of the connection can come from either the remote location or the subscriber location, and therefore, 'selectively accessing' refers to the process of establishing a communication path, regardless of the origin of the connection." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001). \[3906\]

"selectively according to a particular one of a multiple of techniques" — "by selecting a particular one of more than one distinct scrambling methods, where a scrambling method is something more than merely varying one scrambling technique's parameters." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). \[3907\]

"selectively activating"; "selectively energizing" — "cover both printing continuous and strobed stripes." Laitram Corp. v. NEC Corp., et al., 62 F.3d 1388 (Fed. Cir. 1995). \[3908\]

"said step of displaying selectively allowing and prohibiting the display of said route guidance information that returns said vehicle to an original optimal route" — "said step of displaying, after deviation from the original optimal route, sometimes allowing and sometimes prohibiting the display of said route guidance information that returns said vehicle to an original optimal route." Garmin Ltd. v. TomTom, Inc., 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). \[3909\]

"selectively altering circuitry functions depending on mode of operation of the instrument when a first power limit is reached, thereby reducing power consumption" — "cannot be construed further." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008). \[3910\]

"selectively applying at least one layer of insulation material to said semiconductor substrate" — "this language describes a process step during which one or more layers of insulation material of a defined thickness form at specific locations on the top surface of the silicon wafer." Loral Fairchild Corp. v. Victor Co. of Japan, Ltd., et al., 906 F. Supp. 798 (E.D.N.Y. 1995). \[3911\]

"selectively changing" [the first and second transmission rates] — "means that a change is chosen and occurs, although it need not occur during a communication session." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., et al., 92 F. Supp. 2d 483 (E.D. Va. 2000). \[3912\] 

"[T]he 'selectively changing' and 'selectively operating' limitations in claims 1 and 21 mean that a change is chosen or occurs without alteration of the transceiver hardware, although the change need not occur during a communication session." Id., 262 F.3d 1258 (Fed. Cir. 2001). \[3913\]

"selectively connecting" — "we agree with the district court that 'selectively connecting ...' requires that the connection between the electronic circuit and the power supply occur when the trigger means is in the first position and that the operator of the device be able to use the trigger means to select when the power supply and the electronic circuit are connected." McNulty, et al. v. Taser International, Inc., et al., 106 Fed. Appx. 15 (Fed. Cir., Jul. 7, 2004) (unpublished). \[3914\]

"selectively connecting"; "connected"; "selectively interconnected" — "defendants have not overcome the presumption that the limitations are non-means-plus-function terms. No additional construction is required." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). \[3915\]
"selectively controlling said engine by means of said first computer through at least one additional programmed mode provided by said adapter module, said additional programmed mode not being originally included in said originally provided memory" — "making a decision to switch control of the engine from the programmed mode provided in the originally provided memory to the additional programmed mode provided by the adapter module, with the adapter module remaining coupled to the bus such that control of the engine can be switched back and forth between the originally provided programmed mode and the additional programmed mode." Adrain v. Superchips, Inc., 2006 U.S. Dist. LEXIS 25212 (S.D. Tex., March 14, 2006). Id. "[T]he language of [the] claim [] makes no reference to switching back and forth between the originally provided programmed mode and the additional programmed mode during vehicle operation. Nor does [the] claim [] require the further step of storing the original configuration elsewhere in an additional memory ... It merely requires that the adapter module provide at least one additional programmed mode not originally included in the ECM." Id., 2007 U.S. App. LEXIS 1799 (Fed. Cir. 2007) (unpublished); "As the district court properly recognized, 'selectively controlling' indicates the ability to switch back and forth between multiple programmed modes." Id. (Prost, J., dissenting). "This term means that the vehicle's ECM can be selectively changed by the user through the use of at least one of the additional programs in the adapter module." Adrain v. Hypertech, Inc., 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002). Id. 

"selectively controlling the durations of the time intervals of activation" — "controlling the width of pulses during repetition periods." Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002). Selectively delay execution of the said door operation commands" — "delaying the execution of door operation commands when movement of the door would cause operational interference between the door and the ramp." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009). 

"selectively elect to be included in or to be excluded from" — "a customer's acceptance or denial of an invitation to have his name and address, and, if applicable, his order placed, retained in a customer profile by the retailer." Furnace Brook LLC v. Overstock.com, Inc., 2006 U.S. Dist. LEXIS 73422 (S.D.N.Y., Sept. 27, 2006). 

"steps of ... selectively energizing ... to provide a combination of energized unequal capacity compressors that exceeds in number the preselected number of compressors in the system" — "invokes application of § 112 par. 6." Altech Controls Corp., et al. v. E.I.L. Instruments, Inc., 1997 U.S. Dist. LEXIS 21336 (S.D. Tex., Jun. 5, 1997). 

"selectively filling in the void" — "filling in, replicating, creating, modifying, replacing, substituting, adding to, providing, correcting, or improving the void by varying the input signal without solely modifying the on and off times of the signal carrying the image." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006). 

"selectively generating"; "selective transfer" — "to choose whether to generate"; "to choose whether to transfer." Ampex Corp. v. Eastman Kodak Co., et al., 460 F. Supp. 2d 541 (D. Del. 2006).
"selectively mask one or more of said second portions from dopants in a subsequent doping step" — "selectively shield at least one or more of said second portions from dopants implanted during a doping process conducted after forming the masking layer (shield)." Micrel Inc. v. Monolithic Power Systems, Inc., et al., 2006 U.S. Dist. LEXIS 45860 (N.D. Cal., June 28, 2006). 3926

"selectively placing the motion detector camera into one or more of a burst state, a pause state, and a test state" — "the motion detector camera is placed automatically or by the user into at least one of a burst state, a pause state, and a test state." Good Sportsman Marketing LLC v. Testa Associates, LLC, et al., 440 F. Supp. 2d 570 (E.D. Tex. 2006). 3927

"selectively providing access" — "determining which of a plurality of devices coupled to a bus is allowed access to the memory based on a priority scheme." STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004). 3928

"song selector" — "a device that allows a user to select a song." TouchTunes Music Corp. v. Rowe International Corp., 2009 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010). 3931

"being self-aligned with said conductive gate when forming said first region" — "being formed using the conductive gate as a mask so that the relative position of the first region is controlled by the position of the conductive gate." Micrel Inc. v. Monolithic Power Systems, Inc., et al., 2006 U.S. Dist. LEXIS 45860 (N.D. Cal., June 28, 2006). 3932

"self-configuring bus" — "a shared communication medium connecting multiple stations (e.g., instruments) that has functionality for (i) automatically, based on arbitration provisions or assigned priorities, determining which one of the stations will serve as the bus master, and (ii) automatically detecting the connection or disconnection of stations to or from the bus." Karl Storz Endoscopy-America, Inc. v. Smith & Nephew, Inc., 2010 U.S. Dist. LEXIS 85036 (W.D. Tenn., Aug. 18, 2010). 3933

"second doped regions being self-aligned with said first doped regions" — "first and second doped regions being formed using the same mask to control the relative locations of said regions." Micrel Inc. v. Monolithic Power Systems, Inc., et al., 2006 U.S. Dist. LEXIS 45860 (N.D. Cal., June 28, 2006). 3934

"semi-conducting material" — "all materials, whether elements, compounds, or some other material, known to be semi-conducting." Lemelson Medical, Education & Research Foundation, L.P. vs. Intel Corp., et al., 2002 U.S. Dist. LEXIS 8081 (D. Az., Feb. 20, 2002).

[i] "semi-regulation"; [ii] "semi-regulated, isolated output"— [i] "the act of controlling an output towards a predefined value by sensing a voltage in the primary transformer winding circuit without sensing the isolated output voltage"; [ii] "an isolated output that is controlled towards a predefined value by sensing a voltage in the primary transformer winding circuit without sensing the isolated output voltage." SynQor, Inc. v. Artesyn Technologies, Inc., et al., 2010 U.S. Dist. LEXIS 74808 (E.D. Tex., Jul. 26, 2010).

"semiconductor"; "semiconductor material" — "a solid material that conducts limited electric current by means of a small number of carriers (free electrons or holes) and additional carriers that can be freed from their local bonds by the addition of other elements (doping) or by application of an electrical or magnetic field." Seoul Semiconductor Co. Ltd. v. Nichia Corp., et al., 596 F. Supp. 2d 1005 (E.D. Tex. 2009).

"sending"; "transmitting"; "receiving" — "requir[e] the direct transmission of data packets between the local and remote sites over a telephone line and exclud[e] the use of a packet-switched network such as the Internet." Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340 (Fed. Cir. 2004). "I cannot support this court's many leaps of illogic. I would not import the exclusive telephone line limitation, if it even exists in the specification, into the claims." Id., 357 F.3d 1340 (Rader, J., dissenting).

"sending information collected from the pavement construction material mixture to the server" — "sending data collected from the testing of the pavement construction mixture to the server." Ater Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009).

"message originator sending the caller ID with the picture to the message center" — "message originator sending the caller ID, without manual entry of the caller ID, and the picture to the message center." Intellect Wireless, Inc. v. Kyocera Communications, Inc., et al., 2010 U.S. Dist. LEXIS 64726 (N.D. Ill., Jun. 29, 2010).

"sending the one or more reports to a project manager" — "using a computer to provide the one or more reports to a project manager." Ater Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009).

"sensing a torque occurring at a drive shaft of the washer due to an impact from the clothes" — "sensing a torque occurring at a drive shaft of the washer due to a collision from the clothes." LG Electronics U.S.A., Inc. et al. v. Whirlpool Corp., 2007 U.S. Dist. LEXIS 24056 (D.N.J., April 2, 2007). 3949

"sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes" — "sensing a torque occurring at a drive shaft of the washer due to clothes that are entwined together, to sense the distribution of collisions between the clothes and the agitator of the washer." LG Electronics U.S.A., Inc. et al. v. Whirlpool Corp., 2007 U.S. Dist. LEXIS 24056 (D.N.J., April 2, 2007). 3950

"sensing intervals between successive synchronization codes" — "measuring the interval between successive synchronization codes." Sandisk Corp. v. LSI Corp., 2010 U.S. Dist. LEXIS 24973 (N.D. Cal., Mar. 17, 2010). 3952

"sensor" — "a device designed to respond to a physical stimulus (as heat or cold, light, a particular motion) and transmit a resulting impulse for interpretation or measurement or for operating a control." Harmonic Design, Inc. v. Hunter Douglas, Inc., 88 F. Supp. 2d 1102 (N.D. Cal. 2000). 3953

"sensor appliance" — "a network device which contains one or more sensors for monitoring an area and which generates and transmits an IP signal indicating a condition or event in the monitored area." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006). 3954

"sensor means"; "control circuit means"; "switching means" — "we reject DESA's argument that the use of "sensor, "control circuit," and "switching" before the word "means" was sufficient to denote structure. ... Here, we agree with the district court that DESA failed to overcome the presumption that § 112, P 6 does apply." DESA IP, LLC v. EML Technologies, LLC, 2007 U.S. App. LEXIS 256 (Fed. Cir. 2007) (unpublished). 3955

"separate and discrete additional element" — "an element having no value, and not being available for designating by the player as one of the winning numbers or symbols of the usual lottery series. A separate and discrete additional element cannot be combined with a discrete lottery element." FortuNet, Inc., et al. v. Melange Computer Services, et al., 412 F. Supp. 2d 1071 (D. Nev. 2006). 3957
"a separate audio programming channel of the television carrier"; "an SAP associated with television signals" — "the part of the analog signal specifically designed to carry second audio programming,' but ... this definition must be applied in light of the preceding discussion." \textit{Command Audio Corp. v. Sony Electronics, Inc.}, 2003 U.S. Dist. LEXIS 27838 (N.D. Cal., Aug. 5, 2003).\textsuperscript{3958}

"separate electrical power connections being provided to said first and second heating elements" — "each heating element has a separate connection to power and ground." \textit{Cytologix Corp. v. Ventana Medical Systems, Inc.}, 424 F.3d 1168 (Fed. Cir. 2005).\textsuperscript{3959}

"a separate set of queue replenishment control rules" — "a set of rules (distinct from the set of notification rules) governing whether to automatically add playable media titles to the subscriber's rental queue." \textit{Media Queue, LLC v. Netflix, Inc., et al.}, 2009 U.S. Dist. LEXIS 118896 (N.D. Cal., Dec. 1, 2009).\textsuperscript{3960}

"said buffer MOSFETs having impurity diffusion layers \textit{separated} from said impurity diffusion layers of said protection MOSFETs \textit{by an interposed field oxide film}" — "requires that all impurity diffusion layers of the protection MOSFETs be separated by an interposed field oxide film from the impurity diffusion layers of the buffer MOSFETs that the protection MOSFETs serve to protect." \textit{OKI America, Inc., et al. v. Advanced Micro Devices, Inc.}, 2006 U.S. Dist. LEXIS 73144 (N.D. Cal., Sept. 21, 2006).\textsuperscript{3961}

[i] "\textit{respective separately executed}"; [ii] "\textit{executed separately from said kernel}" — [i] "an operating system peer-level facility executed separately from other operating-system peer-level facilities"; [ii] "executed by a processor that does not execute the kernel." \textit{Network Appliance, Inc. v. BlueArc Corp.}, 2004 U.S. Dist. LEXIS 28344 (N.D. Cal., Nov. 30, 2004).\textsuperscript{3962}

"separately, independently, and simultaneously" — "means that each display means responds to different and distinct electrical signals to produce different and distinct visual displays (i.e. images) at the same time." \textit{American Science and Engineering, Inc. v. Autoclear, LLC, et al.}, 2009 U.S. Dist. LEXIS 25954 (E.D. Va., Jan. 30, 2009).\textsuperscript{3963}

"separating into frequency components" — "splitting up the digital sound signal to frequency components by digital transform processing." \textit{Arbitron, Inc. v. International Demographics Inc., et al.}, 2009 U.S. Dist. LEXIS 1382 (E.D. Tex., Jan. 8, 2009).\textsuperscript{3964}

"separator layer" — "the term 'separator layer' speaks for itself and needs no further construction." \textit{Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al.}, 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).\textsuperscript{3965}

"sequence encoder" — "the Court limits its finding of indefiniteness to the independent claims 1, 17 and dependent claim 32. Dependent claims 'shall be presumed valid even though dependent upon an invalid claim.' 35 U.S.C. § 282. The Court leaves for later consideration upon motions by the parties whether or not the limitations in dependent claims 7, 18 and 33 provide additional information about 'sequence encoder' to allow the Court to define it and to satisfy the definiteness requirement." \textit{Acacia Media Technologies Corp. New Destiny Internet Group, et al.}, 405 F. Supp. 2d 1127 (N.D. Cal. 2005).\textsuperscript{3966}
"a sequence of groups of digital bits which represent the respective values of said analog electrical output signal at said periodic instants" — "a series of groups of digital bits in which each group of bits corresponds to values taken at the periodic instants of the analog electrical output signal." Digital Technology Licensing, LLC v. Cingular Wireless, LLC, 2007 U.S. Dist. LEXIS 57492 (E.D. Tex., Aug. 7, 2007).

"sequence of tournament games" — "one or more types of tournament games played at least two times in succession. A single play of a single tournament game is not a 'sequence.'" Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).

"a sequencer" — "a device that performs certain tasks, namely 'receiving data in a non-return to zero format and providing a mode select output for selecting one of a plurality of data patterns and a step select output for selecting one of a plurality of time segments in response thereto.'" Level One Communications, Inc. v. Seeq Technology, Inc., 987 F. Supp. 1191 (N.D. Cal. 1997).

"sequential" — "The term 'sequential' in the claims is in accordance with this description in the specification; no usage or exemplification of the sequential movement requires eliminating all overlap. It is incorrect to construe the claims as barring all overlap, as urged by M3 Systems. On the correct claim construction, no reasonable jury could have found that the claims are not supported by the description in the specification." C.R. Bard, Inc. v. M3 Systems, Inc., 157 F.3d 1340 (Fed. Cir. 1998).

"sequential from each said data line" — "mean[s] that the sequential information within the data lines is sequentially related to the information in the preceding and following lines." Datastrip International Ltd. v. Intacta Technologies, Inc., 253 F. Supp. 2d 1308 (N.D. Ga. 2003).

"sequentially display four calibration marks" — "four calibration marks are displayed individually in four separate successive images." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007).

"sequentially ... contiguous" — "requires the device to have the ability to store multiple command bytes in a sequentially contiguous manner." Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34454 (N.D. Cal., Sept. 9, 2005).

"sequentially transferring data units between said bus master and said secondary memory" — "moving data units from the bus master and the secondary memory in the sequence in which they are stored." OPTi Inc. v. nVidia Corp., 2006 U.S. Dist. LEXIS 22377 (E.D. Tex., April 24, 2006).
"the method for demultiplexing a serial data bit stream consisting of a continuum of an interleaved multiplicity of data bytes of predetermined size derived from a plurality of identically-formatted contributory frames" — "means that each frame of the serial bit stream that is being demultiplexed was formed by interleaving the bytes of two or more contributory frames. Each contributory frame must have exactly the same format and there can be no gaps or pauses in the interleaving." Bell Communications Research, Inc. v. Fore Systems, Inc., 113 F. Supp. 2d 635 (D. Del. 2000). 3977

"serial data packet" — "a unit of information transmitted as a whole from one device to another on a network that includes a keyboard signal, a mouse signal, or both." Apex Inc. v. Raritan Computer; Inc., 325 F.3d 1364 (Fed. Cir. 2003). 3978

"serial number" — "a number that is one of a series." Uniloc USA, Inc., et al. v. Microsoft Corp., 447 F. Supp. 2d 177 (D. R.I. 2006). 3980

"serially connected intelligent cell[s]"; "SICs" — "two or more intelligent cells directly connected using point-to-point medium, where 'intelligent cells' refers to 'programmable elements for providing remote control, sensing and/or communications that when interconnected with other like elements form a communications, control and sensing network or system with distributed intelligence.'" SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007). 3981

"a series circuit connecting in series through a series junction point said entire-width erasing head and said linear record erasing head" — "does not require that the series junction point must be between the two heads, but only that all three must be in series." Funai Electric Co., Ltd. v. Daewoo Electronics Corp., et al., 2010 U.S. App. LEXIS 18237 (Fed. Cir., Sep. 1, 2010). 3982

"a server" — "one or more devices or networks, with each computer or device having user account(s), server database application(s), and server application(s)." Zapmedia Services, Inc. v. Apple Inc., 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010). 3983

"server" — "a computer that provides data." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009). 3984

"server" — "a computer system, such as one or more computers and/or devices, that provides services to other computer systems over a network." Verizon Services Corp., et al. v. Vonage Holdings Corp., et al., 503 F.3d 1295 (Fed. Cir. 2007). 3985

"server" — "a computer or program, on the Internet or another network, that responds to commands from a client." In re Margolin, 2007 U.S. App. LEXIS 14269 (Fed. Cir., June 15, 2007) (unpublished). 3986

"server" — "a computer that provides services to another computer." Atser Research Technologies, Inc. v. Raba-Kisiner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009). 3987
"server" — "computer system that receives, stores, and provides data."  

"server applying one or more test methodologies to the collected information; generating one or more reports from the test methodologies; and sending the one or more reports to a project manager" — "a server that (1) performs calculations for one or more test methodologies using the data collected from the testing of the pavement construction material, (2) generates one or more reports based on the results of the test methodologies, and (3) provides the one or more reports to a project manager." Atser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009).

"server computer" — "a machine on a network that provides a particular service to other machines." Seven Networks Inc. v. Visto Corp., 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006).

"first server computer" — "a computer that makes available information or other resources." Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007).

"server remote from the client computer system" — "a computer that responds to requests from the client computer system through a network connection." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).

"at least one first level name server that provides domain name service (DNS) resolution"; "and at least one second level name server that provides a second level domain name service (DNS) resolution" — "a computer or program hosting framework that receives a request to resolve a name or other identifier into an IP address, and returns the IP address of a name server or servers"; "a computer or program running on a computer in the hosting framework that receives a request to resolve a name or other identifier into an IP address, and returns the IP address of a content server or servers." Akamai Technologies, Inc., et al. v. Limelight Networks, Inc., 494 F. Supp. 2d 34 (D. Mass. 2007).

"service application" — "a program running on a server that provides a service to a client." Pixion, Inc. v. PlaceWare, Inc., 2004 U.S. Dist. LEXIS 15808 (N.D. Cal., Aug. 2, 2004).

"service center" — "the central location at which the system apparatus carries out the process of the invention." In re Cygnus Telecommunications Technology, LLC Patent Litigation, 481 F. Supp. 2d 1029 (N.D. Cal. 2007).

"service request(s)" — "a solicitation of services from a client to a server. A service request may entail the exchange of any number of messages between the client and the server." *Soverain Software LLC v. Amazon.com, Inc.*, 2005 U.S. Dist. LEXIS 46872 (E.D. Tex., Apr. 7, 2005).

"service response" — "is the answer to the question, 'Will you the end user accept (display) the web page containing added function, and on what terms will you accept it?" *Modavox, Inc. v. Tacoda, Inc.*, 607 F. Supp. 2d 530 (S.D.N.Y. 2009).

"service-specific information about a state of a client service session" — "the current conditions of an active communication between the server running a particular service application and a client computer." *Pixion, Inc. v. PlaceWare, Inc.*, 2004 U.S. Dist. LEXIS 15808 (N.D. Cal., Aug. 2, 2004).

"set [of ... followed by ...]"] — "the Court is not persuaded that this term would be clarified further by using either 'sequence' or 'count' instead of set. No party has addressed whether there is any difference between the terms 'sequence' and 'count' or why it would be beneficial to use either of these terms rather than 'set.' Accordingly, without any persuasive argument for giving term nine any construction other than its plain meaning, the Court will provide no additional construction for this term." In re Compression Labs, Inc. Patent Litigation, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006).

"set of cards within the apparatus" — "While claim construction is a question of law, the district court's analysis is important to the process of claim construction, and in this context, as in others, we decline to construe the claim without the guidance of the district court's construction. ... We therefore vacate the preliminary injunction and remand this case to the district court for further proceedings consistent with this opinion." Shuffle Master, Inc. v. VendingData Corp., 2005 U.S. App. LEXIS 28878 (Fed. Cir. 2005) (unpublished). VendingData contends that 'a set of cards' means 'a discrete hand or part of a hand.' Under that construction, however, the trial court could have determined that the internal stack consisted of multiple sets, wherein each set consisted of no more than one hand of cards. This determination is possible since the claims clearly allow more than one set of cards within the apparatus." Shuffle Master, Inc. v. VendingData Corp., 2005 U.S. App. LEXIS 28878 (Fed. Cir. 2005) (unpublished) (Mayer, J., dissenting).

"reference set of colors" — "set denotes 'a group of two or more articles grouped together according to a system of classification' and color means a 'particular hue or tint being one of the constituents into which white or colorless light can be decomposed, the series of which constitutes the spectrum; also any mixture of these' as well as 'the quality or attribute in virtue of which objects present different appearances to the eye.'" X-Rite, Inc. v. Accudent Pty Ltd., 2006 U.S. Dist. LEXIS 70186 (D.D.C., Sept. 28, 2006).

"set of identification information" — "information reflecting a user's identity, such as a PAP ID or PAP password, used to authenticate the user's right to communicate with the network." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).

"set of indices for referencing data in said information database" — "the pieces of digital information (each of which contains an identification value plus, in many cases, other information) used to refer to specific items of information within the database." Finisar Corp. v. Directv Group, Inc., et al., 416 F. Supp. 2d 512 (E.D. Tex. 2006).

"set of log-in information"; "set of log-in data" — "information or data used to authenticate the user's right to connect to the network." MyMail, Ltd. v. American Online, Inc., et al., 2005 U.S. Dist. LEXIS 40716 (E.D. Tex., June 3, 2005).

"comparing the detected code to a set of selected codes" — "comparing a detected program classification code to more than one code, each of which has been assigned a value by the user." Sony Electronics, Inc. v. Guardian Media Technologies, Ltd., 2009 U.S. Dist. LEXIS 79716 (S.D. Cal., Aug. 31, 2009).

"set-up signaling associated with the call" — "a message or messages used to set up the call." Sprint Communications Co. L.P. v. Big River Telephone Co., LLC, 2009 U.S. Dist. LEXIS 58161 (D. Kan., Jul. 8, 2009).

"setting ... to initial values"; "expired" — "have readily apparent ordinary and customary meanings, and do not need to be construed."  *Websidestory, Inc. v. Netratings, Inc.*, 2007 U.S. Dist. LEXIS 50186 (S.D. Cal., July 10, 2007).

"shadow set" — "Copies of data located on one or more storage media. If a change is made to any copy, that change is reflected in the others."  *Hewlett-Packard Co., et al. v. EMC Corp.*, 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).

"shape" — "a mathematical representation of a geometric construct, which can be open or closed, and which is composed of curves or straight lines."  *Adobe Systems Inc. v. Macromedia, Inc.*, 201 F. Supp. 2d 309 (D. Del. 2002).

"shaping input signals to the data storage device to reduce selected unwanted frequencies from a plurality of frequencies" — "the term 'shaping' ... is interpreted to mean: 'applying a transformation to a signal.' ... the term 'selected unwanted frequencies' ... is interpreted to mean: 'at least the chosen unwanted frequencies.'"  *Convolve, Inc., et al. v. Compaq Computer Corp., et al.*, 2005 U.S. Dist. LEXIS 16375 (S.D.N.Y., Aug. 9, 2005).

"shared addressable memory space" — "memory space distributed across the volatile and non-volatile memory of all nodes participating in the patents' shared memory system (though not necessarily all nodes on the network), which shared memory space can be accessed by the various participating nodes using one or more addresses. The participating nodes need not, however, utilize a common or global addressing scheme."  *Mangosoft, Inc., et al. v. Oracle Corp.*, 2004 U.S. Dist. LEXIS 19357 (D.N.H., Sept. 21, 2004).

"shared context storage information" — "static and dynamic information that identifies the register level for the instruction as well as the context file."  *Biax Corp. v. Intel Corp., et al.*, 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).

"shared folder" — "a folder represents the abstraction for grouping related objects and metadata in a repository. The contents of a shared folder may be accessed by other folders in the same repository and/or by other linked repositories through the use of a reference."  *Informatica Corp. v. Business Objects Data Integration, Inc.*, 2005 U.S. Dist. LEXIS 46869 (N.D. Cal., Aug. 1, 2005).
"sharp cut-on" — "in the context of a dye or filter, having a cut-on slope that at some concentration or dye density rises more than one half percent (0.5%) change in transmission for every one nanometer of increasing wavelength change. The cut-on slope is that portion of the transmission spectra of a cut-on dye that represents the transition between [the] substantially blocking and the substantially transmitting region." Suntiger, Inc. v. Sunglass Products of California, 2006 U.S. Dist. LEXIS 1076 (C.D. Cal., Jan. 10, 2006).

"sheet"; "sheet-like" — "A review of the '482 patent and its prosecution history reveals that the terms 'sheet' and 'sheet-like' do not have any special meanings in the art and that the '482 inventors used these terms in their ordinary, everyday sense, i.e., to describe something flat with a fairly broad surface relative to its thickness. The claims thus include within their literal scope only devices with conductive material that comprises a fairly broad surface relative to its thickness." Strattec Security Corp. v. General Automotive Specialty Co., Inc., et al., 126 F.3d 1411 (Fed. Cir. 1997).

"shift register" — "a register in which, at each common shift clock cycle the pattern of 0's and 1's in the register shifts to the right or left, with the data at the input of the register entering from the left or right, respectively." Honeywell International, Inc., et al. v. Acer America Corp., et al., 2009 U.S. Dist. LEXIS 1381 (E.D. Tex., Jan. 7, 2009).

"shopping cart model" — "a method for on-line ordering in which a user selects and accumulates items to be purchased while browsing a merchant's site and then must proceed to one or more checkout or confirmation steps in order to complete the purchase." Amazon.com, Inc. v. Barnesandnoble.com, Inc., 73 F. Supp. 2d 1228 (W.D. Wash. 1999).

"shortest path" — "path through the network having the shortest distance (distance being a function of the time delay incurred by a packet moving from one switch to another, sometimes referred to as 'cost' or 'delay')." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006).

"showing … a number of game credits associated with a deposit of one coin of a particular type" — "no construction is required." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).

"showing … the number of game credits associated with each coin type" — "does not require construction." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).

"showing … the total number of currency units associated with each coin type" — "does not require construction." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007).
"shuffled bit result"; [ii] "bit shuffling operations"; [iii] "bit shuffling function" / "function to shuffle bits"; [iv] "bit shuffle computer program" — [i] "the result of an operation that mixes the bits of its inputs"; [ii] "operations that mix the bits of inputs"; [iii] "a function that mixes the bits of its inputs"; [iv] "a computer program that mixes the bits of its inputs." PACid Group, LLC v. Apple, Inc., et al., 2010 U.S. Dist. LEXIS 70997 (E.D. Tex., Jul. 15, 2010).

"shut-down condition" — "an express signal used for the purposes of entering a low-power state or a loss of framing." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010).

"side view" — "the side view image is not limited to crescent shaped; the viewing angle may not be a 90 degree angle, a top view angle, or identical to the angle created by the first camera; and the viewing angle is not limited to a 'low angle.'" Scanner Technologies Corp. v. ICOS Vision Systems Corp., N.Y., 2002 U.S. Dist. LEXIS 331 (S.D.N.Y., Jan. 10, 2002).

[i] "single instruction multiple data mode (SIMD mode)"; [ii] "multiple instruction multiple data mode (MIMD mode)" — [i] "where each processing element is first loaded with its own data and then a single stream of instructions is broadcast to every processing element in the binary tree"; [ii] "where each processing element has broadcast to it its local program and data and then each processing element is logically disconnected from its neighbor processing element and executes independently." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010).

"sign value" — "an indicator of the sign of a value—i.e., whether a value is positive or negative." In re Compression Labs, Inc. Patent Litigation, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006).

"signal" — "some physical form for the signal is required, but any form will do, so long as a recipient can understand the message—the nature of the signal's physical carrier is totally irrelevant to the claims at issue." In re Petrus A.C.M. Nuijten, 500 F.3d 1346 (Fed. Cir. 2007).

"signal" — "a detectable physical quantity or impulse (as a voltage, current, or magnetic field strength) by which messages or information can be transmitted." Cardiac Science, Inc. v. Koninklijke Philips Electronics N.V., et al., 2006 U.S. Dist. LEXIS 22267 (D. Minn., April 20, 2006).

"signal" — "an impulse by which messages or information can be transmitted." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003).

[i] "signal-dependent noise"; [ii] "signal-dependent branch metric function" — [i] "media noise in the readback signal whose noise structure is attributable to a specific sequence of symbols (e.g., written symbols)"; [ii] "a 'branch metric function' that accounts for the signal-dependent structure of the media noise." Carnegie Mellon University v. Marvell Technology Group, Ltd., et al., 2010 U.S. Dist. LEXIS 104891 (W.D. Pa., Oct. 1, 2010).

"signal point" — "a value that is transmitted by a modulator in one signaling interval." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).

"signal representative of the differences between said interval speech pattern and the interval representative set" — "a sequence of values representative of the differences between the interval speech pattern and the predicted speech pattern based on the set of signals representative of the speech pattern of said time interval." *AT&T Corp. v. Microsoft Corp.*, 2003 U.S. Dist. LEXIS 10716 (S.D.N.Y., Jun. 23, 2003). 4054

"signal transfer device" — "a device that incorporates both a transmission circuit and a reception circuit and involves the transfer of signals between the two." *Broadcast Innovation, LLC v. Echostar Communications Corp.*, 240 F. Supp. 2d 1127 (D. Colo. 2003). 4057

"signaling message" — "a message used to set up or tear down a call." *Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al.*, 518 F. Supp. 2d 1306 (D. Kan. 2007). 4059

"signals representative of" — "one of ordinary skill in this art would not limit this term to numerical or instantaneous values. Rather these signals are inputs into the system which uses its algorithms to process this information into appropriate warnings." *Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al.*, 488 F.3d 982 (Fed. Cir. 2007). 4062

"significant oxide growth" — "a thickness of oxide growth on the exposed portion of the semiconductor body (1) that a metallic interconnect will not readily punch through when deposited thereon, or (2) that requires removal by a separate etching step that will simultaneously remove desirable oxide and thereby disrupt the integrity of the contact hole." Harris Corp., et al. v. Atmel Corp., 14 F. Supp. 2d 821 (E.D. Va. 1998).4066

"signing" — "the process of computing a hash result, which result is converted into a digital signature using a cryptographic function and the signer's private key." Timecertain, LLC v. Authentidate Holding Corp., et al., 2006 U.S. Dist. LEXIS 92789 (M.D. Fla., Dec. 22, 2006).4067

"substantially similar in design"; "similar in design" — "the claim language is clear and understandable to the fact finder and any substitute for the claim language is likely to cause confusion rather than aid. Thus, the terms do not require construction." ACQIS LLC v. Appro International, Inc., et al., 2010 U.S. Dist. LEXIS 77548 (E.D. Tex., Aug. 2, 2010).4068

"simulated LMU" — "refers to a device capable of being used to perform diagnostic testing on an LSM before the LSM is connected to a library." Storage Technology Corp. v. Custom Hardware & Engineering Consulting, Ltd., et al., 2006 U.S. Dist. LEXIS 43690 (D. Mass., June 28, 2006).4069

"simulating a virtual file system" — "appearing to be a system of files, including a directory structure, that is not physically stored; rather, it is constructed or derived from existing data when its contents are requested by an application program so that it appears to exist as a system of files from the point of view of the host device." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).4070

"simultaneous" — "existing or occurring at the same time" Meade Instrument Corp. v. Yamcon, Inc., 2005 U.S. Dist. LEXIS 43396 (C.D. Cal., July 27, 2005).4072 "We agree with the district court that claims 1 and 15 require that information be presented to the user in a manner that allows the user to access the information at the same time that he is observing the field of view." Id., 197 Fed. Appx. 929 (Fed. Cir., Aug. 25, 2006) (unpublished).4073

"simultaneously" — "in the claim preamble refers to the capability of the multiplexed bit stream to carry signals from multiple sources during a finite interval, not to any requirement that several data sources must be inserting data into empty frames at the same instant in time." Bell Communications Research, Inc. v. Fore Systems, Inc., 62 Fed. Appx. 951 (Fed. Cir., Mar. 27, 2003) (unpublished).4074

"simultaneously" — "at or about the same time."  

"simultaneously active windows" — "two or more defined and separated areas on the computer screen which are open at the same time and may be operated on by the user."  

"simultaneously monitoring the selected multiple connection points or wires for presence of the test signal which is applied sequentially to each point on the interconnect of the system under test" — "require[s] the simultaneous monitoring of input and output points, but not necessarily the simultaneous monitoring of an input point and multiple output points."  
In re Graves, 69 F.3d 1147 (Fed. Cir. 1995). 4078 "I construe that claim language to mean that multiple points must be monitored for the test signal, a single test signal, at the same time -- i.e., 'simultaneously.'"  
Id. (Nies, J., dissenting). 4079

"can be simultaneously operated" — "all of the surgical equipment can be controlled and monitored at the same time from the surgeon's control panel."  

"simultaneously supplying the first input-output bus line with one of a logic 1 or 0 signal and the second input-output bus line with the other of a logic 1 or 0 when the memory circuit is enabled in the write operation mode" — "require[s] both events (i.e., the application of a '1' and a '0' signal) to commence at the same time."  

"simultaneously testing to determine if at least one of at least two predefined sequences are present in the digital data received" — "'simultaneously testing' means testing for at least two predefined sequences 'at the same time.' ... the [remainder of the] phrase should be construed exactly as it is written, requiring testing only for at least one of multiple predefined sequences."  

"single action" — "appears to refer to one action (such as clicking a mouse button) that a user takes to purchase an item once the following information is displayed to the user: (1) a description of the item; and (2) a description of the single action the user must take to complete a purchase order for that item."  
Amazon.com, Inc. v. Barnesandnoble.com, Inc., 73 F. Supp. 2d 1228 (W.D. Wash. 1999). 4083 "[W]e ultimately agree with Amazon and construe all four independent claims (i.e., claims 1, 6, 9, and 11) to call for the single action to be performed immediately after a display of information about an item and without any intervening action, but not necessarily immediately after the first display or every display."  
Id., 239 F.3d 1343 (Fed. Cir. 2001). 4084
"single action of a user input device" — "an action by a user within a short period of time that may comprise one or more clicks of a mouse button or other input device." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006). 4085 "This court was easily able to determine that the TSE system's method of order entry did not fall within the boundaries of the patents-in-suit because the combined actions of double-clicking, entering quantity, and pressing 'enter,' even though it literally constitutes 'one or more clicks' of a mouse button, et cetera, did not constitute a single action from the perspective of a user. Our very ability to determine that the TSE does not fall within the claim's ambit is evidence that the claim term is sufficiently definite. Therefore, defendants have failed to meet their burden of proving by clear and convincing evidence that the claim term 'single action' is indefinite." Id., 2008 U.S. Dist. LEXIS 292 (N.D. Ill., Jan. 2, 2008). 4086 "This court agrees with the district court that the claim term as construed is sufficiently definite." Id., 2010 U.S. App. LEXIS 3914 (Fed. Cir., Feb. 25, 2010) (unpublished). 4087

"single, bi-state switch" — "do[es] not limit the dialer unit to only one bi-state switch. The claim language does not preclude other switches on the exterior of a dialer unit, such as another switch to choose a different preprogrammed telephone number. The term 'single,' however, precludes the use of multiple switches to perform the activating function for one phone number. Only a single switch activates the dialing function for a preprogrammed number." Innovad Inc. v. Microsoft Corp., et al., 260 F.3d 1326 (Fed. Cir. 2001). 4088

"single common interface" — "claim 34 discloses a cable system capable of selective connection to either a monitoring device, a stimulating device, or a therapeutic device. It does not require that the system protected is capable of simultaneous connection to all three devices." R2 Medical Systems, Inc., et al. v. Katecho, Inc., et al., 931 F. Supp. 1397 (N.D. Ill. 1996). 4089

"said single connector for making all connections from the microprocessor to said specific computer peripheral devices" — "[this] phrase will be construed to require that all individual peripheral device connections on the housing that connect to the microprocessor also pass through the single connector." Computer Docking Station Corp. v. Dell Inc., et al., 2006 U.S. Dist. LEXIS 58388 (W.D. Wis., Aug. 16, 2006). 4090

"single ended forward converter" — "a device in which (a) the power flow from source to load is controlled (gated) by a single solid state primary switch; (b) energy is transferred forward from the primary winding to the secondary winding of the transformer during the ON period of the switch; and (c) the power transformer is simultaneously connected to the source and the load." VLT Corp., et al. v. Lambda Electronics, Inc., 238 F. Supp. 2d 347 (D. Mass. 2003). 4091 "We agree with VLT that the district court did not err in its interpretation of the term 'single ended forward converter.'" Id., 103 Fed. Appx. 356 (Fed. Cir., May 24, 2004) (unpublished). 4092

"single in-line memory module"; "SIMM" — "a compact circuit board with memory chips mounted on it which can be inserted into a connector within a computer system to expand the computer's memory and which derives all necessary electrical signals from the connector." Sun Microsystems, Inc. v. Dataram Corp., 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997). 4093

"sink object" — "a collection of data and operations that (1) obtains data stream buffers [memory where data can be temporarily stored for transfer] from a transform object and (2) outputs the streams to a video and audio decoder." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005).

"slave game device" — "a secondary data processing device for playing games which is connected to the game network and is at least partially controlled by the master game device." FortuNet, Inc., et al. v. Melange Computer Services, et al., 412 F. Supp. 2d 1071 (D. Nev. 2006).

"slice data" — "the phrase 'slice data' is synonymous with 'active area.'" Digital Biometrix, Inc. v. Identix, Inc., et al., 149 F.3d 1335 (Fed. Cir. 1998).

"slot" — "a space for receiving a computer module,' where 'a computer module' means 'one or more computer modules.'" ACQIS LLC v. Appro International, Inc., et al., 2010 U.S. Dist. LEXIS 77548 (E.D. Tex., Aug. 2, 2010).

"a small magnitude of electromagnetic energy" — "mean[s] that magnitude of electromagnetic energy which is sufficient to reverse the magnetization direction of the electrode or film layer with a lower coercive force (thereby achieving a change in resistance of at least 10%) but less than the amount necessary to reverse the magnetization direction of the electrode or film layer with a higher coercive force." Magsil Corp., et al. v. Seagate Technology, et al., 2010 U.S. Dist. LEXIS 18086 (D. Del., Mar. 1, 2010).

"smart card" — "a card that contains an integrated circuit such as a microprocessor or a memory." AdvanceMe, Inc. v. Rapidpay, LLC, et al., 2006 U.S. Dist. LEXIS 92444 (E.D. Tex., Dec. 21, 2006).

"soft mask" — "a mask is an erodable layer of material used to cover selected areas of a surface during etch. A soft mask erodes more rapidly than a hard mask, which erodes slowly or not at all." Samsung Electronics Co., Ltd. v. Matsushita Electric Industrial Co., Ltd., 2007 U.S. Dist. LEXIS 84758 (E.D. Tex., Nov. 14, 2007).

"software-adjustable memory for storing an ion output current reference value" — "a unit of a computer that holds a value that can be changed to a different value via software." Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003).

"client software means installed on each of said subscriber client computers adapted to forward its identity data to said first server computer at the beginning of an operating session in which access to selected computer resources is requested" — "while 'client software means' is a means-plus-function element, the means-plus-function interpretation does not apply to the phrase 'at the beginning of an operation session in which access to selected computer resources is requested.'" Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007).  

"software modem" — "a modem that utilizes the software executed by the host processor to perform modulation and demodulation rather than including a digital signal processing (DSP) chip." PCTEL, Inc. v. Agere Systems, Inc., et al., 2006 U.S. Dist. LEXIS 25943 (N.D. Cal., March 20, 2006).  

"solely contained within" — "mean[s] that a window object cannot be moved from or displayed, in whole or in part, outside a content manifestation environment." CA, Inc. v. Simple.com, Inc., et al., 2009 U.S. Dist. LEXIS 25241 (E.D.N.Y., Mar. 5, 2009).  

"song" — "a 'studio quality musical recording,' where 'studio quality' means that the recording is suitable for commercial distribution." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 106353 (S.D.N.Y., Oct. 4, 2010).  

"song record" — "information regarding at least one of the following categories: song title, song category, song address, song size, graphics address, graphics size, and play count." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).  

"song selector" — "a device that allows a user to select a song." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007).  

"sorter for supplying signal amplitudes supplied by the trellis coder to storage locations of the IFFT apparatus identified by the respective carrier indices"; "sorter for sorting the carriers in accordance with the stored values" — "are not governed by § 112, P 6." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).  

"sorting said memory requests based on their addresses" — "segregating memory requests into one or more groups based on their addresses." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).
"sorting the subcarrier-indexed estimates of the transmission quality, scaled by the desired subcarrier bit-error-rates, into an invertible ordering" — "requires mere 'sorting' of the estimates, i.e., segregating the estimates into groups based on specified criteria, and does not require reordering." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005). 4118

"a sound signal source for providing a sound electrical signal representative of sound at a source location in a vehicle" — "limiting the recited 'sound signal source' to a 'music' signal source ... would violate In re Yamamoto's prohibition against reading limitations appearing only in the specification into the claims." In re Bose Corp., 1995 U.S. App. LEXIS 18456 (Fed. Cir., July 18, 1995) (unpublished). 4120

"sound signals generated from digital information" — "detectable physical quantities or impulses, generated from digital information, that can be perceived by the sense of hearing by which messages or information can be transmitted." Diagnostic Group, LLC v. Benson Medical Instruments Co., 2005 U.S. Dist. LEXIS 5030 (D. Minn., Mar. 28, 2005). 4121

"source information": "destination information": "channel identification information" — 
"information identifying the source, destination, or channel." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006). 4122

"source leakage" — "leakage from the source terminal to the substrate terminal that occurs during source erase." Fast Memory Erase, LLC v. Spansion, Inc., et al., 2010 U.S. Dist. LEXIS 8658 (N.D. Tex., Feb. 2, 2010). 4123

"source means having AC terminals and being operative to provide an AC voltage thereat" — 

[i] "source node"; [ii] "destination node" — [i] "a 'node' that has the capability to transmit data"; [ii] "a node that has the capability to receive data." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 478 (D. Del. 2001). 4125

"source object" — "a collection of data and operations that (1) extracts video and audio data from a physical data source, (2) obtains a buffer [memory where data can be temporarily stored for transfer] from a transform object, (3) converts video data into data streams, and (4) fills the buffer [memory where data can be temporarily stored for transfer] with the streams." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005). 4126

"source of" — "place or device that originates." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010). 4127

"source of illumination" — "the Court declines to construe 'source of illumination' ... as requiring an angle. The Court declines to further construe the phrase at this time." Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp., 2006 U.S. Dist. LEXIS 62700 (N.D. Cal., Aug. 18, 2006). 4128

"spacer layer defining a well" — "a layer that defines a space that will be created when the layer is removed." Raytheon Co. v. Indigo Systems Corp., 2010 U.S. Dist. LEXIS 3530 (E.D. Tex., Jan. 18, 2010). 4130

"source pad" — "a portion of patterned, electrically conductive material that is provided near the periphery of the thin film transistor array to receive a data signal from a data driving circuit." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010). 4131

"spacial [sic spatial] key" — "a single number that identifies a specific geographically defined area, line, or point that is defined by a set of coordinates." 800 Adept, Inc. v. Murex Securities, Ltd., et al., 2006 U.S. Dist. LEXIS 53696 (M.D. Fla., Aug. 3, 2006). 4132

"spatial detail" — "geographic information relating to an area or region." Civix-DDI, LLC v. Celco Partnership, 387 F. Supp. 2d 869 (N.D. Ill. 2005). 4133

"spatial independence" — "requires the invention to be capable of properly distinguishing and recognizing symbols without reference to where a previous symbol was written on the writing surface." Xerox Corp. v. 3Com Corp., et al., 2000 U.S. Dist. LEXIS 10028 (W.D.N.Y., Jun. 6, 2000). 4134 "The district court properly found 'spatial independence' requires the invention to be capable of properly distinguishing and recognizing symbols without reference to where a previous symbol was written on the writing surface." Id., 267 F.3d 1361 (Fed. Cir. 2001). 4135

"hands-free speaker phone"; "full-duplex speaker phone"; "full-duplex hands-free speaker phone" — "the 'speaker phone' limitations require the use of echo cancellation." Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340 (Fed. Cir. 2004). 4136

"special code" — "a code that is received in return for the deposit of a prepayment amount that is linked to a particular account." Aerotel, Ltd. v. Telco Group, Inc., et al., 2010 U.S. Dist. LEXIS 47266 (S.D.N.Y., May 12, 2010). 4137

"specific driver for the multi-purpose interface" — "the set of software routines that control the multi-purpose interface and that are developed for the particular multi-purpose interface." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009). 4139

"specification for the parts"; "specifications corresponding to the ... parts" — "Defendants do not contend that the terms have any meaning unique to the technology-at-issue. Defendants' only explanation for why these terms need construction is so that 'Orion is not allowed to argue any meaning to the jury.' The same could be said for every single word in any claim. This is not a sufficient reason to construe a term." Orion IP, LLC v. Staples, Inc., et al., 406 F. Supp. 2d 717 (E.D. Tex. 2005). 4140
"specified parameters" — "criteria that limit the available choices or options in a generated menu." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010).

"specifying a selected one of the attractions" — "identifying one of a plurality of attractions chosen by the patron through a corresponding Attraction ID." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).

"specifying for each described action and condition of the series one of said stored definitions" — "specifying for each desired functional specification to be performed by the desired ASIC one of the definitions from the set of stored definitions." Synopsys, Inc. v. Ricoh Co., Ltd., 2005 U.S. Dist. LEXIS 46833 (N.D. Cal., Apr. 7, 2005).

"spectral representative signals" — "signals representing the frequency spectrum (i.e., the whole range of frequencies) of speech for a time interval." AT&T Corp. v. Microsoft Corp., 2003 U.S. Dist. LEXIS 10716 (S.D.N.Y., Jun. 23, 2003).

"speech synthesis"; "voice synthesis"; "synthesized voice messages" — "electronically creating specific units of sound and combining those units of sound to produce audible words that are output from the robotic surgical system to the surgeon." Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002).

"a speech synthesis system to provide the surgeon with voice messages containing information about the operation of the system"; "a voice synthesis system for providing audible information to a surgeon regarding operation of the system during the surgery"; "a speech synthesis system provides the surgeon with voice messages containing information about the operation of the system" — "requires synthesized speech informing the surgeon about the state of the system or a change in the state of the system." Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002).

"spiculation information" — "the computation of all spiculation features. Spiculations are lesions within the breast that have diffuse, irregular appearances such as radially oriented filamentous structures or lines." R2 Technology, Inc. v. Intelligent Systems Software, Inc., 2003 U.S. Dist. LEXIS 7436 (D. Del., Apr. 30, 2003).

"split personal computer system" — "a system where a local portion, which performs the video and input/output portions of the personal computer tasks, communicates through a remote system controller to operate a remote computer unit, which performs the computational and storage portions of the personal computer tasks." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009).
"sponsored community with prescribed rules and procedures for participants" — "[a] group defined by a user or a third-party sponsor, having a facility to conduct negotiations according to prescribed rules and procedures." *Sky Technologies, Inc. v. Ariba, Inc.*, 491 F. Supp. 2d 154 (D. Mass. 2007).\(^{4153}\)

"sponsorship software which enables the creation of a sponsored community with prescribed rules and procedures for participants"— "[s]oftware that permits rules and procedures to be created by a user or a third-party sponsor, which are applicable to a group of participants and provides a facility to conduct negotiations." *Sky Technologies, Inc. v. Ariba, Inc.*, 491 F. Supp. 2d 154 (D. Mass. 2007).\(^{4153}\)

"spots of different sizes" — "light spots of various sizes." *Pitney Bowes, Inc. v. Hewlett-Packard Co.*, 69 F. Supp. 2d 325 (D. Conn. 1998).\(^{4154}\) "[B]ecause we hold that the 'spots' that can be 'of different sizes' are the spots of discharged area on the photoreceptor, not the spots of light produced by the laser beam, we vacate the district court's grant of summary judgment ... and remand for further proceedings in accordance with this decision." *Id.*, 182 F.3d 1298 (Fed. Cir. 1999).\(^{4155}\)

"a plurality of spread-spectrum devices for spread-spectrum processing the plurality of subchannels of data, thereby generating a plurality of spread-spectrum-subchannel signals, respectively." — "a plurality of devices for processing the plurality of subchannels of data with one or more codes that distributes the signal across the available bandwidth, thereby generating a plurality of signals which correspond to each of the subchannels of data." *Linex Technologies, Inc. v. Belkin International, Inc., et al.*, 2009 U.S. Dist. LEXIS 10905 (E.D. Tex., Feb. 12, 2009).\(^{4156}\)

"spread-spectrum subchannel signals" — "signals, corresponding to each of the subchannels of data, which have been processed with one or more codes that distributes each signal across the available bandwidth." *Linex Technologies, Inc. v. Belkin International, Inc., et al.*, 2009 U.S. Dist. LEXIS 10905 (E.D. Tex., Feb. 12, 2009).\(^{4157}\)

"[a] sputter-deposited dielectric" — "cannot be formed by a two-step process in which a metal layer is first sputter-deposited and then oxidized." *Southwall Technologies, Inc. v. Cardinal IG Co.*, 54 F.3d 1570 (Fed. Cir. 1995).\(^{4158}\)

"second stage" — "a stage, operatively coupled to the first stage, generating an output signal which is a sum of the at least one intermediate signal generated in the first stage minus a potential of the at least return reference signal plus an output return reference signal." *Fiori v. Rockford Corp.*, 2006 U.S. Dist. LEXIS 41477 (E.D. Pa., June 21, 2006).\(^{4159}\)

"stand-alone aggregation server" — "an aggregation server that could operate independently from, but works with, an OLAP server." *Hyperion Solutions Corp. v. HyperRoll, Inc., et al.*, 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006).\(^{4161}\)
"standard control module" — "a controller that controls features or components installed by the OEM." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009). 4162

"standby router" — "the router that backs up the active router and becomes the active router under certain circumstances, such as upon receipt of a resign message from the active router, or when a hello message is not received from the active router within a specified amount of time." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 4164

"star-topology network" — "network configuration with data sources transmitting to a central hub which then transmits the data to data sinks. A node can act as both a data source and a data sink." Negotiated Data Solutions, LLC v. Dell, Inc., 596 F. Supp. 2d 949 (E.D. Tex. 2009). 4165

"starting a formatting process for said optical disc as a background process" — "no construction needed." Ricoh Co., Ltd. v. Quanta Computer, Inc., et al., 2007 U.S. Dist. LEXIS 34892 (W.D. Wis., May 11, 2007). 4166

"first state"; "second state" — "The term 'first state' means 'first mode or condition' and the term 'second state' means 'second mode or condition.'" O, Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006). 4167

"changes in state characteristic of an event" — "a change in a unique configuration of information within the system that is indicative of the occurrence of an event within the system." SFA Systems, LLC v. Infor Global Solutions (Michigan), Inc., et al., 2009 U.S. Dist. LEXIS 13705 (E.D. Tex., Feb. 23, 2009). 4168

"shuffler state information" — "information concerning the condition of the shuffler, or the machine that mixes the cards as described in the patent." Shuffle Master, Inc. v. VendingData Corp., et al., 2004 U.S. Dist. LEXIS 27945 (D. Nev., Mar. 31, 2004). 4169

[i] "state object"; [ii] "state information" — [i] "data having a predetermined structure that specifies state information"; [ii] "information, such as a cookie, that specifies an identity, a characteristic, or a condition of a client and/or a server." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009). 4170

"static display of prices" — "a display of prices comprising price levels that do not change positions unless a manual re-centering command is received." Trading Technologies International, Inc. v. eSpeed, Inc., et al., 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006).\(^{4174}\) "We need not alter our construction. And the extrinsic evidence presented -- in light of our construction, based almost entirely on intrinsic evidence -- will not change our construction." Id., 2007 U.S. Dist. LEXIS 12965 (N.D. Ill., Feb. 21, 2007)\(^{4175}\) "[T]his court, after reconstruing this term based on its own understanding of the claims, specification, prosecution history, and record, agrees with the district court's claim construction of the word 'static.'" Id., 2010 U.S. App. LEXIS 3914 (Fed. Cir., Feb. 25, 2010) (unpublished)\(^{4176}\)

"statically adding intelligence" — "adding information prior to program execution." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007)\(^{4177}\)

"station" — "a location at which there is a monitor, input and transmission means." Hamilton v. ComWeb Technology Group, Inc., et al., 2003 U.S. Dist. LEXIS 27832 (D. Md., Nov. 13, 2003)\(^{4178}\)

"statistical decoder" — "a device that takes as input variable-length-encoded data and reverses the encoding process to provide decoded data as output." Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 516 (D. Del. 2001)\(^{4179}\)

"a statistical detection method" — "a method of detecting suspicious network activity by applying one or more statistical functions in the analysis of network traffic data. This method is not a signature matching detection method." SRI International, Inc. v. Internet Security Systems, Inc., et al., 2006 U.S. Dist. LEXIS 75355 (D. Del., Oct. 17, 2006)\(^{4180}\)

"[statistically coded signals such that] the more frequently occurring values ... are represented by shorter code lengths and the less frequently occurring values ... are represented by longer code lengths" — "The Court will adopt neither of the parties' proposed constructions. Instead, as it suggested it would do during oral argument, the Court will use the plain language of the claim term as its construction." In re Compression Labs, Inc. Patent Litigation, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006)\(^{4181}\)

"statistically comparing test results in determining pay factor adjustments and material acceptance" — "using a computer to perform statistical analysis and compare the results of the analysis to the specification requirement for the pavement construction material mixture in order to determine pay factor adjustments and material acceptance." Atser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009)\(^{4182}\)

"status information" — "any subset of information related to whether the defibrillator is treating a patient or other indications of operational status." Koninklijke Philips Electronics, NV, et al. v. Defibtech LLC, et al., 2005 U.S. Dist. LEXIS 39859 (W.D. Wash., Dec. 21, 2005)\(^{4183}\)

"status information therein regarding the status of the electrical device after adjustment of the status in response to the control information as affected by the control information and the manual actuator" — "information about the condition of the electrical device, after the condition has been altered in response to the control information, regardless of whether the condition of the electrical device is being directed by control information or by the manual actuator." Lutron Electronics Co., Inc. v. Control4 Corp., 2009 U.S. Dist. LEXIS 3562 (D. Utah, Jan. 20, 2009). 4185

"status signal" — "a signal that provides the status of a telephone call such as ring-no-answer, busy, or live answer." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005). 4186

"steps of: providing a memory ... determining when the cruise control is engaged; ... retrieving one of the sets [of] data ...; retrieving the other set of ...; and using the retrieved data ..." — "§ 112(6) is not applicable." Caterpillar Inc. v. Detroit Diesel Corp., 961 F. Supp. 1249 (N.D. Ind. 1996). 4188

"steps of ..." — "Because claim 1 uses the phrase 'steps of' rather than 'steps for,' there is no presumption that subsection (a) is in step-plus-function format." Synopsys, Inc. v. Magma Design Automation, Inc., 2005 U.S. Dist. LEXIS 46882 (N.D. Cal., Aug. 23, 2005). 4189

"... the steps ... of: ... placing the retrieved information into a predetermined format as formatted data; placing the formatted data into a sequence of addressable data blocks; ..." — "a step, which is an antecedent to a succeeding step, must commence before the succeeding step commences, and the antecedent step must finish before the succeeding step can finish." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006). 4190

"storage" — "storage occurs when the incoming digital data is sufficiently present on the destination storage medium, and accessible by the operating system or other programs, so that any viruses contained in the data can spread and infect the computer system." Hilgraeve Corp. v. McAfee Associates, Inc., 70 F. Supp. 2d 738 (S.D. Mich. 1999). 4192 "[T]his Court will construe 'storage' here as follows: storage occurs when the incoming digital data is sufficiently present on the destination storage medium so that any viruses contained in the data can spread and infect the computer system. By omitting from the definition a restriction that does not have a basis the patent claims, patent specification, or prosecution history, this definition is closer to the ordinary and customary meaning of the term in this context and still appears to be consistent with the definitions offered by the parties' experts." Hilgraeve Corp. v. Symantec Corp., 90 F. Supp. 2d 850 (E.D. Mich. 2000). 4193

"storage" — "connotes specific structure and that the term is not drafted in means-plus-function format. The ... claim term does not need any further construction." Brooktrout, Inc. v. Eicon Networks Corp., et al., 2004 U.S. Dist. LEXIS 31054 (E.D. Tex., Jul. 27, 2004). 4194

- 387 -
"a storage element for storing electrical energy" — "Because the claim language does not use the word 'means' there is no presumption that 35 U.S.C. § 112 P 6 applies. However, the element is stated in purely functional terms, so 35 U.S.C. § 112 P 6 still controls." Cardiac Pacemakers, Inc., et al. v. St. Jude Medical, Inc., et al., 2000 U.S. Dist. LEXIS 17352 (S.D. Ind., Nov. 29, 2000).4195

"storage means" — "§112, P6 was found to apply." Motorola, Inc. v. VTech Communications, Inc., et al., 2009 U.S. Dist. LEXIS 59226 (E.D. Tex., Jul. 6, 2009).4197

"store" — "a storage location for data that may reside on any type of memory device." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).4200

"a store for storing user identification" — "a medium that stores data used to identify a user." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010).4201

"said data storage unit having a song storage location storing song data and an advertisement storage location receiving advertisement data" — "a data storage unit having separate structural advertisement and song locations within the data unit." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010).4203

"storage medium" — "refers to any storage medium of the computer system, if the data, when stored on the medium, are accessible to the operating system or other programs, such that viruses in the data can spread and infect the computer system." Hilgraeve Corp. v. Symantec Corp., 265 F.3d 1336 (Fed. Cir. 2001).4206

"stored" — "saved temporarily or permanently." Ameranth, Inc. v. Menusoft Systems Corp., et al., 2010 U.S. Dist. LEXIS 39338 (E.D. Tex., Apr. 21, 2010).4207

"stored"; "storing" — "will be easily understood by a jury and [] no construction is necessary." Aloft Media, LLC v. Yahoo!, Inc., et al., 2009 U.S. Dist. LEXIS 59599 (E.D. Tex., Jul. 13, 2009).4208
"stored association" — "a table record that relates a MAC address to a communications port on the node." Fenner Investments, Ltd. v. Hewlett-Packard Co., et al., 2009 U.S. Dist. LEXIS 102765 (E.D. Tex., Nov. 4, 2009).

"storing" — "placing the state object in memory or a storage device." Netscape Communications Corp. v. ValueClick, Inc., et al., 2009 U.S. Dist. LEXIS 98764 (E.D. Va., Oct. 22, 2009).

"storing" — "recording data in an electronic device from which the data can be obtained as needed." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).

"storing" — "data written to a nonvolatile form of storage medium (nonvolatile means the data is not lost when the circuit is broken)." Ethos Technologies, Inc. v. RealNetworks, Inc., 462 F. Supp. 2d 131 (D. Mass. 2006).

"storing a license in a license file" — "maintaining a license on a disk in an area of memory which is capable of storing at least one license and which contains at least a UID." Globetrotter Software, Inc. v. Elan Computer Group, Inc., et al., 1999 U.S. Dist. LEXIS 22482 (N.D. Cal., Oct. 22, 1999).

"storing a sound waveform" — "storing a pattern of pressure variation in a computer memory (i.e. RAM) from which the information can be obtained." Adobe Systems Inc. v. Macromedia, Inc., 201 F. Supp. 2d 309 (D. Del. 2002).

"storing cells arriving for transmission on said virtual path in a buffer for transmission of cells on said virtual path in conformance with said constraint on said rate" — (1) "The dispute is whether a specific buffer is required for each virtual path. The ... the court rejects the defendants' attempt to limit this claim element."; (2) "the court holds that the rate constraint portion of this phrase modifies 'transmission' as opposed to 'storing.'" *QPSX Developments 5 Pty. Ltd. v. Juniper Networks, et al.*, 2007 U.S. Dist. LEXIS 1991 (E.D. Tex., Jan. 10, 2007). 4224

"storing data indicative of the establishing a contract for said goods and/or services based on the term compliance data" — "no interpretation necessary." *Tradecard, Inc. v. S1 Corp., et al.*, 509 F. Supp. 2d 304 (S.D.N.Y. 2007). 4225

"storing, in electronic form, information" — "storing information in a format that an electronic device can read." The term 'electronic' does not exclude magnetic or optical media such as hard drives, floppy disks, or compact disks." *Diego, Inc. v. Audible, Inc.*, 2006 U.S. Dist. LEXIS 22715 (W.D. Wash., March 27, 2006). 4226

"storing in the computer product pictures, product environment pictures and text segments" — "Although the claim language requires 'storing in the computer product pictures, product environment pictures and text segments,' neither the claim language itself, nor the specification, nor the prosecution history clearly limit the storing step to storing the product pictures, product environment pictures, and text segments as 'separate and distinct' items." *Orion IP, LLC v. Staples, Inc., et al.*, 406 F. Supp. 2d 717 (E.D. Tex. 2005). 4229

"a programmable memory storing said song data representing the plurality of songs, said programmable memory also storing said advertisement data representing the at least one advertisement" — "does not ... limit the term to a particular type of memory ..., but rather ... requires both song data and advertisement data to be stored in the same programmable memory." *TouchTunes Music Corp. v. Rowe International Corp., et al.*, 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010). 4232
"storing said telephone number and said first graphical icon together in memory" — "storing together the telephone number and the association to the selected icon in the memory." Motorola, Inc. v. VTech Communications, Inc., et al., 2009 U.S. Dist. LEXIS 59226 (E.D. Tex., Jul. 6, 2009).\textsuperscript{4233}

"storing the first IP address and associating it with a physical media path from which the first data packet was received" — "storing the first IP address (as construed herein) and associating it with a physical media path (as construed herein) from which the first data packet was received." Fenner Investments, Ltd. v. Juniper Networks Inc., et al., 2006 U.S. Dist. LEXIS 29945 (E.D. Tex., May 16, 2006).\textsuperscript{4234}

"storing ... the information in a compressed data form, the information including an identification code and being placed into ordered data blocks" — "storing the information, along with an identification code, in the compressed data library of the transmission system, when, previously to storing: (a) an identification code has already been assigned to the information; (b) the information has been placed into ordered data blocks, and (c) the information has been compressed." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006).\textsuperscript{4235}

"storing the positions of the spraying device and the conveying device at the moment of a movement interruption" — "retaining on an electronic storage medium data representative of the spraying device and conveying device locations at the moment of a movement interruption." Durr Systems, Inc v. Fanuc Ltd., et al., 463 F. Supp. 2d 663 (E.D. Mich. 2006).\textsuperscript{4236}

"storing the positions of the spraying device and the conveying device after movement of the spraying device and conveying device has ended" — "retaining on an electronic storage medium data representative of the spraying device and conveying device locations after the inertial drift of the spraying device and conveying device has ended." Durr Systems, Inc v. Fanuc Ltd., et al., 463 F. Supp. 2d 663 (E.D. Mich. 2006).\textsuperscript{4237}

"storing the text of a plurality of books in a computer" — "the prosecution history and the specification of the '213 patent do not evidence that Plaintiff surrendered the broad meaning of the term 'storing the text of a plurality of books in a computer' so as to require that the text files for books be stored in a bit mapped format." On Demand Machine Corp. v. Ingram Industries, Inc., et al., 2003 U.S. Dist. LEXIS 27127 (E.D. Mo., Jul. 8, 2003).\textsuperscript{4238}

"storing the unified media data streams in a general register file" — "storing the unified media data streams in a set of hardware storage locations that are available to the user/programmer for various purposes." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).\textsuperscript{4239}

"stream of data" — "a stream of raw bytes or words with no used marking or framing for sending included by the application program." Ethos Technologies, Inc. v. RealNetworks, Inc., 462 F. Supp. 2d 131 (D. Mass. 2006).\textsuperscript{4240}

"stream(s) of addressed digital packets" — "continuous sequence of bundles of digital data, including a destination address." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007).\textsuperscript{4241}

"stripline sections"; "stripline segments"; "stripline elements" — "conductive strips that are a portion of the radio-frequency phase shift assembly that transmit electrical signals." Kathrein-Werke KG v. Radiacion y Microondas S.A., et al., 2010 U.S. Dist. LEXIS 50468 (N.D. Ill., May 17, 2010).4243

"wherein said remote server assembly is structured internal site and identify an internal site address of said compact, portable and interchangeable computer readable medium relative to said local processor assembly" — "taking all factors into account (including the case law cited by Citrix) finds that even with the typographical error, the construction proposed by Rothschild is consistent with the language of the '534 Patent. Thus, Claim 4 is construed to mean: the remote server assembly can identify where on the local processor assembly the compact, portable and interchangeable computer readable medium is found." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).4246

"structured store of data" — "data that are organized in some recognized fashion (e.g., database files, word processing document files, or Web pages) and stored in the volatile and/or non-volatile memory of the various nodes participating in the shared memory system." Mangosoft, Inc., et al. v. Oracle Corp., 2004 U.S. Dist. LEXIS 19357 (D.N.H., Sept. 21, 2004).4247

"said local processor assembly being structured to access said primary site address so as to achieve said data transmitting and receiving communication with said remote server assembly" — "the local processor assembly can communicate with the primary site address of the remote server assembly in a manner that permits the transmission and receipt of data." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).4248

"said remotely accessible auxiliary site addresses being structured to be remotely accessed by said remote server assembly so as to initiate utilization of said select portions of auxiliary site data by said local processor assembly in conjunction with said primary site data" — "the auxiliary site address is capable of being remotely interacted with by the remote server assembly so as to cause the use of select portions of said quantity of auxiliary site data by said local processor assembly at the direction of, intermingled with, or otherwise with some of the primary site data." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007).4249
"wherein said compact, portable and interchangeable readable medium is structured to identify an internal site address thereof relative to said local processor assembly, thereby facilitating access thereto by said remote server assembly" — "the remote server assembly can identify where on the local processor assembly the compact, portable and interchangeable computer readable medium is found so that it can interact with it." Rothschild Trust Holdings, LLC v. Cytrix Systems, Inc., et al., 491 F. Supp. 2d 1105 (S.D. Fla. 2007). 4250

"student tasks" — "instructional activities." Better Education, Inc. v. eInstruction Corp., et al., 2010 U.S. Dist. LEXIS 40972 (E.D. Tex., Apr. 27, 2010). 4251

"sub-channel" — "one of the 256 addressable subdivisions of a receiver identification address." Sutton Ltd. v. Nokia Corp., et al., 2009 U.S. Dist. LEXIS 69735 (E.D. Tex., Aug. 10, 2009). 4253

"sub-harmonic signal" — "a signal at a frequency that is a common denominator of the frequency of the first clock signal and the second clock signal." All Computers, Inc. v. Intel Corp., 2005 U.S. Dist. LEXIS 43968 (E.D. Va., Feb. 9, 2005). 4254

"said alterability being subject to permanent disablement" — "being able to prohibit permanently the ability to change the alterable data." Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al., 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006). 4255

"the alterability of data in said alterable memory being subject to permanent disablement" — "being able to prohibit permanently the ability to change the data in the alterable memory." Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al., 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006). 4256

"subjective data" — "data which is input by the patient to the data logger, regardless of whether that data pertains to the patient or the patient's environment, and whether or not the information is objective or factual, such as medication dosage or consumption of a particular food." PHT Corp. v. Invivodata, Inc., 2005 U.S. Dist. LEXIS 9577 (D. Del., May 19, 2005). 4257

"submitting said bid by transmitting at least some of said inputted data from said bidder's computer over said at least one electronic network" — "transmitting at least some of the previously input data from the bidder's computer over at least one network for communicating data messages between said computers, including, but not limited to, the Internet." Muniauction, Inc. v. Thomson Corp., 2006 U.S. Dist. LEXIS 57461 (W.D. Pa., Aug. 15, 2006). 4258

"subscriber" — "to mean a particular individual, not a telephone line." AT&T Corp. v. Excel Communications, Inc., et al., 1999 U.S. Dist. LEXIS 17871 (D. Del., Oct. 25, 1999). 4260

"subscriber area" — "a system component unique to that subscriber that transfers forms between a database server and a subscriber." Billingnetwork, Inc. v. Cerner Physician Practice, Inc., et al., 2006 U.S. Dist. LEXIS 5995 (M.D. Fla., Feb. 1, 2006). 4261

"subscriber selectable receiver stations" — "receiving device or devices which can be designated by the subscriber." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2007 U.S. Dist. LEXIS 19314 (N.D. Cal., Mar. 2, 2007). 4263

"subscriber telephone station" — "a device that allows audio communication over a telephone network." In re Cygnus Telecommunications Technology, LLC Patent Litigation, 481 F. Supp. 2d 1029 (N.D. Cal. 2007). 4264

"subscribers" — "businesses, historical sites, governmental sites or the like that either agreed or requested in some manner to be a part of the database." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000). 4265

"subscription services" — "is not limited to arrangements in which a subscriber pays for services on a flat fee basis." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001). 4266

"detecting a subsequent launch" — "detecting a launch of a computer program after the final log file for that computer program has been generated and stored in RAM, RAM cache, secondary storage, or some other storage." Computer Acceleration Corp. v. Microsoft Corp., 516 F. Supp. 2d 752 (E.D. Tex. 2007). 4267

"subsequent services" — "a service that occurs after the exact geographic location and specific mobile unit identification have been recorded." EMSAT Advanced Geo-Location Technology, et al. v. MetroPCS Communications, Inc., et al., 2010 U.S. Dist. LEXIS 62196 (E.D. Tex., Jun. 23, 2010). 4268

"and having and having a transmittance level in substantial accordance with the formula\[ T(\theta)=\frac{[D(\theta)-[S^*(\theta)+(1-N)]/[S(\theta)+N]]}{[D(\theta)+[S^*(\theta)+(1-N)]/[S(\theta)+N]]} \]" — "requires that [the] coating of the bulb transmit light energy that is in substantial accordance with the stated formula." Tailored Lighting, Inc. v. Osram Sylvania Products, Inc., 514 F. Supp. 2d 417 (W.D.N.Y. 2007). 4269

"substantial loss in transfer of line voltage" — "Loss of receipt of energy -- as measured by the voltage at the final destination (either the receiving circuits or the transfer circuits) after the de-energization of the first feed circuit or first energy source compared to the voltage at the same final destination prior the de-energization of the first feed circuit or first energy source -- sufficient to impair the proper functioning of whatever device is powered by the claimed invention during and after loss of the redundant energy source." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004). 4270

"interconnecting substantially all of said row lines to one another and substantially all of said column lines to one another" — "electrically connecting with conductors nearly all, but not all, of said row lines to one another and nearly all, but not all, of said column lines to one another."  

"substantially all of the blocks surrounding a point in the terrain seen from the current viewpoint within a predetermined distance range" — "Substantially all of the data blocks covering terrain within a uniform predetermined distance from a point in the terrain that is seen from the current viewpoint."  

"[block] substantially all of the flow of current" — "Plaintiff contends that the term should be given its normal meaning of ‘all but an insignificant amount.’ ... the Court adopts plaintiff’s construction."  

"substantially automated process" — "process that takes place with minimal, if any, human interaction."  

"substantially block" — "in reference to wavelengths, it is defined as blocking over 99% of the incident radiation at each and every wavelength"; "in reference to polarization, it is defined as blocking 80% or more of the horizontally polarized incident radiation at each and every wavelength."  

"substantially congruent to said first layer of conducting strips in a top view" — "having the same or very close shape and dimensions when viewed from the top."  

"substantially equal" — "a level that is not completely the same but can be accepted as a substantially equal level."  

"substantially equal" — "equal to the extent that diverse regulatory standards and currencies are applied and the purpose of the invention is enabled."  

"substantially free of agglomerated vacancy [or interstitial] defects" — "a concentration of such agglomerated defects which is less than the detection limit of these defects, which is currently about 1000 defects/cm3."  

"wherein said first bandwidth is substantially greater than said second bandwidth" — "is not indefinite."  
"substantially identical in uniformity to" — "because the inventor specifically defined the term 'substantially identical' in the specification of the '017 patent, the patent's definition controls this court's interpretation of that term." Tailored Lighting, Inc. v. Osram Sylvania Products, Inc., 514 F. Supp. 2d 417 (W.D.N.Y. 2007). 

"substantially monolithic"; "sufficiently close ... to form a first fringe-effect capacitance" — "ATC has failed to show by clear and convincing evidence that the phrases 'substantially monolithic' and 'sufficiently close ... to form a first fringe-effect capacitance' are indefinite as a matter of law." Presidio Components Inc. v. American Technical Ceramics Corp., 2010 U.S. Dist. LEXIS 36127 (S.D. Cal., Apr. 13, 2010).

"said substantially opaque material being a black polyimide material" — "the material that substantially prevents transmission (or passage) of light is a black polyimide material." Advanced Technology Incubator, Inc. v. Sharp Corp., et al., 2009 U.S. Dist. LEXIS 109173 (E.D. Tex., Jun. 26, 2009).

"side surfaces of said embedded insulator being substantially perpendicular to said semiconductor substrate" — "Although the patent does not provide a numerical limitation for the term 'substantially,' the disclosed embodiments and the ordinary and plain meaning of 'substantially' should be sufficient to guide a jury in performing its duties. If necessary, and if the parties marshal any new intrinsic evidence, the court would consider revisiting this issue at a later date. But for present purposes, the court rejects Hynix's construction and declines to construe this term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006).

"substantially replaceable" [and] "differing unscrambling circuits" — "mean that the distinct circuitry of the active user card must take the place of the circuitry of any other user card for use in the unscrambling means." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003).

"receiving and substantially simultaneously processing the second quantity of digital data to determine if at least one of said predefined sequences is present in the second quantity of digital data" — "the computer system of claim 1 receives the second quantity of data and the second quantity of data is received and processed at substantially the same time as the first quantity of digital data is received and screened." Symantec Corp. v. Computer Associates International, Inc., 2005 U.S. Dist. LEXIS 46912 (E.D. Mich., Mar. 16, 2005).
"substantially transmit" — "in reference to wavelengths, [it] is defined as transmitting more than 1% of the incident radiation at each and every wavelength"; "in reference to polarization, it is defined as transmitting more than 20% of the horizontally polarized incident radiation at each and every wavelength." Suntiger, Inc. v. Sunglass Products of California, 2006 U.S. Dist. LEXIS 1076 (C.D. Cal., Jan. 10, 2006). 4291

"substantially uniform magnetic field" — "a field that is sufficiently uniform to obtain useful MRI images." Medrad, Inc. v. MRI Devices Corp., 401 F.3d 1313 (Fed. Cir. 2005). 4292

"substantially zero overlap"; "substantially aligned" — "the same as or very close to zero overlap"; "the same as or very close to perfect alignment." Thorn EMI North America, Inc. v. Intel Corp., 936 F. Supp. 1186 (D. Del. 1996). 4293 "[W]e reach the same conclusion as did the district court." Id., 157 F.3d 887 (Fed. Cir. 1998). 4294

"substrate" — "the supporting material in an LED upon which the other layers of an LED are grown or to which those layers are attached and including the case in which the supporting material functioning as the substrate is grown on top of, or attached to, the other layers." Epistar Corp. v. International Trade Commission, et al., 566 F.3d 1321 (Fed. Cir. 2009). 4296

"substrate" — "any underlying material or materials (such as a silicon wafer alone or a silicon wafer combined with other layers such as a dielectric layer) upon which other materials may be formed or deposited." Agere Systems Inc. v. Atmel Corp., 2003 U.S. Dist. LEXIS 9823 (E.D. Pa., May 23, 2003). 4298

"substrate" — "an item on which a photosensitive layer or pattern is formed or placed." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004). 4299

"substrate interval correction means" — "a structure, located in the areas of the sealing forming region where no wires cross, which compensates for the asymmetry in the wires crossing the sealing region." Semiconductor Energy Laboratory Co. v. Chi Mei Optoelectronics Corp., et al., 2006 U.S. Dist. LEXIS 12343 (N.D. Cal., March 27, 2006). 4300

"subsystem" — "a system that is part of a larger system." SFA Systems, LLC v. Infor Global Solutions (Michigan), Inc., et al., 2009 U.S. Dist. LEXIS 13705 (E.D. Tex., Feb. 23, 2009). 4301

"subsystem" — "because 'subsystem' is always used in the claims to refer to the collection of circuits that performs a function specified in the claim, 'subsystem' does not require separate construction." Zoran Corp., et al. v. Mediatek, Inc., et al., 2005 U.S. Dist. LEXIS 34422 (N.D. Cal., Sept. 9, 2005). 4302

"subtree" — "a subset of the binary tree such that each node has a single parent and two children nodes, except the root node, which has no parent, and the leaf nodes, which have no children." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010). 4303

"such that the sum \( \alpha_1 + \alpha_2 \) is less than unity, and no thyristor action occurs under any device operating conditions" — "cover[s] only four-layer devices that, because of their structure, never act as thyristors (i.e., devices in which the sum \( \alpha_1 + \alpha_2 \) is less than one under all circumstances)."  *Harris Corp. v. IXYS Corp.*, 114 F.3d 1149 (Fed. Cir. 1997). 4308

"suitable"; "suitably" — "'suitable' or 'suitably' give 'life, meaning, and vitality' to the claims, and thus should be read as limitations."  *Cytyc Corp. v. Tripath Imaging, Inc., et al.*, 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005). 4306

"suitable for imaging said multi-sample plate" — "can be used for creating an image of a multi-sample plate having at least one sample in a recessed well."  *Amersham Biosciences Corp., et al. v. PerkinElmer, Inc.*, 2006 U.S. Dist. LEXIS 32758 (D.N.J., May 23, 2006). 4309

"super block" — "two or more blocks that are used to store data, the two or more blocks having addresses that are correlated with a group of logical block addresses that is determined by the number of sectors in a block."  *Lexar Media, Inc. v. Fuji Photo Film USA, Inc.*, 2007 U.S. Dist. LEXIS 19313 (N.D. Cal., Mar. 1, 2007). 4311

"super-block" — "two or more blocks that are used to store data, the two or more blocks having addresses that are correlated with a group of logical block addresses that is determined by the number of sectors in the blocks."  *Toshiba Corp. v. Lexar Media, Inc.*, 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005). 4312

"supplied with a potential of" — "Because Hynix has not provided any reason why 'supplied with a potential of' should be construed and Toshiba's proposed construction appears nearly identical to the term itself, the court declines to construe this term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006).

"supporting the housing of the microprocessor in position relative to said docking connection means so that the single connector on the housing is coupled with said additional connection provided in the docking connection means" — "[this] phrase will be construed to mean that the housing is supported and the single connector on the housing couples or mates with the connector on the docking module." Computer Docking Station Corp. v. Dell Inc., et al., 2006 U.S. Dist. LEXIS 58388 (W.D. Wis., Aug. 16, 2006).

"surface mount semiconductor light elements" — "a semiconductor light emitting element where the electrical leads are designed to be soldered to a surface of a circuit board, rather than mounted through a hole in the circuit board." Litepanels, LLC, et al. v. Gekko Technology, Ltd., 2007 U.S. Dist. LEXIS 89756 (E.D. Tex., Dec. 6, 2007).

"surrender value protected investment credits" — "the components of the term have well-recognized meanings, which allow the reader to infer the meaning of the entire phrase with reasonable confidence." Bancorp Services, L.L.C. v. Hartford Life Insurance Co., et al., 359 F.3d 1367 (Fed. Cir. 2004).

"surveillance sensor appliance controlled by the server" — "a sensor appliance (as defined previously) which monitors one or more conditions or events in an area, and which can receive and respond to signals from a server." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006).

"suspending operation" — "rendering the door control system temporarily unresponsive to door operation commands." Braun Corp. v. Vantage Mobility International, LLC, 608 F. Supp. 2d 1036 (N.D. Ind. 2009).

"switch" — "a device, including mechanical, electrical, electronic or optical devices, which opens or closes circuits, completes or breaks a path, or selects paths or circuits." Neutral Tandem, Inc. v. Peerless Network, LLC, et al., 2010 U.S. Dist. LEXIS 11248 (N.D. Ill., Feb. 8, 2010). 4328

"switch", "optical switch" — "a device to receive an optical signal from at least one input and route the optical signal to one of at least two outputs, or to receive an optical signal from one of at least two inputs and route the optical signal to at least one output." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009). 4329

"a mode selector switch connected to the circuit controlling and processing means and movable between a RECORD and a PLAY mode" — "does not necessarily require a slide switch, but allows for other types of switches." Howes, et al. v. Zircon Corp., 992 F. Supp. 957 (N.D. Ill. 1998). 4330

"a switch connected to said input circuits for ..." — "A switch is a commonly understood to be a structure. It is a device for making, breaking, or changing connections in an electrical circuit. Like the word 'brake,' 'clamp,' or 'screw,' the name of the device connotes what it does. The commonly understood meaning of the word is cast in terms of its function. It is well settled that naming a function-specifying device in a patent claim is not sufficient to bring that claim within the ambit of Section 112, para. 6." TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999). 4331

"a switch coupled to the data path and programmable to manipulate data received from the data path, the switch providing data streams to the data path" — "a routing device that is: (1) coupled to and receives data from the data path, (2) rearranges the data fields received from the data path in different ways in response to instructions, and (3) provides the rearranged data fields to the data path." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 4332

"switch means comprised of at least three distinct parts for connecting said dedicated memory address, data, and control circuits of said path configuring means to each of said first three sets of contacts" — "The Court agrees with Intel that this limitation should be construed as a means-plus-function limitation under 35 U.S.C. § 112, P 6." Maurice Mitchell Innovations, L.P. v. Intel Corp., 2006 U.S. Dist. LEXIS 41453 (E.D. Tex., June 21, 2006). 4334

"switch means for connecting said dedicated memory address, data, and control lines of said path configuring means to said dedicated memory address, data and control lines of said CPU respectively" — "The Court agrees with Intel that this limitation should be construed as a means-plus-function limitation under 35 U.S.C. § 112, P 6." Maurice Mitchell Innovations, L.P. v. Intel Corp., 2006 U.S. Dist. LEXIS 41453 (E.D. Tex., June 21, 2006). 4335

"switched" — "the mode in which the bypass is on or utilized." Isco International, Inc. v. Conductus, Inc., et al., 2002 U.S. Dist. LEXIS 20832 (D. Del., Oct. 30, 2002). 4336

"switched telephone network" — "may be understood according to its ordinary and customary meaning and does not require construction." Catch Curve, Inc. v. Venali, Inc., 2007 U.S. Dist. LEXIS 93667 (C.D. Cal., May 11, 2007). 4337

"switching"; "transferring" — "shifting or reassociating PPP state to another session associated with the new call set-up message." Utstarcom, Inc. v. Starent Networks Corp., 2005 U.S. Dist. LEXIS 40520 (N.D. Cal., Dec. 6, 2005).  

[i] "switching network ... for establishing a communications link"; [ii] "switching network means ... for establishing a communications link"— [i] "a component or set of components to which multiple nodes can attach and that selectively enables transferring of information among attached nodes."; [ii] "This claim is expressed in means plus function format, and the Court therefore construes it pursuant to 35 U.S.C. § 112, P 6." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).  

"symbol" — "a finite, pre-selected representation of the information to be conveyed from the transmitter to the receiver." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).  

"symbol" — "a finite, pre-selected representation of the information to be conveyed from the transmitter to the receiver." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 27820 (D.N.J., Nov. 10, 2005).  

"symbol count" — "a count of individual or groups of symbols." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005).  

"symbol information for uniquely identifying the symbol"; "symbol information" — "information within a symbol that uniquely identifies the symbol." Cognex Corp. v. VCode Holdings, Inc., et al., 2007 U.S. Dist. LEXIS 75364 (D. Minn., Oct. 9, 2007).  

"symmetrical power and ground" — "all of the power and ground leads on the memory module are positioned in such a way that when the memory module is inserted into the connector backwards, all of the power and ground leads on the module line up with comparable power and ground leads on the connector, thereby avoiding damage to the computer or module." Sun Microsystems, Inc. v. Dataram Corp., 1997 U.S. Dist. LEXIS 18363 (N.D. Cal., Aug. 29, 1997).
"symmetrically disposed [bases]" — "bases arranged to correspond in relative position on both sides of a dividing line or median plane or about a center or axis." *International Rectifier Corp. v. IXYS Corp.*, 2002 U.S. Dist. LEXIS 27248 (C.D. Cal., Mar. 5, 2002). 4350

"synchronization" — "updating the client and server databases to reflect changes that have happened since the last connection." *Seven Networks Inc. v. Visto Corp.*, 2006 U.S. Dist. LEXIS 93870 (E.D. Tex., Dec. 29, 2006). 4351

"synchronization agent" — "software routines or code that send at least a portion of second version information to a general synchronization module for purposes of synchronization." *Visto Corp. v. Seven Networks, Inc.*, 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005). 4352

"synchronous digital network virtual container" — "an information payload that can be transported across a digital network that uses time-division multiplexing such as SDH or SONET." *Ciena Corp. v. Nortel Networks, Inc., et al.*, No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006). 4358

"synchronous memory device" — "a memory device that receives an external clock signal which governs the timing of the response to a transaction request." *Hynix Semiconductor Inc., et al. v. Rambus Inc.*, 2004 U.S. Dist. LEXIS 23230 (N.D. Cal., Nov. 15, 2004). 4359

"system" — "the entire set of computers, databases, and mechanical or optical equipment used for electronically exchanging paperless tickets for an event in a secondary market from ticket sellers to buyers." *Flash Seats, LLC v. Paciolan, Inc.*, 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010). 4361

"system" — "an integrated assemblage of hardware and/or software elements operating together to accomplish a prescribed end purpose." *ABB Automation Inc. v. Schlumberger Resource Management Services, Inc.*, 2003 U.S. Dist. LEXIS 5002 (D. Del., Mar. 27, 2003). 4362
"system bus" — "a bus having multiple masters and through which the primary memory communicates with each system element that accesses primary memory." **Intergraph Hardware Technologies Co. v. Toshiba Corp., et al.,** 508 F. Supp. 2d 752 (N.D. Cal. 2007).363

"system bus" — "a plurality of shared signal lines that interconnects more than two agents for transmission of data, address, and control signals." **OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al.,** 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).364

"system bus means" — "is not a means-plus function term." **Intergraph Hardware Technologies Co. v. Toshiba Corp., et al.,** 508 F. Supp. 2d 752 (N.D. Cal. 2007).365

"system clock operably connected to the processor to provide a time base" — "an element, made of up hardware, software, or some combination of the two, that provides electrical signals at a precise frequency to the processor." **Phillip M. Adams & Associates, LLC v. Dell, Inc., et al.,** 2010 U.S. Dist. LEXIS 68749 (D. Utah, Jul. 9, 2010).366

"system clock" — "a circuit that generates the signal(s) used for timing the operation of the CPU." **Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al.,** 514 F. Supp. 2d 916 (E.D. Tex. 2007).367

"system controller" — "a combination of software and hardware operated under the direction of a human operator that is capable of storing and retrieving data generated by the system and of performing data analysis on said data, preferably responsive to predetermined commands." **ADE Corp. v. KLA-Tencor Corp.,** 252 F. Supp. 2d 40 (D. Del. 2003).368

"system database" — "the Court construes the term such that the database is 'in' the Data Center system." **Autobytel, Inc. v. Dealix Corp.,** 2006 U.S. Dist. LEXIS 3381 (E.D. Tex., Jan. 18, 2006).369

"system monitor" — "a circuit, component, or device for receiving information regarding at least one self-test and operating a fail-safe defibrillator status indicator or display to correspond to that information." **Koninklijke Philips Electronics, NV, et al. v. Defibtech LLC, et al.,** 2005 U.S. Dist. LEXIS 39859 (W.D. Wash., Dec. 21, 2005).371

"TV quality" — "generally of the same quality as television (at the time the patent was filed)." *Collaboration Properties, Inc. v. Tandberg ASA, et al.*, 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006).4375

"table" — "[a] collection of data, in which each item is uniquely identified by a label, by its position relative to the other items, or by some other means." *In re Compression Labs, Inc. Patent Litigation*, 2006 U.S. Dist. LEXIS 46308 (N.D. Cal., June 28, 2006).4377

"profile tailoring the concentration of transition metal atoms in the substrate relative to the surface of the substrate" — "fashioning or adjusting the concentration of transition metal atoms as a function of depth within the substrate in order to create a particular pattern or layout of depth-wise concentrations." *IXYS Corp. v. Advanced Power Technology, Inc.*, 301 F. Supp. 2d 1065 (N.D. Cal. 2004).4381

"the transition metal is tailored to have a relatively shallow profile compared to a completed diffusion throughout the entire substrate" — "diffusing the transition metal atoms in the substrate in such a way that there is a higher concentration of transition metal atoms near the surface of the substrate, and a lower concentration of transition metal atoms in the substrate, than there would be with a completed diffusion throughout the entire substrate [construed infra]." *IXYS Corp. v. Advanced Power Technology, Inc.*, 301 F. Supp. 2d 1065 (N.D. Cal. 2004).4382

"taking a sequence of reflectance readings from the testing surface of said matrix at specified time intervals" — "taking reflectance readings at times set in advance." *Home Diagnostics, Inc. v. Lifescan, Inc.*, 2002 U.S. Dist. LEXIS 27575 (N.D. Cal., Oct. 2, 2002).4383

"direct talk path"; "telephone emulation" — "A 'direct talk path' requires a voice pair or a data pair used to carry voice sounds and connected to voice detection circuitry, and 'telephone emulation' is impossible without [a] 'direct talk path.'" *Voice Technologies Group, Inc. v. VMC Systems, Inc.*, 164 F.3d 605 (Fed. Cir. 1999).4385
"tandem access points" — "a point at which a carrier's network is connected to the claimed network." Neutral Tandem, Inc. v. Peerless Network, LLC, et al., 2010 U.S. Dist. LEXIS 11248 (N.D. Ill., Feb. 8, 2010).  

"portable tangible medium" — "a non-volatile storage medium (e.g., printed receipt and/or a smart card) separate from the memory of the voting machine (and thus portable) in which the records stored and contained therein if changed would leave evidence of that change." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).  

"tangible receipt"; "printed receipt"; "printed paper" — "a reviewable printout of the voters' voting selections or choices or a corresponding voting session identifier that is retained by the voter." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).  

"tapping points" — "locations where electrical signals are transferred between, meaning to or from: (1) the tapping element and the stripline sections, segments or elements, (2) the tapping element and the center tap, or (3) the antenna radiating elements and the stripline sections, segments or elements." Kathrein-Werke KG v. Radiacion y Microondas S.A., et al., 2010 U.S. Dist. LEXIS 50468 (N.D. Ill., May 17, 2010).  

"task assistant" — "a feature that displays a list of tasks to be performed on a claim." Accenture Global Services GmbH, et al. v. Guidewire Software Inc., 2010 U.S. Dist. LEXIS 20087 (D. Del., Mar. 5, 2010).  

"task engine" — "a feature that generates the tasks that need to be performed in response to an event." Accenture Global Services GmbH, et al. v. Guidewire Software Inc., 2010 U.S. Dist. LEXIS 20087 (D. Del., Mar. 5, 2010).  

"telecentric lens means for peering into the well" — "As a matter of law, this Court construes that the term 'telecentric lens' is a sufficient structure to support the function of 'peering into the well.' The Court does not accept Defendant's argument of construing the telecentric lens as a limitation stemming from construing the phrase in means-plus-function format of 35 U.S.C. § 112 P6." Amersham Biosciences Corp., et al. v. PerkinElmer, Inc., 2006 U.S. Dist. LEXIS 32758 (D.N.J., May 23, 2006).
"telecommunication services" — "services typically provided on telecommunication networks, including voice communications, private branch exchange services, multimedia messaging, and information services." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).

"telecommunication switches" — "devices that set up calls and relay voice and/or data information from one connection to another." Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al., 518 F. Supp. 2d 1306 (D. Kan. 2007).

"telecommunications means" — "[is] a means-plus-function element, with the function being 'communicating with a host data processor' and the associated structure being 'a modem or its equivalent.'" Stored Value Solutions, Inc. v. Card Activation Technologies, Inc., 2010 U.S. Dist. LEXIS 41569 (D. Del., Apr. 28, 2010).

"telecommunications stage"; "telecom stage" — "the stage that serves to capture and pre-process signals from two or more communication channels and interfaces with the recorder stage." NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007).

"telecommunications system" — "is not limited to the network of a facilities-based IXC." AT&T Corp. v. Excel Communications, Inc., et al., 1999 U.S. Dist. LEXIS 17871 (D. Del., Oct. 25, 1999).

"telephone-communication facility" — "a telephone network that connects remote terminals and other devices having telephonic capabilities, such as the audio response units, for communication." Verizon California Inc. v. Ronald A. Katz Technology Licensing, L.P., 326 F. Supp. 2d 1060 (C.D. Cal. 2003).

"telephone communication link" — "does not need construction." In re Cygnus Telecommunications Technology, LLC Patent Litigation, 481 F. Supp. 2d 1029 (N.D. Cal. 2007).

"telephone connection means" — "one skilled in the art would recognize a telephone line as the structure performing the connecting and receiving functions." In re Cygnus Telecommunications Technology, LLC Patent Litigation, 481 F. Supp. 2d 1029 (N.D. Cal. 2007).

"telephone device"; "telephony device" — "a piece of equipment that uses electricity to send sound or speech to a distant point." BMC Resources, Inc. v. Paymetech, L.P., 2004 U.S. Dist. LEXIS 22536 (N.D. Tex., Nov. 4, 2004).

"telephone network"; "switched telephone network" — "a commercial system that establishes a route for telephone communication from one party to another." USA Video Technology Corp. v. Time Warner Cable, Inc., et al., 2007 U.S. Dist. LEXIS 92578 (E.D. Tex., Dec. 12, 2007).

"telephone number" — "is given its plain and ordinary meaning." Stanacard, LLC v. Rebtel Networks, AB, et al., 2010 U.S. Dist. LEXIS 1109 (S.D.N.Y., Jan. 5, 2010).

"telephone terminal" — "a standard landline telephone unit, which has a standard commercial handset, a touchtone pad, a display unit and an audio unit, and which may have a cordless handset." Furnace Brook LLC v. Overstock.com, Inc., 2006 U.S. Dist. LEXIS 73422 (S.D.N.Y., Sept. 27, 2006). "We agree with Furnace Brook insofar as it suggests that a 'telephone terminal' refers to a device for communicating over a telephone network: a cellular telephone and a personal computer are capable of such communication, and to the extent that they are used to do so, either device can constitute a 'telephone terminal.' But telephone communication, as discussed in the patent, requires more than just communication over a telephone line. It requires a dial-up connection to the catalog server at the other end of the connection." Id., 230 Fed. Appx. 984 (Fed. Cir., May 23, 2007) (unpublished).

"telephone wiring network" — "the network of twisted pair wires extending from the point of convergence where the signal interface may be installed downstream to telephone devices which is shared by information and telephone signals in a telephone voice band." Inline Connection Corp. v. AOL Time Warner, Inc., 2007 U.S. Dist. LEXIS 6209 (D. Del., Jan. 29, 2007).

"telephony events" — "actions or occurrences detected by a computer program and that related to what happens to a phone call (such as the initiation of the call, the addition or removal of callers, the transfer of the phone call, or the termination of the calls)." NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007).

"telescope" — "this Court construes the term 'telescope' to include both 'reflecting telescopes,' which use mirrors as optical elements, and 'refracting telescopes,' which use lenses as optical elements." Lasermax, Inc. v. Glatter, 2005 U.S. Dist. LEXIS 17136 (S.D.N.Y., Aug. 17, 2005).

"a television transmission system ... for transmitting television programs thereover for reception by a plurality of receivers"; "a television transmission system for transmitting programs thereover for reception by a plurality of receivers" — "a system that allows multiple viewers to choose the same program at the same time such that once the chosen program is scheduled for transmission on a particular channel, additional viewers can be added by transmitting the appropriate descrambling signals to the requesting viewer's receiver." In re: VTRAN Media Technologies, LLC, Patent Litigation, 2009 U.S. Dist. LEXIS 61328 (E.D. Pa., Jul. 17, 2009).

"the SNOOP signal telling said one of said second plurality of bus masters when to write cached data to the address appearing on the bus" — "the SNOOP signal indicating to one of the bus masters on the second bus when to write cached data to the one of the second data storage locations at the address appearing on the second bus." Computer Cache Coherency Corp. v. Via Technologies, Inc., 2007 U.S. Dist. LEXIS 81121 (N.D. Cal., Oct. 22, 2007). "[T]he claim language and the patent specification support the district court's construction." Id., 2010 U.S. App. LEXIS 19775 (Fed. Cir., Sep. 22, 2010) (unpublished).
"temperature controller" — "The district court construed 'temperature controller' to mean 'the switch, power amplifier or like device that directly adjusts the flow of electric power to one or more heating elements. The temperature controller includes a means for converting temperature data.' Neither party objected to the instructions at trial. Under these circumstances 'the issue [is] limited to the question of whether substantial evidence supported the verdict under the agreed instruction.' Cytologix Corp. v. Ventana Medical Systems, Inc., 424 F.3d 1168 (Fed. Cir. 2005).

"temperature controller electronic circuits" — "The district court's instruction defined the phrase to mean 'electronic components, wiring, and printed circuit board which comprise the power amplifying device and decoder',' since neither party objected to the instruction, we look to see whether there is substantial evidence under the agreed instruction." Cytologix Corp. v. Ventana Medical Systems, Inc., 424 F.3d 1168 (Fed. Cir. 2005).

"template" — "the only issue regarding this term that may be resolved at this stage of the proceedings is that template can be 'filled in by a compiler during compilation.' Freyburger LLC v. Microsoft Corp., 2009 U.S. Dist. LEXIS 86344 (W.D. Wis., Sep. 21, 2009).

"active template containing terms for use during such a negotiation" — "[a] set of predefined data fields for terms to be negotiated using the automated negotiations engine that is configured so that certain fields can be used automatically by other programs." Sky Technologies, Inc. v. Ariba, Inc., 491 F. Supp. 2d 154 (D. Mass. 2007).

"temporarily assigned network address" — "an address that is assigned to a user and identifies a user only for the duration of a networking session." LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al., 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010).

"temporary storage device" — "a device intended to store data for an impermanent basis and allows for stored data to be retrieved from the storage device while the data resides therein." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 2004 U.S. Dist. LEXIS 13415 (C.D. Cal., Jul. 12, 2004).

"terminal" — "any point on a semiconductor device that can be used to connect the device to the leads." Texas Instruments, Inc. v. Cypress Semiconductor Corp., et al., 1995 U.S. Dist. LEXIS 20328 (N.D. Tex., Aug. 28, 1995).

"terminal" — "a point-of-sale apparatus, which includes a central processing unit, a card reader, a keypad, and a communications interface." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).

"terminal" — "an end point for electrical connection of the package to the outside. It is not necessary that a terminal be externally accessible when the chip package is fully assembled." Samsung Electronics Co., Ltd. v. Tessera Technologies, Inc., 2004 U.S. Dist. LEXIS 31074 (N.D. Cal., Jan. 8, 2004).
"terminal device" — "a computing device such as a data terminal, workstation, portable computer, or smart phone that enables a user to communicate with a host processor. It manages its associated display itself and manages its internal memory with the assistance of the host processor." Lucent Technologies Inc. v. Gateway, Inc., et al., 2007 U.S. Dist. LEXIS 36219 (S.D. Cal., May 16, 2007). The court adopts Judge Brewster's construction of 'terminal device' in the Gateway action. Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005).

"terrain" — "the surface features of an area of land, an object, or a material, including color, elevation, and existing objects or structures on the land, object or material." Skyline Software Systems, Inc. v. Keyhole, Inc., et al., 421 F. Supp. 2d 371 (D. Mass. 2006).

"terrain floor boundary" — "a boundary that extends downwardly below the aircraft which is proportional to the distance to the closest runway." Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al., 488 F.3d 982 (Fed. Cir. 2007).

"test signal" — "a 'test signal' is a 'signal associated with testing.' In several of the asserted claims, however, additional claim language limits the term to a 'signal that initiates testing.'" Koninklijke Philips Electronics NV, et al. v. Defibtech LLC, et al., 397 F. Supp. 2d 1257 (W.D. Wash. 2005).

"the" — "If only some of the transformer's energy needed to be recycled, the word 'the' would not have been used." VLT Corp., et al. v. Lambda Electronics, Inc., 238 F. Supp. 2d 347 (D. Mass. 2003).
"includes the average elapsed time between visits" — "includes a single value representing the calculated average time between visits."  

"the computer" — "The term 'the computer' simply refers to 'a computer' that is programmed to perform the functions of the '474 Patent. Although one embodiment of the Patent can operate using a single computer, the plain language of the claim illustrates that the Patent does not require operating only one computer."  

"the digital data" — "the data as it is output by the analog to digital converter, and/or the data as it is output by the analog to digital converter after it has undergone additional processing, such as digital signal processing."  

"the digital information signal" — "refers to the signal as it exists at the time it is written into memory."  

"the home page" — "the claims' use of the article 'the' preceding 'home page' (i.e. 'the home page') implies that any objective definition must identify just one page. Upon further review, the court does not alter its construction. ... [T]here is no 'objective anchor' that exists for 'the home page' as used in the claims. ... The court concludes, therefore, that claims 1 and 18 are invalid for indefiniteness."  

"the master controller" — "the Court is not prepared to strike the entire claim from this patent because of a misused article. As such, the Court will construe 'the master controller' as 'a master controller.'"  

"partitioning the memory cells within the individual sectors into at least a user data portion and an overhead portion" — "Nothing in the claims precludes additional memory cell configurations, which need not contain such partitioned sectors. Second, claims 1 and 10 are self-evidently drawn to claimed methods. It is fully consistent with practicing the claimed invention to make additional, unclaimed use of Flash EEPROM memory cells, so long as each limitation is satisfied."  
Sandisk Corp. v. Memorex Products, Inc., et al., 415 F.3d 1278 (Fed. Cir. 2005).  

"retrieving one of the sets [of] data from the memory representing one of the fuel delivery limit curves when the cruise control is engaged; ... retrieving the other set of data from the memory representing the other fuel delivery limit curve when the cruise control is not engaged" — "require the retrieval of one set of data representing a fuel delivery limit curve if the cruise control is engaged, and the retrieval of a different set of data representing a different fuel delivery limit curve if the cruise control is not engaged."  
"the output of said waveform memory" — "Yamaha's interpretation would change 'the' in the last clause to 'an.' The claim, however, cannot bear such a weight. Unless there exists a strong indication to the contrary, Yamaha must live with its choice of claim language and the inferences to be drawn therefrom. The language of the claim therefore supports the interpretation requiring the same output value to be both fed-forward and fed-back." *Yamaha Corp. v. ESS Technology, Inc.*, 1996 U.S. App. LEXIS 7631 (Fed. Cir., March 29, 1996) (unpublished).  

"the plurality of media player devices including a media asset portability application" — "two or more 'media player devices,' with at least one of the devices having software permitting a 'media asset' to be copied or moved." *Zapmedia Services, Inc. v. Apple Inc.*, 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010).  

"one or more parts within the plurality of parts" — "In some contexts, 'the plurality of parts' or similar terms may be confusing to a lay jury. Here, the antecedent 'plurality of parts' is identified in the previous step. Given the close proximity of the phrases, it is highly unlikely to be confusing." *Orion IP, LLC v. Staples, Inc., et al.*, 406 F. Supp. 2d 717 (E.D. Tex. 2005).  

"the selection circuit" — "The Court finds that the use of 'the' instead of 'a' to be an error in drafting that does not obscure the ability of the Court to discern a meaning of 'the selection circuit,' when the claim language is construed in light of the specification." *Zoltar Satellite Alarm Systems, Inc. v. Motorola, Inc., et al.*, 2007 U.S. Dist. LEXIS 95521 (N.D. Cal., Dec. 21, 2007).  

"the server" — "deciding which 'server' is described in Claims 26, 27, and 29 is a toss-up. Given the claim language, it is just as likely to be the 'initial server' as the 'central server.' True, with a 50-50 chance one can pick the initial server and argue that it is not insolubly ambiguous, merely debatable. But the only 'debate' is how the coin toss comes out. Therefore, the court finds that this term is insolubly ambiguous." *E-Watch, Inc., et al. v. March Networks Corp.*, 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006).  

"forming a doped gate electrode ... then ... differentially thermally growing an oxide ... whereby a relatively thicker layer of oxide is developed on the top and sides of the gate electrode and a relatively thinner layer of oxide is developed on the intended source and drain regions of the substrate"; "forming a doped polysilicon gate electrode ... growing a dielectric layer over the gate electrode by a process controlled to develop a high differential of dielectric thickness such that the dielectric is relatively thick over the top and sides of the gate electrode and relatively thinner over the intended source/drain regions"; "forming a doped gate electrode ... then ... establishing an isolating oxide on the top and sides of the gate electrode and over the substrate adjacent the gate electrode such that the oxide on the top and sides of the gate electrode is relatively thick compared to the oxide over the substrate, including oxidizing in a steam atmosphere at a temperature which promotes high differential rates of growth of oxide as between the doped poly gate electrode and the substrate" — "all ... require doping of the gate electrode prior to the differential dielectric growth step." *Thorn EMI North America, Inc. v. Intel Corp.*, 928 F. Supp. 449 (D. Del. 1996).  

"third data link" — "a third communications link that is either a separate link or a combination of the first and second links." Rowe International Corp. v. Ecast, Inc., 500 F. Supp. 2d 891 (N.D. Ill. 2007). 4472

"third party" — a "payment receiver, i.e., a party that is neither the merchant or the merchant processor." AdvanceMe, Inc. v. Rapidpay, LLC, et al., 2006 U.S. Dist. LEXIS 92444 (E.D. Tex., Dec. 21, 2006). 4473

"a third party for determining" — "a party, other than the first or second parties, that performs the determining step of the claim." Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010). 4474

"thread" — "the execution of a sequence of instructions constituting one of the possibly many procedures, functions or subroutines within the program. Further, when interrupted, a thread's context must be saved and retrievable when a thread is reassigned control of the CPU and resumes execution." Reiffin v. Microsoft Corp., 2002 U.S. Dist. LEXIS 21690 (N.D. Cal., Apr. 30, 2002). 4475

"threshold" — "the value of current, voltage or other quantity at which something happens." O2 Micro International Ltd. v. Sumida Corp., et al., 2005 U.S. Dist. LEXIS 46584 (E.D. Tex., Mar. 8, 2005). 4477

"threshold voltage" — "the critical gate electrode to source electrode voltage that determines whether a field effect transistor is on or off." UniRAM Technology, Inc. v. Monolithic System Technology, Inc., 2006 U.S. Dist. LEXIS 21661 (N.D. Cal., March 30, 2006). 4479

"through" — "we are dealing with electric current, which by definition passes 'through' the circuitry in the common-sense usage of that term, as contrasted with the wholly figurative concept of passing 'through' a traffic light." Calabrese v. Square D Co., 14 F. Supp. 2d 1050 (N.D. Ill. 1998). 4480 "The court will therefore define the word 'through' as used in the claim as follows: 'to go past, or to enter into and to exit.'" Id., 1999 U.S. Dist. LEXIS 21160 (N.D. Ill., Dec. 21, 1999). 4481

"throughput maximizing unit for processing said memory requests" — "The court concludes that 'throughput maximizing unit for processing said memory requests . . .' is not a means-plus-function limitation. The court therefore adopts the plaintiff's construction and construes 'throughput maximizing unit for processing said memory requests' as an 'element of the controller that processes memory requests in response to scheduling constraints of the synchronous DRAM which maximizes the use of data slots.'" Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005). 4484

"time division multiplexed bus" — "a bus wherein data from a data source is put into time intervals and arranged as a repeating series of frames or templates." Negotiated Data Solutions, LLC v. Dell, Inc., 596 F. Supp. 2d 949 (E.D. Tex. 2009). 4488

[i] "time integration quantity of a brightness change"; [ii] "ideal quantity of light in a stationary state" — [i] "a quantity of light equal to the actual brightness level output through a liquid crystal, summed over the rise and fall response time of the liquid crystal"; [ii] "quantity of light emitted by a pixel during one time increment in which the pixel is in a non-changing state." LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 12969 (D. Del., Feb. 16, 2010). 4489

"time slot" — "one of 8 physical channels in each time-division multiple access (TDMA) frame of a 200 kHz GSM radio channel." WiAV Solutions LLC v. Motorola, Inc., et al., 2010 U.S. Dist. LEXIS 30711 (E.D. Va., Mar. 29, 2010). 4490

"time slot assigned to each of said application programs" — "[t]he court construes 'time slot' to mean 'an interval of time during which data from an application program is transmitted.' All other terms have their plain and ordinary meaning." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007). 4491

"a time-space-time (TST) switch having a space switch including a plurality of inlet ports and a plurality of outlet ports each having a memory" — "a structure with time-switch input and output stages, and with one or more intermediate space-switch stages containing only structure for space translation." Arthur A. Collins, Inc. v. Northern Telecom Ltd., et al., 216 F.3d 1042 (Fed. Cir. 2000). 4492
"time stamp bits representing the time at which said cellular telephone signals were received" — "binary units representing the time when cellular telephone signals were received at the cell site." TruePosition, Inc. v. Andrew Corp., 2007 U.S. Dist. LEXIS 62702 (D. Del., Aug. 23, 2007).

"time vector for each of the joints, the time vector containing three variables which are functions of time whose values correspond to a linear interpolant between the upper limit and the lower limit of the rotational range, on, respectively, each of the rotational axes" — "at any given time, t, this equation is used to specify (by values that can be mathematically combined) the angular position of a joint about each axis of rotation between the upper and lower end point values: j+(k-j)*j(t), where j represents the lower limit value of a rotation about a given axis, k represents the upper limit value of a rotation about the axis, and j(t) is a function whose value varies with time between zero and one." New York University v. Autodesk, Inc., 2007 U.S. Dist. LEXIS 26671 (S.D.N.Y., April 10, 2007).

"time-division multiplexed bus" — "a bus having a bandwidth partitioned into a defined, repeated sequence of time slots, that is shared by two or more sources of data by limiting each source's transmission opportunities to discrete intervals of time." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007).

"timeslice" — "the fixed, predetermined length of time during which each thread is given uninterrupted control of the CPU, at the expiration of which the executing thread is preempted in favor of another thread." Reiffin v. Microsoft Corp., 2002 U.S. Dist. LEXIS 21690 (N.D. Cal., Apr. 30, 2002).

"timing circuit" — "an assemblage of electronic components that cuts off the power to the light source a predetermined time after a switch, responsive to the motion of the footwear, transitions between the 'off' to the 'on' state. The timing circuit cuts off the power to the light source regardless of the position of the switch, i.e., if the switch remains in the 'on' position, the light source will be disconnected from the power source, preventing battery exhaustion." Orlaford Ltd., et al. v. BBC International, Ltd., et al., 1999 U.S. App. LEXIS 9712 (Fed. Cir., May 20, 1999) (unpublished).
"a timing module having an input coupled to said trigger output of said resistive switch, a control output coupled to said generator control input and an arm/disarm output coupled to said arm/disarm input of said resistive switch" — "a specific distinct timing module having an input and two outputs. The input is connected to the trigger output of the resistive switch. A control output is connected to the high voltage generator control input. An arm/disarm output is connected to the arm/disarm input of the resistive switch." Agrizap, Inc. v. Woodstream Corp., et al., 431 F. Supp. 2d 518 (E.D. Pa. 2006). 4501

"said timing module disarms said trigger circuit of said resistive switch upon said activation of said timer module until said timer module is reset" — "the timing module has an output that is coupled to the trigger circuit of the resistive switch to disarm the trigger circuit until a power on reset signal re-enables or re-sets the timing module." Agrizap, Inc. v. Woodstream Corp., et al., 431 F. Supp. 2d 518 (E.D. Pa. 2006). 4502

"titanium film containing nitrogen atoms" — "a thin titanium layer with nitrogen atoms. It may be a composite film including a thickness with a substantial nitrogen concentration and a thickness with little or essentially zero nitrogen concentration. It may include titanium nitride at some point in its thickness." OKI Electric Industry Co., Ltd. v. LG Semicon Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999). 4506

"to a monitor mode" — "to the point the microprocessor is executing a line of code as part of the program." Bed-Check Corp. v. Ultimate Safety, Inc., 2003 U.S. Dist. LEXIS 27845 (N.D. Okla., Nov. 24, 2003). 4509

"to a television set" — "directly to a television set and not to any component residing outside of a television set." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003). 4510

"to allow the devices to withstand relatively high breakdown voltages" — "to permit improvements in breakdown performance of the base-drain junction, even in designs where breakdown first occurs in other locations of the device." International Rectifier Corp. v. IXYS Corp., 2001 U.S. Dist. LEXIS 25712 (C.D. Cal., Jul. 16, 2001). 4511

"a remote control system ... for permitting a viewer of said television to direct said microcontroller to perform a search on at least said updated television programming information contained in said RAM of said microcontroller" — "The phrase 'to perform a search' means a user-directed examination by the microcontroller of all the television programming information stored in the random access memory of the system and the retrieval of a subset of that information which meets the criteria specified by the user for display on the television set." SuperGuide Corp. v. DirecTV Enterprises, Inc., et al., 169 F. Supp. 2d 492 (W.D.N.C. 2001). 4513

"processing ... an electronic payment ... from the user to the one of the multiple institutions to which the form is directed" — "does not require a system that allows a form to go to multiple institutions." CollegeNET, Inc. v. Xap Corp., 442 F. Supp. 2d 1036 (D. Or. 2006). 4514

"token" — "a file indicating whether access should be granted." Digital Reg of Texas, LLC. v. LFP Internet Group, LLC, et al., 2009 U.S. Dist. LEXIS 59610 (E.D. Tex., Jul. 13, 2009). 4515

"token" — "a data structure consisting of a name; an identifier of an element with which the token is associated; an identifier of the method by which the value field may be populated; and the value field, which holds the value associated with the element, which can include an empty value." Sun Microsystems Inc v. Network Appliance, 2009 U.S. Dist. LEXIS 48209 (N.D. Cal., May 29, 2009). 4516

"total area of said single substrate"; "total area of said substrate" — "the total top surface area of the substrate." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007). 4518

"total traffic load" — "information indicative of the aggregate traffic of a multiplexed output data stream obtained from the traffic load parameters of all input data streams forming said multiplexed output data stream." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 4519

"total wager amount" — "The theoretical sum of all wagers made for each prize award event. The total wager amount must be of a value that will support all the criteria for the prize starting value, increment values, and any other values generated as a result of contribution percents applied against wagers. The total wager amount serves as a link between devices and a progressive prize." Goff v. Harrah's Operating Co., 412 F. Supp. 2d 1090 (D. Nev. 2005). 4520

"tournament period for each tournament game" — "a period of time, set during the setup mode, during which each tournament game in a sequence can be played." Merit Industries, Inc. v. JVL Corp., 2007 U.S. Dist. LEXIS 63418 (E.D. Pa., Aug. 24, 2007). 4524

"track" — "a grouping of one or more packets, each of which is comprised of a grouping of contiguous user data blocks"; "a sequence of sectors, the sector numbers of which form a contiguous ascending sequence. No sector belongs to more than one track." Optima Technology Corp. v. Roxio, Inc., 2004 U.S. Dist. LEXIS 30262 (C.D. Cal., Sept. 30, 2004). 4525

"track information map" — "a data structure that is stored on the last use data blocks on the last packet of the track. It contains the start logical block address of the directory, and the start and end logical block address of every track." Optima Technology Corp. v. Roxio, Inc., 2005 U.S. Dist. LEXIS 43210 (C.D. Cal., Oct. 24, 2005). 4526

"track pitch" — "the distance between the center of adjacent tracks, as measured in the radial direction." Toshiba Corp. v. Imation Corp., et al., 2010 U.S. Dist. LEXIS 45653 (W.D. Wis., May 10, 2010). 4527

"tracking movement of the device relative to a region of an environment in which said device resides" — "tracking movement of the device relative to a region of the three-dimensional space in which said device may operate." Avago Technologies General IP PTE, et al. v. Elan Microelectronics Corp., 2006 U.S. Dist. LEXIS 62700 (N.D. Cal., Aug. 18, 2006). 4528

"traditionally connectible"; "standard I/O port" — "mean devices that were 'traditionally connectible' and I/O ports that were 'standard' at the time of the invention. Therefore, the Court defines traditionally connectible as a device that would be connectible to a computer as it was in October of 1988." PC Connector Solutions LLC v. Smartdisk Corp., et al., 2003 U.S. Dist. LEXIS 26452 (M.D. Fla., Oct. 8, 2003). 4529

"traffic channel encoding selector" — "a module that selects the encoding scheme to apply to a traffic channel." WiAV Solutions LLC v. Motorola, Inc., et al., 2010 U.S. Dist. LEXIS 30711 (E.D. Va., Mar. 29, 2010). 4530

"traffic load parameters (ABR, MBR)" — "two or more parameters each of which characterize at least the data rate of an input data stream." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 4531

"transaction type"; [ii] "transaction parameter" — [i] "a particular kind, class, or group of electronic transfer[s] of funds or a particular kind, class, or group of electronic inquiry[ies] as to funds. Examples of transaction types include withdrawals, deposits, transfers, payments, and balance inquiries."; [ii] "a property whose value determines the characteristics of (1) an electronic transfer of funds, or (2) an electronic inquiry as to funds. Examples of transaction parameters include the identification of the specific account, and the specific dollar amount." *IPXL Holdings, L.L.C. v. Amazon.com, Inc.*, 333 F. Supp. 2d 513 (E.D. Va. 2004).

"transfer peripheral device command" — "a command received by a peripheral device -- after it has entered the waiting state in response to the initiator peripheral device command -- from an operating system in response to a transfer peripheral device request sent by an application program to the operating system, and which causes the peripheral device to receive new microcode." *Hewlett-Packard Co., et al. v. EMC Corp.*, 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).

"transferring a device pattern on a workpiece" — "conveying, through a photolithographic process, the pattern for an integrated circuit or similar item onto a substrate with a photoresist layer." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004).  

"transferring electrical energy at a predetermined radio frequency range as arcs in ionized conductive pathways at a predetermined power level within the gas jet in an electrical circuit which includes the tissue" — "transferring electrical energy, at a predetermined radio frequency from the RF drive to a resonant output circuit to the pencil to the needle-like electrode, which extends into the nozzle, to the tissue as arcs in ionized conductive pathways in a gas jet." Erbe Elektromedizin GmbH, et al. v. Canady Technology, LLC, et al., 512 F. Supp. 2d 297 (W.D. Pa. 2007).  

"transform object" — "a collection of data and operations that transforms the form of data upon which it operates." TiVo Inc. v. EchoStar Communications Corp., et al., 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005).  

"transformation component" — "a transformation component is the same as a transformation object, which is a software binary file acting as an individual unit that possesses built-in autonomy and encapsulates the functionalities of a transformation." Informatica Corp. v. Business Objects Data Integration, Inc., 2005 U.S. Dist. LEXIS 46869 (N.D. Cal., Aug. 1, 2005).  

"transformed signal having a predetermined mathematical relationship" — "means a signal representative of light of a second wavelength scattered by the tissue sample and that has a predetermined mathematical relationship to the first probe signal. There is no requirement that the transformation itself must be performed based on a predetermined mathematical relationship." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003).  

"a transformer having a primary side and a secondary side" — "a device, which when used, will raise or lower an incoming voltage, having a side receiving the incoming voltage, and a side outputting the raised or lowered voltage." O. Micro International Ltd. v. Samsung Electronics Co., Ltd., et al., 2006 U.S. Dist. LEXIS 43904 (E.D. Tex., June 28, 2006).  

"transforming" — "converting each of the color characters to monochromatic characters by replacing the pixels in the color character that represent the foreground colors with the corresponding color pattern masks for those colors and by replacing the pixels in the color character that represent the background colors with the corresponding color pattern masks for those colors." OKI Electric Industry Co., Ltd. v. LG Semiconductor Co., Ltd., et al., 1999 U.S. Dist. LEXIS 22625 (N.D. Cal., Jul. 19, 1999).
"transistor" — "only a single transistor with a source, drain and a gate."  

"transit traffic" — "traffic between one telecommunications carrier and another such carrier, transmitted by a third carrier in a local region regardless of any other transport of the call."  

"transition times" — "time periods during which a change of a voltage waveform occurs across a primary winding."  

"translation circuitry" — "electrical components that make the sensor and meter electrically and physically compatible."  

[i] "translator"; [ii] "translating" — [i] "software routines or code that convert information or data in one format to information or data in a second format."; [ii] "converting information of data in one format to information or data in another format."  

"transmission" — "sending."  

"transmission means" — "must be construed as a means-plus-function limitation."  

"transmission channels" — "paths for transmitting electronic signals which are differentiated by their frequencies."  

"transmission line" — "lossy physical media, such as lines, wire and cable."  

"transmission times" — "Transmission times' are 'reserved' by setting aside time for transmitting portions of the information database that are requested by subscribers."  

"transmission system" — "an assembly of elements, hardware and software, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system."  
Acacia Media Technologies Corp. New Destiny Internet Group, et al., 405 F. Supp. 2d 1127 (N.D. Cal. 2005) 4567  "An apparatus which comprises the following interconnected components: a source material library means, an identification encoding means, a conversion means, an ordering means, a compression means, a compressed data storing means (as illustrated in the block diagram labeled Figure 2a), and a compressed data storage means and a transmitter means (as illustrated in the block diagram labeled Figure 2b). The corresponding structure for each means is the structure identified in the specification for performing the recited function."  
Id., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006) 4568

- 421 -
"transmission system at a first location" — "a transmission system at one particular location separate from the location of the reception system." Acacia Media Technologies Corp. v. New Destiny Internet Group, et al., 405 F. Supp. 2d 1127 (N.D. Cal. 2005). 4569

"transmit/transmitting information regarding the acceptance and rejection of the onsite and remote auction bids" — "transmit[ting] facts or data regarding the acceptance and rejection of bids submitted by onsite and remote bidders." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 4570

[i] "transmitted symbol"; [ii] "received symbol" — [i] "a symbol that is in the process of being transmitted which may or may not be in the transmitter"; [ii] "a symbol that is in the process of being received which may or may not be in the receiver." Globespanvirata, Inc. v. Texas Instruments, Inc., et al., 2005 U.S. Dist. LEXIS 5744 (D.N.J., Apr. 6, 2005). 4574

"transmitting"; "transmitted" — "the propagation of a signal from the first location to the second, and does not include the sending of information by mail." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001). 4576

"transmitting, by means of the data processing system, overt terms data representing the overt terms of the offer to trade to at least one party" — "no interpretation necessary." Tradecard, Inc. v. S1 Corp., et al., 509 F. Supp. 2d 304 (S.D.N.Y. 2007). 4578

"transmitting in sequence a plurality of response command signals" — "should not be construed to provide for an automatic transmitting of a plurality of response command signals. Rather, these words are broad enough to include a user transmitting in sequence one at a time a plurality of response command signals." Phillips Electronics North America Corp. v. Universal Electronics Inc., 930 F. Supp. 986 (D. Del. 1996). 4579

"transmitting said e-mail message and executable software associated with said e-mail message from said first computer using said first e-mail platform to said second computer using said second e-mail platform" — "requires sending the executable software with the email message." PostX Corp. v. Secure Data In Motion, Inc., 2003 U.S. Dist. LEXIS 25754 (N.D. Cal., Nov. 25, 2003) (emphasis in original). 4580

"a transmitting terminal" — "one or more devices that transmit a WDM optical signal." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009) 4583

"transmitting the requested resource to the client" — "does not require data transmitted from the server to the client to bypass the load balancer." Resonate, Inc. v. Alteon Websystems, Inc., 338 F.3d 1360 (Fed. Cir. 2003). 4584

"transmitting the proposed reservation time to the PCD" — "sending the proposed reservation time to the PCD." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006). 4585

"transmitting ... to said device" — "transmitting information directly to the device without retransmission of the information by an intermediate processor." Foundry Networks v. Lucent Technologies, Inc., 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005). 4587

"transmitting to a user remote access device at least one specific voice message linked to a specific one of said received first signals" — "the concept of 'play back' does not appear to be inherent in the word 'transmitting,' nor does Vonage point to anything in the intrinsic record, aside from a specific embodiment described in the specification, suggesting otherwise. The Court declines to incorporate details of a disclosed embodiment into a claim term in the absence of clear direction otherwise from the intrinsic record." Klausner Technologies, Inc. v. Vonage Holdings Corp., et al., 2007 U.S. Dist. LEXIS 57604 (E.D. Tex., Aug. 7, 2007). 4588

"transmits primarily non-video information on at least one other one of said multiplicity of transmission channels" — "most of the information which is transmitted on at least one of the frequencies is non-video information." Finisar Corp. v. Directv Group, Inc., et al., 2006 U.S. Dist. LEXIS 33633 (E.D. Tex., April 19, 2006). 4589

"transparent" — "to perform in a manner that is invisible to, and of no concern to a user." Hybrid Patents Inc. v. Charter Communications, Inc., et al., 2007 U.S. Dist. LEXIS 33062 (E.D. Tex., May 4, 2007). 4590

"transparent" — "transmitting light without appreciable scattering in a manner such as ordinary window glass so that objects placed behind the placard are clearly distinguishable." MPT, Inc. v. Marathon Labels, Inc., et al., 2006 U.S. Dist. LEXIS 4612 (N.D. Ohio, Feb. 7, 2006). 4591

"transparent light scattering materials" — "material that is transparent, such as, but not limited to, glass, epoxy, liquid, or gas, including air." Texas Digital Systems, Inc. v. Telegenix, Inc., 2000 U.S. Dist. LEXIS 18360 (N.D. Tex., Dec. 6, 2000). 4592
"transparent window layer" — "a transparent layer that spreads current, composed of semiconductor material different from AlGaInP, where the material has a bandgap greater than the bandgap of the active layers and a resistivity lower than the active layers." Epistar Corp. v. International Trade Commission, et al., 566 F.3d 1321 (Fed. Cir. 2009). 4591

"trap sequence number" — "a number associated with a trap from a particular network element, which can be, and is, used to determine the order in which that trap has been sent with respect to other traps from the same network element." Cisco Systems, Inc., et al. v. Telcordia Technologies, Inc., 2007 U.S. Dist. LEXIS 58650 (E.D. Tex., Aug. 10, 2007). 4594

"traversing" — "navigation according to a specific path or route." Leader Technologies, Inc. v. Facebook, Inc., 2010 U.S. Dist. LEXIS 21100 (D. Del., Mar. 9, 2010). 4595

"trellis encoded channel symbol" — "a set of one or more trellis encoded signal points that corresponds to a group of bits that is treated as a unit by an encoding system." Rembrandt Technologies, L.P. v. Comcast Corp., et al., 512 F. Supp. 2d 749 (E.D. Tex. 2007). 4597

"trellis encoding ones of the aggregated bits to identify, for each of the plurality of symbols, a respective subset from which that symbol is to be chosen" — "trellis encoding some of the aggregated bits to identify one or more subsets, from each of which one symbol is to be chosen." Agere Systems, Inc. v. Broadcom Corp., 2004 U.S. Dist. LEXIS 14992 (E.D. Pa., Aug. 2, 2004). 4598

"a plurality of trenches" — "the court rejects Hynix's construction and the court declines to construe this straightforward term." Toshiba Corp. v. Hynix Semiconductor Inc., et al., 2006 U.S. Dist. LEXIS 63313 (N.D. Cal., Aug. 21, 2006). 4601

"trigger means" — "the 'trigger means' claim element does not recite sufficient structure to perform the undisputed function of selectively activating." Quantronix, Inc. v. Data Trak Technologies, Inc., et al., 503 F. Supp. 2d 1152 (D. Minn. 2007). 4604

"triggering signal"; "triggering event signal"; "triggering activity signal" — "one or more signals sent from the motion detector in response to activity detected by the motion detector." *Good Sportsman Marketing LLC v. Testa Associates, LLC, et al.*, 440 F.Supp.2d 570 (E.D. Tex. 2006). 4606

"triggering the activation of a high voltage and current generator in response to said sensed presence" — "the sensed presence of a pest results in an immediate and irreversible triggering of the high voltage and current generator." *Agrizap, Inc. v. Woodstream Corp., et al.*, 431 F. Supp. 2d 518 (E.D. Pa. 2006). 4607

"a trinary code generator for generating a three-valued or trinary code responsive to the variable binary code" — "a processor programmed to generate a trinary code in response to the variable binary code." *Chamberlain Group, Inc. v. Lear Corp.*, 2006 U.S. Dist. LEXIS 68899 (N.D. Ill. Sept. 11, 2006). 4608

"trusted time source" — "a real time clock, which is not resettable, is independent of any system clock of the PC, and is installed locally relative to the PC." *Timecertain, LLC v. Authentidate Holding Corp., et al.*, 2006 U.S. Dist. LEXIS 92789 (M.D. Fla., Dec. 22, 2006). 4610

"tuning said TV signals to a specific program" — "tuning said TV signals to a specified frequency range." *TiVo Inc. v. EchoStar Communications Corp., et al.*, 2005 U.S. Dist. LEXIS 46879 (E.D. Tex., Aug. 18, 2005). 4611

"layer 2 tunnel" — "communication path between a remote client and a local network through an intermediary, operating according to a layer 2 forwarding protocol." *Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc.*, 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002). 4613

"tunnel identifier" — "an indicator such as an integer that specifies a tunnel, but does not use addresses." *UTStarcom, Inc. v. Starent Networks, Corp., et al.*, 2009 U.S. Dist. LEXIS 93869 (N.D. Ill., Sep. 16, 2009). 4615
(1) "turn-off data"; (2) "turn-off delay period"; (3) "turn-off period"; (4) "turn-on data"; (5) "turn-on delay period"; (6) "turn-on period" — (1) "data indicating when to stop generating an output"; (2) "the time to wait from an event before turning on an output," and "the time to wait from an event before turning off an output"; (3) "the time to wait from an event before turning off an output"; (4) "data indicating when to generate an output"; (5) "the time to wait from an event before turning on an output"; (6) "the time to wait from an event before turning on an output." *Power-One, Inc. v. Artesyn Technologies, Inc.*, 2007 U.S. Dist. LEXIS 20458 (E.D. Tex., March 22, 2007). 4616

"twisted pair" — "twisted pair' wiring, which is used in the '919 patented invention to conduct analog video signals, may be either 'shielded' or 'unshielded." *Avocent Huntsville Corp. v. Clearcube Technology, Inc.*, 443 F. Supp. 2d 1284 (N.D. Al. 2006). 4617

"type information" — "may include the name of an application associated with the object." *Eolas Technologies, Inc. v. Microsoft Corp.*, 2000 U.S. Dist. LEXIS 18886 (N.D. Ill., Dec. 28, 2000). 4619

- U -

"USB" — "an abbreviation for 'Universal Serial Bus,' which is a computer standard technology described in Universal Serial Bus Specification Revision 2.0 and the prior versions of this standard. The court does not reach the issue of whether the term as used in the patent is compatible with possible future versions of the USB specification." *DisplayLink Corp. v. Magic Control Technology Corp.*, 615 F. Supp. 2d 1051 (N.D. Cal. 2009). 4620

"USB based display signals" — "USB encoded display signals." *DisplayLink Corp. v. Magic Control Technology Corp.*, 615 F. Supp. 2d 1051 (N.D. Cal. 2009). 4621

"USB controller" — "USB Controller" is a device that receives a USB display signal, holds it until it receives a bus command, and then forwards the USB display signal out on a FIFO basis." *DisplayLink Corp. v. Magic Control Technology Corp.*, 615 F. Supp. 2d 1051 (N.D. Cal. 2009). 4622

"data to be permanently stored in memory in an unalterable fashion" — "data to be stored in memory in a non-volatile manner and in such a way that the data cannot be changed." *Avid Identification Systems, Inc. v. Philips Electronics North America Corp., et al.*, 2006 U.S. Dist. LEXIS 35477 (E.D. Tex., Feb. 3, 2006). 4623

"occurring under the direction of the auctioneer" — "occurring under the complete control of the auctioneer." *Auction Management Solutions, Inc. v. Adesa, Inc.*, 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 4625
[undisputed claim limitations] — "Although the construction of the claim is independent of the device charged with infringement, it is convenient for the court to concentrate on those aspects of the claim whose relation to the accused device is in dispute." Pall Corp. v. Hemasure, Inc., 181 F.3d 1305, 1308-09 (Fed. Cir. 1999). "[W]e are reviewing only certain disputed terms of the claim construction and lack the power to construe other terms not disputed by the parties." MBO Laboratories, Inc. v. Becton, Dickinson & Co., 474 F.3d 1323 (Fed. Cir. 2007).

"uniaxial medium" — "a type of birefringent material wherein the values of two of the principal optical indices (called the ordinary indices) are equal to each other and the third optical index (called the extraordinary index) has a different value." Commissariat a l'Energie Atomique v. Samsung Electronics Co., et al., 524 F. Supp. 2d 498 (D. Del. 2007).

"unified execution of multiple media data streams" — "processing two or more different types of media data streams by the same execution unit." Microunity Systems Engineering, Inc. v. Dell, Inc., et al., 2005 U.S. Dist. LEXIS 36814 (E.D. Tex., Aug. 26, 2005).

"unique" — "a random or pseudo-random number (alphanumeric character or symbol) or number randomly chosen from a unique sequence of numbers." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).

"a unique audio data signal in IP protocol representing a specific visual condition to be monitored" — "[i]nformation: a. which is transmitted in a protocol compliant with the internet; b. is about a condition, which can be heard, and which has been chosen to be observed; and c. which distinctly identifies the condition being observed." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006).

"unique authorized information" — "information associated with each object, unique to that object and authorized by the '422 patent's system, but excluding information other than serial information alone or randomly-selected information alone." CIAS, Inc. v. Alliance Gaming Corp., et al., 424 F. Supp. 2d 678 (S.D.N.Y. 2006).

"unique identifier"; "unique randomly assigned identifying number" — "random or pseudo random number (or alphanumeric character or symbol) or number randomly chosen from a unique sequence of numbers assigned to a particular voting session which the voter takes away at the end of the voting session to enable the voter to identify his/her voting record from among the voting results published for that particular election." Avante International Technology, Inc. v. Premier Election Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 95047 (E.D. Mo., Oct. 13, 2009).
"unique identification"; "UID" — "data assigned to a license file which is different from the data assigned to any other license file then in existence with which the first mentioned license file otherwise may be confused." Globetrotter Software, Inc. v. Elan Computer Group, Inc., et al., 1999 U.S. Dist. LEXIS 22482 (N.D. Cal., Oct. 22, 1999). 4636

"a unique visual data signal in IP protocol representing a specific visual condition to be monitored" — "[i]nformation: a. which is transmitted in a protocol compliant with the internet; b. is about a condition, which can be seen, and which has been chosen to be observed; and c. which distinctly identifies the condition being observed." E-Watch, Inc., et al. v. March Networks Corp., 2006 U.S. Dist. LEXIS 54366 (E.D. Tex., Aug. 4, 2006). 4638

"uniquely identifying" — "The term 'uniquely,' as used in the claim language, quite simply means one of its kind." ResQNet.com, Inc. v. Lansa, Inc., 2002 U.S. Dist. LEXIS 16667 (S.D.N.Y., Sept. 5, 2002). 4639

"unistroke symbols" — "requires definitive recognition of a symbol immediately upon delimitation - e.g. immediately upon pen lift. I further find that 'definitive recognition' does not simply refer to 'unambiguous differentiation,' but rather requires that the computer be capable of making a final, unalterable interpretation (recognition) of the symbol immediately upon delimitation (e.g. pen lift) without requiring the system to wait for possible additional strokes." Xerox Corp. v. 3Com Corp., et al., 2000 U.S. Dist. LEXIS 10028 (W.D.N.Y., Jun. 6, 2000). 4640

"The term 'unistroke symbols' therefore requires sufficient graphical separation for the computer to definitely recognize a symbol immediately upon delimitation or pen lift." Id., 267 F.3d 1361 (Fed. Cir. 2001). 4641

"unit" — "a device or collection of components, separate from the computer system, that is designed to be installed and removed from the apparatus in the mobile environment." Keystone Autonics, Inc. v. Sirius Satellite Radio Inc., et al., 2009 U.S. Dist. LEXIS 3195 (E.D. Tex., Jan. 16, 2009). 4642

"computing unit" — "because ... the claim language itself does not recite sufficient structure to perform the claimed function, means-plus-function treatment is warranted." Inventio AG v. ThyssenKrupp Elevator Americas Corp., et al., 2010 U.S. Dist. LEXIS 59020 (D. Del., Jun. 14, 2010). 4644

"unit having a persistent unique hardware identification used to restrict access to data received at the unit via the wireless signal" — "number, code, bit pattern or other location independent identifier that identifies a specific piece of hardware and does not identify any other piece of hardware of the same type, and once assigned to that specific piece of hardware does not typically change, and is provided to the computer system so that the computer system makes a determination whether it will accept data from the unit that was received from a wireless signal." Keystone Autonics, Inc. v. Sirius Satellite Radio Inc., et al., 2009 U.S. Dist. LEXIS 3195 (E.D. Tex., Jan. 16, 2009).

"unmagnetized magnetic material" — "material that is capable of being magnetized but in the absence of an applied external magnetic field is not magnetized." Fargo Electronics, Inc. v. Iris Ltd, Inc., 2005 U.S. Dist. LEXIS 34493 (D. Minn., Nov. 30, 2005).

"wherein the unique voting session identifier is unrelated to a particular voter's personal identity" — "the unique voting session identifier consists of a random or pseudo-randomly chosen number which is unrelated and untraceable to the voter's identity." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).

"unrequested" — "not requested by the user." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010). "The Court finds that the construction for the term 'unrequested' should be modified in light of Beneficial's remarks and arguments to the USPTO during reexamination of the '366 patent. ... The Court finds that the term 'unrequested' should be construed to mean 'not in response to any immediate previous input by the user.'" Id., 2010 U.S. Dist. LEXIS 54151 (E.D. Tex., Jun. 3, 2010).

"ordinary unresolved pointer" — "a 'pointer' is a data item that represents the address of a target data item. A 'resolved pointer' contains the target's address. An 'unresolved' pointer does not contain the target's address, but instead, contains data from which that address may be determined." Data General Corp. v. International Business Machines Corp., 93 F. Supp. 2d 89 (D. Mass. 2000).

"unscrambling circuit" — "the entire circuit that restores a modified signal to its unmodified condition." Broadcast Innovation, LLC v. Echostar Communications Corp., 240 F. Supp. 2d 1127 (D. Colo. 2003).

"untrusted network" — "a public network with no controlling organization, with the path to access the network being undefined and the user being anonymous." Prism Technologies LLC v. Verasign, Inc., et al., 512 F. Supp. 2d 174 (D. Del. 2007).

"updating" — "an automatic process of adding, modifying, or deleting data records or program files to bring the remote computer up-to-date." Charles E. Hill & Associates, Inc. v. Compuserve, Inc., et al., 65 F. Supp. 2d 924 (S.D. Ind. 1999).

"updating, without input from each customer, each customer profile in accordance with the content profiles of the data sources actually accessed by that customer to automatically update each customer's actual preferences for said predetermined characteristics" — "modifying, without the customer taking an overt action, each customer profile in accordance with the content profiles of the data sources actually assessed by that customer to automatically update each customer's actual preferences for said predetermined characteristics." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).

"upgrade microprocessor" — "a microprocessor which operates at a faster speed than the first microprocessor." All Computers, Inc. v. Intel Corp., 2005 U.S. Dist. LEXIS 43968 (E.D. Va., Feb. 9, 2005).

"upon confirmation of availability of said funds, accepting said order, generating an electronic record" — "following determination that the funds are available, confirming acceptance of the order and generating an electronic record." DE Technologies, Inc. v. Dell Inc., 2006 U.S. Dist. LEXIS 5459 (W.D. Va., Feb. 14, 2006).

"upon connection with the destination" — "the plain language of the claim is clear, and therefore declines to construe this phrase." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).
"upon detecting a predetermined drop in reflectance sufficient to indicate that said sample has reached said first surface" — "a reflectance reading taken immediately following or very soon after detecting the point in time of a drop in reflectance, the magnitude of which is determined in advance, to be the point in time of the first breakthrough of sample to the testing surface. At that point in time, the reflectance drop must be mostly or entirely due to wetting of the testing surface and not color from chemical reaction."  Home Diagnostics, Inc. v. Lifescan, Inc., 2002 U.S. Dist. LEXIS 27575 (N.D. Cal., Oct. 2, 2002).4669 "[T]his interpretation improperly limits claim 4 to a preferred embodiment and does not give the disputed claim terms their proper scope in this technology at the time of invention. Therefore, 'upon detecting a predetermined drop in reflectance sufficient to indicate that sample reached said first surface' means 'immediately following or very soon after detecting the point in time of a predetermined drop in reflectance, where the predetermined drop in reflectance is mostly or entirely due to wetting of the testing surface.'"  Id., 381 F.3d 1352 (Fed. Cir. 2004).4670

"upon detection of a suitably stable endpoint" — "at the expiration of the predetermined time period."  Home Diagnostics, Inc. v. Lifescan, Inc., 2002 U.S. Dist. LEXIS 27575 (N.D. Cal., Oct. 2, 2002).4671 "[T]his court determines that the customary meaning in this art field of ‘upon detection of a suitable stable endpoint’ means ‘when the stated reaction is sufficiently complete that the glucose concentration of the sample can be calculated without an error of clinical significance.’"  Id., 381 F.3d 1352 (Fed. Cir. 2004).4672

"Upstream Manager" — "a computer system component that (a) accepts messages from a client bound for services on a server; (b) routes messages from a client to services on a server; and (c) is distinct from the Downstream Manager."  nCube Corp. v. Seachange International, Inc., 436 F.3d 1317 (Fed. Cir. 2006).4674

"URI"; "Uniform Resource Identifier" — "the [] patent contemplates that a particular server will field all of the requests for a particular resource (or URI), whereas under WebLogic, a particular server handles all of the requests from a particular user (or session ID). The session ID inserted by WebLogic does not point to a network resource but, instead, to a user and thus fundamentally differs from a URI."  BEA Systems, Inc. v. Web Balance, Inc., 2006 U.S. Dist. LEXIS 15030 (D. Mass., March 31, 2006).4675

"URL" — "A URL, then, as defined by the language and context of the claims, is something that identifies the location of relevant information segments. This can include web pages, audio clips, images, and the like. It can be an absolute URL or a relative URL, as long as it specifies one or more Internet addresses of information segments relating to Internet content."  ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082 (Fed. Cir. 2003).4676

"use information" — "information which a content producer or supplier wishes to consider in regulating access to the digital content."  Digital Reg of Texas, LLC. v. LFP Internet Group, LLC, et al., 2009 U.S. Dist. LEXIS 59610 (E.D. Tex., Jul. 13, 2009).4677

"use mode" — "a mode that allows full use of the digital data or software in accordance with the license."  Uniloc USA, Inc., et al. v. Microsoft Corp., 447 F. Supp. 2d 177 (D. R.I. 2006).4678
"said first responsive information is used for one or more of" — "the first responsive information is used for at least one or more of." Beneficial Innovations, Inc. v. Blockdot, Inc., et al., 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010). 4679

"user" — "is properly construed as 'a person or a person using a computer.'" z4 Technologies, Inc. v. Microsoft Corp., et al., 507 F.3d 1340 (Fed. Cir. 2007). 4680

"user" — "the Court rejects Hyundai's proposed construction and construes the term according to its ordinary meaning." Orion IP, LLC v. Mercedes-Benz USA, LLC, et al., 516 F. Supp. 2d 720 (E.D. Tex. 2007). 4682

"user" — "a person located in the distribution center who has access to the product movement information from the receiving sites." STV Asia, Ltd. v. PRN Corp., et al., 2006 U.S. Dist. LEXIS 95523 (N.D. Cal., Oct. 15, 2006). 4683

"user" — "refers to a human being." Civix-DDI, LLC v. Cellco Partnership, 387 F. Supp. 2d 869 (N.D. Ill. 2005). 4684

"user" — "the court holds that the term 'user' includes 'a person or a computer.'" Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007). 4685

"user" — "a human who issues a command to the computer on which a digital data file was created or copied." Timecertain, LLC v. Authentidate Holding Corp., et al., 2006 U.S. Dist. LEXIS 92789 (M.D. Fla., Dec. 22, 2006). 4686

"user" — "a person who requests information from items in the transmission system. Any person acting as part of the transmission system, such as an operator, is not a user or a subscriber." Acacia Media Technologies Corp. New Destiny Internet Group, et al., 2006 U.S. Dist. LEXIS 93710 (N.D. Cal., Dec. 14, 2006). 4687

"user account" — "a record indicating that the user has the right to access the media assets, and indicating which media player devices may access referenced media assets." Zapmedia Services, Inc. v. Apple Inc., 2010 U.S. Dist. LEXIS 49387 (E.D. Tex., May 19, 2010). 4688

"user attract mode" — "a mode, when the jukebox is not in selection mode, in which graphics are displayed to attract users to the jukebox." TouchTunes Music Corp. v. Rowe International Corp., et al., 2010 U.S. Dist. LEXIS 74043 (S.D.N.Y., Jul. 21, 2010). 4689

"user authorization information" — "user information upon which access is granted." Graphon Corp. v. Autotrader.com, Inc., 2007 U.S. Dist. LEXIS 46941 (E.D. Tex., June 28, 2007). 4690

"user commands" — "instructions issued by a remote computer, causing selected portions of the auction data stored on the host computer network to be located, organized, and transmitted over the communications network to the user's workstation." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 4691

"user computer" — "it was proper for the Board to construe 'user computer' to encompass the mainframes and minicomputers of the cited prior art." In re American Academy of Science Tech Center, 367 F.3d 1359 (Fed. Cir. 2004). 4692
"user configuration information"; [ii] "user identification information" - [i] "information associated with the user such as the user's account information, email information, screen formats, or screen colors"; [ii] "a user's given name or a system user name specially coined by the user that is used to identify the user in each transaction." Logiclink, Inc. v. Keylink Service Solutions, Inc., et al., 2009 U.S. Dist. LEXIS 22962 (C.D. Cal., Mar. 19, 2009).

"user context file" — "a set of registers assigned to a user." Biax Corp. v. Intel Corp., et al., 2007 U.S. Dist. LEXIS 14250 (E.D. Tex., March 1, 2007).

"user-defined reference to aggregated fact data" — "the term[s] 'user-defined' and 'aggregated fact data' do not need additional construction, as their plain meaning corresponds with their usage in claim 1. ... Moreover, the meaning of "reference" is clear from its usage in claim 1 and no further construction is needed." Hyperion Solutions Corp. v. HyperRoll, Inc., et al., 2006 U.S. Dist. LEXIS 64081 (N.D. Cal., Aug. 28, 2006).

"user interface" — "hardware, firmware, or a combination thereof that allows a person, directly or indirectly, to alter parameters." Convolve, Inc., et al. v. Compaq Computer Corp., et al., 2005 U.S. Dist. LEXIS 16375 (S.D.N.Y., Aug. 9, 2005).

"user-selectable options for processing said image data" — "options presented to a user regarding a course of action to be taken with a scanned image, such as faxing, emailing, printing, storing or performing word processing on a scanned image." Soque Holdings (Bermuda) Ltd. v. KeyScan, Inc., 2010 U.S. Dist. LEXIS 60501 (N.D. Cal., Jun. 4, 2010).

"user station" — "is limited to a fixed public structure." CIVIX-DDI, LLC v. Microsoft Corp., et al., 84 F. Supp. 2d 1132 (D. Colo. 2000).

"user store" — "a storage component accessible by a processor containing verification data and information identifying information providers that house personal information for a given end user." Yodlee, Inc. v. CashEdge, Inc., 2006 U.S. Dist. LEXIS 48614 (N.D. Cal., July 7, 2006).

"automatically generating at least one user target profile interest summary for a user at a user terminal, each of said user target profile interest summary being indicative of ones of said target objects and sets of target object characteristics accessed by said user" — "automatically generating a concise statement of the data that describes the significant characteristics of target objects that a user likes and/or dislikes pointing out or showing indirectly the target objects and/or sets of target object characteristics accessed by the user." Pinpoint Inc. v. Amazon.com, et al., 2004 U.S. Dist. LEXIS 17641 (N.D. Ill., Aug. 31, 2004).
"user's rule set" — "elements or conditions that apply during a user's or users' session." *LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al.,* 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010). 4704

"uses" — "it is far from clear that the applicant acted as his own lexicographer to exclusively define 'use' as synonymous with 'environments.' Accordingly, the Court rejects Hyundai's proposed construction." *Orion IP, LLC v. Mercedes-Benz USA, LLC, et al.,* 516 F. Supp. 2d 720 (E.D. Tex. 2007). 4705

"using a computer" — "the use of a computer to aid in performing the sub-steps in (b)(1)-(b)(3)." *Lincoln National Life Insurance Co. v. Transamerica Financial Life Insurance Co.,* 2007 U.S. Dist. LEXIS 16822 (N.D. Ind., March 6, 2007). 4706

"using a telecommunications line" — "using a system of wires and other components to transmit messages between users by various devices such as telegraph, cable, telephone, radio, or television." *BMC Resources, Inc. v. Paymentech, L.P.,* 2004 U.S. Dist. LEXIS 22536 (N.D. Tex., Nov. 4, 2004). 4707

"using the computed positions to define the updated second form line" — "using the new positions computed while deviating from the previously computed second path across the area to recompute the second path across the area to be treated." *Trimble Navigation Ltd. v. RHS, Inc., et al.,* 2007 U.S. Dist. LEXIS 41267 (N.D. Cal., May 29, 2007). 4708

"using the network code to route the user communication through the packet communication system to the network element" — "using the logical address identifying a network element (which network element provides an exit from the packet communication system) to direct the user communication through the packet communication system by a selected route or in a specified direction to the network element that provides an exit from the packet communication system." *Sprint Communications Co. L.P. v. Vonage Holdings Corp., et al.,* 518 F. Supp. 2d 1306 (D. Kan. 2007). 4709

"using the retrieved information"; "transmitting the retrieved information" — "'using the retrieved information' must be presumed to mean something other than 'transmitting the retrieved information.'" *Microstrategy Inc. v. Business Objects Americas,* 2007 U.S. App. LEXIS 15100 (Fed. Cir., June 27, 2007). 4710

"the usual driver for the storage device" — "the customary driver(s) in a host device used to communicate with customary internal and external storage device(s), which driver(s) were normally present within the chassis of most commercially available computers at the time of the invention." *In re Papst Licensing GmbH & Co. KG Litigation,* 624 F. Supp. 2d 54 (D.D.C. 2009). 4712

"utilized by said browser to identify and locate" — "means that the enumerated functions are performed by the browser. This is a fact-intensive inquiry." *Eolas Technologies, Inc. v. Microsoft Corp.,* 2000 U.S. Dist. LEXIS 18886 (N.D. Ill., Dec. 28, 2000). 4713
utilizing an output from the rules engine to determine if intervention is warranted" — "using information generated by the rules engine to determine if intervention is warranted." VISICU, Inc. v. iMDsoft, Ltd. et al., 2009 U.S. Dist. LEXIS 40033 (E.D. Pa., May 7, 2009).4714

V

"VGA controller" — "a component or components that control the routing of VGA signals pursuant to the VGA standard." DisplayLink Corp. v. Magic Control Technology Corp., 615 F. Supp. 2d 1051 (N.D. Cal. 2009).4716

"valid or invalid" — "appropriate or inappropriate for payment." McKesson Info. Solutions LLC v. Trizetto Group, Inc., 2006 U.S. Dist. LEXIS 16097 (D. Del., April 5, 2006).4718

"valid" — "is not simply a synonym of 'consistent' but must be construed in accordance with its broad plain meaning, i.e. correctly stored in a particular data storage system." EMC Corp. v. Hewlett-Packard Co., Inc., 2003 U.S. Dist. LEXIS 27824 (D. Mass., Sept. 12, 2003).4719

"validating"; "verifying" — "the process used for comparing (a) the UTID that is generated by an originator and associated with a transaction with (b) the record of UTIDs for transactions generated by the originator, to confirm the identity of the originator and the transaction related thereto." Starpay.com L.L.C., et al. v. Visa International Service Association, et al., 514 F. Supp. 2d 883 (N.D. Tex. 2007).4720

"validation"; "valid" — "indication of whether the ID information stored on the debit card matches the corresponding ID information stored on the terminal." RealSource, Inc. v. Best Buy Co., Inc., et al., 514 F. Supp. 2d 951 (W.D. Tex. 2007).4721

"value" — "Bid for Position is [] incorrect in arguing for a construction of 'value' that is distinct from the amount or price of the bid. The claim language uses the terms 'bid' and 'value of the bid' interchangeably, such that the two cannot be read to have separate meanings." Bid for Position, LLC v. AOL, LLC, et al., 2010 U.S. App. LEXIS 7163 (Fed. Cir., Apr. 7, 2010).4723
"value" — "any numerical quantity or measure that is not generated by an analog-type trim potentiometer or described as 'hardware component.'" Illinois Tool Works, Inc. v. Ion Systems, Inc., 250 F. Supp. 2d 477 (E.D. Pa. 2003).\textsuperscript{4724}

"value" — "refers to a single numerical quantity." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003).\textsuperscript{4725}

"an associated value representing a desired quality of result" — "one value from a range of values representing the quality of a cut. This value is inputted into an equation containing other values that reflect characteristics of the task that will impact the quality of the cut, such as material type." Omax Corp. v. Flow International Corp., 2006 U.S. Dist. LEXIS 81914 (W.D. Wash., Nov. 7, 2006).\textsuperscript{4726}

"variable" — "is not a technical term that requires construction." Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).\textsuperscript{4727}

"variable authentication number (VAN)" — "a variable number that can be used in verifying the identity of a party or the integrity of information or both." Stambler v. RSA Security, Inc., et al., 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003).\textsuperscript{4728} "The Court slightly modifies the Delaware construction to read, 'an encoded variable number that can be used in verifying the identity of a party or the integrity of information or both.'" Stambler v. JPMorgan Chase & Co., et al., 2010 U.S. Dist. LEXIS 35035 (E.D. Tex., Apr. 9, 2010).\textsuperscript{4729}

"variable data"; "constant data" — "product information classified as capable of changing at any time"; "product information classified as likely to change less often than variable data." Charles E. Hill & Associates, Inc. v. Compuserve, Inc., et al., 65 F. Supp. 2d 924 (S.D. Ind. 1999).\textsuperscript{4730}

"variable parameters"; "measurable parameters" — "parameters of the paths that can vary and are measured." ConnecTel, LLC v. Cisco Systems, Inc., 428 F. Supp. 2d 564 (E.D. Tex. 2006).\textsuperscript{4731}

"variable speed" — "capable of operating at different speeds." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).\textsuperscript{4732}

"variable speed wind turbine controller" — "an integrated set of hardware and software that provides torque command signals, among other things." Gamesa Eólica, S.A. v. General Electric Co., 359 F. Supp. 2d 790 (W.D. Wis. 2005).\textsuperscript{4733}

"variably controlling, in response to a sensed vacuum level in the handpiece corresponding to the occluded condition of the handpiece, the ultrasonic power being provided to the handpiece" — "the ability of the control unit to automatically change the amount of ultrasonic power, other than merely turning it on or off, being provided to the handpiece in response to a signal from the vacuum sensor indicating that a sensed rise in the vacuum of the aspiration line has reached a particular numeric value which is equal to the vacuum that exists in the aspiration line when the doctor believes he is going to have an occlusion issue." Advanced Medical Optics, Inc. v. Alcon Inc., et al., 361 F. Supp. 2d 370 (D. Del. 2005).\textsuperscript{4734}

"varying together"; "vary together"; "varying ... in the same way"; "varying in the same way" — "increasing and decreasing proportionally." Technology Properties Ltd., et al. v. Matsushita Electric Industrial Co., Ltd., et al., 514 F. Supp. 2d 916 (E.D. Tex. 2007).\textsuperscript{4735}

"vehicle sale type" — "a type of vehicle sale which may include regular sale, manufacturer sale, and heavy duty/truck sale." Auction Management Solutions, Inc. v. Adesa, Inc., 2007 U.S. Dist. LEXIS 66994 (N.D. Ga., Sept. 11, 2007). 4739

"ventilation opening" — "an opening in the enclosure to provide for reducing the buildup of heat, fumes, or vapor, within the radio enclosure." Black & Decker Inc., et al. v. Robert Bosch Tool Corp., 389 F. Supp. 2d 1010 (N.D. Ill. 2005). 4743

"verbally command motions" — "the voice recognition system of the robotic surgical system permits the surgeon to use his voice to control the movement of the robotic manipulator or the surgical instrument." Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002). 4744

"verify the applicant's identity" — "confirm or substantiate the applicant's identity. This is not limited to checking biometric information and does not exclude verification using information such as name, address, and social security number plus some additional information less likely to have been improperly obtained (e.g., mother's maiden name, years at current address, years at job, etc)." Decisioning.com, Inc. v. Federated Department Stores, Inc., et al., 2007 U.S. Dist. LEXIS 23045 (D.S.C., Mar. 27, 2007). 4746
"verify the operational status of the computer" — "determine whether the computer is functioning." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007). 4747

"comparing the personal signature produced by the user with said stored personal signature to verify use of said card" — "[T]he district court construed that requirement to mean that the signatures must be compared for the purpose of verifying that it is the user's card that is being used when the personal data is being accessed. ... Since both the claims and the specification would lead a person of skill in the art to conclude that the language of claim 19 requires the party comparing the signatures to verify the use of the card itself, and not just the identity of the user, we hold that the district court correctly construed the disputed claim term." E-Pass Technologies, Inc. v. Microsoft Corp., et al., 2007 U.S. App. LEXIS 10494 (Fed. Cir., May 2, 2007) (unpublished). 4748

"verifying if the originator generated the payment transaction" — "the originator must determine that the originator generated the payment transaction by comparing (a) the unique transaction identifier that has been returned to the originator with a particular transaction with (b) a record of unique transaction identifiers maintained by the originator." Starpay.com L.L.C., et al. v. Visa International Service Association, et al., 514 F. Supp. 2d 883 (N.D. Tex. 2007). 4749

"verifying the authenticity of one of the beam request signals from one of the treatment rooms" — "to confirm or establish the genuine or trustworthy nature of one of the beam request signals from one of the treatment rooms." Optivus Technology, Inc., et al. v. Ion Beam Applications S.A., 2004 U.S. Dist. LEXIS 30314 (C.D. Cal., Aug. 31, 2004). 4750

"verifying the operational status of the user's access to the communications network during delivery of the real-time information" — "Determining whether the user's connection to the communications network is functioning while real-time information is being transmitted." Two-Way Media LLC v. America Online, Inc., 508 F. Supp. 2d 526 (S.D. Tex. 2007). 4751

"very long instruction word" — "a fixed-width instruction that encodes multiple operations. A 'very long instruction word' may contain one or more groups of individual instructions." Intergraph Corp. v. Intel Corp., 2002 U.S. Dist. LEXIS 27117 (E.D. Tex., Jun. 3, 2002). 4753

"via the modular connector" — "through an electrical connector constructed with standardized units or dimensions, and not requiring a direct wire-to-wire connection with equal voltage." Vanguard Products Group, Inc., et al. v. Diam USA, Inc., et al., 2007 U.S. Dist. LEXIS 95710 (N.D. Ill., May 16, 2007). 4755

"video buffer image within said host computer" — "video image data that is stored in memory within the host computer and is currently available for display." Accolade Systems LLC v. Citrix Systems, Inc., 634 F. Supp. 2d 738 (E.D. Tex. 2009). 4756
"video camera" — "is used in the claim in accordance with its plain and ordinary meaning to one skilled in the art and is not limited to analog video cameras."  

"a video combiner connected to said symbol generator and to said display computer for processing said symbol producing signals and delivering them to a selected display device" — "require[s] that the claimed invention have (1) the capability to be attached to multiple display devices, and (2) the capability to project different images on different displays."  

"video data"; "video pixel data"; "data set"; "image data set"; "the video data"; "the video pixel data"; "said video pixel data"; "the data sets"; "said image data sets" — "numerical information representing the same luminance, red chrominance, and blue chrominance components of each pixel in a video image."  

"video delay circuit"; "delayed video signal" — "a circuit that provides to the complementary non-linear amplifier a video signal that is delayed in time"; "a 'video signal' that has passed through a 'video delay circuit.'"  

"video display device"; "display means" — "a device for providing an image which may be viewed by a viewer, where the device is capable of displaying a moving image."  

"video game controller" — "should not be read narrowly to include only one of the possible types to which the inventor refers in the specification."  

"video image"; "video still store" — "an electronic signal representation of visual information displayable in visual form on a monitor or other display device"; "video still store" to mean "a system capable of storing still video images."  

"video player" — "an electronic device capable of playing a video as well as musical sound."  

"video program" — "recorded movies, broadcast television programs, and cable television, regardless of the media on which they are recorded."  

"video signal" — "a signal containing television picture information that is input to the transmitter's IF vision modulator and the video delay circuit."  

- 439 -

"virtual address" — "a memory address provided by the CPU in executing an application software program and that is translated into a real memory address by hardware." Intergraph Hardware Technologies Co. v. Hewlett-Packard Co., 2004 U.S. Dist. LEXIS 31055 (E.D. Tex., Jun. 30, 2004).

"virtual files" — "files that appear to be but are not physically stored; rather, they are constructed or derived from existing data when their contents are requested by an application program so that they appear to exist as files from the point of view of the host device." In re Papst Licensing GmbH & Co. KG Litigation, 624 F. Supp. 2d 54 (D.D.C. 2009).

"virtual interface with the device" — "a virtual display that allows the user of the client machine to send commands from the client machine to the device control circuitry via the module." Digi International, Inc. v. Lantronix, Inc., 402 F. Supp. 2d 1041 (D. Minn. 2005).

"virtual path" — "a logical connection transmitted over a physical path, which is dedicated to a particular virtual private network and has a guaranteed bandwidth, through which one or more virtual circuits may be constructed." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).

"virtual presence" — "a remote user's ability to send and receive voice and data communications to and from a corporate office with the full capabilities and user interfaces of the corporate office just as if the remote user were physically present in the corporate office." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).

"virtual presence server"; "VPS" — "a server located at the corporate office that executes software that enables a virtual presence at the corporate office by dialing the VPS and establishing a direct connection." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).
"virtual presence server communications device" — "a modem, ISDN adapter or similar device attached to the VPS that connects to the VPS through the transmission media to allow the remote user to dial up the VPS and establish a connection with the VPS through the connection media in order to transmit and receive communications." Data Race, Inc. v. Lucent Technologies, Inc., 73 F. Supp. 2d 698 (W.D. Tex. 1999).4779

"virtual queue" — "an electronically-stored representation of a physical queue including reservation information for an attraction retained in solid-state memory such as RAM, magnetic storage such as a disk drive, or other electronic storage facility." PalmTop Productions, Inc. v. LO-Q PLC, et al., 450 F. Supp. 2d 1344 (N.D. Ga. 2006).4782

"virtual router" — "a virtual entity defined by an address or set of addresses capable of identifying a device and its location in the network that can be emulated by a physical router." Alcatel Internetworking, Inc., et al. v. Cisco Systems, Inc., 2002 U.S. Dist. LEXIS 28372 (C.D. Cal., Aug. 27, 2002).4783

"virtual terminal process" — "a process to simulate the operation of a selected real terminal with respect to the transmission and receipt of input and output streams, except that each virtual terminal merely prepares and stores a set of instructions (a display list) for creating a full screen display according to the data from the associated first process; and each virtual terminal process does not independently control a separate screen." American Video Graphics, L.P. v. Microsoft Corp., 2005 U.S. Dist. LEXIS 46858 (E.D. Tex., Jun. 30, 2005).4784

"virtually simultaneously and concurrently" — "means that the transmission is sufficiently swift that insofar as humans are able to perceive, the transmission is effectively, even though not precisely, instantaneous." Hamilton v. ComWeb Technology Group, Inc., et al., 2003 U.S. Dist. LEXIS 27832 (D. Md., Nov. 13, 2003).4786

"visible exterior surface" — "the phrase can be understood as written and no further construction is necessary." 911EP v. Whelen Engineering Co., Inc., et al., 2007 U.S. Dist. LEXIS 20779 (E.D. Tex., March 23, 2007).4787

"visual display"; "displaying" — "displaying' and 'visual display' are limited to the structures or their equivalents actually described in the specification. As discussed above, the specification describes no display mechanism other than a monitor." Cytyc Corp. v. Tripath Imaging, Inc., et al., 2005 U.S. Dist. LEXIS 29850 (D. Mass, Nov. 28, 2005).4789
"visual identification" — "requires a visual correlation or linkage of a selected irregular cell with the selected irregular cell displayed on the television screen. This may include the properties of a conventional cursor." *Gemstar-TV Guide International, Inc., et al. v. International Trade Commission, et al.*, 383 F.3d 1352 (Fed. Cir. 2004). 4790

"visual representations" — "visual representations and may include but are not required to include: text that is anti-aliased; graphical objects; possess the attribute of translucency; prompts for prompting a user; and images." *Luma Corp. v. Stryker Corp., et al.*, 2005 U.S. Dist. LEXIS 40884 (S.D. W. Va., July 27, 2005) 4791

"visualization functionality" — "hardware and/or software that produces a designed effect, that is, to download via the image server a thumbnail visual image which is associated with a given hyperlink." *Girafa.com, Inc. v. IAC Search & Media, Inc., et al.*, 2009 U.S. Dist. LEXIS 84405 (D. Del., Sep. 15, 2009). 4792

"Viterbi-like" — "an algorithm that is or is similar to an iterative algorithm that uses a trellis to determine the best sequence of hidden states (in this case, written symbols) based on observed events (in this case, observed readings that represent the written symbols), where the determined sequence is indicated by the best path through the trellis and is determined using branch metric values calculated for branches of the trellis." *Carnegie Mellon University v. Marvell Technology Group, Ltd., et al.*, 2010 U.S. Dist. LEXIS 104891 (W.D. Pa., Oct. 1, 2010). 4795

"voice communication module" — "a module that enables a communication platform to provide voice-over-IP calls." *Foundry Networks v. Lucent Technologies, Inc.*, 2005 U.S. Dist. LEXIS 46840 (E.D. Tex., May 24, 2005). 4799

"voice guidance" — "spoken words that give accurate directions about how to navigate at a particular position." *Garmin Ltd. v. TomTom, Inc.*, 2006 U.S. Dist. LEXIS 61187 (W.D. Wis., Aug. 24, 2006). 4802
"voice recognition"; "voice recognition system"; "input device" — "an apparatus into which the surgeon speaks verbal instructions. These terms are not limited to the structure of any embodiment described in the specification." Intuitive Surgical, Inc., et al. v. Computer Motion, Inc., 2002 U.S. Dist. LEXIS 14752 (D. Del., Jul. 12, 2002). 4803

"voiceband" — "frequencies in the range of 0 to 4 kHz." WI-Lan Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 99263 (E.D. Tex., Sep. 20, 2010). 4805

"void" — "a space or spaces in the image carried by the input video signal where a change or illumination may be made to cause an improvement of the perceived quality of the image." IP Innovation LLC, et al. v. Mitsubishi Electric Corp., et al., 2009 U.S. Dist. LEXIS 100647 (N.D. Ill., Oct. 29, 2009). 4806

"void" — "a space or spaces in the image where a change of illumination may be made to cause an improvement of the perceived quality of the image." IP Innovation L.L.C. v. Lexmark International, Inc., et al., 424 F. Supp. 2d 1078 (N.D. Ill. 2006). 4807

"void" — "any location, existing at the point of image creation, before or after storage, or at the point of presentation, in or around an image where a change of illumination may be made to cause an improvement of the perceived quality of the image. Such voids may include, but are not limited to, defects, unwanted elements, improper elements, corrupted elements, valid but replaceable elements, locations with no image information, and other locations or elements which may be in question or need for improvement." IP Innovation L.L.C., et al. v. Sony Electronics, Inc., 2005 U.S. Dist. LEXIS 17962 (N.D. Ill., Aug. 18, 2005). 4808

"volley codes" — "codes that define the present stage of a transaction or which reflect the progression of communications for a transaction." Papyrus Technology Corp. v. New York Stock Exchange, Inc., 581 F. Supp. 2d 502 (S.D.N.Y. 2008). 4809

"voltage amplifier" — "a device that at least attenuates voltage." P3 International Corp., et al. v. Unique Products Manufacturing Ltd., et al., 2009 U.S. Dist. LEXIS 43751 (S.D.N.Y., May 21, 2009). 4810

"voltage source means providing a constant or variable magnitude DC voltage between the DC input terminals" — "does not suggest sufficient structure on its face to overcome the means-plus-function presumption, and it must be construed in accordance with section 112, P 6." Lighting Ballast Control, LLC v. Philips Electronics North America Corp., et al., 2010 U.S. Dist. LEXIS 85570 (N.D. Tex., Aug. 19, 2010). 4812

"voltage supply" — "refers to a source of electrical energy, such as a battery, that requires at least two power supply lines to deliver power in an electrical circuit." NeoMagic Corp. v. Trident Microsystems, Inc., 98 F. Supp. 2d 538 (D. Del. 2000). 4813

"voting session" — "the period during which a voter makes his or her voting selections on the voting apparatus, ending when the voter confirms the voting selections." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).

"voting session identifier" — "a random or pseudo-random number (or alphanumeric character or symbol) or number randomly chosen from a unique sequence of numbers assigned to a particular voting session which the voter takes away at the end of the voting session to enable the voter to identify her voting record from among the voting results published for that particular election." Avante International Technology Corp. v. Diebold Election Systems, et al., 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007).

"wafer" — "a thin, generally cylindrical, slice of semiconductor material used as a base for an electronic component or circuit." MEMC Electronic Materials, Inc. v. Mitsubishi Materials Silicon Corp., et al., 2006 U.S. Dist. LEXIS 9353 (N.D. Cal., Feb. 24, 2006).

"wafer cassette" — "a wafer carrier that holds one or more wafers and keeps them separate." Nova Measuring Instruments, Ltd. v. Nanometrics, Inc., 2006 U.S. Dist. LEXIS 90736 (N.D. Cal., Dec. 1, 2006).

"wagering an additional wager" — "placing another wager, either separately or through an increased purchase price, that one or more of the additional lottery elements will be drawn during play of the game." FortuNet, Inc., et al. v. Melange Computer Services, et al., 412 F. Supp. 2d 1071 (D. Nev. 2006).
"wagering format" — "the kind of lottery games that are available, such as Keno, Lotto, and 3- or 4-digit lotteries."  Lottotron, Inc. v. Gtech Corp., 2007 U.S. Dist. LEXIS 82579 (D.N.J., Nov. 7, 2007).4824

"waiting state" — "a state of the peripheral device in which it is ready to receive new microcode." Hewlett-Packard Co., et al. v. EMC Corp., 2004 U.S. Dist. LEXIS 28460 (N.D. Cal., Jun. 23, 2004).4825

"wavelength division multiplexed terminal" — "a terminal at the end of a communication pathway having a transmitter and/or receiver for wavelength division multiplexing communications." Ciena Corp. v. Nortel Networks, Inc., et al., No. 2:05-cv-00014-LED (E.D. Tex., Apr. 25, 2006).4832

"wavelength division multiplexed (WDM) optical network environment" — "an environment having a network for carrying information on a plurality of wavelengths, the plurality of wavelengths multiplexed together as an optical signal." Tellabs Operations, Inc. v. Fujitsu Ltd., et al., 2009 U.S. Dist. LEXIS 40533 (N.D. Ill., May 13, 2009).4833

"waveshape the voltage and current in order to efficiently ignite the fuel in the turbine engine" — "produce a current waveform…which initially rises relatively slowly, followed by a transition to a fast rising current which quickly peaks and thereafter slowly dissipates." Lucas Aerospace, Ltd. v. Unison Industries, L.P., 899 F. Supp. 1268 (D. Del. 1995).4834

"web browser" — "a software application that can be used to locate and display Web pages in human-readable form." ACTV, Inc., et al. v. Walt Disney Co., et al., 204 F. Supp. 2d 650 (S.D.N.Y. 2002).4835

"web browser" — "software that can be used to retrieve information over a network, including, but not limited to, the Internet." Hewlett-Packard Co. v. Intergraph Corp., 2004 U.S. Dist. LEXIS 31073 (N.D. Cal., Dec. 20, 2004).4836

"web server" — "a component that provides access to information accessible from a computer connected to the Internet or an intranet." NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007).

"a web server separated from said image server" — "a web server that is a separate computer from the image server." Girafa.com, Inc. v. IAC Search & Media, Inc., et al., 2009 U.S. Dist. LEXIS 84405 (D. Del., Sep. 15, 2009).

"website" — "one or more servers operating together that (1) can be located on the Internet by use of a Uniform Resource Locator (URL), (2) host one or more web pages retrievable by a web browser through hypertext transfer protocol ('HTTP') and hypertext markup language ('HTML') interpretation, (3) validate logon commands, and (4) send and receive data signal instructions." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009).

"when a subset of the stored terrain information is located within boundaries" — "every time the terrain data intersects with one of the 'alert envelopes.'" *Honeywell International Inc., et al. v. Universal Avionics Systems Corp., et al.*, 264 F. Supp. 2d 135 (D. Del. 2003). 4852

"when not downloading blocks required by the renderer" — "During periods of time when the local computer, or a connection thereof, is not downloading data blocks in response to coordinates received from the renderer." *Skyline Software Systems v. Keyhole, Inc., et al.*, 2006 U.S. Dist. LEXIS 83603 (D. Mass., Nov. 16, 2006). 4853

"when required"; "consistent with the format determined by the control program" — "have ordinary meanings and do not require construction." *Broadcast Innovation, LLC v. Echostar Communications Corp.*, 240 F. Supp. 2d 1127 (D. Colo. 2003). 4854

"when said first voltage signal exceeds a predetermined threshold for said predetermined duration" — "when the above-mentioned first voltage signal exceeds and continues to exceed a voltage value determined beforehand for the above-mentioned time period." *Monolithic Power Systems, Inc. v. O2 Micro international Ltd.*, 2010 U.S. Dist. LEXIS 13106 (N.D. Cal., Feb. 16, 2010). 4855

"the probe generate a trigger signal when said sensing tip contacts an object and said stylus holder is thereby deflected relative to said housing" — "claim 2 covers probes which signal within a nonappreciable period of time after contact such that the delay in signaling is insignificant when compared to the sensitivity and accuracy of the probe." *Renishaw plc v. Marposs Societa' per Azioni, et al.*, 158 F.3d 1243 (Fed. Cir. 1998). 4856

"stopping the relative displacement of corresponding contact surfaces when said testing determines said alignment and existence of correct electrical contact" — "mean[s] stopping that occurs as a result of a positive test for correct alignment and electrical contact, and that is instantaneous or nearly instantaneous such that relative displacing is halted before the corresponding contact surfaces are moved from a position of proper alignment and correct electrical contact to a position out of such alignment and contact." *Thomson Consumer Electronics, Inc. v. Innovatron, S.A.*, 43 F. Supp. 2d 26 (D.D.C. 1999). 4857

"calculating ... when the animal may be released" — "we are satisfied that the term 'when' refers to the beginning of the period in which the animal may be released from the feedlot, which is contrary to the claim construction adopted by the district court." *Micro Chemical, Inc. v. Lextron, Inc., et al.*, 1998 U.S. App. LEXIS 12905 (Fed. Cir., Jun. 17, 1998) (unpublished). 4858

"completing a transfer of the paperless tickets when the bid price equals the ask price and the ask quantity is equal to or greater than the bid quantity" — "transfer of the paperless tickets is completed at, during, or after the time that the bid price equals the ask price and the ask quantity is equal to or greater than the bid quantity." *Flash Seats, LLC v. Paciolan, Inc.*, 2010 U.S. Dist. LEXIS 4181 (D. Del., Jan. 19, 2010). 4859

"causing the display means to display the shape of a character ... when the code numbers entered by the entering means uniquely identify said character" — "We thus construe the term 'when' as requiring only that a character be displayed at the time it is uniquely identified, an event that must occur sooner for those characters with trimmed codes than for those characters with untrimmed codes." *Zi Corp. of Canada Inc. v. Tegic Communications Inc.*, 2000 U.S. App. LEXIS 26659 (Fed. Cir., Oct. 24, 2000) (unpublished). 4860
"SPNAN receives said first responsive information when the first user has reconnected the first network accessible node to the network" — "SPNAN receives said first responsive information at the time that the first user reestablishes a subsequent different network connection with the communications network." *Beneficial Innovations, Inc. v. Blockdot, Inc., et al.*, 2010 U.S. Dist. LEXIS 35784 (E.D. Tex., Apr. 12, 2010). 4861

"when the market changes" — "at the time that new data reflecting a change in the inside market is received." *Trading Technologies International, Inc. v. eSpeed, Inc., et al.*, 2006 U.S. Dist. LEXIS 80153 (N.D. Ill., Oct. 31, 2006). 4862

"whenever" — "whenever' does not require the selection switch to be actuated for sufficient time."; "'whenever' does not permit the output signal to depend upon other logical requirements." *Mars, Inc. v. Coin Acceptors, Inc.*, 2007 U.S. Dist. LEXIS 20094 (D.N.J., March 20, 2007). 4863

"whereby a trade network supports users ... to concurrently engage in interactive data messaging on said topic boards" — "We confirm the district court's construction of the 'whereby' clause as requiring interactive data messaging, and that claim 21 is thereby limited to a method that provides interactive data messaging." *Hoffer v. Microsoft Corp., et al.*, 405 F.3d 1326 (Fed. Cir. 2005). 4864

"whereby data may be selectively transmitted to and received and stored by a remote object only after such remote object has been identified as the correct remote object to receive such data" — "The presence of the conjunctive term 'and' indicates that the interrogator performs all three functions, i.e. transmits, receives and stores data, only after the correct remote object has been identified by the interrogator. As such, whether an interrogator transmits data but does not store the information to the tag is irrelevant to the infringement analysis." *Single Chip Systems Corp., et al. v. Intermec IP Corp., et al.*, 2006 U.S. Dist. LEXIS 96537 (S.D. Cal., Dec. 5, 2006). 4865

"whereby said vehicle is caused to operate in a protocol selected from at least one alternative available in said preprogrammed memory" — "This term means that after a program in the preprogrammed memory is sent to the vehicle's ECM, the vehicle is caused to operate according to the alternate program now residing in the preprogrammed memory. The vehicle must be responsive to the act of selecting a program while the vehicle is moving or while it is stopped, but otherwise in normal operation." *Adrain v. Hypertech, Inc.*, 2002 U.S. Dist. LEXIS 3732 (D. Utah, Mar. 6, 2002). 4866

"whereby the position of the lesion in the ultrasound image can be compared with a position of the lesion in the radiation therapy plan" — "the system must be structured to compare the position of the lesion in the two-dimensional image generated by the ultrasound probe with the position of the lesion identified in the radiation therapy plan." *NOMOS Corp. v. ZMED, Inc.*, 260 F. Supp. 2d 215 (D. Mass. 2002). 4867

"whereby the voting selections marked on each paper ballot are imaged and recorded in accordance with a template corresponding to the jurisdiction identifier for that paper ballot" — "The voting selections on each paper ballot are imaged and the choices/selections are recorded in accordance with a selected template corresponding to the jurisdiction identifier for that paper ballot." *Avante International Technology Corp. v. Diebold Election Systems, et al.*, 2007 U.S. Dist. LEXIS 61011 (E.D. Mo., Aug. 20, 2007). 4868
"wherein a credential is previously issued" — "the credential referenced in the claim must already be issued before the execution of the steps recited in the claim."  *Stambler v. RSA Security, Inc., et al.*, 2003 U.S. Dist. LEXIS 1547 (D. Del., Jan. 29, 2003). 4869

"wherein all the selected portions of said information database in each tier are transmitted at a corresponding repetition rate" — "transmitting the selected portions of the database within a tier at a single, chosen repetition rate, wherein the selected portions per tier are less than the entire database."  *Comcast Cable Communications Corp., LLC v. Finisar Corp.*, 2007 U.S. Dist. LEXIS 28994 (N.D. Cal., April 6, 2007). 4870

"wherein in response to requests for the web page, generated by the client machines the web page including the modified embedded object URL is served from the content provider server and the embedded object identified by the modified embedded object URL is served from a given one of the content servers as identified by the first level and second level name servers" — "This language [] requires only that the embedded object is 'identified by the modified embedded object URL' and is 'served from a given one of the content servers as identified by the first and second level name servers.' The plain meaning of the claim language does not require any load balancing mechanism. Instead, it simply requires the embedded object to be served from 'the content servers as identified by the first level and second level name servers.' Load balancing, if required at all, could be at either the DNS servers or the content provider server. The ordinary meaning of the term 'identifying' in claims 1 and 3 covers standard DNS resolution, without any sort of load balancing."  *Akamai Technologies, Inc., et al. v. Cable & Wireless Internet Services, Inc., et al.*, 344 F.3d 1186 (Fed. Cir. 2003). 4871

"wherein said deposition temperature and environment is controlled such that said interaction is self-limiting with a self-limiting thickness less than said junction depth" — "recites a step-plus-function limitation [] that ... should be construed in accordance with the specification."  *Agere Systems Inc. v. Atmel Corp.*, 2003 U.S. Dist. LEXIS 9823 (E.D. Pa., May 23, 2003). 4872

"wherein said download starts at any point within the data file, exclusive of the start of file and end of file" — "the download cannot resume at the 'start of file' or 'end of file' indicators/markers."  *Ethos Technologies, Inc. v. RealNetworks, Inc.*, 462 F. Supp. 2d 131 (D. Mass. 2006). 4873

"wherein said first and second switch means assume a non signal-conducting state when said CPU power circuit is not supplied with power" — "describes a further function performed by the first and second switch means. When the CPU power circuit is not supplied with power, the switch means takes on a state in which no current or voltage may be conducted through the switch, and therefore a voltage representing a signal on a line connected to one side of the switch will not be affected by and will not affect a voltage representing a signal on a line connected to the other side of the switch. This also means that a voltage representing a signal on a line connected to the switch will not be transmitted through the switch."  *Maurice Mitchell Innovations, L.P. v. Intel Corp.*, 2006 U.S. Dist. LEXIS 41453 (E.D. Tex., June 21, 2006). 4874
"wherein said lines of said CPU and said contacts assume a non signal-conducting state when said first and second switch means are in said non signal-conducting state" — "the dedicated memory address data, and control lines of the CPU and the dedicated memory address, data and control lines of each of the three sets of contacts assume a non signal-conducting state when the first and second switch means are in a non signal-conducting state. Accordingly, those lines take on a state in which no current or voltage may be conducted through them, and voltages representing signals on the lines may not be transmitted along the lines, whenever the first and second switch means are also in this state." Maurice Mitchell Innovations, L.P. v. Intel Corp., 2006 U.S. Dist. LEXIS 41453 (E.D. Tex., June 21, 2006).

"wherein said primary memory interface means selectively transfers data between said primary memory and said cache memory in response to a miss signal" — "Intergraph cites no case where a 'wherein' clause was held not to impose a limitation. ... Here, the 'wherein' clause does not recite a necessary result of arranging the delineated components of the claimed apparatus. Rather, it recites a specific function of the primary memory means. Selectively transferring data between the primary memory and cache memory in response to a miss signal is not a necessary result of coupling data between the primary memory and the cache memory. It is a separate function performed by the primary memory interface means which must be read as part of the limitation." Intergraph Hardware Technologies Co. v. Toshiba Corp., et al., 508 F. Supp. 2d 752 (N.D. Cal. 2007).

"wherein the web site includes a web page having customized information from the first user point for users at the second user point" — "no construction of this claim term is required." Dell USA L.P. v. Lucent Technologies, Inc., 464 F. Supp. 2d 620 (E.D. Tex. 2006).

"whether or not ... approved" — "means determining without human involvement whether or not establishment of the financial account was fully approved, not merely reaching a preapproval determination. This means the automated process continues until information is provided to the applicant as to whether the financial account was approved or not approved." Decisioning.com, Inc. v. TD Ameritrade Holding Corp., Inc., et al., 484 F. Supp. 2d 426 (D.S.C. 2007).

"while buffer overflow is threatened, admitting for storage in said buffer cells only on such of said virtual channel connections on which the previous cell admitted was not indicated by the header of said previous cell as being end of transmission on said virtual channel" — "no additional construction of this phrase is warranted." QPSX Developments 5 Pty. Ltd. v. Juniper Networks, et al., 2007 U.S. Dist. LEXIS 1991 (E.D. Tex., Jan. 10, 2007).

"while maintaining an open association with said first remote device throughout a series of image acquisitions" — "wherein the imaging system is configured to continuously maintain an association with the first remote device that allows for transmission of multiple images acquired by the imaging system." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).

"while said association with said first remote device is open" — "while the association between the ultrasound imaging system and the first remote device has remained open continuously." General Electric Co., et al. v. Sonosite, Inc., 2008 U.S. Dist. LEXIS 33223 (W.D. Wis., Jan. 8, 2008).
"while the amplification reaction is in progress" — "during the amplification reaction." Applera Corp. v. Stratagene Corp., 2007 U.S. Dist. LEXIS 17154 (D. Conn., March 9, 2007).

"modifying at least a portion of the user's rule set while the user's rule set remains correlated to the temporarily assigned network address" — "changing at least one of the elements or conditions in the 'user's rule set' during the session." LinkSmart Wireless Technology, LLC v. T-Mobile USA, Inc., et al., 2010 U.S. Dist. LEXIS 65424 (E.D. Tex., Jun. 30, 2010).

"wide-area-network" — "a geographically distributed network composed of smaller networks of computers that are joined into a single large network using communications services provided by one or more common carriers. The Internet is an example of a WAN." Atser Research Technologies, Inc. v. Raba-Kistner Consultants Inc., et al., 2009 U.S. Dist. LEXIS 25294 (W.D. Tex., Feb. 27, 2009).

[i] "wideband frequency division multiplexer for multiplexing the information onto wideband frequency channels"; [ii] "wideband frequency channels" — [i] "a device that combines the information from multiple inputs into a single output for multiplexing the information onto wideband frequency channels"; [ii] "frequency channels with a K (number of points) and a Δf (frequency band) large enough to be able to achieve a specific throughput and large enough to be able to avoid using either a clock or a carrier recovery device without substantially affecting the BER (bit error rate)." WI-Lan, Inc. v. Acer, Inc., et al., 2010 U.S. Dist. LEXIS 47540 (E.D. Tex., May 11, 2010).

"a total width"; "a width greater than" — "Examining the claim language in light of the specification and the testimony concerning the understanding of one of ordinary skill in the art, the Court concludes that the width terms are not indefinite and are properly defined as proposed by LGD ... Accordingly, the Court concludes that the width terms are defined as 'the width of the first metal layer, determined by the portion of the first metal layer in contact with the second metal layer together with the portions exposed to the subsequently deposited gate insulating layer, is more than 1 μm and less than 4 μm greater than the width of the second metal layer.'" LG Display Co., Ltd. v. AU Optronics Corp., et al., 2010 U.S. Dist. LEXIS 42546 (D. Del., Apr. 30, 2010).

"window" — "a framing device on the computer screen that displays information and may set the displayed information apart from other information on the screen." Apple Computer, Inc. v. Articulate Systems, Inc., 234 F.3d 14 (Fed. Cir. 2000).

[i] "windowing function"; [ii] "prefix and window circuit" — [i] "applying a pattern to the amplitude of the OFDM symbol at the beginning and the end of the symbol"; [ii] "a circuit that copies the last part of the OFDM symbol and augments the OFDM symbol by prefixing it with the copied portion of the OFDM symbol, and which also applies a pattern to the amplitude of the OFDM symbol at the beginning and end of the symbol." Agere Systems, Inc. v. Broadcom Corp., 2004 U.S. Dist. LEXIS 14187 (E.D. Pa., Jul. 20, 2004).

"Windows™ operating system environment"; "Windows™ software on the computer" — "the Court will limit the term [] to include Windows 3.0 and Windows 3.1, as well as prior versions of Windows." PolyVision Corp. v. Smart Technologies, Inc., et al., 501 F. Supp. 2d 1042 (W.D. Mich. 2007).
"wire on a printed board" — "a conductive metallic element interconnecting various regions, contributing to the interconnecting of various regions, on the printed board." Murata Manufacturing Co., Ltd. v. Bel Fuse Inc., 445 F. Supp. 2d 938 (N.D. Ill. 2006).

"wireless device" — "a device that receives and/or transmits electromagnetic signals and can be carried by a person outside of a home or office." NTP, Inc. v. Research In Motion, Ltd., 2002 U.S. Dist. LEXIS 27942 (E.D. Va., Aug. 14, 2002).

"first and second wiring segments in a building" — "two distinct wiring segments, each consists of 2 or more distinct wires exclusively located in a building." SercoNet Ltd. v. NetGear, Inc., 2007 U.S. Dist. LEXIS 58760 (N.D. Cal., July 30, 2007).

"transmitting within at least one allocated television channel frequency band, together with the information transmissions a cost signal indicating the magnitude of the charge for access to the information in the transmissions" — "to the extent 'with the information transmissions' refers to the relationship between the cost signal and the information transmissions, the words mean closely associated in time." IPPV Enterprises, LLC, et al. v. Echostar Communications Corp., et al., 146 F. Supp. 2d 498 (D. Del. 2001).

"within a substrate" — "the Court is not persuaded that the term 'within' requires special construction beyond its ordinary meaning." Power Integrations, Inc. v. Fairchild Semiconductor International, Inc., et al., 2006 U.S. Dist. LEXIS 72718 (D. Del., Oct. 5, 2006).

"within the call pod" — "does not require further construction." Callpod, Inc. v. GN Netcom, Inc., et al., 2009 U.S. Dist. LEXIS 51103 (N.D. Ill., Mar. 6, 2009).

"without direct control of the processors of the processing elements" — "means that the [broadcasting] /[determining a priority] function is performed independently by the I/O device without receiving instructions from its associated processor." Fifth Generation Computer Corp. v. International Business Machines Corp., 2010 U.S. Dist. LEXIS 772 (S.D.N.Y., Jan. 5, 2010).

"without installing new software on the wireless terminal" — "without installing an application program, other than the parsing software, to provide user interfaces." Symbol Technologies, Inc. v. Janam Technologies LLC, 605 F. Supp. 2d 618 (D. Del. 2009).

"without significant interference" — "means that the calculated oxygen saturation is accurate enough for the purposes of which the calculation is being employed." Mallinckrodt, Inc., et al. v. Masimo Corp., et al., 254 F. Supp. 2d 1140 (C.D. Cal. 2003).
"without the need for human analysis" — "not requiring evaluation or choice by a human." Timeline, Inc. v. ProClarity Corp., et al., 2006 U.S. Dist. LEXIS 44478 (W.D. Wash., June 29, 2006).

"data word" — "the term 'word,' in computerese, means the amount of data, or the number of bits (binary digits, or 0s and 1s), that can be transferred to or from input/output devices in a single memory cycle. It is not a specific number of bits; rather, it is whatever number of bits can be transferred to or from input/output devices in one memory cycle." TM Patents, L.P., et al. v. International Business Machines Corp., 72 F. Supp. 2d 370 (S.D.N.Y. 1999).

"word line driver circuit" — "a circuit that applies a driving input voltage to a single word line or a group of word lines." Mosaid Technologies, Inc. v. Samsung Electronics Co., Ltd., et al., 2004 U.S. Dist. LEXIS 27636 (D.N.J., Mar. 23, 2004).

"established on the World Wide Web" — "(1) accessible on the Internet, (2) can be located by a Uniform Resource Locator (URL), and (3) can be communicated with through a browser." Automated Business Cos. v. ENC Technology Corp., et al., 2009 U.S. Dist. LEXIS 91177 (S.D. Tex., Sep. 30, 2009).

"work(s)"; "item(s)"; "media item(s)" — "audio and/or video compositions, e.g. songs, movies, music videos, advertisements." Premier International Associates v. Apple Computer, Inc., et al., 512 F. Supp. 2d 737 (E.D. Tex. 2007).

"workspace data" — "data, including corresponding version information, which may include e-mail data, file data, calendar data, user data, etc. Workspace data may also include other types of data such as applications programs." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).

"workspace element" — "For the '192 and '131 patents, the tentative construction for the term 'workspace element' is as follows: A basic unit of workspace data such as an e-mail, file, bookmark, or calendar.; "For the '708 patent, the tentative construction is as follows: A basic unit of workspace data such as an e-mail or e-mail folder, file or file folder, calendar or calendar folder, or bookmark or bookmark folder." Visto Corp. v. Sproqit Techs., Inc., 445 F. Supp. 2d 1104 (N.D. Cal. 2006).

"workspace element" — "a subset of workspace data such as an e-mail, file, bookmark, calendar, or applications program which may include version information." Visto Corp. v. Seven Networks, Inc., 2005 U.S. Dist. LEXIS 46113 (E.D. Tex., Apr. 20, 2005).

"workstation" — "a position including a device or group of devices, which are equipped with capabilities for computer data processing in combination with audio and video interaction, and which are based upon or include a conventional desktop or portable computer." Collaboration Properties, Inc. v. Tandberg ASA, et al., 2006 U.S. Dist. LEXIS 42466 (N.D. Cal., June 23, 2006).
"writable memory" — "memory that is capable of having data written to and read from." -STMicroelectronics, Inc. v. Motorola, Inc., 327 F. Supp. 2d 687 (E.D. Tex. 2004).

"each signal processor having write access at any time to only a particular one of said memories and read access at any time to any of said memories" — "each signal processor can always: (1) write without delay to only its exclusive memory; and (2) read without delay from any of the memories."  Saxon Innovations, LLC v. Nokia Corp., et al., 2009 U.S. Dist. LEXIS 67019 (E.D. Tex., Jul. 30, 2009).

"writing ... simultaneously" — "initiating a write command to two or more sectors within two or more (row) blocks at the same time."  Toshiba Corp. v. Lexar Media, Inc., 2005 U.S. Dist. LEXIS 46842 (N.D. Cal., Jan. 24, 2005).

"writing the audio data from the buffer onto a digital audio tape and a random access storage device" — "transferring audio data from the buffer directly to both a digital audio tape and a random access storage device."  NICE Systems, Inc., et al. v. Witness Systems, Inc., 528 F. Supp. 2d 470 (D. Del. 2007).

- X -

- Y -

[i] "yield management system"; [ii] "yield management program logic" — [i] "a computer with a program that produces a pricing forecast used to determine prices for sales of commercial time based on factors such as past trends, performance data, and available inventory, updated with data from recent transactions in order to maintain an accurate pricing model. A system does not include a human being attempting to perform a task manually."; [ii] "software that produces a pricing forecast used to determine prices for sales of commercial time based on factors such as past trends, performance data, and available inventory, updated with data from recent transactions in order to maintain an accurate pricing model."  Grantley Patent Holdings, Ltd. v. Clear Channel Communications, Inc., et. al., 2008 U.S. Dist. LEXIS 1588 (E.D. Tex., Jan. 8, 2008).

- Z -
[i] "0-order diffracted beam"; [ii] "non-0-order diffracted beam" — [i] "a light beam or ray formed when a mask pattern diffracts light back directly along the illumination axis"; [ii] "a light beam or ray formed when a mask pattern diffracts light off the illumination axis." Nikon Corp., et al. v. ASM Lithography B.V., 308 F. Supp. 2d 1039 (N.D. Cal. 2004).
8. "ANI" and "Calling Number Identification Data"

"ANI" and "calling number identification data" are the next terms presented to the Court for construction. In general, the term "calling number identification data" appears in the claims and the term "ANI" is used in the specifications. The parties agree that "ANI" and "calling number identification data" have the same meaning.

In the Analysis Control System Claims, the term "calling number identification data" appears in context as "receiving said calling number identification data." See Claims 33, 104, 117, and 192 of the '707 patent and Claim 171 of the '863 patent. In the Conditional Format claims, the terms appear in context as "call data signals as to indicate. . . calling numbers" or "calling numbers as additional call data signals." See Claim 15 of the '150 patent and Claims 17 and 24 of the '285 patent. In the Products Carrying Participation Numbers Claims, the terms appear in context as "call data signals indicative of calling number identification data." See Claim 44 of the '707 patent and Claim 79 of the '863 patent. These terms appear throughout the Katz patents. The parties agree and the Court concludes that the terms have a consistent meaning across the claims.

The arguments of the parties regarding the proper construction of these terms mostly mirror their arguments regarding "DNIS" and "called number identification data." The plaintiffs argue that these terms mean a signal provided by the telephone network that indicates all or part of the calling number. (Pls.' Appendix at 31, 69). The defendants argue that "ANI" and "calling number identification data" must refer to the entire calling number, do not include routing or billing signals used within the telephone network, and must identify the geographic location of the caller such that wireless phones are excluded. The arguments of the defendants will be addressed in turn.

There is no indication in the claim language that "ANI" or "calling number identification data" must be the full calling number; indeed many of the claims call out a signal that indicates the calling number. The specifications do not support the defendants' contention either. In Column 4, lines 62 through 67 of the '707 patent, Katz notes that "ANI capability is a similar function whereby the digital data indicates the calling number with calling terminal digital signals." The defendants contend that because Katz used ten digit phone numbers in his examples in the specifications, the terms "ANI" and "calling number identification data" must include the full seven or ten digit number. In Column 6, lines 62 through 65 of the '707 patent, Katz describes two ways in which the calling number could be transmitted to the Katz system; he notes that "the caller would push the buttons in sequence to indicate his telephone number, e.g. '(213) 627-2222.' Alternatively, the interface 20 can accept the calling number (213) 627-2222) according to its provision by standard ANI equipment of the communication facility C." In Column 7, lines 29 through 30 of the '707 patent, Katz notes that "the first portion, section 53, contains a form of identification data, i.e., the caller's telephone number, i.e. '(213) 627-2222.'"

The first passage of the specifications cited by the defendants is provided as an example of a calling number. It is clear that the number from which a caller is calling would be a full seven or ten digit number; however, the specification is silent about what the signal that conveys this number, the ANI or the calling number identification data, would include. The second passage of the specifications cited by the defendants describes an example of data that is stored in a cell as represented in Figure 2, not "ANI" or "calling number identification data." Neither of these passages indicates that "ANI" or "calling number identification data" must include any particular number of digits.

As for the defendants' second argument, the claim language does not support a construction of "ANI" or "calling number identification data" that excludes routing signals or billing signals that are used within the telephone network. This argument is essentially the same as the defendants' argument that "communication facility" means that the Katz system must operate outside of the telephone network, which the Court addressed above and will not repeat here. In short, neither the claim language nor specifications mention routing or billing signals as either included or excluded in the definition of "ANI" or "calling number identification data." Determining whether routing or billing signals are signals which indicate the calling number is not a matter of claim construction, and as such, is not properly before the Court.

Further, the prosecution history cited by the defendants neither confirms their proposed construction of "ANI" or "calling number identification data" nor conflicts with the plain meaning of the terms "ANI" and "calling number identification data" conveyed by the claim language and specifications. In an Amendment dated April 15, 1996 in the prosecution of the '751
patent, Katz attempted to distinguish the '020 patent to Fodale to support his amendment. Katz described the Fodale patent as providing a system which blocks delinquent telephone terminals from making toll calls by comparing routing and billing information provided by the local telephone office against a list of delinquent terminal numbers. Katz notes that in one arrangement in the Fodale patent, ANI provides the calling or billed number. Katz stated that "no reference to ANI can be located in providing the caller number, which presumably is otherwise available to the local toll network." (Ex. 67). The defendants contend that Katz was referring to "his" version of ANI in this last statement and distinguishing signals that are sent outside the telephone network from the billing signals or routing signals that are internal to the telephone network. The defendants' interpretation of this statement by Katz is inconsistent with his statement that Fodale uses ANI to provide the calling or billed number in one arrangement. While the meaning of Katz's statements in this Amendment is not completely clear, the Court concludes that these statements clearly do not convey the message that the defendants would attribute to them, that Katz was disclaiming coverage of routing and billing signals.

As for the defendants' final argument, there is no requirement in the claim language that "ANI" and "calling number identification data" must identify the geographic location of callers. The defendants argue that the "ANI" and "calling number identification data" must disclose the geographic location of the caller because the formats disclosed in the specifications use ANI to screen callers based on their geographic area. In his description of a television game show format in Column 18, lines 37 through 44, lines 56 through 62 of the '707 patent, Katz proposes that different questions be used for different geographic locations to accommodate the different time zones and that "area code numbers afford an effective geographic classification of callers." In the context of the discussion of a television poll format in Column 20, line 16 through 22 of the '707, Katz proposes that callers may be screened by geographic area according to their telephone number which is provided by ANI equipment. The defendants contend that because Katz uses the geographic location of the callers taken from the calling number in these formats, the Mobile Identification Number or MIN supplied by wireless phones cannot constitute "calling number identification data" or "ANI" because MIN does not supply an accurate indication of the callers geographic location. However, in the discussion of an instant lottery format in Column 12, lines 46 through 47 of the '707 patent, Katz proposes the use of a caller's telephone number and date of birth to qualify a caller based on his age; in this example, the calling number is not used to qualify a caller based on his geographic location. Similarly, Claims 165 and 175 of the '707 patent call out the use of calling numbers for purposes other than determining geographic limitations. To adopt the defendants' construction of the terms at issue to always require the identification of the geographic location of the caller would not only improperly limit the claims by the examples disclosed in the specifications, but also would limit the claims in a manner inconsistent with some of the other examples in the specifications. The Court concludes that there is no basis in the claim language for importing such a limitation.

Based on the foregoing, the Court concludes that "ANI" and "calling number identification data" are synonymous in the claims at issue in the Katz patents and mean: a signal that identifies the calling number, i.e. the number from which a call originated.

2

2. Step (A): "A Prize Winning Number" n1

n1 The term, "defining" was not among the terms highlighted by the parties for construction, although it was addressed somewhat in the briefings and hearing. The parties essentially agree on the meaning of "defining" as "setting" or "fixing" or "making distinct," and we do not address it further here.

Defendants urge us to limit "a prize winning number" to mean a singular number, specifically the number 1. (Def. Br. at 12-13.) Plaintiff claims that "a" has an open-ended meaning of "one or more." (Pl. Resp. at 4.)

In cases addressing the meaning of "a," especially within claims involving "comprising," the Federal Circuit has recommended an open-ended interpretation, unless a specific limitation or evidence of intent to limit is found in the claims. Scanner Techs. Corp. v. ICOS Vision Systems Corp., N.V., 365 F.3d 1299, 1304-06 (Fed. Cir. 2004). We have not found
such an intent to limit in the specification. Occasionally the claims refer to "the" prize winning number, but that occurs in the claims only after an immediate reference to "a" prize winning number, which implies that "the" refers to the number of the previous reference, but not that the number must be singular.

There are references in the specification to multiple prizes and winners, which provide some basis to allow for the existence of multiple prize winning numbers as well. For example, the Summary of the Invention describes a system for linking game devices to "a plurality of progressive prizes," and states that one of the objectives of the invention is to allow players "to share in the possibility of winning common progressive prizes." (460 Patent, col. 4:42-46, 20-24.) In addition, the summary states that "the method enables the system to randomly select one or more of the current participants as a winner." (Id., col. 4:37-38.)

However, multiple winners and prizes are not necessarily equivalent to multiple prize winning numbers. The multiple winner and prizes could be linked to one specific number that occurs in the system more than once. Therefore, the real inquiry remains whether the specification in any way limits the meaning of "prize winning number." Defendants' proffered evidence in support of finding that "a" must be singular is not convincing. First, Defendants find only one potential reference in the specification outside the claims: the use of the word "the." This usage appears to apply to a device's generated number, not a prize winning number, the reference to which in their example contains the article "a." (Id. col 16:43-45 ("If the number produced was equal to a predefined number, such as the number one ('1'), then the prize award process would start."))

Next, Defendants claim that the number must be the number 1 because the odds have not been calculated yet, and the number must be within the range of odds, and 1 is the only number that could anticipate all odds. We disagree with Defendants that the potential prize winning number must be the number 1. First, the specification never states that the prize winning number must be the number 1, but merely provides it as an example. The use of the term "such as" lends more support to an inference that other numbers are possible, than it confines the prize winning number to being the number 1. In addition, the specification provides examples of "win numbers" being numbers other than 1. n² Furthermore as discussed below, we are not convinced that the prize winning number must be determined before the odds are determined, or that the number one is guaranteed to fall within such a range of numbers, and Defendants' argument thus fails on those grounds as well.

n² To what extent "win numbers" are distinct from prize winning numbers is not entirely clear from the specification, but the similarity of the terms makes the reference worth noting.

The specification does not provide a clear indication of how many prize winning numbers are envisioned by the inventor. As stated by the Federal Circuit, "unless the claim is specific as to the number of elements, the article 'a' receives a singular interpretation only in rare circumstances when the patentee evinces a clear intent to so limit the article." Id. at 1304. Because we have not found evidence of an intent to limit the amount of prize winning numbers in the specification, we do not import any quantitative limitation onto Step (A). Thus, we find that "a" means "one or more."

B. "A Computer"

The Magistrate Judge next construed the term "a computer" as that term appears in Claim 26 and dependent Claim 58 of the 653 Patent. He noted that, while the parties agree that the term "a computer" includes "a system of interconnected electronic components that receive, process and present data according to instructions," they part company over whether the term covers "networked systems of two or more computers" where "the components may be co-located or distributed" (Quickview's position) or only "a single computer that does not include networked systems" (Belo's view). (F & R at 6) The Magistrate Judge scanned the intrinsic record including the specification and prosecution history, and found no support for Quickview's interpretation of "a computer" as a networked systems of computers. In discounting Quickview's proposed
construction, he remarked, "nothing in the plain language of the claims themselves or the prosecution history indicates that the program is intended for multiple or networked computers . . . every description of the invention either references or contemplates a single computer." (Id. at 7) Ultimately, he concluded that the term should be construed in conformity with Belo's position as "a system of interconnected electronic components that receive, process, and present data according to instructions, but not a network system of two or more computers." (Id. at 7-8)

Quickview filed objections to the Magistrate Judge's construction of the term "a computer," again arguing that the construction improperly limits the claim element to the preferred embodiment. Quickview further complains that the construction violates the "established" Federal Circuit rule that the article "a" immediately preceding the term "computer" should not limit the claim element "computer" from encompassing two or more like elements. Quickview also takes issue with the Magistrate Judge's determination that "co-located" "does nothing to further elucidate the meaning of the term a computer."

Again, upon de novo review of the claim construction at issue along with the intrinsic record, the Court finds Quickview's objections without merit. Nowhere in the Magistrate Judge's ruling does he suggest he is limiting the term "a computer" to the preferred embodiment. Rather, he correctly relies upon the specification and prosecution history to find that there is no support for Quickview's construction of a networked system of computers and further that "every description of the invention either references or contemplates a single computer," in support of Belo's view. (Id. at 7) Quickview's reliance upon "established" patent precedent to support its construction is wholly unavailing in the absence of any support in the intrinsic proof. The settled patent principles referred to by Quickview do not operate in a vacuum, but rather must be applied in the context of proper claim construction methodology. This requires the Court to look to the language in the claim, specification and prosecution history which, in this instance, simply do not support its proposed construction.

With respect to Quickview's contention that the article "a" immediately preceding "computer" should have been construed by the Magistrate Judge to refer to "two or more computers" in accord with the "Federal Circuit's established rule," the Court is not persuaded. In advancing this argument, Quickview overlooks the fact that Federal Circuit precedent on this issue actually holds that "a" may suggest "one" but can mean "more than one" depending on the context in which it is used. Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977 (Fed. Cir. 1999) (other citations omitted) (emphasis added). Quickview has not adequately explained how, when read in the "context" of this claim, "a" means "two or more." In contrast, in the context of the specification and prosecution history, the Magistrate Judge found "a computer" to refer to a single computer. For this reason, the Court is persuaded, after de novo review, that Quickview's objection on this point should be overruled.

Finally, Quickview objects to the Magistrate Judge's finding that the term "co-located" does not further elucidate the meaning of the term "a computer." Quickview maintains that the Magistrate Judge should have focused on the entire phrase "the components may be co-located or distributed" in making his determination as to the effect of the term "co-located." Citing to a "long held" Federal Circuit principle that terms describing "spatial locations" are proper and must be read in context, Quickview contends that the Magistrate Judge erred in not adhering to this principle with respect to the term "co-located." The Court disagrees.

Simply because the Magistrate Judge addressed the term "co-located" separately, does not mean that he disregarded the term in the context of the sentence from which it derives. He begins his analysis of the term "a computer" by specifically referring to the fact that Quickview "argues for an expanded definition that encompasses networked systems of two or more computers where the components may be co-located or distributed." (F & R at 6 [emphasis added]). Having identified Quickview's definition as including the term "co-located" in the context of the full sentence, he then observes that Quickview's definition is "not supported" by the specification, prosecution history, or preferred embodiment. (Id. at 6-7) This suggests that he did examine Quickview's proposed construction, including the full sentence containing the term "co-located," in the context of the intrinsic record and found Quickview's construction unsupported. In any event, stripped to its essence, this is simply another argument by Quickview to support its position that the term "a computer" refers to a network system of two or more computers. The Magistrate Judge properly examined the intrinsic proof and found no support for Quickview's definition. Moreover, other than contending that the Magistrate Judge disregarded long held patent principles in construing "co-located," Quickview fails to explain how its method of analysis would have yielded a different claim construction of the term "a computer." For all of these reasons, the Court OVERRULES Quickview's objections on this point and accepts the Magistrate Judge's construction of "a computer."
C. What is "a contact"?

The parties also read "a contact" differently. Element d of claim 1 describes a charge sink means "having a contact for applying a bias thereto." The indefinite article "a" when used in a claim normally means one or more. North Am. Vaccine, Inc. v. American Cyanamid, Co., 7 F.3d 1571, 1576 (Fed. Cir. 1993), cert. denied, 128 L. Ed. 2d 365, 114 S. Ct. 1645 (1994).

The specification describes the contact shown in Figure 1. It reads, at column 3, lines 24-27:

In accordance with one embodiment, N + type material, such as phosphorous, is implanted or diffused into layer 12 for forming region 16 which makes ohmic contact with region 14.

It then reads, at lines 27-30: "Other electrical connecting means may be employed for making ohmic contact with region 14. This structure provides a means for externally applying an electrical potential to region 14 . . . . " The discussion in the specification describes generally the single illustrative embodiment depicted in the patent. At the same time, the specification states that skilled artisans will know to employ "other electrical contacting means" to supply a bias to the charge sink means. Nothing in the specification limits the claim to a single contact or to a particular kind of contact. Neither the applicant nor the examiner focused on "contact" during the course of the prosecution.

The specification suggests that skilled artisans would know many ways to make electrical contact. Dr. Barbe agreed that one skilled in the art would understand that contacts are common to anti-blooming devices. These features apply a bias to the charge sink means to make the device operate. Transcript at 44. He explained that the patent does not restrict the point of contact or the number of contacts to apply a bias to the charge sink means. According to Dr. Barbe, "a contact can be anything from a discrete point to -- the complete bottom of a substrate . . . . So [a contact] can be looked at as a single point or as a continuum of points representing a large area." Transcript at 45. Dr. Barbe explained on cross-examination that the contact is generally made from an ohmic contact in the semiconductor and a metallic contact. Transcript at 99. As Dr. Barbe explained, a contact might be any point from or to which charge would flow. Transcript at 101.

The broad definition of "contact" in the specification, coupled with the testimony of Dr. Barbe, show that "a contact" is one or more paths for charge to flow to and from the charge sink means.

Defendant argues that Sigaba technology differs from the invention of the '647 patent because it encrypts and decrypts documents using encryption keys. The encryption keys are unrelated to password data and are managed separately from the content they encrypt. Def.’s Mot. Summ. J. at 5:5-11. Defendant argues in the alternative that summary judgment is appropriate even if the encryption keys are "considered to be the equivalent of a 'password'" because the Sigaba system does not meet the other limitations of independent claims 1, 18, and 43. Id. at 6:4-11. All three claims require: (i) storing password data and trade details in a database and (ii) encrypting an electronic envelope and one or more trade confirmation documents based on the password data and the trade details.

H. Literal Infringement

The parties dispute the proper claim construction of the terms "a," "and," and "based on" present in all three independent claims of the '647 patent. Defendant urges the court to follow the guidance of the Federal Circuit in DeMarini Sports v. Worth, Inc., 239 F.3d 1314 (Fed. Cir. 2001), holding, "the language of the claims as allowed is what [is] construed, and it is that language that determines the limitations of the claim." Id. at 1327-1328.

A. Sigaba Does Not Store Password Data And Trade Details In A Database
Defendant argues that Sigaba technology is unique because it does not use "password data" to encrypt a document. Instead, "encryption keys" are used to encrypt and decrypt a document. If encryption keys are considered to be "password data," however, defendant argues that Sigaba technology does not store password data and trade details in a database. Def.'s Mot. Summ. J. at 6:4-10. Plaintiff argues that defendant's interpretation of "and" and "a" are too restrictive, presenting a competing claim construction of these terms.

1. "A"

Defendant contends that "a" refers to "one and the same" database. PostX asserts that defendant's claim construction with regards to "a" is faulty, citing the Federal Circuit in KCJ Corp. v. Kinetic Concepts Inc., 223 F.3d 1351 (Fed. Cir. 2000), which states that the word "a" in patent parlance is "notoriously accepted as meaning 'one or more.'" Id. at 1356. Plaintiff argues that only in rare circumstances, in which the patentee evinces a clear intent to limit the article, should "a" receive a singular interpretation. Defendant, on the other hand, argues simply that the normal meaning of "a" is singular, citing numerous cases supporting that interpretation. See Def.'s Reply Br. at 4-6.

This Court must look to the written description in order to determine the intention of the claim limitations. KCJ Corp. v. Kinetic Concepts Inc., 223 F.3d at 1356 ("as the rule dictates, when the claim language or context calls for further inquiry, this court consults the written description for a clear intent to limit the invention to a singular embodiment."); North American Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1576 (Fed. Cir. 1993) ("When the meaning of a claim term is in doubt, we look to the specification for guidance."). Plaintiff cites Landis on Mechanics of Patent Claim Drafting, (4th Ed. 2002), to support the argument that "as", singular, generally covers more than one. This Court finds, however, that although it is possible for "a" to mean one or more, analysis of its context within the '647 patent militates in favor a more restricted interpretation. As Landis states, "A more correct view is stated in Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977 U.S.P.Q.2d (BNA) 1109 (Fed. Cir. 1999), wherein 'a' or 'an' suggests 'one,' but can also mean 'one or more than one' or 'at least one,' depending on the context in which the article is used, when the claim has the open-ended transition, such as 'comprising.'" See also North American Vaccine, Inc., 7 F.3d at 1576 ("While it is generally accepted in patent parlance that 'a' can mean one or more... there is no indication in the patent specification that the inventors here intended to have other than its normal singular database."). The plain meaning of the word "a," in the context of the '647 patent suggests a singular database.

PostX makes reference to a singular database throughout the patent specifications. Contrary to the context requirements of KCJ, PostX makes repeated reference to "the database," namely the OTC database 28, in the claim language as well as the specification. '647 patent at 4:54-57, 4:63, 4:67, 5:2, 5:27, 6:7, 6:24, 6:25, 6:43-44, 6:62, 7:57-58 & 11:13. Further, the '647 patent drawings depict one database labeled: "OTC DATABASE FOR STORING TRADE DATA AND PASSWORD DATA." Id. at Fig. 2. The evidence in the specification consistently suggests singularity.

Further, when the patent makes purposeful reference to the possibility of transmitting multiple trade confirmation documents, the '647 patent claims state: "one or more trade confirmation documents." This indicates PostX's intention to identify a plurality. PostX demonstrates awareness of a distinction between "a" and "one or more," evinced in their description of the OTC database and the document[s] that maybe contained in the encrypted electronic envelopes.

A plain reading of the claim term "a" demonstrates that the '647 patent claims one database in which the password data together with trade details data is stored. Because neither party disputes the fact that Sigaba's products and technology do not store password data and trade details data or trade confirmation documents in the same database, Def.'s Reply Br. at 3:16-21, the Court finds no infringement of the '647 patent.

2. "And"

According to Sigaba, even if "a" is interpreted as meaning one or more, the presence of "and" in the claim language requires that each of the one or more database(s) contain both password data and trade details data. Def.'s Reply Br. at 7:15-17. The Court concurs. A normal reading of "and" suggests together with or along with, as defendant argues. Def.'s Reply Br. at 8:1-3. In addition, plaintiff acknowledges that claim language using the word "and" is conjunctive rather than disjunctive, Pl.'s Opp'n '688 at 11:13-19, and that there are several instances in which the patent description represents password data and the trade details data conjunctively. '647 patent at col. 4:54-57, 4:62-63, 6:23-24, Fig. 2.
PostX's interpretation of the claim term would mean that the '647 patent governs the vast terrain of storing password data in one database and trade details in a wholly different database. This expansive interpretation does not comport with a normal reading of the patent. Sigaba technology does not store both password data and trade details data in the same database, Suppl. Decl. of Chakraborty at 2, and, therefore does not infringe on this requirement of the '647 patent.

The '899 Patent

The '899 patent claims a method for reducing the effect of noise on the analog sampling process by switching digital section logic gates in an A/D converter. The patent discloses two sets of clocks: one to control timing of the analog sampling in the analog section; the other to control timing of the logic gate output switching in the digital section. By offsetting the two clocks, digital logic gate switching occurs during gaps in the analog sampling. Clock offsetting prevents digital logic gate noise from affecting analog signal sampling.

The disputed portion of claim 4, which is dependent on claim 1, recites:

a method for reducing deleterious effects of said electrical noise on the analog-to-digital conversion process, said method comprising:

a. providing a first clock signal to said analog circuitry for controlling the sampling of an analog input voltage;

b. . . .

c. generating a second clock signal having its leading edge delayed with respect to the trailing edge of said first clock signal . . . .

(emphasis added). In construing the claims, the district court explained: "The integrated circuit must have at least one common reference clock (either digital or analog . . .)." The district court further stated: "[The phrase] 'first clock signal' . . . indicates the analog circuit clock signal comes prior to the 'second' digital circuit clock signal. Again, this language does not limit the claims construction to one clock."

As the district court correctly noted, "a first clock signal" does not require a single clock signal to control sampling. As previously discussed, the word "comprising" in the transitional phrase of a patent claim creates a presumption that the body of the claim is open. Because claim 4 uses "comprising," it encompasses more than one clock unless the written description or the prosecution history clearly limits claim 4 to its recited elements. Similarly, the article "a" in "a first clock signal" generally suggests one or more clocks. The written description and figures of the '899 patent actually disclose two analog clocks, ACLK1 and ACLK2, in the preferred embodiment. See, e.g., col. 2, ll. 52-56; col. 4, ll. 16-26; Fig. 3. According to the preferred embodiment, analog clock ACLK1 accepts the analog input voltage (the charge), analog clock ACLK2 transfers the charge to or from the feedback capacitor.

2. Claim 12 requires the "first computer" to be one and the same computer

Claim 12 states that the e-mail is sent by a first computer PostX argues that "this does not mean 'one and only one' computer as Sigaba implies." Pl.'s Opp'n at 14:9-10. Here, the question of the proper meaning and interpretation of "a" arises, as it did in the infringement action regarding the '647 patent. See Order Granting Def.'s Mot. for Summ. J. of Noninfringement of U.S. Patent No. '647 at 6-7. PostX makes a similar argument, again citing KCJ Corp. However, the argument must fail here as it did before, because the language suggests the singular meaning of "a."

In the '647 patent action, this Court reasoned:
PostX asserts that defendant's claim construction with regards to "a" is faulty, citing the Federal Circuit in KCJ Corp. v. Kinetic Concepts, Inc., . . ., which states that the word "a" in patent parlance is "notoriously accepted as meaning 'one or more.'" . . . Plaintiff argues that only in rare circumstances, in which the patentee evinces a clear intent to limit the article, should "a" receive a singular interpretation . . . This Court must look to the written description in order to determine the intention of the claim limitations . . . This Court finds . . . that although it is possible for "a" to mean one or more, analysis of its context within the '647 patent militates in favor of a more restricted interpretation . . . The plain meaning of the word "a," in the context of the '647 patent, suggests a singular database.

Id. (citations omitted).

Likewise, in this context "a" describes the singular form. The "first computer" unambiguously refers to the same computer. The claim language, "said first computer," is used throughout the patent and the definite term "said" further indicates a singular meaning. See Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1024 ("Repeatedly the claim refers to 'said chamber' as it describes various portions of the apparatus. This term itself, 'said chamber,' reinforces the singular nature of the chamber. The claim does not place the sterilization zone vaguely within 'a chamber,' but within 'said chamber.' This language clarifies that only one chamber is in question.").

PostX further argues that, in Sigaba's technology, "it is undisputed that the e-mail sent to the recipient includes e-mail message data provided by the original sender, and the executable software provided by the 'Gateway' computer. Accordingly, these two computers cooperate in composing and sending the e-mail received by the computer, and can thus be considered together the claimed 'first computer.'" Pl.'s Opp'n at 14:15-19; see also Pl.'s Supplemental Br. in Opp'n at 5:16-17 ("Sigaba's 'Key Server', 'User Management Server' and 'Administration Server' are not separate computers. Instead, these refer to software functions performed by the Sigaba product."). The Court finds this argument unconvincing. The '688 patent specification confirms that there is only one first computer. The sender computer "contains, as is known, a computer portion 22 that contains, as is known, I/O [input/output] 22A, memory 22B, and some type of processor 22C." '688 Patent at col. 3:45-47. The sender computer is distinguished from "additional computers [that] can also be connected to the network." Id. at 3:41-44. Figure 1 of the specification also confirms that the sender computer is a single computer. 1

1 At oral argument, PostX presented several diagrams of the Sigaba system, all depicting two separate computers, which PostX represents as "a first computer."

If PostX meant one or more computers constituting the first computer, it would not have referred to the first computer as the "said first computer" nor would its specification clearly depict one first computer. Sigaba argues convincingly 2 that equivalence in this instance would "entirely vitiate this claim limitation, particularly given the patentee's decision to precisely enumerate the computers using ordinal numbers (e.g., "first", "second", etc.)." See Def.'s Supplemental Reply Br. at 4:6-9. Id. The Court, therefore, finds no literal or substantial equivalent in the Sigaba technology.

2 Although the Court finds Sigaba's arguments convincing, it finds Sigaba's footnotes unsatisfactory. Sigaba's use of footnotes for most of its case citations and analysis is an improper and unsophisticated effort to evade the page limitations set.

Furthermore, Claim 1 requires the selection of one of the coding modes as "a function, at least in part, of periodicity" of the speech signal. The Board fails to explain how, under even its interpretation of the Bottau disclosure, the prior art discloses
the selection of a coding mode based in part on the periodicity of a segment of the speech signal. The Commissioner's brief tries to correct for this omission in the Board's opinion by referring to the second embodiment of Bottau wherein the high frequency component of the speech signal is filtered out and separately encoded: "the low band and high band components of voiced input signals are separated [in Bottau] as a function of their frequency or periodicity by using a low-frequency pass filter." (emphasis added). However, for Bottau to "teach" the claimed invention in accordance with the Commissioner's argument, we would have to equate "frequency" of the input speech signal with applicants' "periodicity." These phenomena, however, are quite different, particularly in light of the manner in which "periodicity" is defined in the Application specification.

According to the claimed invention as defined in the specification, an incoming speech signal is parsed into a plurality of segments. In the preferred embodiment, speech coding is performed on a frame-by-frame basis wherein each frame is composed of four segments or subframes. For each subframe, a signal Pi is calculated, and for each frame, a signal Pf is calculated. Pi is measured in decibels (dB) and is representative of how much an earlier segment or subframe "substantially conforms to the information in the current segment." This is a measure of the periodicity of the given subframe. Pf is a signal, also measured in dB, that indicates the degree of periodicity of the entire frame compared to an earlier frame. The determination of the coding mode to use to encode the subframes in a given frame is based on the values of the signals Pi and Pf. Accordingly, the "periodicity" function of Claim 1(B), as used and defined in the specification, is a function of how similar recurring signal patterns are over time, not the frequency or decibel level of the signal at a particular time, as the Commissioner and the Board incorrectly supposed.

Finally, the Commissioner makes the argument that, according to the specification, the Bottau coding method is only applied to voiced signals: "Bottau teaches that the two modes are derived for voiced speech because the input s(n) is already sampled (not shown) to provide only voiced signals. A72, column 2, lines 27-30." The portion of the specification referenced by the Commissioner states:

The voice signal to be transmitted, sampled at 8 kHz and digitally PCM encoded with 12 bits per sample in a conventional analog to Digital converter (not shown) provides samples s(n).

(emphasis added). Nothing in this section of the Bottau specification indicates that the incoming speech signal has been sampled only to include voiced, as distinct from unvoiced, speech. Granted, Bottau refers to a "voice signal"; however, the voice signal of Bottau is clearly equivalent to the input speech signal of the present invention and is not related to the voiced nature of sampled signal segments as the Commissioner argues.

Neither Bottau nor Tokura teaches providing a plurality of coding modes for coding a segment of a speech signal wherein at least two of these coding modes are for encoding speech segments that are substantially voiced speech, and selecting one coding mode based, in part, on the periodicity of the speech signal of the segment.

CONCLUSION

The Board reversibly erred in (1) finding a motivation to combine Tokura, Bottau and "various excitation codes and methods . . . known in the art" to arrive at the claimed invention which applies multiple coding modes to substantially voiced speech where such motivation clearly was not shown in the cited prior art; (2) construing Claim 1 to require only "the provision of a plurality of coding modes wherein at least two of the coding modes 'correspond to substantially voiced input speech signals,'" where the claim also requires that a coding mode be selected based on the periodicity of the speech signal; and (3) finding Bottau to teach the application of at least two, distinct coding modes to substantially voiced speech. Thus, even though there were multiple known ways of encoding a speech signal, it would not have been obvious from Tokura and Bottau to encode an input speech signal according to the claimed invention. Therefore, the decision of the Board is reversed.

(i) 1. A multi-unit memory system comprising:

This claim, which was not disputed before Judge Young, means precisely what the words say. "A multi-unit memory
system" is "a" (that is to say, one, or a single) system that uses two or more data storage memory units. Of course, the fact that the patent claims "a" system does not mean that IBM or some other party would escape liability for infringement by constructing two or three or even more such multi-unit memory systems and somehow linking them together or causing them to operate together.

There is no reason to read anything further into the very simple words used by the claimant. There is no mention of a "single array" in the patent claim, and I decline to adopt IBM's suggestion that I read such a limitation into the claim, applying the settled principle of patent construction that the language of the claim defines its scope, see Mantech Environmental Corp. v. Hudson Environmental Servs., Inc., 152 F.3d 1368, 1373 (Fed. Cir. 1998), and that the words of a claim are to be construed in accordance with their ordinary meaning to persons in the relevant field of technology, unless it appears that the inventor used them otherwise. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995). In particular, claims are not to be limited or construed by reading in extraneous words from written descriptions or specifications that are not contained in the claims themselves. See Laitram Corp. v. NEC Corp., 163 F.3d 1342, 1347 (Fed. Cir. 1998). This rule is not inconsistent with the principle that claims should be construed in light of the patent specification, see, e.g., Bell Communications, 55 F.3d at 620, but simply recognizes that the claims of a patent are not limited to the preferred embodiment that is described in the specifications. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997).

Throughout this proceeding, IBM has contorted the plain meaning of words and phrases used in the patent claims themselves by referring to the written description, including the specifications and the embodiment disclosed therein. In construing this patent (and, indeed, all three patents), I have adopted the principle that, where the language of the claim is clear and unambiguous, I will read nothing additional into it. If this means that the patent turns out to be invalid (which is a decision for the jury, not for the Court), then so be it. Although courts are to construe claims so as to sustain a patent's validity where possible, see ACS Hosp. Systems, Inc. v. Montefiore Hosp., 732 F.2d 1572, 1577 (Fed. Cir. 1984), courts are nonetheless bound to follow the other rules of construction discussed above. See id.

2. "a program running on a computer"

Disputed Term comprising a program running on a computer

Plaintiff's Construction one or more computer software programs in operation on one or more computers

Defendant's Construction a set of instructions to accomplish a specific task being executed by a single stand alone computer

Next, the parties disagree as to the meaning of "program running on a computer," which also appears in Claim 8 of the '806 Patent. ('806 Patent at 83:33-34.) Plaintiff contends that "program" and "computer" should be construed to mean "one or more computer software programs in operation on one or more computers." (Jt. Stmt. at 8 (emphasis added).) As a general matter, the Federal Circuit has recognized that an indefinite articles such as "a" or "an" in a patent claim is presumptively interpreted to mean "one or more." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000) (holding that an element of patent requiring "a" continuous chamber was not limited to a single chamber); accord Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1342-43 (Fed. Cir. 2008). Here, although the reference to "program" and "computer" are in the singular, no intrinsic or extrinsic evidence has been offered by Defendant to demonstrate an intent to disclaim the use of multiple programs or computers. KCJ Corp., 223 F.3d at 1356 (noting that absent any indication to disclaim the use of multiple elements, the singular use of "a" or "an" is to be construed as meaning one or more).

Similarly, there is little, if any, support for Defendant's proposed construction of "program running on a computer" to mean "a set of instructions to accomplish a specific task being executed by a single stand alone computer." (Jt. Stmt. at 8.) By definition, a computer program or software is "the set of instructions, known as code, that directs a computer to perform specified functions or operations [.]" See Microsoft Corp. v. AT & T Corp., 550 U.S. 437, 447, 127 S. Ct. 1746, 167 L. Ed. 2d 737 (2007) (internal quotations and citation omitted). There is no need to construe "program," since neither party seeks to depart from the ordinary meaning of that term. See Biotec Biologische Naturverpackungen GmbH & Co. KG v. Biocorp,
Inc., 249 F.3d 1341, 1349 (Fed. Cir. 2001) ("melting" did not require construction where parties did not deviate from its ordinary meaning). Moreover, as discussed above, there is nothing in the patent to support the conclusion that the program must be "executed by a single stand alone computer," as suggested by Defendant. (Jt. Stmt. at 8.) In accordance with Federal Circuit case law in tandem with the language of Claim 8 and the patent specification, the Court construes "a program running on a computer" as "one or more computer software programs in operation on one or more computers."

11

The trial court construed "disposed over a portion" to require an "area of coincidence between the two layers greater than zero." Thus, the court interpreted claim 1 to encompass capacitor structures with layers covering anywhere from a small area to the entire area of the underlying surface.

Claim language itself sets the claim scope. Vitronics Corp v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996). This court has consistently emphasized that the indefinite articles "a" or "an," when used in a patent claim, mean "one or more" in claims containing open-ended transitional phrases such as "comprising." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356, 55 U.S.P.Q.2D (BNA) 1835, 1839 (Fed. Cir. 2000); see Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977, 52 U.S.P.Q.2D (BNA) 1109, 1112 (Fed. Cir. 1999); AbTox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023, 43 U.S.P.Q.2D (BNA) 1545, 1548 (Fed. Cir. 1997). "Under this conventional rule, the claim limitation 'a,' without more, requires at least one." KCJ at 1356 (emphasis added).

Based on this conventional rule, because claim 1 is open-ended, the limitation "disposed over a portion" means "disposed over at least one portion." This claim construction comports completely with the district court's claim construction. Thus, claim 1's proper construction does not limit "disposed over a portion" to only a portion of the layer beneath. In other words, claim 1 includes within its scope a capacitor structure with layers disposed over the entirety of the underlying surface. Claim 1 does not require a capacitor structure shaped like a three-tiered wedding cake, with the first layer being largest in surface area and the third layer being smallest, or stacked like staggered, partly overlapping layers.

When a patent claim uses the word "comprising" as its transitional phrase, the use of "comprising" creates a presumption that the body of the claim is open. In the parlance of patent law, the transition "comprising" creates a presumption that the recited elements are only a part of the device, that the claim does not exclude additional, unrecited elements. See KCJ, 223 F.3d at 1356.

The transition "having" can also make a claim open. Regents of the Univ. of Cal. v. Eli Lilly & Co., 119 F.3d 1559, 1573, 43 U.S.P.Q.2D (BNA) 1398, 1410 (Fed. Cir. 1997). However, the term "having" does not convey the open-ended meaning as strongly as "comprising." "Having," for instance, does not create a presumption that the body of the claim is open. Therefore, this court examines the claim in its full context to determine whether Crystal's use of "having" limits claim 1 to its recited elements.

The language of claim 1 itself does not limit the term "having" to a closed meaning. The '483 patent discloses a capacitor structure that shields the sensitive plate of the capacitor from stray noise. The "Background of the Invention" describes typical prior art capacitors with a two-plate structure. Col. 1, ll. 58-68. The top plate served as a "sensitive 'virtual ground' capacitor plate" while the bottom "shielded the sensitive node from substrate noise." Id. These two-plate capacitors were "still susceptible to noise coupling onto the sensitive top plate through passivation and packaging dielectrics." Id. at 66-68. The claimed tri-layered structure improves noise shielding. The first and third layers are connected together and operate "to shield . . . the second conductive layer, from noise resulting from external sources or from the semiconductor substrate." Col. 2, ll. 19-24; col. 4, ll. 8-11 ("The upper metal plate 38 is operable to shield the shielded plate 36 from noise resulting from signals that are disposed above the plate 38.").

Figure 6 illustrates that the preferred embodiment of the claimed '483 invention shields against noise by entirely covering the middle layer (36):

[SEE FIGURE 6 IN ORIGINAL]

According to the written description, the fourth conductive layer (also called the conductive ring 82) "is disposed between
the contacts 84 and 85, and the shielded plate 36 to substantially eliminate stray capacitance between plate 34 and sensitive plate 36." Col. 5, ll. 10-15. Contacts 84 connect the upper conductive layer to the intermediate interconnection strip 83 as depicted in Figure 6. Col. 5, ll. 42-50. Contacts 85 connect the lower conductive layer to the same interconnection strip to link the upper and lower layers. Because the conductive ring "is disposed between plate 34 and contacts 84 and 85," a capacitor structure with such a conductive ring must have a middle layer that is smaller in surface area than the upper and lower layers. In other words, because claim 1 recites this fourth conductive layer, the written description requires claim 1 to encompass a capacitor structure wherein the third layer covers the entirety of the second layer.

The written description thus shows the intent to make claim 1 at least partially open to permit the limitation "disposed over a portion" to mean "disposed over at least one portion." Any assertion that "disposed over a portion" means "disposed over only one portion" would contradict the clear purpose of the invention as described in the written description, depicted in Figure 6, and recited in claim 1. Such an assertion would also impermissibly read the preferred embodiment out of claim 1. Vitronics, 90 F.3d at 1583.

4. "a processor"

4. The Parties' Proposed Constructions

Ingenio asserts that "a processor" should be construed to mean "one or more processors are present." (D.I. 113 at 22-23.) Ingenio argues that even though "a processor" is followed by claim language referring to "the processor" or "said processor," the term should not be limited to a single processor because it is in a claim using "comprising" claim language. (Id. at 22-23.) GameLogic asserts, to the contrary, that the language used in the asserted claims and the specifications of the '082 and '603 patents clearly limited this term to a single processor in a single location.

b. The Court's Construction

The dispute between the parties centers around the meaning of the term "a" in the context of the claim language. The United States Court of Appeals for the Federal Circuit "has repeatedly emphasized that an indefinite article 'a' or 'an' in patent parlance carries the meaning 'one or more' in open-ended claims containing the transitional phrase 'comprising.'" KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). Furthermore, that Court has held that "[u]nless the claim is specific as to the number of elements, the article 'a' receives a singular interpretation only in rare circumstances when the patentee evinces a clear intent to so limit the article." Id. This is true even where the patentee refers to "a" widget, and later refers to "the" or "said" widget. See id. at 1353, 1356-57 (finding that "a . . . continuous . . . chamber" was not limited to a single chamber, even where the claim language later referred to "said chamber"); Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977 (Fed. Cir. 1999) (holding that term "a . . . feed tube" was not necessarily limited to a single feed tube by later claim language "said feed tube," but that the prosecution history of the patent did so limit the claim). n7

- Footnotes -

n7 To determine whether "a" means only one or one or more than one, the Federal Circuit looks to the language of the patent claims and specification. In both Abtox, Inc. v. Exitron Corp., 122 F.3d 1019 (Fed. Cir. 1997) and North Am. Vaccine, Inc. v. Am. Cyanamid Co., 7 F.3d 1571 (Fed. Cir. 1993), the Court held that the language of the patent indicated that "a" meant only one. See Abtox, 122 F.3d at 1023-24; North Am. Vaccine, 7 F.3d at 1575-76. In Abtox, the Court found that where the claim referred to "a chamber," but later repeatedly referred to "said chamber," "only one chamber is in question." Abtox, 122 F.3d at 1024. Similarly, in North Am. Vaccine, the court found that where a claim referred to linkage at "a terminal aldehyde group," but the specification referred to "the terminal aldehyde group," that there was only one linkage. North Am. Vaccine, 7 F.3d at 1576. Although the Federal Circuit interprets the term "a" in light of the claims and specification, the Court recently has more commonly held that "a" in patent parlance, means one or more than one, even where later claim language refers to "the" or "said." See KCJ Corp., 223 F.3d at 1356 (holding that the article "a" would only be limited to its singular meaning when the inventor evinced a clear intent to so limit it). In light of the decisions in Phillips and KCJ Corp., I have construed "a processor" to mean "one or more processors."
GameLogic's only argument that "a processor" should be limited to a single processor in a single device is the later claim language referring to "the processor" or "said processor." Notably, GameLogic has not cited a single case in support of its position. Because the Federal Circuit has previously held that such language does not evince a clear intent by the patentee to limit the claim to a single device, I will not so limit the claim language here. Thus, I will construe "a processor" to mean "one or more processors."

A.

As noted, claims 1 through 6 of the '327 patent claim "[a] computer system, comprising . . . a rasterization circuit coupled to the processor that rasterizes the primitive according to a rasterization process which operates on a floating point format." (Emphasis added.) The district court construed the term "rasterization" to mean "a graphics operation that translates three-dimensional primitives into a set of corresponding fragments of pixels or both and fills them in." Silicon Graphics, Inc. v. ATI Techs., Inc., No. 06-611, 2007 U.S. Dist. LEXIS 76452, 2007 WL 5614112, at *11 (W.D. Wis. Oct. 15, 2007) ("Claim Construction Opinion"). In its summary judgment ruling, the district court noted that its construction reflected the concept that rasterization includes "two specific judgments: (1) translating three-dimensional primitives into a set of corresponding pixels and fragments and (2) filling in those pixels or fragments" and that the "process as a whole operates on a floating point format." Summary Judgment Opinion, 2008 U.S. Dist. LEXIS 7406, 2008 WL 4200359, at *20.

The district court's construction formed the basis of its summary judgment ruling of non-infringement for those claims that contain the "a rasterization process" term. Even though ATI's products fill in pixels or fragments using floating point values (for example, through fog and blending functions and calculation of color values), they translate primitives into pixels and fragments using fixed point values. Id. Thus, according to the district court, the rasterization process does not operate on a floating point format "as a whole." Id.

Silicon Graphics argues that the district court did not recognize that claims 1-6 refer to one or more rasterization processes, not a single process, and that not all of the rasterization processes need to be conducted in floating point format. Instead, Silicon Graphics proposes that "a rasterization process" means that "one or more of the rasterization processes (e.g., scan conversion, color, texture, fog, shading) operate in floating point format." Scan conversion, the argument continues, is a "translating" rasterization process and shading is an example of a "fill in" rasterization process, but "a rasterization process" does not necessarily refer to both of those processes as a single unit.

Indeed this record shows that the district court erred in requiring rasterization to occur entirely with floating point values. The '327 patent explicitly teaches that rasterization consists of multiple processes: "The processes pertaining to scan converting, assigning colors, depth buffering, texturing, lighting, and anti-aliasing are collectively known as rasterization." '327 patent col.1 ll.43-45 (emphasis added). These passages from the specification define the terms in controlling terms. See Phillips, 415 F.3d at 1316. Thus, when the claims refer to "a rasterization process" they are referring to one of the subsets of rasterization (e.g., scan converting, color, texture, fog, shading) listed in the specification.

The district court concluded that the claims referred to a single rasterization process: "[C]laims 1 through 6 state that the 'rasterization process' operates on a floating point format." Summary Judgment Opinion, 2008 U.S. Dist. LEXIS 7406, 2008 WL 4200359, at *20. The claims themselves, however, specifically claims 1 through 6, recite "a rasterization process which operates on a floating point format . . .," not "the rasterization process." The use of the indefinite article "a" in the claim, when coupled with the list of processes provided in the specification, makes it clear that the claims' references to "a rasterization process" means "one or more rasterization processes." See Tate Access Floors, Inc. v. Interface Architectural Res., Inc., 279 F.3d 1357, 1370 (Fed. Cir. 2002) ("It is well settled that the term 'a' or 'an' ordinarily means 'one or more.'").

The limitation "a rasterization process which operates on a floating point format" therefore means that "one or more of the rasterization processes (e.g., scan conversion, color, texture, fog, shading) operate on a floating point format." This construction is also in line with the rest of the specification. Nowhere does the specification teach that all rasterization processes must operate on a floating point format. To the contrary, the Summary of the Invention states that "[t]he present
invention provides a display system and process whereby the geometry, rasterization, and frame buffer predominately operate on a floating point format." '327 patent col.4 ll.8-11 (emphasis added). Similarly, the Summary of the Invention states that "certain rasterization processes are performed according to a floating point format." Id. col.4 ll.15-16 (emphasis added). And the specification also notes that certain processes within the rasterization and frame buffer processes "can be implemented in a fixed point format without departing from the scope of the present invention." Id. at col. 12 ll.27-29. In sum, this court determines that the language of the claims in context and the specification show the accuracy of Silicon Graphics' proposed construction. Accordingly, the district court's construction of "a rasterization process" is reversed.

1. "a server"

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>FotoMedia's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;a server&quot;</td>
<td>one or more server computers</td>
<td>one server computer</td>
</tr>
</tbody>
</table>

The dispute between the parties concerning the construction of "a server" is whether the claimed systems and methods may include multiple server computers, and whether steps recited in the claims can be divided among these server computers.

The Federal Circuit has held that generally, the use of 'a' or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase 'comprising.' Free Motion Fitness, Inc. v. Cybex Int'l Inc. 423 F.3d 1343, 1350 (Fed. Cir. 2005). However, "a" may be properly construed as being singular when a plural construction is inconsistent with the claim context and neither the specification nor the drawings disclose more than "one". See id. at 1356 (Prost, J., dissenting) (citing Insituform Techs., Inc. v. Cat Contracting, Inc., 99 F.3d 1098, 1105-06 (Fed. Cir. 1996)).

The plaintiff points out that the specification discloses multiple servers. See '774 patent, at col. 2, ll. 49-52 ("The system comprises at least one server computer connected to a network."); id. at Fig. 1 (depicting multiple servers as part of the system disclosed). Fotomedia further argues that an electronic postcard may contain links to websites found on multiple servers. Therefore, Fotomedia contends that the term "a server" cannot be limited to a single server computer.

In response, the defendants argue that issue is whether the steps recited in the claims at issue can be performed by different servers. They contend that even if the patent teaches an overall system having one or more servers, a single server must execute all of the steps of the claimed invention. According to the defendants, a system which distributes processing of the various claimed steps amongst multiple servers would be beyond the scope of the claims. Turning to the specification, the defendants point out that it does not suggest or teach the concept of a distributed system anywhere. 1 Defendants argue that if such a system were claimed, the disclosure would have to spell out the implementation, including the integration of various components, conflict resolution between the multiple servers, and other related problems that would arise from utilizing such a system. 2

1 To the contrary, Figure 2 in the specification shows a single server 31 as containing all of claimed functionality. See '774 patent, at Fig. 2.

2 The defendants also note that the inventor himself has testified to the difficulty of integrating such a system. The Court, however, agrees with Fotomedia that inventor testimony may not be relied on for claim construction purposes. Howmedica Osteonics Corp. v. Wright Med Tech., Inc., 540 F.3d 1337, 1346 (Fed. Cir. 2008).

The Court concludes that the defendants' argument is persuasive. Under these circumstances, there is convincing evidence that the scope of the invention is limited as proposed by the defendants, even in light of the general rule that use of 'a' in a claim would mean 'one or more.' See Insituform Techs., 99 F.3d at 1106 (the rule does not apply where the only correct and
reasonable interpretation of claim limits the scope of the claim to singular). The Court does not rule that there cannot be
more than one server, each capable of performing all of the recited steps, in the claimed system. However, in light of the
disclosure, the inventors did not claim a system that could distribute the steps of the claims at issue between various server
computers. 3

Footnotes

3 Fotomedia also argues that the Court ignore any issues of enablement and written description in construing the term in
dispute. Federal Circuit law counsels otherwise. See Nystrom v. TREX Co., 424 F.3d 1136, 1144-45 (Fed. Cir. 2005) ("As
explained in Phillips, [the patentee] is not entitled to a claim construction divorced from the context of the written
description and prosecution history.")

Footnotes

"A server" is construed as "one server computer."

The Court adopts Plaintiffs' constructions and generally construes "a signal" as "one or more signals." Defendants' proposed
constructions limits "a signal" to "a single signal." Although this appears to accurately reflect the claim language, the
limitation is unwarranted.

"'[A] or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase
'comprising.'" Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1350 (Fed. Cir. 2005) (quoting KCJ Corp. v.
Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000)). "The" is given the same presumptive meaning of "one or
more" when used in a "comprising" claim. Id. at 1350-51. This plural meaning is overcome "only when 'the claim is specific
as to the number of elements' or 'when the patentee evinces a clear intent to . . . limit the article.'" Id. at 1350 (quoting KCJ
Corp., 223 F.3d at 1356). Claim 17 is an open-ended claim and uses the term "comprising." Claim 17 ("A method of
controlling a motion detector camera, the method comprising:"

Defendants argue that the specification limits the signal to a single signal. Defendants are incorrect. Like the claim, the
specification uses the term "a signal." See Abstract; Cols. 1:45-51, 4:14-16,4:25-34. The specification does not expressly
limit the signal to a single signal. Rather, Defendants argue that a single signal is necessary for the one-to-one
 correspondence between the triggering event and signal. However, this one-to-one correspondence between a single
 triggering event and single signal is created by Defendants, not by the patent. The specification, neither by expression nor
 logic, does not require that only a single signal be sent per triggering event. All that is logically required is that the camera
 mechanism know what the signal(s) means. There is nothing in the specification or claim language that would prevent the
 motion detector from always sending two signals when a triggering event occurs. Accordingly, the Court rejects Defendants'
 argument.

GO BACK

15

"Signal" terms n2

n2 Whether "a signal" is "one or more signals" or "a single signal" is the disputed issue in the following terms: receiving a
signal from a motion detector, sending a signal, ignoring the signal from the motion detector, and sending a signal to a test
light to cause the test light to flash. The Court's constructions of these terms can be found in Appendix B.

Footnotes

The Court adopts Plaintiffs' constructions and generally construes "a signal" as "one or more signals." Defendants' proposed
constructions limits "a signal" to "a single signal." Although this appears to accurately reflect the claim language, the
limitation is unwarranted.

"'[A] or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase
'comprising.'" Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1350 (Fed. Cir. 2005) (quoting KCJ Corp. v.
Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000)). "The" is given the same presumptive meaning of "one or
more" when used in a "comprising" claim. Id. at 1350-51. This plural meaning is overcome "only when 'the claim is specific
as to the number of elements' or 'when the patentee evinces a clear intent to . . . limit the article.'" Id. at 1350 (quoting KCJ
Corp., 223 F.3d at 1356). Claim 17 is an open-ended claim and uses the term "comprising." Claim 17 ("A method of
controlling a motion detector camera, the method comprising:"

Defendants argue that the specification limits the signal to a single signal. Defendants are incorrect. Like the claim, the
specification uses the term "a signal." See Abstract; Cols. 1:45-51, 4:14-16,4:25-34. The specification does not expressly
limit the signal to a single signal. Rather, Defendants argue that a single signal is necessary for the one-to-one
 correspondence between the triggering event and signal. However, this one-to-one correspondence between a single
 triggering event and single signal is created by Defendants, not by the patent. The specification, neither by expression nor
 logic, does not require that only a single signal be sent per triggering event. All that is logically required is that the camera
 mechanism know what the signal(s) means. There is nothing in the specification or claim language that would prevent the
 motion detector from always sending two signals when a triggering event occurs. Accordingly, the Court rejects Defendants'
 argument.

GO BACK

16
Spot of Radiation

The final disputed term is "spot of radiation." Philips argues that "it's clear from the specification and from the prosecution history that the claim is broad enough to cover both a one-beam system and a multi-beam system, but it certainly cannot be confined to a one-beam system." See Tr. at 14. It argues further that "the preferred embodiment...shows a three-beam reading system...it is almost never correct...to come up with a claim interpretation that excludes the preferred embodiment." See id. at 15. Defendants argue that "That claim speaks in terms of a beam, intensity distribution caused by the beam so as to enable the position of the spot to be determined. Normal claim language interpretation would indicate that that means a single beam." See id. at 49.

In '209 5:2-14, the patent provides that "said follow-on track being configured to diffract radiation incident thereon when scanned with a spot of radiation of a predetermined size and having a width which is smaller than the dimension of the spot in the width direction..." '493 11:45-46 states "said groove being configured to diffract radiation incident thereon when scanned with a spot of radiation of a predetermined size and having a width which is smaller than the dimension of the spot in the width direction...". The claim language, to which this Court must adhere, is written in terms of "a spot of radiation." The presence of the article "a" does not necessarily limit the element to its singular. See KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). The article "a" will receive a singular interpretation only where the patent evidences a clear intent to limit the article to its singular form.

These patents do not demonstrate an intent to limit "a spot of radiation" to a single spot. The specifications disclose clearly a three-beam tracking system, and such a three-beam system is described as the preferred embodiment of the device. A Court is seldom, if ever, correct to interpret a claim in a manner that does not read on the claim's preferred embodiment. See Vitronics Corp. v. Conceptronic, 90 F.3d 1576, 1583 (Fed. Cir. 1996). Highly persuasive evidentiary support is required before the Court may adopt an interpretation that excludes the preferred embodiment. See Hoechst Celanse Corp. v BP Chems. Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996) ("We share the District Court's view that it is highly unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specification in such a way."). Interpreting the claims to exclude multi-beam tracking systems would exclude the three-beam tracking system which is the preferred embodiment of the claim. To do so in this situation would be improper.

Defendants acknowledged at oral argument that the three beam method is the preferred embodiment. They argue that the claims were redirected from a multibeam tracking system to a single beam system because of a change in technology since these patents originated. See Tr. at 50. The mere fact that the patent speaks to "a spot" in one location and "spots" in another is not "persuasive evidentiary support" that "a spot of radiation" is to be interpreted as applying to only single-spot tracking when such an interpretation would exclude the patents' preferred embodiment. The term must be read consistently with the preferred embodiment, and cannot be construed in a manner than would rule out the inventor's preferred embodiment. Accordingly, the Court interprets "a spot of radiation" to apply to both single and multi-beam tracking systems.

- 471 -
structure or region, or multiple such structures. In both cases the Federal Circuit first noted that the claims referred to the structure or region in the singular: "a chamber" and "said chamber" in Abtox and "a cup" in Insituform. Likewise, the claim language in this case refers to "a tunneling diffusion region" and "said tunneling diffusion region." In Abtox and Insituform, the Federal Circuit then noted that the specifications confirmed the singular reading of the claim language, for they described only a single chamber and cup, respectively. Abtox at 1024; Insituform at 1106. In this case, by contrast, the specification makes clear that the patent contemplates multiple tunneling diffusion regions, formed at different times. The specification states that "tunnel implant region 33 may consist of two segments, 33a and 33b . . . Region 33b, however, may be formed later in the process sequence." '750 patent, 10:9-17. Abtox and Insituform are thus distinguishable. In light of the specification, and noting that the article "a" can mean "one or more," see Abtox at 1023, the Court holds that the '750 patent is not limited to processes that create only a single tunneling diffusion region.

18

7. About one quarter wavelength of the center of [a spectral range of infrared radiation having wavelengths of 8-12 m/the spectral range/said spectral range] (claims 18, 26-27, 33, 35-36)

Plaintiff contends that this term means "about the result of the center of the spectral range divided by four," while Defendants contend that it means "within a few hundred angstroms of one quarter wavelength of the center of the specified spectral range." Defendants thus contend that this claim requires near absolute precision in the spacing between the resistor and the reflective layer.

Because the specification explains how the spacing between the resistor and the reflective layer is optimally 1/4\(\varepsilon\) of the center of the spectral range ('663 patent, 7:66-8:2), the specification contemplates that some degree of deviation from 1/4\(\varepsilon\) is necessarily present in a bolometer detecting any range of wavelengths. For example, 1/4\(\varepsilon\) of 8 \(\mu\)m wavelength radiation is 2 \(\mu\)m, while 1/4\(\varepsilon\) of 12 \(\mu\)m wavelength radiation is 3 \(\mu\)m (a difference of 10,000 Angstroms). Therefore, for a bolometer that detects radiation in a range of 8-12 \(\mu\)m, spacing of 2.5 \(\mu\)m is exactly 1/4\(\varepsilon\) of the center of the 8-12 \(\mu\)m spectral range, yet 5000 Angstroms from 1/4\(\varepsilon\) of the radiation with wavelengths of 8 \(\mu\)m and 12 \(\mu\)m. Even when the spacing is exactly 1/4\(\varepsilon\) of the center of the spectral range, therefore, the specification contemplates that the spacing will be up to 5000 Angstroms from 1/4\(\varepsilon\) for radiation having wavelengths at the ends of the range, yet still be optimally spaced.

Despite the inexact spacing inherent in any bolometer that detects radiation within a range of wavelengths, Defendants contend that this term allows for only a "few hundred angstroms" deviation from 1/4\(\varepsilon\) of the center of the spectral range. In support of this argument, Defendants cite '663 patent, 8:40-43, in which the specification explains that "Fig. 4b illustrates some of the underlying circuitry (CMOS) in substrate 142 and indicates the slight (few hundred ) unevenness of ground plane 192." The specification then explains that "[t]he unevenness of ground plane 192 has minimal effect on the absorption." '663 patent, 8:52-53. This description in the specification, however, does not relate to the tolerance for deviation in the claimed 1/4\(\varepsilon\) spacing or provide a ceiling for maximum allowable deviation in the spacing. Instead, the specification describes how unevenness of a few hundred Angstroms in the ground plane will not materially affect the reflective properties of the ground plane (e.g., by failing to provide uniform reflection). Moreover, even if this statement related to allowable tolerance from 1/4\(\varepsilon\) spacing, it does not purport to provide a maximum amount of deviation. Instead, it simply states that a few hundred Angstroms deviation has minimal effect on the absorption capability of the bolometer.

The court thus declines to add mathematical precision to this claim through construction of this term, which the patentee chose not to include. The court construes this term to mean "about the result of the center of the spectral range divided by four."
5 In its reply brief, Plaintiff submitted an affidavit from Dr. Solomon stating that, in his opinion, "about" would mean +/- 10% in this context. The court, however, specifically declines to impose a numerical limitation to the term "about" in this claim term. Whether any degree of deviation from 1/4λ renders an array of bolometers, or a method of fabrication of an infrared imager, outside the scope of these claims due to degradation in performance, enhanced performance at a different level of spacing, manufacturing capabilities, or otherwise is a fact question better left to the jury. See W.L. Gore Associates, Inc. v. Garlock, Inc., 842 F.2d 1275, 1280-81 (Fed. Cir. 1988).

--- End Footnotes ---

19

c. "above"

A claim construction that excludes a preferred embodiment is "rarely, if ever, correct." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). The first element of claim 1 recites that the metal interconnect layer is formed "above" the substrate surface. The specification states, as illustrated in Figure 1, that the interconnect layer (16) may be separated from the substrate layer (10) by a dielectric layer (12). Thus, the metal interconnect need not sit directly on top of the substrate layer. As is advocated by EMI, the court finds that the term "above" means higher than, but not necessarily directly in contact with.

20

E. "above . . . [and] between"

The patent requires "an electrically isolated first conductive gate disposed above said substrate between said first and second doped regions." '776 patent, 13:3-5. Defendant argues the word "between" requires that the gate span the entire distance between the source and the drain. Plaintiff argues that the word requires only that the gate be located somewhere in between the source and the drain. Plaintiff's construction is the ordinary meaning of the word "between." As plaintiff points out, a chandelier can be "above" a table and "between" the two table ends without extending the table's entire distance. Unless the patent provides a different meaning, this ordinary construction must be adopted.

Defendant argues that the patent originally claimed a floating gate disposed "generally between" the source and the drain, and was amended to "between" to narrow the claim in the face of a prior rejection, thus requiring that the gate span the entire distance. Plaintiff responds by arguing that there was no prior rejection on basis of the floating gate's size, and that the modification was made simply for the purpose of clarity. Neither side cites to any part of the prosecution history that supports its version of events. The Court agrees with plaintiff, however, that the modified patent is clearer than the original, because the phrase "generally between" might have been construed to mean either "usually between" or "partially between." Having no solid reason to adopt defendant's out-of-the-ordinary construction of the term, the Court adopts plaintiff's construction.

21

III. "Abbreviated"

</tbody>
</table>

<table>
<thead>
<tr>
<th>Claim 10</th>
<th>FedEx's Proposal</th>
</tr>
</thead>
</table>

- 473 -
Plaintiff contends its proposal is consistent with the commonly understood meaning of the term. Plaintiff argues that its proposal simply provides further clarity within the context of the claims. Plaintiff further argues that its proposal is supported by the specification's examples of abbreviated information.

Defendants contend that the term does not appear in the specification or prosecution history, but nevertheless is used in accordance with its plain and ordinary meaning. Defendants argue that the examples that Plaintiff cited are not examples of abbreviated information. Defendants further argue that Plaintiff's proposal improperly imports limitations into the claims.

The Court finds no basis for importing a database call limitation into the scope of the term "abbreviated." Outside of the claim language, the term "abbreviated" does not appear in the 377 patent. Plaintiff cites an example from the specification wherein a bar code represents a database command and address. See PL'S. MOT. at 15-16 (quoting '377 Patent col. 4:2-8). Contrary to Plaintiff's contention, this embodiment does not describe abbreviated information as used in claim 10; rather, the command and address are obtained by the scanning process and represent complete information that may be used to access a database. See '377 Patent col. 4:2-8 ("the bar code may store an address command . . . followed by a base 39 alphanumeric value"). Furthermore, in light of the Court's rejection of Plaintiff's "scanning process" construction, the context of claim 10 does not compel the conclusion that the term "abbreviated" necessarily involves a database call. Abbreviated information is simply an amount of information found in a first bar code portion that is shorter or briefer than that which is found in the second bar code portion. Compare '377 Patent col. 6:33-35 ("[E]nhanced information can be additional information, or it can be the same information as in the first bar code portion, as well as additional information") with '377 Patent col. 8:38-46 (claiming a bar code which includes a first part capable of providing "first abbreviated information" and a second part capable of providing "second information, which has more information that said first information, wherein said additional information includes the same information as said first information, and also includes additional information"). Accordingly, the Court finds it appropriate to construe this term in light of what is actually claimed in claim 10.

While the Court agrees generally with Defendants that the term "abbreviated" has a plain and ordinary meaning, the Court finds it more appropriate to construe the phrase "first abbreviated information." In keeping with the above discussion of the specification and the language of claim 10, the Court construes the term as "an amount of information found in the first information that is shorter or briefer than that which is found in the second information."

C. "absorbs/absorbing"

MacDermid contends that no construction of "absorbs" and "absorbing" is necessary but, if the Court determines that a construction is necessary, that it be defined as "to take up by chemical or molecular action." (MacDermid Responsive Br. at 19.) DuPont originally proposed the construction "to retain wholly, without reflection or transmission." (DuPont Opening Br. at 9.) DuPont, during oral argument, stated that it was amenable to altering its construction to "to retain wholly, without reflection or transmission, that which is taken in." (Tr. at 78.)

MacDermid contends that DuPont's original proposed construction was too extreme. (MacDermid Responsive Br. at 19.) MacDermid contends that DuPont's construction would require that the support layer retain all actinic radiation despite the fact that the '835 Patent acknowledges that the support layer is capable of taking in some radiation, not all. (Id.) MacDermid further notes that certain claims in the '835 Patent specify the amount of actinic radiation to be absorbed. (Id.) As such, MacDermid states that a construction requiring complete retention would conflict with these claims. (Id. at 20.) MacDermid states that DuPont provided a dictionary definition, from which it improperly excluded the phrase "that which is taken in." (Id.) MacDermid states that this clause qualifies that only that which is taken in is, in fact, wholly retained. (Id.)

DuPont states that MacDermid is incorrect in characterizing its construction as requiring the complete absorption of all radiation. (Tr. at 77.) Instead, DuPont contends that its construction requires that only the portion of the radiation that is actually absorbed be wholly absorbed. (Id.)
The Court agrees with DuPont's revised construction and construes absorbs/absorbing as "to retain wholly, without reflection or transmission, that which is taken in." MacDermid's objection to DuPont's initial construction was that it required 100% absorption. DuPont has clarified its proposed construction with the insertion of the phrase "that which is taken in," making clear that 100% absorption is not required, but only 100% of that which is actually absorbed must necessarily be retained.

23

2) "AC Power Supply"

MKS contends that the phrase "AC power supply" in claim 19 means "an electric power supply producing alternating current." (D.I. 103 at 31). MKS further contends that "AC power supply" is broader than "AC switching power supply" and to construe the phrases to be equivalent would render dependent claim 24 redundant. (D.I. 103 at 32). Advanced Energy contends that the phrase "AC power supply" is equivalent in meaning to the phrase "AC switching power supply." (D.I. 110 at 23-24). In support, Advanced Energy contends that MKS represented to the Patent and Trademark Office that "all pending apparatus claims include an AC switching power supply..." (D.I. 110 at 25, D.I. 111 A172). Thus, Advanced Energy contends that "AC power supply" means "AC switching power supply." (D.I. 110 at 32).

The doctrine of claim differentiation is well-established. When different words or phrases are used in separate claims, a difference in meaning and scope is presumed. See Comark Communications, Inc. v. Harris, 156 F.3d 1182, 1187 (Fed. Cir. 1998). Further, where there is a conflict between an attorney's remark during the prosecution of the patent application and the language of the claim, the language of the claims controls. See Intervet America, Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1054 (Fed. Cir. 1989). Thus, because the Court finds that the language of the claim controls, the Court concludes that "AC power supply" is not equivalent in meaning to "AC switching power supply." The phrase "AC power supply" means an electric power supply producing alternating current.

24

XI. "An AC powered DC charger for powering said radio and charging a removable DC voltage power source"

The Court next construes the term "an AC powered DC charger for powering said radio and charging a removable DC voltage power source" from claims 1 and 2 of the '925 patent.

A. The Parties' Proposed Constructions

Black & Decker contends that the term "an AC powered DC charger for powering said radio and charging a removable DC voltage power source" means "a direct current charger powered by alternating current that is capable of powering the radio and is capable of charging the removable direct current voltage power source." Bosch proposes construing the term as "a charger that receives an AC voltage and transforms the AC voltage into a first DC output voltage, the first DC output voltage being of a voltage equal to the input voltage to power the radio and the first DC output voltage being transformed to a second DC output voltage equal to the input voltage of the battery to charge the battery."

B. The Court's Construction

As discussed above in Section VI.B., there is no support in the intrinsic record for requiring that any DC output voltage be equal to any particular value. Accordingly, Bosch's attempt to incorporate the limitation "equal to" into the plain and ordinary meaning of the claim language fails. Black & Decker's proposed construction closely tracks the claim language and is supported by the intrinsic record as discussed in Section VI.B. Accordingly, the Court construes the term "an AC powered DC charger for powering said radio and charging a removable DC voltage power source" as "a direct current charger powered by alternating current that is capable of powering the radio and is capable of charging the removable direct current voltage power source."
VI. "An AC powered DC power supply disposed in said enclosure for powering said radio and generating a first DC output voltage having a magnitude sufficient to power said radio"

The Court next construes the term "an AC powered DC power supply disposed in said enclosure for powering said radio and generating a first DC output voltage having a magnitude sufficient to power said radio" from claim 1 of the '059 patent.

A. The Parties' Proposed Constructions

Black & Decker proposes construing the term "an AC powered DC power supply disposed in said enclosure for powering said radio and generating a first DC output voltage having a magnitude sufficient to power said radio" as "a direct current power supply in the enclosure powered by alternating current that generates a direct current output voltage sufficient to power the radio." Bosch argues that the term means "a power supply that receives an AC voltage and transforms that voltage into a DC output voltage, the DC output voltage being of a voltage equal to the input voltage of the radio."

B. The Court's Construction

At the Markman hearing, Bosch's counsel conceded that its proposed construction was too narrow to the extent it sought to require a DC output voltage being of a voltage equal to the "input" voltage of the radio. Rather, Bosch's counsel stated that voltage could merely be equal to the "nominal" voltage of the radio. Black & Decker still could not agree to this construction, arguing that the intrinsic record did not indicate that the DC output voltage be "equal" to anything and instead provided a variety of ranges and magnitudes. Bosch, on the other hand, contends that there is no support in the intrinsic record for a meaning of this term and instead resorts to extrinsic evidence. The Brodsky Declaration, however, is unreliable as discussed above. Even if the Court relied on that Declaration, the paragraph cited by Bosch does not support its assertion that the DC output voltage must be "equal" to any particular value.

Black & Decker contends that the Court should construe this term to require only a DC output voltage "sufficient to power the radio." According to Black & Decker, claim 8 of the '059 patent, which depends from claim 1 of that patent, requires that "the magnitude of said first DC output voltage from the AC powered DC power supply is greater than 9.6 volts and less than 18 volts." Under Federal Circuit law, the Court presumes that this range is not a limitation in independent claim 1, Phillips, 415 F.3d at 1314-15 (citing Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004)), and that independent claim 1 has a broader scope than dependent claim 8, Phillips, 415 F.3d at 1324-25 (citing Dow Chem. Co. v. United States, 226 F.3d 1334, 1341-42 (Fed. Cir. 2000)). n7

n7 The Court recognizes that the doctrine of claim differentiation and other claim construction guides related to the comparison between independent and dependent claims are not hard and fast rules, but instead mere presumptions that a Court may apply. See Fantasy Sports Props., Inc. v. Sportsline.com, Inc., 287 F.3d 1108, 1115 (Fed. Cir. 2002). Nonetheless, here, Bosch fails to rebut the presumption that a DC output voltage sufficient to power the radio is not limited to any particular value or range.

The specification further supports Black & Decker's contention that the patentee did not limit the claimed "DC output voltage sufficient to power the radio" to a particular range or value. The specification provides various embodiments of the claimed invention where the voltage supplied to the radio is not equal to any particular value. ('059 patent; col. 4, ll. 43-45 ("approximately 13.6 volts"); col. 4, ll. 52-55 ("a nominal 12 volts (i.e., 12 to 13.2 volts), is supplied to radio circuit board 33"); col. 4, ll. 22-24 ("Modern batter operated professional power tools use batter packs ranging from 9.6 to 18 volts").) Further, in the prosecution history, the inventor provided that the "AC powered DC power supply generates an output voltage having a magnitude sufficient to power the radio," but did not provide that the DC output voltage be equal to any particular value or within any particular range. (Id. at FH059087.) Accordingly, the intrinsic record is clear that the term "an
AC powered DC power supply disposed in said enclosure for powering said radio and generating a first DC output voltage having a magnitude sufficient to power said radio" means "a direct current power supply in the enclosure powered by alternating current that generates a direct current output voltage sufficient to power the radio." In particular, the intrinsic record provides that the phrase "sufficient to power the radio" means just what it says, and the Court rejects Bosch's attempt to incorporate limitations from the extrinsic record into the plain language of the claims.

GO BACK

26

1) "AC Switching Power Supply"

MKS contends that the phrase "AC switching power supply" used throughout the '628 Patent means "an electrical power supply producing alternating current by the use of devices as switches." (D.I. 103 at 6). Advanced Energy contends that the phrase "AC switching power supply" means "a power supply that uses switching devices to produce an AC output without using an impedance matching network." (D.I. 110 at 32).

In construing the disputed phrase the Court has reviewed the patent specification and prosecution history. (D.I. 94 N.J.L. 480, 111 A9 col. 2 ln. 22-26, A12 col. 7 ln. 49-60, A13 col. 10 ln. 19-21, A121-22, 124, A169-70). Based on a review of these sources, the Court concludes that although the language of the claims might be broad enough to encompass an impedance matching network, the patent specification and prosecution history make it clear that the invention was not intended to encompass an impedance matching network. See SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337, 1345 (Fed. Cir. 2001); (D.I. 94 N.J.L. 480, 111 A9 col. 2 ln. 22-26, A12 col. 7 ln. 49-60, A13 col. 10 ln. 19-21, A121-22, 124, A169-70). Thus the Court concludes that "AC switching power supply" means a power supply that uses switching devices to produce an AC output without using an impedance matching network.

GO BACK

27

1. "accepting television (TV) broadcast signals, wherein said TV signals are based on a multitude of standards"

TiVo argues no construction is needed for this limitation, or, if construed, should be defined as "accepting transmitted television programming that is based on one or more established specifications." See TiVo's Op. Br. 5-7; TiVo's Markman Slides at 51-60.

EchoStar argues "multitude" means "a large number." EchoStar's Opening Br. at 6-8; EchoStar's Slide Presentation at 49-53. During the claims construction hearing, EchoStar stated that "the plain meaning of multitude [is] many, a large number... It is not a specific technical term." 5/23/05 Hr. Tr. at 92:14-17. EchoStar further argues "accepting television (TV) broadcast signals, wherein said TV signals are based on a multitude of standards" means "accepting for processing a large number of different TV broadcast signals formatted in conformance with different TV broadcast signal standards." EchoStar's Opening Br. at 6-8; EchoStar's Slide Presentation at 49-53.

Though "multitude" is a term that is understood by persons of skill in the art, for clarification purposes, the Court defines it as "numerous." The construction proposed by defendant, "a great number," does not clarify the meaning of the term "multitude" and instead only adds ambiguity as the term "great" is a term of degree in need of further construction. The Court's construction accords with the plain meaning of the term "multitude" and with the use of the term in the patent claims and the patent specification. '389 patent at col. 2:4-10; 3:32-37; see also '389 patent Abstract. Further, as written, the claim language requires an invention that accepts TV broadcast signals that are based on a multitude of standards - not that the invention actually process a multitude of TV broadcast standards. See TiVo Op. Br. at 6-7.

Though not determinative in the Court's decision, it is of note that construing "multitude" as "numerous" further accords with extrinsic evidence proffered by defendant. See EchoStar's Opening Br. at 6-7 citing Exh. D, THE AM. HERITAGE DICTIONARY OF THE ENGLISH LANGUAGE (4th ed. 2000) at 1156 ("multitude. n.: 1. the condition or quality of being numerous") and Exh. E, the OXFORD ENGLISH DICTIONARY ONLINE, 2004 ("multitude. n. 1. A mass noun: the character, quality, or condition of being many; numerous").
The Court finds that the remaining terms do not require construction. Therefore, the Court construes "accepting television (TV) broadcast signals, wherein said TV signals are based on a multitude of standards" as "accepting television (TV) broadcast signals, wherein said TV signals are based on numerous standards."

--- Footnotes ---

1 EchoStar argues that the claim term "standards" is indefinite and renders the entire claim invalid. EchoStar Opening Br. at 2, 20-22. Whether or not the claim is indefinite, however, is an invalidity question and should be raised in the context of a summary judgment motion. Patents are presumed valid. 35 U.S.C. § 282. During claim construction, courts will construe claims unless, because of an ambiguity, one of ordinary skill in the art could not reasonably understand the scope of the claim. See Exxon Research and Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001); see also Phillips, 415 F.3d 1303, 1305 WL 1620331 at * 19 (noting that a validity analysis is not a regular component of claim construction). Presently, this Court finds the term "standards" is not so ambiguous that the claim cannot be construed.

--- End Footnotes ---

28 Access device

Claims 1, 2, 6, and 9 of the '930 Patent contain the term "access device." Network-1 contends that the term means "a device that can access an Ethernet network," while Defendants contend that it means "a piece of equipment that requires power to access a network and to receive and transmit data." The parties disagree whether or not the term "access device" is limited to an Ethernet network and whether or not it can receive and transmit data.

Network-1 asserts that the ordinary and customary meaning of the term is merely a device that can access. Further, Network-1 asserts that, in the context of the claim limitation as a whole, the term means a device adapted to access a data network, particularly an Ethernet network. Defendants counter that the Court's construction in the D-Link case, which Network-1 then agreed to, remains proper because it is consistent with the specification and inclusion of an Ethernet requirement is improper.

Inherent in the term "'access device' adapted for data transmission" is the fact that the device requires electrical power to operate. See '930 Patent, col. 4:13. Network-1's construction, other than the improper inclusion of "Ethernet" as addressed in the discussion of the term "data node," adds nothing beyond the understandable meaning of the term itself. Defendants' construction, which Network-1 agreed to in the D-Link case, adds the superfluous recitation of "a piece of equipment that requires power." This language repeats what the claim element itself states, so the Court will adopt a simpler, clearer definition than it did in the D-Link case. Accordingly, the Court construes the term "access device" to mean "a device that can receive and transmit data over a network."

29 K. "accessed by any one of the authorized plurality of media player devices"

This term is located in claim 1 of the '414 patent: "A method of managing access to a plurality of media assets . . . wherein the plurality of referenced media assets can be accessed by any one of the authorized plurality of media player devices." The plaintiff argues that this term means "retrieved, obtained or used by any of the 'media player devices' which are permitted to play said 'media assets.'" Alternatively, the plaintiff contends that the proper construction is "retrieved or obtained, including for use, by any of the 'media player devices' which are permitted to play said 'media assets.'" In contrast, the defendant's proposed definition is "each of a plurality of media player devices communicates with a portal to download or stream the associated media assets for use." The parties' proposals differ in three main respects: direct communication between media player devices, definition of "access," and meaning of "any one."
First, Apple argues that "access" is limited to transfers to and from the portal. But, in the term "the plurality of media player devices including a media asset portability application," construed supra, the court rejected Apple's prosecution history disclaimer argument regarding direct player-to-player communications. Second, the defendant contends that "access" does not include use of the media asset. According to Apple, the specification treats "use" and "access" as distinct and separate concepts, e.g., "access media assets for use." (414 patent, 1:45-46) (emphasis added). But the language "access . . . for use" indicates that use is subsumed within the broader access function. Third, Apple asserts that plain meaning "any one of" is that each media player must be capable of accessing media assets. Apple provides the following example in support of its construction: "you can access Marshall by any [one] of these three roads" means simply that all three, not merely one, of the roads provide access to Marshall. But Zapmedia argues that "any one of" does not mean "every one of"—it means "any of" or "one or more of." The claim language, however, states that the "referenced media assets can be accessed by any one of the . . . media player devices." (emphasis added). The claim indicates that any one of the devices must be capable of accessing the media assets. Therefore, the court construes the term "accessed by any one of the authorized plurality of media player devices" to mean "retrieved or obtained, including for use, by each of the authorized 'media player devices.'"

Go Back

30

3. "According to a function defining generator speed versus generator electrical power output"

As suggested in the preceding discussion, this is a critical aspect of the parties' dispute. In context, the phrase reads as follows:

a variable speed wind turbine controller, responsive to the sensed signals indicative of generator speed and generator electrical power output, for providing a generator torque command signal for commanding maneuvers of the generator speed according to a function defining generator speed versus generator electrical power output which maneuvers tend to cause the wind turbine to operate substantially on the wind turbine power coefficient versus velocity ratio optimum performance curve substantially at the peak thereof;

Both parties agree that the term "function" means a mathematical rule defining the relationship between an independent variable and a dependent variable in which each independent variable value corresponds with exactly one dependent variable value. The question is whether the words "according to" mean "dependent on" or "derived from" or whether they mean simply "consistent with." In its ordinary use, the phrase is susceptible to either interpretation. Merriam-Webster Dictionary online at http://www.m-w. com/cgi.bin/dictionary (definition of "according to" includes both "in conformity with" and "depending on").

The claim specification explains that "the variable speed wind turbine controller, by means of the signal processor, determines what the generator air gap torque should be according to a function defining sensed power versus generator speed to obtain maximum efficiency." '736 Pat. at col. 5, Ins. 5-10 (italics added). This language supports a "dependent on" or "derived from" construction. In plaintiff's view, however, the clause "according to a function defining generator speed versus generator electrical power output" modifies "commanding maneuvers of the generator speed" rather than "providing a generator torque command signal." Even if plaintiff is correct, "according to" would necessarily refer indirectly to the provision of generator torque command signals because generator speed maneuvers are commanded by generator torque command signals.

Moreover, it is not clear that "according to" refers to command maneuvers. It would apply if one used the last antecedent rule, a doctrine of interpretation that presumes that qualifying phrases refer to the terms immediately preceding them. Shelby County State Bank v. Van Diest Supply Co., 303 F.3d 832, 836 (7th Cir. 2002) (noting that Supreme Court recognized "last antecedent" rule as early as 1799). Although rules likes these may be useful in construing patent claim language, Chisum on Patents § 18.03[2][a] (2003), the last antecedent rule is "not an absolute and can assuredly be overcome by other indicia of meaning," Barnhart v. Thomas, 540 U.S. 20, 26, 157 L. Ed. 2d 333, 124 S. Ct. 376 (2003); see also Miniit v. Ed Miniit, Inc., 315 F.3d 712, 715 (7th Cir. 2002); Shelby County, 303 F.3d at 836 (rule is "helpful in determining the existence of the ambiguity, but not in solving the puzzle when [two] readings are plausible").

In this instance, the claim specification is an indication of meaning. It establishes that the function of defining generator
speed in contrast to generator power output is to be used in determining what the generator air gap torque should be. In addition, the preferred embodiments demonstrate that a function that defines generator speed versus generator electrical output is used in producing torque command signals. For example, Fig. 2 depicts a system in which sensed power signals are transmitted to the turbine controller where the function that defines sensed power as distinct from generator speed is used to produce a generator speed reference signal that is transmitted to the summing junction, where it is compared to a signal of actual generator speed. The summing junction generates a difference signal representing the difference between the speed reference signal and the generator speed signal, which is used to determine the generator torque command signal.

Finally, the phrase immediately following the one in dispute reads "which maneuvers tend to cause the wind turbine to operate substantially on the wind turbine power coefficient versus velocity ratio optimum performance curve substantially at the peak thereof." If these maneuvers had been the noun that the "according to" phrase modified, it would have been unnecessary to re-identify it, rendering the second "maneuvers" superfluous.

In this case, the claim language, the claim specification and the preferred embodiment all point towards defendant's construction of the phrase "according to." Therefore, I conclude that "for providing a generator torque command signal for commanding maneuvers of generator speed according to a function defining generator speed versus generator electrical power output," the generator torque command signals issued by the controller must be determined by a mathematical rule defining the relationship between generator speed and generator electrical power output.

5. Acoustic Velocity: Lufkin argues that acoustic velocity is the velocity of sound determined by an acoustic pulse sent down the borehole, which requires determination of collar frequency. To support its definition, Lufkin cites to the language of the '399 Patent specification stating that acoustic velocity is the product of joint length and collar frequency multiplied by two. '399 Patent, at 29 (col. 14, 1. 17-18). Echometer argues that acoustic velocity is the speed of sound through a medium and that the specification of the '399 Patent merely teaches one method, albeit preferred, for calculating acoustic velocity.

The parties' interpretations of acoustic velocity overlap in that both define acoustic velocity as the speed of sound through a medium. Lufkin's definition further specifies the method by which the speed of sound is measured, namely sending an acoustic pulse down a borehole and determining collar frequency. Though the specification discloses this method of calculating acoustic velocity, the Court finds Lufkin's definition unduly restrictive; acoustic velocity is the speed of sound through a medium, and the specification merely describes a preferred method for calculating such numeric value.

9. "acting on the signal from said receiver"

The next disputed claim term is "acting on the signal from said receiver." The plaintiff asserts the term means modifying the signal from said receiver. Joint Claim Construction Brief, Exh. B. The defendants argue the term means processing the scrambled signal received from the receiver and restoring the scrambled signal to its unscrambled condition.

According to defendant EchoStar:

The difference between the parties' proposed constructions is minor. Both recognize that the unscrambling process--or "acting upon" a scrambled signal--occurs on a scrambled signal after it has been received from the receiver.
Defendant EchoStar Opening Claim Construction Brief for the '066 Patent, at p. 23.

I have construed "unscrambling" to mean restoring a modified signal to its unmodified condition. The claim makes clear that that is the process accomplished when the unscrambling means acts on the signal. '066 Patent, col. 6, lines 38-40. Both parties agree that the signal is acted on by the unscrambling means after it is received from the receiver. Joint Claim Construction Brief, Exh. B.

I construe the term "acting on the signal from said receiver" according to the plain language of the claim to mean restoring a modified signal received from the receiver to its unmodified condition.

I. "Activates the call pod", "automatically activate", and "automatically deactivate"

The parties dispute the meaning of these three terms because they disagree over the meaning of the term "activate" in the '611 patent. Callpod claims that "activation" refers to operating the call pod to connect a call, while Defendants contend that "activation" refers to powering the call pod on.

The '611 patent expressly discloses "a power switch adapted to automatically activate the call pod upon detection of a call connection." (JA, Ex. 1, '611 patent, at 6:7-11.) The specifications provide another way for the call pod to receive power: a microphone bias current. (JA, Ex. 1, '611 patent, at 2:44-51.) When the call pod uses the microphone bias current, "the bias current provided by the wireless telephone may be used to activate the call pod during a call, thereby eliminating the need for a power switch . . . ." (JA, Ex. 1, '611 patent, at 2:44-49.) Therefore, the term "activate" refers to turning the call pod on through the use of a power switch or microphone bias current. Regardless of how the call pod receives power, when the '611 patent describes activation of the call pod, it refers to turning the call pod on, not connecting a call. Accordingly, the Court determines that "activate" means "to power the call pod on."

Based upon that construction, the Court determines that "activates the call pod" means "powers on the call pod." Likewise, "automatically activate" means "to automatically power on the call pod during a call." Finally, "automatically deactivate" means "to automatically power off the call pod upon the termination of the call."

A. Activation Amount

The Court construed this term in the Datastream Markman Order. Alexsam asks the Court to modify its prior construction because it does not reflect all disclosed embodiments. After considering Alexsam's arguments, the Court agrees. See Oatey Co. v. IPS Corp., 514 F.3d 1271, 1276-77 (Fed. Cir. 2008) ("We normally do not interpret claim terms in a way that exclude embodiments disclosed in the specification.").
The specification discloses an embodiment in which a card is activated with an amount different than the total value of the card. For example, when a phone card is activated, the vendor will conduct a transaction with a nominal amount in order to comply with banking regulations. The amount of the transaction is significantly less than the value of the card, but may correspond to or be keyed to the total card value. '608 patent, 5:49-6:4. Alexsam argues that this nominal amount is an "activation amount."

Moreover, the claim language indicates that the patentee envisioned that an activation amount could be different than the total card value. For example, claim 34 of the '608 patent shows that the card balance need not be equal to the activation amount. See '608 Patent, claim 34 ("a balance corresponding to the electronic gift certificate activation amount").

IDT argues that "nominal amounts" and activation amounts are distinct concepts. According to IDT, the nominal amount relates to the transaction amount and not the card value. IDT also argues that Alexsam is collaterally estopped from advancing this argument because the Court previously rejected the same argument in Datastream. To prevail on the theory of collateral estoppel, a party must show the following: "(1) the issue is identical to one decided in the first action; (2) the issue was actually litigated in the first action; (3) resolution of the issue was essential to a final judgment in the first action; and (4) plaintiff had a full and fair opportunity to litigate the issue in the first action." In re Freeman, 30 F.3d 1459, 1465 (Fed. Cir. 1994); see also U.S. v. Shanbaum, 10 F.3d 305, 311 (5th Cir. 1994) (setting forth a similar test). In the Datastream Markman order, the Court did not expressly reject Alexsam's argument that the activation amount can be the nominal transaction amount. Moreover, the arguments that the Court considered in the Datastream Markman Order were not identical to the current arguments. Alexsam's present argument is persuasive in light of the reliance on the claim language "corresponding to," which suggests that "activation amount" could be broader than the value of the card. "A patentee may claim an invention broadly and expect enforcement of the full scope of that language absent a clear disavowal or contrary definition in the specification." Home Diagnostics, Inc. v. LifeScan, Inc., 381 F.3d 1352, 1357 (Fed. Cir. 2004). See also Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1371 (Fed. Cir. 2005) ("[A] patentee typically claims broadly enough to cover less preferred embodiments as well as more preferred embodiments, precisely to block competitors from marketing less than optimal versions of the claimed invention."). The Court construes "activation amount" to mean "a value used to establish the total value of goods or services that the user may obtain upon the prepaid account being made functional for use."

The court shall apply the ordinary definition of the term "active electrode" in the relevant art. The term "active electrode" means "a stimulating electrode . . . applied to tissue for stimulation and distinguished from [a return electrode] by having a smaller area of contact, thus affording a higher current density." 3

The term "active layer" appears in Claim 3: "The structure claimed in claim 1, wherein said layer comprising said inclusions is an active layer of an optoelectronic component."

Nichia suggests that the court adopt wording contained in the specification which states that "the active layer [] is the only
region of the structure in which the two types of carriers are simultaneously present. . . " Col. 2, l. 47-53. Nichia's construction does not go far enough, as it is possible for electrons and holes to be simultaneously present in other layers, although not in appreciable numbers relative to the active layer. One of skill in the art would know that outside the active layer, some hole and electrons exist in practice. Even in a pure, undoped semiconductor (called an intrinsic semiconductor) at room temperature, some holes and electrons simultaneously exist. See Tr. at p. 80, l. 24 to p. 81, l. 5. Therefore, the issue is really one of degree. Holes and electrons are simultaneously present in the active layer to a significantly greater degree than in any other layer.

Seoul criticizes Nichia's proposed construction, citing a book by Nichia's technical advisor, for the proposition that "[c]arriers tend to escape from the active layer of an LED into the confinement layers." Seoul's Claim Const. Br. at 13, Ex. 9, E. Fred Schubert, Light-Emitting Diodes, 81 (2nd ed. 2006). However, earlier in the chapter, the text explains that "[i]n an ideal LED, the injected carriers are confined to the active region by the barrier layers adjoining the active regions." Id. at 75. Again, this illustrates that the issue is one of degree. While electrons and holes may simultaneously exist and they may recombine to emit light, this occurs to a greater degree in the active layer. The active layer may simultaneously contain a thousand times more electrons and holes than an intrinsic semiconductor. For example, the carrier density in intrinsic (undoped) GaAs in a quantum well device is 10<15> cm<sup>-3</sup> or less (see Sajal Paul et al., Empirical expressions for the alloy composition and temperature dependence of the band gap and intrinsic carrier density in Ga[x] In[1-x]As, 69 J. Appl. Phys. 827 (1991); Wallace C. H. Choy et al., AlGaAs-GaAs Quantum-Well Electrooptic Phase Modulator with Disorder Delineated Optical Confinement, 34 IEEE J. Quant. Elec. 84 (1998)), whereas the carrier density in the active region of a quantum well laser under operating conditions is over 10<18> cm<sup>-3</sup> (see A. Champage et al., The Performance of Double Active Region InGaAsP Lasers, 27 IEEE J. Quant. Elec. 2238 (1991)).

Further, Seoul's proposal that "active layer" means "a layer in the device that is capable of emitting light (i.e., emitting photons as electrons and holes recombine) when current is applied" suffers the same practical problem. If electrons and holes exist in the same region, they may recombine and release a photon of light. Moreover, the specification discloses more than light emitting devices, specifically optical modulators and optical switches. Col. 4, l. 33-36. The parties even agreed that the term "optoelectronic component" includes more than simply light emitting devices. It would be inappropriate to require the active layer to emit light as not every optoelectronic component that contains inclusions with a smaller bandgap than the surrounding material emits light. Tr. at p. 92, l. 3-13; Tr. at p. 136, l. 7-18; Pl. Resp., Doc. # 53, Ex. 8, U.S. Patent No. 5,187,715. The court will therefore construe the term as follows:

"active layer" means "the layer in which both types of carriers (electrons and holes) are simultaneously present in significant numbers compared to an intrinsic semiconductor at room temperature."

38

5. "the predetermined number is within about a reasonable number for human capacity" Used in Claims 14, 18, and 30.

Cisco proposes that this term should mean that "the predetermined number is a number that humans can understand." Telcordia argues that the limitation is indefinite and incapable of construction.

35 U.S.C. § 112 P 2 requires that the claims of a patent particularly point out and distinctly claim the subject matter which the applicant regards as his invention. "In ruling on a claim of patent indefiniteness, a court must determine whether those skilled in the art would understand what is claimed when the claim is read in light of the specification." Bancorp Servs., LLC v. Hartford Life Ins. Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004). "If the claim is subject to interpretation, i.e., it is not insolubly ambiguous, it is not invalid for indefiniteness." Bancorp Servs., 359 F.3d at 1371. "[T]he definiteness of claim terms depends on whether those terms can be given any reasonable meaning." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005). In determining whether a claim is insolubly ambiguous, the court should construe the terms according to the general principles of claim construction. Id.

The disputed term appears in Claim 14, which is dependent upon Claim 1. Claim 1 states "the number of objects displayed are limited to within a predetermined number . . . ." '304 patent, col. 19, ll. 62-63. (emphasis added). So the "predetermined number" of Claim 14 refers to a number of objects displayed. The problem with this claim language is that nobody of ordinary skill in the art is given any guidance as to what range of objects is encompassed by the "predetermined number."
Cisco asserts that there is a well known principle of psychology that humans have a capacity for remembering a limited number of items before confusion begins, with the number being generally accepted at being about seven. Cisco says this is known as the "rule of seven." Indeed, Claim 15 refers to the predetermined number being "about seven." '304 Patent, col. 22, ll. 65. That might be definite enough. But the disputed term is limited only by "human capacity."

There is no good indication in the claim language or the specification of the time in which the person will have to view, comprehend, and make use of the number of objects displayed. Obviously a person with plenty of time can review and keep track of a greater number of objects than one under pressure to make immediate decisions in a constantly changing environment. Nothing in the patent indicates that one viewing a graphic display will be trying to memorize what is displayed, so extrinsic references to short term human memory studies do not make this term more definite.

Cisco notes that a computer program filed with the patent application was incorporated in the specification. '304 patent, col. 1, ll. 9-13. Cisco asserts that it identifies eight as the number the court should use. Application, December 9, 1998, p. 38, Bates stamped 00000359, Exhibit F part 2 of Cisco's Opening Claim Construction Brief, [Doc. # 50, Attachment # 2, p. 16 of 25]. But that use of "eight" is in reference to a program called "Soapbubbles." There is no indication it is tied to any measure of human capacity.

Cisco also argues that the number is related to the size of the screen of the display, so that at some point a viewer would not understand what is being displayed because objects would be too small or would occlude each other. But the patent does not place a limit on the size of the screen, so that the graphic display which is impossible to read when shown on the screen of a hand-held unit might easily be within "human capacity" on a twenty-one inch monitor.

The range of human capacity to understand numbers and numbers of objects is almost unlimited, and varies greatly. Some poorly educated humans in a rural environment have the capacity to visualize a large number of objects, such as the number of cattle in a herd. On the other hand, many with advanced degrees seem to have little grasp of the actual total number of dollars represented in tax legislation. The average high school quarterback preparing to receive a snap must keep track of twenty-one other players and the ball. How does this, let alone the number of objects on the graphic display screen of an air traffic controller, tie in with a "rule of seven," which is not mentioned in the patent or prosecution history?

The disputed term purports to identify a number of objects, or range within which a number of objects will be, but in actuality, has no discernable limit. There is no objective standard to allow one of ordinary skill to design around the invention. If someone created a GUI with twenty objects, the patentee could assert that since it had been created, twenty was within "human capacity." The court concludes that this term is indefinite.

39

3. accelerator board

a printed circuit board made of insulating material that has an upgraded microprocessor mounted thereon and is adapted to connect into the socket of a computer board system

This definition is derived from the patent following specification language and figure 1.

This invention relates to accelerator board devices that may be used to replace a microprocessor of a personal computer system which operates at a relatively slow speed in comparison to that of the replacement microprocessor to enhance the performance of the system.

('981 Patent Col 1:10-15)

In accordance with one aspect of this invention, an accelerator board plug-in replacement to the microprocessor socket of a system board includes a sub-harmonic signal generator responsive to the clock signal of the system board.

('981 Patent Col 2:31-34)
Accelerator board 1 is used in conjunction with a slow speed system board B which will normally include a socket S for a microprocessor for which board B was designed, which microprocessor will be responsive to those signals on SS Bus 20 indicated above. In this case it will be recognized that these signals form part of the control signals for a 80286 microprocessor. This "slow" microprocessor is removed from the slow system board B and may be consequently referred to hereinafter as a ghost microprocessor. Accelerator board 1 includes pin connectors (not shown) which are receivable in socket S to interconnect SS Bus 20 to socket S; such pin connectors will also connect System Address Bus 26 and System Data Bus 27 to socket S to provide for the transfer of data between the slow system board and microprocessor 11. The control signals on MP Control bus 22 will be recognized as part of the control signals of an 80386SX microprocessor. Given that this latter microprocessor has a different Address and Control timing than that of the ghost microprocessor, System Address Bus 26 is connected to the microprocessor 11 through Address latch 10 and the MP Address Bus 28, the operation of which will be further described. In addition the change in microprocessor clock, causes the Data Bus timing of the new microprocessor and the slow speed system board to be different.

("981 Patent Col 4:27-53)

For the purposes of this description it will be assumed that the ghost microprocessor for which the slow speed system board B was designed was an 80286 microprocessor operating at 16Mhz, and that the microprocessor 11 of the accelerator board 1 is an 80386SX operating at a frequency of 48 Mhz, to which microprocessors the timing diagram of FIG. 10 is applicable. For such system, the frequency of the sub-harmonic generator 3 is conveniently selected to be 4 Mhz, and the phase lock oscillator 4 accordingly to provide a value of N in the divide by N portion of the circuit of twelve.

("981 Patent Col 10:65-11:9 Fig 1)

The following dictionary definitions fully support the Court's definition of accelerator board.

Dictionary of Computer and Internet Words (2001) accelerator board: A printed circuit board that can be added to a computer to enhance its performance by substituting a faster microprocessor without replacing the entire motherboard and associated components.

Microsoft Computer dictionary (4th ed. 1999) daughterboard: A circuit board that attaches to another, such as the main system board (motherboard), to add extra capabilities.

Microsoft Computer Dictionary (4th ed. 1999) board: An electronic module consisting of chips and other electronic components mounted on a flat, rigid substrate on which conductive paths are laid between the components.
H. Accesses [the data]

3

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

3 The bracketed terms are not being offered for construction. (D.I. 179, at 14 n.3.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

Leader's Construction Facebook's Construction
plain and ordinary meaning Retrieves information in the
second context or user
workspace as distinct from
uploading it, adding or
creating it

The phrase "accesses the data" appears in Claims 1, 17, and 23. 4 Facebook contends that the disputed claim term "accesses" means "retrieves information in the second context or user workspace as distinct from uploading, adding or creating it." (D.I. 191, at 22.) According to Facebook, this proposed construction is supported by the intrinsic record, and is consistent with the plain meaning one of ordinary skill in the art would ascribe to the term. (Id. at 23-24.) Leader criticizes Facebook's proposed construction on several grounds: 1) it reads limitations which are unsupported by the specification into a simple term; 2) if adopted, it would render the claim nonsensical; and 3) it attempts to deconstruct the term rather than construe it. (D.I. 179, at 14-15.) Leader contends that the term "accesses" in the '761 patent is used consistently with its everyday meaning, and accordingly, should be given its plain and ordinary meaning. (Id. at 14.)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 In Claim 17, the phrase reads "the data is accessed." '761 patent, col. 22:24.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The Court concludes that Facebook's proposed construction is not supported by the intrinsic record. The specification provides that

Any user operating within any board has access to the suite of applications associated with that board, and can obtain access to any data in any form (e.g., documents and files) created by the applications and to which he or she has permission. Moreover, thereafter, the user can then move to shared workspaces (or boards), and access the same data or other data.

'761 patent, col. 3:37-43. There is no references to "access" of the data being distinct from uploading, adding, or creating the data. Facebook points to a portion of the specification, referring to Figure 8, which states that "[d]ata of any kind and size can be uploaded to a common or shared workspace or board. Varying levels of access can be provided to the uploaded data." '761 patent, col. 11:29-31. The Court is mindful of the Federal Circuit's admonition that "although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments." Phillips, 415 F.3d at 1323. That uploaded data can be "accessed" in this embodiment is insufficient, in the Court's view, to import Facebook's proposed limitation into the claim term.

Accordingly, the Court declines to adopt Facebook's proposed construction for the term "accesses."

IV. Conclusion

An Order consistent with this Memorandum Opinion will be entered.

ORDER

At Wilmington, this 9 day of March 2010, for the reasons discussed in the Memorandum Opinion issued this date;
IT IS HEREBY ORDERED that the following terms in United States Patent No. 7,139,761 (the "'761 patent") are assigned the following meanings:

8. The term "access" shall be given its plain and ordinary meaning.

Access, accessing, all forms of "access"

This term appears, in some form, in every claim of the patent. MyMail argues that all forms of "access" should be defined "establish/establishing the ability to communicate with," while Defendants propose "the right to gain entry to a computer system and make use of its resources (for example, to retrieve data from another computer)."

MyMail's proposed construction is at odds with the language of Claims 11 and 13 of the patent, which recites both "access" and "communicate." It makes no sense to define "access" as a function of "communicate." The Court will instead substantially adopt Defendants' proposed construction, which is consistent with the ordinary meaning of "access." The Webster's New World Dictionary of Computer Terms defines "access" as "the right or ability to gain entry to a computer system and make use of its resources." WEBSTER'S NEW WORLD DICTIONARY OF COMPUTER TERMS 12 (6th ed. 1997). Accordingly, the Court defines all forms of "access" as "to gain entry to a computer system and make use of its resources."

Access authorization data

IPCom defines "access authorization data" as "access rights information that must at least include either (1) information indicating whether access is to be authorized based on an access threshold value or access class information, and at least one of an access threshold value or access class information or (2) access threshold value and access class information." Chart at 5. HTC asserts that this phrase means "bit patterns (45, 50, 55) which may include an access threshold value or alternatively different information from which the mobile station can determine whether it has access rights or must wait until access authorization data are transmitted again." Id.

The specification to the '751 Patent indicates that access to the RACH (random access channel), by which a plurality of mobile stations/cell phones communicates with a singlebase station/cell tower, can be restricted to "certain user classes" or each mobile station can "be provided with its own user class." '751 Patent at 4:14, 21. "User classes with different numbers of mobile stations can also be provided. . . . The network operator can now enable access to the RACH by the individual mobile stations as a function of their membership in one of the . . . user classes." Id. at 4:22-27. "By means of information signals," the network operator "informs the various mobile stations which rights for transmitting on the RACH are granted to the applicable mobile station." Id. at 4:32-36 (numerical references to Fig. 1 omitted).

At predetermined times, the base station transmits information signals to the first mobile station [as an example for all the mobile stations]. The information signals can be transmitted, as shown in FIG. 1, via a signaling channel 25, hereinafter embodied as an example as a broadcast control channel or BCCH. . . .

Since the bit pattern sent from the base station is sent not only to the first mobile station 5 but also to all the other mobile stations 10, 15, 20, and likewise over the signaling channel 25, which as described is embodied as a BCCH, that is, a point-to-multiple-point channel, so that all the mobile stations receive the same ink 16 [i.e. information] at the same time, the bit pattern includes the access rights granted to each user class, 35, 40, for the sake of informing the mobile stations of the RACH access rights they have been allowed.
Id. at 4:41-45, 59-67. A random distribution of access authorization occurs because the base station also sends an access threshold value $S$. The access threshold value $S$ is "delivered" to the evaluation unit in the mobile station. Id. at 5:19. Then, the evaluation unit "draws a random or pseudo-random number $R$ and asks whether the random or pseudo-random number $R$ is at least as great as the access threshold value $S."$ Id. at 5:21-24. "Only then is an [sic] access to the r30 [RACH] allowed." Id. at 5:24-25.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

16 The word "ink" is a typographical error in the '751 Patent, a place holder accidentally left behind by the person who translated the Patent from German into English. Tr. 1/26/10 at 115 (IPCom). "Ink" represents the English word "information." Id.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

However, some classes of users may be enabled to access the RACH even when, "on the basis of the random distribution by means of the access threshold value [such users] are not authorized access." Id. at 1:56-58. "For instance, subscriber stations of emergency services, such as the police or fire department are assigned to a predetermined user class of this kind and can then access the telecommunications channel with priority by means of appropriate access threshold value ink, independently of the random distribution." Id. at 1:59-64.

From these descriptions, it is evident that the term "access authorization data" represents two different kinds of information sent by a base station: access rights granted to each user class and an access threshold value unless the subscriber is, for instance, an emergency service in which event its user class has priority and its access threshold value is not dependent on random distribution. Notably, even emergency services must have both a user class and an access threshold value to gain access to the network.

HTC thus proposes that access authorization data is confined to three particular bit patterns described as preferred embodiments in the specification. There is nothing in the specification, however, that suggests that authorization data is limited to these three specific bit patterns. To the contrary, the specification expressly states that these three bit patterns are set forth as mere examples:

The numbers of bits used for the access threshold value $S$, the access channel [information] $Z_0$, $Z_1$, $Z_2$, $Z_3$, the priority threshold value $P$ and the telecommunications service [information] $D_0$, $D_1$, $D_2$ are understood to be merely examples, and they can also be increased, for example for more extensive signaling, and reduced, for the sake of bandwidth reduction. In this case, the total length of the bit patterns 45, 50, 55 may change as well. Individual components of the [information] can optionally also be omitted entirely.

'751 Patent at 8:54-62. Further, HTC's proposal that the bit patterns "may include an access threshold value or alternatively different information," Chart at 5, fails to appreciate that access authorization data include both access threshold values and access rights granted to each user class. Similarly, IPCom's proposed construction would present an either/or scenario: "information indicating whether access is to be authorized based on an access threshold value or access class information . . .," id., which is not consistent with the specification.

The Court construes "access authorization data" to mean "access rights granted to each user class and an access threshold value."

b. "access code"

i. The Parties' Proposed Constructions

MiniMed argues that the term "access code" should be construed to mean "a secret sequence of characters including a
password which an authorized user must enter to gain access to the controller means." MiniMed cites the dictionary definitions of "access" and "code," to support what it contends is a common usage of the term "access code." Specifically, MiniMed states that access is defined as "to get at: gain access to" and code is defined as a "system of symbols (as letters or numbers) to represent assigned and often secret meanings." (D.I. 167 at 32 (citing Merriam-Webster Dictionary, 6,221 (10th ed. 2001)).) Moreover, MiniMed argues that the term "access code" and the term "password" are used consistently in the specification. (Id.)

Smiths argues that "access code" should be given its plain meaning and argues that MiniMed selectively chooses definitions to support its proposed construction. Smiths also notes that the same dictionary also defines "code" as "a system of principals or rules … a system of signals or symbols for communication." (D.I. 220 at 13-14 (citing Merriam-Webster Dictionary, 6 (10th ed. 2001)).)

ii. The Court's Construction

I have concluded that MiniMed's definition of the term "access code" is correct. An additional dictionary definition, not cited by either party, captures the common and ordinary meaning of the phrase: "an alphanumeric sequence that permits access to an electronic network, such as a telephone network or an automated teller machine." The American Heritage Dictionary of the English Language (4th ed. 2000). Although this definition refers to gaining access to a network, it supports the idea that preventing use by unauthorized people is integral to the meaning of the term "access code." Consequently, I construe the term "access code" to mean "a sequence of characters used as a password which an authorized user must enter to gain access to the controller means."

The rest of the disputed terms 7 have their plain and ordinary meaning and require no further construction.

6. "user remote access device"

Klausner proposes "a device that can from any remote location gain authenticated access to internal system resources from outside the system that does not require separate data and voice channels to communicate with the telephone answering device." Vonages proposes "the user remote access device having the structure specified in Claim 1." In support of its proposal, Vonage contends that "user remote access device" is not discussed in the written description 5 but is expressly defined only in ten of means-plus-function elements in Claim 1. Vonage argues that because there is a presumption that the same terms appearing in different claims have the same meanings, the term "user remote access device" should be defined in all claims as it is in Claim 1. Vonage's argument is without merit.

Vonage's argument hinges on the idea that a "user remote access device" is different from a "remote access device." See Applied Med. Res. Corp. v. U.S. Surgical Corp., 448 F.3d 1324, 1333 n.3 (Fed. Cir. 2006) ("in the absence of any evidence to the contrary, we must presume that the use of . . . different terms in the claims connotes different meanings"). Although different terms in a patent are presumed to have different meanings, that presumption is overcome in this case. Claim 2,
which depends from Claim 1, references the "user remote access device" of Claim 1 by calling it a "remote access device." Moreover, independent Claims 5 and 20 use the terms "remote access device" and "user remote access device" interchangeably within the same claim. Thus, Vonage's proposed construction would have the effect of importing the limitations of Claim 1 into all claims when claims 2 and 5-13 include a "remote access device" that contains different elements.

Vonage also argues that the prosecution history shows that Claim 1 defines this term because the inventors amended Claim 1 to clarify that a "user remote access device" includes the means-plus-function elements in part (b) of Claim 1. As noted by Klausner, however, the examiner expressed concern with the term "system independent user remote access device." ("Regarding claim 15 [current Claim 1], it is not clear if a 'user remote access device (line 11)' and "a system-independent remote access device (line 15) are the same."). Ex. 27 to Klausner's Reply Br. at 4. In response, the inventors removed "system independent" to "make the claim language consistent." Ex. 7 to Klausner's Claim Constr. Br. at 20. The Court cannot conclude that such an amendment reflects an intention to define the "user remote access device" of Claim 3 in terms of the means-plus-function limitations of Claim 1.

Finally, contrary to Vonage's contention, Claim 1 is not defining a "user remote access device" or a "remote access device." Instead, the claim sets forth elements included in the "user remote access device" for purposes of that claim. A claim's elements establish the boundaries of that claim, Innova, 381 F.3d at 1115, rather than define a particular claim term. Indeed, Claims 2 and 5-13 set forth different elements of a "remote access device" but none of these claims purport to define the term. Vonage does not cite to any authority holding that means-plus-function elements in an independent claim can be used to define a term appearing in another independent claim. 6 "There is a rebuttable presumption that different claims are of different scope." Amgen, Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003). Vonage has not rebutted this presumption here.

6 The Court finds this situation distinguishable from the case cited by Vonage, Pods, Inc. v. Porta Stor, Inc., 484 F.3d 1359 (Fed. Cir. 2007). In that case, the parties agreed on the definition of "carrier frame" in Claim 1 and there was no reason to fail to apply that definition to the term as used in another claim. Here, the parties have not agreed on a definition for "user access remote device" and Vonage is attempting to restrict the meaning of a term by way of an independent claim's means-plus-function elements, not by way of some sort of definition.

The construction proposed by Klausner suffers from its own deficiencies. Klausner proposes "a device that can from any remote location gain authenticated access to internal system resources from outside the system and that does not require separate data and voice channels to communicate with the telephone answering device." Klausner points principally to the prosecution history to support various aspects of its proposed construction. However, the Court does not find adequate support for certain aspects of Klausner's proposal. Klausner refers to an Amendment, dated April 3, 1995, in which the Applicant distinguishes a prior art reference to Jachmann. In his argument, the Applicant said that "Jachmann does not disclose a flexible and system-independent remote device that may be used from any remote location to access any TAD wherein visual messages are displayed on the system-independent remote device." See Ex. 6 to Klausner Opening Br., p. 28. But, in this particular argument, the Applicant actually relied on two specific differences to distinguish Jachmann; namely the "system-independent" remote device, and the fact that, in Jachmann, "remote retrieval of information must be accomplished without use of any visual messages." Id. The "system-independent" aspect of the claims at issue was deleted in a subsequent Amendment.

Klausner points to its expert Levine as support for that portion of its proposal reciting "from any remote location gain authenticated access to internal system resources from outside the system." However, Klausner points to nothing specific in the intrinsic record to support these restrictions, other than the notion that access to voice messages is typically intended to be limited or controlled. The reference to "internal system resources" does not aid in the understanding of the subject claim term, at least in the context of the asserted claims of the '576 patent. Those claims do not expressly recite a "system," nor is a "system" implicitly required. Hence, inclusion of a requirement of "authenticated access to internal system resources from outside the system" interjects limitations not reasonably connected to any other claim requirement and will likely only cause confusion to a lay jury. Certainly the word "remote" carries with it the connotation that some distance, and perhaps a
considerable distance, may exist between the remote access device and the telephone answering device. Dr. Levine, Klausner's expert, describes that distance as "any distant location" and having "no range limit on access." Levine Decl. P 51. Klausner's proposed language of "from any remote location" adequately describes this limitation.

Finally, Klausner proposes that the term "remote access device" be construed to require that the device "does not require separate data and voice channels to communicate with the telephone answering device." Klausner points to an Amendment dated November 10, 1995, in which the Applicant again distinguished the Jachmann reference. Klausner points to the Applicant's statement that "in the preferred embodiment of Jachmann, two separate data paths are required for retrieving voice messages." Therefore, argues Klausner, the "remote access device" of the claims must not require two separate channels. However, in the November 10, 1995 Amendment, the Applicant went on to acknowledge that a second embodiment shown by Jachmann "arguably uses only a telephone link to convey both voice and data information." See Ex. 7 to Klausner Opening Br., pp. 24-25. But, said the Applicant, in that second embodiment of Jachmann, the user may be restricted in his use of the single telephone link to only certain times of the day. Thus, the Applicant argued that the distinction between the claimed invention and the disclosure of Jachmann lie in the fact that, in the claimed invention, the "first signals are available upon user demand." Id. The prosecution history is insufficient to show that the Applicant surrendered claim scope regarding the number of channels required for transmission of voice and data. See Sorenson v. Int'l Trade Comm'n, 427 F.3d 1375, 1378 (Fed. Cir. 2005) ("in order to disavow claim scope, a patent applicant must clearly and unambiguously express surrender of subject matter during prosecution").

For the reasons expressed above, the Court construes the terms "user remote access device" and "remote access device" identically to mean "a device that can gain access to voice messages stored on the telephone answering device from a remote location."

7. "Access information." Used in '768 patent, Claims 1, 3, 5, 7, 9, and 11

The parties agree the terms "activation information," "access information," and "recharge information" are closely related. The parties state that the issue with these three claim terms is whether a single security number must be used to activate, use and recharge a prepaid calling card. "Activation" involves associating a dollar amount with a new card or account. "Access" involves actually using the phone, thus depleting the monetary value stored in the account. "Recharge" involves associating a dollar amount for a card or account which has already been established.

TGIP suggests that "access information" means: "data transferred or received in connection with the attempted use of an account." Defendants propose "information including the security number entered to access the telephone network."

Every independent claim of the '768 patent describes a method by which someone with a pre-paid calling card account uses a telephone to obtain access to a telephone network by transmitting "access information," which is used by the call processor to identify "the particular prepaid calling card account." See '768 patent Reexam Cert, col. 1, 11. 47-53 (Claim 1); '768 patent Reexam Cert, col. 2, 11. 38-44 (Claim 3); '768 patent Reexam Cert, col. 3, 11. 30-36 (Claim 5); '768 patent Reexam Cert, col. 4, 11. 25-27 (Claim 7); '768 patent Reexam Cert, col. 5, 11. 13-18 (Claim 9); '768 patent Reexam Cert, col. 6, 11. 23-26 (Claim 11). None of the independent claims omit this step. The specification describes this process as a user making a call by accessing a phone number to which the host computer is connected. The user enters the "security code," and if the account has a positive balance, the user is prompted to enter the desired phone number. '768 patent, col. 5, 11. 42-55.

TGIP objects to the use of the word "security number," raising the familiar argument that the specification recites but a single embodiment and that limitations of the specification should not be imported into the claims. That does not get around the language of the claims themselves, which require in each case that the "access information" is used by the call processor to identify a "particular," i.e. a single, prepaid calling card account. If a unique set of access information identified more than one calling card account, more than one account would be billed for the same call. See e.g. '768 patent Reexam Cert, col. 1, 11. 54-56 (Claim 1); '768 patent Reexam Cert, col. 2,11. 44-47(Claim 3). Each unique set of access information must identify only one pre-paid calling card account.
Perhaps this access information is given the name "security code" only in the specification. In some cases, as suggested by TGIP's counsel it might be called a "PIN number." It could be called the "password" for the calling card account. The precise name is not important. There is a combination of numerals, letters, and/or characters that can be transmitted from a phone to a call processor. Each such combination is associated with only one ("a particular") pre-paid calling card account. The court defines this term as follows:

"Access information" means "a combination of numerals, letters, and/or characters that can be transmitted from a phone to a call processor, which identifies one, and only one pre-paid calling card account."

The Court agrees with MEI and construes "access information" as "information that specifies a memory access." To access memory, the memory address of the information and the operation to be performed at that location are needed. See '921 Patent col. 11:30-40, Figs. 12 & 13. Samsung's proposed construction--"drawing rules (DR), start/stop bits, and H/V bit"--improperly imports limitations from a preferred embodiment. See Turbocare Div. v. Gen. Elec. Co., 264 F.3d 1111, 1123 (Fed. Cir. 2001) (citing Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988)("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.").

The Court agrees with MEI and construes the phrase as "information defining a specification for an operation mode." As discussed above, Samsung's proposed construction--"drawing rules (DR), start/stop bits, and H/V bits provide further details of the operation mode, as defined in Table II"--improperly imports limitations from a preferred embodiment.

The Court construes the phrase as "information defining a specification for an operation mode, which, together with external control input, defines the specifics of the operation mode." Samsung's proposed construction--"drawing rules (DR), start/stop bits, and H/V bits provide further details of the operation mode, as defined in Table II"--improperly imports limitations from a preferred embodiment.

II. "ACCESS POINT" ('311 patent, Claims 1, 2, 10)

In the July 20 Order, the Court: (a) rejected Broadcom's argument that this term had a customary meaning to persons of skill in the art when the patent application was filed; and (b) rejected Agere's construction as without evidentiary basis. Agere, 2004 WL 1658530, at *20-21, 2004 U.S. Dist. LEXIS 14187, at *71-74. In supplemental briefing, Agere contends that the Court held the term to be incapable of proper construction, and that the claim is therefore invalid for indefiniteness. Agere's argument, however, misconstrues the Court's ruling. The Court did not hold that the term is incapable of construction;
indeed, the invitation of supplemental briefing was premised on the fact that additional evidence might permit the Court to adopt a construction of value to the ultimate trier of fact. Id., 2004 WL 1658530, at *47 n.76, 2004 U.S. Dist. LEXIS 14187, at *167 n.76 ("The parties may file supplemental briefs regarding the construction of this term, including new or revised proposed constructions."). Furthermore, the Court did not hold that Broadcom's construction was incorrect, but rather rejected Broadcom's sole contention that this construction represented the customary meaning of the term in 1991. Id., 2004 WL 1658530, at *20, 2004 U.S. Dist. LEXIS 14187, at *73 ("Broadcom having presented no other evidence showing the existence of a customary meaning, the Court holds that this term had no such meaning in 1991."). Accordingly, the Court clarifies that the July 20 Order did not find the instant term incapable of being construed, and instead examines the arguments and evidence provided on supplemental briefing in pursuit of a proper construction.

Broadcom's construction of "access point" as "an element in a network that provides access to the network infrastructure" is clearly supported by both intrinsic and extrinsic evidence. Most importantly, the claim language itself supports this construction, as all three claims at issue describe the access point at the communicative link between the wireless terminal nodes and the remainder of the network. ('311 patent, col. 19, l. 64-col. 20, l. 5 (describing access point as delivering messages and transmitting beacons from network to wireless node), col. 20, ll. 10-15, 36-41 (same).) In addition, the evidence provided by Broadcom in its initial Markman briefing, while insufficient to establish a customary meaning of the term in 1991, supports Broadcom's position that its construction was, at the least, shared by some persons of skill in the art at that time. (See Broadcom Opening Ex. O at 23 (Ken Biba, A Hybrid Wireless MAC Protocol Supporting Asynchronous and Synchronous MSDU Delivery Services, IEEE 802.11 (Sept. 1991)) (defining access point as "controlling access to the infrastructure").) Finally, the contemporaneous technical evidence provided by Broadcom's supplemental brief further bolsters its construction. (See, e.g., Broadcom Fourth Supplemental Br. Ex.BatAS158286-88 (defining access point as fixed transceiver providing radius of communicative functionality for wireless user devices).) In total, therefore, the Court finds that Broadcom's proposed construction is supported by both the claim language and extrinsic evidence, and it is accordingly adopted.

7. "Access threshold value"

HTC suggests "a numerical value optionally included in access authorization data that is transmitted at periodic intervals for controlling network access. If a mobile phone determines that the numerical value was transmitted, it will directly compare the value with a random/pseudo-random numerical value generated within the mobile phone to determine whether it can gain access rights or must wait until access authorization data are transmitted again." Chart at 5-6. IPCom offers "a value used to determine whether the subscriber station is authorized to access the common telecommunications channel." Id. at 5. Part of HTC's definition states that "[i]f a mobile phone determines that the numerical value was transmitted, it will directly compare the value with a random/pseudo-random numerical value generated within the mobile phone to determine whether it can gain access rights or must wait until access authorization data are transmitted again." There is no need to import this limitation again here. It can be found in the "ascertaining" limitation discussed above. See Section III.B.5 of this Opinion. The Court adopts IPCom's straightforward definition: "access threshold value" is "a value used to determine whether the subscriber station is authorized to access the common telecommunications channel."

Preamble

The parties dispute the construction of the preamble to '939 patent claim, which provides, in relevant part, "selected ones of a plurality of target objects and sets of target objects characteristics that are accessible via an electronic storage media." The parties agree that the inventors explicitly defined one of the main terms in the patent specification. "Target object" is defined as "an object available for access by the user, which may be either physical or electronic in nature." Def. Mem. Ex. 3, Col. 4. The parties dispute, however, whether inclusion of the phrase "accessible via an electronic storage media" places additional limitations on the phrase "target objects" as it is used in claim 1.
According to Amazon, the overall language of the disputed phrase limits the relevant "target objects" to those that are "accessible via an electronic storage media," that is only electronic objects, not physical objects. Amazon further relies upon the specification's discussion of relevant architecture to define the term "sets of target object characteristics" as referring to a "unique file that contains an identifying description of the target object." Def. Mem. at 37 (quoting Ex. 3, Col. 29). Amazon therefore construes the disputed phrase as meaning "selected electronic objects and the characteristics, contained in a unique file, describing the objects, that are accessible via an electronic storage media."

In contrast, Pinpoint's proposed construction emphasizes the express definition of "target objects." According to Pinpoint, the disputed phrase is properly construed as "selected ones of a plurality of physical or electronic objects and/or sets of their characteristics available for access by the user, that are capable of being obtained, used, seen, or known, by means of electronic storage media." Pinpoint's proposed construction finds support in the patent specification, which provides examples of both physical and electronic target objects: "published articles, purchasable goods, or even other people," and distinguishes existing technology in the field of information retrieval as merely allowing users to find textual documents, as opposed to non-textual documents: used cars, products being sold, publicly traded stocks, etc. Def. Mem. Ex. 3, Col. 6, 9. The remainder of Pinpoint's proposed construction comes from a general purpose dictionary, which defines the terms "accessible" and "via," respectively as "capable of being used, seen or known: OBTAINABLE," and "by way of. . . [or] by means of." Pl. Opp. Mem. at 5 (quoting Merriam-Webster Dictionary 23 (1997)).

Amazon's proposed construction lacks merit. If the court construes the phrase "target objects" as limited by the phrase "accessible via an electronic storage media," no '939 patent claim would cover physical target objects. This is because every '939 patent claim contains the limitation "accessible via an electronic storage media." The '939 patent claims must cover physical target objects. Amazon concedes as much. See Def. Reply at 4 ("there is no dispute that the '939 Patent purports to provide a system in which users can locate physical target objects"). Therefore, Amazon's proposed construction is untenable. The plain language and the patent specification provide otherwise. Vitronics, 90 F.3d at 1582. The court construes the disputed phrase in accord with Pinpoint's proposed construction: "selected ones of a plurality of physical or electronic objects and/or sets of their characteristics available for access by the user, that are capable of being obtained, used, seen, or known, by means of electronic storage media."

53

1. "Accessing"

Liquidnet proposes that I construe "accessing" to mean "gaining entry to," 64 while ITG/Pulse proposes that I construe it to mean "retrieving." 65 The parties appear to agree that the patented method must perform both of these steps -- i.e., it must first gain entry to the OMS database and then at some point retrieve data from within that database in order to transmit it to an ETM. 66 However, the parties disagree as to which action the term "accessing" refers. While both parties' arguments are meritorious, Liquidnet's construction has the greater evidentiary support.

64 Liquidnet Br. at 12.
65 Opening Brief of ITG and Pulse Concerning Claim Construction ("ITG/Pulse Br.") at 33.
66 See Liquidnet Br. at 13 ("[T]he act of retrieving data must logically be something that takes place after the step of 'accessing' that data."); Responsive Brief of ITG and Pulse ("ITG/Pulse Resp.") at 19 ("ITG and Pulse agree that to retrieve data - in Liquidnet's example email -- one must connect to the database through the use of a computer.").

First, Liquidnet's construction better reflects the ordinary meaning that one skilled in the art would attribute to the term "accessing" when reading it in the context of the specification. In one of the few places that the specification uses the term accessing, it discloses that:
The OIM is in communication with the OMS database and the ETM. An OMS database integration module in the OIM reads data records stored in the OMS database and, in a preferred embodiment, also creates and modifies data records stored in the OMS database upon execution of a trade through the ETM. In one embodiment, the OMS database interaction module directly accesses the OMS database and in another embodiment it sends commands to an application programming interface (API) in the OMS for accessing the database.

Although the specification never defines "accessing," this section uses the terms "accesses" and "accessing" to refer to a mode of "communication" between the OIM and the OMS database wherein the OIM reads and monitors records within the OMS database. Nothing in this section suggests that the records must be retrieved for them to be accessed. Instead, it appears that when the patent applicants used the term "accessing," they contemplated a process in which the OIM would be able to gain entry to the records and read them while they remained within the database.

Second, and relatedly, ITG/Pulse's construction would exclude preferred embodiments described in the specification. According to Patent '834, after a trader logs on to the OMS, the trader's computer "retrieves data records about orders suitable for transmission to the ETM from the OMS database." In one embodiment, "all open orders are suitable for transmission to the ETM," but in other embodiments, only some orders are deemed suitable for transmission. The specification, therefore, discloses embodiments wherein the trader's computer will only retrieve the records of some orders - i.e., those determined to be suitable for transmission. Because the claim describes the patented method as "accessing . . . all records of open orders," construing "accessing" to mean "retrieving" would exclude the preferred embodiments where only some records of open orders are retrieved.
Third, Liquidnet's definition is also supported by extrinsic evidence. Liquidnet has introduced a computer dictionary published by Microsoft in 2002 that defines "access" as "[t]o gain entry to memory in order to read or write data." 72 While courts are cautioned not to rely too heavily on dictionaries, the definition further supports the view that Liquidnet's construction reflects the ordinary meaning of the term "accessing."

Despite this intrinsic and extrinsic evidence, ITG/Pulse objects to defining the term "accessing" to mean "gaining entry to" on the grounds that Liquidnet's construction does not make sense in the syntax of the claim language. The claim describes the patented method as "accessing . . . all records of open orders from a database of an order management system." According to ITG/Pulse, "[c]omputers do not gain entry to records from a database, they retrieve records from a database." 73 While it is true that applying Liquidnet's definition to the term "accessing" results in awkward phrasing, ITG/Pulse is incorrect that Liquidnet's construction is illogical. The preposition "from" may refer to a prepositional object of the transitive verb (e.g., removing a splinter from your skin), but it may also refer to the location of that verb's object (e.g., meeting a man from China). Therefore, "accessing . . . records of open orders from a database of an order management system" can logically be read to mean that the records of the open orders are located in the OMS database without suggesting that they are being removed from that database.

Accordingly, I adopt Liquidnet's construction of the term "accessing" to mean "gaining entry to."
are indefinite...[t]hus, the definiteness of claim terms depends on whether those terms can be given any reasonable meaning.").  The court will therefore construe these terms as follows:

"Accessing" means "any suitable form of solely computer-executed data transfer including exchanging data directly between software modules, uploading a data file, or using a common memory, and may utilize a local area network or wide area network such as the Internet to transfer data."

"System for accessing" means "software or any hardware device programmed to access inventory information of multiple stations. A 'system' does not include a human being attempting to perform the task or function manually."

B. Accessing

The term "accessing" was not one of the 29 terms listed in the Joint Claim Chart submitted by Timeline and ProClarity in February 2006. 3 The term "accessing" is used in various contexts in the claims, such as "accessing" data, content of information, and a data source. See, e.g., '511 patent, claim 1; '617 patent, claim 4. As discussed above, Timeline argues that the court should decline to construe the term "accessing." In the alternative, Timeline proposes that the term should be construed to mean: "Obtain access to. Accessing may include actions such as reading, obtaining, viewing, and/or saving." Defendants propose that the term should simply be construed to mean "reading."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 However, the term "accessing" already arose in the first round of claim construction, when the court construed the term "obtain . . . information about the data structure . . . [by] accessing content of information." In its proposed construction of that term, ProClarity simply repeated the word "accessing," without seeking to define it further.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Timeline does not dispute that the term "accessing" may include "reading." However, Timeline maintains that "accessing" is "a term of art that has a broader meaning than simply 'read'" and that Defendants' proposed construction is too narrow. (Dkt. No. 226 at 19).

Timeline argues that Defendants themselves have suggested a broader meaning of "accessing" in other sections of their claim construction briefing. In particular, Timeline points to Defendants' discussion of a "programming means for accessing" at least two different data sources, where Defendants argue that the steps for "accessing" a data source include selecting directories, searching directories, loading general information, and loading data. (Dkt. No. 218 at 19). Timeline notes that "[n]owhere do defendants explain how 'reading' can be reconciled with the position that 'accessing' requires the functions select directories, search directories, load general information, or load data definitions." (Dkt. No. 226 at 21).

Timeline also observes that the specification of the '511 patent uses the word "obtain" as a synonym for "access," noting that the specification states that "[p]referably, the system is flexible in that it is not inherently limited in the data formats it can access, but can be configured to obtain data from virtually any computer-readable information source." '511 patent, Col 3:6-9 (emphasis added). While Defendants focus on the words "computer-readable" in this sentence to suggest that "access" must mean "read," Timeline is correct that this sentence uses "obtain" rather than "read" as a synonym for "access."

Defendants have also offered several contemporaneous definitions of the term "access" from computer dictionaries. As Timeline notes, these dictionary definitions reflect a broader meaning of "accessing" than simply "reading." While Defendants have offered a declaration from an expert who opines that "accessing" as used in the patents is limited to "reading," the court does not regard this extrinsic evidence as compelling.

In sum, the court agrees with Timeline that the term "accessing" as used in the claims has a broader meaning that simply "reading" and that Defendants' proposed construction is too narrow. However, Timeline's proposed construction is also not ideal. Timeline has proposed construing the term to mean "Obtain access to. Accessing may include actions such as reading, obtaining, viewing, and/or saving." Timeline offers little if any explanation as to why "accessing" would include actions
Therefore, the court will adopt a modified version of Timeline's proposed construction. The court construes the term "accessing" to mean "obtaining access to." The court regards this construction as broad enough to include reading, without limiting the term to that particular action.

The core dispute between the parties in relation to the record structure limitations is over the meaning of the term "accessing." The plaintiffs argue that the term "accessing" includes anything a computer can do to a file, such as creating or opening records or storing additional information entered by callers. The defendants argue that the term "accessing" does not encompass deleting a file or creating or initiating a file because a file must exist before it can be "accessed." The defendants point to passages of the specification in which the ideas of updating a file are distinct from creating a cell in memory in the first instance. See Column 12, line 63-65, Column 16, lines 29-32, and Column 17, lines 29-30 of the '707 patent. Thus, they contend that the term "accessing" must mean retrieving a file that already exists.

In Claim 51 of the '309 patent, Katz recites a "record structure, including memory and control means, . . . for updating a file." This indicates to the Court that the use of the word "accessing" in a similar limitation in another claim connotes a different meaning. Further, although Katz describes updating files and assigning cells in memory as different functions in the specification, there is nothing in the specification that indicates that the term "accessing" could not encompass both of those functions.

Webster's Dictionary defines the verb "access" as "to get at, gain access to." Addenda to Webster's 3rd New International Dictionary at 55a (1986). As a noun, the term is defined as "permission, liberty, or ability to enter, approach, communicate with, or pass to and from" or "freedom or ability to obtain or make use of." The Court concludes that the term "accessing" means in the context of the Katz patents: gaining or obtaining the ability to enter or make use of files. The Court further concludes that the term "accessing" in the context of the Katz patents does not delineate or restrict the types of functions that may be performed on the files once they are accessed, such as updating files, creating new files, or deleting files.

Claim 1e

accessing the master data base, performing a compatibility comparison, and selecting each option of the third plurality of options from the first plurality of options as a function of each option's compatibility with the selected choice

The parties disagree on the meaning of the above-stated language. Dell argued that the ordinary meaning of the above-stated language should suffice. Lucent, however, proposed the following: "accessing the master data base to perform a comparison (using the at least one tag indicating compatibility) of each of the first plurality of options and all previously selected choices in order to select for inclusion in the third plurality of options those options that are designed to work with the selected choices without modification, wherein the comparison cannot be performed using relationship tables."

The court concludes that the term should be construed as follows:

"accessing the master data base to perform a compatibility comparison of each of the first plurality of options and all previously selected choices in order to select for inclusion in the third plurality of options those options that are compatible with all previously chosen options. The compatibility comparison must be performed using compatibility tags and cannot be performed using relationship tables."
5. "Account Number Unique to the Consumer," "Consumer Account Number," and "Unique Account Number"

The plaintiff contends that the terms do not need construction. In the alternative, the plaintiff proposes that the terms, except for "unique account number" mean "an identifying number for a consumer account." The defendant argues that all the terms mean "an identifying number that is not shared by any other consumer, and which is additional to, or separate from, any number associated with a credit card or debit card used to pay for a transaction." The disputes are whether the account number can be shared and whether the number can be the same as a credit card account number.

The defendant argues that Social Security numbers can be used as account numbers and, therefore, the number cannot be shared by another customer. The defendant also argues that the account number cannot be a number associated with a credit card because the accumulation of cash value may not be limited to how the product is paid for. See '116 patent, claim 18. 3

Footnotes

3 The defendant also cites to portions of the '090 patent specification.

The defendant attempts to limit the terms to a preferred embodiment. Aside from the term "consumer," which the court has already construed, these terms may be understood according to their plain and ordinary meaning. No further construction is needed.

59

(ii) Account Value.

As noted above, Claim 1 speaks of an annuity product "having an account value and a guarantee of lifetime payments." The parties agree with the dictionary definitions of account value and lifetime payments but disagree how these terms apply to Claim 1. Thus, both the Plaintiff and the Defendant note that the account value refers to the economic value or proceeds associated with an annuity contract. However, while the Plaintiff puts a period at the end of that definition, the Defendant goes on to add "[value] that is maintained in the post-annuitization phase." Similarly, while agreeing on what a guarantee of lifetime payments is, the parties diverge on whether the term "payment" should be read as the "payment in the post-annuitization phase." In addition, the Defendant distinguishes payments from withdrawals whereas the Plaintiff treats them the same.

The Plaintiff vigorously objects to defining the account value only to apply to the post-annuitization phase. It claims that the invention seamlessly combines the pre- and post-annuitization phases and any reference to the annuitization contradicts the express language of the Claim, which did not include the word annuitization. At the same time, the Plaintiff "acknowledges that an 'annuitization' concept is expressly built into the guarantee of lifetime income benefits from the preamble of claim 1." (Pl. Supp. Br. at 8; DE 63-1.) For this reason, the Plaintiff believes that "adding the words 'annuitization' or 'post-annuitization' into claim 1 renders existing claim limitation superfluous or redundant." (Id.)

As used in the '815 Patent, the account value and the guarantee of lifetime payments are intricately related. After all, the existence of these two concepts alongside each other is the essence of the invention. However, the Plaintiff's initial application for the patent in 2001 did not reflect this idea clearly. In that application, the first sentence of the Claim had no reference to the account value: "What is claimed: A data processing method for administering an annuity product having a guarantee of lifetime payments." (Pf. Ex. C, LIN 00074; DE 36.) The account value was not mentioned until step (e):

"periodically paying the subsequent payment and reporting the account value to the beneficiary." (Id.) The examiner turned down that application for obvious reasons in light of previous art in Hagan and Schirripa. He explained:

Schirripa discloses a data processing method for administering an annuity product having a guarantee lifetime payments (col 6, lines 5-45). There is established a charge for the guarantee of lifetime payments (col 9, lines 1-6). An initial benefit payment and subsequent periodic benefit payments are determined (col 5, lines 5-15). An initial payment to beneficiary is made, periodically paying the subsequent payment and reporting the account value to the beneficiary (col 10, lines 20-50). . . . Subsequent periodic payments are re-determined in the event of a partial withdrawal or additional deposit (col 9,
Schirripa does not explicitly disclose periodically determining an account value.

Hagan (828) discloses periodically determining an account value for annuities (col 3, lines 11-19).

It would have been obvious to one with ordinary skill in the art to include periodically determining an account value for annuities to Schirripa because of what is taught by Hagan (828). Hagan (828) teaches periodic determination of balances for insurance purposes (col 2, lines 30-37).

(Df. Ex. C, TFLIC-RFP55-00093-94; DE 38-4.)

In its response to the examiner, along with other changes, the Plaintiff amended the first sentence of Claim 1 to explicitly state that it claimed a "data processing method for administering an annuity product having an account value and a guarantee of lifetime payments." In addition, the Plaintiff submitted a brief in which it distinguished Schirripa and Hagen from its invention:

In a deferred annuity, an account value is maintained up to the point of annuitization. Following annuitization, the concept of an account value ceases to exist. Payments are made to the annuitant pursuant to the annuity contract. The account value which existed prior to annuitization is exchanged by the annuitant for the stream of payments to be received after annuitization. Thus, the account value is neither periodically determined nor periodically reported to the annuitant. In an immediate annuity, this same process occurs at the time of purchase, where the "account value" equals the purchase price of the annuity, less customary charges and expenses.

In contrast, the present invention (which is applicable in the case of both immediate and deferred annuities) maintains the concept of an account value after annuitization, and bases certain of its features and benefits on the account value in the post-annuitization period. Neither Hagen nor Schirripa disclose such methodology.

The present invention provides a method in which account values, and attendant benefits, can be provided in the post-annuitization period. This method includes establishing a charge associated with the guarantee of lifetime payments, and deducting the charge in a variety of ways to render affordable and practical that which has previously been neither.

(Pf. Ex. C, LIN 208, 210; DE 36.)

The examiner approved the amended application and issued the '815 Patent. In his approval, the examiner concluded that prior art "made of record discloses 'post-annuitization' but does not disclose the invention as claimed in independent claim 1." (Df. Ex. E, TFLIC-RFP55-151; DE 38-6.)

The above examples demonstrate that the novelty of the Plaintiff's invention concerning the account value is limited to the distribution, or post-annuitization, phase of the annuity contracts. The Plaintiff did not invent the concept of account value. At the time of the Plaintiff's patent application, the account value was an established tool in administering annuities. However, as the Plaintiff explained to the examiner, this principle existed only in the deferral, or accumulation, phase of the annuity, and ceased once the disbursements began.

In fact the examiner rejected the Plaintiff's application, believing that it contained the same principle of the account value as previous art, that is, the account value in the pre-annuitization phase of the annuity. The Plaintiff overcame this rejection by clarifying that the account value in the '815 Patent was different from previous art, Schirripa and Hagen in particular, because it was not limited to the deferral phase of the annuity but carried on to the post-annuitization phase. Thus, the essence of the invention, as claimed by the Plaintiff, was the annuity with the account value in the distribution, or post-annuitization, phase of the annuity.

Having made clear to the examiner that its invention was the existence of the account value in the post-annuitization phase of the annuity, whereas previous art maintained the same only during the pre-annuitization phase, the Plaintiff is precluded from claiming that no limitations should be imposed on that term. The Plaintiff's argument to the examiner and the
specification make an explicit record of disavowing the application of the account value to the pre-annuitization phase, a concept already covered by Schirripa and Hagen. This is not a case of ambiguous prosecution history that could be interpreted numerous ways. Rather, taken together, the Plaintiff's file informs a person of ordinary skill in the art that the Plaintiff's claim is narrower than it now claims it to be. Therefore, the Court construes the term "account value" to mean the monetary value that is maintained in the post-annuitization phase.

The Plaintiff complains that such interpretation is unwarranted because the meaning of the word "annuitization" is uncertain. That is not true. The Plaintiff itself has consistently acknowledged that its invention has an annuitization concept expressly built into the guarantee of lifetime benefits. (Pl. Supp. Br. at 8; DE 63-1.) Moreover, the Plaintiff has asserted numerous times to the examiner that its invention was novel because it maintained the account value of the annuity contract in the post-annuitization, that is the distribution, phase. Accordingly, the Court understands the annuitization to mean the point when the annuitant starts to receive regularly scheduled payments from the annuity. This meaning is consistent with both the Plaintiff's own and the general usage of that term.

The Plaintiff also insists that narrowing the term "account value" to post-annuitization phase makes the term "a guarantee of lifetime payments" superfluous, as "lifetime payments" are by definition limited to post-annuitization phase. Such is not the case. The term "account value" does not qualify the term "a guarantee of lifetime payments." These terms are independent of each other and defining the first one to apply only in the post-annuitization phase does not render the second one superfluous. In fact, the use of the two terms side-by-side, one of which by definition is limited to the post-annuitization phase, is consistent with the Court's interpretation that the account value is also limited to the post-annuitization phase.

D. "Accounting Data" ('850 Patent)

Every independent claim (claims 1, 18, and 21) of the '850 patent contains the term "accounting data." The independent claims each describe a method or system for "monitor[ing] interactions between a personal information provider and an end user of personal information via an intermediary computer to determine revenue derived from the interactions." One step in this process is "updating accounting data associated with the intermediary computer based on the serviced request." CashEdge seeks to limit this phrase as meaning "in response to the serviced request, a processor increments a count for each serviced request or for each new user or increments a commission total for the purpose of determining revenue," claiming that the specification indicates that the manner in which accounting data may be updated is limited to these three ways. '850 patent col. 3, lines 23-25. Yodlee advances constructions only for the terms "intermediary computer" and "accounting data," asserting that no further construction of this phrase is needed.

The specification includes a "summary of the invention" which states that the host computer "may update the accounting data in a variety of ways." It then lists the three methods of counting users, counting transactions, and determining a commission when the request is to perform a transaction, and also states that any combination of these three methods may be used. See id. CashEdge's construction impermissibly excludes this combination method, which is also described in the preferred embodiment. See id. at col. 3, lines 23-25; id. at col. 14, lines 36-38; Sandisk Corp. v. Memorex Prods., 415 F.3d 1278, 1285 (Fed. Cir. 2005). CashEdge's approach is also impermissible since it seeks to re-write an entire section of Claim 1. See K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1364 (Fed. Cir. 1999). As proposed by Yodlee, focus on the terms "accounting data" and "intermediary computer" is more appropriate; construing "accounting data" to include only the three methods described above is in any case the chief concern of CashEdge's proposed construction.

Yodlee proposes that "accounting data" should be construed to mean "data associated with the amount of and/or nature of user interaction." This definition is too broad; while the "Summary of Invention" states that the accounting data may be updated in a "variety" of ways, the language describing those ways indicates that the three outlined methods plus any combination of them are all that is in included in this "variety." The summary language reads as follows:

"The host computer processor may update the accounting data in a variety of ways. First, the host computer may increment a user count for each new user of the intermediary computer over a selected period of time. Next, the host computer processor may count the interactions performed through the intermediary computer. Third, the host computer processor may, where the service request is a request to perform a transaction, increment a commission total an amount based on the"
serviced request. Finally, the host computer processor may use any combination of these ways to update the accounting data associated with the intermediary computer.

Through its use of the terms "first," "next," "third," and "finally," this listing indicates that it is exclusive. Therefore, the Court construes "accounting data" to mean "any combination of data associated with the number of users, number of interactions, and, for service requests to perform transactions, the commissions based on such transactions."

2. "Accounting data"

The second term from the Claims Involving Products Carrying Participation Numbers that the parties have presented to the Court for construction is "accounting data." This term appears in Claim 44 of the '707 patent, which includes the step of "providing on-going accounting data to said individual callers at intervals during calls from said individual callers."

The plaintiffs argue that "accounting data" should be construed according to its ordinary, common meaning, which is information relating to a reckoning or a computation. (Pls.' App. 83-84). The defendants argue that "accounting data" means callers' scores in the television game show format because that is the only format in the specifications in which Katz discusses accounting data.

The claim language does not support the construction proposed by the defendants. Nothing in Claim 44 indicates that "accounting data" should be limited to only callers' scores in a television game show format. In addition, Claim 45 of the '707, which is dependent on claim 44, provides for the step of "accounting for said limits on use for said participation numbers for said individual callers by incrementing or decrementing on-line said cumulative use for said individual callers to said limits on use." In this claim, the concept of accounting connotes keeping a record of the usage of the Katz system according to set limits on use associated with a caller's participation number; the language of this claim in no way limits the concept of accounting to scores in a game show.

The defendants contend that Column 16, lines 44-53 of the '707 patent is the only place that Katz describes "accounting data." In that passage of the specification, Katz discusses a television game show format and states that:

However, in Column 17, lines 44 through 48 of the '707 patent, the specifications reads "the table 99 may be a large, shared unit that tabulates each of the key numbers and accounts for their use. If the caller has identified a proper key number, the process proceeds and the key number is accounted, i.e. incremented or decremented to the limit of use if any." Contrary to the defendants assertion, Katz discusses accounting in this passage of the specification in a context other than a television game show format. This passage of the specification is consistent with the language of Claim 45, which adds the step of "accounting for said limits on use for said participation numbers," and indicates that "accounting data" may relate to the limits on use specified in the participation numbers or consumable key numbers, and not only callers' scores in a game show. Further, even if the only example of "accounting data" in the specification were in the television game show context, the Court finds no reason in the claim language to restrict the term to a disclosed embodiment in the specification. See Johnson Worldwide, 1999 WL 243570 at *4.

The defendants argue that the prosecution history of the '707 patent supports their construction of "accounting data." In a Supplemental Amendment dated December 28, 1994 during the prosecution of the '707 patent, Katz added Claim 53, which eventually became Claim 37 (upon which Claim 44 depends). In his remarks, Katz stated that "support for the 'accounting' distinction may be found, for example, at page 34, lines 11-21 of the present specification," which corresponds to the passage in the specifications upon which the defendants rely. The Court concludes that this statement by Katz in no way limits the term "accounting data" to only callers' scores during a television game show format, as evidenced by his use of
the phrase "for example."

The claim language and the specification makes it clear that a caller's score in a television game show format is accounting data, but it only one example of accounting data, not the term's definition. Based on the foregoing, the Court construes the term "accounting data" in accordance with its ordinary, common meaning to mean: information relating to a computation of data.

3. "Accumulating" (claim 1)

The parties agree that the ordinary meaning of "accumulating" is gathering or amassing. The parties disagree as to whether "accumulating" refers to gathering or amassing more than one thing. TriPath argues that it can include only one thing, while Cytyc contends that it requires more than one.

The claims and the specification offer few clues as to the correct construction. "Accumulating" appears only once in the entire patent, and that is in claim 1(d). However, there is sufficient intrinsic evidence to suggest that "accumulating" should be construed as gathering one or more things.

The preamble of claim 1 and the specification support the broader definition of "accumulating." Read together, the preamble and claim 1(d) provide: "[a] method of determining whether a slide processing system has suitably processed a biological specimen slide comprising the steps of . . . (d) accumulating scan processing error flags." 327 patent at col. 8, 11. 38-40. n11 Accumulating error flags is part of the process for determining whether the system properly processed a slide.

Cytyc argues that the object of the word "accumulating" is the plural term "error flags." This weighs in favor of gathering more than one thing. Cytyc also notes that claims 1(b) and (c) use the term "at least one" to refer to machine processing effectiveness parameters. If the patentee intended "accumulating" to include just one error flag, claim 1(d) could have read "accumulating at least one scan processing error flag."

Although persuasive in the abstract, these arguments do not make sense in the context of the preamble and the specification. In other words, the narrower construction does not "naturally align" with the patent's description of the invention. See Phillips, 415 F.3d at 1316 (quoting Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998)). "Ultimately, the interpretation to be given to a term can only be determined and confirmed with a full understanding of what the inventors actually invented and intended to envelop with the claim." Id. Here, the invention gathers error flags, however few there may be, to indicate whether a slide is suitable for processing. Thus, "accumulating" may encompass one or more error flags.

n11 As discussed earlier, the claims are not independent of the preamble.

n12 This construction comports with the understanding of a person skilled in the art. TriPath's expert witness, Dr. Peter Bartels, testified that "accumulating" could mean gathering only one thing. Cytyc/Callahan Decl. Ex. 76 (Deposition of Dr.
Peter Bartels at 209). He explained that if one starts with nothing and adds one thing, this is "accumulating." Id. at 210. He noted that accumulating just one thing is an "extreme case of the definition" and may not be the common meaning, but it is how a mathematician would understand it. Id. From this testimony, Cytyc argues that defining accumulating as gathering just one thing is an extreme, and therefore, incorrect construction. However, the benchmark for claim construction is not the understanding of a layperson, but that of "a person of ordinary skill in the art in question at the time of the invention." Phillips, 415 F.3d at 1313.

6. "Accumulating"

The plaintiff argues that this term does not need further construction. In the alternative, the plaintiff proposes "increasing in number or quantity." The defendant proposes "increasing gradually in quantity or number." The dispute is whether "accumulating" must be done "gradually."

Although the defendant cites to a dictionary in support of its proposed construction, the court concludes that in the context of this patent, the term "accumulate" means "to increase in quantity or number." The court, therefore, adopts the plaintiff's construction.

- "accumulating a count of bytes of data" is construed to mean "maintaining a count of bytes of data." Lucent contends that this term, coupled with the phrase "arriving at a node per interval" means "maintaining a count of bytes that have arrived at a node over a period of time." (D.I. 396 at 6.) Defendants contend that this term should be construed to mean "maintaining an increasing count of bytes." (D.I. 395 at 15; D.I. 385 at 12.) In support of their contention, Defendants point to places in the specification where the COUNT parameter is first set to zero ('810 patent at 6:49-51) and then incremented (Id. at 7:12-15).

The Court finds that both of these references are found in a preferred embodiment of the invention and ignore the fact that the value of COUNT is also decremented. See id. at 7:22-29. After reviewing the claim language and the specification, the Court concludes that there is nothing in the claim language or specification suggesting that an increasing count must be maintained. Accordingly, in the Court's view, the Court's construction is consistent with the plain language of the claim and the patent's specification.

- "accumulating a count of bytes of data arriving at a node per interval" is construed to mean maintaining a count of bytes that have arrived at a node over a period of time. Newbridge contends that this term should be limited to a count that maintains the total number of bytes arriving at a node. After reviewing the claim language and the specification, the Court concludes that there is nothing in the claim language or specification suggesting that a total count must be maintained. Rather, the claim language uses the article "a" before the word "count," suggesting that the count is not limited to a total number, but is kept open. In addition, the specification explains that the count is used to compare the traffic from a particular user's bandwidth against the user's subscribed bandwidth to determine whether the user is exceeding his or her subscription. (810 Patent, col. 5, ll. 36-53, col. 6, ll. 10-20). To this effect, the count does not even accumulate all the bytes of data arriving at the node. Indeed, the count does not accumulate the bytes of data arriving in marked packets, because these packets are outside the traffic contract. (810 Patent, col. 8, ll. 16-18). Thus, the bytes of data accumulated by the count described in step (a) of Claim 12 are akin to a subset of the data arriving at any given node, and not a total count. Accordingly, in the Court's view, its construction is consistent with the plain language of the claim and the Patent's specification.
Accumulating the payments until a predetermined amount is reached

Plaintiff asserts that the phrase "accumulating the payments until a predetermined amount is reached" should be construed as "holding a payment or payments until a predetermined monetary amount is reached." Defendants agree with the ending of Plaintiff's proposed construction "... until a predetermined monetary amount is reached." However, Defendants assert that the construction should start with "accumulating the payments ..." rather than "holding a payment or payments..." as proposed by Plaintiff.

The claim term itself expressly uses "payments" in the plural. This requires that there must be more than one payment, and that more than one payment, i.e., at least two payments, have to be accumulated. Thus, Defendants are correct that more than a single payment must be held, and the Court construes the phrase "accumulating the payments until a predetermined amount is reached" as "accumulating the payments until a predetermined monetary amount is reached."

14. "Accumulator"

The plaintiff argues that this term does not need further construction. In the alternative, the plaintiff proposes "a system, device or program that performs the operation of accumulating." The defendant proposes "a register used for logic or arithmetic to accumulate a sum."

The defendant cites to the Microsoft Computer Dictionary in support of its proposed construction. The plaintiff disputes the propriety of the "register" limitation.

Claim 31, in relevant part, states "an accumulator associated with the computer, coupled to the memory and to the processor, and structures to . . . ." An "accumulator," therefore, is not a program, but is a device that can be coupled to the memory and to the processor. The court construes the term to mean "a device that performs the operation of accumulating."
value in a register which may be modified depending upon arithmetic operations.

In the '442 Patent, the inventors use the word "accumulator" to refer both to a register and a value in a register:

(2c) step (d)(i) is thereafter performed as follows:

(i) if said symbol is of said first type, said step of multiplying said value in said accumulator by said positive integer power of said digital quantity includes multiplying said accumulator value by itself, where said accumulator contains a positive integer power of said digital quantity . . .

('442 Patent, Col. 11:51-57.) In the above excerpt from Claim 2, the word "accumulator" refers to an apparatus, i.e., a register, and the phrase "accumulator value" refers to a value in the apparatus.

In the written description of the '442 Patent, the inventors use the phrases "accumulator R" and "the accumulator steps:"

Here, y_{sub.13} denotes bit i of y such that y_{sub.-- 0} is the least significant bit and y_{(k-1)} is the most significant bit. In standard exponent encoding conventions, a "0" bit specifies a squaring (i.e., multiplication of accumulator R by itself) while a "1" bit specifies squaring followed by a multiplication (of accumulator R by base x).

* * *

In this case, the accumulator steps updating R in the modular exponentiation loop would perform two squaring (mod n) operations, followed by a multiplication (mod n) with one of the table values: x 0 for a "00" bit pair (or "0" in base 4); x 1 for a "01" bit pair (or "1" in base 4); x 2 for a "10" bit pair (or "2" in base 4); and x 3 for a "11" bit pair (or "3" in base 4).

* * *

It will also be understood by one skilled in the art that various combinations of the variations discussed here can be used in connection with the invention. For example and without limitation, the operation-based encoding schemes may be combined with the bit windowing techniques using k-ary modular exponentiation where each nonzero exponent digit could represent a power of x, while zero digits could represent squaring operations. For example, as stated above, a "1" digit denotes simple multiplication of the result accumulator by the value x (i.e., by exponentiation of x to the power 1). Similarly, a "2" digit (if used) denotes multiplication x 2 mod n, and so forth. In one embodiment of the invention, a table of pointers may be employed to indicate the value of the bit. For example, the first entry (offset zero) could be a pointer to the result accumulator R (for squaring operations), the entry at offset 1 could point to x (i.e., x_1), the entry at offset 2 (if used) could point to the precomputed value x 2 mod n, and the entry at offset 3 (if used) could point to the precomputed value x 3 mod n. The powers of x may be precomputed at the beginning of the modular exponentiation operation; even so, the performance benefit obtained by reducing the number of multiplication operations during the modular exponentiation generally more than compensates for the precomputation time. Note that x 0 (equivalent to multiplication by 1) is not used; all steps involve multiplication with a number larger than 1 because "0" digits in the encoding represent multiplication by R.

('442 Patent, Col. 4:26-32; 51-56; Col. 7:64-8:23.) One of ordinary skill would understand the phrase "accumulator R" to refer to a value. The phrase "the accumulator steps" refers to operations on a value.

The Court declines to adopt the parties' stipulation defining "accumulator" as a "memory location." Although a register may be a memory location; a memory location is not a register. 2 In addition, the Court declines to adopt the parties' stipulated definition, "variable." A "variable" is commonly understood to be a value which can change as a program executes. See Microsoft Computer Dictionary, 547 (5th ed. 2002). Thus, while an "accumulator value" might be a variable, an "accumulator" is not a variable.

--- Footnotes ---

2 To define "accumulator" as a "memory location" might cause confusion with other devices such as "random access memory," or "memory cell," or "memory address," all of which might be called a "memory location."

--- End Footnotes ---

- 506 -
The Court construes the word "accumulator," as it is used in the phrase, "loading an accumulator with a positive integer power of said digital quantity," as follows: a register used in arithmetic operations.

1. "means under control of the accumulator . . . including . . . vend selection means" (1[b])

(i) Claim Construction

Mars has asked the Court to construe the claim term "accumulator" as a term in means-plus-function format, which would require looking to the specification for a description of the accumulator's structure. According to 35 U.S.C. § 112, paragraph 6, a claim element "may be expressed as a means . . . for performing a specified function without the recital of structure." Where a claim describes a means for a function without stating the structure associated with the means, "such claim shall be construed to cover the corresponding structure . . . in the specification . . . ." Id. This allows a patentee to draft a claim using generic language describing the means to perform a particular function, "provided that [the patentee] discloses specific structure(s) corresponding to that means in the patent specification." Kemco Sales, Inc. v. Control Papers Co., Inc., 208 F.3d 1352, 1360 (Fed. Cir. 2000); Mass. Inst. of Tech. & Elecs. for Imaging, Inc. v. Abacus Software, 462 F.3d 1344, 1361 (Fed. Cir. 2006); Chiuminatta Concrete Concepts, Inc. v. Cardinal Indus., Inc., 145 F.3d 1303, 1307-08 (Fed. Cir. 1998) ("the 'means' term in a means-plus-function limitation is essentially a generic reference for the corresponding structure disclosed in the specification."). Without a disclosure of adequate structure in the specification, the claim must be rendered invalid as indefinite. Mass. Inst., 462 F.3d at 1361; Kemco, 208 F.3d at 1360-61.

(a) Use of the word "means" triggers the presumption of a means-plus-function analysis of the term "accumulator" in claim 1

Generally, "[t]he use of the word 'means' 'triggers a presumption that the inventor used this term advisedly to invoke the statutory mandate for means-plus-function clauses." Allen Eng'g Corp. v. Bartell Indus., Inc., 299 F.3d 1336, 1347 (Fed. Cir. 2002) (citation omitted); see also Kemco, 208 F.3d at 1361 ("Use of the term 'means' in a claim limitation creates a presumption that 35 U.S.C. section 112, paragraph 6 has been invoked . . . "). A party may rebut this presumption either by (1) showing that the claim element describing "means" does not recite a function corresponding to the means, or (2) by finding sufficient structure within the claim for performing the function. Allen, 299 F.3d, 1347; Kemco, 208 F.3d at 1361.

(1) The claim term "accumulator" in claim 1 does recite a function

Determination of function for a means-plus-function element is a claim construction issue decided as a matter of law. Chiuminatta, 145 F.3d at 1308. In this case, the "accumulator means" and "means to accumulate" of claim 1 recite the function of accumulating "the amount of credit entered in the coin unit during each vending operation," and then producing an output "whenever an amount accumulated at least equals the amount of a selected vend price." '903 Patent col. 8, lines 26-30. n14

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

n14 The specification supports this interpretation of the accumulator's function of price comparison, explaining that "the output of the accumulator 56 on lead 65" is one of the inputs required to create a vend condition. '903 Patent col. 3, lines 60-63. See generally Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

(2) The language of claim 1 does not give a structure for the claim term "accumulator"

Because the function of the accumulator means is well expressed within the claim language, the remaining issue for a determination of whether or not the accumulator means should be construed according to section 112, paragraph 6, is whether these means also recite sufficient definite structure within the language of the claims themselves for producing
these functions. Determination of this structure is also a matter of claim construction. Id.

Coinco points to Cole v. Kimberly-Clark Corp., 102 F.3d 524 (Fed. Cir. 1996), as one example of a case where a court held that a claim element describing a "means" itself recited sufficient structure for performing the stated function. Cole discussed a patent with a claim employing "perforation means . . . for tearing." Id. at 531. Because the accused infringing product did not possess true perforations but instead used bonded seams capable of tearing, the plaintiff in Cole desired to have "perforation means" construed by the court as a means-plus-function element in order to claim infringement via additional embodiments described in the patent's specification. Id. The Federal Circuit rejected the plaintiff's arguments because the claim element recited the structure of perforations to perform the tearing function. Id. at 531. In addition, the claim detailed the location and extent of these perforations. Id. Thus, Cole held that the defendant had shown sufficient definite structure to rebut the presumption of applying 35 U.S.C. § 112, paragraph 6 to "perforation means." n15

n15 Cole also held that the "perforation means" could not apply to stitched seams because of estoppel arising from the prosecution history of the patent. Cole, 102 F.3d at 531-32.

Just as Cole held that a claim with "perforation means" recites sufficient structure so as to avoid the means-plus-function presumption, Coinco asks the Court to also hold that "accumulator means" and "means to accumulate" within the claims of the '903 Patent recite sufficient definite structure to avoid the presumption. Besides the word "accumulator" itself, the only structural descriptions of an accumulator within claim 1 of the patent are that the accumulator has an input and an output, both of which fit within the invention's general structure. The claim language gives no guidance for how the accumulator should keep a record of total money deposited, and how it should compare that total to the "selected vend price." '903 Patent col. 8, lines 20-54. This contrasts with Cole, where the claim language specified the means to perform the tearing function with a detailed structure which included perforations extending from the leg band to the waist band and through an outer impermeable layer. Cole, 102 F.3d at 531. Unlike the "perforations" in Cole, the word "accumulator" by itself describes a function with no associated structure. n16

n16 As in Allen and Cole, the drafter of the '903 patent "was clearly enamored of the word 'means.'" Cole, 102 F.3d at 531; Allen, 299 F.3d at 1348. Although this drafting style may provide some evidence to rebut the presumption created by the presence or absence of the word "means," the most important evidence for or against a finding of a means-plus-function limitation comes from the presence or absence of sufficient definite structure in the claim language.

Where Mars has specifically alleged -- as with the term "accumulator means" -- that a particular use of the word "means" requires an examination into whether function and structure exist, the Court has engaged in a full claim construction analysis. However, in light of Allen and Cole's holding regarding patent drafters enamored of the word "means," the Court declines Mars' invitation to do a full means-plus-function analysis of every other use of the word "means" within the '903 Patent, and gives Coinco the benefit of the doubt regarding those "means" terms not specifically discussed in this Opinion. Without more specific allegations relating to claim construction or invalidity as to all other "means" terms within the '903 Patent, the Court cannot appropriately engage in this analysis.

Further evidence that claim 1(b) does not recite a definite structure for the accumulator comes from the trial testimony of Mr. Upchurch regarding infringement. During his testimony, Mr. Upchurch attempted to use the language of claim 1 to show structural similarity with the inputs and outputs of the U1 microprocessor on Mars' control board. (Tr. vol. 30, 97-99.) However, when he compared the accumulation activity described in claim 1 with the U1 microprocessor, Mr Upchurch's testimony referred only to the function of accumulation within the patent, and did not discuss any supporting structure within the claim language itself which allowed the accumulation to take place. (Tr. vol. 30, 99-100.) The Court would have expected Mr. Upchurch to make some comparison to the structure of the accumulator using the language of claim 1, if such a structure existed within the language of the claim. Because Mr. Upchurch, Coinco's expert witness on infringement, did
not even attempt to reference the language of claim 1 to find a structure for the accumulator, the Court is further persuaded that no such structure exists within the language of the claim itself.

"What is important is not simply that a [term] is defined in terms of what it does, but that the term, as the name for structure, has a reasonably well understood meaning in the art." Greenberg v. Ethicon Endo-Surgery, 91 F.3d 1580, 1583 (Fed. Cir. 1996); see also Watts v. XL Sys., 232 F.3d 877, 880 (Fed. Cir. 2000). Coinco has not convinced the Court that the general term "accumulator" on its own describes sufficient structure for an individual skilled in the art to understand the claim. There was no testimony from Coinco relating the level of ordinary skill to the knowledge required to understand the structure of an accumulator. During his testimony, Mr. Upchurch discussed U.S. Patent No. 3,687,255, which the '903 Patent's specification described as containing an accumulator that could be used in one embodiment of the '903 Patent. (Tr. vol. 34, 138-41.) In the '255 patent, element 14 is labeled "Forward Back Accumulator." '255 Patent Fig.1. Although the '255 Patent appears to refer to this element alone as the accumulator, Mr. Upchurch testified that the accumulator means in claim 1 of the '903 Patent included more than just the Forward Back Accumulator element. (Tr. vol. 34, 138-39.) Because the '903 Patent and the '255 Patent use the word "accumulator" to refer to different types of structures with different purposes, the court must conclude that individuals with ordinary skill in the art at the time of the invention would differ in their understanding of the structure that an "accumulator" requires.

n17 Reference to other patents does more harm than good to Coinco's case because there is little consistency between the structures of the elements marked as accumulators within the various patents submitted as evidence to the Court. For example, the Court notes that the Forward Back Accumulator element 14 in the '255 patent does not perform price comparison, and that any individual skilled in the art would likely realize the necessity of additional elements. Price comparison in the '255 Patent is performed by Price Control elements 28 and 30, which operate based upon outputs from the Forward Back Accumulator. However, the claim language of the '903 Patent uses only the word "accumulator." Many of the patents described as containing accumulators within the '903 Patent's specification appear to separate accumulation and price comparison into different elements. In light of this distinction and the testimony of both Mr. Upchurch and Dr. Morley that the element labeled "Forward Back Accumulator" in the '255 Patent would not satisfy the accumulator described in the '903 Patent, the court cannot find that the word "accumulator" on its own recites sufficient structure so that a person of ordinary skill in the art would understand the structure without further description. (See Tr. vol. 34, 51-58, 104, 115.) There is no basis in the evidence for Coinco's broad assertion that "to someone skilled in the art an 'accumulator means' represents any electromechanical device or electronic circuit . . . ." (Coin Acceptors, Inc.'s Supplemental Memorandum of Law Regarding Coinco Patent Issues ("Coinco's Supp."), at 10.)

The Court reaches this conclusion -- that the word "accumulator" does not have a well defined structure -- in contrast to a recent case which construed the word "scanner" as containing limitations even though "the specification [did] not define the term 'scanner' either explicitly or implicitly." Mass. Inst., 462 F.3d at 1351. The Mass. Inst. court did not construe "scanner" as a means-plus-function term, as the Court does for the word "accumulator." Additionally, Coinco has not convinced the Court that an individual of ordinary skill in the art would have understood the meaning of "accumulator" in light of the claims and the specification of the '903 Patent.

(b) The term "accumulator" in claim 11 is also a means-plus-function term despite lack of the word "means"

The accumulator described in claim 11 also satisfies the requirements for a means-plus-function element. Although the language of claim 11 does not use the word "means" in reference to the accumulator, the requirements of 35 U.S.C. § 112, paragraph 6 still apply. "[A]bsence of the word 'means' creates a presumption that 35 U.S.C. section 112, paragraph 6 has not been invoked," but this presumption may be rebutted if the claim limitation is determined not to recite sufficiently definite structure to perform the claimed function. Kemco, 208 F.3d at 1361. Generally, "the same terms appearing in different portions of the claims should be given the same meaning unless it is clear from the specification and prosecution history that the terms have different meanings at different portions of the claims." Fin Control Sys. Pty. Ltd. v. OAM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). The accumulator described in claim 11 is quite similar to the accumulator described in claim 1. n18 Just as in claim 1, the accumulator must have an input "responsive to outputs produced . . . when coins are deposited to accumulate the value thereof," and must also be capable of "producing an accumulator output signal whenever
the amount accumulated therein at least equals the price of a selected vend." '903 Patent col. 9, line 44 - col. 10, line 14. Because claim 11 also does not recite any structure to perform these functions, the term "accumulator" in claim 11 must also be construed as a means-plus-function element. n19

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
n18 There is no suggestion made that the '903 Patent intended to use the word "accumulator" differently in claims 1 and 11.

n19 The accumulator in claim 11 must also include "means to control the refunding of amounts deposited in excess of the vend price of a selected product." This requirement adds another function to the accumulator without a defined structure within the claim. The specification gives a limited structural description of how this should take place. '903 Patent Fig.1; col. 4, lines 51-54; col. 5, lines 17-22; col. 7, lines 44-53.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

(C) The specification of the '903 Patent provides a structure for the term "accumulator"

"After a court establishes that a means-plus-function limitation is at issue, it must then construe the function recited in that claim and determine what structures have been disclosed in the specification that correspond to the means for performing that function." Kemco, 208 F.3d at 1361; Chiuminatta, 145 F.3d at 1308. The "accumulator means" limitation must be "defined by the corresponding structure, material, or acts described in the patent specification, or their equivalents . . . ." WMS Gaming, 184 F.3d at 1348. Figure 1 of the patent describes a single-price embodiment where all products to be vended share the same price. The specification describes the accumulator's structure in the single-price embodiment as follows:

'903 Patent col. 3, lines 17-23. In addition, the specification states that

[t]he accumulator-change maker circuit 56 can have many different forms as stated and should be able to accumulate amounts deposited or otherwise entered and should be able to make change for deposits in excess of a selected vend price. The form of circuit selected for the circuit 56 is not part of this invention. n20

'903 Patent col. 4, lines 22-27.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
n20 Although the text of the specification indicates that the accumulator element itself adds nothing new to the art of vending machine circuits, the accumulator element is a required portion of any circuit based upon claims 1 and 11.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Figure 6 describes a dual-price embodiment where each product in the vending machine may have one of two prices. The accumulator in this embodiment is a "dual changer or accumulator circuit" which "may be similar to that shown in Johnson U.S. Pat. No. 3,687,255 and which has one of its inputs connected to a cash or credit acceptor circuit 152." '903 Patent col. 6, lines 59-62. The two different price lines in this dual-price embodiment each have their own selection monitor, and each of those selection monitors has a separate connection to the dual changer or accumulator element. Figure 6 also shows two separate outputs from the dual changer or accumulator, each of which connects to an OR gate connected to the escrow element and also back to the product selection switches, which appear intended to provide the high-power current. '903 Patent col. 6, line 59 - col. 7, line 39.

An examination of the accumulator means requires the Court to decide how broadly to interpret the structures and patents given as examples for an "accumulator" within the specification. "When multiple embodiments in the specification
correspond to the claimed function, proper application of § 112, paragraph 6 generally reads the claim element to embrace each of those embodiments." Micro Chem., Inc. v. Great Plains Chem. Co., 194 F.3d 1250, 1258 (Fed. Cir. 1999); see also Versa Corp. v. Ag-Bag Int'l Ltd., 392 F.3d 1325, 1329 (Fed. Cir. 2004). For the single-price embodiment, the specification reveals certain patents as providing the structure for the accumulator means. The specification also advises that the accumulator "is not part of this invention," and that it "can have many different forms." Similarly, the specification broadens the structure of the dual-price (or multi-price) embodiment beyond the '255 Patent by including language that the structure "may be similar" to the accumulator in the '255 Patent. However, "[w]hile the use of means-plus-function language in a claim is clearly permissible by reason of section 112(6), a means clause does not cover every means for performing the specified function." Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1536 (Fed. Cir. 1991) (emphasis in original); see also NOMOS Corp. v. BrainLAB USA, Inc., 357 F.3d 1364, 1368 (Fed. Cir. 2004). A court should not define the structure to include any possible means for performing the designated function, even where the specification lacks disclosure of the structure. WMS Gaming Inc. v. Int'l Game Tech., 184 F.3d at 1348 (refusing to apply a broad definition of structure to "means for assigning" even where the patent was "almost completely devoid of any structure to support this limitation of the claim); see also Source Search Techs., LLC v. Lending Tree, LLC, 2006 U.S. Dist. LEXIS 79651, at *27-*35 (D.N.J. 2006) (unpublished opinion) (quoting WMS Gaming). Thus, regardless of the language in the specification that the accumulator "can have many different forms," the Court construes "accumulator" to include only the structures in those patents disclosed within the specification and equivalents of those structures. NOMOS, 357 F.3d at 1369.

Coinco argues that the court should apply a broad interpretation to the structure of the accumulator. Although the Court believes that it would have been possible to draft the claims to encompass a broader definition of the term "accumulator," the actual language used by the '903 Patent prevents the Court from accepting the broad interpretation urged by Coinco. Instead, the language of the '903 Patent requires the Court to adopt a much narrower construction; therefore, the word "accumulator" includes only the structures in those patents disclosed within the specification and equivalents of those structures.

L) "act as an intermediary between"

The court agrees with 01 Communique that this phrase requires no construction.

1. Acting as a router to recognize and forward to and from end systems user data packets which conform to a first protocol suite and acting as a bridge to recognize and forward between networks user data packets which conform to at least a second protocol suite (claim 1)

Plaintiffs Construction:

. acting as a router. . .: This term is indefinite. Alternatively, it means the device must perform all the functions of a router, including when forwarding user data packets to and from end systems which conform to a first predefined protocol suite. The decision to act as a router depends on the device identifying the protocol suite of the user data packets.

. acting as a bridge . . .: This term is indefinite. To the extent the term can be defined, it means the device must perform all functions of a bridge, including when forwarding user data packets between networks which conform to a second predefined protocol suite. The decision to act as a bridge depends on the device identifying the protocol suite of the user data packets.

Defendant's Construction:

. acting as a router. . .: Performing certain functions and operations typically associated with a router to recognize and forward to and from end systems user data which conform to a first protocol suite.
Although the parties identified a handful of disputed terms regarding the '727 patent in their briefs, they discussed only "acting as a router" and "acting as a bridge" at the claim construction hearing. From that discussion, it appears that the rest of the disputed terms in the '727 patent rise and fall with these two.

The parties focused on two issues: (1) whether "acting as" a bridge or a router means that the device must perform all the functions of such a device; and (2) whether the invention must determine which protocol suite is at issue before deciding whether to act as a router or a bridge.

I do not find persuasive plaintiff's argument that "acting as" means "performing all the functions of." As a general matter one thing may "act as" another thing without behaving in exactly the same manner in all respects. Defendant gave the example of a person who may "act as" a lawyer without simultaneously conducting an oral argument, writing a brief and drafting a contract. Similarly, a babysitter may "act as" a child's guardian while the parents are away but this does not mean that the babysitter assumes the functions of saving for the child's college tuition. As an inanimate example, a pile of books may "act as" a stool even though the books do not possess all the qualities that one would normally associate with a stool.

Plaintiff made a valid point during the hearing that it is not enough that the device act as a router or a bridge in any random manner. It must act as those devices in a manner that satisfies the requirements of the patent. To some extent, the manner in which the device must act as a router or bridge is already specified in the claim itself. With respect to "acting as a router," the device must emulate a router in a manner that allows it "to recognize and forward to and from end systems user data packets which conform to a first protocol suite." With respect to "acting as a bridge," the device must be able "to recognize and forward between networks user data packets which conform to at least a second protocol suite."

At the hearing, plaintiff emphasized that "acting as" a router must mean that the device operates on the network layer and that "acting as" a bridge must mean that the device operates on the data link layer because these are the defining functions of bridges and routers. Defendant did not deny this. In fact, it included these functions in its proposed constructions of "bridge" and "router." Accordingly, I will incorporate those functions into the court's construction: "acting as a router" means "operating at the network layer to forward a message" and "acting as a bridge" means "operating at the data link layer to forward a message."

The second issue disputed by the parties is more complicated but is even more easily resolved. Plaintiff wishes to include an additional sentence in both of its constructions: "The decision to act as a [router or bridge] depends on the device identifying the protocol suite of the user data packets." In other words, plaintiff argues that the device cannot decide whether to act as a bridge or a router until it has identified whether it is dealing with a "first protocol suite" or a "second protocol suite." (The parties agree that a "protocol suite" is "a comprehensive set of protocols that is designed to work together to coherently provide complete communication capabilities." The patent provides the examples of TCP/IP packets as one type of protocol suite and OSI packets as another kind of protocol suite.) Despite the substantial amount of time at the claim construction hearing plaintiff devoted to this issue, it never identified the language in the claim that was the basis for its construction. Obviously, this is a fatal deficiency; plaintiff is not entitled to a "claim" construction that has no basis in the claim. I will not add plaintiff's proposed additional sentence to the constructions.

IV. THE DISPUTED CLAIM TERM

"Acting on the data representing text identified as hostile in order to prevent an attack." Found in '976 patent, claim 7.

The "gateway system" of claim 7 is described as comprising:

2. "an intrusion detection system coupled to the firewall . . ." 10:35; and

3. "acting on the data representing text identified as hostile in order to prevent an attack . . ." 10:43-44.

Deep Nines contends no construction is necessary. Secure argues that claim 7 is indefinite because the third limitation, which begins with the term in dispute, consists of a method step in an apparatus claim, thus impermissibly mixing more than one class of patentable subject matter.

Claim 7 is a system claim and may not include a method step.

A patent claim that covers both an apparatus and a method of using that apparatus is indefinite under 35 U.S.C. § 112, ¶ 2. IPXL Holdings, L.L.C. v. Amazon.com, Inc., 430 F.3d 1377, 1384 (Fed. Cir. 2005). However, "apparatus claims are not necessarily indefinite for using functional language," even where the claim is not in means-plus-function format.2 Microprocessor Enhancement Corp. v. Texas Instruments, Inc., 520 F.3d 1367, 1375 (Fed. Cir. 2008) (citing K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1363 (Fed. Cir. 1999) (where functional language was analyzed as an additional limitation to an apparatus claim for an in-line skate)).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

2 Neither Deep Nines nor Secure argues that this claim term is a means-plus-function limitation.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - 

In Microprocessor, the court indicated that the key question might be whether the limitation is directed to using the claimed apparatus (meaning it is a method step) or whether the limitation is instead a functional description of certain features of the claimed apparatus (meaning it is not a method step). See 520 F.3d at 1374. In that case, the apparatus claim "was clearly limited to a pipelined processor possessing the recited structure and capable of performing the recited functions," and was therefore not indefinite. Id. at 1375 (emphasis in original).

It is undisputed that claim 7 is an apparatus or system claim, not a method claim. See, e.g., '976 patent, claim7, 10:30-31 ("A gateway system for detecting attacks on a network, comprising . . ."); claim 8, 10:51 ("The system recited in claim 7 . . . ."). More specifically, claim 7 describes a system comprised of three elements:

A gateway system for detecting attacks on a network comprising:

a firewall for receiving data . . .; 

an intrusion detection system coupled to the firewall . . .; and

acting on the data representing text identified as hostile in order to prevent an attack . . ." '976 patent, 10:30-50.

Grammatically, the third element of claim 7 is a separate step.

The third element of the claim describes an action—"acting on the data . . ." The question is whether this is an impermissible method step, or merely a functional limitation on the IDS described in the second element of the claim. The court begins by analyzing the grammar and punctuation because, although those responsible for drafting important documents can make mistakes, one begins with the modest expectation that the words of a claim say what the author wanted them to say. See, e.g., SuperGuide Corp. v. DirecTV Enters., Inc., 358 F.3d 870, 885 (Fed. Cir. 2004) (citing William Strunk, Jr. & E.B. White, The Elements of Style (4thed. 2000) to support a grammatical interpretation); Credle v. Bond, 25 F.3d 1566, 1571-72 (Fed. Cir. 1994). Use of a colon following "comprising"and semicolons following each separate paragraph denotes separation of distinct items in a series. Bryan Garner, The Redbook: A Manual on Legal Style 14 (2d ed. 2006).

There is no basis to ignore the grammatical construction and instead read the term as a functional limitation.
Deep Nines now argues that the patentee intended for the "acting on" step to be subsumed in the second claim limitation, which relates to the IDS. That is not how the claim reads. Deep Nines nevertheless suggests that a person of ordinary skill in the art would understand that the only structure performing the "acting on the data" function is the IDS in item 2 above ("an intrusion detection system coupled to the firewall . . . ."). Therefore, "acting on the data" would be understood as a functional limitation of the IDS.

While a general rule is that, if possible, a construction should be chosen that preserves a claim's validity, the rule applies only if the court concludes, after applying all available claim construction tools, that the claim is ambiguous. Phillips, 415 F.3d at 1327. Courts do not redraft a claim with a plain meaning to make it valid or operable. Id. For example, a plainly written claim would not be reworded just because it achieved the absurd result of burnt dough. See Chef America, Inc. v. Lamb-Weston, Inc., 358 F.3d 1371, 1374 (Fed. Cir. 2004)

This is not a case involving obvious typographical errors such as missing letters or punctuation. Claim 7 could be considered ambiguous only if the person of ordinary skill in the art is assumed to ignore standard rules of grammar and punctuation when interpreting a claim. In claim 12, which is stated to be a method claim, the patentee used the same colon and semi-colon structure to list "acting on the data representing text identified as hostile . . . ." as one of the method steps. '976 patent, 10:66-11:31. On the other hand, claim 13, which describes a "system," uses a colon after comprising, but does not use a semi-colon to set off the "acting on data representing text . . . ." term as a separate element. '976 patent, 12:1-29.

Further, the prosecution history does not support Deep Nines's attempt to give a strained interpretation to a claim that is plain when standard rules of grammar are applied. Deep Nines copied claims of McAfee's '122 patent to provoke an interference. Tr. at 16:21-25. Some of the language of the equivalent claim in the '122 patent is deleted in Deep Nines's claim. Compare '122 patent, claim 7, 8:10-31 with '976 patent, claim 7, 10:35:50; see also May 17, 2000 Second Preliminary Amendment, Def. Cl. Const. Br., Ex. 6, 15-17 [Doc. # 112]. Had the '122 patent, claim 7's deleted language ("the intrusion detection system further capable of identifying the data representing text as hostile based on the comparison, and acting on the data representing text . . . .") been included in the final clause of the '976 patent, claim 7, it would have been clear, as it is in the '976 patent, claim 13, that "acting on the data" was a function of the IDS. Without that language, and given claim 7's punctuation, the "acting on the data" clause in claim 7 is a separate method step rather than a functional limitation.

The patentee did not attempt to act as her own lexicographer, using the specification to provide a clear special meaning for a claim term. The specification describes at least two different ways that the "acting on the data" step can be performed. One is at '976 patent,5:18-22:

This in turn activates communication interface 224 to gateway router 13 to instruct the router to perform some action to choke down operation that will begin to limit the flooding operation to help solve the red line situation.

Compare this example with the one described at '976 patent, 4:12-18:

If a problem exists, detection/notification server 21 sends a command via modem 16 to modem 17 to configuration server 22 to instruct server 22 to perform an action with respect to gateway router 13. This action serves to address the attack by choking down the offending volume . . . .

In the latter example, the IDS (labeled as "Detection/Notification Server 21" in Figs. 1 and 2, and described at 4:12-13, 44) sends a command to the configuration server 22, which "performs an action with respect to gateway router 13."

In the first example, the router 13 performs an action. In the second, server 22 “performs an action with respect to gateway router 13.” Even assuming this means that server 22 sends an instruction and router 13 takes an action, in both cases something other than the IDS is what is "acting on the data."

Although Deep Nines contends that the actions in both examples begin with a command from the IDS, a statement that the IDS sends a command to another component that causes it to take some action to choke off the data is not the same as unambiguously stating that the IDS itself is "acting on the data." The specification does not clearly instruct one of ordinary skill that, in all cases, the IDS is acting on the data. To the contrary, the specification indicates that the "acting on the data" step might be performed by something other than the IDS.
Correction of term by court is not justified

The court may act to correct an error in the patent where no certificate of correction has been issued if: "(1) the correction is not subject to reasonable debate based on consideration of the claim language and the specification and (2) the prosecution history does not suggest a different interpretation of the claims." Novo Indus. L.P. v. Micro Molds Corp., 350 F.3d 1348, 1354 (Fed. Cir. 2003). To the extent that Deep Nines would have the court correct the claim's punctuation and wording to make it similar to claim 13—where the "acting on the data" step is subsumed under the IDS element—the preceding discussion, and the patentee's choice to delete certain language in the copied '122 patent claims, strongly suggest a different interpretation of claim 7.

Here, the claim term "acting on the data representing text identified as hostile in order to prevent an attack" consists of a method step in an apparatus claim. This impermissibly mixes more than one class of patentable subject matter and fails to define for the person of ordinary skill in the art what the scope of the claim is. This claim term is therefore indefinite.

1. To Activate

Activate is defined as "to make active …" WEBSTER'S at 13. Webster's defines "active" as "(10) marked by present operation, transaction, movement or use [as in] an [active] account." Id. Claim 12 refers specifically to the activation of an account. Fiala's proposed construction is "to make active and usable by the consumer." (Pl. Brief at 20.) SVS suggests the definition "to make operational." (Def. Slide 24.) The text of Fiala's proposed definition demonstrates that the phrase "usable by the consumer" is an addition to the plain meaning of "active."

In addition, the patent specification anticipates a situation in which the data-encoded cards can be activated and made usable by individuals other than the consumer, namely thieves. See, e.g., U.S. Patent No. 5,918,909, Column 5:30-34, 6:7-14, 18:45-53. It is clear, then, that "usable by the consumer" is not a definitional element of the word "activate." In the context of claim 12, SVS's definition coincides with the meaning that would be given to the term by an ordinary person skilled in the art. The court defines "to activate" as: "to make operational."

A. "repeatedly substantially simultaneously activating"

Each of the asserted claims of TDS's '481 and '561 patents includes the limitation, "repeatedly substantially simultaneously activating." 1 The district court construed this limitation as follows:

The term repeatedly means "repeating" in its ordinary sense, and that the repetitions be fast enough such that the composite color is actually perceived by the viewer. The term substantially, simultaneously activating means that during some portion of this period (defined as repeatedly), the two separate lights are on at the same time.

that the activation of each light begin at substantially the same time. According to Telegenix, the district court improperly separated the adverbs "substantially simultaneously" from the verb it modifies, "activating," and thereby failed to require that the light emitting diodes ("LEDs") must be activated, or turned on, at the same time.

According to TDS, the crucial word in the phrase is "repeatedly," which would signal to one of skill in the art that the invention activates light sources repeatedly within the "refreshing period" or "repetition period" within which humans do not detect pulses due to the principle of "persistence of vision." TDS argues that because one of skill in the art would understand that the claim refers to simultaneously activating light sources of different colors at some time during that critical repetition/refreshing period, and because humans cannot detect changes, pulses, or activations that occur within that period, the question of whether one begins activation of the LEDs at the exact same time or whether one simply ensures that both of the LEDs are on at some time during the repetition period is irrelevant. Thus, according to TDS, one of skill in the art would not interpret the claim term "repeatedly substantially simultaneously activating the light sources" to limit the starting point of the LED activations.

The district court correctly construed the term "repeatedly." However, the district court's construction of the overall phrase "repeatedly substantially simultaneously activating" was in error and ignored the meaning of the term "activating." We begin by ascertaining the ordinary meaning to one skilled in the art. See Specialty Composites, 845 F.2d at 986, 6 USPQ2d at 1604. According to a relevant technical dictionary, to activate is "to start an operation, usually by application of an appropriate enabling signal." Modern Dictionary of Electronics 20 (6th ed. 1984). We presume that the word used in a claim carries this ordinary meaning, but this presumption may be rebutted. See CCS Fitness, 288 F.3d at 1366, 62 USPQ2d at 1662. Here, the intrinsic evidence is entirely consistent with the dictionary definition, and there is nothing in the record to suggest that "activating" means other than what its dictionary definition would suggest, i.e., starting the operation or turning on. We conclude that the presumption has not been rebutted, and thus the ordinary meaning controls.

TDS has argued that "activating" can mean "being on." Certainly, once activated, a lamp might accurately be described as "being on." But the claim does not refer to the state of the lamps as being "substantially simultaneously activated." The words used, which serve as the focus of the claim construction analysis, call for "substantially simultaneously activating" the lamps, and the ordinary meaning of that phrase requires that during some portion of the period defined as "repeatedly," the two separate lights are turned on at the same or nearly the same time.

The controller increases the number of the activity counter and increases the activity counter and the controller activates the activity counter

Defendants argue these terms cannot be construed since "activity counter" cannot be construed. As the Court has construed "activity counter," the Court disagrees. Typically, one assumes that different terms used in claims have different meanings. Nystrom v. TREX Co., 424 F.3d 1136, 1143 (Fed. Cir. 2005). These terms are an exception to that general rule as the inventor used the terms interchangeably. The inventor used "the controller increases the number of the activity counter" in independent claim 7 and "increases the activity counter" in dependent claim 8. In claim 7, upon receiving a triggering signal, in the first mode, the controller "activates the camera mechanism" and, in the second mode, the controller "increases the number of the activity counter and does not activate the camera mechanism." In claim 8, in the first mode, the controller "activates the camera mechanism and increases the activity counter." This appears to be a shortened way of saying "increases the number of the activity counter" since it is contrasted with claim 7, in which the number of the activity counter must be increased in the second mode but not in the first. Additionally, the specification uses the phrases "increase the activity counter by one" and "increase the activity counter" interchangeably. Col. 8:20-20, 26, 27, 33-34. Thus, these terms both mean "increases the number of the activity counter." No further construction of the terms are necessary since the Court has already construed "activity counter."

"The controller activates the activity counter" is used in claims 23 and 26. This term is used in the limitations that distinguish the first and second operating modes. See cols. 14:57-64, 15:11-19; see also claim 7 at col. 13:19-26 (using "the controller increases the number of the activity counter" in the same context). In the first mode, the controller activates the camera mechanism when it receives a triggering signal from the motion detector. In the second mode, the controller activates the activity counter but does not activate the camera mechanism. See also col. 8:23-26 (describing the two modes).
The parties agree that the term "the controller activates the camera mechanism," used in claims 23 and 26, means "the controller causes the camera mechanism to take a picture." Thus, in this context, Defendants agree that "activates the camera mechanism" does not mean to turn the camera mechanism on, but rather it means that the camera mechanism performs its inherent function-taking pictures. Similarly, "the controller activates the activity counter" does not mean that the activity counter is turned on or enabled to operate, but instead means that the activity counter performs its inherent function-counting triggering activities. Thus, the Court construes "the controller activates the activity counter" as "the controller increases the number of the activity counter."

8. "Activation information." Used in '768 patent, Claims 1, 3, 5, 7, 9, and 11.

For "activation information" TGIP proposed "data transferred or received in connection with the activation of an account." The Defendants suggest "information including the security number communicated during activation of the calling card account."

Both these definitions are somewhat circular, each using "activation" as part of the definition of "activation information." The claims disclose that "activation information is transferred to the host computer. '768 patent Reexam. Cert, col. 1, 11. 21-26. With the variable dollar amount accounts this might just be the calling card account number and the dollar amount purchased. See '768 patent Reexam. Cert, col. 1, 11. 35-37; '768 patent Reexam Cert, col. 1, 11. 66 - col. 2, 1. 7; '768 patent, col. 5, 11. 64 - col. 6, 1. 13. Because the data terminals can transmit and receive data, there is no reason the host computer can not select a password (the access information), associate it with the account and the dollar amount and send to the data terminal, to be given to the customer. For example, after the host computer receives the dollar amount the customer wants, it could select a password from a list, associate it with that account, and send it to the data terminal, which would print that number out on paper or even on the card itself See '768 patent, col. 6, 11. 1-12 (describing data terminal transmitting a message to the operator of the data terminal).

There is no absolute requirement for the "access information" to be transmitted to the host computer during initial activation. The court will define this term as follows:

"Activation Information" means "the data transmitted that initially makes it possible to associate a dollar amount with a particular calling card account."

11. "active area"

"Active area" appears in claims 3 and 4 of the 229 patent and claims 3, 4, 5, 6, 24 and 25 of the 148 patent. MoSys and TSMC assert that "active area" is defined as "[t]he area where the claimed select transistor and the trench capacitor are formed, that area being bounded by the edges of the field oxide layer." Jt Cl Const, Ex B at 1. UniRAM contends that the active area is the "area bounded by the field oxide layer." Id.

The court adopts UniRAM's construction because it is simpler and more accurately reflects the disclosed embodiments. For example, one problem with MoSys and TSMC's definition is that the specification does not clearly delineate the select transistor gate's boundary. The specification states, "[T]he poly silicon word lines 1606 define the gates of the select transistors ** *." 229 patent at 20:12-14. But Figure 15(c) shows these word lines traveling both in the active area 1502 and in the field oxide 1504. Because the specification never limits the gates to the active area, the select transistor gate could spill into the field oxide, making MoSys and TSMC's definition inaccurate.

More importantly, the complexity of MoSys and TSMC's construction is unnecessary, because the specification defines active area clearly and in concise terms: "The first step is to define active area 1502, and grow isolation field oxide 1504 to separate those [sic] active area ** *." Id at 19:50-52. And in seven of the eight claims in which active area appears, it is as
"active area isolated and defined by edges of a field oxide layer," "active area isolated by a field oxide," "active area isolated by said field oxide" or "active area isolated as an enclosed area by said field [sic] oxide." Id at 26:16-17, 26:22-23 (claims 3 and 4); 148 patent at 25:55, 25:64-65, 26:9-10, 28:20-21, 28:26-27 (claims 3, 4, 5, 24 and 25). UniRAM's proposed construction captures this meaning better than MoSys and TSMC's construction.

To assist in the analysis, the relevant portion of the first claim of each patent is set out with these terms in bold:

Claim 1 from the '114 patent:

at least one data terminal located at a predetermined location remote from the host computer and connectable to the input port for associating, at the host computer, an amount of call authorization to a security number of a calling card using data transmitted between the data terminal and the host computer during one or more charging transactions, the means for associating of the data terminal including:

means for entering the security number;

means, operative during any initial transaction and any recharge transaction, for entering any monetary amount corresponding to the amount of call authorization;

means for connecting to the host computer to transfer the security number and the call authorization amount; and

means responsive to the transfer for receiving a verification message from the host computer authorizing receipt of the monetary amount to thereby associate at the host computer the call authorization amount to the security number, wherein the calling card does not store the call authorization amount; and

wherein the database includes a record for each calling card security number having a call authorization amount associated therewith, the record including a balance; and

Claim 1 from the '68 patent:

activating the particular pre-paid calling card account in the database of prepaid [sic] calling card accounts in response to receipt of the activation information by associating an active call authorization amount with the particular pre-paid calling card account;

for each pre-paid calling card account that is activated, maintaining in the database information sufficient to identify: (i) a date on which the particular pre-paid calling card account is activated, (ii) a particular point-of-sale location at which the particular pre-paid calling card account is activated, and (iii) the active call authorization amount that was associated with the particular pre-paid calling card account when activated on said date and from said point-of-sale location;

At the hearing the parties agreed generally that:

1. The "data terminal" is the terminal at which the calling card is swiped or data is otherwise entered at the point of sale
where the customer obtains the card or recharges the card. Tr. p. 13-14; and

The parties also agreed that, at a minimum, the three terms in dispute describe variable amounts selected by the customer. The real question is whether these terms can also be defined as including a pre-set amount, say $ 5.00 or $ 10.00. Tr. p. 11-13, p. 34-35. TGIP says they can. Tr. p. 21. The Defendants argue they can not. Tr. p. 22.

TGIP points, among other things, to '114 patent col. 2, 11. 52-54, which describes using a keypad at the point of sale or recharge "for entering any monetary amount corresponding to an amount of call authorization associated with a particular calling card . . . ." TGIP also relies upon its request for reexamination of the '768 patent in which it stated that "[a]n active call authorization amount means a call amount that is then useful for obtaining the call service . . . . a call authorization amount (albeit inactive) may be associated with the account prior to the user purchasing the calling card account because the calling card account is not associated with an 'active call authorization amount' until an active, or usable, amount is joined with the account . . . ." Request for Reexamination, 7/6/2000, p. 3, Ex. E to TGIP's Opening Claim Construction Brief [Doc. # 200, Attachment # 5, p. 3 of 24]. Additionally, during the reexamination process, the Board of Patent Appeals stated that claim limitations of an "active call authorization amount" "do not require (but do not exclude) point-of-sale activation of varying call amounts . . . . The active call authorization amounts could be a limited number of predetermined values as in the prior art." See Board of Patent Appeals Decision of 9/26/2003, Ex. H, p. 11 to TGIP's Opening Claim Construction Brief [Doc. # 200, Attachment # 8, pp. 11 of 31].

The court does not discount TGIP's statement in reexamination proceedings out of hand, but recognizes that it was submitted to the PTO after some years of disputes concerning the patents. The court must be careful about allowing statements made during a reexamination to enlarge the patent's scope, or to recapture scope which had been earlier surrendered when limiting arguments made to obtain the patent have not been retracted and brought to the attention of the new examiner. See Creo Prods. v. Presstek, Inc., 305 F.3d 1337, 1344 (Fed. Cir. 2002); Hakim v. Cannon Avent Group, PLC,-- F.3d --, 2007 U.S. App. LEXIS 3926, 2007 WL 542697, *3 (Fed. Cir. 2007). This would seem especially true when the statement in question was peripheral to the issues being addressed by the examiner and the Board of Appeals.

Of course, TGIP also relies upon the familiar cannons of construction that a patent is defined by its claims, that claims should be given their full scope, and that limitations should not be imported from descriptions of preferred embodiments.

Defendants rely heavily upon statements in the specification such as: "The present invention relates to . . . activation and recharging of calling cards in customer defined amounts." '114 patent, col.1., 11. 6-9. Defendants also argue that TGIP disavowed all cards issued in fixed or pre-set amounts pointing to statements distinguishing prior art such as: "The most significant drawback is the requirement that pre-paid calling cards be issued in fixed or preset amounts." '114 patent, col. 1, 11. 46-48, and '768 patent, col. 1, 11. 51-53. See Astrazeneca AB v. Mut. Pharm. Co., 384 F.3d 1333, 1340 (Fed. Cir. 2004).

It appears to the court that nothing in the claim language itself eliminates all cards with a pre-set amount. n3 The first use of the disputed phrase is in Claim 1 of the ' 114 patent: "associating, at the host computer, an amount of call authorization to a security number of a calling card . . . ." '114 patent, col. 6, 11. 14-16. In Claim 1 of the '768 patent Reexamination Certificate ("Reexam Cert") we see: "activating the particular pre-paid calling card account in the database of prepaid [sic] calling card accounts in response to receipt of the activation information by associating an active call authorization amount with the particular pre-paid calling card account." '768 patent Reexam Cert, col. 1,11.33-37. The statements in the specification and prosecution history of each patent establish that the intent was to go beyond the previous fixed limit card, but they do not eliminate the possibility that what is claimed is a new system which describes: (1) an "open ended" card (or one with a high upper limit) so the customer picks any amount (or any amount less than the high limit); and (2) a card with an amount preprinted on the card, or alternatively two or more amounts, one of which must be selected by the customer.

- - - - - - - - - Footnotes - - - - - - - - -

n3 The record contains a much more detailed exposition on this issue, including the responses of the parties to various hypotheticals. See Tr. pp. 10-60.
Whether the claim language can be defined as including this second type of card is the real dispute. See Tr. p. 11-13. Both patents use the indefinite article "an" when referring to the call authorization amount or the amount of call authorization. The specification describes an embodiment in which there is "an amount of call authorization associated with a particular calling card . . . ." '114 patent, col. 2, 11. 53-54. The court concludes that the claim language describes at least some types of cards with a pre-printed amount, or perhaps a limited choice of amounts. To this extent, "call authorization amount" and "active call authorization" simply mean a monetary amount assigned to the card or account.

But the analysis does not end there. Two systems or scenarios for use of cards with pre-set dollar amounts are technically feasible. Tr. p. 16-18, 42.

Scenario 1: Cards of say $ 5.00 or $ 10.00, etc., where the security number is pre-associated with that amount at the host computer, but the card is not valid until it is "swiped" at the point of sale so the host computer knows it is activated. (In other words the host computer database already "knows" the security number of the card, and the amount of the card, and all that is needed is to validate or activate the card.)

Scenario 2: Cards of say $ 5.00 or $ 10.00 etc., where a security number is not associated with a particular card or amount until the card is swiped. This could include a card with a limited number of choices available, say a choice between $ 5.00, $ 10.00, or $ 15.00. (In other words the host computer database has a list of security numbers, and when a card is activated at the data terminal amount printed on the card is associated with one of those security numbers.)

Comparing these scenarios illuminates the importance of the term "associating" and illustrates why it must be construed in conjunction with the three terms originally submitted. n4

n4 Of course, with a "variable" or pure "customer choice" card, no dollar amount can be associated with a security number until the customer selects an amount and activates or recharges the card for that amount. As noted, the parties do not dispute that the patent terms define this type of transaction.

Claim 1 of the '114 patent states that as part of the system there is a host computer with an input port, and a data terminal "connectible to the input port for associating, at the host computer an amount of call authorization to a security number of a calling card . . . ." '114 patent, col. 6, 11. 13-16 (emphasis added). Similarly, Claim 1 of the '768 patent describes a method in which calling card account in the database is activated "by associating an active call authorization amount with the particular pre-paid calling card account." '768 patent Reexam Cert, col. 1, 11. 35-37 (emphasis added).

"Associating" is an active verb, which must mean something. If, as TGIP argues, cards could have a preset amount printed and coded on the card, along with that card's identifying or security number, then what is left to associate by the host computer or the data terminal? After Claim 1 of original application for the '114 patent had been rejected as obvious in light of two earlier patents, the applicant stated:

Claim 1 has been amended to further emphasize several of the above-identified features and concepts that are neither described nor obtained by Schilling, taken by itself or in combination with Kamil . . . For example, Claim 1 now describes . . . . The data terminal is now described as the device in the system which is used to associate an amount of call authorization to a security number of a calling card using the data transmitted between the terminal and the host computer.

Amendment to First Office Action, 5/18/1995, p. 8 (Bates No. TGIP 006428), Ex. 7 to Defendants' Responsive Brief [Doc. # 207, Attachment # 7, p. 9 of 11].

To define the terms at issue so broadly as to encompass the system of scenario 1 above, would simply ignore this statement to the PTO, and would define "authorizing" as simply meaning "validating." The prosecution history makes it clear that such a construction was rejected by the PTO. n5 The court will define these related terms as follows:
"Call authorization amount" as used in the '114 patent, Claims 1, 6, and 7, and "amount of call authorization" as used in the '114 patent, Claims 1 and 6, mean: "a monetary amount to be used to pay for call service."

"Associating, at the host computer, an amount of call authorization to a security number" as used in the '114 patent Claims 1 and 6, means that as part of the activation process, and not before, the amount of call authorization is linked in the host computer database to a security number for that card.

"Active call authorization amount" as used in the '768 patent, Claims 1-3, and 5-11 means: "a monetary amount to be used to pay for call service."

"Associating an active call authorization amount with the particular pre-paid calling card account" as used in the '768 patent, Claims 1-3, and 5-11, means that as part of the activation process, and not before, the active call authorization amount is linked in the remote location database, to the pre-paid calling card account.

--- Footnotes ---

n5 TGIP tries to get around the statements it made to the PTO to obtain approval of the patent by now arguing that the security number (or other card identifier) and the monetary amount could be combined on the card but not really be "associated" until transmitted to the host computer or database. This is just a fancy way of saying "validating."

--- End Footnotes ---

TGIP points out in its Supplemental Claim Construction Brief ("Supp. Br."), Claim 7 of the '114 patent does not include the term "associating." See TGIP's Supp. Br., p. 2 [Doc. # 229-1, p. 3 of 12]. Claim 7 was added during prosecution after Claim 1 was rejected. See TGIP's Supp. Br., p. 2 [Doc. # 229-1, p. 3 of 12]. After explaining (as set out above) that amended Claim 1 could be distinguished from Schilling and Kamil, because the data terminal associated an amount of call authorization to a security number of a calling card using the data transmitted between the terminal and the host computer, the patentee stated to the PTO:

Independent Claim 7 is directed to a system wherein a "plurality of data terminals" are used to provide the on-site card activation capability. For the reasons set forth above with respect to Claim 1, Claim 7 is also patentable.

Amendment to First Office Action, 5/18/1995, p. 9 (Bates No. TGIP 006429), Ex. 7 to Defendants' Responsive Brief [Doc. # 207, Attachment # 7, p. 10 of 11] (emphasis added). However, the effect of these statements to the PTO on the interpretation of Claim 7 is not before the court at this time.

6. Active Relationship

Trilogy contends that the term "active relationship" is used to describe "a relationship that is presently in effect." Selectica contends that a relationship is "active" when all parts on the left-hand side of the relationship are included in the configuration and all the parts on the right hand side of the relationship have been evaluated according to their classifications during the configuration.

Trilogy acknowledges that one portion of the specification supports Selectica's proposed construction. The specification provides that "a relationship is active when all of the items on the left-hand of the relationship are selected. A relationship is inactive until all of the parts on the left-hand side of the relationship are selected." 651 patent, col. 12, ll. 40-43. Trilogy urges, however, that the passage in the specification should be read as describing only features of the preferred embodiment, and that the claim language (construed with regard to the doctrine of claim differentiation) supports a broader construction. Specifically, Trilogy contends that claim 3 recites the limitation of "determining whether a relationship in said set of relationships is active." Claim 4 depends from claim 3, and recites "the method of claim 3 wherein said step of determining whether a relationship is active further comprises the step of determining whether the elements specified in the left-hand
"Activity counter" terms

Activity counter

Defendants contend that prior-art motion-detector cameras included "event counters" to count each event detected by the motion detector. According to Defendants, "event counter" had acquired an established meaning in the art. Although the "event counter" did not display the number of events, many cameras included a means for the user to view the number of events counted. Defendants argue that the term "activity counter" cannot be construed because one skilled in the art cannot determine whether the "activity counter" performs the counting function (like the known "event counter") and the display function or whether the activity counter only performs the display function and does not perform the counting function.

Although the change in nomenclature may be slightly confusing, it is not fatal. The specification and claims make clear that the activity counter counts and displays the number of triggering signals sent by the motion detector to the controller.

The specification summarily describes one embodiment of the invention as having an "activity counter" activated by the controller when a triggering activity occurs. Col. 1:48-50. Embodiments of the invention may include a display, and that display may be an LCD display. Cols. 4:17-20, 5:25. The display may show the number of exposures taken by the camera, the power level, a film count, or other information. Cols. 4:17-20, 5:25. The display can also be used as an activity counter displaying the number of triggering activities sensed by the motion sensor. Col. 8:17-19. In that situation, "controller 901 can increase the activity counter by one when motion detector 906 is triggered and sends a triggering signal to the controller." Col. 8:20-22.

In one operating mode, when a triggering activity occurs, the controller sends a signal to the activity counter, the activity counter increases, and no picture is taken. Col. 8:25-26. In another operating mode, the activity counter can increase and the camera can take a picture. Col. 8:23-26. The activity counter can also continue to increase after the camera runs out of film. Col. 8:27-29. "In one example, the controller goes into the activity counting mode automatically when the camera runs out of film." Col. 8:39-41.

In claims 5 and 21, the activity counter is programmable to display at least a predetermined number of triggering events detected by the motion detector. Cols. 12:64-67, 14:33-35. In claims 7 and 8, the activity counter is mounted to the housing, displays the number of triggering signals, and the number of the activity counter is increased by the controller when the controller receives a triggering signal. Col. 13:16-17, 23-26, 27-30. In claims 23, 24, and 26, the activity counter is mounted to the housing, and the controller activates the activity counter when the controller receives a triggering signal. Col. 14:55, 61-64.

Generally, a term should be given the same meaning throughout the patent. Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322, 1328 (Fed. Cir. 2006) (citing Phillips, 415 F.3d at 1314). The general role of the activity counter is described in claim 7: "the activity counter for displaying a number of triggering signals." Col. 13:16-17. Although the activity counter's purpose is described in claim 7, the activity counter is actually first mentioned in dependant claim 5, where an additional limitation is placed on the activity counter: "an activity counter which is programmable to display at least a predetermined number of triggering events detected by the motion detector." Col. 12:64-67. Claim 21 also includes this limitation. Col. 14:33-35. The other claims that include the activity counter-claims 8 (dependent on 7), 23, and 26-do not contain any further description of the function or nature of the activity counter. Therefore, the generalized description in claim 7—for displaying a number of triggering signals—is logically read to apply to all other mentions of activity counter. Thus, throughout the claims, the activity counter displays a number of triggering signals.

The patent also teaches that the controller can activate the activity counter when it receives a triggering signal from the motion detector. See claim 5 at col. 12:65-67; claim 21 at col. 14:33-35 ("programmable to display . . . number of triggering
81

7. "actuating"

Claim 1 of the '571 Patent discloses self-test means for "actuating the maintenance indicator if a malfunctioning component is identified." Philips asserts that "actuating" should be construed as "mechanically moving the maintenance indicator to identify a malfunction." Cardiac Science contends that "actuating" means "activating."

The dictionary defines "actuate" as "to put into mechanical action or motion"; and "to move to action." Merriam-Webster's Collegiate Dictionary, supra, at 13. The maintenance indicator of the '571 Patent is "switched to its maintenance required state by processor 74 if faults are identified during the lid closed self-test." ('571 Patent at c. 7, ll: 15-17.) The Court finds that Philips' construction attempts to import the commercial embodiment of the '571 Patent into the claim construction. But neither the specification nor the claim language limits the term "actuating" to a "mechanical" movement of the maintenance indicator when a malfunction is identified. The Court finds that in the context of the '571 Patent, the term "actuating" should be construed as "activating or putting into motion."

82

F) The claimed data communication facility being "adapted to created and send a communication that include a then current dynamic public IP address (publicly addressable) or dynamic LAN IP address (publicly un-addressable) or the personal computer"

Citrix largely changed its construction of this claim in its brief from what it proposed to 01 Communique. Therefore the court chooses to ignore Citrix's newly submitted construction, instead adopting that of 01 Communique. Therefore the court adopts the proposed construction to mean, "The claimed data communication facility has the ability to create and send a communication that includes the current dynamic IP address of the personal computer. This dynamic IP address may be publicly addressable or unaddressable."

83

4. "means for synchronizing the propelling of said balls with said moving image, wherein said programmable controller is adapted to initiate the display of said video image and initiate a countdown upon detecting that said wheels have reached a predetermined speed and the power head has assumed a predetermined horizontal and angular position"

The parties' fourth dispute concerns the clause "means for synchronizing the propelling of said balls with said moving image, wherein said programmable controller is adapted to initiate the display of said video image and initiate a countdown upon detecting that said wheels have reached a predetermined speed and the power head has assumed a predetermined horizontal and angular position." This clause appears in Claim 22 of the '134 Patent. The focus of the parties' dispute with respect to the clause is the language "adapted to initiate the display of said video image and initiate a countdown." Joyner argues that this clause should be construed to mean that "[t]he initiation of the video and the countdown timer must be simultaneous." Joyner's Amended Motion for Markman Construction of Asserted Claims (docket no. 165-1), at 2; see also JACCC (docket no. 174), at 13 (citing '134 Patent, fig. 15 & col. 18, l. 23 through col. 19, l. 13). Joyner does not offer much argument or evidence in support of this construction, however, but simply states that "[i]n context of the specification, which explains how the countdown timer is used to synchronize the video, no reasonable reader could be confused on this point." Joyner's
Amended Brief on Markman Construction of Asserted Claims (docket no. 165-2), at 8. ProBatter responds that nothing in the claims or the specification requires that the initiation of the display of the video image and the initiation of the countdown occur simultaneously and, as a consequence, Joyner is attempting to insert a limitation into the clause that does not exist.

14 At the Hearing, counsel for Joyner appeared to concede that the clause did not require simultaneity and argued for a construction of the claim that would require "near simultaneity." Further, in the JACCC, which was filed after the Hearing, Joyner replaced simultaneity and near simultaneity with an "immediately upon" construction. It is unclear whether ProBatter would object to such a construction. Because Joyner did not brief this argument, however, the court considers Joyner's ever-shifting claim constructions to be waived.

The court declines to adopt Joyner's construction of the clause. Nothing in the intrinsic evidence indicates that the initiation of the display of the video image and the initiation of the countdown must occur simultaneously. Instructing the jury that simultaneity is required would be error.

Cf. Omega Eng'g, 334 F.3d at 1329-30 ("[T]here is no ground for adding a 'sequential' limitation or for excluding the concept of simultaneity. In sum, we reject the [district court's] imposition of a 'sequential' limitation to the function of claims 16 and 18, because that restriction finds no support in the intrinsic evidence.").

I. "Contact arrays being adapted to interchangeably connect"

Foxconn maintains that the district court correctly interpreted the claim limitation "contact arrays being adapted to interchangeably connect" as requiring a contact array that was not present in the prior art. Foxconn asserts that the word "adapted" includes the concept of adjustment or modification of the array known to the prior art such that there must be something different from the prior art. The district court opined that a device which uses preexisting contact arrays does not contain "contact arrays being adapted."

We disagree. There is nothing in either patent to indicate that the claims require a novel contact array. Nowhere in the written description does either patent state that the disclosed contact array is novel or has been specifically adapted from prior art contact arrays. Rather, the written description simply describes the contact array as a pin terminal array that can accept either a memory card or a hard disk drive. We decline to find that the claims require a novel contact array when the only contact array that is disclosed in the written description is not novel.

The patentee's use of the claim term "adapted to" does not change our conclusion. The term "adapted to" is often used in claim drafting to indicate "capable of." There is nothing in the claims, written description, or prosecution history to indicate a different meaning. That a claim element is old does not prevent a claim to a combination from being infringed.

Foxconn asserts that when Berg added the "adapted to" language to overcome the Tarver prior art reference, Berg added the additional limitation of a novel contact array. Tarver teaches a housing used to assemble a complete mini-computer. The Tarver device has spaces for accepting submodules such as a central processing unit, a fan, or a hard disk drive and a midplane member comprising connectors. The patent states that one type of connector is a 32-pin contact array.

During prosecution, Berg stated that although "Tarver appears to show upper and lower storage spaces within a single housing, Tarver never suggests that the upper and lower storage spaces be combined to form a single, larger storage space for accommodating larger submodules. . . . None of Tarver's submodules is designed to occupy more than a single sub-space within the housing" while the applicant's connector device is specifically designed to accept either memory cards in either the upper or lower storage space or both or a single hard disk drive package occupying both spaces.

Berg also stated that Tarver does not teach applicant's claimed feature "wherein 'at least one of [the] upper and lower contact arrays [is] adapted to interchangeably connect to both a memory card and a hard disk drive package.' To the contrary, the 'midplane' of Tarver provides a separate connector for each submodule. None of the connectors of Tarver is capable of interchangeably connecting to two different types of submodules."
We do not read the interchangeable capability of the contact array asserted by Berg during prosecution as requiring a new contact array that has never existed in the prior art. Rather, the capability simply requires a contact array that is selected so that it is connectable to both a memory card and a hard disk drive, so that the connector can receive those memory storage devices in the spaces that the structure of the connector defines to receive them. It is both the structure defining those spaces and the contact array selected to receive both of those devices that give the claimed combination the alternative capability that the Examiner found to be nonobvious.

Foxconn further asserts that we cannot adopt the patentee's claim interpretation because under that interpretation, the claims are invalid as anticipated by the Tarver reference. However, validity of the claim is not at issue on appeal and has not been fully briefed before us. The patentee has urged adoption of its claim interpretation and bears the risk that the claim may later be found invalid.

Thus, we conclude that the term "contact arrays adapted to interchangeably connect" requires contact arrays that are able to interchangeably connect to both a memory card and a hard disk drive package. Because the Foxconn device contains a contact array that is able to interchangeably connect to both a memory card and a hard disk drive package, the district court erred in finding the Foxconn device fails to meet this claim limitation.

This conclusion, however, does not end our analysis. Foxconn additionally asserts that the district court's finding of noninfringement should also be affirmed because its device lacks a storage space that is substantially uninterrupted by a guide member, as required by the claims.

B. Does the court's construction of the claim term "adapted to supplement" means that there is a requirement that a "real live" node actually be augmented

Claim 15 recites, in relevant part:

A network interface for interfacing a network having nodes and for supplementing the nodes of the network … wherein said network interface is adapted to supplement a node selected from said nodes by adding at least one supplemental format to the format set of said selected node.

830 patent, col. 12: 62-13: 24. The court construed the above "wherein" phrase in two parts. The court first found that the claim term "adapted to supplement" means the claimed network interface must be capable of supplementing a node; there is no requirement that it actually supplements the node. Thus, "an interface is adapted to supplement if its use can create a supplemented node." 830 Markman, 172 F. Supp. 2d 478, 2001 WL 1388437 at *31. The court then went on to construe the second portion of the phrase and found that "to supplement a node selected from said nodes by adding said at least one supplemented format to the format set of said selected node" means that the node that the network interface is capable of supplementing may be supplemented either by adding at least one supplemented format to the format set of an existing node or by adding at least one supplemented format to the format set of a previously connected networked node that is subsequently reconnected to the network through the claimed network interface card. Id. With respect to this second portion of the disputed phrase, the key claim construction dispute in the briefing concerned whether the network interface could supplement a node by adding a new node or whether it had to add a format to an already existing node. Based on the limiting language, "selected from said nodes," the court construed that portion of the phrase to mean that the node had to be connected to the communication medium at some time (either an existing node or a node that was previously connected and then re-connected using the network interface card). Taken together, the complete construction of the phrase is that the claimed network interface must be capable of supplementing either by adding a format to an existing node or adding a format to a node that was previously connected and then re-connected using the network interface card. Some of Broadcom's questions of witnesses indicates that it has focused only on the second part of the court's construction of this phrase and thus understands the phrase in claim 15 to mean that the network interface must actually be placed into a network in order to read onto the claims. This erroneously ignores the court's construction of the "adapted to supplement" language. As the court stated in its '830 Markman opinion, based on that claim language, in order to satisfy claim 15, the network interface only must be capable of supplementing, or augmenting, a node.
XV. "An adapter"

The term "an adapter" appears in claims 9 and 10 of the '925 patent.

A. The Parties' Proposed Constructions

Black & Decker argues that the term "an adapter" means "a structure to accommodate different batteries." Bosch counters that the term means "a device for connecting parts that will not otherwise mate, so as to transform the contact configuration of a battery pack from a different manufacturer to fit in a socket."

B. The Court's Construction

At the Markman hearing, Bosch's counsel indicated that it could drop from its proposed construction the requirement that the battery pack be "from a different manufacturer." Black & Decker agrees with the first portion of Bosch's proposed construction -- "a device for connecting parts that will not otherwise mate." Black & Decker, however, argues that Bosch's proposed limitation -- "so as to transform the contact configuration of a battery pack to fit in a socket" -- improperly limits the term "adapter." Black & Decker contends that the specification discloses two embodiments of an adapter: (1) a device that mates with batteries from different manufacturers; and (2) a device that accommodates battery packs with different voltages. Therefore, according to Black & Decker, Bosch's proposed construction is too narrow because it does not cover a device that accommodates battery packs with different voltages. The Court disagrees that the term "adapter" is so broad. The portion of the specification relied on by Black & Decker ('059 patent, col. 4, ll. 55-64) for supporting an adapter that accommodates battery packs with different voltages plainly provides for a DC/DC converter to change the voltage from the batteries, not the adapter. That portion of the specification teaches that the adapter 61 mates with the six contacts on socket 70 in order to match the requirements of particular battery pack 60. ('059 patent, col. 4, ll. 58-60.) It then continues to disclose a DC/DC converter. (Id. at col. 4, ll. 61-64.) Black & Decker concedes that the use of DC/DC converters is a preferred embodiment of a "power correction circuit" that changes the electrical energy flowing to or from a battery pack. Accordingly, with respect to this embodiment relied on by Black & Decker, it is the DC/DC converter 68 that accommodates voltage of different voltages, and not the adapter 61. Therefore, the specification only discloses an adapter that mates with batteries with different contact configurations. (Id. at col. 4, ll. 34-39; ll. 57-60.)

Black & Decker also relies on the doctrine of claim differentiation in arguing for a construction of "adapter" broader than the one proposed by Bosch. Claim 12 of the '925 patent requires a "means to permit use of battery packs lower or higher than the nominal operating voltage to be used by said radio, said means comprising a socket having a plurality of contacts mating with an adapter matching predetermined requirements of a DC source power battery pack, and a double pole single throw on/off switch controlling a DC/DC power source converter for supplying power to said radio." ('059 patent, col. 8, ll.36-35.) This claim language does not further limit the claimed adapter. Rather, it merely provides that an adapter is part of the claimed "means to permit use of battery packs lower or higher than the nominal operating voltage." The means also includes a DC/DC power source converter, which, as discussed above, is the portion of the "means" that converts the voltage. Nothing in this claim language requires that the "adapter" do anything other than accommodate batteries with different contact configurations. Accordingly, the Court does not find support in the intrinsic record for Black & Decker's broad construction of adapter and construes "adapter" as "a device for transforming the contact configuration of a battery pack so as to connect parts that will not otherwise mate. n15"

n15 The Court slightly varies Bosch's proposed construction to remove the requirement of a "socket." The Court does not find any support in the intrinsic record for incorporating the requirement of that additional structure into the plain claim language.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -
(iv) . . . **an adapter** connected to said parallel data bus, said data storage units and said correction bit storage unit for, in response to a storage request, (i) generating an error correction code for each data word, (ii) dividing each data word into a plurality of multi-bit portions, and (iii) transmitting said multi-bit portions and error correction code to respective data storage units and said correction bit storage unit for storage.

The last limitation appears easy to interpret on its face. Taken literally, it means that the system includes an adapter (elsewhere referred to as a controller), which is connected to three things: the parallel data bus (the multiple-wire conduit over which the data travels through the system), the data storage devices, and the correction bit storage unit. When the adapter receives a request to store new data, it causes three things to happen. First, it generates an error correction code for each data word that needs to be stored. Second, it divides the data word into two or more multi-bit portions (i.e., it "stripes" the data). Last, it sends the multi-bit portions and the associated error correction codes to their respective storage units.

IBM asks this Court to take a much less straightforward approach. It argues that this limitation ought to be construed in accordance with Section 112, para. 6 of the Patent Law, because it is a "means-plus-function" claim. I disagree with IBM and decline to impose means-plus-function status on this limitation.

We start from the proposition that a claim is presumptively not a means-plus-function claim when it does not use the talismanic words "means for . . ." See Personalized Media Communications Inc., L.L.C. v. Int'l Trade Comm'n, 161 F.3d 696, 703-04 (Fed. Cir. 1998). Of course, that is a rebuttable presumption, and IBM cites the Court to cases in which the Federal Circuit or a district court construed a claim that lacked the words "means plus." See, e.g., Mas-Hamilton Group, Inc. v. LaGard, Inc., 156 F.3d 1206, 1214 (Fed. Cir. 1998); Raytheon Co. v. Roper Corp., 724 F.2d 951, 957 (Fed. Cir. 1983).

IBM argues that limitation (iv) qualifies as a means-plus-function claim because it discloses nothing more than the function performed (an adapter that does x, y and z) rather than disclosing any structure. TM, supported by a greater number of cases, urges me to find that this limitation discloses enough structure, in addition to the functions performed, to keep the claim within the presumption.

To a neophyte like myself, this special wrinkle to the means-plus-function doctrine is particularly perplexing. TM correctly calls my attention to cases in which the following limitations have been held not to state means plus function claims: Personalized Media, 161 F.3d at 704-05 (finding that "digital detector" could not be construed as means-plus-function limitation; "detector" is not a generic structural term, but rather had well-known meaning to those skilled in the art); Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) (Section 112 para. 6 could not apply to "detent mechanism" simply because claim took its name from function; "detent" had well understood meaning in the art); Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996) (no means-plus-function treatment where claim described both structure and location); Hay & Forage Indus. v. New Holland North America, Inc., 25 F. Supp. 2d 1170, 1175 (D. Kan. 1998) ("steering structure" did not state means-plus-function claim because structure was not a structure connected between junction box and tongue); MediaCom Corp. v. Rates Technology, Inc., 4 F. Supp. 2d 17, 27 (D. Mass 1998) ("switch jack" did not state means-plus-function claim where structure named and described as connected to adjacent structure). This last example is particularly difficult to understand, since the claim actually uses the "means plus" language. IBM responds that, in MediaCom, although the switch term was held not to be a means-plus-function, the construction of the term "switch jack" was nevertheless informed by the structure of the switch as described in the specification. See MediaCom, 4 F. Supp. 2d at 27. IBM also notes that (1) in Ethicon, the Federal Circuit emphasized that it was not suggesting that paragraph 6 is triggered only if the word "means" is used; (2) the digital detector patent in Personalized Media, unlike the one in this case, included numerous embodiments; and (3) the Hay & Forage case has not been reviewed by the Federal Circuit.

--- Footnotes ---

8 Of course, just as the presumption of means-plus-function treatment for claims using means plus language is rebuttable, so also the converse: any presumption that the failure to use means plus language takes one out of the scope of Section 112, para. 6 can also be overcome.

--- End Footnotes ---
IBM's clarifications notwithstanding, the examples cited by TM fairly support an argument that the claim in suit here is not a means-plus-function claim. The claim does not simply state "any means for performing functions x, y, and z." Rather, it discloses the use of an adapter (which TM asserts would connote a well-defined structure to persons of ordinary skill in the art), in a particular electronic configuration ("an adapter ... connected to said parallel data bus, said data storage units and said correction bit storage unit"), which performs those functions. If the cases cited by TM mean anything, it must be that the disclosure of this case is more than sufficient to keep a limitation out of the ambit of Section 112 para. 6.

IBM argues that the term "adapter" does not connote or identify any definite structure, but is rather a "generic descriptor" for "devices used to make electrical or mechanical connections between items not intended for use together." (IBM Br. at 23.) It calls the Court's attention to cases in which devices it deems similar have been found to state means-plus-function claims, notwithstanding the absence of the presumptive language. See, e.g., Mas-Hamilton Group v. La Gard, Inc., 156 F.3d 1206, 1213-14 (Fed. Cir. 1998) ("a substantially non-resilient lever moving element for moving the lever" qualifies as a means plus function claim). And it suggests that the veracity of its position can be confirmed simply by replacing the word "adapter" with the word "means," so that the claim language reads "a means for" achieving the three desired functions.

However, IBM misreads the law. A claim qualifies for Section 112, para. 6 treatment when it covers any and all means for achieving a desired result. See Davies v. United States, 31 Fed. Cl. 769, 776 (Fed. Cl. 1994). Thus, the "lever moving element for moving a lever" in Mas-Hamilton encompasses anything that can be used to make a lever move. It is a tautological claim. The instant claim is not. It does not cover any conceivable means for dividing the data words, generating error codes and sending the data and associated error codes on their respective ways. It covers one means: an adaptor that is simultaneously connected to both types of storage units (data and error correction bit) and to the parallel bus. If this could be converted into a means-plus-function claim, then so could any claim in which the disclosed structure takes its name from the function it performs, e.g., "brake", "clamp", or "filter," to name a few.

I therefore decline to construe this claim under Section 112, para. 6, and I reject IBM's suggestion that it be defined for the jury in terms of the specifications disclosed in the preferred embodiment. I will explain the claim to the jury in the precise terms set forth in the opening paragraph of this section of the opinion.

Claims 16 and 28 of the '642 patent are at issue, and only one limitation present in both claims is relevant to this appeal. Claim 16 reads as follows:

1. A pulse oximeter which measures the oxygen saturation of blood in body tissue, said pulse oximeter comprising:

   a light emitter adapted to emit light of at least first and second wavelengths;

   a light detector responsive to light from said light emitter which has passed through body tissue having blood, said light detector providing intensity signals;

   an adaptive filter responsive to said intensity signals to provide at least one filtered signal; and an oxygen saturation module responsive to at least said filtered signal to calculate oxygen saturation of said blood.

Id. at col. 42, ll. 17-29 (emphasis added). Claim 28 is similar to claim 16, except that claim 28 uses the term "adaptive signal processor" instead of "adaptive filter." 1 Id. at col. 43, l. 7 to col. 44, l. 5.

1 Neither party has argued that any meaningful difference exists between the "adaptive signal processor" and "adaptive filter" limitations. We therefore interpret these limitations identically.

Masimo sued the defendants in the United States District Court for the Central District of California, alleging that the defendants' N-395 stand-alone pulse oximeter and MP-404 OEM pulse oximetry circuit board infringed claims 16 and 28 of the '642 patent. Masimo, slip op. at 1. Masimo thereafter filed a motion for a preliminary injunction and the defendants filed a motion for summary judgment of noninfringement. Id. The district court interpreted the "adaptive filter" limitation of claim 16 and the "adaptive noise canceler" limitation of claim 28 to mean "only one specific type of adaptive filter, an adaptive noise canceler." Id. Based on its claim construction, the court granted the defendants' motion for summary judgment of noninfringement. Id. at 2. The court determined that no reasonable juror could find literal infringement of the "adaptive filter" or "adaptive signal processor" limitations and that Masimo failed to demonstrate that there was a genuine issue of material fact that the adaptive filter in the accused devices satisfy those limitations under the doctrine of equivalents. Id. The district then denied Masimo's motion for a preliminary injunction because it failed to establish a likelihood of success at trial. Id.

Summary judgment is appropriate "if the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c). "The evidence of the nonmovant is to be believed, and all justifiable inferences are to be drawn in his favor." Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 255, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986). We review a district court's grant of a motion for summary judgment de novo. Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 149 F.3d 1309, 1315, 47 U.S.P.Q.2D (BNA) 1272, 1275 (Fed. Cir. 1998). The grant or denial of a preliminary injunction pursuant to 35 U.S.C. § 283 is within the discretion of the district court, Genentech, Inc. v. Novo Nordisk, A/S, 108 F.3d 1361, 1364, 42 U.S.P.Q.2D (BNA) 1001, 1003 (Fed. Cir. 1997), and thus we review such a denial for an abuse of discretion, Canon Computer Sys., Inc. v. Nu-Kote Int'l, Inc., 134 F.3d 1085, 1088, 45 U.S.P.Q.2D (BNA) 1355, 1358 (Fed. Cir. 1998).

Masimo argues that the terms "adaptive filter" and "adaptive signal processor" are readily understood by those skilled in the art to be "devices that remove noise by monitoring their own performance and, in response, self-adjust their own parameters through closed loop action to improve their performance," and that the Widrow and Haykin texts incorporated by reference into the '642 patent confirm that ordinary meaning. Masimo also contends that statements made in the specification and the prosecution history clearly demonstrate that Masimo broadly claimed a generic adaptive filter, not any particular type of filter. Finally, Masimo argues that, even under the district court's construction, it established a genuine issue of material fact that the defendants' products infringe its patent under the doctrine of equivalents.

The defendants respond that the only "adaptive filter" disclosed in the specification is an adaptive noise canceler, and that the Widrow and Haykin references were cited only for their disclosures of particular algorithms that may be utilized in an adaptive filter, not for their discussion of different types of adaptive filters. The defendants also contend that the terms "adaptive filter," "adaptive signal processor," and "adaptive noise canceler" were used interchangeably during prosecution and thus have the same meaning. Finally, the defendants argue that undisputed testimony reveals that the adaptive filter used in its pulse oximeter products operates in a substantially different way from the "adaptive filter" in the '642 patent, and therefore that it cannot infringe that patent either literally or under the doctrine of equivalents.

We agree with the defendants that the district court properly construed the "adaptive filter" and "adaptive signal processor" limitations to mean an adaptive noise canceler. The specification repeatedly teaches the use of an adaptive noise canceler to remove noise from the input signals once the noise reference signal is generated, and it does not point to any other filter that performs a similar function. E.g., '642 patent, col. 10, ll. 21-25; col. 18., ll. 26-30; col. 28, ll. 5-10; col. 32, ll. 63-66. Moreover, the specification characterizes the invention, and makes clear that an adaptive noise canceler is central to the operation of the patented pulse oximeter, when it states that "the present invention is a processor which determines a noise
Masimo argues that the specification states in the Summary of the Invention that "the adaptive signal processor may comprise an adaptive noise canceler," and therefore that it is improper to construe that limitation to cover only the preferred embodiment. However, as discussed above, no embodiments of the "adaptive filter" limitation other than an adaptive noise canceler are disclosed. One isolated statement in the Summary of the Invention to the effect that the limitation at issue "may" be an adaptive noise canceler does not override the teachings of the specification as a whole that it is only an adaptive noise canceler. We therefore conclude that one of ordinary skill in the art reading the specification would understand the term "adaptive filter" to be limited to an adaptive noise canceler.

Masimo also argues that the Widrow and Haykin references provide support for its broad interpretation of the term "adaptive filter." However, as pointed out by the defendants, those texts were referenced for the sole purpose of explaining the least squares and least squares lattice algorithms, respectively, '642 patent, col. 11, ll. 10-16; col. 18, ll. 38-43, and not for the purpose of disclosing alternative types of adaptive filters. The reference to those texts in the specification therefore does not support Masimo's interpretation of the term "adaptive filter."

Moreover, the prosecution history supports the conclusion that the claims of the '642 patent are limited to an adaptive noise canceler. Masimo used the terms "adaptive filter," "adaptive signal processor," and "adaptive noise canceler" interchangeably when it responded to the examiner's initial rejection for failure to provide proper antecedent basis for the term "adaptive filter."

Specifically, Masimo stated that:

```
The term adaptive filter is also supported in the specification. The characteristic of filtering is discussed throughout the specification. The adaptive noise canceler is described on page 19 as a dynamic multiple notch filter. In addition, a "noise canceler" is a filter. . . . Thus, applicants have support for the term adaptive filter.
```

Paper No. 6 at 5-6 (emphasis added). Masimo later stated that "the independent claims define that at least one output/filtered signal is provided by an adaptive canceler, multiple notch filter, adaptive signal processor or adaptive filter," id. at 6 (emphasis added), thus demonstrating that Masimo gave these terms the same meaning.

Finally, and perhaps most compelling, an examination of the claims of the '642 patent demonstrates that Masimo treated these terms synonymously. Claims 18, 19, and 21, all of which depend from claim 16, refer to "said adaptive canceler." '642 patent, col. 42, ll. 32-46. Claim 16 does not refer to an "adaptive canceler," as would be expected from the use of the word "said" in the dependent claims. See MPEP § 2173.05(e) (7th ed. Rev. Feb. 2000) (stating that claim terms must have proper antecedent basis to avoid an indefiniteness rejection). Instead, claim 16 refers to an "adaptive filter." Id. at 25-26. Thus, Masimo drafted the claims such that the term "adaptive filter" provided the antecedent basis for the phrase "said adaptive canceler." Accordingly, those claim terms must be construed to mean the same thing, i.e., an adaptive noise canceler, the only type of adaptive filter disclosed in the '642 patent.

Based on the intrinsic evidence of the '642 patent, we conclude that the district court correctly interpreted the "adaptive filter" and "adaptive signal processor" limitations to mean an adaptive noise canceler.

Go Back
6 Broadcom concedes that, under either construction, "only one operating parameter actually need be selected and scaled." (Broadcom Resp. at 27.)

7 "Our position is operating parameter scaling options is a set of values of various parameters." (R. at 72 (May 7, 2004).)

8 "Your operating parameter options have two components. One is which parameter you change and the second is which value you adopt for that parameter." (R. at 76 (May 7, 2004).)

Although each party argues that the plain language of the term and its surrounding claim text supports its construction, the Court finds that the claim language itself is ambiguous because it could be read to support either construction. The specifications, however, provide strong support for Agere's construction. See Vitronics, 90 F.3d at 1582 ("As we have repeatedly stated, claims must be read in view of the specification, of which they are a part." (internal citation and quotations omitted).) The specifications include a table describing "parameter scaling options" exemplified by sets of fixed values for the various parameters. ('550 patent, col. 5, ll. 37-50.) This table "lists several parameter options for various scaleable transmission or data rates." (Id., col. 5, ll. 32-33 (emphasis added).) In the text describing the table, the term "options" is used to describe sets of operating parameters consisting of given values for each of symbol duration, guard time, number of carriers, bandwidth, and raw data rate. (Id., col. 5, ll. 33-36.) Therefore, although the claim text does not provide clear content to the term "options," the specification demonstrates that "options" consist of sets of specified values of parameters. Accordingly, the intrinsic record supports Agere's proposed construction.

Broadcom attempts to refute this conclusion with evidence from the prosecution history, specifically arguments made by the applicant to distinguish the application from prior art. As originally filed, claim 1 taught "dynamically scaling at least one of said operating parameters for said method." (Broadcom Resp. Ex. E at 22 ("550 File History").) This broad claim was rejected by the Examiner in light of U.S. Patent No. 5,063,574 (the "Moose patent"), which "teaches a method for providing communication OFDM signals which comprises the step of dynamically scaling at least one of the operating parameters." (Id. at 44.) In response, the applicant amended claim 1 to add the limitation of "said dynamic scaling achieving a scalable operating characteristic by adaptively selecting one of a plurality of operating parameter scaling options." (Id. at 49-50.) While this exchange itself does not provide substantive content to the word "options," Broadcom points to a statement in which the applicant writes: "To scale an operating parameter in response to changes in characteristics of the communications environment, one of a plurality of scaled operating parameter options (e.g., the number of carriers, symbol duration, number of bits per carrier, and guard interval) is selected." (Id. at 75.) Broadcom argues that this statement clearly equates "options" with parameters. As Agere points out, however, the very next page of the file history suggests just the opposite. While describing a figure in the specifications, the applicant writes: "The dynamic control circuitry...may adaptively select an operating parameter scaling option having a relatively large guard time interval and large number of subcarriers to achieve the desired data rate while providing low delay spread tolerance." (Id. at 76.) This statement suggests that an "option" consists of a set containing values of multiple parameters and that this set may be selected to achieve a desired operating characteristic. Thus, the file history is ambiguous and therefore cannot overcome the construction suggested by the specifications. See Oakley, Inc. v. Sunglass Hut Int'l, 316 F.3d 1331, 1345 (Fed. Cir. 2003) ("One vague statement from the prosecution history does not have much bearing on the meaning of a claim phrase . . . which [the Federal Circuit] derives from the specification's clear teachings . . .").

Agere also challenges Broadcom's inclusion of the following sentence in its proposed construction: "The choice of which operating parameter(s) to select cannot be predetermined." Broadcom claims that this statement, which is not found in any of the claim text, is necessitated by the claim term "adaptively." The problem with this language, however, is obvious given the Court's resolution of the first dispute. While the choice among parameter scaling options is "adaptively selected" in real time, and thus not predetermined, operating parameters themselves are not "selected," as Broadcom's language would imply. (See '550 patent, Table 1, col. 5, ll. 37-50; see also R. at 80 (May 7, 2004) (Broadcom's counsel conceding that "the numbers are predetermined. The options are not.").) Accordingly, the Court declines to add this further limitation. Therefore, the Court adopts the following construction: "Making a selection from among a set of options, each of which has different values for one or more operating parameters."
15. Adding the current requested website page to the traffic path analysis data and thereby showing the complete path of website pages requested during the current website visit. (First appearing in claim 1 at col. 13, ll. 1-5, and as used similarly in claims 11 and 22)

Websidestory contends that this phrase has an ordinary meaning, and does not need construction. Joint Claims Construction Chart at 7. Netratings contends that the phrase should be construed to mean, "appending in sequence the link for the current requested website page to the preexisting sequence of website page links in the website cookie." Joint Claims Construction Chart at 7. Websidestory rejects Netratings' proposed construction, arguing that (1) Netratings' use of the word "appending" in place of "adding" does nothing to clarify the disputed phrase, (2) Netratings' use of the word "link" is unnecessary, and improperly limits the scope of the '479 Patent, and (3) nothing in the '479 Patent limits storing traffic path analysis data in locations other than the website cookie.

As previously concluded, the claims require that the traffic path analysis data referred to be contained in the website cookie. Accordingly, the Court adopts that part of Netratings' proposed construction which clarifies that the current requested website page is being added to the traffic path analysis data in the website cookie. Patent at col. 12, l. 55 - col. 13, l. 5. The Court concludes that the balance of this disputed phrase does not require construction. The phrase has an ordinary and customary meaning which is "readily apparent" to "lay judges," and the Court concludes that the ordinary meaning today is the same as it was when the '479 Patent issued in 1999. Phillips, 415 F.3d 1314; see Lucent Technologies, 367 F. Supp. 2d at 657 ("marking" construed as "marking"). The Court concludes that use of Netratings' proposed terms "appending" and "link" would impermissibly rewrite claim language and improperly limit the claims.

The Court concludes that the acquired meaning of this disputed phrase is: "Adding the current requested website page to the traffic path analysis data in the website cookie and thereby showing the complete path of website pages requested during the current website visit."

(9) "Additional Information"

Claim 18 of the '792 Patent states, in relevant part,

[the first data storage system maintains . . . an index of information . . . the index identifying data stored in the first data storage system and not yet copied to the second data storage system, the index including additional information about the copy of the data stored in the second data storage system so that the additional information is accessible by the first data storage system without retrieval from the second data storage system in order to reduce time for recovery from a failure to access the data stored in the first data storage system.]

'792 Patent, Col. 63, ll. 54-67 (emphasis added). EMC contends that the term "additional information" as used in the '792 Patent means information in addition to the information "identifying data stored in the first data storage system and not yet copied to the second" including, for example, whether a predetermined data element stored in the second data storage system is valid. HP contends that the term "additional information" is vague and indefinite, but, in any event, relates to the copy of the data on the second data storage system and cannot refer to general information about the status of that system or devices in that system, e.g. device pending or write-disable drive information. The operative dispute is, therefore, whether the term "additional information" is vague and indefinite and, if not, whether it includes device-level information.

Because the parties do not dispute the plain and ordinary meaning of the term "additional information", dictionary definitions are not helpful. Nor do the terms of Claim 18 shed any light on the dispute at issue. The language of dependent Claim 19, however, provides some clarification wherein it states, in relevant part,

[the system as claimed in claim 18, wherein the index includes a first indicator of whether a write to a predetermined
data element is pending to the second data storage system . . . and the additional information about the copy of the data stored in the second data storage system includes a second indicator of whether the predetermined data element is valid in the second data storage system.

'792 Patent, Col. 64, ll. 1-9. Accordingly, the index in dependent Claim 19 of the '792 Patent includes at least a first indicator of write pending information with respect to a predetermined data element and a second indicator of the validity of that predetermined data element on the second data storage system. Under the doctrine of claim differentiation, again, there is a presumption that the term "additional information" as used in Claim 18 includes, at least, validity information about a predetermined data element. As more thoroughly discussed earlier in this Memorandum, an indicator of the validity of a predetermined data element can include both track and device level information, i.e. information about data located at a specific track on a storage device and about all of the data stored in a particular storage device.

Finally, consistent with the claim language itself, the Specification of the '792 Patent does not explicitly or implicitly limit "additional information" to track-level information. Indeed, in many instances the Specification refers to device-level information as "additional". For example, in describing Figure 3, which depicts an index including invalid track, device pending and write disable drive information, the Specification states that

FIG 3 is a schematic representation of an additional list or index . . . to keep track of additional items including an invalid data storage device track, device ready status and write disable device status . . . .

'792 Patent, Col. 6, ll. 23-26 (emphasis added). Later, the Specification also adds,

[i]n addition to the write pending and format pending bits described above, the data storage system 10 also includes several additional general purpose flags to assist in error recovery. As shown in FIG. 3, invalid track flags . . . are utilized and maintained on each data storage device . . . . Additional flags may be provided such as the device ready flags . . . . Similarly, write disable flags 132 may be provided . . . .

'792 Patent, Col. 11, ll. 51-56, Col. 11, ll. 63-67 (emphasis added).

With respect to the '792 Patent, therefore, the term "additional information" has not been limited to track level validity information but rather can include device level information such as device pending or write disable drive information because such information refers, albeit indirectly, to the copy of the data stored on an entire storage device in the second data storage system. As with track level information, moreover, device-level information "assist[s] in error recovery" as required by the language of Claim 18. See '792 Patent, Col. 11, In. 51 - Col. 12, In. 5. Accordingly, the term "additional information" will be construed to include device level validity information.

Finally, the term "additional information" is neither vague nor indefinite. A claim is considered indefinite only if it is "insolubly ambiguous, and no narrowing construction can properly be adopted." Amgen, 314 F.3d at 1342 (internal quotation marks omitted). Here, both the claim language and the Specification make clear that the term "additional information" refers to any information beyond that which identifies data stored in the first storage system but not yet copied to the second and which is about the copy of data stored in the second data storage system. The language of dependent Claim 19 and the Specification instruct that such "information" can include information about the validity of a predetermined data element and the '347 and '792 Patents disclose numerous validity indicators at both the track and device levels. HP's claim that the term "additional information" is vague or indefinite is, therefore, unavailing.

1. Additional Processor Outside Any E-Mail System: A processor or information source which originates electronic information without executing electronic mail programming.

GO BACK

93
3. "an address in a format designating at least one mass memory storage block" and "a mass memory storage block address" ('316 pat., cls. 67 and 79; '842 pat., cls. 1, 10 and 61)

For this term, the parties have one major and one minor dispute. The minor dispute is whether the claimed address must "reference a block of user data" as plaintiff contends. In a sentence, defendants assert that "[t]here is simply no requirement in claim language" to support this limitation. Dkt. #536 at 20. Plaintiff responds in a footnote that elsewhere the claim language requires at least "user data" and "overhead data" and asserts that overhead data can be excluded because it is not "involved" in the method. Dkt. #559 at 16 n.5. The parties' cursory treatment of this matter suggests it is not a matter of importance to them, and may not even be related to a question of infringement or invalidity. At any rate, I am not persuaded that the limitation is required and decline to accept plaintiff's request to add it.

The major dispute is whether the mass memory storage block address must specify a "physical" address for the mass memory system or whether they could also specify a "logical" address. By "physical" address, the parties are referring to a description of a physical location within the mass memory system. A "logical" address describes the data without regard to its physical location; it is simply a number assigned to data to distinguish that data from other data stored in mass memory. In either instance, the system maintains a way for "finding" the data (which is presumably why these physical and logical descriptions are both considered "addresses").

As plaintiff points out, the type of addressing used by a mass memory system (such as a hard disk) matters little to the functioning of a flash memory device. Regardless what sort of address the mass memory gives it, the flash memory device will have to "remap" the memory into its unique storage system. A mass memory physical address cannot become the physical address of the data stored in the flash memory. To take an example, data stored in a magnetic memory disk may be given a "physical address" according to the Cylinder, Head and Sector in which the data is located but a flash memory device does not have cylinders or heads. Therefore, it must convert the previous physical address into an address that reflects its own physical organization.

For plaintiff, this point weighs in favor of including both physical and logical addresses within the claim. Plaintiff adds that its construction is supported by both the "intrinsic record" of the '316 and '842 patents and the "understandings" of persons of ordinary skill in the art at the time of the inventions. In particular, plaintiff asserts that, by the time the patents were filed, it was "well understood" that disk drives could use either physical or logical addressing. Moreover, a prior art patent, U.S. Pat. No. 4,924,331 (the "Robinson patent"), stated that it was already "well known in the disk drive field to convert logical block addresses into cylinder head and sector addresses as most seek commands are initially input as logical block addresses."

Defendants acknowledge that logical addressing in mass memory storage was known at the time the patents at issue were filed but attempt to distinguish the Robinson patent (which also suggests that logical addressing was common). For the sake of argument, I assume defendants are correct in saying that logical addressing would not have been common at the time of the invention. Even so, plaintiff's point is valid: it would make sense for a flash memory device to receive both logical and physical addresses.

That is not enough to say it does. The starting point in construing any term is the language of the claim itself, which in this instance is "an address in a format designating at least one mass memory storage block." (The parties agree that this language is interchangeable with the term "mass memory storage block address.") According to defendants, plaintiff's construction would make the phrase "in a format" superfluous because format falls out of the picture under that construction.

Defendants may be right that logical block addressing is not regularly considered a mass memory storage "format" even if it can be used in that setting. Nonetheless, I am not persuaded that the phrase is as empty as defendants say it is under plaintiff's reading. Leaving out the phrase and claiming "an address designating at least one mass memory storage block" tends to suggest that the address is actively "designating" the block while the phrase "in a format" helps emphasize that the address need be only of a sort designed to work in a mass memory storage block. Moreover, nothing about the phrase or the purpose of the patents at issue suggests an intent to limit the patent to converting only one type of mass memory storage addressing. It would make no sense or produce any additional benefit to include such a limitation. Defendants do not suggest that the limitation was necessary to distinguish prior art. At most, the phrase "in a format" is inartful; it is not intended to impose a requirement that the address of the mass memory storage block be physical.
Thus, I conclude that "an address in a format designating at least one mass memory storage block" and "a mass memory storage block address" need not "refer to a block of user data" and may specify either a physical or a logical address for the mass memory system.

OPTI's construction of "address-data bus" is "a bus that carries both address information and data." nVidia's construction is similar. nVidia contends that "address-data bus" is "the bus that carries address information in one or more address phases, and data information in one or more data phases." As the parties' proposed constructions are similar, the Court's inquiry for this dispute is focused on whether or not "address-data bus" is limited to the use of phasing techniques.

According to nVidia, the intrinsic evidence defines the address-data bus as sending address information and data in phases. The 141 patent Abstract explains:

Address, data, command, interrupt request, and DMA request information are communicated between the host and the peripheral device via a single bus by multiplexing the information on the bus using phase techniques.

Furthermore, nVidia relies on this Court's precedent that statements in the Summary of the Invention and prosecution history that define the invention may limit the scope of the claims. See IAP Intermodal, L.L.C. v. Northwest Airlines Corp., 2:04-CV-65 (Memorandum Opinion and Order of Sept. 7, 2005). Accordingly, nVidia contends that the Summary of the Invention in the 141 patent is so limiting:

The present invention, roughly described, is directed to an interface to be used between a host device and one or more peripheral devices . . . Using phasing techniques, the CISA interface multiplexes the different types of information onto the single bus. For instance, in one cycle, address information may be driven onto the bus for a time period, an "address phase," followed by data information in a "data phase."

'n141 patent, Col. 3:24-58. In further support of its argument, nVidia notes that every other example in the 141 patent specification that communicates address and data information communicates address and data information over the "address-data bus" in at least one address phase and at least one data phase. See 141 patent, Col. 6:7-18.

nVidia's proposed construction is incorrect. nVidia is attempting to incorporate limitations from the preferred embodiment into the claims. The citations nVidia relies on to support its construction are full of non-limiting words such as: "the present invention, roughly described" and "for instance." These non-limiting words appear throughout the Summary of the Invention and specification.

There is nothing in the Summary of Invention or the rest of the specification that would require "address-data bus" to be limited in the manner nVidia desires. To do so would be error. See RF Del., Inc. v. Keystone Techs., Inc., 326 F.3d 1255, 1264 (Fed. Cir. 2003). Phasing techniques are just one method of multiplexing information and the claims will not be limited to phasing techniques absent a disavowal of claim scope by the patentee.

In addition, claim differentiation supports OPTI's proposed construction. As a matter of claim construction, dependent claims are generally narrower in scope than the claims from which they depend. Lampi Corp. v. Am. Power Prods., Inc., 228 F.3d 1365, 1376 (Fed. Cir. 2000). The doctrine of claim differentiation "is clearly applicable when there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims." Werner Mfg. v. Coating Mach. Sys., Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001).

Independent claim 1 of the 141 patent states that the invention comprises "an address-data bus to carry in a multiplexed manner address information . . . [and] data information." Dependent claim 2 states that the "said address information is carried on said address-data bus during an address phase . . . and said data information is carried during a data phase[.]"
Thus, if phasing techniques were a limitation of address-data bus in claim 1, it would render claim 2 of the 141 superfluous.

nVidia asserts that claim differentiation does not apply in this case because claim 2 additionally contains the phrase "said data phase follows said address phase[.]" Thus, nVidia contends, the difference between claim 1 and claim 2 is that the data phase may precede the address phase in claim 1. The Court rejects this argument as it is understood that the data phase follows the address phase. See September 4, 1998 Office Action at 3 ("one of ordinary skill in the art would have considered having the data phase follow the address/command phase because following this sequence is important in order to avoid sending data information to the wrong destination/address."). Accordingly, because the patentee did not disavow other methods of multiplexing and claim differentiation undermines nVidia's assertions, the Court adopts OPTi's proposed construction for "address-data bus."

95

"An FDDI or Ethernet MAC Address for a Nonfunctioning Router"

Cisco's proposed construction for this term is "a MAC address for an FDDI or ethernet network, which address is not assigned to a physical router functioning in the network." Alcatel argues that claim 17, in which the above term appears, is indefinite and thus does not meet the requirements of 35 U.S.C. § 112 P 2. Alcatel contends that claim 16, on which claim 17 depends, is unclear because it contains the phrase "the two or more routers" (emphasis added), and there is no clear indication what routers are being referenced. However, the Court finds it clear that "the two or more routers" in claim 16 is referring to the "at least two physical routers" discussed in claim 10, on which claim 16 depends, and thus Alcatel's argument for indefiniteness fails in this regard.

Furthermore, Alcatel contends that claim 17 is also indefinite because there is no support in the patent to explain what is meant by "a nonfunctioning router." According to Alcatel, one is left to wonder whether this refers to "a virtual router, a broken-down router, or to some other form of router." Alcatel's Opening Markman Brief on Claim Construction Regarding United States Patent No. 5,473,599 (Li et al.) ("Alcatel's '599 Opening Brief"), at 24.

Notwithstanding that argument, while the Court agrees that the patent is devoid of an explanation of "nonfunctioning router," 38 according to Cisco's expert, the term "nonfunctioning router" would be known to one of ordinary skill in the art to refer to a router that is not functioning in the network. See Halpern '599 Report, at 25. Alcatel offers no evidence to refute this assertion, nor does Alcatel even claim that "nonfunctioning router" has no meaning to one of ordinary skill in the art.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

38 None of the passages in the specification identified by Cisco refer to a "nonfunctioning router," or anything that can be understood to mean a "nonfunctioning router."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Nevertheless, even accepting that "nonfunctioning router" is a term known to one of ordinary skill in the art, Cisco's proposed construction does not comport with the meaning of that term. Cisco seeks to construe the language as an FDDI or ethernet MAC address not assigned to a functioning router. However, the claim term does not refer to an address not assigned to a functioning router; the term refers to an address assigned to a nonfunctioning router.

Therefore, Alcatel's argument that claim 17 is indefinite fails, and the Court construes the term "an FDDI or ethernet MAC address for a nonfunctioning router" to mean "an FDDI or ethernet MAC address that is assigned to a router not functioning in the network."

96

1. "address information"

- 536 -
The term appears in claim 1, 6, 8, 12 and 18. The parties deem claim 1 as representative (the disputed term is in boldface):

1. A method for establishing real-time audio communications between a process executing on a computer system coupled to a packet-switched network and an information source coupled to either a packet-switched data network or terminating apparatus on a circuit-switched communication network, the method comprising:

A. retrieving, with a browser process executing on the computer system, address information usable in establishing a real-time audio communication connection with a destination;

B. supplying the address information from the browser process to a computer telephony communication utility associated with the browser process; and

C. initiating with the computer telephony communication utility a real-time audio communication connection with the destination identified by the address information. (emphasis added)

a) The Parties' Proposed Constructions

The parties propose the following constructions:

<table>
<thead>
<tr>
<th>eBay</th>
<th>IDT</th>
</tr>
</thead>
<tbody>
<tr>
<td>An Internet Protocol address,</td>
<td>Information that a telephone communication</td>
</tr>
<tr>
<td>an E-mail address or a</td>
<td>utility will use to establish a communication</td>
</tr>
<tr>
<td>telephone number.</td>
<td>with a destination.</td>
</tr>
</tbody>
</table>

*2*See Doc. No. 99 at 87 (JCCC Exhibit 1 at 85).

b) Discussion

Beginning once again and always with the claim language, nothing in the claim language per se counsels in favor of one construction or the other. However, claim 1 does require "initiating with the computer telephony communication utility a real-time audio communication connection with the destination identified by the address information." (emphasis added)

Thus, turning to the specification, eBay's proposed construction is based on the following statement in the specification:

"Contained on webpage 302 is address information, i.e. an Internet protocol address, an E-mail address or a telephone number, or other information which may be stored in any number of forms including an HTML tag."

(Doc. No. 87 at 38) (quoting '490 patent, col. 9, line 66-col. 10, line 2). eBay points out that "i.e." stands for the Latin term id est, meaning "that is." eBay relies in part on Abbott Labs. v. Novopharm Ltd., 323 F.3d 1324, 1327, 1330 (Fed. Cir. 2003), in urging that the specification thus defines "address information."

In Abbott, the specification of the patent-in-suit explained:

"the "co-micronization of fenofibrate and a solid surfactant (i.e., the micronization of an intimate mixture of fenofibrate and a solid surfactant) makes it possible to improve the bioavailability of the fenofibrate to a significantly greater extent than that which would be achieved either by adding a surfactant [to fenofibrate], or by micronizing the fenofibrate on its own, or by intimately mixing the separately micronized fenofibrate and surfactant.""

323 F.3d at 1327. The district court concluded that claims thus could not be construed to include "mixtures obtained by adding a surfactant to fenofibrate, or micronizing fenofibrate by itself, and/or mixing separately micronized fenofibrate and surfactant." Id. The Federal Circuit agreed: "Had that term not been explicitly defined in the '726 patent specification, we might well agree with the appellants that that term could simply mean 'micronized with or together' and would not necessarily exclude the presence of ingredients not specifically recited in the claim. However, the phrase 'co-micronization of fenofibrate and a solid surfactant' is in fact explicitly defined at column 1, lines 35-38, of the '726 patent, as
'micronization of an intimate mixture of fenofibrate and a solid surfactant.' Hence, this is a case in which the patentee has 'chosen to be his own lexicographer,' and the district court did not err by reading the patentee's definition from the specification into the claim." 323 at 1330.

[EDITOR'S NOTE: TEXT WITHIN THESE SYMBOLS [O> <O] IS OVERSTRUCK IN THE SOURCE.]

Net2Phone argued in its opening brief that "other information" in the quoted portion of the '490 patent specification indicated that "address information" encompasses "all types of information usable in establishing a communication with a destination." (Doc. No. 83 at 28). eBay in response notes that disregards the grammar expressed in the sentence. That is, eBay points out that in the phrase "an Internet protocol address, an E-mail address or a telephone number, or other information," "or other information" does not refer to "address information," but rather other information that may be contained on a webpage. In other words, "[c]ontained on webpage 302 is [1] address information, i.e. an Internet protocol address, an E-mail address or a telephone number, or [2] other information which may be stored in any number of forms including an HTML tag." (Doc. No. 87 at 39). eBay notes that to read the sentence as Net2Phone does, the sentence would have to be rewritten "[c]ontained on webpage 302 is address information, i.e. an Internet protocol address, an E-mail address or a telephone number, or other information which may be stored in any number of forms including an HTML tag." Id.

Net2Phone responds that "eBay's citations to the case law [i.e., Abbott], however, are irrelevant because they would only support eBay's proposition only if there were no other disclosure in the specification as to the scope of 'address information,"" (Doc. No. 92 at 13-14) (citing Pfizer, Inc. v. Teva Pharms.USA, Inc., 429 F.3d 1364, 1373-74 (Fed. Cir. 2005)), urging that the Federal Circuit held that "i.e." did not define the term "saccharides" because the remainder of the specification gave the term a broader scope. Net2Phone urges that "[i]n any case, the Background of the Invention removes any ambiguity regarding whether other information is included in 'address information' by providing that 'other information' can be address information to the extent that it is retrieved from a website and used to establish a communication with a destination." (Doc. No. 92 at 14) (citing '490 patent, col. 3, lines 39-44).

In its sur-reply, eBay urges contends that Net2Phone's reliance on Pfizer is misplaced because here, unlike in Pfizer, there is no disclosure of a broader intended meaning. eBay urges that "Net2Phone has not and cannot point to a single instance in the intrinsic evidence where 'address information' comprises something other than an internet protocol address, an email address or a telephone number." (Doc. No. 95 at 14-15).

The Court agrees with eBay. First, eBay is correct in parsing the sentence, according to punctuation and grammar: "[c]ontained on webpage 302 is [1] address information, i.e. an Internet protocol address, an E-mail address or a telephone number, or [2] other information which may be stored in any number of forms including an HTML tag." Or, using ellipses: "[c]ontained on webpage 302 is [1] address information, . . . or [2] other information which may be stored in any number of forms including an HTML tag." In Finisar Corp. v. DirecTV Group, Inc., 523 F.3d 1323, 1336 (Fed. Cir. 2008), the Federal Circuit, in discussing the doctrine of the last antecedent and the corollary rule of punctuation, commented that "[t]herefore, to avoid slipping into a realm of ambiguity that could render jury verdicts wholly unreviewable, this court imputes an understanding of English grammar and usage to the jury. Moreover this court consults the overall context of the passage." The court also, though, noted that rules of grammar and punctuation "are more guidelines than absolute rules." Id.

Nevertheless, the grammatical construction becomes clearer in the context of the specification. The paragraph in which the subject sentence lies, begins: "FIG. 3 illustrates conceptually the inventive process of the present invention." '490 patent, col. 9, lines 61-62. Fig. 3 illustrates:

GET DRAWING SHEET 5 OF 5

The paragraph continues: "First, a browser utility process 300 executing on one of the same computer systems as WebPhone client 232 of FIG. 2B accesses a webpage 302 residing on web server 260 of FIG. 2B, as illustrated by step 1." '490 patent, col. 9, lines 62-66. The reference to "step 1" refers to arrow 1 in Fig. 3. Fig. 2B illustrates:

GET DRAWING SHEET 4 OF 5

The specification then explains that:
Contained on webpage 302 is address information, i.e. an Internet protocol address, an E-mail address or a telephone number, or other information which may be stored in any number of forms including an HTML tag. The address information is selected by the user of browser process 300, typically with a pointing device by clicking a graphic representation of the data on the webpage, as illustrated by step 2. The address information is then supplied to WebPhone client process 306, as illustrated by step 3. If the WebPhone client process is already executing, the browser process 300 does not need to launch the WebPhone client process, otherwise the process 300 launches the WebPhone client process. Having obtained the address information, the WebPhone client process 306, upon instruction from the user or automatically upon receipt of the address information from browser process 300, attempts to establish a direct, point-to-point communication with a destination specified by the address information, as illustrated [sic. "illustrated"] by step 4.

'490 patent, col. 9, line 66-col. 10, line 15.

The specification then describes the connection processes when the "address information is (1) an Internet protocol address, (2) an E-mail address, or (3) a telephone number. The specification does not describe a connection process if the "address information is "other information."

For an "Internet protocol address," for example, the specification explains:

If the address information is an Internet protocol address, having the form XXX.XXX.XXX, the WebPhone client process 306 will attempt to establish a call directly to WebPhone client process 308.

'490 patent, col. 10, lines 20-24.

For an "E-mail address," the specification explains:

If the address information comprises an E-mail address, WebPhone client process 306 may first attempt to search the local directory associated with the WebPhone client process for a corresponding Internet protocol address. If not found, WebPhone client process 306 will attempt to connect with connection/information server 252 of FIG. 2B to obtain the corresponding dynamically assigned Internet protocol address associated with the E-mail address. In such instance, WebPhone client process 306 supplies the E-mail address in packetized form to connection server 252. In response, if the process identified by the E-mail address is currently online and has a currently assigned Internet protocol address, connection server 252 will supply the Internet protocol address back to WebPhone client process 306 in packetized form. WebPhone client process 306 will then attempt to establish a connection to the second WebPhone client process 308 in a manner previously described. WebPhone client process 308 may be implemented as any process adhering to the WebPhone protocol, including an automatic call distribution system 242, a connection server 252, a gateway 218, etc.

'490 patent, col. 10, lines 24-44.

If the "address information" is a telephone number, the specification explains:

If the address information obtained by browser process 300 comprises a traditional PSTN telephone number, WebPhone client process 306 will supply the telephone number to connection server 252 of FIG. 2B. In one embodiment, connection server 252 recognizes the information as a telephone number and, using a look-up table algorithm matches a portion of the telephone number, such as the country code, area code or exchange, to an IP address representing a gateway which can establish a call over a circuit-switched network to the terminating apparatus represented by the telephone number. Such IP address is then returned to WebPhone client process 306. WebPhone client process 306 then attempts to contact the gateway, e.g. gateway 218. In the illustrative embodiment, gateway 218 implements the WebPhone protocol and is capable of functioning as a WebPhone client process without a graphic user interface. In a manner previously described, gateway 218 then establishes a traditional call to the terminating apparatus specified by the telephone number and performs the functions of translating either analog or digital telephone signals to compressed packetized audio packets, and vice versa to effect communication between the WebPhone client process and the terminating apparatus, i.e., a telephone 214.

Alternatively, the telephone number may be supplied from WebPhone client process 306 to a domain name server which then resolves the telephone number into the Internet protocol address of the appropriate gateway, in a manner described in
U.S. patent application Ser. No. 08/911,133, entitled Method and Apparatus for Establishing Communications Between Packet-Switched and Circuit-Switched Networks, by Keith C. Kelly, filed Aug. 14, 1997, and U.S. patent application Ser. No. 08/911,519, entitled Domain Name Server Architecture for Translating Telephone Number Domain Names into Network Protocol Addresses, by Keith C. Kelly, filed Aug. 14, 1997. The IP address is then returned to WebPhone client process 306 which then contacts the gateway represented by the IP address directly to establish the call to the terminating apparatus on the TSTN network, in the manner described above.

"490 patent, col. 10, line 45-col. 11, line 16. There is no description of using "other information" to establish a connection, or in the terms of claim 1 "initiating with the computer telephony communication utility a real-time audio communication connection with the destination identified by the address information," where the "address information" is something other than (1) an Internet protocol address, (2) an E-mail address, or (3) a telephone number.

Indeed, the next paragraph in the specification says:

"Utilizing the method described above, a user of a web browser utility may single click on an icon representing an HTML tag on a web page and, using the technique described herein seamlessly establish a real-time communication with either an automatic call distribution center associated with the website over a packet-switched data network or with a traditional automatic call distribution system over a telephone line.

"490 patent, col. 11, lines 17-24. The "method described above" does not include "address information" other than (1) an Internet protocol address, (2) an E-mail address, or (3) a telephone number.

The Court is mindful that during prosecution, in a response of April 27, 2001, the applicants stated in an After Final Response that "[g]enerally, upon request from a user, the browser process retrieves address information from a website address information can be in the form of an internet protocol address, an e-mail address, a telephone number or other information, any of which may be stored in the form of an HTML tag (page 17, lines 4-6)." (Doc. 87-17 at 12). That comment appears in an "Amendment After Final Action Under 37 C.F.R. § 1.116." There is a hand-written notation "O.K. to enter" which presumably comes from the examiner. However, the parties have not provided the Court with the entire prosecution history, and the context of that statement, especially given that the statement was made in after a final rejection, remains in doubt. The Court has considered the statement in the context of the parties' briefs and their oral presentations at the Markman hearing, and is not persuaded that that statement trumps the explanation given in the specification. However, the Court is open to reconsidering its conclusion if the parties request.

With respect to Net2Phone's argument that "the Background of the Invention removes any ambiguity regarding whether other information is included in 'address information' by providing that 'other information' can be address information to the extent that it is retrieved from a website and used to establish a communication with a destination," (Doc. No. 92 at 14) (citing '490 patent, col. 3, lines 39-44), that paragraph of the specification says in whole:

A further need exists for the ability to utilize information, such as Internet protocol addresses, telephone numbers, E-mail addresses and other information which may be posted on the Internet to efficiently establish a communication link between a software application, such as a browser, and a source posting of such information.

A "need" may exist for "the ability to utilize . . . other information" to "efficiently establish a communication link between a software application, such as a browser, and a source posting of such information," but that is not what the patentees equate to "address information" in the specification.

With respect to Pfizer, the Federal Circuit in distinguishing Abbott, noted that "the court did not identify any support in the intrinsic evidence for a construction of the disputed claim term other than the construction linked to 'i.e.'" Here, the Court has considered each of the instances in which the patentees referred to "address information" in the specification, and none extend "address information" beyond (1) an Internet protocol address, (2) an E-mail address, or (3) a telephone number. In Pfizer, the patent-in-suit included a section entitled "SACCHARIDES" with the following disclosure:

The saccharide components to be used in the pharmaceutical products and methods of the invention are substances which are compatible with the alkali or alkaline earth metal-containing stabilizers. Generally, they are substances which do not contain groups which could significantly interfere with the function of either the metal-containing component or the drug.
component. Mannitol, lactose, and other sugars are preferred. Mixtures are operable.

The Federal Circuit concluded that a reference to "saccharides (i.e., sugars)" did not constitute a definition of "saccharides" in light of the broader disclosure of "saccharides." Although a separate section of the specification is certainly not required, as was the case in Pfizer, none of the portions of the specification that Net2Phone references suggests that "address information," within the disclosure of the '490 patent, means other than (1) an Internet protocol address, (2) an E-mail address, or (3) a telephone number.

c) Conclusion

In view of the foregoing, the Court concludes that:

In the asserted claims of the '490 patent, "address information" means "an Internet Protocol address, an E-mail address or a telephone number."
Applying nVidia's construction to claim 2 would require that a complete address must fit on the address phase of a first cycle. Thus, nVidia's construction would mandate that claim 2 would only apply to addresses that are small enough to fit on a single phase. However, claim 4 makes clear that the address can be broken into a plurality of sub-phases and would permit transfer of addresses of varying size -- including addresses larger than 16 bits. See, e.g., 141 patent, Col. 6:7-18. In short, under nVidia's construction, claim 4 would be broader than claim 2. As claim 4 depends from claim 2, this construction would violate the canons of claim construction and is therefore rejected. The Court therefore adopts OPTi's construction for "address information."

The court rejects the parties' constructions and construes "address information" to mean "characters, numbers or bits used to represent an address."

---

6. "address set," "command set," "data set"

The dispute with regard to these terms is whether a "set" can contain a single bit, as Power-One proposes, or, as Artesyn suggests, whether it must contain two or more bits. Power-One concedes that the examples of sets given in the specification are multi-bit sets. See, e.g., '916 patent, col. 4:19-25. However, the '916 specification provides that "communication cycles containing more or less information and/or bits is within the spirit and scope of the present invention." Id. at col. 4:30-33. Although the '916 specification provides examples of multi-bit sets, this does not mean that a "set" referred to in the claims must contain more than one bit. See, e.g., Varco, L.P. v. Pason Systems USA, Corp., 436 F.3d 1368, 1373 (Fed. Cir. 2006) ("In examining the specification for proper context... this court will not at any time import limitations from the specification into the claims."). Accordingly, the Court declines to narrow the definition of set and construes these terms as follows:

Address set: A set of one or more bits in a message specifying the address of one or more devices connected to a bus.

Command set: A set of one or more bits in a message specifying a given command operation.

Data set: A set of one or more bits in a message reflecting data that is read from or written to a device.

2. "Address Space"

<table>
<thead>
<tr>
<th>Term</th>
<th>VIA &amp; Intel's Proposal</th>
<th>CCCC's Proposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;address space&quot;</td>
<td>&quot;A set of addresses that may be represented on a particular bus.&quot;</td>
<td>&quot;A set of addresses that may be associated with one or more buses.&quot;</td>
</tr>
</tbody>
</table>

According to Claim 1, each "bus" provides "bus masters connected" to it with access to "data storage locations mapped to
separate addresses within" an "address space." '369 patent at 12:43-46, 58-61. The parties agree that "address" means "an identification, such as a label, number, or name that designates a particular location in storage or any other data destination or source." Accordingly, the court will construe "address space" as "a set of addresses."

But as demonstrated by the parties' differing proposed constructions, the real dispute is over whether the first address space must be associated with the first bus and the second address space must be associated with the second bus. Basically, the parties disagree whether an address space is necessarily associated with only one bus or may be associated with multiple buses. The language of the patent resolves this disagreement. The description of the preferred embodiment makes clear that, at least for the preferred embodiment, each address space is associated with only one bus:

The interface circuit 8 maps a portion of VMEbus address space onto a portion of Futurebus address space so that when computer 2 read or write accesses selected addresses on the VMEbus, the interface circuit 8 implements the read or write access on corresponding addresses in a device on Futurebus 12 such as main memory 3.

'369 patent at 3:35-41. However, limitations from the preferred embodiment may not be read into the claims. Primos, Inc. v. Hunter's Specialties, Inc., 451 F.3d 841, 848 (Fed. Cir. 2006).

Nevertheless, the claims discuss the first address space along with the first bus and components connected to the first bus. The preamble to claim 1 sets forth a first bus providing a first plurality of bus masters to first data storage locations mapped to separate addresses within a first address space. In identical fashion, the second address space is discussed along with the second bus and components attached to the second bus; the preamble sets forth a second bus providing a second plurality of bus masters to second data storage locations mapped to separate addresses within a second address space. This discussion clearly demonstrates that an "address space" when modified by either "first" or "second" is associated with the corresponding bus. 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 There is a portion of the claims from which it might appear that a "first" reference is used inconsistently with the association set forth above. At column 12 lines 58-67, the patent reads, "the second bus providing a second plurality of bus masters connected thereto with data read and write access to second data storage locations mapped to separate addresses within a second address space, wherein one of said second plurality of bus masters writes data to a first particular one of said second data storage locations by placing on the second bus an address to which the first particular one of said second data storage locations is mapped and transmitting the data via said second bus." The "first particular one" is not inconsistent because it refers to the first of a number of second data storage locations that are mapped on the second address space.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Based on the foregoing, the court construes "address space" as "a set of addresses." Further, the court construes "first address space" as an address space that necessarily refers to addresses represented on the first bus and "second address space" as an address space that necessity refers to addresses represented on the second bus.

101

Adjacent neighbouring switches

The Court modifies Ciena's proposed construction and construes the term as “switches coupled with another switch.” Nortel argues that the term should be construed as “the first path-oriented switches encountered along each transmission path from a given switch.” Again, for the reasons discussed above the Court rejects Nortel’s inclusion of the “path-oriented switch” in the definition of the term.

Ciena contends that the term should be construed as “switches directly connected to another switch.” Ciena argues that the claims and the specification support its argument that the switches must be directly connected to one another. See Cols. 3:2-6 (“This information is calculated at switch C and is broadcast to all switches that are directly connected to switch C (i.e. to switches A, B, D, and E in this example)”; 3:21-23; 4:14-17. Nortel argues that the term "directly connected" does not appear in the claim language and is not required by the specification. However, the parties do not dispute that each “adjacent
neighbouring switch” must be able to communicate with the switch connected to it as displayed in Figure 1. The real disagreement between the parties involves Nortel’s concern that the use of the words “directly connected” will create the opportunity for Ciena to later argue that a repeater or some other device placed between two switches will prevent them from being “directly connected.” Therefore, the Court construes the term such that the switches are “coupled with” another switch.

8. Adjacent to/next to.

Intergraph argues "adjacent to" or "next to" carries its plain and ordinary meaning and needs no further construction. Intergraph offers a definition of "relatively near and having nothing of the same kind intervening." Intel, relying on the '028 specification at 5:61-65, counters that the term means groups are to be placed side-by-side within a frame in accordance with the issue sequence of the groups. Intel's position, however, goes beyond that which is necessary to define these relatively simple, descriptive terms. The Court construes "adjacent to" and "next to" as side-by-side, alongside, beside, or in the next position. '028 patent at 3:31-37; 5:61-6:5.

1. "located adjacent to said battery"

Claim 13 describes an AED with a battery and a temperature sensing circuit that is "located adjacent to said battery." The parties dispute the meaning of the term "adjacent." Philips asserts that "adjacent" should be defined as "adjoining or next to the battery, with nothing of the same kind in between." Cardiac Science contends that "adjacent" means "close," but does not require that the temperature sensing circuit needs to touch the battery. Philips agrees that the temperature sensing circuit does not need to touch the battery, but contends that Cardiac Science's definition is not precise enough. (Tr. at 444.) The claim itself provides some guidance as to the proximity required between the battery and the temperature sensors, as the claim describes a "temperature sensing circuit designed to sense the temperature inside of said battery." ('576 Patent at c. 8, ll: 47-48.) However, nothing in the claim language or the specification requires that the temperature sensors adjoin the battery, as Philips proposes. The Court finds that "located adjacent to" is properly construed as "close to," as in "located close to the battery so that it may sense the temperature of the battery."

1. "Adjusting" means "modifying."

The term "adjusting" appears in eight of the claims-in-suit, and in each, the surrounding language strongly supports Defibtech's argument that the term simply means "modifying." Philips proposes that the term means "correcting or modifying to reflect actual [patient] conditions." Inserting Philips' definition into the claims-in-suit demonstrates the flaws in its construction. For example, Claim 1 of the 612 patent covers a method that includes monitoring a "patient-dependent electrical parameter" and "adjusting a discharge parameter of a later phase of the multiphasic waveform as a function of a value of the electrical parameter during an earlier phase." The claim language itself dictates precisely what type of "adjusting" the claim contemplates. Philips' construction is surplusage, as the claim language dictates waveform adjustment according to a patient-dependant electrical parameter. Philips' less specific "modifying to reflect actual [patient] conditions" language would read out or needlessly broaden the specific language of the claim.

The same contextual analysis applies to the remaining claims that use "adjusting." Every "adjusting" claim contains specific language that informs the reader what type of adjusting falls within the invention. Claim 15 of the 454 Patent discloses "adjusting the title of the waveform based on the value of the monitored electrical parameter," and Claim 53 covers "adjusting a waveform parameter based on a value of the monitored parameter." Claims 1 and 13 of the 879 Patent address
"adjusting a discharge parameter based on the measured patient impedance" and "adjusting waveform tilt based on a value of the monitored electrical parameter." The remaining claims are similar in that they unambiguously disclose the parameter that will dictate the necessary "adjusting." Philips' proposed construction is inappropriate in light of this unvarying pattern of using the term "adjusting" followed by specific instructions. The parties agree that "adjusting" means "modifying," but Philips insists that the term has qualifying language built into it. This proposal conflicts with the claim language, which contains its own qualifiers in every instance.

The court finds nothing within the remainder of the patents' specifications that is inconsistent with the meaning that the claim language dictates. Philips insists that a primary feature of the inventions claimed in the shock delivery patents is adjusting the shock waveform to reflect differing electrical parameters within patients. A review of the written descriptions supports Philips' assertion, e.g., 879 Patent at 2:2-7; 454 Patent at 3:38-41, but the assertion is irrelevant. The language surrounding the term "adjusting" in each claim serves the purpose of delimiting how the defibrillator adjusts the waveform in response to those parameters. This is a case in which the patentee has not merely acted as his own lexicographer, but has done so in the language of the claims. The court must defer to that lexicography, Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998), under which "adjusting" means no more than "modifying."

"Adjustment Input" in the '356 Patent's Claim 4

Claim 4 of the '356 Patent relates to an inverter circuit that:

- has an adjustment input operable, in response to receiving an adjustment action, to adjust the magnitude of the lamp current by way of adjusting the frequency of the alternating lamp voltage.

Although that claim element is clearly functional in tone, Nilssen urges that it also recites sufficient structure--more specifically an "adjustment input," where "input" is defined this way (Penguin at 269):

(1) The signal or driving force applied to a circuit….

(2) The terminals at which this signal is applied. 22

On Motorola's part, M. Mem. 14 asserts that the claim element is in means-plus-function format because "a function is recited without a structure to perform that function." To support that position M. Mem. 14 relies on Mas-Hamilton Group, Inc. v. LaGard, Inc., 156 F.3d 1206, 1213 (Fed. Cir. 1998), which found a claim was in that format because "even though the catch phrase ['means'] is not used, the limitation's language does not provide any structure." According to Motorola, the claim element at issue here suffers from the same vice that was described in Mas-Hamilton, id.:

The limitation is drafted as a function to be performed rather than definite structure or materials.

Is "adjustment input" such a "definite structure," as Nilssen would have it? One clue to the answer lies in N. Mem. 24's not-so-subtle shift in the meaning of that term:

An "adjustment input" is simply an input that is adjustable. Accordingly, the "adjustment input" limitation has a reasonably well known meaning in the art.

Not so--for the plain reading of the claim element that has been quoted at the outset of this section adverts to an input that
adjusts the lamp current (a statement of the input's function), rather than to the fact that the input itself is "adjustable" in order to perform that function. 23

23 After all, the claim element did not employ the more normal adjectival locution, if Nilssen's restatement of its meaning were accurate, of referring to "an adjustable input."

In plain meaning terms, then, the only possible candidate for a "structure" referred to in the claim element is "input." And although Nilssen is correct in stating that "input" is a common term--"widely known in the art of electronics" (N. Mem. 24)--that does not at all suffice. Greenberg, 91 F.3d at 1583, reconfirmed by Mas-Hamilton, 156 F.3d at 1213-14, requires that the term under scrutiny must be widely known "as the name for a structure." It can scarcely be gainsaid that "input" is essentially as broadly generic in those terms as the term "circuit"--neither of those terms qualifies as a "definite structure" that satisfies the standard prescribed by the caselaw.

As with the other claim elements that have failed to avoid the impact of Paragraph 6, the claim element now at issue "will be construed to cover the corresponding structure…described in the specification and equivalents thereof" (the statutory prescription). N. Mem. 23-24 and N. Resp. 24-25 say nothing to counter Motorola's characterization of the specification's description, which therefore prevails.

"Adjustment Input Electrically Isolated" in the '356 Patent's Claim 5

M. Mem. 14-15 asserts that the isolated adjustment input structure for this claim element is limited to a rotary knob because the "adjustment input" is to be "electrically isolated from the power line terminals." That contention is based on Nilssen's response to a PTO office action in which he limited the claim element to a specification that recites "a manually rotatable external knob" as the structure for electrically isolating the adjustment input ( '356 Patent col. 3, lines 50-56).

Because that language is not qualified or constrained in an respect, Nilssen has expressly limited that element of his claim, so that prosecutorial estoppel applies. 24 This Court therefore construes the "adjustment input electrically isolated" language of Claim 5 in the '356 Patent to mean "a manually rotatable external knob."

24 This issue was not even discussed in Nilssen's initial memorandum, and N. Resp. 24 devoted only a single sentence to the question.

b. “advertisement data”

The term “advertisement data” appears in claims 3, 4, 7, 10, and 12 of the 834 patent and claims 1 and 8 of the 398 patent. In each instance, the term is coupled with an additional limitation, for example, at least one advertisement, a plurality of advertisements, and at least one time for the advertisement to be run. See Opening Brief, Ex. 6 at 10:30-31, 43-44, 62-63, 11:8-9, 34-12:3; Ex. 5 at 9:49-54, 10:5-6. Plaintiffs contend, therefore, that the term “advertisement data” must always be construed in light of how the term is used in each
They argue that the only generalization that can be drawn regarding “advertising data” is that it includes “data representing one or more advertisement or data representing one or more characteristics of an advertisement.” Id. at 25.

Defendants point to the specification and abstract of the 834 patent to support their contention that “advertisement data” means “digital data representing the identity of each advertisement and the number of times and when (in the day) each of the advertisements is to be run.” Resp. Brief at 25. Specifically, the abstract of the 834 patent states that “[t]he advertisement data represents an identity of each of the plurality of advertisements, and data representing times for each of the advertisements to be run.” Opening Brief, Ex. 6 at Abstract. The specification states that [a]lso downloaded with the advertisements is digital data representing the identity of each advertisement, the number of times, and when each of the advertisements is to be run. The advertisement data is stored at a separate location on the storage unit 93 so that they can be easily located and tracked.

*19 Id. at 9:8-12.

Construing “advertisement data” in the fashion suggested by defendants in all claims regardless of the additional limitations disclosed in certain claims would read particular phrases out of the patent. For example, claim 1 includes a limitation regarding “when and the number of times” the advertisements are to run. Defendants’ proposed construction would render that language superfluous, a result not permitted. See Curtiss-Wright Flow Control Corp., 438 F.3d at 1380-81; see also Phillips, 415 F.3d at 1314-15. The Court therefore adopts plaintiffs’ proposed construction.

A. The ’137 Patent and Related Prosecution History

The ’137 patent, entitled "Electronic Kiosk Authoring System," discloses a software program that allows a person to author user interfaces for electronic kiosks. "The authoring system enables the user interface for each individual kiosk to be customized quickly and easily within wide limits of variation, yet subject to constraints adhering the resulting interface to good standards of aesthetics and user friendliness."’137 patent, Abstract; see also id. at col. 3, ll. 28-32.

The authoring system gives the system author a limited range of pre-defined design choices for stylistic and functional elements appearing on the screens. Id. at col. 3, ll. 52-57. "[M]ajor aesthetic or functional design choices ...as well as hierarchical methods of retrieving information may be built into the system [while] taking into account the considered opinions of aesthetic design specialists, database specialists, and academic studies on public access kiosk systems and user preferences and problems.” Id. at col. 3, ll. 57-64.
Claim 1, the '137 patent's only independent claim, recites:

1. In an electronic kiosk system having a plurality of interactive electronic kiosks for displaying information provided by a plurality of information providers, a method for defining custom interface screens customized for individual kiosks of said plurality and operable to make different assortments of said information available for display at different kiosks of said plurality, said method comprising the steps of:

   providing a master database of information from said plurality of information providers, said master database referencing substantially all information content from said providers to be displayed on any of said plurality of kiosks;

   providing a plurality of pre-defined interface screen element types, each element type defining a form of element available for presentation on said custom interface screens, wherein each said element type permits limited variation in its on-screen characteristics in conformity with a desired uniform and aesthetically pleasing look and feel for said interface screens on all kiosks of said kiosk system,

   each element type having a plurality of attributes associated therewith, wherein each said element type and its associated attributes are subject to pre-defined constraints providing element characteristics in conformance with said uniform and aesthetically pleasing look and feel for said interface screens, and

   wherein said plurality of pre-defined element types includes at least one pre-defined window type, at least one pre-defined button type, and at least one pre-defined multimedia type;

   selecting a plurality of elements to be included in a custom interface screen under construction, said plurality of elements being selected from said plurality of pre-defined elements types, said plurality of selected elements including at least one button type;

   assigning values to the attributes associated with each of said selected elements consistent with said pre-defined constraints, whereby the aggregate layout of said plurality of selected elements on said interface screen under construction will be aesthetically pleasing and functionally operable for effective delivery of information to a kiosk user;

   selecting from said master database an assortment of information content deriving from selected ones of said information providers to define kiosk information content for an individual kiosk of said kiosk system;

   associating said kiosk information content with at least a portion of said selected elements for said interface screen under construction; and

   linking said at least one selected button type element to an action facilitating the viewing of at least portions of said kiosk information content by a kiosk user.

'137 patent, col. 20, l. 37-col. 21, l. 23 (emphases added). At issue in this appeal is the definiteness of "aesthetically pleasing" as it is used in the context of claim 1 of the '137 patent.

The "aesthetically pleasing" claim language was not discussed by the inventor or the patent examiner during prosecution of the application that led to the '137 patent. The language was discussed, however, during prosecution of a continuation application to the '137 patent, which eventually issued as United States Patent No. 6,460,040 ("the '040 patent"). The patent examiner reviewing the application leading to the '040 patent rejected a claim as being indefinite for using the phrase "aesthetically pleasing." In response to this rejection, the inventor argued that the phrase is definite, but ultimately deleted it, stating in part that it is "not intended to identify qualities separate and apart from the remainder of this claim element" and is "superfluous and unnecessary."

B. The District Court Proceedings

Datamize sued Plumtree Software, Inc. ("Plumtree") for infringing the '137 patent, and Plumtree responded by moving for summary judgment on the ground that the '137 patent is invalid for indefiniteness under 35 U.S.C. § 112, P2. The district
court granted Plumtree's motion, concluding that the '137 patent's only independent claim is indefinite due to use of the phrase "aesthetically pleasing."

The district court began its analysis of the definiteness of "aesthetically pleasing" by referring to dictionary definitions of the words "aesthetic" and "pleasing." The court determined that the ordinary and customary meaning of the phrase is "having beauty that gives pleasure or enjoyment" or, in other words, "beautiful," a meaning the court believed to be "quite subjective." Next, the court turned "to determine whether the patent's specification provides an explicit definition of the term that clarifies or differs from its ordinary dictionary meaning." After reciting parts of the specification, the court concluded that the specification does not limit the subjectivity of the phrase "aesthetically pleasing."

The district court then reviewed the prosecution history of the '137 and '040 patents. The court concluded that the prosecution history of the '040 patent "does not provide a more objective means of ascertaining the meaning of 'aesthetically pleasing. In fact, the prosecution history suggests that the language has little meaning at all."

The district court went on to compare the current case with several district court and Federal Circuit opinions addressing indefiniteness. It concluded that three district court cases deal with terms that are similar to "aesthetically pleasing" in that they are all terms "with very subjective ordinary meanings that are not sufficiently narrowed by the patents in question." See Mossman v. Broderbund Software, Inc., 1999 U.S. Dist. LEXIS 8014, No. 98-71244-DT, 1999 WL 696007 (E. D. Mich. May 18, 1999) ("readily follow"); STX, Inc. v. Brine, Inc., 37 F. Supp. 2d 740 (D. Md. 1999), aff'd, 211 F.3d 588 (Fed. Cir. 2000) ("improved handling and playing characteristics"); Semmler v. Am. Honda Motor Co., 990 F. Supp. 967 (S. D. Ohio 1997) ("considerable fuel savings"). On the other hand, the court rejected a comparison with two of our cases, since in those cases the terms were either "not controlled by individual subjective impressions" or "sufficiently well-defined by the patent to make the meaning of the entire term readily discernable." See All Dental Prodx, L.L.C. v. Advantage Dental Prods., Inc., 309 F.3d 774 (Fed. Cir. 2002) ("original unidentified mass"); Bancorp Servs., L.L.C. v. Hartford Life Ins. Co., 359 F.3d 1367 (Fed. Cir. 2004) ("surrender value protected investment credits").

The district court next rejected proposed constructions of "aesthetically pleasing" offered by Datamize, stating that "[t]he term 'aesthetically pleasing' must mean something different from predefined constraints or limitations" since "predefined constraints" are separate limitations in claim 1. Furthermore, the court stated that "aesthetically pleasing" must be given meaning and cannot be read out of the claim. The court also rejected the argument that "aesthetically pleasing" should be evaluated from the system author's view point and that anyone else's perception is irrelevant, stating that "the court would be hard-pressed to construe a patent term so that it would turn on the subjective beliefs of those individuals who will use the authoring tool."

Finally, the district court rejected expert testimony offered by Datamize for various reasons: expert testimony is disfavored and cannot vary or contradict claim language; the expert admitted that no objective measure of aesthetics is disclosed in the specification or any of various references; the expert relied upon an article published after the application for the '137 patent was filed; and the article relied upon admitted that no one knows how to measure aesthetic value and that some people doubt that it can be measured.

Concluding that the phrase "aesthetically pleasing" in claim 1 is "hopelessly indefinite," the district court granted Plumtree's motion for summary judgment of invalidity. Since claim 1 is the '137 patent's sole independent claim, the court's grant of summary judgment of indefiniteness as to claim 1 invalidated each claim in the '137 patent.

Datamize appeals the grant of summary judgment of invalidity for indefiniteness. We have jurisdiction under 28 U.S.C. § 1295(a)(1).

DISCUSSION

A. Standard of Review

We review a district court's grant of summary judgment de novo. High Concrete Structures, Inc. v. New Enter. Stone & Lime Co., 377 F.3d 1379, 1382 (Fed. Cir. 2004). "A determination of claim indefiniteness is a legal conclusion that is drawn from the court's performance of its duty as the construer of patent claims." Personalized Media Communications, L.L.C. v. Int'l Trade Comm'n, 161 F.3d 696, 705 (Fed. Cir. 1998). Thus, as with claim construction, we exercise de novo review over the conclusion that a claim is indefinite under 35 U.S.C. § 112, P.2. Id.
B. The Law of Indefiniteness

Every patent's specification must "conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P2 (2000). Because the claims perform the fundamental function of delineating the scope of the invention, Chimie v. PPG Indus., Inc., 402 F.3d 1371, 1379 (Fed. Cir. 2005), the purpose of the definiteness requirement is to ensure that the claims delineate the scope of the invention using language that adequately notifies the public of the patentee's right to exclude, Honeywell Int'l, Inc. v. ITC, 341 F.3d 1332, 1338 (Fed. Cir. 2003).

According to the Supreme Court, "[t]he statutory requirement of particularity and distinctness in claims is met only when [the claims] clearly distinguish what is claimed from what went before in the art and clearly circumscribe what is foreclosed from future enterprise." United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 236, 87 L. Ed. 232, 63 S. Ct. 165, 1943 Dec. Comm'r Pat. 758 (1942). The definiteness requirement, however, does not compel absolute clarity. Only claims "not amenable to construction" or "insolubly ambiguous" are indefinite. See Novo Indus., L.P. v. Micro Molds Corp., 350 F.3d 1348, 1353 (Fed. Cir. 2003); Honeywell Int'l, 341 F.3d at 1338; Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001). Thus, the definiteness of claim terms depends on whether those terms can be given any reasonable meaning. Furthermore, a difficult issue of claim construction does not ipso facto result in a holding of indefiniteness. Exxon Research & Eng'g, 265 F.3d at 1375. "If the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds." Id. In this regard it is important to note that an issued patent is entitled to a statutory presumption of validity. See 35 U.S.C. § 282 (2000). "By finding claims indefinite only if reasonable efforts at claim construction prove futile, we accord respect to the statutory presumption of validity and we protect the inventive contribution of patentees, even when the drafting of their patents has been less than ideal." Exxon Research & Eng'g, 265 F.3d at 1375 (citation omitted). In this way we also follow the requirement that clear and convincing evidence be shown to invalidate a patent. See Budde v. Harley-Davidson, Inc., 250 F.3d 1369, 1376 (Fed. Cir. 2001).

In the face of an allegation of indefiniteness, general principles of claim construction apply. See Oakley, Inc. v. Sunglass Hut Int'l, 316 F.3d 1331, 1340-41 (Fed. Cir. 2003) (noting that a determination of definiteness "requires a construction of the claims according to the familiar canons of claim construction"). Intrinsic evidence in the form of the patent specification and file history should guide a court toward an acceptable claim construction. Phillips v. AWH Corp., 415 F.3d 1303, 2005 U.S. App. LEXIS 13954, *35, No. 03-1269, -1286 (Fed. Cir. July 12, 2005) (en banc). And while "we have emphasized the importance of intrinsic evidence in claim construction, we have also authorized district courts to rely on extrinsic evidence," such as expert testimony. 2005 U.S. App. LEXIS 13954 at *37. In construing claims, "what matters is for the court to attach the appropriate weight to be assigned to those sources in light of the statutes and policies that inform patent law." 2005 U.S. App. LEXIS 13954 at *58.

C. Analysis

With these principles in mind, we proceed to the question at hand: whether the '137 patent's use of "aesthetically pleasing" meets the standards articulated in our case law concerning definiteness. We begin our analysis by noting our agreement with the district court's understanding that the ordinary meaning of "aesthetically pleasing" includes "having beauty that gives pleasure or enjoyment" or, in other words, "beautiful." We also recognize that the district court's opinion presents a reasoned and detailed analysis of both the intrinsic evidence, including the specification of the '137 patent and the prosecution history of the '040 patent, and the extrinsic evidence in the form of Datamize's expert testimony. Datamize, however, argues that the district court erred by considering the phrase "aesthetically pleasing" divorced from the context of claim 1.

Datamize is right to point out that the phrase "aesthetically pleasing" should be considered in the context of claim 1. Claim construction involves reviewing the intrinsic evidence of record, including the claim language itself. See Chimie, 402 F.3d at 1377; Abbott Labs. v. Syntron Bioresearch, Inc., 334 F.3d 1343, 1351 (Fed. Cir. 2003) (explaining that usage of disputed claim terms in the context of the claims as a whole informs the proper construction of the terms).

"Aesthetically pleasing" is used three times in claim 1. The first use of "aesthetically pleasing" relates to the look and feel of custom interface screens on kiosks:
providing a plurality of pre-defined interface screen element types, each element type defining a form of element available for presentation on said custom interface screens, wherein each said element type permits limited variation in its on-screen characteristics in conformity with a desired uniform and aesthetically pleasing look and feel for said interface screens on all kiosks of said kiosk system,

'137 patent, col. 20, ll. 50-57 (emphasis added). The second use relies on the first use for antecedent basis and similarly relates to the look and feel of interface screens:

each element type having a plurality of attributes associated therewith, wherein each said element type and its associated attributes are subject to pre-defined constraints providing element characteristics in conformance with said uniform and aesthetically pleasing look and feel for said interface screens,

Id. at col. 20, ll. 58-63 (emphasis added). The third use provides a slightly different context, relating to the aggregate layout of elements on the interface screen:

assigning values to the attributes associated with each of said selected elements consistent with said pre-defined constraints, whereby the aggregate layout of said plurality of selected elements on said interface screen under construction will be aesthetically pleasing and functionally operable for effective delivery of information to a kiosk user;

Id. at col. 21, ll. 6-12 (emphasis added). Thus, in the context of claim 1, "aesthetically pleasing" relates to the look and feel of custom interface screens on kiosks, and the aggregate layout of elements on an interface screen is apparently one example or aspect of the interface screens that may be "aesthetically pleasing."

This context, while helpful in terms of identifying the components of the claimed invention that must be "aesthetically pleasing," does not suggest or provide any meaningful definition for the phrase "aesthetically pleasing." Merely understanding that "aesthetically pleasing" relates to the look and feel of interface screens, or more specifically to the aggregate layout of elements on interface screens, fails to provide one of ordinary skill in the art with any way to determine whether an interface screen is "aesthetically pleasing."

Datamize, however, contends that when construed in the context of claim 1, the phrase "aesthetically pleasing" applies to the process of defining a "desired" result and not the actual result itself. Datamize believes a reasonable construction of "aesthetically pleasing" in the context of the claims involves the intent, purpose, wish, or goal of a person practicing the invention: that person simply must intend to create an "aesthetically pleasing" interface screen; whether that person actually succeeds is irrelevant. In other words, Datamize suggests we adopt a construction of "aesthetically pleasing" that only depends on the subjective opinion of a person selecting features to be included on an interface screen. Indeed, Datamize argues that the district court erred by requiring an objective definition for the phrase "aesthetically pleasing." Citing our decision in Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1575-76 (Fed. Cir. 1986), Datamize maintains that a claim term need not be subject to a single, objective definition to be definite but rather may include a subjective element. According to Datamize, subjective terms are permissible so long as one of ordinary skill in the art would understand their scope. In this regard, Datamize, citing Seattle Box Co. v. Industrial Crate & Packing, Inc., 731 F.2d 818, 826 (Fed. Cir. 1984), implies that "aesthetically pleasing" includes "words of degree" that are not fatally imprecise. Datamize also contends that the existence of aesthetic constraints in a computer program, as opposed to purely functional constraints, would be circumstantial evidence of a person's subjective "desire" to achieve an "aesthetically pleasing" look and feel for an interface screen. Related to these arguments, Datamize believes that the person practicing the invention is the "system creator," defined by Datamize as the person who creates the authoring software. According to Datamize, the appropriate inquiry would focus on whether a system creator makes aesthetic choices to limit or constrain the possible on-screen characteristics of screen elements since these choices would reflect a subjective intent to create an "aesthetically pleasing" look and feel for an interface screen.

Datamize's proposed construction of "aesthetically pleasing" in the context of claim 1 is not reasonable for several reasons. First and foremost, the plain meaning of the claim language requires that the look and feel of interface screens actually be "aesthetically pleasing." The first use of "aesthetically pleasing" in claim 1 clearly sets forth two requirements for the look and feel of interface screens: the look and feel must be (1) uniform and (2) "aesthetically pleasing." That the uniform and "aesthetically pleasing" look and feel must also be "desired" does not alter that fact.
Furthermore, in Orthokinetics we did not conclude, as Datamize suggests, that the absence of an objective definition for a claim term does not render the phrase indefinite. In that case we concluded that the phrase "so dimensioned" in the following limitation is not indefinite: "wherein said front leg portion is so dimensioned as to be insertable through the space between the doorframe of an automobile and one of the seats thereof." Orthokinetics, 806 F.2d at 1575. We noted that based on expert testimony it was undisputed that one of ordinary skill in the art would easily have been able to determine the appropriate dimensions that the claim language required. Id. at 1576. One desiring to build and use the invent on, a travel chair, "must measure the space between the selected automobile's doorframe and its seat and then dimension the front legs of the travel chair so they will fit in that particular space in that particular automobile." Id. The fact that the claims were intended to cover the use of the invention with various types of automobiles made no difference; we concluded that the phrase "so dimensioned" is as accurate as the subject matter permits since automobiles are of various sizes. Id. Thus, in Orthokinetics we recognized that an objective definition encompassed by the claim term "so dimensioned" could be applied to innumerable specific automobiles.

In stark contrast to Orthokinetics, here Datamize has offered no objective definition identifying a standard for determining when an interface screen is "aesthetically pleasing." In the absence of a workable objective standard, "aesthetically pleasing" does not just include a subjective element, it is completely dependent on a person's subjective opinion. To the extent Datamize argues that such a construction of "aesthetically pleasing" does not render the phrase indefinite, we disagree. The scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention. See Application of Musgrave, 57 C.C.P.A. 1352, 431 F.2d 882, 893 (C. C.P.A. 1970) (noting that "[a] step requiring the exercise of subjective judgment without restriction might be objectionable as rendering a claim indefinite"). Some objective standard must be provided in order to allow the public to determine the scope of the claimed invention. Even if the relevant perspective is that of the system creator, the identity of who makes aesthetic choices fails to provide any direction regarding the relevant question of how to determine whether that person succeeded in creating an "aesthetic ally pleasing" look and feel for interface screens. A purely subjective construction of "aesthetically pleasing" would not notify the public of the patentee's right to exclude since the meaning of the claim language would depend on the unpredictable vagaries of any one person's opinion of the aesthetics of interface screens. While beauty is in the eye of the beholder, a claim term, to be definite, requires an objective anchor. Thus, even if we adopted a completely subjective construction of "aesthetically pleasing," this would still render the '137 patent invalid.

Furthermore, "aesthetically pleasing" does not exactly compare to words of degree such as "substantially equal to," see Seattle Box Co., 731 F.2d at 826, "about," see BJ Servs. Co. v. Halliburton Energy Servs., Inc., 338 F.3d 1368, 1372-73 (Fed. Cir. 2003), or "substantial absence," see Exxon Research & Eng'g, 265 F.3d at 1380-81. The language, however, invokes a similar analysis. "When a word of degree is used the district court must determine whether the patent's specification provides some standard for measuring that degree." Seattle Box Co., 731 F.2d at 826. Similarly, when faced with a purely subjective phrase like "aesthetically pleasing," a court must determine whether the patent's specification supplies some standard for measuring the scope of the phrase. Thus, we next consult the written description. See id.; see also Chimie, 402 F.3d at 1377 (" When the claim language itself lacks sufficient clarity to ascertain the scope of the 'claims, we look to the written description for guidance." (quoting Deering Precision Instruments, L.L.C. v. Vector Distribution Sys., Inc., 347 F.3d 1314, 1324 (Fed. Cir. 2003))).

The inventor describes various advantages of his invention in the "Summary of the Invention" section of the '137 patent. Most relevant to the construction of "aesthetically pleasing," the inventor states:

The authoring system enables the user interface for each individual kiosk to be customized quickly and easily within wide limits of variation, yet subject to constraints adhering the resting [sic, resulting, see '137 patent, Abstract] interface to good standards of aesthetics and user friendliness. ...It is a further advantage of the present authoring system that an individual using the authoring software to devise a kiosk interface screen (that individual is referred to herein as a "system author") is only given a limited range of choices for stylistic and functional elements appearing in the screen displays. In this way major aesthetic or functional design choices such as button syles [sic] and sizes, window borders, color combinations, and type fonts as well as hierarchical methods of retrieving information may be built into the system taking into account the considered opinions of aesthetic design specialists, database specialists, and academic studies on public access kiosk systems and user preferences and problems.

'137 patent, col. 3, ll. 32; 28-52-64. Furthermore, in the "Detailed Description of Illustrative Embodiments" section of the '137 patent, the inventor, discussing a particular embodiment of the invention, states:
A closer look at the structure of the screen layout of FIG. 2A is in order. The buttons 21 have a fixed predefined size, which is chosen not only to make them aesthetically pleasing in appearance, but also easy to use on a touch screen by persons generally unpracticed with touch screen operation. The button placement in FIG. 2A is generally fixed along two adjacent edges. This is an aesthetic choice, but it is a choice that is forced by the authoring software to assure that once an aesthetically and functionally acceptable button size and layout has been chosen, it will be maintained throughout all further screen layouts for all kiosks without having to expend time and effort re-creating an acceptable button layout anew for each kiosk. Other aesthetic button layouts may also be used, but once a general button layout is devised, the software makes it available for use in all kiosk interface screens. Considering that many many [sic] screen layouts will generally have to be set up and then regularly revised, limiting the system author's freedom to devise new button patterns and button styles greatly enhances the ease with which new kiosks may be brought in operation and ensures that the button pattern will be aesthetically and operationally acceptable. ...The authoring system of the present invention then allows each kiosk to be customized quickly and easily while maintaining a high degree of variability in the screen layouts without sacrificing aesthetic appearance.

'137 patent, col. 5, ll. 35-56.

In general, neither these statements nor any others in the written description set forth an objective way to determine whether an interface screen is "aesthetically pleasing." The description of the advantages of the invention indicates that there are "good standards of aesthetics," which of course implies that there are also standards of aesthetics that are "not good." The inventor does not attempt to explain what distinguishes the two, except to say that experts, specialists, and academics may have views that are influential in determining what aesthetic standards are good. Some statements indicate particular aspects of the screen that might affect whether the screen is "aesthetically pleasing": button styles, sizes, and placements, window borders, color combinations, and type fonts. There is no indication, however, other than by referring to "the considered opinions of aesthetic design specialists, database specialists, and academic studies on public access kiosk systems and user preferences and problems," how to determine what button styles, sizes, and placements, for example, are "aesthetically pleasing." Moreover, what ever the considered opinions of unnamed people and studies say is altogether unclear.

And while the description of an embodiment provides examples of aesthetic features of screen displays that can be controlled by the authoring system, it does not explain what selection of these features would be "aesthetically pleasing." Major aesthetic choices apparently may include some aspect of button styles and sizes, window borders, color combinations, and type fonts. The written description, however, provides no guidance to a person making aesthetic choices such that their choices will result in an "aesthetically pleasing" look and feel of an interface screen. For example, the specification does not explain what factors a person should consider when selecting a feature to include in the authoring system. Left unanswered are questions like: which color combinations would be "aesthetically pleasing" and which would not? And more generally, how does one determine whether a color combination is "aesthetically pleasing"? Again, one skilled in the art reading the specification is left with the unhelpful direction to consult the subjective opinions of aesthetic design specialists, database specialists, and academic studies.

Simply put, the definition of "aesthetically pleasing" cannot depend on an undefined standard. See Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1342 (finding indefinite claim requiring comparison to moving target since the patent failed to direct those of ordinary skill in the art to a standard by which the appropriate comparison could be made). Reference to undefined standards, regardless of whose views might influence the formation of those standards, fails to provide any direction to one skilled in the art attempting to determine the scope of the claimed invention. In short, the definition of "aesthetically pleasing" cannot depend on the undefined views of unnamed persons, even if they are experts, specialists, or academics. Thus, the written description does not provide any reasonable, definite construction of "aesthetically pleasing."

We must also analyze the prosecution history to determine whether it provides any reasonable construction of "aesthetically pleasing." Vtronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582. Since the '040 patent is a continuation of the '137 patent, the '040 patent's prosecution history is relevant material that we should consider. See Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1349 (Fed. Cir. 2004) (recognizing that "the prosecution history of one patent is relevant to an understanding of the scope of a common term in a second patent stemming from the same parent application").

The attorney prosecuting the '040 patent responded to a rejection for indefiniteness of the phrase "aesthetically pleasing" by
making the following statements:

In context "aesthetically pleasing look and feel" is that which is "desired," "chosen," or "predetermined" for uniform appearance. It does not call for the subjective application of some external standard of aesthetics.

The "aesthetically pleasing" language is not itself intended to imply judgment on the relative artistic merits of the "look and feel."

One practicing the invention can create an "aesthetically pleasing look and feel" that is "desired" by that person and that is maintained as desired on screens of the system.

Whether the system creator's sense of aesthetics complies with some other standard of beauty or good taste is irrelevant to the claims.

The "aesthetically pleasing" language is not intended to identify qualities separate and apart from the remainder of this claim element. Accordingly, the deleted language is superfluous and unnecessary to the claims.

These statements merely confirm the understanding derived from the context of the claims and the specification: that the phrase "aesthetically pleasing" fails to delineate the scope of the invention using language that adequately notifies the public of the patentee's right to exclude. By arguing that "aesthetically pleasing" does not depend on any standard of aesthetics other than a purely subjective standard held by any person who steps into the role of the system creator, the prosecuting attorney would eliminate any objective meaning for the phrase "aesthetically pleasing." As discussed, this would be improper.

We next consult the extrinsic evidence in the record. See Frank's Casing Crew & Rental Tools, Inc. v. PMR Techs., Ltd., 292 F.3d 1363, 1374 (Fed. Cir. 2002); Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1216 (Fed. Cir. 1995) ("In construing the claims we look to the language of the claims, the specification, and the prosecution history. Extrinsic evidence may also be considered, if needed to assist in determining the meaning or scope of technical terms in the claims." (internal citation omitted)).

Datamize points to its expert, Jeremy Rosenblatt, who testified in a declaration that persons of ordinary skill in the relevant art would recognize that "[t]he terms 'aesthetic' and 'aesthetically pleasing' in the patent serve to make it clear that the motivation of limiting selection is to allow the system creator to enforce his/her will regarding the 'look and feel' and aesthetic aspects rather than solely functionality." The expert also provided a list of what he denominated "generally accepted" parameters of design that contribute to a display getting high marks from users for being "aesthetically pleasing." The list included symmetry, consistency, predictability, simplicity, cleanliness, and non-crowdedness. The expert concluded that in his opinion "one of ordinary skill in the art of software development of kiosks and computer user interfaces would understand the claims and be able to determine whether their own work was or was not covered by the claims in question."

The expert's declaration attempts to identify parameters that one skilled in the art might reference when attempting to determine whether an interface screen is "aesthetically pleasing." But the identification of parameters one might consider fails to explain how the parameters should be evaluated or weighed to reach the conclusion that an interface screen is "aesthetically pleasing." And while indefiniteness does not depend on the difficulty experienced by a particular person in comparing the claims with the prior art or the claims with allegedly infringing products or acts, see SmithKline Beecham Corp. v. Apotex Corp., 403 F.3d 1331, 1340-41 (Fed. Cir. 2005), even the expert could not determine whether the look and feel of particular interface screens are "aesthetically pleasing" using the parameters he specified, instead testifying that whether an interface screen is "aesthetically pleasing" is a "multidimensional question" that is "not amenable to a single-word answer. "The inability of the expert to use the parameters he himself identified to determine whether an interface screen is "aesthetically pleasing" militates against the reasonableness of those parameters as delineating the metes and bounds of the invention.

Datamize also argues that one of ordinary skill in the art would understand the phrase "aesthetically pleasing" to distinguish aesthetic constraints from purely functional constraints. To support this argument, Datamize first points to the Supreme Court's use of the phrase "aesthetically pleasing": "[t]o qualify for [design patent] protection, a design must present an aesthetically pleasing appearance that is not dictated by function alone, and must satisfy the other criteria of patentability."
Bonito Boats, Inc. v. Thunder Craft Boats, Inc., 489 U.S. 141, 148, 103 L. Ed. 2d 118, 109 S. Ct. 971 (1989) (emphasis added). According to Datamize, "[i]f the term 'aesthetically pleasing' is sufficiently definite for courts to apply in determining whether something qualifies for design patent protection, then it is also sufficiently definite for a trier of fact to apply in determining infringement." Datamize also points to Mr. Rosenblatt's declaration, which it believes shows that one of ordinary skill in the art would understand "aesthetically pleasing" to distinguish functionality from aesthetics. Datamize maintains that infringement could be shown by looking to constraints imposed by the system creator: aesthetic constraints, such as limitations in terms of size and placement of on-screen elements, would be objective evidence of the infringer's "desire" to achieve a "uniform and aesthetically pleasing look and feel."

We reject Datamize's attempt to rely on an understanding of the phrase "aesthetically pleasing" derived from design patent law. Use of the phrase "aesthetically pleasing" in design patent law relates to the threshold question of patentability. See Bonito Boats, 489 U.S. at 148. A design patent protects a particular ornamental, or "aesthetically pleasing" as opposed to functional, design. Id. (citing 35 U.S.C. § 171). In contrast, a utility patent protects "any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof," 35 U.S.C. § 101 (2000), the scope of which is defined by the patent's written claims, see Johnson & Johnston Assocs. v. R.E. Serv. Co., 285 F.3d 1046, 1052 (Fed. Cir. 2002) (en banc) ("[C]laims define the scope of patent protection."); see also 35 U.S.C. § 112, P2. In light of this basic difference between design patent law and utility patent law, it is clear that the understanding of "aesthetically pleasing" used in design patent law bears no reasonable relationship to utility patent law generally. Furthermore, Datamize has not pointed to any discussion in the '137 patent indicating that "aesthetically pleasing" means "aesthetic rather than functional" as opposed to its ordinary meaning of beautiful in the context of this patent in particular. Thus, while creative, Datamize's argument fails.

We also reject Datamize's more general argument, based on its expert's declaration, that one of ordinary skill in the art would understand the phrase "aesthetically pleasing" to distinguish aesthetic constraints from purely functional constraints. Datamize's argument, as well as its citation to its expert's declaration, improperly ignores the plain meaning of the claim language. Furthermore, its proposed construction would improperly eliminate the word "pleasing" from the phrase "aesthetically pleasing." See Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1582 (Fed. Cir. 1996); Allen Eng'g Corp. v. Bartell Indus., Inc., 299 F.3d 1336, 1349 (Fed. Cir. 2002). We would subvert the definiteness requirement if we allowed a word to be eliminated from a phrase when the phrase cannot be given a reasonable meaning except in the absence of that word. Furthermore, because the phrase "aesthetically pleasing" does not simply distinguish aesthetic constraints from purely functional constraints, Datamize's argument, again based on its expert's declaration, that infringement could be shown by determining whether aesthetic constraints are imposed by the system creator is irrelevant.

Finally, additional cases cited by Datamize at oral argument fail to persuade us that "aesthetically pleasing" can be given any reasonable meaning. Datamize points us to Koito Manufacturing Co. v. Turn-Key-Tech, L.L. C., 381 F.3d 1142 (Fed. Cir. 2004), and Combined Systems, Inc. v. Defense Technology Corp. of America, 350 F.3d 1207 (Fed. Cir. 2003). According to Datamize, these cases confirm that intent may properly form part of a phrase's claim construction.

Datamize apparently references the second footnote of Koito Manufacturing, which states:

The jury instruction stated that the "predetermined general direction" means the "prevailing direction of flow determined before injection of the liquid plastic into the mold." (Emphasis added). The instruction thus connotes an element of forethought and planning, which we note is a logically essential part of the patent. The mold designer must be aware of the flow direction that will result upon an injection of plastic so that he can assure himself that the next flow direction will be different. We have held that the construction of a patent term may require an actor to have knowledge of certain facts. See Combined Sys., Inc. v. Def. Tech. Corp. of Am., 350 F.3d 1207, 1211-14 (Fed. Cir. 2003) (construing "forming folds" to require "the deliberate and systematic creation of folds"). In the present case, Turn-Key chose to limit its claims with ascienter requirement and thus was correctly required to demonstrate foreknowledge of flow directions to prove infringement.

381 F.3d at 1150 n. 2. This footnote identifies the unremarkable proposition that a patent applicant may use claim language that requires a person to have foreknowledge of certain facts when practicing the invention. Consistent with this proposition, claim 1 is not indefinite for using the term "desired," which requires foreknowledge and even intent on the part of the person practicing the invention. Neither would claim 1 be indefinite if an "aesthetically pleasing" look and feel for an interface screen was objectively verifiable. For example, the "general direction" construed in Koito Manufacturing and the "folds"
construed in Combined Systems can be objectively verified and do not depend on a particular person's unfettered, subjective opinion. The '137 patent, however, fails to provide any objective way to determine whether the look and feel of an interface screen is "aesthetically pleasing." As explained above, claim 1 is indefinite for this reason.*

* In both its opening and reply briefs, Datamize states that in SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870 (Fed. Cir. 2004), we affirmed the district court's construction of "desired format" and that that construction supports its construction of "desired uniform and aesthetically pleasing look and feel" in the context of claim 1. We disagree. In SuperGuide, the parties did not dispute the district court's construction of "desired format" and so we did not reinterpret the phrase, let alone affirm the district court's claim construction. Id. at 883. We also did not address the definiteness of the district court's claim construction. See id. Finally, unlike the present case, the phrase at issue in SuperGuide did not involve any modifiers between the word "desired" and the noun it modified, "format."

CONCLUSION

"Aesthetically pleasing," as it is used in the only independent claim of the '137 patent, fails to "particularly point[] out and distinctly claim[] the subject matter which the patentee regards as his invention." See 35 U.S.C. § 112, P2. We therefore affirm the district court's grant of summary judgment of invalidity of all claims of the '137 patent.

108

B

This brings us to the next claim interpretation dispute in this case: the significance of the word "after" in the phrase "a cyclic redundancy checker for detecting errors in said assembled data after correction of said data by said correction circuitry." As our sequential view of the claim language would indicate, we agree with the Commission, which found that the device claimed in the '715 patent first performs error correction on an entire Sector of data, and then performs error detection with a cyclic redundancy checker on the entire corrected Sector of data. Referring to an embodiment of the invention, the written description states as follows:

The error correction circuitry would first perform Reed-Solomon error correction on each block of data. . . . Then, a cyclic redundancy check of the corrected data would be performed.

'715 patent, col. 6, ll. 30-39. Like the language of the claim, this passage demonstrates that the data error detection and correction circuitry first performs Reed-Solomon error correction on an entire block or Sector of CD-ROM data, and that after this first operation is complete, the error detection circuitry then performs a cyclic redundancy check on the output of the error correction operation.

As mentioned earlier, according to the Yellow Book, "P-codewords" and "Q-codewords" are associated with Reed-Solomon error correction, while the "EDC-codeword" is associated with error detection using a cyclic redundancy checker. With this in mind, the written description goes on to confirm the exact order of operations in the only embodiment disclosed in the '715 patent:

E01RQ-bit 5-Error Detect and Correct Request "1" enables the error correction and detection (ECC and EDC) logic to process the following CD-ROM blocks, according to the settings of QRQ and PRQ. "0" disables the ECC and EDC logic. Changes to E01RQ control the CD-ROM blocks following the next data sync. If both QRQ and PRQ are enabled, the ECC/EDC sequence is Q-codewords, P-codewords, EDC-codeword. If QRQ is enabled but PRQ is disabled, the sequence is Q-codeword, EDC-codeword. If QRQ is disabled but PRQ is enabled, the sequence is P-codeword, EDC-codeword. If both QRQ and PRQ are disabled, only the EDC-codeword is checked. Normally, QRQ and PRQ are enabled whenever E01RQ is enabled in order to provide maximum correction capability.

'715 patent, col. 12, ll. 44-55 (emphasis supplied). As the above passage plainly indicates, the only embodiment described in the '715 patent always performs error correction before performing CRC error detection. There is no mention in the '715 patent of any embodiments where the sequence of operations is reversed, or where error detection begins before error correction has been completed. As the above passage indicates, the only variations mentioned in the '715 patent simply
describe the possibility of eliminating some or all of the error correction steps. However, the embodiment where "both QRQ and PRQ are disabled" (i.e., where error correction is completely disabled) is inconsistent with the plain language of the asserted claims, which require that error correction take place, and that it be performed before CRC error detection.

Oak argues that reliance on the written description amounts to an impermissible importation of limitations from the preferred embodiment. We disagree. The sequential limitation is imposed by the claim language itself, and the written description simply confirms this understanding. There is no discussion anywhere in the intrinsic record of embodiments of "error detection and correction means" which do not operate in a straightforward sequential manner. More importantly, even if such a disclosure existed, these embodiments would not be covered by the language selected by the claim drafter. In Oak's own words: "Specifications teach. Claims claim." See Texas Instruments Inc. v. United States Int'l Trade Comm'n, 988 F.2d 1165, 1171, 26 U.S.P.Q.2D (BNA) 1018, 1023 (Fed. Cir 1993) ("To construe the claims in the manner suggested [by the patente] would read an express limitation out of the claims. This we will not do because 'courts can neither broaden nor narrow claims to give the patentee something different than what he has set forth.'" (quoting Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 396, 155 U.S.P.Q. (BNA) 697, 701 (Ct. Cl. 1967))).

109

1. "After the subscriber terminates the incoming call attempt"

It is not clear why the parties do not agree on what "after" means. The "control means" of claim 1 of the '964 patent must have the ability of "calling the subscriber remote telephone number through the first telephone connection means after the subscriber terminates the incoming call attempt and connecting to the subscriber telephone station." Defendants argue that "after the subscriber terminates the incoming call attempt" means that the subscriber is not called back "until a detection of the subscriber telephone handset going 'on-hook' to hang-up." Cygnus states that the phrase does not need construction, but also says that the phrase should be read to mean that the subscriber terminates the call before he is charged for it. Cygnus's support for this latter argument is that claim 11 of the '027 patent is a Jepson-style claim directed to "the improvement comprising using direct inward dialing for the initial call from the subscriber to the service, and the subscriber hangs up before there is a charge for the call from the subscriber to the service." Cygnus asserts that this claim "makes explicit what was implicit in the earlier patent."

The term "after" is not a technical telecommunications term but rather an ordinary English word. The limitations each side wish read into "after the subscriber terminates the incoming call attempt" are not supported by the clear language of the claim. "After the subscriber terminates the incoming call attempt" has a plain meaning and needs no interpretation.

110

B. "Accumulator Agency"

The term "accumulator agency" is found throughout the claims of the Patents. ACS's Motion for Summary Judgment is based on its contention that the prior art cited by PCSO does not disclose or suggest an accumulator agency. PCSO, on the other hand, asserts that an accumulator agency is either disclosed or suggested in the prior art. PCSO also contends that ACS's motion was brought prematurely because the Court had not yet construed the terms of the Patents. Because the parties have solely focused in their briefs on the interpretation to be given to the term accumulator agency, the Court will construe that term according to the Patents and use that interpretation to decide the Motion for Summary Judgment.

PCSO asserts the term "accumulator" should be defined as "a device or circuit unit performing one or more of the operations of storage, arithmetic, and logic, as in a computer, cash register, etc." PCSO asserts that "agency" should be defined as "the business of any firm, person, etc., empowered to act for another" or "an administrative division of government with specific functions." Thus, PCSO asserts that, based on the plain and ordinary meaning of the terms, an accumulator agency is merely a computer program or processor that can perform its functions on behalf of any number of entities, including government agencies. In the alternative, PCSO asserts that an accumulator agency can be a state, a state or state agency's bank, or a payroll service or processor.
ACS, on the other hand, defines an accumulator agency as a "processing station between the collector and the recipient/intermediary." ('107, c. 5, 17-19; '669, c. 5, 14-16.) ACS cites to language in the '107 Patent's preferred embodiment that defines a "collector" as "preferably an employer" (107 c. 5, 35-36) and describes a "recipient" at least in one place as a "custodial parent." (107 c. 8, 7-8.) ACS asserts that an accumulator agency cannot merely be a computer program or processor, because Figure 2 of the '669 and '107 Patents clearly reference that the accumulator agency has its own bank. ACS also claims that the accumulator agency cannot be a state or state agency because "accumulator agency" and "state" refer to different parties in the Patents' claim language. Specifically, ACS points to the fact that several of the claims reference transfers of information and payments between the accumulator agency and a state.

A review of the Patents shows that an accumulator agency is not merely a computer program or processor. A finding to the contrary would create the untenable situation in which a computer program or processor, apart from any organizational entity, operated with its own bank account. Thus, the Court determines that an accumulator agency must be some type of public or private entity. The Court next considers whether an accumulator agency can be a state or state agency. The Court finds that an accumulator agency cannot be a state or state agency. Both the terms "accumulator agency" and "state" are used throughout the Patents, but the terms are not used interchangeably. In addition, all of the drawings present in the Patents differentiate an "accumulator agency" from a "state."

A more difficult issue to resolve is whether an accumulator agency can be a bank. The Court finds that an accumulator agency can be a bank, but that it cannot be a bank whose sole involvement in the process is to receive funds and payment information on behalf of a state, state agency, or intermediary. The claims clearly differentiate the accumulator agency from the banks of a state, state agency, or an intermediary. For instance, Claim 13 of the '107 Patent describes a method of processing a payment whereby at one stage in the process the accumulator agency transfers a "payment from the ACH to an intermediary's bank for the benefit of an intermediary." (107, c. 21, 52-67.) Likewise, Claims 19-21 of the '669 Patent adopt verbatim the '107 Patent's language regarding the transfer of funds from an accumulator agency to an intermediary's bank. (669, c. 22, 18-20.) Thus, the Court finds that an accumulator agency can be a bank, but that an accumulator agency cannot be a bank whose sole purpose in the process is to receive funds and payment information on behalf of a state, state agency, or intermediary.

PCSOn's final contention is that an accumulator agency can be a payroll service or processor. A payroll service or processor is a business that provides certain payroll services, including, but not limited to: the basic calculating of employee payroll and tax obligations, the actual production of employees' checks, the preparation of management reports, and the preparation of certain tax forms. A payroll service or processor provides these services to businesses for a fee. The Court finds that a payroll service or processor could be an accumulator agency if it was found to perform certain functions described in the Patents.

Thus, based on the Patents' claim language and usage of the term in the specifications, the Court defines an accumulator agency as a non-state, third-party entity that collects payments and payment information from an individual or entity for a fee and passes along those payments and payment information either directly to a state's bank, a state agency's bank, an individual, or an individual's bank or indirectly to a state, state agency, or an individual.

Pursuant to this Court's Markman Order, the term "wafer" means "a thin, generally cylindrical, slice of semiconductor material used as a base for an electronic component or circuit." The term "a first axially symmetric region" means "a region that is symmetric about the central axis of the wafer." The term "substantially free of agglomerated vacancy [or interstitial] defects" means "a concentration of such agglomerated defects which is less than the detection limit of these defects, which is currently about 1000 defects/cm3." The term "agglomerated vacancy intrinsic point defects" means "defects caused by the reaction in which vacancies agglomerate to produce D-defects, flow pattern defects, gate oxide integrity defects, crystal originated particle defects, crystal originated light point defects, and other such vacancy related defects." Finally, "agglomerated silicon self-interstitial intrinsic point defects" means "defects caused by the reaction in which self-interstitials agglomerate to produce dislocation loops and networks, and other such self-interstitial related defects."
Pursuant to this Court's Markman Order, the term "wafer" means "a thin, generally cylindrical, slice of semiconductor material used as a base for an electronic component or circuit." The term "a first axially symmetric region" means "a region that is symmetric about the central axis of the wafer." The term "substantially free of agglomerated vacancy [or interstitial] defects" means "a concentration of such agglomerated defects which is less than the detection limit of these defects, which is currently about 1000 defects/cm3." The term "agglomerated vacancy intrinsic point defects" means "defects caused by the reaction in which vacancies agglomerate to produce D-defects, flow pattern defects, gate oxide integrity defects, crystal originated particle defects, crystal originated light point defects, and other such vacancy related defects." Finally, "agglomerated silicon self-interstitial intrinsic point defects" means "defects caused by the reaction in which self-interstitials agglomerate to produce dislocation loops and networks, and other such self-interstitial related defects."

Lucent contends that this term means "a collection of." (D.I. 379 at 29.) In support of its contention, Lucent cites a dictionary published in 2003. (Id.) Extreme contends that this term means "gathered into a mass or sum so as to constitute a whole." (D.I. 399 at 21.) In support of its contention, Extreme cites a dictionary published in 1981. (D.I. 384, Ex. 16.)

The filing date of the '650 patent application is December 6, 1988. ('650 patent.) Thus, the Court will choose the ordinary meaning of the term as advanced by Extreme. In the Court's view, the Court's construction is consistent with the plain language of the claim and the specification.

WeddingChannel argues that an "aggregated purchase list" is a list of items selected for purchase by a guest from more than one registry. The Knot argues that an "aggregated purchase list" is a collection of two or more registry items selected by a guest during a session from at least two different registries from at least two different registry database providers.

WeddingChannel argues that the following text from the specification supports its interpretation:

> In another aspect of the present invention, a query is received from a guest and multiple registry databases are searched… The guest may pick items in the registry for purchase while the registry is open. In a preferred embodiment, the guest may make additional queries. The additional queries may designate different registrants or additional event dates. As with the original query, each registry database is searched for matching registries. Unique identifiers, each representing a matching registry, are communicated to the guest. The guest selects one of the unique identifiers and the corresponding registry is opened. Items selected by the guest from the opened registry are added to an aggregated purchase list that includes all items selected by the guest from previously selected registries.

"753 Pat. at col 2, l. 57 - col. 3, l. 8.) According to WeddingChannel, the last sentence of this excerpt, which describes how items are added to the aggregated purchase list, contains no requirement that such items derive from the registries of more than one registry database provider. Rather, the sentence merely states that the items on the aggregated purchase list derive from more than one registry. Elsewhere, the specification states:

"One of the advantages of the present invention is that the guest may make multiple queries in a single Internet session 718. Each query 704 may be for a different party and/or event. Thus, in a single session, a guest may make several different selections, or purchases, from several different registry databases 120. Each selection made by a guest in a single Internet session is collected into an aggregated purchase list."
Id. at col. 9, ll. 21-29. WeddingChannel points out that this passage of the specification does not state that an aggregated purchase list must include items from different database providers. The text merely states that the aggregated list includes items derive from registries for "a different party and/or event."

The Knot argues that the ordinary meaning of "purchase list" is a list of items to be purchased, and the ordinary meaning of the term "aggregate" is "to collect into one mass." The Meriam-Webster Dictionary 33 (1997). 8 Based on these definitions, the Knot takes the position that an "aggregated purchase list" is a collection of purchase lists from different registry database providers. Furthermore, the Knot argues that its construction is consistent with the following text from the specification:

When the guest has finished making queries and selecting items, a single purchase transaction is performed. The purchase transaction includes the steps of producing a requisition for each registry database provider represented in the aggregated purchase list. Each requisition corresponds to a particular registry database provider and includes each item in the purchase list that originated from a particular registry database supported by the corresponding registry database provider.

'753 Pat. at col. 3, ll. 9-16. The Knot argues that this portion of the specification distinguishes between the "aggregated purchase list," which includes items from each registry database provider and the "individual purchase lists" from particular registry databases.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

8 WeddingChannel argues that this definition of the word "aggregate" is consistent with how the inventors used the term during the prosecution of the '753 patent. For example, the inventors stated that an "aggregated registry" is one that "consolidates all of the disparate registries that the registrant has created at different registry databases." (Qualey Decl. Ex. 4 at WC002875, Ex. 5 at WC002903.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The Knot argues that its construction of the term "aggregated purchase list" is further supported by the following text from the specification: "The advantage of an aggregated purchase list is that it provides convenience to the guest. Rather than executing a series of on-line sessions to buy registry items, a guest makes all necessary selections during one session." Id. at col. 9, ll. 64-67. The Knot point out that multiple sessions are not necessary if gifts are purchased from a single registry database provider.

Furthermore, the Knot points out that Figure 9 illustrates the fact that the aggregated purchase list shows multiple registry database providers from which the guest has purchased registry items.

As the Knot has stated, the plain meaning of "purchase list" is "a list of items to be purchased," and the plain meaning of "aggregated" is "to collect into one mass." Based on these plain meanings, the term "aggregated purchase list" means a list of items drawn from multiple purchase lists. That is, the plain meaning merely requires that the items on the "aggregated purchase list" be drawn from more than one registry; it does not impose the requirement that such items be drawn from multiple registry database providers.

Moreover, the Knot has failed to point to any intrinsic material evidencing "expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope" that would support the more restrictive definition that it advocates. ResQNet.com, Inc. v. Lansa, Inc., 346 F.3d 1374, 1384 (Fed. Cir. 2003) (quoting Teleflex, Inc. v. Ficosa North America Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002)).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

9 Indeed, the specification provides ample support for WeddingChannel's construction. The specification states that an "aggregated purchase list" is comprised of "all items selected by the guest from previously selected registries." Id. at col. 3, ll. 7-8. Furthermore, the specification provides that an "aggregated purchase list" contains "each selection made by a guest in a single Internet session." Id. at col. 9, ll. 26-28.
For example, lines 9-16 of column three of the specification, which the Knot cites in support of its construction, merely discloses that the ’753 invention generates vendor-specific requisitions after a guest has made purchases. Lines 64-67 of column 9, also cited by the Knot, states that the "aggregated purchase list" facilitates purchases from the registries of multiple registry database providers, but it does not attempt to impose limitations as to what constitutes an "aggregated purchase list." Finally, Figure 9, which the Knot cites, merely illustrates that an "aggregated purchase list" can include items selected from multiple registry database providers; it does not say that an "aggregated purchase list" must include items selected from multiple registry database providers.

Based on the foregoing, WeddingChannel's construction of the term "aggregated purchase list" is adopted.

C. "aggregation engine * * * storing the resultant aggregated data in a multidimensional data store"

This term "aggregation engine" appears in claims 1, 5 and 7-10 of the ’544 patent. Hyperion contends here, as it did for numerous terms in the ’604 patent, that "aggregation engine" should be interpreted as a means-plus-function term under 35 USC § 112(6). Hyperion asserts that the specification does not recite sufficient structure to perform the claimed function for an "aggregation engine" and therefore the term is indefinite and the claims in which it appears are invalid. Alternatively, Hyperion contends that the specification has not enabled one of ordinary skill to make and use the invention because "HyperRoll has failed to describe an aggregation engine that would be capable of storing the resultant aggregated data in a multidimensional data store." Hyperion Br at 25.

The court first addresses Hyperion's means-plus-function argument. Hyperion contends that the "aggregation engine does not connote sufficient structure to perform the storing function; at best it only connotes sufficient structure to perform the aggregation function." Hyperion Reply Br at 15. But this argument misses the point. The relevant question is whether the claim recites sufficient structure such that one of ordinary skill in the relevant art, having read the claim, could build an aggregation engine. Just because an engine is an "aggregation" engine does not preclude that engine from also performing some other function, such as storing data. And common sense dictates that storing data in a multidimensional database is not a particularly complicated action that would befuddle one of ordinary skill in the art. Accordingly, such a person likely could read the claim and build an aggregation engine that also stores data.

Moreover, Hyperion's enablement argument is without merit. Contrary to Hyperion's contention, the specification describes aggregation engines that store data. See ’544 patent at 7:37-40 ("[T]he aggregation engine carries out a high-performance aggregation algorithm and novel storing and searching methods within the MDDB."); id at 10:64-11:6 ("[A] stand-alone Aggregation Server of the present invention, having an integrated aggregation engine and MDDB * * * the stand-alone Aggregation Server performs aggregation functions * * * and multi-dimensional data storage functions * * * "). And as described above, because storing data in a multidimensional database does not appear to be a particularly difficult action for one skilled in the art, the court concludes that the ’544 patent has satisfied the enablement requirement for this term.

Accordingly, the court rejects Hyperion's proposed construction and declines to construe this term.

A. "Data aggregation server" and "stand-alone data aggregation server"

The term "data aggregation server" appears with the modifier "stand-alone" only in the preamble of independent claim 1 and in the preambles of its dependent claims. As used in claim 1, it is apparent that "data aggregation server" and "stand-alone data aggregation server" refer to the same structure. See ’544 patent at claim 1 ("A stand-alone data aggregation server" later referred to as "the data aggregation server comprising"). Hence, although these terms were briefed separately, the court construes them simultaneously.
Hyperion contends that "data aggregation server" means a "computer system programmed to perform data aggregation functions and not analysis or graphical user interface functions." Joint CI Const at 48. Hyperion further contends that a "stand-alone data aggregation server" is a "data aggregation server that is external (self-contained) and operable independently from an OLAP server." Id at 51.

HyperRoll contends that both of these terms should not be construed because Hyperion did not assert they needed construction in Hyperion's original Pat L R 4-1 contentions. Id at 48. Hyperion also contends that these terms do not need to be construed because they appear in only the preamble of the claims. HyperRoll Br at 4, 7. To the extent the court does construe these terms, HyperRoll defines "data aggregation server" as a "system or computer program for performing data aggregation functions" and "stand-alone data aggregation server" as a "data aggregation server that works with an independently operable OLAP server." Joint CI Const at 48, 51.

First, the preamble of independent claim 1 appears to limit claim scope because limitations in the bodies of various claims derive their antecedent basis from the preamble. Compare '544 patent at claim 1 preamble ("A stand-alone data aggregation server for use with any one of a plurality of different OLAP servers * * *"). See also Catalina Marketing Intl, 289 F3d at 808 ("[D]ependence on a particular disputed preamble phrase for antecedent basis may limit claim scope because it indicates a reliance on both the preamble and claim body to define the claimed invention. Likewise, when the preamble is essential to understand limitations or terms in the claim body, the preamble limits claim scope.").

Turning to construction of the term, the crux of the dispute between the parties appears to center on two issues: (1) whether the data aggregation server can perform "analysis or graphical user interface functions" or whether it is limited to performing "data aggregation functions" and (2) whether the data aggregation server is "external (self-contained) and operable independently from an OLAP server" or whether the server merely works with an independently operable OLAP server.

Regarding the first issue, the court finds that Hyperion's construction improperly limits the functions that a data aggregation server can perform. This is evident based on dependent claim 5, which states: "The stand-alone data aggregation [sic] server of claim 1, wherein computational tasks performed by the aggregation engine is [sic] restricted to data aggregation operations." Because Hyperion's proposed construction would render this claim superfluous, it conflicts with the doctrine of claim differentiation and is disfavored. See Free Motion Fitness, 423 F3d at 1351 (Fed Cir 2005) (quoting Comark, 156 F3d at 1187). On the other hand, HyperRoll's proposed definition for "aggregation server" is consistent with the specification and claim language. See, e.g., '544 patent at 10:17-21 ("[T]he stand-alone Aggregation Server [in FIG 6A] performs aggregation functions (e.g. summation of numbers, as well as other mathematical operations, such as multiplication, subtraction, division etc) and multi-dimensional data storage functions"); id at claim 1 (the "data aggregation server" includes an "aggregation engine" that "perform[s] data aggregation operations").

Turning to the second issue, HyperRoll appears to interpret the modifier "stand-alone" as requiring the OLAP server to be "independently operable." But "stand-alone" does not modify "OLAP server," "stand-alone" modifies "aggregation server," thereby suggesting that the aggregation server must be the claim element that is able to stand by itself.

But what does it mean to "stand alone?" The specification uses the term "external" interchangeably with "stand-alone." See '544 patent at 6:52-53 ("novel stand-alone (i.e., external) data aggregation server"). The specification also teaches that a stand-alone aggregation server could be physically external to an OLAP server. See, e.g., id at 13:19-27 ("[T]he Aggregation Server 603 can be plugged into (e.g. interfaced to) OLAP Servers (two shown as 605’ and 605”) of different users or vendors. * * * This dramatic move discontinues the restricting dependency of aggregation from the analytical functions of OLAP * * *"). But the specification further teaches that a "stand-alone" aggregation server need not be physically external to the OLAP server, as demonstrated by one embodiment in which the data aggregation server "shares the same hardware platform and operating system (OS) that [is] used to run the [OLAP server]." Id at 15:44-46. Hence, "standing alone" does not necessitate physical separation between the aggregation server and the OLAP server.

Rather, the specification consistently describes the "stand-alone" aggregation server as functionally separate from, but
working with an OLAP server. See e.g., FIGS 6A, 6E, 7A, 7B. It would appear that, at a minimum, this would require the software module for the stand-alone aggregation server to be "separate" from the software module for the OLAP server; otherwise, the "stand-alone" limitation would be meaningless. This usage fits with Hyperion's proposed construction, which requires the "stand-alone aggregation server" to be "external to" and operable independently from an OLAP server. Relevant technical dictionaries also support Hyperion's construction. See Webster's New World Computer Dictionary 354 (10th ed 2003) ("standalone ** [s]elf-sufficient; not requiring any additional component or service"); IBM Dictionary of Computing 644 (10th ed 1994) ("stand-alone ** [p]ertaining to operation that is independent of any other device, program, or system"); Microsoft Computer Dictionary 421 (4th ed 1999) ("stand-alone or standalone ** [o], pertaining to, or being a device that does not require support from another device or system, for example, a computer that is not connected to a network"). Accordingly, it appears that for an "aggregation server" to "stand alone," the aggregation server must be able to operate, at least to some extent, independently of the OLAP server.

In sum, the court adopts HyperRoll's definition of an "aggregation server" as a "system or computer program for performing data aggregation functions." The court adopts a blend on the parties' constructions for a "stand-alone aggregation server," which is "an aggregation server that could operate independently from, but works with, an OLAP server."

6. Construction of "Alerting the Subscriber for a Set Period Visually or until an Acknowledge Button is Depressed before the Set Period Expires"

Plaintiffs contend that the claim language "alerting the subscriber for a set period visually or until an acknowledge button is depressed before the set period expires" needs no construction. Defendants contend that this claim language should be construed as "[a]lerting for a specific period of time unless interrupted by manual intervention. n11 (Def.'s Handout p. 54.)

n11 Defendants propose essentially the same construction in their claim construction brief (See Def.'s Cl. Constr. Br. p. 22 (proposing that this claim language should be construed as requiring "a device that has some set period of alerting, rather than a device that alerts at variable speeds. In addition, this phrase also requires that the set time period may be interrupted.").)
n12 See also ’771 Patent, col. 11, ll. 18-22 ("The alert condition is latched for a predetermined period, or until either the acknowledge button switch 121, which is incorporated into the device is depressed, or until a telephonic device, plugged into the voice/FAX port jack 114, is picked up.") (emphasis added). This matter was not raised by the parties during the Markman hearing.

21 The term "algebraic function" is contained in claims 3, 13, and 16 of the '646 patent and claims 1 and 3 of the '612 patent.

The patents-in-suit both contain the claim term "algebraic function." The parties generally agree that a construction for this term should include "any operation in mathematics," but dispute whether the claim term includes "logic." PACid argues for a narrow claim scope under a theory of claim differentiation. OPENING at 9. PACid contends that an algebraic function is separate from a logic function because they are discussed separately in the claims and the specification for the patents-in-suit. Id. Defendants' contend that the patentee gave the claim term an explicit definition and the patent specifically explains that "algebraic function" "is to be understood" to include logic functions. RESPONSE at 23-24.

Starting with the language of the claims themselves, there is nothing that points towards a restrictive reading that would exclude logic, and the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using "words or expressions of manifest exclusion or restriction." Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002). In all five claims where this term appears, a plain reading does not present language excluding logic functions. In particular, while the claims occasionally juxtapose the terms "logic function" and "algebraic function," there is no claim usage requiring that these terms refer to mutually exclusive realms in math. In every claim instance, logic functions may be partially or entirely subsumed in algebraic functions. The same is true with respect to the specification where a form of the term "algebra" is repetitively used to describe an operation of the bit shuffling generator (Item 52, Figure 2). '646 patent at 3:22-26; 3:38-48; 3:49-53; 4:60-65; 5:44-50; and 8:52-55. Further, like the claims, while some of the specification references juxtapose the two terms, none of the references serve to re-define or constrain the term "algebra" to a realm of mathematics that would not include logic. One definitional specification reference, in fact, provides an express inclusion of logic within the realm of algebra:

It is to be understood that the algebraic function executed by the function generator 52, where two inputs... are subjected to a bit-shuffling mapping... can be any of numerous other logic, cryptographic, or algebraic functions that would protect the E-Key Seed from being discovered.

'646 patent at 5:44-50 (emphasis added). Thus, the specification states that the "algebra" performed by bit shuffling generator 52 is not confined to the XOR logic operation used in the example embodiment, '646 patent at 4:60-65, but may include "any of numerous other logic, cryptographic, or algebraic functions." This is further consistent with a commonly
accepted dictionary meaning that is inclusive of the logic functions associated with "Boolean algebra." See CHAMBERS 21ST CENTURY DICTIONARY 805 (1996); WEBSTER'S NEW WORLD DICTIONARY OF COMPUTER TERMS 298 (6th ed. 1997). Therefore, the patentee is entitled to the full scope of the claim language, and based on this record, the claims properly include "logic." In accepting the teaching of the '646 patent specification, the Court also rejects PACid's arguments that "algebraic function" is differentiated in the '612 patent. PACid maintains that based on claims 1 and 4 of the '612 patent, if the claim term included logic functions, it would "render claim 4 superfluous" because the dependent claim separately claims "algebraic, logic, and cryptographic functions." OPENING at 9; REPLY at 9. Contrary to this assertion, however, claim 4 does not alter the broad definition of "algebra." While claim 1 refers to "algebraic function" without limitation and is later narrowed by the step disclosed in dependent claim 4, nothing about claims 1 and 4 indicates that the term "algebraic function" would not remain inclusive of Boolean algebra. Even with the added step of "combining a constant value and a secret plural bit sequence in accordance with an algebraic function," a person of ordinary skill in the art would still read "algebra" to include Boolean concepts based in logic. Phillips, 415 F.3d at 1312 (Claim terms are "generally given their ordinary and customary meaning," the meaning that the term would have to "a person of ordinary skill in the art... at the time of the invention.").

Accordingly, the Court finds that the proper construction of the term "algebraic function" is "any operation used in mathematics or logic."
3. "A method of aligning an optical element in a telescope"

The next dispute concerns the phrase "[a] method of aligning an optical element in a telescope." The phrase appears in every claim in the '908 patent, either expressly or by reference. It appears twice in claim 1, once in the preamble and once in subpart (b).

The key term in this phrase is the word "aligning." As used in the '908 patent, the term "aligning" is construed to mean moving an optical element toward a collimated position in response to a projected reticle image.

Glatter argues that "aligning" means "moving an optical element in a telescope to its optimal position and angular orientation specified in the telescopes' [sic] design." (Def.'s Opp. Br. at 3.) LaserMax contends that "aligning" meant "moving an optical element in a telescope to a desired position." (Pl.'s Reply at 2.) The difference between the terms "optimal" and "desired" is a difficult one to parse. The language of the claims themselves offer little guidance as to the meaning of "aligning," as used therein. The tautological nature of claim 1 makes it difficult to discern a contextual definition of aligning. It claims a "method of aligning an optical element in a telescope" wherein the second step in the method is "aligning the optical element." '908 Patent at 6:29, 33. Thus, the claim itself offers little guidance in discerning a definition. Other claims, however, demonstrate that the choice of the word "aligning" may have been intended to mean more than simply moving or adjusting an element. Claim 18, for example, has "aligning" in the preamble, but uses the term "adjusting," in subpart (c), when indicating that one following the method would move an optical element. Id. at 7:13, 21-23. Therefore, it is unclear based on the claims alone, whether "aligning" means more than simply "moving to a desired position."

The specification provides some guidance in construing the term. Glatter originally construed "aligning" as "moving an optical element to an optimal position," but changed his asserted definition during the Markman hearing to "moving to an optical element in a telescope to its collimated position." (See Hearing Tr. at 33:6-11.) "Collimated" is a term of art in the field of optical devices that would be understood by a person of ordinary skill in the art. The specification uses variations of the word "align" several times. At one point, the specification uses the terms "properly aligned" and "collimated" as synonyms. First, the specification states that "Newtonian type telescopes are subject to misalignment of the optical elements. . . . A misaligned Newtonian telescope will exhibit an image of a star that looks like a comet with a tail." '908 Patent at 1:36-40. In describing how to determine whether the optical elements are aligned, the specification uses the phrase "in a properly aligned or collimated telescope." Id. at 1:43-46. According to the specification, the term "collimate" means "properly aligned," as opposed to "misaligned," and in a Newtonian telescope is characterized as an arrangement of the optical elements wherein "a laser beam is projected through an emission aperture to reflect off of the secondary mirror which directs it to the center of the primary mirror. The primary mirror reflects the beam back to the secondary mirror which then reflects it back to the emission aperture of the laser." Id. at 1:43-49. In other words, "the complete return of the emission aperture assures that the telescope is correctly aligned." Id. at 1:49-51. Thus, the specification indicates that "properly aligned" means "collimated." Aligning, therefore, means moving toward a collimated configuration.

Nonetheless, use of the word "collimated" should not be unduly limited to a single appropriate arrangement for the elements in a telescope. First, although the specification's description of "properly aligned" uses the components of a reflecting telescope as an example, refracting telescopes can also be collimated. See id. at 6:19-21. Second, at the Markman hearing, plaintiff and defendant agreed that there can be more than one "collimated position," depending upon the setup of the telescope, for example, collimation for use with a camera may be slightly different from collimation for use with the eye alone. (See Markman Tr. at 43:18-25.) Since the claims pertain to "optical element(s) in a telescope," the meaning of a claim term should not be limited based on potential uses that differ from one another due to a component that lies outside of the telescope, like the viewer's eye or a camera. Therefore, the word "collimated" restricts the term "aligning" to arrangement of the optical elements for use in a telescope (usually centering the elements along a line formed by the beam's center), but does not connote a single, objectively accurate position.
121

1. "alignment structure, in said computer" (claim 1)

PolyVision's proposed construction: The combination of hardware and software within the computer that provides for alignment.

Smart's proposed construction: Hardware and/or software within the computer that provides for alignment.

PolyVision contends that the term "alignment structure" is properly construed to mean both the hardware and the software in the computer that performs the alignment function on the touch-sensitive display screen. Smart contends that no construction is required because it contends, as it did above regarding the phrase "means for receiving said control signals and in response generating and projecting graphic images onto said touch sensitive display screen at said locations" in the '263 patent, that Federal Circuit case law holds that computer structure includes the software that is necessary to perform the claimed function. Although the Court rejected Smart's argument above, it notes that the instant claim language supports the conclusion that it includes not only the hardware but also the software for performing the alignment function. Finding little or no difference between the parties' proposed constructions, the Court concludes that PolyVision's construction comports with the claim language, and the Court will adopt that construction.

122

2. "All"

Liquidnet construes the term "all" as the "whole number or sum," 74 while ITG/Pulse defines it as "each and every." 75 I see little practical difference between these two constructions once the other terms in the claim are defined, and the parties have not pointed to any evidence that strongly suggests that one of these definitions is more accurate than the other. Therefore I will define "all" in the most common-sense way -- namely "each and every." 76

123

7. "Allotting a plurality of numbers from the predetermined range of numbers"

The parties disagree as to what "allotting a plurality of numbers from the predetermined range of numbers" means. They propose the following interpretations:

Term or Language Requiring Aristocrat's Proposed
Construction Construction
"allotting a plurality of Giving to the player a plurality
numbers from the of numbers from a range of
predetermined range of numbers determined in
In the case of a computer implementation of the method, the term "predetermined" can include "programmed" as in computer programming.

Term or Language Requiring Construction
"allotting a plurality of numbers from the predetermined range of numbers"

IGT's Proposed Construction
Selecting and assigning two or more numbers from the entire predetermined range of numbers. Each number within the predetermined range must be available for selection and assignment. This excludes selecting and assigning only one single number.

The predetermined range of numbers is a range of numbers that is determined before making a wager and before initiating the first main game.

a. "Allotting a Plurality of Numbers"

The '215 Patent describes two possible ways of determining whether the feature game trigger condition has been satisfied. In both embodiments, a single random number is selected from within a range. In the first embodiment, a game is allotted a set of numbers within that range. '215 Patent at 6:18-23; '603 Patent at 51-65. The size of that set of numbers (that is, the number of allotted numbers) is equal to the number of credits the player has bet. '215 Patent at 6:18-23; '603 Patent at 51-65. The trigger condition is satisfied when the random number matches one of the numbers in the allotted set. '215 Patent at 6:18-23; '603 Patent at 51-65. In the second embodiment, the game is allotted a single number corresponding to the number of credits bet. '215 Patent at 6:27-37; '603 Patent at 55-60. If, within the range of numbers, the randomly selected number is less than the single allotted number (called the "player value"), the feature-game trigger condition is satisfied. '215 Patent at 6:27-37; '603 Patent at 55-60. At issue is whether, as described in the second embodiment, the allotting of a single number is foreclosed by the claim's requirement that a "plurality of numbers" be allotted.

"Plurality" means at least two. York Prods., Inc. v. Cent. Tractor Farm & Family Ctr., 99 F.3d 1568, 1575 (Fed. Cir. 1996). Neither party disagrees. The dispute is whether "allotting a plurality of numbers" includes allocating "a single number" which is equal to, or proportional to, the number of credits bet and the trigger value is compared with the "single player value" and a jackpot feature awarded if the trigger value is less than or equal to the player value. '215 Patent at 6:28-32; '603 Patent at 5:58-60. Aristocrat contends that the single number or single player value referred to in the specification is a plurality of numbers because it represents the number and all those numbers less than the number. Aristocrat further points out that IGT's interpretation would exclude coverage of the alternative embodiment of the patent and that a claim interpretation that excludes a preferred embodiment "is rarely, if ever, correct." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996).

IGT points out, however, that the claim language expressly states "allotting a plurality of numbers" and the description of the alternative embodiment in the specification expressly says "a number is allocated" and refers to "the range of numbers below the allotted number." IGT CC at 16 (quoting '215 Patent at 6:18-23 (emphasis added)). Therefore, argues IGT, the claim language cannot include the alternative embodiment. The court disagrees. If Claim 1 of the '215 Patent is read in the context of the specification as a whole, the allocation of a number representing a range of numbers falls within the coverage of "allotting a plurality of numbers."
IGT also argues that Aristocrat gave up coverage of the alternative embodiment during prosecution to get around prior art and that Aristocrat abandoned claims that would have read on the alternative embodiment. Neither argument has merit. Nothing Aristocrat said during prosecution gave up a claim that involved allocating one number (e.g., 20) to represent a plurality of numbers (e.g., 1-20) nor does it appear that Aristocrat intentionally narrowed its claims. See SuperGuide Corp. v. DirectTV Enterprises, Inc., 358 F.3d 870, 875 (Fed. Cir. 2004). Under the alternative embodiment, then, each of the numbers below the player value are "allotted" to the player. The embodiment is therefore covered by the claim language.

b. "Predetermined Range of Numbers"

IGT contends that Aristocrat defined, in the prosecution history, "predetermined range of numbers" as a range of numbers determined before the beginning of the game. IGT CC at 18. IGT points to a prosecution-history document which distinguishes two pieces of prior art, the "Surprise Software Specification," and the "Torango '460 Patent" because "the range of the random number generator in the pending claims does not change during game play." Irvine Decl. Ex. D at 3. The specification supports this reading. The abstract of the '215 Patent states that the range is selected "prior to each game" and the flowchart in Fig. 2 refers to the range as "predetermined" in the first step. Aristocrat responds that the claims do not support this construction of "predetermined range" and that a person of skill in the art would understand the term otherwise. Pls.' Claim Construction Brief 13 (hereinafter "Aristocrat CC"). The court finds that the Aristocrat's statements in the prosecution history constitute a "clear disavowal of claim coverage." SuperGuide, 358 F.3d at 875. The predetermined range of numbers must therefore be determined before the beginning of the main game.

c. Must Each Number in the Predetermined Range Be Available for Allotment?

IGT also proposes that the claim requires that "each number within the predetermined range must be available for selection and assignment." Aristocrat responds that this means, "[i]n other words, if a particular IGT machine one[-]dollar machine had a 100,000 range of possible numbers from which numbers could be given to the player based on his or her bet size, but the particular slot machine, not surprisingly, did not accept $ 100,000 wagers, the IGT machine would not infringe." Aristocrat CC at 13. IGT does not respond in its claim construction brief, and the court agrees that the limitation has no basis in the claim language.

d. Construction of Language

The court construes the language at issue as "giving to the player two or more numbers from a range of numbers. The range of numbers must be determined before the beginning of the first main game. Each number in the predetermined range need not be available for allotment."

GO BACK

124

We conclude that the district court correctly construed these claim terms. The court construed "allowing" as "allow to begin." Ring Plus argues that the term should be construed as "allow to continue or to begin." Ring Plus's proposed construction conflicts with the required order of the claimed steps, which it does not appeal. The claimed algorithm (1c)) determines whether the line is busy, (1d)) allows a sound presentation if the line is not busy, and then (1e)) initiates the actions to play the message. The court held that the step of "allowing for" a sound presentation must be performed before the step of playing that presentation. Because a sound presentation cannot be "allowed to continue" before the presentation is first played, the required order of the steps necessarily indicates that "allowing" a sound presentation means allowing the presentation to begin. Indeed, if we construed "allowing" as Ring Plus proposes, the claims would recite the illogical sequence of allowing a sound presentation to continue before initiating the playing of that presentation. Step 1e) states "initiating those actions to play." If the sound presentation was playing in advance of or during the determination regarding whether the line is busy (step 1c), then the "initiating those actions to play" required by 1e would have already occurred. You cannot initiate the playing of the message as required by step 1e), if it has been playing all along. The court's construction is further supported by the specification, which consistently teaches that a sound presentation is not generated at all until after the algorithm determines that the recipient line is not busy. Id. col.6 l.62-col.7 l.2. Thus, the court did not err in construing "allowing" as "allowing to begin."
16. Allowing access to the client database

The court agrees with Seven that this term, as used in the '201 patent, needs no construction.

B. Claim Construction: allowing

The term allowing appears three times in Claim 40; however, the parties dispute its construction in only two phrases. The phrases at issue read:

- allowing the one or more merchants to select at least one of the localized geographic areas and at least one of the topical categories to list or display information pertaining to the one or more merchants;

- allowing the one or more merchants to input information into the system for viewing by the consumers on the one or more web pages;

Plaintiff asserts that allowing in each of these phrases means permitting. Defendant asserts that allowing means that the task must actually be completed for the next steps to occur. In other words, Defendant asserts that, rather than merely "permitting," the element requires that the merchant "actually" select a geographic area and topical category and "actually" input information into the system. (Def.'s Mem. Supp. Proposed Claim Constr. 14; Hr'g Tr. 106-08.) Defendant argues that all steps must actually be carried out in order for infringement to occur. (Def.'s Mem. Supp. Proposed Claim Constr. 14.) The Court does not disagree with Defendant's assertion regarding requirements for infringement; however, the issue as to if and how many merchants actually pick may be a damages issue addressed later in the lawsuit and is not properly at issue in claim construction.

The ordinary meaning of allowing is letting happen or permitting. (The American Heritage Dictionary of the English Language, 4th Ed. (2004)). As used in the claim, allowing does not mean that the acts accompanying the term must take place or "requiring," as Defendant proposes. There is no mandatory connotation to this word as used in the claim and throughout the Patent. Rather, in this claim and in other claims in this Patent, the term is used in a passive and permissive way. The Court finds no special or extraordinary meaning given to allowing in the Patent, nor does the patentee use language that limits or disavows its plain usage. Moreover, Defendant has not offered sufficient support to overcome the presumption that the word allowing means anything other than its ordinary meaning.

Because there is nothing in the patent history or specification that contradicts the ordinary English definitions, the Court interprets the phrase allowing the one or more merchants to select at least one of the localized geographic areas and at least one of the topical categories as means "permitting one or more merchants to choose or pick at least one localized geographic area and at least one topical category." Furthermore, allowing the one or more merchants to input information into the system means "permitting one or more merchants to create and post information to the system." 3

Footnotes

3 Input appears at various points throughout the '513 Patent. Defendant offers that the term means "to create or post." Plaintiff has not proposed a definition. It is clear from the prosecution history that the patentee intended input information into the system to encompass creating and posting information into the system. (See Pl.'s Claim Constr. Reply Brief 14) ((citing Joint App. A568, Mar. 24, 2004 Decl.) ("[T]he present invention permits the user to create and post . . . information onto the system using a substantially automated process.")) (emphasis added).
"Forcing", "Allowing" and "Clock Pulse Interval"

As noted in the fact section above, the '740 patent claims a novel two-wire bus protocol with unique start and stop control signals. The terms "forcing", "allowing" and "clock pulse interval" appear in, for example, claims 16-18 and are used to describe, in part, the functions of transmitting a clock signal, transmitting a start signal, transmitting a stop signal and transmitting binary data.

The Defendant argues that two transitions are required to cause a periodic clock signal at the clock terminal, a low to high transition (allowing) and a high to low transition (forcing), and that without both there is no clock signal. (Def. Br. at 27.)

Defendant argues that the phrase "allowing … to assume a second voltage level" must include the act of turning a transistor from ON to OFF and that the phrase "forcing … to a first voltage level" must include the act of turning a transistor from OFF to ON. (Def. Br. at 26-27.) In other words, if a switch is already turned OFF, it must be turned ON and then OFF again to "allow." Similarly, they argue that if it is already ON, it must be turned OFF and then ON again to "force." Defendants, arguments are without merit.

At the outset, Defendants' proposed interpretation is inconsistent with the claim language itself. Claim 16 describes "allowing" and "forcing" as continuous acts which occur over a period of time--like holding down a doorbell buzzer for thirty seconds--not as instantaneous acts--like turning ON or OFF a light switch. For example, the step of "transmitting a clock signal" requires "allowing the clock terminal … to assume a second voltage level during each of a series of periodic clock pulse intervals" and then "forcing … to a first voltage level at all other times." Similarly, the steps of "transmitting a start signal" and "transmitting a stop signal" require allowing or forcing "during a first fraction of a clock pulse interval." Also, the step of "transmitting binary data" requires allowing or forcing "during an entire clock pulse interval." The act of switching ON-to-OFF, or OFF-to-ON, is not recited or relevant to the claim. In other words, there is nothing in the claim that requires a transistor that is in the OFF state to be switched ON and then OFF again to "allow" or the reverse--ON-OFF-ON--to "force."

Defendants' proposed "turning the switch" interpretation for "allowing" and "forcing" is also contrary to the patent specification. A basic tenet of claim construction is that "the construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998); see also Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 326 F.3d 1215, 1222 (Fed. Cir. 2003) ("the intrinsic record must always be consulted to identify which of the different possible [ordinary] meanings is most consistent with the use of the words by the inventor"). Here, Defendants' interpretations conflict with not just one part of the '740 specification, but many.

For example, the start and stop signals described in the '740 patent are illustrated below:

Start and Stop Signals Shown in the '740 Patent

GET DRAWING SHEET 1 OF 3.

If the Defendants' "changing the switch" interpretation were adopted, the start and the stop signals would look as follows: 6

6 See Defendants' slide numbers 31 (start) and 30 (stop), presented during the May 30, 2003 tutorial. (Exhibit B, pp. 30-31.)
According to the Defendants' interpretation, a composite start signal, two-bit data transmission, and stop signal would appear as follows:

The stark contrast between the signals illustrated in Figure 3 of the '740 patent and those presented by Defendants confirms that the latter interpretation is not correct. The specification contains other descriptions that conflict with Defendants' interpretation. (E.g., '740 patent, Col. 1, line 48; Col. 2, line 8; Col. 3, lines 15-50.)

The plain meaning of the phrase "allowing ... to assume a second voltage level" requires only that the transistor be turned OFF, or kept turned OFF (i.e., kept in a nonconducting state), so that the voltage stays at a high ("1") logic level for the relevant time period. Similarly, the plain meaning of the phrase "forcing ... to a first voltage level" requires only that the transistor be turned ON, or kept turned ON (i.e., kept in a conducting state), so that the voltage is held at a low ("0") logic level for the relevant time period. When those definitions are applied consistently to the patent claims, they correspond exactly to the clock, start, stop, and data signals shown in Figures 2 and 3 of the '740 patent. (See figures on pp. 30, 32, 34, and 36 of Pl. Br.) Accordingly, Philips' proposed interpretations for the "allowing" and "forcing" elements are the proper constructions to be followed.

Defendants' argument that Philips' proposed claim construction is in some way "inconsistent" is without merit. (Def. Br. at 28-30.) Philips' interpretations are entirely consistent as demonstrated by, inter alia, the "allowing" and "forcing" illustrations in Philips' opening brief.

1. Principles of claim construction

Claim construction of a patent, including terms of art within claims, is exclusively within the province of the court, not the jury. Markman v. Westview Instruments, Inc., 517 U.S. 370, 388-8, 116 S. Ct. 1384, 134 L. Ed. 2d 577, 579 (1996).

It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history. See Markman, 52 F.3d at 979, 34 U.S.P.Q.2d at 1329. Such intrinsic evidence is the most significant source of the legally operative meaning of disputed claim language.

The first step is to look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention. Id. Second, it is necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. Id.

The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication. Id. "Claims must be read in view of the specification, of which they are a part." Id. (citing Markman, 52 F.3d at 979). The specification is always highly relevant to the claim construction analysis, and usually, it is dispositive; it is the single best guide to the meaning of a disputed term. Id. The drawings or figures of the patent are considered with the specification in interpreting claim language. Wright Medical Tech., Inc. v. Osteonics Corp., 122 F.3d 1440, 1443 (Fed. Cir. 1997).
Third, the court may also consider the prosecution history of the patent, if in evidence. Vitronics Corp., 90 F.3d at 1582.

In addition, the Court should not read into a patent limitations that do not exist in the claims. As the Federal Circuit recently held, "[t]he danger of improperly importing a limitation is even greater when the purported limitation is based upon a term not appearing in the claim." Amgen, Inc. V. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1325 (Fed Cir. 2003) (internal citations omitted).

Moreover, like contract interpretation, the Court should first give claim terms their ordinary and accustomed meanings.

Claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic evidence using words Or expressions of manifest exclusion or restriction, representing clear disavowal of claim scope.

Apex, Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1377 (Fed. Cir. 2003) (emphasis added).(citation omitted).

In fact, the Federal Circuit has issued a ruling instructive on this issue. In Rexnord Corp. v. Laitram Corp., 274 F.3d.1336, 1343-44 (Fed. Cir. 2001) the Federal Circuit overruled the district court's holding that the claim term "portion" was to be accorded a meaning narrower than its customary meaning, by finding that the district court had improperly relied on the preferred embodiment, the drawings, and one passage in the prosecution history to overcome the presumption.

Finally, if an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term, it is improper to rely on extrinsic evidence. Id. at 1583. Extrinsic evidence is that evidence which is external to the patent and file history, such as expert testimony, inventor testimony, dictionaries, and technical treatises and articles. Id. at 1584. Extrinsic evidence in general, and expert testimony in particular, may be used only to help the court come to the proper understanding of the claims; it may not be used to vary or contradict the claim language. Id.

This approach was affirmed in the Federal Circuit's most en banc decision, Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005). In that case, the Court reiterated that "[w]e have viewed extrinsic evidence in general as less reliable than the patent and its prosecution history in determining how to read claim terms." Id.

Following this guidance and framework, this Court finds that the '801 Patent's Claim 5 and the specification only requires that the microprocessor permits (allows) audio data to leave through the audio reproduction circuit and not that the audio data must always leave that way.

Additionally, nothing in the claim language, specifications, or prosecution history supports a finding that "allows" is limited to an understanding of "enable" meaning to turn on from a previously turned off starting point. As to "when," this term appears multiple times in the '801 Patent and none support an interpretation of "every time." "When" simply means that "at the time."

Here, it is inappropriate for this Court to find that Mediatek's argument is correct, as there is little to support overcoming the heavy presumption that the terms carry their ordinary meaning. As such, for the purposes of Claim 5 and its dependant claims 6 and 7, the plain terms are interpreted as (1) "allows" meaning "to permit" and (2) "when" meaning "at the time" instead of Defendants' more restrictive interpretation.

GO BACK

5. "wherein said identification encoder allows entry of a popularity code" (claims 6 and 27 of the '702 patent)

The disputed phrase "wherein said identification encoder allows entry of a popularity code" appears in claims 6 and 27 of the '702 patent. Acacia's proposed construction of the phrase is: "a popularity code is the symbols, letters, or words or combinations thereof used to represent the popularity of a particular item. The identification encoder allows entry of the popularity code." See Plaintiff's Claim Construction Brief at 28 (May 7, 2004).
Defendants contend that Acacia's definition is too broad. Defendants assert that the specification discloses a specific function in the transmission system "the popularity code can be used to determine the most appropriate form of media storage of the compressed data in a mixed media system." (Defendants’ Opposition to Plaintiff’s Claim Construction May 13, 2004 at 18) (citing ‘702 patent, col 12, 11. 8-10). "In some cases, where multiple compressed data libraries 118 are organized, the popularity code may dictate the distribution of a particular item to multiple distribution systems." (702 patent, 12:41-43).

"The storage encoding process performed by [the] identification encoder 112 allows entry of a popularity code." (‘702 patent, 12:4-5). According to figure 2a, the "identification encoding process" occurs as the first step of converting material in a source material library into a format suitable for storage in a compressed data library and subsequent transmission. (‘702 patent, fig. 2a). The specification indicates that the "popularity code is preferably assigned on the basis of how often the corresponding item is expected to be requested from the compressed data library 118." (‘702 patent, 12:6-8).

The specification mentions that the popularity code may be updated by "factoring item usage against system usage." (‘702 patent, 12:12-13). However, the specification does not disclose an algorithm, software program, or even a high level block diagram of how requests for a particular item (with copies possibly in other locations) is tracked by the popularity code and how the code is updated.

The specification does not disclose using a popularity code to retrieve items of information, but rather discloses the popularity code as a way of efficiently determining what storage media should be used for particular information to enhance retrieval. For example, how often an item of information is retrieved from the compressed data library determines whether the item is stored on cassette tapes (lower number of requests) or magneto-optical disks (highest number of requests). (‘702 patent, 12:20-23). If a popularity code is assigned, the popularity code dictates distribution of a particular item to multiple distribution systems. (‘702 patent, 12:41-43).

Acacia contends that the term "popularity code" has a plain and ordinary meaning such that the Court need not look to the specification to define the term. While a term "popularity rating" connotes a meaning that it is a rating of how popular an item is, the same does not hold true for a "popularity code." Even if the term had a plain and ordinary meaning, which it does not, the patentees acted as their own lexicographers in assigning a specific meaning to the term in one of the few portions of the specification that are unambiguous.

As defined in the specification of the ‘702 patent, the popularity code, if assigned, has no function separate from the compressed data library. (‘702 patent, 12:5-47). Accordingly, the Court construes "popularity code" to mean "a code that indicates initially the projected requests for an item of information in the compressed data library relative to other items contained therein for purposes of determining its place in the storage hierarchy; where said popularity code may be updated over time to reflect actual requests from users for particular information."

The Court construes "wherein said identification encoder allows entry of a popularity code" to mean "an identification encoder assigns an optional popularity code." 27

27 During the prosecution of the ’992 patent, the applicants disagreed with the examiner that Lang disclosed the recited "identification encoding means." The applicants explained that "the functions of the identification encoding means are to retrieve of [sic] information from the source material library means and to assign a unique identification code to the retrieved information." Id. Thus, in addition to retrieving information from a source material library means and assigning a unique identification code to the retrieved information, here said identification encoder must perform the additional step of assigning an optional popularity code.

End Footnotes

GO BACK
The court need only construe the term "alphanumeric keyboard" within claim 1 to decide the preliminary injunction application. Wireless proposes the following construction: "An alphanumeric keyboard is a regular arrangement of keys. When activated, these keys are used to generate the internal representation of symbols. Alphanumeric symbols include letters of the alphabet and numbers 0-9. Alphanumeric keyboards allow the generation of internal representations for this set of symbols." P. Reply Br. 8 (quoting Dr. Deffner Report P 31, P. App. 306). Sony submits the following proposed construction: "An input device having a QWERTY, FITALY, or Dvorak layout or any other alphanumeric layout that includes a substantially full set of alphabetic and numeric keys." D. Br. 8 (emphasis omitted).

n5 Wireless has submitted proposed constructions for ten terms within claim 1. For purposes of Wireless' preliminary injunction application, Sony does not dispute the proposed constructions of seven of the ten terms, but it does challenge the proposed constructions of three -- "hand-held," "body portion," and "alphanumeric keyboard" -- and maintains that a fourth term -- "high resolution" -- needs to be interpreted. Of these, the court need only construe the term "alphanumeric keyboard" to conclude that Wireless is not entitled to injunctive relief.

To support its proposed construction, Wireless relies exclusively on extrinsic evidence -- primarily the report of its expert, Dr. Gerhard Deffner ("Dr. Deffner"). The Federal Circuit generally views extrinsic evidence as "less reliable than the patent and its prosecution history in determining how to read claim terms." Phillips, 415 F.3d at 1318. The language of Wireless' proposed construction comes directly from Dr. Deffner's report. The report states in conclusory terms that the proposed construction is how "[a] person of ordinary skill in the art would understand" the term. P. App. 306. But "conclusory, unsupported assertions by experts as to the definition of a claim term are not useful to [the] court." Phillips, 415 F.3d at 1318.

n6 Wireless also points to various technical dictionaries to support its proposed construction. Under Phillips the court may review technical dictionaries "if the court deems it helpful." Phillips, 415 F.3d at 1318. Because the court is able to construe the disputed claim term based on intrinsic evidence, it need not resort to technical dictionaries. See Vitronics, 90 F.3d at 1583 (If "an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term . . ., it is improper to rely on extrinsic evidence.").

In addition, Wireless points to allegedly inconsistent positions that Sony and its expert, Dr. Brad A. Myers ("Dr. Myers"), have taken in other patent proceedings. This is also extrinsic evidence because it is external to the 173 patent and its prosecution history. See Phillips, 415 F.3d at 1317.

In contrast to Wireless' reliance on extrinsic evidence, Sony points primarily to the patent specification to support its proposed construction. Indeed, the text of its proposed definition comes directly from the specification. Compare D. Br. 8 with P. App. 20.

Because the meaning of the claim term "alphanumeric keyboard" as understood by persons of skill in the art is not immediately apparent, the court will interpret it by considering the intrinsic evidence. See Vitronics, 90 F.3d at 1582 ("It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record. . . ."). The court turns first to the specification of the 173 patent. The "Background of the Invention" section of the specification summarizes the configurations of several conventional wireless communication devices, including the mobile phone. It describes the mobile phone as typically including, inter alia, "a twelve-digit keypad designed for numeric data entry." P. App. 18. It then details shortcomings with each of the conventional wireless devices. It describes the following fundamental disadvantage with the mobile phone's twelve-digit keypad. Although the twelve-digit keypad usually supports some
alphanumeric data entry,

the commonly used method of accessing alphanumeric characters is to switch the device into a text entry mode, then press a key repeatedly to access a particular one of a subset of characters available for each key, this method being extremely slow, awkward, error prone, and not appropriate for a device intended to transfer textual data on a regular basis.

Id.

The "Summary of the Invention" section distinguishes between the invention's alphanumeric keyboard' and the mobile phone's keypad. "The alphanumeric keyboard is easier and faster to use and learn than the keypads . . . on most mobile phones. . . ." Id. at 20. It describes the alphanumeric keyboard as follows: "The keyboard may be a keyboard with a layout such as the common QWERTY' layout, but need not be limited to this particular layout. Other layouts may include the FITALY' layout, the Dvorak' layout[,] or any other alphanumeric layout that includes a substantially full set of alphanumeric keys." Id. (emphasis added). The specification explains the primary advantage of the invention's keyboard. In contrast to data entry using the mobile phone's twelve-digit keypad, which is "extremely slow, awkward, [and] error prone," id. at 18, the invention's "full alphanumeric keyboard allows the user to quickly and easily transmit messages and other textual and graphical communications in a complete and intuitive manner," id. at 20, and is "effortless to learn and use," id. n7

--- Footnotes ---

n7 Neither party has adduced evidence of the patent's prosecution history. Thus the specification is the only intrinsic evidence that the court will consider.

--- End Footnotes ---

Based on the intrinsic evidence, the court rejects Wireless' proposed construction of "alphanumeric keyboard." The patent specification unambiguously distinguishes between the invention's keyboard and the mobile phone's standard twelve-digit keypad. Because Wireless' proposed construction -- "a regular arrangement of keys" -- would include the twelve-digit keypad, it is simply too broad. Instead, the court adopts Sony's proposed construction, which is taken directly from the language of the patent specification.

Wireless contends that the court's adoption of Sony's proposed construction would be improper because it would use the patent specification to limit the scope of the claims. The court recognizes that it is prohibited from "limiting the claimed invention to preferred embodiments or specific examples in the specification." Tex. Instruments, Inc. v. U.S. Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed. Cir. 1986); see also Phillips, 415 F.3d at 1323 ("Although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments."). The court also "recognize[s] that the distinction between using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim can be a difficult one to apply in practice." Phillips, 415 F.3d at 1323. But because the court's analysis does not refer to the patent's preferred embodiment or to the numerous specific examples of other embodiments listed within the patent, the court is satisfied that it is relying on the specification to interpret the claims, not to improperly limit them.

D

The claims of the 173 patent do not read on the accused products. The Sony devices do not have an "alphanumeric keyboard," as the term is properly construed. Rather, they incorporate a typical twelve-digit numeric keypad, a power key, and a Sony operator-defined key. Like standard mobile phone keypads, the keys associated with the numerals 2 through 9 are also capable of inputting alphabetic characters in a text-entry mode. But the specification makes clear that this is the keypad configuration that suffers from the problems that the inventors sought to overcome by incorporating an alphanumeric keyboard that employs a substantially-full set of alphanumeric keys. Thus the court concludes on the present record that Wireless has failed to establish that it will likely prove infringement of claim 1 at trial. The remaining asserted claims are dependent on claim 1. Because dependent claims necessarily include all limitations of the claims on which they depend, Wireless has not demonstrated that it will likely prove infringement of any of the asserted dependent claims at trial.

The intrinsic evidence provides adequate grounds for the court to construe the term "alphanumeric keyboard." Accordingly,
the court does not rely on any extrinsic evidence, including expert reports. See Vitronics, 90 F.3d at 1583 (If "an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term . . ., it is improper to rely on extrinsic evidence.").

In their briefing on the summary judgment motion, the parties focus their arguments on the construction of "alphanumeric keyboard" alone, disregarding the remaining claim terms. Thus the court in deciding the motion will construe "alphanumeric keyboard" only. In its summary judgment motion, Sony urges the court to adopt its preliminary construction of "alphanumeric keyboard" as its final construction. Sony relies on the court's analysis of the intrinsic evidence in Wireless I, contending that this evidence dictates that an "alphanumeric keyboard" have a substantially full set of alphabetic and numeric keys and maintaining that Wireless cannot rely on extrinsic evidence to contradict the meaning of "alphanumeric keyboard" that is contained in the specification. Wireless posits that the court improperly construed "alphanumeric keyboard" on an incomplete record at the preliminary injunction stage and impermissibly limited the claims of the '173 patent to the preferred embodiment. Wireless also directs the court to the prosecution history of United States Patent Application No. 10/655,802 ("the '802 application"), which Wireless maintains supports a broader construction for "alphanumeric keyboard" than the one the court adopted in Wireless I. Sony replies that the '802 application's prosecution history does not support Wireless' assertions.

Because the parties' arguments are substantially the same ones made at the preliminary injunction stage, the court will address only the new claim construction evidence before issuing its final claim construction for "alphanumeric keyboard." Wireless submitted a November 29, 2005 notice of filing supplemental appendix to its brief in support of its motion to reconsider, which contains the prosecution history of the '802 application. Wireless filed the supplemental appendix even though the court had earlier denied Wireless' motion to reconsider and Wireless had already appealed the denial of the preliminary injunction motion and the motion to reconsider. Sony recognizes the "procedural impropriety" of Wireless' filing a supplemental appendix for a motion that had already been decided by the court and that was the subject of a pending appeal. D. Br. 2 n.6. Nevertheless, Sony does not object to the supplemental appendix; instead, it contends the '802 application's prosecution history does not support Wireless' assertions.

Wireless avers that during the prosecution of the '802 application -- which it maintains has an identical specification to that of the '173 patent -- the Patent and Trademark Office ("PTO") Examiner ruled that an "alphanumeric keyboard" should be construed to include "a qwerty, a Fitaly, a Dvorak or a twelve-key keyboard." P. Br. 3 (emphasis omitted) (quoting P. Supp. App. 32-33). Wireless contends the prosecution histories of related applications are highly relevant and useful evidence in determining a patent's scope, and that the PTO Examiner's conclusion is wholly consistent with Wireless' construction of "alphanumeric keyboard" as specifically including a twelve-digit keypad. Sony alleges that Wireless has misrepresented the prosecution history of the '802 application. It maintains that, in response to the PTO's rejection of all claims in the '802 application, Wireless removed the word "alphanumeric" from the claims, and that the PTO Examiner made no conclusions relating to the construction of "alphanumeric keyboard."

The prosecution history of the '802 application is extrinsic evidence. See Phillips, 415 F.3d at 1317 (holding that extrinsic evidence "consists of all evidence external to the patent and prosecution history" (quoting Markman, 52 F.3d at 980)). As such, it is less reliable than the '173 patent's specification in construing that patent's claim terms, and the court should discount it if it is clearly at odds with the claim construction mandated by the intrinsic evidence. See id. at 1317-18. And because, as the court held in Wireless I, "the intrinsic evidence provides adequate grounds for the court to construe the term 'alphanumeric keyboard,'" Wireless I, 390 F.Supp.2d at 540, it is improper for the court to rely on extrinsic evidence,
including the '802 application's prosecution history. See Vitronics, 90 F.3d at 1583 (If "an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term . . ., it is improper to rely on extrinsic evidence.").

Moreover, even if the court were to afford great weight to the '802 application's prosecution history, it does not support Wireless' assertions. To support its contention that the PTO Examiner "ruled that an 'alphanumeric keyboard' should be construed to include 'a qwerty, a Fitaly, a Dvorak or a twelve-key keyboard,'" P. Br. 3, Wireless cites claims 67, 68, and 69 of the '802 application. Claim 67 depends on claim 1, claim 68 depends on claim 31, and claim 69 depends on claim 56. At one point, claims 1 and 31 required, inter alia, "an alphanumeric keyboard carried by the body portion." P. Supp. App. 16, 25. In response to PTO action, the '802 applicant amended claims 1 and 31 such that the "alphanumeric keyboard" limitation was removed. These claims now include the limitation of "a keyboard carried by the body portion." Id. at 15, 16, 25. Claim 56 also contains the limitation of "a keyboard carried by the body portion." Id. at 30. Claims 67, 68, and 69 each contain the limitation that the "keyboard [be] selected from the group of a qwerty, a Fitaly, a Dvorak or a twelve-key keyboard." Id. at 32-33. Wireless' contention that this language is somehow equivalent to a ruling by the PTO Examiner regarding the construction of "alphanumeric keyboard" is incongruous. To the extent that claims 67, 68, and 69 might enlighten a person of ordinary skill in the art as to whether a claim term includes "a twelve-key keyboard" in its definition, that term is "keyboard," not "alphanumeric keyboard."

Relying only on the intrinsic evidence of the '173 patent as the court explained in Wireless I, the court adopts its tentative construction of "alphanumeric keyboard" at the preliminary injunction stage as its final construction. Thus the court construes "alphanumeric keyboard" as an input device having a QWERTY, FITALY, or Dvorak layout or any other alphanumeric layout that includes a substantially full set of alphabetic and numeric keys.

DISCUSSION

This appeal turns entirely on the correct construction of the term "alphanumeric keyboard." We construe the term "alphanumeric keyboard" without deference to the district court's claim construction. Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1347 (Fed. Cir. 2005).

The scope of the term "alphanumeric keyboard" is not readily apparent from the face of the claim, and there is no common dictionary definition of this term. n2 However, the term "alphanumeric keyboard" "must be read in view of the specification, of which [it is] a part." Phillips, 415 F.3d at 1315 (internal quotation marks and citation omitted). The specification is "the single best guide to the meaning of a disputed term." Id. (internal quotation marks omitted). Here, it is clear to us, as it was to the district court, that an "alphanumeric keyboard" is an input device having a QWERTY, FITALY, or Dvorak layout or any other alphanumeric layout that includes a substantially full set of alphabetic and numeric keys, and that it does not include a twelve-digit keypad.

n2 See Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005) (en banc) (noting that where the meaning of a claim term is readily apparent, claim construction involves "little more than the application of the widely accepted meaning of commonly understood words" and, in such cases, "general purpose dictionaries may be helpful").

First, the description of the invention in the "Summary of the Invention" section of the specification states:

The keyboard may be a keyboard with a layout such as the common "QWERTY" layout, but need not be limited to this particular layout. Other layouts may include the "FITALY" layout, the "Dvorak" layout or any other alphanumeric layout that includes a substantially full set of alphanumeric keys.

'173 patent, col. 5, ll. 6-11 (emphasis added). The description clearly depicts the claimed invention as having "the common 'QWERTY' layout" or "any other alphanumeric layout that includes a substantially full set of alphanumeric keys." This
description is not merely referring to a preferred embodiment; rather, as part of the "Summary of the Invention," it is "commensurate with the invention as claimed." 37 C.F.R. § 1.73 (2004). Therefore, to allow Wireless to claim a keyboard with less than a substantially full set of keys would injure the public's right "to take the patentee at [his] word." Honeywell Int'l, Inc. v. ITT Indus. Inc., 452 F.3d 1312, 2006 U.S. App. LEXIS 15553, F.3d , No. 05-1407, 2006 WL 1703376, at *6 (Fed. Cir. June 22, 2006).

Wireless argues that the specification cannot be used to define the term "alphanumeric keyboard" because at the end of the specification the '173 patent contains the following boilerplate language:

"Although the invention has been described with reference to a particular embodiment, this description is not meant to be construed in a limiting sense. Various modifications of the disclosed embodiments as well as alternative embodiments of the invention will become apparent to persons skilled in the art. . . . It is therefore contemplated that the appended claims will cover any such modifications or embodiments that fall within the scope of the invention."

'173 patent, col. 13, ll. 20-28. We see nothing in this language that contradicts our reading of the specification.

Second, the specification explicitly references the disadvantages of keypads that have only twelve digits, such as the accused device. For example, in describing the disadvantage of the mobile phone twelve-digit keypad, the specification states:

"The mobile phone configuration has the following disadvantages . . . the keypad is typically a twelve-digit keypad designed for numeric data entry, although the keyboard usually supports alphanumeric character entry . . . whereby the commonly used method of accessing alphanumeric characters is to switch the device into a text entry mode, then press a key repeatedly to access a particular one of a subset of characters available for each key, this method being extremely slow, awkward, error prone, and not appropriate for a device intended to transfer textual data on a regular basis. . . ."

'173 patent, col. 2, ll. 39-58 (emphasis added). Further, the specification distinguishes the "alphanumeric keyboard" from the keypads on most mobile phones by stating "[t]he alphanumeric keyboard is easier and faster to use and learn than the keypads and touch screens on most mobile phones and personal digital assistants." '173 patent, col. 5, ll. 4-6.

We have previously recognized that "[w]here the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question." Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001). In Honeywell Int'l, Inc., 2006 U.S. App. LEXIS 15553, F.3d , a case involving similar circumstances, we found that the claim term "electrically conductive fibers" excluded carbon fibers because the specification's "repeated derogatory statements concerning one type of material [carbon fibers)] [was] the equivalent of disavowal of that subject matter from the scope of the patent's claims." Id., 2006 U.S. App. LEXIS 15553, 2006 WL 1703376 at *7. Here too, the specification's repeated derogatory statements about the twelve-digit keypad convince us that the "alphanumeric keyboard" does not include a twelve-digit keypad.

n3 This is not a case like Gemstar-TV Guide Int'l, Inc. v. ITC, 383 F.3d 1352 (Fed. Cir. 2004), where the references to problems with the prior art appear only in the description of the preferred embodiment. Id. at 1365.

Wireless also urges that we look to extrinsic evidence, including a statement by its expert witness that "an 'alphanumeric keyboard' is a regular arrangement of keys." J.A. at 407 (emphasis added). Wireless's expert concluded that the accused device "includes a regular arrangement of keys, i.e., a keyboard, which allows users to generate all the letters of the alphabet and the numbers 0 through 9." J.A. at 415. We find that the expert's statement is conclusory and is unsupported by reference to any contemporaneous document and therefore of no value in our claim construction analysis. Phillips, 415 F.3d at 1318.

Wireless also points to the fact that the Patent and Trademark Office allowed certain claims of Wireless's related patent
application ("the '802 application") to cover a twelve-digit keyboard. The allowed claims of the '802 application do not
include an "alphanumeric keyboard." That allowance has no bearing on the construction of the term "alphanumeric
keyboard." Wireless also cites to various patent applications filed by Sony, arguing that Sony's patents describe a twelve-
digit keypad as an alphanumeric keyboard. None of the references cited by Wireless contains a definition of alphanumeric
keyboard that is contrary to the district court's claim construction here. In any event, the specification here is clear and the
expert testimony and other extrinsic evidence cannot be used to contradict it.

For the foregoing reasons, we conclude that the district court's claim construction was correct. The undisputed evidence
established that the accused device utilized twelve keys rather than a substantially full set of alphanumeric keys. The
preliminary injunction was therefore properly denied. We affirm.

1. "alterable"

Claim 12 of the '616 Patent describes a program memory that includes "at least one alterable AED operating parameter."
The parties dispute the meaning of the word "alterable." Philips asserts that "alterable" should be construed as "able to be
modified or changed to different values in the field by a user." Cardiac Science contends that "alterable" should be defined
as "able to be modified or changed." Thus, the dispute is over the use of "to different values in the field by the user" in
Philips' proposed construction.

In support of its construction, Philips points to the following language from the specification:

Such alterations should be capable of being performed locally in the field after the AED has been delivered to the end
user.

('616 Patent at c. 1, ll: 46-48.)

The present invention substantially meets the aforementioned needs of the industry by providing a parameter altering
capability. These alterations may be performed locally in the field without recourse to factory assistance.

(Id. at c. 1, ll: 51-55.)

The AED includes apparatus for altering at least one AED operating parameter value in the field, the operating parameter
value being programmed in the microprocessor. The apparatus for altering is an information storage medium disposed
operationally exterior to said case and that is selectively communicatively coupled to the microprocessor.

(Id. at c. 2, ll: 7-13.)

An advantage of this capability is that this update may be readily made in the field, without the need to remove the AED
10 from service and return it to the factory for update.

(Id. at c. 14, ll: 26-29.)

Being able to update the AED 10 in the field by means of a data card 29, ensures that all AED's 10 are readily configured
with the latest software program improvements without being removed from service in order for the update to be installed.

(Id. at c. 14, ll: 35-39.)

The Court finds support in the specification for Philips' construction that the AED parameters can be changed "in the field."
The title of the patent further reflects this intent. However, the Court sees no other support to limit the claim in the manner
Philips suggests. Thus, the Court construes "alterable" as "able to be modified or changed in the field."
21. "an alterable memory" (’409 patent, claim 8)

AVID argues that the term should be construed to mean "memory wherein the stored data can be changed." AVID cites the specification at 1:64-68, 2:13-17, and 2:36-43 as support.

The Defendants' proposed construction is "a second type of memory, physically different from the first type of memory, which store data capable of being altered by a user." The Defendants also submit an alternative construction of "a reprogrammable type of memory, physically different from the first type of memory, in which the data can be changed." The Defendants argue that the term "alterable memory" has no accepted meaning in the art. As such, the Defendants point to the specification, which states: "Another portion of the data to be transmitted is stored permanently in a reprogrammable type of memory wherein the stored data can be altered even after the tag has been implanted in the object that is subject to identification." 2:13-17. The Defendants argue that the description of the EEPROM 252 at 6:60-7:2 is consistent with their proposed construction. Furthermore, the Defendants argue that the specification makes clear that "unalterable data" is stored in a first non-reprogrammable memory 258 and "alterable data" is stored in a second reprogrammable memory 252. Thus, while two distinct and separate types of memory are described in detail (i.e., laser PROM 258 and EEPROM 252) for storing "unalterable data" and "alterable data," the Defendants claim there is no suggestion in the ’409 patent that a single memory could be used to store both types of data.

Despite the Defendants' arguments to the contrary, the Court agrees with AVID's proposed construction. The claim does not require a first or second "type of memory," nor does it require that the alterable memory be physically distinct from the unalterable memory.

2. "alterable storage location"

The parties dispute whether this term should be ascribed its ordinary meaning. 3Com offers the dictionary-derived construction "a storage location whose value is changeable." Doc # 81 (05-0098) at 1. Realtek argues that "alterable" does not mean simply "changeable," but rather "dynamically changeable." Doc # 333 (03-2177) at 19-21. Realtek thus proposes the construction "a storage location whose value is dynamically changeable." Doc # 81 (05-0098) at 1.

Realtek once again suggests "dynamically" to capture the repeated nature of the operation. For example, Realtek quotes a passage in the specification that status information "may be used by the host processor as feedback for optimizing the threshold value in the alterable storage location." Doc # 333 (03-2177) at 20. Realtek, however, fails to show that repeated nature is required by the specification. The word "may" in the quoted passage undermines Realtek's argument by declaring that usage of the status information is optional. Accordingly, the court declines to add "dynamically" to the construction.

Realtek argues that "claims should not be interpreted so broadly as to read on prior art." Doc # 333 (03-2177) at 21. The Federal Circuit has explicitly "limited the maxim to cases in which 'the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous.'" Phillips, 415 F.3d at 1327, quoting Liebel-Flarsheim, 358 F.3d at 910. Claim one is not ambiguous. Accordingly, the court adopts "storage location whose value is changeable."

2. Altering (claims 1, 30, 46, 50) 4

For purposes of claim construction, the parties appear to use the words "altered," "altering," and "adjusting" interchangeably. The Court will also use them interchangeably.
Plaintiff one or more techniques selected from the group consisting of adding, removing, isolating and shielding a known fraction of said initial amount.

Defendant a two-phase manufacturing process in which a lot or test characterization is performed, and the initial amount of an oxidizable or reducible species is altered or adjusted to bring it within a desired or target.

For its proposed construction, defendant relies on the language in claims 30 and 46, which include the terms "initial amount" as the thing to be altered. (Def.'s Mem. in Opp'n, 20.) Based on the claim language, defendant argues that "the plain meaning of claim terms 'initial amount' or 'original amount' is the first or beginning amount of oxidizable and reducible species on each iontophoretic device . . . the plain meaning of the terms 'altering' and 'altered' requires a change or variation from that beginning amount." (Id. at 20.) Defendant also argues that the specification shows that the two-step process was necessary to avoid encompassing prior art. (Def.'s Mem. in Support Summ. J., 19.)

Plaintiff's construction simply quotes the language of the claim itself. (014 Patent, col. 8, lines 44-48.) Under plaintiff's proposed construction, a two-phase process is not required. In addition, plaintiff notes that the prosecution history does not suggest that specifically a two-phase manufacturing process, rather than a one-step "altering" process, was necessary to avoid encompassing prior art.

The Court adopts plaintiff's proposed construction of the term "altering." First, plaintiff's proposed construction relies on the claim language itself. Phillips, 415 F.3d at 1312-13. Second, defendant's construction of "altering" would impermissibly import the two-phase manufacturing process limitation from a dependent claim -- claim 32 -- into an independent claim -- claim 30. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004) ("the presence of a dependent claim that adds a particular limitation raises a presumption that the limitation in question is not found in the independent claim"). Therefore, the Court construes the claim term "altering" to mean: one or more techniques selected from the group consisting of adding, removing, isolating and shielding a known fraction of said initial amount.

---

4. "altering the threshold"

This term is offered for construction only for purposes of the '094 patent and appears in claim forty-seven. '094 patent at 32:58. The dispute centers not on the phrase as a whole but on the term "altering." 3Com proposes "changing." Id. Realtek proposes "dynamically changing." Id.

As discussed above, Realtek suggests "dynamically" to capture the repeated nature of the operation. Doc # 333 (03-2177) at 23-25. Although the specification contemplates practicing the method multiple times, there is no evidence that the specification requires practicing the method multiple times or that the method is inoperative if practiced only once.

Because Realtek's construction is flawed and 3Com has not provided any reason why this seemingly simple term must be construed, the court declines to construe the term "altering."

---

138

e. Altering the First Facial Display

The defendants also argue that the "altering" step of claim 1 must include the use of measurement data. The claim reads: "altering under the control of both sets of said data and a programmed digital computer the configuration of said first facial display to produce substantially the configuration of the second facial display." "Both sets of data" clearly refers to the two sets of "data in digital form" discussed above. Consistent with the construction of the "generating" steps, therefore, the two "sets of data" refer to the data representing the configuration of the first facial display, which includes both lip position data and control point data, and the data representing the configuration of the second facial display, which includes only lip position data.

Bloomstein's proposed construction is too broad. He contends that the altering step encompasses any manipulation of the pixels in the digitized, first facial display to conform to new and different words. As discussed, the claim language requires...
that any manipulation be accomplished "under the control of both sets of data." Construed in light of the specification, this requires that the new lip configuration be calculated according to lip position data and control point data. Without such a limitation, the "generating" steps would be wholly superfluous.

The specification supports this interpretation: "While the new and original lip movement measurements will be used to control the amount of alteration of each frame the standard facial curves will control the location of the alterations." Joint Memorandum, Ex. 1 at column 7:32-35.

Footnotes
1. Bloomstein submitted an affidavit claiming that his program allows direct entry of control points. See Bloomstein Affidavit of February 9, 1996, at P 3. Defendants dispute that the referenced lines of the program allow direct entry of control points. The court finds that the (English) text of the claims and specification controls and that resort to the computer program is unnecessary and inappropriate.

139

The parties next set their sights on the term "altering voids." IP contends that the term should bear its ordinary and customary meaning and that one of ordinary skill in the art at the time of filing would understand what "altering voids" means. Lexmark and Dell ask that this term be construed to mean filling voids by varying the input signal without modifying the on and off times of the signal carrying the image.

Lexmark and Dell again point to the prosecution history to support their argument. During prosecution, Cooper attempted to distinguish his invention from the prior art by pointing out that the prior art only modified the on and off times of an input signal. In a response to an office action, Cooper cited three prior art references to the examiner. He went on to explain what each patent disclosed and why his invention was distinguishable. He differentiated the first on the basis that, unlike his invention, it did not modify character scanning or fill voids except by modifying the length of a horizontally adjacent character element via the on and off times of character elements. This operation also affected the size of the object. See S/N 355,461 O.A. response 12/11/91 at 17. Similarly, with respect to the second prior art patent, Cooper contended that the invention did not fill voids or modify the laser beam used in constructing the image except in modifying the on and off times of the beam. See id. at 18, 19. The third discussion proceeded on similar lines. Id. at 20.

The doctrine of prosecution disclaimer provides that, if a patentee disclaims or disavows certain subject matter in order to obtain patentability, the disclaimed matter cannot be recaptured during claim construction. See Omega Engineering, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003). This prevents a patentee from construing the claims of the patent narrowly before the PTO to achieve patentability but later attempting to broaden the same claims when asserting infringement. Autogiro Co. of America v. United States, 384 F.2d 391, 399, 181 Ct. Cl. 55 (Ct. Cl. 1967). Here, Cooper introduced to the examiner three prior art patents related to printers and distinguished each from his invention by pointing out that no voids are filled, and that the patents only modify the on and off times. In so doing, he clearly and unambiguously disclaimed simple modification of on and off times of the input signal. Thus, we agree with Lexmark and Dell to a point, but their proposed definition goes further to exclude any way of altering a void that includes modifying on and off times, even if that is done in combination with some other method. The court therefore construes the term to mean filling voids by varying the input signal without solely modifying the on and off times of the signal carrying the image.
Claim 15 also discloses a step that includes "altering voids in said image in response to said comparing step thereby improving the apparent resolution of the image . . . ." Again, no dispute appears to exist. IPI defines "altering" as meaning a thing different in some respect, to change its characteristics, position, etc., or to modify. See The New Shorter Oxford English Dictionary on Historical Principles 60 (1993). This definition is consistent with the term's use in this claim, as well as other claims throughout the '780 patent that disclose various ways in which an image can be improved, including changing the size, position, or shape of image elements to fill a void or altering the signal illumination. Moreover, Sony disputes IPI's proffered definition only to the extent that the parties disagree on the appropriate scope of the term "void."

Thus, the Court adopts the following interpretation of "altering voids": to make a void different in some respect, to change its characteristics, position, etc., or to modify the void (as the Court has previously defined the term "void").

2 "A" and "B" represent node type. See Col. 2:40-44 ("All the strips 24A of the first layer and the strips 26A of the second layer are connected to form a common node. Likewise, the strips 24B of the first layer and the strips 26B of the second are connected to form a second common node.").
to mean "strips in a given layer of the capacitor structure are connected to either the first node or second node in a manner such that adjacent strips of the capacitor structure are not connected to the same node."

B. "Aluminum and Aluminum Oxide"

Claim 1 of the Ingrey patent claims "a process for gaseous etching of aluminum and aluminum oxide." Samsung contends the language "aluminum and aluminum oxide" must be construed to mean substantially pure aluminum together with the oxide that forms naturally upon it, not any aluminum-based alloy together with its aluminum oxide layer. Samsung manufactures semiconductors from alloys such as aluminum silicon or aluminum silicon copper.

Samsung submits evidence that persons ordinarily skilled in the art in the mid-1970s would understand aluminum to mean substantially pure aluminum. Cecchi Decl. PP 30-32. In support of its position, Samsung argues that etching of aluminum alloys poses different problems than those posed by the etching of pure aluminum. Specifically, etching aluminum alloys requires an additional step of removing a silicon or copper residue that is left on the chip surface after the aluminum is removed.

Northern Telecom submits evidence, contrary to that offered by Samsung, that a person ordinarily skilled in the art in the mid-1970s would understand aluminum and aluminum oxide to encompass aluminum alloys. See, e.g., Taylor Decl., Exs. 51 & 52. Thus, Northern Telecom argues that Samsung's manufacture of semiconductors from aluminum alloys such as aluminum silicon or aluminum silicon copper is included within the scope of the Ingrey patent.

1. Intrinsic Evidence

As Vitronics makes clear, a court constructing a claim must rely primarily on "intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics, 90 F.3d at 1582. Of paramount importance are the words of the claim itself, which should generally be given their "ordinary and customary meaning." Id. Although "a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning," he or she may do so only if "the special definition of the term is clearly stated in the patent specification or file history." Id.

Here, the Ingrey patent claims a process for the plasma etching of "aluminum and aluminum oxide." In the patent, aluminum and aluminum oxide are specified and they are referred to by their periodic table notations (i.e. Al and Al2O3) (subscript notation not available). No alloys are mentioned by name or by their compound periodic table notations. Neither the claim itself nor the specifications specially defines the meaning of either aluminum or aluminum oxide. In addition, the prosecution history of the Ingrey patent contains no information, such as representations by the patent applicant, that is helpful in determining whether "aluminum and aluminum oxide" should be read to include aluminum alloys.

Because terms in a claim are to be given their "ordinary and customary meaning," this court finds that aluminum alloys are not included within the scope of the Ingrey patent. Northern Telecom has offered no intrinsic evidence showing that aluminum alloys are encompassed within the terms "aluminum and aluminum oxide." Rather, Northern Telecom relies on extrinsic evidence such as the testimony of experts 14 to support its claim that "aluminum and aluminum oxide" should be construed to include aluminum alloys. However, as Vitronics makes clear, extrinsic evidence in general, and expert evidence in particular is to be used "only if the patent documents, taken as a whole, are insufficient to enable the court to construe disputed claim terms. Such instances will rarely, if ever, occur." Vitronics, 90 F.3d at 1585. Thus, the court concludes that the term "aluminum and aluminum oxide" in the Ingrey patent refers solely to substantially pure aluminum and its native layer of aluminum oxide, and not to alloys such as aluminum silicon or aluminum silicon copper.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

14 Even were the court to find that the intrinsic evidence was insufficient to enable it to construct the disputed term, Northern Telecom would probably not be able to rely on expert testimony. Even in the "rare instances" where extrinsic
evidence is necessary to construct a claim, expert testimony is frowned upon. Vitronics, 90 F.3d at 1585. Instead "prior art
documents and dictionaries . . . are more objective and reliable guides. Unlike expert testimony, these sources are accessible
to the public in advance of litigation," and "are to be preferred over opinion testimony." Id.

--- End Footnotes ---

III

Samsung cross appeals the district court's construction of claim 1 and grant of summary judgment of infringement in favor
of Northern Telecom. In particular, Samsung challenges: (a) the district court's construction of "aluminum and aluminum
oxide" to mean pure aluminum and its native oxide layer without further limitation; and (b) the district court's conclusion
that "plasma etching," as claimed in the '967 patent, encompasses processes that combine chemical reactive etching and ion
bombardment. We take these arguments in turn.

A

To the district court, Samsung asserted that "aluminum and aluminum oxide," in claim 1, means pure aluminum and
aluminum oxide -- that is, not any other metals or alloys in combination with aluminum. See Northern Telecom, No. C-95-
499, slip op. at 31. After analyzing the intrinsic evidence of record, the district court agreed with Samsung's construction
and concluded that the '967 patent "refers solely to substantially pure aluminum and its native layer of aluminum oxide, and
not to alloys such as aluminum silicon or aluminum silicon copper." Id., slip op. at 33. Nevertheless, the district court found
that Samsung's process literally infringes the '967 patent because pure aluminum is indisputably present in the aluminum
silicon alloy that is etched in that process. See id., slip op. at 34. That is, the district court concluded that there was no
genuine dispute of fact that Samsung's process does indeed etch "aluminum and aluminum oxide" as claim 1 requires. See
id. The court reasoned that the additional etching of the silicon and copper in the Samsung process was simply an additional
step or aspect of the accused process and thus did not prevent a finding of literal infringement. See id.; see also e.g., A.B.
Dick Co. v. Burroughs Corp., 713 F.2d 700, 703, 218 U.S.P.Q. (BNA) 965, 967 (Fed. Cir. 1983) ("It is fundamental that one
cannot avoid infringement merely by adding elements if each element recited in the claims is found in the accused device.").

On appeal, Samsung does not dispute that its accused process etches "aluminum" as defined by the district court: that is,
aluminum -- in the aluminum silicon or aluminum silicon copper alloys -- is etched by the Samsung process. Instead,
Samsung presents to this court yet another interpretation of the "aluminum and aluminum oxide" limitation of claim 1.
Specifically, Samsung now asserts that the aluminum must be arranged in a "layer" to meet the requirements of the
"aluminum and aluminum oxide" limitation, notwithstanding that the term "layer" does not appear anywhere in the text of
claim 1.

We note at the outset that we look with "extreme disfavor" on appeals that allege error in claim constructions that were
advocated below by the very party now challenging them. Key Pharms. v. Hercon Labs. Corp., 161 F.3d 709, 714-15, 48
U.S.P.Q.2d (BNA) 1911, 1915 (Fed. Cir. 1998). In this case, because we find little merit to its arguments on this point, we
need not address whether Samsung is judicially estopped from challenging its own claim construction adopted by the trial
court. See, e.g., Yniguez v. Arizona, 939 F.2d 727, 738 (9th Cir. 1991) (judicial estoppel "prevents a party from changing its
position over the course of judicial proceedings when such positional changes have an adverse impact on the judicial
process.").

1

Samsung's first argument is that the district court's construction of "aluminum" -- as pure elemental aluminum -- would
work (in its view) the "absurd" result that claim 1 could cover processes where even very small (i.e., "trace") amounts of
pure aluminum were etched. In essence, Samsung appears to suggest that the additional "layer" limitation must be read into
the claim to ensure that only larger (i.e., non-"trace") quantities of etched aluminum are covered by the '967 patent. We
reject this contention. Not only is the term "layer" not found in claim 1, but neither is a limitation that establishes a
minimum quantity of aluminum that must be etched to meet the claim. This court has repeatedly and clearly held that it will
Accordingly, we hold that the district court's construction of "aluminum and aluminum oxide" in claim 1 was correct.
CLAIM CONSTRUCTION

On appeal, SVI asserts that the Special Master erroneously construed two limitations in claims 1 and 32 of the '740 patent—the "intelligent prompt" clause and term "amenity identification information." Claim construction is a question of law that we review de novo on appeal. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed Cir. 1998) (en banc). Proper claim construction requires analysis of the patent record's intrinsic evidence—the claim language, the written description, and the prosecution history. See Vitronics Corp. v. Conectarison, Inc., 90 F.3d 1576, 1582-83, 39 U.S.P.Q.2D (BNA) 1573, 1576-77 (Fed. Cir. 1996). Resort to extrinsic evidence for purposes of claim construction is appropriate only if, after a review of the intrinsic evidence, the meaning of a claim term remains ambiguous. See Key Pharms. v. Hercon Labs. Corp., 161 F.3d 709, 716, 48 U.S.P.Q.2D (BNA) 1911, 1917 (Fed. Cir. 1998).

2 When interpreting claims, a special master or a district court should follow this court's precedent and construe claims without recourse to the accused device, or their own personal beliefs of what the law should be.

During prosecution of the '740 patent, the Patent and Trademark Office examiner rejected claims 1 and 32 as obvious over U.S. Patent No. 5,077,607 ("the Johnson patent") in light of U.S. Patent No. 4,700,386. The Johnson patent teaches a system that allows hotel guests to access amenities through an interactive television located in their hotel rooms. According to the Johnson patent, a guest uses a series of television screen menus to order desired amenities and authorize payment for those amenities through an in-room checkout procedure. During the checkout procedure, a screen menu displays a summary of the selected amenities and another screen displays the final bill.

In response to the examiner's rejection, the inventors of the '740 patent amended claims 1 and 32 by adding the following "intelligent prompt" clause: "said CDC [i.e., central distribution computer] determining whether a prompt is to be initiated and determining the content of the prompt." Accompanying the claim amendment, the inventors also argued that, in contrast to the Johnson patent, the '740 patent "initiates the prompts when the system determines the user needs help in entering billing or amenity identification information through the telephone."

To determine the meaning of a claim term, a court must analyze arguments and amendments made during the prosecution of a patent application. See Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir. 1995). In the present case, the Special Master construed the "intelligent prompt" clause as requiring "initiative from the system as to the content of at least some prompt." That construction, however, erroneously ignores arguments made during prosecution to distinguish the claimed invention from the Johnson patent. To overcome the Johnson patent, which teaches a system that determines the content of a prompt, the inventors argued that the claimed invention also performs the additional step of determining whether a prompt is necessary. Thus, based on the prosecution history, we hold that the "intelligent prompt" clause requires the central distribution computer to (1) determine if a prompt is necessary to assist a guest in selecting an amenity or providing billing information, and (2) the content of the prompt.

Claims 1 and 32 of the '740 patent also recite a limitation of storing and processing amenity identification information. The '740 patent explains that amenity identification information is generated by a guest's pressing amenity keypads on the room telephone. The patent further explains that amenity identification information refers broadly to a class of amenities, such as movies or fax services, rather than a specific amenity within that class, such as a particular movie.

The Special Master construed amenity identification information as meaning "credit card information or other data to assist billing." Such a broad construction is not supported by written description of the '740 patent, which makes clear that a system that provides only one class of amenities, such as movies, does not generate amenity identification information.

Under the Special Master's claim construction, however, the term amenity identification information would cover a system that, for example, provides only movies, because the choice of a particular movie would be amenity information that assists billing. Moreover, the Special Master's claim construction is overly broad because it renders the claim term "billing information" redundant, by giving both terms the same meaning. Thus, we reverse the Special Master's claim construction and hold that amenity identification information refers to a class of amenities within a system that offers more than one class.

- 588 -
In sum, because the jury's finding of infringement by SVI and non-infringement by Tharaldson were based on erroneously construed terms, we vacate those findings and remand for a determination of infringement in accordance with our claim construction. Thus, we also vacate the district court's award of treble damages and attorney fees.

PART THREE

The Disputed Claims

Avocent contends that ClearCube's accused products infringe claim 1 of the '997 patent, and claims 1, 6, and 16-18 of the '919 patent. Claim 1 of the '997 patent, and claims 1, 16, and 18 of the '919 patent, are independent claims. Claim 6 of the '919 patent is dependent on claim 1, and claim 17 of the same patent is dependent on claim 16. Claim 1 of the '997 Patent recites:

1. A system for transmission of analog color video signals between a source of said signals and a video monitor, being at spaced locations, comprising: n32

   a plurality of computers, each providing, as a set, said color video signals;

   a switch receiving said sets of said color video signals, each with respect to a common reference, from said computers and providing a selected said set of said color video signals as an output;

   a signal transmitter at a first location responsive to said output of a set of said color video signals, said transmitter, including n33 an amplifier for each said color video signal of one of said sets for providing a color video signal output and wherein n34 at least a high frequency portion of each said color video signal has been amplified as a direct function of frequency and providing both an inverting and non-inverting signal, available as an output;

   a plurality of video transmission circuits, each said circuit having first and second ends, respectively, one circuit for each of said color video signals of one of said sets and each said circuit having an input responsive to an output of said transmitter at said first end, and each said circuit having a responsive signal output at said second end;

   a signal receiver at a second location responsive to each of said transmitted signal outputs and color video signal at said second end, including an amplifier for each said color video signal for providing a discrete color video signal with respect to a common reference; and

   signal means responsive to said receiver for providing each said color signal, each with respect to a common reference, to an analog color video monitor. n35

Claim 1 of the '919 Patent recites:

1. An extended-in-length computer video communications link for transmitting computer video signals comprising:

   a source of computer video signals including red, green, and blue video signals,

   a video transmitter comprising a plurality of amplifiers, one of each said amplifiers for each of said red, green, and blue video signals, each said amplifier comprising:

   a signal input for receiving a one of said red, green and blue video signals,

   frequency sensitive compensating circuitry responsive to a said video signal so that said amplifier provides a first video signal that increases in amplitude with increasing frequency at a first output and a second video signal that is an inverse of said first video signal at a second output,
a twisted pair of conductors for each said amplifier, with first and second conductors of said twisted pair coupled at one
end to respective said first and second outputs of said amplifier,

an adapter for each of said twisted pair of conductors, each said adapter coupled to an opposite end of a respective one of
said twisted pair of conductors, each said adapter receiving said first video signal and said second video signal and
providing a respective said video signal as a single ended output, and further configured to provide a ground reference
potential for said transmitter at said adapter, whereby need for a reference ground conductor between said transmitter and
said adapter is eliminated. n36

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Claim 16 of the '919 Patent recites:

16. A computer video signal communications system for selectively coupling sets of R, G, B computer color video signals
from one of a plurality of computers to a separately located color monitor, said system comprising:

a transmitter including:

switching means for selectively providing a said set of said color video signals from a selected said computer, and

a first signal format converter responsive to each said color signal of a said set of color signals from said switching
means for converting a signal format of each said color signal from single ended format to a balanced format;

- 590 -
a plurality of sets of twisted pair conductors, each set of said conductors having a first end and second end, with a said first end of each of said sets of conductors receiving a discrete color video signal from said said transmitter;

a receiver coupled to said second ends of said sets of said twisted pair conductors and including:

a plurality of second signal format converters for converting a said balanced format of each said discrete color video signal from each said set of conductors from balanced to unbalanced format; and

signal means responsive to unbalanced format signals from said receiver for coupling color video signals to a color video monitor. n38

Claim 18 of the '919 Patent recites:

18. A computer video signal communications system for selectively coupling a set of R, G, and B computer color video signals from one of a plurality of computers to a separately located color monitor, said system comprising:

a transmitter including:

switching means for selectively providing said set of R, G, and B computer color video signals from a selected said computer, and

a first signal format converter responsive to each said R, G and B color video signal for converting a signal format of each said R, G and B color video signal from single ended format to a balanced format;

a set of twisted pair conductors for each said balanced format R, G, and B color video signals, each said set of twisted pair conductors having a first end and a second end, with a said first end of each of said sets of twisted pair conductors receiving a discrete one of said balanced format R, G, and B color video signals from said transmitter;

a receiver coupled to said second ends of said sets of twisted pair conductors and including:

frequency compensation means for boosting a frequency response of each said R, G and B color video signal directly as a function of frequency;

a plurality of second signal format converters for converting said balanced format of each said R, G and B color video signal from each said set of twisted pair conductors from balanced to unbalanced format; and

signal means responsive to said [sic] unbalanced format signals from said receiver for coupling said R, G and B color video signals to a color video monitor. n40
PART FOUR
Claim Construction Decisions

A claim construction hearing was held on February 22 and 23, 2006. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 372, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996) (holding that the first issue in any patent infringement case is that of "claim construction": the interpretation of words used in a patent's claim, "the portion of the patent document that defines the scope of the patentee's rights"); see also, e.g., Rockwell International Corporation v. United States, 147 F.3d 1358, 1362 (Fed. Cir. 1998) ("The first step in any invalidity or infringement analysis is claim construction.") (citations omitted). The memorandum opinion and order entered on March 15, 2006, set forth this court's interpretation of the following, disputed, claim terms.

"Twisted pair" wiring, which is used in the '919 patented invention to conduct analog video signals, may be either "shielded" or "unshielded."

The term "amplifier," as it is claimed in both the '997 and '919 patents, was defined as "a circuit (or a device when connected in a circuit) that draws power from a source other than the input signal and provides an output signal that reproduces the essential features of the input signal."

The term "discrete," as it is used in the claims of both patents, simply means that a color video signal (e.g., red) is separate or distinct from the other two color video signals (e.g., green and blue).

Finally, the phrase "for said transmitter," as recited in claim 1 of the '919 patent, was construed as meaning "from the signals received from the transmitter."

2. "Amplifier circuit" (Claim 11)

The only significant dispute regarding this term is whether it is a means-plus-function term governed by P 6. Because the word "means" is not used, there is a presumption that P 6 does not apply, and this presumption may be overcome only by showing that the term "relies on . . . functional terms rather than structure or material to describe performance of the claimed function." Micro Chem, 194 F.3d at 1250. Broadcom argues that the term is functional, as opposed to structural, because there are many different types of amplifier circuits. In effect, Broadcom suggests that P 6 applies because rather than describing a device, the claim term instead encompasses a number of possible devices that share nothing more than a common function. (See Allen '817 Rep. at 9-10.) This argument, however, is unsupported by Federal Circuit precedent, under which the mere fact that a claim term cannot be linked to a single structure is insufficient to overcome the presumption against the application of P 6. See Linear Tech. Corp. v. Impala Linear Corp., 371 F.3d 1364, 2004 WL 1351181, 2004 U.S. App. LEXIS 11882 (Fed. Cir. 2004) (reversing district court determination that "circuit" was means-plus-function term); Phillips, 363 F.3d at 1212 (holding that broad term "baffle" had ordinary meaning encompassing "sufficient recitation of structure," and that "its particular structure is not relevant"); Personalized Media Communs., L.L.C.
v. ITC, 161 F.3d 696, 704 (Fed. Cir. 1998) (holding that "digital detector" is not means-plus-function term because "detector" is not "a generic structural term such as 'means,' 'element,' or 'device' [or] . . . lacking a clear meaning, such as 'widget'"); Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) (reversing district court's determination that P 6 applied to non-means term that did not invoke "a single well-defined structure"). Indeed, if Broadcom's position were an accurate reflection of the law, no patentee could use common, well-understood claim terms with multiple physical manifestations without being subject to P 6. This is clearly not the manner in which the Federal Circuit has interpreted the statute, and, accordingly, the Court finds that the term "amplifier circuit" is not "functional" language that would overcome the presumption against the application of P 6. Thus, because there do not appear to be any other disputes regarding this term, Agere's proposed construction is adopted.

5. Claim 10: "... a corresponding plurality of amplifiers for amplifying the plurality of filtered RF signals ...." This language is construed to mean "two or more devices for strengthening two or more radio frequency signals, each device associated with one or more filters."

Claim Language
"amplitude and phase differential characteristics"

The Court rejects Wi-LAN's proposal that "differential" in the claims is equal to "distortions." The claims of the '222 patent never mention "distortion." While much of the '222 patent references "phase differential," the patent also references "distortion" in various instances. However, the patent never refers to a "differential" as a "distortion" and never equates those terms. The Court finds that Wi-LAN is seeking to improperly remove the word "differential" from the claims and substitute an entirely different word. The Court finds that "differential" and "distortion" have different meanings. Claim 1 of the '222 patent requires "amplitude and phase differential characteristics," "the amplitude," "the phase differential," "an estimated amplitude," and "an estimated phase differential." Further, dependent claim 4 recites "the estimated amplitude" or "the estimated phase differential," dependent claim 6 recites "estimated amplitude and phase differential," dependent claim 11 recites "an estimated phase differential," and dependent claim 12 recites "the phase differential." The claims recite only two terms: "amplitude" and "phase differential." In other words, the words "differential" and "phase" must be construed together as "phase differential." Thus, the Court rejects the parties' arguments that the term "differential" applies to both "phase" and "amplitude." Accordingly, based on the claim language, the Court rejects Wi-LAN's argument that the "differential" term implies that it is distortions to both the amplitude and phase of the signal or differences in both the amplitude and phase caused by the channel. Similarly, based on the claim language, the Court rejects Defendants' argument that the "differential" term implies that it is the result of differential modulation to both the amplitude and phase of the signal, as compared to just the phase of the signal. If the Court were to require differential modulation to both the amplitude and the phase of the transmitted signal, it would impermissibly eliminate the preferred embodiment of multilevel differential phase shift keying (MDPSK), a technique that changes the phase of a signal and not the amplitude of the signal.

This interpretation is consistent with the specification. The Abstract and the Background and Summary of the Invention sections provide that "[t]he processing of the signal at the second transceiver may include estimating the phase differential of the transmitted signal..." '222 patent, Abstract, 3:4-6. The Detailed Description also has numerous references to "phase differential." See id. at 9:43-61; 10:58-11:2; 11:18-12:13; 18:1-9. While the focus of the patent is on differential phase modulation, hence the repeated use of the term "phase differential," there are at least two references in the specification to the potential use of amplitude modulation by the technique of quadrature amplitude modulation ("QAM"). See id. at 5:34-35; 7:24-27. However, the '222 patent suggests that QAM should not be used because "amplitude modulation makes it difficult to equalize the distorting effects of the channel on the signal." Id. at 7:24-27. Based upon the claim language chosen by the patentee, the Court finds that the claimed embodiment does not necessarily require the alternative disclosed technique of amplitude modulation. In the claims, the term "differential" applies specifically only to the phase of the signal, and does not reference or relate to the term amplitude in the claim language. While the transmitted and received signals will necessarily have an amplitude (and phase), and there will likely be distortions to the amplitude (and phase) caused by the channel, the Court finds that the express claim language indicates that the term differential, and hence differential modulation, only applies to the phase of the signal and not the amplitude.

In the patent, the claimed channel estimator estimates the phase differential of the transmitted signals by sampling the amplitude envelope of the signals. See '222 patent, 11:1-28. The specification expressly describes a "phase estimator" in the channel estimator. See '222 patent, 10:58-60; 18:48-50. The Court agrees with the Defendants that estimates of the "amplitude" and the "phase differential" are used to correct for distortion over the channel, and accordingly, the "phase differential" of the received signal is supplied to the "pre-distorter" to correct for "phase distortion over the channel." See '222 patent, 9:43-61. The channel estimator uses the differences in amplitude of the signals by sampling the amplitude envelope to estimate the phase differential of the transmitted signal, see '222 patent, 11:3-12:22, and the estimated "amplitude" and the "phase differential" are then used to correct for distortion over the channel. See claim 4; see also '222 patent, 9:43-61. This interpretation is further reinforced by the patentee's co-pending application, now U.S. Patent No. 5,369,670 ("the '670 patent"), that was referenced in the prosecution history of the '222 patent as being "relevant to the extent that it includes a description of the phase estimation technique disclosed in the present application." See Applicants' April 19, 1993 Information Disclosure Statement. The '670 patent expressly states that "[a] differential of a sequence of symbols or data points is a measure of the time rate of change of a sequence of symbols or data points. ... it may be estimated as a difference between symbols or data points." '670 patent, 4:3-11. "The information in the carrier signal may be carried in the phase differential of a number of consecutive time instants, or as differential phase shifts of a number of frequency components of the transmitted signal." '670 patent, 4:27-31. Further, the '670 patent states that "the estimation of the phase differential may be made from sampling the amplitude of the transmitted signal" and that the estimated phase differential can be used to "produce a corrected signal." '670 patent, 2:46-48, 63-68. Thus, the specification of the '670 patent is consistent with this Court's interpretation of the claims in the '222 patent.
In an alternative construction, Wi-LAN proposes that the amplitude and phase differences in the received signal are "caused by the wireless channel." Defendants take a contrary position and contend that the differences result solely from "differential modulation." Neither position is entirely correct. The wireless channel can cause differences or distortions to the amplitude or phase of the transmitted signal by numerous affects, such as Doppler shifts, multipath interference, fading, and clock error. Thus, while there will likely be distortions to the amplitude and phase of the transmitted signal caused by the channel, the claim language, as interpreted in light of the specification, indicates that the terms "amplitude" and "phase differential" as claimed are not the distortions or differences to the signal as a result of the channel. Further, the Court finds that the claimed phrase, because the term "differential" applies to "phase" and not "amplitude," cannot be referencing the differences or distortions of the channel on both the amplitude and phase of the received signal. Rather, the term "phase differential," based upon the specification, the claims, and one of ordinary skill in the art, implies that the transmitted information is carried in the phase differential of the transmitted signals, i.e., the phase differential is the result of differential modulation and not the effects of the wireless channel. As described further in the analysis section for the term "channel estimator," the channel estimator computes the effects of the distortions from the differences in the amplitude and phase differential, but it does not directly measure or compute the distortions. Rather, the channel estimator supplies the estimated phase differential to correct for or equalize the phase distortions over the channel. This construction for the term channel estimator confirms the Court's construction for the term "amplitude" and "phase differential" of the signal as not being distortions or mere differences as a result of the channel effects.

For the above reasons, the Court construes the term "phase differential" to mean "difference in phase resulting from differential modulation." The term "characteristic" is not used in the specification of the '222 patent. The Court finds that the term applies to both "amplitude" and "phase differential" in claim 1. Thus, the Court construes the term "amplitude and phase differential characteristics" to mean "characteristics of both the amplitude and the difference in phase resulting from differential modulation of the received data signals." The Court construes the term "amplitude and phase differential" to mean "amplitude and difference in phase resulting from differential modulation." The Court construes the term "an estimated amplitude and an estimated phase differential" to mean "an estimated amplitude and an estimated difference in phase resulting from differential modulation."

2. Amplitude Modulator

The parties also dispute the meaning of "amplitude modulator" as it appears in claims 15 and 22. Claim 15 reads "the improvement wherein the means for coupling one of the program material-modulated carrier frequencies in the circuit comprises an amplitude modulator having a control input, a program material-modulated carrier frequency input, and an amplitude modulated, program material-modulated carrier frequency output . . . " '428 patent, col. 10, In. 54-59. Trilithic asserts that the amplitude modulator is a structure, a device that "imposes on the envelope of the carrier, or on the amplitude of the carrier, a signal of interest." Tr. at 104. Therefore, Trilithic argues that no part of the clause in claim 15, nor the clause in claim 22, is properly interpreted as a means-plus-function limitation because the structure, the amplitude modulator, has been disclosed in the claim. Wavetek contends that the clauses should be construed under 35 U.S.C. § 112, P 6, and accordingly, the Court should construe amplitude modulator as being limited to the variable attenuator disclosed in Figure 1 of the specification and its equivalent. Def.'s Br. on Claim Construction at 22. Maintaining that claims should be construed consistently throughout the patent, Wavetek urges that amplitude modulator be given the same meaning in claim 22 as it is given in claim 15, even though it admits that claim 22 is not written in means-plus-function language. Id. at 22.

Although it is not required that the word "means" be in used in the claim before 35 U.S.C. § 112, P 6 can be utilized, the use of the term "means" is central to the Court's analysis. Greenberg, 91 F.3d at 1583-84; see Personalized Media v. International Trade Comm'n, 161 F.3d 696, 703 (Fed. Cir. 1998). However, the use of the term "means" and particularly "means for" is so closely associated with the means-plus-function format that the use of such words generally invokes 35 U.S.C. § 112, P 6, whereas other formulations generally do not. Greenberg, 91 F.3d at 1583-84; see Personalized Media, 161 F.3d at 703. Using the word "means" gives rise to a presumption that the inventor meant to invoke 35 U.S.C. § 112, P 6, the mean-plus-function clause. Sage Prods., 126 F.3d at 1427 (citing York Prods., 99 F.3d 1568 at 1572). Failing to use the word "means" creates a presumption that 35 U.S.C. § 112, P 6 does not apply. Personalized Media, 161 F.3d at 704.
These presumptions, however, are not always conclusive and may be rebutted by intrinsic and, at times, extrinsic evidence. Id. If a claim contains the word "means" but does not specify a corresponding function for the means, 35 U.S.C. § 112, P 6 is not implicated. Sage Prods., 126 F.3d at 1427; see also York Prods., 99 F.3d at 1574. Similarly, if a claim uses the term "means" and describes a function but also "goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in mean-plus-function format." Sage Prods., 126 F.3d at 1427-28; see also Cole v. Kimberly-Clark Corp., 102 F.3d 524 (Fed. Cir. 1996). Yet, if a claim does not contain the word "means" but is drafted as a function to be performed instead of a definite structure, 35 U.S.C. § 112, P 6 is invoked. Mas-Hamilton Group v. Lagard, Inc., 156 F.3d 1206, 1214 (Fed. Cir. 1998).

When the entire "means for coupling one of the programmed material-modulated carrier frequencies . . . " clause of claim 15 is examined, the wording used by the patentee indicates that the clause was not written in means-plus-function form, even though the term "means" is used in the clause. '428 patent, col. 10., ln. 54-59. The intrinsic evidence overcomes the presumption established by previous case law. The claim states "the means for coupling one of the program material-modulated carrier frequencies in the circuit." Id. ln. 54-55. This language, standing alone would be functional language. However, the claim continues that the means for coupling "comprises an amplitude modulator having control input, a program material-modulator carrier frequency input, and an amplitude modulated, program material-modulated carrier frequency output." Id. ln. 55-59. With that language the patentee disclosed within the claim a specific structure, an amplitude modulator, to support the "means for coupling" function. See Cole, 102 F.3d at 531.

In Cole, a case concerning a patent for disposable training pants, the Federal Circuit examined an element of a claim which read "perforation means extending from the leg band means to the waist band means through the outer impermeable layer means . . . ." Id. at 530. The Court determined that such language did not invoke 35 U.S.C. § 112, P 6. Id. In coming to this conclusion, the court emphasized that the claim described not only the structure that supports the function but also the structure's location and extent. Id. at 531. The court commented, "an element with such a detailed recitation of structure, as opposed to its function, cannot meet the requirements" of § 112 P 6. Id.

Here, the language in the element of the claim clarifies that the means for coupling is composed of or consists of the amplitude modulator that specifically has a control input, a program material-modulated carrier frequency input, and an amplitude-modulated carrier frequency program. '428 patent, col. 10, ln. 57-59. An amplitude modulator is a structure which ordinary skilled people in the art understand to be "any device which imposes amplitude modulation upon a carrier wave in accordance with a desired program." Pltf.'s Ex. 9 at 85 (McGraw-Hill Dictionary). What is required of the structure is set forth directly in the claim language. As in Cole, there is greater emphasis on the detail of the structure than on the detail of the function. The structure which corresponds to the means for coupling is disclosed in the claim, as are the required components for that structure. Because a specific structure has sufficiently been disclosed in the claim, 35 U.S.C. § 112, P 6 is not applicable to this clause.

Nothing in the specification indicates that the patentee meant to give "amplitude modulator" a different or unusual meaning. In the specification, specifically in Figure 1, the patentee depicts the amplitude modulator as a variable attenuator. Wavetek requests that the claim be limited to variable attenuators. However, given that the claim is not written in means-plus-function form, the limitation from the specification should not be read into the scope of the claim. A person of ordinary skill in the art would know that a variable attenuator can perform the function of an amplitude modulator. Tr. at 104- 106; Pltf.'s Ex. 22 (technical data for a Hewlett Packard Voltage Variable Absorptive Attenuator stating that when combined with input/output match it is useful in applications such as amplitude modulation). The Court will not limit the interpretation of this clause to include only the variable attenuator or its equivalents as disclosed in the specification. Additionally, the Court notes that both parties agree that the language of claim 22 is not means- plus- function language. The construction of amplitude modulator in claim 15 is also applicable to claim 22, and therefore, the amplitude modulator noted claim 22 is also not limited to a variable attenuator.

Go Back

Alterable Memory

The Patent teaches "an alterable memory operable to retain a control program and control parameters." Def. Ex. A (Pat.) at col. 14, ll. 47-48. Defendants argue that use of the phrase "an alterable memory" requires that a single alterable memory

- 596 -
store both the control program and the control parameters. Furthermore, although defendant does not contend that the above phrase constitutes a means-plus-function element, defendant relies on the patent specification, which states that the control program is stored in a "RAM 36" memory unit, and that the '754 device reads data block entries of control parameters from a cassette to this RAM memory. See Def. Ex. A (Pat. col.3, ll. 2-5, col. 6 ll. 52-58). As defendant points out, the patent mentions no memory unit other than the RAM 36.

Plaintiff argues that because this language does not state a means-plus-function element, there is no reason for the Court to read the specification as limiting this element to a single RAM 36 chip. Plaintiff is correct. This element states a function (retaining a control program and control parameters) but also specifies a definite structure for performing that function (an alterable memory). See Cole v. Kimberly-Clark, 102 F.3d 524, 531 (Fed. Cir. 1996) (means-plus-function elements "must not recite a definite structure which performs the described function."). As such, the language of this element is not limited by the single RAM 36 chip disclosed in the specification. Furthermore, we find that the patent's use of the language "an alterable memory" does not mandate that the patent be limited to memories based on a single RAM chip. Defendant has cited no authority for the proposition that a single alterable memory could not be comprised of two or more such chips. The Court declines to limit this element to the structure described in the specification, that is, a single RAM 36 chip.

2. The '562 patent

As for the phrases "an entry initiate key" and "entry initiate signal," the district court acknowledged that an indefinite article normally means "one or more" in open-ended claims, but found sufficient evidence in the specification of the '562 patent and the prosecution history to limit "an" to the singular. We agree that "a" or "an" normally carries the meaning of "one or more" in claims containing the transitional phrase "comprising." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). Here, however, the patentee clearly intended the use of only one entry initiate key.

Looking first to the language of Claim 9 itself, the phrase "user activation of an entry initiate key" is immediately followed by a reference to "said entry initiate key," which reinforces the singular meaning. See Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023-24 (Fed. Cir. 1997). Likewise, Claim 1 refers to a "keyboard means having a plurality of keys for providing respective keyboard output signals upon user activation of respective one of said keys . . . said keyboard output signals further comprising an entry initiate signal." The patent thus contemplates pressing only one key at a time to provide keyboard output signals, including the entry initiate signal. Significantly, during prosecution, the claim language was amended from "ones of said keys" to "one of said keys," a disclaimer of the plural.

The specification further confirms that the patented invention only uses one entry initiate key. In describing how a particular embodiment could incorporate the inventions described by the '359 patent as well as the '562 patent, the specification states that pressing more than one key simultaneously would initiate a routine "which is irrelevant to an understanding of the present invention," i.e., the "learn" or "scan" method which is described in the '359 patent. '562 Patent, col. 5, ll. 7-21.

In any case, if the number of keys pressed exceeds one, the routine is not part of the present invention and will not be described in detail herein.

If the number of keys pressed is equal to one, the microprocessor first tests whether this is the record key. If the user has pressed the record key (herein also referred to as the enter initiate key), he has taken the initial step for implementing the present invention, i.e., for entering the necessary data for identifying a particular manufacturer and model number directly on the keyboard.

Id. at col. 5, ll. 21-31 (emphasis added). We thus agree with the district court that "an entry initiate key" means "one entry initiate key" and "entry initiate signal" means "the keyboard output signal generated by the entry initiate key."

Because it is undisputed that the accused device required a user to press two keys simultaneously to initiate the code entry programming sequence, a routine that was expressly disclaimed by the '562 patent, we must affirm the summary judgment of non-infringement.

Claim 1 of the '756 patents reads:

1. A three dimensional inspection apparatus for ball array devices having a plurality of balls, wherein the ball array device is positioned in a fixed optical system, the apparatus comprising:

   a) an illumination apparatus positioned for illuminating the ball array device;

   b) a first camera disposed in a fixed focus position relative to the ball array device for taking a first image of the ball array device to obtain a characteristic circular doughnut shape image from at least one ball;

   c) a second camera disposed in a fixed focus position relative to the ball array device for taking a second image of the ball array device to obtain a side view image of the at least one ball; and

   d) a processor, coupled to receive the first image and the second image, that applies triangulation calculations on related measurements of the first image and the second image to calculate a three dimensional position of the at least one ball with reference to a pre-calculated calibration plane.

'756 patent, col. 18, ll. 34-53 (emphases and formatting added). Similarly, claim 1 of the '757 patent reads:

1. A three dimensional inspection process for ball array devices having a plurality of balls, wherein the ball array device is positioned in a fixed optical system, the process comprising the steps of:

   a) illuminating the ball array device;

   b) taking a first image of the ball array device with a first camera disposed in a fixed focus position relative to the ball array device to obtain a characteristic circular doughnut shape image from at least one ball;

   c) taking a second image of the ball array device with a second camera disposed in a fixed focus position relative to the ball array device to obtain a side view image of the at least one ball; and

   d) processing the first image and the second image using a triangulation method to calculate a three dimensional position of the at least one ball with reference to a pre-calculated calibration plane.

'757 patent, col. 18, ll. 34-49 (emphases and formatting added).

In its claim construction decision, the trial court construed "illumination source," a phrase that does not appear in the patent, to be limited to "only one illumination source." Memorandum Decision at 17. With regard to the '757 patent, the district court did not separately construe "illuminating," instead construing "illumination source" and "illuminating" together. Id, at 8, 17. Scanner sought reconsideration of the district court's claim construction decision, noting that the '756 patent does not claim an "illumination source," but rather an "illumination apparatus." Scanner also challenged the district court's construction on the merits. In denying Scanner's motion for reconsideration, the district court clarified that the distinction between "illumination apparatus" and "illumination source" was "not significant" for purposes of the decision, and that the claim language "apparatus" only "underscored the correctness of the decision." Order Denying Motion for Reconsideration at 1.

Prior to trial, the parties stipulated that, during the infringement period, ICOS sold inspection systems containing one or two
The difference between "illumination apparatus" and "illumination source" is surely not so great. Scanner's own

Scanner timely appealed. We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1).

This opinion follows the court's review of the record and consideration of the parties' oral argument, heard on February 6, 2004.

We review de novo a district court's grant of summary judgment. Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 149 F.3d 1309, 1315 (Fed. Cir. 1998). Summary judgment is appropriate if, drawing all factual inferences in favor of the non-movant, there is no genuine issue of material fact and the movant is entitled to judgment as a matter of law. Fed. R. Civ. P. 56(c); Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 255, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986).

Analysis of infringement involves two steps. Johnson Worldwide Assocs., Inc. v. Zebco Corp., 175 F.3d 985, 988 (Fed. Cir. 1999). First, the trial court determines the scope and meaning of the asserted claims. Markman v. Westview Instruments, Inc., 517 U.S. 370, 372-74, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). The trial court's claim construction is an issue of law reviewed without deference. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456 (Fed. Cir. 1998) (en banc). Second, the claims as construed by the court are compared to the allegedly infringing device. Johnson Worldwide, 175 F.3d at 988. We affirm a district court's grant of summary judgment of non-infringement only if, "after viewing the alleged facts in the light most favorable to the non-movant, there is no genuine issue whether the accused device is encompassed by the claims." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1304 (Fed. Cir. 1999).

On appeal, Scanner challenges the methodology employed by the district court in construing the terms "an illumination apparatus" and "illuminating," and its substantive constructions of those terms. Scanner further challenges the district court's entry of summary judgment of non-infringement as based upon erroneous claim constructions. We address these challenges below.

We first address Scanner's argument that the district court only construed a term that does not appear in either the '756 or '757 patent, namely "illumination source." It is correct that the district court's claim construction order referred to an "illumination source," a term that does not appear in either patent's claims, and was thus imprecisely worded. Nevertheless, in its claim construction decision, the district court concluded that "because the plain language sufficiently shows that the illumination apparatus is limited to one light source, the Court does not rely on extrinsic evidence in construing this term." Memorandum Decision at 10 (emphasis added). Moreover, in its order denying Scanner's motion for reconsideration, the district court acknowledged that "Scanner correctly points out that the memorandum decision refers to the term 'illumination source' when the reference should be to 'illumination apparatus' in the '756 patent and to the term 'illuminating' in the '757 patent," but went on to state that "the distinction, however, is not significant for purposes of my decision." Order Denying Motion for Reconsideration at 1. The district court also made clear that "if anything, the fact that the actual reference is to 'illumination apparatus' underscores the correctness of the decision." Id.

Though we agree with Scanner that it is improper for a district court to construe terms that do not appear in the patent claims, we do not agree that the trial court in the present case construed only the term "illumination source." Rather, a careful review of the district court's claim construction and reconsideration decisions shows that the court used inconsistent wording in referencing its claim construction. However, because the district court made clear that it did in fact construe the claims terms at issue, namely "an illumination apparatus" and "illuminating," we find any error in the district court's use of the phrase "illumination source" to be harmless. 1

1 The difference between "illumination apparatus" and "illumination source" is surely not so great. Scanner's own
Memorandum on Interpretation of the Asserted Claims to be Determined From the Markman Hearing [A326-364] argued that an illumination apparatus is "a source of illumination" and that illuminating "indicates that there is a source of illumination."

We also reject Scanner's argument that the district court failed to take into account the fact that claim 1 of the '756 patent is an apparatus claim, while claim 1 of the '757 patent is a method claim. Indeed, the district court demonstrated that it appreciated the difference between the apparatus and method claims during oral argument, when it noted, "there certainly is a difference between the phrase 'illumination apparatus' and the word 'illuminating.'" The fact that the district court construed both terms together in no way establishes that the district court failed to appreciate the distinction between the apparatus and method claims. Indeed, we find that the limitations "an illumination source" and "illuminating" may properly be construed together because they refer to corresponding portions of the apparatus and steps of the method. The concurrent treatment of these terms is particularly appropriate where the parties themselves referred to the terms "an illumination apparatus" and "illuminating" concomitantly.

2 For purposes of this opinion, we too treat "an illumination apparatus" and "illuminating" together. Thus, to the extent "an illumination apparatus" is construed to include one or more illumination sources, the step of "illuminating" in the '757 patent may be performed by one or more illumination sources. Similarly, if "an illumination apparatus" is found to be limited to a single illumination source, the "illuminating" step may be performed with only one illumination source.

The language of the claim defines the boundary of its scope. Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1324 (Fed. Cir. 2002). Accordingly, "the claim construction inquiry . . . begins and ends in all cases with the actual words of the claim." Id. (quoting Renishaw plc v. Marposs Societa' per Azioni, 158 F.3d 1243, 1248 (Fed. Cir. 1998)). Claim terms must be construed as they would be understood by a person of ordinary skill in the art to which the invention pertains. Specialty Composites v. Cabot Corp., 845 F.2d 981, 986 (Fed. Cir. 1988). "The words used in the claim[] are interpreted in light of the intrinsic evidence of record, including the written description, the drawings, and the prosecution history, if in evidence." Teleflex, 299 F.3d at 1324.

"This court has repeatedly emphasized that an indefinite article 'a' or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase 'comprising.' Unless the claim is specific as to the number of elements, the article 'a' receives a singular interpretation only in rare circumstances when the patentee evinces a clear intent to so limit the article." KCI Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000) (citations omitted).

Here, we agree with Scanner that the district court erred in limiting "an illumination apparatus," and thus "illuminating," to an apparatus containing only a single illumination source. We hold that "an illumination apparatus" is properly construed to encompass one or more illumination sources because the patentee has not evinced a clear intent to limit the article "an" to a single illumination source in either the claims or specification of the '756 patent.

To the extent ICOS argues, and the district court found, that Insituform Technologies, Inc. v. Cat Contracting, Inc., 99 F.3d 1098 (Fed. Cir. 1996), and North American Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571 (Fed. Cir. 1993), require a construction of the disputed claim term as limited to a single illumination source, we disagree.

Unlike the present case, Insituform dealt with claim language and a specification that strongly suggested that the claim language "a cup" was meant to encompass only one cup. There, the asserted claim repeatedly described a single cup, using the term "the cup" and describing a process in terms of a single cup. Insituform, 99 F.3d at 1105-06. The claim at issue in Insituform also used the phrase "region of vacuum application" in a "manner indicating that only one such region exists at any given time" and was thus "inconsistent with the use of more than one cup at any given time, as each cup creates its own associated region of vacuum application." Id. Moreover, the court in Insituform found that "neither the specification nor the drawings disclose the use of more than one cup," and in fact repeatedly described or depicted "the cup." Id. Thus, the court in Insituform found that the claims were properly limited to a single cup. Id.
Here, we discern no intent on the part of the patentees to limit the term "an illumination apparatus" to a single illumination source in either the claim language or the specification. Though ICOS argues, and we acknowledge, that claim 1 of the '756 patent and the specification call out other limitations with multiple components, e.g., "first camera" to take "a first image" and "second camera" to take "a second image," we do not agree that the failure to specifically refer to a "first illumination apparatus" and a "second illumination apparatus" evinces a clear intent on the part of the patentee that the term be limited to a single illumination source. Indeed, the very use of the article "an" indicates, at least presumptively, that the patentees intended the claim language "an illumination apparatus" to mean one or more illumination sources, and thus to cover implicitly "a first illumination apparatus" and subsequent "illumination apparatuses" where they exist. To limit the claim term "an illumination apparatus" to one illumination source, we require much stronger evidence of the patentees' intent than strained extrapolation from the language employed by the patentees in other claim limitations. Barring some evidence that the patentees intended to limit the claims to a single illumination source, evidence we do not find in the claim language, their use of the term "an" is consistent with multiple illumination sources.

3 We also disagree with ICOS's assertion that dependent claim 11 of the '756 patent requires a narrow reading of "an illumination apparatus." Claim 11 claims, "the three dimensional inspection apparatus of claim 1 wherein the illumination apparatus further comprises a diffuser." '756 patent, col. 19, ll. 17-18 [A69]. Though this claim does suggest that there is one illumination source, "the illumination source," it does not suggest or require that every embodiment of the claimed inventions be limited to a single illumination source. We do not find the language of dependent claim 11 to be sufficient to "evince a clear intent" that "an illumination apparatus" must in every embodiment be limited to a single illumination source.

Turning to the specification, we find no evidence of a clear intent on the part of the patentees to limit the claim language at issue to a single illumination source. Even where the specification refers to "a light source," there is no indication that the patentee intended to limit the claims to the single light source. At best, the specification is inconclusive on the issue of one versus multiple light sources. ICOS argues that the specification references and depictions of multiple mirrors or prisms for shaping the course of the light, and the failure to depict multiple illumination sources, suggest that only a single illumination source is covered by the claimed invention. We disagree. Though the specification does disclose multiple mirrors and prisms, it does not describe or depict any illumination source. The closest the specification comes to describing or depicting the number of illumination sources is the reference to the "design of the lighting." And although this language is certainly not conclusive, we find that it at least suggests that multiple lighting sources may be arranged in a particular "design."

Where an open "comprising" claim includes the article "a"or "an," and the specification is at best inconclusive on the patentee's intent to limit that article to a single element or step, we do not find a "clear intent" to so limit the claims. Both the specification and claims in this case are far short of those in Insituform.

In addition, the district court relied upon, and ICOS cites, North American Vaccine in support of limiting the claims to a single illumination source. In North American Vaccine, the court acknowledged that "it is generally accepted in patent parlance that 'a' can mean one or more," but found that in that case, there was no indication in the patent specification that the patentees intended "a terminal portion" to include one or more terminal portions and that the specification repeatedly spoke of "a linkage, not multiple linkages." 7 F.3d at 1575-76. Accordingly, the court construed the article "a" in the singular.

We find North American Vaccine to be inapposite. There, unlike the present case, the disputed claim did not include the open transitional phrase "comprising." The use of the transitional phrase "comprising" itself indicates that the elements or steps following the transition may be supplemented by additional elements or steps and still fall within the scope of the claim. See, e.g., AFG Indus. Inc. v. Cardinal IG Co., Inc., 239 F.3d 1239, 1244-45 (Fed. Cir. 2001) ("When a claim uses an 'open' transition phrase, its scope may cover devices that employ additional, unre cited elements. We have consistently held that the word 'comprising' is an open transition phrase." (citations omitted)). Indeed, it the very use of the transition "comprising" in conjunction with the article "a" or "an" that creates the presumption that the article is construed to mean one or more elements or steps, unless there is evidence of a clear intent to limit the claims. Unlike North American Vaccine, the use of "comprising" in claim 1 of the '756 and '757 patents itself establishes a presumption that those claims are "open," and North American Vaccine is not relevant to the present case on that ground alone.
In view of the above, we find that the patentees have not evinced a clear intent to limit the disputed claims to apparatuses or methods with a single illumination source. Unlike the cases relied upon by ICOS and the district court, neither the claims nor the specification in the present instance indicate any such intent on the part of the patentees. Accordingly, we give the article "an" its ordinary meaning of "one or more" and hold that the '756 and '757 patents encompass apparatuses and methods using one or more illumination sources.

--- Footnotes ---

4 Scanner also relies upon the prosecution history and expert testimony to support its argument that the claims should be construed to encompass one or more illumination sources. Naturally, ICOS disputes the import and interpretation of the prosecution history and presents its own expert testimony. Because we find this evidence to be inconclusive, and because we find the claim language and specification to strongly support a broad construction of the disputed language, we do not further address the prosecution history or expert testimony cited by the parties.

--- End Footnotes ---

CONCLUSION

We hold that the claim terms "an illumination apparatus" and "illuminating" in the '756 and '757 patents respectively encompass one or more illumination sources.

153

3. "analog and digital signals"

The Court has received no evidence that one skilled in the relevant art at the time of the application was aware of an item containing information that would contain both analog and digital signals. However, presuming that such an item is conceivable and could be part of the transmission system, the phrase "analog and digital signals" has a common meaning which requires no further construction.

A question is raised as to whether the transmission system, which performs these steps, is capable of performing simultaneous operations on items containing both analog and digital signals. The apparatus claims pertaining to the transmission system have separated these functions. Claim 1 claims a generic conversion step, and Claims 3 and 4, depending from Claim 1, separately claim to convert analog and digital signals respectively.

154

6. "analog signal" Terms

* * *

During the claim construction hearing, Quantum stipulated to the defendants' proposed construction, with the exception of "entirely." Regarding "entirely," the issue is whether the noise signal can be blended with something else. Quantum contends that there is no disclosure of a signal that includes something other than noise, i.e., there is no deterministic aspect. See '364 Patent, cl. 12; '242 Patent, col. 2, ll. 27-29; col. 12, ll. 43-44, 34-36, Fig. 3. Quantum argues that the patent contains no express disclaimer of something other than noise. The court agrees with Quantum. The intrinsic evidence suggests that the terms require "noise," but there is no indication that it must be "entirely noise."

As such, the court defines "analog noise signal(s)" as "nondigital, nondeterministic signal consisting of noise" and "analog random signal(s)" as "nondigital, nondeterministic signal."

The court defines "hardware device to produce an analog noise signal" as "hardware device to produce a nondigital
16. Analog sound derived from digital data and analog signal

The terms "analog sound derived from digital data" and "analog signal" appear in claim 9 of the '482 Patent. Diagnostic asserts that these two terms are synonymous and both should be construed as an "analog signal representative of a voice instruction and/or message." Benson, on the other hand, asserts that using plain and ordinary meaning of the terms require that "analog sound" be construed as "continuously variable, measurable, physical quantities perceived by the sense of hearing" and that "analog signal" be construed as "a continuously variable, measurable, physical quantity or impulse (as a voltage, current, or magnetic field strength) by which messages or information can be transmitted."

The definition of analog is "of relating to, or being a device in which data are represented by continuously variable, measurable, physical quantities, such as length, width, voltage, or pressure." American Heritage Dictionary 64 (4th ed. 2000). "Signal" is defined as "a detectable physical quantity or impulse (as a voltage, current, or magnetic field strength) by which messages or information can be transmitted." Webster's 2115. Therefore, the ordinary meaning of "analog signal" is "a continuously variable, measurable, physical quantity or impulse (as a voltage, current, or magnetic field strength) by which messages or information can be transmitted."

The Court now turns to the intrinsic record. While the claimed invention is a device and a method for implementing a hearing test in which the sounds heard by the test subject switch between test tones and signals that may be voice instructions and/or messages, the Court notes that the specification indicates that "the particular signals could be representative of virtually any type of information which is subject to derivation from digital data … for example, visual graphics and images and others." ('482 Patent, col. 10, 11. 35-40.) Therefore, the Court finds that the specification does not rebut the presumption that the ordinary meaning of the term applies and construes the term "analog signal" as a "continuously variable, measurable, physical quantity or impulse by which messages or information can be transmitted."

Diagnostic argues that in the text of claim 9, the term "analog signal" and "analog sound" are used interchangeably. Specifically, claim 9 specifies, in part:

- generating an analog sound derived from the digital data;
- switching the audible sound from the step of outputting between the test tone and the analog signal.

Diagnostic argues that because the phrase "analog sound" is followed in the next line with "the analog signal," the term is being used interchangeably. Benson argues that because the two different terms both appear in the same claim, they must have different meanings. The Court finds that the terms are used interchangeably and therefore, "analog sound" is properly construed as a "continuously variable, measurable, physical quantity or impulse by which messages or information can be transmitted."

156

2. "[A]nalog-to-digital converter means."

DTL contends that this limitation is not a means-plus-function limitation under § 112, P 6 and should be construed as "an analog to digital converter, also commonly known as an 'A/D converter.'" Cingular states that this term must be construed as a means-plus-function limitation because not all analog-to-digital converters are capable of converting a sampled signal into a sequence of groups of digital bits which represent the respective values of the analog electrical output signal at the periodic instants.

The means-plus-function presumption can be overcome if the "claim itself" recites sufficient structure "to perform entirely
the recited function." Sage Prods., Inc. v. Devon Indus., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997). Although the disputed phrase contains the word "means," and is presumed to be governed by Section 112, P 6, the specification is replete with evidence that an analog-to-digital converter by itself is a sufficient structure to perform the described function. The prosecution history also reveals that the examiner used the term "A/D converter" generically when distinguishing the Bader reference. Exhibit A of Pl.'s Opening Claim Construction Brief, DTL-000118.

4 See '799 patent, col. 1, l. 64; col. 2, l. 27; col. 3, l. 49; col. 4, l. 12; col. 4, l. 23; col. 4, l. 27; col. 4, l. 37; col. 4, l. 43; col. 4, l. 51; col. 5, l. 12; col. 5, l. 16; col. 5, l. 23; col. 5, l. 37; col. 5, l. 49; col. 7, l. 16; col. 7, l. 64; col. 9, l. 27; col. 9, l. 34; col. 9, l. 47; col. 9, l. 53; col. 9, l. 62; col. 9, l. 64; col. 10, l. 5; col. 10, l. 7; col. 10, l. 11.

End Footnotes

Cingular opposes this interpretation, arguing that even if the court does not consider the limitation to be a means-plus-function limitation, the term should be construed as "an analog-to- digital converter with a resolution output of 16 bits or higher." At the hearing, Cingular's technical advisor admitted that a generic A-to-D converter could sample and convert signals pursuant to the language in claim 18. Trans. at p. 101-102. Even if the specification details a preferred embodiment using a 16 bit A/D converter such as in the '799 patent, col. 10, ll. 25-27, this does not compel the court to deviate from the ordinary and customary meaning by importing added dimensions to the term. The specification consistently refers to a generic A/D converter and there is no evidence that the patentee disclaimed or disavowed all A/D converters except for one with a resolution output of 16 bits or higher.

Cingular will be free to later argue that its A/D converter cannot produce a "highly faithful digital representation." But at this stage, the court will decline to import superfluous limitations in claim construction or engage in anticipating the variety of accused products which may be presented. The court defines the terms as follows:

"[A]nalog-to-digital converter means" is construed as: an analog to digital converter, also commonly known as an 'A/D converter.'

The parties dispute whether the phrase "analog to digital converter means for converting said analog picture information signal into corresponding digital data information signals" is in means-plus-function format. Canon contends that the disputed phrase requires a means-plus-function construction. Canon contends that the phrase uses the term "means," and therefore the presumption that it is a means-plus-function claim applies. Canon also contends that the presumption is not rebutted, because the disputed phrase recites a function without reciting or describing a definite structure.

St. Clair contends that the presumption that the phrase is in means-plus-function format is rebutted, because the structure of an analog digital converter is a structure well known in the art. Thus, St. Clair contends that the "analog to digital converter means" is "analog to digital converter(s)."

Although the disputed phrase contains the word "means," and is presumed to be governed by Section 112, P 6, the Court concludes that the "analog to digital converter means" should not be construed as a means-plus-function term. An analog to digital converter is a sufficient structure to perform the described function, and therefore, additional structures do not need to be imported from the specification. See Rodime, 174 F.3d at 1302. Accordingly, the Court concludes that the "analog to digital converter means" is "analog to digital converter(s)."
2. "Analog-to-Digital Converter"

P3 contends that the term "analog-to-digital converter" ("ADC") as used throughout the claims should be construed as "any device or combination of devices that convert an analog signal to a digital signal." UPM's contends that this construction is improper, because the term as claimed in the '850 Patent is a separate element from the CPU, and therefore it argues that the construction should reflect that the claim term only covers such devices that are separate elements from the CPU.

As claimed in the '850 Patent, the ADC converts the analog voltage or current signals into a digital value, and then "send[s] the digital . . . value to the" CPU. UPM is correct that it appears from the specification that the preferred embodiment uses ADCs that are separate from the CPU. As discussed above, however, while the specification is the best guide to interpreting a disputed term, courts must be careful not to import limitations from the specification into the claim. Here the claim language itself, which states that the ADC sends the converted digital signal to the CPU, also implies that the ADC is separate from the CPU rather than a component within the CPU, and thus the ADC will be construed as a separate element from the CPU.

3 Even if the claims are construed to claim a separate ADC element from the CPU, however, a device that combines the ADC element into the CPU may still infringe under the doctrine of equivalents. See, e.g., Dolly, Inc. v. Spalding & Evenflo Companies, Inc., 16 F.3d 394, 398 (Fed. Cir. 1994) ("Equivalency can . . . exist when separate claim limitations are combined into a single component of the accused device.").

The parties dispute whether "analyzer" is governed by 35 U.S.C. § 112(6). Widevine argues that "analyzer" is a colloquial term that refers to a physical device that analyzes data and should be construed as "software in the shim that monitors the properties or characteristics of a computing device." Verimatrix argues that "analyzer" is a generic term that does not connote a particular structure, the remainder of the claim does not provide the necessary structure, and is therefore equivalent to "means for analyzing."

"Shim," of which "analyzer" is an element, has an agreed construction: "software that is downloaded to or pre-installed on the client machine and used to decrypt transparently incoming data stream from the encryption bridge on its way to the media player software." The agreed construction provides the necessary structure for "analyzer." "Analyzer" is therefore not governed by 35 U.S.C. § 112(6). "Analyzer" means "software in the shim that analyzes monitors the properties or characteristics of a computing device."

Analyzing a property of the data file to be transferred and similar phrases

ConncTel proposes that the Court construe "analyzing a property of the data file to be transferred" to mean "quantitatively or qualitatively observing a characteristic of the data file being transferred, e.g., size, security requirement not including a phone number." ConncTel argues that one skilled in the art would interpret "analyzing" to mean "observing" and "observe" is synonymous with the plain meaning of "analyze," which is to "study or determine." ConncTel also contends the relevant "properties of the data file" are found in the header or control information of data or a data file. Furthermore, because the data properties include quantitative factors, such as data size, and qualitative factors, such as the type of file, analyzing a property of the data file involves observing such quantitative or qualitative factors.
Cisco contends "analyzing a property of the data file to be transferred" means "studying the data file itself, and does not include referencing a data packet header or destination information. The data file may be transmitted in any of various formats (a data file, data packets, encapsulated packets, or data streams)." During the hearing, ConncTel conceded to the use of "studying" rather than "quantitatively or qualitatively observing." The Court modifies Cisco's proposed construction and construes "analyzing a property of the data file to be transferred" to mean "studying the data file itself but does not include referencing destination information. The data file may be transmitted in any of various formats (a data file, data packets, encapsulated packets, or data streams)."

In the specification, the Inventor defined "data file" to include "data file, data packets, encapsulated packets, or data streams." Col. 1:16-19 ("Data may be transmitted in any of various formats, such as a data file, data packets, encapsulated packets, or data streams (referred to herein as a data file)."). Thus, unless there is a clear disavowal in the file history, "analyzing a data file" must include analyzing a data packet. The Applicant's reference to Derby in the prosecution history does not show a clear disavowal that the term data file does not include "data packet." 370 patent application, Amendment 6/19/1998, p. 7-8. This portion of the file history directed to Derby is more properly interpreted toward distinguishing the difference between making packet decisions within a network and "the initial selection of the services to be utilized." See id. at 8. Thus, this portion of the file history impacts the construction of "telecommunication path," but it does not constitute a clear disavowal that the term "data file" no longer includes a "data packet" as stated in the specification.

Although a data packet typically includes a header containing destination information, studying the data file does not include referencing destination information. During prosecution, the Applicant stated that neither Kobayashi or Derby "utilizes a property of the data file being transferred." Id. at 8. Kobayashi taught a method for connecting phone calls and thus utilized the destination telephone number in selecting the appropriate path. Id. at 7. Since Kobayashi used telephone numbers but did not use properties of the data file, the telephone number cannot be a property of the data file. Further, even if Kobayashi was extended to include a line terminal rather than a telephone, Kobayashi would still not utilize a property of the data file. Id. According to the Applicant, Derby was directed at routing packets within a network, which would necessarily require destination information, but Derby did not utilize properties of the data file. Id. at 7-8. Thus, destination information cannot be a property of the data file. Finally, Figure 1 depicts "Destination #" as separate from "Data File 30."

Accordingly, the Court construes "analyzing a property of the data file to be transferred" to mean "studying the data file itself but does not include referencing destination information. The data file may be transmitted in any of various formats (a data file, data packets, encapsulated packets, or data streams)." Since it was not clearly disavowed during prosecution, this includes analyzing a data packet. Because there is evidence of a clear disavowal during prosecution, "analyzing a property of the data file to be transferred" does not include referencing destination information.

3 A ”frame” is a compilation of samples derived from a particular waveform. See Col. 15, ln. 17-19.

As a preliminary matter, the Court notes that Lockheed argued during the Markman hearing that the word ”variable” in the disputed patent language required definition. Upon further reflection and consideration, however, the Court concludes that the words ”analyzing” and ”extract” -- not ”variable” -- require construction. The parties contest not how to describe the frequency components or define ”variable,” but rather what the patented system does (or does not do) during the analysis and extraction phases of the process claimed. 4 Therefore, the Court adopts the plain and ordinary meaning of the word ”variable” 5 and looks to the specification and file wrapper 6 to construe the terms ”analyze” and ”extract” and consider how -- if at all -- MIT has limited its claim.

4 This debate is clear in the transcripts from the Markman hearing and the submissions by the attorneys.

5 The specification and file history make clear that the plain meaning of the word ”variable” should govern. Therefore, the Court interprets ”variable” frequency components to mean that the frequency components vary from frame to frame.

6 The Court will look to the prosecution history of both the reissue ’478 Patent and the original ’790 patent. This analysis is in keeping with 35 U.S.C. § 251 because Claim 1 was reissued without amendment. See Fromson v. Anitec Printing Plates, Inc., 132 F.3d 1437, 1443 (Fed. Cir. 1997) (”The prosecution history when a patent is reissued is part of the framework in which the patent is construed, as is the prosecution history of the original patent.”), abrogated on other grounds by Cybor Corp. v. Fas Technologies, Inc., 138 F.3d 1448, 1456 (Fed. Cir. 1998).

II. DISCUSSION

MIT and Lockheed agree that the Court may look to the specification and the prosecution history to construe a claim properly. See, e.g., Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) (”It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history.”); SRI Int’l v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1118 (Fed. Cir. 1985) (noting that a claim is construed in light of the claim, the specification, and the prosecution history); Automigo Co. of America v. United States, 384 F.2d 391, 397, 181 Ct. Cl. 55 (Fed. Cir. 1967) (”In deriving the meaning of a claim, we inspect all useful documents . . . [including] the specification, the drawings, and the file wrapper.”).

MIT argues, however, that no such examination is needed in this case. It asserts that Claim 1 of the ’478 Patent, on its face, does not limit its method in any way and, therefore, that the language of the claim should be given its plain and ordinary meaning. Pl.’s Mot. For Partial Summ. J. [Docket No. 27] at 15-16. In the alternative, MIT further argues that if any limitation inheres at all in Claim 1, it is only that the technique works independently of voiced/unvoiced decisions with respect to an entire frame because, when such decisions are made, data is potentially discarded or separated out. See Markman Hearing Tr. [Docket No. 60] at 5, 9-12. Thus, MIT argues that if a technique makes some voiced/unvoiced decisions, but does not do so for an entire frame, that technique is still covered by Claim 1 of its patent. The Court disagrees with MIT on both counts.

A court may look to the specification and file wrapper when it needs to determine whether the patentee has limited the scope
of claims. See, e.g., SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001) (noting that claims can be given a narrow construction in light of the written description and explaining that one reason to look to the specification is to determine if the patentee has limited the scope of the claims); Watts v. XL Systems, Inc., 232 F.3d 877, 882-883 (Fed. Cir. 2000) (noting that "one purpose for examining the specification is to determine if the patentee has limited the scope of the claims" and explaining that "even if [the terms] are clear on their face, [a court] must consult the specification to determine if the patentee redefined any of those terms"); CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002) (explaining that the presumption that the claim's ordinary meanings prevail can be overcome by showing that a patentee limited its claim in the specification or prosecution history); Spectrum Int'l, Inc. v. Sterilite Corp., 164 F.3d 1372, 1378 (Fed. Cir. 1998) (noting that it is appropriate to look to "explicit statements made by the patent applicant" in the prosecution history to narrow the scope of the claim). The Court concludes that a review of the specification and file wrapper is appropriate in this case.

A. The Specification

The '478 Patent's "Summary of the Invention" begins with an introductory paragraph summarizing the invention as working "independent of the speech state" -- that is, it does not make voiced/unvoiced decisions. 7 Col. 1, ln. 66-67; Col. 2, ln. 1-3. Immediately thereafter, the '478 Patent outlines the basic method of the new invention which, by deduction, includes this general description. Unlike its references with respect to other aspects of the invention, the specification does not state that the technique "can" work independently of voicing decisions or that "one way of using" the technique is not to resort to a voiced/unvoiced decision. 8 Instead, the technique is described as one that simply works independently of such decisions. 9 The fact that the technique works "independently of the speech state" is repeated and held constant when different ways to utilize the invention are described. Col. 2, ln. 39; see also Col. 3, ln. 23-26. Moreover, the fact that the invention works independently of voicing decisions is never specifically limited to voiced/unvoiced decisions as to an entire frame.

7 The prosecution history makes clear that the words "independent of the speech state" mean the system does not resort to voiced/unvoiced decisions. For example, in an Amendment filed May 20, 1988, MIT stated: "For speech, the representation is independent of the speech state, thus avoiding the need for voicing decisions . . . ." File Wrapper, Ex. 2, Tab. D at 10.

8 In reference to other aspects of the invention, the specification does use this kind of language. See, e.g., Col. 3, ln. 63-64 (noting that "various coding techniques can also be used interchangeably with those described below") (emphasis added); Col. 10, ln. 24-50 (stating that "One way to do this is to force all of the frequencies to be harmonic . . . ." As a practical matter it is preferable to estimate the fundamental frequency that characterizes the set of frequencies in each frame, . . . . For example, pitch extraction can be accomplished by selecting the fundamental frequency that characterizes the set of frequencies in each frame, which in turn relates to pitch extraction, . . . . Other pitch extraction techniques can also be employed.") (emphasis added). This is precisely the specific limitation on a disclaimer that is lacking with regard to voiced/unvoiced decisions.

9 Had MIT intended this feature of the technique to be a preferred embodiment, one would think it would have expressed this intention more carefully, as it did with regard to "pitch extraction." See supra, note 8.

MIT argues that Claim 1 "literally applies" to a system that makes voiced/unvoiced determinations and that it is not "inappropriate or unacceptable to make voiced/unvoiced decisions" when practicing their invention. Pl's. Mot. for Partial Summ. J. at 16-18. While the language of Claim 1, when read without reference to the specification, may be considered broad enough to encompass methods that make some kind of voiced/unvoiced decisions, "where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent . . . ." SciMed, 242 F.3d at 1341. Here, the specification clearly demonstrates that the technique does not include the making of voicing decisions, and, therefore, techniques that do make such decisions are outside the scope of Claim 1, lines 20-22, of the '478 Patent.

MIT responds that the specification merely represents a preferred embodiment of the invention and should not limit the claim. The Court agrees that the specification of a patent usually sets forth the preferred embodiment of the invention and
that this does not normally restrict the claims. "Where the patentee describes an embodiment as being the invention itself and not only one way of utilizing it," however, it can aid interpretation. Autorigio, 384 F.2d at 398; see also Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) (noting that "when the preferred embodiment is described in the specification as the invention itself, the claims are not necessarily entitled to a scope broader than that embodiment").

10 In describing an embodiment of the '478 Patent, the specification states that "recourse is never made to a voice-unvoiced decision" and that "as a consequence, the invention is robust in noise and can be applied at various data transmission rates simply by changing the rules of the bit allocation." Col. 3, ln. 20-26 (emphasis added). In essence, then, this is not a preferred embodiment of the invention, but an integral aspect of the invention itself. Although every embodiment of the invention need not be stated in the specification, the claims cannot "enlarge what is patented beyond what the inventor has described as the invention." Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001) (limiting the claim despite the argument presented during litigation that the invention could work in a different way).

MIT argues that, at most, the only limitation it has placed on its patent is the making of voiced/unvoiced decisions as to an entire frame because, when this is done, valuable data may be discarded or separated out. See Markman Hearing Tr. at 5, 9-12. To support this, MIT claims that the specification distinguishes its invention from the binary model. It explains that, at the time of the invention, the binary model made voiced/unvoiced decisions as to an entire frame. MIT suggests that therefore, each time the specification states that the invention works independently of voiced/unvoiced decisions or speech state, it is doing so in counter-reference to the binary model; in other words, these references imply that the new invention does not make a voicing decision as to an entire frame.

This interpretation of the specification, however, is unsupported. While it is true that the specification distinguishes the new invention from the binary model, the distinction derives primarily from the fact that the binary model relies on the speech state -- not from the fact that it makes a voicing decision for an entire frame. The specification begins by describing the binary model as follows: It "use[s] a speech production model in which speech is viewed as the result of a glottal excitation waveform," in which the "glottal excitation can be in one of two possible states corresponding to voiced or unvoiced speech." Col. 1, ln. 20-27. 11 The specification then details the limitations that are caused by the binary model's reliance on the speech state. The fact that the binary model "requires that each frame of data be classified as either voiced or unvoiced" is merely one of these limitations. Col. 1, ln. 39-42.

Furthermore, the specification's emphasis is on the making of a voiced/unvoiced decision itself and how "particularly difficult" this is to do. Col. 1, ln. 41-42. No emphasis is placed on the fact that the binary method employs a single decision for an entire frame versus multiple decisions. No reference is made to the potential for wasted data that occurs with a single decision per frame. Instead, the specification broadly suggests that it is the difficulty of making a voiced/unvoiced decision in itself that MIT's new invention sidesteps. Col. 1, ln. 66-67 and Col. 2, ln. 1-3. The invention's ability to skip the voiced/unvoiced determination altogether is what makes it "a new analysis-synthesis technique" 12 that is different and "better" than the binary model. Col. 2, ln. 4-5; Col. 1, ln. 57. 13 The binary system is summarized in the specification 14 as one that relies on the speech state, i.e., that makes voiced/unvoiced decisions. MIT's invention, on the other hand, is summarized throughout as one that works independently of the speech state, i.e., that does not make voiced/unvoiced decisions. When the patentee distinguishes its invention from the binary model, the Court interprets it to be doing so in reference to the fact that the binary method relies on voicing decisions, while MIT's technique does not do so at all. The
specification suggests, therefore, that Claim 1, lines 20-22, is limited to a technique that does not resort to any voiced/unvoiced decisions.

--- Footnotes ---

12 This is supported further by the specification. For example, it states: "Although pitch is used to provide side information for the coding algorithm, the standard voice-excitation model for speech is not used. This means that recourse is never made to a voice-unvoiced decision." Col. 3, ln. 20-26 (emphasis added). Here the specification clearly defines the standard binary model as relying on the speech state. MIT's invention, by not relying on the speech state, skips a voice/unvoiced decision entirely.

13 In the prosecution history, the inventor makes the same point -- its new invention does not have to make the difficult voiced/unvoiced decision. "Like the Fulgham system, Hedelin relies on an initial voiced/unvoiced analysis. (In many instances, it is difficult to make the voicing decision in real time; if the voicing decision is wrong for a particular frame, the synthesized speech is faulty, and the result is an unpleasant and unnatural sound to the listener's ear)." File Wrapper, Ex. 2, Tab D at 15.

14 The binary method is summarized similarly in the file wrapper. See, e.g., File Wrapper, Ex. 2, Tab D at 17 (explaining that the Taguchi system is "a conventional binary (voiced/unvoiced) analysis system employing linear predictive analysis of the voiced segments").

--- End Footnotes ---

B. The Prosecution History

The prosecution history similarly compels the conclusion that Claim 1, lines 20-22, of the '478 Patent is limited to such a technique. Arguments made during the prosecution to differentiate a new invention from prior art, or to convince the Patent and Trademark Office to approve a patent, may circumscribe a claim's scope. See, e.g., Spectrum, 164 F.3d at 1378 (noting that "explicit statements made by a patent applicant during prosecution to distinguish a claimed invention over prior art may serve to narrow the scope of the claim"); Southwall Technologies Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995) ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution."); Alpex Computer Corp. v. Nintendo Co. Ltd., 102 F.3d 1214, 1220 (Fed. Cir. 1996) (noting that prosecution history is "relevant . . . for construing the meaning and scope of the claims"); Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1304 (Fed. Cir. 1997) ("An argument contained in an IDS which purports to distinguish an invention from the prior art thus may affect the scope of the patent ultimately granted.").

In the case of the '478 Patent, the inventors distinguished their invention before the Patent and Trademark Office based on the structural difference between a speech analysis system that does not resort to voicing decisions and one that does. In an amendment filed May 20, 1988, the applicants stated that the "most important" distinction between their invention and Fulgham's is that "Fulgham neither teaches nor suggests applicant's system for analysis of acoustic waveforms in which the waveform is sampled to extract a series of variable frequency components directly from each frame (independent of voicing state, pitch or channel constraints)." File Wrapper, Ex. 2, Tab D at 14 (emphasis added). Subsequently, the applicants distinguished their invention from Hedelin because "like the Fulgham system, Hedelin relies on an initial voiced/unvoiced analysis. . . . There is no teaching in the Hedelin reference of any system for analyzing a waveform . . . without regard to voicing decisions or the base band." Id. at 15-16.

Similarly, in a supplemental Information Disclosure Statement before the Patent and Trademark Office on May 20, 1988, the inventor distinguished prior art because, "unlike the present invention, the [prior art] is driven by voiced/unvoiced decisions." File Wrapper, Ex. 2, Tab C at 2.

Because MIT's invention was clearly distinguished from prior art based on the grounds that it does not resort to voiced/unvoiced determinations, the '478 Patent does not cover a technique that makes any voiced/unvoiced determinations. See Ekchian, 104 F.3d at 1304 ("by distinguishing the claimed invention over the prior art, an applicant is indicating what the claims do not cover, [and] he is by implication surrendering such protection."). In essence, MIT is asking this Court now to construe the claim differently for infringement purposes than MIT itself did to obtain the patent. Such construction, however, is impermissible. Alpex, 102 F.3d at 1221 (noting that "just as prosecution history estoppel may act to estop an
equivalence argument under the doctrine of equivalents, positions taken before the PTO may bar an inconsistent position on claim construction’); see also Southwall, 54 F.3d at 1576.

Furthermore, any argument that it was not necessary for the inventors to make such extensive disclaimers for approval of the patent -- because they might well have prevailed even had they only disclaimed voiced/unvoiced determinations for an entire frame -- would fail. Claims cannot be construed in a more limited way for approval of the patent and then more broadly in claim construction even if the statements were not necessary for approval. See, e.g., id. at 1576 ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution."); Standard Oil Co. v. Am. Cyanamid Co. 774 F.2d 448, 452 (Fed. Cir. 1985) ("All express representations made by or on behalf of the applicant to the examiner to induce a patent grant or . . . to reissue a patent" can limit interpretation of claims); KX Industries, L.P. v. PUR Water Purification Prod., 18 Fed. Appx. 871, 876 (Fed. Cir. Aug. 10, 2001) (unpublished opinion) ("whether the limiting assertions made were necessary for allowance of the claims is not dispositive as to whether a patentee has disclaimed certain subject matter.") 15 For example, in Ekchian, the patentee distinguished his invention from prior art preemptively to prevent the Patent and Trademark Office from rejecting the patent. See Ekchian, 104 F.3d at 1304. The patentee was later estopped from asserting a broader construction of the claim. See id. The determining factor is whether the patentees have clearly excluded a broader interpretation. See, e.g., Northern Telecom Ltd. v. Samsung Elec. Co., Ltd., 215 F.3d 1281, 1294-95 (Fed. Cir. 2000) (analyzing whether the patentee "with reasonable clarity and deliberateness" excluded a broader interpretation of the claims in the prosecution history); KX Industries, 18 Fed. Appx. at 876 ("What is determinative is whether the patentee has defined a claim term as excluding a broader interpretation with reasonable clarity and deliberateness."). In the “Remarks” of the May 20, 1988 Amendment, the patentees clearly articulated that its invention worked “independent of the speech state, thus avoiding the need for voicing decisions,” see File Wrapper, Ex. 2, Tab D, at 10, and they repeatedly distinguished their invention from prior art based on this broad characterization.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

MIT argues that extrinsic evidence shows that the only art known at the time the patent was sought and amended was a binary method that made a voiced/unvoiced decision for an entire frame and, therefore, that this must necessarily constitute the extent of the claim limitation. This argument requires the Court to delve into extrinsic evidence -- evidence to which resort ought be had only "if necessary." Vitronics, 90 F.3d at 1583. Even if it were necessary and, thus, appropriate for this Court to consider extrinsic evidence about what art existed at the time -- and the Court believes it is not -- MIT's argument would still fail.

As an initial matter, it is not clear that MIT's characterization of what art existed at the time is accurate. Lockheed has presented extrinsic evidence suggesting that multiple voicing decisions within a frame were known to those skilled in the art prior to 1985. 16 Whether sufficient evidence exists to support this contention, however, is a moot question because MIT's argument fails for two other reasons.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

16 The patent was originally sought in 1985 and then abandoned. The inventors then filed for the patent in April of 1989.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

First, as stated in Autorigo, "it is not the prior art that provides the guidelines, but the applicant's acquiescence with regard to prior art. In its broader use as a source material, the prior art cited in the file wrapper gives clues as to what the claims do not cover." Autorigo, 384 F.2d at 399. Although here the Court is not dealing with traditional file wrapper estoppel as was
the Autorigo court, the same reasoning applies. 17 In the prosecution history of the '478 Patent, the emphasis is placed on
the prior art's reliance on voiced/unvoiced decisions generally. The primary distinction the inventor makes consistently with
respect to the prior art in the file wrapper is that the system works "independent of the speech state, thus avoiding the need
for voicing decisions." File Wrapper, Ex. 2, Tab D at 10. Moreover, the differentiating aspect of the conventional binary
system that is highlighted by the inventors in the prosecution history (and in the specification) is that it makes
voiced/unvoiced decisions -- not that it makes a single decision for the entire frame. For example, in reference to Taguchi,
MIT points out that it "is a conventional binary (voiced/unvoiced) analysis system employing linear predictive analysis of
the voiced segments" as opposed to MIT's "analysis system based on sinusoidal representation of a speech waveform." Id. at
17.

17 Other courts have applied file wrapper estoppel theories to claim construction. See, e.g., Alpex, 102 F.3d at 1221.

Admittedly, there are at least two references to the prior art's determination of whether an entire frame of speech is voiced or
unvoiced in the file wrapper. See, e.g., id. at 14, 15. These two cursory references, however, are insufficient to convince the
Court that the inventor did not clearly disavow a system that resorts to any voiced/unvoiced decisions. 18

18 In one of these instances, the inventor pointed out that the most important difference was that the system worked
"independent of voicing state, pitch, or channel constraints." File Wrapper, Ex. 2, Tab D at 14.

Second, MIT could and should have been clearer about what it was disclaiming. Courts may look to the file wrapper to
interpret claims because the patent approval process is a public one and "the public has a right to rely on such definitive
statements made during prosecution." Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998); see also
Ekchian, 104 F.3d at 1304 (noting that "the courts and the public may rely" on an information disclosure statement to
interpret the claims.) "Notice is an important function of the patent prosecution process, as reflected by the statute itself . . .
and recently confirmed by the Supreme Court." Digital Biometrics, 149 F.3d at 1347 (internal citations omitted), citing
not known of the other voiced/unvoiced techniques, it might well have mentioned in the prosecution that its system is
compatible with voiced/unvoiced decisions or that it was not disclaiming all systems that use any voiced/unvoiced
decisions.

III. CONCLUSION

For the foregoing reasons, the Court interprets Claim 1, lines 20-22, of the '478 Patent to mean that the invention does not
resort to any voiced/unvoiced decision during the analysis and extraction phases. Accordingly, the Court concludes that the
appropriate interpretation of the language of Claim 1, lines 20-22, of the '478 Patent is as follows:

Analyzing each frame of samples and extracting therefrom a set of variable frequency components that have individual
amplitudes, without regard to voiced/unvoiced decisions.

3. The phrase "ANALYZING . . . TO DETERMINE A RESULTING INDICATION" (claim 1) does not require that the
resulting indicator need be one of the two calculation results. It can, for example, be an average of the two results.
Additionally, the process of analyzing includes, but is not necessarily limited to "studying, comparing, or breaking down."
No further construction is required.
Plurality of questions relating to features and uses of the products

Defendants argue that this term and others like it, including "a plurality of questions related to at least one of a desired feature and desired use of the product," and "a plurality of customer answers to the questions, the answers specifying a customer's desired product features and uses," require constructions indicating that at least one question (or answer) relates to a desired product feature and at least one question (or answer) relates to a desired product use. Orion argues that these terms do not require construction. Orion also argues that "and" is fairly common in patent claiming and it is understood in patent parlance that "and" may be used in the disjunctive, depending on the context in which it is used. Orion contends that the phrases mean there are desired features and desired uses and the questions must relate to at least one of those -- the questions must relate to either desired features, or desired uses, or both.

The Court agrees. The specification does not require questions and answers on both features and uses. The phrase "features and uses" appears only in the claims. The 342 patent abstract refers to "needs and interests": "The system queries a user to determine a customer's needs and interests." The specification also says:

The system queries a customer to determine his or her interests and desired options. The interests may include a "use" desired by the customer, such as a marina or golf course. The interests may also include the type of information, such as technical, that the customer would like in the proposal. The desired options may include the various features of interest to the customer, such as the type of engine desired.

Col. 2:12-19. Thus, the specification language tends to equate "interest" with "use" and "features" with "options." But nowhere is there any statement that the invention requires -- at a minimum -- a question and an answer on a customer's desired options (or features) and a question and an answer on a customer's desired interests (or uses).

It further seems clear that the patentee did not intend for the claims to be read to require questions and answers on both features and uses. The claims are drawn generally to a method "for selling products." See Claim 1. Some products may not have "options" or multiple "features" and the only actual variation is seeing that product in various environments. Defendants' constructions would require that all products have both multiple "features" and "uses." Further, in both claims 1 and 11, only one answer is required for the "selecting" step or steps. It is not reasonable to read claim 1 as requiring a minimum of four questions and two answers, and claim 11 as requiring a minimum of two questions and two answers, when only one answer is required for the "selecting" step or steps, especially when nothing in the specification or prosecution history requires the same. n3

- Footnotes -
n3 This is in contrast to the Superguide case, which Defendants rely on, where the specification taught that the user must choose a value for each designated category. See Superguide Corp. v. DirecTV Enters., Inc., 358 F.3d 870, 887 (Fed. Cir. 2004).

- End Footnotes -

Thus the Court agrees with Orion that "and," in context, is used in the disjunctive. Therefore Defendants' proposed construction is unduly narrow, and the Court does not adopt it. Since this is the only clarification Defendants' construction makes to the claim language, the language does not require construction.
n2 This group of terms includes "plurality of questions relating to features and uses of the products" and "a plurality of customer answers to the questions, and the answers specifying a customers desired product features and uses" in claim 1 and "a plurality of questions related to at least one of a desired feature and desired use of the product" and "customer answers of the customer to the plurality of questions" in claim 11.

Hyundai argues "features and uses" should be construed as a conjunctive phrase--i.e., the questions (or answers) must relate to both features and uses. Hyundai incorrectly asserts that this issue was not before the Court in the Staples case. The Staples Defendants took the same position, which the Court rejected and instead construed the term as a disjunctive--i.e., the questions (or answers) must relate to either features or uses.

Hyundai argues that the applicant distinguished Donald and Yourick during prosecution on the basis that the invention queries customers about features and uses. See June 19, 1995 Amendment and Response for Application No. 07/878,602 at 4. However, reading this response in context shows that the applicant distinguished Donald and Yourick because the present invention relates the customer's answers to customer-specific information rather than using an inductive learning technique that did not associate a user's responses with pictures and text. Id.

Hyundai also argues that its construction is necessary to distinguish the patent from the prior art. First, construing claims to preserve validity is a last resort and is only used when claims remain ambiguous after applying all other claim construction tools. MBO Labs., Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1332 (Fed. Cir. 2007). Second, Hyundai has not shown that its construction would preserve validity over Montagna because Hyundai has not shown that Montagna includes all of the limitations of the claims at issue. Finally, Hyundai has not shown that the term remains ambiguous after all other construction tools have been utilized. Accordingly, the Court rejects Hyundai's proposed construction. As Hyundai's proposed construction only addresses the conjunctive-disjunctive issue, further construction is unnecessary.

As Hyundai's proposed construction only addresses the conjunctive-disjunctive issue, further construction is unnecessary.

Turning to the merits, we focus on the critical claim language, which provides that the housing of the claimed apparatus comprises "an electrical operating unit and a pair of spaced-apart electrically exposed conductive probe networks." The claim lists the "electrical operating unit" separately from the "pair of spaced-apart electrically exposed conductive probe networks," and does not suggest that the "pair of . . . probe networks" consists in part of a portion of the "electrical operating unit." Rather, the clear implication of the claim language is that the pair of probe networks is a distinct component, separate from the electrical operating unit of the claimed invention.

The specification confirms that interpretation. 2 The specification refers to the "electrical operating unit" variously as the "voltage-carrying exposed parts" of the device, '047 patent, col. 3, l. 41, the "interior part of the apparatus carrying a voltage," id., col. 5, ll. 61-62, the "other parts of the electrical apparatus which have a voltage on them, e.g., the heating coil in the case of a hairdryer," id., col. 7, ll. 1-2, or the "voltage-carrying parts of the apparatus," id., col. 7, ll. 10-11. The "pair of spaced-apart electrically exposed conductive probe networks" is described in the specification as an "exposed electrical double conductor," id., col. 3, ll. 5-6, and a "probe in the form of a double conductor," id., col. 3, l. 20; col. 5, l. 40; col. 6, l. 66; col. 7, ll. 9-10. Nothing in the descriptions of those two components suggests that their structures or functions overlap. To the contrary, the specification plainly describes the two components as separate.

2 Indeed, as we discuss below, even if the claim language itself did not support the interpretation we adopt, there is in the specification "a clear case of disclaimer of subject matter that, absent the disclaimer, could have been considered to fall within the scope of the claim language." SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1344 (Fed. Cir. 2001); accord Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906-09 (Fed. Cir. 2004).
The Summary of the Invention describes the exposed electrical double conductor and the protective circuit that is wired to it as triggering the disconnection of the power to the appliance as soon as "a conductive fluid such as water penetrates into the apparatus housing." '047 patent, col. 3, ll. 34-39. The device "accomplishes this disconnection," according to the Summary, "before the user can be connected to voltage-carrying exposed parts via the fluid which has entered the housing." Id., col. 3, ll. 39-42. That description plainly contemplates that the double conductor is separate from the voltage-carrying electrical operating unit, a structural separation that is essential to the operation of the device in the prescribed manner.

The specification explains that the "electrical double conductor of the probe" may be configured in the form of strips placed near the areas of the housing to which water might have access, so that "water which penetrates through the opening or through the gap in the housing cannot produce an electrical contact forming a current path from any interior part of the apparatus carrying a voltage to any point lying outward of such interior part, without said water wetting the strips." '047 patent, col. 5, ll. 58-63. Elsewhere, the specification makes the same point, directing that the "electrical double conductor of the probe should be configured in such a way that the trigger switch circuit will respond before the penetrating water reaches any other parts of the electrical apparatus which have a voltage on them (e.g., the heating coil, in the case of a hairdryer)." Id., col. 6, l. 66, through col. 7, l. 3.

The specification further describes how far the probes must be separated from the electrical operating system to avoid any water contacting the electrical operating system before the power has been disconnected. For example, in the case of a protective switch with a tripping speed of 1.3 milliseconds, the specification explains that the minimum distance between the electrical double conductor of the probe and the voltage-carrying parts of the apparatus must be 10 millimeters. '047 patent, col. 7, ll. 7-11. By separating the pair of probe networks from the voltage-carrying components of the device by that amount, the invention ensures that the protective circuit will have time to cut the power to the apparatus before the water reaches the voltage-carrying components.

Moreover, the specification explains that "the object of the invention is to devise a protective device . . . which device will respond in an extremely short time . . . independently of the operating state of the apparatus, so as to protect the user from electric shock." 47 patent, col. 2, ll. 55-61 (emphasis added). The invention therefore cannot encompass a hairdryer with a protective device that relies on current passing between a probe and the electrical operating system, since such a device would be triggered only when the hair dryer was operating and voltage was being applied to the electrical operating system. The specification thus plainly requires that the pair of probe networks be separate from the voltage-carrying electrical operating unit of the device, such as (in the case of a hairdryer) the heating coil and the blower.

Significantly, the specification describes one of the principal advantages of the claimed invention in a way that excludes the electrical operating unit from serving as part of the pair of probe networks. The specification explains that prior art devices would trigger the protective circuit only when there was a direct connection between the water and the power supply circuit, which would result in a shock of at least brief (and thus, ideally, nonlethal) duration to the user of the device. '047 patent, col. 2, ll. 13-20. The specification adds, however, that the invention of the '047 patent protects the user from such a shock, see id., col. 2, ll. 55-61, and the specification explains that the invention does so by arranging for the protective circuit to be separate from the voltage-carrying components of the appliance. The invention achieves that objective because it ensures that water will encounter the two probe networks before it encounters the voltage-carrying electrical operating unit. The lowering of impedance between the two probe conductors caused by the entry of water into the housing triggers the flow of electricity through a circuit that cuts power to the entire apparatus within milliseconds. Because of the presence of large resistors in the protective circuit, the leakage of current from the protective circuit, when it is triggered, is very low and completely safe--approximately 1.8 milliamperes, according to the specification. Id., col. 5, ll. 32-34. For that reason if, for example, a bather drops a hairdryer into the bath water, the claimed invention will interrupt the power to the hairdryer before the bather feels any shock.

Dr. Gaus argues that the specification's discussion of a protective device that prevents the user from being connected to the electrical operating unit via the fluid is merely a description of a preferred embodiment. The specification, however, states that "according to the invention" the protective circuit "accomplishes this disconnection before the user can be connected to voltage-carrying exposed parts via the fluid which has entered the housing." '047 patent, col. 3, ll. 34-42. The specification thus demonstrates that the invention itself requires that the user be completely protected from shock, in contrast to prior art devices that exposed the user to a brief, non-lethal shock.
The parties disagree about whether the "control signal" and "decode control key" of the phrase "utilizing said decode control key and said transmitted control signal to generate a pseudo-random signal at said receiver station" in claim 21 must generate the pseudo-random signal in a particular way. IPPV argues that the signal and key must initialize the pseudo-random signal independently and separately. That is, it contends that the initialization of the key cannot depend on the signal and vice versa. Conversely, Echostar argues that there is no such limitation in the patent, and therefore, the initialization of the key may depend on the signal.

In support of its proposed construction, IPPV points to the plain meaning of the language of the claim, the specification and the prosecution history. First, IPPV argues that the plain meaning of the conjunction "and" requires that the two signals act independently. According to IPPV, "and" precludes combining of the signal and the key, or manipulating one of the two signals based on the other, to produce one or more additional values, and then using these values to generate the pseudo-random signal.

Second, it contends that the specification is consistent with the independent and separate construction. The specification explains that the STAT word indicates the state of each register in the pseudo-random signal generator. The control signal corresponds to the STAT word. The specification also defines a separate quantity called the TAPS word, which corresponds to the decode control key. IPPV argues that the preferred embodiment of the invention employs the TAPS and STAT word independently, and as such, claim 21 requires that the signal and key always be employed independently.

Third, it contends that the August 27, 1984 amendment during the patent prosecution supports the independent and separate construction. In the amendment, the inventors state that "in order to generate this [pseudo-random] signal, two keys are required: the control signal . . . and a separate decode control key." From this statement, IPPV concludes that the signal and key must act separately and independently.

Echostar counters that claim 21 does not specify how the control signal and the decode control key are to be used to generate the pseudo-random signal. It argues that the plain and ordinary meaning of claim 21 does not include such a limitation. Echostar further argues that there is no support for the separate and independent construction in the specification or prosecution history of the patent.

Finally, Echostar contends that IPPV's experts have set forth conflicting validity and infringement constructions. According to Echostar, Sherwood, in attempting to rebut its anticipation allegations, stated that claim 21 requires the control signal and decode key to separately and independently initialize the pseudo-random generator, but on another occasion, Roy Griffen, another IPPV expert, posited that the odd/even bit, a decode key found in the headers of the packets used in Echostar's DISH Network, infringes the control signal limitation in claim 21. The odd/even bit, however, is used to select a control word. The control word depends on the odd/even bit, and therefore, the odd/even bit is not used separately and independently from the control word to generate a pseudo-random signal. From these statements, Echostar concludes that IPPV is improperly advocating opposing constructions depending on the ultimate purpose of each construction. Thus, the essence of this dispute is whether the control signal and the decode key must independently and separately initialize the pseudo-random signal.

Having reviewed the parties' arguments, the court will construe the claim in accordance with the plain and ordinary meaning of "and," which requires that both the signal and the key participate in generation of the pseudo-random signal, but does not limit the way in which the signal and key participate in the generation. As such, the court will not construe claim 21 to require that the control signal and decode key separately and independently initialize the pseudo-random signal.
b. Animated Facial Displays

The parties also dispute the scope of the terms "first animated facial display" and "second animated facial display." The defendants would limit the definitions to a foreign actor displayed in the motion picture on one monitor, and the film of the target actor speaking a translated dialogue displayed on another monitor, respectively. Bloomstein takes the far broader view that each is merely a visual display that depicts a face.

Because Bloomstein's proposed definition comports with the plain meaning of the terms, the defendants' definition must fail unless supported by other language in the claims and specification or by the prosecution history or extrinsic evidence. To support their argument, the defendants point to the next clause in claim 1: "the displays have lip movements corresponding to the languages used . . . ." Of course, this only supports the defendants' interpretation if the term "languages" is construed as a foreign tongue and a translation of that tongue into the "target" tongue. The defendant also points to the specifications which describe and depict an actor in a foreign film providing the "first animated display" and the target actor/translator providing the "second animated facial display." See Joint Memorandum, Ex. A at column 4:15-31, column 4:61-5:4, column 5:41-50, and Figure 2. However, the patent expressly states that the "invention is applicable to works using live actors as well as for animated cartoons." Thus the first animated facial display need not be a depiction of an actor's face. In light of the specifications and a contextual analysis of the claims, the "first animated facial display" is construed to mean a depiction of a face in a cinematic work speaking one "language." "Second animated facial display" is construed to mean a depiction of second face, an actor's, speaking a different "language." Neither display must appear on a "monitor device."

7. "Annotated web page": "A web page modified by the addition of thumbnail visual images." This construction is consistent with claims 13, 14, 35 and 36, as well as the specification: Figs. 1 and 2; col. 5, ll. 59-65; col. 6, ll. 24-32.

2. "Annular"

The same asserted claims that describe the base regions as "polygonal" describe the source regions as "annular." The district court construed "annular" to mean "each claimed source has an outer and inner extent defined by generally, but not necessarily perfectly, polygonal shapes." Construction Order '725 and '767 Patents at para. 7. In another order, the district court, discussing "annular," stated that "each source is ring-like, in that the semiconductor material . . . constituting the source does not completely fill the space within the polygonal-shaped outer boundary of the source, but instead has an inner polygonal-shaped boundary." Int'l Rectifier Corp. v. IXYS Corp., 2002 U.S. Dist. LEXIS 27247, No. CV-00-6756-R, (C.D. Cal. Mar. 5, 2002) ("Statement of Uncontroverted Facts '725 and '767 Patents"), at para. 18 n.11.

The parties and the district court are in agreement regarding the dictionary definition of annular--specifically, "of, relating to, or forming a ring." Id. (citing Webster's Ninth New Collegiate Dictionary at 88); see also Webster's, supra, at 88 (defining "annular" as "of or relating to a ring: forming a ring: shaped like a ring"). Moreover, the parties agree that the "ring" of the source region need not be circular. Even though the word "ring" ordinarily means "circular," the written descriptions of the patents re-define the word and refer to the square regions of the '699 patent and the hexagonal regions of the '725 and '767 patents as "ring-shaped regions" and "polygonal ring regions," respectively. '699 patent, col. 6, l. 32; '725 patent, col. 3, l. 21. But here is where the agreement ends. IXYS argues that the construction provided by the district court is too broad and could encompass shapes not ordinarily considered to be "annular." Such shapes include, for example, an oval shape enclosing two parallel rectangles or a hexagonal shape enclosing a plurality of small squares. These regions, argues IXYS, would not be considered "annular" under the ordinary and customary meaning of the word, but do fit within the district court's construction--having an outer and inner extent defined by generally polygonal shapes. IXYS argues that a better construction for "annular" would be a space "defined by two concentric polygons." IR argues that the district court's interpretation is correct and that IXYS's construction is unsupported. The crux of the disagreement reduces to whether the term "annular" requires concentricity of inner and outer borders of like shape.
As noted above, the ordinary and customary meaning of the term "annular" is "of or relating to a ring: forming a ring: shaped like a ring." Webster's, supra, at 88. In turn, the only relevant definition of "ring" includes "a circular or curved band." Id. at 1958. The relevant definition of "band" includes "an elongated surface or section with parallel or roughly parallel sides." Id. at 170. The ordinary and customary meaning of "annular" is thus "of or relating to a circular or curved surface or section with roughly parallel sides; forming or shaped like a circular or curved surface or section with roughly parallel sides." In order, then, for the surface or section to have roughly parallel sides, it must be formed of two concentric circular or curved regions. The ordinary definition of "annular" is thus "of or relating to an area formed by two concentric circular or curved regions."

In this case, the inventor has deviated from this ordinary and customary meaning, and has used the word "annular" to describe structures that are not circular or curved, but polygonal. In particular, Figure 7 of the '699 patent illustrates base and source regions of concentric squares, and Figure 3 of the '725 and '767 patents illustrates base and source regions of concentric hexagons. The text accompanying these figures refers to these shapes as "rings." See, e.g., '699 patent, col. 6, ll. 20-25, 32; '725 patent, col. 3, l. 21. Therefore, it is evident from the intrinsic record that the inventor has attributed a meaning to the term "annular" that is broader than the ordinary and customary meaning limited to an area formed by two concentric circles. The written description shows that the patentee used the term to describe the area between two concentric polygons, or an area shaped like a polygonal band. In doing so, the patentee acted as his own lexicographer, and the patentee's definition trumps the ordinary and customary meaning that otherwise would have attached. 3M Innovative Props. Co. v. Avery Dennison Corp., 350 F.3d 1365, 1374 (Fed. Cir. Dec. 2, 2003).

The written description, however, does not support any broader reading than this. The district court's construction, requiring only that "each claimed source has an outer and inner extent defined by generally, but not necessarily perfectly, polygonal shapes," is overbroad because it permits sources that are not formed by concentric regions; in fact, the district court's construction would encompass shapes that are not ring-like at all, regardless of the shape of the outer polygonal extent. Therefore, we reverse the district court's construction of the term "annular," and hold that the term, as used in the patents-in-suit, means "a surface area defined by two concentric polygons."

4. "Answer Data"

"Answer data" is the fourth term the parties have presented to the Court for construction from the Claims Involving Products Carrying Participation Numbers. The term appears in Claims 44 and 96 of the '707 patent and Claims 79 and 190 of the '863 patent. The language of the limitations in which "answer data" appears is almost identical in each patent and reads "receiving digital identification data from said individual callers responsive to said voice signals including said participation numbers for said individual callers and answer data developed by said remote terminals under control of said individual callers."

The parties agree that the clear meaning of "answer data" is responses by callers to vocal questions or prompts. The defendants ask this Court to exclude any response that includes a telephone number, and specifically the telephone number of the party the caller would like to reach, from the definition of "answer data."

The defendants argue that the specifications describe callers providing answers to questions only in the context of one of the Katz formats, and because making a telephone call is not a format, a telephone number cannot be included in the definition of "answer data." See Column 7, lines 46 and 59; Column 17, line 8; Column 19, line 17 of the '707 patent. Even taking the defendants characterization of these passages of the specification as true, the Court has already rejected the defendants' narrow definition of the term "format" in the context of these patents. Further, there is nothing in the passages of the specifications cited by the defendants that indicates that answer data could not include any telephone number, including the number the caller is trying to reach.

The Court concludes that there is nothing in the claim language or specification that restricts the ordinary, common meaning of the term "answer data," which denotes data containing answers or responses. The defendants argue that "answer data" cannot encompass all answers to questions because the claims refer to some types of answers with specific terms, such as participation numbers. Although the claims recite different terms to refer to some specific responses received from the
callers, the use of these more specific terms does not indicate that the broad term "answer data" cannot encompass these responses as well.

The prosecution history cited by the defendants does not support their construction of "answer data" nor does it limit the ordinary, plain meaning of the term as expressed in the claims. The defendants argue that Katz distinguished his inventions from a patent to Newkirk, which involved a system that enabled callers to make calls at pay telephones using a magnetic stripe on a card. In the prosecution history of the '968 patent in a Supplemental Amendment dated May 4, 1988, Katz stated that:

The Newkirk et al. patent (4,439,636) is directed to a system for enabling a magnetic stripe card to be used at a pay telephone somewhat independently of the composite telephone system. Although the Newkirk patent discloses digital communication between a remote terminal and central terminal, the communication essentially involves the magstripe of a credit card. Distinct from applicant's development, Newkirk does not contemplate any operations related to statistical analysis. Specifically, with respect to the claims herein, while the Newkirk patent utilizes a calendar clock and form records for purposes of billing, the system does not store any form of "answer data."

(Ex. 33). The defendants contend that Katz's statements indicate that a telephone number could not be answer data. The Court concludes that Katz's statement that the Newkirk system did not store any form of answer data does not limit the term "answer data" to exclude responses that include telephone numbers. Katz stated that the only communication between a remote terminal and a central terminal was through the magnetic stripe; such a magnetic stripe would not have constituted "answer data" as this Court concludes that term is used in the Katz patents.

Although not addressed by Katz in his statements regarding Newkirk, the defendants argue that the Newkirk patent provided for callers to be "prompted" by a dial tone to enter the telephone number they were trying to reach. Thus, the defendants argue, Newkirk involved callers' responses to prompts and Katz statement that Newkirk did not include answer data indicates that Katz was disclaiming responses involving telephone numbers from the scope of the term. The Court is not persuaded by this argument for two reasons. First, Katz did not mention that Newkirk prompted callers with a dial tone in his discussion of the Newkirk patent; thus, the Court will not limit Katz's claims by a statement that he did not make during the prosecution of the patents. Second, the patents make clear that the questions or prompt must be vocal or voice generated. 26 Thus, the dial tone used in Newkirk is not a "prompt" or "cue" as used in the Katz patents.

26 Claim 44 provides support for the notion that the questions or prompts are vocal in nature. The third limitation in Claim 37, upon which Claim 44 depends, provides for "coupling said remote terminals to said interface for providing voice signals to said individual callers and generating said voice signals for actuating said remote terminals as to provide vocal operating instructions to specific ones of said individual callers." The specification also supports the idea that answer data is responses to vocal questions or prompts. See Column 7, lines 46 through 53 of the '707 patent.

During the prosecution of the '846 application, Katz distinguished his patent from a patent to DeBruyn. (Ex. 66). In an Amendment dated July 7,1997, Katz stated:

DeBruyn is silent as to the fourth and fifth steps of claim 31. These steps provide: "cueing callers with selected questions from a batch of questions;" and "receiving answer data . . . responsive to the selected questions." DeBruyn prompts callers for simple and fixed input: a phone number and a Lotto number, which can be confirmed and corrected in linear fashion. There is no suggestion or disclosure of selected "questions from a batch of questions." DeBruyn does not contemplate a selection of the same or different questions for different callers, from a batch of questions. DeBruyn, by its silence, can not imply cueing callers with those questions, nor receiving answer data in response to those questions.

It is clear that in these statements, Katz was distinguishing his patent from DeBruyn on the basis that DeBruyn did not select questions from a batch of questions or receive answers to those questions from a batch of questions. These statements clearly do not indicate that answer data cannot include any telephone number, including the number the caller is trying to reach.
Based on the foregoing, the Court concludes the term "answer data" to mean: responses from callers to vocal questions or prompts.

171

Plaintiff argues that the term "antenna" does not need any construction. If the Court were to adopt defendants' construction, MHL argues that the Court exclude the word "designed" from the construction. Plaintiff argues that the invention uses the wheel already available in the vehicle, not one that was specially designed or intended by automakers to function as an antenna. The defendants argue that the word "designed" includes within the construction the fact that the system is configured to use the wheel as an antenna. The Court fails to read defendants' proposed construction as reflecting the intended meaning. The Court, therefore, construes "antenna" as "that part of a transmitting or receiving system that radiates or receives electromagnetic waves."

172

"Antenna means"

The Court adopts CSIRO's proposed construction and construes the term "antenna means" to mean "a means for radiating or receiving radio waves." Nothing in the claim language, the specification, or the prosecution history supports Buffalo's contention that the term's meaning should be limited to "a means for transmitting and/or receiving radio frequency signals whereby the antenna in the mobile transceiver is a steerable antenna." Buffalo argues that the specification's language referring to a "steerable antenna" supports its interpretation, but the language Buffalo cites unmistakably designates steerability of an antenna as a preferred embodiment: "antenna 37 is preferably a steerable antenna which is electronically steerable." 069 Patent, col. 6:12-16. A preferred embodiment usually does not restrict construction of a patent's claims. See Nazomi Commc'ns, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1369 (Fed. Cir. 2005) (claims may embrace "different subject matter than is illustrated in the specific embodiments of the specification"); see also Phillips, 415 F.3d at 1323; Teleflex, 299 F.3d at 1327. But see Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) (holding that "when the preferred embodiment is described . . . as the invention itself, the claims are not necessarily entitled to a broader scope than that embodiment"), overruled on other grounds by Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., 234 F.3d 558, 574 (Fed. Cir. 2000) (en banc) ("Festo I"). Buffalo tries to circumvent this clear principle of law by arguing that the relevant preference in the specification's text is distributed to the adverb "electronically" but somehow by-passes the adjective "steerable." This construction is grammatically untenable, and a claim must be read in accordance with the precepts of English grammar. In re Hyatt, 708 F.2d 712, 714 (Fed. Cir. 1983).

Therefore, the Court construes "antenna means" as "a means for radiating or receiving radio waves."

173

13. "Recording Any Errors."

The court shall apply the ordinary definition of the words "recording" and "any." The term "recording" means "to set down for preservation in writing or other permanent form." 3 The term "any" means "the whole amount of; all." 4 Thus, the phrase "recording any errors" means "to set down for preservation all errors."

A. ’413 PATENT

All of SLT’s contact probes have optically transparent distal ends made of either sapphire or quartz that transmit laser or radiant energy from a fiber optic cable. Almost all of the contact probes have an infrared coating that is sprinkled on this distal, transparent surface of the probe. This infrared coating, which does not cover the entire distal end, absorbs a limited portion of the radiant energy and converts it to thermal or heat energy. These contact probes also have a stainless steel connecting sleeve that secures the probe to the fiber optic cable. A coolant is supplied to the sleeve to prevent the connecting sleeve from heating. The sleeve also contains a port to vent the coolant.

The district court focused on claims 1 and 20, the only two independent claims of the ‘413 patent asserted against SLT. Claims 1 and 20 read as follows:

1. A localized heat applying medical device for applying heat to a site in a selected lumen in a patient's body, the device comprising in operative association:

an elongated light transmitting conduit having a proximal end and a distal end, and bulbous heat generating means mounted on the distal end, for converting light transmitted by the conduit in part to heat thereby raising the temperature thereof, the diameter of the bulbous heat generating means being larger than the diameter of said conduit, the bulbous heat generating means including a light transmitting aperture therethrough enabling light transmitted by the conduit in part to pass through the means into the lumen to directly impinge on a region thereof.

20. A localized heat applying medical device for applying heat to a site in a patient's lumen, the device comprising in operative association:

an elongated light transmitting conduit having a proximal end and a distal end and a heat generating element defining a cavity with vent means therein for permitting gas to escape from the cavity, the element being mounted on the distal end such that light transmitted by the conduit to the element is in part converted by the element into heat to raise the temperature of the element and the element can then be contacted with material in the patient's lumen to alter the material, the element including a light transmitting aperture through which a part of the transmitted light can pass to impinge directly onto the material; the conduit and heat generating element being adapted for insertion into the patient's lumen.

The district court focused on the claim term "light transmitting aperture" common to both claims 1 and 20. The district court found that the term was described in the specification as a "hole," "window," or "port," and concluded that it should be defined as "an opening in the tip of the device through which laser energy passes." Trimedyne, slip op. at 3 (C.D. Cal. May 8, 1996). The district court found that the accused SLT probes do not have such an aperture because the SLT device tip was entirely light transmissive and there was no evidence that the amount of light transmission could be controlled for clinical effect. Id. The district court additionally found that the accused SLT probes do not have "a cavity with vent means therein for permitting gas to escape from the cavity" as additionally required by claim 20. Id. at 3-4.

The district court held that SLT’s accused probes do not infringe under the doctrine of equivalents because SLT’s probes perform in a different way from that claimed in the ’413 patent. For instance, the district court found that SLT’s probes are light transmissive, but also transmit a "mix" of laser and thermal energy over the entire tip, whereas radiant energy is transmitted straight ahead through a "light transmitting aperture" in the tip of the ’413 claimed probe while the rest of the tip transmits only thermal energy. This difference the district court found creates a different therapeutic effect than SLT’s contact probes. Therefore, the district court granted SLT’s motion for summary judgment of non-infringement of the ’413 patent.

*   *   *

II. DISCUSSION
A. '413 PATENT

First, Trimedyne argues that the district court improperly construed the claim term "light transmitting aperture" from independent claims 1 and 20 as requiring an opening in the tip of the probe through which laser energy passes when the specification of the '413 patent teaches that the aperture can be a quartz window or lens, as in SLT's contact probes. Trimedyne also argues that the district court improperly decided a question of fact when it determined that SLT's contact probe tips or distal ends are entirely light transmissive. SLT applies a heat absorbing coating of carbon particles to the majority of its contact probes. Because such a coating is not perfect, Trimedyne asserts that laser energy escapes from the probe tip through the spaces between the coating's carbon particles. These spaces, Trimedyne asserts, constitute "light transmitting apertures" as claimed in claims 1 and 20.

Trimedyne also argues that during use of SLT's contact probes such an aperture is created. During use, carbonized tissue particles adhere to the surface of the tip, which increases the tip temperature. Through further use, the laser light burns an aperture through the "blackened" tip, which Trimedyne argues independently satisfies the "light transmitting aperture" limitation of the patent claims at issue.

Second, Trimedyne asserts that the SLT contact probes have the vents described in claim 20. Trimedyne argues that a gap is created between the fiber optic cable and the probe when mounted together. A hole or port communicates with the gap and can allow gases as well as liquid coolant to pass from the gap through the hole or port. This ability to vent gases, regardless of whether SLT uses the vent to do so, Trimedyne asserts, meets the limitation of claim 20. Therefore, Trimedyne concludes that at least a triable issue of fact exists concerning whether SLT's contact probes literally infringe the asserted claims of the '413 patent.

Lastly, Trimedyne argues that even if we agree with the district court, after construing the claims, that no literal infringement exists, triable issues of fact remain concerning whether SLT's contact probes infringe the '413 patent under the doctrine of equivalents. For instance, Trimedyne argues that SLT has admitted that its contact probes function to achieve the same therapeutic result as the claimed probe, i.e. to deliver heat to alter the tissue by coagulation, ablation, or vaporization.

SLT counters Trimedyne's arguments by asserting that its various contact probes do not infringe the '413 patent because they lack the claimed light transmitting aperture, vent means, and a bulbous heat generating means or element. First, SLT asserts that the district court properly construed the claim term "light transmitting aperture" to be a hole in an opaque heat generating element through which a portion of the radiant energy may be transmitted directly to the tissue. All of SLT's contact probes are made of quartz or sapphire, which are light transmissive, and therefore, SLT argues, they have no such discrete light transmitting aperture. Therefore, SLT's contact probes do not infringe the '413 patent, it argues, because the claimed probe allows laser energy to pass only through the small, single aperture, while laser energy may exit the entire surface of the distal end of SLT's contact probes.

Second, SLT asserts that the claimed means-plus-function element, "vent means," must function to "permit gas to escape from the cavity." SLT argues that its probes do not use the vents to perform the function of venting gas. Rather, force-driven coolant is used to keep the probe cool to avoid the build-up of such gases. Therefore, its vents do not perform the required function of venting gases.

Third, SLT asserts that its contact probes lack a heat generating element, an issue that the district court did not reach. The heat generating element or means when read in light of the specification, SLT asserts, requires an opaque material in which there is an aperture for transmitting direct laser radiation to the tissue. Because the distal end of SLT's probes are light transmissive with no opaque material, it asserts that it lacks the claimed heat generating element. Finally, SLT asserts that its probes are not bulbous because during the prosecution of the '413 patent the applicants distinguished probes such as SLT's with a cylindrical body portion and distal ends having the same or smaller diameter as the body portion. Because of this increasing diameter, SLT's contact probes have an increasing point of contact with the walls of a vessel when the probe is urged forward; exactly what SLT argues the claimed probe of the '413 patent was intended to avoid. Therefore, SLT asserts that the district court properly found that SLT’s contact probes do not literally infringe any asserted claim of the '413 patent.

SLT also agrees with the district court that none of SLT’s contact probes infringe the '413 patent under the doctrine of equivalents. Taken on an element by element basis, SLT argues that its devices do not perform in substantially the same way.
because SLT's contact probes diffuse laser energy throughout the entire probe surface whereas the claimed probe transmits laser energy only through the light transmitting aperture. This leads to substantially different clinical results, SLT argues. The lesion formed by the claimed device is a double crater; the outer crater mirrors the shape of the heat generating element and the inner crater reflects the intense, direct laser irradiation of the tissue from the aperture. The lesion formed by SLT's probes, on the other hand, is a single, uniform crater.

1. LITERAL INFRINGEMENT

Summary judgment is properly rendered when "the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c); see also Johnston v. IVAC Corp., 885 F.2d 1574, 1576-77, 12 U.S.P.Q.2d (BNA) 1382, 1383 (Fed. Cir. 1989). In deciding whether a genuine issue of material fact exists, any evidence must be viewed in favor of the nonmoving party with any doubts resolved in its favor. O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1580, 42 U.S.P.Q.2d (BNA) 1777, 1779 (Fed. Cir. 1997). A grant of summary judgment is reviewed de novo. Conroy v. Reebok Int'l, Ltd., 14 F.3d 1570, 1575, 42 U.S.P.Q.2d (BNA) 1373, 1377 (Fed. Cir. 1994).

To determine on summary judgment whether SLT literally infringes any claim of either patent in suit, we first interpret the claims, and second, determine whether a reasonable trier of fact could find that every limitation in any construed claim at issue is found in SLT's accused probes. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1575, 34 U.S.P.Q.2d (BNA) 1673, 1676 (Fed. Cir.), cert. denied, 516 U.S. 987, 133 L. Ed. 2d 424, 116 S. Ct. 515 (1995). The primary issue presented in the appeal from the grant of summary judgment of the '413 patent is whether the district court properly construed the claim terms "light transmitting aperture" and "vent means for permitting gas to escape from the cavity." Claim construction is a question of law that we review de novo. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2d (BNA) 1169, 1174 (Fed. Cir. 1998). In defining the meaning of key terms in a claim, the court may refer to the specification, the prosecution history of a patent, prior art, and other claims. Minnesota Mining and Mfg. Co. v. Johnson & Johnson Orthopaedics, 976 F.2d 1559, 1566, 24 U.S.P.Q.2d (BNA) 1321, 1335 (Fed. Cir. 1992) (citing Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1021, 4 U.S.P.Q.2d (BNA) 1283, 1286 (Fed. Cir. 1987)).

The distal end or head portion of the claimed contact probe is a generally rounded, heat generating element preferably made of metal, such as stainless surgical steel, or a combination of metal and ceramic. '413 patent, col. 6, ll. 52-55. This head portion or heat generating element is designed to absorb the radiant energy from fiber optic cable and convert it to heat. Id. at col. 5, ll. 55-60; col. 12, ll. 25-32. This heat is transferred primarily by conduction to ablate any obstruction. Id. at col. 12, ll. 31-32. The heat generating element is thus not light transmissive.

The light transmitting aperture as claimed in the '413 patent is first introduced in one embodiment as

a central aperture or bore which permits a portion of the light transmitted to the heat generating element to pass through the aperture and directly impinge upon a selected region of the plaque obstruction. With this form of heat generating element, both radiant and heat energy can be applied sequentially or simultaneously to the lumen or to the obstruction therein.

'413 patent, col. 3, ll. 11-18.

Under the Description of the Preferred Embodiments, the light transmitting aperture is described in more detail in relation to Figure 10 reproduced below.

[SEE FIGURE 10 IN ORIGINAL]

As illustrated in FIG. 10, tapered body portion 542 has a varying side wall thickness and partly defines a cavity 544. An optically transparent means such as a lens or window 546 is positioned within the head portion 543 so as to block the distal end of the cavity 544 against the inflow of body fluids and tissue components. The window 546 can be made of quartz, sapphire or other optically transparent material. Aperture or bore 550 in head portion 546 defines a communication port between the window 546 and the surroundings. The window 546 prevent bodily fluids or material that have entered the boring 550 from contaminating the end 532a of the fiber optic member 532. The thickness of the side wall of body portion 542 is less than the wall thickness of the head portion 543.
The light transmitting fiber 532 emits light or radiant energy from an end surface 532a which impinges upon a surface 548 of the window 546. As discussed earlier with respect to the embodiments of FIGS 1-8, radiant energy transmitted through the conduit 532 heats the heat generating element 536 when it impinges upon the surface 548. A portion of the radiant energy, such as the light beam designated by the legend R emitted from the surface 532a passes through the window 546 and the aperture 550 directly into the surrounding lumen. The radiant energy R then impinges upon a surface 154a of the obstruction 154. The sequential or simultaneous application of heat and radiant energy to the obstruction 154 softens or vaporizes the plaque thereby easing the advance of the heat generating element 536.

As a result of adding the port or aperture 530, light or electromagnetic energy as well as thermal energy, are sequentially or simultaneously applied to the obstruction 154 desired to be removed. By controlling the size of the aperture 550, it is possible to control the amount of power or energy delivered directly to the site.

"413 patent, col. 13, ll. 20-56.

On the basis of the above description of the aperture, we hold that the district court was correct in defining "light transmitting aperture" as a hole, window, port, or opening in the tip of the probe through which laser energy passes. The written description, including Figure 10, shows the aperture as a discrete hole or bore in the center of the distal end or head portion of the probe. Also, the aperture 550 and the transparent window 546 that is positioned within the aperture to transmit light are always described in the singular. Only one aperture and window are present within the distal head of the probe as described in the '413 patent, not a multitude of small apertures, as Trimedyne asserts, exist between the carbon particles of the infrared coating on some of SLT's contact probes. The reference to controlling the size of the aperture to control the amount of radiant energy for use with Trimedyne's contact probes further supports the conclusion that the claim limitation "light transmitting aperture" refers to a single discrete hole or opening.

"413 patent, col. 13, ll. 20-56.

2. "apparatus" and "system" 6

6 The pertinent claims identified by the parties are: '677 patent (claims 2, 22, 37, 39, 40, 46), '249 patent (claims 1, 2, 6-8, 20, 21, 25, 28, 42-44, 48, 52-54), '698 patent (claims 1-3, 6, 7), and '315 patent (claims 1, 2, 4-7, 12-19, 21-23).

As with the term "automated," AutoScribe argues that because "apparatus" and "system" are included in the identified claims' preambles, they should not be construed. 7 This argument, however, flies in the face of the patents' disclosures and therefore is wrong. Unlike "automated," which was referred to most often in the preamble of the relevant claims, the terms "apparatus" and "system" are consistently used in the body of the claims. Indeed, they are used in the body of 42 out of the 45 identified claims. Even in those claims where the terms are used solely in the preamble, they breathe life and meaning into the claims, not by describing a purpose or intended use, but by adding structure to them. Thus, the argument that the terms are located in the preamble and therefore should not be construed, simply ignores how the patentee chose to claim his invention and thus is inapt. Accordingly, both terms will be construed.

7 It is worth noting that this argument was first articulated in the Joint Chart. In its claim construction brief, AutoScribe contended that they were limitations that should be construed. (Def.'s May 22, 2003 Br. at 24).
is used by a "system operator"); claim 37 (claiming an "automated apparatus" and then referring to that apparatus as a "system" in the body of the claim). Moreover, the parties proffer the same definition for both terms. Thus, they will be given the same construction.

Both parties cite to the specifications of the patents to support their slightly different constructions. AutoScribe, generalizing based on its references to the ’677 specification, argues that the terms mean "computer hardware installed with computer software." (Joint Chart at 2). Intell-A-Check, quoting a particular portion of the specification, argues that they mean "a computer, with a display screen, keyboard and printer, on which the required software program is running." (Id. at 1-2 (quoting ’677 patent, col. 6, lines 40-44)). Although they agree that both terms involve a computer running on the appropriate software, 8 AutoScribe's definition is very general, effectively not limiting the definition to any type of computer hardware used by the operator, whereas Intell-A-Check's definition is more narrow, and limits the system to a computer, keyboard, display and printer. Thus, the issue boils down to what type of computer system, if any, is required by the relevant claims.

--- Footnotes ---

8 The intrinsic records supports the parties' agreement. See, e.g., ’677 patent, claims 2, 22 ("wherein said apparatus is implemented on a computer using software"); ’249 patent, claims 1 and 7 ("automated computer-based apparatus . . . wherein said apparatus is implemented using software"); ’315 patent, claim 12 ("a standalone personal computer apparatus").

--- End Footnotes ---

In this case, Intell-A-Check has the better argument. There is no dispute that the computer requires at least an input device and a display device. Thus, the issue devolves into whether a printer is included in "system" and "apparatus." All of the claims, but one, explicitly require the production of a paper draft. Claim 10 of the ’315 patent does not. AutoScribe argues that is because claim 10 does not produce a paper draft, but is directed to a paperless transaction. 9 However, that construction is not supported by the ’315 patent's disclosure. Indeed, the ’315 specification directly contradicts such a construction.

--- Footnotes ---

9 Claim 10 of the ’315 patent reads:

An automated process for making payments from a payer having a financial account at a financial institution to a payee based on authorization in a telephone conversation between the payer and a system operator representing the payee, comprising the steps of:

- providing an automated payment order computing system having an input screen for receiving payment order input information;

- conducting a telephone conversation with a payee who has not previously authorized payments to payee by telephone, in which said system operator obtains said payment order input information, including at least identification of said financial account and a financial institution identification code identifying said financial institution holding said financial account, and contemporaneously enters said payment order input information in said input screen;

- using said computing system, automatically verifying said financial institution identification code contemporaneously with system operator entry of said draft input information, by comparing said code to entries in an institutional database and determining whether said code matches an entry in the database;

- if said code matches an entry in the database, retrieving identifying information about the institution and displaying said identifying information for the system operator whereby the system operator may verify institution identification with the payer;

- if said code does not match an entry in the database, displaying an error indication to the system operator whereby the
operator may request corrected information from the payer;

using said input information, generating an electronic record containing information sufficient to generate an order to pay an amount authorized by said payer to said payee; and

processing said electronic record and transmitting information to a central clearing system for processing to cause a transfer of funds from said payer account to said payee.

(Emphasis added).

The Abstract of the '315 patent summarizes the claimed invention as follows:

A system and method of collecting payments uses an automated system to generate a draft, payable to the creditor and drawn on the payor's checking account, pursuant to the payor's authorization. The draft is then executed by the debt collector as authorized signatory for the payor, and deposited into the payee's account to complete payment. The automated system has a simple input screen which receives the necessary information for generation of the draft . . . . When verification is complete, the system generates a paper bank draft payable to the payor . . . . '315 patent, Abstract (emphasis added).

Similarly, the "Field of Invention" depicts the invention as a system that generates a printed draft. '315 patent, col. 1, lines 17-19 ("The present invention relates to systems and methods for collecting payments using an automated draft printing system operated by a payment collector.") (emphasis added). Further, and probably of greatest significance to determining whether the patentee limited the construction of the term "apparatus" and "system," is the statement in the '315 specification that differentiates the patented system from one that allows electronic funds transfers. The '315 specification states in pertinent part:

One solution to the problems of reliably collecting repeated payments is a pre-authorized electronic debit. Many large and well-connected creditors, such as banks and the finance arms of automobile manufacturers, generate monthly tapes of authorized payments which are then processed electronically within the banking system. Funds are withdrawn from the checking account of the consumer and transferred directly to the creditor. . . . Such electronic funds transfers cannot be authorized by telephone; a written authorization is legally required, so that immediate authorized collection of a debt cannot be accomplished by this method. '315 patent, col. 2, line 53 - col. 3, line 5 (emphasis added).

As clearly described by the patentee, the patented invention allows for the immediate collection of debts. See, e.g., '315 patent, col. 3, lines 37-41 ("Therefore, the inventor believes there is a need for an improved system and method for collection of debts which can be used for immediately debiting a debtor's bank account when the debtor authorizes this collection method by telephone."). Because electronic funds transfers could not be authorized by telephone, in contradistinction to the patented invention, a person of ordinary skill in the art reading that specification would understand that electronic funds transfers were not included within the scope of the patent. In fact, the patentee represented as much when prosecuting the application that matured into the '677 patent by stating, "the electronic debits of the banking system do not suggest the present invention or provide its advantages." Application No. 07/959,930, May 14, 1993 Petition to Make Special for New Application at 10.

"Where the general summary or description of the invention describes a feature of the invention (here, [immediate debt collection authorized by telephone]) and criticizes other products (here, [electronic funds transfers]) that lack that same feature, this operates as a clear disavowal of these other products (and processes using these products)." Astrazeneca, 384 F.3d at 1340. Thus, the patentee disavowed electronic funds transfers authorized by telephone in the specification. Since the method in claim 10 requires obtaining authorization during a telephone conversation, it cannot encapsulate electronic funds transfers; rather, it must be construed to include the production of a paper draft which provides the necessary written authorization to immediately collect the debt owed. In other words, the disputed terms shall be construed to include a printer.

In sum, the terms "apparatus" and "system" mean "computer hardware running with the required software program,"
Finally, we turn to the language "apparatus for producing a fixed code signal and for combining said fixed code signal with a rolling code signal," appearing in claim 3. In the specification's summary of the invention, the patentee defined "rolling or variable code" as a code "changed with each actuation of the transmitter" (3:15-16). Comparing the two, the patentee defined "fixed code" to "remain the same for each actuation of the transmitter" (3:16-17). As we understand the invention, the fixed code signal acts as an identifier for the receiver, and therefore, the make-up of the fixed code must remain the same for each activation. Thus, if the fixed code is 123, it must remain made up of 1, 2, and 3, such that the receiver can recover the fixed code. Such a static make-up is compared to the rolling code, which, in addition to potential encryption, changes its make-up after each activation. Based on that understanding, and the language in the specification, we find that "fixed code signal" is "a coded signal representing a fixed code generated by the processor."

Chamberlain encourages us to further define "fixed code" to include the clause "regardless of how it is later encrypted before or during the RF (radio frequency) transmission." Defendants disagree, arguing that not only must the make-up of the fixed code remain unchanging, but the representation of the make-up must remain also fixed, up until and through the transmission of the radio frequency signal. So, under defendants' construction, if the fixed code is 123, it must remain 123, and cannot ever be encrypted - for example, mirrored to read 321. Defendants state that because, "[i]n the only embodiment shown, the same fixed code signal is generated and transmitted with each transmitter activation," the "fixed code" must remain the same in each transmission (Lear's Markman position slides, p. 20). First, we note that both parties' arguments anticipate an infringement dispute and should not necessarily be part of the claim construction. Therefore, we decline, at this stage, to define "fixed code" beyond "a coded signal representing a fixed code generated by the processor." We do recognize, however, that the Federal Circuit teaches us that "[a]bsent a clear disclaimer of particular subject matter, the fact that the inventor may have anticipated that the invention would be used in a particular way does not mean that the scope of the invention is limited to that context." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 909 (Fed.Cir.2004) (internal citations omitted). Although the patent does not specifically indicate that the fixed code may be encrypted, it does not clearly disclaim such an embodiment occurring outside of the activation of the transmitter. n5 See Innova/Pure Water, Inc., 381 F.3d at 1117 ("[E]ven where a patent describes only a single embodiment, claims will not be 'read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using 'words or expressions of manifest exclusion or restriction'). In fact, claims 4 and 17 indicate that the fixed binary code is "interleaved" or "combined" with the binary rolling code. Such claim language indicates that the radio frequency signal, which contains the "fixed code," can be altered before or during the radio frequency transmission (as long as the original fixed code can be recovered by the receiver). Therefore, at this point we will not read the preferred embodiment to limit a broader claim. Based on our understanding of "fixed code," we adopt plaintiff's construction of "apparatus for producing a fixed code signal and for combining said fixed code signal with a rolling code signal" to mean "a processor programmed to 1) produce a message carrying information indicative of a non-changing code and also 2) combine that message with a message carrying information indicative of a rolling code."
distributed capacitance disposed in a semiconductor circuit"

The parties agree that the term "plurality" means "two or more." The parties also agree that the phrase "conductive lines having inherent distributed capacitance" as recited in the claim preamble lends meaning to the phrase "said conductive lines" as used in the body of the claim. The parties disagree, however, on the meaning of the phrase "conductive lines having inherent distributed capacitance." Atmel argues that this phrase refers to any line in a semiconductor circuit capable of conducting electronic current and storing electronic charge. ISD counters that this phrase refers only to lines in a memory array having numerous, evenly spaced capacitive elements, and that only word lines can meet this requirement. The Court construes this claim element according to the ordinary principles of claim construction.

The Court finds that the ordinary meaning of the term "conductive line" is a line capable of conducting electronic current. Because the phrase "inherent distributed capacitance" does not have a clear meaning, however, the Court looks to the specification to determine what the patentee meant by this phrase. The specification notes that, "although this disclosure has been made with reference to raising the voltage on a word line in a memory array, those skilled in the art will recognize that other lines, such as y-lines, select lines, and write lines may be pumped up to higher voltages by use of this invention." '811 Patent, 7:26 - 31. Furthermore, Figure 4 of the '811 Patent depicts the invention connected to several types of conductive lines. The specification, in explaining Figure 4, notes that the charge pump circuits are connected to "lines in the memory array which require programming voltages, namely, x-lines (word lines), y-lines, write lines (two shown), and the sense line." '811 Patent, 7:46 - 8:3. The specification language clearly indicates that the patentee intended the phrase "conductive lines having inherent distributed capacitance" to mean more than just word lines.

The Court rejects ISD's argument that the prosecution history and specification show that the patentee intended to limit his invention to word lines in a memory array only. While much of the specification does relate to word lines, the disclosure of a preferred embodiment in a specification should not generally be used to limit a patent's claims, especially in a case as this where portions of the specification clearly evidence an intent to include other types of conductive lines. Furthermore, in reading the prosecution history, the Court finds that the patentee's statements are not inconsistent with the unambiguous language in the specification referring to different types of lines, even if the patentee did focus on the preferred embodiment. (Declaration of Nitin Subhedar, Ex. 2.)

Atmel urges the Court to rule that any line in a semiconductor circuit that can conduct electronic current and store electronic charge is a conductive line having inherent distributed capacitance. Atmel points to language in the specification that the disclosed invention "can be used anywhere where an on-chip generation of high voltage is required to supply small amounts of current." '811 Patent, 7:14 - 16. The Court agrees with ISD that Atmel's construction would not lend sufficient meaning to the phrase "inherent distributed capacitance" because almost all conductive lines disposed on a semiconductor substrate would fall within this definition, and the claim already requires that the conductive line be "disposed in a semiconductor circuit." ISD has conceded, however, that construing "conductive lines having inherent distributed capacitance" as those relatively long lines in a semiconductor memory array having a great deal of capacitance distributed along their length that must be accounted for in the operation of the claimed circuit would read on word lines, y-lines, write lines, and select lines.

For these reasons, the Court adopts the following construction of this claim element:

A conductive line is any line that is capable of conducting electrical current. A conductive line having inherent distributed capacitance is a conductive line in a semiconductor circuit that has capacitance distributed along its length that must be accounted for in the operation of the claimed circuit, and includes word lines, y-lines, write lines, and select lines.

For this term, the parties' dispute relates to what is required for the claimed "redundancy code" (error correcting code) to be "appended to the ends of" the user data. Defendants contend that the claimed redundancy code must be attached immediately adjacent to the user data and plaintiff says the only limitation is that "no other user data" may intervene between the end of the user data and the redundancy code generated from that data.
The plain meaning of the language controls here. As plaintiff points out, the word "appended" could mean "attached to" without requiring immediate adjacency. Think of a set of exhibits "appended to" a brief; not all of the exhibits are immediately adjacent, but any of them could be said to be "appended to" the brief. The problem is that the claim language is more specific: the phrase is "appended to the ends of." The added phrase "to the ends of" emphasizes exactly where the code must be attached.

Plaintiff contends that the phrase "appended to the ends to" has been used loosely to indicate only that data comes after other data. In particular, U.S. Pat. No. 5,551,020 (the Flax patent) discloses information "appended to the ends" of a string and contrasts it with information "appended to the beginning" of the string. There are two problems with this argument. First, plaintiff fails to point to anything in the Flax patent suggesting that the attachment "to the ends" and "to the beginning" was not attached immediately to the ends. Second, even if plaintiff could show the term was used loosely in that patent, the circumstances were different; there the patent contrasted data "appended to the ends" with data "appended to the beginning," suggesting that the phrase "to the ends" served the purpose of emphasizing at which location the data was stored. In this case, that added emphasis is not needed because there is no contrast of the data with data stored elsewhere.

Plaintiff's next argument is that the claim cannot require immediate adjacency because that would interfere with another feature claimed in the invention related to "fill bytes," which are used to fill in defects in the block. Figure 4 of the '893 patent shows an example of how a relationship between user data (labeled "DATA" in the figure) and redundancy code (labeled ECC in the figure) would appear in a "perfect world."

The "SPARE" bytes represent the space that the data may shift if fill bytes are inserted at places in the data "to avoid bad columns." '893 pat., col. 13, lns. 26-29. According to plaintiff, fill bytes could be inserted anywhere, including at the very beginning of the redundancy code. If so, the redundancy code would no longer be immediately adjacent to the user data.

Plaintiff's theory has two problems. First, plaintiff does not explain why the "fill byte" feature of the invention would have to work alongside the feature requiring the redundancy code to be "appended to the ends" of the user data. The only claim plaintiff identifies that includes the "fill byte" feature is claim 60, which depends from claim 52. The claim at issue here is claim 58, which also depends from claim 52. Plaintiff does not explain why these separate dependent claims must be construed in a way that makes them both work together and no principled basis for doing so suggests itself.

Second, even if the present claim language should be construed in a way to accommodate the "fill byte" feature, it would not warrant leaving the construction as wide open as plaintiff proposes (to allow anything but user data to intervene). At most, such an accommodation would allow the redundancy data to be attached either directly to the user data or to fill bytes that are attached directly to the user data. Plaintiff has not indicated it would be satisfied with this accommodation, so adopting it seems unjustified. I conclude that "individual ones of the redundancy codes being appended to the ends of the user data from which they are generated" requires the redundancy code to be attached immediately adjacent to the user data.

IDNT and VeriSign agree that "appending" means "attaching," but dispute whether the term should be construed simply as "attaching" (IDNT) or as "attaching to the end of" (VeriSign). In other words, the dispute regarding the construction of "appending" centers on whether, in the claims at issue, the redirector string must be attached to the end of the domain name, or whether it must simply be attached to the domain name, with the location being unspecified.

Where, as here, the patent applicant has not acted as his or her own lexicographer, the process for determining the acquired meaning of a word in a claim begins with the presumption that the word (or term) has its full ordinary or accustomed meaning. Johnson Worldwide Assocs. v. Zebo Corp., 175 F.3d 985, 989 (Fed. Cir. 1999). If a word has a meaning from the ordinary use of the English language, then the word is presumed to have acquired that meaning. Nat'l Recovery Techs. v. Magnetic Separation Sys., Inc., 166 F.3d 1190, 1195 (Fed. Cir. 1999). In addition, however, if the word had a customary
meaning known at the time of invention to one with ordinary skill in the art to which the patent pertains, then the word is presumed to have acquired that meaning. Arthur A. Collins, Inc. v. Northern Telecom Ltd., 216 F.3d 1042, 1044-45 (Fed. Cir. 2000). If there is both an ordinary meaning and a customary meaning, and the two are in conflict, then the customary meaning to persons skilled in the relevant art is the presumed meaning. Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971 (Fed. Cir. 1999).

Nevertheless, ascertaining the presumed meaning is not dispositive by itself of the acquired meaning of the word (or term) in a patent claim, because the court must also consider the particular use of those words in the patent. Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999).

In construing claim terms, the general meanings gleaned from reference sources, such as dictionaries, must always be compared with the use of the terms in context, and the intrinsic record must always be consulted to identify which of the different possible dictionary meanings is most consistent with the use of the words by the inventor.

Ferguson Beauregard/Logic Controls, Div. of Dover Resources. Inc. v. Mega Sys., LLC, 350 F.3d 1327, 1338 (Fed. Cir. 2003): see also Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir.2001) (claims are directed to invention described in specification; they have no meaning removed from context from which they arose); Toro, 199 F.3d at 1299 (words of ordinary usage must be construed in context of patent documents; court must determine how a person of experience in field of invention would, upon reading the patent documents, understand words used to define the invention); Renishaw, 158 F.3d at 1250 (interpretation to be given claim term can be determined and confirmed only with full understanding of what inventors actually invented and intended to envelope with claim). In addition, it may be necessary for the court to consider the use of the claim language and the patent applicant's statements in the patent's prosecution history, as the claims issue after an examination process. Toro, 199 F.3d at 1299.

In sum, if the patentee is not deemed to be the lexicographer, the court can determine the acquired meaning of the claim language only by ascertaining the acquired meaning of the term, and then testing this meaning against the particular use of the word in the patent and possibly against the particular use in the patent's prosecution history. Cortland Line Co., Inc. v. Orvis Co., Inc., 203 F.3d 1351, 1356-57 (Fed. Cir. 2000). While it is important that the court determine the context and usage of the words in the patent claims by examining the specification, the prior art, and other evidence (including dictionaries and treatises) showing the understanding of those skilled in the art, "a court must resist relying on any of these sources in a vacuum because they each influence the understanding of one of skill in the art at the time of invention." Alloc, 342 F.3d at 1368.

Here, each party claims that its proposed construction is consistent with the ordinary meaning of "appending." Dictionaries provide evidence of a term's "ordinary meaning." Texas Digital Sys., 308 F.3d at 1202. Such dictionaries include standard dictionaries of the English language, which in most cases will provide proper definitions, as well as technical dictionaries, encyclopedias, and treatises, which may be used for establishing specialized meanings in particular fields of art. Inverness Medical Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1369 (Fed. Cir. 2002). IDNT contends that the ordinary meaning is the meaning set forth in a standard dictionary, citing the Merriam-Webster Collegiate Dictionary, which defines "appending" as "attaching." VeriSign asserts that the ordinary meaning is the meaning set forth in two technical dictionaries -- Webopedia, an online dictionary that specializes in Internet terminology, and the Random House Webster's Computer and Internet Dictionary, both of which define "appending" as "adding to the end of or "attaching to the end of." 12

12 IDNT also asserts, however, that there are other technical dictionaries that define "appending" as "attaching" without the limitation of "to the end of," such as the on-line Computer Hopes Computer Dictionary which defines "append" as "attach or combine," and the Webster's New World Dictionary of Computer Terms, which defines "append" as "add on."

A review of a range of both standard and technical dictionaries shows that "append" has multiple, though related, meanings. The "general-use" dictionaries consulted by the court define "append" as follows: (1) attach, affix; to add as a supplement or appendix (as in a book) (Merriam-Webster's Collegiate Dictionary (10th ed., 1999)); (Webster's II New Riverside University
that an accused infringer cannot "narrow a claim term's ordinary meaning . . . simply by pointing to the preferred
preferred embodiments.'" CVI/BETA Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1158 (Fed. Cir. 1997). IDNT also argues
preferred embodiments from the specification. IDNT contends that "it is fundamental that claims of a patent are not limited
to; attach (American Heritage Dictionary of the English Language (4th ed.) (http://www.bartleby.com)).

The court has also consulted a number of self-styled "computer" or "Internet" dictionaries, which provide the following
definitions: 13 1) to add something to the end -- for example, to append one file to another, or to append a file to a record;
"append" always means to add at the end, while "insert" means to add in between (Webopedia
(http://www.webopedia.com)); (Random House Webster's Computer and Internet Dictionary (3d ed. 2000)); 2) to add the
contents or a list, or file, to those of another (Newton's Telecom Dictionary (17th ed. 2001)); 3) to attach or combine
(Computer Hopes Computer Dictionary (http://www.computerhope.com)); 4) to add on, for example, to add new records to
a data base or to add to the end of a character string or list (Webster's New World Dictionary of Computer Terms (3d ed.
1988); 5) state or say further; fix to, attach; add to the very end (HyperDictionary (http://www.hyperdictionary.com)); and 6)
to add to the end of an existing structure (TechEncyclopedia (http://www.techweb.com/encyclopedia).

A review of all these definitions shows that "append" generally means "attach" in the sense of "add to the end of." One
definition that appears repeatedly in the general-purpose dictionaries is "attach or add to a piece of writing," while the
definition in several of the computer/Internet dictionaries is "attach or add to the end of a file [or list or data base or existing
structure]." Nevertheless, where a term has more than one meaning when standing in isolation, the court must consider the
use of the term in context. Inverness Med., 309 F.3d at 1370. VeriSign argues that its proposed construction is supported by
the usage of the term in the specification, and is also supported by the prosecution history. VeriSign cites to two instances in
the description of the preferred embodiments where "appending" is used to exemplify attaching something -- such as a
redirector string or one or more domain labels -- at the end of something else -- such as another domain label. VeriSign also
notes that there is no instance in the 148 patent specification where "appending" refers to adding or attaching something to a
position other than the end.

The first example is taken from an illustration of the translation process. It lists several steps, one of which is "construct the
final domain name by appending the redirector information to the FC1035-compliant domain name obtained above." Col. 7,
lines 35–42. VeriSign notes that in this example, the redirector information ".ar.il8n.net" is added to the end of the initial
string. The second example is the following:

The string "ar.il8n.net" is redirector information 130 that is appended to the converted string and functions like a top level
domain, and identifies the authoritative domain name server responsible for the current domain name. Once the redirector
information is appended to the domain name, the domain name becomes a fully qualified domain name (FQDN). A fully
qualified domain name includes at least a top level domain and a secondary domain which is enough information to resolve
the domain name.

Col. 7, lines 50–58. VeriSign asserts that, by definition, the redirector information or redirector string is added to the end of a
domain name to make the domain name a fully qualified domain name. VeriSign claims that any other position of the
redirector string with respect to the domain name to which it is attached would render the entire string useless for resolution.

IDNT responds, however, that VeriSign is improperly attempting to limit the meaning of "appending" by incorporating the
preferred embodiments from the specification. IDNT contends that "it is fundamental that claims of a patent are not limited
by preferred embodiments." CVI/BETA Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1158 (Fed. Cir. 1997). IDNT also argues
that an accused infringer cannot "narrow a claim term's ordinary meaning . . . simply by pointing to the preferred
VeriSign also argues that its proposed construction is supported by the prosecution history, where the patent owner, in discussing the primary reference applied against the claims, notes that "the user is required to manually enter the suffix i-DNS.apng.org' in order to point the request to the i-DNS Proxy server to properly resolve the request." VeriSign argues that it is clear from this i-DNS reference that "appending" means "adding something at the end," and asserts that the patent owner clearly understood that the term "append" is equivalent to a "suffix," something that is placed at the end of that which precedes it.

IDNT submits, however, that VeriSign's proposed construction conflicts with the way the word "appending" was used in the prosecution history. During prosecution, the patent application (Dr. Walid Tout) commented on the i-DNS reference as follows: "The [prior art] iDNS publication teaches a system that requires the user to manually enter and append a predetermined suffix." IDNT contends that if "append" is construed as "attach to the end of," as VeriSign claims it should be, then the word "suffix" is superfluous in the quoted sentence.

The court is persuaded that VeriSign's proposed construction is the proper one. The term "append" does not convey any special technical meaning; however, its use is "technical" in the sense that it is used in conjunction with the term "redirector string," and in the sense that the person skilled in the art is a person familiar with Internet applications of computer programming or computer science. Thus, the definitions in the computer/Internet dictionaries are likely to more closely reflect the usage of "append" in the context of domain labels and character strings.

The court finds, moreover, that the term "appending" is not ambiguous, because the claims and the written description provide sufficient information to guide the court's interpretation of the term. See Renishaw, 158 F.3d at 1251-52. The examples in the specification -- illustrating the "appending" of redirector information, or a redirector string, to a domain name -- all indicate that "appending" means "attach to the end of." There is no indication anywhere in the specification of a system that would allow the redirector string to be attached to the front of, or to be inserted in the middle of, a domain name.

Nor is the court persuaded by IDNT's argument that the use of the word "suffix" in the prosecution history indicates that the concept "add to the end" cannot be considered part of "appending" because that concept is conveyed by "suffix. In the court's view, the word "suffix" in the quoted sentence is simply being used to underscore that "append" is being used in the sense of "attach to the end of rather than in the sense of "attach somewhere."

I. Remote Interface
A. Construction of Claim Term

Each asserted claim of the '007 Patent requires a "remote interface," or depends from a claim including this or the synonymous limitations: "applicant interface" and "remote applicant interface." 5 The court construed these terms, collectively, as follows:

For purposes of the '007 [Patent], these terms refer to dedicated computer equipment, meaning equipment supplied by the entity providing the financial account or service, such as but not limited to equipment housed in a kiosk, which allows the applicant . . . to provide information to and receive information from a data processing system and which facilitates completion of all steps of the claim involving interaction between the applicant . . . and the data processing system.

Dkt No. 111 at 3 (emphasis added).

5 Some of the claims in the '007 patent use the terms "applicant interface" or "remote applicant interface." The manner of use suggests that these terms and "remote interface" are interchangeable as used in the '007 patent. In any event, the parties agreed that they should be construed uniformly. References in this order to "remote interface," therefore, also encompass the terms "applicant interface" and "remote applicant interface."
3. "applicable pricing adjustment(s)"; "applicable price adjustment(s)"; "pricing information applicable"; "applicable pricing information"

<table>
<thead>
<tr>
<th>Disputed Claim Term or Phrase</th>
<th>Versata's Proposed Construction</th>
<th>SAP's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;applicable pricing adjustment(s)&quot;; &quot;applicable price adjustment(s)&quot;</td>
<td>Plain meaning. If further construction required, this term means: associated adjustment(s) related to pricing.&quot;</td>
<td>a pricing adjustment that corresponds to a given level in the pricing hierarchy either because that pricing adjustment is associated directly with that level, or because that pricing adjustment is associated with a higher level in the hierarchy.</td>
</tr>
<tr>
<td>&quot;pricing information applicable&quot;; &quot;applicable pricing information&quot;</td>
<td>Plain meaning. No construction needed. If further construction required, this term means: &quot;associated information related to pricing.&quot;</td>
<td>pricing information that corresponds to a given level in the hierarchy either because that pricing information is associated directly with that level, or because that pricing information is associated with a higher level in the hierarchy.</td>
</tr>
</tbody>
</table>

The fundamental dispute here is the definition of "applicable." In construing the term, SAP urges a definition that includes adjustments or information corresponding to a hierarchy at the same level or at a higher level. Versata argues that the terms need no construction.

Versata asserts that the limitation imposed is improper for generally three reasons. First, the limitation makes further claim limitations superfluous. For example, the pertinent portion of claim 1 of the '400 patent reads as follows:

retrieving applicable pricing adjustments corresponding to each of the following:

a particular purchasing organization;

each organizational group above said particular purchasing organization in said organizational group hierarchy;

a particular product; and

each product group above said particular product in said product group hierarchy . . . .

Versata argues that the suggested limitation would render the above-emphasized portions unnecessary. Second, Versata argues that SAP's construction would not allow for price adjustments from more than a single level of a branch of a hierarchy in direct contravention of the specification. See, e.g., '350 Patent, col. 9, l. 56-col. 10, l. 8; col. 10, ll. 23-30.
Finally, Versata argues that the asserted limitation would require that adjustments come from a specific level, again contrary to the specification. See '350 Patent, Fig. 4A; col. 7, ll. 18-20; cl. 18; cl. 9.

SAP does not address many of Versata's arguments, but instead generally asserts that the use of "higher" will alleviate jury confusion or misinterpretation by the jury of Fig. 4B or the concept that a price adjustment is applicable based upon higher levels in the hierarchy--in essence, SAP wants to emphasize that the price adjustments roll downhill, not up.

The court agrees with Versata. Read in context of the claim as a whole, the alleged explanatory language/definition suggested by SAP would not clarify nor simplify the terms of the claim.

As such, the court gives the above terms their plain meanings.
collection applications and libraries. Thus, Defendants' construction restricting the application generator to turning "menu selection" to code is unsupported. Instead, as explained by the patent and viewed in the context of the extensive appendix on application generation, the "application generator" is a tool for creating questions (in the form of data collection applications) and answers (in the form of libraries).

On the other hand, Typhoon's suggested definition requires that the "application generator" also "customize[s]" applications. The patents do not describe a difference between the creation of applications and libraries and their customization. Additionally, the ordinary meaning of "customize" is inherently subjective. See The American Heritage College Dictionary 341 (3d ed. 1997) (defining "customize" as "to make or alter to individual or personal specifications"). Finally, as the definition suggests, "creation" necessarily includes the ability to "customize." Therefore, the addition of the phrase "and customize" in Typhoon's proposed definition is inappropriate. See Datamize, 417 F.3d at 1350. Accordingly, "application generator" is defined as "a software tool used to develop data collection applications and libraries."

184

1. Application program

The term "application program" appears in claim 8 of the '201 patent. Seven argues that this term simply means "software." Visto proposes that the term means "a hardware independent program on the client created using the FormLogic Builder for performing tasks such as allowing remote database or email access." Seven's proposed definition is too broad. Not all software constitutes an application program. At the same time, Visto's proposal is too narrow, given that it is limited to the preferred embodiment. The court defines "application program" as "software that performs tasks for an end user."

185

1. "application program"

Claim 1 of the '819 patent requires a master unit communicating with a plurality of remote units. The remote units must be executing "application programs." The parties dispute the construction of this term. The plaintiff defines the term to mean "a computer program or process." The defendants propose "a program designed to assist in the performance of a specific end-user task (e.g., word processing, accounting, or inventory management) in contrast to a program designed to perform management of or maintenance work on the system or system components."

The ordinary meaning of the term "application program" is software that performs tasks for an end-user. Despite the parties' arguments for different constructions, the court discerns nothing in the patent or the prosecution history that would vary the ordinary meaning for this term. As such, the court defines "application program" to mean "software that performs tasks for an end-user."

186

3. "[A]pplication programs" are sequences of machine-level instructions capable of execution on a processor. This construction is consistent with claims 13, 15, and 20, as well as the specification: col. 9:66-10:15.
20. "API": The interface between the application software and the application platform, across which all services are provided.

N18 '203, '212 and '615 patents, multiple claims.

(D.I. 266, exs. R, S)

11. Application Program Interface (API) calls

The parties dispute the meaning of "Application Program Interface (API) calls." Foundry asserts that the ordinary meaning of "Application Program Interface (API) calls" is "a set of formalized software calls that can be referenced by an application program to access underlying services." On the other hand, Lucent submits that "Application Program Interface (API) calls" should be construed to mean "a set of formalized software calls that can be referenced by an application program to access underlying network services." The court adopts Foundry's definition and construes "Application Program Interface (API) calls" accordingly.

ASP and NSP

Two new terms, Access Service Provider ("ASP") and Network Service Provider ("NSP"), are coined by the patentee to claim the invention in the 290 patent. In the lexicon of the 290 patent, an ASP performs many of the same log-in and authentication functions performed by the disclosed prior-art Internet Service Providers ("ISPs"), and an NSP acts similar to prior-art Network Access Providers ("NAPs"), providing the physical connection between the customer and internet. However, the coined terms are not completely analogous to their well-known prior art counterparts. Indeed, these coined terms help delineate the 290 patent's claimed invention from prior art internet access systems, such as those using Remote Authentication Dial-In User Service ("RADIUS") servers for authentication management.

The term "ASP" (or variation thereof) appears in every asserted claim of the patent-in-suit. "NSP" appears in all asserted claims except independent Claim 3 and dependent Claims 4 and 5. MyMail asserts that ASP should be defined as "a party that offers network access service to the user via one or more NSPs" and NSP should be defined as "a party other than the ASP that provides the actual connection to the network." Defendants propose defining ASP as "an ISP broker including a server that (1) has a public Internet address, (2) maintains ISP-specific user IDs and passwords for multiple ISPs, and (3) transmits to the user's computer a user ID and password for a particular ISP selected by the broker based on the user's location and the user's preference for a type of Internet service (such as lowest cost service, highest reliability service, and most available service)" and NSP as "a provider of network services (such as an ISP) that (1) authenticates its customers for access to its services (such as Internet access, email, etc.) based on user IDs and passwords that are specific to the provider, and (2) grants its customers Internet access directly from a modem bank."

To properly define these coined terms, the Court first looks to the ordinary meaning of each component word in ASP and NSP. See Bancorp Servs., 359 F.3d at 1372. That however provides little insight into the meaning of either coined term, so the Court next looks to the specification. See Goldenberg, 373 F.3d at 1164. Although the definitions proposed by both MyMail and Defendants find some support in the specification, when construing terms like NSP and ASP that lack an
accepted meaning in the art, the Court must construe the terms as broadly as provided for by the patent itself. Irdeto Access, Inc. v. EchoStar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004). The Court thus rejects both sets of definitions since both import unnecessary limitations and neither reflect the breadth provided in the specification, figures, and claims.

Figure 1 of the 290 patent provides that a user dials into an NSP, is authenticated, and then connects to the internet. The user next communicates, over the internet, with an ASP. The ASP again authenticates the user and (re)assigns him to an appropriate NSP, which provides internet access for the rest of the session. The specification teaches that the ASP offers network access via multiple NSPs, see Col. 8:32-34, but Claim 8 establishes that an ASP works with either a single NSP or multiple NSPs. Accordingly, the Court defines NSP as "a party that provides a connection to the network and authenticates users for access to the network" and ASP as "a party that provides authenticated access information to a user through the network to enable the user to access one or more NSPs."

<tr>
<td>generating a second menu from said first menu</td>
<td>creating a [second menu] from the [first menu] and transmitting the [second menu] to a wireless handheld computing device or Web page</td>
</tr>
<tr>
<td>transmitting said second menu to a wireless handheld computing device or Web page</td>
<td>This term requires structure for &quot;transmitting the second menu to both a wireless handheld computing device and a Web page.&quot;</td>
</tr>
</tbody>
</table>

The disputed term "generating and transmitting menus" is located in the preamble of each of the asserted independent claims: "An information management and synchronous communications system for generating and transmitting menus
comprising . . . ." The '850 patent specification discusses the menu generation and transmission process:

The menu generation approach of the present invention includes a desktop software application that enables the rapid creation and building of a menu and provides a means to instantly download the menu configuration onto, e.g., a handheld device or Web page and to seamlessly interface with standard point of sale ("POS") systems to enable automatic database updates and communication exchanges when a change or input occurs in any of the other system elements.

('850 patent, 3:16-24).

The plaintiff's and defendants' proposals are similar, except that the plaintiff requires "synchronously configuring display versions for transmission." "Synchronous" was already addressed in the immediately preceding term; adding "synchronous" here would be redundant. Furthermore, "menus" will be construed consistently throughout the claims and there is no support for Ameranth replacing "menus" with "display versions."

The term "generating a second menu from said first menu" is located in claim 1, element (g) of the '850 patent: "application software for generating a second menu from said first menu and transmitting said second menu to a wireless handheld computing device or Web page." Ameranth contends that the second menu is created "from constituents of" the first menu. But this term itself contains no language indicating that the second menu is a subset of the first menu. The separate limitation immediately following the claim at issue discloses that the second menu is generated from the first menu by allowing selection of categories and items from the first menu. As this limitation is independent and clearly stated, there is no need to import the restriction into the term at issue. As such, "generating a second menu from first said menu" is construed consistently with the preamble as "creating a second menu from first said menu."

The term "transmitting said second menu to a wireless handheld computing device or Web page" is located in claim 1, element (g) of the '850 patent. The limitation states: "application software for generating a second menu from said first menu and transmitting said second menu to a wireless handheld computing device or Web page." (emphasis added). The defendants argue that the software must be capable of both transmitting to a handheld computing device and transmitting to a Web page. Ameranth responds that software does not have to be capable of transmitting to both types of clients; transmitting to one or the other only is sufficient. The plaintiff notes that the term reads "handheld computing device or Web page"; it does not say "and." The specification also contains this disjunctive language: "In one embodiment, the present invention is a software tool for building a menu, optimizing the process of how the menu can be downloaded to either a handheld device or Web page . . . ." ('850 patent, 3:35-39).

In support of its argument, the defendants cite Cyrix Corp. v. Intel Corp., 846 F. Supp. 522 (E.D. Tex. 1994), aff'd, 42 F.3d 1411 (Fed. Cir. 1994). In Cyrix, the claim limitation at issue stated, "address generating means connected, in the alternative, to receive either (i) said linear address from said segmentation unit, or (ii) said offset part . . . from said page cache or said page table entry . . . ." Id. at 542. The court held that the claimed address generating means must "hav[e] the capability of" receiving both the segmentation and page cache options. Id. at 530. But it was not necessary for the segmentation and page cache entries to be actually stored in the memory at the same time. Id. Based upon Cyrix, the defendants contend that the software must be capable of transmitting a second menu to both wireless handheld devices and Web pages.

In support of its argument, the defendants cite Cyrix Corp. v. Intel Corp., 846 F. Supp. 522 (E.D. Tex. 1994), aff'd, 42 F.3d 1411 (Fed. Cir. 1994). In Cyrix, the claim limitation at issue stated, "address generating means connected, in the alternative, to receive either (i) said linear address from said segmentation unit, or (ii) said offset part . . . from said page cache or said page table entry . . . ." Id. at 542. The court held that the claimed address generating means must "hav[e] the capability of" receiving both the segmentation and page cache options. Id. at 530. But it was not necessary for the segmentation and page cache entries to be actually stored in the memory at the same time. Id. Based upon Cyrix, the defendants contend that the software must be capable of transmitting a second menu to both wireless handheld devices and Web pages.

The defendants' argument is persuasive. The court construes this term "application software for . . . transmitting said second menu to a wireless handheld computing device or Web page" to mean "application software, which is capable of transmitting to both wireless handheld computing devices and Web pages, transmitting the second menu to a wireless handheld computing device or Web page."

5. "applying"; "applied"

<table>
<thead>
<tr>
<th>Disputed Claim Term or Phrase</th>
<th>Versata's Proposed Construction</th>
<th>SAP's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Determine how to use and</td>
<td>use to influence the</td>
<td></td>
</tr>
</tbody>
</table>
The central issue concerning this term is best understood through the application of each construction to a disclosed embodiment. An aspect of the patent involves the "application" of price adjustments to determine a "final price." A portion of the specification indicates as follows:

In step 1522 the price of the user specified product is set to zero so that the price can be determined by application of the sorted pricing adjustments. In step 1524 the various Pricing Types included in the sorted pricing adjustments are applied in the user specified pricing sequence. Thus, the price of the user specified product is increased, decreased, and/or overridden until the final price is determined. '400 patent, col. 19, ll. 42-50 (emphasis added).

In light of the specification, any construction should allow that a price adjustment is "applied" even if the adjustment is ultimately ignored or overridden. In this sense, SAP's construction is too limiting because a price adjustment that is overridden would not influence the computation of the price. Versata's construction more properly encompasses what the patent teaches. It implicitly recognizes at least a consideration of all price adjustments, whether increased, decreased, ignored, and/or overridden. The court adopts Versata's construction.

8. "applying a rules engine continuously to at least two patient data elements stored in the database"

The crux of the parties' dispute here lies in the word "continuously." Plaintiff proposes, "repeatedly and automatically according to the rules of the rules engine" or "repeatedly and automatically...according to time-driven or event-driven rules." 4 Defendants seek to define this term as "constantly and automatically...24 hours a day 7 days a week." 5

First, as explained previously, the Court has rejected defendants' continued request to add 24/7 to other disputed claim terms when that phrase only appears in the "wherein" clause. Indeed, when questioned by the Court as to why the 24/7 phrase needed to be added to a phrase like "continuously," defendants replied "there is the constant component in that it's always happening, and there is also that it's happening all the time, which is the reason why we have the 24 - hour and day, 7 day a week." (Hr'g., p. 203.) The distinction suggested by defendants between "always happening" and "happening all the time" seems to be excessively nuanced. Adding the 24/7 component to words like constantly and automatically would only serve to confuse the jury as would plaintiff's suggested phrase, "the rules of the rules engine."

Thus, the only remaining dispute is whether "continuously" shall be defined as "repeatedly and automatically" (plaintiff's version), or "constantly and automatically" (defendants' version). Despite the fact that continuously is a commonly understood word, the scope of the meaning is still in dispute. Indeed, plaintiff notes that while the Court may be tempted to give "continuously" its ordinary meaning, the dispute is a matter of law that must be decided by the Court. (Pl.'s Br., p. 21, citing 02 Micro Int'l v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1360 (Fed. Cir. 2008).)

The dictionary definition of "continuous" is: "1. Uninterrupted in time; without cessation: continuous coughing during the concert. 2. Being in immediate connection or spatial relationship: a continuous series of blasts; a continuous row of warehouses." (Webster's Encyclopedic Unabridged Dictionary of the English Language, 1996.) 5 As in 02 Micro, the common meaning of continuously does not completely resolve the parties' dispute regarding the scope of the term as it pertains to the patents-in-suit. 02-Micro, 521 F.3d at 1361 ("a determination that a claim term 'needs no construction' or has the 'plain and ordinary meaning' may be inadequate when a term has more than one 'ordinary' meaning or when reliance on

- 639 -
a term's 'ordinary' meaning does not resolve the parties' dispute.

5 Continuously, the word in dispute here, is the adverb form of continuous.

Plaintiff's proposed construction, "repeatedly and automatically," is consistent with the intrinsic evidence. In the patent, there are descriptions of time-driven and event-driven rules that trigger the rules engine at varying degrees of frequency. (See Pl.'s Br., p. 20, citing examples of laboratory data that can appear relatively infrequently.) This comports more with the idea of something happening "repeatedly" rather than the defendants' more limited meaning of "constantly."

In contrast, defendants' proposed construction narrows the scope of the term's meaning without adequate support. Defendants refer to the prosecution history and plaintiff's argument during similar litigation in the case of Cerner Corp. v. VISICU, Inc., No. 04-1033-CV-W-GAF (W.D. Mo., filed Nov. 12, 2004), to support their position that plaintiff itself defines "continuously" as "constantly" and that it should be bound to this meaning. 6 The Court has reviewed defendants' argument and is not persuaded to adopt their proposed word, "constantly." Plaintiff's proposed construction, "repeatedly and automatically," is clear and consistent with the intrinsic evidence. The term is construed as: "applying a rules engine repeatedly and automatically to at least two patient data elements stored in the database."

6 The Court notes that the parties repeatedly asked the Court to take note of arguments and holdings in the Cerner case. We have considered all of plaintiff's and defendants' arguments here independently of the Cerner litigation. Nonetheless, many of this Court's claim constructions are consistent with those determined by the court in Cerner.

E. "Applying an Approximately Constant Bias Voltage to the Conductive Shield of the Coaxial Cable"

Once the terms "bias voltage," "conductive shield" and "coaxial cable" have been construed, Monster Cable argues that the words remaining in the phrase "applying an approximately constant bias voltage to the conductive shield of the coaxial cable" are plain English that do not require further construction. Quest argues that this court should construe the term "applying" as "placing in direct contact." If construction is deemed necessary, Monster Cable seeks a construction of "applying" as "conducting the voltage or signal to the relevant conductors" or "bringing into nearness or contact with, or conducting them to, the relevant conductors."

Indeed, as Monster Cable points out, the term appears in the constructions of other claims and means-plus-functions agreed to by the parties. See Joint Claim Const. Statement at 1-2 (agreeing to constructions of the term "single line" and the means-plus-function element of "means for applying the electrical signal"). The parties do not dispute that the essence of the term is that voltage is passed to the conductive shield. The preferred embodiment of the patent demonstrates bias voltage connected to the conductive shield via an intermediate conductor. See 416 Patent, figure 9. Quest does not contest that "applying" voltage to the conductive shield described in the 416 Patent would typically involve one or more intermediate conductors. See Villasenor Decl., P 46 ("While it is true that an intermediate conductor would typically carry that bias voltage from the voltage source [to] the conductive shield . . . that intermediate conductor nonetheless places the shield in direct contact with the bias voltage.") "Directness," central to Quest's definition, is therefore not a valid measure of the voltage conduction in this technology. Both parties agree that the function may be accomplished through an intermediate conductor, which in ordinary terms would constitute indirect contact.

Monster argues that if claim construction should be necessary, the proper barometer of contact should be "nearness" rather than "directness." However, there is no reason that distance -- the vector of "nearness" -- is relevant to the connection uncertainty in the patent.
between the voltage and the conductive shield. Rather, the relevant concept is that voltage is "conducted" to the outer conductive shield. Both parties' proposed constructions are thus unsatisfying, and the court finds that "applying" does not require further construction. It will be clear to a jury that "applying" simply means that voltage is conducted to the conductive shield.

This court thus declines to further construe the phrase "applying an approximately constant bias voltage to the conductive shield of the coaxial cable."

G. Applying One or More Test Methodologies to the Collected Information

This term is found in claims one and thirteen of the patent. The Plaintiff proposes that the term does not need construction, but also offers "using a computer to perform calculations for one or more test methodologies using the data collected from the testing of the pavement construction material." The Defendants propose the construction "a server computation engine automatically applying one or more test methodologies to the collected information stored in the server computation spooler in response to the server computation spooler activating the server computation engine, and automatically storing the results in a project specific database on the server" (emphasis added).

The Defendants attempt to shoehorn the limitations that they argued for in previous claims into this disputed phrase. First, the Defendants argue that the test methodologies must be performed automatically. The Defendants support this argument by citing to their arguments that were rejected above. Second, the Defendants argue that collected information is stored in the computation spooler as in the FIG. 2 embodiment. This argument has also been rejected in the construction of the previous term for the reasons state therein.

Third, the Defendants add in the limitation that applying test methodologies involves automatically storing the results in a project specific database on the server. The Defendants do not offer support for why this disputed phrase should encompass the unrelated step of storing the results.

Fourth, the disputed phrase is intact and unchanged in Defendant' proposed construction, but it is buried in the additional limitations the Defendants attempt to jam into this construction. The Defendants' definition does not "construct" any of the disputed phrase, but instead attempts to re-write the claim through this phrase.

In contrast, the Plaintiff's proposed construction is based upon the words of the claim itself, including the parties' agreement that the preamble limits the claim to a computer-implemented method.

Construction: Using a computer to perform calculations for one or more test methodologies using the data collected from the testing of the pavement construction material.

8. "applying FECC (forward error correcting code) coding and codeword interleaving differently to signals of different data channels to produce encoded data signals having different delays"

The next disputed term is found in independent Claim 15, and dependent Claims 16-18. Claim 15 reads:

15. A method of modulating multiple carriers with signals of a plurality of data channels, comprising the steps of:

applying FECC (forward error correcting code) coding and codeword interleaving differently to signals of different data channels to produce encoded data signals having different delays; and

modulating different numbers of bits of the encoded data signals onto different carriers,
wherein the step of applying FECC coding and codeword interleaving comprises the steps of:

storing signals of the different data channels;

sequentially FECC coding the stored signals to produce FECC codewords; and

storing the FECC codewords in an interleaved manner, the interleaving being different for the codewords of the different data channels.

'604 Patent, col. 13, ll. 40-56 (emphasis added). The issue before the Court is whether the application of FECC coding and codeword interleaving must be applied "concurrently." Plaintiff proposes that the term should be construed as "the FECC coding and interleaving is applied concurrently to at least two data channels, so that the FECC coding and interleaving that is applied to the first data channel differs from the FECC coding and interleaving that is applied to the second data channel." (Chart at 11 (emphasis added)). Defendants rely on the arguments they raised when the issue of "concurrently" was first addressed and assert that the inclusion of "concurrently" is again improper.

Based on the same reasoning previously set forth when the issue was first raised, the Court concludes that such a limitation is not warranted by the claims and specification. See supra Part II.C.2. Plaintiff has not offered additional arguments that persuade this Court to change its conclusion. Plaintiff merely asserts that the language "to produce encoded data signals having different delays" makes it "crystal clear" that the claim requires the "concurrently" limitation. (Tr. at 155:5-9). The Court does not agree and rejects Plaintiff's proposed construction.

Accordingly, the Court concludes that the construction of disputed term [32] "applying FECC (forward error correcting code) coding and codeword interleaving differently to signals of different data channels to produce encoded data signals having different delays" does not include the limitation "concurrently," and means "the FECC coding and codeword interleaving are applied in a way that differentiates among the data channels which results in the production of encoded data signals with different delays."

GO BACK

196

A. "appreciably under"

The patent requires that "another portion of said third doped region extend[] appreciably under the edges of said field stop regions which define the sides of said channel." Defendant argues that "appreciably under" requires that the third doped region be formed before the field stop regions. Defendant points out that the process portion of the specification states that "the third region . . . is defined and implanted . . . prior to defining the field oxide channel stop regions." '776 patent, 3:48-51. It is inappropriate, however, to limit a product patent to a manufacturing process described in the specification. See Stratoflex, Inc. v. Aeroquip Corp., 713 F.2d 1530, 1541 (Fed. Cir. 1983). Moreover, no reasonable person would believe that the ordinary meaning of "appreciably under" refers to a production process rather than a spatial relationship. The Court therefore will not adopt defendant's interpretation.

Plaintiff proposes that "appreciably under" means that the third doped region must extend "far enough under . . . so that the edges of the third doped region are not exposed to the thin portion of the first insulating layer." Joint Constr. Ex. B at 6. Defendant objects that this is a "functional" definition precluded by the holding in York Products, Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1573 (Fed. Cir. 1996). The Court disagrees. In York Products, the Federal Circuit construed claim language that required that a ridge extend "for at least a substantial[] part of the entire height" of the sidewall of a pickup truck bed. Construing "substantial part" to mean "nearly the entire length of," the court refused to adopt a "functional definition" of the term "substantial," according to which the term would mean "only so [high] as necessary" to accomplish the function of the structure. 99 F.3d at 1572-73. Plaintiff's construction would be such a "functional definition" if, for example, it required that the doped region be "far enough under to prevent voltage breakdown." Instead, plaintiff's construction is purely spatial.

Plaintiff's proposed construction, moreover, is consistent with the specification, which states that by extending the third
doped region appreciably under, "it is assured that the resulting structure is free from any exposed N+ edges under the
tunnel dielectric region." 776 patent, 6:13-15. The use of the term "assured" suggests that the third doped region must
extend far enough under that its edges are not exposed to the thin portion of the first insulating region no matter what the
width of the thin region. The Court therefore adopts plaintiff's construction of the term "appreciably under."

2. Indefiniteness of "Appropriate Application Software"

Defendants argue that use of "appropriate application software" in the phrase "said database server then, utilizing an
appropriate application software thereon, producing billing invoices and statements to clients and customers, for each
argue that the term has a purely subjective meaning and does not adequately advise the public of the scope of the invention.
Further, Defendants argue that the specification and prosecution history fail to provide any objective definition for
determining whether software is "appropriate." Defendants cite to the declaration of James Whicker, who opines that one of
ordinary skill would conclude that Claim 1 is indefinite because the phrase "appropriate application software" does not
"delineate the scope of the invention." (Dkt. 68 at Ex. C, P 20). n10

The Court agrees that Defendants' arguments that: (1) the inclusion of this sufficiently specific term overcomes the
presumption that the section of the "means for providing electronic transfer" limitation containing that phrase is written in means-plus-function format. Plaintiff further argues that the claims and specification clearly indicate that the type of software application claimed is software that
"produces billing invoices and statements to clients of each corresponding browser-based subscriber." Finally, Plaintiff
argues that the Court must disregard the declaration of James Whicker on substantive and procedural grounds.

Because the Court finds that Plaintiff's expert's conclusion is consistent with the specification, the Court need not address
Plaintiff's argument that Defendants' expert affidavit is barred on substantive and procedural grounds.

n10 Plaintiff replies that Defendants' argument is inconsistent with its contention that a database server "utilizing
appropriate application software" is sufficient structure to overcome the presumption that the section of the "means for
providing electronic transfer" limitation containing that phrase is written in means-plus-function format. Plaintiff further
argues that the claims and specification clearly indicate that the type of software application claimed is software that
"produces billing invoices and statements to clients of each corresponding browser-based subscriber." Finally, Plaintiff
argues that the Court must disregard the declaration of James Whicker on substantive and procedural grounds.

"The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject
matter which the applicant regards as his invention." 35 U.S.C. § 112, P 2. This requirement ensures that the public is
Cir. 2005). The requirement "does not compel absolute clarity" and only claims that are "not amenable to construction" or
are "insolubly ambiguous" are indefinite. Id. Such an approach respects the statutory presumption of patent validity. Exxon
Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001); 35 U.S.C. § 282. Close questions of invalidity
in cases involving issued patents are resolved in favor of the patentee. Id. at 1380. The determination of whether a claim is
invalid for indefiniteness depends on whether those skilled in the art would understand the scope of the claim when read in
light of the specification. Verve, LLC v. Crane Cams, Inc., 311 F.3d 1116, 1119-20 (Fed. Cir. 2002); Atmel Corp. v.
Information Storage Devices, Inc., 198 F.3d at 1378 (citing North Am. Vaccine Inc., v. American Cyanamid Co., 7 F.3d
1571, 1579 (Fed. Cir. 1993)).

Defendants' expert opines that one of ordinary skill would not be able to discern from the specification what constitutes
"appropriate software." (Dkt. 68 at Ex. C, p. 9). In contrast, Plaintiff's expert opines that "every major database system
available on the marketplace had certain inherent tools built into their infrastructures that would allow 'appropriate
application software' to be utilized." (Dkt. 72 at Ex. 4, p. 6). The most common type of "appropriate application software" involves "normalized transactional processing" which allows the addition, modification, deletion and reporting of database
record sets. (Id.); see Verve, LLC, 311 F.3d at 1119 (instructing that extrinsic evidence should be consulted before determining that a claim term is indefinite).

The plain language of the claim itself indicates that the "appropriate application software" is utilized by the database server to produce billing invoices and statements to clients and customers. The specification confirms that "data entered via forms processing is transferred into the database server which utilizes appropriate application software therein to produce billing invoices and statements to clients and customers of each corresponding browser-based subscriber." (229 patent, col. 2, ll. 59-63). The specification provides that no new software is required to be installed at the subscriber's computer as the subscriber is able to access the database server with its software and applications "contained thereon." (Id., col. 2, ll. 38-46, 66, col.3, ll. 1-3). The specification also provides, at the least, that the database allows for the addition and reporting of information. Subscribers enter information on forms which are added to the database server. (Id., col. 3, ll. 58-61). The database server reports information back to the subscriber and creates billings. (Id., col. 4, ll. 9-14, 5, ll. 24-28).

These provisions are consistent with Plaintiff's expert's conclusion that a person of ordinary skill would understand the term "appropriate application software," in light of the claim language and specification, to refer to software that allows for "normalized transactional processing,” or, specifically, for the addition and reporting of database record sets. Accordingly, the phrase "appropriate application software" is not subject to a purely subjective definition, as was the case in Datamize, and the Court will resolve this matter in favor of the patentee. See 417 F.3d at 1352 (finding that the term "aesthetically pleasing" used in the claim language was indefinite because the claim, specification and prosecution history provided no guidance as to what conditions would meet the "aesthetically pleasing" requirement). The Court rejects Defendant's contention that Claim 1 is invalid as indefinite.

GO BACK

198

B. "Approximately Constant"

For the following reasons, this court construes the claim term "approximately constant" in claims 1, 6, 9, and 14 of the '681 patent to mean:

Nearly constant or constant.

The term "approximately constant" occurs in context as: "a controller which controls the gain to be approximately constant." ('681 patent, col. 22:17-18; col. 22:45-46; col. 22:66-67; col. 24:14-15.) The language "approximately constant" therefore refers to the resulting effect of the controller on the gain.

The term "approximately constant" should be given its plain and ordinary meaning. An examination of the specification reveals that the various embodiments within the specification describe the device that controls the gain as an automatic optical gain control circuit ("AGC"). (See, e.g., '681 patent, col. 6:6-14; col. 10:19-38). One embodiment of the specification that describes an automatic optical gain control circuit and is representative of the entire specification states:

[O]ptical gain control circuit controls pump laser diode so as to maintain, at a constant level, the ratio between the level of the input wavelength-multiplexed optical signal . . . and the level of the amplified wavelength-multiplexed optical signal . . . . In this manner, first part conserves the wavelength dependence by controlling the optical gain at a constant level.

('681 patent, col. 6:6-14.) Specifically, Figure 5 provides an illustration of an automatic gain control circuit "for controlling an optical gain to be at a constant level." ('681 patent, col. 10:19-38; see Fig. 5.) All descriptions of an AGC dictate that the circuit works to keep the gain constant, and there is nothing in the specification indicating a special meaning of "constant" beyond the plain and ordinary meaning of the word.

In addition, nothing in the '681 patent's specification dictates that a special meaning is attributed to the word "approximately." Therefore, "approximately" must be given its plain and ordinary meaning. Consequently, "approximately constant" is construed as nearly constant or constant.

GO BACK
199

10. **Arbitrary number of instructions.**

Intergraph contends this phrase carries its ordinary meaning to a person skilled in the art. Intel, incorporating specific claim requirements into the definition of the term, defines the phrase as a number of instructions in a group of instructions that are executed simultaneously that is less than the width of an instruction frame. The Court construes the term as any number of instructions. '028 patent 5:19-23.

200

3. **Arcs.**

The court construes "arcs" to be lines that connect the nodes in a data flow diagram and represent that data produced by one node is used by another.

201

D. **Reconsideration**

1. "architecture independent"

Claim 13 is not the only claim in which the inventors use the phrase "architecture independent" and the phrase "actions and conditions," or some variation of those phrases, in a limitation.

When the same words or phrases are used in different claims of the same patent, a court interprets the words and phrases as having the same meaning unless it is clear from the specification and prosecution history that the phrases have different meanings in the different claims. See Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005).

The phrases "architecture independent" and "actions and conditions" first appear in Claim 1:

A computer-aided design system for designing an application specific integrated circuit directly from architecture independent functional specifications for the integrated circuit, comprising

- a macro library defining a set of architecture independent operations comprised of actions and conditions

input specification means operable by a user for defining architecture independent functional specifications for the integrated circuit, said functional specifications being comprised of a series of operations comprised of actions and conditions, said input specification means including means to permit the user to specify for each operation a macro selected from said macro library

In the Preamble to Claim 1, the inventors use the phrase "architecture independent" to modify "functional specifications." A skilled artisan would understand the Preamble of Claim 1 to recite a system that designs an ASIC from "architecture independent functional specifications." It is necessary therefore, to determine what the inventors meant when they recited that these "functional specifications" are "architecture independent."

In the background section of the specification, the inventors recite state of the art computer-aided design (CAD) systems and methods for designing an ASIC that require input from highly skilled design engineers:

CAD techniques have been used with success in design and verification of integrated circuits, at both the structural level and at the physical layout level. For example, CAD systems have been developed for assisting converting VLSI structural
level descriptions of integrated circuits into the physical layout level topological mask data required for actually producing the chip. Although the presently available computed-aided design systems greatly facilitate the design process, the current practice still requires highly skilled VLSI design engineers to create the necessary structural level hardware descriptions.

('432 Patent, Col. 1:51-63.)

As an improvement over the existing state of the art, the invention is summarized as a computer-aided design system and method that allows a user to define the "functional requirements" for a desired ASIC, using a "sequence of logical operations" independent of the "logic," i.e., hardware structure, that could "carry out those specific functions." ('432 Patent, Col. 2:7-15.) The inventors pointed to a flowchart of logical operations as a preferable example of specifications that are "architecture independent:"

The functional architecture independent specifications of the desired ASIC can be defined in a suitable manner, such as in list form or preferably in a flowchart format. The flowchart is a highly effective means of describing a sequence of logical operations, and is well understood by software and hardware designers of varying levels of expertise and training.

('432 Patent, Col. 2:21-29.)

In contrast to specifications that are "architecture independent," the inventors use the phrase "architecture specific" to refer to specifications that include the logic hardware cells that can perform a particular function:

From the flowchart (or other functional specifications), the system and method of the present invention translates the functional architecture independent specifications into structural and architecture specific level definition of an integrated circuit, which can be used directly to produce the ASIC. The structural level definition includes a list of the integrated circuit hardware cells needed to achieve the functional specifications. The structural level definition includes a list of the integrated circuit hardware cells needed to achieve the functional specifications. These cells are selected from a cell library of previously designed hardware cells of various functions and technical specifications.

('432 Patent Col. 2:34-39.)

Footnotes

4 The Court finds that the article "an" would be understood to be a typographical error and should be read as the conjunction "and."

End Footnotes

The inventors' use of the phrase "architecture dependent" to describe specifications for a functional decision tree and "structural and architect specific" to describe specifications that are of implementing logic components is supported by the drawings and the descriptions of the drawings. The inventors label FIG. 1a, "Functional Level:"

A flowchart is a graphic representation of an algorithm and consists of two kinds of blocks or states, namely actions and conditions (decisions). Actions are conventionally represented in the flowchart by a rectangle or box, and conditions are represented by a diamond. Transitions between actions and conditions are represented by lines with arrows.

('432 Patent, Col. 3:52-57.)

The inventors label FIG. 1b "Structural Level:"

FIG. 1b illustrates a structural (or logic) level representation of an integrated circuit. In this representation, blocks are used to represent integrated architecture specific circuit hardware components for performing various function, and the lines interconnecting the blocks represent paths for the flow of data or control signals between the blocks. The blocks may, for example, represent hardware components such as adders, comparators, registers, system controllers, etc.
2. "actions and conditions"

In the "input specification means" limitation of Claim 1, the inventors state that "operations and conditions" are a series of logical operations:

. . . said functional specifications being comprised of a series of operations comprised of actions and conditions.

(‘432 Patent, Col. 14:43-44.) Consistently throughout the written description, the phrase "actions and conditions" is used to describe the state of the data being controlled by the ASIC, changed in state, and flow of the data based on the state or changes in the state.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
5 In patent claims, the word "comprising" is open ended; it includes the recited elements and additional elements. AGF Industries, Inc. v. Cardinal IG Company, 239 F.3d 1239, 1250 (Fed. Cir. 2001).
- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

3. "a set of definitions"

The storing step of Claim 13, recites "storing a set of definitions of architecture independent actions and conditions." In the written description, the inventors variously describe a "data base" that contains "design data (flowchart, logic, etc.)" 7 The flowchart is described as being created by a "Flowchart Editor." In the written description, "macro names and arguments" are described as data from which a flowchart would be created. A person of ordinary skill in the art would understand macros and arguments as computer instructions. These macros are stored in a macro library. 9 Thus, one skilled in the art would understand "a set of definitions" to mean "a set of computer instructions such as macros and arguments."

9 (‘432 Patent, Col. 7:28.)
- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

There is nothing in the ‘432 Patent documents that indicates that the inventors intended any different meaning of "architecture independent" or of "actions and conditions" in Claim 13.

Accordingly, as used in Claim 13 of the ‘432 Patent, the Court construes the phrase "storing a set of definitions of architecture independent actions and conditions" to mean:

storing a set of instructions of actions or conditions to which a circuit could be subjected that are not dependent on any particular arrangement of hardware cells to perform the actions or create or maintain the conditions.
not imply any set architecture, structure or implementing technology." Aeroflex states that the term means "the logical steps and decisions that are represented as rectangles and diamonds in the flowchart; where register-transfer level (RTL, as defined in Darringer et al.) descriptions are excluded." Thus, the parties disagreement focuses on whether claim 13 limits input specifications for the proposed ASIC to data in a flowchart format.

Ricoh admits that Fig. 1a illustrates an embodiment that utilizes a flowchart representation. However, Ricoh argues that Aeroflex's definition impermissibly attempts to limit the scope of the claimed invention to the preferred embodiment of the '432 patent. Ricoh contends that a broader interpretation of "architecture independent actions and conditions" is supported by the patent specification:

The architecture independent functional specifications can be defined in a suitable manner, such as in list form or preferably in a flowchart form. The flowchart is a highly effective means of describing a sequence of logical operations, and is well understood by software and hardware designers of varying levels of expertise and training. From the flowchart (or other functional specifications), the system and method of the present invention translates the architecture independent functional specifications into an architecture specific structural level definition of an integrated circuit, which can be used directly to produce the ASIC.

'432 patent, col. 2:21-34 (emphasis added). 5 Ricoh also relies on specification language stating that "the present invention . . . enables a user to define the functional requirements for a desired target integrated circuit, using an easily understood architecture independent functional level representation . . ." '432 patent, col. 2:6-11. Ricoh also notes that patent claim 11, not patent claim 13, specifically references a flowchart format and recites "having boxes representing architecture independent actions" and "diamonds representing architecture independent conditions." '432 patent, col. 16:10-12. Ricoh argues that this demonstrates that if the patentee intended the use of "architecture independent" in claim 13 to be restricted to a flowchart format, the patentee would have used the same or similar limiting language as used in claim 11.

--- Footnotes ---

5 Ricoh argues that a "list form" input specification is a preferred embodiment of the '432 patent. However, this argument does not find any support in the patent specification.

--- End Footnotes ---

Aeroflex responds that the '432 patent's file history conclusively demonstrates that claim 13 requires a sequence of logical steps and decisions in a flowchart format. 6 See April 1989 Amendment at 11; October 1989 Examiner Interview Summary; November 1989 Amendment at 7. Aeroflex contends that the Examiner Interview Summary explicitly states that the examiner and the applicant reached an agreement on application term 20 (patent claim 13). Specifically, the Examiner Interview Summary form shows that the examiner checked the box providing: "Agreement was reached with respect to some or all of the claims in question." (October 1989 Interview Summary). The summary form identifies application claim 20 (patent claim 13) as one of the claims discussed, and states that the following agreement was reached: "It is agreed that the features "flowchart editor" and "expert system for translating the flowchart into a netlist defining the necessary hardware cells of the integrated circuit" are patentable [sic] distinct from the reference list above." Aeroflex argues that this language demonstrates that an agreement was reached and that the features "flowchart editor" and "expert system for translating the flowchart into a netlist" were the examiner's only basis for allowing all of the claims including patent claim 13. Furthermore, Aeroflex contends that the file history demonstrates that all register-transfer level descriptions were explicitly excluded from the claimed invention.

--- Footnotes ---

6 Aeroflex's reliance on the specification language to support its argument is not well taken. Aeroflex cites almost exclusively to language from the preferred embodiment. See '432 patent, col. 3:50-59; 4:5-22, 4:35-38, 7:12-23. However, in construing disputed claim terms, a limitation cannot be imported from the preferred embodiment into the claims themselves. Markman, 52 F.3d at 980.

--- End Footnotes ---
Ricoh responds that the October Interview summary, at best, is ambiguous and inconclusive. Ricoh states that while the Interview summary clearly identified the claims discussed in the interview, it specifically left undefined which claims were subject to any agreement reached because the form indicated that an agreement was reached as "to some or all of the claims." Thus, Ricoh concludes that the only thing evidently agreed upon was that the features of a "flowchart editor" and an "expert system" were distinct over prior art, and any claims containing those features would be understood by both parties to be patentable over the cited prior art. Ricoh contends that this understanding is supported in the November 1989 Amendment, in which the patentee stated as follows:

During the interview, the Examiner carefully reconsidered the prior art and applicants' claims, and upon reconsideration agreed that certain features as defined in applicants' claims, such as the "flowchart editor" and the "expert system for translating the flowchart into a netlist defining the necessary hardware cells of the integrated circuit" patently distinguish applicants' invention from the prior art of record, including Darringer et al. 4,703,435. Thus, it was agreed that Claim 18 [patent claim 11] in its present form, for example, patently defines applicants' invention over the prior art of record.

November 1989 Amendment at 7. Ricoh argues that the patentee could have made a similar statement with respect to application claim 20 (patent claim 13). Furthermore, Ricoh argues that Aeroflex's attempt to exclude register-level transfer descriptions from the claimed invention improperly distorts the file history.

Initially, the Court finds that the specification language supports Ricoh's arguments. While the flowchart format input specification is the single embodiment of the '432 patent, the specification explicitly contemplated alternative input descriptions. See '432 patent, col. 2:21-24; 2:27-28. "[I]t is improper to read limitations from a preferred embodiment described in the specification -- even if it is the only embodiment -- into the claims absent a clear indication in the intrinsic record that the patentee intended the claims to be so limited." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 913 (Fed. Cir. 2004). Given the explicit patent language, the Court finds that the specification language does not support the conclusion that the input specification of the claimed invention is limited to a flowchart format.

Furthermore, the Court is not persuaded that the prosecution history unmistakably demonstrates that the input specification of the claimed invention is limited to the designer's use of a flowchart format. As noted by Ricoh, the October Interview Summary specifically left undefined which claims were subject to any agreement between the patentee and the examiner. Thus, contrary to Aeroflex's argument, this case is distinguishable from cases such as Spring Window Fashions LP v. Novo Industries, L.P., 323 F.3d 989 (Fed Cir. 2003), in which the court held that a reasonable competitor could rely on unequivocal statements of disclaimer made during the prosecution history. Here, the statements made during the prosecution history upon which Aeroflex attempts to rely, are at best, ambiguous.

In addition, while the patentee and the examiner evidently agreed that the features of a "flowchart editor" and an "expert system" were distinct over prior art, there is no indication that those terms necessarily applied to application term 20 (patent claim 13). Moreover, the fact that those terms were not included in the final version of patent claim 13 suggests just the opposite. "To be given effect, a disclaimer must be 'clear and unmistakable.'" Sunrace Roots Enter. Co. v. SRAM Corp., 336 F.3d 1298, 1306 (Fed. Cir. 2003) (quoting Omega Eng g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed. Cir. 2003)). While Aeroflex's interpretation of the October Interview summary may be reasonable, the law requires much more. Accordingly, "because the statements in the prosecution history are subject to multiple reasonable interpretations, they do not constitute a clear and unmistakable departure from the ordinary meaning of the [claim term at issue]." Golight, Inc. v. Wal-Mart Stores, Inc., 355 F.3d 1327, 1332 (Fed. Cir. 2004).

Aeroflex's argument pertaining to the file history of register-transfer level descriptions is more persuasive. The file history demonstrates that the patentee amended the patent claims to include the phrase "architecture independent," and distinguished the claimed invention from prior art partially on that basis. See November 1989 Amendment at 7. The patentee stated that the "specifications used by Darringer et al. are not truly at an architecture independent level, but rather are at a lower level which is indeed hardware architecture dependent and defines the system at a 'register-transfer' level description." Id. Similarly, in the April 1989 Amendment, the patentee stated that "a very clear distinction between Darringer and the present invention is that the input to the Darringer system is in the form of a register transfer level flowchart control language . . . [and] input to the present invention is in the form of an architecture independent functional specification." Id. Based on this language, Aeroflex argues that Ricoh disclaimed the "register-transfer" level descriptions described in the Darringer prior art from the scope of its claimed invention. Ricoh responds that the patentee's use of the term "register-transfer level" was merely a shorthand reference used to denote the "structural" RTL-type, as opposed to
"functional" RTL-type, of input systems prevalent at the time.

In order to make this determination, the Court must examine the Darringer 4,703,435 Patent ("the '435 patent") and how closely it reads upon the present invention. The '435 patent specifically defines a register-transfer level description and the subsequent translation or transformation steps described in that patent do not alter this explicit definition. 7 '435 patent, col. 5:27-38. The Court finds no relevant distinction between the RTL described in the '435 patent and the RTL specifically disclaimed by Ricoh in the April and November 1989 Amendments. Furthermore, an examination of the '432 patent's public record fails to provide any support for Ricoh's distinction between "structural" and "functional" RTL-type input systems. Given these findings, Ricoh's attempt to limit the patentee's disclaimer to only "structural" level RTL-type input systems is unpersuasive. See Kumar v. Ovonic Battery Co., Inc., 351 F.3d 1364, 1368 (Fed. Cir. 2003) (adopting definition of term in cited prior art which is intrinsic evidence). Accordingly, the prosecution history indicates that the patentee expressly disclaimed all register-transfer level descriptions.

--- Footnotes ---

7 "[T]he process of this invention begins at step 100 with a register-transfer level description e.g. of the type shown in Fig. 4. The description consists of two parts: a specification of the inputs, outputs and latches of the chip to be synthesized; and a flowchart-like specification of control, describing for a single clock cycle of the machine how the chip outputs and latches are set according to the values of the chip inputs and previous values of the latches. At step 102 in FIG 2., the register-transfer level description undergoes a simple translation to an initial implementation of AND/OR logic. '435 patent, col. 5:27-38.

--- End Footnotes ---

Given these considerations, the Court defines "architecture independent actions and conditions" as functional or behavioral aspects of a portion of a circuit (or circuit segment) that does not imply a set architecture, structure, or implementing technology, but excludes the use of register-transfer level descriptions as taught in Darringer.
Patent No. 7,349,837 col.84 l.48-50, col.85 l.58-60, col.87 l.4-6, col.88 l.18-20 (filed Jan. 22, 2004). This broad claim language is consistent with Plaintiff's construction and provides no support for Defendant's proposed definition which includes additional limitations that a requirements area must be capable of displaying previously recorded requirements before the requirements are associated with any primitives. "[T]he plain language of the claim gives no indication" that requirements must be recorded prior to appearance in the requirements area and must be able to appear in the requirements area before being associated to a primitive. See Biagio W. Sales, 423 F.3d at 1302. Thus, the claim language itself omits any reference to the supplemental "pre-recording" limitation Defendant seeks to include in the construction of "a requirements area."

ii. The Specification

In support of its proposed construction of "a requirements area," mandating that "a requirements area" be capable of displaying previously recorded requirements before the requirements are associated with primitives, Defendant erroneously seeks to import limitations from the preferred embodiment into the broad claim language, "a requirements area comprising one or more requirements," see U.S. Patent No. 7,349,837 col.83 l.47-48 (filed Jan. 22, 2004); see also U.S. Patent No. 7,349,837 col.84 l.48-50, col.85 l.58-60, col.87 l.4-6, col.88 l.18-20 (filed Jan. 22, 2004), even though the '837 Patent does not demonstrate a clear intent to limit the claim scope. (See Pl.'s Opp'n 4-6.) It is a canon of claim construction that a court should not import limitations from the specification into the claims. See ICU Med., Inc., 558 F.3d at 1375 (internal citation omitted); Renishaw PLC, 158 F.3d at 1248. Specifically, "[p]articular embodiments appearing in a specification [should] not be read into the claims when the claim language is broader than such embodiments." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2002) (internal citation omitted). A court may err by placing too much emphasis on "the specification's discussion of the preferred embodiments, rather than the meaning of the claim terms themselves," as the specification need not describe every conceivable embodiment of the invention and the preferred embodiment is "just . . . one way of using the invention." Home Diagnostics, Inc. v. Lifescan, Inc., 381 F.3d 1352, 1357 (Fed. Cir. 2004); see CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002); Gen. Elec. Co. v. Nintendo Co., Ltd., 179 F.3d 1350, 1358 (Fed. Cir. 1999) (internal citation omitted) ("[W]hat is patented is not restricted to the examples, but is defined by the words in the claims."). The Federal Circuit has "cautioned against reading limitations into a claim from the preferred embodiment described in the specification, even if it is the only embodiment described, absent clear disclaimer in the specification." In re Am. Acad. of Sci. Tech. Ctr., 367 F.3d 1359, 1369 (Fed. Cir. 2004) (internal citation omitted). Therefore, even if "the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Id. (internal citation and quotations omitted). The patentee's "choice to describe only a single embodiment does not mean that the patent clearly and unambiguously disavowed other embodiments." Home Diagnostics, Inc., 381 F.3d at 1357 (internal citation omitted). As such, a claim term's ordinary and customary meaning cannot be narrowed "simply by pointing to the preferred embodiment . . . in the specification." CCS Fitness, Inc., 288 F.3d at 1366 (internal citations omitted); see Home Diagnostics, Inc., 381 F.3d at 1357 (internal citation omitted).

As the above analysis of the term "requirements" shows, see supra Part II.A.1.b, Defendant's argument regarding the pre-recording of requirements concentrates on portions of the patent's preferred embodiment in Figure 1 and its accompanying description in the specification. Although it is true that the preferred embodiment of the patented invention allows for pre-recording of requirements, Defendant has not shown that reading such a limitation into the term "a requirements area" is required based on the patentee's clear intention to limit the claim scope by using "words or expressions of manifest exclusion or restriction." See In re Am. Acad. of Sci. Tech. Ctr., 367 F.3d at 1369 (internal citation omitted). Rather, the entirety of Figure 1 and other portions of the specification, which expressly state that users can skip the initial step of recording requirements in the preferred embodiment and demonstrate a more flexible, simultaneous approach to the addition and association of requirements, see U.S. Patent No. 7,349,837 fig. 1, col.6 l.3-5, col.6 l.14-18, col.14 l.35-39, col.62 l.39-46, col.72 l.1-14 (filed Jan. 22, 2004), undermine Defendant's contentions that "a requirements area" as claimed must be
capable of displaying pre-recorded requirements prior to association with primitives. The disclosure in the specification does not clearly and unambiguously disavow other embodiments within the scope of the claim language that do not provide for pre-recorded requirements. See Home Diagnostics, Inc., 381 F.3d at 1357. Thus, the preferred embodiment, allowing for display of pre-recorded requirements prior to association with primitives, does not limit the broader claim language regarding "a requirements area comprising one or more requirements." See Home Diagnostics, Inc., 381 F.3d at 1357 (internal citation omitted).

iii. Extrinsic Evidence

The Court notes that the extrinsic evidence on the issue, limited to expert depositions and reports, does not aid the Court's analysis. The expert report of Defendant's expert, Alexander, merely makes the conclusory assertion that Defendant's construction is "consistent with the disclosure of the '837 [P]atent." (See Alexander Infringement Report 19; see also Alexander Infringement Report 11.) The declarations of Plaintiff's expert, Locke, also repeat the contentions made in Plaintiff's briefs. (See Locke Decl. P 25; Locke Opp'n Decl. PP 11-15.) Nevertheless, Locke does contend that a person having ordinary skill in the art would understand the claim language to correspond with Plaintiff's construction. (See Locke Decl. P 25; Locke Opp'n Decl. P 11.) Accordingly, based on the specification of the '837 Patent and the broad claim language, the Court finds Defendant's attempt to limit "a requirements area" to an area that must be capable of displaying previously recorded requirements before the requirements are associated with primitives to be without merit.

b. "A Requirements Area" Must Be Able to Display "At Least One" Requirement, Not Multiple Requirements

The language in Claim 1 that refers to "a requirements area" includes the language "a requirements area comprising one or more requirements." U.S. Patent No. 7,349,837 col.83 l.47-48 (filed Jan. 22, 2004) (emphasis added). Similarly, Claims 10, 20, 30, and 40 include "a requirements area comprising one or more statements, where a statement describes a desired behavior for a primitive." U.S. Patent No. 7,349,837 col.84 l.48-50, col.85 l.58-60, col.87 l.4-6, col.88 l.18-20 (filed Jan. 22, 2004) (emphasis added). Defendant construes this language to mandate that a "requirements area" be able to display "multiple" requirements for "multiple" primitives. (See Def.'s Mot. 10-11; Def.'s Opp'n 11-13; Def.'s Reply 3.) Plaintiff, however, argues that the claim language covers a "requirements area" that displays "at least one" requirement. (See Pl.'s Mot. 7; Pl.'s Opp'n 5-6; Pl.'s Reply 5-6.)

Federal Circuit precedent establishes that "one or more" means "at least one." See Superguide Corp. v. DirecTV Enters., Inc., 358 F.3d 870, 886 (Fed. Cir. 2004) (internal citation omitted) ("We conclude that the plain and ordinary meaning of the disputed language supports the district court's construction and that the phrase 'at least one of' means 'one or more.'"); Rhine v. Casio, Inc., 183 F.3d 1342, 1346 (Fed. Cir. 1999) ("Use of the phrase 'at least one' means that there could be only one or more than one."); Rhine v. Kistler Instrumente AG v. United States, 628 F.2d 1303, 1318, 224 Ct. Cl. 370 (Ct. Cl. 1980) ("Anyone with even the most rudimentary understanding of the English language understands 'at least one . . . ' to mean 'one or more . . . '.") As such, the phrases "one or more" and "at least one" both mean that "there could be only one or more than one." Rhine, 183 F.3d at 1345. Based on this precedent, the claim language "a requirements area comprising one or more requirements" covers a "requirements area" that displays "only one" requirement or "more than one" requirement, supporting Plaintiff's interpretation that a "requirements area" must be able to display "at least one" requirement as opposed to "multiple" requirements. See Rhine, 183 F.3d at 1346. Moreover, the claim language regarding a "requirements area" does not reference "primitives" and, therefore, provides no support for Defendant's argument that a "requirements area" must be able to display multiple requirements for multiple primitives.

In arguing that "a requirements area comprising one or more requirements" means that a "requirements area" must be capable of displaying multiple requirements, Defendant emphasizes that other claims of the '837 Patent, specifically Claim 8, use the phrase "at least one." See Def.'s Opp'n 11-12; see also U.S. Patent No. 7,349,837 col.84 l.33-34 (filed Jan. 22, 2004) (emphasis added). Defendant argues that the phrases "one or more" and "at least one" must therefore have different meanings under the doctrine of claim differentiation. (See Def.'s Opp'n 11.) The doctrine of claim differentiation provides that "[w]here claims use different terms, those differences are presumed to reflect a difference in the scope of the claims." Forest Labs., Inc., 239 F.3d at 1310 (internal citation omitted). Nevertheless, claim differentiation is merely "a guide, not a rigid rule." ICU Med., Inc., 558 F.3d at 1376 (internal citations omitted). As such, Defendant's reliance on claim differentiation in support of its argument that "one or more" requirements equates with "multiple" requirements is
unconvincing in light of clear Federal Circuit precedent establishing that the phrases are identical in meaning.

In its Reply, Defendant cites to various portions of the specification to support its argument that "a requirements area" must be able to display multiple requirements for multiple primitives, referring to the '837 Patent's "ubiquitous references to display of multiple primitives and multiple requirements." (See Def.'s Reply 3 (citing U.S. Patent No. 7,349,837 col.5 1.49-col.6 l.18; col.6 l.65-col.7 l.4; col.8 l.1-34; col.82 l.34-col.83 l.15 (filed Jan. 22, 2004)).) Although the portions of the specification to which Defendant cites do refer to "requirements" and "primitives" in the plural, they do not support Defendant's contention that a "requirements area" must be limited to an area capable of displaying multiple requirements for multiple primitives.

Accordingly, the Court finds that as properly construed, "a requirements area" is an area displaying "one or more" requirements, i.e., "at least one" requirement.

c. "A" Requirements Area Encompasses "One or More" "Requirements Areas"

Defendant's non-infringement arguments make clear that Defendant interprets "a requirements area" to encompass only one "requirements area" such that a product that has more than one "requirements area" would not be infringing. (See Def.'s Opp'n 11-12; 17-18; Def.'s Reply 3-4.) Plaintiff contends that this interpretation conflicts with Federal Circuit authority equating the article "a" with the phrase "one or more." (See Pl.'s Reply 5.)

The Federal Circuit "has repeatedly emphasized that an indefinite article 'a' or 'an' in patent parlance carries the meaning 'one or more' in open-ended claims containing the transitional phrase 'comprising.'" Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1342 (Fed. Cir. 2008) (quoting KCJ Corp., 223 F.3d at 1356); KCJ Corp., 223 F.3d at 1356 (internal citations omitted). In light of this precedent, "[t]hat 'a' or 'an' . . . mean[s] 'one or more' is best described as a rule rather than merely as a presumption or even a convention." Baldwin Graphic Sys., Inc., 512 F.3d at 1342; see KCJ Corp., 223 F.3d at 1356 ("This court has uniformly applied the general rule for indefinite articles."); Collegenet, Inc. v. Applyyourself, Inc., 418 F.3d 1225, 1232 (Fed. Cir. 2005) (internal citation omitted) ("It is well settled that the term 'a' or 'an' ordinarily means 'one or more.'"). In order to avoid this rule, "a patentee must evince a clear intent to limit 'a' or 'an' to 'one,'" i.e., "the language of the claims themselves, the specification, or the prosecution history [must] necessitate departure from the rule." Baldwin Graphic Sys., Inc., 512 F.3d at 1342, 1343 (internal citations, quotations and alterations omitted); see KCJ Corp., 223 F.3d at 1356 (internal citations omitted); see also TiVo, Inc. v. Echostar Commc'ns Corp., 516 F.3d 1290, 1303 (Fed. Cir. 2008) (internal citations omitted). Moreover, "the subsequent use of definite articles 'the' or 'said' in a claim to refer back to . . . an initial indefinite article[ 'a' or 'an'] does not implicate, let alone mandate" an exception from the general rule that "a" or "an" generally means "one or more." Baldwin Graphic Sys., Inc., 512 F.3d at 1342-43. Rather, "[b]ecause the initial indefinite article . . . carries either a singular or plural meaning, any later reference to that same claim element merely reflects the same potential plurality." Id. at 1343. Additionally, "standing alone, a disclosure of a preferred or exemplary embodiment encompassing a singular element does not disclaim a plural embodiment." KCJ Corp., 223 F.3d at 1356.

In this case, the preambles of all of the independent claims, which later recite a "requirements area," conclude with the "open-ended . . . transitional phrase 'comprising,'" see Baldwin Graphic Sys., Inc., 512 F.3d at 1342 (quoting KCJ Corp., 223 F.3d at 1356); KCJ Corp., 223 F.3d at 1356 (internal citations omitted), U.S. Patent No. 7,349,837 col.83 l.38-40, col.84 l.38-41, col.85 l.46-48, col.86 l.62-63, col.88 l.8-10 (filed Jan. 22, 2004), prior to the claims' reference to the claim term "a requirements area." As such, under the general rule, the indefinite article "a" before "requirements area" means "one or more." Defendant does not point to any portion of the '837 Patent specification demonstrating the patentee's clear intent to depart from the general rule and thereby limit "a" to "one." The Court has not found any such indication, as "[n]othing in the claim language, specification, or prosecution history compels an exceptional reading of 'a' in this case." See Baldwin Graphic Sys., Inc., 512 F.3d at 1343. Moreover, subsequent use of the definite article "the" in the claims to refer to "requirements area," i.e., "wherein the programming area and the requirements area are displayed at the same time" and "such that a primitive displayed in the programming area is visually associated with a displayed requirement of the requirements area," see, e.g., U.S. Patent No. 7,349,837 col.83 l.48-40, col.51-54 (filed Jan. 22, 2004) (emphasis added), does not alter the application of the general rule that "a" means "one or more." See Baldwin Graphic Sys., Inc., 512 F.3d at 1342-43.

Defendant's only support for its contention that "a" requirements area covers only one "requirements area" appears to be from Plaintiff's expert, Locke, who explained at his deposition his understanding that the claim language "a requirements
area" does not cover a product that has "more than one requirements area displayed at the same time." (See Def.'s Opp'n 11-12; Locke Dep. 167:23-169:12; see also Pl.'s Reply 6.) However, Federal Circuit precedent makes clear that the Court is to consider extrinsic evidence, including expert declarations and deposition testimony, only if the intrinsic evidence is insufficient to clarify any ambiguity, see Boss Control, Inc., 410 F.3d at 1377 (internal citation omitted); Vitronics Corp., 90 F.3d at 1583 (internal citation omitted). The Court does not find the intrinsic evidence ambiguous on this point and therefore need not consider this extrinsic evidence. Moreover, even if the Court were to properly consider Locke's opinions, "a court should discount any expert testimony that is clearly at odds with the claim construction mandated by . . . the written record of the patent." Phillips, 415 F.3d at 1318 (internal citation omitted). Because Locke's understanding of the meaning of the claim language "a requirements area" is at odds with Federal Circuit precedent on the issue, his testimony on the point is entitled to no weight.

Accordingly, "in view of the use of an indefinite article 'a' in the claim language without numerical qualifiers" and the absence of evidence in the '837 Patent limiting "a requirements area" to one such area, see Baldwin Graphic Sys., Inc., 512 F.3d at 1342, 1343 (internal citations, quotations and alterations omitted); KCJ Corp., 223 F.3d at 1356 (internal citations omitted), the Court holds that "a requirements area" covers "one or more" requirements areas. Thus, an accused device having "one or more" requirements areas would fall within the claim term "a requirements area." See KCJ Corp., 223 F.3d at 1357.

d. Conclusion

In light of the above analysis, the Court rejects Defendant's limitations to the claim term "a requirements area." The Court therefore finds that the ordinary and customary meaning of the claim term "a requirements area" is "an area (i.e., one or more areas) for displaying one or more requirements (i.e., at least one requirement)."

The patents in suit recite "display areas" and "background area" at several locations in the asserted claims. For example, claim 1 of the '619 patent recites "a plurality of variable color display areas . . .; [and] a variable color background area . . . ." The district court instructed the jury:

Display areas and the background areas "include any illuminated pixel anywhere on the display device with background pixels illuminated to substantially surround the illuminated display area pixels." As the image for illuminated display area changes, so does the adjacent illuminated background area."

Telegenix argues that the jury should have been instructed that the display areas are distinct from the background areas, that display areas cannot become background areas, and that background areas cannot become display areas. TDS argues that the claims encompass display areas arranged in the form of an array or matrix of areas, and as such the display areas and background areas are interchangeable.

Beginning with the words of the claims themselves, the dictionary meaning of display is "[a] visually observable presentation of information . . . ." Illustrated Dictionary of Electronics 147 (3rd ed. 1985). Background is defined as: "[t]he context or supporting area of a picture . . . ." Id. at 43. Thus, the ordinary meaning of "display area," as reflected in these dictionary definitions, is an area designated to portray information. Background is ordinarily understood to provide the context or contrasting reference against which the displayed information is presented. The ordinary meaning of these
The specification of the '619 patent is consistent with an interpretation in which the display and background areas are distinct and not interchangeable. For example, the written description describes the invention as including "a variable color display area" and "a variable color background area 32, substantially surrounding the display area." '619 patent, col. 2, ll. 16-21. The specifications of the patents in suit do not establish that display areas can become background areas, nor do they allow for their interchangeable use.

The specification of the '890 patent describes illuminating selected display areas in the background color to "blend with the background to provide maximum color contrast." '890 patent, col. 2, ll. 41-54. However, this establishes only that the inventor contemplated that display areas could function similar to the background areas, not that the display and background areas could be interchangeable.

Looking to the prosecution history, there is additional evidence supporting a construction that the display and background areas are mutually exclusive. The inventor stated in response to a rejection: "[claims 1 and 2], similar to claim 13 which was not explicitly rejected, are distinguished from the prior art by the recitation of background regions separated from the display areas by opaque walls. No reference of the record describes explicitly defined background regions." This evidence of manifest exclusion or restriction represents a clear disavowal of claim scope. See Teleflex, 299 F.3d at 1325, 63 USPQ2d at 1381. In doing so, the patentee expressly limited background areas to function similar to the background areas, not that the display and background areas could be interchangeable.

Moreover, if the background and display areas could each include "any illuminated pixel," the background area would not be different in nature or quality from the display area. Such a proposition is inconsistent with the language of the claims, in which the inventor claimed a device having two types of areas, and with the specification which describes distinct display areas and background areas.

On the basis of the ordinary meaning of the words of the claim and the intrinsic evidence, we conclude that these limitations should be construed as follows: display areas include any illuminated pixel anywhere on the display device, other than background area pixels in defined background regions. The background area pixels substantially surround the illuminated display area pixels. Display area pixels may be illuminated in the background color, but background area pixels may not be illuminated in the display color.

A. Arithmetic and logic unit (claims 1-4, 8, 11)

The '434 patent relates to the field of data processing. It discloses a structure and method for using an arithmetic and logic unit ("ALU") in a multiplier circuit. 1:9-13. Both multiplier circuits and ALUs were prior art to the '434 patent. They are both circuits that perform operations on data retrieved from memory. 1:15-37. The claimed invention improves the multiplier circuit by making it smaller and more efficient. 2:5-10.

The parties agree that an ALU is a circuit that processes data from memory by performing both arithmetic operations (such as addition and subtraction) and logic operations (such as OR and AND) on the data. They also agree that an ALU can, but need not, include registers. 10 Compare 1:19-21 (specification states that prior art ALU "includes registers"), with 4:15-21.
(claim 3 states that registers are external to the ALU). The parties dispute two narrow issues: (1) whether the construction of this term should include addition as an exemplary operation and (2) whether the construction should specify that an ALU may optionally include registers. AMD proposes the following construction: "Unit that can perform both arithmetic and logic operations." Samsung's proposed construction is: "A conventional circuit which performs arithmetic and logic operations (e.g. addition) within the data processing system and optionally includes registers capable of receiving inputs from multiple sources within that data processing system."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

10 Registers temporarily save data. See, e.g., 1:20-21.

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

The Court finds that Samsung's construction is more likely to confuse jurors than to help them. Samsung's use of "addition" as an example is unlikely to help jurors understand what a logic operation is. In addition, Samsung's inclusion of information about registers is likely to be confusing because Samsung does not explain what registers are. This aspect of Samsung's construction is also unnecessary as there is no dispute that registers are optional. AMD's construction is more useful because it explains to jurors that an ALU simply performs the functions that its name suggests.

Accordingly, the Court adopts AMD's construction of this term.

In PixArt, the Court did not construe the entire phrase, but instead referred the parties to the Court's construction of "frame" as "a single image in a sequence of images" and "the correlation being upon the values in all memory array locations that correspond to overlap between the comparison frame and the other of the reference frame or sample frame" as "the operation of comparing at least one shifted sample frame or at least one shifted reference frame with the other of a reference frame or a sample frame being upon all of the values stored in memory that correspond to the area shared between the frames. The comparison provides the degree to which the frames are related. The values that are being compared are numerical representations of the digitized photo detector outputs." Avago proposes that the claim language should be construed as "at least two frames, each generated by shifting a sample frame or a reference frame, are compared with the other of a reference frame or a sample frame to produce a corresponding number of correlation values and ascertain motion along the first and second axes".

In this embodiment, the comparison frames are not limited to the image captured by the complete array of photodetectors -- rather, the comparison frames may be the product of an internal operation so that what is captured by the array of photodetectors (a reference frame or a subsequent sample frame) may be correlated to the comparison frame, or the comparison frames may be correlated with each other.

- 656 -
Furthermore, Elan's definition of comparison frames excludes the prediction function disclosed in the specification: "For a hand held mouse, several successive collections of comparison frames can usually be obtained from the (16x16) reference frame taken at . . . This shifting to accommodate prediction throws away, or removes, some of the reference frame, reducing the size of the reference frame." Col. 5, ll. 14-25. In the prediction operation the comparison frame is derived from the reference frame and is thus neither a complete image, nor technically, an image captured by the array of photosensors.

Accordingly, the Court construes "a plurality of comparison frames, each being a shifted version of one of the reference frame or the sample frame, is correlated with the other of the reference frame or the sample frame to produce a corresponding plurality of correlation values and ascertain motion in the directions along the first and second axes" as "at least two frames, each generated by shifting a sample frame or a reference frame, are compared with the other of a reference frame or a sample frame to provide the degree to which the frames are related. Such correlations produce numerical representations of the degree of similarity between the frames. Such correlations are also used to ascertain motion in the directions along the first and second axes. A frame refers to a single image in a sequence of images."

2. "arithmetic comparison mechanism coupled to the plurality of correction values, and wherein the motion signals are not output to the computer system whenever a correlation surface described by the plurality of correlation values fails to exhibit a selected curvature"

In the PixArt litigation, the Court construed this claim language to mean: "a device that executes an algorithm which determines a surface shape by plotting the multiple correlation values and that blocks the transmission of motion data to the computer system if the result of the algorithm is that the surface shape is not a suitable curvature." Avago primarily takes issue with the word "plotting" in this Court's construction. Avago proposes that the claim language above be construed as "logic that performs arithmetic comparison operations and that receives correlation values. Wherein signals indicative of actual motion in the directions along the first and second axes and relative to the work surface height irregularities of the illuminated portion of the work surface are not communicated to the computer system whenever the mathematical surface produced or described by the various correlation values does not meet a particular criteria with respect to its curve or shape. This mathematical surface is a mathematical abstraction insofar as it is merely a mathematical representation of the distribution of correlation values." Elan contends that "arithmetic comparison mechanism coupled to the plurality of correlation values" is impossible to construe because the "arithmetic comparison mechanism" bears no relationship with any other element of the claim and there is no explanation as to how this mechanism is "coupled" to correlation values. Elan construes the remainder of the claim language as "motion signals are not output to the computer whenever the surface shape described by the plotting of the multiple correlation values fails to exhibit a predetermined curvature of the plotted correlation values." As to a mechanism being "coupled" to a "plurality of values" the Court invites the parties to stipulate to a construction or present evidence with respect to this relationship. As to the remainder of the claim language, to the extent that the parties interpret the Court's use of "plotting" in its previous construction as "forming an actual graphical representation of the correlation values," such "plotting" is not required by the specification. At a rudimentary level, the Court understands the equation y = 2x to be a linear equation without using graph paper and a ruler. The Court declines to further construe the phrase.

208

8. Claim 10: "around the receiver front end" This language is construed to mean "so as to pass, bypass, or avoid the receiver front end."

209

K. "arranged about/disposed about"

The parties have agreed that "arranged about" and "disposed about" are synonymous and should have the same construction. The plaintiff proposes "placed or set in a particular order." Defendants propose "covering substantially all of."

The plaintiff contends that its construction follows the plain and ordinary meaning of the phrases as defined in dictionaries.
See, e.g., American Heritage Dictionary 129 (2d college ed. 1991). The plaintiff also argues that this dictionary meaning is supported by the prosecution history, and that Defendants' construction is limited to the preferred embodiment.

 Defendants argue that the plaintiff's construction is not supported by the claims or the specification because they do not require "a particular order." Defendants argue that the specification shows LEDs covering substantially all of the surfaces. See '269 patent, fig. 8.

 In reply, the plaintiff contends that it does not need to have "a particular order;" "specific order" or "proper order" would be sufficient as defined by other dictionaries. Furthermore, the plaintiff argues that Defendants' construction would not encompass the specification's figures showing 25-50% of surfaces covered by LEDs. See '269 patent, figures 5-8, 12.

 The Court agrees with the plaintiff that the defendants' construction would exclude preferred embodiments. Accordingly, "arranged about" and "disposed about" mean "placed or set in a specific order."

 210

4. "the modulator is arranged to allocate bits of encoded data signals having relatively less interleaving to carriers carrying relatively fewer bits in each symbol period"

The next disputed term is found in Claims 7 to 14 and 17 to 20 of the '604 Patent. Plaintiff proposes that the term means "the modulator is actually arranged to allocate bits such that, in each symbol period, carriers that have been allocated relatively fewer bits will be modulated to include bits from data signals having relatively less interleaving." (Chart at 8). Defendants assert that term means "the modulator is capable of allocating bits of encoded data signals having relatively less interleaving to carriers carrying relatively fewer bits in each symbol period." (Id.). Again, the issue arises concerning the construction of "arranged to." The Court will adopt the ordinary meaning of this phrase as articulated above.

 In their Reply brief, however, Defendants suggested that Plaintiff's construction could be interpreted to exclude the possibility that interleaved, or slow, data can be allocated to the carriers carrying fewer bits. (Defs.' Reply at 27). Although the Court does not interpret Plaintiff's construction as necessarily incorporating that limitation, the Court concludes that the disputed term should not be construed in such a way that prohibits the encoded data signals with greater interleaving from being allocated to the carriers with fewer bits.

 Accordingly, the Court construes disputed term [27] "the modulator is arranged to allocate bits of encoded data signals having relatively less interleaving to carriers carrying relatively fewer bits in each symbol period" to mean "the modulator is configured in a way such that it allocates bits of encoded data signals with relatively less interleaving to carriers with relatively fewer bits in each symbol period."

 GO BACK

 211

3. "programmable FECC coder arranged to be programmed by the control unit"

Disputed term [26] is found in Claims 3 and 9 of the patent. Plaintiff contends that the term means "the control unit recited in claims 2 and 8 programs the programmable FECC coder with any parameters that relate to FECC coding and interleaving." (Chart at 8). Defendants assert that the term should be construed as: "an FECC coder capable of being programmed by the control unit." (Id.). Two issues predominate construction of this term. The first involves the construction of "arranged to." Rather than argue that "arranged to" means "actually arranged," Plaintiff now asserts that "arranged to program" means "programs." Plaintiff has not proffered sufficient evidence or argument to convince this Court that the term should be construed as "programs." Accordingly, the Court will once again adopt the ordinary meaning of "arranged" and construe this phrase to mean "configured to."

 The second issue is whether "any" parameters that relate to FECC coding and interleaving must be set through the control unit. Plaintiff submits that the term "control unit" in Claim 3 derives its antecedent basis from Claim 2. Claim 2, an
independent claim, states:

2. A data transmission system using multicarrier modulation, comprising:

    FECC (forward error correction code) coding and codeword interleaving apparatus arranged for differently encoding a plurality of data signals to provide a plurality of encoded data signals with different delays through the coding and interleaving apparatus, the coding and interleaving apparatus comprises a first store for storing the plurality of data signals, a second store, an FECC coder coupled between an output of the first store and an input of the second store, and a control unit for controlling the supply of data signals from the first store to the coder and for controlling storage of FECC codewords from the coder into the second store to provide codeword interleaving, and

    a modulator arranged to modulate bits of encoded data signals onto multiple carriers of the transmission system, different numbers of bits in each transmission symbol period being allocated to different carriers.

'604 Patent, col. 11, ll. 21-39 (emphasis added). Claim 8, the claim on which Claim 9 depends, recites, in pertinent part:

8. A data transmission system using multicarrier modulation, comprising:

    FECC (forward error correction code) coding and codeword interleaving apparatus . . . the coding and interleaving apparatus comprises . . . a control unit for controlling the supply of data signals from the first store to the coder and for controlling storage of FECC codewords from the coder into the second store to provide codeword interleaving . . . .

'604 Patent, col. 12, ll. 24-39 (emphasis added). On this basis, Plaintiff argues that the control unit as recited in Claims 2 and 8 sets "any" parameter that relates to the FECC coding and interleaving. In contrast, Defendants argue that the word "any" does not appear in Claims 3 or 9 or in the specification. Further, Defendants assert that the patent's disclosure does not define or limit the types of parameters that are being controlled by the control unit. (Tr. at 129:4-18).

The Court agrees that the "control unit" recited in Claim 3, which is a dependent claim, derives its antecedent basis in Claim 2. Plaintiff's proposed construction, however, is unduly restrictive and unsupported by the claim language and specification. Claim 2 itself does not recite the phrase "with any parameters that relate to FECC coding and interleaving." Nor does the Court find this limitation inherent in the claim language as Plaintiff suggests. Additionally, the specification does not mention this limitation when describing the FECC coder. It states: "The coder 72 is programmed by the control unit 68 to perform sequentially the functions of the plurality of FECC coders 32 in Fig. 2, and R can be different for different FIFOs of the RAM 70." '604 Patent, col. 9, ll. 9-12. Therefore, the Court declines to import such a limitation into the claim.

Accordingly, the Court construes disputed term [26] "programmable FECC coder arranged to be programmed by the control unit" to mean "programmable FECC coder configured in a way that enables it to be programmed by the control unit."
1. "Arrangement for reactivating" (Claims 1 and 18)

The parties are in agreement that the term "arrangement for reactivating" is a means-plus-function term that is subject to the requirements of paragraph 6 of 35 U.S.C. § 112, which requires each described function to also have a structure. The function of "arrangement for reactivating" is "to recommence communications with the first base station over the traffic channel that already was allocated and used prior to the handover attempt" (as asserted by HTC) or, more briefly, "to reactivate the link with the first base station if the handover is unsuccessful" (as described by IPCom). As explained previously, when a claim is expressed in means-plus-function language and it does not recite a definite structure in support of its function, the claim must be construed to cover that which is described in the specification and equivalents, Medtronic, 248 F.3d at 1311, and if one skilled in the art could not determine the bounds of the claim by reading the specification and equivalents, the claim is indefinite. See Halliburton, 514 F.3d at 1249.

HTC asserts that this claim is indefinite under paragraphs two and six of § 112. "[C]lear and convincing evidence that a skilled artisan could not discern the boundaries of the claim based on the claim language, the specification, and the prosecution history, as well as [the accused infringer's] knowledge of the relevant art area" is required to find a claim invalid on indefiniteness grounds. Halliburton, 514 F.3d at 1249-50. HTC fails to meet this standard.

An analysis of whether one skilled in the art would understand the bounds of the claim when read in the light of the specification is necessary to determine whether a claim is definite. See Personalized Media, 161 F.3d at 705. "If the claims read in light of the specification reasonably apprise those skilled in the art of the scope of the invention, § 112 demands no more." Id. Thus, the question is whether the "arrangement" is either identified or obvious to one skilled in the art.

In considering whether a claim term recites sufficient structure to avoid application of section 112 ¶ 6, we have not required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function.

... . . .

Thus, while it is true that the term "connector assembly" does not bring to mind a particular structure, that point is not dispositive. What is important is whether the term is one that is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term "means for."

Lighting World, 382 F.3d at 1359-60.

IPCom says that the structure represented by the "arrangement for reactivating" is "a processor connected to a transceiver and programmed to formulate and send messages to reactivate the link, if the handover is unsuccessful." Chart at 6 (citing '830 Patent at 6:30-44; 7:48-52; 7:65-83; Fig. 1 & Fig. 5 (steps 406-410)). IPCom argues that one skilled in the art would understand what is "plainly understood to be present in a mobile station" and that "the descriptions in the patent of receiving messages over a radio link (see, e.g., . . . Fig. 1; 1:20-21), interpreting the messages (Figs. 2-6; 6:34-36), making decisions based on the messages (Fig. 5; 6:37-38), formulating messages based on the decisions (Fig. 5; 6:37-38), and sending messages back over a radio link (Fig. 5, ref. 408; 6:37)" would indicate to one skilled in the art the required transceiver and properly programmed processor. IPCom's Resp. [Dkt. # 150] at 49. HTC's expert, Dr. Christopher Rose, conceded this point:

Indeed, Dr. Rose's concessions that a mobile station "has to be able to talk to the network so you've got to have a transceiver" and would be understood to have "some sort of processor. Something has to handle the data" ends this dispute as they establish exactly the same point IPCom made in opening - skilled persons would understand the specification to disclose sufficient structure. (Ex. 160B at 15:25-16:14.) 20 Dr. Rose's concessions are devastating to HTC's position. Id.
The Court agrees. The word "arrangement" by itself has no common or special meaning that one skilled in the art of telephony would know meant a processor and transceiver. But in the context of the '830 Patent and the art, the Court has no doubt that one skilled in the art would immediately deduce that a processor with a transceiver was the structure indicated by the term. The Court construes "arrangement for reactivating" in Claims 1 and 18 as meaning "a processor connected to a transceiver and programmed to formulate and send messages to reactivate the link, if the handover is unsuccessful."

The word "array" is used repeatedly in the specification. Claim 16 itself uses the word twice: once to refer to the data structures containing the "slice data" and another time to refer to the data structure containing the "data characteristic of the rolled fingerprint image," i.e., the composite array. Thus, whatever interpretation we assign should encompass both uses because the same word appearing in the same claim should be interpreted consistently. See Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1987) (the meaning of a term in a claim must be defined in a manner that is consistent with its appearance in other claims in the same patent).

The fact that the word "array" is used to refer to both the data structures containing the slice data and the composite data supports the district court's claim construction. The pixel values stored in the image "arrays" (e.g., "IAL") are described as "digital values representative of the intensity of optical fingerprint images . . . ." Col. 4, ll. 13-14. Moreover, according to the written description, the "optical image OIL will be propagated from the prism and data representative thereof will be stored in RAM 14 as image array IAL." Thus, the written description teaches that the array is created upon storing the image data in memory.

The composite "array" is also described as containing digital data. This follows naturally from the fact that the data in the composite array is taken directly from the active area of the image array, which is digital. The data in the composite "array" is also stored in memory. See Col. 6, ll. 20-21 ("Composite array CA is stored in RAM 14.") Our interpretation of "slice data," discussed infra, also supports the district court's construction. Accordingly, both the claim language itself and the written description support the district court's claim construction.

DBI points to one isolated passage in the written description to support its claim construction. That passage states that the "digitizer 24 produces two-dimensional arrays of digital pixel values PVn,m[/] representative of the intensity of fingerprint images at corresponding discrete pixel locations PLn,m[/]." It is clear from the entirety of the written description that this is not an accurate statement. The digitizer is an analog-to-digital converter. Analog data comes in and digital data goes out. The digitizer does not organize the data nor index it. Thus, the digitizer does not "produce[] [an] array" even under DBI's proposed definition of array, which requires the data to be "individually addressable." This isolated passage therefore does not alter our construction, which is based on the entire written description.

In light of the explicit teaching of the '976 patent, it is difficult to understand how the composite data structure could be assembled without storing digital data. The composite image must be stored in a memory separate from the memory used to contain the current image array or otherwise the current image array would overwrite the composite image. Both the current image array and the composite image must also be operated upon in order to integrate the current slice data into the composite image. This requires the data in the composite array to be compared with the image in the active area, which may then be combined according to a mathematical formula. In view of the uncertainties surrounding the implementation of such an invention, we adopt the narrow claim construction that is clearly supported by the written description, and interpret "array" in claim 16 to mean a data structure stored in memory that is representative of a two-dimensional image. See Athletic Alternatives, 73 F.3d at 1581, 37 U.S.P.Q.2D (BNA) at 1372.

A DBI argues that the plain meaning of the word "array," as evidenced by its dictionary definition, does not require the data contained therein to be digital. To support its position it offers the following definition: "an n-dimensional ordered set of
data items identified by a single name and one or more indices, so that each element of the set is individually addressable" (quoting The New IEEE Standard Dictionary of Electrical and Electronic Terms (5th ed. 1993)). The intrinsic evidence clearly indicates that the applicant distinguished between analog "frames" and digital "arrays." Because the intrinsic record is clear we do not give weight to an inconsistent dictionary definition.

215

1. Phase[d] delay array.

The patent claims require a "phase[d] delay array." O2 contends that the court should construe this phrase as a whole and define it to mean "a circuit that generates a plurality of phase shifted signals." O2 argues that the patent uses the phrase (or similar phrases) sixty-six times in the specification. O2 thus argues that the court should define the term by reference to its context in the specification. O2 argues that the inventors implicitly acted as their own lexicographers by using the term phased delay array according to O2's proposed definition. Samsung counters that the term in need of construction is "array." According to Samsung, an array is a narrower term than a "circuit" as proposed by O2. Samsung points to a dictionary definition of "array" and proposes that the term means "a group of components arranged to provide a desired variation."

Despite O2's arguments in the briefs, Samsung correctly observes that O2's proposed construction effectively reads the term "array" out of the claims and substitutes the term "circuit" in its place. The claims and the language of the patent use both the terms "circuit" and "array." Had the inventors desired to use the term "circuit" in the claims, they easily could have done so. Indeed, as Samsung observes, claim 6 of the '264 patent actually used both terms, when it adds the limitation of "phase array driver circuits." In light of these issues, the court defines "array" as used in the claim limitation to mean "a group of components arranged to provide a desired variation." The balance of the phrase needs no construction.

216

a. "LED array"

The parties' dispute over claim 1's "LED array" concerns its configuration and components. Ecolux, Dialight, and Precision argue that the "LED array" requires a series-parallel configuration of strings of LEDs with a ballast resistor 3 in each string. Lumileds supports this construction, but also argues that if I reject it, the plain meaning of "LED array" requires only a group of LEDs forming a complete unit - a broad construction that could encompass a single string of LEDs in series or a series-parallel configuration. Relume contends that the "LED array" requires a series-parallel configuration, but not ballast resistors.

3 A ballast resistor is a resistor that limits and spreads current across a load (here the LED array). This "ballasting" function gives the resistor its name.

4 The exception is the alternative, plain meaning construction offered by Lumileds.
Relume finds its proposed construction in a different passage of the specification than do defendants. That passage describes the preferred embodiment of the LED array as "consisting of a large number of series-parallel connected LED devices." '645, 6:24-25. Relume also relies on the patent's diagrams of three prior art LED arrays, all of which depict series-parallel configurations, but only one of which depicts ballast resistors. From these references - the preferred embodiment passage and the prior art diagrams - Relume argues that a person of ordinary skill in the art of LED array power supplies would understand the series-parallel configuration, but not the ballast resistors, to be a necessary part of the claimed "LED array".

My construction of "LED array" must begin with the language of claim 1. See Phillips Petroleum Co. v. Huntsman Polymers Corp., 157 F.3d 866, 871 (Fed. Cir. 1998). It does not mention series-parallel LED configurations or ballast resistors. All that claim 1 explicitly requires is the "LED array" element to have as physical structure is 1) the LEDs in an array arrangement and 2) an input connected to the output of the power factor correction converter means.

In fact, claim 1 speaks broadly of its claimed invention. It states at the outset that it covers "an apparatus for supplying regulated voltage d.c. electrical power to an LED array." '645, 13:16-17. It further states that this apparatus has three major elements: a rectifier means, a power factor correction converter means, and an LED array. Thus, upon reading claim 1 in its entirety, a person of ordinary skill in this art would understand that it covers a certain kind of regulated voltage power supply for an LED array, but would not necessarily conclude that the invention's application was restricted solely to traffic signals. To put it another way, the invention described by the language of claim 1 is a relatively simple one with potentially broad application: any conceivable use for regulated voltage LED illumination.

This point is important because it informs the ordinary meaning of the phrase "LED array." By itself, the word "array" connotes nothing more than a series or orderly grouping of things. Webster's Third New International Dictionary (1986) (hereafter "Webster's") defines it variously as "a regular and imposing grouping or arrangement" and "an impressive list, series, or group of things." 5 The modifier "LED" simply tells the reader that the things arranged by the array are LEDs. Together, then, the words "LED" and "array" have a range of ordinary meaning that can cover LED configurations as simple as a string of LEDs in a series or as complicated as the series-parallel LED strings of the '645 patent's preferred embodiment. The entirety of claim 1 does not alter this range of ordinary meaning. 6 Thus, after reading claim 1, a person of ordinary skill in the art of LED array power supplies would understand the phrase "LED array," on its face, to cover a wide scope of LED configurations, including, but not limited to, the simple series and the series-parallel.

5 Relume argues, without reference to a dictionary or treatise, that "array" merely means "array shaped," "having a two dimensional extent, width and height." (Pl.'s Consolidated Opp. at 12.) I reject this definition. Besides being circular and at odds with Webster's, it is critically incomplete. It does not speak to the ordered nature of arranged things that the word array evokes. It is also fails to gain Relume what it wants for validity purposes: a construction of "LED array" that excludes from its scope a single string of LEDs in a series. That simple configuration does have a width and a height: it is one LED wide and however many LEDs high.

A related point: In its response to Lumileds' anticipation motion, Relume raised arguments vehemently attacking the use of dictionaries in claim construction because they are extrinsic evidence. (See Pl.'s Anticipation Opp. at 9.) Throughout my opinion, I follow the rule laid down in Vitronics, which permits me to consult dictionaries and treatises "at any time" in my claim construction so long as the dictionary's definition does not contradict the definition supplied by the intrinsic evidence of the patent. See 90 F.3d at 1584, n.6.

6 Some defendants suggest that the reference numeral attached to "LED array" limits the phrase's ordinary meaning by referring the reader to the diagram of the array's preferred embodiment, which shows ballast resistors in the array. I find this argument unpersuasive, however. A reference numeral is simply a convenient tool for directing the reader to an example of the element the patentee has claimed. Had the drafter wanted to incorporate the limitations of the preferred embodiment into the language of claim 1, he or she could have done so quite easily with words.
The parties' proposed constructions for "LED array" raise the issue whether the specification narrows the phrase's ordinary meaning. According to the United States Court of Appeals for the Federal Circuit ("Federal Circuit"), I "must presume that the terms in a claim mean what they say, and, unless otherwise compelled, give fall effect to the ordinary and accustomed meaning of claim terms." Johnson Worldwide Assocs., Inc. v. Zebeco Corp., 175 F.3d 985, 989 (Fed. Cir. 1999). The Federal Circuit has identified "two situations where a sufficient reason exists to require the entry of a definition of a claim term other than its ordinary and accustomed meaning." Id. at 990. "The first arises if the patentee has chosen to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term." Id. "The second is where the term or terms chosen by the patentee so deprive the claim of clarity that there is no means by which the scope of the claim may be ascertained from the language used." Id. This second situation is not at issue here because, as I have explained, the phrase "LED array" is clear on its face.

The ballast resistor construction of "LED array" proposed by defendants is essentially an argument under the first situation. That is, defendants believe that the drafter of the '645 patent acted as his/her own lexicographer and clearly set forth an explicit definition of "LED array" in the specification that requires ballast resistors. At a March 22, 1999 hearing, I stated an inclination for a preliminary construction of "LED array" that was consistent with defendants' construction.

After further consideration, however, I am not persuaded that I should adopt their construction, which relies entirely on a passage and a diagram that describe the preferred embodiment of claim 1's LED array. It is a fundamental rule of claim construction that "references to a preferred embodiment, such as those often present in a specification, are not claim limitations." Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988); see also Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1302-03 (Fed. Cir. 1997). Otherwise, "there would be no need for the claims." SRI Int'l v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1121 (Fed. Cir. 1985).

Claim 1 only requires its array to incorporate one component: the LEDs. No additional components are therefore necessary. Except for its description of the preferred embodiment of the array, the specification of the '645 patent teaches nothing different. Its statement of the invention's objectives does not mention ballast resistors or claim any functional advantage related to ballast resistors. Perhaps most telling, the preferred embodiment passage relied on by defendants is itself only cursory in its reference to ballast resistors; it does not explain what advantage is to be gained by using them in the array. From the context of the '645 patent, then, it is clear that the drafter did not intend for the preferred embodiment's use of ballast resistors to limit the full range of ordinary meaning inherent in the "LED array" phrase of claim 1.

Precision attempts to justify a ballast resistors requirement on functional grounds. As this argument goes, a person of ordinary skill in the art would understand ballast resistors to be necessary components in any voltage-regulated LED array because, without them, a voltage-regulated LED array will not illuminate well in all conditions. From an engineering standpoint, ballast resistors undoubtedly improve the performance of a voltage-regulated LED array. By limiting and spreading the current in the array, they help the LEDs maintain a more even level of illumination. Yet claim 1 recites no limitations on the array's illumination level, nor does it recite limitations for limiting and spreading current. Because their function is not essential to the claimed array, it follows that ballast resistors themselves are not essential components for that array.

Having determined that the "LED array" of claim 1 does not require ballast resistors, the question then becomes whether it also requires a certain configuration of the LEDs. Relume essentially argues that the "LED array" of claim 1 requires a series-parallel configuration of LEDs, but not necessarily the exact series-parallel example of the patent's preferred embodiment. Defendants argue that this construction improperly imports limitations from the specification into claim 1. They correctly point out the fundamental inconsistency in Relume's objection to a ballast resistors requirement, which comes from the specification, and its support for a series-parallel requirement, which also comes from the specification. Relume responds by contending that a person of ordinary skill in the art would know that a series-parallel configuration is necessary because LED string redundancy allows the array to continue to emit light in the event of a single point LED failure. 7

Footnotes

7 A single point LED failure occurs when one LED in a string of connected LEDs fails, for whatever reason, to conduct...
electrical current and therefore emit light. This failure causes the entire LED string to fail as well. A series-parallel configuration of LED strings minimizes the impact of a single point LED failure because, even if one string is extinguished, the other strings will continue to emit light.

I find Relume's series-parallel construction of "LED array" unpersuasive, however, because it fails to overcome the presumption in favor of the phrase's ordinary and accustomed meaning. The language of claim 1 does not explicitly limit the "LED array" to a series-parallel configuration. Nor does it implicitly do so. As discussed above, the phrase "LED array" means on its face that the claimed element must arrange LEDs in a regular grouping. A series configuration is simply the logical minimum of this facial meaning and thus cannot be excluded from the phrase's scope. The specification supports this conclusion. It notes that both series and series-parallel configurations exist in the prior art as design choices for LED arrays. '645, 1:18-30.

If I were to determine that a person of ordinary skill in the art would read a series-parallel limitation into "LED array," I would violate the fundamental principle that the preferred embodiment not limit the meaning of the claims. See Laitram, 863 F.2d at 865. The specification does not indicate that the drafter acted as his own lexicographer and intended for the series-parallel definition of the preferred embodiment to override the ordinary meaning of "LED array." See Zebco, 175 F.3d at 990. Aside from the preferred embodiment, there are no explicit series-parallel definitions for claim 1's LED array set forth in the specification. The specification also does not mention a series-parallel configuration in its summary of the invention, nor in its statement of the invention's objectives. Finally, the specification's diagrams of the prior art tellingly attach "series-parallel" as an adjective to "LED array"; this further reveals that the phrase "LED array" does not inherently teach a series-parallel configuration to those in the art.

Relume falls back on a functionality argument to support its narrow construction. It contends that the LED array of claim 1 requires, at minimum, a series-parallel configuration in order to gain the benefit of LED string redundancy. But just as Precision's function argument failed, so too does Relume's. Claim 1 nowhere recites a limitation on the configuration of the LED array, nor does it state a functional advantage from a series-parallel configuration. Moreover, claim 1 states no concern for how well or how safely the LED array illuminates, only that it does. All of this makes sense given that the invention described by claim 1 is not a kind of LED array or a safer LED array, but an apparatus that supplies voltage-regulated electrical power to any kind of LED array, whatever its application.

I conclude that the intrinsic evidence of record would lead a person of ordinary skill in the art of LED array power supplies to understand the "LED array" of claim 1 to mean an orderly arrangement of LEDs - a meaning that encompasses both a simple series and a series-parallel configuration. I further conclude that a person of ordinary skill in this art would not understand the "LED array" of claim 1 to require ballast resistors.

4. "an array of EEPROM cells" ('808 pat., cl. 16)

The parties disagree about whether the term "an array of EEPROM cells" requires the claimed memory storage elements to be "contiguous" or contain "dedicated row and column decoders." Defendants seek both limitations on the ground that the sole embodiment shows storage elements that are arguably "contiguous" (assuming that term is sufficiently clear to have meaning) and contains decoders labeled "column decoder" and "row decode." (The embodiment is from a separate application incorporated into the '808 patent by reference, Figure 4 from U.S. Patent Application No. 07/337,579, which became U.S. Patent No. 5,172,338).

Even if I assume that the sole embodiment includes contiguous elements and dedicated decoders, this does not necessarily mean that an "array of EEPROM cells" must always do so. As explained above, the mere fact that a sole embodiment includes certain features does not mean that the claimed invention is so limited. Something in the specifications must indicate that the embodiment was intended to demonstrate the contours of the invention, not just provide one example of the invention. Phillips, 415 F.3d at 1323. Defendants do not point to any intrinsic evidence suggesting the inventor intended to limit "an array of EEPROM cells" to the embodiment it incorporated by reference.
Defendants point out that the term is not described in the specification, which is true, but that does not mean the embodiment must be the sole source for interpreting the term. Indeed, the starting point is the "ordinary and customary meaning" of the terms themselves, as understood by a person of ordinary skill in the art at the time of the invention. Id. at 1312-14. The cited embodiment may suggest that, at the time of the invention, an "array" in the relevant field included dedicated row and column decoders and contiguous memory storage elements. However, this does not suggest that either of these features was a requirement of an array. Indeed, as plaintiff's expert avers, at the time of the invention (the late 1980s), "it was well-known in the semiconductor memory industry to divide a memory array into physically distinct units called 'sub-arrays' or 'subarrays.'" Taylor Decl., dkt. #540, ¶ 12. This matters because a memory system using a sub-array might not have "contiguous" memory storage elements throughout the array and may have dedicated decoders at the sub-array level as opposed to the array level, as demonstrated in a later patent of plaintiff's using sub-arrays:

[SEE FIGURE IN ORIGINAL]

Dkt. #60-5, U.S. Pat. No. 5,890,192, Fig. 3. (Although each separate group of memory storage elements is labeled as a "quad" in Fig. 3, elsewhere the patent describes the group of storage elements as a "plurality of flash EEPROM cells 400 organized into four sub-arrays or quadrants, 400-0 to 400-3." Id., col. 3, Ins. 57-58.)

Plaintiff's expert has more than his say-so to back this up; he identifies three patents from the time of the invention that included arrays subdivided into sub-arrays: U.S. Pat. No. 4,694,433, Abstract ("[a] memory structure for very large memory arrays on a chip . . . where the memory array is divided into a number of subarrays."); U.S. Pat. No. 4,758,993, Abstract ("having an array of memory cells which are divided in several sub-arrays."); U.S. Pat. No. 4,807,191, col. 1, Ins. 13-15 ("[t]he integrated circuit memories are frequently characterized by being divided into sub-arrays, or blocks, of memory cells.").

Defendants point out that none of the patents involve flash EEPROM memory, but do not explain why the term "array" would mean something different in the flash memory field from what it would mean in other semiconductor memory devices. Even if defendants are correct that at the time of the invention "sub-arrays" had not been contemplated in the flash memory context, that would not mean an "array" must be limited in the ways that defendants propose. Only if "arrays" in the field of flash memory excluded sub-arrays would there be a ground for imposing the limitations defendants request. Defendants have no evidence of this, so the limitations will not be imposed. "An array of EEPROM cells" need not be "contiguous" or contain "dedicated row and column decoders."

"[A]rray of non-volatile floating gate memory cells" (claims 1 & 10)

The court previously interpreted the term "array of non-volatile floating gate memory cells" as meaning:

- a group of memory cells on one or more memory chips. Multiple chips in the same array are connected through objects such as a common interface and/or common logic and resistor circuits. An array may contain components that are not memory cells, such as an interface.

Doc # 318 at 12.

On appeal, the Federal Circuit did not address the "array" interpretation. SanDisk Corp v Memorex Prods, Inc, 415 F3d at 1292. Despite the Federal Circuit's pass on this term, SanDisk argues that the interpretation should be: "a memory portion of a semiconductor chip that contains non-volatile floating gate memory cells organized into rows and columns (i.e., a non-volatile floating gate memory chip)." SanDisk Br (Doc # 373) at 6 (emphasis added).

SanDisk repeats the argument that an "array" is limited to a single chip. Id at 6-9; SanDisk Reply Br (Doc # 396) at 3-6. This argument was considered and rejected in the initial claim construction order. Doc # 318 at 12-16. SanDisk presents no reason why the court should revisit that decision here. Accordingly, the court declines to adopt SanDisk's construction.
Ritek contends that the Federal Circuit's analysis of the "partitioning" construction provided "additional guidance regarding the meaning of 'array.'" Ritek Br (Doc # 390) at 14-15. Ritek proposes the following claim construction to "conform" with the Federal Circuit opinion:

A group of memory cells on one or more memory chips that are required to perform the steps of the claimed method and are connected through a common interface and/or common logic and resistor circuits. It may contain components that are not memory cells, such as an interface. There may be other memory cells in the memory system that are not part of the array which performs the steps of the claimed method.

Id at 15 (Ritek's proposed additions to this court's original claim construction order in italics). For the reasons that follow, the court declines to modify the original construction of "array."

The Federal Circuit explicitly stated: "The judgment does not depend on the choice between these disputed meanings of 'array.'" * * * [W]e find it unnecessary at this point to decide this dispute." SanDisk Corp v Memorex Prods, Inc, 415 F3d at 1292. This suggests that the Federal Circuit did not intend to provide any "additional guidance" on the term. More importantly, the Federal Circuit explicitly acknowledged it was not reviewing "array." Id. The court finds that the Federal Circuit did not intend to alter the construction of "array" in its analysis of "partitioning."
