The numbers listed above represent all known telephone numbers for making international calls as of 1992 and as Gammino stated they "correspond exactly to his claimed invention." Based on Gammino's statements to the Patent Office regarding the license agreement, "predetermined digit sequences [signals] which are used for international dialing" and "predetermined digit sequences" must mean "the set of all digit sequences which are used for international dialing." Therefore, the Court gives the terms their meaning as proposed by SWB and as supported by intrinsic evidence. Such an interpretation is consistent with the Court's construction set forth in Section IV (A) (2) of this Order.

"Predetermined Severe Congestion Threshold"

Alcatel's proposed construction of this term is "a predetermined number of queued data units, which is greater than the predetermined mild congestion threshold." Cisco's proposed construction is "a configurable percentage of the absolute congestion threshold which is determined by the router as a function of the number of buffers available and the number and access rates of all of the frame relay links on the router."

As Alcatel notes, the parties have already agreed on the construction of the term "predetermined mild congestion threshold." That construction reads: "A predetermined number of queued data units representing a limit that is indicative of the presence of congestion." The Alcatel construction attempts to construe the "predetermined severe congestion threshold" as simply a threshold level greater than the "predetermined mild congestion threshold."

Cisco, on the other hand, claims to have derived its definition from the language of the patent itself. Specifically, language in the preferred embodiment describes "severe congestion threshold" as "a configurable percentage of the absolute
congestions threshold," and defines the "absolute congestions threshold" as "determined by the router as a function of the number of buffers available and the number and access rates of all of the frame-relay links in the router." Watt, at 5:37-42. Therefore, Cisco's proposed construction is simply a combination of these two definitions.

However, Cisco's proposed construction fails for two reasons. First, Cisco's construction limits the language to apply to only frame relay networks, but the claim language indicates otherwise. In particular, the language of "predetermined severe congestion threshold" is contained in both claims 1 and 8. In claim 4, a claim dependent on claim 1, it claims "A data link interface as claimed in claim 1, wherein said network is a frame relay network." Watt, at 7:5-6 (emphasis added). Thus, if "predetermined severe congestion threshold" was construed to apply only to frame relay networks, then the entire language in claim 4 would be rendered meaningless. This construction would be at odds with the notion of claim differentiation. "This doctrine, which is ultimately based on the common sense notion that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope, normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend." Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971 (Fed. Cir. 1999); but see ATD Corp. v. Lydall, Inc., 159 F.3d 534, 541 (Fed. Cir. 1998) (noting that the doctrine of claim differentiation "is a guide, not a rigid rule"). Therefore, reading the language of dependent claim 4 (referring to frame relay networks) into claim 1 is improper, and hence Cisco's construction fails.

Furthermore, Cisco's construction of "predetermined severe congestion threshold" is taken exclusively from the preferred embodiment. However, claims are not ordinarily limited to the preferred embodiment disclosed in the specification. See Interactive Gift Express v. CompuServe, 256 F.3d 1323, 1341 (Fed. Cir. 2001); cf. Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999) ("It is well established that the preferred embodiment does not limit broader claims that are supported by the written description."). Moreover, in the summary of the invention contained in the patent, the language notes that the preferred network is a frame relay network, not the required network. See Watt, at 1:47-49, 60.

Finally, as Alcatel points out, the patent history also recognizes that the invention is particularly applicable to a frame relay network, but is also applicable to other types of packet switched networks with virtual connections. See Watt, File History, at AL 0000891A.

3 Of course, where the patent applicant acts as his or her own lexicographer, the meaning of a term given by the applicant holds. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998) (finding that when an applicant is lexicographer, "the definition selected by the patent applicant controls"). In this instance, however, the Court finds that the applicant was merely giving an example in the specification of a "severe congestion threshold" in the context of a frame relay link, and not a definition.

Therefore, the Court construes "predetermined severe congestion threshold" as "a predetermined number of queued data units, which is greater than the predetermined mild congestion threshold."
51.) Thus, the Court concludes that Defendants impermissibly try to restrict the claim to the particular type of threshold used in the preferred embodiment. Accordingly, in the Court's view, the Court's construction is consistent with the plain language of the claim and the specification.

GO BACK

3287

1. "a predetermined time"
The parties' first dispute concerns the clause "a predetermined time." This clause appears in Claims 7 and 8 of the '512 Patent and within the larger clause "at a predetermined time interval" in Claim 1 of the '134 Patent.

As a threshold matter, the court notes that the parties do not explicitly distinguish between "a predetermined time" and "at a predetermined time interval." The fighting issue is whether the patents-in-suit claim what may be loosely referred to as a "fixed" or "variable" time or time interval.

ProBatter argues that the clause "a predetermined time" is properly construed as "a time . . . that is set or otherwise determined before the ball is propelled toward a target." JACCC (docket no. 174), at 8. Conversely, Joyner argues that the clause is properly construed as "a period of time determined once, before the machine begins operating, that remains the same from pitch to pitch, regardless of conditions." Amended Motion for Markman Construction of Asserted Claims (docket no. 165-1), at 2. 8 In other words, ProBatter argues that the patents-in-suit include a claim for a variable predetermined time, whereas Joyner argues that the predetermined time is fixed, i.e., "determined once and for all, before the videos are ever loaded into the machine." Amended Brief on Markman Construction of Asserted Claims (docket no. 165-2), at 6.

Joyner further argues that "a predetermined time" is a means-plus-function clause within the ambit of 35 U.S.C. § 112, P 6, because (1) in Claim 1 of the '134 Patent the clause is part of a broader "means for synchronizing" clause and (2) the "a predetermined time" clause is "claimed in functional terms, without sufficient recited structure to perform the function." JACCC (docket no. 174), at 8. It is unclear exactly how a means-plus-function analysis would alter the court's conclusion about the proper construction of the clause.

The court shall adopt ProBatter's construction. Joyner's construction impermissibly restricts the scope of the claim language. Nothing in the claim language requires that the time or time interval must be the same for each and every pitch. In other words, "a predetermined time" does not mean "one and only one predetermined time." In addition, the specification of each patent teaches that the time interval, while preferably fixed between 5 and 7 seconds, need not be fixed. In pertinent part, each specification states:

FIG. 15 is a flow chart showing the operation of the ball-throwing machine 10 in conjunction with the video storage means 302 and video projection means 303. The ball 308 is delivered to a queued position 317 in the ball introduction tube 90 by means of a feeder tube 316. Once in the ball introduction tube 90, the ball 308 is retained and prevented from entering the nip 92 by means of ball retaining means 318. Upon delivery of the ball 308 to the queued position 317, the control unit 200 chooses an appropriate video image 310 for the type of pitch being thrown. For example, if the pitch to be thrown is a curve-ball thrown by a left-handed pitcher, the control unit 200 will select the video image of a left-handed pitcher throwing a curve ball. Simultaneously therewith, the control unit 200 determines the appropriate settings for the particular pitch at the particular location from the stored data table and then sends signals to the drive control motors 202A-202C, the horizontal actuator controller 206 and the vertical actuator controller 204 providing them with the applicable settings for the particular pitch. Upon receipt of the applicable signal, each of the drive motor controls 202 set their corresponding drive motors 80 to the specified speed to accomplish the desired wheel speed and the two actuator controllers 204, 206 set their corresponding actuators to the specified positions to position the power head 20 in the desired position. The affect [sic] of this is to reposition the power head 20 in the proper position to deliver the specified pitch to the predetermined position with the coacting wheels 70A-C rotating at an appropriate speed to deliver the selected pitch.

Once the controller 200 receives the proper feedback from the drive control motors 202A-202C, horizontal actuator controller 206 and vertical actuator controller 204 that indicate the power head 20 is in the correct position and the wheels 70A-C are spinning at the correct rotational velocity, the controller 200 instructs the video storage means 302 and video display means 303 to play the chosen video image 310. Immediately upon commencement of the video image 310 playback, the control unit...
200 initiates a countdown for the duration of time between the commencement of the video image 310 and the precise moment in which the ball 308 appears to be released by the video image 310. This duration of time is precisely determined and is the same for every individual video image 310. In the preferred embodiment, this duration is between 5 and 7 seconds, although it should be appreciated that shorter or longer durations may be preferred, either for more rapid operation or for a longer view of the pitcher in his motions.

Upon the termination of the countdown, at which time the pitcher in the video image 310 appears to be about to release the ball 308, the control unit 200 sends a signal to a solenoid 322 located immediately behind the ball 308. This signal instructs the solenoid to impel the ball 308 forward through the introduction tube 90 and into the nip 92, where the ball 308 is engaged by coacting wheels 70A-70C and further impelled through the opening 306 in the screen 304, such that it appears the pitcher in the video image 310 had actually thrown the ball 308.

Having thus described the invention with particular reference to the preferred forms thereof, it will be obvious that various changes and modifications can be made therein without departing from the spirit and scope of the present invention as defined by the appended claims.

'134 Patent, col. 18, ll. 23-67 & col. 19, ll. 1-18; '512 Patent, col. 18, ll. 36-67 & col. 19, ll. 1-31 (emphasis in original). Although the specification states that "[t]his duration of time is precisely determined and is the same for every individual video image," '134 Patent, col. 18, ll. 64-66; '152 Patent col. 19, ll. 10-12, and is preferably "between 5 and 7 seconds," '134 Patent, col. 18, l. 67, '512 Patent, col. 19, l. 13, the specification also makes clear that the predetermined time or time interval need not always be the same for each and every pitch. The specification states "it should be appreciated that shorter or longer durations may be preferred, either for more rapid operation or for a longer view of the pitcher in his motions." '134 Patent, col. 19, ll. 1-3; '512 Patent, col. 19, ll. 14-16. It appears then, that this is a classic case in which the specification "indicate[s] that certain embodiments are preferred, [but] particular embodiments appearing in a specification [should] not be read into the claims when the claim language is broader than such embodiments." KJC Corp., 223 F.3d at 1356.

When the court focuses "on understanding how a person of ordinary skill in the art would understand the claim terms," Phillips, 415 F.3d at 1323, the court finds that the patent claims the possibility of variable predetermined timing. One of the objects of the invention is "to provide . . . a ball-throwing machine that is able to interchangeably deliver a variety of different pitches to a variety of different locations at a variety of different speeds . . . ." '134 Patent, col. 3, ll. 60-62; '512 Patent col. 4, ll. 1-4. If programmed with a smart card reader, the invention is able to simulate the pitches of different pitchers. See '134 Patent, col. 18, ll. 15-22; '512 Patent, col. 18, ll. 28-35. A person of ordinary skill in the art would know, as even the casual observer of baseball knows, that (1) different pitchers take different amounts of time to pitch baseballs and (2) even the same pitcher may sometimes pitch out of a windup position and on other occasions pitch out of a less time-consuming, set position. 9 As a consequence, the video clips used in the machine will often have different lengths. Although it may be preferable to have each video image have the same length, this is plainly not required or all that the patents-in-suit claim.

10 It appears that Joyner may have come to the same conclusion. For example, in the JACCC, Joyner repeatedly proposes the following, weaker construction: "The 'predetermined time' . . . is the same length of time every time a given video clip is displayed." JACCC (docket no. 174), at 8 (emphasis added); id. at 20 (same); id. at 24 (same).

Accordingly, the court shall adopt ProBatter's construction of "a predetermined time." GO BACK

3288

2. '769 Patent Claims 1 and 11: "predetermined time and date"

Claim 1 of the '796 patent relates to a method for updating the database of a call rating device that stores billing rate information for various carriers. The call rating device can be the least cost routing device described in the '085 patent, or other known call rating devices. Claim 1 includes four separate elements only one of which is in dispute. The element in
dispute relates to the first step of the method, connecting to the rate provider.

connecting at a predetermined time and date via a data transfer line the call rating device to a rate provider having billing rate parameters for a plurality of calling stations.

Claim 11 contains the same "predetermined date and time" phrase as Claim 1. The claims specify that the connection step must be performed at a predetermined date and time. The parties dispute the meaning (or rather the significance) of the term "predetermined". MediaCom insists that, as a matter of logic and grammar, the phrase "predetermined time and date" requires that this Court identify by whom the time and date are predetermined. MediaCom contends that the rate provider, and not the individual user, must perform that function. Rates responds that the claim need not and does not identify who must determine the time and date of the connection, but rather allows a variety of arrangements.

The words used in the claim are simple English. The question is whether they create ambiguity in the context of this claim. MediaCom cites Atari Games Corp. v. Nintendo of Am., Inc., 30 U.S.P.Q.2D (BNA) 1401, 1412-13 (N.D. Cal. 1993) in support of its position that the word "predetermined" is ambiguous. In Atari the language in question consisted of a complex series of clauses describing a "predetermined relationship" between the "execution" of one computer program and the "execution" of another. The court held that the words had no readily apparent significance in that context. In contrast, here the meaning of the phrase "predetermined time and date" yields its meaning quite readily. On its face, the language signifies that a particular time and date must be selected substantially in advance of the connection. The language does not require that the person responsible for that selection be identified in order to give meaning to the claim.

The specification does indicate in several places that the rate provider predetermines the time and date of the connection. Those instances, however, appear in contexts that describe particular aspects or embodiments of the invention, and cannot be used to limit the claims. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997) ("While examples disclosed in the preferred embodiment may aid in the proper interpretation of a claim term, the scope of a claim is not necessarily limited by such examples.") For example, the specification states that "the rate provider has the intelligent capability" to determine call-in times, a capability that is essential "in a large network." Col. 5, Lns. 6-10. This capability appears to be an advantage in large networks because staggering the calls from subscribers helps to prevent network overload that would occur if a large number of stations called in at once. Id. It does not appear necessary, however, that the rate provider must schedule the call-in times in smaller networks, for example.

Similarly, in the context of a pay-telephone calling station, the specification calls for connection via a toll number at a time "set by the rate provider." Col. 4, Lns. 23-25. But this aspect of the invention is specifically directed to an automatic billing arrangement for use with pay-telephones, which would not be suited to predetermination of the call-in times by the user of the telephone.

Finally, MediaCom points to the prosecution history to show that Rates urged predetermined by the rate provider as an advantage over prior art references. Indeed, the prosecution history contains the strongest support for MediaCom's position. It is true that in several instances Rates argued that its invention was not anticipated by earlier inventions specifically because it updates the database automatically, at times established by the rate provider, and does not require initiation by the user. The interpretation now advanced by Rates, however, is not precluded by its conduct of the patent prosecution. The factor that distinguished the '769 patent claims over the prior art was that each prior art reference required initiation by the user each time an update was desired. In contrast, Rates claimed an invention that did not require such initiation; indeed, the '769 device could update its database at predetermined dates and times. It would be a different matter if Rates had advanced a distinction between user initiated connection and provider initiated connection, but such was not the case. Rather, the critical distinction was between user initiated connection and predetermined or scheduled connection. See Capraro Decl., '769 patent file history, Amendment, Paper No. 7, p. 3-4, at M002689-90; Amendment, Paper No. 12, p. 1-2, at M002714-15; Amendment, Paper No. 15, p.8, P 3, at M002739; Notice of Allowability, Paper No. 16, p. 2-3, at M002744-45.

In the context of claim construction, the prosecution history, like the specification, is merely an aid to interpreting the language of a claim. In this case, reference to the prosecution history does not clearly overwhelm the ordinary meaning attached to the words of the claim, nor does the prosecution history indicate that Rates so limited its claim to obtain the patent that its current position is now precluded. Because the claim itself speaks clearly and unambiguously, this Court need not import terms from the remainder of the patent record to identify who determines the time and date for connection. To do so impermissibly allows statements in the prosecution history to diminish the scope of the claims. See Markman 52 F.3d at
980. Claims 1 and 11 therefore encompass a method in which the time and date for calling the rate provider are selected a substantial period in advance of the call, and in which each call to the rate provider need not be initiated by the individual user.

GO BACK

3. Claim 1

Terms and phrases within subsections (b), (d), and (e) of Claim 1 require construction. Claim 1(b) states:

triggering the activation of a high voltage and current generator in response to said sensed presence, said generator coupled between said high voltage electrode and said reference electrode, said triggered generator being activated for a predetermined time period.

There are two terms in Claim 1(b) that require construction: "triggering" and "predetermined time period."

With respect to the "triggering" term, Agrizap argues that triggering is defined as "any manner of initiating, actuating or causing activation of a high voltage and current generator in response to the sensed presence, such as through hardware, software or any combination thereof." (Agrizap's Reply Br., at 8). Woodstream argues that Agrizap's definition of "triggering" is unsupported by the patent and does not consider the term in the context of Claim 1(b). Woodstream's proposed construction is: "the sensed presence of a pest results in an immediate and irreversible triggering of the high voltage and current generator without regard to any verification of the sensed presence." (Woodstream's Reply Br., at 7). In response, Agrizap argues that the triggering is neither immediate nor irreversible because after the pest makes contact, the invention allows for a delay to prevent triggering based on the momentary presence of a pest. According to the specification, when a pest makes contact, a voltage drop on the triggering mechanism occurs and there is a delay of the rising voltage to ensure that the timer is not activated by a momentary presence of a pest. (636 patent, col. 8, lines 21-36).

This Court will construe the "triggering" term as:

the sensed presence of a pest results in an immediate and irreversible triggering of the high voltage and current generator.

As Woodstream argued, the triggering is immediate and irreversible upon sensing the pest. The specification supports this conclusion. See Phillips, 415 F.3d at 1315 (stating that specification is single best guide for determining meaning of disputed term). The specification states that "[g]ood contact must be established before [the] current will be large enough to trigger a timing circuit." (636 patent, col. 4, lines 32-36). Furthermore, the specification states that after the voltage drop, "Capacitor 10 creates a time constant which delays the rising voltage on TTRIG 99 to ensure that the timer is not activated by a momentary presence of a pest." (636 patent, col. 8, lines 32-36). Thus, the triggering of the activation of the generator does not occur until after the delay of the rising voltage in the triggering mechanism. Once this delay has occurred, the generator is triggered immediately and there is no indication in the patent that it can be reversed.

The second term within Claim 1(b) that requires construction is "predetermined time period." According to Claim 1(b), the triggered generator is activated for a "predetermined time period." Agrizap contends that "predetermined time period" means "a time period determined or set prior to triggering of the generator, the time period being set in any manner, including using manually or through hardware, software/ firmware, or any combination thereof. The time period can also comprise any number of shorter cycles." (Agrizap's Reply Br., at 12). Woodstream argues that "predetermined time period" means "a single, distinct, fixed time period between activation and deactivation of the generator." (Woodstream's Reply Br., at 8). Woodstream further states that the "predetermined time period cannot be indeterminate in the amount of time or number of times that the high voltage generator is activated." (Id.).

This Court will construe "predetermined time period" as:

the time period between activation and deactivation of the generator that has its length programmed prior to the triggering of the generator.
The specification supports the construction that the predetermined time period is not of one set length. According to the specification, "the predetermined time period can be easily adjusted to suit the application and the available power." (636 patent, col. 4, lines 42-44). A more thorough description states that the predetermined time period is:

programmed through the selection of the values of resistor 14 and the capacitor 16, and proportional to the values of the resistor 14 and capacitor 16. Those of skill in the art will be able to program such a timer to attain the desired timing values from the data sheet provided with the timer. The amount of time necessary to reliably dispose of a particular pet will depend on the typical size of the type of pest to be dispatched and amplitude of the current and voltage the high voltage and current generator is capable of producing.

(636 patent, col. 8, lines 54-60). Therefore, while the "predetermined time period" is a definitive time period, it is not of definitive length until it is programmed prior to triggering.

The Court construes the phrase "waiting for a predetermined time period . . ." to mean "waiting a predetermined period of time before varying the absorption of power from the reversing magnetic field, the predetermined period of time being substantially equal to the time required for the transient associated with the generation of the reversing magnetic field to decrease to a level sufficient for the reader to distinguish the transient from the variation in absorption of power."

The parties dispute the meaning of only one phrase of Claim 10: "applying a positive direct current to said distal tip for a predetermined time period." The written description discusses the phrase "predetermined time period" in connection with an embodiment of the invention:

As will be described below in greater detail in connection with the third embodiment of FIG. 3, after placement of secondary coil 28 within the interior of the aneurysm, a direct current is applied to wire 10 from a voltage source exterior to the body. The positive charge on secondary coil 28 within the cavity of the aneurysm causes a thrombus to form within the

B. The '133 Patent - Claim 10

Claim 10 patent provides:

The apparatus of claim 1 where said distal tip is detached from said wire by applying a positive direct current to said distal tip for a predetermined time period.
an aneurysm by electrothrombosis. Detachment of the tip occurs either: (1) by continued application of current for a predetermined time when the portion 18 is exposed to blood; or (2) by movement of the wire to expose portion 18 to blood followed by continued current application for a predetermined time. Ultimately, both threadlike portion and stainless steel coil 26 will be completely disintegrated at least at one point, thereby allowing wire 10 to be withdrawn from the vascular space while leaving secondary coil 28 embedded within the thrombus formed within the aneurysm.

('133 Patent, Col. 7:61 - 8:10.)

The written description discusses other embodiments in which detachment is achieved by conditions other than applying current for a predetermined time period:

Many alterations and modifications may be made by those having ordinary skill in the art without departing from the spirit and scope of the invention. Still further, the diameter of the wire, various of the wire described above and the stainless steel coil immediately proximal to the detachable tip may be provided with differing diameters or cross sections to vary the times and current magnitudes necessary in order to effectuate electrolytic detachment from the tip. Still further, the invention may include conventional electronics connected to the proximal end of the wire for determining the exact instant of detachment of the distal tip from the wire.

('133 Patent, Col. 12:17-35.)

The Court finds that one of ordinary skill in the art would understand the term "applying a positive direct current to said distal tip for a predetermined time period" to have its customary meaning, namely, applying current for a time period that is determined in advance.

The Court construes "predetermined time period," as it is used in the phrase, "applying a positive direct current to said distal tip for a predetermined time period" in Claim 1 of the '133 Patent to mean:

applying a positive direct current to the distal tip for a time period determined in advance of the initiation of the detachment process.

---

32 The phrase "predetermined value" is used in claims 7, 10, 22, and 31 of the '259 patent. The phrase "predetermined measure" is used in claims 9, 24, and 33 of the '259 patent. The phrase "threshold value" is used in claims 8, 23, and 32 of the '259 patent.

---

1. ADE's Position

ADE proposes that "predetermined value should mean "a value determined prior to comparison of the value to the ratio of the signals" and "predetermined measure" should mean "a value or functional relationship determined prior to comparison with the ratio of the intensity signals."(JCCS at 10-11.) ADE also asserts that "threshold value" should mean "a minimum value." (Id. at 11.)

2. KLA's Position

In contrast, KLA argues that "predetermined value" should mean ""a value determined prior to scanning the workpiece"" and "predetermined measure" should be construed to mean ""a measure determined prior to scanning the workpiece."" (Id. at 10-11.) KLA then suggests that the Court construe "threshold value" to mean ""a value determined prior to scanning the
workpiece." (Id. at 11.)

3. Analysis

"Value" and "measure" have ordinary meanings representing numerical quantities. MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 1301, 719 (10th ed. 2002). Similarly, "predetermined" means fixed before another event occurred. Id. at 915. The parties' real dispute is over when those values and measures are set, i.e., when the predetermination occurs. The answer to that question cannot be determined from the claims in which the phrases are found and thus requires resort to the remainder of the intrinsic record.

Referring to the '259 patent claims in which the phrases "predetermined value" and "predetermined measure" appear (claims 7, 9, 10, 22, 24, 31, and 33), the system controller, comparator, or classifier either compare or classify signals to detect defects on the surface of the workpiece being scanned. ADE directs this Court to col. 11 II. 10-49 of the '259 specification for a construction of the phrases "predetermined value" and "predetermined measure." (JCCS at 10-11.) KLA also directs the Court to the same passage, which discusses the algorithm depicted in Figure 16 of the '259 patent.

As earlier discussed, supra at 5-6 and 34-36, Figure 16 of the '259 patent teaches an algorithm for comparing the signals from the center, back, and forward channel detectors to determine whether a defect is a pit or particle. Although it is evident from the discussion of this algorithm in the '259 written description that the value or measure used in the comparison must be determined before the signals are compared, there is no support, as KLA suggests, for concluding that the value or measure must be determined before a scan is performed. (See D.I. 627, '259 Patent Prosecution File History, '259 patent at col. 9 I. 25 to col. 11 I. 36.) The Court, therefore, concludes, as ADE proposes, that "predetermined value" and "predetermined measure" mean a value or measure determined before the signals are compared. Similarly, there is no basis in the '259 specification for restricting the determination of a "threshold value" to a point in time preceding the scanning of the workpiece, as KLA suggests. The Court holds that it means a numerical quantity "above which something is true or will take place and below which it is not or will not." See MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 1225 10th ed. 2002).

3293

3. Plurality of Predetermined Waveforms

Again, Seeq proposes augmenting the definition of "a plurality of predetermined waveforms" with a description taken directly from the preferred embodiment, specifically from column 4, lines 8-18, and adding to it that the "six predetermined waveforms are illustrated in Figures 7A and 7B of the '269 Patent (where the seventh pattern, "idle," is zero)." Level One objects that what is stored in memory is data that "represents" a plurality of predetermined waveforms and how the data represents the waveforms may vary. Therefore, the term cannot be limited to the example shown in Figure 7B which happens to show the data patterns in seven time segments as four-bit data words.

Level One is correct that the predetermined waveforms are "representative" rather than actual. The specification repeatedly refers to them as such. '269 Patent at Abstract, 4:8-16. The specification also specifically notes that the applicants found that a value of N equal to seven provided sufficient temporal resolution, '269 Patent at 4:25-28, but suggests that other values could readily be substituted.

Apart from the dispute over whether the predetermined waveforms are representative or as depicted in Figures 7A and 7B, it is not clear that the parties disagree. The section of the preferred embodiment cited by Seeq consistently refers to the predetermined waveforms as "representative of a desirous output response by a hypothetical transmit filter when excited with predistorted Manchester encoded data." '269 Patent at 4:9-11. While Level One appears to have no objection to this description and it is useful to understanding the term at issue, the court is not inclined to import it into the definition of "a plurality of predetermined waveforms." The court rejects defendant's theory of claim construction, which would incorporate any description of a given claim term in the specification into the claim itself. As the court has already noted in this order, it is not the purpose of a Markman hearing to seek to strategically limit a patent's claims under the guise of a genuine dispute as to meaning. While claims are read in light of the specification, "it does not follow that limitations from the specification may be read into the claims . . . ." Sjolund v. Musland, 847 F.2d 1573, 1581 (Fed. Cir. 1988); accord E.I. Du Pont de
Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988) ("It is entirely proper to use the specification to interpret what the patentee meant by a word or a phrase in the claim. But this is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.") (citations omitted); see also Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997).

Both parties seem to understand that predetermined waveforms are simply representative waveforms set in advance to compensate for known transmission distortion. Therefore, the court adopts that construction.

3294

The district court construed the limitation "progressive . . . predetermined winning combination" to mean the precise elements necessary to achieve bingo in a particular game are known before the first bingo ball is drawn. Infringement Decision, slip op. 10. All of the asserted claims contain this limitation. The district court's opinion for both non-infringement and invalidity rested on its reading of this limitation.

Claim 2 of the '289 patent shows this limitation in context: n1

2. The method of playing a game of bingo comprising:

   a) providing a player with a bingo card having a plurality of numbered spaces formed as a matrix having five rows and five columns used in the play of a five-by-five bingo game;

   b) providing a plurality of bingo balls, each having individual numbers corresponding to the numbered spaces on the bingo card;

   c) a player making a first wager to be eligible for the five-by-five bingo game;

   d) a player making a second wager to be eligible for a progressive jackpot;

   e) randomly selecting consecutive bingo balls;

   f) awarding a first preselected amount when the player achieves a predetermined winning combination on the five-by-five matrix of the bingo card;

   g) designating a portion of the second wager to a separate progressive jackpot pool;

   h) establishing a predetermined combination as a winning combination for the progressive jackpot pool; and

   i) awarding the progressive jackpot pool to the player when he achieves the predetermined winning combination on the bingo card.

'289 patent, col.7 ll.31-55 (emphasis added).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n1 The district court found this claim invalid in view of HOTBALL but offered no decision regarding infringement of this claim.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

On appeal, GameTech argues that, the "progressive . . . predetermined winning combination" limitation requires fixation of the entire winning combination before drawing the first bingo ball in any given bingo game. According to GameTech, a player of a Planet Bingo game will know ahead of time that "red" squares will give the progressive bingo and the position of those red squares on the board, but a player of Rainbow Bingo will not know this information until after the first ball is
drawn. Planet Bingo responds that "progressive . . . predetermined winning combination" merely requires that the participants in the game know, before the start of play, the predetermined rules for winning a progressive jackpot. Planet Bingo argues that the disclosure only requires that the player know in advance that he (according to claim 2 of the '289 patent) is playing for a red bingo to win the progressive prize, not what the exact location on the board the red squares will be before the game begins. Thus, the claims recite a "progressive . . . predetermined winning combination," but the parties dispute what must be predetermined before drawing the first bingo ball.

The claim language governs claim meaning. Phillips v. AWH Corp., 415 F.3d 1303,1312 (Fed. Cir. 2005) (en banc). In this case, the claim language supports GameTech's construction. The claims recite a "progressive . . . predetermined winning combination" not merely "predetermined rules" for identifying a winning combination. The rules may dictate that a "red bingo" will win the progressive game. The winning combination, however, identifies the particular squares, colored red, that will produce the progressive bingo.

Further, the claim's preamble calls for "a game" of bingo. While the rules for a particular progressive jackpot may require achieving bingo with red squares, the winning combination for that game is something different; i.e., a straight red bingo, a diagonal red bingo, a four corners red bingo, etc. Each game will have a particular "progressive . . . predetermined winning combination." The claims themselves specify that each individual game, rather than the rules for overall play, will have a different winning combination.

The specification often supplies the critical context to construe the claim language. Phillips, 415 F.3d at 1315. In this case, again, the discussion of the disputed term in the specification supports the district court's construction. Repeatedly the specification explains that the game determines the "winning combination" before the first bingo ball is drawn, thus making it "predetermined." For example, the '289 patent states: "The operator of the bingo game will designate at the beginning of the game which particular combination or combinations of covered spots will be winning combinations for that particular game." Col.1 ll.34-37. The '289 patent states that, in the preferred embodiment, "[a] winning combination is established for the progressive jackpot pool and bingo balls are randomly selected." Col.6 ll.12-13. The '289 patent uses this exact same phrase again to describe an alternative embodiment. Col.6 ll.28-29.

Likewise, the '786 patent states: "The operator of the bingo game will designate at the beginning of the game which particular combination or combinations of covered spots will be winning combinations for that particular game." Col.1 ll.41-45. The '786 patent goes on to describe a feature of the invention, the electronic display board, noting that "[p]rior to each game, some of the numbers on the display board are specifically designated with the first distinctive marking and a smaller portion of the numbers on the display board are specifically designated with the second distinctive marking." Col.3 ll.12-15.

The summary of the invention for the '786 patent states: "At the beginning of each game, an electronic random number generator selects a predetermined group of bingo numbers" which will be blue, green, red, and so forth. Col.3 ll.37-40. The '786 patent goes on to state that the electronic board illuminates the colors so that "[e]ach player can then see at the beginning of a game which of the bingo numbers have the various distinctions." Col.5 ll.31-33. Finally the '786 patent reiterates: "The only modification that a bingo establishment needs to undertake to practice the method of the present invention is to install the electronic reader board that can show different designations on the numbers on the board as well as a random number generator to predetermine which numbers are going to have which designations in a particular game." Col.5 1.64-Col.6.1.3. Thus, these passages inform the meaning of "progressive . . . predetermined winning combination," specifying both what it is and when it occurs. Specifically, the specification invariably fixes the winning combinations before a game starts.

Preemption

Plaintiff argues that preemption refers to the taking of control away from an executing thread. Microsoft argues that preemption requires more than interruption and includes the requirement that control must be not only taken away from the executing thread, but control must be given to another thread. This construction would make plaintiff's claims read against his preferred embodiment, as although control is periodically taken away from the compiler, it is only given to the editor.
when a keystroke has been entered. The court is aware of no reason to impose an additional requirement upon the term preemption.

As a result, the court determines that a thread is "preempted" when control is taken away from it.

3296

A. Preemption Request

3M proposes that "preemption request" be construed as "light pulses occurring at a repetition rate, where the repetition rate itself is a request for traffic signal preemption." To support this construction, 3M points to the '113 patent specification, which includes a description of the Long and Munkberg prior art which lead to the current patent.

With respect to Long, the specification provides that "preemption request" was described as follows: "a preemption request comprised of a stream of light pulses occurring at a predetermined repetition rate, such as 10 pulses per second." '113 patent, 1:44-47. The specification goes on to describe Munkberg as disclosing "an optical traffic preemption system wherein vehicles can transmit preemption requests at different priority levels." Id. 2:38-40. Munkberg further claimed that the priority of a preemption request is determined by the repetition rate of the light pulses. Id. 2:41-44. Based on these descriptions, 3M asserts that preemption request must be construed as "light pulses occurring at a repetition rate, where the repetition rate itself is a request for traffic signal preemption."

Tomar presently construes this claim as representing "a stream of light pulses having equal time intervals between each consecutive pair of light pulses." Tomar's Proposed Claim Interpretations, p. 26. In support of this construction, Tomar refers to the '113 specification which refers to a "predetermined repetition rate, such as 10 pulses per second" Id. 1:42-48, and to "[t]he optical emitter disclosed by Munkberg [that] can transmit light pulses at a variety of selectable predetermined repetition rates, with the selected repetition rate indicative of a priority level." Id. 2:38-44. Tomar argues that reference to a particular repetition rate, such as 10 pulses per second, represents a repetition rate with a fixed or equal time interval between pulses.

--- Footnotes ---

n1 Tomar construed "preemption request" differently in the Joint Claim Construction Statement: "[a] request for preemption transmitted by the emitter and defined by the frequency of the emitted optical signal." The Court notes no reference to an "equal time interval" in this proposed construction.

--- End Footnotes ---

The Court finds that references to certain repetition rates was provided for illustrative purposes only. See Id., 7:54-57. ("For illustrative purposes only, the data transmission scheme will be described with reference to a low priority signal having a repetition rate of 10 pulses per second.") A full reading of the specification discloses discussion of a number of other embodiments of the invention, and none of these descriptions define a preemption request as having equal time intervals between pulses. Because the claim only requires a "predetermined" repetition rate, and because the specification does not discuss preemption request in terms of having to include equal time intervals between pulses, the Court rejects Tomar's proposed construction. Instead, the Court finds that preemption request will be construed as "light pulses occurring at a repetition rate, where the repetition rate itself is a request for traffic signal preemption."

3297

# 3

# 3 -- "preference database" -- (appears in claims 14, 15, 17, 19, 29, 30, 32 and 34) Luma's Construction (Luma May 4, 2005, p. 2).
MASTER'S CONSTRUCTION

# 3 -- "preference database" -- means a database for pre-storing preference information. A database is a collection of logically related data stored together. Preference information has been construed in "# 4 preference information" below and is incorporated by reference in this construction of "preference database".

REASONS

INTRINSIC EVIDENCE

Patent claims recite preference database for pre-storing preference information. See, for example, claim 14. (Col. 48, Ls. 18-21). Also see the Specification, Col. 1, Ls. 60-63; Col. 2, Ls. 1-3 that supports the Master's Construction.

EXTRINSIC EVIDENCE

Stryker offered the Declaration of John Atkins (June 10, 2003) which attached a copy of Page 304 of the New IEEE Standard Dictionary of Electrical and Electronics Terms January 1993. The term "database" is defined and the Master used the phrase "a collection of logically related data stored together * * *" in the definition to construe the term "database".

LUMA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Luma's position is set forth in (Luma May 4, 2005, p. 2).

Luma's construction requires hardware or software based storage. The Master does not find this limitation in the intrinsic evidence. The Master's construction incorporates the context in which the term is used in the claims. This includes the ability to store preference information.

STRYKER'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Stryker's position is set forth in (Stryker May 23, 2005, pp. 4-5).

Stryker argues and objects to Luma's "piecemeal construction". The Master dealt with this same issue although for a different term in # 2 of Master's Construction.

Stryker points to a set of claims requiring the preference database for each of a plurality of users and another set of claims requiring the preference database for each of a plurality of medical procedures. The common element in both sets of claims is the storing of preference information as stated in the Master's Construction. The storing of preference information is the limiting language in the claims for defining the preference database.

Stryker argues that the Patent does not define database to mean storage devices which is in Luma's Proposed Construction. The Master agrees. The Master has not limited the database to a storage device.

Stryker argues that the proper construction must exclude voice-recognition devices. Whether voice-recognition devices are to be included or excluded in the construction of the meaning of a preference database will depend upon whether voice-recognition meets the definition of the Master's Construction for the "preference database".

Stryker argues that a personal interface card is not a preference database. This depends upon whether the card meets the definition of the Master's Construction for a preference database.

KSEA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

KSEA's position is set forth in (KSEA May 23, 2005, Sheet 4). KSEA objects to Luma's Construction and argues that the term relates to a database and not to a "storage medium". The Master agrees and "storage medium" is not a limitation in the Master's Construction. Whether a storage medium comes within the meaning of a "preference database" must be determined.
against the Master's Construction. For example, if a storage medium has a database for pre-storing preference information (Master's Construction), then even though it is a storage medium, it meets the Master's Construction of "preference database" because it has a database for pre-storing preference information. KSEA gives a proposed construction that has a number of limitations that the Master does not agree should limit the construction of "preference database". For example, KSEA is asking "identifies preferences"; and "regarding the processing display and storage". Each of these may or may not come within the scope of the Master's Construction but they should not be articulated as defining the meaning of "preference database".

4. With a preference for avoiding

The second subpart of claim 9 states: "calculating a new route to a desired destination with a preference for avoiding the particular portion of the thoroughfare in the route." The parties disagree about the phrase that I have underlined. Their primary dispute concerns the meaning of "with a preference for avoiding." Plaintiff suggests that it means, "with a bias for refraining from use." Defendant defines it as "the likelihood . . . is reduced, but not eliminated." Neither construction accurately captures the description provided in the specification. I construe "with a preference for avoiding" to mean "with the possibility of avoiding." This is consistent with the specification, which explains that the device exercises "high, medium or low" levels of preference ('615 pat., col. 10, Ins. 34-35). Plaintiff again asks the court to insert "user-selected" before "portion of the thoroughfare." For the reasons discussed in Section 3 above, I decline to do so. Accordingly, I construe the disputed phrase as: "with the possibility of avoiding the particular portion of the thoroughfare in the route."
CRT displays) preferentially used by the physician during the procedure (step 222); and

Col. 29, Ls. 1-4:

CPU 38 also maintains and updates the preference information in response to changes ordered by the physicians.

The Master's construction is consistent with the file history (Applicant's Response (Bates LUM 0000191) to Office Action mailed April 18, 1994 Remarks p. 4-6).

EXTRINSIC EVIDENCE

The testimony of Branson at the Markman hearing is not inconsistent with the Master's Construction (Markman Hearing Tr. 29:11-21; 37:10-25; 38:1-19; 44:1-14).

LUMA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Luma's Construction is stated in (Luma May 4, 2005, p. 2). Luma's Construction places more limitations on the construction which the Master does not believe are warranted such as "parameters or settings that can be modified to reflect preferences". These are not excluded and may be included providing they are not inconsistent with the Master's Construction.

STRYKER'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Stryker gives its position in (Stryker May 23, 2005 p. 6).

Stryker objects to Luma's "piecemeal construction". The Master has dealt with this issue for # 2 above. Stryker argues that "preference information" indicate physician - preferred "visual representations". The Master has construed that it means information preferred by a user of the system. Preference information is not limited to "visual representations". It may include "visual representations". It may include visual representations but it is not limited to "visual representations". Stryker argues that depending on which set of claims are real "preference information" can be informative in connection with a medical procedure. The Master has construed the term to cover either information specific to user preference or information specific to procedure or both.

KSEA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

KSEA's position is set forth in (KSEA May 23, 2005, Sheet 5).

KSEA argues that the term cannot be interpreted without the surrounding claim language. The Master has construed the term. The language in the claims surrounding the term stand as limiting language but the surrounding limiting language should not be incorporated into the term to be defined or construed. KSEA's Proposed Construction proposes limitations in the construction of the term "preference information" that are not warranted. KSEA narrows the construction beyond the meaning of the term as referred to in the Patent Specification. KSEA's concerns that Luma has proposed language as unjustifiably broad will be addressed when all the language of the claims are taken into account. Other language in the claim will have the effect of limiting the scope of "preference information". That is the purpose of the other language in the claims.

GO BACK

3300

1. "preliminarily"

Initially, the parties dispute the meaning of the language in claims 1 and 91 of the '086 patent: "using preliminarily an unfilled tubular sock-like projectile body having a closed front end and a rear edge bounding a rear opening thereinto." '086 patent, 5:5-7. Plaintiff argues that this phrase describes the initial shape of the projectile body, "preliminarily" or "prior to" taking the first step in the patented preparation process. Under plaintiff's proposed construction, the "projectile body" may have multiple openings at earlier stages in the preparation sequence, as long as a closed front end is formed prior to taking
the first enumerated step in plaintiff's patented preparation method, which is filling the sock-like body with shot.

--- Footnotes ---

1 Claim 1 of the '086 patent is identical to Claim 9, except that the word "constricting" is replaced by "delineating." Claims 1 and 9 are the two independent claims in the '086 patent.

--- End Footnotes ---

Defendants disagree. They argue that the inclusion of the word "preliminarily" requires "that the method of shaping a low lethality projectile starts with using an unfilled tubular sock-like shape, i.e., a tube shape hollow body having a single inner compartment formed by one closed end opposite one opening formed by a rear edge." Def. Br. at 6. 2 Defendants argue that the claim requires that the projectile body have only one opening at the very beginning of the preparation process, prior to the employment of any steps taken to shape the projectile body, not merely prior to the first enumerated step in plaintiff's patented preparation method.

--- Footnotes ---

--- End Footnotes ---

**The plain meaning of "preliminarily" is "at first" or "prior to."** In the patent claims, "preliminarily" is used as an adverb which modifies "using," meaning that the claimed preparation process begins by using "an unfilled tubular sock-like projectile body having a closed front end." Therefore, the claim covers all processes which use an "unfilled", "tubular", "sock-like" projectile body prior to taking the first enumerated step in the preparation process of filling the projectile body with shot.

**GO BACK**

**3301**

3. "Prepaid Calling Card Accounts." Used in '768 patent, Claims 1-3 and 5-10.

TGIP proposes "prepaid accounts capable of being used to obtain telephone service." The Defendants do not think this term should be construed. If the term is construed, Defendants suggest "an account associated with a prepaid calling card."

The '768 patent describes a "pre-paid card system having a remote terminal to provide on-site activation and recharging of cards in customer defined amounts." '768 patent, col. 1, 11. 12-14 (emphasis added); see also '768 patent, Abstract. During the reexamination process the patentee distinguished the '768 patent from an earlier Japanese patent (Yamaki) in view of an earlier U.S. patent (Leaden, U.S. Patent No. 5,327,485) by asserting that the '768 patent system did not involve cards. TGIP emphasizes that the '768 patent Reexamination Certificate claims only systems with "pre-paid calling card accounts," and that there is no requirement for there ever to have been a calling card. (Actually, the patent and the prosecution history strongly suggest that the system involves the distribution of physical cards of some type, and certain claims actually use that term, but this does not affect the analysis.)

As with the '114 patent, nothing suggests that a physical card must be maintained or actually present to make a phone call. The security number (or whatever one wants to call the code or information used to access the telephone system and charge the call against the particular calling card account) can be memorized. But to simply say a "prepaid calling card account" is merely a prepaid account capable of being used to obtain telephone service is simplistic and would include the account of every homeowner who pays the monthly bill in advance for basic land line service.

The '768 patent is a continuation in part of the '114 patent. While the '768 patent focuses on a system of "accounts" rather than on the "pre-paid cards" no attempt is made to suggest that each of these accounts is not associated with some kind of distinguishing access information, sometimes called a "security number," '768 patent, col. 3,11.64-65, or "security code," '768 patent, col. 5, 1.47, which the user enters to gain access to the system. To the contrary, the patentee constantly emphasizes the connection between the account and a security number. '768 patent, col. 2, 11. 36-38; '768 patent, col. 211.
Therefore, the court will define this term as follows:

"Pre-paid calling card account" is "a record maintained in a data base which, when activated, allows a user with the access information for that account to obtain access to a phone system or network."

4. "Preparing Electronically"

Simplification's Construction  Block's Construction
Preparing an electronic tax return by way of devices, circuits, or systems utilizing electron devices.  The act of completing automatically without manual intervention from the user.

Outside of the dispute over the meaning of "electronically," the parties dispute whether the word "preparing" in this claim term should be understood to imply "completeness" (Block's position) or not (Simplification's position). Block notes that the specification explains that "[i]n step 15, the electronic intermediary electronically files the electronic tax returns prepared in step 14 with the taxing authorities." (‘052 patent at 6:63-64.) According to Block, because tax returns that were "prepared" in step 14 may then be filed with the taxing authority in step 15, those tax returns must have been "completed" during the "preparing" step. Block further contends that, in normal usage, "if one asks an accountant to prepare a tax return, then the accountant understands that the tax form (e.g., IRS Form 1040) is to be completed." (D.I. 79 at 26.)

Simplification's briefing on this term appears focused on the meaning of the word "electronically." 3 Nevertheless, as part of this argument, Simplification notes that the specification explains that "step 14" - the tax return preparation step - could be implemented using prior art technology, such as TurboTax software. (D.I. 85 at 23-24.) Such prior art software, Simplification explains, required the taxpayer to print, sign and submit an original signature even when e-filing. Likewise, Simplification explains that even when using prior art software, the taxpayer still needed to complete an IRS Form 8453-OL and that the IRS did not consider a tax return to be completed until it received that signed form. (Id.) Thus, because the specification supposedly embraces the use of prior art techniques for "preparing" a tax return, and because these techniques clearly did not yield a truly completed tax return, Simplification apparently contends that it would be inconsistent with the specification to construe "preparing" to imply "completeness."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 The parties do not appear to hotly contest the issue of whether the term "preparing" should imply "completeness." Indeed, Simplification asserts that it is "unclear whether the parties' competing definitions of 'preparing' as 'preparing' or 'the act of competing' reflect a substantive difference," and then devotes the remainder of its briefing to the issue of how the term "electronically" should be construed. (See D.I. 85 at 23-24.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

However, as explained above, the Court concludes that, at most, the specification explains that certain steps can be completed using software "similar" to prior art software. See supra Part II.B. On the whole, the specification and prosecution history distinguish the invention from prior art software, particularly on the basis of the prior art requiring manual involvement by the taxpayer. Block's proposed construction, which calls for the tax return to actually be "completed" through the process of "preparing" the tax return, is much more in line with the idea of the fully-automated tax preparation system that is presented in the specification and prosecution history of the patents-in-suit. Indeed, should the process of "preparing" a tax return result in only a partially completed tax return, manual intervention by the taxpayer would be required. But, as set forth above, Simplification relegated such manual input to the unclaimed initiation procedure.
described in the specification as "Step 11." Put another way, allowing for manual intervention following the preparation of a partially completed tax return would be akin to "start[ing] the rinse cycle" or "add[ing] the water" in an automatic dishwasher, which are the sort of actions Simplification specifically explained were not required in the present invention. (D.I. 79, Exh. F at 16:13-18, 17:11-14.) Accordingly, the Court concludes that "preparing electronically" means, as Block contends, "completing without manual intervention from the user."

C. "preparing first and second substrates provided with active elements"

Plaintiff proposes that "preparing first and second substrates provided with active elements" be construed to mean "preparing the first and second substrates such that at least one substrate has active elements." Defendants counter that the phrase should be construed to mean "preparing the first and second substrates so they both have active circuit elements, which are components (such as transistors) whose operation involves the activity of a semiconductor junction." Plaintiff does not dispute defendants' definition of "active element." Rather, plaintiff argues that both substrates need not have active elements.

The grammar of the disputed element is certainly awkward. Slight alterations of the language would unequivocally support both parties positions. For example "providing first and second substrates with active elements" or "preparing first and second substrates with active elements" would more clearly support defendants' construction. Alternatively, "preparing first and second substrates, including active elements" and similar variations would comport with plaintiff's construction. As drafted, the language defies easy understanding. n5

n5 The court deplores the sloppy claim language that disregards fundamental rules of grammar. As a general rule poorly drafted language is entitled to a narrow meaning. Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996); see also Ethicon Endo-Surgery Inc. v. United States Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir. 1996). If read literally, adhering to proper grammatical construction, the phrase "provided with active elements" clearly modifies "first and second substrates," thus indicating that both substrates must have active elements. If plaintiff really meant what it now argues, the drafter should have used language such as "preparing a first substrate and a second substrate at least one of which is provided with active elements". While it is axiomatic that the drafter is his own lexicographer, the corollary principle should also control: the drafter is his own grammarian and he is bound by his own grammar whether good or poor. Nonetheless, in this case it would appear that the drafter's poor choice is contrary to the overall context of the patent (which does not devote any significant discussion to the preparation of the substrates), the relationship of independent claims such as claim 62 to narrower dependent claims such as claim 64, and the examiner's comments during prosecution, all of which favor the broader construction.

The claims depending from claim 62 help to resolve the ambiguity. Claim 64 covers "[a] method according to claim 62, wherein active elements are provided with the first substrate." 995 patent Cl at 8:19-20. Under defendants' proposed construction, claim 64 would be completely superfluous, as claim 62 already would require that both the first and second substrates have active elements. While defendants correctly point out that the doctrine of claim differentiation does not override unambiguous claim language, the meaning of the disputed element in this case is unclear. Claim 64 thus provides helpful guidance.

The file history also tends to support plaintiff's construction. The examiner noted twice during prosecution that "[a] step of preparing first and second substrates provided with active elements' is understood by the examiner to be satisfied when either or both of the substrates have active elements." Harris Dec., Exh. 8 at 9; id., Exh. 9 at 7. Defendants argue that the views of the examiner should be given little weight, and that plaintiff should not benefit from allowing the confusing language to remain in the claims. The fact that the examiner adopted plaintiff's interpretation, however, may have discouraged plaintiff from amending.
The court therefore construes the disputed phrase to mean "preparing the first and second substrates such that at least one substrate has active elements."

"preparing to transmit the data packet" is construed to mean accessing the header of a packet to make a decision on where to send the packet and to obtain the marking field. Newbridge contends that this phrase should be defined to mean "that the data packet is at the transmit side of a buffer and is being made ready for sending to its next destination." (D.I. 547 at 20). In other words, Newbridge's proposed construction would limit this phrase to "output dropping" which is dropping performed on the output side of the buffer. After reviewing the claim language and the specification, the Court concludes that Newbridge's construction would exclude the preferred embodiment, because the preferred embodiment drops packets before they are placed in a buffer. The Court's construction of this phrase is supported by the specification, which explains:

The packet proceeds through the access node 20 of FIG. 1 to an output controller before being put into an output buffer associated with the output link, through which the packet is to be transmitted. At that time, the information in the packet header field, reserved for the marking signal, is forwarded to a packet dropping logic circuit 53 . . ."

(811 Patent, col. 8, ll. 40-49) (emphasis added).

Turning to "prepayment amount" (as it is used in steps (a) and (b)), the parties dispute (1) whether the amount stored at the special exchange must equal the amount paid, and (2) whether the amount must be paid by the user. Aerotel contends claim 1 contains no such limitations, while Telco argues that the claim contains both. (See Joint Claim Chart, at 2-3; Def.'s Opening Br. 14-15).

The specification speaks directly to the parties' first dispute. Specifically, the first paragraph of the specification's general description outlines the process whereby a user obtains a special code and the special exchange stores an account's balance:

The customer, such as a regular telephone user or a traveler[,] acquires a special code, a credit amount and the telephone number of the special central offices by either a cash or credit card payment. The code[, the credit amount and telephone numbers may be acquired, for example[,] through the regular credit card companies and charged to the acquirer's account. Alternatively, the credit amount, the telephone numbers and identifying code can be purchased at sales points such as in airports[], hotels, rent-a-car stations and the like. The amount paid is credited to the acquirer for use against future telephone calls. The credited amount is stored in a memory at the special central office along with the special code. (Col.1 ll.1-6; 12-16 (emphasis added).)

Consistent with the principle that the specification "is the single best guide to the meaning of a disputed term," Vitronics, 90 F.3d at 1582, the Court finds that "prepayment amount" of steps (a) and (b) is the precise amount deposited by a user to obtain a special code, not any amount credited to the user by the prepaid system operator. The express language of steps (a) and (b) further supports this conclusion. Step (a) describes "obtaining a special code by depositing a prepayment amount." Step (b) then refers back to step (a), and calls for "storing the prepayment amount"--i.e., the prepayment amount of step (a)--"in a memory in a special exchange for use in verifying calling party calls."

While the amount paid must be the amount credited, the specification does not teach that the prepayment amount must be paid by the user who ends up making a prepaid call. Step (a) nowhere says who "obtain[s]" a special code. And the two examples of how a special code is obtained are similarly silent on the relationship between the person who acquires the code and the person who makes a call. The Court therefore does not read steps (a) and (b) to contain a limitation that the user of the prepaid telephone system must be the person who deposited the prepayment amount.
"Prepayment amount," as used in steps (a) and (b), is the exact amount of money deposited to obtain a special code. It may be deposited by anyone.

3306
a. Prepayment amount

Step (h) of claim 1 calls for "monitoring the prepayment amount less deductions for the running cost of the call." As noted above, see supra II.C.2, steps (a) and (b) use "prepayment amount" to refer to the exact amount of money a user deposits to obtain a special code. Step (f) calls for the system to compare "the prepayment amount less any deduction for previous calls" with "the minimum cost of the inputted call." Thus, there is something strange about step (h): it calls for deducting "the running cost of the call" from the prepayment amount in the monitoring operation, but not the cost of previous calls.

The parties draw different conclusions from this omission. According to Aerotel, the claim as a whole reflects an intent to monitor an account's balance; "prepayment amount" in step (h) is shorthand for "the prepayment amount less any deduction for previous calls' referred to in step (f)." (Joint Claim Chart, at 7.) Telco, however, contends that the "prepayment amount" of step (h) has the same meaning in steps (a), (b), and (f): "[a]n amount of money deposited by a user with the prepaid telephone service to receive a special code." (Id. at 6, 2.)

The Court has little doubt that at some point, the drafters of the '275 patent intended the claim to include a limitation similar to step (h) that referred to an account's balance. In the original version of the patent, step (a) referred simply to a "prepayment," while the rest of the claim referred to the "credit" associated with a special code. (See Nov. 1985 Amdt., at 1-2.) The claim thus distinguished between two values: the amount of money a user deposited to establish an account (the "prepayment"), and the amount of credit available to an account ("credit").

Yet by amending the claim to use the same term ("prepayment amount") to refer to both the "prepayment" and the "credit" linked to an account, Aerotel precluded a reading of claim 1 that draws this distinction. Interpreted in light of the specification, "prepayment amount" refers to the amount of money deposited by a user to establish a prepaid account. See supra II.C.2. Consistent with this understanding, step (b) refers to storing that amount in memory, and step (f) refers to comparing that amount "less any deduction for previous calls in the memory" with the "minimum cost of the inputted call." Without resorting to principles of construction derived from Through the Looking Glass, the "prepayment amount" of step (h) cannot suddenly and without explanation mean the total credit then available in an account. See Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350 (Fed. Cir. 1999) (rejecting contention that same term can have two different meanings within a claim); Banyan Licensing, L.C. v. Orthosupport Intern., Inc., 34 Fed. Appx. 696, 698 (Fed. Cir. 2002) (recognizing that in Process Control Corp. "[t]he court held that the phrase used in the same way in the same claim had to be interpreted in the same way") Phonometrics, Inc. v. Northern Telecom Inc., 133 F.3d 1459, 1465 (Fed.Cir.1998) ("A word or phrase used consistently throughout a claim should be interpreted consistently."). See also Helmsderfer v. Bobrick Washroom Equipment, Inc., 527 F.3d 1379, 1383 (Fed. Cir. 2008) ("Courts cannot rewrite claim language."); SRAM Corp. v. AD-II Engineering, Inc., 465 F.3d 1351, 1359 (Fed. Cir. 2006) ("[W]e are powerless to rewrite the claims and must construe the language of the claim at issue based on the words used."); Pfizer, Inc. v. Ranbaxy Labs. Ltd., 457 F.3d 1284, 1292 (Fed. Cir. 2006) ("[C]laim 6 could have been properly drafted either as dependent from claim 1 or as an independent claim--i.e., 'the hemicalcium salt of atorvastatin acid.' But, we 'should not rewrite claims to preserve validity.'" (quoting Nazomi Commc'nns, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1368 (Fed. Cir. 2005)).

Thus, although it is possible to discern a contrary interpretation from the patent's history, "prepayment amount less deductions for the running cost of the call" means what it says: the exact amount of money deposited to obtain a special code, supra § II.C.2, less the running cost of the current call.

<tr>
<th>Term</th>
<th>Court's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>… prepending given data to a content provider-supplied URL to generate an alternate resource locator (ARL) …</td>
<td>… generating an alternative resource locator (ARL) by adding a name or other identifier that can be translated by a domain name system into the IP address of a content server to the beginning of the URL of an embedded object supplied by a content provider …</td>
</tr>
</tbody>
</table>

Claim 17 describes several steps comprising a "content delivery method" which, inter alia, requires modifying the URL of an embedded object to generate an alternative resource locator ("ARL"). (‘703 Patent, Claim 17.) This ARL is then "resolv[ed] to identify a content server in [a domain other than a content provider's] domain." (Id.) Thus, the language of the remaining steps in the claim limits "given data" to a string resolvable to the address of a content server in the content delivery system.

4. Pre-programmed logic

The term "pre-programmed logic" appears in claim 4 of the '681 Patent. Diagnostic asserts that "pre-programmed logic" should be construed as "software and/or hardware that provides preset responses dictated by the test subject's inputs." Benson asserts that the term "pre-programmed logic" must include the logical testing procedure and proposes that it be construed as a "pre-programmed logic for the hearing test." Benson also claims that while it does not necessarily disagree with Diagnostic's proposal, its proposed construction is more straightforward.

The definition of "preprogram" is "to program in advance." American Heritage Dictionary 1431. The definition of "logic" in the field of computer science is "a. The nonarithmetic operations performed by a computer, such as sorting, comparing, and matching, that involve yes-no decisions, b. Computer circuitry, c. Graphic representation of computer circuitry." Id. at 1057. Using these definitions, the ordinary meaning of "pre-programmed logic" is computer source code (software) programmed into a device and/or computer circuitry (hardware) for performing a specified function.

The Court next examines the intrinsic evidence and determines that the ordinary meaning has not been rebutted. However, remarks made by the patentees in the Amendment clarify the meaning of "pre-programmed logic" in the context of the invention. Specifically, the patentees stated that: "the conventional audiometer has certain, but limited, logical functions during the testing procedure. These logical functions provide certain pre-programmed responses dictated by the test subject's inputs." (Amend, at 9.) These remarks demonstrate that "providing preset responses dictated by the test subject's inputs" is the "specified function" of the software or hardware. On the other hand, there is nothing in the intrinsic evidence that persuades the Court to import Benson's proposed "for the hearing test" limitation into the construction. Therefore, the term "pre-programmed logic" is properly construed as "software and/or hardware that provides preset responses dictated by the test subject's inputs."

C. "Prescribed coupon limits"

The district court construed "prescribed coupon limits" as being "predetermined limits on the number of coupons..."
collectively and per store." District Court Opinion at 20. On appeal, Catalina argues that the district court's construction is too limiting. Instead, it argues that "prescribed coupon limits" should have been construed as the "designated maximum quantity or number" of coupons. Catalina's argument, however, is refuted by the prosecution history of the '041 patent.

During the course of prosecuting the '041 patent, the named inventors amended the term "prescribed coupon criteria" in their original patent application to "prescribed coupon limits." Going further, they stated that, according to the specification, the term "prescribed coupon criteria" was "exemplified by the per store limits, the per day limits and the per customer limits as indicated." District Court Opinion at 20. In explaining their amendment to claim 1, they stated that, "Claim 1 has been amended and the phrase 'prescribed coupon criteria' has been replaced by 'prescribed coupon limits' which may more effectively communicate the same idea." Id. What the inventors represented to the patent examiner at the time of prosecution Catalina cannot now retract.

Accordingly, the district court's construction of "prescribed coupon limits" is upheld.

3310

1. "Prescribed set of reverse control channels". A predetermined range of frequencies that transmit control information in only one direction, from a cellular telephone to a cell site.

The invention disclosed in the '144 patent is limited to "the different use of the control signal" (D.I. 144 at A160), that is, using the reverse (as opposed to the forward) signal. (D.I. 144 at A146-151) The reverse control signal is characterized by the kind of information it carries (e.g., "information for establishing a voice communication link between the cellular phone and the cell network," D.I. 168 at B567) and the direction in which such information is being carried (from the cellular telephone to the cell site). The patentee, however, added another distinguishing characteristic to the claimed invention, that is, that the signals be transmitted "over one of a prescribed set of reverse control channels." Because the patentee chose to describe the invention in terms of a "prescribed set" of reverse control "channels," not signals, the court must be meaning to the distinction between a "signal" and a "channel."

Plaintiff argues in this regard that a channel (without further explanation of what a "channel" is) can accommodate signals transmitted in both directions (forward and reverse); i.e., when the single control channel is transmitting one way, it is "called" a reverse control channel; when it is transmitting in the other way, it is "called" a forward control channel. (D.I. 199 at 26) Plaintiff analogizes this arrangement to a highway, with lanes dedicated to different directions. (D.I. 204 at 33) In the field of telecommunications, however, the court understands that the "lanes" of the "highway" are assigned "frequencies" (see D.I. 168 at B567-568; D.I. 150 at exs. X, Z) and that the phrase "range of frequencies" is an accurate and helpful description of what a "channel" is. Having said that, clearly the northbound lanes of I-95 do not provide for southbound traffic, and the parties have not adequately addressed the question of whether a single "lane" or frequency can, from a technical point of view, accommodate the flow of information in both the reverse and forward directions for this claim construction exercise to be any more precise.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

1 The court declines to embrace plaintiff's implied suggestion that it is the signal that defines the channel at any given time; i.e., there are no "prescribed sets" of reverse control channels.

3311

Preselected Condition

The Court modifies Network-1's proposed construction and construes the term as "a parameter of the voltage on the signaling pair that indicates whether an access device is able to accept remote power from the data node." Network-1's proposed construction omits the term "of voltage on the data signaling pair." At the Markman hearing, Network-1 said it did not include this term because it is redundant as the term is already stated in the claim, "preselected condition of said voltage
level." Col. 4:29. However, this language should be included in the construction because it is helpful to the jury's understanding of the term.

D-Link's argues the term should be construed as:

preselected condition refers to three possible voltage level conditions: (1) no voltage drop; (2) a fixed level voltage drop; or (3) a varying level voltage drop. If conditions (1) or (2) are detected (no voltage drop or a fixed voltage drop), then the access device is identified as one that is unable to support remote power feed. If condition (3) is detected (a varying drop), then the access device is identified as one that is able to support remote power feed.

Network-1 argues that this construction seeks to limit the claim to the preferred embodiment. In the Markman hearing, D-Link argued that its construction is correct in light of Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258 (Fed. Cir. 2001). In Bell Atlantic, the district court construed the term "plurality of different modes" as limited to three specific categories of modes. Id. at 1269. The patentee argued that the universe of modes contemplated by the patent was not limited to the three categories discussed by the district court. The court of appeals upheld the construction citing to the specification language, which stated "the system operates in one of three selectable modes." Id. at 1271. The court was careful to note that limitations from the specification generally may not be read into the claims. Id. at 1270. However, the court further based its decision on the patent prosecution history. Id. at 1273. During the patent prosecution, the patentee made concessions because the examiner rejected the relevant claims as obvious. Id. In an attempt to distinguish his invention from the prior art, the patentee made statements that narrowed the scope of "modes." Id.

In the present case, the specification language discusses three states which can be determined after the delivery of the low level current: no voltage drop, a fixed level voltage drop, or a varying level voltage drop. Col. 3:2-4. Although the language in the preferred embodiment does discuss three specific states, the Court is unpersuaded by D-Link's argument that the construction should be limited to these three states. Unlike the Bell patent, the patentee in this case did not make any concessions during the prosecution of this patent. The examiner in this case issued no claim rejections or objections, and the USPTO allowed the patent less than a year after the application was filed.

CLAIM 2

With the disputed terms in bold, claim 2 states:

2. Apparatus according to claim 1, wherein there are at least two data signaling pairs connected between the data node and the access device to supply phantom power from the secondary source to the access device, and wherein said access device includes a pair of data transformers having center taps connected for locally powering the access device.

Preselected condition

Claims 1 and 6 of the '930 Patent contain the term "preselected condition." Network-1 contends that the term means "any parameters of the voltage on the signaling pair that indicates whether an access device is able to accept remote power from the data node," while Defendants contend that it means "a parameter of the voltage on the signaling pair that indicates whether an access device is able to accept remote power from the data node, where a fixed level voltage drop or no voltage drop indicates that the access device is unable to accept power from the data node." The parties disagree whether the term "preselected condition" requires detectable conditions of the resulting voltage level produced.

Network-1 asserts that Defendants improperly seek to import limitations from the specification. Defendants counter that the specification makes a disclaimer of the conditions of a fixed voltage drop and no voltage drop.

Defendants' construction does not encompass a disclaimer, but it does improperly impose additional detectable conditions of a resulting voltage level produced in response to a low level current. A "preselected condition" determines whether or not an access device can accept remote power and does not contemplate conditions that might indicate that the access device cannot accept remote power. See '930 Patent, col. 2:66-3:27. Defendants are making a misplaced attempt to include what a
preselected condition is not rather than merely stating what it is, so the additional limitation of "where a fixed level voltage drop or no voltage drop indicates that the access device is unable to accept power from the data node" is improper. Network-1's construction adds "any parameters," however the claim specifies "a resulting voltage level" on the signaling pair. '930 Patent, col. 4:24-25. Thus, the specification does not contemplate multiple or any parameters of a voltage on the signaling pair. Accordingly, the Court construes the term "preselected condition" to mean "a parameter of the voltage on the signaling pair that indicates whether an access device is able to accept remote power from the data node."

3313

3. "presentation"

The differences between the parties' proposed claim interpretations are as follows:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Emergis's Construction</th>
<th>Cable One's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;presentation&quot;</td>
<td>providing customer</td>
<td>providing via electronic means</td>
</tr>
<tr>
<td>billing data via</td>
<td>an &quot;invoice&quot; containing at</td>
<td></td>
</tr>
<tr>
<td>electronic means</td>
<td>least the same customer</td>
<td></td>
</tr>
<tr>
<td>and does not include the</td>
<td>billing data typically included</td>
<td></td>
</tr>
<tr>
<td>specialized definition</td>
<td>on a paper invoice</td>
<td></td>
</tr>
<tr>
<td>normally associated with</td>
<td></td>
<td></td>
</tr>
<tr>
<td>commercial paper</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Emergis contends that the specification supports its construction. First, the specification states that "presentment' as used herein does not include the specialized definition normally associated with commercial paper." n42 Second, Emergis argues that the specification allows for more flexibility in the types of information presented rather than Cable One's construction that requires "at least the same customer billing data typically included on a paper invoice." The specification states that "[t]he billing information that may be submitted to the customer includes any combination of the following items: payment due date, amount due, detail of goods/services provided during a billing period, late charges, account information, customer information . . ., invoice identifier, e.g., invoice number." n43 The specification also states that the "invoice would include billing data such as the customer name, address, account number and email address" and "may further include bill data typically included with a paper invoice to include the period covered by the invoice, a detail of the goods/services covered by the invoice, a total amount due and a payment due date." n44 Based on the language in the specification, the construction of "presentation" need not limit the types of billing data to "at least the same customer billing data typically included on a paper invoice" as Cable One proposes. Thus, the Court will construe the term, "presentation," as "providing customer billing data via electronic means and does not include the specialized definition normally associated with commercial paper."

n42 (4:24-26.)
n43 (6:34-47.)
n44 (4:40-45) (emphasis added).

G. "Presenting . . . a Link Corresponding to the Personal Information Stored on the Personal Information Provider" ('245 Patent)

This phrase appears in every independent claim (claims 1, 2, 7, 8, and 9) of the '245 patent. CashEdge proposes that the phrase be construed to mean "displaying on the client computer a hyperlink which the end user can activate to connect to
and access the underlying Web page of the provider." Yodlee asserts that this phrase does not require construction, and that CashEdge's construction seeks to import limitations from elsewhere in the independent claims. For example, claim 1(b) states that "upon activation of the presented link . . . the client computer [is redirected] to a post login page on the personal information provider." '245 patent, col. 17, lines 7-11. The other independent claims also contain similar limitations. The Court agrees that CashEdge's construction does nothing to enhance the understanding of what this phrase means. CashEdge asserts that this construction makes clear that the purpose of the link is so the client computer can access the underlying web page of the provider, but the claims already makes this clear. '245 patent col. 17 11 7-17. No construction is necessary.

3315

a. "Said apparatus . . . presenting information to the user . . ."

Meade proposes that this claim should be construed as not requiring that the presentation of information be overlaid on the field of view. Meade provides two persuasive bases for this construction, which the Court adopts. First, Meade contends and the Court agrees that the phrase "presenting information" does not modify the term "field of view", but, rather, modifies the term "apparatus" such that the apparatus need not involve the field of view in the presentation of information. Second, the specification cites certain data presentation embodiments that cannot be overlaid on the field of view. (See, e.g., '203 Patent, 11:39-46.) Such embodiments would not be possible if the data must always be presented as a field of view overlay. Under the rules of claim construction, it requires "highly persuasive evidentiary support" to read a preferred embodiment out of a patent. Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1327 (Fed. Cir. 2000) (internal quotes deleted). The Court has found no, much less persuasive, evidence that embodiments permitting presentation exclusively via auditory means, for example, do not fall within the scope of the '203 Patent. Finally, under the doctrine of claim differentiation, the Court finds that because dependent claims 2, 5 and 16 specifically claim visual display of information, the Court cannot construe this phrase in the independent claims to include such a limitation. See 5A Chisum on Patents, § 18.03[6] (1999) (noting that ordinarily the language of one claim should not be interpreted to make any other claim identical in scope). Accordingly, the Court agrees with Meade that the presentation of information need not occur via an overlay on the field of view.

3316

a. Presenting to a form user over a computer network by a third party forms servicer a form.

Defendant contends its XAP System does not "present" a form to a user within the meaning of Claim 16. Defendant relies on a dictionary definition of the word "present" from The New Shorter Oxford English Dictionary 2393 (4th ed. 1993) and asserts, in the context of this limitation, "present" means to "show, exhibit, or display" a form to someone. Thus, Defendant argues it "presents" a form to a "form user" only if Defendant displays the form to the user, but not if "some other entity" such as a web browser displays the form. Because a web browser does the "presenting" in conjunction with Defendant's XAP System, Defendant contends its System does not meet the "presenting" limitation of Claim 16.

According to Plaintiff, however, the term "presenting" is nontechnical "and simply means getting a form to a user over a computer network (like the internet). . . . When the form is transmitted to the user's web browser, it is presented or provided to the user." In support of this construction, Plaintiff emphasizes the preferred embodiment identified in the '042 Patent "communicates with applicants and institutions over the World Wide Web," and "entry page 36 as well as all other pages presented to the applicant, is presented as an HTML page."

Pl.'s Fourth Amended Compl., Ex. B at 2-4. "[I]t is axiomatic that a claim construction that excludes a preferred embodiment . . . is rarely, if ever correct and would require highly persuasive evidentiary support." Anchor Wall Sys., Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1308 (Fed. Cir. 2003) (citation omitted).

The Court notes Defendant's selected definition omits other, more common definitions of the term "presenting" such as "to offer or convey by way of message." See Webster's Third New Int'l Dictionary 1793 (1981). In addition, Defendant's narrow construction of the term "presenting" is contrary to the preferred embodiment. Although the Court was not asked to construe the term "presenting" in the course of the Markman hearings, the Court agrees with Plaintiff that, consistent with the
preferred embodiment described in the '042 Patent, the limitation in Claim 16 as to "presenting" a form means to provide the form to a form user via the form user's web browser.

GO BACK

Claim 1g

presenting to the user via the user interface, the list of the third plurality of options

The parties disagree on the meaning of the above-stated language. Dell argued that the ordinary meaning of the above-stated language should suffice. Lucent, however, proposed the following: "displaying to the user only those options that are determined to be compatible with all previously selected choices."

The court agrees with Lucent and construes the above-stated claim term as follows:

"displaying to the user only those options that are determined to be compatible with all previously selected choices."

GO BACK

a. The "Presetable Level"

In accordance with the '283 patent, objects whose attenuated and backscattered radiation responses correspond to "at least a . . . presettable level" are identified in separate colors, a first color based on transmitted radiation and a second color based on backscattered radiation. The district court construed "at least a . . . presettable level" to mean that the pixels are illuminated when an object attenuates or scatters a quantity of radiation equal to or more than a quantified, preset threshold value. The district court held that this quantified threshold can be preset by an operator before the object is scanned. AS&E disputes this interpretation, pointing out that the claims do not limit "when, where, or how the level of backscattered radiation is preset." AS&E argues that "presettable" does not mean that the threshold level must be manually set before the actual scan, independent of the scanned object, but only that the machine is capable of being preset to a threshold level "before the display of pixels (as distinguished from pre-set before scanning)."

Vivid responds that the district court's claim construction is mandated by the claim language, the specification, and the prosecution history. On de novo review we reach the same conclusion as did the district court. The specification describes use of a color look-up table, which establishes the color of the displayed object based on the level of radiation response, and varies the intensity of a given color based on the amount that the radiation response exceeds the preset reference level. During prosecution, in response to a rejection on prior art, AS&E explained both the use and the significance of the preset levels:

In accordance with the present invention, appropriate reference levels for any given application are programmed into the system (see specification, page 8). These pre-set levels may obviously be changed, so that pixels which appear in a first color in a system where the first and second levels are pre-set at certain values, may appear in different colors, when the preset levels are changed. This flexibility to pre-set the threshold levels at which pixels are displayed in a single, unambiguous color is a useful feature of the present invention, which is totally absent from [the cited reference].

Neither the specification nor the prosecution history suggests that the threshold levels of color display may be set after the radiation beam scans the object, or recognizes such a mode of operation. We conclude, as did the district court, that the term "presettable level" means that threshold levels of attenuated and backscattered radiation can be preset before the scan of the object.

GO BACK

- 3631 -

--- Footnotes ---
7 Parties agree that the similar terms, "pressure-sensitive variable conductance sensor," "pressure-sensitive analog sensor," "pressure-sensitive variable conductance structural arrangement," "pressure-sensitive variable conductance structure," "pressure-sensitive variable sensor," and "pressure-sensitive . . . button sensor," which appear in the '802, '991, '525 and '700 patents should be construed the same way.

--- End Footnotes ---

Introduction

Anascape proposes that this term should mean "an electricity manipulating device for varying electrical output proportional to varying physical force."

Microsoft contends that this term should be defined as follows:

A pressure-sensitive variable-conductance sensor has material to contact conductive elements. This type of sensor has a conductivity that changes due to a volume effect. As pressure on the material increases the material volume decreases. This decrease in volume of the material increases the internal conductivity through the material. As a result, the conductivity through the sensor increases.

A pressure-sensitive variable-conductance sensor does not include a variable conductivity sensor utilizing a micro-protrusion surface area effect. In such a sensor, as pressure on the material increases the surface area of contact between the microprotrusions and the conductive elements increases. As a result, the conductivity through the sensor increases.

Here, the central question is whether a PSVC sensor must utilize PSVC material. The patent uses language of requirement in this regard, and every embodiment described incorporates PSVC material. The court concludes that sensors using PSVC material are what the patents disclose.

Analysis

It is clear from the claim language that a sensor is an electricity manipulating device. 8 '802 Patent, Col. 12, ll. 29-30; '991 Patent, Col. 14, ll. 60-62. The specifications also describe a sensor as an "electricity manipulating device." See '802 patent, Col. 3, ll. 39-42. In differentiating the present invention from prior art, the specifications of the patents state that a "pressure sensitive variable conductance analog sensor" is different from a prior art on/off sensor due to its ability to vary electrical output or flow proportional to varying physical force. Compare '991 Patent, Col. 1, ll. 42-56 with '991 Patent, Col. 6, ll. 2-5. See also '084 Patent, Col. 2, ll. 8-12. Anascape's proposal includes these elements. Microsoft's wants to add the presence of PSVC material, and the absence of other material, as limitations.

--- Footnotes ---
8 The patents use the terms "sensor" and "switch" interchangeably. '084 Patent, Col. 1, l. 8 16, '886 Patent, Col. 1, ll 20-21.

--- End Footnotes ---

Many of the claims in the patents state specifically that the PSVC sensor (or the means for creating an analog output proportional to varying physical pressure) utilizes PSVC material. These include: '802 Patent, Claims 1-4, 7, and 10; '084 Patent, Claims 1-11; '886 Patent, Claim 7.

Other claims refer to a PSVC sensor or a button which manipulates electric current or imagery relative to physical pressure (or means or a method for the same) but there is no express statement that PSVC material is utilized. These include: '802 Patent, Claims 5, 9, 12, 13, 14, 15, 16, and 17; '991 Patent, Claim 11, 23, 29, and 44. Anascape therefore argues that claim differentiation mandates a construction by which the analog sensor may, or may not, have PSVC material. Claim differentiation is a guide to proper construction, not a card that trumps a careful review of the specification and prosecution history. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380-1381 (Fed. Cir. 2006).
The real issue is whether a PSVC sensor must have in it, somewhere, at least some PSVC material as defined above. Here the court is faced with the familiar duel between powerful opposing canons of construction. Anascape argues that "limitations may not be imported from the specification to the claims." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 904 (Fed. Cir. 2004), cert. denied, 543 U.S. 925, 125 S. Ct. 316, 160 L. Ed. 2d 223 (2004).

Even if a specification describes only a single embodiment, the claims "will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using "words or expressions of manifest exclusion or restriction." Id. at 906. On the other hand, the same case recites that claims must be read in the context of the specification, and notes the "particular difficulties" which arise when the claim language is broad but the specification is narrow. Id. at 905. The importance of the specification has since been given even more emphasis. Phillips, 413 F.3d at 1315.

The specification of the '802 patent describes a sensor in which the flow of current through the PSVC material (Item 36 in fig. 7 & 8) is increased because "material 36 which is flexible deform[s] with additional applied pressure to somewhat flatten-out and contact additional surface area of both traces 32 and 34." The results include "additional conductivity changes . . . by the additional surface contact area." See '802 Patent, Col. 8, 58 - Col. 9, l. 4, Fig. 7 & 8. There is increased conductivity through the PSVC material due to the surface effect.

Another specification explicitly describes an embodiment in which the intrinsic conductivity of the PSVC material does not change very much during deformation. The patentee points out that in the prior art a "carbon-rich conductive pill or disc" had been used as "simple On/Off momentary-On switches" but not to provide "action intensity control of electronic imagery." '991 Patent, Col 9, ll. 16-36. "Carbon-rich pills are typically made of granular carbon in high concentrations in a silicone rubber binder producing a resilient conductive material resistant to mechanical bouncing when depressed onto a surface." '991 Patent, Col. 9, ll. 28-31.

The patentee states he had discovered that such a carbon rich pill or disc could be used in his variable conductivity invention. '991 Patent, Col. 9, ll. 39-47. Anascape points out that the carbon-rich pill does not change its conductivity very much with deformation, so one skilled in the art would know that the surface effect would be a significant contributor to variable conductivity in such a device. '991 patent, Col. 9, ll. 43-60.

Resistivity in a device with a carbon-rich pill changes only within a narrow range of approximately 3 thousand ohms to a low value near 10 ohms. Id. In that particular configuration, most of the change in conductivity of the sensor as a whole will come from the deformation of the domed/convex conductive material 36 as it presses against the contact wires - the surface effect.

Microsoft responds with "fire" from its own canon: claim language can not be read to exceed the scope of the unequivocal language of the specifications of the patents. See Nystrom v. Trex Co. Inc., 424 F.3d 1136, 1143 (Fed. Cir. 2005), cert. denied, 547 U.S. 1055, 126 S.Ct. 1654, 164 L. Ed. 2d 396 (2006). Microsoft argues that the specifications of the patents compel a construction of "pressure-sensitive variable conductance analog sensor" that excludes the possibility that electrical conductivity is modulated only by varying the surface area of contact between micro-protrusions and conductive elements, as for example explained in the Yaniger patent. Microsoft does not point to any clear disclaimer by the patentee of an embodiment which includes only a surface area effect.

Microsoft cites Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1372 (Fed. Cir. 2004) and Honeywell Int'l, Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006) and argues that with regard to the presence of PSVC material in the sensors, the following statements in the specification of the patents use language of requirement, not preference:

1. In the "Summary of the Invention": "The present invention involves the use of structures (pressure sensors) having pressure-sensitive variable-conductance material across proximal circuit traces in order to provide variable output ." '802 Patent, Col. 2, ll. 55-58.

2. "Pressure-sensitive variable-conductance material 36 is an important aspect of the present invention." '802 Patent, Col. 6, ll. 49-50.

3. "With the present sensor in all embodiments shown and described herein, pressure-sensitive variable-conductance
material 30 is positioned as a variably conductive element . . . " '084 Patent, Col. 8, ll. 10-12.

4. "At this point in the disclosure it should be quite clear that the pressure-sensitive variable conductance material 30 is a very important aspect, as is the tactile feedback from the snap-through dome-cap 16 of the present invention." '084 Patent, Col. 6, ll. 53-56.

5. In the "Summary of the Invention": "The present invention involves the use of structures (pressure sensors) having pressure-sensitive variable-conductance material across proximal circuit traces in order to provide variable output." '991 Patent, Col. 2, ll. 59-62.

6. "Pressure-sensitive variable-conductance material 36 is an important aspect of the present invention." '991 Patent, Col. 6, ll. 53-54.

7. The '886 patent describes related prior art has having a dome cap with a conductive "pill" referred to as the "active element." '886 Patent, Col. 1, ll. 36-37. The specification then goes on to say: "With applied varying pressure changes, the active element changes it's conductivity . . . . This pressure-sensitive variable-conductance aspect of the active element in the . . . dome cap opens many new and valuable possibilities of use." '886 Patent, Col. 3, ll. 14-23.

Microsoft's argument is bolstered by the fact that every single embodiment described in the four patents is of a sensor that utilizes PSVC material. As discussed above, there are descriptions of the surface area effect when the PSVC material is flattened across contacts. That is always an additional effect, involving PSVC material. Even the description of the use of a carbon-rich pill with a narrow range of resistivity changes did not imply an embodiment with no PSVC material. Rather, that discussion concluded by pointing out that a greater range of resistivity change could be achieved by replacing the carbon with tungsten carbide. "Therefore, tungsten carbide is a preferred active material for use with the present invention." '991 Patent, Col. 10, ll. 1-3.

Finally, two of the patents cite the '471 Patent (Mitchell) while discussing sensors '886 Patent, Col. 2, ll. 16-28; '084 Patent, Col. 2, ll. 13-22. As mentioned earlier, all four patents referred to the Mitchell patent as having information about PSVC material that increased conductivity through the volume effect. It only teaches sensors that use such material.

The '886 Patent refers to Mitchell as "describing sensors which utilize pressure-sensitive variable-output material to produce analog output" but distinguished that invention only by noting that Mitchell did not use or suggest an elastomeric dome cap to carry the PSVC material, to transfer force, or to provide tactile feedback. '886 Patent, Col. 2, ll. 36-48.

The '084 Patent cites the Mitchell patent as describing sensors which use PSVC material, but distinguishes it only with: "Mitchell fails to anticipate any structuring useful for providing a tactile feedback discernible to a human user of his sensors." '084 Patent, Col. 2, ll. 20-22. These references to the PSVC sensors disclosed in the Mitchell patent, which all use PSVC material, have "particular value as a guide to the proper construction of the term" "PSVC sensor." LG Elec., Inc. v. Bizcom Elec., Inc., 453 F.3d 1364, 1375 (Fed. Cir. 2006), cert. granted, 128 S. Ct. 28, 168 L. Ed. 2d 805 (2007)(No. 06-936, 2007 Term).

The question is whether, in light of the foregoing, one of ordinary skill could read the patent and conclude that patentee was claiming sensors without PSVC material? In view of Phillips and the resulting line of decisions that have wrestled with the "don't import limitations" - "read claims in light of the specification" dichotomy, the court thinks not. Anascape argues that a skilled artisan would realize that a depressible sensor suitable for game controllers that varies electric current in response to varying pressure only by action of a surface effect, is equivalent to such a sensor with PSVC material. That is an argument for infringement by equivalents - a matter for trial, not claim construction. The court will construe this claim term as follows:

"Pressure-sensitive variable-conductance analog sensor" means: "an electricity manipulating device that uses pressure-sensitive variable conductance material, to vary electrical output as varying physical force is applied."

shall be construed the same way.

GO BACK

3320

1. "Pressure-sensitive variable conductance material." Used in '084 Patent, Claims 5-6, 11; '802 Patent, Claims 1, 7, 10; '886 Patent, Claim 7; '991 patent, claims 12, 29, 31, 50.

Introduction

Anascape proposed, "a conductive element that provides for variable electrical flow dependent upon the applied force." Microsoft suggested that this term means:

Material that has a conductivity that changes due to a volume effect. As pressure on the material increases the material volume decreases. This decrease in volume of the material increases the internal conductivity through the material. As a result, the conductivity through the sensor increases.

This does not include material utilizing a micro-protrusion surface area effect. In such material, as pressure on the material increases the surface area of contact between the micro-protrusions and the conductive elements increases. As a result, the conductivity through the sensor increases.

The main point of contention is whether the construction should exclude the surface effect - the increased flow of current as two conductors come into contact over a greater area. Because the specification describes a surface effect, it will not be excluded.

Analysis

The skilled artisan would know, and the parties agreed, that "conductivity" (resistance to the movement of an electrical charge) is the inverse of "resistivity." Trans. p. 9-10. In other words, as resistivity goes down, conductivity goes up. The parties also agreed that, as used in these patents, conductivity may refer to resistive or rectifying properties depending on the pressure sensor material utilized. See '802 Patent, Col. 3, ll. 2-3 & '991 Patent, Col. 3, ll. 7-8; Trans. p. 10-11.

This claim, like many others in the patents, says the material is "positioned as a variably conductive element." So Anascape's suggestion to define the "material," which can be used or positioned as an element as "an element," could be misleading, or at the least redundant. Nothing in the patents hints that the PSVC material is a device, like a transistor or a relay in a circuit. It is a substance or compound, as described in detail at '802 Patent, Col. 6, ll. 50 - Col. 7, 1. 21.

The claim states that the electrical conductivity of the substance (the PSVC material) is altered relative to received force. '084 Patent, Col. 12, ll. 50-52. See also '082 Patent, Col. 2, 1. 67 - Col. 3, 1. 5. In other words, PSVC material "changes its conductivity with applied pressure to alter the conductance of the electrical path provided thereby . . . ." '802 Patent, Col. 6, ll. 24-26. See also '991 Patent, Col. 6, ll. 28-30.

Referring to "the present invention," the patentee stated "Compressive force against pressure-sensitive variable conductance material 30 causes it to become sufficiently conductive as to allow current flow therethrough, the degree of conductivity being dependant upon the applied, received, or transferred pressure or force." '084 Patent, Col 9, ll. 1-6.

In another patent, the PSVC material is labeled the "active element." '886 Patent, Col. 1, ll. 36-37. "The active element, while a moderate to poor conductor when not under compressive force, drops in resistivity when placed under compressive force, such drop in resistivity being related to the amount of compression of the active element." '886 Patent, Col. 3, ll. 16-20.

The patents describe PSVC material as formed from conductive particles in a rubbery or elastic type binder. The patents specifically refer to U.S. Patent No. 3,806,471 (Mitchell), as having "[a]dditional information regarding such materials." 6

See '886 Patent, Col. 9, ll. 43-47; '084 Patent, Col. 7, ll. 8-12; '991 Patent, Col. 6, ll. 61-66, '802, Col. 6, ll. 57-62.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
6 Since the patents in dispute specifically refer to the Mitchell patent in the specification, it is intrinsic evidence. LG Elec., Inc. v. Bizcom Elec., Inc., 453 F.3d 1364, 1375 (Fed. Cir. 2006), cert. granted, 128 S. Ct. 28, 168 L. Ed. 2d 805 (2007)(No. 06-936, 2007 Term).

The '471 patent describes and diagrams the way in which the conductive elements in PSVC material are forced closer together as pressure is applied. This creates a greater number of electrical pathways between the conductive elements, thus increasing the conductivity of the material. See '802 Patent, Col. 6, l. 55 - Col. 7, l. 11; '471 Patent (Mitchell) Col. 2, l. 58 - Col. 3, l. 5, Fig. 3-6. This is sometimes referred to as the "volume effect."

Microsoft's proposed definition seeks to exclude "material utilizing a microprotrusion surface area effect." This effect is explained in U.S. Patent No. 5,296,837 (Yaniger). Briefly, a thin coat of resin with conductive particles such as carbon mixed with particles of a less conductive material (stannous oxide in the preferred embodiment) is applied to a supporting ply, creating a base. The stannous oxide particles are larger than the more conductive particles and create "micro-protrusions." As flexible conductors on a flexible base are pressed down on the base, the conductors make contact with the conductive resin and the circuit is completed. As more pressure is applied, more of the flexible conductor material is pushed down around the micro-protrusions, resulting in more contact with the conductive resin and thus a greater flow of current.

The parties do not dispute that one skilled in the art would know that bringing two conductors into contact over a greater area will result in an increase in current flow, assuming voltage is constant. This will be referred to as the "surface area effect." Once good contact is made between conductors of a material with low resistivity (high conductivity) such as copper, the change in resistance as surface area contact is increased might be insignificant, when compared to the overall resistance of the circuit. But with materials of higher resistivity (lower conductivity), such as the PSVC materials described in these patents, the increase in current flow resulting from increasing the area of contact between conductors (the surface area effect) can be significant. See '084 Patent, Col. 7, ll. 28-37.

The problem with expressly excluding a surface area effect in the definition of PSVC material is that Figures 7 and 8 of the '802 patent, and the accompanying text of the specification, describe additional current flow through the PSVC material caused by greater surface area contact between the PSVC material 36 and the circuit traces 32 and 34 (the open electrical contacts in the circuit) as the PSVC material is compressed and flattens across the traces. '802 Patent, Col. 8, l. 58 - Col. 9, l. 4, Fig. 7 & 8. In short, Microsoft's construction improperly limits the definition of the disputed claim term by excluding a preferred embodiment.

Of course, simply because a greater flow of current can be achieved between two electrical contacts by increasing pressure on them, or increasing the surface area of contact, does not mean either contact is made of a PSVC material. The metal used for car battery terminals and cable clamps would not fit the patent's description of a pressure-sensitive variable conductance material, nor would it be recognized as such by a skilled artisan. However, tightening the clamp on the terminal could still improve the flow of current. PSVC material, as described in the claims and specification, and as known to those skilled in the art, must itself change in conductivity as a result of pressure, even though in certain applications increasing the surface area of contact may also increase the flow of current. **The court will define this term as follows:**

"Pressure-sensitive variable conductance material" means: "a substance that changes in conductivity to allow a greater flow of electric current through it, as pressure is applied to it."

Microsoft stated this definition was acceptable and Anascape's only concern was that "changes in conductivity" was redundant and might be used in later arguments before a jury. Trans. p. 29-32. Since the specifications of the patents make it clear that the conductivity of the material itself changes, even if in some applications there is a surface effect, the slight redundancy is justified. Learned counsel are well equipped to handle a misleading argument before the jury.

**3321**

3. "Pressure-sensitive variable conductance of one of said buttons." Used in '802 patent, claim 11.
Anascape suggests that this term should be construed as "variable electrical flow produced by a button associated with an electricity manipulating device for varying electrical output proportional to varying physical force." Microsoft contends that this term should mean "the conductivity of a pressure-sensitive variable-conductance sensor."

The proposals are substantially similar. In the end the definition of this term really depends on the construction of the prior term, because there is no real dispute over what a button on a game controller is. See Trans. p. 68-71. The button, or dome cap 28, with the pressure-sensitive conductance material together comprises the sensor. '802 patent, col. 8, ll. 36-45. The court will define this term as follows:

"Pressure-sensitive variable conductance of one of said buttons" means: "the conductivity of a pressure-sensitive variable-conductance sensor associated with one of said buttons."

3. Analysis:

Defendants argue that there is nothing in the Patents to show that Mr. Hair intended the word "prevent" from having its ordinary dictionary meaning, that is, "to keep from happening, avert." (Defs.' Brief at 19.) Defendants contend that the Patents disclose no methodology or system which explains how the invention would keep unauthorized copying from happening. Nor would one possessing ordinary skill in the art know in 1988 how to incorporate some method or system to do so because then, as now, there was no effective means to prevent unauthorized copying. (Id. at 18-20.)

Plaintiff does not argue that either Patent specifically discloses a method for preventing the unauthorized copying. Sightsound's position is that Defendants' Claims of non-enablement rest on "a nonsensical interpretation" of the word "prevent" and that the proper definition is "to impede or present an obstacle to." (Plf.'s Brief in Opp. at 26.) The definition chosen by Defendants is nonsensical because its use would require the Patents to claim "an absolute form of copy protection, a practical impossibility." (Id. at 27.) Moreover, one skilled in the art in 1988 would have known such absolute protection was unachievable and would have employed a method that would have been reasonable, given the state of the art at that time. (Id. at 26-27.)

In construing a term, the court begins by considering the relevant intrinsic evidence, i.e., the claim language, the specification and the prosecution history. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979. The analytical focus must begin and remain centered on the language of the claims themselves, "for it is that language that the patentee chose to use to 'particularly point[] out and distinctly claim[] the subject matter which the patentee regards as his invention.'" Interactive Gift Express, Inc. v. CompuServe, Inc., 256 F.3d 1323, 1331 (Fed. Cir. 2001), quoting 35 U.S.C. § 112, para. 2, . "Generally speaking, we indulge a heavy presumption that a claim term carries its ordinary and customary meaning." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). This presumption is rebutted when the patentee, acting as his own lexicographer, has provided a definition different from the term's ordinary and customary meaning or if he has provided or disavowed an interpretation of the term during the prosecution history. Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 and n.3 (Fed. Cir. 1998). Neither party points to any interpretation of the word "prevent" which was provided or disavowed in the prosecution history and thus could be used to shape the scope of the claim, nor is there any evidence that Mr. Hair defined the term "prevent" in the patent claims or specifications.

The phrase in question is "a configuration which would prevent unauthorized reproduction of the … signals." The dictionary on which both parties rely defines "prevent" as "(1) to keep from happening: AVERT; (2) to keep (someone) from doing something: IMPED; (3) to anticipate or counter in advance or to present an obstacle." Webster's II New Riverside University Dictionary (1988) at 933. 11 Defendants criticize Plaintiff for passing over the first definition of "prevent" in favor of the second and third entries. (Defendants' Reply Brief in Support of Their Motion for Summary Judgment, "Defs.' Reply Brief," Docket No. 184, at 1.) I find no support for this criticism in the case law and, in fact, courts have clearly done exactly that when doing so allows the claims to be reasonably construed. 12

11 Although dictionaries are, strictly speaking, extrinsic evidence, an exception has been made for them and for other
objective resource works which were publicly available at the time the patent was issued in order to allow the court to determine "the established meanings that would have been attributed to the terms of the claims by those of skill in the art. Such references are unbiased reflections of common understanding not influenced by expert testimony or events subsequent to the fixing of the intrinsic record by the grant of the patent, not colored by the motives of the parties, and not inspired by litigation." Intellectual Prop. Dev., Inc. v. UA-Columbia Cablevision, 336 F.3d 1308, 1315 (Fed. Cir. 2003) (internal quotation omitted).

12 For instance, in Intel Corp. v. United States Int'l Trademark'n, 946 F.2d 821, 835 (Fed. Cir. 1991), the court reviewed the construction by the International Trade Commission of the phrase "permanently programmed." Although the Court did not include in its opinion any dictionary definitions of the word "permanent," a contemporaneous edition of the Random House Collegiate Dictionary (rev. ed. 1980 at 988) defines it as "(1) existing perpetually; everlasting; (2) intended to exist or function for a long, indefinite period without regard to unforeseeable conditions; (3) long-lasting." The Intel court affirmed the Commission's construction of "permanently programmed" as requiring only that the devices in question remained programmed for the useful life of the invention under normal operating conditions, reasoning that "permanent" was a relative term. Thus, it is clear that the requirement was not that the devices remained "perpetually" programmed, only that they function "for a long, indefinite period." Intel, 946 F.2d at 836.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Another dictionary which would have been available in the late 1980s, the Compact Edition of the Oxford English Dictionary (1984) ("OED"), provides as the first contemporary 13 definition, "to stop, keep, or hinder (a person or other agent) from doing something:" the next definition is "to provide beforehand against the occurrence (of something); to render (an act or event) impracticable or impossible by anticipating action; to preclude, stop, hinder." OED at 1337-38, definitions 7 and 8. This latter definition is described as "a chief current sense." The Random House Unabridged Dictionary of the English Language (1987) at 1535 defines "prevent" as "to keep from occurring; avert; hinder; (2) to hinder or stop from doing something." Thus, it is apparent when comparing all three dictionaries that the word "prevent" incorporates both the concept of absolutely stopping or keeping an event from happening (Defendants' choice of definition) as well as merely hindering the event by taking anticipatory action which would make it difficult for the event to occur (Plaintiff's definition).

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

13 Definitions 1 through 6 are classified as obsolete, rare, archaic or theological.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Where a claim term is expressed in general descriptive words, the court will not add a "narrowing modifier before an otherwise general term that stands unmodified in a claim." Renishaw, 158 F.3d at 1249. Despite Defendants' protestations in their Reply Brief (at 1) that they have never taken the position the patents are not enabled because they do not teach "an absolute and unbreakable form of copy protection," that position is undercut by comparing the two definitions the parties propose. If "prevent" is understood to encompass anything less than an act which would result making unauthorized copying totally impossible, that act would fall within the scope of Plaintiff's definition of interposing some hindrance to make it extremely difficult to copy the digital signals. Because any means which would allow copying even one time would essentially do away with Defendants' argument on this point, I must conclude that the definition of "prevent" which they would have me adopt is just such an absolute standard.

Where review of the patent language itself fails to resolve an ambiguity as to a disputed term, a court may turn to extrinsic evidence such as expert testimony, prior art, technical treatises and inventor testimony. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996); Markman, 52 F.3d at 980. Such evidence may be used to help the Court understand the claims, but may not be used to vary or contradict the claim language. Vitronics, id. Where there is a dispute about the ordinary and customary meaning of the word, the court turns to "the best indicator of claim meaning ... its usage as understood by one of skill in the art at the time of invention." Moba v. Diamond Automation, 325 F.3d 1306 1316, citing Markman, 52 F.3d at 986.

Although they never explicitly agree upon the qualifications of one skilled in the art, the parties do agree that in 1988, such a person would have known methods of encryption designed to protect digital signals from unauthorized copying. 14 (Plf.'s
Brief in Opp. at 30;Defs.' Brief at 20.) According to the Oxford English Dictionary, the verb "to encrypt" means "to convert (data, a message, etc.) into cipher or code, esp. in order to prevent unauthorized access; to conceal in something by this means." See "OED Online" at http://dictionary.ow.com. (emphasis added). 15 Similarly, the American Heritage Dictionary of the English Language (1992), at 607 defines "encrypt" as "to scramble access codes (to computerized information) so as to prevent unauthorized access." (Emphasis added.) If one of ordinary skill in 1988 thought that the purpose of encryption was to prevent unauthorized access, but knew there was no effective means to achieve that goal absolutely, then logically, he or she would have interpreted the phrase "a configuration which would prevent unauthorized reproduction of the … signals" as meaning a configuration which would incorporate the most effective method of protecting the digital signals from copying, given the capabilities of encryption or other means known at that time. Moreover, there is evidence that those skilled in the art use the word "prevent" in a non-absolute sense, at least today. Plaintiff's expert, Justin Douglas Tygar, Ph.D., points out that the website controlled by CDNow used the phrase "encryption prevents the file from being copied or played without permission." (Plaintiff's Exhibits to Brief in Opposition to Motion for Summary Judgment, "Plf.'s Exhs.," Docket No. 175, Exh. A, Rebuttal Expert Report, "Tygar Rebuttal," at 34-39 and Appendix D thereto, eighth page). James A. Moorer, Ph.D., one of Defendants' experts, also repeatedly used the word "prevent" in describing copy protection methods which he acknowledged did not absolutely stop copying. (Plf.'s Exh. E, Deposition of James A. Moorer, March 3, 2003, "Moorer Depo." at 89-94.) Dr. Moorer conceded that a system he had previously described as a means to prevent copying provided only "a limited deterrent or a limited discouragement to unauthorized copying." (Id. at 97.)

14 Defendants specifically refer to public key encryption as one means of deterring unauthorized copying but provide no other examples in the text of their Brief. (Defs.' Brief at 20-21.) I do not take this use of a specific example to imply that encryption was the only means known at the time to deter copying. (See Plf.'s Exhibits, Docket No.175, Exh. E, Deposition of James A. Moorer, at 18-20, discussing watermarking.) Dr. Moorer described watermarking and encryption as providing "limited technological barriers to copying. Neither are [sic] absolute." They provide "a measure of protection … [and] tend to deter someone from making unauthorized copies." (Id. at 20-21.)

15 I note that the Random House Collegiate Dictionary (1980) and the Compact Edition of the OED (1984) do not define the words "encrypt" or "encryption."

4. Conclusion:

In sum, if "to prevent" is given its broader, non-absolute meaning of "to hinder" or "to impede," the Copy Protection Claims are enabled because, as Defendants admit, one of ordinary skill in the art in 1988 would have known methods of converting the digital signals into a code which would make it difficult for someone to copy the downloaded signals without authorization but would also have realized that such methods were far from perfect. Defendants' argument that encryption methods were easily decrypted is only another way of saying that the methods to prevent copying were not absolutely foolproof; it does not mean that the use of encryption did not hinder the unauthorized copying. And it is common knowledge, even among the "Computer challenged," that developers of decryption methods are only a short step behind the encrypters. 16 I therefore conclude that Plaintiff's definition of "prevent" set out at page 29 of its Brief in Opposition, i.e., "presenting a technical obstacle sufficient to impede the ordinary customer from duplicating the purchased digital audio signal" is appropriate to the facts of this case. Since Defendants' argument for lack of enablement rests only on its overly restrictive definition of "prevent," their Motion for Summary Judgment in this regard must be denied. 17

16 See, e.g., Vault Corp. v. Quaid Software Ltd., 847 F.2d 255 (5th Cir. 1988). Vault developed a computer program which protected other programs from unauthorized copying. In response, Quaid developed a program which circumvented Vault's program. As Vault issued new versions of its copy protection software, Quaid modified its software to overcome those new protective measures.

17 Defendants also argue in passing that the Sightsound Patents describe the copy protection element as "new and improved" and therefore, the Patents should be considered invalid for failure to provide any features that are "both novel
and better than what was previously known.” (Defs.’ Brief at 21; see also Defs.’ Reply Brief at 1.) However, the point is never developed beyond this conclusory statement and I decline to address it further, not knowing what argument Defendants might make in this regard.

B. The Prevent Limitation

We now turn to the prevent limitation, which the district court also found was not satisfied by LM 5.0. This limitation appears in each of the asserted claims. See ‘297 patent, col. 17, ll.42-47 (claim 3); col. 23, ll.4-9 (claim 23); col. 31, ll.33-37 (claim 55). We did not decide in Globetrotter I whether the district court's construction of the prevent limitation was correct. See 236 F.3d at 1370 & n.3. Thus, we must first decide whether the district court correctly construed the prevent limitation.

As noted above, the district court construed the claim to require the license management means to perform the function of "returning a run-prevention message where no available license is found." Claim Construction Order, 1999 U.S. Dist. LEXIS 22482 at *31. However, it altered its construction when applying it, interpreting its claim construction "to mean that the license management means must actively prevent a program from running when no license is available, and that the run-prevention limitation is not met if the license management means merely returns a status message indicating that no license is available." Globetrotter II, slip op. at 4. LM 5.0 does not actively prevent a program from running if no licenses are available. Instead, it merely sends a signal that causes the program requesting a license to stop itself from running. Therefore, in accordance with its active prevention interpretation, the district court granted summary judgment of non-infringement.

First, we must consider whether the district court's claim construction was correct. In construing a patent's claims, we look first to their language. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Although the language of each of the asserted claims is slightly different, each claim includes a limitation requiring the license management means to send "a message preventing" an external program from running when there are no available licenses for the requesting program. See '297 patent, col. 17, ll.45-46 (claim 3); col. 23, l.7 (claim 23); col. 31, l.36 (claim 55). The word "prevent" means "to keep from occurring; avert; hinder" or "to hinder or stop from doing something." Random House Webster's Unabridged Dictionary 1535 (2d ed. 1998); see also Webster's 3d New International Dictionary 1798 (2002) (defining "prevent" as "to keep from happening or existing esp. by precautionary measures: hinder the progress, appearance, or fulfillment of: make impossible through advance provisions"). This language is ambiguous; it is unclear whether the message itself must actively stop the requesting program from running or whether the message can merely be a signal that keeps the requesting program from running when it is received. Therefore, we must look to the intrinsic evidence to determine whether it sheds light on the meaning of the claim term "message preventing." See Deering Precision Instruments, L.L.C. v. Vector Distribution Sys., Inc., 347 F.3d 1314, 1323 (Fed. Cir. 2003); Vitronics Corp., 90 F.3d at 1582.

The specification of the '297 patent describes two embodiments of the disclosed license management system. In both embodiments, the license manager program searches for licenses only when a requesting program, which is distinct from the license management software described in the patent, requests a license from the license management software. For example, the specification states:

"The copy of the given computer program 24A on the local node 14 contacts the license manager 25A at the local node 14 by making a subroutine call. In response, the license manager 25A asks (Step 30) whether a license 27 exists on the local node 14 for the given computer program 24A."

'297 patent, col. 9, ll.49-54; see also id. at col. 13, ll.51-56; Figs. 3, 6 (showing that the license manager routine is initiated by a subroutine call from an external computer program).

The specification does not teach a system that requires the license manager to engage in active prevention; rather, it states that the license manager returns a status to the requesting program if no license is available:
In response to locating the available license in the valid license file, the management system enables the computer program at the selected node to run. If no valid license file is located, or if all valid license files contain licenses that are in use, or unavailable, then the management system returns a status to the computer program indicating that it is not authorized to run.

'297 patent, col. 3, ll.27-34 (emphasis added).

Furthermore, both embodiments disclosed in the specification send a message to the program requesting a license from the license manager program and telling the requesting program that it is not authorized to run. See id. at col. 16, ll.20, 33, 39 (Appendix A) (providing "Tell computer program it can run" and "Tell computer program that it cannot run" as results of requesting a license from the license manager program); col. 16, ll.61-64 (Appendix B) (setting a status of "authorized to run" or "not authorized to run" and returning it to the requesting program); see also id. at Figs. 3, 6. Neither of the disclosed embodiments actively prevents the requesting program from running; rather, each merely sends a signal to the requesting program, which then must shut itself down. A claim interpretation that excludes a preferred embodiment from the scope of the claim "is rarely, if ever, correct." Vitronics Corp., 90 F.3d at 1583. We construe the claim to require only a message that results in the program's being prevented from running; active prevention is not required.

Thus, the claim construction of the prevent limitation as applied by the district court in its grants of summary judgment of non-infringement, which required the license management means to engage in active prevention, is incorrect. However, the district court's claim construction in its Claim Construction Order, which required only that the license management means "return[ ] a run-prevention message," Claim Construction Order, 1999 U.S. Dist. LEXIS 22482 at *31, was correct. There is no contention that there is a lack of a genuine issue of fact with respect to whether LM 5.0 infringes under the district court's (proper) claim construction in its Claim Construction Order. Indeed, Greer conceded that LM 5.0 returns a status message.

Although we vacate the district court's grant of summary judgment, we note that a full trial is not necessarily required in this case. The district court retains the discretion to reopen the record for clearer, more specific expert testimony from the parties and to entertain a new summary judgment motion based upon that evidence under the proper claim construction. See, e.g., Mass. Bay Transp. Auth. v. United States, 254 F.3d 1367, 1377 (Fed. Cir. 2001). However, the testimony must demonstrate that the witness is using the correct claim construction and address specific alleged acts of infringement and inducement, not conjectures as to what might occur hypothetically. 12

12 Greer urges us to affirm on other grounds than those upon which the district court relied. We decline to address those issues on appeal, though they remain open in the district court.

C. Disputed Term # 3: "preventing intelligible viewing"

The third term in dispute is:

"preventing intelligible viewing" ('320 Patent, Claim 1; '078 Patent, Claim 10)

Plaintiff's Proposed Construction: "prohibiting access by a non-requesting viewer"

Defendants' Proposed Construction: "scrambling the video signal of the chosen program transmission such that the video signal displays in an incomprehensible form and transmitting the descrambling signal related to said transmission only to requesting viewers' receivers"

Plaintiff argues that its proposed construction, "prohibiting access by a non-requesting viewer," is consistent with the specification because the patents themselves merely state that non-requesting viewers are prohibited access to programs.
While the specification offers scrambling/descrambling as an example of "preventing intelligible viewing," Plaintiff maintains that the term should not be limited to that single example.

However, the specification refers to scrambling and transmitting a descrambling signal each time "preventing intelligible viewing" is described in the patents. See, e.g., '320 Patent, 2:63-3:2 ("Preferably the television transmission system is an 'addressable' system in which selected programs are scrambled to prevent intelligible viewing thereof and in which a descrambling signal can then be addressed to the receiver associated with the requesting viewer which in turn prompts the included control unit to descramble the program transmission for viewing on that receiver."); id. at 7:3-7 ("By scrambling the transmission, and by not providing a descrambling signal to other receivers, subscribers other than the requesting viewer are prevented from intelligible viewing of the chosen program.").

In contrast, the only other disclosed means to prevent non-requesting viewers from viewing the transmission do not prevent intelligible viewing. For example, communicating the specific channel number (e.g., Channel 3, Channel 10) only to the requesting viewer, as described in Claim 4 of the '320 Patent, would not prevent intelligible viewing because non-requesting viewers who inadvertently encounter the program when changing channels would be able to view it intelligibly. See Markman Hr'g Tr. 59-60 (Plaintiff's counsel states "there could be a few other people [who] are going to get a chance to see" a program they did not request if the only means used to prevent unauthorized access was revealing the channel number only to requesting viewers). Likewise, transmitting the signal to only one or more sections of land lines, as described in Claim 11 of the '320 Patent, would not prevent any non-requesting viewer on the section receiving the transmission from intelligibly viewing the program. See id. at 61 (Plaintiff's counsel states that this step "would prevent the vast majority of people from getting a look at your movie, but . . . some [on the same section] might inadvertently find out"). Because claims cannot be broader in scope than the invention set forth in the specification, and because the specification consistently discloses "preventing intelligible viewing" only as scrambling and transmitting a descrambling signal, "preventing intelligible viewing" must be confined to scrambling and descrambling. See, e.g., On-Demand Mach. Corp. v. Ingram Indus., 442 F.3d 1331, 1340 (Fed. Cir. 2006) ("[T]he role of the specification is to describe and enable the invention. In turn, the claims cannot be of broader scope than the invention that is set forth in the specification.").

Defendants' proposed construction is supported further by the prosecution history, in which the applicants clarified that scrambling is part of Claim 1 of the '320 Patent by describing Claim 2 of the '320 Patent as "more specific to the scrambling step and to the transmission of decoder signals for receipt by the receiver associated with the requesting viewer(s)." 320 Patent, 7/6/89 Resp. to Office Action 14. Clearly, the applicants understood Claim 2 as a more specific component of the overall "scrambling step" embodied in Claim 1.

- 3642 -
Plaintiff, however, argues that pursuant to the doctrine of claim differentiation, Claim 1 of the '320 Patent and Claim 10 of the '078 Patent should not be construed to have the same meanings as Claim 2 of the '320 Patent and Claim 15 of the '078 Patent, respectively. Claim differentiation is a "presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006); see also Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999) ("This doctrine, which is ultimately based on the common sense notion that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope, normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend." (citation omitted)). Because Claims 2 and 15 are dependent claims that relate specifically to the scrambling/descrambling process, Plaintiff argues that independent Claims 1 and 10 should be read more broadly and not be limited only to scrambling.

As the Federal Circuit has noted, however, claim differentiation is only a presumption, "not a hard and fast rule of construction." Comark Commc'ns v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). Moreover, "the doctrine of claim differentiation can not broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence." Multiform Desiccants, Inc. v. Medzam Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998). Claim differentiation does not, for example, "mean that every limitation must be distinguished from its counterpart in another claim, but only that at least one limitation must differ." Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000). In the instant case, Plaintiff concedes that Claim 2 of the '320 Patent contains several limitations not found in Claim 1. See Markman Hr'g Tr. 148 (Plaintiff's counsel states, "I acknowledge that there are a number of different meanings in Claim 2 . . . ."). With respect to Claim 15, it contains a means-plus-function limitation ("means for decoding a scrambled program") as well as the "scrambling" and "decoding" step. Thus, in addition to the scrambling/decoding step, the additional means-plus-function limitation to a specific structure in the specification means that Claim 15 contains two limitations, neither of which appear in Claim 10. Accordingly, the Court concludes that the claim differentiation presumption is unwarranted with respect to Claim 1 and Claim 10.

The Court is persuaded that Defendants' construction is correct based on examination of the specification, which consistently describes scrambling/descrambling as the only example of how to prevent intelligible viewing, and the prosecution history, in which Claim 2 is described as "more specific" to the scrambling step of Claim 1. Accordingly, the Court will adopt Defendants' proposed construction.

As with the foregoing phrases, the Court finds that the construction proposed by the R&R for "price affordable to an average consumer" fails to give meaning to all of the claim terms. As an initial matter, the Court notes that this limitation is found in the preambles to claims 1 and 9. The R&R treated the phrase as a limitation, and Plaintiff filed no objection to that conclusion.

Although the issue has not been specifically raised, the Court finds that these phrases within the preambles do limit the scope of the respective claims. There is no litmus test for determining whether to treat a preamble as limiting the scope of the patent claims. Catalina Mktg. Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002). Rather, "a claim preamble has the import that the claim as a whole suggests for it." Pitney Bowes, Inc. v. Hewlett Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999). Thus, "whether to treat a preamble as a claim limitation is determined on the facts of each case in light of the claim as a whole and the invention described in the patent." Bicon, Inc. v. Straumann Co., 441 F.3d 945, 952 (Fed. Cir. 2006) (quoting Storage Tech. Corp. v. Cisco Sys., Inc., 329 F.3d 823, 831 (Fed. Cir. 2003)); see also Catalina Mktg., 289 F.3d at 808 ("Whether to treat a preamble as a limitation is a determination 'resolved on review of the entire[. . . ] patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim.'" (quoting Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989))).

In general, "[i]f the body of the claim 'sets out the complete invention,' the preamble is not ordinarily treated as limiting the scope of the claim." Bicon, 441 F.3d at 952. Similarly, "a preamble simply stating the intended use or purpose of the invention" or "merely extolling benefits or features of the claimed invention" will usually not limit the scope of the claim. Catalina Mktg., 289 F.3d at 809; see also On Demand Mach. Corp. v. Ingram Indus., Inc., 442 F.3d 1331, 1343 (Fed. Cir. 2006) ("[T]he preamble is analyzed to ascertain whether it states a necessary and defining aspect of the invention, or is
simply an introduction to the general field of the claim."; Boehringer Ingelheim v. Schering-Plough Corp., 320 F.3d 1339, 1345 (Fed. Cir. 2003) ("An intended use or purpose usually will not limit the scope of the claim because such statements usually do no more than define a context in which the invention operates.").

Conversely, a preamble will be regarded as limiting if it is "necessary to give life, meaning, and vitality to the claim." Catalina Mktg., 289 F.3d at 808 (quoting Pitney Bowes, 182 F.3d at 1305). "That is, if the claim drafter 'chooses to use both the preamble and the body to define the subject matter of the claimed invention, the invention so defined, and not some other, is the one the patent protects.'" Bicon, 441 F.3d at 952 (quoting Bell Comm'n's Research, Inc. v. Vitalink Comm'n's Corp., 55 F.3d 615, 620 (Fed. Cir. 1995)) (emphasis in original). In such situations, "there is no meaningful distinction to be drawn between the claim preamble and the rest of the claim, for only together do they comprise the 'claim.'" Pitney Bowes, 182 F.3d at 1305.

The Federal Circuit has identified several situations in which the preamble will be deemed a limitation. For example, the preamble will generally constitute a limitation where it "recites essential structure that is important to the invention," Catalina Mktg., 289 F.3d at 808, or where it "provides antecedents for ensuing claim terms." Boehringer, 320 F.3d at 1345; see also Pitney Bowes, 182 F.3d at 1309 (finding term in preamble limiting where it is "intimately meshed with the ensuing language in the claim" and where claim terms "could only be understood in the context of the preamble statement"). Additionally, "preamble language will limit the claim if it recites not merely a context in which the invention may be used, but the essence of the invention without which performance of the recited steps is nothing more than an academic exercise." Boehringer, 320 F.3d at 1345. Finally, and most relevant for purposes of the instant patent, the Federal Circuit has recognized that "clear reliance on the preamble during prosecution to distinguish the claimed invention from the prior art transforms preamble into a claim limitation because such reliance indicates use of the preamble to define, in part, the claimed invention." Catalina Mktg., 289 F.3d at 808-09.

The R&R provides an excellent review of the prosecution history of the patent-in-suit. The patent application went through numerous revisions from its original filing on November 8, 1999 until it issued on July 22, 2003. "The finally issued claims in the '973 Patent were presented following a telephone interview with the examiner." (R&R at 27.) Application claims 55 and 66 that became patent claims 1 and 9 were amended as set out in the R&R. (R&R at 27-28.) Included among the amendments to these claims was the addition of the following language in the preambles to the claims:

\[
\text{to enable assembly line production and sale of the top at a price affordable to an average consumer [claim 55];}
\]

(R&R at 27-28.) After these amendments, the patent finally issued. The Court finds that the language was used to help distinguish the claimed invention from the prior art and should be treated as a limitation.

Unlike the earlier phrases, the meaning of "price affordable to an average consumer" is not clear when the construction of "average consumer" is inserted. The R&R defines affordability based upon the absence of the need for a stone cutter. As noted in regard to the earlier phrases, this limitation is already explicitly stated in the patent. To impose the "no stone cutter" limitation through this phrase makes this limitation superfluous. Therefore, the Court concludes that further definition is required.

The meaning of this phrases is not clearly discernable from its words. An individual that purchases supplies for a home improvement task from a retail outlet and performs the home improvement task himself or herself, regardless of whether the individual has any training in that task can be an individual from any economic class. The Court finds nothing in the intrinsic or extrinsic evidence that provides an objective standard from which one could determine whether the product is affordable to such a consumer. A person reading the patent is not able to discern the scope of the limitation.

This phrase is similar to the phrase "aesthetically pleasing" that was addressed in Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342 (Fed. Cir. 2005). Datamize involved a patent for an electronic kiosk system. The claim-at-issue recited a method that included the step of providing interface screen element types with an "aesthetically pleasing" look and feel. Id. at 1345. The district court concluded that the phrase "aesthetically pleasing" was "hopelessly indefinite" and granted a motion for summary judgment of invalidity. Id. at 1347.
The Federal Circuit first looked at the phrase "aesthetically pleasing" in context. However, it found that the context did "not suggest or provide any meaningful definition for the phrase 'aesthetically pleasing' itself. Merely understanding that 'aesthetically pleasing' relates to the look and feel of interface screens, or more specifically to the aggregate layout of elements on interface screens, fails to provide one of ordinary skill in the art with any way to determine whether an interface screen is 'aesthetically pleasing.'" Id. at 1349. The Court found that the patent holder "offered no objective definition identifying a standard for determining when an interface screen is 'aesthetically pleasing.' In the absence of a workable objective standard, 'aesthetically pleasing' does not just include a subjective element, it is completely dependent on a person's subjective opinion. . . . The scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention. Some objective standard must be provided in order to allow the public to determine the scope of the claimed invention . . . [A] claim term, to be definite, requires an objective anchor." Id. at 1350 (internal citation omitted).

The Court finds that "a price affordable to an average consumer" suffers from the same failings as "aesthetically pleasing." Assuming that "a price affordable to an average consumer" means something more than a pre cut stone top, no objective standard is provided by which a person reading the patent could determine if he were infringing the patent.

Based on the foregoing, the Court finds that the phrase "a price affordable to an average consumer" is not amenable to construction.

3 The term "price-determining-activity" is located in claims 1 and 18.

3326

I. "price determining activity" 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 The term "price-determining-activity" is located in claims 1 and 18.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

Plaintiff's Proposed Construction
1) any activity or combination of
activities, other than offering or
accepting a price, that is used to
determine the price paid for the
product or service; or
2) any form of competition or
entertainment activity or combination
of such activities, other than
offering or accepting a price, that
is used to determine the price paid
for the product or service

Defendants' Proposed Construction
inherently entertaining activity, such
as a game, puzzle or quiz, that is
used to set the product's price, but
otherwise is collateral to its sale

Plaintiff argues that a price-determining activity ("PDA") may be either any activity or any entertaining and/or competitive activity. OPENING at 1-2. Plaintiff argues that the activities listed in the specification conclude with "or any other activity," and therefore a PDA is not limited to inherently entertaining activities. Id. at 2. Plaintiff adds that the specification explicitly notes that a PDA includes "various forms of competition and/or entertainment." Id. at 3. Plaintiff also argues that the PDA must be collateral to the main activity, which is offering or accepting a price. Id. at 6.

Defendants argue that because the term "PDA" was coined by the patentee the PDA must be collateral to the sale, as the specification discloses. RESPONSE at 5-7. Defendants contend that by excluding only the offer or acceptance of a price from the definition of a PDA, selecting a product would improperly be included within the scope of the term. Id. at 7-8. Finally, Defendants argue that the PDA must be "inherently entertaining" because the specification repeatedly discloses this requirement. 4 RESPONSE at 8-10.
4 Defendants also argue that Plaintiff's proposed construction would render the patent invalid as lacking a sufficient written description. RESPONSE at 11-12. Claim language should generally be construed to preserve validity, if possible. Tate Access Floors, Inc. v. Interface Architectural Resources, Inc., 279 F.3d 1357, 1367 (Fed. Cir. 2002). However, where the only claim construction that is consistent with the claim's language and written description renders the claim invalid, this axiom does not apply and the claim is invalid. Id (quoting Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999)).

Looking first to the claims of the '253 patent, claim 1 discloses:

1. A method of doing business over a global communications network comprising the steps:
   communicating to a buyer via the global communications network, a description of a product;
   accepting a first request from the buyer to buy the product for a price to be determined within a price range;
   accepting a second request from the buyer to allow the price to be determined based upon a performance of the buyer while participating in a Price-Determining-Activity (PDA);
   receiving data from the buyer over the global communications network, said data representing the performance of the buyer during the PDA; and
   determining the price of the product based at least partially upon the data received, said price being within the price range and scaled to the performance of the buyer.

'253 patent at 9:31-49 (claim 1). While claim 1 does not indicate what type of price-determining activity is contemplated, other dependent claims indicate that the PDA can be a video game. Id. at 9:59-60 (claim 5), 10:32-33 (claim 17), 11:22-12 (claim 29).

In the Background section of the specification, the patentee explains that prior art business models did not allow "a potential buyer to engage in a competitive/entertaining collateral price-determining activity (PDA) which ultimately determines the price of the product or service to be secured, depending on the buyer's performance during the collateral activity." '253 patent at 1:57-62. Throughout the specification, the PDA is referred to as a "collateral" or "intermediary" activity. See, e.g., '253 patent at 1:59,1:62, 2:19, 2:25, 4:1, 4:3,

In the Summary of the Invention section, the patentee further explains that

Various forms of electronic competition and/or entertainment are used as intermediary activities between said buyers and sellers to ultimately determine a contract price…. The ultimate price (within the range) is determined based upon the buyer's performance rating, or score, which the buyer receives from participating in a collateral activity . . . . The activity may be a video game (including audio/visual games), electronic board game, crossword puzzle or other word game, sports bet, card game, or any other activity or combination of activities.

'253 patent at 2:17-35; see also id. at 4:3-5; 5:22-24. Specific examples of PDAs disclosed in the specification include a bridge game where the buyer would be dealer and North and would be playing with three other individuals; a Mark McGwire trivia quiz of ten questions; an offer to predict which major league baseball player will be the first to reach fifty homeruns this season; a game of keno; a classic PacMan video arcade game; a simulated stock market; sports wagering; Trivial Pursuit; Monopoly; and simulated horse racing, among others. '253 patent at 5:53-60, 7:53-54, 7:66-67, 8:6-10, 8:16-26. It is further noted that a "wide variety" of PDAs may be used. Id. at 7:14-16. These disclosures indicate that a broad range of activities are contemplated by the patentee's use of the term "PDA."

The prosecution history further supports this conclusion. After a Final Rejection from the United States Patent and
Trademark Office, the applicant appealed the examiner's decision to the Board of Patent Appeals and Interferences ("BPAI"). See RESPONSE, SISTOS DEC., EXH. 2 at 65, 115. The BPAI held that certain claims were patentable. The BPAI also indicated that it took a broad view of the activities comprising a PDA. Id. at 155.

We find nothing in claim 1 that limits the claim to only "competitive or entertainment-based" activity. Rather, the claim merely recites "a Price-Determining-Activity (PDA)"). Nothing in the claim requires that the PDA be read as competitive or entertainment-based. Further, Appellant's specification recites at page 3, lines 18-29, that the collateral activity may be "any other activity or combination of activities. 5

Id. The intrinsic record makes unambiguously clear that a PDA is not limited to an "inherently entertaining activity," as Defendants propose.

5 This interpretation sets forth the broadest reasonable interpretation of the term. See In re Trans Texas Holdings Corp., 498 F.3d 1290, 1295 (Fed. Cir. 2007). While the courts are bound by different standards for claim construction, this interpretation is a part of the prosecution history and should be considered by the Court as part of the intrinsic record. See Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc); Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 (Fed. Cir. 1996).

The parties agree that the "collateral" or "intermediary" nature of the PDA should be included in the construction. RESPONSE at 5-6; REPLY at 3-4. However, the parties dispute whether the term "collateral" sufficiently defines the term. REPLY at 4-5. At the hearing, Plaintiff indicated that it would agree to defining "collateral" as "not otherwise part of a conventional or traditional sales transaction." Defendants indicated that they agreed if the terms "conventional" and "traditional" were not in the definition.

In support of including the term "traditional" or "conventional," Plaintiff points to the specification of the '253 patent which indicates that the invention differs from "traditional transaction methods" in a number of ways. '253 patent at 1:19-25. While the patentee does refer to the state of the art in this manner, the Court sees no reason to include the term in the construction. The specification indicates that the PDA is collateral to the purchase transaction between a buyer and seller. See '253 patent at 1:17-48. This purchase transaction comprises "[s]ellers offer[ing] a product or service within a specified price range, and buyers enter[ing] into a contract to buy the product or service within that price range. Id. at 2:20-23. The specification also notes that the buyer may provide payment information in a number of ways, including "via phone, regular mail, e-mail, or any other means" and this disclosure "preferably occurs prior to allowing the buyer to participate in the PDA." Id. at 5:4-35. In conjunction, these excerpts indicate that the PDA is collateral to a sales transaction and one part of a sales transaction involves disclosing payment information, which need not occur in a "traditional" manner--it may occur via e-mail or "any other means." Id. Therefore, the Court finds that the proper construction of the term "price determining activity" is "any form of competition or entertainment activity or combination of such activities that is used to determine the price paid for the product or service and is not otherwise part of a sales transaction."

4. "Price for a Credit Account" and "Price for a Proposed Credit Account"

Walker proposes that these claim terms should be construed to mean "[a]n exchange of value expressed as the composite credit or account parameters that a credit card issuer is willing to offer a customer, together with any fee or credit for modifying or entering into the credit account." Capital One disagrees with this proposed construction and instead proffers that the court should construe this term to mean "[a] one time fee or credit for modifying or entering into a credit account."

Initially, it is important to note that the court finds that there is no support for Capital One's proposed limitation that the fee be limited to "one time." This "one time" limitation can be found nowhere in either of the Walker Patents. Although the preferred embodiment and Figure 7 do indicate that the customer makes a determination as to whether the account price is
acceptable, there is no indication of a limitation that this fee is charged only "one time." Indeed, it is possible that a customer could agree to pay a recurring fee in exchange for the ability to, as an example, keep her interest rate lower than it otherwise would be.

The court also does not find support for Walker's contention that the claim term "price for a credit account" should be construed in terms of "an exchange of value expressed as the composite credit or account parameters that a credit card issuer is willing to offer a customer, together with any fee or credit for modifying or entering into the credit account." The somewhat convoluted definition Walker proffers more appropriately describes: a) a transaction (exchange of value), in the first part of the sentence; and b) that which is received in exchange for the price, in the second half of the sentence. Thus, Walker attempts to construe "price" to mean "everything in a transaction, including the transaction itself." This result does not comport with the ordinary meaning of the term "price." Walker argues that the patentee acted as his own lexicographer when he wrote that:

the phrase 'calculating the price', or equivalent phraseology used herein to describe an exchange of value for a change in credit terms, contemplates not only the computation of a price to be paid by the customer, but also circumstances in which the price or fee may be zero, or even where the credit issuer may provide a payment or credit to the customer for accepting new terms more favorable to the credit issuer."

('478 patent, Col. 8:14-21). The key phrase here is "exchange of value for a change in credit terms." At its essence, this phrase describes a transaction whereby "value" is exchanged "for a change in credit terms." But it is important to note that the price is not the exchange of value in this transaction. Rather, the price is the amount of value that is exchanged. This interpretation is reinforced by the patentee's willingness to interchange the words "price or fee" and the recognition that the price or fee could be zero.

The specification refers to a method of pricing a credit account including "receiving the credit parameters, calculating a price for a corresponding credit account, and outputting the price." ('478 patent, Col. 2:45-49). It also states that the price of modifying the account is based on the credit card parameters received from the agent terminal along with the customer parameters from the customer database. ('478 patent, Col. 6:49-52). The specification also discusses a "base price" ('478 patent, Col. 6:61) that is then adjusted taking into consideration desired changes to the parameters of the existing account and the "price" for the adjustments is then determined. ('478 patent, Col. 7:3-58). The specification also states that the "price calculated based on the credit parameters may also be modified by customer parameters." ('478 patent, Col. 7: 66-67). The preferred embodiment includes a process whereby the customer can trade off various parameters and after the customer revises the credit card parameters, "the new credit card parameters are processed by the system in the same way as the original credit card parameters to generate a new price." ('478 patent, Col. 8:43-48). For new accounts, the '478 patent acknowledges that there are no pre-existing credit parameters on which the "price for opening a new account" can be based and suggests using a set of "standard parameters." ('478 patent, Col 8:65-67).

Given the consistent language used throughout the specification and taking into consideration what a person of ordinary skill in the art at the time of the invention would have considered these claim terms to mean in the context of the entire patent, the court construes the terms "price for a credit account" and "price for a proposed credit account" to mean "a fee or credit (that may be zero) for modifying or entering into a credit account, based on the credit or account parameters."
the price may vary within which the price may vary

Plaintiff argues that, like the previous term, Defendants' construction improperly requires a "specific" upper and lower bound for the price range. OPENING at 30. Defendants argue that the range must be specified because the Abstract and Summary of the Invention sections of the '253 patent use this term. RESPONSE at 27-28.

Claim 1 of the '253 patent discloses:

1. A method of doing business over a global communications network comprising the steps:
   
   communicating to a buyer via the global communications network, a description of a product;

   accepting a first request from the buyer to buy the product for a price to be determined within a price range;

   accepting a second request from the buyer to allow the price to be determined based upon a performance of the buyer while participating in a Price-Determining-Activity (PDA);

   receiving data from the buyer over the global communications network, said data representing the performance of the buyer during the PDA; and

   determining the price of the product based at least partially upon the data received, said price being within the price range and scaled to the performance of the buyer.

'253 patent at 9:31-49 (claim 1). The specification refers to "a specified price range," "that price range," "a certain price range," "a price range," and "the price range." See, e.g., id. at 2:21, 2:22-23, 2:47-48, 2:65, 3:6-7. While the specification does refer to a "specified price range," the specification refers to a price range without this modifier on a number of occasions. See, e.g., id. at 2:65, 3:6-7, 4:52, 3:63. In whole, the intrinsic record fails to indicate that a "specified" price range is required. Therefore, the Court finds that the proper construction for "price range" is "upper and lower bounds within which the price may vary."

3329

12. Claim Construction of "price selection switch" (11[p.4])

The parties disagree over the meaning of the term "price selection switch" in claim 11. Mars contends that claim 11 of the '903 Patent is directed to and limited to a vend control system capable of vending at multiple prices. As evidence, Mars points to the prosecution history of claim 11. This prosecution history reveals that the initial version of claim 11 of the '903 Patent submitted to the United States Patent and Trademark Office (USPTO) made multiple references to a "price selection switch." (Def's Ex. 471, at 37-38.) After the rejection of the initial version, Mr. Levasseur resubmitted the patent with changes to claim 11 that included replacing three occurrences of "price selection switch" with "product selection switch." (Id.) However, even after this amendment, one occurrence of the phrase "price selection switch" remained within claim 11. (Id.) Thus, the evidence shows that the drafter of the '903 Patent deliberately allowed a single reference to a "price selection switch" to remain within claim 11 of the '903 Patent despite a clear intention to replace other references to "price selection switch" with "product selection switch." The prosecution history makes clear that the drafter of the '903 Patent intentionally chose to use the different words "price" and "product" to refer to two separate concepts. This raises the question of to what extent the Court should construe the term "price selection switch" differently from a "product selection switch." Mars is correct that "the use of [two] terms in close proximity in the same claim gives rise to an inference that a different meaning should be assigned to each." Bancorp Servs., L.L.C. v. Hartford Life Ins. Co., 359 F.3d 1367, 1373 (Fed. Cir. 2004); see also Ethicon Endo-Surgery, Inc., 93 F.3d at 1579. Although "it is not unknown for different words to be used to express similar concepts, even though it may be poor drafting practice," Bancorp Servs., 359 F.3d at 1373, the specification of the '903 Patent provides ample evidence that "price selection switch" and "product selection switch" refer to two different capabilities. The description of the single-price embodiment of Figure 1 refers to elements 12, 14, 16, and 18 as "product selection switches." '903 Patent col.3, lines 48-49. In contrast, the description of the multi-price embodiment of Figure 6
refers to "price selection switches." '903 Patent col. 6, line 65 - col. 7, line 11. n39 Because the prosecution history shows an intent to differentiate between price and product selection switches, and the specification places the words within different contexts, the Court construes "price selection switch" and "product selection switch" to have different meanings.

n39 The reference to "price selection switches" at column 3, lines 66-67 appears to be a generic reference to elements that come later in the specification.

Therefore, a "price selection switch" actuatable by a customer must mean that the customer is choosing one price from among more than one price. This is separate from a "product selection switch" which differentiates between different products. Because choosing one price from among more than one price requires a vending machine with a multi-price construction, claim 11 must refer to a vending machine that operates at multiple prices. n40

n40 Because the words of claim 11 later refer to a "product selection switch," one reasonable interpretation is that a "product selection switch" includes a "price selection switch." However, the context of claim 11 and the specification also indicates that a "price selection switch" does not necessarily include a "product selection switch."

Just as Mars contends that claim 11 is limited to a multi-price construction, Mars also contends that claim 1 is directed to and limited to a vend control system capable of vending at multiple prices. The Court disagrees. Because the language of claim 1 does not contain the same reference to "price selection switch," the Court construes claim 1 as not limited solely to a multi-price construction. n41

n41 It is not clear to the Court how either party wishes to apply this claim construction to infringement.

Disputed Claim Term or Phrase | Versata's Proposed Construction | SAP's Proposed Construction |
--------------------------------|-------------------------------|-----------------------------|
"pricing adjustment(s)"        | Plain meaning.                | The terms "pricing adjustment" and "price adjustment" mean a denormalized number that may affect the determined price. |
"price adjustment(s)"          | If further construction required, this term means: "adjustment(s) related to pricing." | |

With respect to these terms, the key dispute is whether they should be limited to "denormalized numbers," as suggested by SAP. 1
The '400 patent expressly defines a "denormalized number." "[D]enormalized' numbers refers to numbers that do not have a fixed unit and may assume a different meaning and different units depending on the pricing operation that is being performed. In other words, each denormalized number has a unique significance." '400 Patent, col. 8, ll. 47-52.

Versata argues that the claims are not so limited, and that claim differentiation and consistency counsel against SAP's proposed limitation. For example, claims 6 and 7 of the '350 patent read as follows:

6. The method of claim 1 wherein the pricing information comprises pricing adjustments.

7. The method of claim 6 where the pricing adjustments comprise denormalized pricing adjustments. (emphasis added).

Versata argues that the doctrine of claim differentiation directs that the disputed term as contained in claim 6, e.g., should not be limited by a specific limitation appearing in a subsequent dependent claim. 2

Regarding consistency, claim 2 of the '400 patent requires a "pricing adjustment" to include one or more "pricing types." Applying the stipulated construction of "pricing type"--a class or category of pricing adjustments--and a citation from the specification which indicates that various "pricing types" may include non-denormalized numbers, Versata argues that the court's goal of defining each term consistently would be undermined through the imposition of the limitation urged by SAP.

Turning to the specification, Versata further argues that "denormalized" describes a preferred embodiment. For example, Versata asserts that the specification simply discusses the possibility of using denormalized numbers, which teaches against a limiting construction. See '400 Patent, col. 10, ll. 45-48 (stating, "The numbers in this column are used to arrive at a price adjustment. The numbers in this column are 'denormalized,' meaning that each number in this column has a unique significance.").

In response, SAP argues that pricing adjustments are properly limited to "denormalized numbers" as suggested through the patent's consistent use and reference to the "denormalized" embodiment as "this invention," and through the specification's emphasis on "denormalized" as a distinguishing feature over prior art. See '400 Patent, col. 4, ll. 27-30; col. 8, l. 40-col. 9, l. 2; col. 10, l. 54-col. 11, l. 25; col. 11, ll. 15-36; col. 11, ll. 34-44; col. 11, ll. 45-67. SAP further argues that the patents' use of "this invention" in the abstract and summary of the invention sections provides even stronger support for its contention. See '400 Patent, abstract; col. 3, l. 63-col. 4, l. 6. SAP also addresses Versata's argument, asserting (1) the claimed embodiment is manufactured by Versata; (2) the doctrine of claim differentiation is trumped by the disclaimer as addressed above; and (3) the "non-denormalized" examples cited by Versata are actually discussions of "denormalized" price adjustments.

The court concludes that SAP's argument is persuasive. Under these circumstances, there is convincing evidence that the scope of the invention is limited as proposed by SAP, even in light of the doctrine of claim differentiation and the court's goal of construing claim terms consistently. See O.I. Corp. v. Tekmar Co., Inc., 115 F.3d 1576, 1582 (Fed. Cir. 1997); Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999). The specification consistently describes "this invention" as utilizing denormalized numbers--the patent discusses "this invention" in the context of denormalized numbers or tables no less than ten times. See Alloc, Inc. v. ITC, 342 F.3d 1361, 1368-69 (Fed. Cir. 2003); Watts v. XL Sys., Inc., 232 F.3d 877, 883 (Fed. Cir. 2000); Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1348 (Fed. Cir. 2004); Verizon Servs. Corp. v. Vonage Holds. Corp., 503 F.3d 1295, 1308 (Fed. Cir. 2007); Honeywell Int'l Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006). Second, there are a number of instances in which the specification distinguishes the present
invention over prior art precisely for the reason that the prior art did not use denormalized numbers--in fact, in one instance, the specification distinguishes SAP's R3 product as disadvantaged because R3 does not use denormalized price tables. '400 Patent, col. 11, ll. 34-44. The failure to use denormalized tables is criticized because it requires numerous database accesses to multiple price tables. See Astrazeneca v. Mutual Pharm. Co., Inc., 384 F.3d 1333, 1340 (Fed. Cir. 2004); O.I. Corp., 115 F.3d at 1581-82; Alloc, Inc., 342 F.3d at 1368-72; Honeywell Int'l, 452 F.3d at 1318. Under the circumstances, the patentee limited the scope of price adjustments to denormalized numbers.

For these reasons, the court defines "pricing adjustment(s)" and "price adjustment(s)" as "a denormalized number that may affect the determined price."

This term appears in only the '350 patent. The issue regarding this term, similar to the previous term, is whether the term excludes price adjustments that are not denormalized numbers.

Versata argues that "pricing information," as used in the specification, refers to a number of various types of information relating to pricing. See '350 Patent, col. 1, ll. 26-27; col. 9, ll. 12-15; Fig. 1; cl. 8; cl. 9. Furthermore, as indicated by claims 6 and 24, "pricing information" encompasses both price adjustments and denormalized price adjustments. As this term appears in only the '350 patent, SAP argues that the disclaimers that effectively limit the above terms also limit the scope of "pricing information."

As discussed earlier, the '350 patent is a continuation of the '400 patent. "A continuation is a second application for the same invention claimed in a prior nonprovisional application and filed before the original becomes abandoned or patented." MPEP § 201.07 (rev. July 2008); see also Microsoft Corp., 357 F.3d at 1348-49 (finding disclaimer across three continuation patents).

The court is persuaded that the patentee limited price adjustments to denormalized numbers. As such, the court limits the scope of "pricing information," as well and adopts SAP's construction.

A. "primary circuit"

By adopting Chairman Bragg's supplemental views, the Commission adopted her construction of claims 1 and 9 of the '903 patent. The Commission, therefore, determined that "primary circuit" "means the circuitry that performs the primary task for which the semiconductor chip is designed and excludes the auxiliary circuitry that is added to furnish the identification capability." Supplemental Views at 17. In other words, the primary circuit includes "everything but the product information array and the access circuitry." Id. This court detects no error in that construction.
The term "primary circuit" has not been argued by the parties to be a term of art or to have any special meaning to those of skill in this art. The written description informs the meaning of "primary circuit." The written description first defines "primary circuit" as the "portion of the chip which performs the primary function of that circuit." Col.1, ll. 66-68. The written description further describes the primary circuit as being "the memory array and associated decoders, gates and buffers." Col. 3, ll. 36-37. Furthermore, the written description uses the terms "primary circuit" and "memory array" throughout but never limits the primary circuit to the memory array alone. Accordingly, the written description supports the Commission's construction of primary array as "any circuitry present in an integrated chip before the addition of the rest of the circuitry that implements the invention." Supplemental Views at 20.

The doctrine of claim differentiation also underscores that "primary circuit" does not refer to the memory array alone as alleged by respondents. Although claim 2 was found to be invalid for indefiniteness, a finding that Atmel has not contested on appeal, dependent claim 2 provides guidance for the interpretation of broader claim 1. Specifically, claim 2 recites "[a] device as set forth in claim 1, wherein said primary circuit is a semiconductor memory having a first portion arranged to provide a primary memory array . . . ." Dependent claim 2 narrows the meaning of the term "primary circuit" of claim 1 to a semiconductor memory providing a memory array. This claim thus suggests that "primary circuit" as used in claim 1 has a broader scope than a semiconductor memory with only a memory array.

As defined by the Commission, the decoders and buffers are part of the primary circuit. This definition, however, does not define an inoperable device. As explained above, decoders and buffers retrieve and read out information from the product information array. In addition, the "access means" functions to prevent access to the primary circuit when information is read from the product information array. Thus, it might appear that, with decoders and buffers as part of the primary circuit, the product information array could not be read. To the contrary, the Commission's reading of the claim accommodates a meaning of "access means" that includes decoders. The decoders, as already noted, are also part of the primary circuit. Likewise, the output buffer is a common structure to both the "primary circuit" and "output means" claim elements.

This court's predecessor, The United States Court of Customs and Patent Appeals, held that a single structural element may perform two functions and may also support two different claim terms. In re Kelley, 49 C.C.P.A. 1359, 305 F.2d 909, 914, 134 U.S.P.Q. (BNA) 397, 401 (CCPA 1962) (the same cylinder is both the "means for reducing said actuating force" and the "power driven actuator"); cf. Reed v. Edwards, 26 C.C.P.A. 901, 101 F.2d 550, 554, 40 U.S.P.Q. (BNA) 620, 622 (CCPA 1939) (holding that different parts of a single element could support two means clauses); see also Landis, Mechanics of Patent Claim Drafting, § 21 (4th ed. 1999) ("If two differently named elements of a claim each contain some or much common structure, but not entirely common structure, it is not double inclusion to give those elements different names so long as at least some structure is different."). Thus, the Commission correctly discerned that a single structure, such as a decoder or a buffer, may support two different claim limitations when such a reading "is a reasonable construction of the language of the claims." In re Kelley at 1367.

According to the written description and claims of the '903 patent, when the access logic receives the first signal for selecting the primary circuit, it enables the row decoder. The access logic and row decoder thus function as part of the access means. The row decoder and column decoder then "perform the primary function of the circuit," namely retrieving information from the memory array. In this scenario, the output buffer and pins also "perform the primary function of the circuit," presenting the retrieved memory array data. The row and column decoders and the output buffer and pins thus function as components of the primary circuit.

When the access logic receives the second signal for selecting the product information array, it disables the row decoder. This action prevents access to the row decoder and the rest of the primary circuit. In this capacity, the column decoder no longer functions as part of the primary circuit. Rather it retrieves information from the product information array. Similarly, the output buffer and pins perform a non-primary function of presenting the retrieved product information array data. Thus, the output buffer and pins form the structure of the "output buffer" when they are not functioning as part of the primary circuit. Therefore, under this court's construction of primary circuit, including, e.g., decoders and buffers, claims 1 and 9 of the '903 patent remain operable.
Cisco's proposed construction for "primary router address" is "address associated with the router for a particular interface as a principal identifier of the router." Alcatel's proposed construction is "the network layer address of the router."

Alcatel's contends that its proposed construction is supported by the specification, which refers several times to a "primary IP address." See, e.g., Li, at 9:38-42, 10:63-65. While this is certainly true, the specification also refers several times to a "primary MAC address." See, e.g., Li, at 15:41-48, 15:63-16:32. Furthermore, the claim language itself does not indicate whether the "primary router address" is required to be a network layer address or a MAC address, although the patent only identifies the primary address as being either a network layer address or a MAC address. Aside from those references, however, neither the patent language nor the parties offer any additional guidance as to the proper construction of the term "primary router address."

Nevertheless, it is apparent that the claim language does not limit the "primary router address" to only the network layer address, or to any particular type of address for that matter. Additionally, the use of the terms "primary IP address" and "primary MAC address" in the specification indicate that "primary address" is referring to the principal identifying address of the router, as opposed to the "virtual address," which is the address of the router when it is emulating the "virtual router."

Therefore, the Court construes the term "primary router address" as "address associated with the router as a principal identifier of the router."

a. "primary site data"

Claim 1 calls for "a remote server assembly, said remote server assembly including a quantity of primary site data." Citrix contends that the term "primary site data" should be construed as "the principal data that a user of the claimed system seeks to access and interface with," while Rothschild proposes that the term means "data at a location on the remote server assembly." "Primary site data" is not a term of art in the computer science field.

Rothschild argues that "primary" modifies "data" and that "primary site data" is primary because it is located on the primary (first) site one accesses when using the technology described in the '534 Patent. Conversely, Citrix argues that "primary" modifies "data" and is the "principal data" one seeks to access. Citrix's construction is consistent with basic tenets of grammatical construction. Moreover, Citrix's contention is not supported by the Patent. Because the parties are in agreement that the primary site data is located on the remote server assembly as consistently set forth in the '534 Patent, the Court construes "primary site data" to mean: data at a location on the remote server assembly.

a. primary voltage

It appears to the Court that both Fairchild and Power Integrations agree that a "primary voltage" means a "base or initial voltage." (D.I. 152 at 11; D.I. 166 at 37). However, Fairchild contends that the primary voltage must, by definition, be generated by the primary voltage source. Fairchild contends that the voltages and voltage sources must be considered together, because the voltage must be generated from some source. Fairchild contends that a construction which ignores the source blurs the distinction between the primary and secondary voltages, because the claim describes the secondary voltage as being generated from a secondary voltage source. Thus, Fairchild maintains that the primary voltage cannot come from the secondary voltage source as Power Integrations suggests.

Power Integrations contends that any claim limitations with respect to how the secondary voltage is generated should not be imported into the meaning of the term "primary voltage." Power integrations contends that nothing in the patent limits the primary voltage to a voltage generated solely by a primary voltage source. (D.I. 152 at 11-12; D.I. 164 at 18-19).
Reviewing the disputed term in light of the claim language and the specification, the Court concludes that the term "primary voltage" means "a base or initial voltage" and that the term should not be defined by reference to the source from which it may be generated. Neither the claim language nor the specification describe how the primary voltage source is generated, and therefore, the Court declines to construe the term to require a distinct source.

2. "Printed board" and "Wire on a printed board"

The parties have asked the court to construe "printed board" and "wire on a printed board." Because construction of these two terms involves the resolution of a single disputed issue, namely, whether a wire on the printed board must be printed or can be discrete, the court will address the construction of these terms together.

Claim 1 of the '641 patent uses these terms as follows:

1. A modular jack to be mounted on a circuit board, said modular jack comprising:

   a printed board containing an electronic element for suppressing noise;

   a contactor for contacting with a plug, said contactor being electrically connected with the electronic element by a wire on the printed board;

   a terminal for contacting with the circuit board, said terminal being electrically connected with the electronic element by a wire on the printed board; and

   an insulating housing for encasing the printed board.

As to "printed board," Murata proposes the following construction:

A generally flat piece of material typically fabricated from insulating material that provides support and structural integrity for a plurality of interconnected components comprising a circuit. In printed circuit board technology, some or all of the conducting interconnection pattern is formed on the board.

Murata's Opening Brief, at 17. Bel Fuse proposes:

A flat board made of nonconducting material on which electronic components are adapted to be mounted and electrically connected by a pattern of conductive metal pathways or traces that are printed on the surface of the printed board.

Bel Fuse's Responsive Brief, at 11. Thus, the parties' primary dispute as to the construction of "printed board" is whether all of the wires on the printed board must be printed.

As to "wire on the printed board," Murata proposes: "A conductive metallic element interconnecting various regions, or contributing to the interconnecting of various regions, on the printed board." Murata's Opening Brief, at 20. Bel Fuse proposes: "A conductive metal pathway or trace formed (printed) on a surface of a printed board for electrically connecting components held on the board." Bel Fuse's Responsive Brief, at 11. As with "printed board," the parties dispute whether a "wire on the printed board" must be a printed wire.

The court begins with an examination of the specification of the '641 patent. As part of the summary of the invention, the specification states: "A contactor for contacting with a plug and a terminal for contacting with a circuit board are electrically connected with the electronic element by wires on the printed board." '641 Patent, col. 2, ll. 1-4. The specification also describes three preferred embodiments. As to the first embodiment, it states that "the printed board 30 has printed wires 33 and 34 on both sides," id. at col. 3, ll. 23-24 (emphasis added), and "[i]n order to increase and decrease the number of signal circuits, it is only required to change patterns of the wires 33 and 34 on the printed board 30." Id. at col. 3, ll. 59-62.

"Design of the wires 34 on the printed board 30 is comparatively free, and the pitch P among the holes 32, that is, the pitch
among the terminals 36 can be set to 1.02 mm which is the pitch of an ordinary circuit board on which the modular jack is mounted." Id. at col. 4, ll. 11-16. Likewise, the second and third embodiments disclose printed wires. See id. at col. 4, ll. 22-23 ("printed wires 44 and 45 on the board 41 are connected to chip inductors 40."); col. 4, ll. 37-39 ("printed wires 54 and 55 and an earth electrode 57 on the board 51 are connected to the [chip] capacitors 50."). Finally, the specification states:

Although the present invention has been described in conjunction with the embodiments above, it is to be noted that various changes and modifications are apparent to those who are skilled in the art. Such changes and modification are to be understood as included within the scope of the present invention defined by the appended claims.

Id. at col. 4, 11. 50-56.

Thus, the preferred embodiments in the specification of the '641 teach only printed wires on the printed board, but the specification does not expressly exclude the use of discrete wires and states that the invention includes variations to the preferred embodiments that would be apparent to persons of ordinary skill in the art. The question then becomes whether a person of ordinary skill in the art would recognize that some of the printed wires could be replaced by discrete wires.

Murata argues that jumper wires are well-known in the art; jumper wires create "a direct electrical connection, which is not a portion of the conductive pattern, between two points in a printed circuit." The Modern Dictionary of Electronics 532. Murata also cites a photo of an IBM circuit board which includes a jumper wire and the NASA Workmanship Standards which provide standards for the use of jumper wires on printed boards. Exs. 26 and 30 to Murata's Opening Brief. Because the use of jumper wires is well-known in the art and the patent does not specifically exclude them, Murata argues that "printed board" as used in claim 1 of the '641 patent can include discrete wires as well as printed wires and that "wire on a printed board" as used in claim 1 can be either a discrete wire or a printed wire.

Bel Fuse argues that a "wire on a printed board" as used in claim 1 includes only printed wires. Bel Fuse relies on the description of the preferred embodiments in the specification of the '641 Patent, which, as discussed above, include only printed wires. Bel Fuse also argues that one of the objects of the invention of the '641 Patent is that "[a] change in wire patterns on the printed board meets an increase of the required number of signal circuits, thereby never requiring more space." ‘641 Patent, col. 2, ll. 15-18. Because wire patterns on a printed board are composed of printed wires, Bel Fuse argues that, to achieve this advantage, the invention must include only printed wires. However, Bel Fuse has not explained why this advantage could not be achieved if a discrete wire was used for a connection while the remaining pattern was composed of printed wires, and Bel Fuse does not argue that discrete wires on the type of printed board used in the '641 patent are not known in the art.

Significantly, limiting a "printed board" to one with only printed wires or traces and a "wire on a printed board" to a printed wire would restrict the interpretation of these terms to the preferred embodiments, despite language in the specification saying that modifications apparent to a person of ordinary skill in the art are not excluded. Murata has provided evidence that the use of jumper wires is known in the art, and Bel Fuse has provided the court with no reason to believe that such the modification of using a jumper wire(s) would not have been apparent to a person of ordinary skill in the art. Thus, the court finds that adopting a construction that excludes discrete wires would improperly import a limitation from the specification into the claims. Phillips, 415 F.3d at 1323 (stating that courts should avoid "reading limitations from the specification into the claim"). The court construes "printed board" as "a generally flat piece of material typically fabricated from insulating material that provides support and structural integrity for a plurality of electrically interconnected components comprising a circuit, with some or all of the conducting interconnection pattern formed on the board," and the court construes "wire on the printed board" as "a conductive metallic element interconnecting various regions, contributing to the interconnecting of various regions, on the printed board."

C. Ref. No. 4 "Printed Paper"

This term is recited in Claims 1, 2, 17, 20, and 22 of the '787 Patent.

Plaintiff provides the following construction: "A non-intangible storage medium separate from the memory of the voting
machine (and thus portable), in which the records stored or contained therein if changed would leave evidence of that change. Here, the non-intangible medium is printed by a printer." Defendants' construction is: "A reviewable printout of the voters' voting selections or choices or a corresponding voting session identifier that is retained by the voter." Defendants' interpretation of this term is taken from the Court's construction of the terms "tangible receipt," "printed receipt," and "printed paper" in the prior lawsuit. (See Avante, 4:06cv1978 TCM, Doc. 276 at 26-30.)

The specifications of the instant patent provide that there is a "printed receipt [] for each voter at the conclusion of his voting": that following the voting session, the voting machine provides a tangible record of the individual's vote "in the form of a printed receipt PR, to the voter"; that each voter may use the voting session identifier to check his or her voting record posted on the printed receipt; and that "[t]he voter may keep the printed record for his/her own reference." (Defs. Ex. 3, Col. 6 ll. 7-8; Col. 6, l. 66-Col. 7, l. 4; Col. 7, ll. 45-50; Col. 14, ll. 13-14.)

As in the '730 Patent, the term "printed paper" is used to modify the term "receipt" in the '787 Patent. (See id. Col. 9, l. 63.) Moreover, the '787 Patent specifications provide that each voter deposits the smart card into a collection box but the "voter retains the printed voting receipt." (Id. Col. 6, ll. 37-41.) (Emphasis added.) This is identical to the language in the '730 Patent specifications. Plaintiff presents no new argument or distinction in the Claim or specification of the '787 Patent that causes the Court to construe "printed paper" in a manner different from the construction of the same term in the '730 Patent.

The term is construed as follows:

A reviewable printout of the voters' voting selections or choices or a corresponding voting session identifier that is retained by the voter.

D. Ref. No. 6 "Printer"

The term "printer" is recited in Claim 49 of the '209 Patent. 2 Plaintiff provides the following construction for the term "printer": "A commonly known device that provides a specific type of tangible medium (i.e., a printer paper)." Defendants' construction is: "A printer that retains no record of the data printed (including but not limited to a thermal jet printer, a dot matrix printer, an ink-jet printer, a bubble jet printer, a laser printer, and the like)."

2 In the parties' joint construction of terms, the term "printer" is said to be recited in Claim 31. Defendants' brief refers to Claim 49 as the appropriate Claim. The Court notes that the term "printer" does not appear in Claim 31 and will construe the term as it appears in Claim 49.

Claim 49 states that the printer provides a tangible receipt for each voting session. (Id. Col. 45, ll. 65-66.) The patent specifications provide that the printer is of a type that "retains no record of the data printed" and that the printer is "such as a thermal printer, a dot matrix printer, an ink-jet printer, a bubble jet printer, a laser printer and the like, which are conventional." (Id. Col. 11, ll. 55-63.)

Accordingly, the Court construes the term as follows:

A printer that retains no record of the data printed (including but not limited to conventional printers such as a thermal printer, a dot matrix printer, an ink-jet printer, a bubble jet printer, or a laser printer.)
J. Ref. Nos, 15, 22, and 24 "Printer."

This disputed term is recited in or referred to in Claims 5, 21, and 24.

The parties have agreed that Ref. Nos. 15, 22, and 24 should be grouped together because they can be decided on the construction of the single term "printer."

The Court adopts the reasoning set forth in Ref. No. 13, discussing the inventor's intention that the printer provide no additional record of the voting event. 

A printer that retains no record of the data printed (including but not limited to a thermal jet printer, a dot matrix printer, an ink-jet printer, a bubble jet printer, a laser printer, and the like).

2. Prior

Artesyn urges the Court to define the words "prior to" as meaning "before" in the element of the claim that states "a switch control circuit operating said auxiliary switch in accordance with a control logic such that (a) said auxiliary switch is opened prior [to] the ON period of said primary switch."

In Unitrode, I held: "By its usage of the word 'prior,' Claim One requires some delay between the 'ON period' of the auxiliary switch and the 'ON period' of the primary switch. The claim does not, however, specify the length of the delay." 130 F. Supp.2d at 191. The term "prior" was not a focus of either proceeding because neither Unitrode nor Lucent disputed that the claim language required a delay prior to the "ON period." Artesyn urges the Court to reconsider this construction based on three arguments.

First, citing the dictionary definition, Artesyn argues that the words "prior to" do not require a delay between the ON period of the primary and auxiliary switches, so long as the ON period of the auxiliary switch immediately precedes chronologically the ON period of the primary switch. According to the dictionary, "prior to" means "preceding; before: Prior to that time, buffalo had roamed the Great Plains in tremendous numbers." Random House Unabridged Dictionary, 1540 (2d ed. 1987) (Random House). See Texas Digital Sys. Inc. v. Telegenix, 308 F.3d 1193, 1202 (Fed. Cir. 2002) (emphasizing the importance of ordinary meaning as defined in dictionaries). The words "prior to" mean before or preceding, but the dictionary definition does not indicate how long before. Artesyn fairly argues that in some contexts "prior to" can mean immediately prior to, without a delay. As illustration, counsel explicated: "Yesterday was prior to today, your Honor. But there is no dead time between yesterday and today. . . . If A happens prior to B, there doesn't have to be a delay in between them. One can happen immediately after, the instant in time after the other one." (Hearing Tr. 20.)

Shoehorning its "anticipation" argument into the Markman hearing, Artesyn argues that the claim captures "coincident switching" as it existed in prior art. In idealized coincident switching there is a point in time when the controllable current in each switch is zero. (See Hearing Ex. 2,4.) The element is met, they explain, so long as the auxiliary switch enables current (that could otherwise be blocked) before the primary switch enables current (that could otherwise be blocked). Bassett, Artesyn's expert, testified that "for a coincident switching, the auxiliary switch stops conducting controllable current prior to the [time the] primary switch starts to conduct it." (May Hearing Tr. 33.)

There are two problems with this construction. First, it is inconsistent with the structure of the claim read in light of the specification. Vicor points out that Claim One contains a switch timing "control logic" in three phases. Clause (b) states "Said auxiliary switch remains open throughout the ON period of said primary switch." Vicor argues that Clause (b) ensures no overlap of the switches. If Claim One simply meant no overlap of the switches and permitted coincident switching, then, according to Vicor, Clause (a) and Clause (c) would be redundant. Instead, Vicor explicates, these two clauses are needed to specify delay in the switch timing. This is clarified by the specification, which requires a "delay" and a period of "dead time" in which no current is flowing. Mr. Bassett agreed with the "concept that dead time means there's no current that could otherwise be blocked." (Hearing Tr. 51.) Because the switch-timing requires the delay in the specification, the words "prior to" do not include coincident switching. I Rather, Claim One requires a delay between the opening of the auxiliary switch.
and the "ON period" of the primary switch.

Moreover, while the discussion can become a bit metaphysical, in idealized coincident switching, the transition point could be understood as a theoretical time when the "ON" periods overlap.

Second, a definition of "prior" that included coincident switching would capture prior art. Because the "word to the wise" in 1982 was that overlap was to be avoided, those skilled in the art in 1982 (like Mr. Carsten) practiced coincident switching. The patent history demonstrates that neither the applicant nor the examiner considered coincident switching to be included within Claim One. See Ex. 7 to Vicor's Response to Lambda's Claim Construction Memorandum (Interview Summary of April 1, 1998). Specifically, the examiner noted that Claim One was distinguished over Carsten and Polykarpov based upon the "switch timing." See Id. ("Applicant's attorney was informed that the above two references even if they were earlier art wouldn't anticipate or wouldn't have been obvious over claims 1 and 18, nor do the references disclose the switch timing.")

"Claims amenable to more than one construction should, when it is reasonably possible to do so, be construed to preserve their validity." Karsten Manuf. Corp. v. Cleveland Golf Co., 242 F.3d 1376, 1384 (Fed. Cir. 2001). "However when the claim's language embraces the prior art, the Court is not unlimited in the extent to which it can interpret the claims." Id. Claims cannot be rewritten by the Court to avoid the impact of newly discovered prior art. Id. "Therefore, if the only claim construction that is more consistent with the claim's language and the written description renders the claim invalid, then the axiom does not apply and the claim is simply invalid." Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999).

Where there are two reasonable definitions, one which adumbrates prior art, and one which does not, the Court should choose the latter. This is particularly true when the definition that does not embrace the prior art is consistent with the specification and prosecution history. See Vivid Techs, Inc. v. American Science and Engineering Inc., 200 F.3d 795, 804 (Fed. Cir. 1999) (holding that the "prosecution history is often helpful in understanding the intended meaning as well as the scope of technical terms"); Ekchian v. The Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997) (suggesting statements made to the patent office can be the basis for a court to interpret the scope of the claims).

Taking a different tact, Artesyn makes a third argument that one skilled in the art would have taken switch tolerances (measured by the number of nanoseconds it takes for a switch to open and close a circuit) into account in the control switch timing in order to avoid overlap. Artesyn points to the statutory declaration 2 of the inventor filed in the United Kingdom in 1977:

Both suggest only coincident switching. I was the only one of the three to teach the use of both coincident switching (no overlap, minimized delays) and non-coincident switching (no overlap; small, purposeful, delay to utilize the reversed flow of magnetizing current to charge and discharge parasitic capacitances).

(Hearing Ex. 5.) Mr. Bassett explained:

Well, Mr. Vinciarelli is saying there, that his invention would put in just some little bit of delay just to account for some guard-band on your [switch] tolerances, but put in some significant purposeful delay in addition to whatever delay was required just to avoid overlap, considering all tolerances.

(Hearing Tr. 4.) Although the desired outcome was to accomplish coincident switching with no overlap and no dead time, Bassett testified: "And when you strive for coincident switching, just meeting the requirement to avoid overlap, you will likely end up with some of that dead time." (Hearing Tr. 51.) Only in the "worst case" switches (when the tolerances are at their maximum) would there be no dead time because one current would hit zero while the other current began to rise.

(Hearing Tr. 51-52.) Bassett believes that it was well known in the prior art of Carsten and Polykarpov to use delay in the control circuit to avoid overlap by considering switch tolerances. (Hearing Tr. 43-45.)
2 While a statement of a party in a foreign related judicial proceeding is an admission, see Fed. R. Evid. 801(d)(2), the Federal Circuit has never defined it as part of the "intrinsic" evidence used to construe a claim, which has been primarily limited to the claim, the specification and the prosecution history. See Viterionics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). However, if the foreign pleadings (like the German briefs) were submitted during the reissue proceedings, they morph into intrinsic evidence. It is unclear whether this British statutory declaration was filed during these reissue proceedings.

Again, Artesyn is seeking to bootstrap its anticipation argument into the Markman hearing by using extrinsic evidence (i.e., the Bassett testimony and affidavits from related foreign patent proceedings) to explain why the prior art actually, as a practical matter, sometimes had minimized delays in switch-timing, albeit for a different purpose -- to avoid switch overlap, not to discharge parasitic capacitances.

Vicor disputes the contention by pointing out that Carsten's device actually had overlap as did those of others skilled in the art. Moreover, Vicor contends that a small amount of overlap was tolerable in the prior art, and any delays amounted only to accidental anticipation. See generally Tilghman v. Proctor, 102 U.S. 707, 711-712, 26 L. Ed. 279, 1881 Dec. Comm'r Pat. 163 (1880) (unintended and unappreciated occurrences do not constitute anticipation); Eibel Process Co. v. Minnesota & Ontario Paper Co., 261 U.S. 45, 66, 67 L. Ed. 523, 43 S. Ct. 322, 1923 Dec. Comm'r Pat. 623 (1923) (same). Similarly, Vicor floats the doctrine of "inherent anticipation." See Rosco Inc. v. Mirror Lite Co., 304 F.3d 1373, 1380 (Fed. Cir. 2001) ("Inherent anticipation requires that the missing descriptive material is 'necessarily present,' not merely probably or possibly present, in the prior art.") (citation omitted). This debate is beside the point at this stage. Extrinsic evidence concerning possible anticipation cannot vary the meaning of a claim as derived from the intrinsic evidence, specifically, the claim and the specification language itself.

Finally, Artesyn argues that the Court should not import from the specifications a requirement of "purposeful delay" sufficient to discharge parasitic capacitances. The Court need not address this point because Vicor is not pressing for a claim construction that a delay must be "purposeful." (Hearing Tr. 85.)

3 However, a related issue has been raised in VLT, Inc. v. Power-One, Inc., 2003 U.S. Dist. LEXIS 81, Civ. Action No. 10207-PBS. Power-One seeks a functional definition of delay, which I will discuss in the context of the cross-motions for summary judgment in that litigation.

ORDER

The Court orders as follows:

1. Claims 1 and 5 of the '098 patent are not invalid as indefinite;

2. "Closed" means that a switch is enabled to conduct current that it could otherwise block;

3. "Open" means that a switch is not enabled to conduct current that it could otherwise block;

4. "Prior to" means "before" and requires a delay during which neither the primary nor the auxiliary switch is enabled to conduct current that it could otherwise block;

* * *

- Footnotes -

5 The Court will be construing "delay" in the Power-One litigation.

B. The "Prior" Limitation

VLT next argues that the district court erred in construing the phrase "said auxiliary switch is opened prior [sic] the ON period of said primary switch." VLT asserts that that limitation simply requires some delay between the opening of the auxiliary switch and the closing of the primary switch. Artsyn and Lambda also disagree with the district court's interpretation of the "prior" limitation, but for a different reason: they maintain that the limitation does not require any switching delay. In contrast, Power-One defends the district court's construction, arguing that the "prior" limitation requires a switching delay that is useful to charge and discharge parasitic capacitances and that eliminates or greatly reduces heat loss.

We agree with Power-One that the district court correctly interpreted the "prior" limitation to require a useful switching delay. As the district court observed, the claim language - "said auxiliary switch is opened prior [sic] the ON period of said primary switch" - simply means that the opening of the auxiliary switch must occur before the closing of the primary switch. But we must turn to the other intrinsic evidence of record to determine whether the "prior" limitation requires a switching delay and, if so, how long that switching delay must be.

Although the district court cited the specification as one reason for narrowing the scope of the "prior" limitation, we do not read the specification as identifying any particular delay that must occur between the opening of the auxiliary switch and the closing of the primary switch. On the contrary, the detailed description of the invention refers to opening the auxiliary switch and closing the primary switch at the same time. '098 patent, col. 5, ll. 59-60 ("At time t[1], the auxiliary switch 21 is opened and the primary switch 10 is closed, initiating the first ON period."). Elsewhere, the specification teaches that any delay between the opening of the auxiliary switch and the closing of the primary switch should be kept to a minimum in order to avoid "dead time." Id., col. 7, ll. 4-8. It also discloses, however, that "a small delay is useful to allow the magnetizing current to charge and discharge parasitic capacitances associated with the switches and windings." Id., col. 7, ll. 8-11. To be sure, that statement suggests that a small switching delay may be desirable, but it does so in the context of discussing the design trade-offs between minimizing "dead time" and utilizing a delay during such "dead time" to charge and discharge parasitic capacitances. Viewing the teachings of the specification as a whole, we cannot say that the patentee clearly disavowed reset mechanisms that do not use a small switching delay.

Nevertheless, the prosecution history compels us to construe the "prior" limitation as requiring a switching delay that allows the magnetizing current to charge and discharge parasitic capacitances. During the reissue proceedings, the patentee repeatedly emphasized that the claimed invention, unlike the prior art, introduces a small switching delay for that purpose. For example, the inventor pointed out the lack of "a single prior art reference mentioning the use of a delay in a single-ended forward converter involving active reset for achieving charging and discharging of parasitic capacitances." He further declared that the specification's reference to a "small delay that is useful to allow the magnetizing current to charge and discharge parasitic capacitances" would be sufficient to enable a skilled artisan to achieve "the benefit of the invention." We read those and other statements made by the inventor during the reissue proceedings to represent the patentee's clear disavowal of reset mechanisms that do not employ a small switching delay for charging and discharging parasitic capacitances. 4 See Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452-53 (Fed. Cir. 1985) (stating that claims should be construed so as to exclude any interpretation that a patentee disclaimed during reissue proceedings in order to obtain claim allowance).

4 Although certain claims that were added during reissue specifically recite a "small delay period," the patentee's prosecution remarks also apply to claim 1. During the reissue proceedings, the inventor represented to the Patent and Trademark Office ("PTO") that there are "clearly defined delay requirements" in claim 1 "both as granted and as sought to be amended." The inventor also referred to "the notion (disclosed and claimed in the [original] '146 patent) of using a
Moreover, the examiner relied on the patentee's characterization of the invention as requiring a useful switching delay in allowing the reissued claims, including claim 1, over the prior art. In the Notice of Allowability, the examiner explained that one reason for allowance was that the prior art did not teach "controlling the primary switch to close a short time after the auxiliary switch is opened at the end of the reset interval or [that] the switch timing (small delay) is useful to allow the magnetizing current to charge of [sic] discharge parasitic capacitances associated with the switches and the windings."

Although an examiner's statement does not always limit a claim, the examiner's reasons for allowance in this case make clear that both the patentee and the examiner understood the claimed invention to require a small switching delay. See ACCO Brands, Inc. v. Micro Sec. Devices, Inc., 346 F.3d 1075, 1078-79 (Fed. Cir. 2003) (relying on an examiner's reasons for allowance in interpreting a claim). Thus, in view of the patentee's representations to the PTO during the reissue proceedings and the examiner's reliance on those representations, we conclude that the "prior" limitation of claim 1 requires a small delay between the opening of the auxiliary switch and the closing of the primary switch that is useful to allow the magnetizing current to charge and discharge parasitic capacitances associated with the switches and windings.

The parties further dispute, however, whether the switching delay must also be sufficient to reduce heat loss. We hold that it must. During the reissue proceedings, the inventor criticized the prior art for its "switching losses" caused in part by the "dissipation of energy stored in parasitic capacitances at times when switches are turned on." More importantly, he stated several times that the purpose of using a small delay to charge and discharge parasitic capacitances is to reduce switching losses. We therefore conclude that the switching delay should be long enough to reduce switching losses and, as the district court concluded, includes delay that eliminates or greatly reduces heat loss.

In sum, we affirm the district court's construction of the "prior" limitation as requiring a small delay between the opening of the auxiliary switch and the closing of the primary switch that is useful to allow the magnetizing current to charge and discharge parasitic capacitances associated with the switches and windings. We also agree with the district court that the delay should be long enough to reduce switching losses and that it includes delay that eliminates or greatly reduces such losses.

5 Although it is unnecessary for us to reach the issue, we are not inclined to limit claim 1 through judicial estoppel, as Power-One urges, when the district court did not expressly exercise its discretion to do so. See New Hampshire v. Maine, 532 U.S. 742, 750, 149 L. Ed. 2d 968, 121 S. Ct. 1808 (2001) (observing that "judicial estoppel is an equitable doctrine invoked by a court at its discretion" (citation omitted)).

3. "Prior to any attempted use of the defibrillator" means "prior to any attempted use of the defibrillator to treat a patient, and possibly other uses as well."

The 374 Patent contains several claims covering defibrillator self-test technology with aspects that operate "prior to any attempted use of the defibrillator." 374 Patent Claims 1, 41, 42, 44, 67. Philips relies on the open-ended claim language (i.e., "any attempted use") and contends that the court should construe "use" broadly to encompass non-therapeutic uses including simply turning the defibrillator on or using the defibrillator to perform a manual self-test. Defibtech asserts that "use" is limited to using the defibrillator to treat a patient.

It makes little difference what the phrase "prior to any attempted use" means, because the claims in which it appears impose modifications that resolve the parties' disputes. See supra n.4. Claim 1 covers a defibrillator with "means for" operating a "test signal generator" and a "defibrillator status indicator" "prior to any attempted use." The other four claims, however, contain important qualifying language. Claim 41 is identical to Claim 1 except that, critically, the claimed test signal

-3662-
generator is "periodic." Claims 42 and 44 are method claims for "automatically determining and indicating" a defibrillator status "prior to any attempted use." Claim 42 requires a test signal generated "automatically and periodically," whereas Claim 44 requires a test signal generated "automatically in response to a predetermined event or condition." Claim 67 is unique in that its method requires "automatic [] and periodic []" test signal generation "without human intervention" "prior to any attempted use," but does not require that the indication of defibrillator status occur prior to use. These explicit qualifications, when read in light of the remainder of the specification, alter the scope of the phrase "prior to any attempted use."

The 374 Patent discloses numerous self-tests that precede various uses of the defibrillator. It teaches several sets of periodic tests that would occur even if a user never touched a defibrillator incorporating the patented technology. 374 Patent at 6:44-58 (disclosing weekly periodic self-tests, monthly periodic self-tests, as well as daily periodic self-tests). When a user inserts a battery, the defibrillator can perform another series of self-tests. 374 Patent at 6:35-43. Another possible self-test assesses the defibrillator at the moment a user turns it on. 374 Patent at 6:59-65. A set of "runtime" self-tests monitors the defibrillator "continually" after a user turns it on. 374 Patent at 6:66-7:2.

With these examples of self-tests in mind, the court turns to Claim 1 and its requirement of a means for status indication "prior to any attempted use of the defibrillator." If the patented technology required the use of all of the above self-tests, Philips' open-ended construction of the term would be correct, as the defibrillator would have means for performing at least one self-test in advance of any use. The Claim, however, does not require all of these self-tests; it requires only one. Moreover, the Claim does not explain which test the defibrillator has means to perform.

A defibrillator with means for performing a single self-test would be capable of indicating a status before all therapeutic uses, but not necessarily before other uses. Because a defibrillator that has means to perform only one test would satisfy Claim 1, it would not necessarily provide means to indicate status before non-therapeutic uses. For example, although turning the defibrillator on is a "use," a defibrillator that had means for conducting only "runtime" tests would not reveal its status before that use. The same is true of a defibrillator with means to conduct only a manual self-test: it could not indicate a status in advance of the manual self-test, which is itself a "use."

Ultimately, the only "uses" of the defibrillator for which the invention of Claim 1 would invariably have means to provide an indication of pre-use status are uses in treating a patient. For any defibrillator with means to perform a randomly selected self-test, the defibrillator could indicate status before anyone used it to treat a patient, but not necessarily before other uses. Thus, in Claim 1, the phrase "prior to any attempted use" carries a meaning more consistent with Defibtech's proposed construction. The phrase means "prior to any attempted use of the defibrillator to treat a patient, and possibly before other uses as well."

The other claims, however, limit the "prior to any attempted use" phrase. Claims 41 and 42 introduce an additional limitation -- the test signals that initiate the self-tests must be "periodic" or must be generated "periodically." The parties have not asked the court to construe "periodically," but in the 374 Patent it means "on an internal, pre-set schedule." The specification teaches that "periodic" tests are different than tests conducted "in response to predetermined conditions or events." 374 Patent at 2:10-13. Thus, when Claims 41 and 42 require "periodic" test initiation signals, they require at least one periodic self-test. As noted above, the patent teaches that these are tests that occur daily or weekly or monthly, whether the defibrillator is turned on or not. By their nature, these tests occur before any use of the defibrillator, including merely turning the device on. Thus, in Claims 41 and 42, the scope of the phrase "prior to any attempted use" is "prior to any attempted use of the defibrillator, even non-therapeutic uses."

Claim 67 not only requires the "periodic" generation of a test signal, it requires that the generation occur "without human intervention." Thus, like Claims 41 and 42, Claim 67 requires at least one of the periodic self-tests, and thus requires status indication "prior to any attempted use of the defibrillator, even non-therapeutic uses."

The method of Claim 44 does not require a "periodic" test signal, but rather requires one generated "automatically in response to a predetermined event or condition." This method requires at least one self-test, but it excludes the periodic self-tests. If the test was a "runtime" self-test, the method of this Claim would be (like the defibrillator of Claim 1) incapable of indicating status before the defibrillator is turned on. In this Claim, therefore, "prior to any attempted use" carries the same meaning as in Claim 1 -- "prior to any attempted use of the defibrillator to treat a patient, and possibly before other uses as well."
The prosecution history of the 374 Patent does not alter the court's construction. In overcoming the PTO's objection that the prior art Eikefjord Patent (United States Patent No. 5,097,830) anticipated the invention, Philips argued that its claims required operating the self-test system "prior to any attempted use of the defibrillator," whereas the Eikefjord Patent disclosed testing that occurred "during" use of the defibrillator. J.A. 00463-64 (emphasis in original). The "use" described in the Eikefjord Patent, however, is use or attempted therapeutic use of the defibrillator on a patient. The Eikefjord Patent does not disclose self-testing that occurs prior to therapeutic uses. The prosecution history merely shows that Philips' claims require a means of indicating status prior to therapeutic use. This is consistent with the court's construction.

1. The Claims

   a. The '462 Patent:

   1. A method for producing and locating an apparent origin of a selected sound from an electrical signal corresponding to the selected sound in a predetermined and localized position anywhere within the three-dimensional space containing a listener, comprising the steps of:

      separating said electrical signal into respective first and second channel signals;

      altering the amplitude and shifting the phase of the signal in both said first and second channel signals while maintaining said phase and amplitude differential therebetween for successive discrete frequency bands across the audio spectrum and each successive phase shift being different than the preceding phase shift, relative to zero degrees, thereby producing first channel and second channel modified signals and creating a phase differential and an amplitude differential between the two channel signals;

      maintaining the first channel signal separate and apart from the second channel signal following the step of altering the amplitude and shifting the phase;

      respectively applying said first and second channel modified signals that are maintained separate and apart and that have said phase and amplitude differential therebetween to first and second transducer means located within the three-dimensional space and spaced part [sic: apart] from the listener to produce a sound apparently originating at a predetermined location in the three-dimensional space that may be different from the location of said sound transducer means.

   7. A system for conditioning a signal for producing and locating, using two transducers located in free space, an auditory sensory illusion of an apparent origin for at least one selected sound at a predetermined localized position located within the three-dimensional space containing a listener from a single electrical signal corresponding to the selected sound, comprising: first and second channel means both receiving the same single electrical signal, said first and second channel means including respective first and second sound processor means each for altering the amplitude and shifting the phase angle of the respective electrical signal on a frequency dependent basis for successive discrete frequency intervals across the audio spectrum to produce a respective modified signal wherein the amplitude alteration differential and the phase angle shift differential occurring between the two channels are respective predetermined values for each said successive frequency interval of the audio spectrum, said sound processor means shifting the phase angle such that each successive phase angle shift is different and independent of a preceding phase angle shift relative to zero degrees, and said first and second channels being maintained separate and apart prior to being fed to the two transducers.

   b. The '860 Patent:

   1. A method for producing and locating an apparent origin of a selected sound from an input monaural signal corresponding to the selected sound in a predetermined and localized position anywhere within the three-dimensional space containing a listener, comprising the steps of:
separating said input monaural signal into respective first and second channel signals;

providing a sound position control signal derived independently of the input monaural signal for making amplitude and phase adjustments at each of a number of discrete frequency bands over the audio spectrum and relating to a sound location determined by azimuth, height, and depth;

altering the amplitude and shifting the phase of the signal in at least one of said first and second channels in response to said sound position control signal, both altering and shifting being done on a predetermined frequency dependent basis for successive discrete frequency bands across the audio spectrum and each successive phase shift being different than the preceding phase shift relative to zero degrees, whereby producing at least a first channel or a second channel modified signal and creating a continuous phase differential and a continuous amplitude differential between the two channel signals that varies for each of said discrete frequency bands;

maintaining the first channel signal separate and apart from the second channel signal following the step of altering the amplitude and shifting the phase; and

respectively applying at least first and second channel modified signals that are maintained separate and apart and that have said phase and amplitude differential therebetween to first and second transducer means located with the three-dimensional space and spaced apart from the listener to produce a sound apparently originating at a predetermined location in the three dimensional space that may be different from the location of said sound transducer means.

5. A system for conditioning a signal for producing and locating, using two transducers located in free space, an auditory sensory illusion of an apparent origin for at least one selected sound at a predetermined localized position located within the three-dimensional space containing a listener from a single monaural input signal corresponding to be selected sound, comprising: first and second channel means both receiving the same single monaural input signal, one of said first and signal channel means including sound processor means connected to receive a sound position control signal derived independently of the input monaural signal for controlling amplitude and phase adjustments at each of a number of selected frequency intervals of the audio spectrum and relating to a sound location determined by azimuth, height, and depth for altering the amplitude and shifting the phase angle of the respective signal on a frequency dependent basis for successive discrete frequency intervals across the audio spectrum to produce a respective modified signal therefrom in response to said sound position control signal, wherein the amplitude alterations and the phase shifts form a continuous differential between the two channels that varies for each said successive frequency interval of the audio spectrum, said sound processor means shifting the phase angle such that each phase angle shift is different relative to zero degrees, and said first and second channels being maintained separate and apart prior to being fed to the two transducers.

2. The Claim Construction

The first claim at issue of each of the patents is a method claim, while the second claim at issue of each of the patents is a claim to a "system." After examining the prosecution history, the special master gave the phrase "being maintained separate and apart" its ordinary, literal meaning. He distinguished, however, between the term "following" that appears in claim 1 of the '462 and the '860 patents and the phrase "prior to" that appears in claim 7 of the '462 patent and claim 5 of the '860 patent.

The special master interpreted "prior to" as simply requiring that the two signals be kept separate and apart "merely immediately before the loudspeakers [i.e., the 'transducers'] where the signals are clearly separate and apart." "Following," however, was deemed more restrictive. The special master interpreted that term to require the two signals to be kept "separate and apart" from each other immediately after the two signals are initially altered.

Because the two channel signals in the accused Spatializer device are combined after their phase and amplitudes are altered, but are separated immediately before they are fed to the speakers, the special master recommended that the Spatializer does not infringe the "following" claims but potentially could infringe the "prior to" claims. As indicated above, the district court adopted the special master's recommendations as to the "following" claims but not the "prior to" claims. The district court held that Desper was entitled to summary judgment of non-infringement on the "prior to" claims as well as the "following" claims. On appeal, QSound challenges the district court's interpretation of both "following" and "prior to."
2 QSound also challenges the interpretation of "discrete" and "independent," as it must to ultimately prevail. Given our interpretation of "maintained separate and apart," "following," and "prior to," however, we need not reach these issues.

DISCUSSION

"The law governing summary judgment is well established." C.R. Bard, Inc. v. Advanced Cardiovascular, Inc., 911 F.2d 670, 672, 15 U.S.P.Q.2D (BNA) 1540, 1542 (Fed. Cir. 1990). "Summary judgment is as appropriate in a patent case as it is in any other case." Id. Under the Federal Rules of Civil Procedure, a motion for summary judgment should properly be granted when "there is no genuine issue as to any material fact and . . . the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c).

The determination of whether an accused product or process infringes a claim of a patent is universally understood to involve two steps. First, we construe the asserted claim to determine its meaning and scope. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 976, 34 U.S.P.Q.2D (BNA) 1321, 1326 (Fed. Cir. 1995) (in banc), aff'd, 517 U.S. 370, 38 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). In the second step, we compare the accused product or process to the properly construed claim. See id.

Whether a product or process infringes the properly construed claims of a patent, literally or under the doctrine of equivalents, is a question of fact. See Tanabe Seiyaku Co. v. United States Int'l Trade Comm'n, 109 F.3d 726, 731, 41 U.S.P.Q.2D (BNA) 1976, 1981 (Fed. Cir. 1997). Often, as in this case, the composition of the allegedly infringing process or product is undisputed. In such a case, literal infringement collapses into claim construction—a matter of law—amenable to summary judgment. See Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1578, 37 U.S.P.Q.2D (BNA) 1365, 1370 (Fed. Cir. 1996).

To determine the meaning and scope of a claim, we first examine the claim language, the specification, and, if in evidence, the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1581, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). Extrinsic evidence, that is, evidence outside the record before the United States Patent and Trademark Office ("PTO"), such as expert testimony about how those skilled in the art would interpret certain language in the claim, may also be considered when appropriate as an inherent part of the process of claim construction and as an aid in arriving at the proper construction of the claim, but may not be used to vary or contradict the otherwise unambiguous meaning of the claim. See id. at 1582, 39 U.S.P.Q.2D (BNA) at 1577. The proper interpretation of a claim is a legal conclusion, over which we exercise plenary review. See Cybor Corp. v. FAS Tech., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed. Cir. 1998) (in banc) ("We review claim construction de novo on appeal including any allegedly fact-based questions relating to claim construction.").

I. "Following"

We start first with the claim language itself. See Thermalloy, Inc. v. Aavid Eng'g, Inc., 121 F.3d 691, 692, 43 U.S.P.Q.2D (BNA) 1846, 1848 (Fed. Cir. 1997) ("Throughout the interpretation process, the focus remains on the meaning of claim language.") The first claims of both the '462 patent and the '860 patent require that the system "maintain[] the first channel signal separate and apart from the second channel signal following the step of altering the amplitude and shifting the phase" (emphasis added). The plain meaning of "following" is "subsequent to, after in time" or "next after," depending on the context. Webster's Third New International Dictionary 883 (1986). The problem in this case is that this definition does not tell us how close in time to the "altering" step the signals must be maintained separate and apart. To answer that question we consult the specifications.

Though not definitive, the specifications support an interpretation that requires the two signals to be maintained separate and apart beginning immediately after the amplitude is initially altered and the phase is initially shifted. The word "following" appears only twice in each of the written descriptions and is not used with reference to the channel signals. (The same is true of the phrase "prior to," discussed infra.) The drawings, Fig. 16 and Fig. 18a (pictured supra), however, graphically demonstrate that once the two channel signals are separated they are thereafter kept separate. Thus, the drawings...
support the interpretation that, immediately after the amplitude and phase of the channels signals are initially altered by the filter, they thereafter must be maintained separate and apart.

QSound points to an isolated passage in the written description to support its proposed claim construction that it is only after the alteration of the amplitude and the shifting of the phase by filters and summers are complete that the signals are required to be maintained separate and apart. The passage upon which QSound relies simply indicates that the sound processor "may include some or all of the following circuit elements: filters, delays, [inverters], summers, amplifiers, and phase shifters." '462 patent, col. 11, ll. 11-12. The passage sheds no light as to when the signals must be maintained separate and apart.

In contrast, the prosecution history confirms our claim construction. The limitation that the channel signals be maintained separate and apart was not in the original claim language. The original claims of what is now the '462 patent were rejected as obvious under § 103 in light of British patent No. 942,459. The original application (Ser. No. 07/398,988) was then abandoned in favor of a File Wrapper Continuation ("FWC") (Ser. No. 07/696,989). See 37 C.F.R. § 1.62 (1997). The limitation that the channel signals be maintained separate and apart was then added in a preliminary amendment dated June 12, 1991. In the remarks accompanying that amendment, the patent applicants' attorney stated:

In fact, according to the present invention, once the monaural signal is split into the two channel signals, those signals are forever after isolated one from another and are never combined or commingled. Various operations may take place in each channel provided by the present invention, yet the signals being operated upon are never recombined or mixed. This is in direct distinction to the teaching of the British patent . . . .

(Emphasis added.) In his closing remarks, the attorney further stressed in urging reconsideration:

In view of the amendments to the claims hereby, as well as the above remarks, it is respectfully submitted that a method and apparatus for producing two sound signals derived from a single monaural input signal in which an amplitude and phase shift is provided with such signals being maintained separate and apart up until the actual production of the sounds at the speakers, as taught by the present invention and as recited in the amended claims, is neither shown nor suggested in any of the cited references, alone or in combination.

(Emphasis added). Rather than wait for a formal, written response, the applicants conducted a personal examiner interview. In the resulting "Examiner Interview Summary Record," the examiner indicated that the amended claims "appear to distinguish over art of record in prior case (FR 1,512,059 & B 942,459)." However, the examiner did come up with a new reference on which to base another prior art rejection. Despite this new reference, the examiner indicated that two dependent claims would be allowable if they were to be rewritten in independent form. In response, the applicants abandoned the original independent claims and took what the examiner allowed. The rewritten claims were subsequently allowed and issued as part of the '462 patent.

The prosecution history of the '860 patents tells much the same story. The '860 patent was originally filed as a Rule 60 divisional of the FWC (Ser. No. 07/696,989). See 37 C.F.R. § 1.60 (1997). In a preliminary amendment dated October 31, 1991, after the parent application had been rejected in view of the British patent, the applicants amended all the independent claims to include the limitation that the channel signals be maintained separate and apart. In an office action dated February 5, 1992, the examiner rejected the amended claims as obvious in light of another reference. The applicants' attorney responded with further amendments to the claims, and accompanying remarks in which the attorney distinguished the claimed invention from the cited reference. This amendment was sufficient to overcome the rejection, and the amended claims were issued as part of the '860 patent. Thus, in the file history of both patents, the limitation that the channel signals be maintained separate and apart was added to overcome the prior art rejection based on the British reference, and in both cases it succeeded.

QSound does not argue on appeal that its attorney's comments do not, on their face, limit the scope of the asserted claims.

Rather, QSound argues that the prosecuting attorney's remarks should not be used to interpret the disputed claim language because the remarks, according to QSound, were both erroneous and extraneous -- erroneous because they are contrary to the express teaching of the patent itself and extraneous because they did not become part of the claim. We disagree on both accounts.

Fig. 18a (pictured supra), according to QSound, "proves . . . that counsel's statement was erroneous." Brief for Appellant at - 3667 -
Claim 7 of the '462 patent and claim 5 of the '860 patent, the two other independent claims that are at issue, both claim a
II.

We conclude that the claim construction for claim 1 of the '462 patent and of the '860 patent adopted by the district court is
correct.

II. "Prior To"

Claim 7 of the '462 patent and claim 5 of the '860 patent, the two other independent claims that are at issue, both claim a

QSound argues that the district court misconstrued the functional language -- "said first and second channels being maintained separate and apart prior to being fed to the two transducers" -- appearing in claims 5 and 7. In particular, QSound argues that the court erred in its construction of "prior to." The district court construed "prior to," based on the written description and the prosecution history, consistent with its interpretation of "following." In light of all the intrinsic evidence, we conclude that the district court properly construed this phrase.

The plain meaning of "prior" supports QSound's argument that "prior to" should be construed more broadly than "following." QSound offers a definition for "prior," which Desper does not dispute: "preceding in time; earlier; previous; former," quoting Webster's New World Dictionary 1131 (2d ed. 1984). Accord Webster's II New College Dictionary 879 (1995). All the plain language requires, under this definition, is that the two channel signals must be maintained separate and apart before they are fed into the transducers (i.e., the speakers). There is some appeal to this argument. Common words, unless the context suggests otherwise, should be interpreted according to their ordinary meaning. See Proks v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D (BNA) 1619, 1622 (Fed. Cir. 1996) ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning.") The problem with QSound's approach in this case is that the context of the specifications strongly suggests that "prior to" should not be given its ordinary meaning.

The drawings and corresponding discussion in the written description show that the two channel signals are initially separated and thereafter maintained separate and apart. The phase and amplitude of each channel signal is altered and then supplied to one of the speakers. The district court construed the "prior to" language as requiring the channel signals to be maintained separate and apart after the phase and amplitude are initially altered. Obviously, this construction is supported by the written description because this is precisely how the preferred embodiment of the invention works. Moreover, maintaining the channel signals separate and apart after the phase and amplitude are initially altered is still before the signals are fed into the transducers.

The district court concluded that the prosecution history tips the balance in favor of construing "prior to" in the same manner as "following" in claim 1. We agree. Prosecution history is an important source of intrinsic evidence in interpreting claims because it is a contemporaneous exchange between the applicant and the examiner. This is true whether the claim element in question is written pursuant to § 112, P 6 or not. See Alpex Computer Corp. v. Nintendo Co., 102 F.3d 1214, 1220, 40 U.S.P.Q.2D (BNA) 1667, 1671 (Fed. Cir. 1996) (prosecution history is relevant to interpreting an element written in means-plus-function language); United States v. Teletronics, Inc., 857 F.2d 778, 782, 8 U.S.P.Q.2D (BNA) 1217, 1220 (Fed. Cir. 1988). During the prosecution of claim 7 of the '462 patent, QSound treated claim 1 and claim 7 (then claim 8) together even though one used "following" language and the other used "prior to" language. In successfully overcoming the prior art rejection based on the British patent, QSound argued that "claims 1 and 8 have been amended hereby to make it more clear that the first channel signal is always maintained separate and apart from the second channel signal following the step of altering the amplitude and shifting the phase in at least one of those signals." (Emphasis added.) Thus, even though only claim 1 included the "following" language, QSound itself considered the scope of claims 1 and 8 commensurate in this regard.

Because the public has the right to rely on the applicants' remarks in seeking allowance of their claims, see Alpex, 102 F.3d at 1221, 40 U.S.P.Q.2D (BNA) at 1673 ("Just as prosecution history estoppel may act to estop an equivalence argument under the doctrine of equivalents, positions taken before the PTO may bar an inconsistent position on claim construction under § 112, P 6."). we agree with the district court that "prior to" should be construed to mean after the altering of the amplitude and shifting of the phase has begun; see Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987) ("Two claims which read differently can cover the same subject matter.").

--- Footnotes ---

3
3 QSound invokes the rule that different words should be interpreted differently, yet it concedes that in other parts of the claims different words should be interpreted the same. For example, the special master found and, QSound concedes, that the phrase "frequency bands" in Claim 1 of the '860 patent and the phrase "frequency intervals" in claim 5 mean the same thing. QSound's argument based on constructional rules therefore loses much of its force.

3344

F. Ref. No. 64 "Prior to said reading and for each of a plurality of voters, producing by a voting machine a paper ballot including voting selections made by a voter.

This phrase is recited in Claim 26.

The dispute concerning this claim is in two parts. Defendants interpret the phrase "prior to said reading and for each of a plurality of voters" to require that, prior to the reading step, a plurality of voters' paper ballots are produced. Plaintiff interprets this phrase to require the entire process to be repeated for multiple voters. The Court agrees with Plaintiff's construction because of the plain language of the claim.

The phrase "and for each of a plurality of voters" explains that the process described is applied to each individual voter. Defendants' proposal does not provide for this construction and does nothing more than repeat the phrase in their construction.

The second dispute on the claim is about the phrase "producing by a voting machine a paper ballot including voting selections made by a voter." In support of its construction, Plaintiff cites the specification providing for "[a] specialty or security-type of paper, or other medium making authentication of a printed receipt and/or ballot easier . . ." and for a local printer which "prints information identifying the election district, the date and time of voting and similar information that may help to authenticate printed receipt PR and/or optical ballot[.]"] (Col. 11, ll. 21-24.) Defendants refers the Court to Column 10, lines 31-36, which provide that the ballot may be printed in advance of an election. The claim itself provides that a voting machine produces a "paper ballot including voting selections made by the voter." (Claim 26) "In construing claims, we begin with the language of the claims themselves." North Am. Vaccine, Inc., 7 F.3d at 1575. When the meaning of the claims is in doubt, the court looks to the specification for guidance. Id. at 1576.

There is nothing in the specification that negates Plaintiff's construction. To the contrary, the specification referred to herein supports for Plaintiff's construction. When viewing the claim's clear language, the phrase "voting selections made by a voter" refers to the choices made by that voter.

Consequently, the Court construes the term in Ref. No. 64 as: Before the reading step, a ballot is produced with the voter's choices printed thereon. The entire process is then repeated for multiple voters.

3345

IV.

Although the parties nominally agree on the district court's claim interpretation, Hilgraeve also argued before that court that the phrase "prior to storage" must be construed from the ordinary user's perspective, i.e., that whether or not VirusScan screens before or after storage, it will infringe if the user perceives that screening occurs before storage. As support for this argument, Hilgraeve refers to comments the applicant made to the Patent and Trademark Office (PTO) during prosecution, in support of the amendments to its application which resulted in allowance. The amendments added, inter alia, the phrase "prior to storage on the destination storage medium" to claim 1. See Hilgraeve, 70 F. Supp. 2d at 750. In its comments to the PTO, Hilgraeve asserted that "the Applicants' invention requires only one step. The user simply initiates the data transfer. The program automatically screens the data, as it is being transferred . . . ." Hilgraeve asserts that this comment means that
the patented invention requires only that the user perceive screening before storage, regardless of how the program actually operates.

The district court correctly found nothing in the intrinsic evidence to support Hilgraeve's argument based on the perception of the program's operation. See Hilgraeve, 70 F. Supp. 2d at 756. Neither the claims nor the rest of the specification of the '776 patent show that the invention involves the user's perception of the program's operation. The written description supplies some suggestions for user interaction with the program to direct inspection for certain specific error protocols. The claims of the '776 patent, however, do not claim a method of screening data "so that the user perceives that screening occurs before storage," but instead claims a method of actually screening before storage. The patentee claimed a technical method, not a method for projecting a perception.

A. Claim Construction

On February 16, 2006, the Court held a claims-construction hearing in this matter. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The Court considered the '136 Patent and prosecution history, the parties' Markman briefs, the applicable law regarding, inter alia, claim construction, indefiniteness, and means-plus-function claims, and the argument of counsel. On May 25, 2006, this Court rendered a claims-construction order (Doc. # 292), which construed the terms as following:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Construed Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Debit Card&quot;</td>
<td>&quot;a prepaid card for exchange of value&quot;</td>
</tr>

</tbody>
</table>
4. "Priority" and "Highest Priority Test"

I construe "priority" in claims 1, 3, and 5 of the '415 patent to mean "relative importance," and "highest priority test" in claim 1 of the '415 patent to mean "test of the highest relative importance."

As described above, claim 1 of the '415 patent specifies a laboratory automation system that reads the specimen carrier's identification code and determines various "priorities," such as "the priority of the first specimen relative to any other specimens entered into the LAS" and "the priority of each test to be conducted on the first specimen relative to one another." (Filing 64-3, Ex. C, at 6:13-21; see also id. at 6:31, 6:48, 6:62 (more "priority" language).) In each of these usages, "priority" connotes the relative importance of either the specimen or the test to be performed on it.

I decline to read "based on a physician's designation" into the meaning of "priority," as Siemens argues, because such a qualification is at odds with the plain meaning of the language of the patent. While there may be instances where a
physician's designation plays some role in the determination of relative priorities made by the LAS, a physician's designation may play no role in other such determinations. A physician may have no knowledge of other specimens moving through the LAS at the same time as the first specimen, and that physician's designation of the tests to be performed on the first specimen may not impact the LAS's calculation of the relative importance "of the first specimen relative to any other specimens entered into the LAS." (Filing 64-3, Ex. C, at 6:15-16.) Likewise, a physician's designation may play no role in "the LAS recalculating the priority of the first specimen and any other specimens in the LAS upon directing of the first carrier to the first workstation." (Filing 64-3, Ex. C, at 6:31-33.) In addition, one object of the '415 patent "is to provide a method for automating a laboratory which determines optional routing to a particular workstation, and detects any time delays because of other specimens present in a queue at a workstation." (Filing 64-3, Ex. C, at 2:11-15.) Nothing in the '415 patent suggests that such a determination depends on a physician's designation.

After the LAS calculates the priority of the first specimen relative to others and the priority of each test to be conducted on the first specimen, the LAS determines "the most direct route from the receiving station to a first workstation for conducting the highest priority test of the first specimen." (Filing 64-3, Ex. C, at 6:19-21.) The context within which "highest priority test" is used dictates that this phrase must refer to the test of the highest relative importance. There is simply no reason to believe that the term "priority" means something different in the context of the phrase "highest priority test."

C. "A Prioritized Set of Tiers."

The third term to be construed appeared in claims 1 and 16. Claim 16 recited as follows (col. 21:34-59):

16. An information transmission system comprising the steps of:

* * *

scheduling transmission of selected portions of said information database, including assigning each selected portion of said information database one or more scheduled transmission times;

transmitting a stream of data packets containing said selected portions of said information database in accordance with said scheduled transmission times;

said scheduling step including dividing said selected portions of said information database into a prioritized set of tiers, wherein all the selected portions of said information database in each tier are transmitted at a corresponding repetition rate, wherein the repetition rate for higher priority tiers is higher than the repetition rate for lower priority tiers;

* * *

Finisar argues that this term means "things ranked or preferentially designated based on priority, for example, a selected portion of the information database designated to be transmitted at a higher repetition rate than another selected portion." 3 Comcast proposes that it should mean "levels that are ranked in order of importance." Comcast goes on to add that "the top-level indices that a subscriber needs to access the database are not part of any tier."

--- Footnotes ---

3 On this point, the Texas Court construed the term "dividing said selected portions of said information database into a prioritized set of tiers, wherein all the selected portions of said information database in each tier are transmitted at a corresponding repetition rate." The whole term was held to mean "placing each part of the information database into a prioritized set of tiers, wherein all the selected portions of said information database in each tier are transmitted at a corresponding repetition rate" (Melgar Decl. Exh. B at 12). It appears that the Texas Court equated "tiers" to "groups of information."

--- End Footnotes ---
Both the words "priority" and "tier" are commonly understood words in the English language. A "priority" connotes a higher rank. A "tier" is a level. Each tier can include one or more portions of the database.

It is worthwhile to distinguish the "prioritized set of tiers" from the "hierarchically arranged set of indices," i.e., a system of indices and a system of tiers. The system of indices is used to organize the database. The indices are embedded within the database. The system of tiers contains selected portions of the database, with each tier having a set, specific repetition rate for transmission.

The parties disagree over whether the tiers are ranked by "importance" or whether a priority can connote some other kind of ranking. This question is addressed in the specification: "[e]ach successively lower tier of information contains a larger amount of information than the next higher tier, prioritized in accordance with the actual or expected subscriber usage, and is transmitted less often" (col. 14:9-12). Comcast argues that although the tiers are ranked by repetition rate, "priority" must mean something more than that. Comcast is correct. The claims specifically state that apart from priority, the higher priority tiers have a higher repetition rate while the lower priority tiers have a lower repetition rate. Repetition is already inherent in the claim.

Comcast's further proposal that the tiers must be ranked by "importance," however, gives little help in defining the term. Comcast concedes that priorities other than importance can be used when it discusses ordering the tiers by how much a subscriber would pay. The specification contemplates ranking the tiers based on expected or actual usage, not based on a philosophical assessment of importance. Expected or actual usage would embrace a range of possible allocations and need not invariably lead automatically to a single result for a given set of circumstances. As long as expected or actual subscription usage is a basis for the allocation, then the priority element will be satisfied.

Finally, Comcast urges that the "root information" used to define the indices within the database must be separate from the tiers, i.e., the root information would be sent, according to Comcast, separately from the tiers. The specification made clear that the root information had its own repetition rate. That repetition rate is higher than for all other information, but the "root information," even though it may not be called out specifically as a "level," is still part of the set of prioritized tiers (col. 14:2-15, Table 1). The root information is the top tier of the set. It is sent the most frequently and contains the smallest amount of information, the top-level indices used to access the rest of the database.

Accordingly, "a prioritized set of tiers" means a set of levels ranked by expected or actual customer usage possibly together with other allocation factors, wherein each successively lower level of information contains a larger amount of information than the next higher level. The root information described in the specification is part of the top tier.

7. "priority bit"

The term "priority bit" appears in claim 11 of the '819 patent. The issue is whether the priority bit is limited to defining the importance of remote units or whether it can define the importance of other things, such as an application. By limiting the construction to the importance of remote units, the defendants attempt to limit the construction to a preferred embodiment. The language of the claim is entitled to a broader construction, and the court construes this term to mean "a bit that is used to convey the relative importance of the communication."

7. Private branch exchange network

Foundry argues that "private branch exchange network" should be construed to mean "a communication network that enables private branch exchange services." Lucent, on the other hand, submits that the disputed phrase should be construed to mean "a telephone exchange on the user's premises providing a switching facility for telephone lines within the premises and access to the public telephone network and the extension lines and attached telephones." (emphasis added) At issue here
is the meaning of the phrase "private branch exchange." After considering the submissions and arguments of counsel on this point, the court construes "private branch exchange network" to mean "a private telecommunications exchange network that includes access to a public telecommunications exchange. It may be on the user's premises and may provide a switching facility for telephones on extension lines within the premises and access to the public telephone network." See IEEE Standard Dictionary of Electrical and Electronics Terms (6th ed. 1997).

5. Said private branch exchange services including providing substantially real-time voice communications

After considering the submissions of the parties, the court concludes that this phrase requires no construction.

"Local Network"

"Private Local Network"

"Private Network"

The parties agree that these three terms should have the same construction. Cisco's proposed construction for the above terms is "distinct set of interconnected elements used to communicate data." Alcatel's proposed construction is "distinct set of interconnected elements in a trusted environment used to communicate data." The obvious difference between the two parties' proposals is that Alcatel seeks to limit the construction to requiring a "trusted environment," while Cisco opposes such a limitation.

Both parties agree that the term network is given its ordinary meaning. According to the 1996 IEEE Standard Dictionary of Electrical and Electronics Terms, such meaning is "a series of points interconnected by communication channels." Id. at 683 (6th ed. 1996). However, Cisco seeks to limit the construction of "private local network" to the definition of "network." Clearly, the inclusion of the modifiers "private" and "local" were meant to limit the above terms to something more narrow than simply a network.

In the patent specification, references are specifically made to local area networks (LANs) as being operated by private customers. See Valencia, at 1:19-20, 3:48-51. As Cisco even admits, a "private network" is "a network of communications channels confined to the use of one customer." See Cisco's Opening Claim Construction Brief Concerning U.S. Patent No. 5,918,019 (Valencia) ("Cisco's '019 Opening Brief"), at 16; IEEE Dictionary, at 683.

While Alcatel argues that the Court should construe the terms to include a "trusted environment," based primarily on the presence of a firewall 66 in Figure 2 of the '019 patent, the Court finds that this requirement is not sufficiently supported by the patent language. The patent language does not appear to alter the ordinary meaning of the terms, and therefore the Court construes the terms "private local network," "private network," and "local network" as "distinct set of interconnected elements confined to the use of one customer used to communicate data."

--- Footnotes ---

66 The parties agree that the term firewall means "system that precludes unauthorized access to a device or network." See Revised Joint Statement, Ex. F, at 84.

--- End Footnotes ---
There is no dispute that a "probability density function estimation" ("PDFE") is, in some manner, an "estimation" of a "probability density function" ("PDF"). In the words of Wavetronix's expert, "probability density function is a precisely defined term in statistics which corresponds to the probabilities of the different possible outcomes of some experiment." EIS agrees that "PDF" is a well known mathematics term and offers the following dictionary definition: "a function of a continuous variable whose integral over a region gives the probability that a random variable falls within the region." 6 While the parties agree upon the definition of "PDF," they dispute the definition of "PDFE." We conclude below that the salient difference between the two concepts is that a PDF is a mathematical function, whereas a PDFE is an approximation of such a function using actual finite data. We also explain below that, in light of the teachings of the specification and the recitation of the PDFE within the claim language, for the purposes of claim 1 a PDFE must estimate a PDF with sufficient precision to indicate both where vehicles are located and where they are not. In other words, as the specification teaches, a PDFE should at a minimum provide enough data to ascertain "peaks" and "valleys" approximating the centers and boundaries of traffic lanes, respectively.

6 Random House Webster's Unabridged Dictionary 1541 (2d ed. 2001). This definition comports with those found in other general reference and technical dictionaries. See, e.g., Webster's Third New International Dictionary 1806 (2002) ("a function of a continuous random variable whose integral over an interval gives the probability that its value will fall within the interval"); McGraw-Hill Dictionary of Scientific and Technical Terms 1674 (6th ed. 2003) ("[a] real-valued function whose integral over any set gives the probability that a random variable has values in this set").

In advocating for its construction of "PDFE," EIS focuses on the term "probability" and argues that a PDFE must represent some sort of probabilistic analysis. Wavetronix argues that the "E" in "PDFE" modifies the whole phrase "PDF," not just "P" or "probability." According to Wavetronix, an "estimate" of a PDF need not have all of the characteristics of an actual PDF, including estimating the actual probability that a vehicle has driven in a given lane. Rather, as we understand Wavetronix's argument, any histogram that allows for an estimation of lane boundaries is a PDFE, because any graph that accurately allows for lane detection must have some correlation with the number or probability of cars in each lane. Wavetronix argues that the definition that most aligns with the specification and includes all of the disclosed embodiments is "a tabulation of frequencies of vehicle positions."

The claim language itself provides little guidance on how to define "PDFE," and the parties have not relied upon the patent's prosecution history to define the proper scope of the claim limitations referencing a PDFE. 7 The patent's specification does provide guidance, but its references to PDFE are not entirely consistent. Nowhere does the patent set forth an explicit definition of PDFE. See Phillips, 415 F.3d at 1316 (patentee may act as own lexicographer); Johnson Worldwide Assocs., Inc. v. Zebco Corp., 175 F.3d 985, 990 (Fed. Cir. 1999) (same). The specification refers variously to: a PDF "as estimated," '916 patent col.6 l.6; using a PDF "to estimate" lane boundaries, id. col.6 ll.14-15; "PDF estimation," id. col.6 l.32; a "PDF estimator," id. col.6 l.33; and "estimated PDFs," id. col.8 l.13. In some places, the specification appears to refer to PDF and PDFE interchangeably. Id. col.4 ll.1-7, col.7 ll.30-39.

7 The parties look to the patent's prosecution history only for the purposes of supporting their respective positions on the question of whether claim 1 requires the counting of discrete vehicles. EIS points out that Wavetronix remained silent in the face of the patent examiner's characterization of the patent's method as "determining . . . the number of cars which pass beneath [the sensor]." According to EIS, Wavetronix conceded through its silence that the patent claimed the counting of discrete vehicles as opposed to mere vehicle detections that may or may not yield an accurate tally of individual vehicles. The parties have expended considerable effort arguing this point. Whatever the merits of the argument, see 3M Innovative Props. Co. v. Avery Dennison Corp., 350 F.3d 1365, 1373-74 (Fed. Cir. 2003) (silence does not necessarily indicate acquiescence to examiner's characterization when allowance is on grounds unrelated to characterization), it is unnecessary to decide whether the claim encompasses only detections of discrete vehicles. Even if the claim also encompasses vehicle
detected, an accused system must still generate a PDFE and define lanes from the PDFE to infringe. For the same reason, it is also unnecessary to determine whether a PDFE requires "unbiased" or "normalized" data, as asserted by EIS.

The concept of "PDF" is defined with greater clarity and consistency in the specification than is the concept of "PDFE" standing alone. Both the summary of the invention and the description of the preferred embodiments describe the concept of PDF in terms of a graph in which enough data is collected to observe peaks, which represent the centers of lanes, and valleys, which represent the lane boundaries or edges. See, e.g., id. col.4 ll.2-7 (summary of invention) ("The probability density function describes the probability that a vehicle will be located at any range. The peaks of the probability function represent the center of each lane and the valleys of the probability density function represent the lane boundaries."); id. col.6 ll.15-19 (explanation of Figure 3, a diagram of the method) ("The peaks of the PDF represent the center of each lane and the low spots (or valleys) of the PDF represent the lane boundaries (or regions where cars don't drive). The lane boundaries are set to be the low spots (or valleys) between peaks."). This "peaks and valleys" arrangement allows for the definition of lanes from the PDFE as recited in step (c) of claim 1.

The understanding of PDF as a data plot showing a range of high values ("peaks") and low values ("valleys") as explicated in the specification aligns well with the standard mathematics definition of PDF. A PDF is a theoretical mathematical function that seeks to model reality. As Wavetronix's expert noted, a PDF does not represent actual data. When displayed on a histogram, the PDF is a smooth line or curve, because it is produced by a mathematical equation. When a finite set of actual data is plotted on a histogram, the resulting plot will not be a smooth curve but rather a disjointed one. See, e.g., '916 patent col.7 ll.25 ("The number of vehicles in each bin is counted . . . ."). Two embodiments apparently refer to a count of individual vehicles (Figures 6 and 8), see '916 patent col.7 ll.25 ("The number of vehicles in each bin is counted . . . ."). While a third (Figure 7) could just as easily refer to vehicle detections, i.e., the number of signals bounced back to the transceiver, which may be more than one per vehicle. What is the same about all of the disclosed embodiments (Figures 6, 7 and 8) is that each of them represents, in the form of a histogram, a comparison of the number of vehicles or vehicle detections across a range. This ability to compare the data across a range is significant, because it provides information not only about where vehicles are but where they are not--i.e., where traffic lanes begin and end. Such data is used for "defining . . . traffic lanes . . . from said [PDFE]." The record reveals no material intrinsic or extrinsic evidence indicating that the attribute of a PDF that a PDFE does not possess is the fundamental property of functioning over a range.

The specification is hardly a paragon of clarity, but this understanding of PDF estimation comports with the various descriptions and explanations of the PDF and PDFE concepts found in the specification. There are differences between the embodiments disclosed in the specification, but each of them suggests that a number of data points is used to estimate a hypothetical mathematical model, i.e., a PDF. One embodiment (shown in the histogram at Figure 7) uses "normalized" data, i.e., data displayed as a percentage of a total rather than as raw counts, while at least one (shown in the histogram at Figure 8) does not. Two embodiments apparently refer to a count of individual vehicles (Figures 6 and 8), see '916 patent col.7 ll.25 ("The number of vehicles in each bin is counted . . . ."); while a third (Figure 7) could just as easily refer to vehicle detections, i.e., the number of signals bounced back to the transceiver, which may be more than one per vehicle. What is the same about all of the disclosed embodiments (Figures 6, 7 and 8) is that each of them represents, in the form of a histogram, a comparison of the number of vehicles or vehicle detections across a range. This ability to compare the data across a range is significant, because it provides information not only about where vehicles are but where they are not--i.e., where traffic lanes begin and end. Such data is used for "defining . . . traffic lanes . . . from said [PDFE]." The record reveals no material intrinsic or extrinsic evidence indicating that the attribute of a PDF that a PDFE does not possess is the fundamental property of functioning over a range.

8 That Figure 7 represents a normalized graph is indicated by the fact that the y-axis is scaled from zero to one. A given value is expressed as a fraction of the whole, rather than as a raw count of detections. Determining the fraction of the whole represented by a given value in Figure 8, which is not normalized, would require dividing that value by the total number of counts measured in all positions.

9 The patent contains two references suggesting that some embodiments may have only one range bin per lane. See '916 patent col.7 ll.7-8 ("[A] lane may be comprised of a plurality of bins") (emphasis added); id. col.9 ll.58-61 (a limitation in claim 3 claiming a plurality of range bins in each lane, which appears redundant if claim 1 already implies this limitation).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
No doubt, using one bin per lane would not result in an optimal lane definition using the "peaks" and "valleys" method. Nevertheless, there is nothing plainly suggesting that, if only one bin per lane were used, the method would take advantage of some technique other than comparing values across a range of lanes to define lanes. The specification teaches that range bins of a width that results in histograms without "peaks" and "valleys" are incapable of providing useful information about where vehicle lanes begin and end. This teaching is an essential characteristic of the patented system, and is relevant to the analysis of both literal infringement and infringement under the doctrine of equivalents.

In summary, what makes a PDFE an estimate of a PDF in the context of the '916 patent is the fact that a PDFE is based on actual data points, rather than a perfectly smooth, if hypothetical, mathematical function or model. But a PDFE, like a PDF, has the characteristic of comparing values across a range of positions. The court therefore construes a PDFE to be "a finite data set large enough to approximate a function of a continuous variable whose integral over a region gives the probability that a random variable falls within the region." This construction applies equally to step (b) ("generating a [PDFE] . . .") and step (c) ("defining . . . traffic lanes . . . from said [PDFE]") of claim 1; however, our infringement analysis infra focuses on step (c).

2. Parameter Values & Procedure Routine Specifications

The parties dispute the definition of the terms "parameter values" and "procedure routines specifications" in claim 1. At its core, the parties' argument turns on whether the terms are numbers or software code. Roche contends that both terms refer to numbers or data values of different types. Defendants contend that "parameter values" are numbers, while "procedure routine specifications" are code. The Court agrees with Roche.

Although the parties dispute the proper construction for the term "parameter values," their definitions for the term are very similar. Roche contends that the term means "data values used in the algorithm," while Apex/HDI argue that the term means "constants and variables that are critical to the operation of the meter," and Biosite avers that the term means "constant values that are assigned to variables for a specified application." The Court finds the term "parameter values" has its ordinary meaning of "constants that are assigned to variables."

The ordinary meaning for the term "parameter" is a constant or value associated with a particular value or variable. See, e.g., WEBSTER'S THIRD NEW INT'L DICTIONARY at 1638; IEEE Std. Glossary of Software Eng't Term., IEEE St. 610.12-1990, at 55; Biosite Exh. 5, Louder Rep. P 15; Roche Exh. 5, Dunsmore Dep. at 55. The other claims of the 609 patent confirm that the ordinary meaning of the term should apply in this instance. Claim 4 is perhaps the most revealing claim with respect to the varied types of constants or data intended to be included as a "parameter:"

. . . pluggable memory key means including a plurality of stored parameter values for controlling operations of said meter; and

processor means . . . wherein the processor means is responsive to parameter values accessed from said pluggable memory key means, to cause said excitation supply means to apply a plurality of voltages to said first electrode, each said voltage having a potential and being applied for a duration that is determined by said processor means from parameter values accessed from said pluggable memory key means, and to further control said sense amplifier means to provide a plurality of signal outputs over a set duration and to further calculate from said signal outputs a value equivalent to a concentration of an analyte in said analyte-containing fluid in said sample well, all in conformance with parameter values accessed from said memory key means.

'609 Patent, col. 9, ll. 48-68. Likewise, claim 5 also designates that control values, or parameters, are accessed on the pluggable memory key means, including "values of said first and second excitation potentials and the number of signal outputs from said sense amplifier means controlled by parameter values accessed from said memory key means." Id. col. 10, ll. 31-35.
The specification also indicates that the plain meaning of "parameter values" should apply to the term in the context of the 609 patent. The summary of the invention teaches that "[a] microprocessor is responsive to a procedure routine and parameter values accessed from the pluggable memory key to cause the excitation supply to apply a plurality of potentials for preset durations, both the values of the potentials and the time duration of their application determined from parameter values derived from the memory key." Id. col. 3, ll. 49-55. Similarly, the 609 patent reads: "the sense amplifier [is] operated under control of specific parameter values derived from the pluggable memory key." Id. col. 3, ll. 57-60. From these passages alone, it is clear that a "parameter value" is a constant or data that is assigned to a variable in the programs that are run by the microprocessor. This is also consistent with the language used to describe the interaction between the microprocessor and the ROM key: "When ROM key 30 is inserted into meter 10, a plurality of flexible contacts ... enable a microprocessor within meter 10 to access data stored in ROM chip 32." Id. col. 4, ll. 52-56.

The most compelling support for the ordinary meaning of "parameter value" in the 609 patent specification, however, is found in the more detailed descriptions of the contents of the ROM key. The 609 patent reads, in pertinent parts:

A microprocessor 59 ... provides overall control of the operation of biosensing meter 10 in combination with data read from ROM key 30. ROM key 30 is pluggable into biosensing meter 10 and contains non-volatile memory that includes constants and other data required to carry out analyte-determination procedures. In general, a ROM key 30 will accompany each batch of disposable sample strips 18 and will contain constants and procedure code that enable meter 10 to adjust its measurement parameters to match the specific batch characteristics of disposable sample strips 18. Further, ROM key 30 will also contain a large number of additional variable values that control the operation of microprocessor 59 in performing the actual analyte determination tests.

***

As above indicated, the operation of a biosensing meter 10 is substantially controlled by data contained in ROM key 30. ROM key 30 will contain a variety of data values that are critical to the proper operation of meter 10. Those values encompass measurement delay times, an incubation time, the number of measurements to be taken during a measurement period, various thresholds against which voltage levels are to be compared, values of excitation voltage levels to be applied to sample strip 18 during a test procedure, glucose value conversion factors, and a variety of failsafe test threshold values.

Id. col. 5, ll. 3-18; id. col. 5, ll. 66-68, to col. 6, ll. 1-8. These passages indicate that "parameter values" must be "constants or data" because the same language is used to describe how those "constants or data" are used to control the microprocessor of the meter that is used in claim 1 to describe what the "parameter values" do to control the processor means. Compare id. col. 5, ll. 3-18 and id. col. 5, ll. 66-68 to col. 6, ll. 1-8 (the passages listed here), with col. 9, ll. 4-11 (describing the interaction between the processor means and the parameter values and procedure routine specifications on the memory key).

Roche contends that there are two types of constants, "parameter values" and "procedure routine specifications," where "parameter values" are constants used in the algorithm, but "procedure routine specifications" are data values or numbers used to control execution of the algorithm. Roche asserts that the first passage above teaches "constants and other data" and "additional variable data," which is two different types of data. Roche argues that the former type of data is "parameter values" and that the latter type of data is "procedure routine specifications." Furthermore, Roche argues that because dependent claim 2 specifically requires that the pluggable memory key means contain "procedure routines," which Roche agrees with Defendants must be code, the only way to differentiate claim 2 from claim 1 is if "procedure routine specifications" is not code, but numbers or data. In addition, Roche asserts that in the prosecution history, the inventors clearly intended to include two types of data: parameters and specifications. Roche Br. at 45-46. Defendants do not really address this reference in the prosecution history.

Although the Court does not agree with Roche's argument in its entirety, the three sources of intrinsic evidence indicate that "procedure routine specifications" are data rather than code. The Court looks to the claims first. Claim 1 uses the term "procedure routine specifications" three times:

... said pluggable memory key means including a plurality of stored parameter values and procedure routine specifications that are employed in controlling execution of an algorithm performed by said meter that enables determination of an analyte concentration value, said procedure routine specifications including stored values from which time values can be determined for controlling said sense means during execution of said algorithm; and
processor means . . . responsive to parameter values and procedure routine specifications accessed from said pluggable memory key means, for controlling operation of said sense means in accordance with said algorithm and for calculating from signal outputs from said sense means a concentration value of an analyte in said analyte-containing fluid is said sample well.

Id. col. 8, ll. 62-68, to col. 9, ll. 1-11 (emphasis added). It is clear from the second usage of the term that "procedure routine specifications" must include "stored values from which time values can be determined for controlling said sense means during execution of said algorithm," therefore, to that extent, "procedure routine specifications" include values, or numbers. No other claims of the 609 patent uses the term "procedure routine specifications." Instead, the remainder of the claims use the term "parameter value" to describe all types of data values, including ones that Roche asserts are "procedure routine specifications."

Roche contends that two different types of data are referred to in the specification: "measurement parameters" and "additional variable values." Id. col. 5, ll. 12-15. The former, Roche argues, are "parameters" and the latter are "procedure routine specifications." However, several of the "additional variable values," described in more detail later in the specification, are identified by other claims as "parameter values." Compare, e.g., id. col. 5, ll. 3-18 and id. col. 5, ll. 66-68 to col. 6, ll. 1-8 (describing particularly the "additional variable values"), with col. 9, ll. 55-68 (describing the interaction between the processor means and the parameter values in claim 4). This evidence points away from a definition of "procedure routine specifications" that would limit the type of values that could serve as "parameter values," and suggests that an argument for an arbitrary distinction between the two types of data is flawed.

Roche also argues that the doctrine of claim differentiation supports its argument that "procedure routine specifications" are data. Apex/HDI contend that this is unworkable given the strong evidence that "procedure routine" is code and that the 609 patent specifically identifies that the pluggable memory key means has both procedure and code. See id. col. 5, ll. 9-11. To varying degrees, Roche and Biosite urge the Court to look to the plain meaning of the term "specification" to resolve the parties' dispute. The Court agrees that this approach helps illuminate the difference between "procedure routine specifications" and a "procedure routine" as those terms are used in the 609 patent. The plain meaning for specification is to make something more specific, or to identify something in greater detail. See WEBSTER'S NEW INT'L DICTIONARY at 2187; WEBSTER'S COLLEGIATE DICTIONARY(10th Ed.). Claim 1 already teaches that "procedure routine specifications" include "stored values from which time values can be determined for controlling said sense means during execution of said algorithm," 609 Patent, col. 9, ll. 1-3, therefore, it is not a stretch to combine the plain meaning of "specification" with "procedure routine" to decide that a "procedure routine specification" is something that identifies a procedure routine, or an identifier for something within the procedure routine. But, how is type of data distinguishable from a parameter value?

A definition for "procedure routine specification" that is data is consistent with the 609 patent specification's apparent reference to at least two different inventions, one in which there are two types of data on the pluggable memory key means, see id. col. 5, ll. 5-9 ("ROM key 30 is pluggable into meter 10 and contains non-volatile memory that includes constants and other data required to carry out analyte-determination procedures."). and one in which there are both "constants and procedure code." See id. col. 5, ll. 10-11 (stating "a ROM key 30 . . . will contain constants and procedure code"); id. col. 6, ll. 8-13 ("In addition, ROM key 30 may contain either a portion of or the entire code listing that controls the procedures of meter 10 so that, by substitution of a new ROM key, test procedures performed by meter 10 can be altered accordingly."). Moreover, it is the only definition that is consistent with the use of the term "specification" in the prosecution history. The prosecution history reads:

Claims 1-5, 15 and 16 were rejected under 35 USC [sic] 102(b) in view of Keiser et al. Prior to considering the rejection, it is worthwhile to briefly review Applicants' invention. Applicants biosensing meter resembles the meter of Keiser et al. in several respects, but departs therefrom in such a manner as to provide substantial functional improvements. Applicants' biosensing meter receives a pluggable memory key that contains a memory chip which stores (1) plural parameters, (2) specification values which are used to control the operation of an algorithm that analyzes a sample to determine the presence of analyte and (3) further contains in certain configurations, the actual procedure to be used by the meter. By inserting these parameters, values and procedures into the meter via a pluggable key, Applicants have enabled the meter to be reprogrammed at any time there is an improvement in the algorithm (e.g. an improvement which enables a faster or more accurate analysis procedure to be performed). Prior art biosensing meters were incapable of being modified to accept an
improved algorithm for the performance of a test function. As a result, prior art biosensing meters had to be structurally altered so as to accommodate a revised algorithm, test procedure or other improvement.

***

Keiser et al. include no teaching that the pluggable memory chip contain parameters which define "procedure routine specifications that are employed in controlling execution of an algorithm performed by said meter . . . said procedure routine specifications including stored values from which are determinable time values used to control said sense means during execution of said algorithm" (see claim 1 [as then amended]). Claim 2 is dependent upon claim 1 and indicates that the pluggable key means includes "a procedure routine that when executed by said processor means, enables execution of said algorithm". [sic] Keiser et al. have no such data in their pluggable memory key.

Defs.' Exh. 2, at A71-A73 (emphasis added).

This section of the prosecution history teaches two things. First, that the inventors saw a distinction between "plural parameters" and "specification values." Id. at A71. Second, that in distinguishing their invention from that of the prior art, the inventors seemed to refer to the language of claim 1 regarding "procedure routine specifications" as a subset of "parameters" within the context of claim 1. Id. at A72 ("Keiser et al. include no teaching that the pluggable memory chip contains parameters which define procedure routine specifications that are employed in controlling execution of an algorithm performed by said meter . . . ’ (see claim 1).”). It is this piece of information, in conjunction with the lack of evidence in the other claims or in the 609 patent's specification as to how to distinguish between data that comprises "parameter values" and data that comprises "procedure routine specifications," that convinces the Court that "procedure routine specifications" should be limited to the definition given it by claim 1 itself: "procedure routine specifications including stored values from which time values can be determined for controlling said sense means during execution of said algorithm." 609 Patent, col. 8, l. 68, to col. 9, ll. 1-3.

Roche's expert, Dr. H.E. Dunsmore ("Dr. Dunsmore"), an Associate Professor of Computer Science at Purdue University in West Lafayette, Indiana, opines that "procedure routine specifications" means "values that determine what the algorithm is," and distinguishes "procedure routine specifications" from "parameter values" by stating that the "parameter values" in claim 1 are narrower than the "parameter values" referenced in the remaining claims. Roche's Exh. 5, Dunsmore Rep. P 41. But, the Court sees no real way to distinguish between what is a "parameter value" and what is a "procedure routine specification" under this analysis. Yes, Dr. Dunsmore's report explains that a procedure routine specification could refer to numbers that change the formula for calculating a particular unknown, while parameter values are constants in the same formula, but there is nothing in the claims, the specification or the prosecution history that supports this distinction. Compare id. PP 15-22 with id. PP 23-41. In other words, this is an arbitrary differentiation between the two types of values that is only resolved by consultation with the description for "procedure routine specification" contained in claim 1.

The Court recognizes that limiting the definition of "procedure routine specification" to that found in the claim itself is extraordinary, however, the Court finds no better way to reconcile the clear meaning of the term "parameter value," the lack of evidence to support a more clear distinction between "parameter values" and "procedure routine specifications," and the evidence of two types of values in the prosecution history.

For the foregoing reasons, the Court finds that "parameter values" means: constants that are assigned to variables; and the term "procedure routine specifications" means: stored values from which time values can be determined for controlling a sense means during execution of an algorithm.

7. "process"

<table>
<thead>

<td>&quot;process&quot;</td>
<td>Storing and/or manipulating</td>
<td>manipulate the electronic image data</td>
</tr>
</tbody>
</table>
Fotomedia proposes that the Court incorporate "storing" as part of "processing." Fotomedia notes that the specification recites "processing on the server consists of one or more of the following: captioning, formatting, storing, . . . " 774 patent, col. 2, ll. 64-67. Here, Fotomedia argues, the patentee chose to be his own lexicographer and defined the term "process" to include the storing of data.

The defendants point to the use of the term "store" in the claims. Claim 1 of the '936 patent describes a program that directs a CPU to store electronic image data and to process the electronic image data. Defendants, therefore, argue that construing "process" to include "store," would lead to the result that the claim uses two different terms to mean "store." Further, the defendants argue that specification discloses that the "server is adapted to store and process data," thereby treating these steps as separate. 774 patent, col. 4, ll. 66-67.

Despite the language of the specification relied on by Fotomedia, the claim language requires that the "processing" step in claim 1 be read as being different and separate from the "storing" step.

"Process" means "manipulate the electronic image data."

The Court construes "process" to mean "a series of actions or operations executed by a computer program for a given purpose." AVG argues the term should be construed to mean "a series of actions or operations conducted by a computer system for a given purpose." AVG asserts that this definition comports with the entire technological and temporal context of the term, in view of the patent's specification and prosecution history. However, AVG's use of the phrase "computer system" results in a definition that is too broad and not sufficiently software-centric given the clear reference to a software process in the specification and file history. In particular, AVG's proposal provides no limitation on the number of programs or amount of time used for completing the "given purpose." This is inconsistent with the specification's clear reference to a "process" as a software process. Alternatively, Microsoft argues that "process" should be construed as "a program in execution." This definition is confusing because the phrase "in execution" implies that the "program" must have microprocessor attention in order to be a process. Such an implication contradicts the term's plain meaning and the specification. Thus, Microsoft's proposed definition will not sufficiently enlighten the jury.

Claim 1 describes the clerk system as operable "to process auction bids." Similarly, Claims 2 and 3 describe a method comprising, in part, "processing auction bids." The term "process auction bids" is not explicitly defined in the patent, however, all parties appear to agree that one reasonably skilled in the art would understand this term to refer to performing operations on bid data. While the plain meaning of this processing limitation is extremely broad and potentially reaches any number of potential operations, all claims of the patent describe "receiving," "accepting," and "transmitting" bids separately from "processing auction bids." Therefore, these operations must be excluded from the definition of that term. Accordingly, the Court adopts the following construction: The term "process auction bids" appearing in Claim 1 shall mean "perform operations on bids other than receiving, accepting, or transmitting bids," the term "processing auction bids" appearing in Claims 2 and 3 shall mean "performing operations on bids other than receiving, accepting, or transmitting bids."

1. A process for downloading a data file from a server computer to a client computer
The Court's Construction: Transferring a file capable of being stored from a server computer to a client computer.
Markman Tr. 5:12-13.

Ethos found the Court's construction "an appropriate definition." Markman Tr. at 5:9-17. RealNetworks, however, objected to the phrase "capable of being stored," as inconsistent with the term as used in the claim and specification. Id. at 6:11-7:5.

The term "a process for downloading" is common to claims 7 and 8 of the '892 patent and claims 1 and 2 of the '709 patent. The specifications of both patents contain a definition of the term "download" in the following sentence: "In most computer networks it is desirable to have the capability to download, i.e., transfer, data from one computer to another." '892 patent col.1 ll.12-14 (emphasis added); '709 patent col.1 11.19-21. The patents, therefore, appear to equate "downloading" with the transfer of data. Such a definition, however, would encompass every instance of data retrieval on the Internet, including simply clicking on a hypertext link. The specification of the patents eschew such a broad construction of the term by distinguishing between "downloading" and a more basic transfer of data: "Several client programs are available, such as browsers for the World Wide Web which may download files or read and display HTML documents . . . ." '892 patent col.5 11.60-62 (emphasis added); '709 patent col.6 11.1-3. By contrasting "download" and the "read and display" functions of browsers, the patent specifications exclude that function from its characterization of the term "download." Limiting the construction of "download" to "data capable of being stored" is also consistent with the expressed field of the invention as identified by the specifications, which contemplate the storage of the data transferred. Both patents state: "The present invention is related to processes and apparatus for transferring information between computers, particularly between a client computer and a server computer where the information is stored." '892 patent col.1 11.6-9; '709 patent col.1 11.13-16.

The specifications also make several references to the storage of data. See Pl. Br. [Doc. No. 264], Ex. F (citing the numerous references to the storage of data). RealNetworks contends that these references relate only to those claims which contain an additional storage step, citing, by way of example, claim 2 of the '709 patent, which does not have a separate storage step. Markman Tr. 9:1-7. Because it is unclear whether the references to storage relate only to the claims that contain a storage step, the Court does not rely on these references in making its determination. The Court noted that the specifications of the patents describe embodiments of the invention where the executed client program stores data, see '892 patent col.3 11.8-9, col.6 11.29-30, col.10 11.3-4; '709 patent col.3 11.15-16, col.6 11.37-38, col.10 11.11-12, and that claim 8 of the '892 patent and claim 2 of the '709 patent teach the download process involving the execution of a client program, see '892 patent, claim 8, col.14 11.34-38, '709 patent, claim 2, col.12 11.29-31. It is likely, therefore, that some of the "storage" references in the specifications relate to those claims that do not teach a storage step.

3359

B. Process(ing) . . . to Select

The terms "process . . . to select" and "processing . . . to select" may be found in the '932 Patent, claims 1 and 18; the '052 Patent, claim 1; the '561 Patent, claims 1 and 6; the '429 Patent, claims 1 and 23; and the '064 Patent, claims 1 and 35. Sprint construes these terms to mean process/processing to participate in the selecting. Big River construes these terms to mean a processing system processing/those processes [the information] and making/makes the selection.

In its summary judgment ruling in the Vonage case, the Court did not construe this particular term, but it noted that this language in two patents did not require that the processing system actually "select" a network code, but instead required only that the system "process [the signaling] to select" the code. See 500 F. Supp. 2d at 1323. Therefore, a fact question remained regarding infringement in light of evidence that Vonage's processing system was "involved in the selection of the network code." See id.

Subsequently, Sprint and Vonage asked the Court to construe this term "process(ing) to select." See 518 F. Supp. 2d at 1320-21. Relying on the Court's summary judgment order, Sprint argued that the term should mean process/processing to participate in selecting; Vonage, on the other hand, argued that the term should mean process/processing and make/making a selection. See id. In response to Sprint's argument, the Court noted that it had not approached the issue as one of construction in the prior order, and "did not ascribe the definitive meaning to the claim terms that the processing must do nothing more than merely 'participate' in the selection." See id. at 1321. The Court also rejected Vonage's argument based on
a portion of the prosecution history in which the applicant distinguished another invention as one that selects actions for switches instead of selecting connections, as in the present invention; the Court held that the excerpt was not helpful because it did not address this distinction between making a selection and merely participating in the selection. See id. at 1321-22. Because neither party had directed the Court to relevant supporting evidence in the intrinsic patent record, the Court rejected both parties' constructions and concluded that the claim term did not require further construction. See id.

In the present case as well, the parties dispute whether the processing system must make the requisite selection or merely participate in making the selection. Big River relies on the same excerpt from the prosecution history that Vonage cited. Big River has not explained how the Court erred in considering that excerpt in Vonage, however, and the Court again finds that excerpt to be unhelpful. Big River also notes that the goal of the invention in the '301 Family of patents is to avoid having to use the processing capabilities of switches; recognition of that goal does not resolve whether the processor must make the selection or merely participate, however.

As Sprint notes, the specification does make clear that information from elements other than the processor may be used in selection. With respect to the parties' dispute regarding the scope of the claims, the Court agrees with Sprint and concludes, as it did in Vonage, that the claim language does not require the processing system actually to select the network element, but only that it "processes [information] . . . to select" the element. Thus, the Court rejects Big River's proposed construction. The Court further concludes that the scope of the claims might be ambiguous on this issue, to the extent that someone might believe that the selection must be made without help from any other network elements. Therefore, the Court adopts Sprint's proposed construction, and construes the terms "process . . . to select" and "processing . . . to select" to mean process/processing to participate in the selecting. See O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1361 (Fed. Cir. 2008) (court may be required to determine scope of claim when reliance on claim terms' ordinary meaning does not resolve parties' dispute).

7. Process travel along a route

The fourth subpart of claim 1 reads: "wherein the device is adapted to process the device's location and travel along a route." The disputed phrase is underlined. Defendant contends that the phrase needs no construction (besides the term "route"), but plaintiff argues that "process . . . travel along a route" should be construed as "monitor progress along an established or selected route." Plaintiff's definition of "process" as "monitor" is consistent with the specification, which explains that "the server processes the majority of a device's travel along the route using a set of processing algorithms and the cartographic and route data . . . ." '873 pat., col. 8, Ins. 28-30. It is clear that the server uses processing algorithms to keep up with, or monitor the device's travel. However, plaintiff's inclusion of "establish or selected" in the definition is inappropriate because it adds functions that were not included in the claim. The claim discloses nothing about who or what establishes or selects the route. I construe the phrase, "process . . . travel along a route" to mean "monitor . . . travel along a route."

E. "processed" / "processing"

Claim 1 contains the term "processed": "wherein data directed toward the public network from the one of the users' computers are processed by the redirection server according to the individualized rule set." Claim 8 contains the term "processing": "processing data directed toward the public network from the one of the users' computers according to the individualized rule set." As in the term "individualized rule set," Linksmart believes that no construction is necessary, and the defendants wish to limit the scope of this term to filtering and redirecting.

Based on the context of the claim language, it is evident that the "processed" or "processing" stepped performed by the redirection server is analogous to the redirection server "control[ling] data passing" to the public network. Thus, "processed" and "processing" should be given the same construction as "control data passing": "redirect[ing], allow[ing], or block[ing]"
a. Claim term one

"digital signals" (claims 1 and 38) & "processed signals" (claim 6)

The parties' dispute with respect to term one is a dispute as to whether the '672 patent applies only to video signals or also to other types of signals (including, significantly, still images). Plaintiff argues that term one should be construed as: "A sequence of data to be runlength encoded, having multiple values and a predetermined length." Defendants argue that this term should be construed as: "A digital signal or processed signal is a set of data representing frames of a video."

As Defendants argue, in the context of the "typical[]" utilization of the ordered redundancy coding system, the specification of the '672 patent clarifies that "processed signals" include only video signals: "The processed signals are in the form of a plurality of multivalued digital numbers, X(k), typically one number X(k), for each frame." '672 Patent col.3 11.49-56 (emphasis added). Plaintiff argues that the foregoing definition must include a typographical error because there are necessarily many numbers in a block and many blocks in a frame. Tr. 117:3-10. However, because the specification makes clear that "X(k)" represents a series of values, n the foregoing description of "processed signals" is consistent with Plaintiff's view that there are many numbers in a block. Accordingly, as explained in the specification, "processed signals" typically are comprised of plural frames, thus indicating that processed signals are video signals.

--- Footnotes ---

n3 "In general, a K-valued digital number, X(k), is formed by a series of K values, x(k), as follows: X(k) = x(1), x(2), x(3), . . . x(k), . . ., x(K) where 1=k=K." '672 Patent col.12 11.38-43.

--- End Footnotes ---

Plaintiff contends that its construction of "processed signals" and "digital signals" is supported by the doctrine of claim differentiation. This doctrine "refers to the presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006); see also Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir., 2004) ("the presence of a dependent claim that adds a particular limitation raises a presumption that the limitation in question is not found in the independent claim."). While claim 19 is limited to "input signals represent[ing] images . . . presented in sequential frames," claim 6, which addresses "processed signals" and upon which claim nineteen is dependent, does not include such a restriction. '672 Patent col.24 11.13-16; col.25 11.52-65. Plaintiff argues that this necessarily means that claim six does not include a requirement that the signals be video signals. However, "that the claims are presumed to differ in scope does not mean that every limitation must be distinguished from its counterpart in another claim, but only that at least one limitation must differ." Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000). As Defendants point out, because claim 19 adds limitations that are not in claim 6-the steps of forming the mean-square difference and error and selecting a mode-the doctrine of claim differentiation does not compel the Court to read out the restriction that the processed signals in claim 6 are video signals.

Although the specification does not provide a similar explanation of "digital signals," the parties initially agreed "that the Court should construe the terms 'processed signals' and 'digital signals' identically for the purposes of the claims at issue." n4 Defendants and Declaratory Judgment Plaintiffs' Responsive Markman Brief, p. 7 n.3. Because "processed signals" are a subset of "digital signals," the Court was hesitant to apply the above explanation of "processed signals" also to "digital signals." Accordingly, the Court requested and received supplemental briefing addressing the question of whether "digital signals" and "processed signals" should be given the same construction and, if so, why.

--- Footnotes ---

n4 Plaintiff's expert, Dr. Sheila Hemami, indicated that both "digital signals" and "processed signals" have a special
meaning: "The terms 'digital signals' and 'processed signals' normally have a very broad meaning, but those terms are given a special and more particular meaning in the specification of the '672 Patent and as they are used [in] the claims." Declaration of Tibor L. Nagy ("Nagy Decl."), Ex. 2, p. 18. During oral argument, Plaintiff's counsel indicated that this was an "error" and that Dr. Hemami and Plaintiff's counsel "both regret having opened this can of worms [that Plaintiff conceded that the term 'processed signals' is not being used in the patent in accordance with how those ordinarily skilled in the art would commonly understand it] by suggesting that there is some special meaning to 'digital processed signals.'" Tr. 109:4-20. While the Court finds it somewhat instructive that Dr. Hemami wrote that "digital signals" and "processed signals" have a special and particular meaning in the '672 patent, the Court's construction of these terms does not turn on her statement.

Plaintiff argues in its supplemental brief that, if the Court gives the above construction to "processed signals," n5 "digital signals" should not be similarly limited. Plaintiff emphasizes that "processed signals" are a subset of "digital signals," pointing out that "digital signals" are equivalent to "input signals" n6 and "input signals" are processed to form "processed signals." n7 Plaintiff argues also that the "processing" referred to in claims 1 and 38 is different than the "processing" in claim 6. However, assuming arguendo that "digital signals" are not video signals, Plaintiff does not provide any explanation for how the processing of "digital signals" to create "processed signals" converts non-video signals into video signals. As Defendants argue, if "processed signals" are video signals, and processing does not convert non-video signals into video signals, the input signals or "digital signals" must also be video signals. In light of Plaintiff's initial concession that the terms should be construed identically, and in the absence of a persuasive argument as to how processing "digital signals" would convert non-video signals into video signals, the Court concludes that, if "processed signals" are video signals, "digital signals" must be given the same restriction.

n5 Plaintiff disputes that "processed signals" should be limited to video signals in its supplemental brief. Plaintiff's Second Supplemental Brief, p. 1.

n6 "Digital signals to be processed are input on lines 5 to the transmitter 2. The input signals on lines 5 are processed in one of a number of different modes so as to efficiently compress the data input signals to form processed signals for transmission to a receiver." '672 Patent col.4 11.33-37.

n7 Claim 6 describes "[a] method for processing input signals to reduce the amount of data utilized to represent the input signals, the steps comprising, processing the input signals to form processed signals where the processed signals are digital numbers having first values, second values, and other values." '672 Patent col.24 11.10-16; see also id.

Considering that the above explanation of "processed signals" is given in the context of a "typical[ ]" system, it does not on its own persuade the Court that "processed signals" and "digital signals" must be construed as video signals. However, this clear explanation of "processed signals," combined with numerous other indications that the patent applies exclusively to video signals, most logically supports such a construction. As noted above, where "the specification makes clear at various points that the claimed invention is narrower than the claim language might imply, it is entirely permissible and proper to limit the claim." Alloc, 342 F.3d at 1370.

The abstract of the '672 patent indicates that the patent is limited to video data: "The present invention specifically relates to methods and apparatus useful in video compression systems." '672 Patent, abstract; Hill-Rom Co., Inc. v. Kinetic Concepts, Inc., 209 F.3d 1337, 1341 (Fed. Cir. 2000) ("We have frequently looked to the abstract to determine the scope of the invention, [citations], and we are aware of no legal principle that would require us to disregard that potentially helpful source of intrinsic evidence as to the meaning of claims."). The location of a statement within the specification "can signal the likelihood that the statement will support a limiting definition of a claim term." C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 864 (Fed. Cir. 2004). Specifically, "[s]tatement that describe the invention as a whole [which are more likely to be found in certain sections of the specification], rather than statements that describe only preferred embodiments, are more likely to support a limiting definition of a claim term." Id. Although "certain sections of the specification are more likely to contain statements that support a limiting definition of a claim term than other sections," the Court must determine
the significance of language in the specification "on a case-by-case basis." Id. Because the abstract of the '672 patent states that it is "useful in video compression systems," this language in itself does not necessarily limit the patent to video data. However, the language is another significant factor supporting the Court's conclusion that the patent applies specifically to video signals.

Another such factor is the explanation in the specification that the '672 patent was designed to solve a problem specific to video data. "In construing claims, the problem the inventor was attempting to solve, as discerned from the specification and the prosecution history, is a relevant consideration." CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1160 (Fed. Cir. 1997). The patent specification describes the need that the '672 patent was designed to meet:

If the communications link is an earth satellite, an unprocessed video signal typically occupies nearly the entire bandwidth of the satellite, with very few channels, if any, left over for other uses. A T1 communication channel is typical and has only a 1.5 megabit per second bandwidth. A practical yet effective way to reduce the bandwidth of digitalized television signals is needed so that fewer channels are required for transmission over a communications path and so that the quality of transmitted signals is maintained even when reduced bandwidth transmission is employed.

'672 Patent col.1 11.34-44 (emphasis added).

Plaintiff argues that video data is referred to in the specification as an example of how the ordered redundancy coding system may be applied. n8 However, Plaintiff does not identify any examples in the patent that do not involve video data. Plaintiff's argument that the specified application of the patent to the "intraframe mode" demonstrates that the patent was intended to be applied to still images is not persuasive. The specification explains that "[t]he decision as to which mode to select is made based upon an analysis of the frame-to-frame differences (motion) between the current input signals and the previous input signals." '672 Patent, col.3 11.61-64. While the specification describes a "single image frame" in intraframe coding, it does so in the broader context of describing video:

--- Footnotes ---

n8 See, e.g., "The present invention specifically relates to methods and apparatus useful in video compression systems," '672 Patent, col.1 ll.19-20; "The ordered redundancy coding of the present invention is typically utilized in a system that processes input signals, such as spatial domain image signals occurring in successive frames, to form processed signals for each frame," id. col. 3 11.49-53.

--- End Footnotes ---

The U.S. Pat. No. 4,302,775 patents reduces redundancy by employing intraframe coding techniques utilizing intraframe comparisons of cosine transform coefficients. While the patent provides significant improvement over other techniques, there is a need for even greater compression.

In addition to intraframe coding techniques, interframe coding techniques have been used to reduce the rate required for video transmission as described, for example, in the above-identified application. Typically, each video frame is held in memory at both the transmitter and the receiver and only frame-to-frame changes are transmitted over the communication link. In contrast to intraframe coding schemes in which the quality of coded images is dependent upon the amount of detail in each single image frame, the quality of the coded image in interframe coding is dependent upon the differences from frame to frame. Frame-to-frame differences are often referred to as "motion."

'672 Patent, col.2 11.12-31 (emphasis added). Nor is Plaintiff's argument that Defendants' proposed construction excludes intraframe coding persuasive, as intraframe coding is a type of video coding.

Considered together, the explanation that "processed signals" typically are comprised of plural frames, the language of the abstract, the purpose of the invention, and the absence of any example expressly identified as applying to still images all point to the conclusion that the '672 patent applies exclusively to video data. Defendants note that Plaintiff's conduct over the past two decades n9 is persuasive extrinsic evidence that the '672 patent applies exclusively to video data. This line of argument is unnecessary to support the Court's conclusion that "digital signals" and "processed signals" are video signals and is in the outer bounds of the type of extrinsic evidence that a Court should consider in construing patent claims.
Accordingly, while evidence that Plaintiff may have delayed asserting that the use of JPEGs infringes the '672 patent would be highly relevant to a defense of laches at a later stage of litigation, the Court need not and does not rely on this argument in construing term one.

n9 For example, Defendants argue that even though Plaintiff was aware of the work being done by JPEG standard-setting committee and itself voted to approve the JPEG standard, it neither disclosed the '672 patent to the committee nor sought to license it. See Scarsi Decl., Ex. 2, pp. 202-204; Ex. 3, pp.153-56; Ex. 15. In contrast, Plaintiff was involved in the MPEG committee and disclosed the '672 patent to that committee. See, e.g., Scarsi Decl., Exs. 12 and 13.

For the reasons stated above, the Court adopts Defendants' proposed construction of term one.

B. Construction of "Processing"

Brown contends that it is not necessary to construe the term "processing," arguing that the term is clear without construction and that "[a]nyone sitting in the jury box would be able to relate 'processing' with a processor of a computer." (Docket Entry Nos. 132 at 20-21; 140 at 8-9). Brown argues in the alternative that "processing" should be construed as "performing a series of comparisons and/or calculations on data that lead toward a particular result." (Docket Entry No. 132 at 21). The defendants argue that "most laypersons do not readily understand the meaning a person of skill in the art of computer systems in 1986 would assign to the term 'processing.'" (Docket Entry No. 138 at 25). They propose that "processing" should be construed as "performing a series of comparisons and calculations on data that lead toward a particular result." (Id.).

The '713 Patent claim recites a portable processing means for "processing" bar codes "so as to determine" if a particular medication, good, service, or procedure is "permitted to be delivered" to a particular patient at a particular time. This "determination requires that said identified medications . . . would be delivered to said identified patient at an appropriate time according to when identified medications . . . were last delivered." (Docket Entry No. 132, Ex. A, col. 4 ll. 30-40). This requires the system to calculate the time elapsed since the last delivery, as recorded in the patient instruction file, and compare this with the interval prescribed in the physician instruction file. The plain language of the claim requires "processing" to involve both comparisons and calculations. The specification supports the claim language by explaining that the portable computer means "calculates the time interval since the last recorded delivery" and then compares the calculated interval "with the interval prescribed in the physician instruction file." (Id., Ex. A, col. 3 ll. 27-32).
4. "processing" (claims 1 and 6)

The plaintiff proposes defining this term to mean "putting through the steps of a prescribed procedure" while the defendant defines the term to mean "manipulating the data access operation requests into a format usable by the external storage device." The plaintiff argues that "processing" is an ordinary word with an ordinary meaning. The plaintiff cites an extrinsic source for the dictionary definition of processing.

The term "processing" occurs twice in claim 1. In the first occurrence, the claim language addresses directly accessing data or information in the flash memory using the USB or IEEE 1394 standard"...by implementing and processing the data access operation requests issued by users." The second instance of "processing" in claim 1 is as follows: "processing the operation request in magnetic disk operation format issued from users upon plug..." The patent specification teaches that user requests are converted to special instructions by the driver. See e.g., 2:45-64; 3:19-40. In these passages, the patent specification specifically discloses converting user requests from a magnetic disk storage device to special instructions for the flash memory.

The claim language must be construed in light of the disclosures in the specification and the context of the claim itself. "Processing" means "manipulating the data access operation requests into a format usable by the external storage device."

8. Processing: Echometer argues that "processing" should be construed consistent with its ordinary meaning as the manipulation of digital information. Lufkin seeks to limit Echometer's broad definition of processing by requiring the term to include the step of determining acoustic velocity, which requires collar counting or detection of collar frequency.

As previously defined, acoustic velocity, used only in claim 25, is the speed of sound through a medium and does not necessarily require the determination of collar counting or collar frequency to calculate its numeric value. Further, the Court finds processing to be a general term which is defined, or limited, by the context in which it is used, e.g. claim 6 describes the step of processing the digital samples to detect an echo return from the liquid surface and claim 7 describes the step of processing digital samples to detect a reflection from the liquid surface. '399 Patent, at 41, (col. 37, 1. 4-5, 33-34). The general term processing, therefore, is further defined and limited by its context in the asserted claims; the Court does not find that the term processing need be limited to processing via specific equations or calculations. The Court, therefore, defines processing generally as the manipulation of digital information and does not adopt Lufkin's additional limitations concerning the method by which the processing must occur.

3. "Processing"

The next term the parties presented to the Court for construction from the Analysis Control System patents is "processing." In Claims 104 and 117 of the '707 patent, the term appears in context as "means for processing at least certain of said data developed by said terminals and said calling number identification data relating to certain select ones of said individual callers." In Claim 192 of the '707 patent, the terms appears in context as "analysis structure for receiving and processing said caller data signals under control of said record testing structure." The final analysis control system claim at issue in which "processing" appears reads "means for processing at least certain of said data developed by said remote terminals relating to certain select ones of said individual callers." Claim 171 of the '863 patent.

The parties agree and the Court concludes that the phrase "means for processing" is a means-plus-function limitation subject
to 35 U.S.C. § 112, P 6. The structures corresponding to the "means" in "means for processing" include the Processing Unit 92 in Figure 4, the Central Processing Unit 251 in Figure 9, or the Processors PR1 through PRn in Figure 1.

The defendants argue that the term "analysis structure" in "analysis structure for . . . processing" is also subject to means-plus-function analysis. To support their position, the defendants contend that in the ’739 patent, which shares the same specification as the ’707, ’863, and the ’309 patents, Katz used the term "analysis means" in limitations similar to the limitations which contain "analysis structure." The plaintiffs contend that "analysis structure" had meaning to those in the art and connoted computer hardware and software used to analyze data, such as a processor. (Pls' App at 160-61). The Court concludes that the term analysis structure is written in functional language and does not connotate sufficient structure to avoid the application of 35 U.S.C. § 112, P 6, despite the presumption to the contrary. The function of the analysis structure in the terms of the claim language is "receiving and processing said caller data signals under control of said record testing structure." The structures that correspond to "analysis structure" are the same as those that correspond to the "means" in "means for processing," i.e., the Processing Unit 92 in Figure 4, the Central Processing Unit 251 in Figure 9, or the Processors PR1 through PRn in Figure 1.

The core dispute between the plaintiffs and defendants is whether "processing," as used in "means for processing" or otherwise in the patents, requires a specific type of processing. The defendants contend, in the context of their means-plus-function arguments, that the structures that correspond to the "means" in "means for processing" also include the software that performs the function of processing, and because the only type of processing disclosed in the specification is statistical analysis to isolate a subset of callers in the context of the specific formats disclosed, the computer must be programmed with software that performs this particular kind of processing. Specifically, the defendants argue that all of the disclosed formats in the specification, including a health poll format, mail order format, instant lottery format, auction sale format, television game show formats, and television poll format, require the use of statistical analysis to isolate a subset; thus, they argue, "processing" and "statistical analysis" are synonymous. The defendants also argue that if the term "processing" is given a broad, unlimited meaning, it would render other limitations that call out specific functions of a computer surplusage, such as "accessing" a file, "storing" data, and "testing" data.

The plaintiffs argue that the defendants' proposed construction of "processing" has no support in the claim language, and that the defendants are attempting to define the function of "processing" by importing structural limitations from the specifications. The plaintiffs argue that the term should be given its ordinary meaning, which is "performing some operation or sequence of operations on data and/or telephone calls." (Pls.' Appendix at 7).

The term "processing," even as part of the phrase "means for processing," is not subject to means-plus-function analysis, so an immediate resort to the specification for meaning is not appropriate unless there is some "hook" in the claim language on which limitations from the specification may be hung. See Renishaw, 158 F.3d at 1252. Thus, if the term "processing" in the context of the claim language had a common, ordinary meaning to those of ordinary skill in the art, that meaning is the proper construction of the term, even if it is broad. See Johnson, 1999 WL 243570, *3.

Contemporary technical dictionaries indicate to the Court that "processing" had a broad meaning to those of skill in the art for some time. In the context of these claims it is clearly implied that the processing is being performed on data. The Standard Dictionary of Computers and Information Processing by Martin H. Weik (1969) defines the verb "process" as follows: "In data processing, to handle, manipulate, or perform some operation or sequence of operations on data in accordance with a specified or implied algorithm, usually as a series of discrete steps, including operations such as compute, assemble, compile, interpret, generate, translate, store, retrieve, transfer, select, extract, shift, search, sort, merge, transliterate, read, write, print, erase, and punch. The processing usually results in a solution to a problem." (Ex. 458). In the Computer Dictionary, by Charles J. Sippl (1966), the term "process" is defined as a "generic term that may include compute, assemble, compile, interpret, generate, etc." (Ex. 498). In the Dictionary of Computing and New Information Technology, by A.J. Meadows et al. (1984), the term "data processing" is defined as including "all clerical, arithmetical and logical operations on data. Data processing in the context of information technology always implies the use of a computer for these operations." (Ex. 483).

The claim language also shows that the term "processing" does not by itself indicate statistical analysis to isolate a subset of callers. Many claims, dependent and independent, in the ’707, ’863, and ’309 patents specifically call out processing to isolate a subset of callers. For example, Claim 169 of the ’707 patent specifically calls out processing to isolate a subset of callers. Claim 174 of the ’863 provides for "subsequent" processing that isolates a subset of callers; however, Claim 171,
upon which Claim 174 depends, does not require such a parameter on the initial processing. Similarly, Claim 181 of the '863 provides for "processing . . . responsive to said approval signals." Claim 185 of the '863 patent, which is dependant on Claim 181, specifically provides for processing to isolate a subset callers. The fact that "processing" is called out in some claims, and then specifically "processing to isolate a subset of callers" is called out in other claims, some of which are dependant on the claims that call out "processing" generally, indicates that the independent claims which contain the term "processing" do not necessarily require that the processing perform statistical analysis to isolate a subset of callers or data. See Rodime PLC v. Seagate Technology, Inc., 174 F.3d 1294, 1999 WL 216236, *9 (Fed. Cir. 1999). If the term "processing" were given the limited scope explicitly called out in the dependent claims, those claims would be rendered superfluous, a result that should be avoided if the claim language will allow under the doctrine of claim differentiation. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Ct. 1991). 18

There is nothing in the specifications that requires the Court to alter the broad meaning of "processing" conveyed in the claims, even though the subject of statistical analysis to isolate a subset of callers is repeatedly discussed. The name of the patents under consideration is "Telephonic-Interface Statistical Analysis System." At several points in the specification, Katz describes his invention generally or one of the formats generally as performing statistical analysis to isolate a subset of callers. See Column 1, line 58-67 of the '707 patent (providing that "in general, the present invention comprises a telephonic-interface system and related process . . . in a variety of different interface formats or programs, as to . . . statistically analyze acquired data, as in combination and is association with external data (time independent), and accordingly to isolate a subset of the callers with variable identification"); Column 2, line 22-26 of the '707 patent (providing that "in accordance with various formats, acquired data is processed in statistical relationship, or in relation to applied external data"); Column 5, lines 53-55 of the '707 patent (providing that "in general, the processing evolves a subset (at least one caller) the members of which may be verified or confirmed"); Column 21, lines 33-38 (providing that "in view of the above explanation of exemplary systems, it will be appreciated that other embodiments of the present invention may be employed in many applications to accumulate statistical data, process such data, and define subsets of callers of concern").

It is no surprise that Katz discussed statistical analysis to isolate a subset of callers in the specifications to the '707, '863, and '309 patents because he specifically called out this function in some, but not all, of the claims in those patents. Conversely, there is no mention in the specifications to the '285 and '150 patents of "statistical analysis" or "isolating a subset of callers" because none of the claims in those patents specifically call out such processing, even though the term "processing" appears in the claims of those patents. While the specifications of the '707, '863, and '309 patents call out several embodiments of the Katz invention in which processing is performed to isolate a subset of callers through statistical analysis, not all of the claims that contain the broad term "processing" require this limitation. Whether, as defendants argue, Katz's claims are broader than his disclosure in the specifications of his patents, is a question for another day and does not alter the construction of "processing," a term that clearly had a broad and common meaning to those of ordinary skill in the art.

The portions of the prosecution history highlighted by the defendants do not conflict with the common understanding of "processing." During the prosecution of the '968 patent, from which the patents-in-suit descended, Katz distinguished his invention from a collection of prior art in part on the basis that his invention variously incorporated "(1) personal participant selectivity, (2) participant record development and (3) analytical inter-related data processing with respect to developed records." (Ex. 33, March 2, 1988 Amendment at 14). The defendants argue that this statement by Katz indicates that all of his claims, including pending Claim 37 which did not explicitly call out "statistical analysis to isolate a subset," incorporate statistical analysis or "inter-related processing." However, pending Claim 38, which was dependent on Claim 37, added the specific limitation of "processing said statistical data as to isolate a subset of said individual callers." Katz's assertions during the prosecution of the '968 patent that his invention variously incorporated three elements does not require, and this Court will not, import the limitation of "analytical inter-related data processing" or "statistical analysis to isolate a subset" into the definition of "processing" in claims of the '968 patent, or of any of the patents at issue in the Markman hearing.
During the prosecution of the '923 patent, which has the same specification as the '707, '863, and '309 patents, Katz attempted to distinguish his invention from a patent to Riskin by stating that the Riskin patent did not "suggest any interrelated processing between callers, nor are processing files formed other than merely to accommodate billing." (Ex. 38). In an Appeal Brief dated September 11, 1992 during the same prosecution, Katz described his invention as systems that "statistically acquire data, as in combination with and in association with external data (time independent), and accordingly isolate a subset of the callers with verifiable identification." (Ex. 38). Similarly, in the Information Disclosure Statement dated January 31, 1996 at 13 during the prosecution of the '185 patent, Katz informed the PTO that "in various applications, Applicant's inventive systems have utilized an operation of processing data to isolate a subset of callers. In a refined form, the operation involves processing data from callers in combination to isolate a select subset of the callers by 'interrelated' processing." (Ex. 56). These statements by Katz indicated that his patents suggest or include interrelated processing or statistical analysis to isolate a subset of callers, which is clear by the claims which explicitly call out this function. However, none of these statements by Katz indicates that any particular claim includes this type of processing or that all processing suggested in his patent is of this type.

Based on the foregoing, the Court construes the term "processing" to mean: manipulation of data which performs some operation or sequence of operations on the data.
standard and the number of data layers on the disk. He did not disclaim the processing of an optical signal reflected from pits located in the read-in area which represent other encoded TOC data.

--- Footnotes ---

2 An optical disk contains, in general terms, a read-in region, a program area, and a read-out region. The read-in area is an area of the disk reserved for storing table of contents data and other information. The actual data program is stored on an optical disk in the program area of the disk. The read-out (or lead-out) area follows the program area.

--- End Footnotes ---

To illustrate the difference, one might observe an object, such as a chair, and conclude by looking at it that the object is in fact a chair. That same person might also read a sign on the object that says "this is a chair" and conclude that the object is a chair by virtue of the information communicated by the sign. It is the former situation that is analogous to the processing step described in claim 3. It is the latter situation that is more akin to the reading limitation imposed by claims 1 and 2. The optical signal reflected from the pits might reveal, as the prosecution history suggests, the bit rate, which, in turn, would reveal the pit configuration standard. The total number of data layers might also be revealed by the dimensions of the tracks and the pits. That those pits might represent other types of TOC data, as, for instance, playback time, does not mean that their characteristics could not aid in a determination of the type of disk in the drive. There is nothing in the file history that suggests that the encoded pits from which the beam is reflected cannot be located in the read-in area of the disk.

Although the prosecution history does not impose the limitation sought by the defendants, the defendants also urge that the language of the claims mandates this result. Claims 1 and 2 require that the TOC data be read from the read-in portion of the disk. Claim 3 requires that the optical signal be reflected from "encoded pits" on the optical disk (emphasis added). Data is encoded before it is stored on an optical disk. For instance, a video file must be compressed before it is stored on a disk. The defendants argue that the patentee's use of the term "encoded pits" suggests that the patentee was referring to the pits which store the actual data on the disk and those pits are located in the program area of the disk, outside of the read-in region. A review of the specification, however, reveals that the patentee used the term "encoded" to refer to both the pits that represent TOC data as well as pits that reflect the program data stored on the disk. See '981 patent, col. 1, ll. 51-54 ("In an optical disk such as a compact disk (CD), a Mini-Disk (MD) and a digital video disk (DVD), a TOC data is encoded in the read-in region of the disk"); col. 3, ll. 48-52 ("In case that the TOC data is not encoded on the optical disk in step 2 (S2) and the case that type of the optical disk is not identified in step 5 (S5), the system controller operates the pickup to read any data on the optical disk by modulating the servo control circuit, tracking servo circuit, and the focusing servo circuit (S6)). These passages suggest that the patentee used the term "encoded pits" more broadly than the defendants suggest. Those pits may be located in either the read-in region as well as elsewhere on the optical disk, such as the program area.

III.

We ultimately conclude that it was proper to grant the motion for summary judgment of non-infringement albeit taking issue with some of the reasoning relied upon by the district court. Although the district court determined that it need not decide "whether the condenser is part of the process chamber or a separate unit," Semitool Order, 2005 U.S. Dist. LEXIS 4889 at *11, we find that summary judgment of non-infringement can only be properly granted if we determine that the condenser is inside the processing chamber.

The district court decided it did not have to reach that issue because "regardless of whether the condenser is merely an area within the process chamber or a separate unit, it does not 'supply a drying gas to the process chamber.'" Id. "The Tornado system is a closed system, meaning no external air enters or exits the machine during operation," and in the Tornado system "there is no introduction of 'drying gas' into the process chamber." Id.

As stated above, the Claim Construction Order construed "supplying drying gas to the process chamber" to require that "supplying gas is introduced into the process chamber" and furthermore "once inside the process chamber, all that is required is that the "drying gas" . . . is capable of readily absorbing evaporated cleaning liquid from the carriers and
removing said vapor(s) from the process chamber as it is evacuated therefrom." Id. The Claim Construction Order focuses on introduction of gas into the process chamber and evacuation of drying gas from the process chamber. Whether gases enter or are evacuated from the process chamber, as required by the claims, is quite different from whether "air enters or exits the machine during operation" as described by the district court in its infringement determination. For example, depending on how the processing chamber is defined, air may not exit the machine but nonetheless could be introduced into the processing chamber and could remove vapors from the processing chamber. Specifically, as argued by Semitool, if the condenser were located outside the processing chamber and yet still within the machine then the condenser could potentially introduce drying gases into the processing chamber and could remove vapors when drying gases are evacuated from the processing chamber despite the fact that the apparatus as a whole is a closed system. Because of this, we find it is necessary to reach the question that the district court did not reach: Is the condenser inside the processing chamber or is it outside the processing chamber?

While the Claim Construction Order does not explicitly construe the term "processing chamber," the term appears throughout the Claim Construction Order. As a result, in order to resolve this dispute, we must turn to the standard tools of claim construction to determine what the Claim Construction Order meant when it used the term "processing chamber."

In order to properly understand how the district court was using this term in its Claim Construction Order, it is necessary to define the relationship between the processing chamber and the major structural limitation in the patent: the processing vessel. Semitool argues that the processing chamber encompasses only the area inside the processing vessel where wafer carriers are loaded, cleaned, and dried. In other words, the processing chamber is only the central region of the processing vessel; the other outlying regions of the processing vessel are not part of the processing chamber. In contrast, DMS argues that the processing chamber encompasses the entire enclosed area bounded by the processing vessel's walls and that this interpretation is based on the specification from the '127 and '113 patents.

In resolving this issue, we begin with the claims. "Quite apart from the written description and the prosecution history, the claims themselves provide substantial guidance as to the meaning of particular claim terms." Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005) (en banc). "First, we look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

Asserted independent claims 1 and 39 of the '113 patent have the limitation that the apparatus contain "a processing vessel defining a process chamber therewithin." In fact, as described above, Semitool supports its interpretation by pointing to DMS's own admissions wherein DMS stated that "the central area of the DMS Model 300 contains a vessel defining a process chamber in which wafer carriers are loaded, cleaned, and dried." Semitool argues that this supports their interpretation of process chamber. We do not agree. In fact, according to the explicit language of the claims themselves, the process chamber is defined as the interior of the processing vessel. For these claims, there is no doubt that the processing chamber encompasses the entire interior of the processing vessel and this conclusion is consistent with DMS's interpretation of processing chamber.

Asserted claim 28, however, presents a more complex question. In contrast to the other asserted claims, independent claim 28 of the '127 patent does not itself contain the limitation of "a processing vessel defining a processing chamber therewithin." Rather, that claim only specifies "a processing chamber within the processing vessel." All that can be concluded from claim 28 itself is that the processing chamber must be within the processing vessel. In other words, according to claim 28, the processing chamber could constitute the entire interior of the process vessel or it could constitute some smaller space within the processing vessel. However, the clear definition of the process chamber language in the claims of the earlier '113 patent application suggests the same definition of the processing chamber in the continuation application which issued as the '127 patent. See, e.g., NTP, Inc. v. Research in Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2005); Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1350 (Fed. Cir. 2004).

In any event, the specification makes clear that the processing chamber is coextensive with the processing vessel. As we stated in Phillips, "the specification 'is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.'" 415 F.3d at 1315 (quoting Vitronics, 90 F.3d at 1582).

DMS argues that the specification emphasizes that the processing chamber is meant to include the entire interior of the processing vessel. In other words, even regions of the processing vessel that are not areas where wafer carriers are loaded,
cleaned, and dried are described by the patent as part of the processing chamber. In contrast, Semitool argues that the specification limits the process chamber because the specification describes a bottom baffle that separates the area where wafers are cleaned and dried from the rest of the processing vessel. Such a partition, according to Semitool, is quite relevant as the infringing device has a spray guard between the condenser and the area where the carriers are cleaned and dried.

The specification states that "the processing chamber 47 is also most preferably provided with a false bottom or bottom baffle 85." '127 patent, col. 5, ll. 57-60. The specification describes the baffle as a "false bottom" rather than an actual bottom. As argued by DMS, this suggests that the area below the baffle is still part of the processing chamber. The specification also further describes this region below the bottom baffle by stating that "the outer bottom wall piece 77 [of the processing vessel] has a processing chamber outflow opening or port formed therethrough adjacent to the outflow box." '127 patent, col. 7, ll. 26-30. Because this opening is specifically labeled as the "processing chamber outflow" rather than the "processing vessel outflow," the specification further reinforces the conclusion that the area below the false bottom baffle is still part of the processing chamber. Therefore, contrary to Semitool's contentions, the specification supports an interpretation of processing chamber as the entire interior of the processing vessel.

Furthermore, the specification treats the three terms processing bowl, processing chamber, and processing vessel synonymously thus further reinforcing the fact that processing chamber should be interpreted to encompass the entire interior of the processing vessel. First, the specification describes the processing vessel synonymously with the "bowl." The specification introduces these two terms together by discussing "a processing bowl or vessel 21." '127 patent, col. 2, l. 66. Similarly, the specification describes a "sidewall of processing vessel or bowl 21." '127 patent, col. 3, l. 20. From these passages, the specification makes it clear that the processing vessel and the processing bowl are one and the same structural element.

But the specification also uses "bowl" in association with the processing chamber. The specification describes that "the processing chamber bowl and other conduits which supply gas or liquids are preferably made of stainless steel." '127 patent, col. 11, l. 44. This passage indicates that the processing chamber is associated with the "processing bowl" and in every other portion of the specification the processing bowl is used synonymously with the processing vessel. The specification makes no meaningful distinction between the vessel, the bowl, or the chamber and therefore the specification further reinforces that the entire interior of the processing vessel and the processing chamber should be interpreted to be coextensive.

Thus, for claims 1, 4, 9, 17, 19, 39, 55, 56, and 57 of the '113 patent, the claims themselves state that the "processing vessel defines a process chamber therewithin." Therefore, we agree with DMS that the processing chamber encompasses the entire interior of the processing vessel. Similarly, for claims 28-33 of the '127 patent, although the claims themselves leave room for argument, the specification makes clear that the processing chamber is coextensive with the entire interior of the processing vessel. Having interpreted processing chamber to be coextensive with the processing vessel, we now turn to the question of the alleged infringement of the asserted claims by DMS's Tornado wafer carrier cleaner.

3369

6. "Processing data"

The term "processing data" means the execution of a systematic sequence of mathematical and/or logical operations.

3370

3. "Processing Electronically"

utilizing electron devices.

The parties offer competing constructions for the word "processing" in the term "processing electronically." Simplification offers a definition from the IEEE Standard Dictionary of Electronic Terms. (See D.I. 80, Exh. D.) Block, on the other hand, points to the portion of the specification that describes how the "electronic intermediary process the tax data," which explains that this includes "appropriate tax computations" such as "addition, subtraction, multiplication, and division . . . ." (’052 patent at 6:42-47.) Simplification contends that this definition is inappropriate because it limits the claims to examples in the specification. However, Block's proposed construction is, in fact, quite broad, referring only to "appropriate computations." Furthermore, it is inherently non-limiting, explicitly stating that listed operations are only exemplary. The Court further favors Block's construction because, rather than being based on a dictionary that the Court has found inappropriate for other disputed terms, it is based on evidence in the specification. Accordingly, the Court concludes that "processing electronically" means, as Block contends, "performing the appropriate computations (e.g., addition, subtraction, multiplication, and division) without manual intervention from the user."

The dispute between the parties concerning the construction of "processing hub" is whether the hub is capable of processing anything besides authorizations and activations. Defendant Humana asks the Court to retain its construction for this term from its Datastream Markman Order. In construing this term in that case, the Court had found that the ’608 patent specification provided a definition of the "processing hub" as used in this invention. See Datastream Markman Order at 10. The Court, therefore, adopted the definition for this term as recited in the specification. Id. Humana argues that the Court's prior construction is also in line with the prosecution history of the ’608 patent where the applicant highlighted the ability of the system to be activated through existing POS devices.

Alexsam argues that the Court's prior construction was only appropriate to other claims of the patent; Claim 32 was not at issue in that case. Here too, Alexsam argues that Claims 32 and 33 are different and have nothing to do with activation. According to Alexsam, the Court's prior construction is inappropriate in this case because it does not account for the types of medical-related transactions and processing of "medical-related" data that claim 32 contemplates. As examples of other transactions that the hub can be used for, Alexsam points to sections of the specification that deal with medical information retrieval and adding loyalty data to a card. See, e.g., ’608 patent, 5:11-12, 10:13-14, 10:22-27. Because the Court agrees with Alexsam that Claims 32 and 33 do not involve activation, and these are the only claims asserted in this case, the Court will modify its previous construction to exclude "activation" from its prior construction this term. However, in light of an express definition of the term in the specification, the Court is not persuaded to adopt plaintiff's proposed construction. Alexsam's proposed inclusion of the phrase "other functions depending on the card type or transaction" makes the claim term much broader than ’608 patent specification would allow. The Court, therefore, construes the term "processing hub" as "a computer which provides front-end POS device management and message processing for card authorizations."
"activation" means. See Datastream Markman Order, at 10 (construing the term "activating an account").

4. Construction of Claims 1, 2, and 33

Turning to the substantive claim construction issue, WMS Gaming restricts computer-implemented means-plus-function terms to the algorithm disclosed in the specification. Construing the term "means for assigning a plurality of numbers representing said angular positions of said reel, said plurality of numbers exceeding said predetermined number of radial positions such that some rotational positions are represented by a plurality of numbers..." the court in WMS Gaming rejected the argument that the corresponding structure was merely "an algorithm executed by a computer," holding instead that it was limited to the specific algorithm disclosed in the specification. WMS Gaming, 184 F.3d at 1348-49. The specification's algorithm resembled the functional language "assigning a plurality of numbers..." in the claim itself and this court ultimately relied on that functional limitation to hold that there was no infringement. Id. at 1352. On that basis, Harris argues that this court's construction in WMS Gaming was merely a restatement of the function, not a legal holding that means-plus-function claims involving a microprocessor are always limited to the disclosed algorithm. We do not read WMS Gaming to be so limited. The WMS Gaming court could have relied on the function to limit the claim, but explicitly based the claim construction portion of its ruling on structure instead. Id. at 1348-49. A computer-implemented means-plus-function term is limited to the corresponding structure disclosed in the specification and equivalents thereof, and the corresponding structure is the algorithm.

Ericsson is correct that WMS Gaming applies to the means-plus-function claims in this case. Like the claim in WMS Gaming, Harris's claim 1 includes a means-plus-function limitation implemented by a microprocessor. Specifically, it recites 

- time domain processing means for simulating the time domain effect of said dispersive medium on signals transmitted through it by deducing prescribed characteristics of said medium, and for producing estimates of said information signals in accordance with a preselected relationship between said prescribed characteristics of said simulated effect and said known and received signals.

The district court did not have the benefit of briefing on WMS Gaming, but this precedent establishes that corresponding structure of the "time domain processing means" cannot be merely a "symbol processor," as the district court held. The "symbol processor" construction does not incorporate any disclosed algorithm. We hold that the corresponding structure for the "time domain processing means" is a microprocessor programmed to carry out a two-step algorithm in which the processor calculates generally nondiscrete estimates and then selects the discrete value closest to each estimate. Specifically, the patent discloses, as corresponding structure, a processor 37, "advantageously comprised of a pair of processors - a support processor (SUPP) [37A] and a fast array processor (FAP) [37B]," shown in Figure 4 and described at col. 11, l. 37 -col. 12, l. 32, which is programmed to carry out the disclosed "data recovery algorithm" illustrated in Figures 8A, 8B, and 9 and described at col. 7, l. 18 -col. 8, l. 38; col. 13, l. 45 -col. 14, l. 20; and col. 15, l. 2 -col. 16, l. 11. Processor 37A carries out the first part of the algorithm: calculating the effect of the medium and applying it to the received symbols. '338 patent, col. 15, II. 2-6. Processor 37B "examines the ... estimates and compares these codes with those corresponding to the code values capable of being transmitted." Id. col. 15, II. 13-17. Thus, each processor performs one of the steps.

Aspects of this algorithm can vary based on implementation, as the specification implies. For example, the algorithm need not be applied to "an eight-ary PSK transmission scheme"; this is an "illustration of the effect of [the] thus-far described decision process as applied" to such a transmission scheme. Id. col. 15, II. 27-29. The same "decision process" could be applied to another type of transmission scheme. Likewise, as Ericsson concedes, the corresponding structure of the "time domain processing means" is not limited to Equation (7) disclosed in column 8, line 30 of the patent. However, the specification characterizes the two-step process as "the invention," not merely an implementation of the invention. See id. col. 5, II. 50-55; col. 7, II. 18-27. Thus, we reject Harris's argument that the disclosed algorithm is broad enough to literally encompass one-step processes.
4 Even if we agreed with Harris that a one-step process was consistent with the disclosed algorithm, we would not follow Harris to its conclusion that "the district court's construction is correct[.]" Harris is clearly referring to the district court's "one-step" jury instruction as part of the court's "construction." Assuming that label is proper, we still do not believe that the instruction "claims 1, 2, 33, and 45 are not limited to equation 7 and cover a one or two-step process" constitutes a claim construction limited to the disclosed algorithm.

Figure 9 illustrates how this algorithm is implemented. In Figure 9, the point labeled "A" represents the received symbol value. See id. col. 15, ll. 31-33. The point labeled "B" represents the estimate obtained from the matrix calculations performed by processor 37A. The algorithm then involves the further step of choosing the allowed value that is closest to the estimate. In Figure 9's example, this closest discrete value is 010. Id. col. 15, ll. 37-39.

Thus, the district court erred in holding that claims 1, 2, and 33 can cover systems that implement either a one-step or two-step process. The corresponding structure limits the "time domain processing means" to a two-step algorithm in which the processor calculates generally nondiscrete estimates and then selects the discrete value closest to each estimate, or structural equivalents thereof.

16. "user response processing modules for …" (366 patent)

Beneficial's Proposed Construction

Defendants' Proposed Construction

No construction is necessary.

Alternatively, "user response processing modules" means "devices, components or units of a computer program that process information received by a user"

Function: One or more of: evaluating an effectiveness of said corresponding presentation, and obtaining another one of said advertising presentations for providing to said combiner, said processing modules receiving said one or more user data items.

Structure: A computer that is programmed to carry out the algorithm for performing the claimed function. However, the '366 patent lacks disclosure of all of the structure or algorithm for performing the corresponding function, which renders this term indefinite.

The parties' primary dispute with respect to this term is whether it should be construed as a means-plus-function limitation under § 112, P 6. Beneficial argues that because the claim element does not use the word "means," there is a rebuttable presumption that § 112, P 6 does not apply. Beneficial argues that the presumption cannot be overcome because the phrase "user response processing modules…” is a claim term that recites a sufficient structure and the term has a well understood meaning in the art. Defendants argue that the "user response processing modules" limitation should be construed under § 112, P 6. Defendants generally argue that a limitation that does not recite the term "means" can still be construed as a means-plus-function limitation if it can be shown that the claim term fails to recite sufficiently definite structure or else recites function without reciting sufficient structure for performing that function. Defendants argue that generic or software-related terms do not connote sufficient structure. Defendants argue that the phrase "user response processing modules" does not recite sufficiently definite structure, does not appear anywhere in the specification of the '366 patent, and does not have a generally understood meaning to a person of ordinary skill in the art. Defendants argue that the generic words "modules"
and "user response processing" do not convey sufficient structure. Defendants further argue that the remainder of the limitation merely recites function and does not convey sufficient structure for performing that function. However, Defendants argue that the specification does not recite sufficient structure for performing the claimed function, and therefore, the claim is indefinite.

The Court finds that, because the claim element "user response processing modules" does not use the word "means," there is a rebuttable presumption that § 112, P 6 does not apply. MIT, 462 F.3d at 1353-54. The Court finds that the Defendants have not met their burden to rebut the presumption. The Court finds that one of ordinary skill in the art would understand the term "user response processing modules" to recite sufficient structure and to have a reasonably well understood meaning to one of skill in the art. Beneficial has provided dictionary definitions for "processing" as "the manipulation of data within a computer system" and "module" as "a collection of routines and data structures that performs a particular task or implements a particular abstract data type." The Court finds that the term "user response processing modules" is not "simply a nonce word or a verbal construct that is not recognized as the name of structure." See Lighting World, 382 F.3d at 1359-60. Here, technical dictionaries supply ample evidence that the claim term designates structure. Other courts have also found that a "module" provides sufficient structure. PalmTop Productions, Inc. v. Lo-Q PLC, 450 F. Supp. 2d 1344, 1364-66 (N.D. Ga. 2006) (finding that "communications module" and "module" represents more than a mere verbal construct serving as a means for substitute); Stanacard, LLC v. Rebtel Networks, AB, F.Supp.2d , 2010 U.S. Dist. LEXIS 1109, 2010 WL 46006, *13-15 (S.D.N.Y. 2010) (finding "module" limitations to have sufficient structure such that § 112, P 6 is not invoked). The Court notes that the Defendants have not provided an alternative construction, and have not argued against Beneficial's proposed construction, if the term is not construed under § 112, P 6. Thus, the Court construes the term "user response processing modules" to mean "components or units of a computer program that process information received by a user."

A.1.g.1. "processing qualified calls"

According to Verizon, the claim language requires that the calls received by the first response unit are qualified before the common processing operations. Katz contends that the plain meaning of the functional language expresses no such requirement.

The functional language "processing qualified calls" requires that the calls be qualified prior to execution of common processing operations. This interpretation is consistent with the claim language, as the qualification means provides "qualified calls," while the "means for processing" processes "qualified" calls. This is also consistent with the specification of the 734 patent which teaches a preliminary qualification phase and a common interface format phase, where qualified calls are coupled to the interface processor. See, e.g., 734 patent, Col. 4:21-25 ("Accordingly, with overall supervision by the control unit 28, the audio response units 18, 20 and 22 answer and preliminarily qualify callers from the terminals T1-TN for connection through the coupler 24 to the interface processor 26."); Col. 4:66-67 ("The audio response unit 22 accepts calls without initial qualification."); Col. 8:27-29 ("With the entry of a call into the common phase, the line carrying the call is connected through the coupler 24 (FIG. 1) to the interface processor 26."). Moreover, Katz, during prosecution, appears to have distinguished the claimed invention on this basis. See Rooklidge 1/31/03 Decl. Ex. 1 ("Applicant's claims are distinct from Gordon because Gordon does not show receiving calls by one response unit and coupling those calls after qualification with calls received by another response unit.") (emphasis in original).
at least one item of audio/video information at the non-real time rate to the means for receiving.

1. "processing station"

The parties dispute the proper construction of the phrase "process station" as used in Claim 6 of the '720 Patent.

Claim 6 is a dependent claim to Claim 4. The introductory language of Claim 6 uses the phrase "further comprising," which means that the elements of Claim 6 are in addition to those recited in Claim 4. The phrase "process station" is used in the claim but it is not used in the written description. Therefore, the Court must determine whether a skilled artisan reading the patent document would understand the meaning of the phrase even if it is not used elsewhere in the specification. See Bancorp Services, 359 F.3d at 1372.

In Section IA2 above, using the principles of claim construction discussed in the Bancorp Services, the Court construed the phrase "central procession location" to be "a single transmission system, as previously defined, from which compressed, digitized data, representing a complete copy of at least one item of audio/video information, is transmitted at a non-real time rate to at least one of a multiple of local distribution systems." The Court finds that the phrase "processing station" is synonymous to a "transmission system."

The Court construes the phrase "process station" as follows:
the transmission system as previously defined by the Court.

3376

E. "Processing System"

Claims 1 and 5 of the '429 patent and claims 1 and 7 of the '064 patent recite the claim terms "processing system." Sprint contends that this phrase does not require further construction, whereas Vonage contends that the court should construe it to mean any processing system platform that can receive and process signaling to select virtual connections, and then generate and transmit signaling to identify the selections.

Vonage argues that its proposed claim construction is warranted because the patentee specifically defined the phrase "processing system" in the specification. The excerpt in the specification upon which Vonage relies states as follows: "Signaling processing system 160 is any processing platform that can receive and process signaling to select virtual connections, and then generate and transmit signaling to identify the selections." '429 Patent at 4:21-24. Vonage's argument is without merit for two reasons. First and foremost, this statement appears in a discussion concerning one version of the invention, id. at 3:36 ("FIG. 1 depicts a version of the present invention" wherein 160 is labeled the "signaling processing system"), and absent some clear intent to the contrary such examples from the specification are generally not read into the claims. In re Omeprazole Patent Litig., 483 F.3d 1364, 1372 (Fed. Cir. 2007). No such clear intent appears here, particularly where the specification concludes that "[t]he invention should not be restricted to the above embodiments, but should be measured by the following claims." '429 Patent at 25:39-41. Second, Sprint persuasively points out that Vonage's proposed claim construction which centers around the selection of "virtual connections" is nonsensical when considered in the context of the claims in question. For example, in claim 1 of the '064 patent, the "processing system" expressly processes set-up signaling to select a "DSO connection," which is not a "virtual connection." In claim 1 of the '429 patent, the processing system must process information to "select an identifier" rather than a "virtual connection."

Vonage also contends that Sprint relied on the fact that the "processing system" is defined as a system that receives and processes signaling in order to overcome the Skoog prior art during prosecution of the "928 patent (a child in the '301 Family Patents)." 2 Although the prosecution history of ancestor patent applications can be relevant to construing the claim terms of subsequent patent applications, the Federal Circuit has not applied the reverse of this principle. See, e.g., Ormco Corp. v. Align Tech., Inc., -- F.3d --, 2007 WL 2404723, at *5 (Fed. Cir. Aug. 24, 2007) (publication forthcoming) (prosecution history of claims of "parent" patent application were relevant in construing claims of "child" patents); Goldenberg v. Cytogen, 373 F.3d 1158, 1167 (Fed. Cir. 2004) (prosecution history of the parent application is treated "as part of the intrinsic evidence" of the child application when construing claim terms); Omega Eng 'g, Inc. v. Raytek Corp.,

- 3700 -
E. "Processing . . . the electronic advertisement . . . in compliance with the presentation rules of the internet media venue"

Claim 1 of the '025 patent states in part: "A computer system for creating and publishing customized electronic advertisements, for a seller, to internet media venues owned or controlled by other than the seller, comprising: . . . a computer controller of the computer system processing . . . the electronic advertisement . . . in compliance with the presentation rules of the internet media venue, whereby the electronic advertisement is displayed on each of the one or more of the selected internet media venues in compliance with the presentation rules of the internet media venue." (emphasis added). FM contends that "processing . . . the electronic advertisement . . . in compliance with the presentation rules of the internet media venue" means "executing a systematic sequence of mathematical and/or logical operations upon the inputted information to create an electronic advertisement customized for each selected internet media venue in a form that complies with the presentation rules set by that media venue." In contrast, Google argues that this term means "executing a systematic sequence of mathematical and/or logical operations upon the electronic advertisement to process it in compliance with the presentation rules of the internet media venues." The relevant difference between the two proposed constructions is the object of the processing step: "the electronic advertisement" or "the inputted information." Nowhere within the computer controller limitation does the term "inputted information" appear. The claim language unambiguously states that the act of "processing" is applied to the "electronic advertisement." Therefore, the court construes the term "processing . . . the electronic advertisement . . . in compliance with the presentation rules of the internet media venue" to mean "executing a
systematic sequence of mathematical and/or logical operations upon the customized electronic advertisement to make it comply with the presentation rules of the internet media venues.

3378

c. Processing time parameters

The parties dispute the meaning of the phrase "processing time parameters." ITI proposes that the limitation means a set of values that determine the duration of one or more of a series of actions in manufacture. Defendants' proffered construction includes quantities (such as the mean or a variance) that describe random fluctuations in processing times. ITI contends that defendants' construction is too narrow because not all parameters pertain to random fluctuations. The Court agrees.

Nowhere does the patent suggest that processing time parameters must involve means and variances or that the term "parameters" is limited to describing random fluctuations in processing times. The specification describes the second step of the invention's algorithm as determining the parameters that describe the specific factory. U.S. Patent No. 4,796,194, col. 5, lines 26-28. Parameters are determined for many aspects of the factory other than processing time, including the factory's products, fabrication sequences, machines, equipment reliability, and set-up time. See id., col. 5, lines 48-50; col. 7, lines 21-22. These parameters are defined in terms of data structures of the individual factory model. Id., col. 5, lines 28-29. The term "parameters" should not be defined in a manner that would not make sense in the context of other types of factory variables. In addition, the specification states that "fabrication sequence parameters . . . define allowable process flows." Id., col. 11, lines 1-2. This does not indicate that the parameters describe random fluctuations in process flows.

Finally, defendants place too heavy an emphasis on their proffered dictionary definition of "parameters." They argue that ITI's proposal ignores the express dictionary definition of parameters, which includes mean and variance as descriptive terms. But although dictionaries can inform claim construction, the focus should remain on the how the term is used within the patent. Courts must be careful to not adopt a definition that contradicts the intrinsic evidence. Phillips, 415 F.3d at 1322-23. But even so, the definition that defendants propose is only one possible definition of "parameter." The same dictionary includes the following definitions of "parameter": "any of a set of physical properties whose values determine the characteristics or behavior of something" and "something represented by a parameter: a characteristic element." Webster's Ninth New Collegiate Dictionary 854 (1986). These definitions align with ITI's interpretation. In short, the Court accepts ITI's proposed construction: a set of values that determine the duration of one or more of a series of actions in manufacture.

3379

K. "Process[ing] . . . to Select"

Claim 1 of the '561 patent, claim 1 of the '429 patent, claim 1 of the '064 patent, claim 38 of the '572 patent, and claim 18 of the '932 patent require "processing . . . to select" or "process . . . to select." Sprint contends that these phrases should be construed to mean process/processing to participate in selecting. Vonage contends that they should be construed to mean process/processing and make/making a selection.

Sprint's argument is based on this court's stated view of the claim language in the court's prior ruling on the parties' motions for summary judgment. There, the court reasoned that a rational trier of fact could find that the Vonage processing system processes signaling "to select" a network code (as required by claim 1 of the '561 patent and claim 1 of the '052 patent), "i.e., that the processing system is involved in the selection of the network code." Sprint Commc'ns Co. v. Vonage Holdings Corp., F. Supp. 2d , 2007 WL 2263955, at *25 (D. Kan. Aug. 7, 2007) (publication forthcoming). Importantly, however, at that time the parties presented the issue as a question of fact as to infringement, not as an issue of law as to claim construction. Consequently, the court's reasoning was simply that a rational trier of fact could conclude that "processing signaling to select" was satisfied by the system's involvement in processing the selection. The court certainly did not ascribe the definitive meaning to the claim terms that the processing must do nothing more than merely "participate" in the selection. And, indeed, Sprint has not directed the court's attention to any evidence in the intrinsic record which would require defining those claim terms in such a manner. Thus, the court rejects Sprint's claim construction argument.
Vonage, on the other hand, presents its claim construction argument as one of prosecution disclaimer. The prosecution history relied on by Vonage is an excerpt relating to one of the claims in the '780 patent in which Sprint responded to rejections over D'Amato and explained as follows:

Claim 139 recite[s] that the signaling processor processes the telecommunications signaling to select a "connection" for the communications path. In D'Amato, signaling director 151 does not select a connection, but selects an action for switch 130; either to: (a) proceed, (b) wait, or (c) deny . . . . None of these responses is a connection. If response (a) is given, switch 130 must possess the IAM to select the connection. Because it selects connections, the signaling processor of claim 139 is different than signaling director 151 of D'Amato. The signaling processor of claim 139 is advantageous in that it can avoid the need for this level of processing complexity in the switch.

(Emphasis added.) Vonage contends that the second boldfaced phrase means that the processor must actually "select" connections rather than merely perform "processing . . . to select."

The court disagrees and finds, once again, that this is too ambiguous to constitute a clear disclaimer of claim scope. The remark explains that in D'Amato the signaling director does not select a connection at all but instead selects an action for a switch, none of which is a connection. It makes the distinction that the signaling processor in the subject claim is different because it selects connections. Notably, the first boldface phrase states that the claim recites a signaling processor that "processes . . . signaling to select" a connection. Thus, this remark in the prosecution history does not purport to make any distinction between "selecting" and "processing to select." Rather, the distinction made is that the claim recites a processor that is involved in making the selection rather than simply selecting an action for a switch. There was no argument made that the signaling director in D'Amato performs the action of "processing . . . to select" and the remark itself does not make any distinction as to whether the processor must actually make the selection or whether it may simply perform "processing to select" the connection. Consequently, the excerpt set forth above does not clearly disavow the full scope of the claim and, therefore, the court rejects Vonage's prosecution disclaimer argument with respect to this claim term. Because neither of the parties has directed the court to intrinsic evidence which would support their proposed claim constructions, then, the court finds that these claim terms do not require further construction.

2. "processor"

In his Part B, the Special Master found that "[n]one of the asserted claims of the patents in suit appear to require that the software that is part of the claimed inventions be executed 'outside of the FDC'" 71 as argued by Defendants. The Special Master held that there is a significant difference in the industry between the meaning of the terms "CPU" and "processor," with the Federal Circuit using an industry standard definition for CPU. He held that evaluating the '414 claim in light of its calling out a CPU meant it "should be construed to require a CPU that is separate from the FDC and that controls the interpretation of instructions and their execution" but that "no such limitation should be applied to the term 'processor' in the asserted claims of the remaining patents." 72

A comparison of the Claim 1 of the '414 claim's calling out a CPU to the claims of the subsequent patents shows the difference. Claim 1 of the '414 patent reads in part as follows:

1. A method for detecting and preventing floppy diskette controller data transfer errors in computer systems having:
a central processing unit (CPU);

a system interrupt timer;

a floppy diskette, the floppy diskette having at least one sector for receiving multiple data bytes;

a floppy diskette controller (FDC) for controlling the transfer of data to the floppy diskette;

means associated with the FDC for providing a data request (DREQ) signal and a data acknowledge (DACK) signal, the DREQ signal being provided when data transfer is requested and the DACK signal being provided when data transfer is permitted; . . . 73

--- Footnotes ---

73 '414 patent (emphasis added).

--- End Footnotes ---

A comparison with the claims of the remaining patents, quoted above in section B, reveals they do not similarly call for a "CPU," but instead use the much broader term "processor." Thus, the Special Master found that the term "processor" in the '002 and '222, patents should not be construed as limited to a processor that is separate from the FDC. He also found that it was even more inappropriate to construe the '858 patent as containing the same restriction as the '414 patent because the '858 patent does not use the term "processor" in its claims.

The Special Master further explained that the Defendants' contention that the term "processor" should be construed to not be part of the FDC--dubbed the "outside the FDC" contention--was part of Defendants' broader contention that it would be improper to construe the claims to cover code that is contained within a properly functioning FDC. In other words, Defendants' position is that the patents should be construed to exclude a redesigned FDC that incorporates the claimed solutions.

Defendants agree with the Special Master's construction of "CPU" and of the '414 patent as requiring a CPU that is separate from the FDC. They make no objection to his interpretation of how a person ordinarily skilled in the art would have understood "CPU" at the time of the '414 patent. However, they argue that the key term "processor" in the '002 and '222 patents should be construed in the same manner as was the term "central processing unit (CPU)" for the '414 patent, as limited to a processor that is separate from and not part of the FDC; and that the '858 patent should also be so construed.

In making this argument, Defendants rely heavily on the specifications of the '002 and '222 patents. But the limitation they seek to impose, "outside of the FDC," appears nowhere in the '002 or '222 specifications or claims. Having reviewed all of Defendants' arguments and the specification language they cite, including the figures cited, the Court finds that their argument is an example of Defendants "reading a limitation from the specification into the claim." As the Special Master explained, he was "well aware of the fine and tortured difference between construing a claim term in light of the specification and reading a limitation from the specification into the claim. The former is required; the latter forbidden." 74 Defendants' position on the construction of "processor" as requiring one "outside of the FDC" is one of those rejected by the Special Master as straying toward the forbidden ground of reading a limitation from the specification into the claim. 75

--- Footnotes ---

74 R & R at 21-22 (citing Comark Comm. Inc. v. Harris Corp., 156 F.3d 1182, 48 USPQ2d 1001, 1005 (Fed. Cir. 1998)).
75 Id.

--- End Footnotes ---

The Special Master is correct that the Federal Circuit has warned against the risks of improperly reading a preferred embodiment into the claims, most recently in Trading Technologies International, Inc. v. eSpeed, Inc.: 76
The claims “must be read in view of the specification, of which they are a part.” A patent’s specification “is always highly relevant to the claim construction analysis.” When consulting the specification to clarify the meaning of claim terms, courts must not import limitations into the claims from the specification. Therefore, when the specification uses a single embodiment to enable the claims, courts should not limit the broader claim language to that embodiment “unless the patentee has demonstrated a clear intention to limit the claim scope using ‘words or expressions of manifest execution or restriction.’” “In addition, other claims of the patent . . . can also be valuable sources of enlightenment as to the meaning of a claim term.” 77

As did the Special Master, the Court rejects Defendants’ attempt to read a limitation from the specifications into the claim. Defendants argue that in the claims of the ’002 and ’222 patents the element “processor” is identified as a separate claim element from “floppy disc controller” and, therefore, they are separate components. Defendants do not cite case law supporting this argument. More importantly, it is not supported by a reading of the patents. Accordingly, it is not persuasive.

The Court adopts the Special Master’s claim construction as follows: no limitation requiring a CPU that is separate from the FDC and that controls the interpretation of instructions and their execution should be applied to the term “processor” in the asserted claims of the ’002 and ’222 patents or in the ’858 patent. Further, the Court agrees with and adopts the Special Master’s finding that “[t]here is absolutely no warrant for construing the claims of these patents in a way that would exclude redesigned FDCs that nonetheless incorporate the claimed solutions.” 78

3381

Claim Construction

The independent claims of the ’751 patent call for “an interface between a joystick device having a first source voltage and a processor, comprising . . . an interface circuit having a second source voltage that is lower than the first source voltage, including a buffer circuit . . . and a pulse generator . . . .” 11 The Court’s claim construction opinion defined “interface circuit” as “a circuit that connects the joystick and the processor.” See Claim Construction Opinion at 8. The parties dispute the meaning of several terms within this limitation.

First, the claims call for an interface "between" a joystick device and "processor." Fenner argues that the "interface circuit"
can include the periphery of the processor. 12 Fenner points out that a "processor chip" is composed of many different parts. According to the argument, the word "processor" in the '751 patent refers to only the "central processing unit (CPU)" of the chip or the "processor core." Fenner makes this distinction because the processor core is the only component of Defendants' accused products that operates at a lower source voltage than the "joystick device." Defendants assert that processor includes the whole "processor chip" and urges that a "processor" (or what Fenner calls a "processor core") would not be functional without its component parts. Neither party disputes that the "interface circuit" must be between and not include the "joystick device" or whatever is meant by the "processor." Thus, the central dispute is whether the "processor" includes the entire "processor chip" or only the "processor core."

12 Fenner urges that "processor" needs no further construction, but consistently uses different language to describe its conception of the claims' use of the word "processor." Compare Fenner's Response to Microsoft's Motion, 6:07-CV-8-LED, Docket No. 226 at 8 (12/17/2008) (describing the "processor" as a "processor core" and "chip" as a "processor circuit") with Fenner's Response to Defendant's Motion for Clarification, 6:07-CV-8-LED, Docket No. 328 at 9 (3/16/2009) (referring to the "chip" as "processor chip" and the "processor" as the "central processing unit").

The only description of "processor" used in the specification describes it as "being a host computer" but specifies that the definition is "[f]or purposes of discussion only." '751 Patent at 2:24-25. Additionally, Figure 2 of the specification contains no part of any "processor" in the "interface circuit" (marked as 200). The description suggests that the preferred embodiment does not include the "processor core" or the "processor chip" within the "interface circuit" and even suggests that the "processor" could be analogous to an entire host computer. Therefore, no part of the description or specification supports Fenner's argument. In fact, the figures and specification suggest that the term "processor" could be used even more broadly than Defendants suggest. However, given the ambiguity inherent in these intrinsic definitions, "processor" will be accorded its plain and ordinary meaning to one skilled in the art.

The parties, though recognizing the ambiguity in the terms, provided no extrinsic definitions of "processor." The IEEE defines "processor" as "a data processor." The IEEE Standard Dictionary of Electrical and Electronics Terms (6th ed. 1996); The IEEE Standard Dictionary of Electrical and Electronics Terms (7th ed. 2000). "Data processor" is further defined as "a processor capable of performing operations on data. For example: a desk calculator or tabulating machine, or a computer." The IEEE Standard Dictionary of Electrical and Electronics Terms (6th ed. 1996); The Authoritative Dictionary of IEEE Standards Terms (7th ed. 2000). Thus, the extrinsic definition of "processor" is in accordance with the understanding suggested by the specification: that the term is broad rather than narrow. Additionally, the definition requires the "capability" of performing operations on data. Fenner does not dispute that a "processor core" without its supporting structure, will not function at all. 13 This definition, along with the supporting context of the claim supports a definition of "processor" that includes its peripheral circuitry. Thus, in accordance with the intrinsic and extrinsic evidence, the term "processor" is defined as "the CPU along with its peripheral circuitry."

13 The IEEE Dictionary has no definition of "processor core."

2. processor (Claim 1)

Keystone proposes the term "processor" be given its ordinary meaning. It contends that the term "processor" is used in a manner consistent with its ordinary meaning throughout the claims and specification of the '123 Patent. Alternatively, Keystone's proposed construction is adopted from the Communications Standard Dictionary as "a part of a computer that executes instructions." See COMMUNICATIONS STANDARD DICTIONARY, 722 (1983 New York: Van Nostrand
Reinhold Company Inc.) (defining "processor" as "[I]n computers and communications systems, a functional unit that interprets instructions and executes them.").

Defendants argue that the term processor be construed consistently with their proposed construction of the term "computer system." According to the defendants, a "processor" means "a device for executing general purpose personal computer instructions in the computer system." The Court finds that "processor" in the '123 patent means "a part of a general purpose computer that interprets and executes instructions."

# 5

"processor" -- (appears in claims 14, 15, 17, 19, 29, 30, 32, 34, 44 and 45) Luma's Construction (Luma May 4, 2005, p. 3).

MASTER'S CONSTRUCTION

"processor" -- means a central processing unit in a computer for processing data and executing a program.

REASONS

INTRINSIC EVIDENCE

The Patent Specification refers to a "processor" * * * performing processing operations" (Col. 1, Ls. 33-35). There are numerous functions recited in the Specification of the Patent as to what a processor does in the system. The Master found the Markman hearing helpful in this regard and is discussed in the "EXTRINSIC EVIDENCE" section below.

EXTRINSIC EVIDENCE

A central processing unit in a computer is a processing unit. The processor processes data and executes a program (Markman Hearing, Nutter Tr. 115: Ls. 22-25; 116: Ls. 1-25; 117: Ls. 1-18; 130: L. 16; 131: Ls. 1-5).

LUMA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Luma's Construction is set forth in (Luma May 4, 2005, p. 3) Luma construes the processor as a device for processing or acting upon data. The Master agrees and has given a construction consistent with Luma's proposal. Luma includes "information" and "images". To the extent that data can include information or images the Master's construction is in accord with Luma's position.

STRYKER'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Stryker's position is set forth (Stryker May 23, 2005, p. 7-8). Stryker objects to "piecemeal" construction by Luma. The Master has addressed this issue in # 2 above. Stryker agrees that all the claims require a processor but just not any processor and that different claims require a special processor based upon the actions that must be performed by the processor. Stryker wants all of the other language in the claims to define the type of processor. The Master's position is that is the purpose of determining the scope of the claim as a whole and not just the scope of one element in the claim.

The Master notes that Luma has asked that only the term "processor" be construed. Luma is entitled to a construction of that single one-word term. Further modifications or limitations of that term that Stryker asks to have added are stated in the claims where the word "processor" appears. Those additional terms in the claims further modify the term "processor" as the Master has construed the meaning of the term "processor". Various claims state various functions or features of the "processor" and the claims by their individual wording will further modify the term "processor" as the Master has construed it.
KSEA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

KSEA's position is set forth in (KSEA May 23, 2005, Sheet 6).

KSEA agrees that the plain meaning should be given and that it is any device that processes. The Master has given a construction that is limited to that where a processor is used when one is referring to computers. KSEA argues that the particular processors of the claims are defined by the particular processing operations they perform and are recited after the word processor. The Master agrees. However, Luma has asked that only the term "processor" be construed and the Master has construed the term "processor" by itself.

GO BACK

3384

2. The word "PROCESSOR" (claims 5, 7, and 16) requires no construction.

GO BACK

3385

2. The terms "PROCESSOR CALCULATOR" (claim 9) and "CALCULATING" (claim 20) require no construction.

GO BACK

3386

The '140 patent describes a method and apparatus in a communication receiver for selecting and generating a unique and/or default audible alert (e.g., a ring). The user stores in a phone's memory a phone number and associates a special alert with the stored number. When a communication with the same phone number is received and recognized, the stored associated "special" alert will be generated by the device. Moreover, if a received phone number does not match a phone number stored in memory, a default alert is generated.

The parties dispute the meaning of ten claim limitations. According to VTech, five limitations ("receiver means," "storage means," "processor means," "audible alert generation means," and "first processor element") are written in "means-plus-function" format and should be interpreted pursuant to 35 U.S.C. §112, P6. Conversely, Motorola asserts the five terms are not "means-plus-function" terms governed by 35 U.S.C. §112, P6. (Docket Entry # 93 at A7-A11). Before reaching the specific terms at issue, the Court will first address the applicability of 35 U.S.C. §112, P6 in general. Then, in the separate discussion portions below, the Court will address any remaining disputes for each term.

For each of the terms "receiver means," "storage means," "processor means," and "audible alert generation means," Motorola cites Allen Eng'g Corp. v. Bartell Indus., Inc., 299 F.3d 1336, 1348 (Fed. Cir. 2002) for the proposition that even when the term "means" is utilized, 35 U.S.C. §112, P6 does not control if the term itself and surrounding claim limitations provide sufficient structure. (Docket Entry # 76 at 23-38). For the term "receiver means," Motorola asserts that the term "receiver" and the surrounding claim language which includes "processor means coupled to the receiver means" provides adequate structure such that § 112, P6 does not apply. (Id. at 23). For the term "storage means," Motorola asserts that the term itself and the surrounding claim language of "processor means ... coupled to the storage means" and "the storage means comprises a non-volatile memory" provide sufficient structure. (Id. at 24). For the term "processor means," Motorola asserts that the term itself and the surrounding claim language of "processor means coupled to the receiver means ... coupled to the storage means" provide sufficient structure. (Id. at 25). For the term "audible alert generation means," Motorola asserts that the term itself and the surrounding claims language of "coupled to the processor means" provide sufficient structure. Motorola further cites cases in which district courts have found that "receiver means," "storage means," and "processor means" are not governed by §112, P6. (Docket Entry # 88 at 10-12).

VTech counters that the use of means language creates a presumption that § 112, P6 controls. VTech asserts that the claim terms in Allen Eng'g Corp. were laden with structure. (Docket Entry # 83 at 26-27). VTech asserts that the claim terms at issue are defined in a functional manner and that Motorola's surrounding structure is generally merely another means plus function term (i.e., "processor means coupled to the receiver means"). (Docket Entry # 83 at 27). VTech asserts that the
claim terms themselves do not provide any structure whatsoever and are exactly the type of generic claim language which invokes § 112, P6. (Id. at 31-32).

This Court notes that the use of the word "means" triggers a presumption to "invoke the statutory mandate for means-plus-function clauses." Allen Eng'g Corp. v. Bartell Industries, Inc., 299 F.3d 1336, 1347 (Fed. Cir. 2003). The Federal Circuit has stated that the presumption may be overcome in two ways: first, if the claim element recites no function corresponding to the means, and second, "even if the claim element specifies a function, if it also recites sufficient structure or material for performing that function, §112, P6 does not apply." Id. Here, the claim language in question is drafted in the means plus function format and the particular language is generalized language without the use of specific structural language. Under such circumstances, the Court shall construe the language to be subject to 35 U.S.C. §112, P 6. See Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1372 (Fed. Cir. 2003); Kemco Sales, Inc. v. Control Papers Co., Inc., 208 F.3d 1352, 1361 (Fed. Cir. 2000).

As for Motorola's citation to the surrounding claim language, VTech accurately notes that such language often merely just recites the other means elements. The claim language of the terms in question does not rise to the level of that in Allen Eng'g Corp. so as to justify deviating from the presumption that § 112, P6 governs. The Court finds that the terms receiver means, storage means, processor means, and audible alert generation means are means plus function terms governed by §112, P6.

Motorola asserts that in contrast to the terms discussed above, the "first processor element" does not include the words "means for" and as such there is a presumption that §112, P6 does not apply. (Docket Entry # 76 at 29)(citing TIP Sys., LLC v. Phillips & Brooks/Gladwin, Inc., 529 F.3d 1364, 1364 WL 2437764 at *8 (Fed. Cir. 2008)). Further, Motorola asserts that the term "processor element" includes structure. (Docket Entry # 88 at 13).

VTech counters that even if the word "means" is not utilized, when a word such as "element" is used with insufficient structure to perform the claimed function, the limitation is still a means plus function limitation under §112, P6. (Docket Entry # 83 at 32-33)(citing MAS-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213-1214 (Fed. Cir. 1988)("lever moving element" subject to 35 U.S.C. §112, P6). VTech asserts that taken in context of the entirety of claim 1, "first processor element" does not contain sufficient structure.

The parties acknowledge that a different presumption applies when the disputed claim term does not include "means." The lack of inclusion of "means" creates a presumption that §112, P6 does not apply. TIP Sys., LLC v. Phillips & Brooks/Gladwin, Inc., 529 F.3d 1364, 1373-74 (Fed. Cir. 2008). The Court finds that VTech has not provided adequate justification overcoming the presumption that a term that does not include the "means" language is not controlled by § 112, P6. The term in question recites a "processor element" which in light of the governing presumption the Court finds sufficiently definite such that §112, P6 does not apply.

3. Processor Element

The next term in dispute is "processor element." This term is not drafted in means-plus-function format and accordingly the plaintiffs are entitled to the ordinary meaning of the term, unrestricted by limitations in the preferred embodiment. The plaintiff contends that this term means "a device in a computer that executes instructions." The defendants argue that the term means "a microprocessor or CPU." Although the court agrees with the defendants that the term "processor element" connotes a device that does more than simply "execute instructions", the court disagrees that the patentee used the term "processor element" and microprocessor to mean the same thing. In addition, portions of the specification support the view that the processor element is capable of both interpreting and executing instructions. The court has considered the parties' briefing and is persuaded that the term "processor element" means "a device that is capable of interpreting and executing instructions."
17. Said processor elements being connected

Claim 37 of the '755 patent requires a plurality of processor elements, "said processor elements being connected to said plurality of sets of shared resources." The question is whether this limitation is drafted according to § 112 P 6. The court holds it is not. The claim language does not recite the term "means," and Intel and ADI have not overcome the presumption attaching to the claim language.

6. "processor executing detection executables effective to determine an underrun error undetected by a floppy diskette controller" ('002 and '222 patents)

The Special Master noted that the Defendants' contentions regarding a processor being neither "outside the FDC" nor limited to a CPU. However, he found that the word "executable" might cause some puzzlement to jurors, and suggested a construction adopted from various online dictionaries as meaning "software" that can run on the processor. He went on to define "software" in its broadest sense of the term as including firmware (as somewhere between hardware and software).

Defendants reiterate their objections to the term "processor" not being limited to processors not part of the FDC and also argue without elaboration that "executables" should be limited to application programs executing on a processor not part of the FDC. Plaintiff, also without elaboration, argues that the processor-not-part-of-the-FDC argument has been decided.

The Court adopts the following claim construction: The term "processor" means an element capable of controlling the interpretation of instructions and their execution; this element need not be the CPU nor need it be outside the FDC. The term "executables" means software that can run on the processor. The term "software" is used in its broadest sense, and includes high-level applications, portions or "modules" of programs, and so-called "firmware" (instructions or data that are embedded in a particular hardware device).

6. "processor within a computing device" and "processor includes a computing device"

a. The Parties' Proposed Constructions

The parties also dispute the terms "processor within a computing device," found in dependent claim 8 of the '082 patent, and "processor includes a computing device," found in dependent claim 16 of the '082 patent. Ingenio asserts that "processor within a computing device" means "the processor is a component of a computing device," citing to the specification of the patent where examples of computing devices are given. (D.I. 113 at 23.) GameLogic asserts, on the other hand, that this term should be construed to be synonymous with the term "processor" as set forth in claim 1, as the processor of claim 1 must be in a computing device to perform its claimed functions. (D.I. 117 at 26.) GameLogic further claims that any other construction of the term "processor within a computing device" would make claim 1 indefinite. (Id.)

As to "processor includes a computing device," Ingenio asserts that this term should be construed to mean that the processor "has a component device that can perform computations." (D.I. 113 at 24-25.) Ingenio cites to the portions of the specification of the patent that disclose that a home computer could be implemented to access the system, and states that, "at the time of the invention, home computers were known to include . . . software that could perform computations." (Id. at 24.) GameLogic, on the other hand, argues that the term should be construed to mean that "the processor, such as a microchip, contains within it a personal computer." (D.I. 116 at 28.) GameLogic also contends that this claim term is unclear.
b. The Court's Construction

The ordinary meaning of the term processor is "[a] device that performs one or many functions, usually a central processing unit" n8 or "[a] program that transforms some input into some output, such as an assembler, compiler, or linkage editor." McGraw-Hill Dictionary of Scientific and Technical Terms 1676 (6th ed. 2003). n9 Thus, a processor can either be circuitry or it can be a program in a computer that performs a particular function. Computer circuitry or a computer program, standing alone, cannot perform the functions of the patent, such as allowing the player to "enter[] the code . . . into a processor." That function, and others required by the patent, can be performed by the processor only where the processor is part of a computing device. For that reason, the term "a processor" in claim 1 of the '082 patent must be construed such that the processor of claim 1 is within a computing device. As a result, "processor within a computing device" will be construed to mean the same thing as "a processor." The language "within a computing device" adds no additional limitation to the term "a processor," as a processor must be within a computing device to perform the functions it is required to perform in claim 1 of the '082 patent.

--- Footnotes ---

n8 A central processing unit is "[t]he part of a computer containing the circuits required to interpret and execute the instructions." McGraw-Hill Dictionary of Scientific and Technical Terms 356 (6th ed. 2003)

n9 No one contends that the ordinary meaning of "processor" in the context of computer science has changed between the time the patents issued and today.

--- End Footnotes ---

The term "processor includes a computing device" is indecipherable. As Ingenio points out, the patent describes "a home computer or an interactive TV system" as examples of "a computing device." (‘082 patent at 5:60; see also id. at Fig. 6.) Because a processor itself must be a part of a computing device to function, it cannot also include "a computing device," as that terminology is used in the patent. Ingenio attempts to avoid this conclusion by arguing that the computing device in this claim is simply "a component device that can perform computations." (D.I. 113 at 24-25.) The patent's own description of what a "computing device" is, as cited by Ingenio, does not comport with this construction. Therefore, I find that the term "processor includes a computing device" is indecipherable in the context of this patent.

3391

3. "Processor Means"

Data General maintains that "processor means" refers to the central processor of any general purpose computer system, while IBM argues that the term refers to FU 10120, an unconventional processor described in the Common Specification, not including MRU 27017 or PU 27019.

Claim 10 refers to "processor means" as follows:

…processor means connected to said memory means for providing said memory commands and providing and receiving said data items in response to sequences of instructions of said data items executed by said processor means….

‘603 Patent, col. 7, ll. 9-13 (emphasis added).

Data General contends that § 112(6) does not apply to the construction of the term "processor means" because the claim recites a structure which performs the functions associated with the "means", while IBM responds that there is no detailed and specific structure set forth in the claim.

The functions performed by the "processor means" set forth in Claim 10 are 1) providing memory commands, 2) providing and receiving data items which are sequences of instructions and 3) executing those sequences of instructions. See ‘603 Patent, col. 7, ll. 10-13.
This Court is persuaded by the testimony of Data General's expert, Professor Finkel, that, to one of ordinary skill in the art, "processor" refers to a central processing unit which provides memory commands and provides and receives data items. (Finkel T. 1/103-04). Because Claim 10 refers to a structure, i.e., a "processor" which a person of ordinary skill in the art would consider to be a structure that performs the same functions as the "means", § 112(6) does not apply to the construction of that term. Thus, this Court concludes that the term "processor means" in the '603 Patent refers to the central processing unit of a general purpose computer system.

4. "Processor Means"

Finally, IBM and Data General dispute the meaning of the term "processor means". IBM argues that it refers to FU 10120, the hardware implementation of the processor in the preferred embodiment in the Common Specification, which includes numerous specialized components. Data General responds that "processor means" also includes a conventional CPU of a computer system, a software interpreter and an operating system.

7 IBM claims that the corresponding structure is FU 10120, except for Memory Reference Unit 27017 and Protection Unit 27019.

The parties agree that § 112(6) applies to the term "processor means" in the '797 Patent and thus, the construction of that term is limited to the corresponding structures in the specification which perform the function associated with the "processor means." 8

The function of the processor means of Claim 1 is:

...receiving said items including said instructions and responding to each said received instruction by performing said operation defined for said operation code in said received instruction in said operation code set to which said operation code in said received instruction belongs.

'797 Patent, col. 4, ll. 39-44. The Court has previously found that "said instructions" refers to S-Instructions which are a level below high-level language instructions and a level above conventional machine language instructions.

The Common Specification provides, in pertinent part, that:

Principal functions of FU 10120 include: (1) Fetching and interpreting instructions, that is SINs comprising SOPs and Names, and data from MEM 10112 for use by FU 10120 and EU 10122; (2) Organizing and controlling flow and execution of user programs; (3) Initiating EU 10122 operations; (4) Performing arithmetic and logic operations on data; (5)
Controlling transfer of data from FU 10120 and EU 10122 to MEM 10122; and, (6) Maintaining certain stack register mechanisms.

'602 Specification, col. 172, ll. 20-29. It is clear that FU 10120 performs the function performed by the "processor means" in Claim 1.

In addition, Data General contends an alternative corresponding structure may also perform the function of the "processor means." In Micro Chemical, Inc. v. Great Plains Chemical Co., 194 F.3d 1250, 1258-59 (Fed. Cir. 1999), the specification disclosed three kinds of structures: (1) the preferred embodiment, (2) several alternative embodiments and (3) a suggested embodiment. The Federal Circuit Court held that the pertinent means element includes each of the three embodiments or an equivalent structure.

Data General argues that a conventional CPU, together with a software interpreter and an operating system, could perform the function of the "processor means." The Common Specification states that FU 10120 may be "replaced by a conventional CPU, such as Data General Corporation's Eclipse(R)." '602 Specification, col. 73, ll. 33-36.

IBM concedes that a conventional CPU is mentioned in the Common Specification, but asserts that 1) it is not sufficiently described to be an alternative corresponding structure and 2) the Common Specification never states that a conventional CPU can perform the claimed processor means function. When the Common Specification notes, however, that FU 10120 may be replaced by a conventional CPU, it implies that a conventional CPU can perform the same functions that FU 10120 performs and thus be considered an alternative corresponding structure.

Furthermore, IBM's contention that a software interpreter is not disclosed conflicts with the intrinsic evidence. The Common Specification discloses a software interpreter:

In the present embodiment, the interpreters consist of dispatch tables and microcode, but in other embodiments, the interpreters may themselves be written in high-level languages.

'602 Specification, col. 360, ll. 27-31. As Data General's expert witness, Professor Gruner, testified, interpreters written in high-level languages are software interpreters. (Gruner T. 2/42-43).

This Court finds that "processor means" may refer to either FU 10120 (except for Memory Reference Unit 27017 and Protection Unit 27019) or a conventional CPU, together with a software interpreter and an operating system.
sense amplifier; (3) calculate the analyte concentration value by comparing the current flow measured by the sense means to a Cottrell curve.

n6 Biosite takes no position on the processor means per se, however, argues about the "coupled to" limitation within the claim element.

Roche argues that "processor means" has a well-understood meaning in the art and is simply a microprocessor or central processing unit ("CPU"). Roche contends that the presumption that the term is a means-plus-function term because of its language is overcome by the fact that the term has enough structure to perform the function without more. Moreover, Roche asserts that even if the term is a means-plus-function term, Apex/HDI have added an additional functional limitation to the claim, "accessing data from the memory key means," that is unsupported in the claim.

Unlike with the "pluggable memory key means" element, the Court finds that there is not enough structure defined by claim 1 to rebut the presumption that "processor means" is subject to interpretation under § 112, P 6. As already discussed, the use of the term "means" creates a presumption that section 112, paragraph 6 [sic] has been invoked, but that presumption may be rebutted if the properly construed claim limitation itself recites sufficiently definite structure to perform the claimed function." Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1361 (Fed. Cir. 2000) (citing Personalized Media Commc'ns LLC v. ITC, 161 F.3d 696, 704 & nn. 9 & 10 (Fed. Cir. 1998)). The focus is on whether the claim "recites sufficiently definite structure to avoid the ambit of § 112, P 6." Personalized Media Commc'ns, 161 F.3d at 704 (citing Sage Prods. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997)). A term with a well-known meaning in the art may also connote enough structure to fall outside the ambit of § 112, P 6. See id. at 704-05 (discussing a term "detector" without the qualifier "means" after it). Here, Roche contends that "processor" has a well-known meaning in the art, which rebuts the presumption that § 112, P 6 applies. There is no dispute that this is true. However, here it is clear that the "processor" of claim 1 is not a generic one, but one that runs a particular algorithm to control a sense amplifier and to calculate the concentration of an analyte. In such a case, the Federal Circuit has suggested that "in a means-plus-function claim in which the disclosed structure is a computer, or microprocessor, programmed to carry out an algorithm, the disclosed structure is not the general purpose computer, but rather the special purpose computer programmed to perform the disclosed algorithm. " WMS Gaming, 184 F.3d at 1349 (citing In re Alappat, 33 F.3d 1526, 1545). See also Tehrani v. Hamilton Med., Inc., 331 F.3d 1355, 1362 (Fed. Cir. 2000) (remanding the case for determination of the algorithm that "forms part of the structure of the means for processing' limitation of" the disputed claim).

n7 The Court recognizes the difference in the claim term in Tehrani and the one at issue in this case because "processing" in Tehrani is actually part of the function rather than the means, however, there is little difference between the term at issue in WMS Gaming and the one in this case, and the Tehrani court clearly relied upon WMS Gaming to determine that the district court in the Tehrani case had erred by not more particularly describing the relevant algorithm that corresponded to the means.

There are other clues that the Court should construe the "processor means" term as a means-plus-function term. See Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999) (instructing to look for the term "means" first, then look "to whether the element specifies a function for performing the claimed means" next). As the Court just eluded to in the prior discussion, the element itself specifies functions for the "processor means," namely "controlling operation of said sense means" and "calculating . . . a concentration value of an analyte." 609 Patent, col. 9, ll. 7-10. For these reasons, the Court concludes that the "processor means" limitation must be construed according to § 112, P 6.

Although the Court has identified the two functions clearly outlined by the "processor means" limitation, Apex/HDI contend that there is an additional function, although their corresponding structural definitions imply that they think there are two additional functions performed by the "processor means." Specifically, Apex/HDI argue that the "processor means" also
performs the function of accessing parameter values and procedure routine specifications from the pluggable memory key means. To support this argument Apex/HDI cite In re Donaldson, 16 F.3d 1189 (Fed. Cir. 1994), and Ferguson Beauregard/Logic v. Mega Sys., 350 F.3d 1327 (Fed. Cir. 2003). Those cases refer to disputed terms that contain the word "responsive." Ferguson Beauregard/Logic, 350 F.3d at 1333; In re Donaldson, 16 F.3d at 1195.

The Court disagrees with Apex/HDI's analysis and the applicability of those cases to the instant claim. In re Donaldson never refers to the "responsive" phrase as a functional limitation; it merely includes it as part of the means. In re Donaldson, 16 F.3d at 1196 (repeating the phrase as part of the means, but never referring to it as an additional function). In the Ferguson Beauregard/Logic case, the Federal Circuit sidestepped the claim construction question because the dispute on appeal centered around an additional function that neither the lower court nor the appellate court found in either the claim or the allegedly infringing device. Ferguson Beauregard/Logic, 350 F.3d at 1344 (stating that the argument presented was based on a factual comparison of the allegedly infringing device to the claim rather than claim construction).

In the instant case, the Court sees no reason to include an "accessing" function to the processor means. The phrase "and responsive to parameter values and procedure routine specifications accessed from said pluggable memory key means" only describes the interface of the "processor means" with the memory key, it does not describe a functionality of the "processor means." The "accessed from" language is merely descriptive of where the "processor means" finds certain data. To the extent that the phrase "responsive to" can be construed as a function, the only disclosure in the specification for a structure that corresponds to that function is a microprocessor, without more. 609 Patent, col. 3, ll. 49-51.

Having determined the functions associated with the "processor means," namely to control the sense means and to calculate the concentration of an analyte, the Court must now determine the algorithm associated with those functions disclosed by the 609 patent. See WMS Gaming, 184 F.3d at 1348. With respect to the "controlling the sense means" function, Apex/HDI contend that the microprocessor is programmed to open and close the switch of the sense means to change the gain of the amplifier while the output current from the reaction is being measured to prevent saturation of the sense amplifier. Roche argues that this is not the only manner in which the microprocessor controls the sense means as disclosed by the specification.

The Court agrees with Roche that there is more to the algorithm that controls the sense means. The 609 patent teaches that a "microprocessor controls the sense amplifier to provide a plurality of signal outputs over a predetermined duration. . . ." 609 Patent, col. 3, ll. 55-57. This is the first, and perhaps most important, function performed by the microprocessor to control the sense means. This part of the algorithm is also described later in the specification: "Trace 78 is either displaced upwardly or downwardly in the plot of FIG. 66 depending upon glucose concentration. During the period of trace 78, microprocessor 59 causes a plurality of current measurement values to be sampled. . . . The sense current measurements enable a glucose determination to be made. . . ." Id. col. 7, ll. 19-28. This shutting on and off of the sense amplifier is further described in the more specific description of the sense means and its controls:

A further delay measurement interval value is also derived from ROM key 30 and represents a count of a number of measurement intervals during which current measurements are inhibited after reapplication of excitation potential 76 to excitation electrode 24.

***

During the delay measurement interval (key), microprocessor 59 causes switch 106 to be closed thereby shunting amplifier 100. . . . This action prevents saturation of amplifier 100 during the period when the Cottrell current exceeds a maximum measurable current level (key). Subsequent to the delay measurement time, microprocessor 59 causes switch 106 to open so that operational amplifier 100 exhibits its normal gain characteristics and enables measurements 82, 84, etc. to be taken.

Id. col. 7, ll. 46-65. The 609 patent also teaches that "sense amplifier 50 receive[s] [its] commands from microprocessor 59. . . . Sense amplifier 59 is controlled to have two different levels of gain so as to avoid a saturation condition upon an initial application of an excitation voltage to sample strip 18." Id. col. 5, ll. 19-26. This seems to the be algorithm referenced by Apex/HDI.

Apex/HDI's description is too narrow because it only accounts for one of the ways in which the microprocessor is
programmed to control the sense amplifier. The passages in the specification calls for two different algorithms, one that inhibits current measurement and one that allows for current measurements to be sampled at specific time durations. Therefore, the Court finds that the structure of the "processor means" that performs the "controlling" function is: a microprocessor programmed to open and close the sense means to change the gain of the amplifier alternatively to inhibit current measurements, to avoid saturation, or to take current measurements.

Turning next to the function of "calculating the analyte concentration," Apex/HDI argue that the corresponding structure of the "processor means" is: a microprocessor programmed to calculate the analyte concentration value by comparing the current flow measured by the sense means to a Cottrell curve. The Court also finds this definition too narrow.

The 609 patent teaches that a microprocessor "performs the actual analyte determination tests," using variable values from the pluggable memory key means. Id. col. 5, ll. 14-17. With respect to glucose determinations specifically, the 609 patent teaches that

subsequent to the Cottrell currents being recorded and stored, meter 10 proceeds to determine a glucose concentration by performing conversion of current values to glucose values from a calibration curve defined by values in ROM key 30; and then performing a temperature compensation correction procedure (key) in accordance with a temperature estimation procedure (key).

Id. col. 7, ll. 66-68 to col. 8, ll. 1-5. The first passage indicates that the inventors intended to change the type of analyte tested for by the different analyte determination tests employed by the microprocessor. The algorithm would be determined by the actual "analyte determination test" and the variable values from the pluggable memory key means. Moreover, the second passage indicates an intent for determination of glucose values, specifically, through a comparison of measured current values to a calibration curve defined by values from the pluggable memory key means. This disclosed algorithm is broader than the algorithm proposed by Apex/HDI because it allows for different types of calibration curves to be used. The Court finds that the broader algorithms discussed here are supported by the specification.

For this reason, the Court finds that the structure of the "processor means" for performing the "calculating" function is: a microprocessor programmed to perform an analyte testing procedure using variable values from a pluggable memory key means or, for glucose values specifically, a microprocessor programmed to compare measured current values to a calibration curve defined by values from a pluggable memory key means.

3. "processor systems"

The district court construed "processor systems" to require that each system have "at least one [CPU] capable of running application type software, and at least one mass storage subsystem." Seachange, 115 F. Supp. 2d at 483. C-COR argues that the district court erroneously imported the "capable of running application type software" limitation from a preferred embodiment. Seachange counters that C-COR's position is inconsistent with the patent's objective of applying RAID-5 at the system level. Seachange asserts that because the system runs application software, if each processor system did not run the application software, then the claims would simply cover a prior art RAID-5 arrangement. Seachange points us to the language that a component of a "single processor system" is a "remote file provider," '312 patent, col. 8, ll. 39-42, that "the remote file provider represents any third party application or device driver that might use the cluster technology," id., col. 9, ll. 7-9, and that "examples include Lotus Notes, medical applications, or database systems," id., ll. 9-11. C-COR responds by noting that nothing in the ordinary meaning of CPU or in the intrinsic record requires that the claimed processor system be capable of running application software. C-COR adds that Seachange's citation to the written description bolsters C-COR's own position because the citation suggests that processors can simply execute device driver instructions.

The claim states that "each processor system comprises at least one [CPU] and at least one mass storage sub-system." '312 patent, col. 22, ll. 19-20. The claim requires that "data [be] stored at each of [the] processor systems," id., col. 22, ll. 25-28, presumably within the mass storage sub-system. However, the claim provides no more detail about the CPU and does not state that it must be capable of running application-type software. The ordinary meaning of CPU is "the unit of a computing system that includes the circuits controlling the interpretation of instructions and their execution." IEEE 171. That definition
likewise says nothing about a CPU being capable of running application-type software. Moreover, although the written description teaches an embodiment in which the CPU runs a "third party application," that is not the only embodiment. The written description says that the remote file provider can be any third-party application or device driver. '312 patent, col. 9, ll. 7-9. A device driver need not be the same as application-type software. See IEEE 387 (defining "driver"). Thus, C-COR is correct that the written description supports a broader construction. Because we do not import limitations from a preferred embodiment, Fuji Photo Film Co., Ltd. v. Int'l Trade Comm'n, 386 F.3d 1095, 1106 (Fed. Cir. 2004), each "processor system" need not have a CPU capable of running application software.

Seachange's final argument is a plea for the import of a limitation to help preserve the validity of the asserted claims. However, we must decline Seachange's invitation to import a limitation to preserve validity because this is not a case in which "the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous." Liebel-Flarsheim, 358 F.3d at 911. The limitation finds no support in the claims, written description, prosecution history, or technical dictionary.

For the foregoing reasons, we hold that the district court erred in its construction of the "processor system" limitation. A "processor system" must have a CPU but it need not be capable of running application-type software.

B. "Processor Systems"

The dispute over "processor systems" raises the following question: does claim 37 disclose a processor capable of running "application level" software? nCUBE argues that "processor system" should be construed to mean "at least one of any sort of central processing unit, regardless of the nature of the processing performed, and at least one mass storage subsystem." (D.I. 79 at 2.) nCUBE characterizes the issue as "boiling down to whether 'application-level' processing or computation is a necessary part of the definition of 'central processor unit'." (D.I. 79 at 20.) nCUBE cites two dictionary definitions as indicia of the meaning of central processor unit to one of skill in the art:

(1) "The unit of a computing system that includes certain circuits controlling the interpretation of instructions and their execution." The New IEEE Standard Dictionary of Electrical and Electronic Terms (5th ed. 1993); and

(2) "the part of a computer system that operates on data." Merriam-Webster Online Dictionary - Thesaurus (visited August 29, 2000) <http://www.m-w.com>.

nCUBE also looks to the specification, arguing that there is no clear definition provided by the patentee that would add something else to the dictionary definitions cited. (D.I. 79 at 21-22.)

After a review of the specification, the Court cannot agree with nCUBE. Figure 4 of the patent, reproduced below, "illustrates the software architecture in accordance with the invention." ('312 patent col. 5, ll. 7-8.)

[SEE FIGURE 4 IN ORIGINAL]

Figure 4 depicts the processor system 12, also shown in Figures 1 and 2. The mass memory storage unit 26 shown in Figure 2 is also depicted in Figure 4. The text of the specification states: "Referring now to FIG. 4, the major components of a single processor system 12 ('also called a cluster member') include a . . . remote file provider 54. . . ." ('312 patent col. 8, ll. 39-45.) The remote file provider is further described as "representing any third party application or device driver that might use the cluster technology. Examples include Lotus Notes, medical applications, or database systems." ('312 patent col. 9, ll. 7-11.) In the Court's view, this reference to application type software as a part of the processor 12 is a clear statement by the patentee that the processor at a minimum must be capable of operating the software described. Also, the specification describes an embodiment that not only stores the video data, but plays it as well. ('312 patent, col. 10, ll. 34-35.)

Accordingly, the Court concludes that the proposed construction advanced by nCUBE is too broad, in view of the disclosure. That is, the processor and its central processing unit must be capable, at a minimum, of operating the application software described in the specification. Therefore, the Court construes "processor systems" to mean "at least one central
processing unit capable of running application type software, and at least one mass storage subsystem."

6. "processor within a computing device" and "processor includes a computing device"

a. The Parties' Proposed Constructions

The parties also dispute the terms "processor within a computing device," found in dependent claim 8 of the '082 patent, and "processor includes a computing device," found in dependent claim 16 of the '082 patent. Ingenio asserts that "processor within a computing device" means "the processor is a component of a computing device," citing to the specification of the patent where examples of computing devices are given. (D.I. 113 at 23.) GameLogic asserts, on the other hand, that this term should be construed to be synonymous with the term "processor" as set forth in claim 1, as the processor of claim 1 must be in a computing device to perform its claimed functions. (D.I. 117 at 26.) GameLogic further claims that any other construction of the term "processor within a computing device" would make claim 1 indefinite. (Id.)

As to "processor includes a computing device," Ingenio asserts that this term should be construed to mean that the processor "has a component device that can perform computations." (D.I. 113 at 24-25.) Ingenio cites to the portions of the specification of the patent that disclose that a home computer could be implemented to access the system, and states that, "at the time of the invention, home computers were known to include . . . software that could perform computations." (Id. at 24.) GameLogic, on the other hand, argues that the term should be construed to mean that "the processor, such as a microchip, contains within it a personal computer." (D.I. 116 at 28.) GameLogic also contends that this claim term is unclear.

b. The Court's Construction

The ordinary meaning of the term processor is "[a] device that performs one or many functions, usually a central processing unit" n8 or "[a] program that transforms some input into some output, such as an assembler, compiler, or linkage editor." McGraw-Hill Dictionary of Scientific and Technical Terms 1676 (6th ed. 2003). n9 Thus, a processor can either be circuitry or it can be a program in a computer that performs a particular function. Computer circuitry or a computer program, standing alone, cannot perform the functions of the patent, such as allowing the player to "enter[] the code . . . into a processor." That function, and others required by the patent, can be performed by the processor only where the processor is part of a computing device. For that reason, the term "a processor" in claim 1 of the '082 patent must be construed such that the processor of claim 1 is within a computing device. As a result, "processor within a computing device" will be construed to mean the same thing as "a processor." The language "within a computing device" adds no additional limitation to the term "a processor," as a processor must be within a computing device to perform the functions it is required to perform in claim 1 of the '082 patent.

The term "processor includes a computing device" is indecipherable. As Ingenio points out, the patent describes "a home computer or an interactive TV system" as examples of "a computing device." ('082 patent at 5:60; see also id. at Fig. 6.) Because a processor itself must be a part of a computing device to function, it cannot also include "a computing device," as that terminology is used in the patent. Ingenio attempts to avoid this conclusion by arguing that the computing device in this claim is simply "a component device that can perform computations." (D.I. 113 at 24-25.) The patent's own description of what a "computing device" is, as cited by Ingenio, does not comport with this construction. Therefore, I find that the term

n8 A central processing unit is "[t]he part of a computer containing the circuits required to interpret and execute the instructions." McGraw-Hill Dictionary of Scientific and Technical Terms 356 (6th ed. 2003)

n9 No one contends that the ordinary meaning of "processor" in the context of computer science has changed between the time the patents issued and today.
"processor includes a computing device" is indecipherable in the context of this patent.

3397

9. Producing (First appearing in claim 1 at col. 12, l. 57, and as used similarly thereafter in claims 1-31, e.g. as "produces" in col. 14, l. 62)

Websidestory contends that "producing" does not need to be construed by the Court, and that its plain meaning should control. Joint Claims Construction Chart at 4. Netratings contends that "producing" should be construed to mean "generating," and cites the specification in support. Joint Claims Construction Chart at 4. Netratings contends that the specification defines "producing" as "generating."

As the terms "producing" and "generating" are similar, the Court notes disputed terms are generally to be given their ordinary and customary meaning. Phillips, 415 F.3d at 1312, 1314. Webster's Third New International Dictionary defines "produce," the root word of producing, as either "something that is brought forth or yielded either naturally or as a result of effort and work," or "to cause to have existence or to happen." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1810 (1986). Webster's Third New International Dictionary defines "generate" as "to cause to be . . . bring into existence." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 945 (1986).

Netratings cites the specification which states, "then the traffic analysis server generates an initial cookie," for the proposition that the '479 Patent defines "producing" as "generating." See Patent at col. 8, ll. 36-37. However, in order to assign meaning to a term which is different from the term's ordinary and customary meaning, a patent applicant must define the term with reasonable precision and clarity. See Teva Pharms., 395 F.3d at 1370-72 ("When a patentee acts as his own lexicographer in redefining the meaning of particular claim terms away from their ordinary meaning, he must clearly express that intent in the written description."). After reviewing the '479 Patent's claims and specification, the Court concludes that no part of the '479 Patent defines "producing" with sufficient precision and clarity so as to define its meaning as "generating." In fact, though the specification does use the phrase "generates an initial cookie" on one occasion, see Patent at col. 8, ll. 36-37, the specification also uses the word "produced" consistent with the language of the claims. See Patent at col. 6, ll. 56-58. The Court notes again that it is improper to read limitations from a specification into a claim. Callicrate, 427 F.3d at 1368; see also Phillips, 415 F.3d at 1312.

The Court concludes that "producing" is used in the claims in accordance with its ordinary meaning, and no construction is necessary.

GO BACK

3398

A. Noninfringement

"We review a district court's grant of summary judgment of non-infringement without deference." O2 Micro Int'l, Ltd. v. Monolithic Power Sys., Inc., 467 F.3d 1355, 1359 (Fed. Cir. 2006). Our de novo review of summary judgment of noninfringement requires two steps--claim construction, which we review without deference, and infringement, which we review to determine whether there was no genuine issue of material fact. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1304 (Fed. Cir. 1999).

On appeal, Ormco argues that the district court erred when it interpreted the claims to require automatic determination of finish tooth positions, contrary to their plain language, and when it failed to tie that interpretation to specific language in each claim. Ormco further argues that the statements referenced by the court to support its application of the automatic determination limitation do not meet the standard for an intentional disavowal of claim scope and that statements from the prosecution history of the '562 patent are limiting only as to the particular claim language with respect to which they were made (e.g., "ideal dental archform").

In response, Align argues that a patentee can make a disavowal of scope as to the general nature of an invention that in turn
limits all claims even though specific claim language is not being interpreted. Align argues that the statements in the Ormco patents' specification and the prosecution history of the '562 patent constitute such a disclaimer. In the alternative, Align argues that all of the asserted claims except claims 37-40, 45, and 69 of the '444 patent contain express language that requires a construction that includes the automatic determination limitation.

"It is a bedrock principle of patent law that the claims of a patent define the invention to which the patentee is entitled the right to exclude." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc) (citation and internal quotations omitted); see also Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) ("[W]e look to the words of the claims themselves . . . to define the scope of the patented invention."). However, "claims 'must be read in view of the specification, of which they are a part.'" Phillips, 415 F.3d at 1315 (quoting Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996)), and "[t]he construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction," id. at 1316 (quoting Renishaw PLC v. Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998)) (emphasis added).

Consistent with that precedent, we conclude that the district court correctly determined, as to most, but not all, of the asserted claims of the Ormco patents, that requiring automatic determination of finish tooth positions is a proper construction of the asserted claims. Interpreting most of the claims to require automatic determination of finish tooth positions "most naturally aligns with the patent's description of the invention." From the beginning of the common specification of the Ormco patents, it is clear that the inventors' primary basis for distinguishing their invention was its high level of automation in the design of custom orthodontic appliances as compared to the prior art. In the Background of the Invention, the inventors stated, "In reality, the treatment of patients is in many cases more of an art than a science, with results ranging from poor to excellent, and generally variable." '444 patent col.3 ll.7-10. The inventors specifically stated that the prior art had encountered difficulties in "the task of developing an automated system that includes reliable and efficient decision making algorithms and techniques for automatically determining an ideal finish position of the teeth." Id. at col.3 ll.17-22 (emphases added).

The specification then indicates a clear emphasis in the patent on removing the referenced variability in the orthodontic treatment process by relying on a predetermined set of calculations rather than human judgment to determine final tooth positions. "A primary objective of the present invention is to provide a practical, reliable and efficient custom appliance automated design and manufacturing system and methods of automatically designing custom orthodontic appliances and treating patients therewith." '444 patent col.3 ll.41-45 (emphases added). "In accordance with the preferred embodiment of the present invention, there is provided a computerized system and method with which finish positions of the teeth of a patient are derived from digitized information of anatomical shapes of the patient's mouth . . . ." '444 patent col.4 ll.16-20 (emphases added). "The computer 30b at the appliance facility 13 calculates, based on the digitized information 26, the final position of the patient's teeth . . . ." '444 patent col.14 ll.6-8 (emphases added).

Nowhere does the specification suggest or even allow for human adjustment of the computer-calculated tooth finish positions. Statements in the specification cited by Ormco to support human participation in the process are limited to input from the orthodontist and/or computer operator at the start of the process (i.e., when particular "landmarks," data points related to teeth and jaw anatomy and geometry, are selected for input into the automatic calculation process) and not related to determination of tooth finish positions. See, e.g., '444 patent col.10 l. 63--col.11 l.2, col.13 ll.51-57. The first of those passages again emphasizes that the invention "applies automated decision making processes in the appliance design." Id. at col.10 ll.66-67.

The specification goes on to state, "In the computer analysis procedure (95), the digitized information input by the input procedure (94) is analyzed to calculate the finish position of the teeth, so that the custom appliance (25) can be designed in computerized design procedure (96) and manufactured in computer controlled manufacturing procedure (97)." Id. at col.24 ll.25-30 (emphases added). Further, the detailed recitation of the formulas and algorithms for automatic calculation of final tooth positions that follows, see id. at col.39 l.41--col. 53, l. 52, concludes with the statement, "At this point, the final positions of the maxillary teeth have been calculated, and thus, the finish positions of all of the teeth." Id. at col.53 ll.50-52. There is no discussion of operator or orthodontist review or adjustment of those finish positions or of the bases on which such review and adjustment might be made. Instead, the specification turns to a description of the "Appliance Design Procedure," which utilizes the finish tooth positions that have been automatically determined. The specification thus provides clear indication that the invention is in the automatic determination of tooth position.
While all those statements by the inventors in the specification of the Ormco patents, standing alone, may not be conclusive in showing that the claims require completely automatic determination of final tooth positions, those in the prosecution history make it even clearer. "[T]he prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Phillips, 415 F.3d at 1317 (emphasis added). Thus, we turn to the prosecution history of the Ormco patents, and other patents from the same family, to determine if there are statements there that should further inform our construction of the claims. As the district court correctly observed, we have held that "prosecution disclaimer may arise from disavowals made during the prosecution of ancestor patent applications." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1333 (Fed. Cir. 2003). When the application of prosecution disclaimer involves statements from prosecution of a familial patent relating to the same subject matter as the claim language at issue in the patent being construed, those statements in the familial application are relevant in construing the claims at issue. See, e.g., Wang Lab., Inc. v. Am. Online, Inc., 197 F.3d 1377, 1384 (Fed. Cir. 1999); Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990). In this case, the specifications of the prior '562 patent, which is the parent of three of the patents in issue, and all the presently litigated patents, have the same content. Thus, the prosecution history of the claims of application number 07/973,973, which led to the '562 patent, are relevant in construing the claims of the '432, the '243, the '861, and the '444 patents.

The claims of the parent 07/973,973 application were rejected by the United States Patent and Trademark Office ("PTO") under 35 U.S.C. § 103 in an Office Action on September 13, 1993, based in part on U.S. Patent 5,011,405 to Lemchen. In a Response on March 16, 1994, the inventors made a number of statements characterizing the Lemchen patent and seeking to distinguish their invention. The first part of the Response describing Lemchen, noted by the district court, states:

Using such a CAD [computer-aided design] program in a conventional manner, as Lemchen describes, an operator would manipulate the tooth images to provide the desired occlusion. This would presumably involve some decision making by the operator. As the operator manipulates the images, the computer, under the control of the conventional CAD program, would perform the calculations that would generate data of the tooth movements made by the operator and thus of the finish positions of the teeth.

(emphases added). This passage illustrates the inventors' characterization of the Lemchen prior art, viz., that it involves use of an operator. The inventors then distinguish between their automated design process and processes that are merely computer assisted and involve human input in a further characterization of the Lemchen patent:

The Lemchen patent relies, to produce the calculations, on the conventional calculation techniques employed in generalized CAD software. This in turn relies on a user interactive interface by which an operator contributes human decision making powers to manipulate images until the operator is satisfied that finish tooth position criteria have been met. . . . However, with conventional CAD programs, the reliance on human decision making is heavy, and rigorous fully automated arrival at tooth finish positions is lacking.

(emphases added). The inventors thus distinguished Lemchen by emphasizing its reliance on an operator for the decision-making process.

Further statements by the inventors in arguing for allowance of their claims in their Response continued to characterize their method by which final tooth positions may be determined. They stated, "The present invention of applicants is directed toward the most complete and fully automated method for orthodontic appliance design and manufacture made." (emphasis added). None of the prior statements in the Response were limited to particular claims. Again, in a section entitled "Deriving Finish Positions from Derived Ideal Dental Archform," the inventors argued, "The judgment, or decision making, on the acceptability of tooth positions must be imposed externally of Lemchen's system. This leads to human error and inconsistencies from patient to patient. Lemchen does not disclose this being done automatically thereby avoiding such errors and inconsistencies." In that same section, the inventors conclude, "Therefore, Lemchen, while primarily concerned with bracket placement, uses a user interactive computer system to calculate tooth finish positions, [but] applicants have provided a computerized system with the intelligence to decide for itself the best finish positions of the teeth." (emphasis added). That statement was directed to amended claims 1-30, 35-38, and 65-72, but was not associated with particular language from those claims. Furthermore, the method of amended claim 1 included the step of "deriving with the computer tooth finish positions," demonstrating that the same subject matter of automatic determination of finish tooth positions was
included in those claims. In an effort to further bolster their arguments to the examiner, the applicants also submitted a Declaration from an orthodontist, Michael W. Scott. Dr. Scott's declaration states, "In applicants' overall method, it is a computer, not an orthodontist or an orthodontically skilled computer operator that makes the decision on the finish positions in which the teeth are to be placed."

With these and other similar statements from the prosecution history of the '562 patent in mind, we address the claims of the Ormco patents involved in this lawsuit. Ormco has asserted infringement of claims 1, 9, and 10 of the '432 patent; claims 1 and 2 of the '243 patent; claims 1, 3, 4, 9-12, and 16-18 of the '861 patent; and claims 10-17, 23-29, 30-36, 46-68, and 70-79 of the '444 patent.

All of the above claims require determining the finish positions of the teeth. E.g., '432 patent, claim 1 ("producing desired tooth position signals containing digitized data of desired positions of a plurality of the patient's teeth"); '243 patent, claim 1 ("a computer programmed . . . to calculate finish positions of the teeth of the patient"); '861 patent, claim 1 ("determining treatment positions of the teeth"); '444 patent, claim 10 ("a computer programmed to apply at least some automated tooth position criteria to produce a digital model of the teeth of the scanned shapes in desired positions"). Although their claim language does not expressly recite automatic control of the finish tooth positioning, that is what they mean, and that is all that the specification describes; the specification does not support operator positioning. Moreover, the prosecution of the '562 patent, with the same specification, makes clear that the inventors understood their invention to encompass only automatic positioning because they so argued in order to distinguish their claims over Lemchen. We are mindful of the precaution that we must not incorporate into the claims limitations only found in the specification. We are not doing so here, nor did the district court. We are interpreting the claims in light of the specification. The situation here involves specifications that in all respects tell us what the claims mean, buttressed by statements made during prosecution in order to overcome a rejection over prior art. Accordingly, to attribute to the claims a meaning broader than any indicated in the patents and their prosecution history would be to ignore the totality of the facts of the case and exalt slogans over real meaning. We thus agree with the district court that in light of the specification of the Ormco patents and statements from the prosecution history of the parent '562 patent, the claims specified above require automatic computer determination of the finish positions of the teeth without human adjustment of the final results.

Ormco has also asserted infringement of claims 1-5, 8, 9, and 18-22 of the '444 patent. Claims 2-5, 8, and 9 depend from independent claim 1. The method of claim 1 does include the limitation "through an operator interacting with a computer located remote from the orthodontic practitioner, altering the graphic representation to arrange a plurality of the teeth in relation to each other in accordance with the prescription, to produce a digital model of a desired arrangement of the teeth of the patient." Ormco argues that the specific recitation of an operator in this clause differentiates this claim from other claims in which the operator is not mentioned and supports the scope of the claim to allow for the operator to select the finish tooth positions or at least aid in the process. We do not agree. The role of an operator in this claim and its dependent claims is only to help generate and enter the tooth data into the computer that is needed for the automatic process to operate. The operator does not determine the finish positions of the teeth; that is still done automatically. Thus the district court did not improperly construe claims 1-5, 8, and 9 of the '444 patent to require automatic determination of tooth positions.

The method of claim 18 includes the limitation of "a computer . . . programmed to select geometric parameters on the patient's teeth from the digitized data by operator-interaction and to produce a digital model of the teeth in desired positions." Claims 19-22 of the '444 patent depend from independent claim 18. As with claim 1, the fact that a role for the operator is required by the claim language at the beginning of the process does not support Ormco's argument that determination of finish tooth positions in claim 18 is not done automatically. Thus, in light of the specification of the Ormco patents and statements from the prosecution history of the '562 patent as a whole, "altering the graphic representation to arrange a plurality of the teeth in relation to each other . . . to produce a digital model of a desired arrangement of the teeth of the patient" and "producing a digital model of the teeth in desired positions" each require automatic computer determination of the finish positions of the teeth without human adjustment of the final results.

We reach a different conclusion with respect to claims 37-40, 45, and 69. The district court treated those claims in the same manner as all the others. Align argues that the methods of claims 37-40, 45, and 69 similarly relate to automatic design or automatic calculation of finish tooth positions. We do not agree. Those claims relate to the preliminary gathering and organization of tooth data as an aid to further unspecified orthodontic treatment or for use in creation of a digital model, not to the specific automatic determination of finish tooth positions. Such preliminary gathering and organization do not, by themselves, determine finish tooth positions. We therefore conclude that claims 37-40, 45, and 69 do not require automatic
computer determination of finish positions of teeth, and that the district court thus erred in so concluding. However, each of
the dependent claims 41-44 requires "manipulating the separate digital representations of the generated data in a computer
to rearrange the shapes of the individual teeth" into "desired relative positions." Such rearrangement requires determination
of the finish positions of the teeth and therefore as with the other claims in suit discussed previously, automatic
determination of those finish positions is implicit in those claims. Thus, in light of the specification of the Ormco patents
and statements from the prosecution history of the '562 patent as a whole, "manipulating . . . the individual teeth" into
"desired relative positions" requires automatic computer determination of the finish positions of the teeth without human
adjustment of the final results.

In summary, we conclude that all of the asserted claims of the Ormco patents, except claims 37-40, 45, and 69 of the '444
patent, require automatic computer determination of the finish positions of the teeth without human adjustment of the final
results. Since Ormco does not challenge the district court's finding that Align relies on skilled operators rather than a fully
automated computerized process to determine finish positions of the teeth, we affirm the district court's grant of summary
judgment of noninfringement as to claims 1, 9, and 10 of the '432 patent; claims 1 and 2 of the '243 patent; claims 1, 3, 4, 9-
12, and 16-18 of the '861 patent; and claims 1-5, 8-36, 41-44, 46-68, and 70-79 of the '444 patent. However, because claims
37-40, 45, and 69 of the '444 patent do not require automatic computer determination of teeth finish positions, we reverse
the district court's grant of summary judgment of noninfringement as to those claims and remand for further proceedings
consistent with this opinion.

We accept that Ormco's argument, and that of the dissent, that the district court failed to conduct a claim construction in this
case focusing on specific claim language, is not lacking in force. However, we review decisions, not opinions, see
Stratoflex, Inc. v. Aeroquip Corp., 713 F.2d 1530, 1540 (Fed. Cir. 1983), and when we are able to fully comprehend the specification, prosecution history, and claims and can
determine that, to the extent we have indicated, the district court arrived at the correct conclusion, we need not exalt form
over substance and vacate what is essentially a correct decision.
While I sympathize with the district court's desire to resolve the case before it without resort to the daunting task of construing ninety-two claims in four separate patents, a non-infringement decision which eschews the very exercise of claim construction is inconsistent with this court's repeated directives to district courts. I believe, accordingly, that the district court's failure to construe the claim language in this case, standing alone, warrants remand.

II.

Rather than remand the matter, the majority chooses, instead, to conduct its own infringement analysis. It opens that analysis by recognizing that claim construction begins with the language of the claims themselves. In support, the majority cites Phillips and Markman for the truisms that, "the claims of a patent define the invention to which the patentee is entitled" and that, though claims, "must be read in view of the specification, of which they are a part," it is the language of the claims that is to be construed, not the specification. Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc); Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The majority, nevertheless, appears to ignore its own opening admonitions in the remainder of its opinion. First, the majority does not "begin" with the language of the claims. Indeed, it never actually tells us what word or words in the claims in suit it purports to construe. At best, after examining the specification of one of the patents in suit (but not its prosecution history), and the prosecution history of a patent which is not in suit, it backs into a form of claim construction by asserting that all of the claims address themselves to the practice of determining finish tooth positions. Nowhere, however, does the majority tell us what language is used in which claims to describe that practice, or why such language is in need of interpretation.

The majority concedes, as it must, that none of the claims in suit "expressly recite automatic control of the finish tooth positioning." Despite the absence of this language in the claims, however, the majority concludes that this unstated (and seemingly important) limitation is "what [the claims] mean."

In its analysis of the specification, the majority first cites to general statements in the Background and Summary of Invention sections of the patent where the inventors discuss the benefits of computer-assisted (i.e., automated) methods for designing orthodontic appliances, most particularly the greater accuracy that can be gained by reducing reliance on human decision-making. It then examines the preferred embodiments and concludes that those embodiments only contemplate human or operator input into the process at the front end--i.e., when the user first inputs the data into the computer for processing. From these portions of the specification, the majority concludes that the essence of Ormco's invention requires, "automatic determination of the finish positions of teeth without human adjustment of the final results." This exercise of attempting to glean the intended invention from sources other than the claims themselves is precisely what Align asked that we do. (See Appellee's Br., 36, 39 ("Ormco made it very clear in the specification . . . that the very nature of its invention was for automatic computer determination of the finish positions of teeth . . .;" and "the statements Align drew from the specification and the file histories are admissions concerning the fundamental nature of Ormco's invention, not narrow statements concerning the meaning of some particular specific term.") (emphases in original).)
This court, however, has rejected a claim construction process based on the "essence" of an invention. See, e.g., Allen Eng'g Corp. v. Bartell Indus., Inc., 299 F.3d 1336, 1345 (Fed. Cir. 2002) ("It is well settled that 'there is no legally recognizable or protected essential element, gist or heart of the invention in a combination patent.'") (citing Aro Mfg. Co. v. Convertible Top Replacement Co., 365 U.S. 336, 345, 81 S. Ct. 599, 5 L. Ed. 2d 592, 1961 Dec. Comm'r Pat. 635 (1961)). Indeed, this court has done so quite forcefully and quite recently. See MBO Labs., Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1330-31 (Fed. Cir. 2007) ("We sympathize with the district court's choice, since we agree that [the feature] is an essential element of the invention . . . . However, we cannot endorse a construction analysis that does not identify 'a textual reference in the actual language of the claim with which to associate a proffered claim construction.'") (quoting Johnson Worldwide Assocs., Inc. v. Zebo Corp., 175 F.3d 985, 990 (Fed. Cir. 1999)). Simply stated, "automatic determination of finish tooth positions without human adjustment of the final results" is a limitation that the majority has amalgamated from the specification of one of the patents in suit without reference to the specific language of any claim of any of the patents.

The court's recent decision in Ventana Medical Systems, Inc. v. Biogenex Laboratories, Inc., 473 F.3d 1173 (Fed. Cir. 2006), counsels against this practice. In Ventana, the issue was the proper construction of the term "dispensing" in a patent claiming automated methods for staining microscope slides. Ventana, 473 F.3d at 1176. The district court construed "dispensing" to require "direct dispensing," because the embodiments in the specification involved direct dispensing (much as the district court here determined that processing, determining, and calculating orthodontic solutions require automatic processing, automatic determining, and automatic calculating). Id. at 1178. On appeal, Biogenex argued that the specification, when read in its entirety, would lead to the "inescapable conclusion" that the heart of the invention involved "direct dispensing," and that the specification implicitly defined the term "dispensing" to mean "direct dispensing." This court, in Ventana, rejected that narrowed construction of the claims, noting this court's previous repeated warnings against confining claims solely to disclosed embodiments. Id. at 1181 ("[While] the fact that the disclosed embodiments are limited can assist in interpreting claim language . . . [it] does not in and of itself mean that the method claims at issue are limited to the disclosed embodiments."); see also Phillips, 415 F.3d at 1323 (rejecting, "the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment"). The court should do so again here.

As mentioned above, there are four separate patents in suit, the '444, the '861, the '243, and the '432. Ormco points to ninety-two claims in those patents which it claims Align has infringed, seventy-six of which are found in the '444 patent. By way of example, independent claim 1 of the '444 patent claims:

A method for use in the orthodontic correction of maloccluded teeth of a patient in accordance with the individual anatomy of the patient and a prescription of an orthodontic practitioner for treatment of the patient, the method comprising:

- generating data by scanning shapes of the teeth of a patient;

- displaying a graphic representation of the teeth of the patient with a computer from the generated data; and

- through an operator interacting with a computer located remote from the orthodontic practitioner, altering the graphic representation to arrange a plurality of the teeth in relation to each other in accordance with the prescription, to produce a digital model of a desired arrangement of the teeth of the patient that includes data of the shapes of a plurality of the teeth positioned relative to each other.

'444 patent col.67 l.57--col.68 l.6. Though this claim does not exclude operator involvement in the process and, indeed, claims the involvement of an operator in certain steps of the process, and though the claim never uses the term "automatically," the majority concludes that this claim, and virtually every other claim in suit, claims a process that is "completely automatic" and allows for no skilled operator involvement. In short, the majority has: imported the terms "automatically" and "automated" from the specification to the claims; found that the terms "automatically" and "automated," when used in the specification, are the same terms (without a record of how one skilled in the art would construe those terms); 3 concluded that, in every instance, the words "automatically" and "automated" mean "completely automatically" or "completely automated;" found that, where a claim is silent on the issue, use of an operator is wholly precluded; and found that, where involvement of an operator is claimed, that operator cannot be skilled. Given the limited record in the trial court, I cannot find support either in the claims or in the record for these determinations.
The absence of a record regarding how one of ordinary skill in the art would have understood the terms "automated" and "automatically" at the time the application was filed is particularly important. In fast-moving technologies, like the computer technology at issue here, words can mean vastly different things at different points in time. Thus, what we would consider to be meaningful advances in the use of computers in a particular process (i.e., injecting automation into a process previously done by hand) today could be far different from what one skilled in the art would understand was possible—and, thus, was novel—even a few years earlier.

In reaching these conclusions, moreover, the majority necessarily ignores those places in the claims where the addition of an automatic process is discussed. For instance, claim 4 of the '444 patent recites: "The method of claim 3 further comprising: generating machine code in response to the designed geometry; and transmitting the machine code to a manufacturing machine to substantially automatically operate the machine in accordance with the shapes of the plurality of teeth." '444 patent, col. 68, ll. 19-26 (emphasis added). Why would a claim use the phrase "substantially automatically operate the machine" if the inventors intended that every claim included a requirement that the machine be operated "completely" or "wholly" automatically? Who or what completes the "substantial" operation of the machine if not an operator? These kinds of questions emphasize the need for an assessment of the actual language used in the claims, rather than a construction of the invention that is reached despite that language.

Applying the ordinary meaning approach, this court concludes that the claims require completely "automatic determination of finish tooth positions." To support its construction of the claim, the majority turns to the prosecution history of the '562 patent and finds that the doctrine of prosecution history disclaimer mandates the conclusion the majority reaches. This approach is similarly unavailing. See Armament Sys. & Procedures, Inc. v. Monadnock Lifetime Prods., 168 F.3d 1319 (Table), 1998 WL 537746, at **3 (Fed. Cir. Aug. 7, 1998) (citing Markman, 52 F.3d at 980) (emphasis added) (noting that "Monadnock next argues that the prosecution history requires that the four-step process be read into claim 1 of the '297 patent. Again we disagree," and finding that "any argument based on prosecution history must fail for the same reason as the specification argument: lack of textual support in the claim"); id. ("Accordingly, statements appearing in the file history of the patent are not sufficient to add entirely new limitations to a claim.").

Prosecution disclaimer requires a patentee to clearly and unmistakably disavow certain interpretations, and I find no such disavowal here. SanDisk Corp. v. Memorex Prods., Inc., 415 F.3d 1278, 1287 (Fed. Cir. 2005) ("There is no 'clear and unmistakable' disclaimer if a prosecution argument is subject to more than one reasonable interpretation, one of which is consistent with a proffered meaning of the disputed term."); Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324 (Fed. Cir. 2003). Importantly, while the quotations lifted from the '562 patent history do appear to support the majority's conclusion that the process contemplated in that potential invention was a highly automated one, that language was proffered to the examiner in connection with claims in that patent which do not share claim language with the majority of the claims at issue in this suit. The amendments were all made in response to the examiner's concerns regarding the formation of "ideal dental archforms," and the use of a computer to "derive . . . tooth finish positions . . . to place the teeth on the ideal dental archform." That process simply is not claimed in the '444 patent. The majority conceives this fact, but finds no limitations on the application of prosecution disclaimer posed by it. The majority cites Wang Laboratories, Inc. v. America Online, Inc., 197 F.3d 1377, 1384 (Fed. Cir. 1999), and Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990), for the proposition that statements in the prosecution history of an ancestor patent are relevant as long as the patents in suit address the same general subject matter.

The court's more recent decisions, however, set forth a more restrictive rule—requiring common language or a linguistic "hook" among the claims before resort to a parent application's prosecution history is appropriate. Invitrogen Corp. v. Clontech Labs., Inc., 429 F.3d 1052, 1078 (Fed. Cir. 2005) ("[T]he prosecution of one claim term in a parent application will generally not limit different claim language in a continuation application."); ResQNets.com, Inc. v. Lansa, Inc., 346 F.3d 1374, 1383 (Fed. Cir. 2003) ("Although a parent patent's prosecution history may inform the claim construction of its descendent . . . prosecution history is irrelevant to the meaning of [a] limitation [if] the two patents do not share the same claim language."); Advanced Cardiovascular Sys., Inc. v. Medtronic, Inc., 265 F.3d 1294, 1305-06 (Fed. Cir. 2001) (finding prosecution history of parent patents to be irrelevant where "there are no common claims in dispute"); see also Alloc, Inc. v.
experimentation is needed is not a single, simple factual determination, but rather is a conclusion reached by weighing many 

Co. v. Teva Pharms. USA, Inc., 418 F.3d 1326, 1337 (Fed. Cir. 2005) (citations omitted). "Furthermore, 'whether undue 

An enablement inquiry turns on whether the specification of a challenged patent: "provide[s] sufficient teaching such that 

III. 

The district court's rulings regarding enablement were based wholly upon this flawed claim construction and, therefore, are unsustainable as well. See Chiron Corp. v. Genentech, Inc., 363 F.3d 1247, 1254 (Fed. Cir. 2004) (stating: "an enablement 

An enablement inquiry turns on whether the specification of a challenged patent: "provide[s] sufficient teaching such that 

- 3727 -
factual considerations." Id. (quoting In re Wands, 858 F.2d 731, 737 (Fed. Cir.1988)). "Some of these considerations, commonly referred to as 'the Wands factors,' include '(1) the quantity of experimentation necessary, (2) the amount of direction or guidance presented, (3) the presence or absence of working examples, (4) the nature of the invention, (5) the state of the prior art, (6) the relative skill of those in the art, (7) the predictability or unpredictability of the art, and (8) the breadth of the claims.'" Id. (quoting Wands, 858 F.2d at 737).

Here, however, the district court did not examine the specifications to determine whether one of ordinary skill in the art could make and use the invention without undue experimentation. Indeed, there is no indication that the district court considered any of the factors enumerated in Wands. Ormco Corp. v. Align Tech., Inc., No. 03-cv-00016, slip op. at 3-7 (C.D. Cal. Aug. 23, 2004). Instead, Align only produced, and the district court only focused on, evidence of whether Ormco had perfected a commercially successful version of the invention. Commercial success, however, is not determinative of enablement. See CFMT, Inc. v. YieldUp Int'l Corp., 349 F.3d 1333, 1338 (Fed. Cir. 2003) ("Title 35 does not require that a patent disclosure enable one of ordinary skill in the art to make and use a perfected, commercially viable embodiment absent a claim limitation to that effect."). 6 I believe, therefore, that the district court's limited, improper examination of the enablement issue could not have supported summary judgment in Align's favor on this issue.

6 It is also apparent that the district court improperly shifted the burden of proof to Ormco by requiring it to produce corroborated testimony on the issue of enablement. "[C]orroboration is required of any witness whose testimony alone is asserted to invalidate a patent, regardless of his or her level of interest." Finnigan Corp. v. Int'l Trade Comm'n, 180 F.3d 1354, 1369 (Fed. Cir. 1999) (emphasis added). Here, Align, not Ormco, sought invalidation of the patent.

IV.

For the foregoing reasons, I cannot endorse the district court's infringement analysis or its analysis of enablement, and cannot agree with the majority's construction of the claims in the face of an inadequate record upon which to do so. While it ultimately may be true that some language of some of the claims in suit may require the very "construction" the district court and the majority afford them (because the specification is critical to a proper claim construction process, and a parent application does meaningfuly inform construction of similar claim language in later patents), it is impossible to tell from the current record whether, and to what extent, that fact is true. It appears, moreover, that, as to many, if not most, of the critical claims at issue, the construction the majority endorses is simply not supported by a proper application of this court's precedents. Accordingly, I would reverse the district court's grants of summary judgment, and remand with direction that the claim language at issue be construed and that a record supporting that construction be developed.
Dealix argues that there is no support for construing the term in such a way that product identification data can be both displayed to and submitted by a potential buyer.

Autobytel contends that the term should be construed as "information submitted by and displayed to a potential buyer that identifies a product sought to be purchased." Autobytel argues that Dealix tries to limit the term's construction to exclude the embodiment in which information can be displayed to a potential buyer. Autobytel points to Column 7, lines 6 to 9 of the specification to support its argument that in one embodiment product identification data is displayed to a potential buyer. See Col. 7:6-7. The Court is persuaded by Autobytel's argument and agrees that the claim language should not be limited to exclude the embodiment in which identification data can be displayed to a potential buyer. However, the claim language does not require that information be displayed, and the Court will not construe the term in such a manner. Therefore, the Court modifies Autobytel's proposed construction so that information can be displayed to, "and/or" submitted by, the potential buyer.

3402

2. Product Name

Generally the "product name" describes a designation of a commercial software program. The Isogon invention searches for and recognizes these product name designations on computer systems in order that it can report on their existence and use. Markman Tr. at p. 45. Amdahl argues that a "product name" designates only the "name by which the software is generally known to the public." Def.'s Mem. at p. 18. Isogon argues that the "product name" refers interchangeably to the name "generally" known to the public, an "alphanumerical designation," a "product code," a "vendor name and description," or any other designation by which the software programs may be recognized by the invention for purposes of reporting on their use. See Isogon Reply to Amdahl's Memorandum of Law Concerning Construction of the Claims of U.S. Patent Nos. 5,499,340 and 5,590,056 ("Pl.'s Reply Mem."), p. 5.

"Product name" is not defined in the claims. Rather the term is referenced as that which the invention associates with a "program module name". '340 Pat. at col. 12, ll. 53-65, col. 13, l. 3, col. 14, ll. 8-28. The resulting association is stored by the invention for the purposes of monitoring, correlating, and reporting. See id.. The specification likewise fails to define "product name." Further, nowhere in the claims or the specification is "product name" even referred to as a "generically known name" of a software program.

At one point in the specification "product name" is referred to within a list of items that may be contained in a "product record": "For each product, a product record contains the product ID, the product name, the vendor ID, and (optionally) the product code used by the vendor for that product." Id. at col. 5, ll. 32-35. While such specification language suggests that the terms listed are distinct, and thus that "product code" and "vendor ID" could not refer interchangeably to the same concept as "product name," the specification does not require that these terms be distinct, nor that a "product name" exclude the other listed terms. Because limitations not required by the specification may not be read into the claims, see Specialty Composites, 845 F.2d at 987, the inference that "product name" is distinct from, and thus exclusive of, other terms appearing along with it in a list within the specification, may not be read as a limitation on the claims. Thus, a "product name" could refer to a "product code" or a "vendor ID."

Although Dr. Kaliski testified that in his expert opinion the "product name" is the name "that we are going to want to use in the user readable reports for the unsophisticated user," Mr. Keohane noted that some software programs may have more than one commercially known name or more than one version under the same commercially known label, such as "Wordperfect". Markman Tr. at pp. 143-44, 188. Mr. Keohane implied that because there could be more than one "generically known name," that name may not identify a specific product adequately for the purposes of the invention or its users. Nothing in the patent, its specification, or the testimony of those skilled in the art suggests that the invention requires use of a "generically known name" as its product name. Indeed, as Mr. Keohane testified, use of such generic designation may not suffice for the purposes of the invention or its users.

For the reasons set forth above, the term "product name" is not limited to a "generically known name". It may include an "alphanumerical designation," a "product code," or a "vendor name and description," or any other designation by which the software programs may be recognized for the purpose of reporting on their use.
Defendants urge the Court to construe "product pictures" as: "More than one picture, each of which is of a product and does not include a product environment picture or text segment. Each product picture must be capable of being placed within more than one product environment picture." Defendants urge the Court to construe "product environment pictures" as: "More than one picture, each of which is an environment that will serve as a background within which a product picture is placed and which does not include either a product picture or text segment. Each product environment picture must be capable of serving as a background for more than one product picture."

Given the interrelatedness of Defendants' proposed constructions for these terms, the Court considers them together. To a great extent, these terms determine the "separate and distinct" issue since it is these items that Defendants contend must be stored and selected separately and distinctly. Defendants' constructions place two limitations on both terms: (1) exclusivity ("does not include . . .") and (2) the ability to be superimposed on the other type of picture.

The specification does not define "product pictures" or "product environment pictures," but the specification does give various examples of both. According to the Abstract, "the pictures may include various products, environments in which the products may be used, and available product options." In describing Figure 1B, the specification also explains that

Based upon the answers to the queries, the system may "fill in" the template 60 to customize a proposal for the customer. For example, if the customer has an interest in sailing or boating, the system may choose a picture of a marina environment 51 to use as the background or environment 62 in picture 61 of template 60. Likewise, if the customer has an interest in golfing, the system may choose a golf course environment 52. Within the environment 62, the system places a product 63 by selecting one of the plurality of product picture 56 based upon the customer's answers.

Each product 63 typically has several options available to the customer, such as the type of engine and wheels. Based upon the customer's answers, which indicate the customer's desired options, the system may select parts from the picture database 50 for parts 64 and 65 on product 63 in the template.

Col. 5:4-20. In that example, the environment picture is used as the "background" for product picture 63. The "parts" are illustrated as being superimposed on product picture 63. Finally, the specification explains,"the system may also select one of the plurality of text segments 59 to fill in text frame 66. The text in text frame 66 would typically correspond to picture 61 and, for example, provide a description of the product or its performance specifications." Col. 5:20-24. Those text segments are not illustrated as being superimposed on environment picture 62. But all of this is only exemplary since "one skilled in the art will recognize that the system is capable of creating different types of templates or proposals based on different picture building blocks or different combinations of the building blocks." Col. 5:48-53. Further, "the user may select from several generic types of pages to include in the printed proposal. The types of pages typically include cover sheets, personalized letters, product description pages, product specification pages, performance specification pages, trade-in specification pages. . . ." Col. 11:63-12:3. That is, the template may vary.

Exclusivity limitation

Thus, although the specification does not define what constitutes "product pictures" as opposed to "environment pictures," the specification does describe "environment pictures" as relating to the environment in which a product may be used and "product pictures" as relating to features and benefits of a product. The patentee used the terms (1) "product pictures," (2) "environment pictures," and (3) "text segments" to refer to three separate types of pictures. But that does not necessarily
mean that a "product picture" must be devoid of anything but the product or that an "environment picture" must be devoid of anything but the environment.

Although the specification describes the invention in the context of selling vehicles, claim 1 is not limited to that context, but rather is drawn to "[a] computer assisted method of generating a customized proposal for selling products to particular customers." Claim 11 is similar. There is no inherent limitation on the types of "products" that may be sold. Thus, while it is fairly easy to visualize a pickup truck as a "product," and a "marina" as an "environment," that is not necessarily the case when the products change. An exclusivity limitation is not required by the claims, the specification, or the disclosed invention.

Superimposed limitation

The "storing" and "selecting" limitations of claim 1 do not go beyond the steps of "storing" and "selecting." Nothing in those limitations expressly or inherently requires that "each product picture must be capable of being placed within more than one product environment picture" or "each product environment picture must be capable of serving as a background for more than one product picture." The "generating" step also does not expressly or inherently require those limitations. The claim language simply calls for "generating" a proposal "using the particular product picture. . . ." This step does not say how the pictures and text are used and does not require that the product picture be superimposed or placed within the environment picture.

As noted above, the user has flexibility in designing the template and formatting the proposal. See col. 17:38-43; 18:64-19:27. Although superimposing a product on a background or environment is certainly described in connection with the embodiment of Figure 1B, there is nothing in the specification that necessarily limits the invention to doing so. Nor is there anything in the prosecution history of either the 342 patent or its parent application that would so limit the claims.

Thus, the method steps of "selecting" and then "generating a customized proposal" are not necessarily limited to the template of Figure 1B in which the "product picture" is superimposed on the "product environment picture." Such a limitation is inconsistent with the claim language. Claim 1 calls for "selecting" (1) "a particular product picture," (2) "a particular product environment picture," and (3) "a particular text segment." The claim requires "selecting" a "text segment," but Figure 1B does not illustrate the "text segment" as being superimposed on the background or "product environment picture."

The specification speaks in terms of "linking" together product pictures, environment pictures and text, but "linking" is not restricted to "superimposing" or placing a product picture "within" an environment picture. See col. 1:9-12.; 2:20-31. The specification speaks in terms of "linking" textual descriptions, yet even in the preferred embodiment, the textual description is not "superimposed" on a background or a "product environment picture."

Conclusion

Nothing in the claim language, specification, or prosecution history supports Defendants' proposed limitations. Thus, the Court does not adopt them. Without these limitations, Defendants' proposed construction of "product pictures" is "more than one picture, each of which is of a product." This is no different than how "product pictures" would ordinarily be understood. Accordingly, "product pictures" does not require construction. Without these limitations, Defendants' proposed construction of "product environment pictures" is similarly reduced to "more than one picture, each of which is an environment." Likewise, this adds nothing to the term "product environment pictures," and the term does not require further construction.

n3 "Product images" and "product environment images" are used in Claim 11.
In the Staples case, the Court determined these terms did not require further construction after resolving the parties' disputes about the terms. Hyundai asks the Court to clarify that the "'product pictures' and 'product environment pictures' must be separate items in terms of content." Hyundai argues such clarification is necessary to prevent juror confusion and because, as presently construed, the '342 patent reads on intrinsic prior art. n4 Specifically, Hyundai wants the Court to construe "product pictures" as "pictures of products that are separate from the product environment pictures" and "product environment pictures" as "pictures of surroundings in which the product may be used that are separate from the product pictures."

n4 As previously discussed, the Court rejects this argument because "[c]onstruction of the claims here is not so difficult a problem as to require resort to the validity maxim." MBO Labs., 474 F.3d at 1332.

The Staples Defendants urged the Court to construe "product pictures" as "More than one picture, each of which is of a product and does not include a product environment picture or text segment. Each product picture must be capable of being placed within more than one product environment picture." They urged the Court to construe "product environment pictures" as "More than one picture, each of which is an environment that will serve as a background within which a product picture is placed and which does not include either a product picture or text segment. Each product environment picture must be capable of serving as a background for more than one product picture." The Staples Defendants argued that these items must be stored and selected separately and distinctly.

Thus, Hyundai reurges the Staples Defendants' position that the product pictures [images] and product environment pictures [images] must be separate, i.e., they cannot contain the same content. Based on the specification, the Court previously rejected such an exclusivity requirement. See Staples Markman opinion, at 20 ("An exclusivity limitation is not required by the claims, the specification, or the disclosed invention."). Hyundai also argues that the prosecution history supports such an exclusivity requirement. However, the sections from the prosecution history that Hyundai relies on are taken out of context. In proper context, the applicant first acknowledged that Donald mentions combining composite images and then distinguished Donald for not disclosing gathering and formatting customer-specific information. See June 19, 1995 Amendment and Response, 7,878,602 application, at 3. The applicant then distinguished Yourick for failing to combine various pieces of customer-specific information and format the information for a particular layout. Id. at 4. Finally, the applicant distinguished Yourick's "best guess" technique from the present invention's method of obtaining information specifying the customer's desired product features and uses. Id. Thus, taken in context, the applicant did not disclaim the use of composite images.

Accordingly, the Court's rejects Hyundai's exclusivity requirement and its proposed constructions.

3405

1. Product relationship.

The term "product relationship" is used in claims 1, 20, 60, and 73 of the 651 patent and in claims 18 and 20 of the 308 patent. Trilogy contends that the court should define product relationship as "a classification of the specific association that exists between a product and one or more parts." Selectica contends that the court should define the term to mean "a relationship between a product on the left hand side of a table and a set of elements on the right hand side of a table." The court construes the term to mean "an association between a product and one or more parts, the association having a left-hand side and a right-hand side. The product represents the left-hand side of the relationship, and the set of elements represents the right-hand side of the relationship."
"Product records" and "information records," used synonymously in the claim language, are contained in the knowledge base for the purposes of identifying a software product. Id. at p. 14. Isogon and Amdahl disagree as to which elements a "product record" must contain. Amdahl contends that it must contain a "product ID," a "product name," and a "vendor ID." Id. at p. 65. Isogon contends that a "product record" may contain such information that is sufficient "to allow software users to recognize the software product that has been identified," but "it has to do this other than by file names or module names..." Id. at p. 14. The claims do not define "product record" or "information record." Instead the '340 patent claims refer to "information records" as contained in the knowledge base and as associated with "at least one module name." '340 Pat. at col. 14, ll. 66-67-col. 15, ll. 1-13. The '056 patent claims refer to "product record" when describing an inventorying method which operates in part by "storing said module identifier as a product record in said first memory means..." '056 Pat. at col. 17, ll. 6-9.

The specification states: "Product Records: For each product, a product record contains the product ID, the product name, the vendor ID, and (optionally) the product code used by the vendor for that product." '056 Pat.at col. 5, ll. 47-50. Amdahl contends that this specification language defines the minimum of what a product record must contain. See Markman Tr. at p. 65. This language does suggest that the first three items listed are not optional elements of the product record because of the placement of "optionally" modifying only the fourth listed element, "product code." '056, at col. 5, ll. 47-50.

However, as noted above, the specification also states that a "module identifier" can be stored as a "product record". '056 Pat. at col. 17, ll. 6-9. A "module identifier" is a string of text characters which could consist of information available in a "copyright statement" embedded within a software program. '340 Pat. at col. 5, ll. 59-60 (explaining information scanned by "file reader 12B" in order to formulate module identifiers includes "copyrights statements...") See also Markman Tr. at p. 102. Mr. Keohane explained that a copyright statement may contain:

- the word copyright, there may be the copyright symbol and then the text after that might be, company name, might be a date, might be a product name...something that helps identify the module. The module identifier in that case could be looking for the word 'copyright' and pulling out from the module the information following, preceding, whatever, to hopefully identify where the module came from.

Id. This testimony supports the conclusion that a "module identifier" does not require a "product ID," "product name," and "vendor ID," but could be composed of whatever elements are found within the copyright statement. The specification clearly states that the "module identifier," when stored, may be stored as a "product record," and is then stored in the "first memory means." '056 Pat. at col. 17, ll. 7-8. The '056 patent specification later explains that the "first memory" includes the "knowledge base" which contains "data representative" of "information records." Id. at col. 19, ll. 4-10. Thus the specification teaches that a "module identifier" can be stored as a "product record," and such a product record will be stored in the "knowledge base". Id. at col. 17, ll. 7-8. Further, that "product record" may include less than the "product ID," the "product name," and the "vendor ID" if the "product record" is made from a "module identifier" that has been gleaned from a copyright statement, which contains less than all three of those elements. Id.; '340 Pat. at col. 5, ll. 59-60. See also Markman Tr. at p. 102. It follows that a "product record" in the "knowledge base" is not required to contain the "product ID," the "product name," and the "vendor ID".

Dr. Kaliski testified that information not contained in the knowledge base which the invention uses to identify a monitored program would not constitute "a product record a priori in the knowledge base," but would instead be stored in "the system configuration file." Markman Tr. at p. 191. However, expert testimony "may not be used to vary or contradict the terms of the claims as understood from the intrinsic evidence." Intellectual Property Development, Inc. v. U.A-Columbia Cablevision of Westchester, Inc., 1998 U.S. Dist. LEXIS 3901, 94 Civ. 6296, 1998 WL 142346, at *21 (S.D.N.Y. March 26, 1998) (citing Markman, 52 F.3d at 981, 983). The intrinsic evidence reveals that a "product record" may include less than all three elements when it is comprised of a "module identifier," and, under such conditions, will be stored in the knowledge base, or "first memory means". '056 Pat. at col. 17, ll. 7-8; '340 Pat. at col. 5, ll. 59-60. Dr. Kaliski's limiting interpretation, which contradicts the teaching of the intrinsic evidence is rejected. The "product record" is not limited to the "product ID," the "product name" and the "vendor ID," and is not required to contain a "product name," but may contain whatever information
Step 1

The parties dispute the proper construction of Step 1, which provides "creating at least one customer profile for each eligible recipient of said data, said customer profile including a profile of data previously accessed by said customer." The key phrases in dispute are "for each eligible recipient of said data" and "said customer profile including a profile of data previously accessed by said customer."

Amazon asserts that "for each eligible recipient of said data" means "every user that is qualified to receive the data from a plurality of data sources." Amazon relies on two general purpose dictionaries defining "each" and "eligible" as meaning respectively "being one of two or more considered individually; every" and "qualified to be chosen or used." Def. Mem. at 27 (quoting The American Heritage Dictionary of the English Language (4th ed. 2000) and Webster's Third New International Dictionary of the English Language Unabridged (Philip Babcock Gove et al. eds, 1993)). Amazon further contends the phrase "eligible recipient" does not apply to the World Wide Web, but only to subscription-based services, such as cable television. In contrast, Pinpoint asserts claim construction is not required, and challenges Amazon's attempt to distinguish between cable television and the Worldwide Web as in conflict with the patent specification. The court finds the phrase "for each eligible recipient of said data" unambiguous, and claim construction unnecessary. The court is unpersuaded by Amazon's unsupported construction of the claim term "eligible" as excluding the World Wide Web. Indeed, the patent specification indicates otherwise. See Def. Mem. Ex. 1, Col. 51 ("the method of... selecting preferred video programming... may be generalized for use in other types of data retrieval systems... such as the Internet").

Nor is Amazon's proposed construction of "said customer profile including a profile of data previously accessed by said customer" as "the customer profile is based (at least in part) on the degree of content the predetermined characteristics indicated in the profiles of data that the user previously accessed" acceptable. As Pinpoint correctly argues, the language of Claim 43 does not include the phrase "degree of content" or the phrase "predetermined characteristics." Amazon lifts this language from other asserted claims. Compare Def. Mem. Ex. 1, Col. 55, Claim 17 ("said customer profile indicating the customer's preferences for data having predetermined characteristics") and ("said content profiles indicating the degree of content of said predetermined characteristics in data from each data source") with Col. 59 ("said customer profile including a profile of data previously accessed by said customer"). Amazon's proposed construction must therefore fail. Pinpoint's proposed construction is based upon the same construction of "customer profile" accepted by the court. Thus, "said customer profile including a profile of data previously accessed by said customer" is construed as, "the customer profile includes data that describes the significant characteristics of the data previously accessed by the customer."

Program: A sequence of coded instructions that can be loaded into a mechanism such as a computer.

Application Program: A software program that performs substantial useful functions for a user (e.g., electronic mail programming, word processors, spreadsheets, personal calendar programs, games) as opposed to software that primarily controls the allocation and use of computer resources (e.g., memory, display, storage devices, modem).

"program" in the '638 patent

Lexar's proposed construction: the operation of injecting electrons onto the floating gate

Toshiba's proposed construction: -- none --

Pretec's proposed construction: Write
of the memory cell.

Only Lexar and Pretec disagree about the proper construction of "program" in the '638; Toshiba does not propose a construction. Pretec proposes that "program" should simply be construed as "write." Lexar, however, argues that programming is just one part of the write cycle and that the two terms are not synonymous. Lexar relies on the IEEE treatise for its proposed construction, arguing that the IEEE provides the ordinary meaning of the term "program" and that the patent itself provides no indication that a different meaning was intended. The Court agrees with Lexar here.

Both the 1991 and 1998 versions of the IEEE Standard Definitions and Characterization of Floating Gate Semiconductor Arrays indicates that "program" means "the operation of injecting electrons onto the floating gate of the memory cell." The IEEE definition is relevant, then, to the construction of "program" in the '638 patent, the application for which was filed in 1993. Additionally, Lexar relies on Figure 5, which indicates that programming is one part of the write cycle but is not synonymous with "write." The Court agrees with Lexar. Pretec's proposed construction, "write," is incorrect. Column 2, lines 48-52 indicate that in the erase cycle, each bit is programmed and then the bits are erased in a block. This suggests that writing is something different from programming and that Lexar is right. The Court therefore construes "program" as the operation of injecting electrons onto the floating gate of the memory cell.

ii. "program" in the '314 patent

Lexar's proposed construction: the operation of injecting electrons onto the floating gate of the memory cell.

Toshiba's proposed construction: issuing a write command, followed by address and data.

Toshiba has failed to propose a construction for the disputed claim term "program" in the '314. However, Toshiba does propose a construction for the disputed claim term "programming . . . simultaneously." The Court therefore considers "issuing a write command, followed by address and data," the first portion of Toshiba's proposed construction of "programming . . . simultaneously," to be Toshiba's proposed construction for "program" here.

Lexar again urges the Court to adopt the meaning of "program" offered in the IEEE treatise. Toshiba contends that because the '314 contains no discussion of injecting electrons onto floating gates as "programming," the IEEE definition is inapplicable. Toshiba instead proposes that the proper construction is "issuing a write command, followed by address and data." The Court first rejects the "followed by address and data" portion of Toshiba's construction. This excess verbiage is simply unnecessary and the Court declines to include it in the construction. Toshiba's remaining language, "issuing a write command," is, as in the '638, not the proper construction. Claim 1 of the '314 patent discusses programming and Claim 2 discusses writing. If the two processes were synonymous, there would be no need for the two separate claims. Programming is clearly a phase of the larger write cycle. The Court therefore agrees with Lexar and construes "program" as follows: the operation of injecting electrons onto the floating gate of the memory cell.

3. "synchronizing the movements of the spraying device and the conveying device using a stored processing program"

Although both parties propose constructions of this limitation, the limitation itself is not particularly confusing. Indeed, most of the '538 Patent is written in clear and concise language. Inasmuch as "[t]he construction of claims is simply a way of elaborating the normally terse claim language in order to understand and explain, but not to change, the scope of the claims," Embrex, 216 F.3d at 1347, the court sees little necessity for further complicating matters when, as here, the plain language of the claim is relatively straightforward. Nonetheless, both parties present proposed constructions, and the court
Durr asserts that this limitation means "maintaining a specific relationship between the spraying device and the conveying device based upon instructions from a stored processing program." (Durr Opening Br. at 11.) FANUC proposes a much more complex construction of this phrase: "using a stored processing program containing a plurality of individually defined paint-impact points to establish and maintain a pre-programmed position of each of the spraying device's axes for each pre-programmed position of the conveying device." (FANUC Opening Br. at 9.)

n9 FANUC spends much of its claim construction argument on this phrase debating whether the '538 Patent was meant to encompass "Cartesian-Space Control," or merely "Joint-Space Control," as described by FANUC's expert, Dr. Louis Whitcomb. (See FANUC Opening Br. at 13-16.) Such arguments, however, are better asserted at the infringement stage of this litigation. The court does not view them as construing at the claim construction stage.

Durr's proposed construction restates the claim limitation, in simple terms, while remaining generally faithful to the claim language and the specification. The court has already construed "spraying device" and "conveying device," and the court will construe "stored processing program" below. Thus, the only words Which conceivably require construction are "synchronizing," and possibly "using." Durr suggests that synchronizing means "maintaining a specific relationship," but the court finds that this construction is ambiguous. The preferred embodiment, for example, details a process by which the movement of the spraying device and the conveying device are "synchronized and controlled." (538 Patent at 2: 24-25, 29.) Such controlled synchronization involves more than maintaining a specific relationship because it involves a degree of correlation between the two devices. Indeed, in its brief, Durr itself uses "correlated" as synonymous with "synchronized." (Durr Opening Br. at 11.) The court finds that "correlating" is a more understandable and accurate construction of "synchronizing" than is "maintaining a specific relationship."

The court does agree, however, with Durr's construction of the remaining portion of this limitation. The limitation specifies how synchronization occurs by requiring synchronization of the spraying device and the conveying device "using a stored processing program." Durr thus construes this portion of the limitation to mean that the devices are synchronized (or correlated) "based upon instructions from a stored processing program." (Durr Opening Br. at 11.) This construction is consistent with the plain language of the claim and is unobjectionable.

In contrast, FANUC's construction, rather than clarifying the language, further confuses the issue while simultaneously improperly adding limitations to the claim. See Liquid Dynamics Corp. v. Vaughan Co., Inc., 355 F.3d 1361, 1368 (Fed. Cir. 2004) (reversing district court "[b]ecause the plain language of the claim was clear and uncontradicted by anything in the written description or the figures, [and thus] the district court should not have relied upon the written description, the figures, or the prosecution history to add limitations to the claim"). Specifically, FANUC seeks to add limitations found in the preferred embodiment regarding "axes" and "paint impact points." "Not only does FANUC's construction overly complicate what is otherwise a straightforward limitation, it also violates the Federal Circuit's consistent instruction that "unless required by the specification, limitations that do not otherwise appear in the claims should not be imported into the claims." N. American Container, Inc. v. Plastipak Packaging, Inc. 415 F.3d 1335, 1348 (Fed. Cir. 2005) (citing E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed.Cir. 1988) ("Where a specification does not require an extraneous limitation, that limitation should not be read from the specification into the claims."). (emphasis in original)).

Finally, as Durr points out, FANUC's proposed construction would violate the principles of claim differentiation, which "refers to the presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright Flow Control Corp. v. Velan, Inc. 438 F.3d 1374, 1380 (Fed. Cir. 2006); Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005) ("[T]he presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim."). Because FANUC's construction seeks to import would "paint impact points" from Claim 5 into Claim 1, the court will reject it.

For these reasons, the court will adopt Durr's construction, in part, and construe the phrase "synchronizing the movements of the spraying device and the conveying device using a stored processing program" as "correlating the movement of the
spraying device and the conveying device based upon instructions from a stored processing program."

Within this limitation, the parties also debate how "stored processing program" should be construed. Durr contends that it means "a set of instructions stored on a computer," while FANUC argues it means "a program containing a plurality of individually-defined paint impact points for coating workpieces that is placed and retained on an electronic storage medium for later retrieval by a computer." (Am. Joint Claim Construction Chart at 2, FANUC's Ex. 1.)

For the reasons discussed above, the court again reject's FANUC's attempt to import the "paint impact points" into this construction. The court also agrees with Durr that FANUC's construction implies that the data is stored on a device, an electronic storage medium, which is external to a computer. There is no support for this construction in the claim language, and the court will therefore reject it.

While the court is inclined to adopt Durr's construction and construe "stored processing program" as "a set of instructions stored on a computer," this construction fails to construe the meaning of the term "stored," which the parties also debate in connection with later limitations. Durr does not suggest a construction of the term, while FANUC argues it should be construed as "placed and retained." While "retained" is fairly synonymous with the word "stored," adding the term "placed" is redundant and is not necessary for a proper understanding of the word "stored." Thus the court will adopt portions of Durr's proposed construction, slightly modified by FANUC's proposal, and construe "stored processing program" as "a set of instructions retained on a computer."

3411

Means-Plus-Function

GL and FuturePath argue that 432 patent claim 8 is a "means-plus-function" claim subject to the limitations of 35 U.S.C. § 112, P 6 (1994). The statute states:

An element in a claim for a combination may be expressed as a means or step

for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Paragraph 6 was included in the statute to "allow the use of means expressions in patent claims without requiring the patentee to recite in the claims all possible structures that could be used as means in the claimed apparatus." Med. Instrumentation and Diagnostics Corp. v. Elekta AB, 344 F.3d 1205, 1211 (Fed.Cir. 2003) (citing O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1583 (Fed.Cir. 1997)). The Federal Circuit further held, however, that "[t]he price that must be paid for use of that convenience is limitation of the claim to the means specified in the written description and equivalents thereof." Id. Based on that reasoning, GL and FuturePath assert that claim 8 is a means-plus-function claim, that neither the claim itself nor the specifications provide sufficient structure to fulfill the stated functions, and that, therefore, claim 8 and claims dependent thereon are invalid.

First, we must determine whether claim 8 is a means-plus-function claim. The claim reads:

A computer readable medium having program code recorded thereon, for execution on a computer having a graphical user input device, to place a trade order for a commodity on an electronic exchange having an inside market with a highest bid price and a lowest ask price, comprising:

[1] a first program code for setting a preset parameter for the trade order;

[2] a second program code displaying market depth of a commodity, through a dynamic display of a plurality of bids and a plurality of asks in the market for the commodity, including the bid and ask quantities of the commodity, aligned with a static display of prices corresponding thereto, wherein the static display of prices does not move in response to a change in the inside market;
[3] a third program code for displaying an order entry region comprising plurality of areas for receiving commands from the user input device to send trade orders, aligned with the static display of prices, each area corresponding to a price of the static display of prices; and

[4] a fourth program code for receiving a command as a result of a selection of a particular area in the order entry region by a single action of the user input device with a pointer of the user input device positioned over the particular area, to set a plurality of additional parameters for the trade order and send the trade order to the electronic exchange.

'132, Claim 8.

In determining whether a claim falls under the ambit of § 112, P 6, we first look to whether the claim language itself includes the term "means." The Federal Circuit has "made clear that use of the term 'means' is central to the analysis: 'the use of the term 'means' has come to be so closely associated with 'means-plus-function' claiming that it is fair to say that the use of the term 'means' (particularly as used in the phrase 'means for') generally invokes [§ 112, P 6] and that the use of a different formulation generally does not.'" Personaliised Media Communications, LLC v. Int'l Trade Commission, 161 F.3d 696, 703 (Fed.Cir. 1998). Thus, both parties agree that because Claim 8 does not employ the term "means" or "means for," there is a presumption that the claim is not a means-plus-function claim. The presumption can be rebutted, however, if the intrinsic evidence so warrants, and "the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112, P 6." Id., at 704.

GL and FuturePath argue that claim 8 does not provide sufficient structure to remove it from the scope of § 112, P 6, regardless of the fact that the claim language does not include the term "means." Specifically, they argue that the claim asserts four functions, and that the term "program code" is insufficient to provide accompanying structure through which to perform the stated functions. We agree that claim 8 provides four functions, or outcomes. We disagree, however, that "program code" is insufficient to provide sufficient structure.

In determining whether a claim provides sufficient structure to remove it from § 112, P 6, the Federal Circuit has not required the claim term to set forth a specific structure. Rather, "it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function." Lighting Worldling, v. Birchwood Lighting, Inc., 382 F.3d 1354, 1359-60 (Fed.Cir. 2004). The term "code," with regard to computer technology, is defined as: "In software engineering, computer instructions and data definitions expressed in a programming language or in a form output by an assembler, compiler, or other translator." THE NEW IEEE STANDARD DICTIONARY OF ELECTRICAL AND ELECTRONICS TERMS, FIFTH ED. (1993). Such a definition is not a 'generic structural term such as 'means,' 'element,' or 'device'; nor is it a coined term lacking a clear meaning, such as 'widget' or 'ram-a-frain.'" Personalized Media Communications, 161 F.3d at 704 (finding that "digital detector" was sufficient structure to remove a claim from § 112, P 6). See also Affymetrix, Inc. v. Hyseq, Inc., 132 F. Supp. 2d 1212, 1231-32 (N.D.Cal.2001) (finding that "computer code" recited a sufficient structure, understood by one skilled in the art, to be able to accomplish the stated functions); Harmonic Design, Inc. v. Hunter Douglas Inc., 88 F. Supp. 2d 1102, 1105 (C.D.Cal.2000) (finding that "electronic circuit" recited sufficient structure). We turn to the recent case of Massachusetts Institute of Technology and Electronics For Imaging, Inc. v. Abacus Software, 462 F.3d 1344, 2006 U.S. App. LEXIS 23281, 2006 WL 2613439 (Fed.Cir. 2006) for analysis assistance. There, the Federal Circuit, in analyzing claim language of two claims, neither of which employed the term "means," determined that one should be viewed as a means-plus-function claim and the other should not. First, the court determined that the term "colorant selection mechanism" invoked § 112, P 6 because "mechanism" was used synonymously with means, "colorant selection" was defined in neither a dictionary nor the specification, and there was no indication that "colorant selection" had a generally understood meaning. 462 F.3d 1344, [WL] at *7-8. In contrast, the court found that "aesthetic correction circuitry" did not fall within the ambit of § 112, P 6. The court noted that dictionary definitions establish that the term "circuitry," by itself, connotes structure, pointing to, for example, Linear Tech. Corp. v. Imnala Linear Com., 379 F.3d 1311, 1320 (Fed.Cir. 2004), which relied on the Dictionary of Computing's definition of "circuit" as "the combination of a number of electrical devices and conductors that, when interconnected to form a conducting path, fulfill some desired function." The definition of "code," noted above, places "program code" in a category more analogous to the court's analysis of "aesthetic correction circuitry," than "colorant selection mechanism." See also WEBSTER'S II NEW COLLEGE DICTIONARY 2001, 216 (defining "code" with respect to computer science as "A set of symbols and rules used to represent instructions to a computer").
CL's and FuturePath's use of Altiris, Inc. v. Symantec Corp., 318 F.3d 1363 (Fed. Cir. 2003), is of no assistance to their argument in this case. In Altiris, the claim included the language "means of," and therefore the court began with the presumption of means-plus-function. Such is not the case here. Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206 (Fed. Cir. 1998), can be distinguished as well. In Mas-Hamilton, the Federal Circuit affirmed a district court's reading of means-plus-function into a claim for a "lever moving element," even where the claim did not utilize the term "means " The Mas-Hamilton court found it persuasive that LaGard could not point to any evidence demonstrating that the term "lever moving element" was reasonably well understood in the art. 156 F.3d at 1214. Such is not the case here. In addition to the case law discussed above, plaintiff pointed us to the Manual of Patent Examining Procedure (U.S. Dep't of Commerce, MANUAL OF PATENT EXAMINING PROCEDURE, (8th ed. 2001, rev. Oct. 2005)), wherein the guidelines indicate that "a claimed computer-readable medium encoded with a data structure defines structural and functional interrelationships between the data structure and the computer software and hardware components which permit the data structure's functionality to be realized, and is thus statutory." n8 Although the guidelines are not binding, they do provide some evidence that computer-readable mediums, such as the one claimed in claim 8, are known in the art to include a structural component.

n8 Defendants GL and FuturePath argue that the MPEP only allows for the patenting of computer systems where a specific data structure is coupled with a computer-readable medium. We agree, but find that "program code" provides sufficient structure for the reasons stated herein.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

Defendants GL and FuturePath argue that the fact that the patent's inventors admit that they struggled for over two years to reduce the invention to practice "makes abundantly clear that the 'program code...' limitations in the context of the '132 Patent, do not use simple, off-the-shelf programs that one skilled in the art can readily implement without undue experimentation" (defs' reply at 5). We do not buy such an argument. Here, defendants' allegedly infringing products have managed to create systems that seemingly realize the functions stated in claim 8 - set preset parameters, display market depth, display an order entry region, and receive a single action command. While we make no determination of infringement, it seems to us that the inventors or developers of defendants' products, all of whom are reasonably skilled in the art, were either able to develop plaintiff's (or another's) program codes, or develop their own. Thus, either plaintiff supplied sufficient structure to develop its claimed program codes or one reasonably skilled in the art was able to develop the codes independently. Either way, plaintiff wins this argument.

Because we begin with the presumption that claim 8 is not a means-plus-function claim, and because defendants GL and FuturePath have failed to rebut that presumption, we find that claim 8 does not come within the ambit of § 112, P 6.

3412

3. "programmable controller"
The parties' third dispute concerns the clause "programmable controller." This clause appears in Claims 1 and 22 of the '134 Patent and Claim 7 of the '512 Patent. The specification of each patent is nearly silent as to the meaning of the clause. The specification of each patent simply states:
A programmable controller 208 is provided to control all of the various operations of the ball-throwing machine. A particularly preferred controller is the MultiPro+ MC controller, manufactured by Control Technology, Inc.

'134 Patent, col. 10, ll. 50-54 (emphasis in original); '512 Patent, col. 10, ll. 59-64 (emphasis in original).

In the JACC, ProBatter declines to propose a construction for the clause, because it argues that "programmable controller' is a well understood term ... and the plain meaning of the clause is clear . . . . " JACC (docket no. 174), at 7. Joyner argues that the court should construe "programmable controller" as "a control device, normally used in industrial control applications, that employs the hardware architecture of a computer and a relay ladder diagram language [and also] known as a programmable logic controller [("PLC")]. Id. Joyner avers that "[p]rogrammable controllers are different than cam timers and microcontrollers, but equivalent to desktop computers." Id.
At the Hearing, the nature and extent of the parties' dispute became less clear. On the one hand, ProBatter argued that Joyner's proposed construction of "programmable controller" as including a PLC was wrong, because the specification of each patent proves that a "programmable controller" is not a PLC. Specifically, ProBatter claimed that the MultiPro+ MC controller is not a PLC and, therefore, a "programmable controller" is not a PLC. ProBatter argued that the MultiPro+ MC controller is not a PLC, because its specification makes clear that it has a central processing unit ("CPU") like a computer and is, in essence, a computer. See ProBatter's Ex. FF (docket no. 159-7), at 1 (reflecting that the MultiPro+ MC controller has a "CPU").

On the other hand, notwithstanding its original position that "programmable controller" need not be construed, ProBatter indicated that it would be "fine" if the court construed the term. ProBatter argued that the court should accept a definition in the McGraw-Hill Dictionary of Scientific and Technical Terms ("SciTech Dictionary")--extrinsic evidence that Joyner relied upon in the briefing. In pertinent part, the SciTech Dictionary states:

- programmatic controller . . . A control device, normally used in industrial control applications, that employs the hardware architecture of a computer and a relay ladder diagram language. Also known as programmable logic controller.
- programmable controllers . . . Electronic computers that are used for the control of machines and manufacturing processes through the implementation of specific functions such as logic, sequencing, timing, counting, and arithmetic. They are also known as programmable logic controllers (PLCs).

Accordingly, the court shall construe "programmable controller" as set forth above in the SciTech Dictionary, because it appears the parties do not dispute the accuracy of the SciTech Dictionary definition or the appropriate use of the same. 13 Although the construction is admittedly based upon extrinsic evidence, the court shall enforce the parties' concessions.

13 The court notes that, in addition to stating that a programmable controller is also known as a PLC, the SciTech Dictionary also states that "[m]icroprocessors used in programmable controllers are similar or the same as those used in personal computers." Ex. GG (docket no. 159-8), at 1. This undercuts ProBatter's argument at the Hearing that the presence of a CPU in the MultiPro+ MC controller somehow proves that such controller is not a PLC.
4. "Switch"

The district court interpreted the term "switch" in as a device that opens or closes a circuit to form a direct path between inputs and outputs. The district court adopted this narrow interpretation at the behest of Raritan, without explanation. In the art of networking, the ordinary meaning of the term "switch" is "a device capable of forwarding packets directly to the ports associated with particular network addresses." Microsoft Computer Dictionary, (4th ed. 1999). According to the written description of the patents in suit, a signal conditioning unit receives mouse and keyboard signals from a workstation. The signal conditioning unit generates a serial data packet and sends the mouse/keyboard packet to a central crosspoint switch. The central crosspoint switch routes the data packet to another signal conditioning unit coupled to the remote server that decodes the mouse/keyboard packet. '176 patent, col 1, ll. 54-64. The written description discloses one embodiment of this "crosspoint switch" or "programmable switch." Id. at col. 6, ll. 15-61. This switch includes a master CPU and a number of input and output cards for transmitting and receiving signals. The written description does not limit the term switch to a device that opens or closes a circuit to form a direct path. Nothing was identified in the prosecution history to suggest this direct path. Thus, properly construed, a "programmable switch" or "crosspoint switch" is a programmable device capable of forwarding packets from one computer/workstation/server to another. Therefore, we reverse the district court's claim construction of the term "switch."

15. "programmatic elements for…" (702 patent)

<table>
<thead>
<tr>
<th>S&amp;N's Proposed Construction</th>
<th>Arthrex's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternatively, &quot;programmatic elements&quot; means &quot;computer readable instructions to perform a function, task or step&quot;</td>
<td>Function: Combining advertising related information with service related information to obtain a resulting combination that is in a format: (a) acceptable for being transmitted on the network by the SPNAN to at least the first user, and (b) processed by the first network accessible node so that, as a consequence of such processing, a display of an advertising presentation corresponding to said advertising information is provided on said first network accessible node.</td>
</tr>
</tbody>
</table>

The parties' primary dispute with respect to this term is whether it should be construed as a means-plus-function limitation under § 112, P 6. Beneficial argues that because the claim element does not use the word "means," there is a rebuttable presumption that § 112, P 6 does not apply. Beneficial argues that the presumption cannot be overcome because the phrase "programmatic elements" is a claim term that recites a sufficient structure and the term has a well understood meaning in the art. Defendants argue that the "programmatic elements…" limitation should be construed under § 112, P 6. Defendants generally argue that a limitation that does not recite the term "means" can still be construed as a means-plus-function limitation if it can be shown that the claim term fails to recite sufficiently definite structure or else recites function without reciting sufficient structure for performing that function. Defendants argue that generic or software-related terms do not connote sufficient structure. Defendants argue that the phrase "programmatic elements" does not recite sufficiently definite structure, does not appear anywhere in the specification of the '702 patent, and does not have a generally understood meaning to a person of ordinary skill in the art. Defendants further argue that the generic words "elements" and "programmatic" do not convey sufficient structure. Defendants argue that this limitation should be construed as a means-plus-function limitation. However, Defendants argue that the specification does not recite sufficient structure for performing...
the claimed function -- it does not describe any specific algorithm for combining advertising related information with service related information to obtain a resulting combination. Thus, Defendants argue that the claim term is indefinite.

The Court finds that, because the claim element "programmatic elements" does not use the word "means," there is a rebuttable presumption that § 112, ¶ 6 does not apply. MIT, 462 F.3d at 1353-54. The Court finds that the Defendants have not met their burden to rebut the presumption. The Federal Circuit has indicated that the generic term "element" typically does not connotate sufficiently definite structure. See id. ("The generic terms 'mechanism,' 'means,' 'element,' and 'device,' typically do not connote sufficiently definite structure.") However, in this case, the Court finds that one of ordinary skill in the art would understand the term "programmatic elements" to recite sufficient structure and to have a reasonably well understood meaning to one of skill in the art. The Court finds that Beneficial has provided a dictionary definition for the term "programmatic" as "of, relating to, or having a program" and "program" as "a set of coded instructions that enables a machine, especially a computer, to perform a desired sequence of operations." The Court also finds that Beneficial has provided a dictionary definition for the term "program element" as "part of a central computer system that carries out the instruction sequence scheduled by the programmer." The Court finds that the term "programmatic elements" is not "simply a nonce word or a verbal construct that is not recognized as the name of structure." See Lighting World, 382 F.3d at 1359-60.

Here, technical dictionaries supply ample evidence that the claim term designates structure. Other courts have also found that computer code or program code provides sufficient structure. See Affymetrix, Inc. v. Hyseq, Inc., 132 F. Supp. 2d 1212, 1232 (N.D. Cal. 2002) ("The Court finds that 'computer code' is not a generic term, but rather recites structure that is understood by those of skill in the art to be a type of device for accomplishing the stated functions."); Trading Technologies Intern., Inc. v. eSpeed, Inc., 2006 U.S. Dist. LEXIS 80153, 2006 WL 3147697, *11-13 (N.D. Ill. 2006) (finding "program code" to not be a generic term and to have sufficient structure); Aloft Media, LLC v. Adobe Systems Inc., 570 F. Supp. 2d 887, 894-96 (E.D. Tex. 2008) (finding that the "computer code" elements referenced by the "wherein" clauses showing operation of the code recite sufficiently definite structure to avoid § 112, ¶6). Further, the term "program element" is recited in another limitation of claim 53 without any implications of a means-plus-function limitation, implying that the terms "program element" and "programmatic element" should not be construed under § 112, ¶ 6. The Court notes that the Defendants have not provided an alternative construction, and have not argued against Beneficial's proposed construction, if the term is not construed under § 112, ¶ 6. Thus, the Court construes the term "programmatic elements" to mean "computer readable instructions to perform a specific function."

Finally, the parties dispute whether a "programmed digital computer" must process measurement data. Consistent with its interpretation of the altering step, the court construes "programmed" to mean programmed with algorithms which process the lip position data and control point data, resulting in data representing the new pixel configuration of the altered first facial display.

The plain and ordinary meaning of the term "programmed channel signal" includes any video signal carried by a channel. A "programmed channel" would be understood by a person of ordinary skill in the art to be a cable channel or network such as CNN and MTV. Additionally, it is an inherent limitation of the claim that the programmed channel signal must include time slots for local advertising insertion; otherwise, there would be no need for switching between the programmed channel signal and the commercial insert signal. Because programmed channel signals typically include cue tones to signal upcoming local avails, a person of ordinary skill in the art would so understand the term "programmed channel signal" to include this limitation.

Defendants argue that the programmed channel must be "received and monitored at a remote Control Center." SeaChange and the Cox Companies' Markman Br. on the Interpretation of Disputed Claim Language, at 12 (emphasis deleted). This limitation does not properly belong in the definition of programmed channel signal.
5. "Programmed response mode." Used in Claim 1(c).

E-Watch now argues that this term means "the server receives and logs the surveillance sensor appliance data in a pre-programmed response to a condition, situation, or event." March Networks suggests "the sensor appliance responds to the event in a mode of operation established by the server."

E-Watch's construction has the phrase modifying what the server does. But what is claimed is "a surveillance sensor appliance," not a server. The parties have previously agreed that the claim is for a system "comprising a plurality of sensor appliances [which are connected] to a network based server. . . ." There is no basis in the specification to adopt a grammatically strained construction of Claim 1(c), in which "programmed response mode" does modify "server" rather than "surveillance sensor appliance."

The plain language of the claim states that the appliance monitors an area, and generates a signal indicating a condition in the area. This monitoring and generation of a signal is described as being in a "programmed response mode controlled by the server." The appliance may respond automatically to certain conditions or events, if programmed or instructed to do so by the server. See '183 patent, col. 4, ll. 21-22 (a server may provide "auto response generation.").

The appliance, such as a wireless camera, can send data to the monitoring station, "continuously, periodically as programmed, or upon event detection. . . ." '183 patent col. 17, 11.14-17. Again, it is the appliance responding either automatically in accordance with prior instructions from the server, or reacting as an event occurs, in compliance with instructions from the server. See '183 patent, col. 30, ll. 58-61; '183 patent, col. 37, ll. 22-27.

March Network's argument was in accord with this interpretation. Tr. p. 53, p. 54, ll. 14-16. E-Watch agreed that this was one way to interpret the claim. Tr. p. 46, ll. 21-23. E-Watch wanted to emphasize that the server was controlling the programmed response mode, but that is already in other language of the claim. The court therefore defines the term as follows:

"Programmed response mode" means "the surveillance sensor appliance responds to the condition in accordance with predetermined instructions which are, or previously have been, received from the server."

5. "Programmed with Information to Simulate the Natural Motion of Gestures" ('053 patent, claim 20)

The fifth phrase in dispute is "programmed with information to simulate the natural motion of gestures." Plaintiff's proposed construction is "to include information in a motion which makes the motion appear more realistic." Defendant's proposed construction is "encoded with procedures that define normal body movements."

Plaintiff's principal objection is to the word "procedures" in defendant's construction because, as plaintiff's expert Dr. Badler testified, the word "procedures' is narrow," and "doesn't particularly explain how to simulate the natural motion of gestures." See Tr. at 82; see also Tr. at 87. But defendant's use of the word "procedures" is supported by the '053 specification, which states that "[t]he present invention uses the procedural texture synthesis approach to control limb motion," '053 patent at 2:39-40 (emphasis added), as well as by Dr. Perlin's deposition testimony, where Dr. Perlin stated that "[t]here are procedures involved which define component movements, and there are other procedures which combine those component movements to make what I call composite movements," "[a]nd together the whole conglomeration expresses human body movement," Perlin Dep. at 271-73 (emphasis added). Further, the Court credits Dr. Booth's testimony that someone skilled in the art of computer animation at the time of the patent would have understood the claim at issue to entail "procedural animation" and would have understood defendant's construction to be a "normal use" of the term "procedures." See Tr. at 136-37.
n3 With respect to the word "normal" in defendant's construction, the word "realistic" in plaintiff's construction, and the word "natural" in the '053 patent itself, the Court finds (and the parties essentially agreed) that there is no material difference between these terms. See Tr. at 92, 187.

Accordingly, the Court hereby adopts defendant's construction of "programmed with information to simulate the natural motion of gestures."

The parties next dispute Step 4 of Claim 10. This step reads:

programming said dispensers by means of electronic instructional signals transmitted from a central location, said programming including value information to be borne by said token, said step of programming occurring subsequent to exposure of individuals to said stimulus, and prior to an individual requesting the dispensing of a token through entry of a command in said dispenser,

VTB argues that it does not program "dispensers" i.e. customers' printers, and that there is no programming "subsequent to exposure of the individuals to said stimulus." See Defendant's Reply in Further Support of its Motion for Summary Judgment ("Def. Reply") at 4. AI asserts that when VTB's customers select the hyperlink "Print this coupon" using their Internet browsers, they activate a "javascript:window.print()" function and cause the browsers' printing functions to activate and print the factory tour coupon. See Pl. Opp'n at 6; Print-out of Javascript Commands for Coupon Web Page ("Javascript"), Ex. 3 to Qualey Decl.

Neither the '874 patent nor the parties explicitly define the term "programming." The Academic Press Dictionary of Science and Technology defines "programming" as "a general term for the process of designing, coding, and testing programs for carrying out operations on a computer." Id. (1992). The dictionary definition is adopted and the term "programming" means "the process of designing, coding, and testing programs for carrying out operations on a computer." Nothing in the specification of the '874 patent contradicts this construction.

1. "programming" ('181 patent, claim 1, '664 patent, claims 1 and 3, '768 patent, claims 1 and 19)

While both sides are agreed that the term "programming" as used in the claims here in issue refers to a data stream containing signals, defendants argue that it specifically here refers, more narrowly, to a single integrated data stream that contains a video signal, an audio signal and one or more URLs, while plaintiffs argue that it refers, more broadly, to a data stream containing video signals, audio signals, and/or uniform resource locators, with no requirement that all the signals be contained in a single data stream. Plaintiffs' reading is the more natural one, and there is nothing in the function or structure of the patents that compels defendants' definition; on the contrary, such a construction would exclude the embodiment shown in Figure 4 of the '664 and '768 patents and described in the specification, as well as the means for receiving at the user's end as shown in Figure 2 and described in all of the patents in dispute. Accordingly, the Court rejects defendants' definition, see Dow Chemical v. Sumitomo Chemical Co. 257 F.3d 1364, 1378 (it is "well established that a claim construction that excludes a preferred embodiment is 'rarely, if ever, correct.'") (citation omitted), and accepts plaintiffs'.

"programming mode"
The invention has two modes: a "programming mode" and a "menu choice selection mode." '717 patent, 2:23-25. A mode selector allows the operator to choose between the two modes. '717 patent, claim 1. The parties dispute the meaning of the term "programming mode" as used repeatedly in claim 1 and throughout the '717 patent claims.

Merit construes this phrase as "a mode in which selectable game menu items are chosen." Pl.'s Suppl. Br. at 11. Once again, JVL proposes a lengthier construction, suggesting that "programming mode" is "a mode in which video game menu options, which appear on a display, are selected to be video game menu choices, which appear simultaneously on the same display as the video game menu options." Def.'s Presentation, '717 patent at 19.

The primary dispute is whether the video game menu options and video game menu choices must be displayed simultaneously. According to JVL, the intrinsic evidence demonstrates that they must. The specification distinguishes the "simultaneous display of video game menu options and video game menu choices on the video screen when the mode selector is in the programming mode," from the display of only "video game menu choices when the mode selector is in the menu choice selection mode." '717 patent at 2:28-31. The brief description of Figure 2 contained in the '717 patent explains that menu options are selected by the operator in the programming mode. '717 patent at 4:8-9.

The prosecution history also lends support for JVL's interpretation. During reexamination, Merit distinguished the '717 patent from a piece of prior art called the Super Duper Casino. At the time, Merit argued the Super Duper Casino's manual "does not suggest that a display controller simultaneously displays "video game menu options" and "video game menu choices" on a video display when a mode selector is in a programming mode." JVL's Supplemental Claim Construction Brief, Ex. E at 15 ("Def.'s Suppl. Br.") (emphasis in original). Merit's invention does.

Though the display controller does cause "a simultaneous display of video game menu options and video game menu choices on the video screen when the mode selector is in the programming mode," this is not sufficient reason to construe "programming mode" as JVL suggests. The language that JVL relies on describes what a display controller does. It is not meant to describe the meaning of "programming mode." Nothing in limitation (a) of claim 1, which describes what the programming mode does, indicates that the display of options and choices must be simultaneous. Similarly, claim 13 which describes selecting video game menu options in the programming mode does not describe video game menu options and video game menu choices as being displayed simultaneously. Indeed, the specification explains that in one embodiment of the programming mode, selected menu options are deleted from the first region of the display when placed in the designated video game menu choice location. '717 patent at 2:19-28. Thus, the video game menu options and choices are not always displayed simultaneously.

"Programming mode" is construed as "a mode in which video game menu options are selected to be video game menu choices."

2. "Progressive prize"

Both patents claim "a method of awarding one progressive prize from a plurality of progressive prizes . . . . " '215 Patent at 8:49-51; '603 Patent at 8:10-11. The specification does not define "progressive prize", but the plain meaning of "progressive" and the disclosure in the specification suggest that the prize increases according to some criteria. The '215 Patent abstract, for example, states that "the jackpot controller is arranged to receive each of the machine operation signals and to increment the value of a random jackpot prize on the occurrence of each of these operation signals." The parties agree that the prize should be increased based on some criteria, but disagree as to whether the prize must be paid from a "pool." The parties propose the following constructions of "progressive prize":

<table>
<thead>
<tr>
<th>Term or Language Requiring Construction</th>
<th>Aristocrat's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;progressive prize&quot;</td>
<td>a prize that increases based on some criteria (i.e., time, games played, marketing money, coin</td>
</tr>
</tbody>
</table>
IGT points to the following language from the "Summary of the Invention" where the patent describes a "fifth aspect" of the invention:

such that the progressive feature jackpot is implemented using a central feature jackpot system connected to the network to provide an incrementing jackpot pool which increases in response to signals from the connected consoles, and the feature jackpot game on each machine awards a jackpot drawn from the jackpot pool.

'215 Patent at 3:19-24. The preferred embodiments also use the term "pool" to describe the jackpot system, stating that "the machine contributions go into the prize pool as with known prior art jackpot systems, while the overhead display shows the incrementing prize value." Id. at 5:64-67; '603 Patent at 5:24-27. Finally, IGT offers the testimony of Scott Olive ("Olive"), the inventor, that a progressive jackpot, understood by one skilled in the art, uses a system of networked gaming machines that share the same bonus pool. Def.'s Claim Construction Brief 3:7-14 (hereinafter "IGT CC"). Olive gives an example top prize, called a "Grand Progressive" which was a "fixed prize" of $50,000 or two motorbikes. Id. Aristocrat responds that the claims themselves nowhere require that the prize come from a pool, and that Claim 1's requirement that the machine award "one progressive prize from a plurality of progressive prizes" indicates that the progressive prize need not come from a pool. Pls.' Reply Claim Construction Brief 5 (hereinafter "Reply CC").

The parties seem to have different understandings of the term "pool." In including "pool" in its construction, IGT seems to require that the prize amount is paid into by each of the networked machines and can also be paid out to any of them. Aristocrat, on the other hand, appears to suggest that a pool has contents of similar type (and therefore, according to Aristocrat, a plurality of progressive prizes, some of which may be supplemented by other sources, are not in a "pool"). The abstract of the '215 Patent supports what appears to be IGT's construction:

Each of the electronic gaming machines are provided with a network interface arranged to provide a signal onto the network on each occurrence of an operation of a respective machine and the jackpot controller is arranged to receive each of the machine operation signals and to increment the value of a random jackpot prize on the occurrence of each of these operation signals.

'215 Patent abstract. In fact, the reason the gaming machines are networked appears primarily to be to allow the prize to be increased by operation signals from each machine, and to be paid out to any of the networked machines. The court finds that the term "pool" relates to but inadequately captures this idea. Therefore, the court construes the term "progressive prize" to mean "a prize amount or value that increases based, at least in part, upon contributions from networked gaming machines."
counter that undue emphasis should not be placed on the article "a," as Claim 11's references to "a progressive prize" in the preamble and Step (B) mutate into "the progressive prize" in Step (G). However, the term that we are called upon to construe is that attached to the total wager amount determined in Step (B). While the use of "the" in Step (G) may shed some light on its meaning in other steps, it does not negate any inferences contained in the prior uses of "a." As argued by Plaintiff, the use of "the" indicates that Step (G) is merely referring to the progressive prize described in Step (B), not that the prize must be singular. We adopt that reasoning as the most plausible interpretation of the use of different articles modifying "progressive prize" in Claim 11, and focus our construction on the use of the open-ended "a" in Step (B).

Second, there are several references to multiple progressive prizes in the specification. (See, '460 Patent, col. 4 throughout.) Indeed, in a discussion of the Free Play apparatus, the preferred embodiment provides a selection button to choose from multiple prizes. (Id. col. 15:63 - col. 16: 2.) The specification even allows for more than one winner for a prize. (Id. col. 4:36-38.)

In her argument against a singular limitation, Plaintiff suggests that a prize could be a valuable object plus a variable monetary amount, or a choice between different prizes. While the specification's references to multiple prizes and winners stop short of expressly providing for the possibility of multiple prizes attaching to a particular total wager amount or a handle pull, we have not found any language in the specification that would rule out this possibility. Thus, we find no basis to limit the meaning of "a progressive prize" to a singular prize.

In addition, we do not find sufficient basis at this time to limit the meaning of "increment value" to the "difference between the prize's starting value and the prize's current value." Although Defendants argued for such a limitation in their briefing, they did not so argue at the hearing, and the succinct arguments in their brief were not persuasive, as they primarily relied on expert testimony merely claiming that the ordinary meaning was such. In addition, it is not obvious that Defendants' proposal is easily reconciled with the specification's definition and usage of "increment value." The specification's definition, although less than crystal clear, does provide that "the increment value is the result of multiplying the value of the wagers made by a contribution percentage." ('460 Patent, col. 7:51-53.) In addition, the specification describes the use of a "prior increment value" within the equation for calculating current prize values. (Id. at col. 19:18-38.) In that equation, the prior increment value is added to the minimum prize amount, and that sum is added to a figure that is the result of the multiplication of accumulated wagers with a particular exchange rate, increment percent, and surcharge percent. (Id.) The multiplied portion of the equation appears to be a more detailed version of "the result of multiplying the value of the wagers made by a contribution percent," put forth as the definition of the increment value in the specification as described above. While these equations from the specification may be compatible with Defendants' proposed definition of increment value, without more compelling evidence in support of how they are compatible, we are not persuaded that it should be adopted as a limitation.

Therefore we adopt the definition of progressive prize put forth in the specification at col. 7:50-53, without any of the limitations proposed by defendants.

I. Project Manager

The Plaintiff argues that this term should be construed as "an individual or entity assigned to carry out and be responsible for construction of all or a specified portion of a project," if a construction is necessary. The Defendants propose the construction "the contractor who is responsible for the methods and sequences of construction processes, and for the pavement construction material mixture meeting specifications." This term is found in claims one and thirteen.

While the Defendants argue that this disputed phrase has a specific meaning in the context of the patent, they also concede that the patent does not provide an express definition of this term. The Defendants argue that only contractors perform "quality control" in the context of this patent (an argument rejected above) and that they are responsible for "keeping material processes within specifications." Although it is true that one of the benefits of the patent is described as allowing quality control, the patent never links quality control performance to the project manager beyond his role in the claims or in receiving an email for viewing the final report online. The patent also never limits quality control to a contractor, as discussed above, so the Defendants cannot limit the project manager to a contractor through his supposed role in quality
The Plaintiff cites to a Construction Dictionary and a treatise on Construction Project Administration in support of its definition. These sources, however, depict the project manager as an individual, not as "an individual or entity" as the Plaintiff suggests. The ordinary meaning of the term as it would be to one of ordinary skill in the art is plain with the support of these technical resources.

**Construction:** An individual assigned to carry out and be responsible for construction of all or a specified portion of a project.

3426

C. Projection Format Information (Claims 1, 3, 11, 13)

HP contends that the term means "information sufficient to reproduce later the same view of a 3D model, such as data representing, but not limited to, the orientation, distance, and view angle with respect to the 3D model." In contrast, Intergraph proposes that the term means "data that represents the orientation, near depth, far depth, distance and view angle, of the viewer with respect to the 3D model."

HP's proposed construction attempts to take into account that there are numerous methods available to generate a projection of a 3D model into a 2D view. HP states that two of the most well known methods of projection include "parallel" and "perspective," and each method requires different data or information. HP argues that the '241 patent does not limit the types of projections (and thus information) that can be used to generate its 2D drawings. See '241 patent, col. 6:33-57.

Intergraph's proposed construction purportedly reflects that in order to reproduce a certain view, it is necessary for the projection information to include the "orientation" and "view angle" with respect to the 3D model. Intergraph states that in certain other projections, other data, such as distance, near depth, and far depth will be required. Therefore, Intergraph's proposed construction attempts to encompass the projection information needed for any possible projection. 2

--- Footnotes ---

2 As noted by HP, Intergraph's argument here seems self-defeating. Intergraph states that in order to reproduce a view, only the "orientation and view angle" are necessary. Intergraph also states that such data as "distance, near depth, and far depth" will be required in certain other projections. If Intergraph is correct, and the "orientation and view angle" are the only information necessary to reproduce a certain view, then Intergraph's proposed construction which include information such as "distance, near depth, and far depth" is clearly too broad.

--- End Footnotes ---

The problem with Intergraph's proposed construction is quite clear. While Intergraph's proposed construction attempts to encompass the projection format information required for each possible type of projection, the '241 Patent does not require one particular type of projection. The "exemplary embodiment" of the '241 Patent states that project format information needed for each type of view will be different. See '241 Patent, col. 6:33-57. Accordingly, it would be a mistake for the Court to limit the term "project formation information" to any particular set of parameters. The Court construes "projection data information" as the data necessary to permit a particular 2D representation of a 3D model to be reproduced.

3427

4. "projector means connected to said one or more computers for receiving and projecting said screen video displays onto said display screen" (claim 1)

PolyVision's proposed construction

Smart's proposed construction
An LCD projector panel projected by an overhead projector.
A projector that receives screen video displays from one or more computers and projects the screen video displays onto a display screen, and structural equivalents thereof.

The term at issue is "projector means," although it is unclear whether the parties disagree over the construction of this term. In the chart attached to its claim construction brief, PolyVision stated that the parties were in agreement regarding the construction of this limitation, although the parties' Markman hearing materials addressed this claim term. There is no dispute that this is a means-plus-function limitation and that the specification must be consulted to determine the structure.

The specification discloses that:

An overhead projector 7 is oriented so as to project an image onto the surface of touch-sensitive screen 1. The image is generated by means of LCD projector panel 9 which is connected to the graphics output of the personal computer 5.

(Col. 3, ll. 40-44.) This configuration is shown in Fig. 1, with the LCD projector panel placed on top of the overhead projector. The specification also states that an integrated unit, with the LCD panel incorporated into the projector, would also be within the scope of the claim. (Col. 15, ll. 12-15.) Accordingly, this term is properly construed to mean a structure formed from an overhead projector and a separate LCD panel, an integrated overhead projector/LCD panel unit, and structural equivalents thereof.

4.

Paymentech correctly observes that the patent specifications contain numerous references to the Telepay system. However, while claims must be interpreted in light of the specifications, not everything expressed in the specifications must be read into the claims. See Watson & Chalin Manufacturing, Inc. v. Boler Co., 227 F. Supp.2d 633, 640 (E.D. Tex. 2002), citing E.I. du Pont de Nemours & Co. v. Phillips Petroleum, 849 F.2d 1430, 1433 (Fed. Cir.), cert. denied, 109 S. Ct. 542, 488 U.S. 986, 102 L. Ed. 2d 572 (1988). This is especially true where, as here, the specifications provide that "the embodiments shown herein are intended to illustrate rather than to limit the invention[.]" (Plf. App., Exh. 1 at 16 & Exh. 3 at 42). The court therefore concludes that the definitions of "prompting," "accessing," and "determining" should not be limited to actions performed by any particular person, entity, or device, including the payee's agent's system.

Having resolved this issue, the parties are able to agree on the definitions of two of the three disputed claim terms. BMC and Paymentech both agree that "accessing" means "connecting to." (Def. Resp. Br. at 6; Plf. Reply Br. at 7). The parties also agree that "determining" means "coming to a decision." (Def. Op. Br. at 6; Plf. Op. Br. at 2). Those definitions are consistent with the ordinary and customary meanings of the terms and should be accepted by the court.

The parties disagree as to the meaning of "prompting." Paymentech suggests a definition of "inducing to action." (Def. Op. Br. at 14). BMC argues that the term means "urging or suggesting that information be input." (Plf. Op. Br. at 13). The court declines to adopt the construction proposed by either party. The dictionary defines "prompting" as "causing someone to do something." THE WORLD BOOK DICTIONARY at 1666 (1996). That definition also is consistent with claim language, which describes:

A method of paying bills using a telephone connectable to at least one remote payment card network via a payee's agent's system, wherein a caller places a call using said telephone to initiate a spontaneous payment transaction that does not require pre-registration, to a payee, the method comprising the steps of:
The court should construe the term "prompting" to mean "causing someone to do something."
Accordingly, the Court construes "prompting said first application server" as follows:

"giving a cue to a server running the service application"

1. Determining geographic coordinates corresponding to the property identification data.

The first disputed phrase appears in the 326 patent and is "determining geographic coordinates corresponding to the property identification data." The parties agree that "geographic coordinates" means "latitude and longitude or other coordinate set that defines the position of the property on the earth's surface." The dispute concerns the term "determining.

The plaintiff suggests that the term needs no construction. Alternatively, the plaintiff suggests that the term means "identifying." The defendants contend that the term "determining" means "converting" such that the phrase means "converting" the received property identification data into geographic coordinates. The court rejects the defendants' position. As the plaintiff points out, in other portions of the defendants' brief, the defendants define "determining" synonymously with "identifying." The court agrees with the plaintiff's alternate construction and construes the term "determining" to mean "identifying."

The parties also dispute the meaning of "property identification data." The plaintiff proposes it means "street address, legal address, metes and bounds, latitude and longitude, or the like." The defendants propose that the term means "street address, legal address, or metes and bounds." Contrary to the defendants' arguments, the patent specification does not restrict the term to the examples stated therein. As such, the court construes the term "property identification data" to mean "street address, legal address, metes and bounds, latitude and longitude, or the like."

3. "generating a signal proportionate to the denomination of each validated bill"

Tidel proposes the term means "creating a communication that indicates the value of the bill as read by the bill receiving apparatus." FKI takes a different approach and seeks construction of "signal" and "proportionate" separate from the combined term. The specification provides that after a bill is accepted by the bill validator, "a signal pulse emitting a credit valuation proportionate to the denomination of the validated bill is initiated. . . ." [2:33-39]

Tidel argues the phrase is detailed enough to clearly indicate what it means, therefore, the plain and ordinary meaning of the phrase should apply. FKI proposes "signal" should be construed as "a fluctuating electric quantity, such as voltage, current or electric field, whose variations represent information." FKI argues this construction is the plain and ordinary meaning of "signal" in the electrical arts. FKI's proposed construction is an attempt to limit the signal to an analog signal. The specification makes clear that some electrical "pulse," associated with a particular denomination of a bill, is emitted. FKI comes forward with no meaningful support for its proposition that the signal must be analog.

Next, FKI proposes that "proportionate" means "corresponding in size, degree, or intensity while having the same or a constant ratio." FKI cites to an extrinsic source for the definition of "proportionate": "corresponding in size degree or intensity." MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 997 (11th ed. 2003). It argues, however, that "proportionate" requires an additional limitation as it is used in the patent. FKI argues that the term must be construed as to require a constant ratio be maintained between the denomination of the bill and the signal. FKI argues this is because "proportionate" modifies "signal." FKI's argument is unpersuasive and there is no support for this limitation in the specification.

FKI proposes the phrase means "generating a signal that varies some signal attribute (e.g. amplitude or duration) based upon a mathematical relationship with the value of the bill being validated." FKI argues the plain and ordinary meaning of the term "becomes clear" once the constructions of "signal" and "proportionate" are read into this construction. As discussed
above, FKI finds no meaningful support in the specification for its proposed construction. The court, therefore, construes the term "generating a signal proportionate to the denomination of each validated bill" to mean "creating an electrical communication that indicates the value of the bill as read by the bill receiving apparatus."

3. "Proposal"

In its moving papers Walker proffered that the claim term "proposal" be defined simply as "[s]omething proposed." Capital One disputes this assertion and instead offers that the claim term should be defined as "[a] contractual offer." The claim term "proposal" is not used in any of the claims in the '478 patent and it does not appear in the specifications for either of the Walker Patents. The claim term "proposal" does appear in claims 1, 2, 3, 12, 13 and 14 of the '230 patent. During the hearing on May 28, 2010, the court questioned counsel as to why they presented this claim term to the court for construction and the basis for their proposed constructions. During this hearing counsel for Walker conceded that there was no need to construe this term. Counsel for Capital One persisted in arguing for a specific definition of "a contractual offer" claiming that Figure 7 of the Walker Patents supports that construction because as shown in that diagram once the account price has been transmitted to the customer, the customer decides whether the account price is acceptable and if the answer is yes, the customer's credit card is billed for the cost of the new account. The specification does not use the term "proposal" but it does describe a process that after the price information is submitted to the customer, the customer decides whether the price is acceptable and if he accepts the price, the system "can" process the "sale" or alternative methods of payment may be used. ('478 patent, Col. 8:22-38). Nothing in the specification states that the transmission of the price information to the customer constitutes a contractual offer. As argued by counsel for Walker, the acceptance of the price submitted by the customer could then prompt a final credit review by the issuer or the issuer may require actual receipt of payment before entering into a binding agreement.

The claim term "proposal" is a plain English, non-technical term and it derives no special meaning from either the patent or the specification. Neither party has presented evidence that the claim term "proposal" would have any special meaning to a person of ordinary skill in the art at the time of the invention. Any attempt to provide a construction of the claim term "proposal" would only result in the court functioning as a thesaurus and would not be of any assistance to the jury. The claim term "proposal," as it is used in the '230 patent, has its ordinary meaning and it is a term that would be familiar to a lay juror. As such, the court declines to construe the claim term "proposal."

Proposal

"Proposal" is common to both patents, and, although the patents are not related, the parties agree it should be construed consistently for both patents. The Court construes "proposal" to mean "information intended for conveyance to a potential customer." Orion argues the term should be construed as "sales information presented to a customer for promoting a sale." Defendants urge the Court to construe the term as "information to be considered for a potential sale." Thus, according to Orion, Defendants' construction does not limit the term to sales information or to information presented to a customer.

Orion argues its construction reflects the term's plain and ordinary meaning as understood by those skilled in the art. Orion contends that because both patents are for the purpose of selling, the relevant information must be "sales information." Because Defendants' construction does not require "sales information" or presentation to a customer, Orion argues it ignores the inventions' very purposes.

Defendants argue that claim 1 of the 627 patent describes the proposal as containing parts-related information, which Orion's construction ignores. See 627 patent, col. 30:21-22 ("compiling the parts-related information into a proposal"). Defendants also argue that the Summary of the Invention in the 627 patent explains the "computerized system is provided for providing a salesperson with assistance related to . . . sales of parts. . . ."; thus the 627 patent does not require the proposal be shown to a customer. See 627 patent, col. 1:53-55.
The Court agrees with Defendants that Orion's phrase "sales information" is too vague to be helpful. The Court also agrees with Defendants that, based on both patents' claim language and the 627 patent's Summary of the Invention, it is clear that the patents do not require that a proposal is shown to the customer. The Court however agrees with Orion that the patents intend that this information is conveyed to the customer, otherwise it would do little to assist in a sale to a customer. Accordingly, the Court construes "proposal" to mean "information intended for conveyance to a potential customer."

G. "proposed reservation time"

The parties' constructions of this disputed phrase are similar in that they agree that the ordinary meaning of the phrase includes the fact that the reservation time can be accepted or rejected by the patron. (See Pl.'s Resp. to Defs.' Opening Claim Construction Br. at 15.) However, both the Plaintiff and the Defendants propose additional elements in their constructions. Incorporating its construction of "reservation," the Plaintiff claims that "proposed reservation time" means "a time reflective of a position in the virtual queue to be set forth for acceptance or rejection." n4 The Defendants argue that the proper construction of "proposed reservation time" must adequately distinguish between a "proposed" and an "actual" reservation time. Specifically, the Defendants advocate the following construction: "a reservation time that can be accepted or rejected by the patron, and requires an acceptance response from the patron before it becomes an actual reservation." Nothing in the claims or the specification support the Defendants' contention that the construction of this phrase should contain language regarding converting a proposed reservation time to an actual reservation time through patron acceptance. Rather, the fact that "reservation time" is modified by "proposed," i.e., set forth for acceptance or rejection, is sufficient to indicate that the reservation time is merely a requested or pending reservation that is not yet an actual reservation. Although the specification discusses the fact that proposed reservations will be cancelled absent an acceptance response by the patron, it is not necessary to read this limitation into the ordinary meaning of "proposed reservation time." Thus, the Court rejects the second clause of the Defendants' construction and construes "proposed reservation time" to mean "a time reflective of a position in the virtual queue that can be accepted or rejected by the patron."

--- Footnotes ---

n4 The Plaintiff originally construed this phrase to mean "an estimated time reflective of a position in the virtual queue to be set forth for acceptance or rejection." However, the Plaintiff amended its construction to eliminate the "estimated" requirement. (Pl.'s Resp. to Defs.' Opening Claim Construction Br. at 16.)

--- End Footnotes ---

B. Prospective Wagerer

Both parties agree that the term "subscriber" in the claims means "one who wishes to enroll or wager with the system." See Gtech's Sur-reply Claim Construction Brief at p. 2. However, with respect to the term "prospective wagerer," Lottotron submits that, pursuant to the context of the '865 patent, "prospective wagerer" should be construed to mean the same as a "subscriber." On the other hand, Gtech contends that "prospective wagers" are a subset of the category of the individuals who are "subscribers." Particularly, "prospective wagerer" is a subscriber who then goes on to access the system to enter one or more wagers. Based upon the intrinsic evidence, the Court adopts Gtech's definition of this term.

Lottotron submits that based upon the language of claims, "prospective wagerer" is used interchangeably with "subscriber" without any distinction. For example, Lottotron cites to claim 8 of the '865 patent, which reads in relevant part, "receiving incoming communications from prospective wagers and routing each of said communications according to which one of said plurality of different wagering formats is requested by a subscriber." '865 patent, col. 12, ll. 38-41. Lottotron contends that the if the two terms were to have different meanings, it would render the claim language illogical because "subscriber"
and "prospective wagerer" would be two different users both accessing the system at the same time. The Court finds this argument unpersuasive and insufficient to demonstrate the meaning of the term. Under Gtech's proposed definition, a "prospective wagerer" is simply a subset of "subscriber." Therefore, it is consistent for a "subscriber" user, who has enrolled with the system, to call in to make a wager. The Court finds that the ordinary meaning of the term "prospective wagerer" controlling.

The term "prospective wagerer" is not used in the specification, but its ordinary meaning is consistent with the specification's use of the synonymous phrase "subscribers who wish to wager with the system" described in the specification. For instance, in the "Summary of Invention" section, the patentee specifically references "subscribers who wish to enroll with the system, and for receiving incoming wagering calls from subscribers who wish to wager with the system." '865 patent, col. 2, ll. 5-9. This statement specifically differentiates between users that "wish to enroll" and users that "wish to wager." Although both parties agree that "subscribers" are users that wish to enroll and wager with the system, the Court finds that to afford "prospective wagerer" the same meaning as "subscribers" would render this statement meaningless. More importantly, without explicitly defining the "prospective wagerer" in the specification, the Court is to accord the plain and ordinary meaning of the term "prospective wagerer"; simply put, a subscriber who has enrolled [not who simply wishes to enroll] and "wish[es] to wager." Accordingly, based on the foregoing reasons, the Court construes the term "prospective wagerer" to mean "a subscriber who then goes on to access the system to enter one or more wagers."

7. "password protecting the entries" (claim 1) and "password protecting the entry" (claims 4 & 7)

The plaintiff contends that this term means "that the database entry or entries are protected by a word, string of characters and/or numbers which must be supplied before a user can create, access, or update an entry." The defendant proposes that the term should be construed to mean "restricting access to the data by means of a password." Plaintiff's proposed construction asks the court to import a variety of limitations from the specification to the claim language. Specifically, Plaintiff asks the court to limit "password protecting" the entry or entries such that a password is required to access, update, or create a database entry. But the patent states that users are asked to choose a password and that the password "may be required to access some system services." 7:60-67.

The claims make it clear that the password must be used to "protect" the database entries. The court is persuaded that Defendant's proposed claim construction "restricting access to the data by means of a password" is consistent with the plain meaning of "protecting" without importing additional unsupported limitations from the specification. Accordingly, the court construes this term to mean "restricting access to the data by means of a password."

2. "protection circuit"

Claim 1 of the '054 Patent refers to a "protection circuit." Philips asserts that this term should be construed as "a circuit for protecting the steering circuit from a fault condition by selectively controlling the delivery of therapeutic electrical energy from the storage circuit to the steering circuit." Cardiac Science contends that a "protection circuit" is "a circuit that limits energy delivery from the storage circuit to the steering circuit and discharges or otherwise disarms the storage circuit in the event of a fault condition."

The specification describes the preferred embodiment as follows:

The protection circuit 48 (shown in FIG. 3) functions to limit energy delivery from the ESC 42 to the steering circuit 46 (and hence to the patient) and to discharge or otherwise disarm the ESC 42 in the event of a fault condition. ('054 Patent at c. 5, ll: 6-9.) Yet, the specification also states, more broadly, that "the protection circuit may include a limit
circuit that limits the rate of delivery of the electrical energy from the storage circuit to the steering circuit." (Id. at c. 2, ll: 60-62.) Dependent Claims 2 and 9 also appear to offer alternate embodiments: Claim 2 including a disarm circuit and Claim 9 including a disarm circuit and a limit circuit. The doctrine of claim differentiation would provide that Claim 1, the claim from which Claims 2 and 9 depend, is broader and encompasses both of the constructions of Claims 2 and 9 -- a disarm circuit alone, or a disarm circuit plus a limit circuit. Based on this language from the specification, the Court finds that both ways of protecting -- the disarm circuit and the limit circuit -- are not required elements of the protection circuit. Philips' proposed construction encompasses this notion. (Id. at c. 2, ll: 55-57 ("The protection circuit selectively controls the delivery of the electrical energy from the storage circuit to the steering circuit.").) For these reasons, the Court construes "protection circuit" as "a circuit for protecting the steering circuit from a fault condition by selectively controlling the delivery of therapeutic electrical energy from the storage circuit to the steering circuit."

3439

The Claim Construction Order issued by this Court construed the term "protection MOSFET" as "a MOSFET connected to a circuit in such a way that it tends to prevent one or more circuits from undergoing electrostatic breakdown." Order, Feb. 14, 2006, at 10:17-18.

3440

Protective MOS transistor

The Court agrees with MEI and construes the term as "a MOS transistor that provides a discharge path for current to flow from the first power supply terminal to the second power supply terminal when activated by a voltage on the drain that exceeds a predetermined level." Samsung argues that the term should be construed as "a MOS transistor that shunts the surge/ESD event by the breakdown of the MOS transistor due to the punch-through effect."

Both parties agree that the protective MOS transistor provides a discharge path or shunts current. Samsung's proposed construction limits the claim to "punch-thru effect" MOS breakdowns. Samsung argues that the patentees disclaimed breakdown of the MOS by avalanche effect in statements made during patent prosecution. See '588 Pros. Hist., June 3, 1992 Amendment at 9 (Docket No. 120, Exh. 9). The applicants' discussion of punch-through effect in the prosecution history is not a clear disclaimer of claim scope for numerous reasons. First, the patent specification shows a MOS transistor configured to operate in an avalanche mode. See '588 Patent Fig. 5. Second, the applicants' statements that the MOS transistor could operate in "punch-through" mode were not critical to distinguishing the claimed invention over the prior art, and the applicants never limited the MOS transistor to operating in the punch-through mode. See Pros. Hist., June 3, 1992 Amendment at 9-10 (distinguishing Armstrong prior art reference as capable of operating in avalanche mode only, whereas applicants' invention was capable of operating in punch-through mode).

3441

Protective transistor

The Court agrees with MEI and construes the term as "a transistor which provides a discharge path for current to flow between the first power supply wire and the second power supply wire when activated." This term simply refers to a single one of the "plural protective transistors" of claim 2. See '588 col. 9:3-14; col. 10:10-13.

Footnotes

5 In the parties' Joint Claim Construction Charts, MEI's proposed construction is listed as "a transistor which provides a discharge path for current to follow between the first power supply wire and the second power supply wire when activated." However, MEI's brief and its construction of "plural protective transistors" use the word "flow" rather than "follow." Accordingly, the Court construes the term as stated above using the word "flow."
a. "Protocol"

Claims 1, 13, 18, 23, and 27 of the '539 Patent disclose a "protocol" in various contexts. The claim language teaches that different "protocols" are associated with different devices. See, e.g., '539 Pat. col.10 ll.2-7 (describing a "controller" with a "controller command protocol," a "first remotely controllable surgical device" with a "first command protocol," and a "second remotely controllable surgical device" with a "second command protocol"); id. at col.10 ll.9-13 (describing an "interface" for "converting the controller command protocol to the first and second command protocols").

KSEA argues that "protocol" should be construed as a "set of rules governing the communication and/or transfer of data." (Proposed Constructions Chart 9.) S&N contends that it should be construed as a "set of rules governing the exchange of information between electronic devices; the touchscreen controller uses a protocol that is different from the protocols used by the first and second remotely controllable surgical devices." (Id.)

The Court adopts KSEA's proposed construction. S&N has not established why it is necessary at this time to restate the claims' teaching that the touchscreen controller's "protocol" is different than the remotely controllable surgical devices' "protocols." Claim construction "is not an obligatory exercise in redundancy." U.S. Surgical Corp., 103 F.3d at 1568. The Court construes "protocol" as a "set of rules governing the communication and/or transfer of data."

(a) Protocol Data Unit (PDU) Network Policy

StorageTek's proposed construction is "network policies are rules and procedures that govern PDUs. Examples of PDUs are data packets, cells, or frames which contain voice, video, or data information." Cisco's proposed construction of PDU network policy is "a filtering or auditing rule which determines if and why a PDU should be forwarded, not where a PDU should be forwarded." The main dispute between the parties is whether the "network policies" of the 040 patent include policies directing where a PDU packet should be forwarded or are limited to policies that determine if and why a PDU should be forwarded.

Cisco argues that a network policy in the 040 patent is limited to filtering or auditing rules. 9 To supports its argument, Cisco cites to portions of the specification discussing enforcement of "network policies" by filtering and/or auditing packets to ensure network security. StorageTek accuses Cisco of citing to portions of the specification discussing the preferred embodiment of the 040 patent, thus attempting to impermissibly read limitations from the preferred embodiment into the broader claim language, and of ignoring the broad definitions of "network policies" given in the background to the invention section of the patent. See 040 Patent Col. 1, In. 22-26; Col. 2, In. 9-13 (defining communications network policies as "routing, bridging, switching, filtering, and auditing functions"); Hughes Decl., PP 9-10, 19. However, Cisco also cites to the section of the patent discussing the "summary of the invention," as opposed to the general technological background of the invention, which refers to examples of network policies appropriate for caching as filtering and/or auditing policies. See 040 Patent, Col. 2, In. 61-Col. 3, In. 1. The summary of the invention describes how the "instance of policy network policy is performed by filtering or auditing the related-received PDUs." Id., Col. 3, In. 9-11. 10

9 In the summary of the invention portion of the patent, the patent provides examples of network policies including "filtering (e.g., forward or not forward the PDU) and/or auditing (e.g., send a copy of the PDU to a third party)." 040 Patent, Col. 2, In. 65 -- Col. 3, In. 1.

10 The Court notes that Cisco's expert, Dr. Smith, states that "one of ordinary skill in the art would understand in the context
of the 040 patent that the terms network policy, PDU network policy and policy refer to a specific type of rule -- i.e., a filtering or auditing rule." Smith Decl. P 21.

Additionally, in support of its claim construction Cisco relies on the prosecution history of the 040 patent. In distinguishing the 040 patent from the prior art, the patentee asserted:

Unlike a bridge, which analyzes source or destination addresses to determine where data should be forwarded, the present invention more broadly analyzes the content of the PDUs in order to perform filtering and auditing functions which determine if and why data should be forwarded. In addition to source and destination addresses, information which can be filtered includes network protocol, transport protocol, source and destination ports, and security options.

See Declaration of Thomas A. Lewry in Support in Support of StorageTek's Proposed 040 Claim Construction ("Lewry 040 Decl."), Exh. 3, 11/4/97 Amendment and Response at 3 (emphasis in original). StorageTek argues that this statement demonstrates that the invention has more functionality than just a bridge, and that "in addition" to determining "where" data should be forwarded, the invention also determines "if and why" the data should be forwarded. However, this statement clarifies that the invention "more broadly analyzes" the PDU to perform "filtering and auditing functions." The "in addition to" signifies that source and destination address information can be used, not to determine where to send the PDU, but in the filtering and auditing of the PDU. Therefore, the prosecution history does not support StorageTek, but supports Cisco's proposed construction. 11

Finally StorageTek argues that to interpret "network policies" as limited to filtering and auditing rules would violate the doctrine of claim differentiation. Under the doctrine of claim differentiation "there is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." U.S. v. Telecommunications, Inc., 857 F.2d 778, 783-84 (Fed Cir. 1988) (quoting Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed.Cir. 1987)). StorageTek points out that network policies are specifically limited to filtering and auditing in claim 8 of the 040 patent. See StorageTek Reply Brief in Support of its Proposed 040 Claim Construction ("StorageTek 040 Reply") at 5. 12 Therefore, StorageTek argues that it would be improper, under claim differentiation, to limit the scope of "network policies" in claim 1 to the same scope as in claim 8.

Finally StorageTek argues that to interpret "network policies" as limited to filtering and auditing rules would violate the doctrine of claim differentiation. Under the doctrine of claim differentiation "there is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." U.S. v. Telecommunications, Inc., 857 F.2d 778, 783-84 (Fed Cir. 1988) (quoting Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed.Cir. 1987)). StorageTek points out that network policies are specifically limited to filtering and auditing in claim 8 of the 040 patent. See StorageTek Reply Brief in Support of its Proposed 040 Claim Construction ("StorageTek 040 Reply") at 5. 12 Therefore, StorageTek argues that it would be improper, under claim differentiation, to limit the scope of "network policies" in claim 1 to the same scope as in claim 8.

12 StorageTek admits that claim 11 limits the policies to filtering and auditing. See StorageTek's Claim Construction Slides, Exh. 36; StorageTek 040 Brief at 13. Claim 11 recites a "policy caching method for use in a communication device, comprising steps of . . . (f) performing the instance of network policy by filtering or auditing the stream of PDUs."
reference to filtering and auditing in claim 8 superfluous in violation of the claim differentiation doctrine, because the scope of claim 1 is different from the scope of claim 8. Claim 1 addresses the "determination" of a network policy. Claim 8, however, claims the "policy caching method of claim 4 further compromising a step of performing the instance of network policy by filtering or auditing the stream of PDUs." (emphasis added). A consistent interpretation of "network policies" in claim 1 and claim 8 would not make claim 8 superfluous, since claim 8 includes the additional step of performing the identified policies.

13 Cisco also argues that even if the doctrine of claim differentiation could apply in this instance, the Court does not have to "blindly" apply that doctrine when application would conflict with proper construction of the claims given the claim language, the specification, and the prosecution history, all of which support a definition of network policy limited to filtering and auditing rules. See Bristol-Myers Squibb Co. v. Ben Venue Laboratories, Inc., 246 F.3d 1368 (Fed. Cir. 2001) (declining to "blindly apply the doctrine in this case to supplant other canons of claim construction").

The Court finds that "network policy" as used in the 040 patent is limited to filtering and auditing rules based on the use of this term in the specification and in the prosecution history. 14 Therefore, the Court construes this element as:

"protocol data unit (PDU) network policy" means a filtering or auditing rule which determines if and why a PDU should be forwarded.

14 On August 16, 2001, StorageTek submitted to the Court two documents filed by Cisco with the PTO: a patent application and an interference request form seeking an interference between Cisco's patent application and the 040 patent. See Plaintiff's August 16, 2001 Letter Brief. StorageTek points out that in its application, Cisco defines "policy treatment" as including switching, access control, accounting, encryption, and any other special treatment for packets. See Exhibit 1 at C025089-90. In the request for interference, Cisco asserts that the "term policy treatment' of the application claim is equivalent in meaning to the term network policy' as used in the Hughes et al. patent claim." Exhibit 2 C0250721. StorageTek argues that this demonstrates, contrary to Cisco's argument to this Court, that "network policies" include switching and other policies. Cisco responds that it did not represent that the terms were "synonymous," as it did in the following sentence with respect to another term, but that the terms were "equivalent." Because the terms are only equivalent, Cisco asserts that the term "policy treatment" can still be broader in scope than "network policy" for purposes of an interference proceeding. See Defendants' August 20, 2001 Letter. However, even assuming that Cisco's admission of "equivalence" can be equated with an assertion that the terms are coextensive or synonymous, the Court will not rely on this extrinsic evidence in construing the claim language at issue. The minimal relevance of this extrinsic evidence does not outweigh the clear intrinsic evidence that StorageTek limited "network policies" to auditing and filtering rules.

The sole claim construction issue with respect to claims 14 and 23 of the '170 patent is whether the "protocol data unit processor" (or "first processor" in claim 23), which adds "next operation information" to the packet header, and the "forwarding processor" (or "second processor" in claim 23), which forwards the packet based on the added next operation information, must be part of the same forwarding device. StorageTek contends that the district court erred in interpreting the term "forwarding device," which appears only in the preamble of each claim, to be a limitation. In StorageTek's view there is no "forwarding device," and the two processors recited in the claims may be anywhere in the communication network.

In this case, we agree with the district court that the preamble term "forwarding device" limits the claims. The written description emphasizes that a key benefit of the invention is that the use of the next operation information within a forwarding device reduces the processing otherwise performed by the forwarding device. For example, the "Summary of the
"Invention" states that "a protocol data unit preprocessor is used in a protocol data unit forwarding device... such that subsequent processing of the protocol data unit by the protocol data unit forwarding device is reduced." '170 patent, col. 4, l. 64 - col. 5, l. 11 (emphasis added). Figure 2 of the patent shows a forwarding device 100 that contains preprocessor 104 and forwarding processor 108. Because the written description makes it abundantly clear that the preprocessor and the forwarding processor are part of a single forwarding device, the term "forwarding device" in the preambles of claims 14 and 23 limits the scope of the claims such that both processors must be contained within one forwarding device. See Catalina Mktg., 289 F.3d at 808, 62 USPQ2d at 1785 ("When reciting additional structure or steps underscored as important by the specification, the preamble may operate as a claim limitation.").

The prosecution history supports the district court's claim construction. Claims 14 and 23 as originally filed contained the phrase "such that subsequent processing of the protocol data unit by the protocol data unit forwarding device is reduced," referring back to the "forwarding device" recited in the preamble. Had the claims issued in that form, the term "forwarding device" unquestionably would have been a limitation. See id. ("Dependence on a particular disputed preamble phrase for antecedent basis may limit claim scope because it indicates a reliance on both the preamble and claim body to define the claimed invention."). The patent applicants, however, deleted that phrase in an amendment during the course of prosecution. In some circumstances that deletion might have removed the "forwarding device" as a limitation, because it is the claims as allowed that we must examine. See Intervet, 887 F.2d at 1054, 12 USPQ2d at 1477. Nevertheless, we are not persuaded by StorageTek's argument that removal of the reference to "forwarding device" eliminated any limiting effect of the preamble. The reason is that in their remarks accompanying the amendment, the applicants stated that, in response to an indefiniteness rejection, the language was deleted as unnecessary "because the use of the added next operation information by the forwarding device is recited as part of each claim." (Emphasis added.) Because the claims recite the use of the next operation information by the forwarding processor (claim 14) or second processor (claim 23), it follows that the applicants considered the forwarding processor or second processor to be part of the forwarding device recited in the preamble, which therefore operates as a limitation upon the claims.

The applicants also relied on the existence of a "forwarding device" in distinguishing their invention over prior art. In comparing the claimed invention to the Johnston reference, the applicants stated: "Instead of being part of a forwarding device in a communication network as required by the present invention, the ATM/AAL interface of Johnston et al. is more aptly characterized as an interface device." (Emphasis added.) The passage goes on to allege that there is no teaching or suggestion in Johnston of a preprocessor that "will modify media header information by inserting next operation instructions so as to decrease the amount of processing that would otherwise be required to be performed by the primary processor in the forwarding device." (Emphasis added.) These statements further support the district court's conclusion that the term "forwarding device" is a limitation of the claims and that both processors recited in the body of claims 14 and 23 are part of the forwarding device. See Catalina Mktg., 289 F.3d at 808, 62 USPQ2d at 1785 ("Clear reliance on the preamble during prosecution to distinguish the claimed invention from the prior art transforms the preamble into a claim limitation because such reliance indicates use of the preamble to define, in part, the claimed invention.").

We also reject StorageTek's argument that even if the claims require both processors to be contained in a forwarding device, the term "forwarding device" can be interpreted broadly to include a data communication network or the Internet itself. The '170 patent provides as examples of forwarding devices a data packet switch, a bridge, and a router. '170 patent, col. 1, ll. 31-32; col. 2, ll. 14-15. There is no suggestion in the claim language or the written description that the term could refer to an entire network.

Because we affirm the district court's claim construction, and it is undisputed that in Cisco's MPLS technology the alleged "next operation information" is added by one network device and used by a second, downstream network device, we affirm the district court's grant of Cisco's motion for summary judgment that it does not literally infringe the '170 patent.

We also affirm the district court's judgment regarding infringement under the doctrine of equivalents. In particular, we agree with the district court that prosecution history estoppel bars StorageTek from arguing that Cisco's MPLS technology contains an equivalent of the forwarding device recited in claims 14 and 23 of the '170 patent. As discussed above, during prosecution the applicants clearly stated that the next operation information added by the preprocessor is used to reduce the processing time of the processor in the forwarding device. StorageTek cannot now assert that the existence of a forwarding device containing both processors is unnecessary and that any communication network may be the equivalent of a forwarding device. See Allen Eng'g Corp. v. Bartell Indus., Inc., 299 F.3d 1336, 1350, 63 USPQ2d 1769, 1776 (Fed. Cir. 2002) ("[Prosecution history] estoppel also may be found on the basis of arguments made during prosecution of the
CONCLUSION

The district court erred in its claim construction of the terms "caching policy identification information" and "protocol data unit (PDU) network policy" in the '040 patent. Accordingly, we vacate the district court's grant of summary judgment of noninfringement of the '040 patent and remand for further proceedings consistent with this opinion. The district court, however, properly granted summary judgment of noninfringement of the '170 patent. Finally, the United States District Court for the Western District of Wisconsin did not abuse its discretion when it transferred the case to the Northern District of California.
Defendant asks the court to construe the following phrase in claim 38:

wherein the initial voice guidance, the advance voice guidance and the confirmation voice guidance provide different prompts to provide specific guidance when the decision point is within an initial guidance range, within an advance guidance range, and within confirmation guidance range.

Defendant proposes a construction of this phrase to link the initial voice guidance more explicitly with the initial guidance range, the advance voice guidance with the advance guidance range and the confirmation voice guidance with the confirmation guidance range. (Defendant's proposed construction is: "wherein the initial voice guidance is provided when the decision point is within the initial guidance range, the advance voice guidance is provided when the decision point is within the advance guidance range and confirmation voice guidance is provided when the decision point is within the confirmation voice guidance range.") I agree with plaintiff that the phrase is clear and unambiguous and no judicial construction is necessary.

3447

(3) Provide Power to Said Power Meter

The parties next dispute the appropriate construction of the phrase "provide power to said power meter," which appears in both the '364 and the '934 patents. The '364 patent claims, among other things,

41. A revenue meter for measuring the delivery of electrical energy from an energy supplier to a consumer through an electric circuit, said meter comprising:

  bayonet terminals disposed on said meter mateable with matching jaws of a detachable meter mounting device;

  a seal connected between said meter and said detachable meter mounting device, said seal operative to prevent removal of said meter and indicate tampering with said meter;

  a first power supply coupled with said electric circuit and operative to provide power to said meter from said electric circuit under normal operating conditions;

  a second power supply operative to provide power to said meter when a power quality event occurs on said electric circuit, said second power supply including:

    at least one first capacitor coupled with said electric circuit and operative to store electrical energy from said electric circuit; and

    at least one second capacitor coupled with said at least one first capacitor and said meter and operative to store electrical energy from said electric circuit;

  said first and second capacitors further operative to provide said energy to said meter when said power quality event occurs.

U.S. Patent No. 6,792,364 B2, col. 43, lines 21-45.

Square D contends that the phrase "provide power to said power meter" should be construed to mean "provide power to the power meter"; EI argues that the phrase should be construed to mean "provide operating power to said meter sufficient to meet the energy requirements of the meter to continue monitoring and data storage." The dispute thus centers on whether the plain language of the claim requires a specific, or threshold, amount of power. The Court finds that it does not. To be sure, the patentee knew how to include claim language specifying a particular threshold of power; indeed, in claim 41 of the '364, the patentee did just that: the plain language of the claim discloses a first power supply, which must provide enough power to run the meter under normal operating conditions, and a second power supply, which must provide enough power to operate the meter when a power quality event occurs. U.S. Patent No. 6,792,364 B2, col. 43, lines 31-37. Here, he chose not
to do so. Accordingly, the Court will not limit the claim language "provide power to said meter" to require a specific or threshold amount or level of power, other than as specified in the plain language of the claims.

4. "The speech synthesis system provides a message to the surgeon stating information about the movement of the surgical camera." Requires synthesized speech informing the surgeon about the movement of the surgical camera.

In the Markman hearings, Defendant urged the Court to construe the word "providing" to mean "making the generated form available to the user." The Court rejected that construction and agreed with Plaintiff that the term "is an everyday word[] used in [its] ordinary, everyday sense and, thus, [it] need[s] no construction." In particular, Defendant argues that uploading the applicant information to a student-information system requires colleges to convert the flat-file format provided by the XAP System into a relational database format or a proprietary database format for use in the colleges' student-information systems. Defendant points to the expert opinion of Justin Tygar, Ph.D., to support Defendant's proposition that the XAP System does not provide information in a format specified by the institution.

The parties first focus on Step 2 of Claim 10 of the '874 patent. This step, and the following step to which it is linked, read:

providing said individuals with electronically programmable token dispensers capable,

upon the request of individual ones of said individuals, of dispensing a token having value to said requesting individual, said value being available upon the performance of said act and upon surrender of said token,

VTB construes the term "electronically programmable token dispensers" to refer to an article of hardware for printing a hard copy record such as a coupon. See Defendant's Local Rule 56.1 Statement of Undisputed Facts ("Def. 56.1") P 4; Def. Mem. at 11. VTB maintains that it has never provided its customers with electronically programmable token dispensers. See 06/17/05 Declaration of Elisabeth B. Robert, President and Chief Executive Officer of The Vermont Teddy Bear Co., Inc. ("Robert Decl.") P 3–4. Further, VTB asserts that it had no involvement with its prospective customers when they obtained token dispensers. See Def. Mem. at 13.

AI accepts VTB's construction of "electronically programmable token dispensers" for purposes of this motion for summary judgment of non-infringement. See Plaintiff's Local Rule 56.1 Statement of Undisputed Facts ("Pl.56.1") P 4; Pl. Mem. at 7. To the contrary, AI asserts that the genuine issue of fact is that VTB had a direct connection to each and every prospective customer, and that VTB's promotion of an online coupon for a free factory tour induced its web site visitors to provide their own computers and printers to print the coupon in question. See Pl. Opp'n at 6-9.

The parties' dispute hinges on the meaning of the term "providing." Unfortunately, neither party offers a construction of this
term, but it appears that VTB interprets "providing" narrowly to mean "supplying newly-acquired [equipment]," that is, that customers "provide" equipment when they purchase or obtain computers and printers they did not previously possess, or to which they did not previously have access. To the contrary, AI reads the term broadly to mean "making available already-acquired [equipment]," that is, that customers "provide" equipment when they make use of computers and printers they already own, or to which they already have access. Because the ‘874 patent does not explicitly define the meaning of the term "providing," and neither party argues that the term has an established specialized meaning in technical dictionaries, encyclopedias, or treatises of the relevant field of art, a standard English dictionary is a proper resource to understand the ordinary and accustomed meaning of this term. The most closely applicable definition of "provide" in The Oxford English Dictionary is "to supply or furnish for use." Id. (2d ed. 1989). The American Heritage Dictionary offers the definitions "to furnish; supply" or "to make available." Id. (4th ed. 2000). Neither dictionary requires that the thing supplied, furnished, or made available be newly acquired. Therefore, for purposes of this motion, I construe the term "providing" to mean "furnishing, supplying, or making available already-existing [equipment]." Nothing in the specification of the ‘874 patent contradicts this construction. This construction supports AI's argument that Step 2 of Claim 10 of the ‘874 patent is satisfied by VTB's customers supplying or making available their already-acquired computer systems and printers to print VTB's factory tour coupon.

14. "Providing": "Supplying." The crux of the invention is presenting information (via thumbnail images) to the user, not simply transmitting these images. 4 (See Abstract ("A method and system for presenting internet information to a user. . ."); col. 1, ll. 10-15 ("The present invention relates to internet methodologies and systems generally and more particularly to systems and methodologies for displaying information received over the internet.")). Neither is Yahoo's advocated definition of "displaying" correct; the drafters specifically used that term to impart information regarding the location of the visual image (versus the supply of that image). (Compare claim 1 with claims 2-4) Further, an image server ("that stores and provides said thumbnail visual image") cannot "display" images itself, but it can "supply" them. (See, e.g., claim 1) Finally, the drafters consistently referred to providing web pages or visual images "via the internet" or "over the internet," indicating that content moves over the internet from a remote server to a user's computer. (See claims 1, 8, 12, 18, 25, 29, 35, 46; col. 2, ll. 5 & 17; col. 3, ll. 33 & 45-46; col. 5, l. 47; col. 6, ll. 2 & 6) This is further indication that "providing" implicates the "supply" (or movement) of information, in contrast to simply the "display" or "making available" of information as plaintiff suggests.

4 At oral argument, Snap argued that the image server is "transmitting" the thumbnail visual image to the browser for rendering and display.

IT IS ORDERED that the court's memorandum order dated September 15, 2009 is hereby revised to reflect that the following limitation of U.S. Patent No. 6,864,904 ("the '904 patent") shall be construed consistent with the tenets of claim construction set forth by the United States Court of Appeals for the Federal Circuit in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005), as follows: "Providing to a user a visual image of a web page" and "providing [to a user] a thumbnail visual image" means "displaying to a user a thumbnail visual image."

During claim construction, the parties traversed different meanings of the term "providing" as it appears in the '904 patent claims. The court construed "providing" as "supplying." Upon additional review, however, the court believes that "providing" cannot be isolated from the remainder of the relevant phrase. The terms "providing to a user a visual image or a web page" and "providing [to a user] a thumbnail visual image" require definition commensurate with the disclosure of the '904 patent.

The '904 patent discloses a web browser as being the mechanism by which an annotated web page is provided to a user. (e.g., col. 2, ll. 19-24; Figs. 1 & 2; col. 5, ll. 48-50) "Providing to a user a visual image or a web page," therefore.
contemplates the use of a web browser (and display screen).

More specifically, the specification provides that visualization functionality 103 "download[s]" "via the image server 104 from the image database 106 images of web pages referenced in hyperlinks" on the web page and then "provide[s] to a user, via the web browser 100," an annotated web page also displaying the thumbnail visual images. (col. 5, II. 59-65 (describing Fig. 1); see also col. 6, II. 24-31 (describing Fig. 2)) In one embodiment (Fig. 1), the visualization functionality (itself) "download[s]" the images; in another (Fig. 2), the visualization functionality sends commands to the web browser which "download[s]" the images via the image server. (Id.) The images are generally stored in the image database prior to retrieval; the patent teaches, however, that the image server may also "store" the images before they are "provid[ed]" to a user. (See, e.g., claim 1 (image server "stores and provides" the thumbnails; col. 11, I. 8 (image server has at least 1 GB of its own memory)) It is unclear from the specification for how long the image server may "store" the image before it is "provid[ed]" to the user. The claims require that the thumbnail is "provided" "at least partially concurrently" with the original web page, thereby contemplating that the image server may hold the image for some amount of time prior to relaying it to the user via the web browser. 1

--- Footnotes ---

1 The web browser receives HTML and, essentially, translates a web page for viewing. (col. 5, II. 43-53) There is no indication that the web browser has any storage capabilities.

--- End Footnotes ---

Upon further study, it is the court's conclusion that the invention is directed to the (at least partially concurrent) display of images to the user, as compared to the (at least partially concurrent) rendering of images for a user's (perhaps future) viewing. The invention is consistently described as a methodology for "displaying" information for a user's benefit. (See, e.g., col. 1, I. 14; col. 1, II. 39-41) The claims are drawn to the user's vantage point ("presenting internet information to a user"), as compared to describing the underlying system by which images are (concurrently) rendered by the web server and image server (via the web browser) for viewing. The term "providing [to a user] a thumbnail visual image" is construed, therefore, as "displaying to a user a thumbnail visual image."

**3453**

C. Ref. No. 8 "Provides" and "Providing."

These terms are recited in Claims 1, 21, 42, 49, 54, 82, and 83.

The parties agree that the terms "provides" or "providing" as used in Claims 1, 42, and 83 mean "generating or creating." Defendants propose that the same construction should also be applied to the terms as used in Claims 21, 49, 54, and 82. Plaintiff contends that in the latter claims the terms mean "making available a tangible medium with a voting record and/or a unique voting session identifier for review."

The disputed terms used in Claims 1, 42, and 83 each involve supplying a voting session identifier and, in Claim 1, a voting record. In Claims 21, 49, 54, and 82, the term refers to supplying a receipt or paper.

There is "a presumption that the same terms appearing in different portions of the claims should be given the same meaning unless it is clear from reviewing the specification and prosecution history that the terms have different meanings at different portions of the claims." PODS, Inc., 484 F.3d at 1366 (quoting Fin Control Sys. Pty. Ltd., 265 F.3d at 1318). Nothing cited in Plaintiff's supporting evidence makes it clear to the Court that the terms have different meanings when used at different portions of the patent. In the context of the disputed claims, generating or creating is a logical and rational meaning for "provides" and "providing."

Accordingly, the Court construes the terms "provides" and "providing" in Ref. No. 8 to mean "generating" or "creating."
8. Claim 5 -- "Providing to Said User Station Map/Subscriber Electronic Information"

Defendants contend that Claim 5 is comprised of step-plus-function limitations controlled and limited by 35 U.S.C. § 112 P 6 and the precise embodiments and specifications of the claim. CIVIX disagrees and asserts that Claim 5 is a method claim and not limited by Section 112. I disagree with Defendants' characterization of this claim as steps-plus-function and hold Claim 5 to be one of method.

35 U.S.C. § 112 P 6 states, in relevant part:

An element in a claim for a combination may be expressed as a . . . step for performing a specified function without the recital of . . . acts in support thereof, and such claim shall be construed to cover the corresponding . . . acts described in the specification and equivalents thereof.

35 U.S.C. § 112 P 6; see also O.I. Corp. v. Tekmar Co. Inc., 115 F.3d 1576, 1582-1583 (Fed. Cir. 1997). However, this paragraph "is implicated only when steps plus function without acts are present." Id. at 1583. The paragraph allows that "an element in a combination method or process claim may be recited as a step for performing a specified function without the recital of acts in support of the function." Id. The price for this convenience is limitation of the claim to the steps specified in the written description and equivalents thereof. Id. However, merely claiming a step or even a series of steps without recital of a function does not implicate 35 U.S.C. § 112 P 6.

Claim 5 reads, in pertinent part:

A method for identifying the location within a predetermined region of a selected group of a set of a plurality of subscribers relative to the location of a user station comprising,

- providing to said user station map electronic information representing a map of said predetermined region around said user station,

- providing to said user station subscriber electronic information representing the location and at least one characteristic for each subscriber of said set of subscribers,

- said at least one characteristic being common to the members of a group,

- selecting at said user station at least one of said characteristics as a group characterization identifying a group of said subscribers,

- searching said subscriber electronic information with respect to said group characterization,

and providing said map at said user location displaying the locations of members of said selected group identified by said group characterization relative to the location of said user station.

Defendants contend that the emphasized elements of this claim, beginning with the terms providing, providing, selecting, searching, providing, constitute steps-plus-function limitations. 35 U.S.C. § 115 P 6. I disagree. Although not determinative, the term "step for" does not appear in this method claim. See Seal-Flex, Inc. v. Athletic Track and Court Construction, 172 F.3d 836, 849 (Fed. Cir. 1999) (Rader, J., concurring) (holding that only the words "step for" raise the presumption that 35 U.S.C. § 112 P 6 applies). Further, this method claim is not composed of steps aimed at performing a specified function.

The Federal Circuit addressed an analogous situation in O.I. Corp., 115 F.3d at 1576. This case involved a method claim that read, in pertinent part:

A method for removing water vapor from an analyte slug passing between a sparge vessel, trap and gas chromatograph, comprising the steps of:
(A) passing the analyte slug through a passage heated . . . ;

(B) passing the analyte slug through the passage that is air cooled . . . .

The Federal Circuit rejected the Defendants' arguments that both "passing" limitations were part of a means plus function limitation. The Court stated,

Claiming a step by itself, or even a series of steps, does not implicate 35 U.S.C. Section 112, P 6 . . . . If we were to construe every process claim containing steps described by an "ing" verb, such as passing, heating, reacting, transferring, etc. into a step-plus-function limitation, we would be limiting process claims in a manner never intended by Congress.

Id. at 1583. I find no reason here to limit Claim 5's terms by 35 U.S.C. 112 P 6. Thus, I reject Defendants' contention that "providing to said user station map electronic information" is limited to only the eight acts specified by Defendants and present as specifications in the patent. I further reject the contention that "providing to said user station subscriber electronic information," is limited to the specified six acts. Instead, I construe the term "providing" in both phrases according to its ordinary usage, "supplying for use." Websters' Third New International Dictionary, p. 1827. Nothing in the '170 patent suggests a different meaning. In all the embodiments discussed in the specification, map and subscriber electronic information is supplied to the user station by loading this information into the user station. Likewise, the act of "providing" a map to a user at a user station is limited as it was above, through the element of a printer.

For these reasons, I reject Defendants' contention that the terms within this claim are limited to specific acts within the '170 patent. Instead, I construe the term "selecting" according to the specification which provides that the step of selecting at least one desired characteristic at a user station merely requires the entry of one or more desired characteristics to interrogate a database. Although the preferred embodiment represents the pressing of a single key representing at least one desired characteristic, limitations from these precise embodiments should not be read into the claim. See, e.g., Burke, Inc., 183 F.3d at 1341 ("an attribute of the preferred embodiment cannot be read into the claim as a limitation."). "In the absence of ambiguity, it is fundamental that the language of a count should be given the broadest reasonable interpretation it will support." Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 500 (Fed. Cir. 1997).

Likewise, I find that the ordinary meaning of "searching" in database technology applies, such as "querying" a database. (Oxman Declaration, P 13). This is supported by the specification: "A user activates the apparatus by pressing one of the input keys. This causes an electronic element to search the subscribers to determine the group of subscribers having that characteristic." ('170 Patent, Abstract). Thus, "searching said subscriber electronic information with respect to said group characterization" denotes the act of querying the database to provide all subscribers within the database which have the user-selected group characterization.

Likewise, Plaintiff Netcraft Corporation owns several patents related to internet billing methods. It contends that defendants Ebay, Inc. and PayPal, Inc. are infringing its patents by providing a third party payment system to customers wishing to make secure purchases over the internet. Defendants deny the contentions and have moved for summary judgment.

The question presented in defendants' motion for summary judgment is whether the phrase "providing a communications link through equipment of a third party" in U.S. Patent Nos. 6,351,739 and 6,976,008 imposes a limitation that a third party, such as a company like defendants, must provide internet access to the customer. All parties agree that defendants do not provide their customers with access to the internet, meaning that the allegation of infringement rises and falls on a conclusion that plaintiff's patents do not include such a limitation. Because I agree with defendants that plaintiff's patents do include such a limitation because "providing a communications link" means "providing customers with internet access" in the context of plaintiff's asserted patents, I will grant defendants' motion for summary judgment. (Because the question of infringement hinges entirely on this one question of claim construction, it is unnecessary to discuss the parties' proposed findings of fact.)
OPINION

The basic purpose behind plaintiff’s patents is undisputed: to allow customers to make purchases over the internet through a trusted third party intermediary so that the customer does not have to provide sensitive financial information to an unfamiliar vendor. As is usually the case, the dispute is in the details.

The first and only question I must answer relates to the construction of the phrase "providing a communications link through equipment of the third party," which appears in all of the asserted claims in both asserted patents. Claim 1 of the '739 patent is representative. The first step of that method claim is to establish a billing agreement between the customer and the trusted third party. The second step is "providing a communications link through equipment of the third party between the purchasing customer and the selling vendor through which the purchasing customer obtains information from the selling vendor with respect to a purchase of a product or service by the purchasing customer from the selling vendor."

The question in dispute is whether "providing a communications link through equipment of the third party" means providing internet access to the customer. Defendants say it does; plaintiff says the phrase is not so limited (though plaintiff never identified a definitive construction of the phrase).

Plaintiff is correct that the claim itself does not define "communications link" the way defendants propose. And plaintiff is also correct that the lay understanding of "communications link" is much broader than "internet access." However, courts cannot look at the claims in isolation or at just the lay understanding of them, but must consider the patent as a whole. As the court explained in Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005) (citations and quotations omitted):

The claims, of course, do not stand alone. Rather, they are part of a fully integrated written instrument, consisting principally of a specification that concludes with the claims. For that reason, claims must be read in view of the specification, of which they are a part. . . . [T]he specification is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.

The phrase "communications link" is never used in the specification, which is the same in both asserted patents, but the specification makes it unmistakably clear that the invention requires that the third party provide internet access to the customer. Because the phrase "communications link" is the only part of the claim that could incorporate this requirement, I construe "providing a communications link" to mean "providing customers access to the internet."

The first two sentences of the abstract support this construction: "An Internet billing method comprises establishing an agreement between an Internet access provider and a customer . . . . The provider creates access to the Internet for the customer." '739 pat., abstract. Thus, the abstract is unambiguous: the third party intermediary is "an Internet access provider" and that provider does in fact connect the customer to the internet. The Court of Appeals for the Federal Circuit has recognized on multiple occasions the importance of the abstract in construing the scope of a claim term. Pandrol USA, LP v. Airboss Ry. Products, Inc., 320 F.3d 1354, 1363 (Fed. Cir. 2003); SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337 (Fed. Cir. 2001). Plaintiff advances no argument for disregarding it in this case.

The same understanding of the invention is repeated throughout the Summary of the Invention as well. In describing the invention, the patent states that "a provider establishes an agreement with a customer," '739 pat., col. 2, Ins. 19-20 and even more explicitly that "the provider creates access to the Internet for the customer through the provider's equipment," '739 pat., col. 2, Ins. 27-29. In countless instances, the specification refers to the third party as the "provider," which plaintiff conceded at the claim construction hearing means "internet access provider."

Plaintiff attempts to dismiss these references in the specification as discussions of embodiments, but its efforts are unconvincing. To be sure, the embodiments in the patents require the third party to provide the customer with access to the internet. For example, the second step of Figure 2 is "Connect Customer to Internet." But the references in the Summary of the Invention to the "provider" are made in the context of discussions of "the present invention," which, in accordance with Federal Circuit precedent and common sense, means what it sounds like: the limitation of a provider connecting the customer to the internet applies to the invention as a whole and not just to a particular embodiment. Verizon Services Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1308 (Fed. Cir. 2007) ("When a patent thus describes the features of the 'present
Plaintiff argues that other parts of the patent support a more expansive construction, but none of these arguments is persuasive. First, plaintiff points to dependent claim 6 of the '739 patent, which provides: "The method according to claim 1, 2, 3, 4, or 5, wherein the third party is an Internet access provider, a cable television company, a telephone company, or a company offering financial services." Plaintiff argues that claim 6 would be "meaningless" under defendants' proposed construction because there would be no need to identify an "Internet access provider" as an example of a third party if claim 1 required the third party to connect the customer to the internet.

Plaintiff's argument has some surface appeal, but I agree with defendants that a reasonable reading of claim 6 is that it simply lists examples of entities that may provide customers with access to the internet. Thus, in claim 6, "Internet access provider" means a company like America On-Line, "whose only business is to offer connection to the Internet," '739 pat., col. 1, Ins. 26-27; the other examples, such as "a cable television company," are entities that may offer internet access as an additional service.

This reading is supported by the specification, which contemplates in multiple locations the possibility that a cable television company or telephone company will provide the customer with internet access. E.g., '739 pat., col. 1, Ins. 29-30 ("[T]elephone companies and cable television companies have announced plans to provide Internet access."); id. at col. 2, Ins. 64-65 (access to internet may be provided by "cable television companies" or "telephone companies"). In any event, plaintiff's reliance on a presumption of claim differentiation cannot overcome the plain language of the patents. Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1369-70 (Fed. Cir. 2007).

Plaintiff seizes on the patents' references to "companies offering financial services" as an example of a potential third party intermediary, but never explains why "companies offering financial services" could not also be internet access providers. Although the patent does not include financial service companies in its lists of examples of internet access providers, e.g., '739 pat., col. 2, Ins. 61-65, that does not mean that such companies cannot be providers. An invention is not limited to its examples.

Further, the Summary of the Invention appears to contemplate that financial service companies will provide internet access: "The main object of the present invention is to create a new business opportunity for telephone companies, cable television companies, existing internet access providers, and companies offering financial services . . . ." '739 pat., col. 1, Ins. 61-64 (emphasis added). By distinguishing "existing" internet access providers from other types of companies, the specification suggests that the "new business opportunity" for those other companies involves providing internet access.

Finally, plaintiff points to passages in the patent discussing vendors that obtain internet access from a source other than the third party intermediary. In other words, the patent permits vendors to connect to the internet however they wish. This gets plaintiff nowhere because the dispute is not related to where vendors get internet access, but where customers obtain it. The specification makes it clear that customers must get their internet access from the third party intermediary. Plaintiff can cite no passage to the contrary despite its best efforts.

Both sides advance arguments supporting their view of how the prosecution history informs the meaning of "communications link," but it is unnecessary to consider those arguments when the patent itself is clear. Phillips, 415 F.3d at 1317 ("[B]ecause the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes.") Accordingly I conclude that "providing a communications link" means "providing customers access to the internet." Because it is undisputed that defendants do not provide their customers with internet access, I conclude as a matter of law that defendants do not literally infringe plaintiff's asserted claims. Further, because plaintiff failed to respond to defendants' argument that defendants do not infringe under the doctrine of equivalents, I conclude that plaintiff has forfeited that issue.

GO BACK
4. "providing"

The parties dispute the meaning of the term "providing" in the phrase "providing a decode control key to the receiver station" of claim 21. Echostar argues that "providing" includes the process by which a decode control key is permanently stored in a memory of the receiver, while IPPV argues that "providing" describes the act of making something available that was previously unavailable. Thus, IPPV contends that if the receiver station accesses the decode control key after it has been permanently stored in a memory, it has not been "provided" with the key.

In support of its position, Echostar argues that the plain and ordinary meaning of "provide" is to furnish or supply. It contends that in accordance with the plain meaning, "providing" includes permanently storing in a memory at the receiving station. Echostar also refers the court to the preferred embodiment where a master key is permanently stored in read-only memory. This type of memory is a permanent memory. Finally, Echostar cites the following exchange from Sherwood's deposition testimony:

Q. So if the decode control key is stored in the receiver, that doesn't meet your definition of the word "provide." Is that correct?

A. It depends upon how it is stored.

Q. Tell me what kind of storing would meet the definition of "provide" and what kind of storing would not.

A. It could be stored in electronic form.

Q. Would that meet the definition of provide or not?

A. Yes.

* * *

Q. You answered one question by referring to something being stored in electronic form.

A. Yes.

Q. Are you referring to memory?

A. I -- yes. I can't think right now of any other method of storing in electronic form.

Echostar argues that Sherwood's deposition testimony that "providing" includes storing in a memory is consistent with its construction.

IPPV counters that the plain meaning of "providing" describes the act of making something available that was previously unavailable. It explains that after the key is stored in a memory, it is available, and therefore, when the receiver station accesses the key, it has not been "provided" with the key. Thus, IPPV argues that in accordance with the plain meaning of "providing," the act of storing the key in a memory does not constitute "providing."

IPPV views "providing" as containing an element or condition of immediate need. The court finds no reason to insert that condition into the plain meaning of "providing." In the same way that an oil supplier provides heating oil to homes before it is needed to produce heat, the method in claim 21 provides the decode control key to the receiver station before it is needed for decryption. The key is still provided by the method even though the receiver does not need or use the key immediately. As a result, the court concludes that "providing" includes permanently storing in a memory at the receiving station.
C. Providing a Driver

The term "providing a driver" or "providing a first driver" appears in a number of claims. Timeline argues that if the court construes this term, it should be construed as "to supply or make available a driver." Defendants argue that the term should be construed as "identifying and initializing a driver."

The word "providing" is not a term of art and its ordinary meaning is not difficult to determine. Defendants themselves refer to the following definition of the term from a standard dictionary:

provide: "1. archaic: to prepare or get ready in advance 2 a: to supply or make available (something wanted or needed) . . . . b: to make something available to . . . . 3: to have as a condition." Webster's Ninth New Collegiate Dictionary, 1987.

Timeline's proposed definition matches one of the definitions in the dictionary cited by Defendants.

In support of their proposed construction, Defendants note that the '511 patent specification states:

In the procedure depicted in FIG. 10, the first step after the procedure starts 1002 is to identify and initialize the dynamic drivers 1004.

511 patent, col. 11:39-41. The "1004" in this sentence refers to block number 1004 in Figure 10. Defendants then point to claim 1 of the '511 patent, which discloses a method comprising of "a first step for providing a first driver. . . ." (as well as "a second step for using said first driver. . . ."). Defendants suggest that the "first step for providing a first driver" in claim 1 relates to the "first step after the procedure starts" in block number 1004, which involves "identify[ing] and initializ[ing] the dynamic drivers."

In response, Timeline argues that Defendants' own briefing suggests that block number 1004 (i.e., identifying and initializing the dynamic drivers) relates to "using" a driver, rather than "providing" a driver. Timeline notes that in Defendants' briefing on one of the means-plus-function claims, Defendants assert that block number 1004 is part of the structure that performs the function of "using" a driver. See Dkt. No. 218 at 14-16. Specifically, Defendants state that block 1004 involves "activating drivers" and that block 1004 is one of "four steps relating to the function 'using said driver . . . '", Id. at 15.

The terms "providing" a driver and "using" a driver both appear in a number of the same claims. As Timeline notes, Defendants contend in one section of their brief that "providing a driver" means "identifying and initializing" a driver as shown in block number 1004, but argue later in their brief that block number 1004 relates to "using" a driver. As Timeline suggests, Defendants' arguments appear to be inconsistent.

Therefore, the court adopts Timeline's proposed construction of "providing a driver," which is consistent with its ordinary meaning. The term "providing a driver" means "supplying or making available a driver."

"Providing a Level of Service to the Traffic Associated with the Particular Customer of the Packet-Based Network Independent of All Other Traffic on the Packet-Based Network Outside of the Virtual Private Network's Logical Domain"

Alcatel's proposed construction for the above term is "a customer's virtual private network receives an agreed upon performance for its traffic regardless of any traffic in the network that is not associated with that virtual private network."

Cisco's proposed construction is "resources providing a particular level of service to a particular customer's virtual private network."
Again, both parties are largely in agreement as to the meaning of the above term. In fact, both parties essentially argue that the above language is plain on its face. Cisco argues that the above claim language is "self-explanatory," and Alcatel has stated that it "agrees with [Cisco's] assessment." See Cisco's Opening Claim Construction Brief Concerning U.S. Patent No. 5,768,271 (Seid) ("Cisco's '271 Opening Brief"), at 13; Alcatel's Responsive Markman Brief on Claim Construction Regarding United States Patent No. 5,768,271 (Seid et al.) ("Alcatel's '271 Responsive Brief"), at 13.

In light of the parties' arguments regarding the self-explanatory nature of the above term, and the Court's own reading of the term, the Court finds that the language in the above term is plain on its face and requires no further construction. 54

54 The only words in the above term that require independent construction are "virtual private network," which the Court has already construed previously.

G. "Providing A Readout Of The Glucose Concentration In The Blood Sample"

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiffs' Construction</th>
<th>Defendants' Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;providing a readout of the glucose concentration in the blood sample&quot;</td>
<td>An output indicating the concentration of glucose in the blood sample.</td>
<td>Displaying the blood glucose concentration on a device that can be read by the user.</td>
</tr>
</tbody>
</table>

Plaintiffs contend that Defendants are attempting to improperly "impose a 'display' and 'read by user' requirement." (D.I. 397 at 32:21-23.) Plaintiffs assert - and the Court agrees - that "[t]he specification of the patents in suit does not expressly define the term 'readout.'" (D.I. 357 at 31.) Accordingly, Plaintiffs purport to draw their proposed construction from a number of general purpose dictionary definitions, which is not inappropriate. See, Mass. Inst. of Tech. v. Abacus Software, 462 F.3d 1344, 1351 (Fed. Cir. 2006) (where the specification failed to define a claim term, explaining that "it is appropriate . . . to look to dictionary definitions of the terms").

However, on reviewing Plaintiffs' dictionary definitions, the Court concludes that they actually tend to support Defendants' proposed construction. For instance, Plaintiffs note that the Oxford English Dictionary defines "readout" as "[t]he display of data by an automatic device in an understandable form." (Id. (citing Oxford English Dictionary Online, Oxford University Press 2008 (emphasis added))). Similarly, Plaintiffs point out that WordNet, a lexical database of English, provides that "readout" means "1. the output of a computer in readable form; 2. the information displayed or recorded as an electronic device; and 3. an electronic device the displays information is a visual form." (Id. at 32 (citing WordNet 3.0,
http://wordnet.princeton.edu/ (emphasis added)). Referring to "understandable" and "readable" forms and the use of "devices" that "display," the Court concludes that Plaintiffs' dictionary definitions comport most closely with Defendants' proposed construction for this claim term. And, in the Court's view, these definitions also comport with the plain and ordinary meaning of "readout." Accordingly, the Court will construe the claim term "providing a readout of the glucose concentration in the blood sample" to mean, as Defendants contend, "displaying the blood glucose concentration on a device that can be read by the user."

5. "providing a second substantially transparent substrate member having a continuous layer of transparent conductive material disposed on one surface thereof, said second substrate being spacedly disposed from said first substrate and arranged so that the layer of transparent conductive material of said second substrate faces the layer of transparent conductive material of the first substrate" (Claim Element 9) (Claim 26 of the '711 Patent; Claims 22, 25, 26, and 29 of the '682 Patent)

ATI has proposed that this term means:

Providing a second substrate having a continuous layer of transparent conductive material placed on one surface. The substrates are assembled so that the first and second substrates are spaced apart from each other and the layer of conductive material of the first substrate and the layer of conductive material of the second substrate face each other.

Dkt. No. 113, Ex. at 7. Sharp has proposed:

The phrases "providing a second substantially transparent substrate member having a continuous layer of transparent material" and "said second substrate" mean a "continuous transparent conductive layer on the second substrate."

The overall phrase means "providing a second substrate having a continuous layer of transparent conductive material placed on its surface, where said second substrate is assembled so that the first and second substrates are spaced apart from each other and the layer of conductive material of the first substrate and the layer of conductive material of the second substrate face each other."

Id. DNP has proposed that this term means:

Providing a second substrate having a continuous layer of transparent electrically conductive material placed on its surface (i.e., directly onto the second substrate), where the first and second substrate are assembled so that the first and second substrates are spaced apart from each other and the layer of conductive material of the first substrate and the layer of conductive material of the second substrate face each other.

Id.

The Order construed this term to mean "providing a second substrate having a continuous layer of transparent conductive material placed on one surface. The substrates are assembled so that the first and second substrates are spaced apart from each other and the layer of conductive material of the first substrate and the layer of conductive material of the second substrate face each other." Dkt. No. 117 at 48-49.

a. Objections

Sharp submitted a Request for Clarification of the Order, which requested that a third sentence be added to the construction as follows: "With respect to claim 26 of the '711 patent, when the two substrates are assembled so that they face each other, the conductive layer on the second substrate is continuous." See Dkt. No. 120. Sharps argued, in part, that "the use of 'said second substrate' in Claim Element 9 demonstrates that the conductive layer must be 'continuous' because there is no reference in claim 26 of the '711 patent to a patterning step or a patterned conductive layer." Id. at 2. In support, Sharp argues that "a layer cannot be both 'continuous' and 'patterned' at the same time. Id. ATI responded that terms should be construed consistently across claims and that a 'comprising' method claim should not be construed to exclude additional
steps. Dkt. No. 121 at 2-3. Sharp replies that because the antecedent basis for "the layer" in Claim Element 9 refers to "a continuous layer," the layer must remain continuous, i.e., cannot be patterned. See Dkt. No. 122. Magistrate Judge Bryant denied Sharp's request, finding that "no such clarification of Claim Element 9 is necessary." Dkt. No. 127 at 1-2.

b. Discussion

Claim Element 9 appears in both Claim 26 of the '711 Patent and claim 22 of the '682 Patent. The '682 Patent is derived from a continuation of the '711 Patent, and these two patents share a common parent application. See '682 Patent and '711 Patent at item [63] of cover page. Where "patents all derive from the same parent application and share many common terms, we must interpret the claims consistently across all asserted patents." NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2005); see also Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990) ("The '912 patent is the result of a continuation-in-part application from the original '008 application, which led to the '251 patent. Hence . . . the construction of the term 'diffuse light' contained in that patent, is relevant to an understanding of 'diffuse light' as that term is used in the '912 patent."). Claim Element 9 should therefore be interpreted consistently in both the '711 Patent and the '682 Patent if possible. The Court therefore rejects Sharp's argument that Claim Element 9 should be construed such that patterning is permissible in Claim 22 of the '682 Patent but impermissible in Claim 26 of the '711.

Further, Claim 26 of the '711 Patent is a method "comprising" several steps, which should generally not be construed to exclude additional steps. Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997); Smith & Nephew v. Ethicon, Inc., 276 F.3d 1304, 1311 (Fed. Cir. 2001). Sharp has not shown that a layer cannot be "provided" as "a continuous layer" and then "patterned." Instead, the recitation of such a scenario in Claim 26 of the '711 Patent teaches that Claim Element 9 does not exclude patterning. The specification also suggests that a layer can be provided or disposed in a continuous manner and then patterned, as discussed in § III.6, below. Sharp points to the absence of the words "continuous" or "patterned" in a similar step in Claim 18 of the '682 Patent, but Claim 18 does not outweigh, nor even contradict, the noted intrinsic evidence suggesting that a layer that is continuous can undergo patterning.

The Court expressly rejects the clarification requested by Sharp, and the order (Dkt. No. 127) on Sharp's Request for Clarification should accordingly be modified to reflect this rejection. The construction of Claim Element 6 in the Order (Dkt. No. 117) should be affirmed.

3462

a. "providing a signal based on the measured pressure in the chamber to a control module"

ATI contends that no construction is necessary whereas Defendants argue that the court should construe this phrase to parallel Claim 1: "providing a signal indicating the measured pressure in the chamber to the control module."

For subsequent claims that reproduce relevant language construed above (particularly, "a signal based on the measured pressure"), the court's construction of those claims shall correspond to the above construction. 3 The Federal Circuit has instructed that "[u]nless otherwise compelled, when different claims of a patent use the same language, we give that language the same effect in each claim." Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1119 (Fed. Cir. 2004); see also Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987), overruled on other grounds by Cardinal Chemical Co. v. Morton Intern., Inc., 508 U.S. 83, 113 S. Ct. 1967, 124 L. Ed. 2d 1 (1993); see generally Digital Biometrics, Inc. v. Identix, Inc. 149 F.3d 1335, 1345 (Fed. Cir. 1998) ("[W]hatever interpretation we assign should encompass both uses because the same word appearing in the same claim should be interpreted consistently.").

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Indeed, the parties' claim construction chart relies heavily upon "see above" as the parties refer back, and even across patents, to various phrases in the claim construction chart. The court sees no reason to deviate from a consistent construction of this language across all of the patents. Likewise, where the parties rely upon earlier constructions, across claims or patents, the court will adhere to consistent constructions. While in some cases like language in different patents might result in differing constructions, in this case the parties agree that the language should be construed similarly.
However, the court will use the indefinite article "a" rather than "the" because no prior mention of a "control module" is given in this claim to which to refer. Accordingly, the court will construe the phrase "providing a signal based on the measured pressure in the chamber to a control module" as "providing a signal based upon the measured pressure in the chamber to a control module."

3463
C) "Providing access to a personal computer . . . from a remote computer"

The parties disagree about the definition of this phrase. First, 01 Communique contends that this phrase requires no construction at all. In the alternative, 01 Communique proposes that it means "Providing access to (i.e., permission, liberty, or ability to enter, approach, or pass to and from a place or to approach or communicate with a person or thing) the claimed personal computer . . . from a remote computer." Citrix, meanwhile, suggests a more literal translation, to wit, "Providing a connection (i.e., a physical link via wire, radio, fiber-optic cable or other medium) between the claimed personal computer and the claimed remote computer."

When evaluating a claim term, "[i]n those cases where the ordinary meaning of a claim term as understood by a person of ordinary skill in the art is readily apparent even to lay persons, the ordinary meaning becomes the acquired meaning of the term." Herbert F. Schwartz, Patent Law and Practice § 5.I.A.2. (5th ed. 2006) (citing Phillips, 415 F.3d at 1314). This phrase falls within that category; the court finds that it requires no construction.

3464
8. "providing access . . . to each component provided for the computer selected from the group consisting of"

This term appears in the '408 patent claim 9. It is helpful to provide the full language of that claim, which recites:

A computer comprising:

- a main board having I/O connectors including one or more data transmission ports mounted thereon; and
- a chassis comprising a front panel providing access to the I/O connectors including the one or more data transmission ports and access to each component provided for the computer selected from the group consisting of removable power supplies, removable drives, removable media drives, one or more plugs for external drives and devices, and ports for switches.

At the hearing, the court noted that in its claim construction brief, Supermicro had proposed a construction different from that proposed in the joint claim construction statement, without complying with the court's standing order. Supermicro advised the court that any change was inadvertent, and that it would rely upon the joint claim construction statement. Accordingly, that is the construction that the court now considers.

Rackable contends that "providing access . . . to each component provided for the computer selected from the group consisting of" means "to each removable power supply, removable drive or removable media drive, if present." Supermicro asserts that "providing access . . . to each component provided for the computer selected from the group consisting of" means "providing the user or operator of the computer with access to each of the following parts of the computer if present [see claim language for list of items]."

According to Rackable, the issue concerns which of the items must each be located on the front, if present, as opposed to being potentially found on both the front and back of the computer. Rackable breaks down the subsequent claim language into three categories, including: (1) removable power supplies, removable drives, and removable media drives; (2) plugs for
external drives and devices; and (3) ports for switches. According to Rackable, the claim language requires access only to the items included in category (1) -- the removable power supplies, removable drives, and removable media drives to the extent that these removable components are present. In other words, it asserts that the members of the group for which access is required are only those referred to as "removable."

Rackable thus argues that the access described does not apply to the "plugs for external drives and devices, and ports for switches." It argues that only one plug for external drives and devices need be present on the front panel, and that redundant or duplicate plugs may indeed be located on a rear panel. Regarding the third component, the "ports for switches," Rackable implies that the "providing access" language does not apply to the ports. Instead, the ports are simply located on the front panel.

Supermicro, on the other hand, argues that "providing access" refers to all components -- not just the removable ones. In other words, Supermicro asserts that the access language applies to all three groups that Rackable has listed, including the (1) removable power supplies, removable drives, and removable media drives; (2) plugs for external drives and devices; and (3) ports for switches. To the extent that any of the three groups of components is present, Supermicro argues that they must be located on the front of the computer.

Supermicro argues that Rackable's construction makes no sense because it is ignoring words that actually appear in the disputed claim language, and instead improperly imports other limitations into its construction. It further notes that there is a "linguistic dispute" among the parties regarding the phrase "group consisting of." Supermicro asserts that because all of the items following that phrase are listed in succession, and separated by commas, its reading is the more natural of the two. It argues that Rackable misreads the placement of the word "and."

The term "consisting of" means that the list of ingredients following the term is a closed list, such that additional ingredients cannot be present in the composition. Robert C. Karhl, Patent Claim Construction § 4.03[1], Transitional Words and Phrases (Aspen 2005 Suppl.); Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1327 (Fed. Cir. 1999). The term, however, "does not necessarily mean that no other components can be used with the invention, but only that the list of ingredients of the same type cannot be augmented." Id.; Norian Corp. v. Stryker Corp., 363 F.3d 1321, 1331-32 (Fed. Cir. 2004); see also Mars, Inc. v. H.J. Heinz Co., 377 F.3d 1369, 1375-76 (Fed. Cir. 2004).

Rackable's proposed construction is contrary to the normal construction of a group following "consisting of" language. It attempts to limit the closed group inappropriately. There is nothing in the claim language or the specification that suggests that the plugs and ports, which follow the removable components, are not a part of "the group consisting of," as Rackable implies.

Additionally, Supermicro's construction is a more grammatically correct interpretation of the disputed language, as endorsed by the Federal Circuit. See SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870, 885 (Fed. Cir. 2004). Where a phrase such as "group consisting of" "precedes a series of categories of criteria, and the patentee used the term "and" to separate the categories of criteria," this "connotes a conjunctive list." Id. In other words, applying the correct grammatical principle, the phrase "group consisting of" "modifies each member of the list, i.e., each category in the list." Id. (relying in part on William Strunk, Jr. & E.B. White, The Elements of Style).

Accordingly, the court adopts Supermicro's definition and construes "providing access . . . to each component provided for the computer selected from the group consisting of" as providing the user or operator of the computer with access to each of the following parts of the computer if present: removable power supplies, removable drives, removable media drives, one or more plugs for external drives and devices, and ports for switches. In other words, the court construes "group consisting of" to include all three categories that follow the phrase, including removable components, plugs, and ports. Rackable's attempt to limit the group to the removable components improperly narrows and modifies the claim language. See Renishaw, 158 F.3d at 1250 (claim may not be construed to "add a narrowing modifier before an otherwise general term that stands unmodified in a claim").
EMC contends that the phrase "write is pending," which is used solely in the claims of the ’792 patent, means that a write operation has not yet been completed. Although HP does not specifically dispute that definition, it maintains that the phrase "write is pending" means that data for a predetermined data element is stored in cache memory on the controller and waiting to be "de-staged" to the storage device. The prevailing dispute, therefore, is whether "write is pending" includes only write operations pending from cache memory.

As an initial matter, this Court has already determined that the ’347 and ’792 patents do not disclose an invention that requires cache memory. Likewise, neither the claim language nor the Specification of the ’792 Patent defines the phrase "write is pending" to mean data stored in the cache memory of the controller and waiting to be "de-staged" to a storage device. Indeed, Claim 10 of the ’792 Patent states, in relevant part,

maintaining, in said data storage system, a third indicator providing an indication of whether a write is pending to said predetermined data element stored on said data storage system . . . .

’792 Patent, Col. 62, ll. 32-35 (emphasis added). Nothing in that language explicitly or implicitly requires that the third indicator provide an indication of whether there is data stored in the cache memory of the controller waiting to be "de-staged" to the storage device. Moreover, dependent Claim 12 of the ’792 patent states, in relevant part,

[t]he method as claimed in claim 10, wherein said data storage system contains a cache memory and a disk data storage device, said third indicator provides an indication of whether a write is pending from said cache memory to said disk data storage device. . . .

’792 Patent, Col. 62, ll. 52-56 (emphasis added). Pursuant to the doctrine of claim differentiation, therefore, there is a presumption that the phrase "write is pending," as used in Claim 10 of the ’792 patent, includes more than write operations pending from cache memory.

Although the Specification of the ’792 Patent refers, in some instances, to cache memory when discussing the "write pending" indicators, EMC did not become its own lexicographer by redefining the term "write is pending" to mean a write pending from cache memory. For example, the Specification states that

when a host computer writes data to a primary data storage system, it sets both the primary and secondary bits . . . of the write pending bits . . . when data is written to cache.

’792 Patent, Col. 11, ll. 31-33 (emphasis added). Prior to that statement, however, the patentees explain that data for which a write is pending can be stored in places other than the cache memory of the controller when they state that

the primary data storage system must maintain a log file of pending data which has yet to be written to the secondary data storage device. Such data may be kept on removable, non-volatile media, in the cache memory of the primary or secondary data storage system controller . . . or in the service processor . . . .

’792 Patent, Col. 10, ll. 51-57 (emphasis added).

Neither the plain and ordinary meaning of the phrase "write is pending" nor the language of the Specification of the ’792 Patent require that it be defined as data stored in the cache memory of the controller and waiting to be "de-staged" to the storage device. As used in the ’792 Patent, therefore, the phrase “providing an indication of whether a write is pending” will be construed to mean providing an indication of whether a write operation is in progress but not yet completed. 11

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -
in vain.

The parties dispute the meaning of the limitation "providing fabrication sequences" found in claim 1. IPI interprets the phrase to mean providing an alterable series of operations for the manufacture of a part or parts. Defendants argue that to provide a sequence of process operations, it is necessary for the patented method to include both the type of the processing operations being modeled and the order in which those operations are conducted. Thus, defendants propose that the limitation should be construed to mean supplying the type and order of process operations that are required to complete the products manufactured in the plant with the type and order of process operations being capable of changing during modeling.

The claim itself indicates what is meant by the phrase "fabrication sequence." Claim 1 reads "providing fabrication sequences consisting of process steps for the products manufactured in the plant." (emphasis added). Consistent with this definition, the specification defines a fabrication sequence as "a sequence of process operations that are required to complete a product." U.S. Patent No. 4,796,194, col. 11, lines 39-40. Among other things, the patent provides that allowable variations include changes in the attributes of a small set of process steps and the addition or deletion of one or more process steps. Id., col. 11, lines 53-56. The term is more nuanced than what is conveyed by defendants' inclusion of "type and order of process operations." Similarly, the defendants have not convinced the Court that the insertion of "during the modeling" is necessary.

Both parties' definitions include the notion that fabrication sequences are "alterable" or "capable of changing." Though the patent makes it clear that this is the case, the Court does not find that the term itself encompasses this meaning. If it did, the patent's references to "dynamic fabrication sequences" would be repetitive. Moreover, claim 17, which is dependent upon claim 1, discloses "the process for modeling a manufacturing plant of claim 1 in which the fabrication sequences are dynamic, time-varying fabrication sequences." As a dependent claim, claim 17 must be narrower in scope than claim 1. See Nazomi Communications, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1370 (Fed. Cir. 2005) (noting that the concept of claim differentiation normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend). Claim 17 adds the limitation that the fabrication sequences of claim 1 are dynamic and time-varying. The Court therefore adopts the following construction of the phrase "providing fabrication sequences" in claim 1: providing a series of operations for the manufacture of a part or parts.

Claims 1 and 18 of the '352 patent also require "providing an indication of the simultaneous presence of two fingers in response to identification of said first and second maxima." This limitation was amended during prosecution to distinguish prior art that inherently produced a finger profile with two maxima separated by a minimum when two fingers were placed on the touchpad. Applicants explained the amendment stating that "[t]he present invention uniquely utilizes the detection of two maxima to determine if two fingers are present on the touchpad. Nowhere does [the prior art] suggest analyzing profile information to obtain this result, or to use the result to provide an indication of two fingers." Declaration of Karl J. Kramer in Support of Synaptics' Motion for Summary Judgment of Noninfringement of the Asserted Claims of the '352 patent ("Kramer SJ Decl."), Ex. 5, April 6, 1998 Amendment at 4. The Court did not construe the meaning of the "providing an indication" limitation in the Claim Construction Order.

Synaptics alleges that the parties agreed that "providing an indication" is "[t]he function of detecting the simultaneous presence of two fingers and reporting that presence to the host." Synaptics' MSJ Brief at 11:18-20 (emphasis supplied).
Elantech disputes that the claim requires an indication of multiple fingers returned to the host; instead, Elantech argues that any form of indication is sufficient to satisfy the claim limitation. For example, Elantech argues that the "providing an indication" step is met by Synaptics' [redacted] code module. This module processes the finger profile to determine the location of the user's primary finger on the touchpad. [redacted] creates a temporary data structure which implicitly identifies multiple fingers in contact with the touchpad, although the code never attempts to "provide" such indication outside of the code module itself. Elantech alleges creating this data structure alone is sufficient to meet the "providing an indication" limitation.

Neither party's argument is persuasive. Nothing in the claim language or prosecution history supports Synaptics' argument that an indication of multiple fingers must be returned to the host in order to infringe. On the other hand, Elantech's position reads the limitation out of the claims. Elantech argues that implicit identification of multiple fingers is all that is required to meet the claim limitation. But simply recognizing a finger profile with two maxima separated by a minima also implicitly identifies the presence of multiple fingers, and the "providing an indication" limitation was added to the claims of the '352 patent during prosecution for the express purpose of overcoming prior art that produced such a finger profile. See Kramer SJ Decl., Ex. 5, April 6, 1998 Amendment at 4. Thus, Elantech's argument that implicit identification of multiple fingers is all that the claim requires eviscerates the claim limitation and cannot stand.

The "providing an indication" limitation does not require that the "indication" of two fingers be returned to the host. However, the limitation does require that infringing methodology perform some affirmative step to provide an indication of multiple fingers.

3468

d. "Providing Said At Least Partially Surrounding Image Elements In Respect To Said Particular Position"

Though this term appears in the claim construction chart, the only discussion provided for its construction appears in IP's brief, which advances its definition and provides what it contends to be Lexmark and Dell's proposed definition. IP proposes that the term means making at least some of the image elements of the original image that surround the particular position available for inspection. Lexmark and Dell supposedly propose that it means making the pixels of the electronically coded input image that at least partially surround the particular position simultaneously available for electronic inspection.

Lexmark and Dell's apparent position would add terms unsupported by the plain language of the claim, namely that the input image be "electronically coded," that the pixels be "simultaneously" available, and that inspection be "electronic." For the reasons described above where similar insertions were attempted, we conclude that IP's definition is preferable here. Thus, we construe this term to mean making at least some of the image elements of the original image that surround the particular position available for inspection.

3469

"DNS proxy server"

The '135 patent, claim 10 contains the term "DNS proxy server." VirnetX contends that "DNS proxy server" means "a computer or program that responds to a domain name inquiry in place of a DNS." Microsoft contends that "DNS proxy server" means "a computer that intercepts a DNS request from a client computer to a DNS server and checks the request to determine whether access to a secure web site has been requested." The parties dispute whether the "DNS proxy server" must check the DNS request or if it "responds" to a domain name inquiry, whether "DNS proxy server" can only be a computer or if it can be a computer or a program, and whether the "DNS proxy server" must be separate from the client computer.

The Court adopts VirnetX's proposed construction and construes "DNS proxy server" as "a computer or program that responds to a domain name inquiry in place of a DNS." First, the claim language supports that a "DNS proxy server" "responds to a domain name inquiry in place of a DNS." Claim 10 states
a DNS proxy server that receives a request from the client computer to look up an IP address for a domain name, wherein
the DNS proxy server returns the IP address for the requested domain name if it is determined that access to a non-secure
web site has been requested, and wherein the DNS proxy server generates a request to create the VPN between the client
computer and the secure target computer if it is determined that access to a secure web site has been requested.

Col. 48:6-15 (emphasis added). This excerpt shows that a DNS proxy server receives a request from the client computer to
look up an IP address for a domain name and then responds by returning the IP address for the requested domain name or by
creating a VPN, depending on the type of request made by the client computer. Thus, a DNS proxy server "responds"
according to the type of request made by the client computer.

Second, the specification supports that the "DNS proxy server" is a "computer or program." The specification discusses a
"DNS proxy server" in the following context: "It will be appreciated that the functions of DNS proxy 2610 and DNS server
2609 can be combined into a single server for convenience. Moreover, although element 2602 is shown as combining the
functions of two servers, the two servers can be made to operate independently." Col. 38:61-65. This excerpt discusses a
DNS proxy server as potentially being combined into a single server, and those skilled in the art understand "servers" as
including computers. See IEEE 100: THE AUTHORITATIVE DICTIONARY OF IEEE STANDARDS TERMS 1031 (7th
ed. 2000) (defining "server" in the third definition as "In a network, a device or computer system that is dedicated to
providing specific facilities to other devices attached to the network"). Then, the specification discusses "combining the
functions of two servers." Functions on servers/computers are understood by those skilled in the art to be controlled by
software. Thus, the specification discusses a "DNS proxy server" as a "computer or program." Accordingly, the Court
construes "DNS proxy server" as "a computer or program that responds to a domain name inquiry in place of a DNS."
4 The term "pseudo-random" is contained in claims 1, 12, 17, and 26 of the '646 patent and claim 1 of the '612 patent.

--- Footnotes ---

Plaintiff's Proposed Construction: No construction necessary; alternatively, "apparently random, but repeatable and predictable."
Defendants' Proposed Construction: "refers to output that is repeatable and predictable to anyone who knows the function's input but appears to be totally random to those without such knowledge."

The patents-in-suit both contain the claim term "pseudo-random," and the parties agree that this term has the same meaning in all of the asserted claims. In the specifications, the claim term is recited as "output that is repeatable and predictable to anyone who knows the E-Key seed input to the function producing the output." The specifications further states that "without such knowledge, the output appears to be totally random." '646 patent at 5:14-18; '612 patent at 4:1-5.

--- Footnotes ---

5 The presumption that the same claim term retains the same meaning throughout related patents will be applied throughout the instant Memorandum Opinion and Order. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1334 (Fed. Cir. 2003) ("we presume, unless otherwise compelled, that the same claim term in . . . related patents carries the same construed meaning").

--- Footnotes ---

PACid contends that this term does not need to be construed because the jury may apply its plain meaning. OPENING at 3. Alternatively, PACid proposes a construction that incorporates the "relevant properties of a pseudo-random output." In particular, PACid suggests a construction for pseudo-random that it is "repeatable and predictable, yet apparently random." Id. at 4. Defendants contend that a lay juror will not be familiar with the claim term and the Court should adopt the explicit definition in the specifications. RESPONSE at 3-4.

A review of the disputed claim term suggests that even while "pseudo-random" should be accorded its "ordinary and customary meaning," in this case, determining the plain and ordinary meaning of "pseudo-random" goes beyond the application of widely accepted meaning of commonly understood words. See Phillips, 415 F.3d at 1314. Accordingly, it is appropriate to provide a construction that would assist a lay jury in understanding what a person of ordinary skill in the art would understand "pseudo-random" to mean in light of the '646 and '612 patent. See O2 Micro International Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1362-63 (Fed. Cir. 2008).

The Court finds that the inventor provided an express definition for the disputed term:

The term 'pseudo-random' as used in this specification means that the output referred to is repeatable and predictable to anyone who knows they E-Key seed input to the function producing the output. Without such knowledge, the output appears to be totally random.

'646 patent at 5:14-18; '612 patent at 4:1-4. The inventor's express definition offers a construction that includes three elements that the patentee considered important at the time of the invention: (1) "without knowledge of the function's input," the output "appears to be totally random"; (2) the function is repeatable and predictable "to anyone who knows the function's input; and (3) the output appears to be "totally" random. See '646 patent at 5:14-18; '612 patent at 4:1-5. Since these elements were clearly set forth, a construction not including all of the inventor's requirements-- as provided in the specification-- would impermissibly broaden the term beyond its express definition. PACid considers the explicit requirements of the specification to be "surplus language," but by explicitly defining "pseudo-random" in the specification, the patentee instructed those skilled in the art that all three requirements would be present in the claim term. See Cook Biotech Inc. v. Acell, Inc., 460 F.3d 1365, 1372 (Fed. Cir. 2006) (recognizing that the person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification). Where, as here, the inventor provided an explicit definition for "pseudo-random," that definition will govern. Phillips, 415 F.3d at 1313; Martek Biosciences Corp. v. Nutrinova, Inc., 579
Accordingly, the Court finds that a construction is needed to resolve the parties' dispute and that the claim scope is best defined by combining passages in the specification. The construction for the term "pseudo-random" is "refers to output that is repeatable and predictable to anyone who knows the function's input but appears to be totally random to those without such knowledge."

**3472**

"Pseudo Virtual Path"

Alcatel's proposed construction for the term "pseudo virtual path" is "a logical connection transmitted over a physical path for carrying data that is not associated with any virtual private network." Cisco's proposed construction is "a virtual path for carrying data that is not associated with any virtual private network." The primary difference between the parties' proposals is that Cisco is seeking to import the construction of "virtual path" (and hence, the limitations associated with that construction) into the construction of "pseudo virtual path."

Nevertheless, in their briefs, the parties appear to agree on the meaning of "pseudo virtual path," they just disagree on the proper way to phrase the construction of the term. Both parties acknowledge that a "pseudo virtual path" is not associated with any virtual private network, and the language of claim 23 makes that point clear. See Seid, at 24:44-46 ("[A] pseudo virtual path is provided on each physical path to carry traffic not associated with a virtual private network.").

Therefore, since the non-association of the "pseudo virtual path" with a virtual private network is its primary identifying feature, the Court construes the term "pseudo virtual path" as "a logical connection transmitted over a physical path for carrying data that is not associated with any virtual private network."

**3473**

E. "Pseudorandom Number Generator Device"

The parties agree that a pseudorandom number is "a number having a seemingly random occurrence but which in fact was specifically selected or generated." Claim 1 uses the phrase "pseudorandom number generator device" as follows: (1) col. 6, l. 13-14 ("pseudorandom number generator device located in the computer"), (2) col. 6, l. 19-20 ("said pseudorandom number generator device including a sealed casing"), and (3) col. 6, l. 23-25 ("coupled to said reading means and said pseudorandom number generator device").

1. Disputed definitions

Plaintiff defines the generator as "hardware, software or a combination thereof, which provides one or more pseudorandom numbers as an output." Defendant defines the generator as "hardware that generates, in a deterministic fashion, a sequence of numbers that appear to be random."

The parties' dispute is whether the generator device consists of hardware only, software only, or a combination thereof.

2. Analysis

Claim 1 refers to a pseudorandom number generator device. The use of the word "device" implies the use of hardware, rather than software. For example, the '353 repeatedly uses the phrase "external memory device." "Device," as used in this phrase, refers to hardware, such as a disk drive or CD ROM and supports an interpretation of "pseudorandom number generator device" as also referring to hardware.

Moreover, the phrase "pseudorandom number generator device including a sealed casing" indicates that hardware must be
involved. At the claim construction hearing plaintiff conceded that the sealed casing would cover the hardware, although he contended that software could also be included. His concession, however, demonstrates that his proposed definition -- which would allow the pseudorandom number generator device to consist of only software -- is contrary to what is claimed.

Further, the specification identifies the "pseudorandom number generator" as hardware. In Fig. 3, the '353 identifies a generator that comprises a "shift register." Col. 4, l. 4-10.

Finally, the construction of "pseudorandom number generator device" as excluding software is consistent with the prosecution history. The Patent Examiner, in an action dated July 27, 1984, specifically stated that plaintiff "has claimed and disclosed a hardware random number generator 22 whereas [the prior art] discloses the software generation of random numbers." (Emphasis added.) There is nothing in the subsequent prosecution history that suggests that plaintiff objected to the characterization of his invention as claiming a hardware PRN generator. Rather, in his reply to the Patent Examiner, plaintiff specifically distinguished his invention from the prior art by stating that the prior art "does not have the pseudorandom number generator device including a sealed casing." Plaintiff stated further that his PRN generator device "includes a sealed casing, thereby preventing identification of the pseudorandom number generator device algorithm." Nov. 4, 1984 response at pages 3-4. Plaintiff thus agreed that his invention involves a hardware generator; as plaintiff conceded at the hearing, a software-only PRN generator would not require a sealed casing to prevent identification of the algorithm.

The fact that the specification states that "by implementing the PRN algorithm using software, rather than in a discrete generator, it is possible to render the algorithm reasonably inaccessible by essentially 'burying' the routine in the software," col. 5, l. 28-32, does not compel a definition of "generator device" that includes software only. As stated above, the claim uses the term "device" and states that the "device" includes a "sealed casing," thus requiring that hardware be involved. The reference to software in the specification may support an argument that a software implementation of the PRN generator is equivalent to the hardware implementation claimed, see generally Warner-Jenkinson co. v. Hilton Davis Chemical Co., 520 U.S. 17, 137 L. Ed. 2d 146, 117 S. Ct. 1040 (1997), but it is insufficient to demonstrate that plaintiff claimed a software-only device in light of the overwhelming evidence showing that he claimed a hardware PRN generator. Plaintiff's argument that the PRN generator device may include a combination of hardware and software is likewise an equivalence argument; there is nothing in the language of the claim, the specification or the prosecution history to support the conclusion that plaintiff specifically claimed a combination hardware/software PRN generator device.

F. "Pseudorandom Sequence"

Claim 1 provides that a second authorization code be a part of a "pseudorandom sequence." Col. 6, l. 10.

1. Disputed definitions

Plaintiff proposes that "sequence" means "an ordered set of pseudorandom numbers" (emphasis added). According to plaintiff, a "set," in turn, is a collection of particular things; a "set" can have zero, one or many elements.

Defendant proposes that a sequence be "a sequence of numbers produced by a pseudorandom number generator device."

2. Analysis

Plaintiff's proposed definition renders the word "sequence" meaningless. He does not explain how no number, that is, zero numbers, constitutes a "sequence" of numbers. Moreover, the specification supports an interpretation of sequence as requiring more than one number. "Pseudorandom sequences are characterized by sequences of long strings of numbers that appear as noise within portions of the sting." Col. 3, l. 58-60 (emphasis added). A "sting" must consist of two or more numbers.

GO BACK
"Public packet switched computer network" means "a packet switched computer network, accessible by the public through communication common carriers to provide data transmission services." "Packet switching" means "a message-delivery technique in which small units of information (packets) are relayed through stations in a computer network preferably along the best route available between the source and the destination." See IEEE Standard Dictionary of Elec. & Elecs. Terms, at 741 (6th ed. 1996) (defining "packet switching"). "Public data network" is "a network established and operated by common carriers for the specific purpose of providing low error-rate data transmission services to the public." See IEEE Standard Dictionary of Elec. & Elecs. Terms, at 834 (6th ed. 1996) (defining "public data network").

D. "Publishing the electronic advertisement to one or more of the selected internet media venues"

Claim 1 of the '025 patent states in part: "A computer system for creating and publishing customized electronic advertisements, for a seller, to internet media venues owned or controlled by other than the seller, comprising: . . . a computer controller of the computer system . . . publishing the electronic advertisement to one or more of the selected internet media venues in compliance with the presentation rules of the internet media venue, whereby the electronic advertisement is displayed on each of the one or more of the selected internet media venues in compliance with the presentation rules of the internet media venue." (emphasis added). FM contends that "publishing the electronic advertisement to one or more of the selected internet media venues" means ". . . placing or making available the customized electronic advertisement within the framework of each internet media venue so that it is accessible by the end users, consumers, viewers, or buyers . . . ." In contrast, Google argues that this term means "placing or making available the electronic advertisement at one or more of the selected internet media venue location for public display." The primary differences between the two proposed constructions are how closely they track the glossary's "publishing" definition and whether they add the modifiers "customized" and "each."

FM and Google's proposals apparently differ on the meaning of "publishing," as used in the claim. The '025 patent specification contains a "Patent Application Glossary," which defines several terms. The glossary defines "publishing" as "[t]he act of placing or making available the presentation or information within the framework of media venue so that it is accessible by the end users, consumers, viewers, or Buyers. . . ." [025 Patent, 11:48-52]. FM's proposed construction closely tracks the glossary's definition of "publishing:" The Federal Circuit recently affirmed that "[w]hen a patentee explicitly defines a claim term in the patent specification, the patentee's definition controls." Martek Biosciences Corp. v. Nutrinova, Inc., 579 F.3d 1363, 2009 U.S. App. LEXIS 20001, 2009 WL 2780367, at *13 (Fed. Cir. Sept. 3, 2009).

Therefore, the court adopts the portion of FM's proposed construction containing the phrase, "so that it is accessible by the end users, consumers, viewers, or Buyers." Next, Google suggests that the actual claim language requires "publishing . . . to one or more of the selected internet media venues." (emphasis added). As a consequence, Google includes the word "at" in its proposed construction. The court agrees with Google's position and thus adopts a construction reflecting that the publication occurs "at" the selected internet media venues.

As stated above, FM proposes a "customized electronic advertisement within the framework of each internet media venue," whereas Google does not include the modifiers "customized" or "each." Neither the glossary definition of "publishing" nor the body of the claim contains the word "customized." Claim 1's preamble, however, does state, "A computer system for creating and publishing customized electronic advertisements . . . ." (emphasis added). Moreover, the parties have agreed that "create an electronic advertisement for publication to the selected internet media venues" means "create an electronic advertisement for publication in a form customized to each of the selected internet media venue's presentation rules." See Section IV (emphasis added). In light of this agreement, the court will include the term "customized" in the construction.

Like "customized," the "each" modifier does not appear in the glossary definition of "publishing." But "each" does appear in the body of claim 1: "whereby the electronic advertisement is displayed on each of the one or more of the selected internet media venues."
media venues." (emphasis added). The use of "each" in the "whereby" clause teaches that the advertisement must be displayed on every selected internet venue. The court finds that the inclusion of "each" in the claim construction is proper. Therefore, the court defines the term "publishing the electronic advertisement to one or more of the selected internet media venues" to mean "placing or making available the customized electronic advertisement within the framework of and at each internet media venue so that it is accessible by the end users, consumers, viewers, or buyers."

3477
Disputed Claim Language

"assigning a pulse value for each of said reflected signal pulses with respect to said series of signal pulses transmitted to said target;"

Analysis

Plaintiff argues that the claim term "pulse value" should be construed according to its plain meaning. Plaintiff's Memo, 3. The plain meaning, according to Plaintiff, would require "assigning a pulse value to reflected signal pulses received in the receiving section of the laser range finder." Id. "Pulse value" would mean "a value that provides information sufficient to permit correlation of the received signal with other received signals to determine which of the received signals represents the actual return-reflected signals, as opposed to noise signals." Id.

This claim language does not define "pulse value." What is clear from the claim language, however, is that each reflected signal pulse is assigned a pulse value, whatever its definition may be. There is one "pulse value" for each of "said reflected signal pulses."

The '779 patent specification sheds light on the term "signal pulses" as related to "pulse value." It reads: "The system includes means responsive to the central processing section for determining a desired signal-to-noise ratio for a series of possible signal pulses, including both noise and actual signal pulses received through the signal receiving section. The possible signal pulses each have a representative pulse value with respect to a pulse previously transmitted from the signal transmitting device." '799 Patent, col. 2, lines 22-29 (emphasis added). From this, I conclude that the term "signal pulses" covers both noise and actual pulses, which fall into the category of "possible" signal pulses. Further, I conclude that each signal pulse, including both noise and actual pulses, has an associated pulse value.

Other sections of the '779 specification support my conclusions. The device must arrange all of the "possible signal values" before the "predetermined number of them coincide within a specified precision." Id. at col. 2, 30-32. Then, "the value of one or more of the predetermined number of the possible signal values is … considered to be representative of the actual return signal." Id. at col. 2, 32-35. The specification then states "a method for discriminating between an actual return signal and associated noise … [which] comprises the steps of transmitting a series of signal pulses to a target and receiving a number of possible reflected signal pulses therefrom with the possible reflected signal pulses including both noise and actual signal pulses." Id. at col. 2, 55-62.

So, the "possible" signal values consist of both noise and target signals, because the device could not parse out the noise values before receiving all possible values, consisting of both noise and those values "representative of the actual return signal." That the target signal is the "actual" return signal is buttressed by the statement that pulses are transmitted to the target, with possible reflected signals including both noise and actual signal pulses. I conclude that this statement also clarifies that both noise and actual signal pulses are reflected signal pulses.

I agree with Plaintiff that "pulse value should be construed to mean a value that provides information sufficient to permit correlation of the received signal with other received signals to determine which of the received signals represents the actual return-reflected signal, as opposed to random noise signals." Plaintiff's Reply Memo, 3.

I reject Defendants' contention that a pulse value should only refer to "reflected" signals but not "noise" signals. Defendants' Reply Memo, 12. See also, Defendants' Memo, 26 (Defendants argue that "pulse value" is undefined). The '779 patent specification reads, "the possible reflected signal pulses include both noise and actual signal pulses." '779 patent, col. 2,
The '779 patent specification clearly acknowledges that the possible signal pulses include both noise and actual signals. Indeed, even I, a layperson, understand that in order to determine whether a signal is one reflected from the target--here, the "actual" signals--or reflected from other light-reflecting surfaces--here, "noise" signals, there must be a way to identify them so that they may be separated from one another in the process of target discrimination.

Finally, Defendants argue that "pulse value" itself lacks clear meaning. Defendants' Memo, 28-30; Defendants' Reply Memo, 12. Although Defendants point to deposition testimony as support for their contention, see id., they need not go so far. Neither in the plain language of Claim 11 nor in the patent specification is there clear indication of what "pulse value" means. But Defendants assume, and virtually conceded at oral argument, that "the pulse value assigned is a time of flight," contending "… this is not done by the Nikon/ AOI laser range finder." Id.

In any event, construing "pulse value" to mean "time of flight" makes the most sense. As Plaintiff argues, "the claim term pulse value should be construed to mean a value that provides information sufficient to permit correlation of the received signal with other received signals to determine which of the received signals represents the actual return-reflected signal, as opposed to random noise signals …. Indeed, why else would one assign a value to a pulse for the purpose of target discrimination other than to assist in the discrimination process?" Plaintiff's Memo, 3 (citing McAlexander Decl. PP 18-19). Discounting the parties' "battle of experts" over the meaning of "pulse value," I construe "pulse value" to identify time-of-flight data.

CONSTRUCTION: Pulse value should be construed to mean a value identifying time-of-flight data, including noise and signals reflected from the target, that provides information sufficient to permit correlation of the received signal with other received signals to determine which of the received signals represents the actual return or target-reflected signal, as opposed to random noise signals.

1. Pulse width (claim 1)

Plaintiff's construction: No construction needed

Defendants' construction: "the time interval between the leading and trailing edges of the pulse"

Although plaintiff initially argued that no construction was necessary for this term, at the claims construction hearing, it stated that it would not object to a construction that clarified that "width" was measured in time rather than distance. However, plaintiff objects to defendants' proposal specifying that the width is measured using the "edges" of the pulse. In fact, plaintiff objects to including in the construction any explanation of how the width is measured.

Plaintiff's explanation for this objection is not completely satisfactory. On the one hand, plaintiff says that "[p]eople of ordinary skill in the art know how to measure pulse duration. Engineers do this all the time." Dkt. # 186, at 11. In other words, plaintiff appears to be saying that it is so obvious to one of ordinary skill in the art how to measure pulse width that it is unnecessary to put it in the construction. However, plaintiff also says that "it's easy enough to tell where the edges are" only "when you have an idealized waveform;" a "real waveform doesn't have that kind of edge," suggesting that it will be too difficult to use the edges to obtain a measurement. Similarly, plaintiff acknowledges that experts may disagree about how to measure pulse duration, but suggests "that is a debate [to be resolved by] the jury." Dkt. # 186, at 12.

So, is the term too easy to construe or too hard? Plaintiff never gave a straightforward answer to this question. However, regardless whether it is easy or difficult to measure a pulse, surely plaintiff agrees that a pulse (or anything else) is measured from its beginning to its end, which is essentially what defendants propose to include in the construction. Although it may
be that the beginning and end are sometimes difficult to discern, this does not mean there is no beginning or end or that the
beginning and end are ignored in calculating a measurement.

More open to debate is defendants' choice of the word "edges" to demarcate the beginning and the end. I agree with plaintiff
that defendants have not adequately justified this choice. Defendants cite a computer science dictionary as the source of
their proposal, but in Phillips the court of appeals cautioned district courts not to rely solely on dictionary definitions
because doing so is "unlikely to result in a reliable interpretation of patent claim scope unless considered in the context of
the intrinsic evidence," such as the specification. Phillips, 415 F.3d at 1319. Further, defendants' definition does not come
directly from a dictionary; it is one that defendants modified. The dictionary definition cited by defendants states that a
"pulse width" is "the time interval between the points on the leading and trailing edges of the pulse." Dkt. # 175, Exh. F, at
894 (emphasis added). At the hearing, defendants said they decided to drop the reference to "points" in part because the
patent teaches waveforms with straight edges. However, their only support for this assertion is one figure shown in the
specification:

[SEE FIG.4B IN ORIGINAL]

Defendants' reliance on this figure is unpersuasive for two reasons. First, a description of one preferred embodiment cannot
be read into the claim unless the specification makes it clear that the description relates to the invention as a whole rather
2001)(limitation from specification could be read into claim when specification made it clear that limitation applied to all
embodiments). Defendants have not shown this. Rather, the specification refers to Figure 4B as "an example." '109 Patent,
col. 10, ln. 28. Further, defendants point to nothing in the specification suggesting that Figure 4B represents what the
waveform actually looks like rather than an idealized or simplified form of it used for purposes of demonstration.

Accordingly, I conclude that defendants have not established that claim 1 of the '109 patent requires the pulse to be
measured from its "edges." Further, because neither side advocates a construction using "points on the edges," I am not
prepared to adopt that construction at this time. Plaintiff may be right that the precise method of measurement is a question
of fact that cannot be resolved as a matter of claim construction. Markman v. Westview Instruments, Inc., 517 U.S. 370, 384
(1996) (claim construction is question of law, not fact). However, because the parties appear to agree that the pulse is
measured in time and that the pulse is measured from the beginning to the end, I will incorporate these concepts into the
construction of "pulse width."

**Court's construction: the time interval between the beginning and the end of the pulse.**

### 3479

b. "ON/OFF pulses"

On the basis of some of the invention's preferred embodiments, Ecolux argues that the "ON/OFF pulses" of electrical energy
called for by claim 1 must have a rectangular wave form. Relume contends that the "ON/OFF pulses"' limitation does not
require a specific wave form but only that the invention's power supply employ a switching action to control the current
delivered to the LEDs.

Ecolux's construction ignores the clear meaning of both the claim language and the specification. Claim 1 recites no
limitation on the shape of the pulses' wave form. Nor does the specification. In fact, it notes that at least two types of wave
forms can be utilized by the invention: rectangular and a.c. sinusoidal. Accordingly, I hold that one of ordinary skill in the
art of LEDs would understand that "ON/OFF pulses" does not limit the shape of the pulses' wave form but instead requires
that a switching power supply create the pulses by turning a switch on and off.

**GO BACK**

### 3480

(2) Operative to Punch Through a Firewall
The term "operative to punch through a firewall" also appears in claim 53 of the '562 patent. According to Square D, this language should be construed to mean "an application that can initiate the transmission of data from the IED using a trusted, standard application protocol, such as SMTP (email), HTTP (web), or FTP." EI contends that it should be construed to mean that "at least one application that encapsulates or reconfigures power management data contained in a protocol that is blocked by a firewall into a protocol that is not blocked by said firewall." At the Markman hearing, Square D offered an alternative construction: "an application that has the ability to communicate through a firewall."

The specification discusses in some detail the issue of firewalls and the importance to the invention of being able to communicate through a firewall. See U.S. Patent No. 6,751,562 B1, col. 23, line 22 - col. 29, line 3. And, to be sure, the specification discusses embodiments where data is reconfigured (as email, for example). But the specification also states that the described embodiments are "illustrative" and not "limiting." Id., col. 29, line 49. And the Court does not read the specification as requiring that data be "encapsulated" or "reconfigured," as EI urges in its proposed construction. Instead, the specification - consistent with the claim language - simply requires that the application be operative to communicate through the firewall.

The Court adopts Square D's proposed alternative construction and construes the phrase "at least one application operative to punch through a firewall" to mean "an application that has the ability to communicate through a firewall."

The Court agrees with Autobytel's proposed construction and construes the term as "information concerning a potential purchase transaction submitted by a potential buyer and received by a Data Center system." Dealix argues that the term should be construed with the limitation that a purchase request must go directly from a potential buyer to the Data Center system. Dealix cites various excerpts from the specification in support of its argument. See, e.g., Col. 5:9-36, Col. 6:31-33, Col. 7:24-25, Col. 13:37-40. Autobytel contends that the claim language and specification both contradict Dealix's proposed construction. Claim 1 requires, "receiving said purchase request over a computer network from a potential buyer," and Autobytel argues that no limitation is placed on the purchase request requiring it to go directly from the potential buyer to the Data Center system. Col. 18:9-10. Autobytel also points to the language in claim 2 that states, "wherein said act of receiving said purchase request comprises receipt of a request that is transmitted through a plurality of web pages" arguing that because the purchase request can go through a "plurality of web pages" it is not limited to traveling directly from the potential buyer to the Data Center system. Col. 18:30-32. Furthermore, Autobytel points to Column 7, lines 7 to 9 of the specification, which states "in yet another embodiment, the potential buyer may also submit a vehicle purchase request from the third-party computer" arguing that a purchase request does not have to come directly from the potential buyer's computer.

The Court is persuaded by Autobytel's arguments. Claim 2 claims a method for receiving a purchase request through a plurality of web pages. To prevent claim 2 from being superfluous, claim 1 is differentiated in that a purchase request under claim 1 is not transmitted through a plurality of web pages. However, nothing in the claim language or specification prevents a purchase request under claim 1 from traveling through some other type of computer network, one not employing a plurality of web pages, in an indirect path between the potential buyer and the Data Center system. Accordingly, the Court does not construe purchase request with the limitation that it must travel directly from a potential buyer to the Data Center system.

SVS proposes that the term "purchasing value of a card in response to card use" be construed to mean "a value in an account associated with a card or a value stored on a card itself." (D.I. 43 at 15) CAT takes issue only with SVS's use of the word "account." (D.I. 46 at 8) CAT instead construes the disputed term to mean "a value in a central data base identified by the
card (for magnetic stripe cards) or stored on the card (for chip cards).” (D.I. 44 at 18) I agree with SVS that the value of a card is in an account or stored on the card itself.

SVS argues for the "account" limitation here based on the same intrinsic evidence presented in support of the "account" limitation in the term "debit styled card." (D.I. 43 at 15) CAT concedes that use of the word "account" is not per se objectionable, but expresses concern that the word could be used to limit the scope of the patent claims through the implied requirement of a business arrangement between the card holder and the host data processor. (D.I. 44 at 19) I agree with CAT that there is no such requirement. Although the claims, viewed in light of the specification, are broad enough to encompass the situation where a card holder has a business arrangement with the host data processor, nothing in the ’859 patent expressly or impliedly requires such an arrangement.

Thus, I recommend that the Court construe the term "purchasing value of a card in response to card use" to mean "a value stored on a card itself or a value in an account associated with a card (but not limited to situations where the card holder has a business arrangement with the host data processor)."

e. "Qualification Structure"

"Qualification structure" appears in many of the Analysis Control System Claims, and the limitations in which this term appears vary from claim to claim. 16 Claims 104 and 117 of the ’707 patent and Claim 171 of the ’863 patent include the broadest limitation including the term, providing for a "qualification structure controlled by said record structure for controlling access to said system by said individual callers.” The other limitations containing this term vary on how and on what basis access to the system is controlled.

16 The term "qualification structure" appears in Claim 51 of the ’309 patent, Claims 33, 104, and 117 of the ’707 patent, and Claims 49, 50, 65, and 171 of the ’863 patent.

The plaintiffs argue that this term is not subject to means-plus-function analysis because the term "qualification structure" was well known to those of ordinary skill in the art of building interactive voice applications. The plaintiffs contend that "qualification structure" would have brought to mind a computer processor and its software programs to those of skill in the art.

The defendants argue that this term is subject to means-plus-function analysis because it is written in functional terms and has no meaning to those of ordinary skill in the art without more information than is provided in the claim language. The defendants argue that the term does not escape application of 35 U.S.C. § 112, P 6 because it calls to mind a computer processor and its programs, as plaintiffs contend. The defendants argue that the structure in Figure 4 that corresponds to this term is the Qualification Unit 93, the Processing Unit 92, the Memory 98, and the software required to qualify callers. See Column 6, line 56 to Column 7, lines 36 and Column 16, lines 19-31 of the ’707 patent. The defendants contend that the only software that is disclosed in the patents is in the context of the specific formats discussed by Katz, such as game shows, lotteries, and auctions.

The Court concludes that although the term "qualification structure" does not include the term "means," it is subject to 35 U.S.C. § 112, P 6. "Qualification structure" is written in functional terms and the Court is not convinced that it would not have brought to mind sufficient structure to a person of ordinary skill in the art without further reference to the specification. The function performed by the "qualification structure" is controlling access to the Katz system by individual callers. The structures disclosed in the specification that perform this function are the Qualification Unit 93 and the Processor 92 in Figure 4. 17
17 For the term "qualification structure" in Claim 33 of the '707 patent, which provides for "an analysis control system according to claim 26, wherein said limit on use restricts relates to a dollar amount," the defendants claim that the corresponding structures are the Qualification Unit (93) and Look-up Table (99) or Use Rate Calculator (100) in Figure 4, as well as the software required to perform the function of testing the data from callers to specify a basis for entitlement to assess to the Katz system. See Column 17, lines 38-62 of the '707 patent. The Court concludes that these structures designated by the defendants correspond to the qualification structure in Claim 33 of the '707 patent.

4. The term "QUALITY" (claim 22) requires no construction.

1. "quality of result" or "desired quality of result" (claims 9 and 23, respectively)

Omax proposes that the Court adopt the following construction:

Desired quality of result means and includes any characteristic(s) of a part or other work piece that a user desires to result from operation upon the work piece of a machine tool following a desired trajectory. These characteristics include surface finish and dimensional accuracy and precision, as well as uniformity of cut surface. More specific examples include: accuracy in cutting curves; accuracy as to the desired depth of a cut when cutting only partially through a workpiece; and avoidance of any of the following: undesirable marks or troughs, rounding of sharp corners, excessive kerf width; excessive taper, errors (beyond desired tolerance limits) caused by jet lag; deflection of the jet into areas not intended to be cut; and failure to cut portion intended to be cut.

Flow proposes the following construction: "The relative grade of cut surface finish of a work piece (specified by the user) that is cut at a speed just fast enough to cut through a work piece having a virtual thickness equal to or greater than the actual thickness of the material being cut, the grade of quality increasing as the virtual thickness of the material increases. Quality of result does not include dimensional tolerance or precision (e.g. error)." The first parenthetical is included where the construed phrase includes the term "desired."

This claim appears in the following context: "9. A method for determining tool motion control commands for operation of a machine tool on a desired trajectory to achieve a desired quality of result. . . ." '596 Patent, col. 17, ll. 14-16. The term "quality of result" or "quality" appears throughout the specification, as well, including the following:

The resulting finish is assigned a quality of 1. The top half of a material that has just barely been cut through has a much better surface finish than the bottom half. If the speed is reduced so that the jet could just cut through a piece twice as thick, the surface finish is much better. This finish is assigned a quality of 2. Moving slowly enough to cut more than 5 times the material thickness does not significantly improve the finish. Therefore, quality 5 is regarded as the best finish possible.

'596 Patent, col. 14, ll. 58-67 (emphasis added). This explanation in the patent specification appears to suggest that the quality value (Q) relates exclusively to the resulting finish of the piece that is cut. Flow relies heavily on this passage to argue that "quality of result," as used in the claims, is either ambiguous or refers to a single feature of quality: surface finish. Flow argues that the Court should defer to the term as defined by the patentee in this passage. Johnson Worldwide Assocs. v. Zebco Corp., 175 F.3d 985, 990 (Fed. Cir. 1999) (requiring "the entry of a definition of a claim term other than its ordinary and accustomed meaning [when] the patentee has chosen to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term").

Omax concedes that the above-quoted passage focuses exclusively on the finish of the cut, but argues that Flow relies on
that passage to the exclusion of many passages that address other aspects of quality. For example, the claim terms frequently refer to the "uniformity of resulting cut surface." '596 Patent, claim 10, 11. The claims also refer to a method for which the goal is to "limit lag error." '596 Patent, claim 12. The specification frequently refers to both the surface finish and the "precision" of the cut. E.g., '596 Patent, col. 7, l. 31. Other references to characteristics of quality include tapering, troughs, marks, and excessive kerfs, issues that arise in the context of the regularity of speed and the traversing of curves and corners. '596 Patent, col. 14, ll. 30-53, col. 15, l. 40--col. 16, l. 10. These references make clear that the passage referring only to surface finish is only an exemplary, and not limiting, embodiment. See Phillips, 415 F.3d at 1323 (reiterating the requirement to "avoid the danger of reading limitations from the specification into the claim").

The Court finds that this claim term and its use in the patent do not support the narrow reading proposed by Flow. First, it is clear that contrary to Flow's argument, Dr. Olsen never "acted as his own lexicographer" in regards to "quality," nor defined it exclusively as surface finish. According to Flow's approach, if quality does not refer only to surface finish, then it is ambiguous beyond retrieval. This argument is unpersuasive. While the patent's construction of "quality" does not reach the exacting specificity proposed in Flow's construction, it is clear that quality or "cut quality" refers to a variety of characteristics that are recognizable by all experts of ordinary skill in the art. Flow's expert, Dr. Garris, does not deny that issues like lag are related to quality, but limited his argument largely to the notion that an individual of ordinary skill in the art would have read the passage quoted above and assumed that quality for the purpose of the patent focused only on surface finish. Finding this argument unavailing, the Court adopts the following construction: "Quality of result refers to any number of features or characteristics of a cut, including but not limited to surface finish, uniformity of cut surface, precision and dimensional accuracy. A user specifies his or her desired quality of result using an associated value."

A. Quality of Service (claims 10, 13-14, 21, 26 and 28-29 of the '700 patent, claims 1 and 15 of the '248 patent and claims 1 and 5 of the '438 patent)

Plaintiff's Proposed Construction: A quantifiable measure of service provided

Defendant's Proposed Construction: A quantifiable measure of service provided, the measure of the service being provided in terms of a packet loss rate, a maximum delay, a committed minimum bandwidth, or a limited maximum bandwidth.

The parties agree that this term can be defined in part as "a quantifiable measure of service provided," which is how it is defined in the specifications. E.g., '700 pat., col. 3, Ins. 39-41 ("'Quality of Service' in this context essentially means that there is a quantifiable measure of the service being provided."). Although there is some tension in defining "quality" as "quantity," neither party takes issue with that part of the construction, making it unnecessary to consider that point further.

The only dispute is whether the ways in which "quality of service" may be measured are limited to those provided in defendant's proposed construction. Although those types of measurement are identified in the specification, they are identified as examples and not as a restricting definition. '700 pat., col. 3, Ins. 42-44 ("The measure of service being provided may be in terms of a packet loss rate, a maximum delay, a committed minimum bandwidth, or a limited maximum bandwidth, for example.") (Emphasis added.) Because examples may not be read into the claims, In re Omeprazole Patent Litigation, 483 F.3d 1364, 1372 (Fed. Cir. 2007), I must reject defendant's proposed construction and adopt plaintiff's: "a quantifiable measure of service provided."

The Court agrees with Plaintiff and thus adopts Plaintiff's construction of these disputed terms. The phrase "quality value" is construed as "a value that indicates the value of a wireless communications link." The phrase "first link quality" is construed as "a value that indicates the quality of a downlink." The phrase "second link quality" is construed as "a value that indicates the quality of an uplink.

A. Parties' Construction Arguments
Plaintiff argues its constructions are supported by the teachings of the '759 patent, will assist jury, and make the meaning of
the terms clearer. Defendants argue "quality value" should be construed as the "value of a link quality," and Defendants
argue the terms "first link quality" and "second link quality" do not need construction. At the hearing, Defendants agreed
that if the Court wished to construe "first link quality" and "second link quality" that they agreed with Plaintiff insofar as the
"first link" represented the downlink and the "second link" represented the uplink. However, Defendants argue Plaintiff
conflicts the construction of "link quality" with "link quality value" by construing both phrases as "a value." Additionally,
Defendants argue the quality value is a value of the quality of the link, rather than something that "indicates" the quality of
the link. Finally, Defendants argue that Plaintiff incorrectly inserts a requirement that the link be "wireless" without support.

B. Analysis

The Court agrees with Plaintiff's proposed constructions. "Claim construction is a matter of resolution of disputed meanings
and technical scope, to clarify and when necessary to explain what the patentee covered by the claims, for use in the
determination of infringement." U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997). Defendants'
proposed constructions are not helpful because they do not add any meaning to these phrases that need clarity. The Court
will first consider "first link quality" and "second link quality." The specification does not explicitly define the terms in
question, but taking an in-depth look at the specification supports Plaintiff's construction. The specification specifically
states that "FIG. 4 illustrates . . . six modulation thresholds (L1-L6, where L1 indicates the lowest link quality and L6
indicates the highest link quality)." '759 patent, 9:5-10 (emphasis added). This supports Plaintiff's "indicates" language.
Further, Figure 4 is an illustration that includes variables representing the values of link quality (e.g., L1-L6), but Figure 5
actually includes example values, such as values of signal to noise ratio, instead of just variables. See '759 patent, 9:66-
10:17. So when reading Figure 5 in conjunction with Figure 4, it becomes clear that the variables L1-L6 are actually values
that indicate the link quality. These variables, L1-L6, are also called the modulation threshold values in the specification,
which are the values used select the modulation scheme. See '759 patent, 2:48-52 (describing the process of "comparing
the determined first downlink quality to a second plurality of modulation threshold values"). Since the modulation scheme
requires comparing the "downlink quality" to the "values," see id., it necessitates that the "downlink quality" or "first link
quality" is a value. Otherwise, if "first link quality" referred to a qualitative measurement as Defendants suggested at the
hearing (as opposed to "value" which is a quantitative measurement), then the comparison with the modulation threshold
values that the specification discusses would not be possible. Consequently, while Defendants argue "first link quality"
cannot be a value or the terms "quality value" and "first link quality" would be conflated, the specification itself conflates
those terms by making the "first link quality" a value, so Plaintiff's construction of "first link quality" and "second link
quality" is accurate.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

1 Note that the patent uses "first downlink quality" and "first link quality" interchangeably. See generally '759 patent, 2:8-
57. This is why Defendants at the hearing agreed that "first link quality" refers to the downlink.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

Plaintiff's construction of "quality value" is also accurate. The specification does not mention "quality value." The phrase
only appears in the claim language of claims 11, 13, and 14. But Plaintiff's construction of "quality value" is supported by
reading the context of the claim language. "A claim term used in multiple claims should be construed consistently." Inverness Med.
Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1371 (Fed. Cir. 2002). Reading the language in claim 13 and claim 14 is instructive. Claim 13 includes "a signal to noise ratio configured to measure the quality
value" and claim 14 includes "a bit error rate module configured to measure the quality value." So in claim 13 the quality
value is the signal to noise ratio value because presumably the signal to noise ratio module measures signal to noise ratio
values. Likewise, in claim 14 the quality value is the bit error rate value. Therefore, referring back to Figure 4 again, the
specification states that "L1 indicates the lowest link quality," '759 patent, 9:9-10, and the specification in Figure 5 shows
that L1 may be a signal to noise ratio value. Compare '759 patent, FIG. 4; '759 patent, FIG. 5. So in claim 13 the quality
value refers to the signal to noise ratio value that indicates the quality of the wireless communications link. '759 patent, 9:5-
10 ("L1 indicates the lowest link quality") (emphasis added) More generically, therefore, "quality value" is "a value that
indicates the quality of a wireless communications link." Defendants' final argument that Plaintiff's construction erroniously
includes the word "wireless" is groundless—the entire patent relates to wireless communications links—it is even titled

- 3791 -

Hence, the Court agrees with Plaintiff and thus adopts Plaintiff's construction of these disputed terms. The phrase "quality value" is construed as "a value that indicates the value of a wireless communications link." The phrase "first link quality" is construed as "a value that indicates the quality of a downlink." The phrase "second link quality" is construed as "a value that indicates the quality of an uplink."

that at least one of the halogens Cl, Br or I is present in a quantity

The '181 Patent's "Summary of the Invention" describes the potential for tungsten evaporated from the electrodes to be deposited on the wall of the envelope (bulb), thereby causing blackening of the walls which would lead to higher wall temperatures and a shorter life of the lamp. It further describes how the presence of a small quantity of a halogen (chlorine, bromine or iodine) creates a cycle by which the evaporated tungsten is transported back to the electrodes, thereby lessening the blackening. (col. 2, ll. 30-34)

The parties dispute the interpretation of the phrase "that at least one of the halogens Cl, Br or I is present in a quantity between 10^{-6} and 10^{-4} \text{ mol/mm}^3." Neither party disputes that "Cl," "Br" and "I" are the abbreviations for the halogens chlorine, bromine and iodine. I construe "quantity" to mean a concentration--the amount per unit volume.

Philips reads the phrase "is present in a quantity" to mean only such of the halogen that is "participating, supporting and keeping in existence the tungsten transport cycle during lamp operation." (Philips Br. at 14-18; Philips Reply Br. at 4-5.) Philips relies upon the preamble language--"a halogen for maintaining a tungsten transport cycle during lamp operation"--preceding the transitional phrase "characterized in that." I conclude that the phrase "a halogen for maintaining a tungsten transport cycle during lamp operation" identifies a filling material and describes the function of that material and nothing more. The phrase, fairly read, does not qualify or limit the halogen that "is present in a quantity."

Reading the claim as a whole, one of ordinary skill in the art would conclude that the quantity that is stated following the transitional phrase "characterized in that:" means the quantity of halogen in the bulb or envelope. It would be a strained construction to interpret the language to mean an amount of halogen less than the total quantity of halogen present in the envelope, i.e. only such of the quantity of halogen that is necessary "for participating, supporting and keeping in existence the tungsten transport cycle during lamp operation." I also have considered the extrinsic evidence and do not find it persuasive in Philips' favor.

2 "I would say that the quantity being added, when we look to measure this quantity, it is this quantity has to be there that is for the tungsten transport cycle. Any quantities that are there that are not used for the tungsten transport cycle are irrelevant. We're only claiming the quantities in the bulb for maintaining a tungsten transport cycle." (Counsel for Philips, Nov. 22 Hr'g at 38)
a quantity between $10^{-6}$ and $10^{-4}$ [\text{mu mol/mm}^3]$

The parties also dispute the meaning of the phrase "a quantity between $10^{-6}$ and $10^{-4}$ [\text{mu mol/mm}^3]." There is no dispute that the phrase "[\text{mu mol/mm}^3]" means micromoles per cubic millimeter. Iwasaki contends that "$10^{-6}$ and $10^{-4}$" is intended to express a specific numerical range between $1 \times 10^{-6}$ and $1 \times 10^{-4}$ while Philips argues that the phrase refers to a range between two orders of magnitude. Philips points out that there is no multiplier preceding the values "between $10^{-6}$ and $10^{-4}$ [\text{mu mol/mm}^3]." Iwasaki points out that there are no words used such as "on the order of" or "approximately" or "of a magnitude of" that would give a person of ordinary skill in the art an awareness that the number that followed was not a specific numerical value.

I have examined other uses of scientific notation in the specification. There are references to quantities of methyl bromine in quantities of "5.10^{-6}". (col. 3, l. 53) Elsewhere there is a reference to "5.10^{-4} to 5.10^{-2} g atoms of at least one of the halogens per cubic millimeter are fed into the envelope." (col. 1, l. 22.) While the use of a numerical multiplier is of some significance, it is also true that a numerical multiplier is not universally used when the multiplier is 1. 3 For example, to one skilled in the art, $10^5$ means 100,000 and it may also be expressed as $1 \times 10^5$. But, depending upon how it is used, it could also mean an order of magnitude of $10^5$, i.e. any numerical value in the hundreds of thousands. The specific context becomes critical to understanding. Here, I conclude that the use of two numbers in the phrase "a quantity between ____ and ____" implies a specific range, as argued by Iwasaki. It does not imply a range between two values which are themselves ranges.

Philips disclaims inexactitude in its interpretation. (Nov. 22 Hr'g at 78) To bring precision, Philips urges that, utilizing rounding principles, "$10^{-5}$ [\text{mu mol of Br/mm}^3]" (col. 3, l. 54) and conclude it to be ambiguous for the reasons discussed at the hearing. (Nov. 22 Hr'g, compare 25-27 with 56-59.)

Philips relies upon Holmes, et al. (U.S. Patent No. 3,382,396). In that patent in this field of art, quantities of iodine are displayed in a one single table in the form "1x 10^{-5}" and also in the form "10^{-4}". For the reasons discussed at the November 22 hearing, these references are ambiguous.

I note that Claim 5 employees the language "that the mercury vapor pressure is about 400 bar." (emphasis added).
I conclude that the phrase "a quantity between 10^{-6} and 10^{-4} [mu] mol/mm^3" means that the halogen is present in the envelope or bulb in a quantity between 1 divided by 1,000,000 and 1 divided by 10,000 micromoles per cubic millimeter.

C. Claim Construction

We next turn to the question of claim construction. U.S. Philips argues that the term "between 10^{-6} and 10^{-4} [mu] mol/mm^3" expresses a range of orders of magnitude, not a range of more-precise numbers, and that it was therefore error for the district court to construe the claim to mean "between 1 \times 10^{-6} and 1 \times 10^{-4} [mu] mol/mm^3." According to U.S. Philips, one of ordinary skill in the art of lamp chemistry would understand "10^{-4}" to mean something different and less precise than "1 \times 10^{-4}"; i.e., the absence of a coefficient ("1") means that the term encompasses all values that are closer on a logarithmic scale to 10^{-4} than to 10^{-5} or 10^{-3}, or a range of approximately 3.2 \times 10^{-5} to 3.2 \times 10^{-4}. Thus, according to U.S. Philips, the full range should be construed as approximately 3.2 \times 10^{-7} to 3.2 \times 10^{-4} [mu] mol/mm^3, and Iwasaki's lamps with admitted halogen concentrations of 1.2 \times 10^{-4} to 2.0 \times 10^{-4} [mu] mol/mm^3 literally infringe.

--- Footnotes ---

1 In other words, under U.S. Philips's proffered construction, the term "10^{-4}," as an order of magnitude, encompasses a range of values from 10^{-4.5} and 10^{-3.5}--the set of numbers with base-10 logarithms that round to -4. This range is approximately 3.2 \times 10^{-5} to 3.2 \times 10^{-4}. Mathematically, 10^{-4.5} = 10^{-0.5} \times 10^{-5} = \sqrt{10} \times 10^{-5}, and 10^{-3.5} = 10^{-0.5} \times 10^{-4} = \sqrt{10} \times 10^{-4}; the square root of 10 is approximately 3.2.

--- End Footnotes ---

We disagree with U.S. Philips and, like the district court, conclude that the claim limitation is properly construed to mean "between 1 \times 10^{-6} and 1 \times 10^{-4} [mu] mol/mm^3." Although the upper and lower bounds of the claimed range are expressed as powers of ten, this alone is no reason for treating them as anything other than the ordinary numbers that they are. As the district court observed, the overall phrase--"a quantity between --"is a construction that "implies a specific range . . . . It does not imply a range between two values which are themselves ranges." Claim Construction Opinion at 8. The limitation does not refer to either bound as a range, an order of magnitude, or an approximation.

The specification fully supports this construction. In the LAMP 1 embodiment, under the heading "halogen," the '181 patent refers to "5 \times 10^{-6} [mu] mol of CH[2]Br[2]/[mm^3] (10^{-5} [mu] mol of Br/mm^3)." '181 patent, col. 3, ll. 53-54. The parenthetical expression apparently refers to the fact that one molecule of CH[2]Br[2] contains two bromine atoms, so the concentration of atomic bromine (Br) should be double the concentration of CH[2]Br[2]--two times 5 \times 10^{-6}, or 1 \times 10^{-5}. See Tr. of 11/22/2005 motion hearing at 57, ll. 10-11 (Dist Ct. Dckt. No. 64; Fed. Civ. J.A. 1233) ("You simply multiply the number on the first line by 2 because there are two bromines in every mole."). This suggests that "10^{-5}" is used as a synonym for "1 \times 10^{-5}." Moreover, the LAMP 1 example specifies particular quantities for a number of attributes of the embodiment: e.g., an envelope volume of 23 mm^3, filling mercury at a concentration of 0.261 mg/mm^3, and power of 50W. It would be odd to infer in this context that "10^{-5} [mu] mol of Br/mm^3," alone among the specified quantities, refers to a range or order of magnitude, solely because it uses a power of ten. Indeed, there is no use of a power-of-ten quantity such as 10^{-5} anywhere in the specification that requires the broader construction that U.S. Philips advocates. We therefore affirm the district court's claim construction of the halogen range "between 10^{-6} and 10^{-4} [mu] mol/mm^3" as meaning "between 1 \times 10^{-6} and 1 \times 10^{-4} [mu] mol/mm^3."

However, there remains the question of how this construction is to be applied to the accused lamps. Before the district court, U.S. Philips argued that even under a claim construction of "between 1 \times 10^{-6} and 1 \times 10^{-4} [mu] mol/mm^3," a lamp with a halogen concentration toward the lower end of Iwasaki's admitted range--for instance, with a concentration of 1.2 \times 10^{-4} [mu] mol/mm^3--might still literally infringe due to rounding. The question of whether and how to apply rounding, it argued, is a question of fact that should have been left for the jury rather than decided as part of the claim construction or at summary judgment. See Summary Judgment Opinion, 2006 U.S. Dist. LEXIS 71276 at *18-19. The district court disagreed and held that the question of whether to apply rounding should be treated solely as a claim construction issue that did not
present any factual questions for a jury. 2006 U.S. Dist. LEXIS 71276 at *20. U.S. Philips declined to argue its position as to rounding as a matter of claim construction, instead limiting its claim construction argument to its contentions regarding the meaning of the phrase "between 10^-6 and 10^-4 [mu] mol/mm^3," as discussed supra. 2006 U.S. Dist. LEXIS 71276 at *21.

In its opening brief on appeal, U.S. Philips does not challenge the district court's decision to treat the question of rounding as an issue of claim construction, nor does it challenge the district court's entry of summary judgment of no literal infringement under the district court's claim construction. Its sole infringement arguments on appeal are that the bounds of the claimed range refer to orders of magnitude rather than ordinary numbers—the claim construction argument we reject above—and that the doctrine of equivalents should have been available, an argument we address below. Accordingly, we deem the argument based on rounding to have been waived as to the Iwasaki products that the district court considered. See SmithKline Beecham Corp. v. Apotex Corp., 439 F.3d 1312, 1319 (Fed. Cir. 2006) (“Arguments not raised in the opening brief are waived.”). We therefore affirm the entry of summary judgment of no literal infringement as to Iwasaki's alleged acts of infringement after the filing of the complaint. 2 We do not reach U.S. Philips's argument that the question of rounding should have been presented to a jury, nor do we determine in this case where the process of claim construction ends and the literal infringement analysis begins.

--- Footnotes ---

2 In so doing, we do not decide whether and to what extent this waiver applies to further proceedings in this case on remand with respect to alleged literal infringement occurring between the Rolfes letter and the filing of the complaint.

--- End Footnotes ---

We emphasize that the claim construction we affirm today should not be read to state the endpoints of the claimed range with greater precision than the claim language warrants. In some scientific contexts, "1" represents a less precise quantity than "1.0," and "1" may encompass values such as 1.1 that "1.0" may not. See Viskase Corp. v. Am. Nat'l Can Co., 261 F.3d 1316, 1320-21 (Fed. Cir. 2001) (discussing distinction between "0.91 g/cm^3" and "0.910 g/cm^3"). In other words, "1.0" may be said to have more significant digits than "1" with no decimal point. Because "10^-6" and "10^-4" are simply the numbers 0.000001 and 0.0001 expressed as powers of ten, the claim language provides no basis for inferring any level of precision beyond the single digit "1." The way that power-of-ten quantities are used in the specification, discussed supra, confirms that the quantities of halogen described by the claims are not intended to be more precise. Thus, it is technically incorrect to assert, as Iwasaki does in its brief before this court, e.g., Br. for Appellee at 35, that "10^-x" should be construed to mean "1.0 x 10^-x." It means, simply, "1 x 10^-x." "1.0 x 10^-x" expresses a quantity with greater precision, reflected in the recitation of a significant digit following the decimal point.

The claim construction that we affirm today is "between 1 x 10^-6 and 1 x 10^-4 [mu] mol/mm^3," not "between 1.0 x 10^-6 and 1.0 x 10^-4 [mu] mol/mm^3." We leave for another day the question of whether this claim construction is sufficient to answer the infringement questions presented by a future record. See E-Pass Techs., Inc. v. 3Com Corp., 473 F.3d 1213, 1219 (Fed. Cir. 2007) (“Any articulated definition of a claim term ultimately must relate to the infringement questions that it is intended to answer.”).
addressed at this stage of the litigation. To the extent that the Court does construe the phrase, however, OTF proposes that the terms "quantity" and "intensity" be given distinct meanings. In particular, OTF submits that "quantity" refers to area under the reflectance curve and "intensity" refers to the peak reflectance of a color on the reflectance curve. According to OTF, the use of the word "or" indicates that quantity and intensity are alternative methods of measurement, not equivalent terms.

In response, SEC counters that the use of the term "or" is not dispositive, as it can be used to introduce synonyms. SEC argues that the patentee, acting as lexicographer, defined "quantity or intensity" as interchangeable terms that both refer to the area under the reflectance curve.

OTF concedes that the specification states that "[t]he relative quantities or intensities of each colour can be determined by comparing the areas under the spectroscopic graph of reflectance (percent) versus wavelength occupied by the specified colour." However, OTF claims that this language explains the meaning of the term "quantity" only. According to OTF, no explanation of "intensity" was provided because that term is commonly understood by those skilled in the art to mean peak reflectance. SEC counters that "intensity" does not have an accepted meaning to a person of ordinary skill in the art. [65 at 19]; Supp. Hunt Decl. P 5.

SEC also argues that if the Court declines to adopt the specification's definition for the "quantity or intensity" of a color, the patent claims will be invalid for indefiniteness because the same color may fall within the scope of the claims if "quantity or intensity" is defined one way, and fall outside the scope of the claims if "quantity or intensity" is defined in a different way.

2. Analysis

As a threshold matter, the Court must determine whether to construe the phrase "quantity or intensity" during the claim construction phase, or whether such a limitation would be extraneous. A claim limitation is "extraneous" if it is not necessary "to interpret what the patentee meant by a particular term or phrase in a claim." Renishaw PLC, 158 F.3d at 1249. Therefore, if the way in which "quantity or intensity" is measured is "necessary to an understanding of what the [claimed colors] mean," then a claim limitation based on that language would not be extraneous. Alza Corp. v. Mylan Labs., Inc., 349 F. Supp. 2d 1002, 1014 (N.D. W.Va. 2004). For example, in Honeywell Int'l, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332, 1340 (Fed. Cir. 2003), the Federal Circuit held indefinite a claim that included a specified melting parameter of a polymeric yarn because the claim did not state which of four known sample preparation methods should be used, and "knowing the proper sample preparation method [was] necessary to practice the invention."

Conversely, if the methodology for measuring "quantity or intensity" "is solely an issue of infringement," then the Court should "refuse[] to apply any claim limitation that mandates certain" procedures for determining "quantity or intensity." Alza, 349 F. Supp. 2d at 1014. For example, Alza concerned a patent disclosing an extended release version of the drug oxybutynin. The patent claims did not mention any methodology for measuring the claimed release rates of oxybutynin. Nevertheless, the defendant argued that the court should construe the claims to require all methods of in vitro testing to determine oxybutynin release rates. Id. at 1013. The court noted that, "unlike the sample preparation method in the Honeywell patent, no particular dissolution test is required to manufacture the claimed drug," meaning "a skilled artisan could read the * * * patent, create an infringing drug (assuming enablement), and never employ any testing to determine the release rates of that drug." Id. at 1014. Therefore, the court refused to include a claim limitation mandating certain testing procedures. Id.

Here, each claimed color is defined by comparing the "quantity or intensity" in which it reflects the basic colors. In order to create a printing system featuring the six claimed colors, one must be able to measure the "quantity or intensity" with which a given color reflects the basic colors. For example, in order to select an "orange-red," one would need to be able to measure the "quantity or intensity" with which a given color reflects the basic colors to select one that reflects "red followed by orange and then violet." Because the method for measuring "quantity or intensity" is necessary to practice the invention, a claim limitation construing that phrase is not extraneous. Honeywell, 341 F.3d at 1340.

Turning to the proper construction of that phrase, the Court assumes, arguendo, that the term "intensity" has an ordinary and accepted meaning among persons of ordinary skill in the field of color science, as OTF contends. The Court nevertheless "must look at the intrinsic evidence to determine whether the patentee has given the term an unconventional meaning." Bell Atlantic, 262 F.3d at 1269-70 (affirming district court's narrow construction of claim term "mode" despite recognizing that "the ordinary meaning of the word 'mode' [may] support[] a broader meaning than the construction ascertained by the
district court," where "patentees defined the term 'mode' [narrowly] by implication * * * [in the] specification"). If the patentee "clearly" used the term 'intensity' "in the specification * * * in a manner inconsistent with its ordinary meaning," then the presumption that that term should be construed according to its ordinary meaning is overcome. ResQNet.com, Inc. v. Lansa, Inc., 346 F.3d 1374, 1378 (Fed. Cir. 2003) ("a patent applicant may consistently and clearly use a term in a manner either more or less expansive than its general usage in the relevant community, and thus expand or limit the scope of the term in the context of the patent claims").

The specification states that "[t]he relative quantities or intensities of each colour can be determined by comparing the areas under the spectroscopic graph of reflectance (percent) versus wavelength occupied by the specified colour." '339 patent, col. 3, 11. 8-11. The most natural reading of that sentence is the one proposed by SEC -- for purposes of the patent, the terms "quantity" and "intensity" refer to the area under the spectroscopic graph. If the patentee had intended to provide only a definition of "quantity," as OTF contends, he would have done so by stating that "the relative quantities of each colour can be determined by comparing the areas under the spectroscopic graph of reflectance (percent) versus wavelength occupied by the specified colour." By including the term "intensities" in the definitional sentence, the patentee acted as his own lexicographer and provided an unconventional definition of that term -- namely, the area under the spectroscopic graph.

Other statements in the specification confirm that the patentee elected to use the term "intensity" as a synonym for the term "quantity" meaning the areas under the spectroscopic graph. For example, the terms "quantity" and "intensity" appear together in the specification nine times, and in each instance they appear to be interchangeable. '339 patent, col. 3, 11. 7-27; id. at col. 5, 1. 8; id. at col. 5, 1. 13. The words "intensity" and "intense" are used elsewhere in the specification to describe various colors. See, e.g., Id. at col. 1, ll. 58-59 ("Magenta, Cyan and a mid intensity Yellow are felt to be as close to the 'pure' primaries as possible."); id. at col. 5, ll. 41-42 ("Pigment Violet 19 is a transparent, intense pigment, possessing a high violet content."). However, nothing in the specification suggests that quantity and intensity are not synonyms, or that intensity means peak reflectance, as OTF claims.

Rather, it appears to the Court that OTF is seeking to "proffer an interpretation [of the term intensity] for the purposes of litigation that would alter the indisputable public record consisting of the claims, the specification and the prosecution history." Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1578 (Fed. Cir. 1995). But the public and OTF's competitors were entitled to rely on that public record, including the specification, to ascertain the scope of OTF's claimed invention. Vitronics, 90 F.3d at 1583. Allowing OTF to alter the meaning of "intensity" now would defeat the public notice function of patent claims, the importance of which has been recognized by the Federal Circuit and the Supreme Court. See Superior Fireplace Co. v. Majestic Products Co., 270 F.3d 1358, 1371-72 (Fed. Cir. 2001). Therefore, the Court must apply the definition of "quantity or intensity" set forth in the specification.

19. Query/Querying

The court defines "query" to mean "a request for information."

2. "Query processing mechanism for processing a given query statement, wherein, upon identifying that the given query statement is on said user-defined reference, communicates with said aggregation module over an interface therebetween to retrieve portions of aggregated fact data pointed to by said reference that are relevant to said given query statement"

The analysis for the previous term also applies to the term "query processing mechanism," which appears in claims 1, 2 and 13. Technical dictionaries, the claim language and common sense indicate that one having ordinary skill would be able to design a software component that, in essence, identifies a particular kind of query and if appropriate, communicates with another module over an interface and retrieves certain data. See Microsoft Computer Dictionary 359 (4th ed 1999) ("processing * * * "The manipulation of data within a computer system. Processing is the vital step between receiving data (input) and producing results (output) - the task for which computers are designed."). Hence, the court rejects Hyperion's
proposed means-plus-function construction and declines to construe this term.

**3494**

1. "Query servicing mechanism, operatively coupled to the aggregation module, for servicing query statements generated in response to user input"

The court concludes that the term "query servicing mechanism" as used in claims 1, 3 and 5 would connote sufficient structure to enable one skilled in the art to create that component. First, technical dictionary definitions contemporaneous with the filing of the patent application suggest that the term itself connotes some structure. See IBM Dictionary of Computing 549 (10th ed 1994) ("query: (1) a request for data from a database, based on specified conditions"). Cf Microsoft Computer Dictionary 404 (4th ed 1999) ("service: * * * (3) In networking, a specialized, software-based functionality provided by network servers - for example, directory services that provide the network equivalent of 'phone books' needed for locating users and resources."). Moreover, the claim describes at least some structure, noting that the "query servicing mechanism" is "operatively coupled to the aggregation module" and that the mechanism services "query statements."

But perhaps most persuasive is that as a practical matter, the court believes that a person of ordinary skill in the art would be able to build a "query servicing mechanism" given that databases and querying are, after all, well-known and ubiquitous technologies. See, e.g., IBM Dictionary of Computing 549 (10th ed 1994) (citing as an example of querying "a request for availability of a seat on a flight reservation system"). And in any event, Hyperion has not shown that it is more likely than not that one of ordinary skill would be unable to build this component. Accordingly, the court rejects Hyperion's proposed means-plus-function construction and declines to construe this term.

**3495**

H. "responding to queries"

Plaintiff argues that this phrase should be construed as "replying to requests to a database for information", relying on the American Heritage Dictionary of the English Language 712 (4th Ed. 2001), the Dictionary of Computer and Internet Words at page 227 and the Shames Declaration. (Dkt. 86 at Ex. 1, p. 2). Defendants argue, as noted, that the entire phrase "a PC type computer electronically connected to said database server for controlling said forms as required and responding to queries entered by each browser-based subscriber," should be construed as "(a) PC type computer, as mutually defined by the parties, that: (1) is electronically connected to the database server; (2) is used to develop and customize forms; and (3) submits information requested by a browser-based subscriber in response to a specific set of instructions entered by the subscriber."

The plain language of Claim 1 provides that the second function of the PC type computer electronically connected to the database server is to respond to queries entered by each browser-based subscriber. (229 patent, col. 5, ll. 12-13). The specification provides that "input and query forms are developed within the system II by billing network PC work stations 38 which are connected at hub 36 . . . ." (Id., col. 4, ll. 13-16). The specification provides that "forms which enter a query into the database server 90 will be output back to the browser-based subscriber terminal 72." (Id., col. 5, ll. 26-28). This citation suggests that information will be provided to the browser-based subscriber in response to a query.

The specification also provides that "the forms also establish query links to the database server 32. Query forms (not shown) are also available for transmission to the remote PC screen of each browser-based subscriber 12 and 20. These query forms provide each subscriber with access to the database server 32 which, in combination with drop-down lists, select the desired account for access to the database of the data server 32 to retrieve the requested information to the screen of the remote PC."

(Id., col. 4, ll. 6-13)(emphasis added).

Defendants suggest that the Court include the phrase "in response to a specific set of instructions entered by the subscriber" in the construction of the term. That construction is not suggested by the specification and would improperly import a limitation into the claim. See Burke, Inc., 183 F.3d at 1340. The Court finds that Plaintiff's proposed construction is
consistent with the plain language of Claim 1 and the specification. The phrase "responding to queries" is accordingly construed to mean "replying to requests to a database for information."

Defendants contend "questions" should be construed to mean: "More than one inquiry that requests an answer and ends with a question mark. Commands and statements are not questions. Menus presenting options are not questions. Words or phrases not in question form that are selected with a cursor or selection device are not questions." Defendants argue that this narrowed definition is necessary to reflect the Applicant's disclaimer of a broader meaning during prosecution to overcome prior art.

During prosecution, the Examiner rejected various claims in view of prior-art patents to Donald and Yourick (U.K. Patent No. 2,177,245 and U.S. Patent No. 4,775,935):

Donald fails to expressly disclose presenting questions to users and receiving answers in order to associate the answers with stored images or text portions. Instead, Donald's system is drawn to generating images or other information in response to direct user entries on a keyboard or user selections from a menu-driven software program.

However, question and answer query systems for presenting a product for selection are known in the art. . . . In particular, Yourick's system queries the user for preferences by asking questions and makes suggestions in response to selected answers in order to present a product most suited to the needs and desires of the user. It would have been obvious to one of ordinary skill in the art at the time of the invention to apply the teaching of Yourick within the system disclosed by Donald with the motivation of presenting items which most likely appeal to the user.

Office Action 8/29/96, pp. 8-9. The Applicant distinguished his invention from Donald and Yourick:

It is respectfully submitted that Donald and Yourick, alone or in combination, fail to disclose this combination of features. Neither Donald nor Yourick teach, for example, teach or suggest the selection of particular pictures and text segments in response to a customer's answers to computer generated questions. Even if the teachings of Donald and Yourick are combined, the specific claimed combination is not suggested without use of hindsight and the teachings of the present application.

Amendment & Request for Reconsideration, 9/24/96. The Examiner accepted the Applicant's argument:

The prior art fails to teach or fairly suggest, either singly or in combination, the utilization of a customer's answers to computer-generated questions to select stored pictures of products, stored pictures of product environments, and stored text segments, and to compile this information accordingly, so as to generate a customized proposal for the sale of the product. . . . Notice of Allowance, 10/2/96. Defendants contend that the Applicant explicitly argued that neither Donald nor Yourick taught "questions" and "answers," thus disclaiming any broader meaning that "questions" might otherwise convey.

The Court disagrees. Neither the Examiner's rejection, nor the Applicant's argument was premised on a narrowed definition of "questions." Rather, the Examiner clearly reasoned that Donald failed to disclose the claimed combination of "presenting questions to users and receiving answers in order to associate the answers with stored images or text portions." The Examiner did not reason that Donald failed to disclose "questions." Similarly, the Applicant responded that the references did not disclose the claimed "combination of features." The Applicant did not contend that Donald failed to disclose "questions," nor would such an argument have succeeded because Yourick taught using questions. Instead, the Applicant argued the invention's novelty (and non-obviousness) was using questions and answers to select stored product pictures, product environment pictures, and text segments to generate a customized proposal.

Thus, there is nothing in the prosecution history indicating that the Applicant disclaimed a broader meaning of "questions." Further, there is no reason within the patent to believe the Applicant used "questions" in any manner besides its ordinary
meaning. Accordingly, there is no need to construe the term, much less to stringently limit the meaning of "questions" as Defendants would like.

3497

Questions

The Staples Defendants contended "questions" should be construed to mean: "More than one inquiry that requests an answer and ends with a question mark. Commands and statements are not questions. Menus presenting options are not questions. Words or phrases not in question form that are selected with a cursor or selection device are not questions." Hyundai now argues a simplified version of the Staples Defendants' proposed construction--"queries that request answers instead of user selections from a menu."

Hyundai also argues that during prosecution, the applicant distinguished his invention from prior art that utilized "menus" on the basis that his invention utilized "questions." The Court previously examined the prosecution history in the Staples Markman opinion and found "there is nothing in the prosecution history indicating that the Applicant disclaimed a broader meaning of 'questions.' Further, there is no reason within the patent to believe the Applicant used "questions" in any manner besides its ordinary meaning. Accordingly, there is no need to construe the term, much less to stringently limit the meaning of 'questions' as Defendants would like." See Staples Markman opinion, at 9-11.

Hyundai also argues that "menus" and "questions" are used in the specification to refer to different things. See '342 Patent, cols. 15:14-39; 17:54-18:7; 20:22-24; 24:53-25:19; 27:22-56; 29:60-30:32; 32:37-33:5; 37:25-57. While the specification does refer to both "menus" and "questions," it also refers to menus or menu-like interfaces as questions. See '342 Patent, cols. 25:15-19 ("The predetermined questions allow the user to select one of a list of predetermined answers that correspond to the trade-in product of the customer who is to receive the proposal."); 30:28-32 ("The predetermined questions allow the user to select one of a list of predetermined answers that correspond to the financing of a product configuration that is of particular interest to the customer who is to receive the proposal."); 33:1-5 ("The predetermined questions allow the user to select one of a list of predetermined answers that correspond to the life cycle cost relating to a product configuration that is of particular interest to the customer who is to receive the proposal."). Thus, the specification does not preclude menus as types of questions.

Since there is evidence that the applicant did not limit the meaning of "questions" to exclude menus, the Court rejects Hyundai's proposed construction. As there is no other dispute about the term's meaning, the term does not require further construction.

3498

(2). "Queue" Implies an Order.

For the phrase "rental queue," the parties have two primary points of contention: whether "queue" implies an order, i.e., sequence of priority, and whether that order is determined by the provider. Netflix defines the term as the "sequence of movies/items used by a rental provider to determine which movies/items to deliver." Blockbuster contends that this proposed definition conflates the definition of "rental queue" with the concept of "ordered list," another disputed term. It proposes that "item/movie rental queue" should mean "two or more items/movies for future rental or possible future rental, or the names or other representations of two or more such items/movies."

A "queue" has a commonly-understood meaning, specifically, "a waiting line especially of persons or vehicles . . . ." Merriam-Webster, Ninth New Collegiate Dictionary, 1984. This definition inherently implies some kind of sequence or order, such as first come, first served. Netflix also cites to a more technical, computer-programming definition of queue, which defined it as "a sequence of stored data programs awaiting processing" (Ramani Decl. Exh. 9). Thus a queue must have some sequence or order; it cannot merely be a group of things as Blockbuster's proposed definition would suggest.
The idea that a queue must have some sequence or order finds support in the specification. Specifically, the '450 patent stated that "the one or more item selection criteria provided by customer 102 to provider 104 indicate the particular items that customer 102 desires to rent from provider 104. Thus the item selection criteria define a customer-specific order queue that is fulfilled by provider 104" (col. 4:54-58). In that embodiment, movies or items can be added to the queue based on customer selection criteria. The specification does not say precisely the order in which those items were added to the queue. It could be according to some other priority determined by the provider.

Blockbuster argues that including some kind of order in the definition of "item/movie rental queue" would render some claims redundant. Specifically, defendant argues that claim 39 of the '381 patent would add no limitation if this were the case. It recited (16:4-8):

39. A computer-implemented method as recited in claim 34, further comprising determining the order of the two or more movies indicated by the movie rental queue based upon preferences of the customer.

This argument, however, disregards the possibility that the provider, in arranging the queue, may take into account different priorities than those used to create the "ordered list." This is supported by the claim language itself. For example, claim 34 of the '381 patent recited "a movie rental queue associated with a customer comprising an ordered list indicating two or more movies for renting to the customer." The ordered list is part of the queue but may contain additional items arranged according to some other priority.

Finally, Blockbuster argues that the queue cannot have an order because during prosecution of the '450 patent, Neil Hunt, Netflix's CEO and a named inventor on both patents, referred to the queue as establishing a "set" of movies to be rented (Ramani Decl. Exh. 3, P 4). Specifically, the Hunt declared "[t]he pay-per-rental model did not include a mechanism, such as a rental queue, for establishing a set of specified movies from which initial and subsequent movies were rented." Blockbuster argues that this declaration means that the "rental queue" is a "set" which inherently cannot have any order. Hunt's statement does not, however, preclude the set's having some sequence. Hunt was trying to distinguish his invention from prior art rental models by showing that his invention did not require the customer to choose the item he or she wanted to rent on the spot; the item would instead be chosen from a preexisting queue. This statement does not mean that a queue has no order whatsoever.

9. Claim 12 - "Queuing"

In Claim 12, the word "queuing" means placing data into a structure in which items are removed in a first in, first out (FIFO) manner (Tr. 79 ).

8. RF Information Transmission Network/RF Information Network/RF Information Transmission System/RF Transmission System: A combination of circuits and devices for transmitting data, which combination includes a plurality of RF transmitters for transmitting RF signals carrying data and one or more RF receivers for receiving data. Each RF transmitter has a substantial geographic RF coverage area and is interconnected with other RF transmitters. [The combination may include pluralities of local, lata and hub switches].

10. RF Receiver: A device for receiving radio frequency electromagnetic signals, for demodulating the radio frequency electromagnetic signals, and for recovering data that is carried by the radio frequency electromagnetic signals. The RF receiver can be carried by a person outside a home or office and can receive data while being carried.
The next portion of Claim 1 which must be construed is Element (c) which provides for "an RF section for receiving instructions from said microcontroller and for receiving radio frequency information from the mixer and a television station and properly converting the information into video signals which may be sent to said television for viewing."

SuperGuide's position is that the language of the claim constitutes a definition of "RF section." Defendants cite the specification to support their position that the RF section must include a tuner and converter.

The claim and the specification recite three functions for the RF section. The first function is performed when the programming guide is off: "television signals received, such as VHF/UHF channels 2-82, or cable channels 2-62, are sent directly through RF section 64 to the television 40 for viewing." Reiter '578, at Col. 4, ll. 1-8. The second function occurs when the viewer uses the programming guide as a remote control system: "The system 10 may therefore function simply as a remote control device which permits the viewer to change channels. In this mode, according to the command of control unit 32, the microcontroller 60 instructs RF section 64 as to which channel is to be received from antenna 22 or cable 24 and sent to the television 40 for viewing on locally non-used channel 3 or 4." Id., at Col. 4, ll. 21-28 (emphasis added). The third function involves the use of the programming guide by the viewer: "The mixed signal would then be sent via RF section 64 to the television 40 for viewing by the viewer." Id., at Col. 5, ll. 13-15.

Because the inventor clearly intended the system to function as a remote control device, the RF section must include a method for selecting one channel from the many being bombarded at the television. "'[A] claim interpretation that would exclude the inventor's device is rarely the correct interpretation.' . . ." Interactive Gift Express, 256 F.3d at 1343 (quoting Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1550 (Fed. Cir. 1996)). Thus, it is unlikely that those skilled in the art would read the claim and specification as not including such a device. Id. Likewise, the RF section must convert information received from the mixer and the television station into "video signals which may be sent to said television for viewing. . . ." Thus, a conversion device is prescribed by the invention. Reiter '578, supra.

The Court finds the term "RF section" to mean the electronics for (1) receiving radio frequency signals from a source external to the invention; (2) receiving instructions from the microcontroller internal to the invention; (3) making a channel selection pursuant to the instructions received from the microcontroller; (4) receiving and converting signals received from the mixer or a television station into video signals capable of being received by the television set; and (5) transmitted the converted signals to the television for viewing.

The Court next considers the term "RFID tag", found in the claims of the '585 Patent and the '169 Patent. Defendants propose that the term be construed to mean a device designed to send a radio frequency signal upon encountering a radio frequency signal or magnetic field. TSI argues that the term need not be construed. In the alternative, TSI argues that if the term is defined in some way, it should be construed to mean a device designed to send a radio frequency signal upon encountering a radio frequency signal or magnetic field from an RFID reader and which comprises (1) an antenna designed to receive and transmit radio frequency signals containing information that is not dependent upon the material properties of the antenna alone and (2) an integrated circuit that can store information in an associated electronic memory.

Thus, as shown by TSI's alternative construction, the parties generally agree that an RFID tag is a device designed to send a radio frequency signal upon encountering a radio frequency signal or magnetic field from an RFID reader. TSI would add the additional limitations that the tag comprise a particular antenna and an integrated circuit or chip. At oral argument, TSI explained that it believed that no construction was necessary for this term, but if the term is defined, the particular type of RFID tag used in the invention should be described.

The Court might ordinarily consider granting a patent-holder's own request to impose a limitation on the scope of its patent's claims. The excerpts cited by TSI for its alternative construction, however, do not support such a limitation, as they refer
only to embodiments and not to the invention as a whole. See '585 Patent at 3:65-67; '169 Patent at 6:54-58. Moreover, TSI first argues that no construction is necessary, and the Court agrees with that assessment. Defendants have not explained why this term requires construction, and it is clear to the Court that a person schooled in the relevant art would understand the meaning of RFID tag in the context of these claims and its use with an RFID reader. Accordingly, the Court concludes that no construction of the term "RFID tag" is necessary.

GO BACK

3504

1. "rack"

This term appears in the '366 patent claims 1, 4, 6, 18, 23, 29, 30, 32, 35, 37, 41, 42, 46, and 47. Rackable contends that "rack" means "frame or cabinet for holding multiple computer chassis that can be removed and are accessible after installation, such as a standard industry server rack" Supermicro proposes that "rack" means "a frame or cabinet that contains mounting arrangements for holding electronic devices in a stacked manner."

The essence of the parties' dispute concerns whether "rack" should be construed to mean a particular type of frame or cabinet used in the server storage industry, or whether it should be construed as a more general purpose rack capable of holding all types of electronic devices; and whether the device enables the mounting or the removal of the computers or electronic devices.

Rackable argues that "rack" refers to a particular type of electronic device -- computer chassis -- and enables removal. In support of its construction, Rackable contends that the patent itself targets the computer server industry, and notes that the specification example, figure 4, is of a type of rack used for holding computers in the high-density computer industry. It also argues that figure 4 of the patent demonstrates that the rack is a type that enables the removal of the computers after installation. Rackable further asserts that its construction, referring to the "standard industry server rack," is consistent with the patent itself, which describes a rack whose dimensions are those of a "standard industry server rack."

Supermicro contends that "racks" store electronic devices generally, and enable the mounting of the devices. Supermicro responds that figure 4 to the '366 patent supports its construction. It also relies in part on the expert declaration of Sam Wood. In support of its mounting argument, Supermicro also cites to language in the patent for the proposition that "[i]n a typical setup, the rack will have holes and the electronic devices will contain 'ears' that are screwed into the holes, thus connecting the electronic devices to the rack." It further argues that the specification discloses that the rack can hold items other than computers. Finally, Supermicro asserts that its construction is supported by technical dictionary definitions.

Because the patent is not ambiguous, the court declines to consider extrinsic evidence as to this term. It also declines to adopt either party's construction in full. First, the court finds that the intrinsic evidence supports Rackable's construction that the "rack" holds computers, as opposed to Supermicro's more general construction, which encompasses all "electronic devices." The '366 specification's field, background, and summary of the invention clarifies that the patent concerns the storage of computers, as opposed to simply "electronic devices." There is absolutely no suggestion anywhere in the patent that the rack is utilized for holding other types of electronic devices. See, e.g., Phillips, 415 F.3d at 1313 (person of ordinary skill is "deemed to read the claim term not only in the context of the particular claim . . . but in the context of the entire patent, including the specification").

The court also rejects both of the parties' injection of the mounting and removability limitations on the computers held by the racks. Those are limitations that are not properly read into this court's construction of the claims. The law is clear that it is error to import a limitation from the specification into the claim. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 904 (Fed. Cir. 2004). The "fact that a patent asserts that an invention achieves several objectives does not require that each of the claims be construed as limited to structures that are capable of achieving all of the objectives." Id. at 908. Nor should an embodiment disclosed in the specification limit the claims. Id. at 906.

In conclusion, the court adopts a modified version of Rackable's construction of the term "rack" as a frame or cabinet for holding multiple computer chassis.

GO BACK
Claim 55 of the '785 Patent contains the term "radial motion." IPI contends the term means "motion or displacement along one or more rays," while Google contends the term simply means "perceived movement along a ray." The parties' dispute centers around whether there can be movement along more than one ray.

IPI derives its proposed construction directly from the specification, which provides: "'Radial motion' or 'radial displacement' is perceived as motion or displacement along one or more rays." '785 Patent, col: 7:55-57. IPI argues that its proposed construction should be adopted because the inventors acted as their own lexicographers in defining the term "radial motion." However, as Google points out, the specification goes on to clarify that "[a] ray extends from a 'radial source.'" '785 Patent, col: 7:55-57. IPI's proposed construction of "radial motion" would allow the motion to take place across multiple rays in an unbounded fashion, which is unsupported by the specification and the claim language. Google interprets the specification to indicate "that although radial motion can begin along one ray and subsequently shift to take place along a different ray, to be radial, motion must be perceived as movement along a ray." Google's Responsive Brief, at 29-30. Google further argues that the plain language of claim 55 supports its proposed construction that "radial motion" is "perceived movement along a ray": "The method of claim 52 in which the first viewpoint motion includes radial motion, the second viewpoint being displaced radially along a ray extending from the second point of interest through the first viewpoint." '785 Patent, col: 27:15-19.

Although the specification defines the term as including "motion or displacement along one or more rays," "radial motion" along multiple rays is inconsistent with the claim language. The claim language and specification allow "radial motion" to take place along different rays, but the motion can only take place along one ray at a time. To further explain,"radial motion" can take place along one ray, then a request to move to a different point of interest can cause the "radial motion" to shift to another ray. This is illustrated in Figure 7 of the '785 Patent:

[SEE Fig. 7 IN ORIGINAL]
Figure 7 of the '785 Patent

The specification's description of Figure 7 further supports the Court's understanding of "radial motion":

FIG. 7 illustrates viewpoint motion together with point of interest motion. Surface 140 is perceptible in a three-dimensional workspace, and includes POI 142 and POI 144. From initial viewpoint 150, radial motion is requested toward POI 142, so that an image is presented from viewpoint 152 on the ray from POI 142 through viewpoint 150. Then, while the request for radial motion toward the POI continues, a request to move to POI 144 is also received, so that an image is presented from viewpoint 154 on the ray from POI 144 through viewpoint 152.

'785 Patent, col: 12:9-19 (emphasis added). Accordingly, the Court adopts Google's proposed construction and construes the term "radial motion" to mean "perceived movement along a ray."

1. "Radiant Energy." Used in Claims 1, 3, 4, 12, and 24-30.

Flashmark suggests "the forms of energy described in [dependent] Claims 3 and 4, or any form of heat or range of light wavelengths." GTECH proposes "energy transferred by electromagnetic waves, rather than by conduction or convection." The main dispute here is whether "radiant energy" is limited to electromagnetic energy, or can include heat transferred by contact with a hot object (conduction) and heat transferred by hot liquid or gas moving past an object (convection).

A common example may help illustrate the difference. A microwave oven uses the part of the electromagnetic spectrum known as microwaves to heat food. A microwave safe plate will not feel hot after being placed in an operating microwave
oven. However, the microwave will heat food on that plate. When the food heats, the plate can become hot from the transfer of heat from the food through conduction.

Flashmark maintains that the patentee acted as his own lexicographer in defining "radiant energy" as both electromagnetic energy, such as visible light and infrared light, and as "heat," of a type which is not electromagnetic energy. Flashmark points to language in the specification such as "a particular form of radiant energy, whether it be heat or light . . . ." '153 Patent Col. 1, 11. 65-66. Several other similar references are made in the specification, and the claims themselves use phrases such as:

"3. The article of claim 1 wherein said particular form of radiant energy comprises heat." Col. 7, 11. 30-31;

"4. The article of claim 1 wherein said particular form of radiant energy comprises a range of light wavelengths." Col. 7, 11. 32-34; and

"5. The article of claim 4 wherein said range of light wavelengths covers from about 750 nanometers to about 950 nanometers." Col. 7, 11. 35-37.

Flashmark invokes the doctrine of claim differentiation to assert that "heat" must therefore surely be different than "light." They are different, but that does not answer the question of whether one of ordinary skill would understand "radiant energy comprises heat" to refer to some form of energy outside of the electromagnetic spectrum. As discussed below, "light" and "heat" are commonly used to describe different bands of wavelengths in that spectrum.

In spite of Flashmark's impassioned arguments, the patentee provided no special definition of "radiant energy." On the other hand, the task is not made easy by a clear intentional disclaimer. The court is faced with the familiar problem of the "twin axioms," which require reading claims in view of the specification but forbid importing limitations from the specification into the claims Liebel-Flarsheim Co. v. Medrad, 358 F.3d 898, 904 (Fed. Cir. 2004). Resort to dueling canons of construction is not going to resolve this dilemma.

No single statement in the patent nor in the prosecution history is sufficient by itself to determine the meaning of "radiant energy." Rather the court must examine the claim, the specification, the prosecution history, and relevant scientific principles to determine how one of ordinary skill trying to use, or design around, the invention would have understood the term.

Scientific Principles Relevant to the Art

A court may not attempt to define claim terms from extrinsic evidence. However, the "customary meaning" of a term "refers to the 'customary meaning in [the] art field.'" Phillips, 415 F.3d at 1313 (citation omitted). A review of basic, uncontroversial scientific principles provides "an objective baseline from which to begin claim interpretation." Id. The words of the claims are viewed from the point of view of one of ordinary skill in the art - in this case, someone with a knowledge of science, including the properties of energy.

The parties agreed that "light," in its everyday meaning, and as used in this patent, is a form of electromagnetic energy that travels at specified wavelengths. The parties also agreed that the electromagnetic spectrum can be divided into ranges, shown generally on the chart, attached as Appendix A, and discussed at the hearing as Court Exhibit 1.

The ranges are marked on the chart in micrometers or one thousandth of a millimeter, denoted by the symbol "[mu] m." The patent uses the unit of measurement known as the "nanometer," 31 which is one thousandth of a micrometer. So Claim 5's description of light wavelengths "from about 750 nanometers to about 950 nanometers" would be shown on the chart from about .750 [mu] m to about .950 [mu] m. As shown on the chart, this would range from about the bottom end of the visible red light spectrum into what is called the "near infrared" area on the chart. Longer wavelengths, from about 5.5 [mu] m to about 1000 [mu] m fall into what is sometimes denoted as "thermal infrared." 31 This is generally the range of electromagnetic radiation felt as heat and used in cooking.

Language in the Claim and Specification

Given a basic understanding of the electromagnetic spectrum, it would not be unusual for one skilled in the art to understand "heat" as referring to energy at a particular wavelength. With this interpretation, Claims 3, 4, and 5 are simply dependent
claims, each of which limits the broad scope of "radiant energy" of Claim 1 to a smaller portion of the electromagnetic spectrum. This does no violence to the presumption that flows from claim differentiation. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006). Of course, this does not by itself dispose of Flashmark's claim that "heat" may be something other than radiant energy.

Claim 1, upon which each of these claims is dependent, limits "radiant energy" to "a particular form . . . not normally present in ambient light . . . ." Col. 7, 11. 21-23. This phrase is important, because, as discussed in more detail below, it was added by the patentee to overcome a rejection by the PTO. Flashmark admits that "light" refers to a portion of the electromagnetic spectrum, but insists that "heat" does not. If "heat" as used in this patent is not in the form of electromagnetic waves, it is not going to be "in," i.e., a component of, ambient light. 3 Flashmark has shown no basis to ignore this limitation of the independent claim.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
3 Claim construction can not rest the sophistical argument that anything placed in a room can be "in" the room's ambient light, but since the non-electromagnetic heat source is not normally "in" a room it meets the limitation of Claim 1.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Independent Claim 24 teaches a device that invalidates the voidable articles and documents of Claims 1 - 23. It describes "a radiant energy source which exposes at least a portion of said article to a dose of radiant energy . . . ." Col. 8, 11. 34-35. Again, the dependent claims describe a variety of forms of "radiant energy" including "heat." But all are dependent upon Claim 24, in which the patentee carefully chose "dose" to describe the application of radiant energy. It would be unusual to describe the application of a heated scanner head to an article as a "dose." However the use of "dose" is consistent with radiation in the form of wavelengths of the electromagnetic spectrum. The dependent claims 25, 26, 27, 28, 29, and 30 would then each describe the "dose of radiant energy" of Claim 24 as occurring in different bands of the spectrum.

The use of "dose," by itself, is not enough for the court to construe the term in dispute. It must be taken in conjunction with the other references discussed. However, it is illuminating that in describing the device that voided his voidable articles, the patentee made no attempt to formulate a claim, nor to describe in the specification, any application of "heat" by contact with heated metal, ceramic, or other material (conduction), nor through exposure to moving heated gas or liquid (convection).

One of ordinary skill in the art would know of the different types of energy transfer. A voidable article could be touched with a hot material (conduction) or placed in a blast of hot air (convection). But nearly every use of the word "energy" in this patent is preceded by the word "radiant." Except in the discussion of prior art, there is no hint in the specification, nor in the prosecution history, of an article or document placed in direct contact with a hot surface or exposed to heated air or other gas. Accordingly, the claims and specification support a construction of "radiant energy" as part of the electromagnetic spectrum.

Prosecution History

Another indication of the way in which claim language was interpreted at the time of the application is seen in the "Supplemental Information Disclosure Statement." See Supplemental Information Disclosure Statement, 1.28/1991, FLASH 0000061-63 in GTECH's Ex. E [Doc. #107, Attach. # 11, p. 1-3 of 76]. 4 As required by law, the patentee was disclosing relevant prior art. Obviously an applicant does not submit a disclosure with the statement "this prior art invalidates our requested patent." Instead the applicant points out that while the disclosed art may be relevant, it is distinguishable. Distinctions drawn between the patented invention and prior art may be useful "since they indicate in the inventor's own words what the invention is not." MBO Labs., Inc. v. Becton, Dickinson, & Co., 474 F.3d 1323, 1330 (Fed. Cir. 2007).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
4 The court is not engaging in prosecution disclaimer analysis, but rather is examining how the term was used in the prosecution history at the time of the invention.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In this case the patentee disclosed European Patent Application No: 0 305 211 ("Herbert"), with the explanation: "Herbert discloses a mail item treated with heat sensitive material. Heating causes the material to turn color." Supplemental
Information Disclosure Statement, 1/28/1991, FLASH 0000063 in GTECH's Ex. E [Doc. # 107, attachment # 11, p. 3 of 76]. The Herbert Application describes applying a thermal print head to items treated with a heat sensitive material that changes color when heat is applied. See European Patent Application No: 0 305 211, pp. 2-3 in GTECH's Ex. J [Doc. # 107, Attach. # 16, pp.3-4 of 8].

In other words, Herbert discloses a heated surface (the thermal print head), applied to "a material peculiarly responsive to" the heat from that heated surface, causing the item to change color. Unless one is to assume that the patentee in the present case intended to inform the PTO of invalidating prior art, the "heat" and "heat sensitive materials" of Herbert are not what was claimed in the '153 patent by "radiant energy" and "material peculiarly responsive to a particular form of radiant energy."

Finally, the correspondence between the patentee and the Examiner indicate that both understood "radiant energy" to refer to energy of particular wavelengths. The Examiner initially rejected claims 1-23 as unpatentable over earlier patents that had disclosed materials that changed colors upon exposure to light. "It would have been obvious to have made the Jenkins tickets respond to non-visible wavelengths of energy as taught by Parrotta in order to obtain energy levels . . . ." Office Action, 3/26/1991, FLASH 0000065 in GTECH's Ex. E [Doc. # 107, attachment # 11, p. 5 of 76](emphasis added).

The patentee did not respond that his invention claimed a form of "heat" that was not part of the electromagnetic spectrum at all, and thus was not affected by these prior references. That would have run afoul of the Herbert patent. Rather, the patentee amended Claim 1 by adding "not normally present in ambient light in amounts sufficient to cause said material to discolor." Response to Office Action, 6/28/1991, FLASH 0000078 in GTECH's Ex. E [Doc. # 107, Attachment # 11, p. 18 of 76]. As discussed above, the added language indicates that the "radiant energy" of Claim 1 can be defined by wavelengths, as can "ambient light." Otherwise, the amendment means nothing, and was used only as a subterfuge to confuse the Examiner.

This understanding is confirmed by the Examiner's Reasons For Allowance, which substitutes "radiation" for "radiant energy."

Claims 1-23 and 36 are considered allowable over the prior art because the art of record does not disclose or teach voidable machine-readable articles or documents utilizing a material responsive to radiation which is not normally present in sufficient amounts in ambient light.

Notice of Allowability, p. 2, 9/10/1991, FLASH 0000085 in GTECH's Exhibit E [Doc. # 107, Attach. # 11, p. 25 of 76] (emphasis added). It strains credulity to argue that either the patentee or the Examiner even imagined that the language of the claims referred to energy that was not part of the electromagnetic spectrum and thus would not be part of the waves that make up ambient light.

Flashmark argues that the Examiner could have been referring only to Claim 14, which describes documents (not articles) exposed not to "radiant energy," but to "a sufficient intensity of non-visible wavelength light . . . ." Col. 7,11.62-63. But Claim 14 simply limits the kinds of articles to documents, and the range of wavelengths to those in the non-visible range. Only a very strained interpretation of the referenced dialogue in the prosecution history would support a conclusion by one skilled in the art that "radiant energy" refers to anything other than energy in the form of specified wavelengths of the electromagnetic spectrum.

In the end, the court must determine what the patentee invented and, more importantly, described. This description can not be read from the point of view of the present patent holder years after the patent was issued, nor of a lawyer, nor even from that of the uneducated inventor operating in a field of art strange to him. The description in the patent is addressed, "as section 112 says, to those skilled in the art to which the invention pertains or with which it is most connected." Phillips, 415 F.3d at 1313 (citation omitted). Accordingly, the court must reject Flashmark's argument that Mr. Johnson had only a high school education and, lacking a sophisticated scientific background, might have created his own definition that "radiant energy not normally present in ambient light" includes heat other than that present in the electromagnetic spectrum. The court construes this term as follows:

"Radiant Energy" means "energy transferred at certain wavelengths and frequencies of the electromagnetic spectrum."
3. A radiation absorbing material with a sheet resistance providing at least 50% absorption in said spectral range (claims 35-38)

Plaintiff argues that this term means "material having sheet resistance, wherein the material absorbs at least 50% of incident radiation in the specified spectral range." Though Defendants originally proposed a different construction, they agreed at the Markman hearing that this term means "a layer of material that absorbs, through its sheet resistance, at least 50% of incident radiation in the specified spectral range." See Transcript of April 9, 2008 Markman Hearing ("Markman Tr."), 68:7-8. Moreover, both parties agreed at the Markman hearing that sheet resistance provides radiation absorption.

--- Footnotes ---
1 The court initially proposed a similar construction--substituting "effective sheet resistance" for "sheet resistance"--to account for the radiation reflected from the ground plane, as discussed herein, although both parties argued that the meaning of "effective sheet resistance" is unclear.

--- End Footnotes ---

The specification describes that "free carrier absorption [] can be optimized by choice of resistivity, thickness, and gap from stack 144 to ground plane 192." '663 patent, 7:53-56. The patent then explains that Fig. 7 illustrates the absorption A on a metal film of thickness t and resistivity [rho], with absorption A approaching slightly less than 50% absorption at its peak. Id. at 7:57-65; Fig. 7. It then describes how "the addition of a thick conducting layer parallel to the metal film and at a distance of 1/4e away" increases absorption to nearly 100%. Id. at 7:66-8:2. The specification, therefore, describes how the spacing of a radiation absorbing material at a distance of 1/4 wavelength from a thick conductive layer will significantly enhance the absorption capability of the radiation absorbing material. Indeed, the "Summary of the Invention" portion of the specification explains that "[t]he distance between the suspended resistance material and the underlying reflective substrate is one-quarter of the wavelength of the center of the infrared spectral band and provides enhanced infrared absorption." '663 patent, 2:27-31.

Describing a preferred embodiment, bolometer 140, the specification then describes that "the distance from electrodes 148 and 152 to ground plane 192 is set at" one quarter wavelength. Id. at 8:3-7. Given this 1/4e spacing, the specification explains that "only the ratio of resistivity-to-thickness enters into the absorption analysis" (i.e., because the spacing has already been determined) and that adjustments may be made to compensate for the resistivity of the material to allow for greater absorption. Id. at 8:18-25. Defendants argue that this statement means that only resistivity and thickness enter into the absorption analysis at any point, although the specification's description of absorption and the preferred embodiment in columns 7 and 8 clarifies that each of resistivity, thickness, and spacing is a factor in a material's ability to absorb radiation. See id. at 7:53-56. The specification statement upon which Defendants rely reiterates that resistivity and thickness are the only factors that enter into the absorption analysis after spacing has been determined.

Plaintiff's primary concern with the court's proposed construction at the Markman hearing was that "a layer of material that absorbs, through its sheet resistance, at least 50% of incident radiation in the specified spectral range" is ambiguous in that it appears to require that the sheet resistance alone--without regard for the spacing from the ground plane and without regard for any radiation reflected from the ground plane--absorbs at least 50% of incident radiation. However, the court's construction necessarily takes into account the total incident radiation absorption, including incident radiation initially absorbed by the sheet resistance and incident radiation absorbed by the sheet resistance as a result of the positioning of the layer of material (e.g., absorption after reflection from the ground plane).

The court construes "a radiation absorbing material with a sheet resistance providing at least 50% absorption in said spectral range" to mean "a layer of material that absorbs, through its sheet resistance, at least 50% of incident radiation in the specified spectral range."
IV. "Radio"

The Court first turns to the term "radio." This term appears in claim 1 of the ’059 patent and claims 1 and 2 of the ’925 patent.

A. The Parties' Proposed Constructions

Black & Decker proposes construing "radio" as "radio receiver and an audio output component." Bosch proposes that "radio" means "radio receiver and a loudspeaker device used to project audible sound."

B. The Construction Of "Radio"

The parties agree that the term "radio" includes a "radio receiver" plus at least one other component. The parties disagree on what that additional component must include. Bosch argues that in order to be a "radio," a "radio receiver" must be combined with "loudspeakers." The Court disagrees and finds that a person of ordinary skill in the art at the time of the invention, after having read the intrinsic record, would have understood the term "radio" to not require the presence of loudspeakers. The plain claim language does not mention loudspeakers or any similar component. Rather, the claim language merely requires that the "radio" is enclosed and that it includes a "radio receiver." Although the specification mentions "loudspeakers" it does not contain any language indicating that they are a required component of a radio. n4 It would be improper for the Court to incorporate the additional structure of loudspeakers into the plain claim language of "radio." Dayco Prods., Inc. v. Total Containment, Inc., 258 F.3d 1317, 1325 (Fed. Cir. 2001).

n4 The Court notes that Bosch's position would require that a person of ordinary skill in the art would not consider a "Walkman radio" a "radio" unless the headphones were connected. Bosch has not convinced the Court that this should be the case. In fact, at the Markman hearing, counsel for Bosch referred to an audio car stereo, not connected to any loudspeakers, as a "radio." (Markman Transcript at 58:4.)

The portions of the intrinsic and extrinsic record relied on by Bosch also support a construction of "radio" that does not require loudspeakers. Bosch relies on the declaration from its expert, Harvey A. Brodsky ("the Brodsky Declaration"). As Black & Decker points out, the Brodsky Declaration suffers from several deficiencies. First, it states its opinions of the understanding of one of ordinary skill in the art in the present tense. Federal Circuit law is clear that the Court is to construe the claims from the vantage point of a person of ordinary skill in the art at the time of the alleged invention, which in this case is around 1997. Phillips, 415 F.3d at 1313 (citing Innova, 381 F.3d at 1116). Next, the Brodsky Declaration does not provide that Mr. Brodsky ever reviewed the intrinsic record. Phillips, 415 F.3d at 1313 (citing Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477 (Fed. Cir. 1998)). Rather, the Brodsky Declaration contains conclusory unsupported opinions. See Phillips, 415 F.3d at 1318. Accordingly, the Court assigns this declaration very little probative value. Even if the Court did give weight to the Brodsky Declaration, his testimony confirms that a "radio" does not necessarily include loudspeakers. Referring to various possible components of a radio, Brodsky states that "without any one of these circuits, the tuner circuit, the voltage regulator circuit, or the amplifier circuit, the radio device will not operate properly." (Brodsky Decl. P12.) Brodsky, therefore, concedes that even in the absence of one of these components, the device is still a "radio" device, even if he opines that it will not work properly. Accordingly, under Brodsky's opinion, even if given significant weight, a radio does not necessarily include loudspeakers.

Bosch further relies on the specification, arguing that the "Summary of Invention" section states that one of the goals of the claimed invention is to overcome ambient noise present in construction sites. This stated objective, however, does not require that the "radio" limitation, itself, be capable of overcoming ambient noise. Rather, the claimed invention, comprised of all claimed components, should be capable of achieving this objective. n5
n5 Bosch concedes that the term "radio" as used in the preamble is different than the term "radio" as used in the claim body.

Next, Bosch relies on U.S. Patent No. 6,427,070 (the '070 patent), filed on March 4, 1999, by a Black & Decker engineer, Roger Q. Smith. The '070 patent provides that "radio circuitry may include an FM Front End integrated circuit, [], in combination with a low frequency power amplifier integrated circuit, []." (R. 54-1; Ex. D, col. 3, ll. 63-67.) The '070 patent continues that "the radio circuitry may be replaced with other circuitry for producing audio signals to the speakers via circuitry used with a cassette deck, compact disk or other methods to play music." (Id. at col. 4, ll. 4-7.) The '070 patent is extrinsic evidence and the Court cannot use it to rebut a plain and ordinary meaning provided in the intrinsic evidence. Phillips, 415 F.3d at 1317. Even if the Court did rely on the '070 patent, the portions of the specification cited by Bosch do not require that a "radio" include loudspeakers. Most notably, the specification states that radio circuitry "may" be replaced with other circuitry for producing audio signals, and is therefore permissive. (R. 57-1; Ex. D., col. 3, ll. 54-60.) Accordingly, neither the intrinsic or extrinsic evidence of record supports incorporating a limitation of "loud speaker" into the plain language of the claims and the Court construes the term "radio" as a "radio receiver and an audio output component."

The Court adopts CSIRO's proposed construction and construes the term "radio frequencies" to mean "the frequencies in the portion of the electromagnetic spectrum that is between the audio-frequency portion and the infrared portion." Buffalo urges the Court to construe "radio frequencies" to mean "frequencies, in excess of 10 GHz but still within the electromagnetic spectrum normally associated with radio signal propagation, i.e., less than or equal to 300 GHz," and argues that the doctrine of prosecution history estoppel prevents CSIRO from asserting its preferred construction.

The claim terms' context supports CSIRO's construction. Reading the term "radio frequencies" in both the asserted and unasserted claims, one of ordinary skill in the art would interpret that term to connote all frequencies in the radio portion of the electromagnetic spectrum. Construing "radio frequencies" to mean a range between 10 and 300 GHz would contradict the term's ordinary meaning n2 and render numerous claims substantively identical in scope. The doctrine of claim differentiation makes Buffalo's construction presumptively unreasonable because under the doctrine each claim in a patent is presumed to have a different scope. Comark, 156 F.3d at 1187; Beachcomber v. Wildewood Creative Prods., Inc., 31 F.2d 1154, 1162 (Fed. Cir. 1994). The specification explicitly identifies different embodiments of the invention, some of which operate at "radio frequencies" and others that operate "in excess of 10 GHz."

n2 The parties do not dispute that the ordinary meaning of "radio frequencies" connotes a range of 3 KHz (three thousand cycles per second) to 300 GHz (three hundred billion cycles per second).

Buffalo concedes these points but argues the patentees disavowed CSIRO's construction of "radio frequencies" during prosecution and therefore the doctrine of prosecution history estoppel renders Buffalo's construction the only legitimate one. Accordingly, argues Buffalo, the doctrine of claim differentiation permits adopting that construction.

Specifically, Buffalo argues that although certain claims in the 069 Patent mention an invention transmitting at frequencies exceeding 10 GHz and other claims mention an invention transmitting simply at "radio frequencies," the patentees' 1992 Australian patent application and 1993 U.S. patent application mentioned only an invention transmitting at frequencies exceeding 10 GHz. Buffalo argues that the patentees never intended to patent an invention that transmitted at frequencies exceeding 10 GHz.
less than 10 GHz and that the patentees replaced certain references to the 10 GHz limitation with the less restrictive "radio frequencies" only when they realized Institute of Electrical and Electronics Engineers standards for wireless LANs would likely permit operation at frequencies less than 10 GHz. Buffalo contends that this replacement introduces "new matter" into disclosure of the invention, which 35 U.S.C. § 112 prohibits. Therefore the claims must be limited to the scope of the embodiments describing transmission above 10 GHz.

The claim differentiation doctrine's presumption is rebutted if the claims will bear only an interpretation that makes them identical. Autogiro Co. of Am. v. United States, 384 F.2d 391, 404, 181 Ct. Cl. 55 (Ct. Cl. 1967); see also Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998) ("The doctrine of claim differentiation can not broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence."). However, Buffalo errs when it contends that the law makes its construction of "radio frequencies" the only permissible interpretation. Buffalo cites Schering Corp. v. Amgen, Inc., 222 F.3d 1347, 1352 (Fed. Cir. 2000), to support its argument regarding new matter, but the Federal Circuit in Schering imposed limitations on a term based on the patentee's explicit disavowals during prosecution, not because the patentee improperly introduced new matter. See Affymetrix v. Hyseq, Inc., 132 F.Supp.2d 1212, 1219 (N.D.Cal. 2001); Reiffin v. Microsoft, 64 U.S.P.Q.2d (BNA) 1107, 1112 (N.D. Cal. 2002). Determining whether the patentee introduced new matter during prosecution is not appropriate during claim construction. See, e.g., Pliant Corp. v. MSCMktg. & Tech., Inc., 416 F. Supp. 2d 632, 643 n.5 (N.D. Ill. 2006) (finding that the issue of new matter "is not a matter for claim construction"); Reiffin, 64 U.S.P.Q.2d (BNA) at 1112 ("Courts do not [determine] whether a patent contains new matter at the claim construction stage."

Buffalo likewise misapprehends the law of prosecution history estoppel. Prosecution history estoppel normally arises when a patentee narrows the patent's scope through amendment to avoid prior art. See Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., 535 U.S. 722, 735-36, 122 S. Ct. 1831, 152 L. Ed. 2d 944 (2002) ("Festo II"). This precludes the patentee from recapturing subject matter through the doctrine of equivalents that the amendment relinquished. See id. at 733-34; Wang Lab. v. Mitsubishi Elecs. Am., 103 F.3d 1571, 1577-78 (Fed. Cir. 1997) (holding that prosecution history estoppel "preclud[es] a patentee from regaining, through litigation, coverage of subject matter relinquished during prosecution of the application for the patent"). Prosecution history estoppel helps ensure that the doctrine of equivalents is used only to protect subject matter not affirmatively surrendered. See Festo II, 535 U.S. at 734-35. Though the Supreme Court has held that amendments for purposes other than avoiding prior art may still give rise to estoppel, only a narrowing amendment gives rise to estoppel. See id. at 735-36 ("Estoppel arises when an amendment is made to secure the patent and the amendment narrows the patent's scope."); see also Bus. Objects, S.A. v. Microstrategy, Inc., 393 F.3d 1366, 1375 (Fed Cir. 2005); Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., 344 F.3d 1359, 1366 (Fed. Cir. 2003) ("Festo III") (holding that "if the amendment was not narrowing, then prosecution history estoppel does not apply"). In this case, the portions of the 1995 amendment at issue replaced certain references to "in excess of 10 GHz" with "radio frequencies." There is no dispute that these were broadening amendments. Prosecution history estoppel thus cannot apply.

Finally, Buffalo points to nothing in the specification or prosecution history that reflects the patentees' clear and express disavowal of multipath propagation at frequencies below 10 GHz. An express disavowal is the only kind that the law will consider as effective. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324-25 (Fed. Cir. 2003) (disavowal of claim scope in prosecution history must be unequivocal); see also SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed Cir. 2001) ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the [patent's] claims . . ."); Cutlor Corp. v. A.E. Staley Mfg. Co., 224 F.3d 1328, 1331 (Fed. Cir. 2000) ("Claims are not correctly construed to cover what was expressly disclaimed."). Indeed, Buffalo foregoes any argument that the patentees disavowed multipath frequencies below 10 GHz entirely and relies solely on its prohibited new matter and prosecution history estoppel arguments, neither of which apply.

Therefore, the Court adopts CSIRO's construction and construes "radio frequencies" to mean "the frequencies in the portion of the electromagnetic spectrum that is between the audio-frequency portion and the infrared portion."

Radio Frequency Communication Switch

Fenner seeks to define "radio frequency communication switch" as "a personal communications system switch including
radio frequency links," whereas Defendants argue for, "a telecommunications device, with a radio frequency interface, that selectively connects calls."

Fenner's proposed limitation "including radio frequency links," implies that radio frequency links are incorporated into or constitute a part of the radio frequency switch. However, radio frequency links are better understood as avenues or conduits that connect discrete parts. In support of its construction, Fenner cites a passage of the specification that reads, "[a] plurality of personal identification numbers are able to communicate with a personal communications systems switch via wire line and radio frequency links." '706 Patent, Col 2, In. 32-34. The term "via" in Fenner's reference instructs that the personal identification numbers and personal communications systems switch are separate elements that communicate through the wire line and radio frequency links, whereas Fenner's construction suggests that radio frequency links are a part of a radio frequency switch. Defendants' phrase "radio frequency interface" more accurately reflects the relationship between the radio frequency switch and the radio frequency links.

Neither "a personal communications system switch" nor "a telecommunications device" is necessary or clarifying and could potentially inject confusion into the construction. Further, the Court declines to adopt Defendants proposed phrase "selectively connects calls" for the reasons discussed in the section on "calls." Accordingly, the Court construes radio frequency switch to mean, "a switch with a radio frequency interface."

Element (c) of claim 1 contains the phrase "radio frequency information" which is described as coming from the mixer and a television station. SuperGuide argues that "radio frequency information" is either analog or digital information which may be carried or derived from a radio frequency carrier signal. And, SuperGuide notes the information received from the mixer is not modulated but still qualifies as radio frequency information because it can be modulated in the RF section for viewing on a television. Thus, digital television signals also qualify as radio frequency information because they may be modulated onto a carrier wave.

The Court rejects this attempt to bootstrap technology which was not in the state of the art at the time of this invention. The specification provides that when the programming guide is not in use, "television signals received, such as VHF/UHF channels 2-82, or cable channels 2-62, are sent directly through RF section 64 to the television 40 for viewing." Reiter '578, at Col. 4, ll. 5-8. The Court has construed "regularly received television signals" to mean analog signals.

The Federal Circuit has indicated that in certain situations, a narrow written description may constitute a basis for adopting a narrow construction of otherwise-broad claim language. The Federal Circuit has held that the literal meaning of a claim is fixed upon its issuance. Variants of a claimed invention that are based on after-developed technology could not have been disclosed in a patent. When a claim is written sufficiently broadly to cover after-developed technologies, the claims may be construed to limit their scope to those technologies disclosed in the written description of a patent.

IPPV Enter., 106 F. Supp. 2d at 605 (quoting Wang Labs., Inc. v. America Online, Inc., 197 F.3d 1377, 1383 (Fed. Cir. 1999) ("The only embodiment described in the '699 patent specification is the character-based protocol, and the claims were correctly interpreted as limited thereto.")) (other internal citations omitted). Such is the case here. The specification limits radio frequency information to the type of television signals being broadcast in 1985 and may not be broadened to encompass the construction urged by SuperGuide and Gemstar. Thus, the phrase is construed to mean modulated or unmodulated analog signals containing television programming and video information received either from the mixer internal to the system or from a television station. It does not include digital television signals.
The plain and ordinary meaning of "radio receiver" is a receiver that receives radio signals. The radio receiver of Claim 61 must meet the functional limitation that it be capable of "receiving a command." The word "command" has a commonly understood meaning when interpreted with respect to radio signal processing. A "command" is "[o]ne of a set of several signals . . . that occurs as a result of interpreting an instruction; the command[] initiate[s] the individual steps that form the process of executing the instruction's operation." INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERING (IEEE) DICTIONARY OF STANDARDS TERMS, 193 (7th ed. 2000). Thus, a command is a particular species of radio signals, i.e., one which communicates an instruction to perform an operation.

The specification contains the following Figure 5, which illustrates that the inventors used the word "command" with its plain and ordinary meaning:

FIG. 5 is a pictorial diagram of a preferred digital format for a base station to remote unit transmission, generally indicated by the numeral 180. The digital message format 180 includes a command field 182 and a plurality of unassigned bits 190 reserved for future application. . . .

('770 Patent, Col. 7:61-65.) The parties dispute whether the word "command" should be construed to include a radio signal having a particular strength if the signal strength causes the radio receiver to perform an operation.

From the specification as a whole, but in particular from Figure 5 and the accompanying discussion, it is evident that the "command" which the radio receiver must be capable of receiving under Claim 61 is a "command" from the base station. In the specification, the inventors use the word "command" to discuss a particular kind of signal, i.e., one representing an instruction from the base station to the remote unit that requires the remote unit to perform an operation. When used in this fashion, the meaning of "command" is narrower than the meaning of "signal," even were a "signal" to carry the characteristic of "signal strength." A "command" is a certain type of signal--one that communicates an instruction to perform an operation rather than a characteristic upon which an operation may be performed.
12 The construction that the radio receiver receive a command from a "base station" is required by the claim language disclosing a "remote unit" which contains a "selection circuit." It is also required by the specification in which the relevant embodiment of the "selection circuit" discloses that the command be received from a base unit. See discussion in Section (IV)(B)(5).

V. "Radio receiver for receiving radio signals and generating audio output signals responsive thereto"

The Court next turns to the term "radio receiver for receiving radio signals and generating audio output signals responsive thereto" from claim 1 of the '059 patent and claim 1 and claim 2 of the '925 patent.

A. The Parties' Proposed Constructions

Black & Decker proposes construing the term "radio receiver for receiving audio signals and generating audio output signals responsive thereto" as "a portion of the radio for receiving radio signals and converting the signals to audio output signals." Bosch argues that the term means "radio circuit board including at least a tuner circuit, having a voltage regulator, for receiving radio signals and an amplifier circuit for generating audio output signals responsive thereto."

B. The Court's Construction

Here, the language of the claims plainly defines the term "radio receiver." Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 334 F.3d 1294, 1299 (Fed. Cir. 2003) (finding that a patentee defined a term by how he used the term in the claims themselves). Because the "radio" includes the "radio receiver," the receiver is a portion of the radio. Further, the claim language specifies that the "radio receiver" receives radio signals and generates audio output signals responsive thereto. Bosch argues that the claimed "radio receiver" must include at least a tuner circuit, having a voltage regulator, for receiving radio signals and an amplifier circuit for generating audio output signals responsive thereto. Bosch, however, does not point to any part of the claim language requiring the structure of an "amplifier circuit" and a "voltage regulator" within the scope of the claimed "radio receiver." Instead, Bosch relies on extrinsic evidence. Extrinsic evidence, however, cannot trump the plain meaning of a term set forth in the intrinsic evidence. Phillips, 415 F.3d at 1317.

Further, even if the Court relied on Bosch's extrinsic evidence, such evidence does not support a construction of the claimed "radio receiver" limited to having an amplifier and a voltage regulator. Bosh first relies on the Brodsky Declaration. As discussed above, however, the Court gives the Brodsky Declaration little weight.

Bosch next argues that the '070 patent from a Black & Decker engineer confirms that a "radio receiver" necessarily includes an amplifier circuit and a voltage regulator. The '070 patent, however, actually evidences that a "radio receiver" is not limited as Bosch suggests. As Black & Decker points out, the '070 patent provides that "Amplifier 46 may also amplify signals received from an auxiliary input 13, allowing a user to play a separate cassette disk or compact disk player through the radio." (R. 57-1; Ex. D.) The fact that an amplifier can receive signals from a cassette disk or compact disk suggests that the amplifier does not necessarily have to be included with the radio receiver. Further, the '070 patent states:

Persons skilled in the art should recognize that the specific circuitry for each component is well known in the art. For example, the radio circuitry 44 may include an FM Front End integrated circuit, such as the Sanyo LA1186N used in a well-known manner, in combination with a low frequency power amplifier integrated circuit, such as the Toshiba TA8227P used in well-known manner.

(Id. at col. 3, ll. 61-68.) This permissive language suggests that a radio receiver is not limited as Bosch proposes.

Last, at the Markman hearing, Bosch introduced various dictionary definitions of the term "radio receiver." The McGraw-Hill Dictionary of Scientific and Technical Terms (5th Edition) defines "radio receiver" as "a device that converts
radio waves into intelligible sounds or other perceptible signals," but that definition goes on to state that a "radio receiver" is a "also known as radio." (Markman Hearing, Bosch Ex. 100.) Because the parties agree that the claim language requires that the terms "radio receiver" and "radio" have different scopes, this definition does not reflect the view of one of ordinary skill in the art after reviewing the intrinsic record. The Illustrated Dictionary of Electronics (1994) defines "radio receiver" as "the complete apparatus that selects, demodulates, and reproduces a radio signal for purposes of communication [ ]." This dictionary, however, also defines "radio" as "2. Radio receiver," and therefore suffers from the safe defect as the McGraw-Hill definition. Further, the definition from the Illustrated Dictionary of Electronics, actually supports Black & Decker's proposed construction. Although that dictionary definition states that a "radio receiver" "selects, amplifies, demodulates, and reproduces a radio signal," the plain claim language of the asserted patents states a "radio receiver for receiving radio signals and generating audio output signals responsive thereto." It does not make sense that the inventor would specify two of the functions of a radio receiver (as set forth in the Illustrated Dictionary of Electronics), if he intended for all of those functions to necessarily be present in structures that were part of the claimed "radio receiver." Rather, the Court finds that one of ordinary skill in the art at the time of the invention would understand that the inventor was setting forth the requirements of the claimed "radio receiver" in the claim language itself. Accordingly, the Court construes the term "radio receiver for receiving radio signals and generating audio output signals responsive thereto" as "a portion of the radio for receiving radio signals and converting the signals to audio output signals."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n6 The Federal Circuit recently clarified the role of dictionaries in the claim construction process. See Phillips, 415 F.3d at 1322-24. There, the Federal Circuit confirmed that "judges are free to consult dictionaries and technical treatises." Id. at 1322. Although, a claim "should not rise or fall based upon the preferences of a particular dictionary editor, or the court's independent decision, uninformed by the specification, to rely on one dictionary rather than another." Id.

3515

XII. "Radio receiver means for receiving radio signals and generating electronic audio output signals responsive thereto"

The term "radio receiver means for receiving radio signals and generating electronic audio output signals responsive thereto" appears in claims 9 and 10 of the '925 patent.

A. The Parties' Proposed Constructions

Black & Decker asserts that the term "radio receiver means for receiving radio signals and generating electronic audio output signals responsive thereto" is a means-plus-function term under 35 U.S.C. § 112, P6. Black & Decker contends that the claimed function is "receiving radio signals and generating electronic audio output signals responsive thereto" and the claimed structure is a "radio circuit board or the corresponding structure thereof." Bosch proposes construing this term as a "radio circuit board including at least a tuner circuit, having a voltage regulator, for receiving radio signals and an amplifier circuit for generating audio output signals responsive thereto."

B. The Court's Construction

The parties agree that the term "radio receiver means for receiving radio signals and generating electronic audio output signals responsive thereto" is a "means-plus-function" limitation, invoking section 112, paragraph 6. That section of the Patent Act provides:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P6. The Federal Circuit has held that "claim construction of a § 112, P6 limitation includes identifying the
claimed function and determining the corresponding structure or act disclosed in the specification." Versa Corp. v. Ag-Bag Intern. Ltd., 392 F.3d 1325, 1328 (Fed. Cir. 2004).

The parties agree that the claimed function is "receiving radio signals and generating electronic audio output signals responsive thereto." Further, the parties agree that the corresponding structure in the specification for performing this claimed function is the radio circuit board, identified as reference number 33 in Figures 6 and 7. The parties disagree, however, on whether the radio circuit board must necessarily include a tuner circuit, having a voltage regulator, that receives signals and an amplifier circuit that generates audio output signals. As discussed above in Section V.B. with respect to the term "radio receiver," there is no support in the intrinsic record for the Court limiting the radio receiver or the radio circuit board 33 to having an amplifier and a voltage regulator. Accordingly, the Court construes the term "Radio receiver means for receiving radio signals and generating electronic audio output signals responsive thereto" as a § 112, P6 claim term where the claimed function is "receiving radio signals and generating electronic audio output signals responsive thereto" and the claimed structure is "the radio circuit board disclosed as item 33 in Figures 6 and 7, and any equivalent structure thereof."

GO BACK

3516

2. "a radio transmitter connected for receiving the remote unit location, the at least one switch output, defining a switch status, and transmitting the remote unit location and the switch status"

There are several aspects to the dispute with respect to the radio transmitter limitation of Claim 55: (a) whether the limitation is subject to § 112 P 6; (b) the construction of the phrase "radio transmitter," particularly with reference to the functions it performs; and (c) the construction of the phrase "switch status." The Court proceeds to consider each issue in turn.

a. Inapplicability of means-plus-function

As with the navigational receiver limitation discussed above, the Court finds that although functional language is included in the claim, the radio transmitter limitation is not a means-plus-function limitation subject to construction under § 112 P 6.

b. "for receiving the remote unit location, the . . . switch output, . . . and transmitting the remote unit location and the switch status"

The second issue is the construction of the functional phrase radio transmitter 5 "for receiving the remote unit location, the . . . switch output, . . . and transmitting the remote unit location and the switch status."

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -
5 The parties have not indicated that there is a dispute over the phrase "radio transmitter." The Court invites the parties to address this issue if there is a dispute.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

The claim language describes a particular type of radio transmitter--one that is capable of the following functions: (1) "receiving the remote unit location" and "switch output, defining a switch status" and (2) "transmitting the remote unit location and the switch status." The Court examines the specification for any discussion of these functions.

Figure 11 of the '770 Patent, reproduced below, is an embodiment useful for construing the functional language of Claim 55. It illustrates a "radio transmitter connected for receiving the remote unit location" and for "transmitting the remote unit location and switch status." 6

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -
6 For purposes of this patent, the inventors use "switch" and "sensor" interchangeably.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
The written description which discusses Figure 11 states:

The navigational receiver 304 receives navigational information, as for example from global positioning satellites 336. The navigational receiver 304 converts the navigational information into a location of the remote unit 302 and outputs the location 338 to the radio transmitter 314 for transmission to the base station 318. The sensor 308 provides an output signal 310 and defines a sensor status. The output signal 310 is connected to the radio transmitter 314 for transmitting the sensor status to the base station 318.

('770 Patent, Col. 11:29-38.) Thus, for purposes of defining the function "for receiving the remote unit location, the . . . switch output, . . .and transmitting the remote unit location and the switch status" as used in Claim 55, a person of ordinary skill in the art would understand that the inventors meant the functionality and connectivity illustrated in Figure 11 and described in the associated written description.

The parties have agreed that "switch status" means "the description of the state of the switch." (Joint Claim Construction Chart at 17, Docket Item No. 212.) This definition is largely in accordance with the plain meaning of switch status.

However, the Court modifies the construction submitted by the parties to mean: "information on the state of the switch."

The parties dispute whether the switch status must be "directly" received from the switch in light of the prosecution history of Claim 11 of the '390 Patent. 7 The Court finds that Claim 11 of the '390 Patent describes a different radio transmitter than does Claim 55 of the '770 Patent. 8 Since the claim language is different, the prosecution history with respect to Claim 11 of the '390 Patent does not constitute a disavowal of claim scope for purposes of construing Claim 55 of the '770 Patent. See Ventana Medical Systems, Inc. v. Biogenex Laboratories, Inc., 473 F.3d 1173, 1182 (Fed. Cir. 2006). Although the plain language of Claim 55 requires that the radio transmitter be "connected," the Court declines to read into the claim any limitation with respect to "connected" as "direct," "indirect" or otherwise.

- - - - - - - - - - - - - Footnotes - - - - - - - - - - - - -

7 (See, e.g., Plaintiffs' Responsive Claim Construction Brief at 17, hereafter, "Opposition CCB," Docket Item No. 202.)
8 The "for" clause of each of these claims defines a purpose for each radio transmitter limitation. Particularly, Claim 11 of the '390 Patent requires "a radio transmitter for transmitting demodulated navigational information, the precise time-of-day information, and the switch status" while Claim 55 of the '770 Patent requires "a radio transmitter connected for receiving the remote unit location, the at least one switch output, defining a switch status, and transmitting the remote unit location and the switch status." (See '390 Patent, Col. 29:50-53; '770 Patent, Col. 22:60-23:2.) Thus, each of these radio transmitters form different limitations, as they are defined by different functional requirements.

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

Accordingly, the Court construes the phrase "a radio transmitter connected for receiving the remote unit location, the at least one switch output, defining a switch status, and transmitting the remote unit location and the switch status" as used in Claim 55 of the '770 Patent to mean: a radio transmitter that is connected: to the navigational receiver and receives the remote unit location from the navigational receiver; to at least one manually operated switch and receives switch output, defining the state of the switch. The radio transmitter transmits the remote unit location and information on the state of the switch.

3. Random Access Memory

Lectrolarm proposes that "random access memory" should be construed to mean:

"a read/write memory that permits access to any of its address (storage) locations in any desired sequence with similar access time to each location."
The Defendants would interpret "random access memory" to mean:

random access memory is completely synonymous with RAM and means a volatile memory that permits access to any of its address (storage locations in any desired sequence with similar access time to each location, and that also has a read access time that is similar to its write access time. RAM is one of two mean classes of electronic memory that are mutually exclusive, the other class of which is ROM. RAM includes static RAM and dynamic RAM. ROM includes masked ROM, PROM, EPROM, and EEPROM (including flash memory).

The parties agree that to a person of skill in the art the terms "random access memory" and "RAM" can have different meanings but disagree about which definition applies in the '088 patent. (Pl.'s Br. at 81.) In particular the parties disagree about whether "random access memory" includes both volatile and non-volatile memory.

The claim states that the storing means includes a "random access memory." U.S. Patent No. 4,974,088, Column 10:48-49. The structure that performs the function claimed in a means-plus-function claim must be disclosed in the specification. See, e.g., Gemstar, 383 F.3d at 1361. The specification never uses the words "random access memory;" it uses the term "RAM" extensively. The court concludes that the phrase "random access memory" in the claim refers to the term "RAM" in the specification. Because these terms are used in conjunction with a means-plus-function claim, it is the duty of the court to construe the term used to disclose a structure in the specification, not in the claim. Therefore, "random access memory" is defined as "RAM" as that term was understood in 1989.

The specification includes structures labeled RAM and structures labeled ROM. The patent clearly contemplates that RAM and ROM are different. Whatever definition the court chooses for RAM must exclude ROM as that term was understood in 1989.

Whether the definition of "random access memory" includes both volatile and non-volatile memory depends on the definitions of "RAM" and "ROM" to a person of ordinary skill in the art in 1989. Lectrolarm has presented the definition of "random access" from the fourth edition of the IEEE Dictionary, which was printed in 1988:

random access (computing systems). (1) Pertaining to the process of obtaining data from, or placing data into storage where the time required for such access is independent of the location of the data most recently obtained or placed in storage. (2) Pertaining to a storage device in which the access time is effectively independent of the location of the data.

IEEE Dictionary, 411 (4th ed. 1988). This definition does not address the term "RAM," the issue of volatility, or the difference between "RAM" and "ROM."

Absent illuminating intrinsic evidence or useful dictionary definitions or treatises from the relevant time period, extrinsic evidence should be consulted. Vitronics, 90 F.3d at 1584. The intrinsic evidence demonstrates only that "RAM" and "ROM" are different, it does not discuss how they are different. The parties have not offered any dictionary definitions or treatises from the relevant time period that discuss the difference between "RAM" and "ROM." Therefore, any extrinsic evidence can assist in construing the term "random access memory."

The distinction between "RAM" and "ROM," and whether "RAM" includes both volatile and non-volatile memory, was argued extensively in Pelco. (Pelco Decision at 85.) The Pelco court heard testimony from experts for both Lectrolarm and Pelco and appointed an independent expert to present evidence on the issue. The Pelco court determined that "in 1988 the terms RAM and ROM were mutually exclusive. The Random Access memory (RAM) referred to in the patent is a volatile memory with fast write capability and similar read and write times." (Pelco Decision at 84.) The Pelco court disposed of the issue as follows:

A court appointed expert consultant testified October 15, 2002. His testimony unequivocally establishes that Random Access Memory (RAM) as used in the '088 patent, is volatile and that as of 1988, to one skilled in the art, the term ROM, including PROMs, CPROMs, and EEPROMs, were mutually exclusive from Random Access Memory (RAM). The definition of random access memory, RAM, as used in the '088 patent, is interpreted as a volatile memory with high-speed read-write memory that permits access to any of its address (storage) locations in any desired sequence with similar access time to each location.
Both Lectrolarm's expert, Dr. Rhyne, and the Defendants' expert, Dr. Horowitz, agree that "RAM" means a volatile memory. (Rhyne Decl., P 58; Horowitz Report, P 36.)

Lectrolarm's expert Dr. Rhyne included in his expert report citations from a number of dictionaries and treaties that suggest that around 1989 the term "RAM" was a synonym for "random access memory" and would have included non-volatile memory. This argument misses the central point. The question is not whether the term "RAM" when presented in isolation would have been understood by a person of skill in the art in 1989. The question is what a person of skill in the art would have understood "RAM" to mean when presented in the context of a document showing it to be something different from "ROM."

The court construes "random access memory" as "synonymous with the term 'RAM' as that term was used in 1988, but not including 'ROM' as that term was understood in 1988. It is a volatile memory that permits access to any of its address (storage) locations in any desired sequence with similar access time to each location. ROM includes masked ROM, PROM, EPROM, and EEPROM."

Burst argues that the applicable functional language is "storing the time compressed representation." Burst notes that both experts concede that this term is specific enough to connote a particular class of structures. In particular, Burst argues that Apple's expert, Dr. Halpern, agreed that "random access storage" describes a "general class of structure." Halpern Dep. at 253. Burst further relies upon the prosecution history of the '995 Patent to demonstrate that the applicant used "random access storage" as a noun without the word "means" to connote structure. See, e.g., '995 Patent File History, Payne Dec., Exh. 9 at APBU 89 (describing new claims as directed at the ability to "store the time compressed representation of the audio/video source information in a random access storage.") Burst also points to devices in the '995 Patent that provide random access memory, such as DRAM and optical disc memories, as examples of the types of random access memory. See
The report of Burst's expert supports this view. While Dr. Hemami contends that the term would be "self-descriptive" to one ordinarily skilled in the art in 1988, she further notes that "[i]t would be clear that random access storage could be provided by many types of media and that any such media would be acceptable as long as it provided [this] subject to design constraint." Hemami Report at 44. The specification discloses certain examples of the types of random access storage that would meet these constraints. See '995 Patent at 6:8-19 (listing DRAM, SRAM and CMOS memory as types of random access storage). Apple's expert, Dr. Halpern, observed that "there are a wide variety of different classes of structures that provide random access storage, including magnetic and optical disks, RAM and ROM." Halpern Dec. 34-35; see also Halpern Dep. at 258 (noting that "random access storage . . . [is] a general class of structure). While Halpern concludes that the term "random access storage" does not connote sufficient structure, his identification of various structures associated with the term belies this conclusion. "That the disputed term is not limited to a single structure does not disqualify it as a corresponding structure, as long as the class of structures is identifiable by a person of ordinary skill in the art." See Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d 1311, 1322 (Fed. Cir. 2004). Halpern's admission that the term connotes a set of structures, however general, indicates that "random access storage" is structural in nature. See id. (construing "circuit" as structural because it connoted a general class of structures). Thus, the court is satisfied that "random access storage", unlike "storage", connotes sufficient structure to one ordinarily skilled in the art. Section 112(6) does not apply to this term.

Burst's proposed construction comports with this understanding of the term. Therefore, the court construes "random access storage means" to mean "storage that provides for random access to any given segment of stored audio/video source information."

4. Randomly Selected

The final term requiring construction is "randomly selected," which appears in Claims 13 and 14. Those claims describe each particular object as being associated with unique "randomly selected" authorized information comprised of machine-readable code elements. The term is thus substituted in Claims 13 and 14 for the term "detectable series" in Claims 1-12. The specification does not define the term.

Alliance contends that the term means exactly what it says: selection according to a random process, without any pattern or predictability whatsoever, as in a generator that selects digits based on cosmic noise. It argues further that the term cannot include pseudo-random selection, which is apparent randomness that has been generated purposefully, as by a computer algorithm or other program. CIAS does not disagree with Alliance's definition of pseudo-random or argue that a computer or algorithm can generate anything besides a pseudo-random number. It contends, however, that a person of ordinary skill in the art understands "randomly selected" to include information selected by both true and pseudo-random means.
Each side has provided expert testimony to support its position, but neither expert provides additional support, making their assertions less helpful. The specification is silent. Alliance makes the somewhat convoluted argument that because the specification does not teach the use of an algorithm for information selection - which no party disputes would be a pseudo-random selection process - "randomly selected" should be construed to refer only to true random selection. But Alliance does not argue, nor could it, that the use of an algorithm is the only means of pseudo-random selection, so that its absence necessitates the exclusion of pseudo-random selection altogether.

Each side points to prior art to support its position. Alliance cites to Shoshani, which explicitly defines "random numbers" as true random numbers, as well as pseudo-random numbers." Alliance argues that Shoshani must have included this definition because the normal meaning of "random" as excluding pseudo-random would otherwise apply. In other words, Shoshani had to provide its own definition to bring pseudo-random within "random." In turn, CIAS cites to U.S. Patent No. 6,048,269 ("Burns"), a slot machine system patent, which discloses use of a "unique random number" that nonetheless is generated by a computer and therefore pseudo-random. CIAS cites also to U.S. Patent No. 4,448,419 ("Telnaes"), a gaming machine patent, which uses a "random number generator" to select the machine's stopping position. See generally id., Exhibit N ("Telnaes Patent"). It is not clear from the Telnaes claims or specification, however, whether the patent relies on a true or pseudo-random number generator, and thus it is also not clear what Telnaes meant by "random." Although Mr. Storch, one of the '422 patent inventors, states that he is familiar with the "type of slot machines described in" the Telnaes patent and that they do not use true random number generators, his professed experience with that genre of slot machines (which may very well include slot machines other than those described in Telnaes) cannot circumscribe the Telnaes language itself. See Storch Decl. P15.

Finally, Alliance argues further that a sibling patent by the same inventors, U.S. Patent No. 5,367,148 (the "'148 patent"), recognizes that "random" does not include pseudo-random. A court may look to a sibling patent and the common application for the meaning of shared terms used in similar contexts. Both the '148 and '422 patents include the term "randomly selected" in the context of choosing information for counterfeit detection.

The '148 patent describes a system in which "each random portion may contain one or more randomly selected digits. A random number generator may be used which may, e.g., randomly select digits based on cosmic noise." n112 The '148 specification goes on to state, "with the applicants' random technique, the problems and worries described above for traditional serial numbers and ID numbers in accord with a secret algorithm are simply avoided." n113 This distinction between the results of the '148 "randomly selected" technique and those of pseudo-random algorithmic methods indicates that the '148 technique is a true random one and, therefore, that the '148/'422 inventors used "random" to mean true random.

N113 Id. at 10:63-65.

Further, during prosecution of the '148 patent, the inventors described another patent, Zoltai, as disclosing a system in which

"[so-called] random process units at a central and remote location output the same code in response to the same unit. The "random" in [Zoltai's so-called] random process units is a misnomer. If both [Zoltai] units are truly random generators, there should be an infinitesimal or no chance for them both to output the same number at the same time . . . [In fact,] Zoltai [elsewhere] discloses that the patterns are not random but 'predetermined from within the units' . . . Thus, [Zoltai does] not disclose the use of random numbers." n114

Thus, the '148 inventors took prior art to task for using the term "random" incorrectly to include pseudo- or non-random information. This correction further clarifies that when the inventors themselves used "randomly selected" in the '148 patent, they referred to true random selection.

n114 Roberts Decl., Exhibit P ("'148 File History") at 7.

Since the '148 and '422 patents are siblings, the identical claim language of the former can be considered in construing the '422 patent's claims. n115 Although it is a close question, the Court concludes that "randomly selected," as used by the '148 and '422 inventors, refers to true and not pseudo-random selection.

The district court construed "unique authorized information" as meaning "information associated with each object, unique to that object and authorized by the '422 patent's system, but excluding information other than serial information alone or randomly-selected information alone." Taking cognizance of Alliance's accused systems and drawing on the prosecution history, the district court ruled that "unique authorized information" excluded a combination of serial and randomly-selected information. The district court held, and CIAS had conceded, that "[s]ince part of the SDS eTicket identification number is not a detectable series, the entire held numbers are not a detectable series, and so that SDS series does not include that element." CIAS argues that this does not avoid infringement, on the correct construction of "unique authorized information."

CIAS argues that "unique authorized information" includes "multi-digit identifying numbers unique to a [gaming] ticket," including data such as associated pairs or sets containing pseudo-random computer-generated numbers. Alliance points out that such associated pairs were described in a patent to Shoshani, U.S. Patent No. 3,833,795, that CIAS presented during reexamination of the '422 patent. CIAS argues that the claims were not rejected on Shoshani, and that during reexamination the inventors explained that "Shoshani, like Simjian, applies to a set or an associated pair of numbers . . . one number of the pair is a serially-selected identification number . . . . The other number of the pair is a randomly-selected control number . . . ."

The district court observed that during reexamination the inventors emphasized that the '422 invention did not include comparison of pairs of numbers as in Shoshani. Although CIAS stresses that there was no rejection based on Shoshani, and thus no amendments were made or needed, this does not negate the arguments made during reexamination in order to distinguish Shoshani. We agree with the district court that the reexamination recharacterization of Shoshani requires the construction that the '422 claims exclude information other than serial information alone or randomly-selected information alone.

During reexamination the inventors also addressed the previously cited reference to McNeight, U.S. Patent No. 4,463,250 entitled "Method and Apparatus for Use Against Counterfeiting." McNeight describes a system that detects counterfeit mass-produced articles such as currency notes, drivers licenses, passports, share bonds, tickets for sporting events, etc., according to a detectable series and through the use of a secret algorithm. Upon amendment of the '422 claims during the original prosecution, the CIAS inventors had explained to the examiner: "[T]he claims herein may be distinguished from McNeight et al. [who teach] use of an algorithm . . . . This is risky from a security standpoint . . . because once the algorithm was either deduced or stolen, then a counterfeiter could . . . counterfeit with increased impunity." The '422 inventors thereby distinguished McNeight, explaining that the '422 patent's authorized information is "not generated by an algorithm."

Applying the positions taken during the '422 examination and reexamination, the district court construed "randomly selected" in claim 13 to mean "true random" numbers, that is, numbers "without any pattern or predictability whatsoever," rather than "pseudo-random, which is apparent randomness that has been generated purposefully, as by a computer algorithm or other program." The court reasoned that the scope of the patent was voluntarily narrowed, in light of McNeight and Shoshani, to exclude the use of solely serial information or solely randomly-selected information.

CIAS argues that it did not disavow "multi-part" numbers during reexamination, and that the statements made during reexamination were not disclaimers. CIAS points out that to constitute a disclaimer, any statements made during the patent's prosecution require "clear and unmistakable statements of disavowal" of the specific claim interpretation at issue, quoting Cordis Corp. v. Medtronic AVE, Inc., 339 F.3d 1352, 1358 (Fed. Cir. 2003). CIAS contends that no clear and unmistakable disavowal occurred in the '422 patent's prosecution, and that the additional reference of Shoshani presented for reexamination was merely cumulative of the prior art previously of record. CIAS states that its discussion of Shoshani and McNeight did not limit any claim or disavow any subject matter.

The district court held that the inventors, by limiting the '422 claims to a counterfeit detection system relying on a "detectable series," had disavowed use of a secret algorithm. The court held that this precluded now reading the claims on the accused SDS systems, which use a secret algorithm. The court also concluded that the reexamined claims now excluded systems that employ an identification number that is neither serial nor randomly-selected information alone.

The district court ruled that "randomly selected" can mean only "true random" numbers, and excludes pseudo-random. In construing this term the court looked first to the patent document, and found that the '422 specification did not elaborate on the meaning of this term. The court examined several prior art references and a CIAS sibling patent to reach its construction of this term. It was generally undisputed at trial that the usual computer algorithm generates only pseudo-random numbers.
We agree with CIAS that persons of skill in the field of computer randomization would recognize that the product thereof is most aptly understood as pseudo-random; CIAS conceded that another of its patents shows generation of true random numbers. The district court, receiving conflicting opinions on this point, deemed it a "close question." However, it is not controlling of the question of infringement, for the district court's judgment of non-infringement is supported alone by the court's construction of "unique authorized information."

We discern no error in the district court's construction of the scope of the '422 claims. Although the usage "comprised of" does not of itself exclude the presence of additional elements or steps, this does not permit recovery of claim scope that was limited during prosecution. The district court was correct that the amendments and arguments during examination and reexamination bar interpretation of "unique randomly selected authorized information" to include the accused systems.

"range"

Claim 1 of the '819 Patent contains the term "range." IPI contends that the term means "the distance of text around a retrieved word," while Google contends the term means "a window of contiguous words." The parties disagree as to whether the claimed "range" covers a distance "measured in the number of words, . . . characters, . . . sentences[,] or paragraphs" or whether the "range" is limited to "contiguous words."

Google asserts that the claim language clearly shows that "range" should be defined in terms of contiguous words only. For instance, claim 1 recites the steps of "recording a number of times a co-occurring word co-occurs in a same document within a predetermined range of the retrieved word" and "repeating the recording step for every co-occurring word located within the predetermined range for each occurrence of the retrieved word in the corpus." '819 Patent, col. 24:45-50 (emphasis added). IPI counters that the word every in the claim language relates to the co-occurring words, not the predetermined range. Indeed, there is nothing in the specification that states that the predetermined range must be a "contiguous" string of words. IPI further argues that '819 Patent teaches the elimination of certain "stop words," such as "the" or "an," from the process. See '819 Patent, col. 15:51-53 ("For example, the B-subset contains the 20,000 most frequent words, excluding stop words.") and col. 20:57-60 ("Many words in the Tipster topic descriptions are not relevant for the query in question, but they should not be placed on a stop list either because they could be relevant for other queries."). In light of the foregoing, there is no basis in the claim language or the specification to limit "range" to "a window of contiguous words."

IPI's proposed construction is consistent with the specification and the claim language. However, the Court modifies IPI's proposed construction slightly to make it clearer to the fact finder. Accordingly, the Court construes the term "range" to mean "the distance within a body of text surrounding a retrieved word."

2. range

O2 Micro proposes that the term "range" means "the set of values that a quantity or function may assume." Rohm proposes a construction of "the set of values between the highest and lowest value that a quantity or function may assume." Claim 3 of the '129 patent is instructive. In this regard, claim 3 states "[a] circuit as claimed in claim 2, wherein said predetermined range is zero amps to a first predetermined current value." As such, the court concludes that the term "range" means "the set of values between the highest and lowest value that a quantity or function may assume."

4. range value
Hyperion contends that a range value is "a name associated with certain data that is used to extract that data from the database." OutlookSoft asserts that the proper construction is "a shortcut to refer to several data cells each having a different SEPT value where the user can extract data from all desired cells at once."

OutlookSoft seeks to incorporate the limitation of SEPT from the preferred embodiment into the term "range values." In fact, OutlookSoft seeks to incorporate the SEPT limitation into many claim terms, arguing that SEPT is the invention rather than the preferred embodiment. While OutlookSoft points to some statements made during prosecution and in the summary of the invention, the Court is not persuaded that the Hyperion patents are limited exclusively to SEPT.

The plain language of the claims supports the Court's view. For example, claim 1 of the 141 patent requires the use of only three attributes: S, E, and P. Claim 5 of the 141 patent does not require any particular number of attributes, nor does it require that the attributes be of any particular type. Claim 1 of the 609 patent (and claim 1 originally filed with the application for the 141 patent) requires that at least three attributes be used, but (like claim 5 of the 141 patent) it does not specify what they must be. Thus, the Hyperion claims make clear that the inventors made use of the attributes in general and did not limit their invention to SEPT. Any construction limited to SEPT would therefore be incorrect. Accordingly, the Court adopts Hyperion's construction of the term "range value."

Raster clock signal

The Court modifies MediaTek's proposed construction and construes the term as "a periodic signal used to synchronize a display device in response to a program clock reference ("PCR")." MediaTek argues that the term should be construed according to its ordinary meaning--"a periodic signal used to synchronize a display device." Sanyo argues that the patent provides a special meaning for the term raster clock signal--"a signal with a nonstandard frequency easily derived in response to a PCR."

MediaTek agreed at the hearing that the raster clock signal is produced in response to a PCR. Sanyo asserts that the raster clock signal must be "nonstandard" and "easily derived" because the prosecution history and specification require minimal circuitry. Sanyo argues that using minimal circuitry leads to an "easily derived" raster clock signal. Sanyo further argues that a nonstandard signal is required because the specification only contemplates nonstandard signals.

Sanyo's arguments are unpersuasive. First, claims 1 and 2 do not require that the raster clock signal have a nonstandard frequency or be easily derived. See '486 Patent col. 14:7-54. Second, the specification allows--but does not limit this invention to--raster clock signals with nonstandard frequencies. '486 Patent col. 2:33-34 ("display raster signals need not conform to the waveforms commonly used"). The specification deals explicitly with nonstandard frequencies, but also states that "the invention contemplates the use of other native display formats and other raster frequencies." '486 Patent col. 13:8-9. Finally, requiring the raster clock signal to be easily derived is not supported by the specification. It would instead add a vague term which would not assist the trier of fact. Sanyo argued at the hearing that "easily derived" is not vague because it means created with "minimal circuitry." This proposed construction is not helpful because "minimal circuitry" is itself vague.

Rate adapting said Ethernet frame based data by adapting an Ethernet data frame to at least one bit stream, each bit stream having a data rate which can be multiplexed into a synchronous digital network virtual container

The Court modifies both Ciena's and Nortel's proposed constructions and construes the term as "converting Ethernet frame based data and the data rate into one or more bit streams, each bit stream has a data rate which can be multiplexed into a synchronous digital network virtual container, the bit stream is not encapsulated in an intermediate format." Ciena argues that the term should be construed as "converting the data rate of the data in Ethernet frames to a data rate of at least on bit stream by dividing the data in Ethernet frames among one or more bit streams, where each bit stream has a data rate which
can be multiplexed into a synchronous digital network virtual container. The bit stream is not encapsulated in an intermediate format.” Nortel argues that the term should be construed as “converting Ethernet frame based data into one or more bit streams, each bit stream has a data rate which can be multiplexed into a synchronous digital network virtual container.” The parties mainly dispute whether the Ethernet frame based data or the data rate of the data in the Ethernet frames is being converted or adapted.

Ciena argues that the data rate in the Ethernet frames is being adapted. Ciena contends that the presence of the words “rate adapting said Ethernet frame based data” at the beginning of the claim term requires such a conclusion. Ciena also points to Column 7, Lines 60 through 63 of the specification, which state, “Rate adaption means 203 comprises a plurality of multiple channels each adapting an IEEE standard 802.3 rate data frame channel to a 2 Mbits/s, 50 Mbits/s or 100 Mbits/s bitstream channel” arguing that it proves that the whole point of the invention is rate adapting the data received at a higher rate into one or more bit streams at a lower rate. Furthermore, Ciena argues that a Response to an Examiner’s Office Action found in the file history of the patent supports its construction. The Response states, “The invention provides means to adapt the Ethernet data frames to a rate which matches a rate which can be multiplexed into a virtual container and maps each Ethernet data frame into one or more virtual containers without any further encapsulation in intermediate protocols.” Response to Office Action for ‘519 Patent dated July 17, 2001, at 9.

The Court proposed the first part of its construction to the parties during the Markman Hearing. This portion of the proposed construction reads, “converting Ethernet frame based data and the data rate into one or more bit streams, each bit stream has a data rate which can be multiplexed into a synchronous digital network virtual container.” Ciena’s only objection to the proposed construction was the fact that the construction did not address the encapsulation issue discussed below. Therefore, Ciena agreed that the Ethernet framed based data is also converted under the claim language.

However, Nortel still argues that only the Ethernet framed based data is being adapted. Nortel contends that the claim language requires its construction. Nortel points to the claim language, which reads, “rate adapting said Ethernet frame based data by adapting an Ethernet data frame to at least one bit stream,” arguing that the claim does not limit the Ethernet rate adaption to rate adaption of a frame because the claim language does not contain the word “rate” before the second occurrence of the word “adapting” in the quoted excerpt. Nortel also argues that its construction is supported by the specification, which states, “Rate adaption means 203 comprises a plurality of through channels for adapting IEEE standard 802.3 data frames into bitstreams . . . .” Col. 7:57-60. Nortel further cites Column 7, Lines 60 through 63 of the specification that state, “Rate adaption means 203 comprises a plurality of multiple channels each adapting an IEEE standard 802.3 rate data frame channel to a . . . bitstream channel.”

The claim language and the specification indicate that both the data rate and the Ethernet frame based data are converted under claims 1, 23, and 24. The claim language starts off with the words “rate adapting.” These words indicate that the data rate is being converted by this step of the method. This claim language cannot be ignored in construing the term. The parties and the Court agree that the Ethernet frame based data is converted under the claim. Accordingly, the Court construes the term such that both the data rate and the Ethernet frame based data are converted.

Ciena further contends that the term should be construed such that the bit stream is not encapsulated in an intermediate format. Nortel argues that this limitation is improper because: “(1) the inventor did not clearly disclaim intermediate encapsulation in the asserted claims; (2) intermediate encapsulation is not a part of the asserted claims; and (3) the specification’s discussion of intermediate encapsulation relates to the mapping step, not the rate adapting step.” Ciena cites Home Diagnostics, 381 F.3d at 1358, arguing that nothing in the specification or file history amounts to a clear and unambiguous disavowal of “intermediate encapsulation.” Ciena contends that a specific absence of intermediate encapsulation in the specification is only a preferred embodiment and not a required limitation. See Cols. 3:18-21; 2:52-3:2. Furthermore, Nortel argues that claims 1, 23, and 24 leave open the possibility that the Ethernet frame based data can pass through an intermediate protocol and that the limitation on intermediate encapsulation only applies to other claims that state that the Ethernet frame based data is “mapped directly” to a synchronous digital network. Finally, Nortel argues that there are two steps to the method asserted in claims 1, 23, and 24 and that the absence of intermediate encapsulation only applies to the “inputting” step, while the claim language at issue deals with the “adapting” step. Nortel looks to a continuation patent of the 45 ’519 patent to support this argument.

Ciena argues that no language in claim 1 indicates that the bit stream is encapsulated in an intermediate format but rather indicates that the rate adapted bit stream is passed along the synchronous digital network. Ciena cites the abstract of the
patent, which states, “frame based data is incorporated directly into a synchronous virtual container without encapsulation in an intermediate protocol” and several excerpts from the specification arguing that the patent prohibits the bit stream from being encapsulated in an intermediate format. Specifically, Ciena points to an excerpt from the summary of the invention that states, “Another object of the present invention is to incorporate frame based data directly into a synchronous digital hierarchy payload, without encapsulation in an [Asynchronous Transfer Mode] cell or other intermediate carrier.” Col. 2:62-65; see also 7:16-21.

The abstract and the quoted section of the specification refer to the invention as a whole and not just a preferred embodiment. When the specification reveals an intentional disclaimer or disavowal, “the inventor has dictated the correct claim scope and, and the inventor’s intention, as expressed in the specification, is regarded as dispositive.” Phillips, 415 F.3d at 1316. Furthermore, there is not compelling intrinsic evidence from the ‘519 patent that the limitation only applies to claims that involve “mapping” and not claims such as 1, 23, and 24 that relate to adapting. Accordingly, the Court construes the term to include the encapsulation limitation.

3526

C. "Ratings"

The parties dispute the meaning of the word "ratings" and the various phrases utilizing that word. Part of the difficulty is that the word is used in two broad contexts: ratings assigned to consumers and ratings assigned to financial card offers or data.

a. consumer ratings

Defendant suggests all phrases referring to consumer ratings should be defined the same, and the appropriate definition is "a letter grade and a numerical score (e.g., A-760) assigned to the applicant calculated based on the application data." In other words, all customer ratings must have both a letter grade and a numerical score. This limitation is not justified by the intrinsic evidence.

Critical to Defendant's argument is the meaning and importance of certain provisions in the Preferred Embodiments.

A 'grading system' process may be employed which uses the application data, as well as other data, as input to determine which financial card offers may be presented to the applicant. Preferably, the grading system assigns a grade/score to the applicant by using the application data and other information such as credit bureau data to derive a letter grade and a numerical score (e.g., A-760). The assigned grade/score may then be used to search each participating financial institution's selection criteria to locate the offers that may be presented to the applicant. Preferably, a financial institution's selection criteria are organized in a matrix that associates financial card term data with a minimum grade/score combination. For example, a bank may have the following selection matrix.

Col. 4, lines 17-29 (emphasis supplied). There follows a sample table assigning a "grade" to various "score" ranges, with corresponding offers (and specified terms) for each grade/score range (the "Table"). Defendant reads this passage as requiring the customer rating -- regardless of the phrase actually used to refer to the customer rating -- consist of a letter and number combination. However, the form of the rating described in the Preferred Embodiment is an example; the rating is not required to take any particular form. Examples set forth in thePreferred Embodiment cannot limit the scope of the Claims. E.g., Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1362 (Fed. Cir. 2000).

Patent '645's claims also defeat Defendant's narrow construction and support Plaintiff's interpretation. Claim 11 identifies an electronic method comprised of several steps, one of which is "assigning a rating to [the] applicant." Col. 7, line 28. Several claims depend on Claim 11 and further limit the definition of the rating assigned to an applicant. For instance, Claim 14 is "[t]he method of claim 11 wherein said rating is a financial risk rating." Col. 7, lines 41-42. Narrower still is Claim 15, which consist of "[t]he method of Claim 11 wherein said rating is a grade and score combination." Col. 7, lines 43-44. Claims 14 and 15 are dependent claims and thus cannot mean exactly the same thing as Claim 11 (the claim upon which they depend). E.g., Nazomi Communications, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1370 (Fed. Cir. 2005). Therefore, Defendant's definition cannot be accepted because it effectively equates Claims 14 and 15 with Claim 11, rendering them
Defendant also insists that the grade/score must be calculated, but even if this is true this does not mean the grade/score must take any particular form. Defendant believes the requirement of a calculation excludes the possibility that a financial institution will "borrow a preexisting value or measure from one aspect of the borrower's financial or credit profile -- such as an applicant's credit score or income level -- and compare that to a single lender criteria." Defendant's Markman Brief at 19. A necessary corollary of this argument is the existence of a list of criteria that must be considered in establishing the rating, but no such list exists. In any event, the extent of effort necessary to conduct a "calculation" is beyond the scope of the present discussion. Defendant's proffered definition of "rating" goes further than necessary to impose a calculation requirement -- assuming such a requirement exists -- because the grade/score can take other forms and still be the product of a calculation as posited by Defendant.

Defendant also argues its interpretation is consistent with the prosecution history. In explaining its final decision on the reexamination, the PTO approved Claims 11-20 and 34 and explained that it "interprets the rating assigned to the applicant . . . as exemplified and disclosed in col. 4 L 20-43 of the specification," referring to the Table referenced in the discussion of the Preferred Embodiments, above. Defendant correctly observes Plaintiff did not object or otherwise respond to this understanding and so must be deemed to have accepted it. E.g., Fuji Photo Film Co., Ltd v. International Trade Comm'n, 386 F.3d 1095, 1100 (Fed. Cir. 2004). However, nothing in this sentence suggests the format or components of the grade/score, so it sheds no light on the matter. The Table is offered as an example, not as a requirement. In context, (the entirety of which is not set forth here in the interest of brevity), the sentence only explains the PTO's understanding of the difference between (1) the rating assigned to the applicant and (2) the criteria or "chart" used to determine whether a particular customer is qualified for the offer in question.

Plaintiff suggests the term "rating," as related to an applicant, means "a value or measure assigned to the applicant." This is an accurate definition of the term, and allows for consistency between the various claims comprising the patent. Claim 11 describes an electronic method comprised of several steps, one of which involves assigning some value or measure to the applicant. Claim 11 is further narrowed by Claim 14, which specifies that the value assigned in Claim 11 is some measure of financial risk. Claim 15 further narrows the term. As between Plaintiff's definition and Defendant's definition, Plaintiff's definition has greater support in the record.

While it is tempting to include in the definition a requirement that the rating be intended to reflect the financial risk ascribed to the applicant, such inclusion would render Claim 14 redundant.

b. financial card term data ratings

Claim 11 also comprises "ratings associated with . . . financial card data," and similar phrases are used in other claims as well. Defendant reasons that the financial card data's rating must be compared to the applicant's rating and so concludes the proper definition for the financial card terms' rating is "a letter grade and numerical score (e.g., A-760) assigned to the terms of each financial card offer that a participating financial institution is willing to make." There must be correlation between the financial card data's rating and the applicant's rating in order to insure the terms are presented only to applicants with the necessary rating -- but as with the applicant's rating, the '645 Patent does not proscribe the form or content of the financial card term rating. In light of the Court's rejection of Defendant's rigid definition in the applicant's context, the Court must also reject Defendant's rigid definition in this context.

3527

B. Proper Construction of the Term "Ratio"

The parties agree that Stanley's motion for summary judgment of no literal infringement may be decided based on the proper construction of the term "ratio" as it is used in every independent claim of the '091 patent. Stanley proposes that the
term "ratio" of the '091 patent should be construed as "a result of dividing two values." Zircon proposes that the term should be construed more broadly as "relation in degree or number between two similar things." For the following reasons, the Court adopts Stanley's proposed construction.

1. Stanley's Proposal: A Result of Dividing Two Values

Stanley argues that all of the intrinsic evidence supports its proposed construction and that the plain meaning of the term ratio is limited to division and does not include subtraction. Specifically, Stanley contends that the specification confirms its proposed construction of the term by explicitly defining "ratio" as the result of dividing two values. For example, the specification provides that: "A ratio between the first and second capacitance measurements may be computed . . . If the capacitance measurements are equal or the ratio is approximately equal to unity, both plates may be centered over the stud's edge [] and the centerline [] of the sensor [] may be centered over the centerline [] of the stud[]." '091 Patent at 7:20-23 (internal numbering omitted). A description of Figure 5E explains that a ratio of capacitance measurements of the two plates "may be computed as the smaller capacitance divided by the larger capacitance, thereby resulting in a ratio that is equal to or less than one." Id. at 7:45-52. Similarly, the specification provides that:

When the first plate [] produces a capacitance that is greater than the capacitance produced by the second plate[], a ratio is calculated by dividing the second plate's change in capacitance value by the larger first plate's change in capacitance value. Similarly, when the first plate [] produces a capacitance that is less than the capacitance produced by the second plate [], the ratio is calculated by dividing the smaller first plate's change in capacitance value by the second plate's change in capacitance value. Formulaically, the ratio curve [] may be computed by:

\[ \text{cap	extunderscore ratio}(D) = \min \left[ \text{FirstPlaceValue}(D), \text{SecondPlateValue}(D) \right] / \max \left[ \text{FirstPlace Value}(D), \text{SecondPlate Value}(D) \right] \]

Id. at 12:27-45. The specification also states that, "Dividing the smaller of the two capacitance measurements by the larger gives an updated capacitance ratio. The centerline of a stud may be determined when the capacitance ratio is equal to unity." Id. at 16:39-46. Stanley argues that these explicit references to dividing two numbers to obtain a "ratio" expressly support its proposed construction. The Court agrees with Stanley that these portions of the specification indicate that the term "ratio" connotes a division of two numbers, as opposed to subtraction.

Additionally, the fact that the references explain that the centerline is determined when the ratio is equal to "unity" (i.e., one) also shows that division, and not subtraction, is contemplated. Specifically, when two equal values are divided, the result is one, whereas when two equal values are subtracted, the result is zero. Stanley persuasively contends that Zircon understood this difference during drafting, because the specification states that a centerline has been detected "if the capacitance ratio is approximately equal to unity," or "alternatively," "if the capacitance measurements are approximately equal to each other." Id. at 19:30-34. Additionally, column 14:47-53 explains that the comparison circuit "may compute a ratio" or "may determine whether the capacitive measurements are within a predetermined value of each other." These portions of the specification, presenting ratio and subtraction as alternative operations, also point toward construction of the term "ratio" as limited to division, and not subtraction.

Stanley also persuasively argues that the way the ratio value is expressed throughout the patent supports the fact that it refers to a division of two values. Stanley asserts that, "[b]y definition, a ratio of two values measured in the same units has no unit. For example, 2 farads [a unit of capacitance] divided by 2 farads equals 1 (unitless)." Motion at 13. Stanley points out that, in the '091 Patent, all of the "ratio" values described in the patent are similarly unitless, which is consistent with the plain meaning of the term "ratio" and only make sense if they result from division that eliminates the units. See id. at 21:67, 22:16, 22:46, 22:67, 24:6, 24:33, 24:55. If they resulted from subtraction, the values would retain a unit; i.e., 2 farads minus one farad equals one farad. Zipicon did not dispute this basic mathematical concept.

Stanley next argues that the prosecution history, and specifically Zircon's amendment of claim 1, confirms the correctness of its proposed construction. Stanley points to Zircon's statement that:

Claim 1 has been amended to include the subject matter of allowable Claim 39 and Claim 37 upon which Claim 39 was dependent. Thereby the final clause of Claim 1 now recites "providing an indication of the ratio, and wherein if the indication is approximately one, thereby locating a centerline of the structure." The Claim 1 is now allowable for at least the same reasons as indicated by the Examiner for Claim 39.
Kiersz Decl. Ex. G (5/5/06 Amendment) at S146. This passage also shows that Zircon understood the meaning of "ratio" to be the unitless result of dividing the two values of the capacitance of the sensor plates, and acknowledged that because the values of the plates will be substantially equal when over the centerline of the stud, the value would be "approximately one" (always the result of dividing any two numbers of equal value).

Finally, Stanley argues that extrinsic evidence confirms that the plain and ordinary meaning of the term "ratio" connotes an elementary mathematical operation where two values are divided to obtain a "ratio." The Court agrees that Stanley's definition comports with the plain meaning of the term. Also, Stanley cites various dictionaries and other literature defining the mathematical term "ratio" in terms of division of two values. See generally Kiersz Decl. Exs. J, H, B. Most specifically, Stanley relies on the third, mathematical definition of the term listed in the American Heritage Dictionary that a ratio is: "the relative size of two quantities expressed as the quotient of one divided by the other." American Heritage Dictionary, 2d Ed. 1028 (Houghton Mifflin Co. 1991) (attached as Kiersz Decl. Ex. I). Zircon does not challenge Stanley's reliance on the American Heritage Dictionary to determine the plain meaning of the term "ratio," but argues that the Court should use the first definition listed, or "relation in degree or number between two similar things." Opp. at 7; see also Kiersz Decl. Ex. I. However, the Court agrees with Stanley that the mathematical dictionary definition (as opposed to the first dictionary definition) is appropriate, because the references to "ratio" in the patent refer to a mathematical operation.

2. Zircon's Proposal: Relation in Degree or Number Between Two Similar Things

Zircon relies on the first American Heritage Dictionary definition of ratio as "relation in degree or number between two similar things," but spends very little time explaining how it is consistent with most of the claims and specification. Instead, Zircon's primary argument is that Stanley's proposed construction of "ratio" is inconsistent with patent claims 10, 19 and 21. Specifically, claim 10 discloses a method of "finding a feature" that includes the step "computing a ratio." '091 Patent at 21:48-60. Dependent claim 19 provides that the "computing a ratio" of claim 10 comprises "comparing the first and second capacitances." Id. at 22:20-24. Claim 21, which is in turn dependent on claim 19, further provides that the act of "comparing" as claimed in claim 19 includes "determining whether the first and second capacitances differ by less than a threshold." Id. at 22:33-39. Zircon argues persuasively that the term "differ" in claim 21 is shorthand for "difference," which relates to subtraction and not only division. Indeed, Stanley agrees that the term "differ" in the '091 Patent means subtraction and not division. See Motion at 18-19 (arguing this point in the context of the prosecution history).

Zircon contends that, under applicable rules of claim construction, independent claim 10 must be broader than its dependent claims 19 and 21, which serve to limit claim 10. Opp. at 9 (citing Monsanto Co. LLC v. Syngenta Seeds, Inc., 503 F.3d 1352, 1357 (Fed. Cir. 2007) (“a claim in dependent form shall be construed to incorporate by reference all the limitations of the claim to which it refers.”). Therefore, according to Zircon, the "computing a ratio" of claim 10 cannot be limited to division, because it necessarily also includes the subtraction approach of claim 21, which is incorporated into claim 10 through claim 19. If the Court construed "ratio" to include only division and not subtraction, Zircon contends that this would be inconsistent with claims 10, 19, and 21 because they include the subtraction method as part of "computing a ratio," and therefore run afof the rule that claims must be interpreted in context with other claims.

However, to accept this argument would be to create much more inconsistency between the claims and to only selectively apply applicable patent law regarding dependent claims. Patent claims 1, 17, 22, 23, 31 and 32 expressly contemplate the invention finding a centerline when it detects a "ratio" of "approximately one" or some derivative thereof (i.e., 0.9-1.1). See '091 Patent at 21:66, 22:16, 22:46, 22:66-67, 24:6. 2 This claim language only makes sense if the invention is computing a ratio by dividing equal or almost-equal values to get a result of approximately one, and not if the values were instead being subtracted, because in the latter case the result of subtracting two equal values would be zero. If "ratio" were interpreted to include subtraction in each of those claims specifying that the result of the ratio should be close to one (i.e., in the range of 0.9 to 1.1) to determine a centerline, then the device would not function properly to indicate that it was centered over the stud in the very instance where it is most centered.

- - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - - -

2 At oral argument, Zircon argued that claim 1 states that "if the indication is approximately one," then the device is located over a center line. See '091 Patent at 20:65-67. For the first time, Zircon focused on the term "indication" and argued that this is somehow distinguishable from a "ratio" of approximately one. However, Zircon's argument fails to take into account - 3830 -
the context in which the term "indication" is used in claim 1, and that it is an "indication of the ratio" which must be approximately one. Additionally, claims 22, 23, 31 and 32 do not use the term "indication" and require that the ratio be within a range of approximately one. Therefore, the Court rejects Zircon's argument.

--- Footnotes ---

Central to both arguments is the relationship between dependent and independent claims and how they should be construed. Monsanto quotes 35 U.S.C. § 112 P 4: "[A] claim in dependent form shall contain a reference to a claim previously set forth and then specify a further limitation of the subject matter claimed. A claim in dependent form shall be construed to incorporate by reference all the limitations of the claim to which it refers." Monsanto Co. LLC v. Syngenta Seeds, Inc., 503 F.3d 1352, 1357 (Fed. Cir. 2007). Zircon is correct that under its construction the independent claim would be read more broadly than its dependent claim as required, but the same is true under Stanley's construction. Further, the statute does not mandate that the limitations in claims 10 and 19 must be read more broadly than drafted to sustain the validity of claim 21. To support this argument, Stanley relies on Michilin Prosperity Co. v. Fellowes Mfg. Co., 450 F.Supp. 2d 35 (D.D.C. 2006), where the district court was asked to construe a dependent claim term. In Michilin, the patent at issue claimed invention of a shredder with at least two "touch switches" at claim 1 (though it disclosed the possibility of a one-switch shredder in the specification). Claim 4, dependent on claim 1, claimed a "single touch switch." Michilin argued that the single switch of claim 4 should be construed as a single-switch embodiment of the invention. Id. at 39. The defendant countered that dependent claim 4 could not be construed that way because of its dependent status, which meant that it must incorporate all of the limitations of claim 1 in addition to any additional elements claimed. Id. However, the court reasoned that because independent claim 1 required at least two switches, the single switch of dependent claim 4 had to be construed as a third switch, in addition to the two switches of claim 1 because "[a]ny other result would amount to redrafting Michilin's claims, a power this court lacks." Id.

Stanley argues that, following the reasoning of Michilin, to be a valid dependent claim, claim 21 must be construed as narrower than the independent claim it depends from, by covering an embodiment combining the features of both variations (the division of claim 10 in addition to the subtraction of claim 21). Alternatively, Stanley contends that if claim 21 as drafted does not contain a further limitation of claims 10 and 19, and instead contains a limitation of non-overlapping scope, then it is invalid under § 112 P 4. See Pfizer, Inc. v. Ranbaxy Laboratories Ltd., 457 F.3d 1284, 1292 (Fed. Cir. 2006) (reversing district court and invalidating a dependent claim that failed to "specify a further limitation of the subject matter" of the claim to which it referred because it was completely outside the scope of claim). 3 The Court agrees. Either way, claim 10 cannot be construed more broadly to accommodate dependent claim 21, especially where this construction would create significant inconsistency with other claims.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

3 When questioned at oral argument, however, Stanley acknowledged that it is not moving on grounds of invalidity.

--- Footnotes ---

Zircon also contends that Stanley's proposed construction does not comply with the doctrine of claim differentiation. This doctrine provides that "[t]here is presumed to be a difference in means and scope when different words or phrases are used in separate claims. To the extent that the absence of such differentiation would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987). Zircon argues that Stanley's proposed construction of "ratio" would render claim 21 meaningless because "determining whether the first and second capacitances differ by less than a threshold" is a limitation on the "act of comparing" in claim 19, which is a limitation on "computing a ratio" in claim 10. To give claim 21 any meaning, according to Zircon, "ratio" must include both subtraction as well as division, and to find otherwise would violate the doctrine of claim differentiation. Stanley counters correctly that the doctrine of claim differentiation does not apply because neither party is advancing a construction of "ratio" that would give claim 21 the same scope as another claim. Zircon's construction of claim 10 is broader than Stanley's because it includes both division and subtraction in "ratio," and then its construction of claim 21 is narrower than its own construction of claim 10 because it is limited to subtraction, whereas Stanley's construction of claim 10 is narrower than Zircon's because ratio is limited to division, but its construction of claim 21 is narrower still because it must do both methods of subtraction and division to detect a centerline. Given the above, the Court does not find Zircon's claim differentiation argument persuasive.
Finally, Zircon contends that Stanley's proposed construction improperly imports limitations from the specification into the claims. Zircon points out that, even if the specification discloses only one embodiment or implementation for a claim element, that does not necessarily mean that all requirements of that embodiment must be read onto the claim. Instead of following up on this argument, however, Zircon changes course and argues that the proposed construction is defective because it is in conflict with the preferred embodiments described by Figures 12 and 13. Zircon's real argument appears to be, not that Stanley's proposed construction impermissibly relies on the specification, but that it impermissibly conflicts with the specification.

Specifically, Zircon contends that the preferred embodiments described in Figures 12 and 13 show computing a ratio by methods other than "dividing two values." The description of Figure 12 specifies that the capacitance circuit processes capacitance measurements, and states: "For example, the comparison circuit [] may compute a ratio between capacitive measurements. The comparison circuit may determine whether the capacitive measurements are within a predetermined value of each other." '091 Patent at 14:47-53. The description of Figure 13 explains that in that embodiment a "microcontroller carries out the comparator functions of the comparison circuit of FIG. 12." Id. at 15:25-26. Zircon's position appears to be that, because these embodiments disclose methods other than specifically division (i.e., by use of a microcontroller) for computing a ratio, Stanley's proposed construction is impermissibly narrow. However, this argument is circular because its success depends on the proper construction of the term "ratio," and does not support Zircon's position unless the Court agrees with its proposed construction. Moreover, as addressed below, Stanley also argues persuasively that although the specification disclosed the division method, during the course of the prosecution history, that method was dropped from the claims, resulting in its dedication to the public.

Accordingly, the Court concludes that the intrinsic evidence, including the surrounding patent claims and the language of the specification, as well as the plain meaning of the term, establishes that the "ratio" of the '091 Patent should be construed as "a result of dividing two values."

3528

4. "a reaction force caused by movement of the mask stage and the object stage"

For similar reasons, the court construes "a reaction force caused by movement of the mask stage and the object stage" to mean precisely what the claim term implies: "an equal and opposite counterforce spurred by the shifts and vibrations of the mask stage and the object stage." Repeating, by implication, its claim differentiation doctrine argument, Nikon asks the court to read "a reaction force . . . stage" to mean "a reaction force produced by a motor drive in moving the mask stage and a reaction force produced by a motor drive in moving the object stage." The specification language does discuss "transmitting the reaction forces of the reticle stage mechanism drive motors." See Patent '500 at 5:23-31. But this specification language says nothing about motor drives acting specifically on mask or object stages. Read in context, the term "a reaction force caused by movement of the mask stage and the object stage" concerns transference of this operation-related force to the reaction frame. Id. at 7:42-59. The "cause[]" of the force is specified by the claim language itself, and the court need not import limitations from elliptically relevant specification language. "[A] reaction force caused by movement of the mask stage and the object stage" should be read consistently with "a drive to move the mask stage and the object stage." Thus, the court construes "a reaction force caused by movement of the mask stage and the object stage" to mean "an equal and opposite counterforce created by the shifts and vibrations of the mask stage and the object stage."

3529

a. Definition of "Read"

The Court first considers Symbol's contention that the term "read" should be construed as "decoded." This argument is the product of several inferences that Symbol draws from the specification in which the patentees appear to utilize the word "read" to describe functions described elsewhere as decoding. For instance, Symbol points out that the "patent teaches that bar code decoding occurs during the 'bar code symbol reading' state." (Symbol's Rebuttal Br. 22.) While the occurrence of
"decoding" during the "reading state" might superficially imply that reading means decoding, it could just as easily mean that decoding is a subset of reading, thus illustrating why the Federal Circuit has "consistently warned against" importing limitations from inferences drawn from the specification. Liquid Dynamics, 355 F.3d at 1361. Symbol argues that elsewhere, the specification "equates a bar code that is read with one that is "scanned and decoded."" (Symbol's Rebuttal Br. 22.) See, e.g., '971 Patent col. 1 11. 38-39 ("... reading (i.e. scanning and decoding)..."); id. col. 7 11. 18-19 (same); id. col. 16 11. 53 ("... successfully read (i.e. scanned and decoded)... "); id. col. 25 1. 55 (same). This argument actually seems to undercut Symbol's argument that the term "read" should be construed to mean only "decoded," and in any event does not imply that every use of the term "read" in the '971 patent means "scanned and decoded." It is more likely, in light of its differing usage elsewhere in the specification, that the patentees intended the term "read" to mean "scanned and decoded" only where they expressly indicated. As such, Symbol's argument once again seeks impermissibly to add a limitation based on an inference drawn from selected portions of the specification. SeeResonate Inc., 338 F.3d at 1364-65.

Symbol also notes that with respect to the state diagram of Figure 13, which schematically represents the operation of the preferred embodiments disclosed in the specification, n13 the "bar code symbol reading" state (State C or State F) is depicted as occurring after the "bar code symbol presence detection" state (State B or State E) but before the "symbol character data transmission/storage" state (State D), '971 Patent Fig. 13. The specification teaches that activation control signals trigger the transition between states, and that activation control signal A3, which causes the system to transition from State C or State F to State D, is produced "[w]hen the symbol decoding module successfully decodes a bar code symbol" within a predetermined time period. Id. col. 13 11. 23-31; see also id. col. 17 11. 16-19; col. 27 1. 68-col. 28 1. 13. Thus, the '971 patent discloses that in both preferred embodiments, the "bar code symbol reading" state ends when the system controller receives signal A3, signifying a successful decode. See id. col. 17 11. 16-30; col. 26 11. 21-35. From this disclosure, Symbol concludes that "reading" cannot mean more than "decoding."

--- Footnotes ---

n13 The Court disagrees with Symbol's contention that Figure 13 represents a separate embodiment of the claimed invention. Under the heading "Brief Description of the Drawings," the '971 patent describes Figure 13 as "a state diagram illustrating the various states that the automatic bar code symbol reading devices of the illustrative embodiments may undergo during the course of their operation." '971 Patent col. 5 1. 67-col. 6 1. 2 (emphasis added). It is therefore apparent that the state diagram of Figure 13 applies to both of the preferred embodiments disclosed in the specification, and is not itself a preferred embodiment.

--- End Footnotes ---

1*.GI:1;4481:5340971;22 GET DRAWING SHEET 22 OF 27.

Once again, Symbol's argument proves too much, placing undue significance on the labels attached to State C and State F and drawing sweeping inferences from the figures and illustrative embodiments. This is not an instance in which the patent makes repeated and consistent limiting statements or represents that important objects of the invention are served by a bar code symbol reading state that is conterminous with bar code symbol decoding. Cf.Honeywell Int'l, 452 F.3d at 1320; Alloc, Inc., 342 F.3d at 1370. Nor is claim 44 a means-plus-function claim, which at least would require the Court to look to the structure disclosed in the specification to ascertain the limits of the claim. The preferred embodiments disclosed in the '971 patent do not represent limitations on the claimed invention, and therefore do not support Symbol's argument that reading and decoding are the same. See Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.").

If the '971 patent consistently used the term "read" to mean decode, as Symbol suggests, then the Court might have less difficulty in adopting Symbol's proposed construction. However, with respect to its use of the term "read" and variations on that word, the '971 patent is far from consistent. Throughout the patent, examples are legion of the terms "read" or "reading" being used to indicate more than simply "decoding." The very title of the claimed invention is "Automatic Bar Code Reading System Having Selectable Long Range and Short Range Modes of Operation," and even Symbol would concede that the claimed invention purports to do more than simply "decode" bar code symbols. Cf. '971 Patent Abstract ("Method and apparatus for automatically reading bar code symbols is disclosed."). Elsewhere, the specification equates reading with
Finally, the Court takes note of Metrologic's argument that defining "read" to mean "decoded" effectively would exclude the consecutively identical bar code symbols. By extension, the Court finds no basis in the IDS for defining "read" to mean rejecting Symbol's crabbed reading of the June 23, 1993 IDS as expressly distinguishing over prior art that decodes that Ouchi may be capable of possessing some of the qualities of the Metrologic system, but not all. Therefore, the Court sequencially produces only symbol character data representative thereof. (Id.) In essence, Metrologic was saying in its IDS which being a processor that "sequentially detects and decodes a plurality of consecutively different bar code symbols and sequentially produces only symbol character data representative thereof." (Id.) In essence, Metrologic represented that Ouchi lacked the combination of qualities possessed by the Metrologic system, one of which being a processor that "sequentially detects and decodes a plurality of consecutively different bar code symbols and sequentially produces only symbol character data representative thereof." (Id.) In essence, Metrologic was saying in its IDS that Ouchi may be capable of possessing some of the qualities of the Metrologic system, but not all. Therefore, the Court rejects Symbol's crabbed reading of the June 23, 1993 IDS as expressly distinguishing over prior art that decodes consecutively identical bar code symbols. By extension, the Court finds no basis in the IDS for defining "read" to mean "decoded."

Finally, the Court takes note of Metrologic's argument that defining "read" to mean "decoded" effectively would exclude the
preferred embodiments. See SanDisk Corp. v. Memorex Prods., 415 F.3d 1278, 1285 ("A claim construction that excludes a preferred embodiment . . . 'is rarely, if ever, correct.'" (quoting Vitronics, 90 F.3d at 1583)). One of the objects of the invention disclosed in the '971 patent is "to provide an automatic bar code symbol reading device which prevents multiple reading of the same bar code symbol due to dwelling of scanning beam upon a bar code symbol for an extended period of time." '971 Patent col. 3 11. 36-40. The patent teaches that bar code symbol decoding occurs before the system controller compares consecutive bar code symbols to determine whether they are different. See id. col. 18 11. 8-20; col. 27 11. 18-29; Fig. 8E (Block Y and Block Z); Fig. 12E (Block Y and Block Z). Therefore, Metrologic reasons, the preferred embodiments must both decode and compare bar code symbols in order to carry out the object of preventing multiple "reading" of the same bar code symbol. While this argument is some evidence of the patentees' intention to define "read" as including both decoding and comparing, it arguably conflicts with the specification's disclosure elsewhere that activation control signal A3 indicates "that a bar code symbol has been successfully read." See, e.g., id. col. 26 11. 22-23; cf. id. Fig. 8E (Block Y); Fig. 12E (Block Y). Nevertheless, it appears that a certain amount of inconsistency is inevitable in this patent. (See Markman H'r'g Tr. 111:25-112:6 (conceding that the '971 patent sometimes uses "read" to be limited to functions occurring before the compare function.).) The Court finds that even if the patent fails to signal uniformly and unambiguously the patentees' intention to define "read" to include decoding and comparing, it does clearly refute Symbol's argument that "read" is narrowly limited to mean "decoded."

For all of these reasons, it is evident that the term "read," as it appears in claim 44, cannot be construed narrowly to mean "decoded." Its use elsewhere in the '971 patent suggests a broader meaning, and its use within claim 44 suggests a meaning that includes decoding bar code symbols and producing symbol character data for consecutively different bar code symbols. When read in conjunction with the specification, see id. col. 18 11. 8-20; col. 27 11. 18-28; Fig. 8E; Fig. 12E, this broader meaning dictates that "reading" includes the function of comparing consecutive, decoded bar code symbols. (See Metrologic's Rebuttal Br. 22-23.) Nothing in the prosecution history of the '971 patent clearly and unmistakably refutes this conclusion. Accordingly, the Court rejects Symbol's argument that the '971 patent defines the term "read" to mean "decoded."

3530

C.

Mediamatics has also challenged LaserDynamics' definition of "read" or "reading" contained in the '743 Patent. LaserDynamics would have the term construed as covering both extracting information from the pits 4 on the disk as well as retrieving information stored in memory. Mediamatics proffers that "read" should mean the process of "projecting a laser beam at the optical disk, receiving a reflection of the laser beam, and producing an electrical signal from the reflection of the laser beam." Mediamatics argues that there is no basis in the claims or specification that support the broader definition. Thus, Mediamatics argues that the term is limited by its uses in claims 3, 7 and 11.

4 Pits are hollow depressions made on the layers of a disc plane into which data is stored or compressed. [See Webster's Twentieth-Century Dictionary, Publishers Guild, Inc (1939)]

Again, Mediamatics' reference is to the specification. Clearly, the claims refer to retrieving the data and storing it in memory. It follows logically that the data in memory is there for the purpose of being retrieved at some point in time. In these claims, the terms "read and reading" are used in paragraphs (iv) and (v) where the claims state: "(iv) reading [read] out and routing [route] the recorded data... and ... (v) read out recorded data...." The process described starts with data stored in pits and that is to be stored in memory on the DVD disk. The process also describes the technique for retrieving that data and making it available to the viewer. If the invention expressed in the '743 patent were limited to a single instance of read and store, the process whereby data may be transferred to other products, even other DVD disks that have memory capacity, is eliminated and would require yet another term to define the procedure for retrieving the stored data from memory. Thus, the Court rejects Mediamatics more constricted definition and adopts the definition proffered by LaserDynamics that, in the Court's opinion is the ordinary meaning and use of the terms. "Read," therefore, means "to extract data from memory or a
storage medium and [usually] transfer it to another area of memory or other medium "for use or extraction at a point in time."
See, The Illustrated Dictionary of Electronics, [8th Ed.].

3531

B. Ref. No. 57 "Reading," Optically Reading," and "Read."

These terms and phrases are recited or referred to in Claims 1, 13, 18-20, 23, 26, 30, 31, 42-44, and 49.

Plaintiff asserts that the term "reading" in Claims 1, 13, 18, and 31 should be construed as "scanning/sensing/reading" and "detecting and/or imaging" in Claims 30, 42, and 44. Plaintiff says nothing about the contested terms in Claims 19, 20, 23, 26, 42-43, and 49. Plaintiff argues that the term "reading" in Claims 1 and 31 does not require the Court to construe its meaning, yet Plaintiff proposes the above construction. Defendants, on the other hand, first argue that the contested terms are used interchangeably and such "flexibility" deprives the term of clarity; therefore, the scope of the claim using these terms cannot be ascertained. Defendants alternatively argue that the definition "capturing data from the ballot or from the image of a ballot" is appropriate in every claim in which these terms are recited.

The Court finds it instructive to analyze each disputed claim in which the contested terms appear. In Claims 1, 13, 18, 43, and 49, the term "reading" is described as "optically" reading ballots. Claims 19, 20, 23, and 26 detail the "method" of Claim 18. In Claims 1, 13, 30, 31, and 42, "reading" also includes "imaging" the ballots. In Claim 30 "reading" is "using any of a keyboard, a touch screen, a button, a switch, voice recognition apparatus, a Braille keyboard, [or] a pen with writing recognition interface." (Alteration added.) Claim 44 describes the "method" of "reading" ballots as comprising "reading each ballot" to obtain specific information such as the jurisdiction identifier and the voting selections marked thereon.

As noted above, there is a presumption that the same term appearing in different portions of the patent should be given the same meaning unless it is clear from the specification and prosecution history that the term has different meanings at different locations in the patent. See PODS, Inc., 484 F.3d at 1366. There is also a presumption that a claim is valid and is to be found indefinite only if the claim is "insolubly ambiguous" and "no narrowing construction can properly be adopted." Honeywell Int'l, Inc., 341 F.3d at 1338-39.

In reviewing the contested terms cited herein, the Court does not find their usage deprives the claims of clarity. The three terms in dispute all relate to the same functions -- collecting, gathering, observing data, and then reading the data in some manner. Column 3, lines 25-28 of the specification provides that, after the ballot is marked by the voter, it is read and tabulated by a reading machine or optical reader that "reads or senses the defined mark spaces to determine" the voting selections. With respect to Figure 8, the specification describes it as "a schematic flow diagram of an example ballot reading process . . . " (Col. 2, ll. 43-44.) Figure 8 begins with "pass ballots through reader (310)" and then depicts two paths, 320a and 320b, in which the ballot is passed through to be read or imaged and decoded. At the end of paths 320a and 320b, the voting selections are tabulated (330), and the "read" ballot is stored (332). The ballots are "read" by the alternative processes in 320a and 320b. In essence, the term "reading," "optically reading," and "read" refer to the same process. Information is either scanned, read, or captured from the ballot, and, through that process, the votes are tabulated and stored. This construction is consistent with the Court's construction of the term "optically readable" in Ref. No. 38 of the '730 Patent as meaning "capable of being read by an optical scanner." The Court's construction is also consistent with that in Ref. No. 59 in the '944 Patent, wherein the terms "imaging," "image," and "imaged" are construed to mean "electronically capturing and reproducing images and data from a ballot in a pixilated or bitmapped format."

For the foregoing reasons, the Court construes the terms "reading," "optically reading," and "read" as: Scanning, reading, or capturing data from the ballot or from the image of a ballot.

3532

Claim 1f
the compatibility comparison including reading a characteristic of each option

The parties disagree on the meaning of the above-stated language. Dell argued that the ordinary meaning of the above-stated language should suffice. Lucent, however, proposed the following: "reading a tag indicating compatibility with other options in the master data base for each option."

The court agrees with Dell that no construction of this claim term is required. The ordinary meaning suffices.

5. "reading the code by a processor"

a. The Parties' Proposed Constructions

The only asserted claim that contains the term "reading the code by a processor" is claim 1 of the '603 patent ('603 patent at 16:6.) Ingenio asserts that the term "reading" in the context of the phrase "reading the code by a processor" means "to receive input of the code (a system of symbols that represent an assigned and secret meaning) from some source. That source may thus include a computer program/software source." (D.I. 113 at 22.) Ingenio relies on the ordinary meaning of the term "read," as well as the specification to support its proposed construction. (Id. at 21-22.) GameLogic asserts, however, that "reading" should be construed to mean "actively examine and grasp the meaning of the code." (D.I. 117 at 29.) In support of its proposed construction, GameLogic cites the specification of the '603 patent and the testimony of one of Ingenio's experts. (Id. at 29-30.)

b. The Court's Construction

The ordinary meaning of the term "read," In the context of a computer processor, is, as Ingenio asserts, "to input data from a storage device, a data medium, or any other source." See Computer User's High-Tech Dictionary, http://www.computeruser.com/resources/dictionary/dictionary.html (cited by Ingenio at D.I. 113 at 21). The specification of the '603 patent confirms that this Is the proper definition of the term "reading". (See '603 patent at 2:20-22 (the "code is stored on the gaming piece in a memory device. . . . The code is read by a processor.".) Nothing in the portions of the specification cited by GameLogic indicates that a different definition of "read" should be used. (See id. at 11:13-16 (describing an embodiment "using gaming pieces in the form of casino chips or tokens containing Destiny Codes to allow a player to simulate wagering games with cash"); id. at 12:1-7 ("the amusement +actualization game system reads the Destiny Code contained on the gaming piece. The reading operation takes place by a processor which reads the Destiny Code stored in the memory device contained on the gaming piece.") Therefore, the term "reading" in the context of the phrase "reading the code by a processor" will be construed to mean "receiving input of the code from some source, which may include a computer program/software source."

21. reading the command from a user interface

This phrase only appears in claim 35 of the '927 patent. The defendants contend that the phrase is indefinite because it is incomprehensible and the specification fails to provide meaning to this phrase. The court disagrees and finds one of ordinary skill in the art would understand the phrase to refer to a command initiated by the user. Accordingly, the defendants' indefiniteness argument is rejected and the phrase is construed to mean "reading a command initiated by a user through a user interface."

G. Claim Construction of "real time" 7

- 3837 -
7 Both parties' proposed constructions for this term changed from what was offered in the claims construction briefs.

The term real time appears in Claim 51 of the '513 Patent. Plaintiff asserts that the term means "substantially immediately, given processing limitations." Plaintiff further argues that the Federal Circuit's definition, as stated in Paragon Solutions, LLC v. Timex Corp., 566 F.3d 1075 (Fed Cir. 2009), is applicable to the instant claim term. Defendant, however, asserts that the term means "substantially immediately" without any additional limiting language. Defendant argues that real time is a term of art and is not defined in the '513 Patent or in the prosecution history. Defendant further argues that the construction established in Paragon is inappropriate to the instant claim because the Paragon court relied on intrinsic evidence, whereas there is no intrinsic evidence in the instant case regarding processing limitations. Finally, Defendant explains that, unlike the invention in Paragon, there is no need to qualify the timeliness of the processing once the merchant has created and posted the information to the system.

The Court finds neither the specification nor the patent prosecution history useful in defining this term. Since the intrinsic evidence does not provide meaningful guidance as to the proper construction of the term, the Court finds it appropriate to consult the Federal Circuit's opinion in Paragon. The court in Paragon spent a great deal of time on the intrinsic evidence regarding the claimed system's ability to process, transmit and calculate the data being displayed. Unlike the claimed system in Paragon, the system claimed in the '513 Patent does not require measurement of data requiring the passage of time; instead, the instant Patent claims "inputting of information that occurs in real time," which does not require the processing or calculation extensively discussed in Paragon. This Court finds that the limiting language regarding intentional delay and processing limitations, as announced in Paragon, is inapplicable to the '513 Patent. Neither intrinsic nor extrinsic evidence for the instant claim supports such additional limitations. Accordingly the Court FINDS that real time as defined in the '513 Patent means "substantially immediately."

C. "Real Time," (or "Real-Time," or "In Real Time")

I adopt the following definition: "at the same time that a transaction is taking place."

"Real-time," as used in the patent, can be either an adjective, as in "real-time monitoring" ('725 Patent, col. 20:31), or a noun within an adverbial phrase, as in "enables a cardholder to monitor, in real time, activity involving his or her card(s)" (Id., col 20:33-34). The patent also uses the phrases "in real-time" and "in real time" (no hyphen) interchangeably.

Plaintiffs offer the following four definitions: "immediately, or instantaneously, or at once, or at the actual time as something takes place." These four definitions are derived from different definitions of "real time" in standard English dictionaries. Defendants offer the definition, "simultaneously with the execution of the banking transaction."

"Real-time" has a technical definition, meaning a program that operates within a brief interval of time. When the term was coined, it was used to describe computer systems which had to work reliably within a pre-defined time interval, usually a matter of milliseconds, such as anti-lock braking systems in cars. However, it is clear from the patent that the drafters did not intend the technical definition. The invention does not impose any actual time limits, absolute or relative, on how long the transaction security protocol takes. Therefore, I must look to some other definition of the term.

"Immediately," "instantaneously," and "at once" are essentially synonymous, meaning without perceptible duration or interval of time. Merriam-Webster Online Dictionary at http://www.m-w.com/dictionary/instantaneous. However, "at the actual time as something takes place" -- plaintiff's fourth proposal -- is not the same as "immediately" -- there may be a small, barely perceptible delay of time between the inception of a transaction and subsequent notification, although notification could still occur before the transaction concluded.
"Immediately" (or "instantaneously," or "at once") also does not reflect the speed at which a system processes real-time notifications. A slow central processing computer may nevertheless provide real-time information, if the information provided is current as of the time the request is made and processed. The patentee could not have intended to limit their invention to systems in which such notification must be instantaneous; otherwise, one could design around the patent by building a system which imposes a delay of a few seconds before issuing the warning.

The phrase offered by defendants -- "simultaneously with the execution of the banking transaction"—is fine, except that I would eliminate the word "banking" (since the invention was clearly intended to extend beyond banking transactions). According the Merriam-Webster Online dictionary, "simultaneous" means "existing or occurring at the same time." As I understand the invention, the monitoring and notification of the account holder are designed to take place after the transaction begins but before it ends, so that the holder has an opportunity to stop the transaction before it is concluded. Thus, notification in real time is notification that occurs at the same time as (simultaneously with) the transaction.

Similarly, the Court finds no evidence that the patentee acted as his own lexicographer for the term "real-time." Consistent with Phillips, The Court, therefore, adopts the plain and ordinary meaning for this term, as defined in the Merriam-Webster online dictionary, "the actual time during which something takes place." Merriam-Webster Online Dictionary, available at www.merriam-webster.com.

We agree with the district court that claims 1 and 15 require that information be presented to the user in a manner that allows the user to access the information at the same time that he is observing the field of view. Claim 1 requires the information to be "simultaneously presented to the user as the user observes the field of view" (emphasis added), and claim 15 requires the information to be "provided . . . to the user . . . in real-time as the user observes the field of view." Especially when followed by the preposition "to," the verb "present" (or "provide," in the case of claim 15) suggests the act of making something immediately accessible for the user to view. Webster's New International Dictionary 1955 (2d ed. 1954) (defining "present" as "[t]o exhibit or offer to view"); id. at 1994 (defining "provide" as "[t]o supply for use"). It would be strange to say that an image is "presented to" a user as the user observes the field of view if the user is not in a position to view the image while observing the field of view.

In the context of the '203 patent, there is a significant difference between displaying information on a side screen that the user cannot see while observing the field of view, as opposed to simultaneously presenting information to a user as the user observes a celestial object in the field of view. The specification makes it clear that one of the key features of the invention is that the user can receive information about a particular celestial object while using the device to observe the object in the field of view. For example, the patent explains that one of the main disadvantages of observing aids such as star charts is that the observer "has to refer back and forth from the sky to the star chart." '203 patent, col. 1, ll. 30-31. But that is precisely what users of Yamcon's accused device must do with respect to the screen display, because Yamcon's device lacks the simultaneity feature touted in the patent.

All of the embodiments described in the patent allow information to be presented so that the user is exposed to the information and the field of view at the same time. In one embodiment, the device "superimposes on the observed night sky within the instrument's field of view an image in the form of a graphic representation of a prominent astronomical feature such as a constellation." '203 patent, col. 2, ll. 22-25. In discussing alternative embodiments, the specification notes that the "display is placed in the user's line of sight for direct viewing." '203 patent, col. 4, ll. 20-21. Nothing in the specification indicates that the relevant claim language can be interpreted to cover devices that do not present information to the user while the user is viewing the field of view.
Meade makes several arguments in support of its interpretation, but they are not persuasive. First, Meade challenges the district court's conclusion that the "user of the device must actually be aware of and receive the data at the same time that he or she is viewing the celestial object." Meade argues that the claims do not require "awareness" of the information on the part of the user, but only require that the information be "presented or provided." While it is true that the claim limitations are directed to the capabilities of the device, not the capabilities of the user, we do not interpret the district court's claim construction to require that the user actually absorb textual information at the same time that he is viewing an object. All that is required is that the information be made available to the user so that the user can access it while observing the field of view. In that regard, the district court's claim construction is entirely consistent with the prosecution history of the '203 patent, in which the applicant asserted that the invention "provides a device that a user can hold in his or her hand, point it in a desired direction, look through it at the night sky, and see both the actual night sky (in some limited field of view) and also see educational information about the prominent feature or features in that portion of the sky."

Second, Meade makes the related argument that the district court's claim construction excludes the embodiments disclosed in the specification, because even in the embodiments that call for overlaying information on the field of view it would be impossible for a user to read the displayed textual information and look at a celestial object in the field of view at the same moment. That is because, according to Meade, a user must shift the focus of his eyes away from the celestial object in order to focus on the overlaid visual display. Again, that argument overlooks the claim language. The claims require that the user be able to access the information at the same time that he is "observe[ing] the field of view." If the user can detect the information while using the device to observe the field of view, then even if the user must shift his attention from the celestial object in order to read the information that is displayed in or around the eyepiece field of view, the user is still observing the field of view as he accesses the information.

Finally, Meade raises a claim differentiation argument in support of its interpretation of the claim language. Meade argues that the only distinction between independent claim 1 and some of the dependent claims, such as claims 2 and 3, is that the dependent claims require real-time display of textual information overlaid on the field of view. Thus, in Meade's view, claim 1 must include some means of presentation other than overlaying information on the field of view. Although we agree that claim 1 must be broader than the claims that depend on claim 1, we disagree that the broader scope of claim 1 includes Yamcon's side screen display. Rather, the additional breadth of claim 1 includes methods of simultaneous presentation to the user other than overlaying the information as text on the field of view. For example, claim 1 may include audio presentation of information, see '203 patent, col. 11, ll. 39-42 ("certain data from the database may be provided to the user aurally with known speech synthesis integrated-circuit chips in place of the visual display"), or overlaying textual information within the observer's vision but outside the field of view of the eyepiece. Particular embodiments are not at issue in this appeal, so we need not rule on whether they would fall within the scope of claim 1; it is sufficient simply to note that there are various embodiments that might fall within claim 1 but outside the dependent claims. Therefore, we reject Meade's claim differentiation argument.

1. "Real Time"

The phrase "real time" appears throughout the patents, each of which addresses either a real-time reporting system or a specific feature or apparatus to make such a system easier to use. Engate asks us to construe this phrase to mean:

as instantaneously as possible, limited by a reporter's ability to transcribe text, the CAT [computer-aided transcription] system's ability to convert the transcribed text into readable text, and the ability of the utilized software and hardware to display the converted text.

Engate's Claim Construction Brief, p. 3. The defendants argue that "real time" means that a written, video or audio record "is generated virtually simultaneously during the speaking of words during a testimonial proceeding so that the user can immediately use the record." Defendants' Claim Construction Brief, p. 4.

The Court was initially fuzzy as to whether the parties' constructions actually posed a conflict; after all, even in the context of real time reporting involving a court reporter, the words do not magically appear on a screen once spoken, but appear
only after the court reporter has entered corresponding keystrokes and the transcription system has interpreted those keystrokes. At the January 3 hearing, the defendants explained that the conflict exists because of the "utilized software and hardware" language in Engage's definition. The defendants have no quarrel with the limitations concerning human (court reporter) capability and CAT system capability allowed under Engage's construction. They argue, however, that the way Engage has worded the limitation regarding software and hardware, it is really no limitation at all, and that the claim could encompass, for example, hardware consisting of "a can and a string," or the situation where a party takes a disk from the CAT system back to his office and downloads the disk to his hard drive -- an event which could take place hours or days after the signals were originally transcribed. Under anyone's definition, neither of these scenarios produces a "real time" result. Thus, although these situations are unlikely -- especially because the parties using the patented inventions will in all probability be more technologically sophisticated than that -- we agree that Engage's definition is insufficient to capture the spirit of the technology. Accordingly, we construe the phrase "real time" to mean: as instantaneously as possible, limited by the ability of the reporter to transcribe text, the ability of the CAT system to convert the transcribed text into readable text, and the ability of the software/hardware that is directly connected to the transcription means to display the converted text.

4. In data communication with

The Court lets stand its previous definition of "in data communication with" to mean two or more devices connected such that data is being transferred between the devices in real time. During the September hearing, questions arose as to the meaning of "in real time" after the previous order was issued. The Court defines "in real time" to mean that the receiving system receives the data in the same electronic time frame as the transmission system sends the data.

3541

2.1 Real Time

The dispute about "real time" arises from claim 1, which comprises "a means for correlating the voice information and business transaction data in real time and for generating a written report containing the combined information and data in real time," along with an ACD and a host computer for supplying information about the call ("voice information") to agents, and generating business transaction data. Rockwell proposes that real time means "fast enough for the purpose intended" which in the context of the 117 patent is a minute-to-minute time frame in which reports are printed within minutes of being requested and can include reports of data summarized in 15 to 30 minute time periods." According to Rockwell, real time does not require that correlation or printing occur "instantly." Apropos proposes that real time means "immediately, as it happens; in the context of a system that processes data, it means processing the data as it is received (as against storing the data as it is received and processing the data later on)."

The idea of the 117 patent is to take caller information that is generated by the ACD (data which indicates to an administrator how well calls are being answered, and generally how well the phone staff are performing) and correlate it with business information (reports of customer sales, reservations, complaints) to enable the call center manager to be more accurate in business decisions. (See col. 1, l. 5-45). In the background section of the patent, the inventor reports that typically the ACD-generated information is available in real time and summarized in 15 to 30 minute time periods, but the business information is usually "batched and available on a daily basis." The improvement he proposes is to correlate the two streams of information in one report and to do it in a "rapid manner." Rockwell relies on various references in the specification, which uses phrases such as "15-30 minute time periods" for ACD summaries, managing call centers on a "minute-to-minute" (as opposed to daily) basis with only partial information available in real time, and that a report may be prepared "when needed," 7 as evidence that real time is a flexible term that means merely "fast enough to meet the need." Rockwell contends that real time simply means the appropriate time sequence for taking the appropriate action, citing IBM DICTIONARY OF COMPUTING, at 558-59, which defines real time as "... pertaining to the processing of data by a computer in connection with another process outside the computer according to time requirements imposed by the outside process" and "...pertaining to an application such as a process control system or a computer-assisted instruction system in which response to input is fast enough to affect subsequent input." It relies further on MacCrisken, who opined that real
time could have more than one meaning and in this instance could be as long as 15 to 30 minutes, and the inventor Andre Zazzera's testimony stating that real time might be different in different contexts. 8 In opposition, Apropos cites a long list of places within the patent and prosecution history where real time is used in the context of immediate, as soon as technically possible, 9 as well as MacCrisken's concession that GeoTel's GLOSSARY OF COMPUTER TELEPHONY TERMS defines data that is stored in 5 and 30 minute intervals as "historical data," whereas data that is collected as the events happen is called "real time data" and various witnesses who testified that real time is essentially immediate. 10

7 Rockwell cites Interactive Gift Express, Inc. v. Compuserve Inc., which states "Then [after looking to the claim language] we look to the rest of the intrinsic evidence, beginning with the specification and concluding with the prosecution history, if in evidence." 231 F.3d at 865, withdrawn, 256 F.3d at 1327; see also col. 1, l. 27-28, and col. 3, l. 3-6 (ACD information is summarized in "15 to 30 minute time periods"); col. 1, l. 44-45 ("call centers are managed minute-to-minute"); col. 4, l. 36 ("This correlation of data may be formed in a simplified manner and may be prepared for the person when needed.").

8 Brady also testified that "real-time" is "always" "context-dependent." (Markman Tr. at 91-92). In the context of a physicist at Fermi labs, "real time" might mean nanoseconds (Brady Dep., p. 123), to a filmmaker, "real-time" means faster than a thirtieth of a second (1/30 sec.) because slower than that is visible as a flicker to the human eye (Brady Dep. at 123), and to a computer telephony engineer it might mean 10 to 15 seconds (Id. at 156).

9 Apropos cites to 117 Patent, col. 1, l. 35-47 (in an air traffic control system, distance and altitude data are available in real time), col. 1, l. 45-46 (call centers are managed on a minute-to-minute basis), col. 3, l. 3-4 ("The ACD generated information is typically available in real-time and summarized in 15 to 30 minute time periods."); and col. 3, l. 8-10 ("as quickly as technically possible"); Pros. Hist. of 117 patent, at R000048 (" information and data is [sic] printed in real time such that the user has immediate access . . ") (emphasis added).

10 Apropos cites Ex. 22, Zazzera Dep. at 31 and at 58-59 (inventor Andre Zazzera testifying that the ordinary meaning of "real time" is "now," "immediately," "what's happening right now"); Ex. 53, WEBSTER'S 973 ("real-time" the actual time during which something takes place . . ."); Brady Dep. at 147, l. 16 to 149, l. 18 ("real-time" in the context of a call center "needs to happen in seconds"); id. at 169, l. 17 to 171, l. 20 (the industry would not accept a definition of "real time" as applied to a report that's printed every 15 minutes); id. at 177, l. 14 to 178, l. 4 (the two uses of "real time" in claim I have to have the same time horizon because "it seems to clearly say that these things are kind of happening one leading to . . . the other"); Markman Tr. at 175 (Forys) (real time means "immediately, right now, without perceptible delay."); id. at 177 (Forys) (explaining that Rockwell uses the term real time in the context of displays (RTDs) to provide immediate feedback on call center operations in a form of status and performance data); id. at 127-28 (MacCrisken) (unable to identify even a single example of a telephone system where 15 to 30 minutes was viewed as real time); MacCrisken Dep. at 181 (describing review of historical data regarding routed calls as, "It's not real time. It's not now."); id. at 442 (agreeing that data sent "as it happens is being sent in real time") and id. at 446 ("'real time' means as those systems have the data available . . . . In a typical system, the information for reporting to the database would be available within a second.").

Again, Apropos' evidence is more convincing than that offered by Rockwell. The definition contained in the IEEE STANDARD DICTIONARY OF ELECTRICAL TERMS 879 (6th ed.) (Rockwell Pre-Hr'g Mem., Ex. 7), defines real time as "pertaining to the actual time during which a physical process transpires . . . ." Although the amount of time that constitutes real time may be different in other contexts, in every context the notion is that data is processed as soon as received rather than stored and processed later. The description (at col. 3, l. 20 ff.) of the "interaction between the ACD and the host computer 26 and display 28" as shown in Fig. 2 strongly indicates that the correlation of data is to occur on a immediate basis and that a delay of 15 minutes would not be real time in this context. The court accepts Apropos' definition of real time.
Claims 7 and 12 of the '969 Patent describe a "real-time clock." Philips asserts that this term should be construed as "a device that keeps track of the actual date and time, and not just elapsed time." Cardiac Science, on the other hand, contends that the term should be defined as "a component that keeps track of time."

In support of its construction, Philips points to the specification, which states that upon completion of the periodic self-tests, the processor causes a record of the self-test to be stored in memory. ('969 Patent at c. 8, ll: 6-8.) The specification further states that "each stored record includes data representative of the date and time of the test and the results of the test." (Id. at c. 8, ll: 8-10.) The specification also references stored memory data in the form of the "real time" or "actual time" that certain events occurred related to the use and testing of the defibrillator unit. (Id. at c. 7, ll: 56-67.)

Consistent with the specification, the Court construes "real time clock" to mean "a clock that keeps track of the actual date and time."

GO BACK

3. "displaying real-time data"

The district court construed "displaying real-time data" to mean "displaying data substantially immediately without contextually meaningful delay so that the information is displayed in a time frame experienced by people." Claim Construction Op. at 9. As an alternative basis for affirmance, Timex argues that this construction was incorrect and that its products cannot infringe under the correct construction. Both before the district court and on appeal, Timex argues that "displaying real-time data" means "displaying the measured parameter at the given moment in time that the measurement of the parameter occurs." Id. at 8. Paragon argues that the district court's construction was correct and that Timex's proposed construction would require instantaneous display, which is not possible in practice.

a. Claim Language

Although not addressed by the district court or the parties, we find important aspects of the claim language itself to provide at least some insight into the meaning of "real-time." Specifically, claim 1 recites that the "display unit configured for displaying real-time data" is "separate from [the] data acquisition unit" that includes the electronic positioning device and the physiological monitor that provide the data. '759 patent col.28 ll.3-6. Thus, when the claimed system is in operation, the displayed data must first be acquired by the electronic positioning device and the physiological monitor and then transmitted to the display unit for display. Even assuming that this transmission happens at the speed of light, it still takes a non-zero amount of time. Thus, what the claims describe as "displaying real-time data" cannot possibly mean displaying data literally instantaneously, because the claims themselves require a transmission that necessarily takes some time, however minute that might be.

Second, claim 1 identifies five types of "real-time data," at least one of which must be displayed: "location, altitude, velocity, pace, and distance traveled." Three of these types of real-time data--location, altitude, and distance traveled--require the electronic positioning device to receive three or more signals that enable the device to calculate a position. See, e.g., '759 patent col.3 ll.6-10 ("The electronic positioning device is configured to receive electromagnetic signals from three or more sources so that the monitoring system can determine at least one of a subject's location, altitude, velocity, pace, and distance traveled."); id. col.6 ll.46-52 ("The electronic positioning device uses electromagnetic signals from three or more sources in order to provide data indicative of one or more of the subject's location, altitude, velocity, pace and/or distance traveled. By way of example, the electronic positioning component may comprise a GPS device which utilizes signals from satellites of the Global Positioning System . . . ."). Receiving and processing these signals necessarily takes a non-zero amount of time. See, e.g., id. col.9 ll.27-28 (describing "processing of GPS signals in order to determine the subject's location").

Moreover, the other two of the claimed types of real-time data--velocity and pace--are calculations of the rate of movement. Because a rate of movement is simply distance moved over time (or time over distance moved), calculation of a rate of movement necessarily requires the passage of a non-zero amount of time. More particularly, calculation of a rate of movement requires sufficient time to have elapsed to allow for a meaningful measurement. Similarly, in dependent claim
14, the "physiological monitor comprises a heart rate monitor." Id. col.28, ll.51-52. The measurement of a heart rate necessarily requires the passage of time between at least two heartbeats.

Thus, from the claim language alone, it is clear that in this case "real-time" cannot mean instantaneous, and must permit at least some amount of time to pass to allow for both the processing limitations of the system and the time required to accurately measure the data that is to be displayed.

b. Specification

Each of the parties relies heavily on the specification for its construction of "real time." Timex first points out that the specification is critical of prior art that does not provide "instantaneous" feedback, because "[h]uman nature requires instantaneous feedback for motivation and encouragement." '759 patent col.1 ll.29-30; see also id. col.23 ll.50-52 (criticizing prior art because runner cannot determine "instantaneous velocity"). Timex is correct that the specification criticizes the prior art as failing to provide "instantaneous" feedback. However, taken in context, the specification's criticisms are targeted at systems that do not provide any feedback during the course of the physical activity itself, so that the person engaged in the activity would have the opportunity to modify his activity in response. Specifically, immediately following the sentence concerning "instantaneous feedback for motivation and encouragement," the specification states:

[Many athletes also do not know how to train effectively for maximal improvement. For example, competitive runners may have difficulty determining whether their pace on a particular day of training is too fast or too slow.

Id. col.1 ll.31-36. The specification also includes a section entitled "Analytical and Training Methods," in which it describes in detail the use of the electronic monitoring system--including various alarms--to allow the user to modify his or her activity in response to data collected and displayed during the activity. See id. col.23 l.28-col.27 l.63. Thus, the specification's criticism of prior art as not providing "instantaneous" feedback cannot be read as suggesting that the patented invention displays data literally instantaneously. Rather, the criticism of prior art is more appropriately read to distinguish the invention's "real-time" display from prior art methods that stored data for review only after the activity was complete, so that the user could not make modifications during the course of the activity. Thus, the specification supports a construction of "real-time" in this case that precludes intentionally delaying the display of data by storing it for later review. The specification's references to "instantaneous" feedback do not preclude some delay to allow for the processing limitations of the system and the time required to accurately measure the data that is to be displayed.

Timex also relies on the specification's references to providing data "at any given moment." See '759 patent col.13 ll.4-8 (disclosing that "an individual can use the GPS device of the monitoring system . . . in order to determine their velocity at any given moment (e.g., in miles per hour), their pace at any given moment (e.g., in terms of minutes per mile)"; id. col.13 ll.16-29 (disclosing that "a heart rate monitor device incorporated into a monitoring system according to the present invention may display a subject's heart rate at any given moment"). The problem with Timex's reliance on the language "at any given moment" is that this language is no more or less clear than "real-time." The term "at any given moment" might mean literally instantaneously, or it might allow for the passage of some amount of time. As the district court recognized, Timex's "given moment" language is therefore unhelpful in ascertaining the meaning of "real time."

In addition to the portions of the specification identified by the parties and the district court, we note two additional aspects of the specification relevant to the construction of "displaying real-time data." First, the specification expressly states that the invention can be practiced using commercially available technology. See '759 patent col.12 ll.1-4 ("In order to provide the above-described functionality, the GPS device utilized in embodiments of the present invention may employ conventional, commercially-available components."); id. col.14 ll.52-55 ("The oximeter device utilized in embodiments of the present invention may employ commercially-available components in order to provide the functionality described above."). Plainly, the commercial GPS technology available at the time of filing--November 9, 1999--was not able to display data literally instantaneously. Thus, the fact that the specification describes embodiments using commercially available products confirms that "displaying real-time data" does not require instantaneous display.

Second, like the claims, the specification expressly describes measuring rate data, which necessarily requires the passage of time. See, e.g., '759 patent col.3 ll.6-10 ("The electronic positioning device is configured to receive electromagnetic signals from three or more sources so that the monitoring system can determine at least one of a subject's location, altitude, velocity, pace, and distance traveled.") (emphases added); id. col.3 ll.11-13 ("The physiological monitor may be chosen from the
group consisting of: an oximeter and a heart rate monitor." (emphasis added); id. col.22 ll.16-23 (describing a display unit with regions displaying "the subject's heart rate (in beats per minute)" and "the subject's velocity (in miles per hour or kilometers per hour) or the subject's pace (e.g., in minutes per mile)"). In this respect, the specification again confirms that that "displaying real-time data" must permit the passage of time required to accurately measure the data that is to be displayed.

Paragon defends the district court's construction by referring to a separate portion of the specification—the only part of the specification in which the term "real-time data" actually appears. That portion of the specification states that "[t]he systems and methods of the present invention, for example, provide real-time data and feedback useful to individuals performing a physical activity (such as athletes)." '759 patent col.6 ll.39-41. According to Paragon, this sentence supports the district court's construction of real-time as "substantially immediately without contextually meaningful delay." Claim Construction Op. at 9. In essence, in the views of both Paragon and the district court, the amount of delay that the system can impose and still be "displaying real-time data" depends on the use to which the system is being put. Under the district court's construction, if the system is being used in a "context" in which the delay is "meaningful," then the "displaying real-time data" limitation is not met; if, however, the system is being used in a "context" in which the delay is not "meaningful," the display is in "real-time" and the limitation is met. Thus, the district court offers as an example that, "for a runner, [data must be displayed] presumably within the stride" to meet the "displaying real-time data" limitation. Id. at 8.

The problem with construing "displaying real-time data" as used in the claims of the '759 patent to preclude "contextually meaningful delay" is that such a construction injects a use limitation into a claim written in structural terms. "[A]pparatus claims cover what a device is, not what a device does." Hewlett-Packard Co. v. Bausch & Lomb, Inc., 909 F.2d 1464, 1468 (Fed. Cir. 1990). If the district court's construction were correct, then the same apparatus might infringe when used in one activity, but not infringe when used in another. For example, consider a device that had a delay of thirty seconds between the time at which it calculated a user's velocity and the time that it displayed it. A thirty-second delay might be insignificant in some contexts—including "walking," "climbing," and "snowshoeing," all of which are listed in the specification as activities for which the patented invention is suitable. '759 patent col.4 ll.52, 54. By contrast, a thirty-second delay in determining velocity would be highly significant in other contexts—for example, short- and middle-distance running or skiing. See id. col.4 l.53. Moreover, the wide variety of contexts disclosed as suitable uses for the claimed exercise monitoring system would render it nearly impossible to determine in advance whether the delay in a particular system would be sufficient to avoid infringement. See, e.g., id. col.4 l.53 (listing "flying" as suitable physical activity); id. col.4 l.53 (listing "singing" as suitable physical activity); id. col.5 ll.38-39 (describing use of invention to monitor activity of "horses and camels"); id. col.7 ll.27-28 (describing use of invention for "rehabilitating an injured animal"). See also, e.g., Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1311 (Fed. Cir. 1999). (discussing importance of public notice function in claim construction). Absent an express limitation to the contrary, any use of a device that meets all of the limitations of an apparatus claim written in structural terms infringes that apparatus claim. See, e.g., Catalina Mktg. Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 809 (Fed. Cir. 2002) (holding that "a patent grants the right to exclude others from making, using, selling, offering to sale, or importing the claimed apparatus or composition for any use of that apparatus or composition" (emphasis added)); see also Roberts v. Ryer, 91 U.S. 150, 157, 23 L. Ed. 267, 1876 Dec. Comm'r Pat. 439 (1875) ("The inventor of a machine is entitled to the benefit of all the uses to which it can be put, no matter whether he had conceived the idea of the use or not."). Construing a non-functional term in an apparatus claim in a way that makes direct infringement turn on the use to which an accused apparatus is later put confuses rather than clarifies, frustrates the ability of both the patentee and potential infringers to ascertain the propriety of particular activities, and is inconsistent with the notice function central to the patent system. See, e.g. PSC Computer Prods., Inc. v. Foxconn Int'l, Inc., 355 F.3d 1353, 1361 (Fed. Cir. 2004) (emphasizing "the important public notice function of patents—the mechanism whereby the public learns which innovations are the subjects of the claimed invention, and which are in the public domain"); see also Halliburton Energy Servs., Inc. v. M-I LLC, 514 F.3d 1244, 1255 (Fed. Cir. 2008) (emphasizing that claim language should "provide a clear-cut indication of the scope of subject matter embraced by the claim" and noting "that the patent drafter is in the best position to resolve the ambiguity in the patent claims").

c. Prosecution History

Timex argues that the prosecution history supports its construction requiring instantaneous display of data. Specifically, Timex argues that "the applicants stressed the 'real-time data' limitation in their Remarks to overcome the Examiner's rejections" and "argued that the 'real-time data' limitation was supported by the specification," which "disparages non-instantaneous systems." Br. of Appellee Timex Corp. at 58.
To the contrary, we conclude that the prosecution history offers further evidence that "real-time," as used in this case, does not mean instantaneous. After claims 1 and 18 were rejected as anticipated by Root, the applicants amended the claims to add the "displaying real-time data" limitation. Doc. 21, Ex. 2-P (J.A. 310); id., Ex. 2-Q (J.A. 318). In their remarks, the applicants stated, "Furthermore, the personal computer depicted in Fig. 7 of Root cannot be used to display real-time data, as required by claim 1. Rather, the personal computer in Fig. 7 of Root will merely display performance data after the athlete has completed their activity." Doc. 21, Ex. 2-P (J.A. 308). The applicants similarly remarked that "Claim 18 also requires that the display unit display real-time data acquired by the electronic positioning device." Id. (J.A. 309). The applicants' remarks distinguishing Root therefore echo the criticism of the prior art in the specification. In the applicants' view, the invention is preferable because it does not intentionally delay the display of data by storing it for later review after the athlete has completed his or her activity (as in Root). Rather, in this invention, the data is displayed without any intentional delay—i.e., in "real time."

d. Extrinsic Evidence

The district court relied heavily on extrinsic evidence—namely, a dictionary definition—in construing "displaying real-time data." Specifically, the district court relied on a Microsoft Computer Dictionary, which defined "real time" as "[o]f or relating to a time frame imposed by external constraints." Claim Construction Op. at 9 (quoting Microsoft Computer Dictionary 375 (4th ed. 1999)).

We have made clear that "dictionaries and treatises can be useful in claim construction," particularly insofar as they help the court "to better understand the underlying technology and the way in which one of skill in the art might use the claim terms." Phillips, 415 F.3d at 1318. However, we find the dictionary definition relied on by the district court too vague to be of significant help in resolving the dispute in this case. The cited definition sheds no light on whether "real-time" means "instantaneous" or, if not, how much of a delay is permissible.

Moreover, we note that definitions of "real-time" in other technical dictionaries suggest that a real-time process cannot involve intentional delay or storage for later processing. See Rudolf F. Graf, Modern Dictionary of Electronics 627 (7th ed. 1999) (including definition of "real time" as "The performance of a computation during the actual time that the related physical process transpires in order that results of the computations are useful in guiding the physical process"); id. (including definition of "real-time operation" as "Data-processing technique in which information is utilized as events occur and the information is generated, as opposed to batch processing at a time unrelated to the time the information was generated"); IEEE 100: The Authoritative Dictionary of IEEE Standards Terms (7th ed. 2000) (including definition of "real time" related to "software" as "Pertaining to a system or mode of operation in which computation is performed during the actual time that an external process occurs, in order that the computation results can be used to control, monitor, or respond in a timely manner to the external process. Contrast: batch."); Steven M. Kaplan, Wiley Electrical and Electronics Engineering Dictionary 639 (2004) (including definition of "real-time" as "In computers, that which is processed, or otherwise acted upon, without any delay."); Harry Newton, Newton's Telecom Dictionary 758 (22d ed. 2006) ("In data processing or data communications, real time means the data is processed the moment it enters a computer, as opposed to BATCH processing where the information enters the system, is stored and is operated on at a later time.").

For the foregoing reasons, we modify the district court's construction of "displaying real time data" to reflect that, while the data need not be displayed instantaneously, it must be displayed without any intentional delay, taking into account the processing limitations of the system and the time required to accurately measure the data. We therefore construe "displaying real-time data," as used in the claims of this case, as "displaying data without intentional delay, given the processing limitations of the system and the time required to accurately measure the data."

3544

Real Time Operation

The Court adopts ST's proposed construction of "real time operation" and construes it to mean "processing fast enough to keep up with an input data stream." In part, the Court finds that a person of ordinary skill in the art would apply ST's proposed construction as the term's ordinary meaning because the relevant technical dictionary defines "real time" as "a
system or mode of operation in which computation is performed during the actual time that an external process occurs." IEEE Standard Dictionary of Elec. & Elecs. Terms, at 879 (6th ed. 1996). The relevant dictionary definition indicates that real time concerns the processor's ability to "keep up with" the data input. Moreover, because the term is concerned with the processor's ability to keep up with the input, Motorola's proposed construction 2 improperly shifts the focus to the viewer or listener.

Motorola's proposed construction is: "operation of the decoder so that the rate of decoding is faster or the same as the display rate and the human viewer or listener cannot detect any loss of information."

The parties dispute the meaning of the term "real-time video" as that term appears in Claim 3. The parties propose substantially identical constructions with one exception. Defendants posit that the term should mean "non-buffered video transmitted and displayed to the remote users without perceived delay between the events as they occur and the events depicted in the video," while AMS urges the Court to exclude the "non-buffered" limitation.

The specification clearly states that the video must be non-buffered. First, the patent abstract states that the invention comprises, in part, "an audio/video system for streaming instantaneous and buffer-free live audio and video data from a live auction site to one or more remote auction bidders. . . ." Second, in the Summary of Invention, the patent states that the "present invention removes the buffering without sacrificing quality" (612 Patent col. 3, 11. 5-6); describes the "two overarching design elements that firmly define and delineate the unique nature of the A/V System 100: connectionless and non-buffered performance;" and clarifies that the "A/V System 100 uses connectionless, non-buffered designs." In view of these clear statements in the specification, the Court finds that the term "real-time video" shall mean "non-buffered video transmitted and displayed to the remote users without perceived delay between the events as they occur and the events depicted in the video."

The purpose of "realizing" the "initial intended delay" is to ensure that "predetermined timing constraints are met." (See
The specification of the '446 patent recognizes that timing constraints may be met when the delay is less than intended. It expressly notes that in the prior art, one way of "increasing the probability of meeting timing constraints" is to make the size of the gates larger than necessary, (see id. at 1:61-2:3), and further notes that although such an approach "increases the probability of meeting timing constraints," gates that are "larger than the necessary size are wasteful in both silicon area and power consumption," (see id. at 1:63-2:1). The invention set forth in the '446 patent is intended to address this problem, (see id. at 3:12-13), by permitting the size of each cell to be adjusted during or after placement to more closely achieve the desired delay. (See id. at 16:24-26.) Nothing in the specification, however, requires that the cell size be adjusted to exactly achieve the initial intended delay. Indeed, the specification recognizes that timing constraints are met if "slack is zero or positive," 8 (see id. at 13:29-30), and further provides that "it is preferable to maintain a small amount of slack for a path, in order to compensate for downstream delay effects, such as wire delay." (See id. at 15:44-46.)

--- Footnotes ---

8 Dr. Harris attests that "[s]lack is the difference between the actual path delay and the maximum path delay permitted by the timing constraint." (See Harris Decl. P 71.)

9 The Court notes that Magma's own expert, Dr. Sechen, testified that "there's a certain goal, . . . a certain timing constraint, and then you have to be below it, at or below it." (See Boyce Decl. Ex. A (Sechen Dep.) at 32:8-13.)

--- End Footnotes ---

Accordingly, the Court agrees with Synopsis that the "initial intended delay" is "realized" if "the delay obtained is less than or approximately equal to the initial intended delay."
8. Rebooting

The term "rebooting," as used in Claims 1, 8, and 13, must be construed in accordance with its plain and ordinary meaning to a person skilled in the art. Citec's proposed construction is supported by reference to the Random House Unabridged Dictionary (2d ed. 1993), which defines "boot" as "to start (a computer) by loading the operating system" and the prefix "re" as "again" or "again and again." In addition, the claims and specification identify "rebooting" as a function associated with the central processing unit. See, e.g., Col. 5, ll. 46-47 ("reset means for rebooting said central processing unit"); Col. 2, ll. 9-10 ("activating the reset switch reboots the CPU"). Accordingly, the Court construes the term "rebooting" to mean the restarting of the central processing unit of a computer.

3. "Recalculating pricing data with the yield management system in a manner consistent with a pricing strategy implemented by the yield management system, so that price changes caused by a reduction in available inventory due to the customer request are taken into account" Used in '691 patent, claim 1 [Parties' Joint Claim Construction Chart, term # 5].

"Recalculating pricing data with the yield management system in a manner consistent with a pricing strategy implemented by the yield management system, so that price changes caused by a reduction in available inventors [sic] due to the customer request are taken into account, wherein the recalculating system is configured to operate with sufficient frequency such that the effect of each customer order on pricing is taken into account before a price quote for a subsequent customer order is generated." Used in '691 patent, claim 14 [Parties' Joint claim Construction Chart, term # 5].

These terms, submitted at the request of Clear Channel, are entire steps from the respective claims. As with "yield management system," Clear Channel did not seem to be seeking a definition of a particular word or term, see Tr. at p. 111, l. 14- p. 115, l. 20, and in fact agreed that the word "recalculating" itself meant "calculating again." Tr. at p. 114, l. 23- p. 115, l. 5. The court will not enter an advisory opinion delineating all of the systems and methods that are not described by the claims. Arguments over whether a particular system infringes are inappropriate at the claim construction stage and will be dealt with at a later time. Likewise, the court will not undertake to rewrite paragraphs of claim language in a patent.

Clear Channel asserts that any "recalculating" terms should be read as being limited to "real time" because, in Clear Channel's view, the specification only discloses one preferred embodiment as to the time when the calculations should be performed - right after each inventory change. '691 patent, col. 4, ll. 15-21. Although the specification discloses a second situation in which "a slight delay in updating may also be acceptable," Clear Channel argues that this is not a preferred embodiment and is directly contrary to the optimum state the specification does disclose, namely a system where the recalculating performed after each order is done before the next order is placed. See '691 patent, col. 4, l. 22; co. 2, ll. 62-67.

Again, courts should avoid importing limitations from the specification into the claim terms, absent a clear disclaimer of claim scope. Phillips, 415 F.3d at 1323. Here, the specification of the '691 patent allows for a second embodiment in which a "slight delay" may be acceptable. Clear Channel can point to no place in the specification or anything in the prosecution history which would suggest that the preferred embodiment of updating right after an inventory change was meant to limit the claims to this embodiment, other than the language in the '691 patent, col. 2, ll. 62-67. This portion of the specification, however, states that a system where the recalculating is done before a subsequent order is placed is "optimum," not that it is required or necessary for the system. Thus, absent any clear disclaimer of claim scope, this court will not import limitations from the specification into the claim language. The court will define this term as follows:

"Recalculating pricing data" means: "calculating pricing data again."
Next, Plaintiffs ask the Court to insert the word "directly" before the claim term "receive." (See R. 82, Pls.’ Mem. at 20.) In support of their proposal, Plaintiffs point to the language in claim 1, which recites "a principal market maker operative to receive and automatically execute primary currency futures purchase and sale trades and orders." ’923 patent, col. 10, ll. 49-53. According to them, "[b]y the plain language of [this] claim, PMM computers, not the electronic trading systems such as the GLOBEX or Project A systems, directly receive the purchase and sales trades and orders." (R. 82, Pls.’ Mem. at 20.) Thus, they contend, the inclusion of the modifier "directly" before the claim term "receive" is proper. (Id.) The Court disagrees.

Plaintiffs point to various portions of the intrinsic record-- specifically, the specification along with figures and their accompanying text--that suggest a direct relationship between the PMM computer and orders to support their request that the Court insert the modifier "directly" before the claim term "receive." (Seeid.) The Court finds Plaintiffs’ arguments unconvincing as they improperly seek to import a claim limitation from the specification and patent figures. The Federal Circuit has clearly warned against such a practice. See, e.g., Playtex, 400 F.3d at 907 (finding that a district court's reliance on figures to limit claim to a preferred embodiment was improper); Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1325 (Fed. Cir. 2003) ("Because the claims are best understood in light of the specification of which they are a part, however, courts must take extreme care when ascertaining the proper scope of the claims, lest they simultaneously import into the claims limitations that were unintended by the patentee."). The Court therefore refuses to modify the term "receive."

Newbridge contends that this term is indefinite, or to the extent that it was capable of construction, should be defined as a customer terminal that receives data from a packet switch node. After reviewing the specification, the Court concludes that the specification refutes Newbridge's construction, because it indicates that the customer terminal equipment actually resides outside the network and is not co-located with a packet switch node. (810 Patent, col. 4, ll. 38-56, Fig. 1). Further, the monitoring and marking described in this claim is not performed by customer terminal equipment, but rather, is performed at the packet-switching node. That the receive terminal is an input port is supported by the specification which describes that the data packet is "received by an access node." (810 Patent, col. 3, ll. 57-60, col. 5, l.67-col. 6, l. 1, 3). In addition, the Court's construction is supported by the meaning ascribed to the word "terminal" by those of ordinary skill in the art. Specifically, the word "terminal" is defined as "[a] point in a system or communication network at which data can either enter or leave." The New IEEE Standard Dictionary of Electrical And Electronics Terms 1351 (5th ed. 1993).

AMS proposes this claim term should mean "live audio and video received concurrently at a remote location with auction item information such as characteristics of the auction item and status of bids over one or more ports associated with an IP address." The Court finds no basis to support AMS's proposed definition in either the '612 Patent or its prosecution history, and finds the testimony of AMS's expert on this point unconvincing. The Court therefore adopts the definition proposed by Manheim, and this term as it appears in claim 3 shall mean "audio and video streams travel on the same channel as the data stream containing information about the item being auctioned and information about the acceptance and rejection of bids."
1. "receiver"

The disputed claim term "receiver" appears in claims 1, 2, 4, 7, 25, 35, 36, 43, and 44 of the '416 Patent and claims 1, 2, 4, 5, 8, 10, 13, 14, 17, 34, and 35 of the '186 Patent. Kyocera seeks to have the court construe "receiver" as "circuitry for receiving RF transmissions operably coupled to a paging network." (Dkt. No. 207 ("Kyocera Br.") at 6.) Intellect Wireless, on the other hand, challenges the "operably coupled to a paging network" limitation in Kyocera's proffered definition. Intellect Wireless contends that the "receiver" is simply a "circuit or device for receiving signals." (Dkt. No. 212 ("Intellect Wireless Resp.") at 7.) The dispute between the parties centers on whether the "receiver" in the asserted claims of the '186 and '416 Patents must include circuitry which enables it to communicate with a paging network.

In construing the disputed terms, the court first looks to the claim language. See Phillips, 415 F.3d at 1312. Here, the asserted claims in the '186 and '416 Patents do not expressly require that the "receiver" be coupled to or able to communicate with a paging network. Claim 1 of the '186 Patent and claims 1 and 43 of the '416 Patent state that the "receiver" is "operably coupled to receive a message from a message center over a wireless connection." '186 Patent, col.46 ll.46-47; '416 Patent, col.46 ll.41-42, col.50 ll.30-31. Those claims additionally only identify "a communications network" without expressly defining the type of network, i.e. paging or cellular. '186 Patent, col.46 l.50; '416 Patent, col.46 l.45, col.50 l.34.

The doctrine of claim differentiation further supports Intellect Wireless's position that the claimed "receiver" is not necessarily operably coupled to a paging network. Under that doctrine, "the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim." Phillips, 415 F.3d at 1315. Dependent claim 14 of the '186 Patent, for example, claims "[a] wireless portable communication device according to claim 1, wherein the receiver comprises at least one of: a page receiver; a cellular telephone receiver; a radio frequency receiver; and a personal digital receiver." '186 Patent, col.47 ll.48-53. By stating that the "receiver" includes at least a "pager receiver," claim 14 indicates that the "receiver" in independent claim 1 is not required to include a page receiver or, in other words, a receiver operably coupled to a paging network. If, as Kyocera argues, the claimed "receiver" in independent claim 1 of the '186 Patent must be operably coupled to a paging network, the inclusion of a "page receiver" in dependent claim 14 would be redundant.

Dependent claims 7 and 8 of the '416 Patent also undercut Kyocera's argument that the claimed "receiver" in the asserted claims must be able to communicate with a paging network. Dependent claim 7 states that "the communication network includes a cellular system and the wireless portable communication device includes one of a cellular telephone device or a two-way communication device." '416 Patent, col.47 ll.14-18. The communications network which provides the caller ID in claim 1 of the '416 Patent presumably is broader than the communications network in dependent claim 7. Dependent claim 7, therefore, indicates that the communication network in independent claim 1 is not limited to a paging network, as Kyocera contends, but could instead be a cellular communications system. As a result, the claimed "receiver," which receives the message, need not be operably coupled to a paging network.

Additionally, dependent claim 8 of the '416 Patent claims "[a] wireless portable communication device as in claim 1 where the communications network includes a paging system and the wireless communication device is a pager." Id. at col.47 ll.19-21. Again, because the communications network in the independent claim is presumed to be broader than in the dependant claim, requiring the communications network in claim 1 of the '416 Patent to include a paging system would render superfluous the language in dependent claim 8 specifying that "the communications network includes a paging system." Accordingly, the language of the claims does not support the "operably coupled to a paging network" limitation in Kyocera's proposed definition. See Bradford Co. v. Conveyor N. Am, Inc., 603 F.3d 1262, 1271 (Fed. Cir. 2010) (relying on claim differentiation to determine that disputed claim term was "entitled to a broader scope than the district court allowed").

Nor do the specifications or the prosecution histories of the patents at issue support imposing Kyocera's "paging" limitation into the claims. Admittedly, Kyocera is correct that the specifications are replete with references to "paging" and "pagers." The Field of Invention, for example, explains that "[t]his invention relates in general to communications systems and in particular to wireless communications systems which include paging devices." '186 Patent, col.1 ll.25-28. Similarly, the specifications' Description of the Prior Art "is specifically related to stored voice paging receivers and paging systems." Id.
Nevertheless, "[t]he claims, not specification embodiments, define the scope of patent protection." Kara Tech., Inc. v. Stamps.com Inc., 582 F.3d 1341, 1348 (Fed. Cir. 2009). "Generally, a claim is not limited to the embodiments described in the specification unless the patentee has demonstrated a 'clear intention' to limit the claim's scope with 'words or expressions of manifest exclusion or restriction.'" i4i Ltd. v. Microsoft Corp., 598 F.3d 831, 843 (Fed. Cir. 2010) (quoting Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004)).

3 Although Kyocera's counsel relies upon the Federal Circuit's en banc opinion in Ariad Pharmaceuticals, Inc. v. Eli Lilly & Co., 598 F.3d 1336 (Fed. Cir. 2010), to bolster its position that the "paging" limitation should be imported into the claims, the court is not persuaded that Ariad alters the specification's role in the claim construction analysis. To the contrary, in Ariad, the Federal Circuit merely reaffirmed the well-established requirement that "the specification must describe an invention understandable to the skilled artisan and show that the inventor actually invented the invention claimed." Id. at 1351. Furthermore, to the extent that Kyocera relies on Ariad to suggest that the patents in suit are invalid for lack of enablement, that question is not currently before the court. By way of dicta, this court hereby suggests that the statutory requirements of enablement and validity appear satisfied.

In this case, the specifications do not support requiring the "receiver" to be operably coupled to a paging network. First, the Abstracts for the '186 and '416 Patents illustrate that the court's construction of "receiver" should not depart from the term's plain and ordinary meaning. See Hill-Rom Co. v. Kinetic Concepts, Inc., 209 F.3d 1337, 1341 n.* (Fed. Cir. 2000) ("We have frequently looked to the abstract to determine the scope of the invention, and we are aware of no legal principle that would require us to disregard that potentially helpful source of intrinsic evidence as to the meaning of claims.") (citations omitted); Lucent Techs., Inc. v. Gateway, Inc., 525 F.3d 1200, 1207-10 (Fed. Cir. 2008) (reviewing patent's abstract in determining that specification did not support the district court's claim construction). The '186 Patent's Abstract, for example, recognizes that "[t]he personal communication device can be a cellular telephone, PDA or pager." Similarly, the '416 Patent's Abstract states: "The wireless communication device may include a cellular or paging link and can receive Caller ID data originating from the public switched telephone network over a wireless communication system." Notably, the Abstract for the '416 Patent does not require that the claimed "receiver" be able to communicate with a paging network but rather merely indicates that the "receiver" may have such a capability.

Regarding the remainder of the specifications, although Intellect Wireless directs the court to the various references to "cellular" throughout the patent, the court finds that the following discussion of the AT&T "EO" is persuasive support for Intellect Wireless's position that the claimed "receiver" is not necessarily coupled to a paging network:

Personal communication device 61 [sic] may be a receive-only device, such as a paging device, or a more sophisticated bi-directional communication device, such as a personal communication device or personal digital assistant, such as the personal digital assistant sold under the trademark "Macintosh Newton" by Apple Computer, or the product sold by AT&T under the trademark "EO."

'186 Patent, col.36 l.66-col.37 l.5. According to a February 1993 article titled "EO Personal Communicator" which is cited in the specifications, the AT&T "EO" is a personal communication device which "connects to the cellular or external telephone system." (Dkt. No. 233 at 3.) Noticeably absent from the 1993 article is any discussion of paging networks or a paging receiver (see id. at 2-3), and Kyocera has not presented any evidence that the AT&T "EO," without additional equipment, could communicate with a paging network. Thus, the court agrees with Intellect Wireless that the specifications' reference to the "EO" would have indicated to one of ordinary skill in the art in the mid-1990s that the "receiver" in the claimed personal communication device was not limited to those only possessing circuitry enabling communication with a paging network.

As additional support for its proposed construction, Kyocera emphasizes the specifications' discussion of various paging communication protocols such as "POCSAG," arguing that the absence of any cellular communication protocols would suggest to one of ordinary skill in the art that the "receiver" must be able to communicate with a paging network. The
specifications, however, recognize that such protocols "are not essential to the main concept of the embodiments." '186 Patent, col.36 ll.61-62. Furthermore, Kyocera's wireless communications expert, Dr. Harold Poor, admitted that one of ordinary skill in the art in the mid-1990s would have understood that cellular protocols applied to communications involving cellular phones even if the patent did not specifically identify such a cellular protocol. (4/8/10 Tr. 154:7-155:24.) The court, therefore, does not find that the absence of cellular protocols in the specifications would indicate to one of ordinary skill in the art that the claimed "receiver" must be operably coupled to a paging network.

Kyocera also relies on the '186 Patent's prosecution history to attempt to justify its proposed construction and directs the court to the inventor's Rule 131 Declaration to the U.S. Patent & Trademark Office ("PTO") as well as to a letter attached to that declaration. The prosecution history, like the specification, "provides evidence of how the PTO and the inventor understood the patent." Phillips, 415 F.3d at 1317. "[W]here the patentee has unequivocally disavowed a certain meaning to obtain his patent, the doctrine of prosecution disclaimer attaches and narrows the ordinary meaning of the claim congruent with the scope of the surrender." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324 (Fed. Cir. 2003). The Federal Circuit, however, has "consistently rejected prosecution statements too vague or ambiguous to qualify as a disavowal of claim scope." Id. at 1325. In this case, the court finds that the excerpts from the prosecution history are too vague and ambiguous to be held to disavow embodiments that are not operably coupled to a paging network.

Specifically, in the Rule 131 declaration cited by Kyocera, the inventor attempted to convince the examiner that his invention disclosed in the '186 Patent was conceived before February 10, 1993--the filing date for U.S. Patent No. 5,452,356 ("'356 Patent") which the examiner had cited against the '186 Patent's claims. As support for his asserted date of conception, the inventor stated:

5. . . . Applicant conceived the subject invention prior to February 10, 1993, as evidenced by a block diagram and flow chart indicating the wireless transmission of an image and caller ID to a wireless portable communications device.

6. That this block diagram describes a pageable device, namely the paging receiver, in which an image and the caller's telephone number are transmitted over a paging network.

7. That this caller identification information is transmitted along with the image to the paging network, which caller identification information is then transmitted through the paging network to the portable communication device.

(Joint Appendix ("J.A") at 186FH000997.)

"An argument to the examiner constitutes a disclaimer only if it is 'clear and unmistakable.'" Schindler Elevator Corp. v. Otis Elevator Co., 593 F.3d 1275, 1285 (Fed. Cir. 2010) (quoting Purdue Pharma L.P. v. Endo Pharms, Inc., 438 F.3d 1123, 1136 (Fed. Cir. 2006)). In this case, although the inventor explains that the diagram demonstrating the date of conception includes a "paging receiver" and "paging network," those comments do not clearly and unmistakably limit the invention to paging communications. "In evaluating whether a patentee has disavowed claim scope, context matters." id Ltd. P'ship v. Microsoft Corp., 598 F.3d 831, 843 (Fed. Cir. 2010). Here, the inventor was not distinguishing his invention from the prior art to avoid rejections based on either anticipation under 35 U.S.C. § 102 or obviousness under 35 U.S.C. § 103. The inventor was merely illustrating that his invention was conceived prior to the filing date of the '356 Patent. In fact, the '356 Patent relates to paging communications; it is titled "Paging Transmission System" and, according to its Abstract, discloses a "[m]ethod and apparatus for sending, receiving, and displaying custom coded textual and/or graphic data via an alphanumeric paging system." Thus, when viewed in the appropriate context, the inventor's references to "paging" in the Rule 131 Declaration can be interpreted as describing one embodiment of the invention which was relevant to the cited '356 Patent. This interpretation is further supported by the inventor's more general description of his invention as related to the "wireless transmission of an image and caller ID to a wireless portable communications device." (J.A. at 186FH000997 P 5.) Therefore, the court does not find that the inventor's statements in his Rule 131 Declaration constitute a disclaimer supporting Kyocera's "paging" limitation.

The court similarly disagrees with Kyocera that the inventor's October 1, 1993 letter to Sho Saito of Shinwa Communications of America Inc. ("Shinwa"), which he attached to the Rule 131 Declaration, warrants requiring the "receiver" to be operably coupled to a paging network. In that letter, the inventor described his invention as follows: "Thank you for taking an interest in me and my new invention related to intelligent numeric paging devices and systems. . . . My vision is to change the way in which pagers are used in the future and improve the information that is available to the end-
user." (J.A. at 186FH001098.) Like the Rule 131 Declaration, the court is not persuaded that the inventor's description of one embodiment of his invention to a potential licensee supports imposing limitations on the claimed "receiver" that are not found in either the specifications or the asserted claims of the patents in suit.

Nor does the testimony of Kyocera's expert, Dr. Harold Poor, compel a different result. As the Federal Circuit has explained, "[w]hile helpful," "extrinsic evidence such as expert testimony is 'less significant than the intrinsic record in determining the legally operative meaning of claim language.'" Kara Tech., Inc. v. Stamps.com Inc., 582 F.3d 1341, 1348 (Fed. Cir. 2009) (quoting Phillips, 415 F.3d at 1317). In this case, the court finds that Dr. Poor's testimony does not overcome the intrinsic record's support for Intellect Wireless's proposed claim construction.

Dr. Poor testified that in his opinion, one of ordinary skill in the art in the mid-1990s would have found that the claimed "receiver" must have the capability of receiving and understanding transmissions from a paging network and have the ability to turn those transmissions "into useful information"; in other words, the "receiver" must be "operably coupled to a paging network." (4/8/10 Tr. 102:13-19; 103:25-104:8.) As one of the reasons supporting his position that the patents at issue involve paging as opposed to cellular networks, Dr. Poor contrasted how each network operated in transmitting communications between users. Paging networks, according to Dr. Poor, were "store and forward networks" where "[t]he person wanting to page another person would leave a message at a center, which would then be stored and then forwarded on to that person." (Id. at 86:12-16.) Cellular networks, on the other hand, "were designed for . . . realtime communication between two people talking on the phone." (Id. at 86:17-21.) Thus, Dr. Poor opined, because the patents at issue relate to this store and forward type of communication, they involve paging networks.

The evidence in the intrinsic record, however, suggests that other types of networks in addition to paging networks performed this store and forward service. According to the article discussed above about the AT&T "EO," that device provided "store and forward fax services" where the "[n]ext time a [user is] in range of the cellphone system or . . . plug[s] into a wall socket, all [his or her] messages are transferred to [the user]." (Dkt. No. 233 at 2.) Again, that article makes no reference to "paging" or a "paging network," and Kyocera has not presented any evidence that the "EO," without the assistance of any additional equipment, was capable of connecting to a paging network. The intrinsic evidence, therefore, contradicts Dr. Poor's distinction between paging and cellular networks, instead suggesting that store and forward messaging was available on devices that did not connect to paging networks. Hence, as evidenced by the AT&T "EO" article, the presence of store and forward technology does not inherently require the involvement of a paging network. Accordingly, the court, with all due respect to Dr. Poor's expertise, has not relied on or credited Dr. Poor's testimony on this point because the court finds that his opinions cannot overcome the plain language of the asserted patents' claims or specifications.

After carefully reviewing the '186 and '416 Patents, including their claims, specifications, and prosecution history, and considering Dr. Poor's testimony, the court finds that a person of ordinary skill in the art would not have understood that the claimed "receiver" must be "operably coupled to a paging network," as argued by Kyocera.

Instead, the court adopts Intellect Wireless's construction which captures the plain and ordinary meaning of "receiver": "circuit or device for receiving signals."

"Receiver" is construed to mean, "A device for receiving signals or data from an outside source and converting those signals or data to usable form."

Defendants urge that the term be construed in accordance with the definition that appears in the relevant technical dictionary, McGRAW-HILL DICTIONARY OF SCIENTIFIC AND TECHNOLOGICAL TERMS, 1759 (6th ed. 2003). In connection with the field of electronics, which for our purposes appears the most germane of the fields listed, that source defines a "receiver" as:

The complete equipment required for receiving modulated radio waves and converting them into original intelligence,
such as into sounds or pictures, or converting to desired useful information as in a radar receiver.

Plaintiff argues that defendants' construction is too limiting, because the term "receiver" is used to cover different sorts of devices in different parts of the patent. Indeed, plaintiff urges that the '725 patent discloses at least nine receivers in nine separate elements.

Plaintiffs' proposed definition, however -- "A device that can receive something" -- is almost ridiculously overbroad, not to mention tautological. Defendants are correct that this definition fails to provide the court with any elucidation of the intended scope of the term.

A review of the relevant specifications contains no indications that plaintiffs did not intend for receiver to have its ordinary meaning.

I choose to modify the McGRAW-HILL definition by eliminating its unnecessary and confusing references to radio and radar. Plaintiffs' patent clearly contemplates the use of computers and computer terminals; indeed, the specifications indicate that the receiver is to receive signals and/or data from a "central processing computer." Radar has nothing whatever to do with the sort of "receiver" contemplated here.

The next disputed claim term is "receiver." The plaintiff contends that the term does not require construction. Joint Claim Construction Brief, Exh. B. Defendant EchoStar argues that "receiver" means the electronics of an integral television set that receive the signal from the transmitter means. Id. The DIRECTV defendants argue that "receiver" is a device that receives the scrambled analog signal from the transmitter means. Id.

One embodiment of the receiver is "the electronics of and the user output 140 the video screen of an integral television set," but the specification does not limit the term to this one embodiment. I therefore reject EchoStar's proposed construction, which would improperly limit the claim to a single embodiment imported from the specification. Texas Digital, 308 F.3d at 1204; CCS Fitness, 288 F.3d at 1367.

I have construed scrambling to apply to both analog and digital signals. I therefore reject the DIRECTV defendants' proposed construction that would limit the receiver to a device that receives scrambled analog signals.

I construe the term "receiver" to have its ordinary and accustomed meaning as an apparatus for receiving television broadcasts. Webster's Ninth New Collegiate Dictionary, at p. 982.

This construction is supported by the specification, which states that "as with the transmission circuit 10 certain items, namely the receiver 110, the override switch 130 and the user output 140, are standard purchase items." '066 Patent, col. 3, lines 1-3 (emphasis added).

Claim 19 of patent 768 claims "a receiver, for receiving a video signal and the playlist. . .." As with the term "programming," supra, there is no need to read the conjunction "and" to require that the playlist must be integrated with the video signal. Since, rather, the specification describes a playlist being sent to students' desktops during playback of a pre-recorded program, see '768 patent, col. 10, 11. 47-49, it is clear that the playlist and video signal need not be integrated. Thus, "receiver" here means a device that can receive video signals and playlists either together or independently.
Next, the court considers the term "message receiver." Brooktrout argues that the term needs no construction. The defendants, however, urge the court to construe the term according to 35 U.S.C. § 112 P 6. The court has considered the pertinent portions of the briefs and arguments and is not persuaded that the term is drafted in means-plus-function format. The claim term does not invoke the word "means;" therefore, a presumption applies that the term is not drafted according to 35 U.S.C. § 112 P 6. Apex v. Raritan Computer Inc., 325 F.3d 1364 (Fed. Cir. 2003); Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213 (Fed. Cir. 1998). Contrary to the defendants' arguments, the court holds that one of skill in the art would have understood receiver to connote specific structure such that the term is not drafted according to 35 U.S.C. § 112 P 6.

A. Heterodyne Receiver Circuit, Common Heterodyne Receiver and Receiver

According to the parties, the prominent issues in dispute in the '582 patent are the meanings of the terms "heterodyne receiver circuit," "common heterodyne receiver" and "receiver," as those terms are used in claims 1, 26, 35 and 44. Trilithic maintains that those terms should be given their ordinary meanings, as such meanings are consistent with the dictionary definitions, as well as the use of the terms in the patent and in the prior art. According to Trilithic, the three terms are not interchangeable. Furthermore, Trilithic maintains that Wavetek's suggested definitions are incorrect as they violate the claim differentiation doctrine. In contrast, Wavetek maintains that the three terms are vague, generic terms that do not have an unambiguous definition that is consistent with the way the terms are used in the patent. Wavetek argues that the terms of the patent must be read in light of the specification and that the prosecution history should be examined in order to determine how a person of ordinary skill in the art would define the terms in the context of the patent. Highlighting that claim differentiation cannot broaden a claim beyond its proper scope, Wavetek contends that nothing in the specification provides a basis for construing the terms "heterodyne receiver circuit," "common heterodyne receiver" and "receiver" to have different meanings.

Trilithic urges that the terms "heterodyne receiver circuit," "common heterodyne receiver" and "receiver" be given their ordinary and well-understood meanings. Claim 1 of the '582 patent reads:

A combined signal level meter and leakage detector for a cable television system comprising: a CATV cable signal level input; a CATV leakage signal antenna; a heterodyne receiver circuit connected to said CATV cable signal level input and said CATV leakage signal antenna, said heterodyne receiver circuit having a greater sensitivity for CATV leakage measurement than for CATV cable signal level measurement; a detector having an input connected to said heterodyne receiver circuit; a processing and controlling circuit having an input connected to said detector . . . .

'528 patent, col. 10, ln. 61-col. 11, ln. 6. Claim 26 reads:

A method of measuring signal level and leakage in a cable television system comprising the steps: obtaining a CATV cable signal from a CATV cable; obtaining a CATV leakage signal radiated from the CATV cable using an antenna; supplying said CATV cable signal and said CATV leakage signal to a common heterodyne receiver; providing greater sensitivity for CATV leakage measurement than for CATV cable signal level measurement; a detector having an input connected to said heterodyne receiver circuit; a processing and controlling circuit having an input connected to said detector . . . .

Id. col.12, ln.66- col. 13, ln. 4. Claim 35 reads:

A cable television instrumentation system, comprising: a source of CATV signals; a cable distribution system connected to said source and carrying CATV signals; and a combined signal level meter and leakage detector coupled to said cable distribution system and compromising a) a CATV cable connector connected to said cable distribution system; b) a CATV
leakage signal antenna in proximity to said cable distribution system; c) a receiver connected to said CATV leakage signal antenna, said receiver having greater sensitivity for CATV leakage measurement than for CATV cable signal measurement; . . .

Id. col. 13, ln.42-58. Claim 44 describes a cable television system comprising, among other things, "a receiver separately connected to said CATV cable connector and one of said CATV leakage antennas." '528 patent, col. 14., ln. 45-47. That receiver is to include a tuned preamplifier, at least one mixer for CATV signal level measurement, one mixer for CATV leakage measurement, one common mixer for CATV signal level measurement and CATV leakage measurement, an IF stage with a wide bandwidth for CATV signal level measurement and a relatively narrow bandwidth for CATV leakage measurement. Id. ln. 48-61.

Both parties agree that the term "heterodyning" refers to the process of beating two signals together in order to get the sum and the difference signals. Tr. at 118, 189. The parties also agree that the term "circuit" generally refers to a collection of components arranged in a loop that performs some type of function. Id. at 118, 191. Accordingly, Silva defined "heterodyne circuit: to be an electronic circuit that beats two frequencies together. Id. at 118. Silva then went on to offer a definition from the McGraw-Hill Dictionary for "heterodyne reception" which defines the term as "radio reception in which the incoming radio-frequency signal is combined with a locally generated RF signal of different frequency, followed by detection." Pltf.'s Ex. 9 at 929; Tr. at 119. The dictionary definition of "receiver" is "the complete equipment required for receiving modulated radio waves and converting them into the original intelligence . . . or desired information . . . ." Pltf.'s Ex. 9 at 1661. Silva explained that under claim 1 of the '582 patent, the detector is separate from the heterodyne receiver circuit and is instead part of the receiver circuit. Tr. at 120. Both he and Large stated that although a detector is usually considered part of a receiver, claim 1 treats the detector as being separate from the heterodyne receiver circuit. Silva concluded that given these ordinary meanings, a person of ordinary skill in the art would define a "heterodyne receiver circuit" to be a heterodyne circuit that operates inside a receiver. Id. at 119.

In the process of offering definitions that people of ordinary skill in the art would give the terms, Silva narrowed the possible components of a heterodyne receiver circuit to include amplification at the radio-frequency ("RF") stage, one or more mixers, one or more local oscillators, one or more intermediate frequency ("IF") stages and no detectors. Id. at 128. He testified that such a definition was consistent with the dictionary definition of "heterodyne reception" and with the prior art according to the Armstrong patent. Tr. at 123; Pltf.'s Ex. 30. Moreover, Trilithic offered into evidence another patent that also used the term "heterodyne receiver circuit," and Silva testified that the introduced patent used the term in the same manner as did the '582 patent. Tr. at 128. Silva identified two heterodyne receiver circuits in Figure 3 of the '582 patent, stating that although the boundaries of the two circuits are not clear, neither includes the third mixer located at 70 on Figure 3. Id. at 161-62; '582 patent, Fig. 3. Silva explained that this interpretation was in accordance with the language of claim 1 that states "a combined signal level meter and leakage detector for cable television system comprising . . . a heterodyne receiver circuit connected to said CATV cable signal level input and said CATV leakage signal antenna, said heterodyne receiver circuit having greater sensitivity for CATV leakage measurement than for CATV cable signal level measurement." Tr. at 162; '582 patent, col. 10, ln. 61 - col. 11, ln. 4. According to Silva, there are "fuzzy borderlines . . . between the input of the common heterodyne receiver and the output of the heterodyne receiver circuit associated with the antenna input and that associated with the signal level input." Tr. at 162.

Although Silva stated, and Large agreed, that the addition of the word "circuit" to "heterodyne receiver" is relatively unimportant to the term's meaning, Silva stressed that the addition of the word "common" in front of "heterodyne receiver" in claim 26 gives that term a very specific meaning. Id. at 160, 191, 207. The term "common" means that there is more than one input and either signal from the inputs can use the same circuit or components. Id. at 127. Silva defined the "common heterodyne receiver" as including an amplifier, mixer, local oscillator and IF output. Id. at 144. He emphasized that the signal path and the leakage path come together at node 64 of Figure 3 and then share a common path. Id. at 113-14. Trilithic notes that Wavetek's definition of common heterodyne receiver is wrong because it includes significant portions of circuitry that are not common to the signal and leakage paths. It points to the "Summary of the Invention" to support its conclusion, as the summary states that the preferred embodiment maximizes the common circuit portions for both modes of operation. '582 patent, col. 2, ln. 17-21. As to the reference of a "receiver" in claim 35, Silva testified that the term refers "to this instrument, this whole instrument here, or the receivers in the instrument, the one on the right, the right-hand position having more sensitivity than the one on the left-hand portion of the diagram." Id. at 148. In a later exhibit offered to the Court, Trilithic suggested that the term encompassed the same components as did the heterodyne receiver circuit, with the addition of the detector. Pltf.'s Post-Hearing Reply to Claim Construction, Att. 3.
Wavetek argues that Trilithic's approach of piecemeal definitions is inappropriate and inaccurate. Large suggested that the terms at issue are not unambiguous and that the "cobbling" together of ordinary definitions, even if the two parties agree as to the definitions of certain individual words, is not proper within the context of the patent. Id. at 189, 191-92 For example, Large highlighted that the ordinary understanding of the term "receiver" implies a detector will be included. Id. at 191-92, 200-01. Yet, claim 1 of the patent specifies that a detector is separate from the heterodyne receiver circuit. Id. at 191-92. Large suggested that because the term "heterodyne receiver circuit" would not be understood by a person skilled in the art to be a mere compilation of the definitions of each term, the person of ordinary skill would look to the patent description to determine the meaning of "heterodyne receiver circuit," "common heterodyne receiver" and "receiver." Id. at 193.

According to Large, a careful reading of the claims and the specification leads to the conclusion that the three terms at issue here are used almost interchangeably, as they in essence refer to the same basic structure with only some minor alterations in the claims. Id. at 275. Large viewed the language of claim 1 and claim 26 as parallel. Id. at 200-01. Thus, he determined that a person of ordinary skill in the art would conclude that the use of the term "common heterodyne receiver" is synonymous with the term "heterodyne receiver circuit" as used in claim 1. Id. Furthermore, Large proposed that the term "receiver" in claim 35 refers to essentially the same structure as is described in claims 1 and 26. Id. at 201. Wavetek's proposed definition of all three terms, "heterodyne receiver circuit," "common heterodyne receiver" and "receiver" is

- a device that has two separate RF front ends, respectively comprising a signal level meter ("SLM") input and a leakage input. The RF front end to which the SLM input is connected is a dual-conversion front end, having two IF stages, each of which includes a local oscillator and a mixer. The RF front end to which the leakage input is connected is a single-conversion front end, having only one IF stage which includes a local oscillator and a mixer. The output of the two RF front ends is input to a third, common IF stage which includes a local oscillator and a mixer.

See Def.'s Ex. 13.

In support of its definition, Wavetek cites to the prosecution history and a notice of allowance issued to the patentee which stated that the prior art of record failed to teach the "claimed invention of a combined signal level meter and leakage detector comprising, first RF input, second RF input, a wideband dual-conversion receiver end connected to said first RF input." Def.'s Ex. 2 (Notice of Allowability 10/29/96). Given this allowance, Wavetek suggests that the examiner's understanding of the device comports with Wavetek's proposed definition of the three terms. Trilithic points to an amendment after the allowance notice in which Trilithic stated that

- the reasons for the allowances as stated by the Examiner do not necessarily apply to all the claims. For example, among other reasons for allowance of this application, the prior art fails to teach or suggest a combined CATV signal level meter and leakage detector, as claimed in claim 3, including a heterodyne receiver circuit connected to a CATV cable signal level input and a CATV leakage signal antenna and having greater sensitivity for CATV leakage measurement than for CATV cable signal, a processing and control circuit, and a display means for selectively displaying signal level information and leakage information corresponding to signals supplied to the CATV cable signal level input and the CATV leakage signal input circuit, respectively.

Id. (December 13, 1996, Amendment After Allowance at 4-5). In response to that proposed amendment, the Patent and Trademark Office sent confirmation that the amendment filed December 13, 1996, had been considered, entered and entered as directed to matters of form not affecting the scope of the invention. Id. (Amendment 2213, Paper Number 7).

Furthermore, Trilithic contends that Wavetek's definition violates the doctrine of claim differentiation and limits the claims to the preferred embodiment. According to Trilithic, claims such as dependent claims 15 and 16 would be rendered superfluous by accepting Wavetek's definition because those two claims specifically address the dual conversion and single conversion front end requirements, which are not addressed in claim 1. The doctrine of claim differentiation presumes that there is a difference in the scopes of the patent's claims. Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987). Such a presumption, however, "is a guide, not a rigid rule." ATD Corp. v. Lydall, Inc., 159 F.3d 534, 541 (Fed. Cir. 1998) (citing Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391 (Fed. Cir. 1967)). According to the Federal Circuit, "the doctrine cannot alter a definition that is otherwise clear from the claim language, description, and prosecution history." O.I. Corp. v. Tekmar Co., Inc., 115 F.3d 1576, 1582 (Fed. Cir. 1997). The doctrine cannot broaden claims beyond their correct scope as that scope has been determined in light in the specification, prosecution.

1. **Heterodyne Receiver Circuit**

In claim 1, the language of the claim itself requires that the "heterodyne receiver circuit" be connected to the CATV cable signal level input and the CATV leakage signal antenna. ‘528 patent, col. 10, ln. 65-67. Therefore, Silva’s suggestion that a person of ordinary skill in the art could read that to mean there are two separate heterodyne receiver circuits, one attached to the signal input and one attached to the leakage antenna, seems to be in direct conflict with the language of the claim itself.

The language of claim 1 requires that there be a "detector having an input connected to said heterodyne receiver circuit." Id. col. 11., ln. 3-4. Both parties agree that the audio detector is not part of the heterodyne receiver circuit. Tr. at 120, 200-01; Pltf.’s Post-Hearing Reply to Claim Construction, Att. 3. In fact, when the Court examines how both parties interpret claim 1 in accordance with the specification, it appears that the parties agree as to what elements are included in the "heterodyne receiver circuit." In its reply brief, Trilithic suggested that the term "heterodyne receiver circuit" in claim 1 refers to only one circuit which includes nodes 32, 38, 40, 42, 44, 46, 50, 52, 54, 58, 60, 62, 64, 66, 68, 70, and 72 in Figure 3. See Pltf.’s Post-Hearing Reply Br. Ex. 3. The Court acknowledges that although the claims must be read in light of the specification and the preferred embodiment found therein, limitations from the specification cannot be imported into the claims. Accordingly, the Court is not limiting the definition of "heterodyne receiver circuit" to the embodiment depicted in Figure 3. However, for convenience sake, the Court will refer to Figure 3 of the patent which provides illustrations of the preferred embodiment.

In accordance with the claims and specifications, the audio detector must have an input connected to "said heterodyne receiver circuit." ‘582 patent, col. 11, ln. 3-4. That input must come from the "heterodyne receiver circuit" after the signal has passed through the common circuitry that can be shared by either the cable signal or the leakage signal. Thus, in order for the combined signal level meter and leakage detector to work according to claim 1 of the patent, whether it is phrased in such terms or not, that signal must go through the common circuitry before getting to the audio detector. Therefore, the heterodyne receiver circuit referenced in claim 1 must include the circuitry that connects to both the cable signal level input and the leakage antennas, as well as the common circuitry that then leads into the said detector. See Fig. 3. Before providing input for the detector, the common circuitry must receive and mix a signal from either the cable signal input or the leakage input. See id.

Furthermore, the wording of claim 1 explains that the said "heterodyne receiver circuit" must have greater sensitivity for CATV leakage measurement than for CATV cable signal level measurement. ‘582 patent, col. 11., ln.1-2. This tells a person of ordinary skill in the art that the circuitry that is attached to both of these inputs may require different uses of components such as oscillators, mixers and amplifiers for each respective side. The specification provides a suggestion for how this can be done. See ‘582 patent, Fig. 3.

Although the parties agree on which components are included in the term, Trilithic advocates for a very broad definition while Wavetek suggests that a much narrower definition be given that specifically includes the components required for the circuitry depicted in Figure 3. The Court cannot give the claim a broader scope than is required by the claim language and the specification, yet it also cannot import limitations from the specifications into the claim language. A person of ordinary skill in the art would understand "heterodyne receiver circuit" as it is used in claim 1 to mean that such a circuit must be connected to both the cable signal level and the leakage antenna inputs, and the circuit must have greater sensitivity for the leakage antenna input. Accordingly, a person of ordinary skill in the art would know that a certain combination of oscillator and mixers must be used in order to make one side of the circuit more sensitive. Implicit in this understanding is knowledge concerning the use of dual conversion or single conversion front ends and IF stages. A person of ordinary skill in the art would also know what combination of oscillators, mixers and circuitry are required to get either of those two signals from the input of the cable signal or leakage to the point of becoming input for the detector. Because the claim specifically provides that the input from the heterodyne receiver circuit is separate from the detector, the person of ordinary skill in the art will know that the detector is not part of the receiver. Although the construction is not limited to the embodiment found in the specification, such information will assist the person of ordinary skill in the art to determine what type of circuitry may be used. If both parties agree as to what nodes in the specification are included in the "heterodyne receiver circuit," given the language of the claim and the explanation in the specification, a person of ordinary skill in the art will be able to determine the same.
2. "Common Heterodyne Receiver"

Claim 26 of the '582 patent is a method claim. It specifically calls for "a method of measuring signal level and leakage in a cable television system comprising the steps . . . supplying said CATV cable signal and said CATV leakage signal to a common heterodyne receiver; . . . demodulating the output signal of said heterodyne receiver." '582 patent, col. 12, ln. 66- col. 13, ln.4. Wavetek suggests that the same circuitry in Figure 3 that comprises the heterodyne receiver circuit of claim 1 comprises the common heterodyne receiver circuitry of claim 26. Trilithic maintains that the term should be given the ordinary meaning of "common heterodyne receiver" proposed by Trilithic to be a circuit in which two signals are connected to an input terminal of a single heterodyne receiver.

There is a difference between the language of claim 1 and claim 26. In claim 1, the heterodyne receiver circuit is "connected to" the signal input and the leakage antenna. "Connected to" means "joined or fastened." Webster's II New Riverside University Dictionary 299 (1984). Claim 26 addresses a step of "supplying" the two different signals to a common heterodyne receiver. "Supplying" means "making available for use." Id. at 1164. Large suggested that there is no difference between "connected to" and "supplying." However, a difference does exist between those two words and the two claims. The first two steps listed in Claim 26 are "obtaining a CATV cable signal from a CATV cable" and "obtaining a CATV leakage signal radiated from the CATV cable using an antenna." '582 patent, col. 12, ln. 63-65. These steps cover the method for connecting the circuitry to the cable signal and the leakage signal. Some circuitry must be connected to those inputs in order to obtain the signals and make the signals useful. The next step talks of supplying the signals, in the required manner, to the common heterodyne receiver. This wording indicates that those signals undergo some process in between being obtained from the their sources and being delivered to the common heterodyne receiver. This process is described in many of the other claims of the patent. The circuitry that is used to get the two signals to the common heterodyne receiver is therefore not included as part of the common heterodyne receiver.

Moreover, claim 26 does not include the requirement that the common heterodyne receiver have greater sensitivity for one signal verses the other signal. Therefore, claim 26 does not require that the elements considered to be the common heterodyne receiver actually be the circuitry that is connected to the two different inputs-- the cable signal input and the leakage antenna. Instead, claim 26 addresses the common circuitry that either of those two signals can utilize. The elements of the common heterodyne receiver do not have to be as all-encompassing as the elements included in the heterodyne receiver circuit as it is defined in claim 1 because the elements of the common heterodyne receiver do not have to be connected to the cable signal input and the leakage antenna, nor do they have to provide components that account for greater sensitivity to one side.

The language of the claim allows the person of ordinary skill in the art to know that somehow, as explained in other claims, each of the signals needs to get through the other circuitry that is connected to the common heterodyne receiver. The ordinary meaning of "common" is "shared." Therefore, in the context of this claim, the common heterodyne receiver includes the part of the circuitry where there is a single input into a heterodyne receiver that is shared by the signals coming from either the cable signal input or the leakage antenna. In its next step, the claim further defines what is included in the common heterodyne receiver by requiring that the common heterodyne receiver produce some sort of output signal that is then demodulated. '582 patent, col. 13, ln. 3-4. Accordingly, a person of ordinary skill in the art would understand that the common heterodyne receiver begins with a single input to the heterodyning circuitry, providing a point where the cable signal input and the leakage input come together to share circuitry. The common heterodyne receiver includes whatever components are necessary to complete the heterodyning process, and whatever components are necessary to produce an output that can then be demodulated. A person of ordinary skill in the art should know what components those processes encompass. Although the claim is not limited by this reading of the specification, the specification assists a person of ordinary skill in the art to determine what is included in the term "common heterodyne receiver" as it applies in claim 26. In the context of Figure 3, and according to Silva's testimony, at the very least, the common heterodyne receiver includes an amplifier, a mixer, a local oscillator and an IF input. Tr. at 144; see '582 patent, Fig. 3.

3. "Receiver"

Claim 35 of the '582 patent refers to a "receiver" in terms of it being one of the elements that comprises the combined signal level meter and leakage detector which is coupled to the cable distribution system. '582 patent, col. 13, ln. 47-48. The claim requires that the receiver be connected to the CATV cable connector and the CATV leakage signal antenna and that the
receiver have greater sensitivity for the CATV leakage measurement than for the CATV cable signal level measurement. Id. In. 54-58. The McGraw-Hill Dictionary defines "receiver" as a unit that receives modulated material and converts the material into original intelligence or other useful information. Pltf.'s Ex. 9 at 1661. A receiver generally has a detector for detecting or demodulating the material. Tr. at 200-01; Ptf's Ex. 9 at 550. In the previous claims that involved the terms "heterodyne receiver circuit" and "common heterodyne receiver" the language of the claims made clear that the detector was not considered to be part of either of those terms, even though the word "receiver" was used in the phrase. Unlike claims 1 and 26, this claim does not specify that the detector is separate from the "receiver" term. Accordingly, the use of the term "receiver" in claim 35 encompasses all the circuitry that is attached to both the CATV signal level meter input and the CATV leakage antennas that is needed to move the signals from the inputs to and through the detector. The claim also specifies that the receiver must have greater sensitivity for the leakage side than the signal level side, and as previously discussed, a person of ordinary skill in the art will understand the circuitry and components that are needed to accomplish this. However, in addition to that circuitry and the circuitry that is required for taking those input signals and getting them to the detector, the detector itself is also included in this use of the term "receiver."

In claim 44, the patent again uses the term "receiver." However, this claim makes quite clear what is included in the receiver referenced in claim 44. The patent specifies that

a receiver separately connected to said CATV cable connector and one of said CATV leakage antennas, said receiver including a tuned preamplifier having an input connected to said one CATV leakage signal antenna; at least one dedicated mixer for CATV signal level measurement; at least one dedicated mixer for CATV leakage measurement; at least one common mixer for CATV signal level measurement and CATV leakage measurement; and an IF stage having a relatively wide bandwidth for CATV signal level measurement and a relatively narrow bandwidth for a CATV leakage measurement

is required. '582 patent, col. 14, ln. 45-59.

2. "receiver incorporating an unscrambling circuit"

I have construed "receiver" to mean an apparatus for receiving television broadcasts. Claims 10 and 11 contain the term "receiver incorporating an unscrambling circuit." I construe the term "receiver incorporating an unscrambling circuit" to mean an apparatus for receiving television broadcasts which includes a circuit that restores a modified signal to its unmodified condition.

4. "Receiver means" (Claim 1)

a. The Parties' Proposed Constructions

Motorola's Proposal
Not subject to 35 U.S.C. § 112 (6):
"Receiver means" is "a circuit that obtains and demodulates radio signals."
Agreed to structure and disputed function if § 112 (6) applies:
Function: "receiving a message comprising at least a received call-back number."

VTECH's Proposal
Subject to 35 U.S.C. § 112(6):
Function: "to receive and derive address and message information. The message information contains an instruction to call back the sender on a phone."
Agreed-to Structure: "an antenna and receiver"
Agreed-to Structure: "an antenna and receiver"

b. Discussion

If § 112, P6 was found to apply, and it has been herein, the parties agreed that the structure for the "receiving means" is "an antenna and receiver." (Docket Entry # 93 at A7). Motorola asserts that the function of the receiving means is "receiving a message comprising at least a received call-back number." Id. VTech asserts that the function is: "to receive and derive address and message information. The Message information contains an instruction to call back the sender on a phone." Id.

Motorola notes that its language parrots the language used in the claim itself. (Docket Entry # 76 at 23). Motorola asserts that great care should be taken to avoid adopting a function different from that recited in the claim. (Docket Entry # 88 at 11)(citing Cardiac Pacemakers, Inc. v. St. Jude Med. Inc., 296 F.3d 1106, 1113 (Fed. Cir. 2002)) (The court must construe the function of a mean-plus-function limitation to include the limitations contained in the claim language, and only those limitations) and (citing Generation II Orthotics, Inc. v. Med. Tech., Inc., 263 F.3d 1356, 1364-65 (Fed. Cir. 2001)) ("When construing the functional statement in a means-plus-functional statement in a means-plus-function limitation, we must take great care not to impermissibly limit the function by adopting a function different from that explicitly recited in the claim."). Finally Motorola asserts that the function language is not ambiguous or confusing for a jury such that additional construction would be needed. (Docket Entry # 88 at 11).

VTech asserts that its construction is consistent with the function as described within the specification of the '140 Patent. VTech cites to a portion of the specification to support its construction and quotes the case Smiths Indus. Medical Sys. Inc. v. Vital Signs, Inc., 183 F.3d 1347, 1357 (Fed Cir. 1999) for the proposition that "for a claim drafted as a means-plus-function under 35 U.S.C. §112 P6, a court must first look to the patent specification to determine the 'corresponding structure' that performs the claimed function: the claim is then construed to cover that corresponding structure as well as 'equivalents thereof.'" (Docket Entry # 83 at 27-28).

The Court agrees with Motorola that the starting point for construing the claimed function is the claim language itself. As noted, the Federal Circuit has cautioned against deviating from the claimed functional language. The functional language of the claim term itself is "receiving a message comprising at least a received call-back number." The Court does not find the need for additional construction of this term. VTech has not presented a valid reason from deviating from this language. VTech correctly notes that the corresponding structure is determined from the corresponding structure in the specification. However, the issue at hand is determining the functional limitations of the means plus function term and VTech is attempting to import functional limitations from the specification.

c. The Court's Construction

Accordingly, the Court construes the structure of the "receiver means" term to be "an antennae and receiver." The function is construed to be "receiving a message comprising at least a received call-back number."

GO BACK

3561

H. "receiving a proposed reservation time"

The Defendants argue that "receiving a proposed reservation time" is not an independent phrase that warrants construction but, rather, is a limitation associated with "personal communication device." Alternatively, the Defendants argue that if "personal communication device" is construed as a means-plus-function under § 112, P 6, then "receiving a proposed reservation time" indicates a function. As discussed above in relation to the construction of "personal communication device," the Defendants' arguments are without merit. The Court has previously construed "proposed reservation time," and "receiving" is a widely recognized term and does not require further construction.

GO BACK
19. receiving a command for performing an operation with said picture from image data

The defendants contend that the phrase is indefinite because it is incomprehensible and the specification fails to provide meaning to this phrase. The court disagrees and finds that the phrase, as written and in the context of the whole patent, can be understood by one of ordinary skill in the art. Accordingly, the phrase requires no construction and the defendants' indefiniteness argument is rejected.

- "receiving a packet" is construed to mean "receiving a packet" in accordance with the plain meaning of the term. The Court declines to further construe this term.

Lucent contends that this term should be given its ordinary meaning. (D.I. 396 at 8.) Defendants contend that this phrase means "acquiring a packet at the receive side (i.e., input port) of an access node." (D.I. 395 at 13; D.I. 385 at 14.) For the reasons discussed in Section II.B of this Opinion, the Court will not limit the claims of the '810 patent to access nodes. This, in the Court's view, the Court's construction is consistent with the plain language of the claim and the patent's specification and prosecution history.

- "receiving a request for retrieval of stored data," "retrieving stored data," & "transferring the retrieved data" in accordance with the plain meaning of the term. The parties dispute the meaning of "receiving a request for retrieval of stored data," "retrieving stored data," and "transferring the retrieved data," as used in claims 1, 16, and 21 of the '920 patent. NICE contends that Witness' proposals improperly add the limitation that the data retrieved is stored in the digital logger. The claims themselves, NICE contends, show this construction to be wrong. Claims 6 and 21 recite "wherein the step of retrieving stored data comprises accessing archived data at the Web server." NICE contends this language (1) directly contradicts Witness's proposed construction, and (2) mandates, according to principles of claim differentiation, that claims 1 and 16 must be broad enough to cover, at the least, data stored at the logger or at a Web server. With respect to language "Web server," NICE contends that only the "receiving a request" step of the method of claim 1 occurs "at a Web server."

Witness contends that the intrinsic evidence and the claim structure support its proposal that all three steps, "receiving," "retrieving," and "transferring," are performed by the Web server. The specification, Witness contends, reveals only the Web server as the device or component that retrieves or transfers data after a request is made, citing col. 13:21-25 ("In response to [client requests], Web server accesses the loggers records directly . . . and sends the requested files to the requesting client."). With respect to the "digital logger" language it proposes, Witness contends that claim requires the "digital logger" limitation, and that NICE's claim differentiation argument only shows that claim 6 is invalid.
The Court construes the disputed terms to include the language "Web server" but not "digital logger." With respect to "Web server," NICE did not attempt to rebut Witness contention regarding the specification. With respect to "digital logger," the claim language and the principle of claim differentiation establish that data received need not be stored in the digital logger.

3565

3. "receiving an indication of a speed" (claim 1)

Flow proposes that this phrase should be construed as: "To acquire a value related to speed, such as supplied by a computer system." Omax agrees generally, but argues that "related to speed" changes the meaning of the claim term and, moreover, is equally ambiguous. Omax proposes instead that the term "speed" be specifically construed as "distance per unit time."

Omax's expert endorses this approach, but fails to note that in the claim term, the word "speed" is preceded by the words "an indication of." These words support the use of the more general construction proposed by Flow. Their inclusion would signal to someone of ordinary skill in the art that the value acquired by the computer system might not be an actual velocity, in distance per time, but something more generally related to speed. Omax is correct, however, that "related to" opens up the realm of possibilities too far, at the risk of the inclusion of every aspect of the cutting process, such as the "nozzle orifice diameter." Instead of introducing a new term to the claim construction, the Court finds the term "indicating" to be adequately understandable by a lay jury. See Phillips, 415 F.3d at 1314. As such, the Court will construe the claim term as: "To acquire a value indicating speed, such as supplied by a computer system."

3566

C. "Receiving and Screening the Transferred Digital Data"

The parties next dispute the meaning of the phrase "receiving and screening the transferred digital data." Plaintiff contends that the phrase should be construed as "receiving and screening the digital data resulting from the transfer." JCCS, Appx. A, at 5 (term 21). Defendant contends that the phrase means "the computer system having a destination storage medium acquires and examines the digital data resulting from the transfer." Id.

Defendant correctly notes that plaintiff's proposed construction does not actually construe the language; it merely restates the phrase. Plaintiff nevertheless contends that the phrase is unambiguous, and that defendant's proposed construction improperly attempts to limit the claim by requiring the receiving and screening step to be performed by a single computer. As explained above, however, the Court has concluded that the term "computer system" as used in the patent means a personal computer or workstation. And the patent makes clear that it is in this "computer system having a destination storage medium" that the receiving and screening occurs. See '776 Patent, col. 4 lns.7-13. Thus, regardless of whether there is some other destination ultimately intended by the user, for purposes of the patent it is the computer system which is doing the "receiving" and "screening." Accordingly, the Court adopts defendant's proposed construction of this phrase.

3567

[a] receiving, at a financing institution-accessible facility, [a] receiving, transmitted data within a computer system accessible by a financing institution.

3568

H. FOR RECEIVING EXCLUSIVELY THERE THROUGH USB BASED DISPLAY SIGNALS
Claim 1 of the '788 patent requires that the USB controller be "detachably connected to a USB port of the computer for receiving exclusively therethrough USB based display signals from the computer. . . ." (emphasis added). The parties propose the following constructions for the highlighted language:

<table>
<thead>
<tr>
<th>Term</th>
<th>DisplayLink's proposed construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>For receiving exclusively therethrough USB based display signals</td>
<td>Indefinite under 35 U.S.C. §112, P2 or, in the alternative, For receiving all of the USB display signals into the USB controller</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Term</th>
<th>MCT's proposed construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>For receiving exclusively therethrough USB based display signals</td>
<td>For receiving only USB based signals containing display information and forwarding them to the bridge in the signal form understood by the bridge</td>
</tr>
</tbody>
</table>

MCT asserts that the term "receiving exclusively therethrough" refers to the process whereby display signals are sent by the USB port of the computer "exclusively" to the USB controller and not another structure. However, MCT contends nothing in the intrinsic evidence limits the USB controller from receiving information other than display signals. DisplayLink asserts that the term means that the USB controller can receive only USB based display signals and nothing more. Thus, the parties agree that all USB based display signals emanating from the computer must pass through the USB controller. However, the parties do not agree on whether the USB controller can receive signals other than USB based display signals.

DisplayLink supports its position by pointing out that during prosecution of the '788 patent, in March 2006, MCT amended claim 1 in response to an interview with the PTO examiner by replacing "for receiving USB based display signals" with "for receiving exclusively therethrough USB based display signals." Jones decl. P 59. However, MCT correctly observes that the amendment was made to clarify the scope of claims 1 and 19 such that the "converter includes among its combination of features that of a USB controller 'external to the computer' which 'detachably' connects to the computer's USB port for 'receiving exclusively therethrough' the 'USB based display signals from the computer.'" Id. Thus, this amendment appears to have been intended to clarify that all USB display signals are received by the USB controller to the exclusion of any other controller or device, not that only USB display signals are received by the USB controller to the exclusion of any other type of signal.

DisplayLink also argues that its position is supported by the '788 patent specification which states that "an object of the present invention is to provide a USB-to-VGA converter which converts USB based display signals from a host computer into VGA signals that can be received and recognized by a display device whereby image to be displayed can be transmitted from the host computer in USB form." 788 patent at 1:31-36. In addition, the specification states that a "further object of the present invention is to provide a USB-to-VGA converter that allows for direct transmission of USB signals from a host computer to a display device without adding any display interface card inside the host computer." Id. at 1:41-45. The abstract of the invention states "[a] USB-to-VGA converter includes a USB controller connectable to a USB port of a computer for receiving USB based display signals from the computer . . . ." Id. at Abstract. And finally, DisplayLink points to the specification language that "[t]he USB controller (10) is connectable to a USB port (210) of a host computer for receiving USB based display signals from the host computer (200)." Id. at 2:6-29.

The citations from the specification support the fact that the USB controller is the device that receives the USB based display signals to the exclusion of any other device. But they are not inconsistent with the USB controller's receipt of signals other than display based signals. For these reasons, the court construes the phrase "for receiving exclusively therethrough USB based display signals" as follows:

"for receiving exclusively therethrough USB based display signals" means that the USB controller receives all of the
USB display based signals

19. "receiving data to be stored in memory in an alterable fashion . . . said alterable data being permanently stored until purposely altered" ('409 patent, claim 8)

AVID contends that the term should be construed as "receiving data to be stored in memory in a manner such that the data can be changed . . . the alterable data being stored in a non-volatile manner until it is purposely altered." According to AVID, the specification at 1:64-68, 2:36-43, and 6:57-7:2 supports what it contends is the plain meaning of the term. AVID also suggests that dictionary definition of "non-volatile storage" confirms the plain meaning of the term. The Defendants argue that the term should be construed as "receiving data to be stored in non-volatile reprogrammable memory in which the data can be changed." According to the Defendants, the requirement of a reprogrammable memory is consistent with the specification at 1:64-68, 2:13-19; 2:36-43, and 6:60-7:2. After carefully considering the parties' proposed constructions, the Court agrees with AVID's proposed construction and adopts it.

2. Receiving [receives] from the renderer; Providing [provides] the renderer

I construed the term "renderer" in the first Markman Memorandum as a "software and/or hardware object that performs at least the following-functions: (1) determining and providing to another object the required coordinates in the terrain along with a respective resolution level; (2) receiving the data blocks corresponding to the specified coordinates; and (3) using the received data blocks to display a three-dimensional image." Skyline Software Sys. v. Keyhole, Inc., 421 F.Supp.2d 371, 388 (D. Mass. 2006) (emphasis supplied). Google now argues that the phrases "receiving [receives] from the renderer" and "providing [provides] the renderer" should be construed to emphasize that something separate from the renderer either receives or provides the information handled by the renderer, depending on the context. Skyline simply maintains that these phrases should not be construed, and provides no alternate construction.

To the extent necessary to clarify the matter, I agree that the renderer must interact with other objects, n7 whether hardware or software, and does not exist in a self-contained universe. The '189 Patent is based on the conception of a renderer that receives information, over a communication link, and uses the transferred data to display three-dimensional terrain. In every description in the claims and specifications, and in the explanatory drawings, the renderer is depicted as receiving data from another location, and providing information to other discrete objects. n8 This construction is consistent with the prior construction of "renderer," where I found a key function of the renderer to be "providing [information] to another object." n9

n7 Skyline has expressed concern over the use of the word "object," which has a specific meaning in the context of computer programming. (Skyline's Claim Construction Slides, Nov. 1, 2006 at 13-15; Nov. 1, 2006 Transcript pp. 15:21-16:15). "Object," as used in this discussion, should not be read to refer specifically to software objects of the sort used in object-oriented programming. I use "object" in the more general sense of a "thing," which could be a software object, but need not be.

n8 See, e.g., col. 11, 11. 19-38 (describing the renderer).

Construction: (Receiving from the renderer; Receives from the renderer) Something distinct from the renderer receiving
with respect to this term, the key dispute is whether a limitation reciting a user sending the image data has to be included as a step of the claims at issue. plaintiff contends that no further construction is necessary because the claim language provides that it is the server that "receives" the image data. foto/media contends that the preamble requires the step be performed "by the server," and defendants' proposed construction would require the "receiving" to be performed "at the server." further, foto/media argues that there might be instances where the server already possesses the image data. in such a case there would be no need for the user to send such data.

defendants argue that prosecution history makes it incontrovertible that a user (sender) must provide the image to be shared. as originally filed, the "receiving image data" step in claim 1 read "receiving image data representing an electronic image." the examiner rejected this claim over the wright patent disclosing an electronic greeting card system that allowed users to send cards by pulling images from a library of images stored on a server. see '774 file history, january 11, 1999 resp. to office action at 2-3. the sender's computer in the wright system had a local listing of library images and would simply tell the server which of the images it wanted to pull into the electronic greeting card being processed. id. therefore, the examiner rejected the applicants' claim language that broadly claimed "receiving image data" at the server, regardless of where it came from. in response, the applicants distinguished their claims from wright based on the source of the image:

the system of wright et al. teaches selecting a greeting card image stored on a central image server. the presently claimed invention is directed to a system wherein the image data is created by the sender, and not selected from a preexisting list of greeting card images.

id. at 3.

the amended language, as the claim issued, reads:

receiving image data embodying an electronic image, the image data transferred under control of the user at the sending computer, the image data residing in the sending computer or an image source separate from and in communication with the sending computer.

'774 patent, col. 14, ll. 23-27.

in the notice of allowability, the examiner wrote: "none of the prior art of record teaches . . . the image data residing in the sending [sic] and transferred under control of the user at the sending computer . . . ." see '774 file history, notice of allowability, at 2.

defendants contend that the amended "receiving" limitation must therefore be read as requiring that the user provide the
image to be shared. Defendants propose that the Court ignore any inconsistency between this requirement and the fact that the preamble recites that all the steps are performed "by the server." See N. Am. Container, Inc. v. Plastipak Packaging, Inc., 415 F.3d 1335, 1344-46 (Fed. Cir. 2005) (adopting construction preserving inconsistency added during prosecution).

According to the defendants, it is important that the Court inform a lay jury, unfamiliar with the prosecution history, that this claim requires that a user issue a command to send the image data.

Fotomedia responds by arguing that the claims were amended simply to identify the source of the received image, rather than to require a transfer step performed by a user. Although the Court disagrees with Fotomedia on the scope of the amendment, the Court concludes that the amendment already captures the requirement of the image data being sent by the user at the sending computer. See Laitram Corp. v. NEC Corp., 163 F.3d 1342, 1348 (Fed. Cir. 1998) (holding that the scope of an amendment made to overcome claim rejection should be determined in light of the written description, the prosecution history and the language of the respective claims). What the amendment does not do is require a user to perform a step of the method. See BMC Resources, Inc. v. Paymentech, L.P., 498 F.3d 1373, 14381 (Fed. Cir. 2007) (reasoning that claim drafting allows a patentee to structure a claim to capture infringement by a single party or multiple parties). This claim is drafted from the perspective of the server, not the sender.

"Receiving image data" is construed as "receiving by the server, image data."

Receiving information identifying a customer's parts requirements for the equipment

The Staples Defendants contended this term should be construed as "Receiving information identifying the parts required by the customer for the equipment. Identification of the equipment alone is not sufficient because it is not enough to identify the parts which the customer requires for that equipment." Orion contended that claim 1's structure requires no more than an "identification of the equipment," which was the opposite of the Staples Defendants' construction. The Court agreed and determined the term did not require further construction.

Hyundai argues the term should be construed to mean "receiving information identifying a customer's parts requirements and at least a portion of a manufacturer's part number for the equipment" in order to preserve the claim's validity over prior art. Hyundai argues is that "Nagano's teaching arguably invalidates" claim 1. Hyundai "cannot avoid a full-blown validity analysis by raising the specter of invalidity during the claim construction phase." See Rhine v. Casio, Inc., 183 F.3d 1342, 1346 (Fed. Cir. 1999). Whether a claim is valid or not depends on the claim as a whole, not simply one limitation. Whether Nagano teaches "selection of parts in response to an identification of only the equipment owned" or not says nothing about the validity of the claim as a whole.

Nor has Hyundai shown that the claim language or specification requires receiving information at least a portion of a manufacturer's part number for the equipment. In the Staples Markman opinion, the Court rejected the contention that the limitation should be construed to include that "identification of the equipment alone is not sufficient . . . ." Having already resolved that dispute, no further construction is necessary. Thus, the Court rejects Hyundai's proposed construction and determines the claim language does not require further construction.

A. Claim Construction: "Receiving Means"

The claimed CCTV system requires a "receiving means for receiving said video signals and said first code signals." Because this limitation uses "means for" there is a presumption that the claim invokes 35 U.S.C. § 112, P 6. See Biomedino L.L.C. v. Waters Techs. Corp., 490 F.3d 946, 950 (Fed. Cir. 2007). Neither party contends that the presumption has been rebutted; we agree that it has not. Our case law provides the appropriate framework for construing a claim limitation expressed in means-plus-function format. "First, the court must determine the claimed function." Applied Med. Res. Corp. v. U.S. Surgical Corp., 448 F.3d 1324, 1332 (Fed. Cir. 2006). Once the function has been identified, we turn to the specification to determine
which structures disclosed in the specification perform that function. Id.

The function recited in the "receiving means" limitation is the reception of video signals and first code signals. As for the structure, the specification states that

[the receiving device 16 includes a low-pass filter 54 which allows the video signals to pass and prevents the high frequency output signals of the controller device 14 from passing. The output signals of the filter are supplied to a television receiver or monitor via an interface 56 which superposes the display signals from the controller 46 on the output signals of the filter 54.]

[SEE FIG. 1 IN ORIGINAL]

'085 patent, col.5 ll.55-61. The receiving device (16) is depicted in Figure 1 of the '085 patent, as reproduced below. '085 patent, Figure 1. The receiving means includes an input line, a low pass filter, an interface and a television receiver or monitor and any equivalents thereof under § 112, P 6.

Claim terms are entitled to a "heavy presumption" that they carry their ordinary and customary meaning to those skilled in the art. See Superguide Corp. v. DirecTV Enters. Inc., 358 F.3d 870, 874 (Fed. Cir. 2004); Omega Eng'r, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003). However, when a patent applicant surrendered claim scope during prosecution before the PTO, the ordinary and customary meaning of a claim term may not apply. This doctrine of prosecution disclaimer has been "adopted . . . as a fundamental precept in our claim construction jurisprudence." Omega Eng'r, 334 F.3d at 1323 (citing cases). Prosecution disclaimer "promotes the public notice function of the intrinsic evidence and protects the public's reliance on definitive statements made during prosecution." Id. at 1324. This doctrine does not apply "where the alleged disavowal is ambiguous;" the disavowal must "be both clear and unmistakable" to one of ordinary skill in the art. Id. at 1326; Seachange Int'l, Inc. v. C-COR Inc., 413 F.3d 1361, 1373 (Fed. Cir. 2005) ("A disclaimer must be clear and unambiguous."); Rambus Inc. v. Infineon Techs. AG, 318 F.3d 1081, 1089-91 (Fed. Cir. 2003) (finding no clear disclaimer because the statement made was "facially inaccurate" in light of the remainder of the prosecution history); Biotec Biologische Naturverpackungen GmbH & Co. KG v. Biocorp, Inc., 249 F.3d 1341, 1348 (Fed. Cir. 2001) (finding no clear disclaimer because "a person of reasonable intelligence would not be misled into relying on the erroneous statement, for it is contrary not only to the plain language of the claims and the specification, but also to other statements in the same prosecution document"); Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 956-57 (Fed. Cir. 2000) (finding disavowal because "reasonable competitor . . . would have no reason to believe that a mistake was made"); Desper Prods., Inc. v. QSound Labs., Inc., 157 F.3d 1325, 1334-36 (Fed. Cir. 1998) (concluding prosecution statements were clear and unmistakable disclaimer because they were entirely consistent with written description and knowledge of those skilled in the art).

In the present case, the district court found that the inventor limited the "receiving means" that receives the first code signal to a "monitor" that receives the first code signal. Implicit in its determination is a finding that the inventor clearly and unmistakably surrendered any claim scope between the "receiving means" that receives first code signals as expressly recited in the claims, and a "monitor" that receives first code signals. We cannot agree. The statements to the effect that the code signal is received by the monitor did not amount to a clear and unmistakable surrender of claim scope.

First, the statement in the prosecution history is unsupported by even a shred of evidence from the specification. The specification never suggests that the monitor of the receiving means receives first code signals and returns a corresponding code to the cameras. Figure 1 above shows that the first code signal would be received by the receiving means 16 on an input line from the transmitter and then would travel to the controlling means 14. After receiving the first code signal, the controlling means decodes and manipulates the first code signal and then generates the second code signal which is transmitted back to the camera along with the control signals via the receiving means. See, e.g., '085 patent, col.1 ll.62-67; col.2 ll.32-36; col.2 ll.39-42. As Figure 1 shows, the receiving means receives the first code signal, but the monitor does not. There is nothing in the specification to suggest that the first code signal ever reaches the monitor.

Second, read in isolation, the statement in the prosecution history could be argued to be a disclaimer. When the prosecution history as a whole is considered, the inventor's response to the PTO is not as clear. Because of the potential for such ambiguities, we have recognized that "because the prosecution history represents an ongoing negotiation between the PTO and the applicant . . . it often lacks the clarity of the specification and thus is less useful for claim construction purposes."
Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005). In this case, two paragraphs after the alleged disclaimer, the inventor also included the following statement to distinguish a reference relied on by the PTO examiner:

The Bellman reference fails to suggest that the code received by a display device is sent back to the camera along with the control signal and that the camera is operated by control signals only upon the coincidence of the original camera code with the code returned to the camera.

Amendment & Remarks at 6. The specification equates the "display device" and the "receiving device." See '085 patent, col.3 l.4 ("... a displaying device or receiving device 16 ..."). This statement, unlike the alleged disclaimer, is fully supported by the written description and provides further indication that the earlier statement in the same document was not a clear and unmistakable surrender.

Third, reading the specification and remainder of the intrinsic record as a whole would lead those skilled in the art to the conclusion that the inventor's statement that the monitor received the first code signals and, "based upon" that code, transmits a second code signal "back to the camera" was not a clear and unmistakable surrender of claim scope. Amendment & Remarks at 5-6. This prosecution statement if taken literally would result in an inoperable system. Even if the monitor contained the necessary hardware to receive and generate a second code signal corresponding to the first code signal to be sent back to the cameras (a technological concept not at all supported by the specification), the second code signals would not reach the cameras. The low pass filter is positioned between the monitor and the cameras. The sole purpose of that filter is to "prevent the high frequency output signals [i.e., the "second code signals"] of the controller device 14 from passing." '085 patent, col.5 ll.55-58. Hence, the second code signal would be filtered out before it ever reached the camera. Even Sensormatic's own technical witness testified that he "ha[d] trouble figuring out how [transmitting the code signals to and from the monitor] would work."

For a prosecution statement to prevail over the plain language of the claim, the statement must be clear and unmistakable such that the public should be entitled to rely on any "definitive statements made during prosecution." Omega, 334 F.3d at 1324. On this unique amalgamation of facts, including (1) the absence of support in the specification or drawings for a monitor that receives code signals from and returns code signals to the cameras; (2) the ambiguity created by other statements in the same prosecution document; (3) the fact that Sensormatic's own technical witness did not understand how the system would operate consistent with the erroneous statement; and (4) the inoperability of a device constructed in accordance with the incorrect statement, we conclude that this is not a case of prosecution disclaimer. One of skill in the art would understand the claim to cover a receiving means (not limited to a monitor) for receiving the video signals and the first code signals.

GO BACK

3574

1. "Receiving Station"

First, the parties dispute the meaning of the term "receiving station." The parties agree that the term "receiving station" as used in these claims did not have an understood meaning in the art in 1989, the date of the applications. Generally speaking, however, the language of the term suggests simply a "station" that "receives" something.

Both sides offer suggested definitions in an attempt to describe this term, given the context in which it appears. The plaintiff urges that the court should define "receiving station" as "an apparatus that answers a telephone call." The defendants argue that the court should define the term to mean "one or more devices which accepts a signal from a network."

Each side notes problems with the other's suggested definition. The defendants argue that the plaintiff is attempting to define the term too narrowly. They point out that the plaintiff's proposed definition—a device which simply answers a telephone call—fails to account for the primary "receiving" function of the receiving station. The defendants argue that the plaintiff, by describing the claim term by reference to one of the several non-receiving functions performed at the station, is suggesting a definition at odds with the plain language of the claim. For its part, the plaintiff argues that the defendants' proposal is too vague. The plaintiff points to the written description and notes that many devices in the system "accept signals" from the network, but not all of these devices are appropriately classified as receiving stations. For instance, a Central Office would accept a signal from the network, but, according to the description of the invention, a Central Office is
something distinct from a receiving station.

To define the terms in the context of this invention, the court has reviewed the claims in light of the specification and the prosecution history to determine what meaning the patentee gave to the terms. As Claim 1 of the '546 patent illustrates, the claim language itself sets forth various functions performed at the receiving station. See claim elements 1(d) and (g) (imposing limitations of answering telephone call, receiving part of the telephone address signal and receiving the sent message at the receiving station). The written description is no different. In the '546 patent specification, the patentee states in the Summary of Invention that:

In general, in one aspect, the invention features a method for causing information including at least a FAX message sent via a telephone system to be subjected to prespecified actions at a receiving station. In this feature, a telephone call is initiated via the telephone system to the receiving station by dialing a telephone number enabling the telephone call to be routed to the receiving station, the telephone number also indicating the prespecified action to which a message is to be subjected at the receiving end. The telephone number is passed through the telephone system in the form of a telephone address signal as part of the call initiation process. At the FAX receiving station, the telephone call is answered and the telephone address signal is received. When the call has been established, the FAX message is sent via the telephone system to and received at the FAX receiving station. Stored action information associates each possible telephone address signal with a prespecified action to be taken with respect to each received FAX message corresponding to the telephone address signal.

The Summary of Invention also states:

In general, in another aspect, the invention features a FAX receiving station which includes (i) a FAX message receiver which answers the telephone call, receives the telephone address signal, and, when the call has been established, receives the FAX message via the telephone system, and (ii) storage for storing the action information. The FAX receiving station is arranged to handle the received FAX message in accordance with the prespecified action based on the telephone address signal.

'546 Patent, Col. 2, ll. 16-25.

In the course of the prosecution of the '546 patent, the applicant stated the following in connection with a July 12, 1993 amendment:

In the system of the present invention, a receiving station comprises a message receiver which receives telephone address signals such as DID address signals and handles the received telephone message in accordance with a prespecified action stored in memory for that address.

See Remarks, attached as Exhibit G to Defendants' Claim Construction Brief, BKT 000166.

After considering the claims and the intrinsic record, the court is persuaded that both parties are correct to criticize the other's proposed definition. In the context of this patent, the receiving station performs a variety of functions, but many of these functions are set forth as additional limitations in the language of the claims. At a minimum, however, a receiving station must have the capability to answer a telephone call and accept a telephone address signal. Accordingly, the court defines a receiving station as "a device which answers a telephone call and accepts a telephone address signal."

4. "receiving system"

The parties dispute the proper construction of the phrase "receiving system" as that phrase is used in Claim 19 of the '992 Patent. One aspect of the dispute is the patentee's use in the specification of the phrases "receiving system" and "reception system." The dispute is whether the two phrases are used interchangeably in the patent specification and should, therefore,
be given the same definition.

The specification uses the phrases "receiving system" and "reception system" interchangeably. n2 For example, Figures 1a - 1g are block diagrams which contain graphic figures labeled "200," entitled "RECEPTION SYSTEM." With respect to Figures 1a - 1g, the written description describes them as illustrations of an embodiment of "receiving systems:"

With respect to the transmission and receiving systems set forth in Figures 1a - 1g...

***

In any of the transmission and receiving systems illustrated in FIGS. 1a - 1g, the requested material may be copy protected.

('992 Patent, Col. 4:64-65; Col. 5:34-35.)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

n2 The Court's attention is drawn to Claim 2 of the '275 Patent which also shares the same specification as the '992 Patent. Claim 2 of the '275 Patent does not use the terms interchangeably. Instead, Claim 2 refers to "receiving system" and "reception system" as being two separate but "associated" systems:

A distribution method responsive to requests from a user identifying items in a transmission system containing information to be sent from the transmission system to receiving systems at remote locations, the method comprising the steps of:

***

sending a request, by the user to the transmission system, for at least a part of the stored information to be transmitted to a reception system associated with a receiving system at one of the remote locations selected by the user; ...

Except for their use in Claim 2 of the '275 Patent, throughout the specification the patentee used the two phrases interchangeably. The Court will defer consideration of the effect of its construction on Claim 2 of the '275 Patent until that Claim is formally brought into consideration.

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

With specific reference to Figure 1d, the specification uses the phrases "receiving systems" and "reception systems" interchangeably:

**FIG. 1d shows a high level block diagram of the transmission and receiving system of the present invention including a transmission system 100 distributing to a plurality of users via a reception system 200 configured as a cable television system.**

('992 Patent, Col. 4:14-18.)

At one point in the specification, graphic block 200 is called a "receiving system." At another place it is called a "reception system:"

... for communication with the receiving system 200 ...

***

The received information is preferably buffered (step 418) by a storage means analogous to element 203 shown in FIG. 3. The information is preferably buffered so that it may be stored by the user for possible future viewings. The requested information is then payed back to the reception system 200 of the user at the time requested by the user (step 419).
In light of the specification, the Court finds that the phrases "receiving system" and "reception system" should be given common definitions.

A second aspect of the dispute with respect to the phrase "receiving system" is the definition of the phrase itself. In the July 12 Order, the Court construed the phrase "reception system," used in Claim 1 of the '702 Patent, to mean "an assembly of elements, hardware and software, capable of functioning together to receive items of information." (July 12 Order at 28-29.)

The '702 Patent shares the same specification as the '992 Patent. Upon reconsideration following the June and September hearings, the Court finds that the patentee intended "receiving system" to have a specialized meaning:

Additionally, the present invention comprises a receiving system responsive to a user input identifying a choice of an item stored in a source material library to be played back to the subscriber at a location remote from the source material library, the item containing information to be sent from a transmitter to the receiving system, and wherein the receiving system comprises transceiver means for automatically receiving the requested information from the transmitter as compressed formatted data blocks; receiver format conversion means, coupled to the transceiver means, for converting the compressed formatted data blocks into a format suitable for storage and processing resulting in playback in real time; storage means, coupled to the receiver format conversion means, for holding the compressed formatted data; decompressing means, coupled to the receiver format conversion means, for decompressing the compressed formatted information; and output data conversion means, coupled to the decompressing means, for playing back the decompressed information in real time at a time specified by the user.

Figure 6 is a block diagram illustrating an embodiment of a reception system which has the necessary components to perform the method disclosed in Claim 19. The specification also contains the phrase "receiving device." The specification provides that a "receiving device" is not part of a "receiving system:

The outputs from converters 211-214 are produced in real time. The real time output signals are output to a playback system such as a TV or audio amplifier. They may also be sent to an audio/video recorder of the user. By using the reception system 200 of the present invention, the user may utilize the stop, pause, and multiple viewing functions of the receiving device. Moreover, in a preferred embodiment of the present invention, the output format converters may be connected to a recorder which enables the user to record the requested item for future multiple playbacks.

The Court finds, however, that the use of the word "directly" in its construction would clarify that the invention is one which discloses transmission directly to receiving systems with no intermediary.

The Court construes the phrase "receiving systems" as follows:

In a distribution method as disclosed in Claim 19 of the '992 Patent, in which a transmission system sends information to receiving systems at remote locations in response to a user's request, the phrase "receiving systems" means "an apparatus which directly receives information from the transmission system. The apparatus comprises the following interconnected components: transceiver means, receiver format conversion means, storage means, decompressing means and output data conversion means, as illustrated in Figure 6. The corresponding structure for each means is the structure identified in the specification for performing the recited function. A "reception system" is the same apparatus as a "receiving system." A "receiving device" is not part of a receiving system.
C. "A Receiving Terminal"

For the following reasons, this court construes the claim term "a receiving terminal" in claim 9 to mean:

One or more devices that receive a WDM optical signal.

The court employed similar reasoning in construing "a receiving terminal" as it did in construing "a transmitting terminal." See section II.A, supra. The term "a receiving terminal" occurs in context as "a receiving terminal receiving the amplified WDM optical signal from the optical amplifier." (’681 patent, col. 23:1-2.)

Within the specification, receivers are represented as both a single device and as a combination of devices. Specifically, Figure 25 illustrates "a transmitter (Tx) transmits a SV light beam to a receiver (Rx), were an SV light beam is light that is wavelength-multiplexed with a main signal." (’681 patent, col. 19:40-44.) So, a receiving terminal, as represented by receiver Rx, can be a single device. Figure 1 of the ’681 patent, however, depicts:

The wavelength-multiplexed optical signal is transmitted through an optical fiber to an optical demultiplexer. Optical demultiplexer branches the wavelength-multiplexed optical signal into four separate optical signals having the wavelengths [lambda] 1- [lambda] 4, respectively. The four separate branched optical signals are then detected by receiving units, respectively.

(’681 patent, col. 1:53-59; see Fig. 1.) Thus, the receiving terminal that receives a WDM optical signal in Figure 1 of the ’681 patent can be more than one device that includes the receiving units and the demultiplexer.

3. Reception system at a second location

The Court lets stand its previous definition of "reception system at a second location" to mean a reception system at one particular location separate from the location of the transmission system.

9. "Recharge information." Used in ’768 patent, Claims 2, 3, 6, 10, and 11.

TGIP offers "data received in connection with the recharge of an account." Defendants argue for "information including the security number communicated during the recharge of the calling card account." For the reasons stated above, the court concludes that there must be a combination of numerals, letters, and/or characters associated with each activated account. This is referred to in the claims as "access information" See, e.g., ’768 Reexam Cert, col. 1, 11. 47-51. For marketing purposes it might be given any number of names, including "security code" as seen in the specification. ’768 patent, col. 5, 1. 47. For convenience the court will use "password."

As explained above, the claims do not require transmission of the password to the host computer at the time of activation of the card. The question is whether the password must be used to recharge the card?

An example from the specification and claims may clarify the differences and similarities between activation, access and recharge. See ’768 patent, col. 5, 1. 64 - col. 6, 1. 13; ’768 patent Reexam. Cert., col. 1, 11. 18-57. To activate an account, a customer asks a store clerk for $12.00 of calling time. The clerk selects card number 55 and uses the data terminal to transmit that number, which designates a calling card account number in the database, to the host computer. The computer
associates $12.00 with account 55 and with a password, say 44, and transmits the message that the password has been activated for the amount of $12.00.

To access a phone network the customer dials a number to which the host computer is connected and is prompted to enter the password, 44, but not necessarily the card number, 55. The computer keeps track of the time used and deducts it from the $12.00 balance. To recharge the card the customer goes back to the clerk and asks for $15.00 to be added to the account. The clerk must transmit information identifying the account number. The account now has two numbers associated with it - the card number 55, and the password 44. As written, the claims allow a programmer to program the host computer to accept either or both numbers for a recharge, since both now identify the account.

It might make sense in a recharge situation to follow the preferred embodiment and transmit a "security code" (the password) from the card. '768 patent, col. 5,11.42-50. But there is nothing in the claim language or specification to indicate that the account number can't be combined in the same data field with the password at the time of initial activation. In such a case it would be feasible to transmit the card number and not the password, although once the card is activated those numbers are inextricably linked. Therefore the court defines this term as follows:

"Recharge information" means: "data transmitted that makes it possible to associate a dollar amount with a particular previously activated calling card account."

GO BACK

3579

C. "recipient"

Stanacard proposes that "recipient" be given its plain and ordinary meaning. Rebtel seeks to define "recipient" as a "person, or device or address associated with the person, which the caller is attempting to connect" on the grounds that it is necessary to clarify that a recipient is not limited to a person, but may include various devices or addresses associated with a person.

Like "telephone number," recipient is a commonly used and understood term that does not require a lengthy definition that would only serve to confuse the jury. Moreover, although the parties agree that "recipient" would include not only people, but also entities and businesses, Rebtel's specific reference to a "person" or "items associated with a person" in its proposed definition would imply that certain non-person entities are excluded from the scope of the term "recipient" as used in the '156 Patent.

"Recipient" is therefore given its plain and ordinary meaning. GO BACK

3580

B. "recipient"

The magistrate judge recommended that "recipient" be construed as: "The party which receives the transaction from the originator." First Report at 4. No objections have been filed with respect to the magistrate judge's proposed construction. After careful review of the magistrate judge's findings and conclusions, record, legal briefing, and applicable law, the court determines that the magistrate judge's proposed construction of "recipient" in patent '878 is correct, and it is hereby accepted as the court's construction of "recipient."

<td>&quot;recognition of&quot;</td>
<td>N/A</td>
<td>&quot;the passenger identification&quot;</td>
</tr>
</tbody>
</table>
Defendants note that the Patents-in-Suit fail to establish the meaning of the term "recognition" as it relates to identification codes. Plaintiff has provided no counter-definition of the term "recognition" as it relates to identification codes.

The Court finds that the definition of the term "recognition" cannot be discerned from the plain meaning of the claim language or the specification. Therefore, it is appropriate to look to extrinsic evidence to inform the meaning of "recognition." See generally Phillips, 415 F.3d at 1318 (noting that dictionaries, and in particular technical dictionaries, "have been properly recognized as among the many tools that can assist the court in determining the meaning of particular terminology to those of skill in the art of the invention"); Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1368 (Fed. Cir. 2003) ("Dictionaries and scientific treatises may also help supply the pertinent context and usage for claim construction.") (citations omitted). The McGraw-Hill Dictionary of Scientific and Technical Terms defines "recognition" as "[t]he act or process of identifying (or associating) an input with one of a set of possible known alternatives, as in character recognition and pattern recognition." McGraw-Hill Dictionary of Scientific and Technical Terms 1761 (6th ed. 2003). This meaning controls "unless the intrinsic evidence clearly redefines the claim term so as to put one reasonably skilled in the relevant art on notice that [the patent applicant] intended to assign the term a different meaning." Union Carbide Chemicals & Plastics Tech. Corp. v. Shell Oil Co., 308 F.3d 1167, 1177 (Fed. Cir. 2002) (citation omitted).

The Court finds that this dictionary definition of recognition, meaning "identifying" or "associating," is consistent with the available intrinsic evidence as explained above. Therefore, the Court concludes that "recognition of identification codes of passengers" means "the passenger identification codes are associated with each individual passenger's identity as well as that passenger's destination floor."

Recognizable Relationship

Konami proposes that "recognizable relationship" should be construed as "having a correspondence such that one can be identified with another," while Defendants argue that "visually apparent association" is more appropriate. However, neither proposal offers any more guidance than the ordinary and accustomed meaning of the claim language itself. As that ordinary meaning is consistent with a proper understanding of "recognizable relationship" the Court sees no reason to construe this term.

"Recognizable relationship" is employed in Claim 11 to describe the relationship between the "first display parts" and the "corresponding actuateable parts," n4 and in Claim 12 to describe the relationship between "first display parts" and "second display parts." n5 19:48-50, 65-67. n6 Although neither proffered construction is inappropriate or misleading, neither construction would assist a jury in adducing the meaning of this phrase. See Sulzer Textil A.G. v. Picanol N. V., 358 F.3d 1356, 1366 (Fed. Cir. 2004). Both parties offer constructions that merely re-characterize the claim language without adding any helpful guidance about the meaning of "recognizable relationship" that is not already apparent from the language itself.

--- Footnotes ---

n4 "Recognizable relationship" also describes this relationship in claims 22, 28, 36, 42, 45, 46, 48, 49, and 50, but claim 11 is a fair exemplar of how "recognizable relationship" is used in those claims.

n5 "Recognizable relationship" also describes this relationship in claims 27, 29, and 37, but claim 12 is a fair exemplar of how "recognizable relationship" is used in those claims.

n6 The surrounding language in claim 11 reads "a plurality of actuateable parts for actuation by a player's feet; a display unit
Claim 12 depends from claim 11 and reads, "[d]ance apparatus according to claim 11 wherein said second display parts have a recognizable relationship with corresponding first display parts."

In essence, Defendants' construction "visually apparent association" substitutes "visually apparent" for "recognizable" and "association" for "relationship." However, "visually apparent" does not advance the meaning of "recognizable" beyond its ordinary and accustomed meaning, and "association" does not measurably clarify "relationship." Similarly, Konami's construction "having a correspondence such that one can be identified with another" simply restates the ordinary understanding of "recognizable relationship." These constructions are not incorrect. In fact, they are both fairly accurate characterizations of the disputed term, but the Court declines to adopt any construction because a proper understanding of this term may be reached from the ordinary and accustomed meaning of these terms in the context of the claims. Accordingly, the Court elects not to construe "recognizable relationship."
be an inaccurate interpretation. See Vitronics, 90 F.3d at 1583 (construction that necessarily excludes the preferred embodiment "is rarely, if ever, correct"); see also Hoechst Celanese Corp. v. BP Chemicals, Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996) (unlikely that inventor would define invention in way that excludes preferred embodiment or that those skilled in the art would read it that way). However, I concluded at the hearing that the examples recited in the specification would fit within defendant's definition. Accordingly, "record" and "data record" as used in claims 49 and 53 of the '461 patent mean components of a database composed of fields arranged in a particular predefined structure.

3585

a. "Record" and "Multiple Records."

Judge Hubel construed "record" to mean "a Collection of related data items stored in named data fields" and "multiple records" to mean "multiple Collections of related data items stored in named data fields." Judge Hubel explained:

In the preferred embodiment, this construction includes the understanding that one record is one row. In other embodiments, however, the restriction of record to one row may not be workable. For example, with XML, there is no traditional "row."

Construction Order 1 at 55. In reaching this construction, Judge Hubel rejected Plaintiff's argument that "record" can comprise "multiple rows of information." Construction Order 1 at 51. Although Judge Hubel acknowledged the "preferred embodiment" should be understood as a single row in the table subject to the caveat that it might not work in other embodiments, he specifically rejected Defendant's proposed construction of "multiple records" as "rows of a single relation." Construction Order 1 at 54. This Court adopted Judge Hubel's construction.

3586

Purchase request record

The Court modifies Autobytel's proposed construction and construes the term as "a collection of fields populated by dealer information and buyer information." Dealix argues that the term should be construed as "purchase request formatted for entry into the system database." Dealix contends that there is no intrinsic support for Autobytel's construction and that the Court must turn to extrinsic evidence to construe the term. However, Autobytel contends there is intrinsic evidence, specifically the specification, that supports its construction of purchase request record as "a collection of fields populated with dealer information and validated buyer information." Autobytel argues that the dealer information is part of the purchase request record. To support this conclusion, Autobytel looks to the specification, which states, "The Data Center system receives the purchase request information from the buyer and determines an appropriate seller to receive the purchase request. The Data Center then proceeds to create and store the appropriate purchase request record in the database region exclusively assigned to the seller." Col. 3:5-9. Autobytel contends that this language illustrates that the record must include dealer information if it is to be directed to the appropriate seller. Autobytel also points to the specification's description of Figure 7 as an example of a purchase request record that includes dealer information. See Col. 11:9-18. The specification describes "a set of information fields comprising a new vehicle purchase request record according to one embodiment of the invention" and lists "dealer identification number" as one of the items found in said purchase request record. See id. The Court is persuaded by Autobytel's argument and agrees that the term should be construed to include both dealer information and buyer information. However, the Court does not agree with Autobytel that the word "validated" or "checked" should modify buyer information.

Autobytel cites language from the specification that states, "Once the buyer information is entered, the Data Center moves to a step wherein a check is performed to determine if the buyer has previously submitted a new vehicle purchase request within the previous 48 hours." Col. 15:47-50. Dealix argues this language only demonstrates that one embodiment of the invention includes a step for checking to see if a potential buyer has previously submitted a request and does not justify adding a "validated" or "checked" modifier to buyer information. The Court agrees with Dealix that there is no other mention of any other buyer information being validated or checked in the patent. Accordingly, neither term should be
4. "record of an input channel" & "record of a communication channel"

<table>
<thead>
<tr>
<th>NICE's Construction</th>
<th>Witness's Construction</th>

</thead>
<tbody>
<tr>
<td>Stored voice and/or call information received from an input channel.</td>
<td>A record identified by an input channel.</td>
</tr>
<tr>
<td>Stored voice and/or call information received from a communication channel.</td>
<td>A record identified by a communication channel. 2</td>
</tr>
</tbody>
</table>

2 The Court lists the constructions used by Witness in its claim construction briefings. For reasons the Court cannot discern, Witness proffers different constructions in the "November 8, 2007 Revised Joint Claim Construction Chart."

The parties dispute the meaning of "record of an input channel" and "record of a communication channel," as used in claims 3 and 21 of the '920 patent. NICE contends that its proposal is based on the specification, which echoes the plain meaning of the words, citing col. 10:30-34.

In a particular embodiment directed to storing voice records, the function of recorder stage 104 can be described broadly as creating voice files and providing an associated database with stored call information.

(col. 10:30-34.) NICE further contends that Witness's construction improperly adds the limitation that the record is "identified by the input [or communication] channel." Witness contends that the word "of" in the disputed term equates "identified by," and cites col. 11:14-19 to support its construction.

After reviewing the claims and the specification, the Court concludes that NICE's construction is the correct one. The specification makes clear that a record can be identified by more than just an input channel:

[Records that correspond to different input channels appear to the user as separate files having unique record addresses. In a preferred embodiment, these files are identified by the call record information and contain, for example, information about the caller ID, the date and time of the communication, its duration, and others.

(col. 11:14-23.) Accordingly, the disputed terms are construed without Witness's proposed limitation.
the '707 patent, and Claims 49, 50, 65, and 171 of the '863 patent. The wording of the record structure limitations varies across these claims; however, all include "memory and control means" and the concept of receiving information about callers from the interface structure or the communication facility and then storing, updating, accessing, or testing that information. Thus, the definition of the term "record structure" will be the same across the claims at issue in which it appears.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The plaintiffs argue that "record structure" is not subject to means-plus-function analysis because the term connotes structure to those of ordinary skill in the art. Morganstein testified at the Markman hearing that a person of ordinary skill in the art who had read the Katz patents would have understood "record structure" to refer to a set of structures; Morganstein testified that the record structure would correspond to one of the building blocks of interactive voice applications, including processors, memory, and software. (Transcript volume 1 at 181-182). Larky did not disagree with Morganstein and testified that "record structure" would have connoted structure to those in the field. (Transcript volume 3 at 67-68). The plaintiffs also argue that the phrases "including memory" 14 and "connected to receive said caller data signals from said interface structure" are additional structural descriptions of record structure in the claims which support their position that the term does not implicate 35 U.S.C. § 112, P 6. The plaintiffs' proposed construction of this term is "a hardware device with associated software, including memory and control means, used to store information." (Pls. ' Appendix at 132).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

14 It appears that both sides agree that the term "memory" does not implicate 35 U.S.C. § 112, P 6. Morganstein testified at the Markman hearing that a person of ordinary skill in the art would have been aware of many kinds of "memory," such as RAM, tapes, cassettes, and disks. See Morganstein Testimony, Transcript volume 1 at 106. Thus, the Court construes the term "memory" according to its plain meaning as: computer hardware that stores information, such as disks, RAM, or tapes.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The defendants argue that "record structure" is subject to 35 U.S.C. § 112, P 6 because the term is defined by the function it performs - accessing a file and storing data -- and because it lacks a sufficiently definite structure to those of ordinary skill in the art. The structures that correspond to this term, the defendants argue, are the Processing Unit 92, Memory 98 with storage cells C1 through Cn in Figure 4, and the required wiring to connect these structures together. The defendants argue that "record structure" also corresponds to the required software for performing the disclosed functions. The defendants contend that the only software programs disclosed in the specifications are in the context of the specific "formats" described by Katz, such as game shows, lotteries, and auctions. 15

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

15 The defendants argued as well on other claim terms that the structures corresponding to the means in mean-plus-function limitations included software that was particularly programmed to carry out one of the seven formats disclosed in the specifications or to perform "statistical analysis to isolate a subset." In support of this argument, the defendants submitted the recent case of WMS Gaming Inc. v. International Game Technology, 184 F.3d 1339, 1999 U.S. App. LEXIS 16696 (Fed. Cir. 1999) after the close of the Markman hearing. Upon full consideration of the WMS Gaming case and the letters submitted to the Court by the parties regarding this issue, the Court concludes that the new decision by the Federal Circuit does not require that the software corresponding to the means in these limitations be specifically programmed to perform one of the seven formats disclosed in the specifications or statistical analysis to isolate a subset of callers or data.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Based on contemporary technical dictionaries and the testimony of the experts, the Court concludes that the term "record structure" is not subject to 35 U.S.C. § 112, P 6 because the term would have connoted sufficient structure to those of ordinary skill in the art. The Court construes the term "record structure" to mean: computer hardware and software required to receive data signals, update files, and store information.

The limitations containing the term "record structure" provide that the record structure includes memory and "control
means . . . for accessing a file." The parties agree that "control means" is subject to 35 U.S.C. § 112 P 6. The plaintiffs point to the Processing Unit 92 and Memory 98, including cells C1 through Cn in Figure 4 or Processors PR1 through PRn in Figure 1 as the structures that correspond to "control means." The plaintiffs contend that an alternative structure for control means disclosed in the patents is a microcomputer or microprocessor, such as the Central Processing Unit 251 in Figure 9, programmed to perform the disclosed functions. The defendants agree that the term "control means" corresponds with the structures the plaintiffs have identified, but the defendants contend that the term also must include the associated wiring and software.

The first step in means-plus-function analysis is to identify the function performed by the means; here, the function of the "control means" is to receive calling number identification data, to access a file, and to store data relating to certain of said individuals callers. The Court concludes that the patent discloses that the control means correspond to the Processing Unit 92 and Memory 98, including the cells, C1 through Cn in Figure 4 and the Processors PR1 through PRn in Figure 1. See Column 16, lines 24-28, and 44-46 of the '707 patent and Column 18, lines 21-25 of the '707 patent. In addition, "control means" corresponds to the software that enables these structures to perform the functions of receiving and storing data and accessing files. The Court concludes that the control means also correspond to a microprocessor, such as the Central Processing Unit 251 in Figure 9, programmed to perform the disclosed functions, as such a structure can also perform the disclosed functions of the control means. See Column 5, lines 12-33, Column 9, lines 59 to 67, and Column 21, lines 9-20 of the '707 patent.

The core dispute between the parties in relation to the record structure limitations is over the meaning of the term "accessing." The plaintiffs argue that the term "accessing" includes anything a computer can do to a file, such as creating or opening records or storing additional information entered by callers. The defendants argue that the term "accessing" does not encompass deleting a file or creating or initiating a file because a file must exist before it can be "accessed." The defendants point to passages of the specification in which the ideas of updating a file are distinct from creating a cell in memory in the first instance. See Column 12, line 63-65, Column 16, lines 29-32, and Column 17, lines 29-30 of the '707 patent. Thus, they contend that the term "accessing" must mean retrieving a file that already exists.

In Claim 51 of the '309 patent, Katz recites a "record structure, including memory and control means, . . . for updating a file." This indicates to the Court that the use of the word "accessing" in a similar limitation in another claim connotes a different meaning. Further, although Katz describes updating files and assigning cells in memory as different functions in the specification, there is nothing in the specification that indicates that the term "accessing" could not encompass both of those functions.

Webster's Dictionary defines the verb "access" as "to get at, gain access to." Addenda to Webster's 3rd New International Dictionary at 55a (1986). As a noun, the term is defined as "permission, liberty, or ability to enter, approach, communicate with, or pass to and from" or "freedom or ability to obtain or make use of." The Court concludes that the term "accessing" means in the context of the Katz patents: gaining or obtaining the ability to enter or make use of files. The Court further concludes that the term "accessing" in the context of the Katz patents does not delineate or restrict the types of functions that may be performed on the files once they are accessed, such as updating files, creating new files, or deleting files.
The defendants argue that "record testing structure" is subject to 35 U.S.C. § 112, P 6. The structures the defendants contend corresponds to the function performed by the record testing structure are the Processing Unit 96, the Qualification Unit 93, the Buffer Storage 97, either the Look-up Table 99 or the Use Rate Calculator 100, and the logic within the qualification unit to receive information regarding the calling number from the interface. Further, the defendants argue that the structure corresponding to "record testing structure" cannot be any computer with any type of memory; if this were the case, the defendants argue, 35 U.S.C. § 112, P 6 would have no meaning. The defendants contend that the processing unit must be programmed to receive decoded personal identification data from the callers and to test it against stored data for the callers.

The Court concludes that "record testing structure" implicates 35 U.S.C. § 112, P 6 because "record testing" is clearly a functional term and it does not connote any structure for performing the function of receiving and testing said caller data signals including said calling number identification data and said caller personal identification data against previously stored calling number identification and caller personal identification data. The Court concludes that the structures disclosed in the specification that correspond to "record testing structure" are the Processing Unit 96, the Qualification Unit 93, and the Look-Up Table 99 in Figure 4. See Column 10, lines 1 through 25 of the '707 patent. Contrary to the defendants' contentions, the described functions of the Use Rate Calculator 100 and the Buffer Storage 97 in Column 10, lines 1 through 25 of the '707 patent are not required to perform the function of receiving and testing signals against stored data called out in the claim. Thus, these structures do not correspond to record testing structure.

2. "Recording" and "Storing"

Variations of the words "Record" and "Store" appear throughout the '686 Patent. Illustrative examples are:

"A method of incrementally storing data on a compact disc of the type having a lead-in area, a program area having a plurality of sectors, and a lead out area . . . ."

('686 Patent, col. 18, ll. 65-67.)

"The method of claim 1 including recording with each selected file link information to the recorded location of at least one other selected file."

('686 Patent, col. 19, ll. 22-24.)

Each party's proposed claim construction of "Recording" and "Storing" is as follows:

<table>

</table>

The Court agrees with Optima that "Recording" means "writing information to the CD," as that construction is in line with the ordinary meaning; of the term and there is nothing in the claim language of the '686 Patent to suggest a contrary interpretation. The Court, however, rejects Optima's proposed construction of "Storing" because the plain English meaning of the word suffices. The word "Store" is defined as follows: "To copy (data) into memory or onto a storage device, such as a hard disk." AMERICAN HERITAGE DICTIONARY OF THE ENGLISH LANGUAGE (4th ed. 2000). The Court finds this definition in accord with the language of the '686 Patent 10 and thus adopts it as the proper construction of the term "Store." Moreover, the patent itself makes clear that "Storing" is not limited to a CD (See '686 Patent, Claims 10, 11.)
10 For example, Claim One of the '686 Patent states, "A method of incrementally storing data on a compact disk . . . ." ('686 Patent, col. 18, l. 65-66 (emphasis added)).

<tr>
<td>NICE's Construction</td>
</tr>
<tr>
<td>A device which records IP audio and/or video data.</td>
</tr>
</tbody>
</table>

The parties dispute the meaning of "recording device," as used in claim 1. NICE contends that Witness's construction imposes a negative requirement - "does not require an additional connection or port in the network" - that is ambiguous and is not used anywhere in the specification. Witness contends that NICE distinguished, in a foreign counterpart to the '109 patent's parent (the '106 application), the prior art by disclaiming all recording devices except those that could be connected to a conference call as a participant, "without any need to change the number of connected extensions, etc." (EPO Proceedings., File Hist. for W02001IL0100805, Amend. 3.) In response, NICE contends that the out-of-context quote was made after the '109 patent issued, was made in passing and prefaced by "it should be mentioned," and clearly did not constitute a "clear and unmistakable" disavowal of claim scope.

In light of the claim language and pertinent prosecution history, the Court construes "recording device" to mean "a device which records IP audio and/or video data." Witness has not demonstrated that the prosecution history it cites constitutes a "clear and unmistakable" disavowal of claim scope.

</tbody>
</table>

Plaintiff's construction: a recording layer of a disc

Defendants' construction: [not seeking construction]

Plaintiff requests construction of "recording plane," contending that this term must be construed to clarify that "recording plane" can mean "layers" of a disc and does not refer exclusively to a "side" of a disc. Defendants do not seek construction of this term, contending that plaintiff's proposed construction unnecessarily limits the term to a "disc." I agree with defendants. By limiting "recording plane" to a layer of a "disc," plaintiff's construction is too narrow. Claim 1 recites specifically "a recording medium" rather than a disc. The parties agree that a "recording medium includes, but is not limited to, any single-sided or double-sided disc having any number of recording layers." Defs.' Mot., dkt. 69, at 4; Busey Decl., dkt. 76-2, at 4. The patent specification states that "[t]he present invention relates to a recording medium, such as an optical disc . . . ." '966 patent, 1:9-10 (emphasis added), and throughout the "Summary of the Invention," the inventors repeatedly use the term "recording medium" rather than "optical disc." The words "such as" indicate that the present invention could be applied to recording mediums that are not optical discs. Although the figures in the specification depict an optical disc, the specification states that it is depicting only "an embodiment" of the invention.

In addition, plaintiff's proposed construction is not necessary to clarify the meaning of "recording plane" because the claim itself provides a meaning. Claim 1 states that a recording plane is a construct on which "data is recorded." '966 patent, 16:23-24. Defendants have not argued that a recording plane cannot include a layer of a disc. Dfts.' Resp. Br., dkt. 81, at 33.
("The defendants are not arguing that a recording plane must be limited to a side of a disc.") In fact, defendants state in their brief that recording planes include "the number of recording sides/layers on a disc." Dfts.' Br., dkt. 71, at 50. Because plaintiff's proposed construction is too narrow and is unnecessary to clarify the meaning of "recording plane," I conclude that construction of this term is unwarranted.

**Court's construction: no construction necessary**

C. "Circuit Means For Recording Time Of Energy Use"

Independent claims 5 and 10 disclose a device for recording time of energy use for use with electric meters having a rotatable disc which has a housing containing "circuit means for recording time of energy use." The focus of the parties' dispute with respect to this term concerns the meaning of the phrase "recording time of energy use." Itron contends that the term "must include the ability to determine and record the time that energy is used." Itron's Memorandum, 18:20-21. CellNet asserts that the term is broader than Itron's interpretation:

The ordinary meaning of the words circuit means for recording energy use is much broader than a circuit with an internal clock that tracks time in years, weeks, hours, minutes, and seconds. Ordinary usage would permit tracking energy use with other types of time-keeping circuitry and recording time of use other than by year, day, or hour. For example, time could be measured in terms of usage during high-rate and low-rate time periods.

CellNet's Opening Brief, 20:1-5. During the claim construction hearing, CellNet explained that the term "recording time of energy use" simply refers to the ability to record the number of revolutions over a period of time. CellNet's proposed definition is also set forth in the June 12, 1998 expert report of inventor Larsh Johnson. In the expert report, Mr. Johnson represents that "recording time of energy use means recording energy use over time." Johnson Expert Disclosure, 3:15-17. In short, CellNet argues that the disputed term has nothing to do with recording the time of day, week or year when energy is used.

13 The parties dispute whether the subject term is a means-plus-function limitation. Since the Court has already explained the reasons supporting its conclusion that the term "circuit means" is a structural rather than a means-plus-function element, that discussion will not be reiterated here.

CellNet contends that the term "time of energy use" is a special term that was used for the first time in the '623 patent. CellNet also contends that the term is to be distinguished from the term "time of use" which was well known in the electric utility meter field at the time the purported invention was conceived. According to CellNet, the term "time of use" refers to the ability to record the amount of energy used at certain times of the day, week or year. Itron argues that the terms "time of use" and "time of energy use" are equivalent phrases and have the same meaning. Itron points out the term "time of use," as it is commonly understood by those skilled in the art, clearly refers to the use of energy. Finally, Itron argues that there is no indication or suggestion in the '623 specification that the patentees intended a give "time of energy use" a special meaning.

The Court has reviewed the intrinsic evidence and found no indication or suggestion that the patentees intended to use the phrase "time of energy use" in a special way. In particular, the Court notes that the phrases "time of use" and time of energy use" are used interchangeably in the patent specification with no disclosure to the public that they have different meaning. '623 patent, 1:8; 1:50; 2:42-43; 2:46; 2:49; 2:58-59; 4:21; 4:24; 4:64. The Court also notes that CellNet specifically indicated in its supplemental claim chart and proposed claim construction statement that the first clause of claims 5 and 10, where the phrase "time of energy use" appears, should be given its ordinary meaning. Since the patentees did not expressly or impliedly indicate a special definition, the Court must adopt the common and ordinary definition of the phrase "time of energy use." See Vitronics, 90 F.3d at 1582; and Wolverine, 38 F.3d at 1196.
The Court construes the disputed term "circuit means for recording time of energy use" to mean a circuit for use with standard electric meters capable of recording information regarding the amount of energy used or consumed and the time of day, week or year when the energy was used or consumed. Furthermore, the Court construes the term "circuit means" to mean:

The combination of a number of electrical devices and conductors that, when connected together to form a conducting path, fulfill a desired function such as amplification, filtering, or oscillation. Penguin Dictionary of Electronics (2nd Ed. 1988).

The Court's interpretation comports with the plain meaning of the disputed language and the disclosures made in the specification. Although CellNet contends that the specification mentions the possibility of "recording time of use other than by year, day, or hour," the plain language of the term and the specification contradict this broad reading of the claim element. First, the specification clearly states that the disclosed invention is intended to address the inefficiencies resulting from the different demand levels for electricity during different times of the day:

Since there are peak and slow periods occurring at different times of the day, electrical distribution and generations systems are overloaded at certain times and underutilized at other times. This results in substantial inefficiencies as a much larger generation and distribution system than is economically desirable is required to meet the peak demands. Additionally, the low demand consumer is in effect subsidizing the high demand consumer as they are both charged the same rate for power consumption.

'623 patent, 1:15-24. The patentees then discuss other methods previously employed to attempt to "spread the demand for energy over greater portions of the day." '623 patent, 1:25-27. In each example discussed, the purpose of the method was to equalize electricity demand over different times of the day. '623 patent, 1:25-2:6.

The second reason for rejecting CellNet's proposed construction as overly broad is that the cited portion of the specification does not indicate or suggest the recording of energy use in intervals other than by time of day:

Time-of-day meters measure and record power consumption on a demand meter register during demand intervals of predetermined lengths. The demand register is capable of being engaged at the start of a demand interval, as determined by a program in the meter, and disengaged to terminate the demand interval as determined by an interval counter. The demand intervals occur at fixed times throughout the day.

'623 patent, 2:7-16 (emphasis added). Finally, the specification indicates that the disclosed circuitry is also capable of recording information concerning the time of week or year when the energy is used. '623 patent, 4:38-43. Itron agrees that the circuit means disclosed in the '623 patent allows the user to track energy use by time of day, week and year.

Next, the Court concludes that the proposed definition advanced by CellNet finds no support in the evidence or in reason. As discussed above, the patentees made no effort to distinguish the term "time of energy use" from the equivalent term "time of use" in the patent specification or during the prosecution of the patent. Thus, they have waived their right to claim a special meaning for the term. Furthermore, the Court discerns no meaningful difference between the recording of the amount of energy use over a period of time and the recording of the time of day, week or year of energy use. The very definition of the period of time, in other words, must be performed by reference to a time when the period begins and the time when the period terminates. Otherwise, if the entire function of defining the time of use is left to another device with the required circuitry, which is a possibility suggested by CellNet during the claim construction hearing, then the claimed device is indistinguishable from the prior art. 14

14 CellNet's strained interpretation of "time of energy use" would cover a substantial portion of the prior art. Under CellNet's construction, electric utilities have arguably had the capability of recording energy use over time for decades since their meter readers defined the period (usually the billing month) when energy was consumed.
During the claim construction hearing, CellNet's counsel argued that the following portion of the '623 patent specification also supports its position:

The device measures time of energy use by detecting the rate of rotation of the meter's disc. A black mark (not illustrated) is located on the lower surface of the disc. Sensor means are mounted within a housing of device 10 to detect the black mark as it rotates past an optical port 32 in the top surface 33 of housing 30. The sensor means may comprise an infrared light-emitting diode and a phototransistor that generate a signal in response to the passage of the disc past optical port 32. The rotating black mark interrupts reflection of infrared light to the sensor means, once each revolution. The phototransistor generates a different signal in response to that interruption. The signals are processed and stored by appropriate circuitry in device 10.

'623 patent, 4:24-37 (emphasis added). According to CellNet, the above passage of the specification proves that recording "time of energy use" merely means recording energy use over time since there is no clock or calendar mechanism disclosed. The Court cannot agree. In the above passage, the patentees were simply describing how the claimed device determines the amount of energy used. This is done through the disclosed sensor means which is not incorporated in claim 5 or claim 10. The discussed circuit means has no role whatsoever in the detection of the rate of disc rotation. Thus, there is no suggestion or indication in the above portion of the specification to support CellNet's contention that "recording time of energy use" has a definition other than simply recording the time of day, week or year when energy is used.

4. "records"

The plaintiff contends that the term "records" as used in the '094 Patent means entries in a database. Joint Claim Construction Brief, Exh. A. The defendants argue that as used in the patent, "records" are complete units of related data intended for display on a television screen. Id. The issue is whether all "records" must be "displayable records." I agree with the plaintiff that "records" are distinct from "displayable records" and that the term "records" as used in the claims are not required to be displayable.

The term "records" appears in each of the four claims at issue. Looking to claim 8 as an example, it provides in relevant part that the improvement of the patent involves "constructing a data stream from the records of a transmission database . . . [with] at least one of the first records comprising executable program code or an object." This last provision, "at least one of the first records comprising executable program code," appears in each of the four claims in suit. The specification makes clear that data may be of at least two types--displayable data intended for display, and executable code which is not intended for display--stating:

Broadly the data may be of a displayable nature intended for display and which is termed displayable data in this specification. Alternatively the data may be in the nature of executable code which can, for example, be directly executable by the data manipulator/CPU 123 or can be executable by the data manipulator/CPU after passing through an interpreter (which itself can form part of the control programme) or can comprise look up table data adapted for modification of the behavior of executable code already resident in executable data store 126.

Because the specification provides that executable code is not necessarily displayable, and because the language of each of the four claims at issue expressly provides that at least one record is to be comprised of executable code (which is not necessarily displayable), it is axiomatic that the claims do not require that every record be a displayable record. To construe the claims otherwise would do violence to their unambiguous language.

One of ordinary skill in the art would understand a record to be "an item in a database." The Illustrated Computer Dictionary, 245 (3d ed. 1986). I adopt this construction of the term.
The defendants contend that records must be displayable records, arguing first that such a construction is consistent with the core context of the '094 Patent which employs records to replace the teletext page as a variable sized display unit. The defendants point to the following language of the specification:

It should be appreciated that the present invention described with respect to the first embodiment has many advantages over previous distributed database systems such as Videotex and Teletext. Moreover, the particular concept of using a data record as the basic logic unit rather than a fully formatted page, as is the case with Teletext[,] provides for more records to be transmitted more quickly. This is especially useful if the records are small such as in small advertisements.

Furthermore, the particular method of processing the received information and determining storage before displaying the same and the methodology of searching and displaying selected records instead of complete pages, overcomes many limitations of Teletext. Accordingly, in the present system, the majority of data which is transmitted are actual displayable records, whereas this is not the case in Teletext. Moreover, in Teletext, the pages for eventual display are pre-formatted at the central station and therefore are transmitted as complete pages with display information, formatting characters and display colours. Thus, normally a large amount of empty space must be transmitted in every page that is transmitted making the Teletext method of broadcasting extremely inefficient.

'094 Patent, col. 9, lines 43-65 (emphasis added).

There is nothing inherently inconsistent in using a data record rather than a fully formatted page as the basic logic and display unit, on the one hand, and having both displayable and non-displayable records within the data stream, on the other hand. The specification recognizes this through the use of the distinct terms "records" and "displayable records."

The defendants argue, however, that the specification consistently equates the terms "records" and "displayable records," and that the terms therefore must be construed to have the same meaning, citing Pickholtz v. Rainbow Technologies, Inc., 284 F.3d 1365 (Fed. Cir. 2002). In Pickholtz, the Court of Appeals for the Federal Circuit held:

We agree . . . that the proper construction of the term "computer" follows without ambiguity from the intrinsic evidence . . . The '353 patent uses the terms "computer" and "computer system" as synonyms. Although we would typically be inclined to give meaning to the word "system," rather than regard it as surplusage [citing Elekta Instrument S.A. v. O.U.R. Scientific Int'l, Inc., 214 F.3d 1302, 1307 (Fed. Cir. 2000)], the patent in this case provides no indication that the two terms mean different things. Instead, the patent uses the term "computer system" in the specification and the term "computer" in the claims; nothing in the patent itself explicates their relationship or indicates any difference in meaning.

Here, however, in contradistinction to the facts in Pickholtz, the terms "records" and "displayable records" both appear in the specification. According to the defendants, the term "records" appears 43 times in the specification, 26 times as "displayable records" and 17 times simply as "records."

I do not agree that the terms "records" and "displayable records" are used as synonyms. For example, the specification uses the term "records" more broadly to include displayable and non-displayable records, as follows:

The central station 11 for the purposes of datacasting generally comprises a data store in the form of a computer file server 17 which is adapted to accumulate and store data in the form of digital records to form the database.

'094 Patent, col. 4, lines 26-29.

Thus, it is apparent that "displayable records" are a subset of "records." This distinction is further supported by the fact that the specification provides that "the majority," but not all, "of the data which is transmitted are actually displayable records." Id., at col. 9, lines 56-59. See Johnson Worldwide, 175 F.3d at 989 ("General descriptive terms will ordinarily be given their full meaning; modifiers will not be added to broad terms standing alone").

I construe the term "records" to mean an item in a database.

GO BACK
Also disputed are the construction of the terms "records recovered from the data stream" and "records recovered from the broadcast database records." The specification provides:

In accordance with one broad aspect of the present invention, there is provided a distributed system comprising:

a central station for accumulating and distributing data on a database; and

a plurality of receiver stations for receiving said data. . . .

* * *

a said receiver station comprises: decoder means to receive and decode transmitted data so as to reconstitute said data therefrom. . . .

The specification makes clear that "records recovered from" means records received from a transmission. Those records are decoded so as to reconstitute their data. Reconstitute means to restore to a former condition. Webster's Ninth New Collegiate Dictionary, 984 (1984).

I construe the terms "records recovered from the data stream" and "records recovered from the broadcast database records" to mean records received from the transmission and decoded so as to restore the transmitted data to its former condition.

"Rectifier Circuitry" in the '067 Patent's Claim 4

Another disputed claim from the '067 Patent is its claim 4, which includes as an element:

rectifier circuitry connected with the AC terminals and operative to provide a substantially constant DC supply voltage across a pair of DC terminals.

Nilssen says (and Motorola does not quarrel with the proposition) that "rectifier" has a well known meaning in the relevant art and cites its definition in Penguin at 479: "[a] device that passes current only in the forward direction and can therefore be used as an a.c. to d.c. converter." That definition goes on to elaborate on the typical structure of a rectifier. While Nilssen uses the term "rectifier" not as a noun on its own but as an adjectival noun modifying "circuitry," this Court finds unpersuasive Motorola's extensive efforts (M. Resp. 8-11) to convert that difference in terminology into a difference in analysis.

Just as this opinion has indicated earlier that "inverter" alone would qualify as a sufficient designation of "structure" to satisfy the cases that rely on that factor to take a claim element out of the constraints imposed by Paragraph 6, this Court views "rectifier" alone as equally sufficient to that end. And for that purpose "rectifier circuitry" is really synonymous with "rectifier." Accordingly the use of "rectifier circuitry" in claim 4 of the '067 Patent does not trigger means-plus-function treatment, and that claim element limitation is not subject to Paragraph 6.

"Rectifying and Filtering Circuitry" in the '067 Patent's Claim 21

At long last, the final round of the means-plus-function battle royale involves this language from claim 21 of the '067 Patent:
rectifying and filtering circuitry connected with the AC terminals and operative to provide a substantially constant DC supply voltage across a pair of DC terminals;…

Here M. Mem. 16-17 and M. Resp. 11 advance essentially the same conceptual arguments as to "rectifying and filtering circuitry" that were found wanting as to "rectifier circuitry" in the preceding section of this opinion. Those arguments are no more convincing here, and the same result follows.

That means "rectifying and filtering circuitry" will be construed consistently with the commonly understood meaning of those terms. Once again Paragraph 6 does not come into play.

B. "Recycling the magnetizing energy stored in said transformer to reset it"

Lambda argues that the phrase "recycling the magnetizing energy stored in said transformer to reset it" must be construed to require that all of the magnetizing energy (except for energy loss attributed to the non-ideal nature of circuit components) in the transformer be recycled to reset the transformer. Vicor argues that the claim requires only that sufficient magnetizing energy be returned to the core to reset it, i.e., bring the transformer's magnetic core back to the approximate state of magnetization present at the beginning of the ON period. In Vicor's view, the requirement of "recycling" is met so long as no energy is wasted - that is, dissipated as heat. Thus, energy is "recycled" if it is returned to the source, used to reset the core transformer, or transferred to the load, so long as it is not wasted as heat. This dispute matters because Lambda's devices deliver some of the magnetizing energy to the load during core reset, rather than returning it exclusively to the transformer.

1. It Depends On What the Word "The" Means

The first skirmish involves the word "the." The claim language states "circuitry for recycling the magnetizing energy stored in said transformer to reset it." (Emphasis added). Lambda asserts that the word "the" means all of the magnetizing energy in the transformer. Vicor contends that the claim allows for the possibility that some of the energy may be recycled to reset the core while other energy is delivered to the load. In other words, it argues that the word "the" can mean "some of the," and explains that the word "the" was used to distinguish "the magnetizing" energy from the more general term "energy" that is used earlier in the preamble. Nice linguistic jousting, but the use of the word "magnetizing" alone would have been an adequate adjective to single out the kind of energy intended for recycling. If only some of the transformer's energy needed to be recycled, the word "the" would not have been used.

Lambda's argument that the word "the" connotes all the magnetizing energy is persuasive because it gives ordinary and common sense effect to the word "the" in the claim language. See Merriam-Webster's Collegiate Dictionary 1221 (10th ed. 1993) (giving one definition of "the" as: "used as a function word before a noun . . . to indicate reference to a group as a whole"). This claim thus describes an invention that recycles all of the magnetizing energy to reset the transformer core.

2. Recycle

The determination that all the magnetizing energy in the transformer must be recycled does not resolve the dispute. Vicor argues that the claim requires only that the magnetizing energy that is removed from the core not be discharged dissipatively. In other words, it argues that "recycling" the magnetizing energy includes sending it to the source or the load, so long as it is not wasted as heat.

Again, the place to start in construing the claim is the ordinary meaning of the word "recycling" as it is used in the claim preamble. See CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002) ("Sensibly enough, our precedents show that dictionary definitions may establish a claim term's ordinary meaning.") "Recycle" has a variety of meanings which could apply to Claim One, all of which include the concept of using again:

"1. to treat or process (used or waste materials) so as to make suitable for reuse; recycling paper to save trees. 2. to alter or adapt for new use without changing the essential form or nature of: The old factor is being recycled as a theater. 3. to use
again in the original form or with minimal alteration. The governor recycled some speeches from his early days. 4. to cause to pass through a cycle again: to recycle laundry through a washing machine. 5. to pass through a cycle again; repeat a process from the beginning. 6. to undergo reuse or renewal; be subject to or suitable for further use, activity, etc. The industry will recycle and become profitable once more. 7. The act or process of recycling.

Random House Unabridged Dictionary 1614 (3rd ed. 1993). "Recycle" does not have a special meaning to one skilled in the art of electronic engineers, according to Dr. Paul Horowitz, Vicor's expert.

Both sides point to portions of the specification to support their definition of recycling. "Among the intrinsic evidence, 'the specification is always highly relevant to the claim construction analysis. Usually it is dispositive; it is the single best guide to the meaning of a disputed term.'" Teleflex Inc. v. Ficosa North America Corp., 299 F.3d. 1313, 1325 (Fed Cir. 2002), quoting Vitronics Corp., 90 F.3d at 1582.

Vicor highlights language that uses the word "recycled" in connection with the term "non-dissipative." See e.g., Col. 3, ll. 51-52 ([the "optimal" reset mechanism] should be non-dissipative in nature, i.e., it should recycle the core's magnetization energy), Col. 3, ll. 22 to 25. It points out that a transformer can be reset even if some of the magnetizing energy is not returned to the core. To support the argument that recycling the magnetizing energy does not require that all of the energy be returned to core, Vicor cites a portion of the specification describing a prior art reset method, which states:

"Following time $t[2]$, I decays as magnetizing energy is returned to the voltage source $V[0]$. At time $t[3]$, the recycling of the magnetic energy is completed . . . ."

Col. 2, ll. 8-10. While the meaning of this description of the prior art is elusive, Vicor urges the Court to conclude from this snippet that recycling can occur even when some of the energy is returned to the voltage source, and not returned to the core.

Lambda emphasizes that the claim must be understood in light of the "summary of the invention," which provides:

"Aside from transient conditions, during which the voltage $V_c$ across the storage capacitor changes to adjust itself to a
vaying duty cycle, the magnetizing current mirror and the transformer's core define an essentially closed system: magnetizing energy transferred from the transformer to the storage capacitor is injected back into the transformer within the converter's OFF period. This internal recycling is only incomplete to the extent that non-deal circuit elements give rise to energy losses. These may be accounted for by modifying the resonant circuit of FIG 4d with the addition of resistive components representing the effects of losses associated with the transformer's core, the winding resistance and the equivalent series resistances of the storage capacitor and the auxiliary switch.

Lambda argues that the disputed terms must be understood in light of the specification's twin objectives to create a magnetizing current mirror and to "maximize the flux swing," both of which requires that all of the energy be returned to the core for reset. See Report of Mark N. Horenstein, Ph.D., in Connection with Defendant Lambda Electronic, Inc.'s Opening Brief on Claim Construction, Tab A, pp. 7-8 (pointing out that achieving a magnetizing current mirror requires that all of the magnetizing energy stored in the transformer be recycled.) This is undisputed extrinsic evidence. Indeed, Vicor conceded the point in its Memorandum in Support of the Motion for Partial Summary Judgment in the Unitrode case, p. 5.

Vicor does not dispute the key argument that a device which diverts energy from the core fails to maximize the flux swing in the transformer; and it concedes that no embodiment is presented in which the flux swing is not maximized and in which only some of the energy from the core is recycled to reset the core. Rather, Vicor argues that Lambda has wrongly singled out a description only of a preferred embodiment of the invention and argues that the Court should not limit the language of the claim with the condition of a maximized flux swing.

Vicor's contention that the term "recycling" permits transfer of some of the energy to the load fails for four reasons: First, the description of recycling as a closed system is contained in the self-described "summary of the invention" and "detailed description of the invention," not a description of a "preferred embodiment." Second, every dictionary definition of the word recycle includes the concept of using again. If the magnetizing energy is transferred to load, it can not be used again "to reset the core." Third, transfer of energy to load would defeat two of the objectives of the optimal reset mechanism -- to create a magnetizing current mirror and to "maximize the flux swing" -- which are stated at least twice in the patent itself. The prosecution history provides additional intrinsic evidence that the inventor Vinciarelli considers this flux swing part of the invention, stating: "This invention is non-dissipative, maximizes the available flux swing, minimizes the voltage stress on the switch of the primary winding, and simplifies transformer construction as it can be implemented without auxiliary windings." (Vinciarelli Response to Office Action, July 13, 1983, at 2). Fourth and finally, while there is a prior art description which might be stretched to read that the term "recycling" could mean transferring energy back to source (rather than to the core), there is no persuasive intrinsic evidence to suggest that transfer to load is included within the meaning of recycle.

Accordingly, based on the ordinary and accustomed meaning of the claim terms "recycling" and "the", and the description of the invention in the specification, I adopt Lambda's claim construction.

A. The "Recycling" Limitation

On appeal, VLT first contests the district court's construction of the phrase "recycling the magnetizing energy stored in said transformer to reset it." VLT asserts that the "recycling" limitation requires that the magnetizing energy removed from the transformer's core be put to some use, which may include powering the load, and not be dissipated as heat. Artesyn, Lambda, and Lucent respond that the court did not err in interpreting the "recycling" limitation to require that all of the magnetizing energy removed from the transformer's core be returned to the transformer to reset it.

We agree with Artesyn, Lambda, and Lucent that the district court correctly interpreted the "recycling" limitation. To begin with, claim 1 provides that "recycling the magnetizing energy" occurs for a specific purpose: to reset the transformer. The claim language itself thus suggests that "recycling" involves returning the magnetizing energy to the transformer. In addition, the specification clearly teaches that the claimed reset mechanism returns all of the transformer's magnetizing
energy back to the core. The summary of the invention explains that the invention resets the transformer's core by implementing a "magnetizing current mirror," which takes the magnetization at the end of the primary switch's ON period and reflects it through the storage capacitor to create a "mirror image" of the magnetization prior to the next conversion cycle. '098 patent, col. 4, ll. 9-13. Resetting the core's magnetization to its "mirror image" - i.e., a value that is equal in magnitude but opposite in orientation - enables the reset mechanism to maximize the available flux swing. Id., col. 4, ll. 20-26 ("The new apparatus . . . maximizes the available flux swing, as it creates a mirror image of the magnetic flux between ON periods . . . "). Resetting the core's magnetization to its mirror image and maximizing flux swing can only be achieved by recycling all of the transformer's magnetizing energy to the core. The specification thus teaches that "recycling the magnetizing energy" to reset the transformer requires all of the magnetizing energy to be returned to the transformer.

VLT argues, however, that the specification refers to the use of a current mirror and the maximization of flux swing only as objectives that are implemented in the preferred embodiment. We disagree. Not only do all of the disclosed embodiments utilize a current mirror, but the patent explains that the invention, in all its varied forms, employs a magnetizing current mirror as its reset mechanism. E.g., id., col. 7, ll. 12-14 ("A different perspective on the operation of the magnetizing current mirror as a reset mechanism for single ended forward converters is offered by FIG. 4d . . . "); id., col. 7, ll. 60-63 ("Useful variations of the new reset mechanism are indeed obtained by connecting the mirror in parallel with different transformer windings."). Furthermore, as discussed above, the specification repeatedly and consistently describes the claimed invention, and not just the preferred embodiment, as a current mirror that maximizes flux swing. The patent thus leaves no doubt that the claimed invention requires all of the magnetizing energy to be returned to the transformer.

Accordingly, we affirm the district court's construction of the phrase "recycling the magnetizing energy stored in said transformer to reset it" as requiring that all of the magnetizing energy removed from the transformer's core be returned to the transformer to reset it. As such, claim 1 does not read on reset mechanisms that transfer some of the transformer's magnetizing energy to the load.

3599

(7) In claims five, eight and nine, the term "red wavelength spectral range." Defendants submit that the term "red wavelength spectral range" should be given its ordinary meaning and that to people skilled in the art, that range is approximately 620 to 800 nanometers. Plaintiffs argue the specification only provides for a definition of about 630 nanometers, but would agree to a range of 615 to 685 nm. 613 Patent at 6:48; 7:43-44; Plaintiffs' Proposed Claim Construction Order.

Defendants' expert, Dr. Walmsley, explained that a person of ordinary skill in the art would understand the term to mean that there is a "range of wavelengths associated with this light and that it had to do . . . with illuminating the particular fluorophore in the target material." Tr. 223-24. He explained the range is somewhat indefinite in that people of ordinary skill in the art understand that it is not precisely defined. Tr. 224. 630 nanometers is given as an example of light in the red spectral range, it is not a definition. Tr. 226. Dr. Walmsley submitted that figure 2 of the patent contemplates a situation in which red would be 730 nm. Tr. 228. Further, he testified that what people see as red can vary because the determination is somewhat physiological, but generally the range is 600 to 800 nm. In support of this range, Dr. Walmsley read from two textbooks that described red as 622 to 780 nm and 620 to 800 nm, respectively. Tr. 232-35. Additionally, Dr. Walmsley testified that Zeiss' own website describes the red range as including 780 nanometers. Tr. 304. Dr. Svoboda testified that the term is somewhat opaque in that people do not agree on a precise range, he has seen 600 to 800 nm as the broadest range and 620 to 750 nm as the narrowest. Tr. 343.

Dr. Fraser testified in support of Plaintiffs' definition that people skilled in the art would understand the red range to include 615 to 685 nm. Tr. 500. Yet, as discussed above, he admitted that up to 800 nm could be seen as red. Tr. 502.

As the Court is not convinced that the patent or its prosecution history provides definitive guidance on this term, it must rely on extrinsic evidence to determine what people skilled in the art in 1991 understood the red range to cover. Key Pharm. v. Hercon Labs. Corp., 161 F.3d 709, 716 (Fed. Cir. 1999) (approving use of extrinsic sources when intrinsic evidence is not sufficient to construe a patent term); Wiener v. NEC Elecs. Inc., 102 F.3d 534, 539 (Fed. Cir. 1996) (noting the Court must consider the term's meaning at the time of patent application). Dr. Walmsley read from a textbook entitled Optics, by Eugene Hecht. The book was originally published in 1974 and reprinted with corrections in 1990. It supported a red range
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

from 622 to 780 nanometers. Defendants' Markman Exhibit 9. 10 Accordingly, since the Plaintiffs' expert agreed that the red range could begin as low as 615 nanometers and the Optics textbook supports an upper limit of 780 nanometers, the Court will define the red spectral range as "615-780 nanometers."

--- Footnotes ---

10 The second text from which Dr. Walmsley read was Chemistry, by James Birk, published in 1994. Defendants' Markman Exhibit 8. Although it supports a definition of red in the 620-800 nanometer range, the Court will not rely on it since it was published after the 613 Patent was accepted.

--- End Footnotes ---

3600

G. "redirection server"

Claim 1 contains the term "redirection server": "a redirection server connected to the dial-up network server and a public network," "wherein the authentication accounting server . . . communicates the individualized rule set . . . to the redirection server," and "wherein data directed toward the public network from the one of the users' computers are processed by the redirection server according to the individualized rule set." "Redirection server" is found throughout the '118 patent's specification:

The redirection server [] is logically located between the user's computer [] and the network, and controls the user's access to the network . . . . The redirection server [] receives the IP address and rule set, and is programed to implement the rule set for the IP address, as well as other attendant logical decisions such as: checking data packets and blocking or allowing the packets as a function of the rule sets, performing the physical redirection of data packets based on the rule sets, and dynamically changing the rule sets based on conditions.

('118 patent, 4:50-52 & 59-66) (emphasis added). The plaintiff asserts the following construction of this term: "hardware and/or software that dynamically controls the user's access to the network." The defendants' proposed construction is "a server that causes a user to be sent to a location other than the one requested by the user."

According to the defendants, the plain meaning of "redirection" requires the redirection server to redirect traffic, i.e., "cause[] a user to be sent to a location other than the one requested by the user." But the specification teaches that the redirection server performs functions other redirecting, such as blocking or allowing packets. This additional redirection server functionality is confirmed by dependent claims 2 and 3: "wherein the redirection server further blocks the data" and "wherein the redirection server further allows the data." Based upon the specification's explicit description of the redirection server, quoted above, the court construes the term to mean "a server logically located between the user's computer and the network that controls the user's access to the network."

---

1. "Redirector String"

IDNT argues that "redirector string" should be construed as "delegation instructions -- information that is part of a path under a root -- for enabling domain name servers to provide information (e.g., an IP number) corresponding to a compliant domain name request." VeriSign contends that "redirector string" means "one or more contiguous domain labels, including a top level domain that was not part of the originally entered domain name, which identify the domain name server responsible for resolving the transformed compliant domain name."

In the language of the claims, the "redirector string" is identified only as something that "includes information for resolving" the compliant domain name or the domain name request. The parties agree that "redirector string" does not have an ordinary
meaning and is not generally known in the art. In such cases, the specification of the patent becomes the best source of meaning. Novartis Pharmaceuticals Corp. v. Abbott Labs, 375 F.3d 1328, 1334-35 (Fed. Cir. 2004). Both sides find support for their proposed constructions in the specification. VeriSign also claims that the prosecution history supports at least part of its proposed construction -- the requirement that the TLD in the "redirector string" not be entered by the user. IDNT argues, however, that the prosecution history does not shed light on the meaning of "redirector string."

a. IDNT's proposed construction

IDNT argues that "redirector string" means "delegation instructions," as stated above. IDNT cites to the specification, which states that "the redirector string . . . provides delegation instructions for resolving the compliant domain name," col. 2, lines 49-53; that "the redirector information . . . provides delegation instructions for resolving the international domain name," col. 8, lines 1-3; and that "the redirector information controls the delegation path for resolving the domain name," col. 8, lines 32-37. VeriSign contends, however, that none of the statements in the specification actually defines what a "redirector string" is, suggesting that stating what something provides is not the same as stating what it is.

IDNT asserts that "delegation instructions" is commonly understood to mean "information that is part of a path under a root," citing Paul Albitz & Cricket Liu, DNS and BIND (3d ed. 1988) ("Albitz") chapter 2.0. 9 IDNT describes the concept of the "delegation path," from root to TLD to SLD, and explains that this delegation path enables a domain name server to resolve the domain name. IDNT argues that the specification of the 148 patent provides a specific example as to how such "delegation instructions" are used for resolving IDNs, and an explanation of what they are and what they do to facilitate resolution. The example cited by IDNT states that the "redirector information" ar.i18n.net "provides the following exemplary delegation instructions for resolving the international domain name."

The "i18n" identifies the domain name as "international" and the "ar" further identifies it as being in Arabic which is determined from the UNICODE range of the domain name characters. The domain resolution is explained as follows. The transformed compliant domain name including the redirector information is received by the domain name server 30 where it is attempted to be resolved. The domain name server 30 identifies the top level domain ".net" for which it is not an authoritative DNS. As such, the domain name server consults an authoritative root server which is responsible for net domain, for example, root server m from the root server group 35. Examining the second level domain "i18n", root server m determines from its database that the authoritative domain name server for this domain is, for example, DNS2 40. DNS1 30 then communicates the entire domain to DNS2 40. DNS2 40 first determines whether it is authoritative and delegated for this domain by scanning its database of registered domains. In this case, DNS2 40 determines from the redirector information that the delegated server for "ar.i18n.net" (Arabic domains) is the root server i3 from root server group 60. The resolution continues in the predescribed manner until the authoritative DNS for the current domain is determined which returns the IP number of the domain name. The foregoing example assumes that the domain "i18n.net" and sub-domain "ar.i18.net" were properly pre-assigned and registered to the appropriate root servers and domain name servers.

Col. 8, lines 1-31. IDNT does not analyze this example, however, or explain it any further other than to assert that "the specification describes precisely how the path under the root is traversed in order to resolve a domain name."

9 Albitz states that "the term delegation refers to assigning responsibility for a subdomain to another organization."

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

VeriSign contends that "delegation instructions" is an undefined term without an ordinary meaning. VeriSign disputes IDNT's assertion that the phrase "delegation instructions" is well-known and commonly understood in the art to mean "information that is part of a path under a root." VeriSign asserts that the Albitz reference does not support IDNT's proposed construction, noting that Albitz discusses "delegation" in the context of the delegation of subdomains by the organization that administers a given domain, much as a manager delegates responsibilities to his/her subordinates. VeriSign argues that "delegation" -- which involves the granting of authority to someone else over something that is currently controlled by the person or thing doing the delegating -- is not analogous to the description of "redirector string" or "redirector information" as it appears in the 148 patent, because a "redirector string" does not grant authority over anything to anyone.
VeriSign notes three differences between the concept of "redirector string" and "delegation." First, delegation occurs in a domain name server controlled by a domain name registrant, whereas a redirector string would reside in an Internet user's application or resolver. Second, delegation is executed by the registrant of a particular domain name or domain name server to give authority to another zone, whereas a redirector string can be created by anyone (such as by an application) to alter the resolution of the domain name to which a redirector string is appended. Third, delegation is analogous to instructions that configure a domain name server or system to function a certain way, occurring relatively rarely, while a redirector string is analogous to an instruction to go to a particular place, and is automatically generated each and every time an IDN is accessed,

b. VeriSign's proposed construction

VeriSign claims that the purpose of a "redirector string" in the 148 patent is to "provide a particular transformed IDN (in compliant format) with a specialized international" TLD . . . where that IDN can be resolved." VeriSign argues that the specification and the prosecution history reveal several essential characteristics, which, taken together, define a "redirector string" in the 148 patent. VeriSign contends that "redirector string" means "one or more contiguous domain labels, including a top level domain that was not part of the originally entered domain name, which identify the domain name server responsible for resolving the transformed compliant domain name."

First, based on the examples in the 148 patent, VeriSign claims that a "redirector string" includes one or more contiguous domain labels. As indicated above, a domain label is part of a domain name, and consists of a string of characters delineated by dots. The specification states that "any identifiers can be used to represent a domain set." Col. 8, lines 3-4. The specification states further that "the redirector information can be a single unique top level domain which identifies an international root server," referred to as an "iroot server," or "may include multiple levels of identifiers such as "ar.i8n.net." Col. 8, lines 34-37. Put another way, the examples of redirector information provided in the specification all consist either of one domain label or of multiple contiguous domain labels.

Second, based on the specification, VeriSign asserts that a "redirector string" in the 148 patent must include a TLD. The specification identifies a string -- "ar.i8n.net" -- as "redirector information" that is "appended to" the converted string of domain labels and which "functions like a top level domain" and "identifies the authoritative domain name server responsible for the current domain name." Col. 7, lines 50-54. The specification states further that a domain name becomes a fully-qualified domain name once "redirector information" is appended to the domain name. Col. 7, lines 54-58. According to the Albitz reference, a "fully-qualified domain name" must, by definition, include a TLD. As explained in the patent, a compliant domain name can be resolved only if it is a fully-qualified domain name, thereby including by definition a TLD that identifies the domain name server responsible for resolving the compliant domain name, Id.

Third, VeriSign argues that the TLD in the "redirector string" cannot be part of the originally entered domain name. VeriSign contends that this requirement is established by the fact that every embodiment of the 148 patent requires a TLD that is not part of the originally entered domain name, and by the fact that the only detailed example in the 148 patent that attempts to explain how to append a "redirector string" to a domain name does not include a TLD in the string entered by the user (citing to col. 7, lines 5-46, where the entered foreign script or text does not include a TLD and the TLD appears for the first time as part of the "redirector information"). 10 VeriSign argues that this requirement is also implied by the definition in the specification -- "the redirector information . . . is appended to the converted string and functions like a top level domain" (citing col. 7, lines 50-53).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 The specification includes two additional examples in which the TLD portion of the "redirector string" is not part of the originally-entered IDN, but rather is automatically provided by the computer system running the translation process.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -
resolution of the entered IDN. The Examiner found that the claims of the 148 patent application were anticipated by prior art (the i-DNS reference).

In response to the Examiner's rejection of the claims, the applicant added the word "automatically" to the phrase "generating a redirector string" in each of the independent claims, arguing that this distinguished the claimed invention from the prior art, where the user entered the redirector information. The applicant argued that "with the present method, international domain names can be used with existing internet protocols" and "without additional steps performed by a user." VeriSign claims that these "additional steps" referred to by the applicant include the entry of a TLD by the user as defined in the i-DNS reference. In other words, in the system claimed in the 148 patent, the user does not need to input or even to know what TLD is required to resolve an IDN. Thus, VeriSign claims, the patent requires that the system automatically generate the "redirector string" without any user input of the TLD or any other portion of the redirector string.

IDNT contends that the patent provides no basis for construing "redirector string" as argued by VeriSign, and asserts that the three "essential characteristics" are not defined in the specification, the claims, or the prosecution history. First, IDNT argues that it is not essential for a "redirector string" to include one or more domain labels. IDNT cites to the statement in the specification which states that "any predetermined string can be used to identify an international domain and identify a responsible server." Col. 9, lines 1-2. IDNT contends that there is no requirement in the 148 patent that the "redirector string" include a single label, let alone one or more contiguous labels. IDNT asserts that according to the 148 patent, a "redirector string" need only be delegation instructions, and any "predetermined" string can suffice. IDNT argues that examples from the patent specification cannot not be read into the claims as limitations, and that claims of a patent cannot be limited by preferred embodiments.

IDNT also contends that the requirement that a "redirector string" include "one or more contiguous labels" contravenes the doctrine of claim differentiation. This doctrine provides that an independent claim is to be afforded a broader scope than a claim that depends from it. AK Steel Corp. v. Sollac and Ugine, 344 F.3d 1234, 1242 (Fed. Cir. 2003). In the case of the 148 patent, claim 30 depends from claim 28. Claim 28 recites "[a] software program . . . comprising . . . instructions for performing the following steps: . . . automatically generating a redirector string which includes information for resolving the domain name request." Claim 30 recites "[a] software program . . . including instructions for automatically generating the redirector string where the redirector string identifies a domain name server for resolving the transformed compliant domain name." Under the doctrine of claim differentiation, claim 28 must be interpreted as broader than (or at least not narrower than) claim 30. Thus, the "redirector string" in independent claim 28 can include, but is not limited to, a "redirector string" that identifies a domain name server. IDNT contends that VeriSign's interpretation requiring "one or more contiguous labels" -- which IDNT claims effectively requires that the "redirector string" identify a domain name server -- cannot be correct.

Finally, IDNT asserts that it is not necessary for a "redirector string" to include a top-level domain. IDNT points to the specification, which states at col. 8, lines 34-35, that "the redirector information can be a single unique top level domain." IDNT argues that there is nothing in the specification that requires that the "redirector information" include a TLD, and asserts that the inventor's use of the open-ended word "can" -- as opposed to "must" -- mandates the opposition conclusion. IDNT claims that the DNS tree could be structured so that the "redirector string" functions as an SLD, rather than a TLD.

IDNT also disputes VeriSign's contention that it is necessary under the 148 patent for the "redirector string" to include a TLD because the patent does not teach through experimentation or example what a "redirector string" would look like if the user entered a TLD with the IDN. IDNT asserts that while it is true that a patent application must adequately disclose the claimed invention, it is not necessary that there be a description of "every nut, bolt, or detail used to practice the invention." IDNT claims that a person skilled in the art would know that a prerequisite for any implementation of IDNs is a set of rules governing how IDNs are handled in DNS, including the way a "redirector string" is generated. Once those rules are set, it would be a simple matter of routine programming to generate the "redirector string."

c. construction of "redirector string"

The court finds that VeriSign's proposed construction is the better of the two. While it is true, as IDNT contends, that the specification indicates that the "redirector string . . . provides delegation instructions," that does not mean that the "redirector string" is delegation instructions. Moreover, as VeriSign persuasively argues, the concept of "delegation" -- a term that is well-known in the art -- is not analogous to the concept of "redirector string" or "redirector information" as it
appears in the claims of the 148 patent, because a "redirector string" does not grant authority over anything to anyone. Nor can "delegation instructions" (or "redirector string") be defined in turn as "information that is part of a path under a root." As VeriSign's counsel noted during the hearing on claims construction, "information" can mean anything or everything, and "the path under the roof includes everything in the Internet.

One of the questions underlying the parties' dispute with regard to the construction of "redirector string" is the extent to which the specification should limit the construction, in a case where there is no common meaning for the disputed term and the patentee did not directly indicate a definition. The general rule is that the court is required to interpret the claims in light of the specification, but must avoid impermissibly importing limitations from the specification. The balance between the two turns on how the specification characterizes the claimed invention. Alloc, Inc. v. Int'l Trade Com'n, 342 F.3d 1361, 1370 (Fed. Cir. 2003), cert. denied, 158 L. Ed. 2d 963, 124 S. Ct. 2390 (2004).

In this respect, the court looks to whether the specification refers to a limitation only as a part of less than all possible embodiments or whether the specification read as a whole suggests that the very character of the invention requires the limitation be a part of every embodiment. For example, it is impermissible to read the one and only disclosed embodiment into a claim without other indicia that the patentee so intended to limit the invention. On the other hand, where the specification makes clear at various points that the claimed invention is narrower than the claim language might imply, it is entirely permissible and proper to limit the claims.

In a case such as the present one, where a term has no meaning outside of the patent, the general rule that the court cannot read limitations into the claims from the examples in the specification does not apply in the same way. Instead, the specification may act as a dictionary when it defines the claim terms by implication, just as when it expressly defines claim terms. See Vitronics, 90 F.3d at 1582. When a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term "by implication." Bell Atlantic Network Servs., Inc. v. Covad Communications Group. Inc., 262 F.3d 1258, 1271 (Fed. Cir. 2001); see also Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1344 (Fed. Cir. 2002) (while it is true that the claims define the scope of the right to exclude and that the claim construction inquiry begins and ends in all cases with the actual words of the claim, the written description can provide guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitonal format).

VeriSign's proposed construction finds support in both the specification and the prosecution history. First, the "redirector string" must include a TLD. The specification states that "[a] redirector string . . . includes information for resolving the RFC1035 compliant domain name" and is "appended to the RFC1035 compliant domain name." Col. 1, lines 61-64. This "redirector information . . . functions like a top-level domain," and once it is appended to the compliant domain name, "the domain name becomes a fully qualified domain name" that includes at least a TLD and a SLD, "which is enough information to resolve the domain name." Col. 7, lines 49-57.

Second, the "redirector string" contains one or more contiguous labels. 11 The only way to specify a TLD is with a label. According to the specification, the redirector information "can be a single unique top-level domain" -- a single label -- or it "may include multiple levels of identifiers" -- several contiguous labels. See Col. 8, lines 34-37. The court does not agree with IDNT that this construction violates the principle of claim differentiation as to claims 28 and 30. It is true that a "redirector string" in claim 28 can include, but is not limited to, a "redirector string" that identifies a domain name server for resolving the compliant domain name. However, it does not follow from this that defining "redirector string" as having one or more contiguous labels effectively requires that the "redirector string" identify the domain name server responsible for resolving the compliant domain name.

--- Footnotes ---

11 It is more accurate to say that a "redirector string" consists of either a single label or two or more contiguous labels.

--- End Footnotes ---
requires a TLD that is not part of the originally entered domain name. Moreover, the only detailed example that explains how to append a "redirector string" to a domain name does not include a TLD in the string entered by the user. See col. 7, lines 5-46.

This requirement is also reflected in the prosecution history, which indicates that the patent applicant added the word "automatically" to the phrase "generating a redirector string" in the independent claims, arguing that this distinguished the claimed invention from the prior art (where the user entered the information). It is well-established that statements made during prosecution are used to interpret the scope and meaning of ambiguous claim terminology. Schumer v. Lab. Computer Sys., Inc., 308 F.3d 1304, 1312 (Fed. Cir. 2002) (citing Vitronics., 90 F.3d at 1582).

**3602**

H. "Redirects the Client Computer to a Post Login Page on the Personal Information Provider" ('245 Patent)

This phrase appears in independent claim 1 of the '245 patent. CashEdge construes this language to mean "redirects the client computer to automatically log onto and be connected to a post-login page on the provider's Web site without user input," while Yodlee again asserts that no construction is necessary. The Court agrees with Yodlee; read in context, it is clear that the redirection of the client computer to the post login page does not involve further user input other than what has already taken place in the first portion of claim 1(b). '245 patent col. 17, lines 7-15. **Construing this claim is thus unnecessary, and would needlessly complicate jury instructions at trial.**

**3603**

1. "method of operating the instrument at a reduced power consumption level"

Plaintiffs' construction: a method of using the portable ultrasonic diagnostic instrument for its intended purpose, including acquiring and/or displaying ultrasonic images, on no more than 25 watts of electrical power

Defendant's construction: a method of operating the instrument by altering the function of selected circuits to reduce power consumption by those circuits

The parties disagree about two aspects of this claim language. First, plaintiffs argue that the phrase "method of operating the instrument" requires construction; defendant does not believe that construction is necessary. Next, the more substantive dispute relates to whether the phrase "reduced power consumption level" means no more than 25 watts of power.

I turn first to the phrase "method of operating the instrument." Plaintiffs contend that it is necessary to import the limitation that "operating the instrument" means "using" it for its "intended purpose." However, this limitation is not supported by the cited portions of the patent specification. Nor is it clear that the phrase "using the portable ultrasonic diagnostic instrument for its intended purpose" is any more clear than the claim language itself. Therefore, I conclude that no construction is necessary.

In contrast, the patent specification provides numerous references to a 25-watt limitation. Throughout the patent specification, the patentee describes an instrument that "operates on no more than 25 watts of electrical power." e.g., '651 pat., Abstract; Id. at col. 2, Ins. 11-12. In fact, the Summary of the Invention begins by explaining "In accordance with the invention a portable ultrasonic instrument is provided . . . wherein the instrument operates on no more than 25 watts of electrical power." '651 pat., col. 1, Ins. 66-67, col. 2, Ins. 5-6 (emphasis added). This is not a reference to a particular embodiment of the invention, but rather the description of "the invention" as a whole.

In the face of this strong evidence that the patent discloses a particular power consumption limitation, defendant argues that limitation applies only to claims 14 through 26 of the '651 patent, which are apparatus claims, and not to claims 1-13, which are method claims. The apparatus claims all include a specific reference to the 25-watt power consumption level, while the method claims do not. However, this argument is not persuasive. As defendant itself argued at other points in its claim
construction materials, claim language may be limited by unambiguous statements included in the specification. The court of appeals explained in Phillips, 415 F.3d at 1315,

The claims, of course, do not stand alone. Rather, they are part of a fully integrated written instrument, consisting principally of a specification that concludes with the claims. For that reason, claims must be read in view of the specification, of which they are a part. . . . [T]he specification is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.

(citations and quotations omitted). Given the unambiguous limiting language included in the Abstract and the Summary of the Invention, I conclude that it is proper to read claim 1 of the '651 patent to include a 25-watt power consumption limitation.

3604

9. "reference"

The term "reference" is found in four claims of the '374 patent (claims 1, 4, 7, 9). Informatica proposes the construction "A denotation of shareable metadata." BODI proposes the construction "Metadata is accessed through the use of an object reference, i.e., a shortcut. Basically, a reference points to the object stored in the global repository. Rather than storing an object directly in each of the data marts desiring to access that particular object, a reference to that object is stored instead in those data marts. By using multiple references, the same object can be accessed, used, and shared by multiple users across many different data marts." Once again, Informatica's proposed construction is too vague and BODI's proposed construction is too narrow. The Court declines to adopt either construction.

The patent discloses in several places throughout the specification that a reference is an abstraction for pointing to an object, which may be stored in various places. This definition is consistent with the use of the term in claims one, four, seven, and nine. The claims instruct that references residing in various data marts "specify a link to metadata in the shared folder," or "point[] to the metadata residing within the global repository" or "specify a link to where the metadata is stored in [a particular] database." Thus, in the context of the '374 patent, a reference is an abstraction for either denoting or pointing to the contents of a shared folder, which may reside in either the same repository or in the global data mart repository.

The Court construes the term "reference" to mean: A reference represents an abstraction for pointing to the contents of a shared folder within the same repository or in the global data mart repository.

3605

5. reference file

Hyperion's construction of "reference file" is "computer instructions that tell the computer how to extract data from a database and where to place that data in a spreadsheet." OutlookSoft asserts that the proper construction is "a modified worksheet that begins with one or two predefined characters (for example a pound sign (#) or a double pound sign (##)) used to tell the computer how to extract data from a database and where to place that data in the modified worksheet."

OutlookSoft points to the specification to support its construction:

After a worksheet is selected, it is modified by the addition of codes in the first column and row of the worksheet which tell the computer system what data to extract from the database and where to display it in the modified worksheet. This modified worksheet is referred to as a reference file.

Thus, OutlookSoft is correct that the specification requires that the reference file be, at a minimum, some sort of modified worksheet. Where OutlookSoft goes wrong is in the attempt to incorporate additional limitations from the preferred embodiment into its construction. Accordingly, "reference file" means a "modified worksheet that includes computer instructions that tell the computer how to extract data from a database and where to place that data in a spreadsheet."

3. "Reference generating mechanism for generating a user-defined reference to aggregated fact data generated by the aggregation module"

The court concludes that the term "reference generating mechanism" as used in claim 1 would connote sufficient structure to one skilled in the art to construct that component. As with the previous terms, technical dictionaries suggest that generating "references" is something that a person of ordinary skill in the art could do. Cf Microsoft Computer Dictionary 378 (4th ed 1999) ("[to] reference * * * "To access a variable, such as an element in an array or a field in a record"). And again, the claim language provides some structure to guide a would-be programmer. Moreover, as mentioned earlier, a "reference" may simply be a "pointer" in some embodiments; common sense indicates that at least in these situations, one skilled in the art would be capable of creating a program that generates something as basic as a pointer. Accordingly, the court rejects Hyperion's proposed means-plus-function construction and declines to construe this term.

There are two phrases that use the term "signal." The court agrees with O2 that the patent uses the term signal according to its ordinary meaning. As such, the court defines the term "reference signal" to mean "a signal that provides a reference" and "frequency selection signal" to mean "a signal used to select a frequency."
G. Reflecting surface/Reflecting surface on the tip of the waveguide

AMS maintains that no construction of "reflecting surface on the tip of the waveguide" is required other than a construction of "reflecting surface" and "tip of the waveguide." As a construction for "reflecting surface," AMS proposes "surface that internally reflects essentially all of the incident electromagnetic radiation communicated by the waveguide." LP offers "an angled surface of the prism or the bevelled far end of the optical fiber having a core cladding over a fiber core and may include a reflective coating" as a construction of "reflecting surface on the tip of the waveguide." Having construed "tip of the waveguide," the Court turns to the construction of "reflecting surface."

Claims 1 and 25 recite "a reflecting surface . . . for internally reflecting electromagnetic radiation communicated by the waveguide in a direction lateral to the propagation direction toward a particular area on the transmitting surface" and "a reflecting surface . . . for internally reflecting electromagnetic radiation communicated in the first propagation direction by the waveguide in a second propagation direction toward the transmitting surface." Claim 25 recites that the first propagation direction is "to the tip of the waveguide." Accordingly, the claim language indicates that the reflecting surface is a surface that internally reflects electromagnetic radiation that is communicated by the waveguide toward the tip in a direction lateral to the propagation direction.

With respect to LP's inclusion of the terms "angled surface of the prism" and "bevelled far end of the optical fiber," the Court finds no support in the specification or prosecution history for limiting "reflecting surface" to the embodiments disclosed in the specification. See Phillips, 415 F.3d at 1323. Moreover, the doctrine of claim differentiation weighs against including these limitations because claim 2, which depends from claim 1, recites "wherein the reflecting surface comprises a bevelled surface." See Nazomi Commc'n's, 403 F.3d at 1370.

AMS asserts that "internally reflects" means "total internal reflection," which occurs when all angles of incidence on a surface are greater than the critical angle such that none of the incident light propagates through the interface of the surface and adjacent medium. This contention is supported by the explanation in the specification that essentially all light incident on an interface between two substances is internally reflected when the angle of incidence on the interface is greater than the critical angle, which is a function of the indices of refraction of the substances, see '699 Patent col.6, l.57-col.7 l.3, and by the explanation in the Abstract that internal reflection off the transmitting surface is prevented when electromagnetic radiation is incident on the transmitting surface at below the critical angle. The specification also explains that the bevelled end in Figure 5b must be at an angle above the critical angle to cause the internal reflection of incident light off the bevelled end at an angle lateral to the longitudinal axis of the waveguide. '699 Patent col.7 ll.4-11.

In addition, AMS offers the declaration of Tom D. Milster, a Professor of Optical Sciences, Electrical Engineering and Computer Engineering, in support of its construction of "internally reflects." Milster states that "total internal reflection" occurs when no light propagates through an interface because all angles of incidence are greater than the critical angle. He further states that a person of ordinary skill in the art would understand "internally reflects" to mean "total internal reflection." LP offers no evidence indicating that a person of ordinary skill in the art would not construe "internally reflects" as "total internal reflection" or that "total internal reflection" does not occur when all angles of incidence on a surface are greater than the critical angle such that no light propagates through the interface. The Court concludes that "internally reflects" refers to total internal reflection, which occurs when all angles of incidence on a surface are greater than the critical angle.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 In two footnotes in its response brief, LP purportedly moves to strike the Milster Declaration on the ground that its submission violates the scheduling order in this case. A "motion to strike" contained in a footnote in a response brief does not comply with the requirements for non-dispositive motions set forth in Local Rule 7.1(a). The Court declines to strike the
LP's proposed construction of "reflecting surface" states that the reflecting surface "may include a reflective coating." The claim language offers no guidance as to whether a reflective coating is a reflecting surface. The specification states: "Although it is not necessary as long as the angle of the bevelled end 95 is greater than the critical angle, a reflective coating 99 can be included on the reflecting surface 95." '699 Patent col.13 ll.7-10 (emphasis added). This language indicates that a "reflective coating" is a separate element from the "reflecting surface." LP asserts that this language indicates that light reflected off of the reflective coating is reflected internally. This argument ignores the meaning of "internally reflects." Further, Milster states in his declaration that light that is reflected by a coating on a glass surface is not "internally reflected" because it is reflected by a medium external to the glass, not the surface of the glass. LP offers no evidence contradicting this statement. The Court concludes that a "reflective coating" is not a "reflecting surface," but rather a separate component.

The Court construes "reflecting surface" as "surface that internally reflects essentially all of the incident electromagnetic radiation that is communicated by the waveguide toward the tip, where 'internally reflects' means the electromagnetic radiation is reflected because it is incident on the reflecting surface at an angle greater than the critical angle." Given the Court's construction of "reflecting surface" and "tip of the waveguide," no construction of "reflecting surface on the tip of the waveguide" is necessary.

3611

Step 2

The parties' dispute with respect to Step 2 parallels Step 1. Amazon relies on the concept "predetermined characteristics," which is not mentioned in the plain language of claim 43, in formulating its proposed construction. See Def. Mem. at 28 ("This construction makes sense because the customer profiles and content profiles are represented using the same set of predetermined characteristics, e.g., descriptive attributes of movies") (emphasis added). Amazon's proposed construction therefore fails. Pinpoint solely directs the court to Merriam-Webster Dictionary for the ordinary meaning of "reflect" as "to bring as a result." Pl. Opp. Mem. at 20. Accordingly, the court construes "said content profiles reflecting the customer profiles of those customers who have previously accessed said data from each data source" as "content profiles contain data that results from the customer profiles of those customers who have previously accessed data from each data source."

3612

3.3 Interpretation of the "Reflector Means" Claim Limitation

Genlyte argues that the "reflector means" claim limitation limits the scope of that claim element to a one hundred percent reflectivity reflector as opposed to a partially reflective reflector or a partially transmissive reflector. Genlyte further contends that the "reflector means" claim limitation excludes from its scope a reflector which provides uplighting or upwardly directed light rays.

Before addressing the intrinsic evidence relevant to the interpretation of this claim term, it is important to note that Federal Circuit precedent states that an interpretation of a claim limitation in a way that would exclude an inventor's preferred embodiment disclosed in a patent represents an "… interpretation [which] is rarely, if ever correct, and would require highly persuasive evidentiary support." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). See also, Modine Mfg. Co. v. Int'l Trade Comm'n, 75 F.3d 1545, 1550 (Fed. Cir. 1996).

The Tickner '414 patent discloses three distinct preferred embodiments. Tickner's first preferred embodiment is illustrated in Figs. 2-8 of the '414 patent where the reflector is identified by Reference Nos. 14A and 14B. Tickner's second preferred embodiment is disclosed in Figs. 9-15 where the reflector is designated by Reference No. 100. Tickner's third embodiment is illustrated in Fig. 16 where the reflector is designated by Reference No. 200.
The written description of the Tickner '414 patent recites a detailed explanation of design features implemented to provide for the circulation of cooling air through various openings in the second and third embodiments. At Column 8, lines 28-48, Tickner describes open spaces 112, central aperture 130 and smaller apertures 136 which provide openings designed to circulate cooling air -- and inherently the radiation of light through those holes -- literally through the reflector itself. At Column 9, lines 15-22, Tickner further describes how his structural ribs 121 cooperate with openings 130 and 136 to provide air circulation -- and necessarily for radiation of light through the reflector itself.

At Column 9, lines 56-61, Tickner describes his Fig. 16 third reflector embodiment which includes a plurality of elongated vertically oriented slots designated by Reference No. 215. Those slots similarly provide for both the circulation of cooling air through the reflector as well as the radiation of light through the reflector.

This intrinsic evidence in the form of Tickner's patent drawings and the written description clearly teaches the incorporation of numerous apertures, or open spaces and slots all representing holes in the reflector in two of his three preferred embodiments to provide cooling flow air, -- and inherently for the escape compact fluorescent light radiation through the reflector itself. The light passing through these numerous holes in the reflectors radiates both laterally to the side as well as vertically upwardly.

With Genlyte's proposed claim interpretation requiring total containment of all compact fluorescent light radiation within the reflector with one hundred percent reflectivity, two of Tickner's three embodiments would be excluded from the scope of the "reflector means" claim limitation. In view of Vitronics and the intrinsic evidence, however, the Special Master interprets the "reflector means" limitation as encompassing either a totally reflective reflector, a partially reflective reflector, as well as a partially light transmissive reflector, with or without apertures or openings in the reflector itself, where the reflector is capable of radiating light through or out of the reflector in all directions, including both laterally and upwardly. This interpretation expressly encompasses a reflector providing uplighting. This interpretation is consistent with and is, in fact, required by the claim interpretation guidelines stated in the Vitronics case which requires that a claim limitation be interpreted to encompass the preferred embodiments disclosed in the intrinsic evidence. In the present case, the intrinsic evidence does not stand in the way of such a broad interpretation. To the contrary, it requires it.

This interpretation is consistent with a lighting industry publication which was jointly submitted to the Court by the parties which defines the term "reflection" as the process by which a part of the light falling on a medium leaves that medium from the incident side. Lighting Handbook Reference & Application (8th ed. 1993) (Illuminating Engineering Society of North America). That definition is consistent with the Special Master's interpretation of the "reflector means" claim limitation.

---

17. reformatting

The plaintiff proposes "reinitializing." The defendants propose "repeating a formatting operation to prepare a particular memory module for reuse." The defendants agree that, according to the customary usage in the computer field, "reinitializing" is the same thing as "reformatting." The plaintiff does not object to the defendants' general proposal. Accordingly, "reformatting" means "reinitializing a particular memory module for reuse."

---

7. "refund operation[s]" (11[a])

(i) Claim Construction

Claim 11 also describes "means to inhibit the accumulator from initiating a . . . refund operation . . . " '903 Patent col. 9, lines 59-60. Mars has asked the Court to construe "refund" as including both the refund of amounts deposited in excess of a vend price and the full refund of all money deposited. As far as the Court can tell, Coinco has asked the Court to construe
"refund" in claim 11 as limited to the refunding of amounts deposited in excess of a vend price.

As stated above, generally, the same terms in a patent should have the same meaning. Phillips, 415 F.3d at 1314. In this case, the claims and specification of the patent make it difficult to determine exactly which meaning of the word "refund" is intended for any given use. This is because in some cases the word is qualified so that it only applies to either full refund or the return of excess deposit, whereas in other cases the word is unqualified. See, e.g., '903 Patent col. 1, line 45; col. 4, line 37; col. 5, line 18; col. 7, line 48. Claim 11 itself first refers to "accumulator means including means to control the refunding of amounts deposited in excess of the vend price of a selected product." This text contains a qualified use of the word "refunding" and therefore defines the word. Accordingly, the Court construes all other uses in claim 11 of the word "refund" in the same way, to mean "refunding amounts deposited in excess of the vend price of a selected product."

However, as with the "means to inhibit the accumulator from initiating a vend," described above, this means to inhibit a refund is also stated in means-plus-function format. As with the discussion regarding inhibiting a vend operation, the function here is inhibiting the accumulator from initiating a refund operation. The Court had difficulty finding a structure within the specification which enables this function. See, e.g., '903 Patent col. 5, lines 13-32. Without a disclosure of structure in the specification, the claim must be rendered invalid as indefinite. Mass. Inst., 462 F.3d at 1361.

9. Regardless of the presence of markers, frame boundaries, and other boundaries that may occur within said data

The Court's Construction: The download restarts at any point within the data file heedless of markers, frame boundaries, or other boundaries that may occur within the data. Markman Tr. 56:2-5.

Neither party objected to the Court's construction of this phrase. Markman Tr. 56:7-8; 57:12-13. The Court simply adopted the ordinary meaning of the term "regardless of." See Webster's II New College Dictionary 955 (3d ed. 2005) (defining "regardless of" as "in spite of").

4. "substantially a same informational content regardless of which of said advertising presentations are combined therewith" ('366 patent)

Beneficial's Proposed Construction
No construction is necessary.

Defendants' Proposed Construction
"informational content that is unrelated to the advertising presentation combined therewith"

The Court rejects Defendants' proposal. The Court finds that "regardless" does not mean "unrelated." Thus, the Court finds that Defendants' proposal to equate the phrase "regardless of which" with "unrelated" should be rejected. The Court construes the phrase "substantially a same informational content regardless of which of said advertising presentations are combined therewith" to mean "informational content that is not substantially changed based on which of said advertising presentations are combined therewith."

3617

(3) In the part of Claim 4 of the '901 patent that says "regenerating the video signal for a given period of time after sensing the sync pulses in a manner attenuating at least some of the AGC pulses,"

(a) "Regenerating" means "forming, constructing or creating anew," and
d. "Regenerating"

Macromedia contends that the term "regenerating" should be construed to mean "automatically recalculating new derived elements, and discarding the old derived elements, without requiring user interaction." (D.I. 470 at 16). Adobe contends that the term "regenerating" should be construed in accordance with the definition expressly provided in the specification, namely "to automatically recalculate the new derived elements and discard the old derived elements." (D.I. 479 at 13).

In construing the term "regenerating," the Court has considered the specification of the '443 Patent. ( '443 Patent, Col. 5, line 67 - Col. 6, line 2). Because the specification expressly defines the term "regenerating" as Adobe contends, the Court construes the term "regenerating" to mean "to automatically recalculate the new derived elements and discard the old derived elements."

The terms "a first region" and "a second region" appear in claim 2 of the '717 patent:

(2) An apparatus according to claim 1 wherein the video display includes a first region for displaying the video game menu options and a second region for displaying the video game menu choices.

Because it refers back to claim 1, claim 2 is considered "dependent" on claim 1. In addition to its own limitations, it also includes all of the limitations of claim 1. 35 U.S.C. § 112, P 4. Accordingly, the "video display" of claim 2 is the same "video display" claimed in limitation (b) of claim 1.

"a first region" and "a second region"

Again relying on Figure 2 of the '717 patent and the constructions it propounded for claim 1, JVL argues that "a first region" and "a second region" are "separate and distinct areas. The first region displays all video game menu choices and the second region simultaneously and separately displays all video game menu options." Def.'s '717 Presentation at 35. Merit proffers an alternative construction of claim 2: "The apparatus of claim 1, wherein: The video screen includes a first area for showing images relating to all of the selectable game menu items. And a second area for showing images relating to the chosen game menu items." Pl.'s '717 Presentation, Ex. 3 at 4.

The primary dispute concerns JVL's use of the additional words "separate and distinct" and "simultaneously and separately." Merit argues nothing in the specification or prosecution history supports the insertion of these words. It specifically takes issue with JVL's reliance on the '717 patent's description of the preferred embodiment. JVL argues that the "detailed description of preferred embodiments" teaches that Figure 2 is a game menu screen "divided into first, second and third regions." '717 patent at 3:48-50. This justification for the "separate and distinct" construction is improper because Figure 2 is a preferred embodiment of the '717 patent that should not limit construction of the claims. Phillips, 415 F.3d at 1323. ("[A]lthough the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments."); Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998) (cautioning against limiting claimed invention to preferred or specific embodiments or examples). More importantly, the specification expressly notes that the invention is "not limited" to preferred embodiments depicted in the drawings. '717 patent at 2:65 - 3:2.

Nonetheless, there can be no doubt that "a first" and "a second" region are distinct regions. Anyone, including one of ordinary skill in the art, would understand these terms to refer to two different regions. The specification advises "[t]he present invention is an apparatus for providing menu choices of video games on a video screen having first and second regions." '717 patent at 2:20-22. As JVL points out, Merit stated during the reexamination that "menu options from a region are placed into specific locations in another region" when addressing the construction of claim 8, 3 which also includes the terms "a first region" and "a second region." Def.'s Suppl. Br., Ex. E at 8 (emphasis added).
3 Claim 8 reads as follows:

(8) An apparatus for programming video game menu choices on a display from a group of video game menu options, the apparatus comprising:

(a) a video screen having

   (i) a first region for displaying video game menu choices;

   (ii) a second region for displaying video game menu options, the video game menu choices and video game menu options being simultaneously displayed; and

(b) a display controller for causing video game menu options selected from the second region to be displayed in the first region as a video game menu choice.

Relying on the fact that claim 2 depends on claim 1, JVL argues that the first and second regions "simultaneously and separately" display options and choices. The basis for JVL's current interpretation is its earlier construction of "displaying … options and … choices" as requiring simultaneous and separate display. Because that construction was rejected, it does not support JVL's current construction of "a first region" and "a second region."

There is no clearer way to interpret "a first region" and "a second region" than the language of the claim itself. The clear and unambiguous meaning is that they are two different regions. No further construction is necessary.

17. Register controllable cross bar switch

The plaintiff asserts that "register controllable cross bar switch" means "a routing device that selectively couples a plurality of outputs to a plurality of inputs under the control of the contents of a register." The defendants propose that "register controllable cross bar switch" means "a switch which can independently connect any input to any output, and that is controlled through the use of hardware storage locations in the media processor that are available to the user/programmer."

At issue is whether the "cross bar switch" must be able to connect any input with any output.

The plaintiff contends that "switch 104," which is described in the specification of the 061 patent, is the cross-bar switch recited in the claims. According to the plaintiff, the specification does not require that "switch 104" be able to connect any input with any output. The defendants, on the other hand, argue that "cross bar switch" is a term of art that means "a switch that allows any input to be connected to any output." The defendants note that the term "cross bar" does not appear in the specifications of the media processor patents and that there is no indication that the patents use the term "cross bar" in a manner different from its ordinary meaning. After considering the submissions of counsel, the court construes "register controllable cross bar switch" to mean "a routing device that selectively couples a plurality of outputs to a plurality of inputs under the control of the contents of a register."

B. "Registered Juxtaposition" and "Juxtaposed Registry"

Ultratech argues that the phrase "registered juxtaposition" and "juxtaposed registry" has no special technical meaning in the context of the '996 patent. Thus, Ultratech contends that the analysis should focus on the ordinary meaning of the words. It
argues that in accordance with the patent specification, the clear meaning of "registered juxtaposition" is "aligned with patterns previously placed on the wafer." Jt. Cl. Constr. at 4-5.

ASML argues that the phrase "registered juxtaposition" and "juxtaposed registry" must be considered in light of what one skilled in the art would know. Accordingly, one skilled in the art of lithography would recognize that the terms describe an application that can only be performed in the context of imaging with a stepper. Thus, ASML asserts that the meaning of the term must be construed as "aligned and meeting along an edge in the context of imaging with a stepper device." Jt. Cl. Constr. at 6.

This Court rejects ASML's proposed definition based on the principle of claim differentiation. Under this principle there is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant.

Claim 13 of the '996 patent refers to a microcircuit device which is imaged in portions, with portions "formed in juxtaposed registry with each other until all of said mask is imaged on said wafer." '996 Patent, col. 8, lns. 24-29. According to ASML, the term "juxtaposed registry" necessarily requires that the imaged portions be imaged while the wafer and mask are stopped. ASML's Cl. Constr. Br. at 16.

However, Claim 17 depends from Claim 14, which in turn depends from Claim 13. Thus, Claim 14 and 17 include the "juxtaposed registry" limitation recited in claim 13. Claim 17 provides a single limitation: "The method of Claim 14 including stopping the imaging during movement of said mask and said wafer." Id., col. 8, Ins. 38-39. Applying ASML's definition, Claim 13 and 14 would already embody the limitation of Claim 17, making that claim superfluous. Furthermore, Claim 18 refers to the "method of Claim 13, including forming images on said wafer during movement of said mask and said wafer." Id., col. 8, Ins. 40-42. This Claim directly contradicts ASML's assertion that the term "juxtaposed registry" requires imaging using a "stepper" method because Claim 18 contemplates the imaging of patterns in juxtaposed registry which occurs "during movement."

While ASML argues that claim differentiation is a doctrine and not a hard and fast rule, it fails to cite any "express and contrary intentions of the patent draftsman" to prompt the Court to depart from the doctrine. Hormone Research Found., Inc. v. Genentech, Inc., 904 F.2d 1558, 1567 n.15 (Fed. Cir. 1990). Instead, ASML cites only one phrase in the patent which implies that a "stepper" limitation should apply: "Imaging by our methods can also be done in intervals between movement of the mask and wafer stages ...." '996 Patent, col. 2, INS. 14-18 (emphasis added). This reference is unpersuasive.

The Court declines to insert an additional claim limitation based on this language, and instead, will apply the ordinary definition for these terms, so as to give effect to every claim. Accordingly, the Court will construe the terms "registered juxtaposition" and "juxtaposed registry" to mean: "next to and aligned with."

Ultratech's proposed definition uses the language "next to and aligned with" but it also adds the language "with patterns previously placed on the wafer." Ultratech's Cl. Constr. Opening Br. at 3. This language is redundant due to how the term is used in the patent. For example, Claim 8, the first claim to use the term, recites "images of said mask portions are formed in registered juxtaposition on said wafer." '996 Patent, col. 7, Ins. 49-50. Similarly, Claim 13(c) states that the "images are formed in juxtaposed registry with each other until all of said mask is imaged on said wafer." Id., col. 8, Ins. 27-28. Since the proposed additional language appears to already be included in the patent, it may be argued that its inclusion in the definition is unnecessary. However, for purposes of clarity, the Court will include the additional language in its construction.

In conclusion, the terms "registered juxtaposition" and "juxtaposed registry" are construed to mean: "next to and aligned with patterns previously placed on the wafer."
b. Claim 5

Claim 5 of the '892 patent reads (bracketed text and letters provided for ease of reference):

[Preamble] 5. A method of providing a bingo game comprising the steps of:

[A] providing a bingo operator for determining at least one winning bingo pattern;

[B] registering at least one bingo card bearing a plurality of bingo numbers with said operator;

[C] generating a predetermined number of random bingo numbers; and,

[D] identifying all registered bingo cards on which the generated random bingo numbers form one of said at least one [sic] winning bingo pattern and,

[E] awarding the holder of the winning bingo card an award wherein the amount of said award is independent of the number of registered bingo cards on which a winning bingo pattern is formed.

c. Defendant’s Proposed Constructions

Defendant contends the Court should give the following terms the meaning they would have had to a person of ordinary skill in the art in light of the intrinsic record. In this regard, Defendant asserts that the following terms should have the following constructions

The term "bingo game" from the preamble: A game of bingo limited by the elements and limitations [A]-[E] from the body of Claim 5.

The term "bingo operator" from paragraph [A]: A person or entity, or a machine or the software in it, that operates a bingo game.

The term "registering at least one bingo card" from paragraph [B]: Assigning each card an identify that will differentiate that card from all the others in play.

The term "a predetermined number of random bingo numbers" from paragraph [C]: The specific and predesignated quantity of random bingo numbers that will be played during a complete bingo game after which the game will end.

The term "an award wherein the amount of said award is independent of the number of registered bingo cards on which a winning bingo pattern is formed" from paragraph [E]: An award of any type in which the value of the award is not based upon how many cards have a winning pattern.

c. Plaintiff’s Proposed Constructions

Plaintiff contends that, based upon the general acceptance of certain terms by the public and by using dictionary definitions, the following terms should be constructed as follows:

"Bingo game" - a "traditional" bingo game as that term is understood by the general public. In this regard, Plaintiff suggests that the Court construct the term "bingo game" within Claim 5 as:

a game simultaneously played by multiple players that contains the following elements: (1) displayed cards that bear numbers, (2) which must be daubed on each card when numbers are determined by random means during the game, and (3) which game is won by at least the first person to hold a card on which a previously designated arrangement of numbers has been covered.
"Predetermined number" of random bingo numbers: Plaintiff argues that the term "predetermined number" should be construed in accordance with the dictionary definition of "predetermined." In this regard, Plaintiff argues that the construction should be: "A number or range of numbers that is determined, decided, or established in advance."

"Registered": Plaintiff argues that the term should be constructed as follows:

identifying a discrete bingo card chosen by a player, communicating the pattern of that card to the game operator, and having the game operator record the pattern of the card prior to play of a discrete bingo game.

III. CONCLUSION

Having carefully reviewed the text of Claim 5, the specification, and the prosecution history of the '892 patent, and having considered the parties' arguments presented at the Markman Hearing, the Court finds that the construction proposed by Defendant is, in all respects, proper. The '892 patent was proposed and amended in order to distinguish the patent from prior art. Plaintiff's proposed construction would have the opposite effect. Therefore, the Court finds as a matter of the law that the following terms from Claim 5 shall have the following constructions:

The term "bingo game" from the preamble: A game of bingo limited by the elements and limitations [A]-[E] from the body of Claim 5.

The term "bingo operator" from paragraph [A]: A person or entity, or a machine or the software in it, that operates a bingo game.

The term "registering at least one bingo card" from paragraph [B]: Assigning each card an identify that will differentiate that card from all the others in play.

The term "a predetermined number of random bingo numbers" from paragraph [C]: The specific and predesignated quantity of random bingo numbers that will be played during a complete bingo game after which the game will end.

The term "an award wherein the amount of said award is independent of the number of registered bingo cards on which a winning bingo pattern is formed" from paragraph [E]: An award of any type in which the value of the award is not based upon how many cards have a winning pattern.

IT IS SO ORDERED.

2. "Registering Use" or "Registering the Use"

VendingData argues that the terms "registering use" or "registering the use" are ambiguous at best because the dictionary provides multiple definitions of the terms "register" and "use," VendingData also argues that the patentee acted as his own lexicographer and defined the terms "registering use" or "registering the use" in two different ways in the written description of the patent such that the term "register" means "in alignment" and the term "use" relates to shuffling cycles. In turn, VendingData argues the shuffling cycle refers to a selected number of riffles sufficient to adequately and completely shuffle the cards. VendingData supports its argument by referring to the written description and prosecution history. It urges the court to construe the terms "registering use" or "registering the use" to mean:

counting the number of shuffling cycles the machine has performed, thereby facilitating the determination of a lease rate or sales price based on accurate quantification of use of the machine, where a "shuffle cycle" is a selected number of riffles sufficient to adequately and completely shuffle the cards.

The court finds VendingData has not rebutted the presumption of ordinary meaning with respect to the terms "registering use" or "registering the use." While it is true that a standard dictionary provides multiple definitions for the terms "register"
and "use," Federal Circuit authority makes it clear that, "If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all consistent meanings." Brookhill-Wilk, LLC v. Intuitive Surgical, Inc., 326 F.3d 1215, 1222 (Fed. Cir. 2003). It is also well established that, "Where there are several common meanings for a claim term, the patent disclosures serve to point away from the improper meanings and toward the proper meanings." Id., quoting, Renishaw PLC v. Marposs Societa 'per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998). Viewed in the context of the intrinsic record before the court, it is clear the term "registering use" refers to recording, indicating or making note of the amount of use of the shuffler. The claim term is not limited to the number of times the shuffler has completely shuffled a stack of cards as VendingData argues.

VendingData's reliance on the specification is equally unavailing. The citation to the specification relied upon is simply one embodiment of the claimed invention. The specification itself does not define the term "registering use." Rather, it uses the term "register" in a manner consistent with its ordinary meaning. Finally, the prosecution history does not support VendingData's proposed limitation. The portions of the prosecution history cited by VendingData consist of an exchange between the patent Examiner and Shuffle Master.

The patent Examiner rejected three of Shuffle Master's claims as originally filed, concluding that the prior art Stevens Patent, U.S. Patent No. 5,000,453, described an automatic shuffler and card shuffling method that were identical to the shuffler and shuffling method cited in Shuffle Master's pending claims. (Schwartz Decl., Exhibit 8, '258 Patent Prosecution History, at SM0363-64). Shuffle Master responded by amending its claims and deleting the requirement that the shuffler count "the number of shuffling cycles." The amended claims required a counter "for registering the use of the apparatus." Id. at SM0372-76. Shuffle Master explained to the Examiner that this change from counting shuffling cycles to tracking the amount of use of the apparatus distinguished Shuffle Master's invention from the Stevens' shuffler. Id. at SM0377. It seems clear to the court in reviewing the prosecution history that Shuffle Master's remarks to the Examiner explain how its claims were intended to cover registering or quantifying the use of the apparatus to facilitate a lease rate or sales price based on the use of the shuffling apparatus as distinguished from the prior art that counted and displayed shuffling cycles to confirm the cards had been shuffled a sufficient number of times to be removed to the shoe assembly for security purposes. A patent applicant's remarks during prosecution will limit the scope of the claims only where the remarks are not to occlude the disclaimer of the claim's scope. "Absent a clear disclaimer of particular subject matter, the fact that the inventor anticipated that the invention may be used in a particular manner does not limit the scope to that narrow context." Brookhill-Wilk, 326 F.3d at 1223.

Finally, Shuffle Master points out Shuffle Master deleted the requirement of counting shuffle cycles in the claims as originally filed, and added the requirement that the counter "register use" of the shuffler. This clarification clearly communicated that registering the amount of use of the shuffler instead of simply counting shuffle cycles is what distinguish Shuffle Master's claims from the Stevens shuffler.

4. Element [B] -- "Registries"

WeddingChannel argues that the term "registry" in a "registry database" describes, at minimum, a registrant, an event, and the items that the registrant would like to acquire to celebrate the event. The Knot defines a "registry" in a "registry database" as a collection of data that describes either (A) a registrant, an event, and the products and/or services that the registrant would like to acquire in celebration of the event; or (B) a registrant and a wishlist of products and/or services that the registrant would like to acquire.

In the description of the related art, the specification provides the following general definition for the term "registry":

Each registry in a registry database describes a registrant, an event, and the items that the registrant would like to acquire in celebration of the event. Further, rather than representing an event, a registry may simply represent the generalized wish list of the registrant.

'753 Pat. at col. 1, ll. 24-33. WeddingChannel acknowledges that this text from the specification describes two types of registries -- the first describing three things (the registrant, the event, and item information) and the second describing two
things (the registrant and a wishlist of items).

This broad definition notwithstanding, WeddingChannel argues that the term "registry" was given the following more narrow definition during the course of the prosecution of an earlier-filed parent application:

Registry databases are collections of registries. Each registry in a registry database describes a registrant, an event, and the items that the registrant would like to acquire in celebration of the event.

(Qualey Decl. Ex. 3 at WC002937 (quoting from the parent application's specification).) WeddingChannel argues that this narrower definition was a "clear disavowal of claim scope" that limited the term "registry" in the '753 claims to the definition cited by WeddingChannel. See Int'l Rectifier Corp. v. IXYS Corp., 361 F.3d 1363, 1370 (Fed. Cir. 2004).

Furthermore, WeddingChannel argues that the preamble of claim 35, which states "[a] computer system for purchasing a gift for a registrant of an event[,"] provides further support for its construction of the term "registry." See Poly-America, L.P. v. GSE Lining Technology, Inc., 383 F.3d 1303, 1309 (Fed. Cir. 2004) (stating that "whether to treat a preamble as a limitation is a determination resolved only on review of the entire . . . patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim.") (quoting Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989)).

The Knot offers three arguments in support of its position that in the context of the '753 patent, the term "registry" should be interpreted to include wishlists.

First, the Knot argues the above-quoted text from the prosecution history did not function as a disavowal of the language in the specification. Rather, according to the Knot, the above-described discussion of registries in the prosecution history was addressed to the distinction between the '753 patent (which involves associating a unique identifier with an already constructed registry) from an invention in the prior art that involved the construction of a registry from (1) personal information about the registrant and (2) information about items the registrant would like to acquire. The Knot argues that the above-described narrow definition of the term "registry" was merely incidental to this recitation of the differences between the prior art and the claimed invention. On this basis, the Knot concludes that the term "registry" was not narrowed by the prosecution history. See, e.g., York Products, Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1575 (Fed. Cir. 1996) (stating that "unless altering claim language to escape an examiner rejection, a patent applicant only limits claims during prosecution by clearly disavowing claim coverage.")

Second, the Knot disputes WeddingChannel's argument that the preamble of claim 35 serves to limit the definition of the term "registry." The Knot argues that the preamble is not regarded as a limitation on a claim unless it "breathes life and meaning" into the claimed language. In re Paulsen, 30 F.3d 1475, 1479 (Fed. Cir. 1994). Furthermore, the Knot argues that nothing in the preamble requires that the term "registry" necessarily exclude wishlists.

Third, the Knot argues that regardless of whether WeddingChannel expressly disclaimed wishlists during the prosecution of the '753 patent, it submitted a continuation application to the USPO on June 30, 2003 that contained new dependent claims 41, 59, and 87, each of which defined a "registry" as comprising "a registrant and a plurality of items that the registrant would like to acquire . . . wherein said plurality represents a generalized wish list of the registrant." (See Qualey 2d Supp. Decl. Ex 20 at LO002001 (claim 41), LO002003 (claim 59), and LO002006 (claim 87)). According to the Knot, this continuation application demonstrates that WeddingChannel did not disclaim wishlist registries during the prosecution of the '753 patent.

In response to the Knot's argument concerning the continuation patents, which was first raised in a supplemental brief filed on September 13, 2004, WeddingChannel argues that it cancelled the continuation claims at issue on October 7, 2003. (See 2d Supp. Qualey Decl. Ex. 21 at LO002091, L0002102). Furthermore, WeddingChannel argues that once claims have been narrowed by a prosecution history disclaimer, they cannot be re-broadened. See Hockerson-Halberstadt, Inc. v. Avia Group Intern., Inc., 222 F.3d 951, 957 (Fed. Cir. 2000) (stating that "[p]laintiff's argument . . . reduces to a request for a mulligan that would erase from the prosecution history the inventor's disavowal of a particular aspect of a claim term's meaning. Such an argument is inimical to the public notice function provided by the prosecution history").

The text quoted from the prosecution history does no more than highlight a difference between the '753 invention and the
The court stated that the parties agreed that, at least as it is received in the RF section from the outside, the video data is in analog format. The mixer does not function as a switch.

The principal issue with respect to the disputed claim language is whether claim 1 covers digital signals. The district court observed that the only type of television signals that were broadcast in 1985 were analog signals. SuperGuide Corp., 169 F. Supp. 2d at 498. Relying on a portion of the specification explaining that when the programming guide is not in use the received television signals are sent directly through the RF section to the television for viewing, the district court reasoned that the terms "radio frequency information" and "regularly received TV signals" must be limited to analog signals and, more specifically, do not embrace digital television signals. In light of its construction that the '578 patent is limited to the type of television signals that were broadcast in 1985, i.e., analog signals, the district court held in its infringement decision that the patentees disclosed but did not claim digital captioning and that the patentees could not invoke the doctrine of equivalents to extend the scope of the '578 patent to encompass digital technology. Id. at 510. The district court suggested that the patentees' failure to enlarge the scope of the claims to explicitly include digital signals or closed captioning signals indicates that the disclosed embodiment directed to closed captioning was dedicated to the public. To reach such a conclusion, the district court operated under the assumption, which we find to be incorrect below, that the claimed invention is limited to analog television signals. The district court concluded that "regularly received television signal" means "an analog signal modulated onto a carrier wave and transmitted via terrestrial antennae or through a cable or satellite system" and does not include "a digital television signal as understood in the state of the art in the mid-1990's." SuperGuide Corp., 169 F. Supp. 2d at 509. The court construed "radio frequency information" to mean "modulated or unmodulated analog signals containing television programming and video information received either from the mixer internal to the system or from a television station" and as not including "digital television signals." Id. at 526.

The court also relied on the specification and the state of the art in 1985 to construe the disputed term "mixer." The court noted that the information generated by the microcontroller is in digital format and that the specification states that the mixer converts such digital information into a format which can be viewed in the same way as the video data received from the RF section. The court found that the video data received in the RF section is in analog format. 4 Recognizing that the literal scope of a claim term is limited to what it was understood to mean at the time the patent was filed, the court concluded that in 1985, one of ordinary skill in the art would have understood that the digital data received from the microcontroller would of necessity be converted into analog format. Thus, the district court determined that the "mixer" first converts the digital signal from the microcontroller into an analog format and then mixes it with the video data. The court therefore construed the term "mixer" as follows:

- the electronics for (a) receiving an unmodulated digital signal generated by the microcontroller which contains television programming information and converting the same into an analog format; (b) receiving from the RF section an analog television signal, whether demodulated or unmodulated, which contains television video information; (c) receiving and stripping a modulated analog signal which contains television video information from the RF section; and (d) mixing the two analog signals to produce an analog signal containing television programming and video information which is then transmitted to the RF section. The mixer does not function as a switch.

Id.

4 The court stated that the parties agreed that, at least as it is received in the RF section from the outside, the video data is in

- 3912 -
analog format. SuperGuide Corp., 169 F. Supp. 2d at 504. Based on the record, however, it is unclear how the court arrived at this conclusion.

On appeal, Gemstar maintains that the '578 patent covers systems that receive digital as well as analog television signals. It specifically argues that the district court misapplied cases involving "means-plus-function" claims and "after-arising technologies." In addition, Gemstar contends that the court failed to apply the plain meaning of the disputed claim language, erred by reading analog limitations from one embodiment into claim 1, and improperly adopted a claim construction inconsistent with a preferred embodiment.

According to Gemstar, "regularly received television signal" means non-customized, acquired electrical information representing visual images with the form of the signal not being relevant; "radio frequency information" means the information received from the mixer, microcontroller, and/or a television station that is carried on or derived from a radio frequency signal; and "mixer" means the electronics that receive the "regularly received television signal" and a signal generated by the microcontroller, and that combine those two signals as instructed by the microcontroller.

In response, relying primarily on the state of the art when the '578 patent was filed in 1985 and the knowledge of those skilled in the art at that time, EchoStar argues that the phrases "regularly received television signal" and "radio frequency information" refer to the ordinary analog television signals that were being broadcast in 1985 and that an ordinary television could receive and process at that time. It contends that nothing in the specification or prosecution history suggests that the '578 patentees gave these phrases a different meaning. Thus, according to EchoStar, the district court correctly construed the disputed claim language as excluding digital television signals. EchoStar next relies on the specification and its interpretation of "regularly received television signal" and "radio frequency information" as limited to analog signals to argue that the recited mixer requires circuitry that converts the signal from the microcontroller into analog signals. It adds that the district court correctly concluded that the "mixer" does not function as a "switch" because the patentees disclaimed switching or toggling when distinguishing their invention over a prior art reference.

We begin our review of the district court's construction of the asserted claim by agreeing with Gemstar that the court improperly relied on cases involving means-plus-function claims to conclude that later or "after-arising technologies" cannot fall within the literal scope of the claim at issue. Method and apparatus claims not written in means-plus-function format are not necessarily limited to that disclosed in the specification but rather are defined by the language of the claims themselves. See SRI, 775 F.2d at 1121 ("It is the claims that measure the invention.").

In construing the terms "regularly received television signal," "radio frequency information," and "mixer," the district court should have begun its analysis by first examining the claim language. The district court held and the defendants argue essentially that "regularly received television signal" refers to the format of television signals that were "regularly" received by televisions as of 1985, and that because no televisions existed as of that date that could receive digital signals, the term, as understood by those skilled in the art, necessarily excludes digital technology.

While that argument appears persuasive at first blush, closer analysis of the intrinsic record does not bear support for such a claim construction. The claim language does not limit the disputed phrases to any particular type of technology or specify a particular type of signal format, such as analog or digital. Indeed, neither "analog" nor "digital" appears in any of the asserted claims.

We find that the district court's and EchoStar's reliance on Kopykake Enters., Inc. v. Lucks Co., 264 F.3d 1377 (Fed. Cir. 2001), as authority for limiting the meaning of the disputed claim language to analog technology is likewise misplaced. The limitation at issue in Kopykake required "screen printing" of images on foodstuffs and the accused product used "ink jet printing." Id. at 1380. Thus, the issue was whether the claim language "screen printing" literally covered ink jet printing. Id.
The specification explicitly defined the term "screen printing" as limited to "conventional" or then-existing technologies. Id. Specifically, the specification stated that "the term screen printing as used herein encompasses not only conventional screen printing, but also includes any other conventional printing process and any other conventional means." Id. (citation omitted). Although ink jet systems were well known in the field of paper printing, it was not a conventional printing process for applying images to foodstuffs. Id. at 1383-84. We therefore held that ink jet printing was not covered by the claim term at issue. Id. at 1384. That holding, however, does not have relevance here because the patentees in Kopykake explicitly limited the claim term to technologies that were "conventional" at the time of the invention. In contrast, the '578 patentees did not explicitly limit the disputed claim language to technologies that were "conventional" at the time of the invention.

The "regularly received television signal" received by the mixer is referred to in the specification as "video data." '578 patent, col. 5, ll. 3-6; col. 6, ll. 44-47; fig. 1. "Regularly received television signal" therefore refers not to signal directly received by the RF section and sent directly to the television, but rather to the video data received by the mixer. It appears indisputable that it was known to those skilled in the art during the pendency of the '578 patent application that video data could be communicated in either analog or digital format. Although analog may have been the dominant format of video data when the '578 patent application was filed, we have little doubt that those skilled in the art knew of the existence of digital video data at the time. 6 Indeed, the first digital television standard was created in 1981, and as early as 1983, systems were used to transmit digital data to provide videoconferencing and videotext. By 1985, work on developing a standard for the transmission of digital video data for telephony had begun, and by 1988, the year the '578 patent issued, there was sufficient interest by those in the video industry to establish a Motion Picture Experts Group to create a digital video standard for television broadcasts. Moreover, a review of the '578 patent specification reveals that the patentees were aware of the existence of analog and digital signals. For example, the specification describes examples of transmitting digital signals, such as those conveyed to and from the microprocessor and from digital sound files. Had the patentees intended to limit the disputed claim terms to "analog" technology, they could have easily done so by explicitly modifying the disputed claim language with the term "analog." We find nothing in the written description of the '578 patent, much less the claim language, that precludes the mixer of the claimed invention from receiving video data in digital format. The law "does not require that an applicant describe in his specification every conceivable and possible future embodiment of his invention." SRI, 775 F.2d at 1121. We find no reason here to limit the scope of the claimed invention to analog technology, when "regularly received television signals," i.e., video data, is broad enough to encompass both formats and those skilled in the art knew both formats could be used for video.

6 The district court also did not resolve the disagreement between Gemstar and EchoStar as to the state of the art in 1985. On appeal, EchoStar asserts that in the 1985-1988 time frame, digital television was still in its infancy, while Gemstar would have us believe that digital television was at a more advanced stage of development. EchoStar acknowledges, however, that when the '578 patent was filed, "conceptual work for digital television had begun but was 'little known'" and "the essential 'Motion Picture Expert Group' (MPEG) standards for compressing video for digital transmission were not issued until 1988." It further characterizes digital television as "at best an 'emerging technology' in the 1985-1988 time frame." Based on these statements by EchoStar, we are confident in stating that in 1985 the '578 patentees were at least aware that digital television signals could be broadcast in the future.
1098 (6th ed. 1976) (defining "regular" to mean "customary"), and not to video-on-demand signals, such as those received by the military in the Lindman invention or pay-per-view, which other customers ordinarily would not receive unless special ordered.

Nothing in regard to the Bourassin reference alters our interpretation of the pertinent claim language. The Examiner initially rejected the claim at issue over the Bourassin reference, which describes the mixing of two analog television signals in a picture-in-picture display. The Examiner stated that Bourassin's "regular TV signal" met the applicant's "regularly received TV signal" limitation. In distinguishing Bourassin, the patentees argued that "the image-on-image of Bourassin is regular TV signals as opposed to TV signals overlaid by signals being generated by a microprocessor." (Emphasis added). According to EchoStar, this prosecution argument shows that the patentees and the Examiner equated the "regularly received television signal" with the analog television signals in Bourassin. Gemstar, on the other hand, argues that because the '578 patent undisputedly covers at least analog signals, they had no reason to argue that the analog television signals described in Bourassin were different from a "regularly received television signal." We agree with Gemstar. The patentees distinguished their invention from Bourassin on the ground that it overlaid "image on image" regular television signals "as opposed to TV signals overlaid by signals being generated by a microprocessor," and thus the patentees had no reason to distinguish the signal format used in Bourassin.

Thus, the prosecution history does not preclude a construction of the asserted claim as covering any particular type of signal format. It is irrelevant that the patentees did not argue during prosecution of the '578 patent that "regularly received television signal" also included digital technology because the absence of such an argument does not necessarily indicate a clear and deliberate disavowal. See DeMarini Sports, Inc. v. Worth, Inc., 239 F.3d 1314, 1326 (Fed. Cir. 2001) (stating that silence cannot serve as a basis for prosecution history estoppel because "we can draw no inference from what [the patentees] did not argue"). Therefore, we see nothing in the prosecution history to alter our conclusion that claim 1 is not limited to analog technology.

Accordingly, we construe "regularly received television signal" to mean video data that is customarily received by the television viewing public and not video-on-demand. The form of the television signal is irrelevant; it could be an analog signal, a digital signal, some combination of the two, or another format. The '578 patent defines "radio frequency information" as the signal generated from the antenna, mixer, and microcontroller. '578 patent, col. 2, l. 48. We therefore construe "radio frequency information" to mean the information received from the mixer, microcontroller, and/or a television station that is carried on or derived from a radio frequency signal. Finally, we construe the term "mixer" to mean the electronics that receive the "regularly received television signal" and a signal generated by the microcontroller, and that combine those two signals as instructed by the microcontroller. The mixer is not limited to any particular electronics because the claim language does not so limit the scope of the mixer. The preferred embodiments may describe the mixer as including certain components, including a digital-to-analog converter, but that does not mean that the claims are so limited. Accordingly, for the reasons stated, we reverse the district court's construction of the disputed claim language and adopt the constructions discussed above.

GO BACK

3626

MICHEL, Circuit Judge, concurring in the result.

The majority's claim constructions expand the scope of the '578 patent far beyond what the named inventors say they actually invented in their application, and what it describes and enables. Thus, the patent now covers home receivers for digital television signals not even transmitted by television stations until nearly a decade after the '578 patent issued. Further, the court's constructions ignore the expert declarations and rely instead on a literalistic and abstract reading of the term "signal," and the absence of a clear disavowal of digital signals in the specification or claim language. Indeed, under the court's analysis, the term "regularly received television signal" would have to have read "regularly received analog television signal" for it to be limited to the technology actually in use at the time. With such fundamentally incorrect constructions and methods, I must respectfully disagree.

Construing "regularly received television signal," "radio frequency information," and "mixer" in the '578 patent, the majority holds that these terms encompass receiving and processing digital signals not transmitted by television broadcasters at the time the patent issued. As in the majority opinion, I treat these three terms together because they present
the common issue of whether digital signals fall within the literal scope of the claim; that is because the latter two terms involve downstream processing of the "regularly received television signal."

The majority's only support for its broad meaning of "regularly received television signal" as encompassing digital television signals is that, because digital television standards were under development in the early 1980s, and because videoconferencing and videotext systems transmitted digital data at the time, a person of ordinary skill in the art would have known that regularly received television signals could someday be transmitted in either analog or digital form. This statement ignores the fact that such videoconferencing and videotext systems are distinct from systems for digital television signals from television stations, which were indisputably not broadcast until the mid-1990s. Moreover, the majority states that because the patentees were surely aware of the difference between digital and analog technology, having described certain intra-system digital data in their patent disclosure, they could have easily limited the "regularly received television signals" to analog signals, and that digital signals must be included because they did not. I disagree.

The question is not the meaning of the term, in isolation, to laymen or later, but whether "regularly received television signal" would have had a particular meaning to one of ordinary skill in the television art at the time, in the context of this patent disclosure. Though it cites to "indisputable" evidence of the state of the art at the time, the majority cites no evidence whatsoever indicating how one of ordinary skill in the art would have understood the critical claim term in 1985, despite expert declarations on that precise issue. 1 The majority never even mentions, much less rebuts, the declaration of Martin Sperber, an expert retained by DirecTV and Hughes. Mr. Sperber unequivocally asserted that in the 1985 time frame, one skilled in the art would have understood the phrase "a regularly received television signal" in claim 1 of the '578 patent to mean an "analog NTSC television signal transmitted from a regular television station," and that in 1985, "a person skilled in the television art would not have interpreted this to mean a digital satellite signal." (emphasis added). S. Merrill Weiss, although an expert retained by Gemstar, confirmed that "originally, all television signals were analog signals" and only "in the mid-1990's, various system providers began transmitting digital television signals." (emphasis added). Though Mr. Weiss went on to state that a "regularly received television signal" could be in digital or analog form, this assertion was not temporally limited to the 1985 time-frame. Nor could it have been. Superguide's expert, Teresa Dahlberg, noted that, while she had "not been asked to state opinions on the meaning of the claim language," she disagreed with "the essence of Mr. Sperber's opinions and regards them as not correct as relates to the meaning of the claim language." Ms. Dahlberg did not, however, specifically contradict Mr. Sperber's two assertions about signal transmissions circa 1985 being analog signals, as quoted above. Neither did Ms. Dahlberg, or any other plaintiffs' expert, offer an opinion on how one of ordinary skill in the art would have read these terms in 1985. Surely, the declarations of these experts are the best evidence, particularly as the specification gives little, if any, guidance, and the two critical assertions of Mr. Sperber were not directly challenged by Mr. Weiss or Ms. Dahlberg.

--- Footnotes ---

1 Neither does the majority cite any technical treatises, technical dictionaries, or other technical publications, or contemporaneous or prior art patents, to support its ordinary meaning of "regularly received television signal."

--- End Footnotes ---

In my view, the expert evidence briefly summarized above establishes that a person of ordinary skill in the art in 1985 would have read the critical claim term to mean only the analog television signals that were being regularly transmitted at the time, and not the later-developed, later-transmitted digital signals. 2 I therefore cannot extend the literal scope of the claims to systems for receiving signal technology that was not then in use by the television industry, nor even conceived of and reduced to practice by these inventors, much less described and enabled in their '578 patent application filed in 1985.

--- Footnotes ---

2 Though it is undisputed that digital signal technology was under development by other technologists in the mid-1980s, the patentees in this case were not developing systems that receive such signals. The claimed invention was, moreover, undeniably directed to marketable commercial products for use in the home, not the laboratory. It is undisputed that, as of 1985, reception for home use was limited to analog television signals. Thus, claim construction here is less a matter of the state of the laboratory art than of the history of commercial television.
Nor does it matter that the district judge did not discuss the expert declarations in his opinion, as we must uphold trial judge rulings when supported by the record, even if not discussed in its opinion.

But the cause of my alarm extends far beyond this case. I am also concerned that the court's opinion relies on certain imprecise statements prior panels of this court have occasionally made in recent years concerning the "plain" or "ordinary" meaning of claim terms. Despite the now-common references to the "plain meaning" or "ordinary meaning" of claim terms, or even the "ordinary dictionary meaning" cited in the majority's opinion, our precedent requires that the correct meaning of claim terms is that determined from the standpoint of a person of ordinary skill in the relevant art and at the time of the patent. I am concerned then that the use of these "short-hand" expressions about ordinary meaning obscures the correct analysis, tempting panels to look for an "ordinary meaning" divorced from the proper perspective -- the artisan's -- and the preferred, proper sources of interpretation -- the disclosure, technical dictionaries, prior art patents, and expert testimony. The ultimate result of this trend is claim constructions providing the broadest possible scope to claim terms, absent express limiting language in the claim, specification or prosecution history, but regardless of what the inventors actually invented.

If we fall into such error, we may render ineffective the examination process at the Patent and Trademark Office, for patents will later get broader scope than what the examiner understood, and found new and non-obvious, and hence patentable, at the time. Such error also compromises two fundamental tenets of the patent system: first, that the applicant must be the "inventor" of the things covered by the patent claims, and second, that the right to exclude will be no broader than the inventor's enabling disclosure. The inventors here most assuredly did not invent a system that receives digital signals; their patent cannot therefore cover such systems.

Because I agree with the court that there is at least a triable issue as to infringement of the '578 patent under the doctrine of equivalents, I concur in the result as to the '578 patent. As to its rulings respecting the other patents and terms, I have no disagreement with the majority and join its opinion.

J. "Regulate the transfer"

This language appears in claim 7 of the '734 patent in describing the role of the integrated circuits with respect to the transfer of signals: "said second party control integrated circuit and said first party control integrated circuit regulate the transfer of the desired digital video or digital audio signals . . . ." (Docket # 69, Exhibit I, Column 10, lines 29-32). Identical language appears in claim 15 of the '440 patent (Id., Tab K, Column 11, lines 20-23).

Defendants assert that this means "receive or transmit." Sightsound responds that "the claimed term 'transfer' may not be exactly the same as receive or transmit, as such verbs may describe part of the transfer but not the whole occurrence thereof." (Docket # 74 at 29). Clearly, the transfer of the digital signals involves transmitting on one end and receiving on the other. To "regulate" that transfer, however, bespeaks more than simply transmitting or receiving. The use of the term "regulate" indicates that the transmitting and receiving are being controlled, directed or governed. See, Webster's New World Dictionary, Third College Edition (1988). Thus, in the context of the patent claims at issue, the phrase "regulate the transfer" is construed to mean that the first party and second party integrated circuits control the transfer of the digital signals, i.e., control the transmitting and receiving of such signals.
regulated DC output" controlled towards a predefined value during normal operation.
"regulating" "producing a regulated [DC] output during normal operation."
"regulation" "the state of regulating"
that is controlled towards a predefined value"
"controlling an output towards a predefined value"
"controlling an output towards a predefined value"

The parties propose fairly similar constructions for these terms and agree that "regulation" generally means controlling the output voltage. The primary dispute is regarding SynQor's "during normal operation" language. The phrase "during normal operation" only appears in the '021 patent as a result of added matter during the continuation-in-part application leading to the '021 patent. See, e.g., '021 patent, 2:1-22. The phrase does not appear in any of the other patents' specifications or claims. During prosecution of the application leading to the '021 patent, the inventor explained that "[t]he claims are not limited with respect to potential control during system transients such as during turn on or turn off of the converter system. Such control may or may not be included." In the initial office action of the reexamination of the '021 patent, the PTO rejected claims in the '021 patent and found that the '021 patent claims were only entitled to a late priority date because the discussion of "normal" versus non-normal operation was not found in the original application.

SynQor argues that one of ordinary skill in the art would understand that "regulating" or "regulation" could not mean "all the time" regulation. Rather, one of ordinary skill would know that if a converter regulates during its normal operation, it is regulation, and it need not regulate under every conceivable condition or mode of operation. Thus, SynQor argues that a person skilled in the art would understand that the "regulation stage" would not regulate at voltage or current levels outside its normal operating range, or when the control circuit is first powered on. SynQor argues that the specification describes converters that "regulate" under specified operating conditions and that the prosecution history confirms that "regulation" does not require regulation "all the time." Further, SynQor argues that the claims do not require any particular operation during non-normal operating conditions. SynQor argues that no known power converter regulates under every conceivable condition, and that such a construction is absurd. SynQor argues that the finding by the examiner in reexamination is not conclusive in this case and that it has not yet had a chance to respond.

Defendants argue that there is nothing in the term "regulation" or "regulating" or the claims themselves that suggests a limitation as to time or to specific modes of operation for these terms. Defendants argue that there is no hint as to how one would determine what is normal operation versus abnormal operation in any of the patents but for the '021 patent. Further, Defendants argue that there is no circuitry disclosed in these patents that would sense and differentiate between a "normal" mode of operation and another mode of operation. In the '021 patent, Defendants argue that when the patentee meant to modify "non-regulating" to mean "during normal operation," the patentee did so explicitly by adding the word "normally" before "non-regulating" and discussing the control of the circuit as being only "during normal operation." Defendants argue that when the patentee intended a claim term to apply only "during normal operation," the patentee explicitly added those words to the claim. Defendants argue that the specification of the '021 patent supports their interpretation because the '021 patent specifically describes regulation during "other than normal operation," and it would contradict the specification to construe the term "regulating" to mean "regulating during normal operation." See '021 patent, 2:1-21. Thus, the Defendants argue that the term "regulation" is general and is not restricted to any particular mode or timeframe. Defendants argue that the examiner's finding in reexamination that "normal operation" was not supported by the original filed application is directly contrary to SynQor's argument that the terms "regulating" and "non-regulating" by themselves implicitly incorporate the concept of "during normal operation."

The Court rejects SynQor's attempts to add the "during normal language" limitation to these claim terms. The "during normal operation" language only appears in the '021 patent. There is no support for such language in any of the other patents, and the Court rejects SynQor's arguments that there is such support. Further, in the '021 patent, the disputed "regulating" terms appear in the claims in addition to the "normal" operation language, implying that the "regulating" terms are not limited to just "during normal operation." It is not the Court's job to rewrite the claims, and where there is no support for the inclusion of such a term, either in the claim language or the specification, the Court will not do so. As the inventor stated during the prosecution history, whether control or regulation in the claims during system transients such as during turn on or turn off "mayor may not be included." The Court finds that there is no temporal limitation in the term. Thus,
"regulated" is not necessarily limited to only "during normal operation." The Defendants' proposal does not include the "all the time" limitation, and the Defendants stated during oral argument that they are not seeking to add the "all the time" limitation. The Court rejects the contention, if there is still such a contention, that the term requires regulating "all the time." Likewise, the Court rejects the addition of the phrase "during normal operation" in all other instances where that language is otherwise not present.

The parties are in agreement, but for the dispute of "during normal operation," that a "regulated output" is an output that is controlled towards a predefined value, and thus the Court adopts the parties' similar language for the term "regulated output." The Court finds that the construction for the term "regulating" should resemble the essentially undisputed language for the term "regulated output." "Regulation" is generally defined as "the act of regulating" or "the state of being regulated." Thus, the Court adopts the following constructions:

"regulated output" means "an output that is controlled towards a predefined value;"

"regulated DC output" means "a DC output that is controlled towards a predefined value;"

"regulating" means "controlling an output towards a predefined value;" and

"regulation" means "the act of controlling an output towards a predefined value."

c. "generating regulated voltage

Defendants argue that the plain meaning of "generating regulated voltage" excludes from the scope of claim 1 those power supplies designed to regulate current. Relume argues that because of the basic electrical principle of Ohm's Law (voltage = current x resistance) current regulation will result in voltage regulation in a certain circumstance - specifically when resistance is constant. Relume argues that the voltage regulation performed by its invention is limited to that circumstance and, therefore, devices designed to regulate current can fall within the scope of its invention.

I begin my claim construction with the ordinary meaning of the disputed phrase. See Phillips, 157 F.3d at 871. The basic meaning of "generate" found in Webster's is that of a thing producing something else. 11 The meaning of "regulated" is likewise straightforward; Webster's conveys the idea of something being ordered and controlled. 12 Finally, Webster's defines "voltage" as "electric potential or potential difference expressed in volts."

--- Footnotes ---

11 Webster's most pertinent definitions of "generate" are 1) "to cause to be: to bring into existence," 2) "to originate (something material) by a physical or chemical process," and 3) "to be the cause of (a state of mind, an action, or something immaterial or intangible)."

12 Webster's most pertinent definitions of "regulate" are 1) "to reduce to order, method, or uniformity" and 2) "to fix the time, amount, degree, or rate of."

--- End Footnotes ---

By combining these dictionary definitions, it is clear that "generating regulated voltage" means, on its face, the function of producing controlled electric potential. This function has a specialized understanding to those in the field of electronics. According to The Illustrated Dictionary of Electronics (7th ed. 1997), "voltage regulation" is "the stabilization of a voltage against fluctuations in source or load." 13 Thus, upon reading the words "regulated voltage," a person of ordinary skill in the art would understand claim 1 to require the "power factor correction converter means" to stabilize the voltage it generates against fluctuations either in the input line voltage (the source) or in the LED array (the load).
13 Relume is correct to point out the significance of the "or" in this definition of "voltage regulation." A device need not regulate voltage against fluctuations in both source and load to be called voltage regulating in the art. The specification of the '645 patent makes it clear that claim 1's "converter means" is a voltage regulator concerned only with minimizing source voltage fluctuations.

Yet that is not all the language of claim 1 communicates regarding its voltage regulation function. As held above, the ordinary meaning of "converter" also implies to one of ordinary skill in the art the structure necessary to perform voltage regulation: a switching power supply. At its most basic, a switching power supply must have some sort of switch and a controller circuit. See Power Supply Cookbook at 25-26. For a voltage-regulating power supply, the controller circuit's "main purpose" must be "to maintain a regulated output voltage." Id. at 26. It does so by acting as a voltage feedback loop. See id. at 73.

These structural limitations implied by the ordinary meaning of "converter" cannot be ignored. Voltage regulation calls for unique componentry - for example, the controller's output voltage feedback loop. Yet there is an even more important point: a voltage-regulating power supply is a device expressly designed to stabilize the electrical property of voltage and thus generate regulated voltage. It is built to act on voltage, not current.

Relume's tortured construction of "generating regulated voltage" turns a blind eye to these realities. Relume wants claim 1 to be nonsensically construed so that any device, regardless of its design and structure, would fall within its scope so long as that device effects source voltage regulation in the limited circumstance when resistance is constant. I have a duty, however, to give meaning to all the words in claim 1 in order to determine the scope of its claimed invention; the drafter has linked the "converter means" to the "generating regulated voltage" function. Thus I cannot ignore the implicit structural limitations in the term "converter" - structural limitations, I note, that Relume urged me to recognize in order to avoid the application of 35 U.S.C. section 112, paragraph 6 to the "converter means."

There is another flaw in Relume's construction. The much trumpeted truth of Ohm's Law is ultimately immaterial to the resolution of the claim construction question before me. All it tells me is that in a certain situation, when resistance is controlled, current-regulating and voltage-regulating power supplies will have the same effect on their output voltage. It does not tell me anything about the purpose, design, and structure of current-regulating and voltage-regulating devices in the art. Thus, while interesting, the scientific fact of Ohm's Law does not address the underlying issue posed by the construction of "generating regulated voltage": What does it mean in the art when a converter regulates voltage instead of current?

The specification of the '645 patent reinforces these points. In its discussion of prior art power supplies, it recognizes the distinction drawn in the art between current regulation and voltage regulation. 14 That distinction is based on meaningful engineering reasons. For instance, the specification notes that current regulation will result in better LED light output than voltage regulation. '645, 4:51-54. The reason: LED light output is directly related to the current flowing through the LED, not the voltage. There is of course a more obvious basis for the distinction in the art: current regulation and voltage regulation act on, and regulate, different electrical properties. Thus it is clear that treating power supplies designed for current regulation like those designed for voltage regulation - the effect of Relume's construction - would violate precepts in the art.

14 So too does The Illustrated Dictionary of Electronics. It gives distinct definitions for voltage regulation (quoted above) and for current regulation ("the stabilization of current at a predetermined level or value").
The converter 38 includes a power factor correction (P.F.C.) integrated circuit (I.C.) controller 40, which is a commercial device available from many sources and functions by allowing current to charge a storage capacitor C (LARGE) only in phase with the rectified a.c. voltage thereby assuring a power factor close to unity. The control I.C. 40 also provides voltage regulation in the switchmode buck/boost converter by monitoring the output voltage and adjusting the high frequency on-off switching period of the pass element commensurately.

'645, 5:41-53. Not surprisingly, the specification nowhere instructs the reader on how a current-regulating power supply could be used instead of a voltage-regulating power supply to effect the aims of the invention.

For all of the reasons discussed, then, I hold that a person of ordinary skill in the art of LED array power supplies would understand "generating regulated voltage" to mean that claim 1's "converter means" is designed to produce stabilized voltage at its output despite fluctuations in its input voltage. Because the intrinsic evidence of the patent provides a clear meaning for "generating regulated voltage," I decline to consider the extrinsic testimony of the '645 patent's inventor, Mr. Hochstein, which Relume offers in support of its construction. See Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1578 (Fed. Cir. 1995); see also Vitronics, 90 F.3d at 1583.

GO BACK

3630

The difference in the parties' infringement analyses comes down to an issue of claim construction. Medrad's analysis rests on its construction of the term "related to" as describing a direct one-to-one relationship. 12 According to Medrad, the asserted claims require that the information detected from the physical indicia must actually be the capacity of the syringe, the distance of the plunger from the end of the syringe, the amount of fluid in the syringe, the end of travel position of an injector ram, the range of travel of an injector ram, or an offset value. (Doc. Nos. 250/251, p. 19). L-F, on the other hand, views the term "related to" as encompassing direct and indirect relationships. As such, L-F argues that the physical indicia are "related to" various syringe properties if the information detected from physical indicia is the actual syringe properties or is merely used in some manner to determine syringe properties, as in the case of the Accused Injectors which use the information detected from the physical indicia as an index to look up syringe parameters in a table and then use those parameters to determine various syringe properties. (Doc. No. 257, p. 22; Doc. No. 262, p. 8).

12 The Court did not construe the term "related to" in its Oct. 18th Order. The Court used the term in its definition of the term "physical indicia" but took no position on the meaning of the term "related to" as it is used in the asserted claims.

13 Independent Claims 7 of the 612 and 1, 7, 13, 19, and 25 of the 197 patent describe the injector claimed in the patents. (Doc. No. 30, Exhs. 3 and 4). Independent Claims 10 of the 612 patent and 4, 10, 16, 22, and 27 of the 197 patent describes...
methods of using an injector which correspond to the claims describing the injector. (Id.).

The pertinent claim language of Claim 7 of the 197 patent states as follows:

An injector and syringe, comprising:

a syringe having . . . physical indicia related to the amount of fluid in the syringe . . ., and . . .

a controller in the injector . . . comprising:

a detector . . . for detecting the physical indicia on said syringe, and generating an electrical signal representative of said physical indicia, and a control circuit . . . wherein said control computes the amount of fluid in said syringe, using said electrical signal and the tracked location of said motor.

From this language, one can conclude that the after detecting the physical indicia on the syringe, a detector located in the injector generates an electrical signal that represents the information detected from the physical indicia:

a detector . . . for detecting the physical indicia on said syringe, and generating an electrical signal representative of said physical indicia, and

The control circuit of the injector then uses this electrical signal and the tracked location of the motor to compute various syringe properties:

control circuit computes 14 the amount of fluid in said syringe, using said electrical signal 15 and the tracked location of said motor. 16

Of key importance to the Court's analysis is that the electrical signal referenced in the asserted claims is generated by the detector and not the control circuit. 17 It is the signal generated by the detector that is used in the computation of various syringe properties. The claim language does not describe using the electrical signal generated by the detector to ascertain information from another source and then using this ascertained information to compute syringe properties. Thus, the information from the physical indicia that is represented by the electrical signal generated by the detector must be of the type that can be directly used in the computation of various syringe properties without reference to some outside source of information. 18 Under the plain language of the asserted claims, therefore, physical indicia is/are "related to" various syringe properties when the information detected from the physical indicia is/are the actual syringe properties or can be directly used in the computation of the various syringe properties without reference to some other source of information.

--- Footnotes ---

14 Claim 13 of the 197 patent uses the term "determines" rather than "computes". The parties have not argued nor does it appear that this difference in language has any significance.

15 Claim 7 of the 612 patent uses the term "by relating said electrical signal" rather than "using said electrical signal". The parties have not argued nor does it appear that this difference in language has any significance.

16 Claim 19 of the 197 patent computes the "range of travel of said ram" using the electrical signal without reference to the tracked location of the motor.

17 L-F's expert, Helmicki, states the following in his affidavit:

[Medrad's] assertion is based upon the erroneous assumption that the "electrical signal" referenced in the claims is, and can only be, the signal output by the optical sensors (slotted detectors) themselves, excluding the multiple electrical signals derived from the output of the optical sensors, which also represent the syringe information encoded in the indicia. (Doc. No. 257, Exh. 8, Helmicki Post-Claim Construction Aff., P 10).
This excerpt demonstrates that L-F's argument is based on the assumption that the electrical signal disclosed in the claims does not necessarily have to be the same electrical signal generated by the detector. L-F's (and Helmicki's) assumption is incorrect. The only electrical signal described in the claims is the original electrical signal generated by the detector.

18 Claims 25 and 27 do not track the language of the other asserted claims. As already discussed in footnote 7, the physical indicia described in Claim 25 constitutes an actual offset value rather than just relating to an offset value. Claim 27, which describes the method of controlling an injector, states in pertinent part that:

A method of controlling an injector . . . comprising:

  detecting a physical indicia on a syringe installed on said injector, said indicia being related to the capacity of said syringe, to obtain an offset value, . . .

(Doc. No. 30, Exh. 4).

At first glance, it would appear that the term "obtain", as it used in Claim 27, is not the same as the term "compute" and could, arguably, encompass references to an outside source of information. However, the term "obtain" must be read in light of the specification of the 197 patent, which states that "the offset value may be automatically computed by detecting physical indica on the syringe or extender which indicates the length of the syringe." (Doc. No. 30, Exh. 4, Col. 3, line 1 - Col. 4, line 1-2). Thus, the specification equates the term "obtain" with the term "compute".

Thus, the Court adopts neither parties' proposed construction of the term "related to" as it is used in the asserted claims. Rather, the Court finds that the term "related to" encompasses both a direct and indirect relationship, with the indirect relationship being limited to information that can be directly used in the computation of the various syringe properties without reference to some other source of information.

19 L-F argues that its construction of the term "related to" is supported by the deposition testimony of Thomas Braunstein, Medrad's 30(b)(6) witness. L-F is incorrect. First, Braunstein's deposition testimony is irrelevant to the Court's claim construction analysis because the Court can construe the term "related to" based solely on the intrinsic evidence. Therefore, the Court should not rely on any extrinsic evidence, such as Braunstein's deposition testimony. Second, Braunstein's deposition testimony regarding the relationship of the indents on the Accused Syringes to various syringe properties is of little assistance to the Court because Braunstein was not testifying about such relationships in terms of the Court's construction of the term "relate to" as it is used in the asserted claims. Consequently, Braunstein's deposition testimony does not support L-F's proposed claim construction. Furthermore, despite L-F's argument to the contrary, there is nothing inconsistent between Braunstein's deposition testimony and his Second Post-Claim Construction Declaration. (Doc. No. 262, pp. 6-7).
the control circuit must use the signal generated by the detector, rather than a signal generated by the control circuit, to compute the value of the property in question. The court thus construed the claims as requiring a direct relationship between the physical indicia and the property to which the physical indicia are related. That direct relationship, the district court reasoned, would exclude products, such as the Medrad injectors, that "indirectly" compute the value of the syringe property by using the electrical signal to reference a look-up table.

The language of the claims at issue does not support the interpretation adopted by the district court. The term "related to" by itself does not limit the relationship between the physical indicia and the properties in question to a direct relationship. The issue, then, is whether the claim language setting forth how the control circuit must use the electrical signal confines the relationship between the physical indicia and the syringe properties to a direct relationship. The exemplary claim quoted above requires that the "control circuit compute[] the amount of fluid in said syringe using said electrical signal." That language does not specify that the control circuit must use the electrical signal in any particular way. In the ordinary sense of the word "using," the act of employing the electrical signal to obtain a syringe property value from a look-up table constitutes "using" the electrical signal to compute that syringe property value. Therefore, the very language relied on by the district court to restrict the scope of the claims at issue does not exclude an injector in which the control circuit uses the electrical signal to compute the syringe property indirectly, for example by using the electrical signal in conjunction with a look-up table.

Medrad asserts that during prosecution the applicants distinguished the '612 and '197 patent claims from prior art substantially similar to Medrad's accused devices and that the asserted claims therefore must be read restrictively. During prosecution of an application that matured into the '612 patent and that gave rise to a continuation that matured into the '197 patent, the examiner rejected the claims as obvious over two prior art references, McDaniel and Arthur. The McDaniel reference disclosed associating the type of syringe with its corresponding properties using a look-up table, while the Arthur reference disclosed a detector for detecting a bar code on a syringe. The examiner asserted that it would be obvious to combine the detector and bar coding of Arthur with the McDaniel device to arrive at Liebel's claims. The applicants overcame that rejection by arguing that McDaniel and Arthur should not be combined because they addressed different problems. Liebel argued that the bar code "indicia" in Arthur did not indicate any syringe properties at all, but rather provided information regarding the concentration of the medication in the syringe. McDaniel, according to Liebel, disclosed a mechanical system for determining the syringe type, such as by measuring the angle of the conical forward end of the syringe. Instead of arguing that McDaniel did not teach detecting information "related to" syringe properties, Liebel argued that McDaniel did not teach detecting physical indicia at all. The applicants thus did not disclaim an "indirect" relationship between the physical indicia and the syringe properties.

Because both the plain language of the claims and the prosecution history do not support a claim construction limiting the relationship between the physical indicia and the syringe properties to a direct relationship, the district court erred in so ruling. It was therefore improper for the court to enter summary judgment of noninfringement of the asserted claims of the '612 and '197 patents. The district court will have to reconsider the infringement claims in light of the claim construction we have set forth above.

In view of its claim construction ruling, the district court did not need to analyze claim 25 separately from the other asserted claims of the '612 and '197 patents, other than to note that the language of claim 25 differs somewhat from that of the other claims. To the extent that Liebel continues to assert claim 25 on remand, the district court will have an opportunity to consider the proper construction of that claim in light of our interpretation of the language of the other asserted claims of the '612 and '197 patents.

22. Predefined text area "related to each fields of the second set of fields based on the selected fields:" 22 The predefined text area "has text which is predefined on the basis of the contents of the second set of fields, which in turn are based on the fields selected from the first set of fields." This construction is consistent with Figure 1B of the specification.
A. Claim Construction

On February 16, 2006, the Court held a claims-construction hearing in this matter. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The Court considered the '136 Patent and prosecution history, the parties' Markman briefs, the applicable law regarding, inter alia, claim construction, indefiniteness, and means-plus-function claims, and the argument of counsel. On May 25, 2006, this Court rendered a claims-construction order (Doc. # 292), which construed the terms as following:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Construed Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Debit Card&quot;</td>
<td>&quot;a prepaid card for exchange of value&quot;</td>
</tr>
<tr>
<td>n2&quot;ID information [stored on the debit card]&quot;</td>
<td>&quot;encrypted data, excluding the card number, stored on the debit card in the form of merchant ID, store ID, or terminal ID&quot;</td>
</tr>
<tr>
<td>&quot;Terminal&quot;</td>
<td>&quot;a point-of-sale apparatus, which includes a central processing unit, a card reader, a keypad, and a communications interface&quot;</td>
</tr>
<tr>
<td>&quot;ID information [stored on the terminal]&quot;</td>
<td>&quot;data stored on the terminal in the form of merchant ID, store ID, or terminal ID&quot;</td>
</tr>
<tr>
<td>&quot;Stored thereon prior to the transaction&quot;</td>
<td>&quot;stored on the terminal prior to the consumer presenting the debit card to the merchant&quot;</td>
</tr>
<tr>
<td>&quot;Relates . . . in a predetermined manner&quot;</td>
<td>&quot;prior to a transaction, ID information stored on the debit card and ID information stored on a terminal are capable of being matched&quot;</td>
</tr>
<tr>
<td>&quot;Matching&quot; and &quot;Matched&quot;</td>
<td>&quot;determining whether ID information stored on the debit card and corresponding ID information stored on the terminal are equal or identical&quot;</td>
</tr>
<tr>
<td>&quot;Retrieving via the terminal&quot;</td>
<td>&quot;locating and returning, by means of the terminal, ID information and a card number stored on the debit card&quot;</td>
</tr>
<tr>
<td>&quot;Computer&quot; and &quot;Computer means&quot;</td>
<td>&quot;a data processing device&quot;</td>
</tr>
<tr>
<td>&quot;Transmitting to a computer&quot;</td>
<td>&quot;sending by means of a signal path to a computer&quot;</td>
</tr>
</tbody>
</table>
"Validation" and "Valid" "indication of whether the ID information stored on the debit card matches the corresponding ID information stored on the terminal"

"Computer means disposed remotely" "a computer that is located apart from a terminal and connected to the terminal by a signal path"

"Card reader means" "a device, included as part of a terminal, used for retrieving ID information from a debit card"

"Communication means" function "transmitting the ID information stored on the debit card and the ID information stored on the terminal to the computer means"

"Communication means" structure "a modem or a signal path"

"Selected from a group of ID information" (Claim 2) "chosen from one of the following ID information"

n2 "ID," as used throughout this opinion, in whatever context, is shorthand for "identification."

--- Footnotes ---

3634

Step 3

Step 3 provides for "relating said at least one customer profile with the content profiles for the data available from each data source to the customer." Amazon's proposed construction, "comparing the customer profile with the content profiles for the data available from each one of the data sources by comparing the corresponding values for each of the predetermined characteristics," fails on the same grounds as its claim construction in Steps 1 and 2. Amazon improperly narrows the claim language of Step 3 by reading the phrase "predetermined characteristics" into the claim language, despite the fact the term is conspicuously absent. In contrast, Pinpoint's proposed construction is buttressed by the ordinary meaning of the term "relating," as meaning "to show or establish a logical or causal connection between." Pl. Opp. Mem. at 22 (quoting Merriam-Webster Dictionary at 621). The court construes "relating said at least one customer profile with the content profiles for the data available from each data source to the customer" as "establishing a logical connection between the customer profile and content profiles for the available data."

3635

b. Relative delay value

Disputed Claim Language Synopsys's Proposed Construction Magma's Proposed Construction
The phrase "relative delay value" appears in claims 28, 29, 51 and 52 of the '446 patent and claims 1, 12, 13, 14 and 16 of the '438 patent. (See '446 Patent at 19:24-34, 22:13-31; see also '438 Patent at 17:8-27, 18:26-38, 18:42-45.) Magma contends that "relative delay value" has the same meaning as "initial intended delay," while Synopsys contends that the two terms have different meanings.

Other than claim 1 of the '438 patent, each of the claims that contains the term "relative delay value" mentions "stretching" or "compressing" the "relative delay value" of a cell. (See '446 Patent at 19:24-34, 22:13-31; see also '438 Patent at 18:26-38, 18:42-45.) For example, claim 28 of the '446 patent requires the step of "stretching the associated relative delay value of a selected cell after the step of placing and before the step of determining the area." (See '446 Patent at 19:26-28.) Claim 1 of the '438 patent, by contrast, does not provide for any change to the "relative delay values." (See '438 Patent at 17:8-27.)

As an initial matter, the Court notes that "different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope." See Seachange In'l, Inc. v. C-Cor, Inc., 413 F.3d 1361, 1368 (Fed. Cir. 2005) (quoting Karlin Technology Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999)). Because the claims of the '446 patent include both the phrases "initial intended delay" and "relative delay value," it is presumed that the two phrases have different meanings. "However, the doctrine only creates a presumption that each claim in a patent has a different scope; it is not a hard and fast rule of construction" and cannot be used to "broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence." See id. at 1369 (internal quotations and citations omitted).

As Magma correctly points out, the '446 patent application was amended in May 2000 to replace, in some instances, the phrase "relative delay value" with the phrase "initial intended delay." (See Huffsmith Decl. Ex. 17 at SY002223.) Magma contends that this substitution indicates the two phrases have the same meaning. 5 Magma also points out that references to "relative delay value" in the dependent claims of the '446 patent are based on independent claims that appear to use the phrase "initial intended delay" to describe the same thing. Specifically, claim 21 of the '446 patent refers to "an initial intended delay associated with each cell" and contains no reference to "relative delay value," (see '446 Patent at 18:55-56), while dependent claims 28 and 29 describe, respectively, stretching or compressing "the associated relative delay value of a selected cell," and make no mention of "initial intended delay." (See id. at 19:24-33.) The Court agrees that "relative delay value" in dependent claims 28 and 29 appears to refer to the "initial intended delay" set forth in independent claim 21. Similarly, independent claim 49 refers to "computing the initial intended delay value of each cell based on the initial intended gain value," while dependent claims 51 and 52 discuss changing the gain value in order to change "the associated relative delay value of said cells." (See id. at 22:7-8, 13-20.) The Court agrees with Magma that "relative delay value" in claims 51 and 52 appears to refer to the "initial intended delay" set forth in independent claim 49.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

5 At his deposition, Dr. Sechen testified that "initial intended delay has units of time, whereas the relative delay value is unitless," but further testified that the difference in measurement of the two terms did not constitute a difference in meaning. (See Boyce Decl. Ex. A (Sechen Dep.) at 80:3-15, 85:5-86:1.)

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Moreover, the only reference in the specification to "relative delay" appears in the "Summary of the Invention" section, which states that the invention "broadly provides a method for designing an integrated circuit layout based upon an electronic circuit description and by using a cell library containing cells that each have an associated relative delay value[.]" (See id. at 3:17-21.) The summary of the invention further provides that "the initial intended area of at least some of the selected plurality of cells" is "determined using the associated relative delay value of the selected cell and the initial intended lengths of some of the wires coupled to the selected cell[.]" (See id. at 3:31-35.) Other than in the language of the
claims, no other reference to "relative delay value" appears in the '446 or '438 patents. Although Synopsys argues that "relative delay value" is "not an initial delay at all, but rather is a delay that has already been adjusted 'relative to' another value such as the timing constraints in the circuit," (see Reply at 10), the claim language, as well as the above-cited language from the specification, contradicts Synopsys's argument. In particular, claim 1 of the '438 patent makes no reference to adjusting the "relative delay value"; rather, it notes that the cells in a cell library already have "an associated relative delay value" when selected from the library, and that the "area" of some of the selected cells is adjusted based on the "relative delay value" of those cells in order meet predetermined timing constraints. (See '438 Patent at 17:8-28.) The Court finds there is no distinction in the patent between the "initial intended delay" and the "relative delay value." 6

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

6 Synopsys concedes that the terms "initial intended delay" and "relative delay value" are "at least similar," as its proposed constructions of the two terms and its own expert's testimony demonstrate. (See Harris Decl. P 93 ("It appears that the parties are in agreement that the 'relative delay value' is at least similar to the 'initial intended delay' set forth in the claims of the '446 Patent.")

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Accordingly, the Court will construe "relative delay value" in the same manner as it construed "initial intended delay": "a delay set as a target." 3636

Relative Movement

Konami argues that "relative movement" should be construed as "continuous movement of one thing with reference to another." Defendants Roxor and Redoctane contend that the term requires no construction, and Defendant MadCatz proposes that if the Court decides to construe the term, it should mean "movement of one thing with reference to another." In addition to whether "relative movement" should be construed at all, the parties disagree about the propriety of Konami's requirement that the movement be "continuous." The Court finds that the term requires no construction because the patentee used the term in accordance with its ordinary accustomed meaning, and additionally finds that Konami's "continuous" limitation lacks support as applied to "relative movement." n10

"Relative movement" is generally found in the following context: n11

a guidance unit effecting display of relative movement between said first and second display parts;

said guidance unit including a control section for controlling said relative movement to display a matching relationship between said first and second display parts in timed relationship with said rhythmic piece to thereby direct the player to actuate said actuable parts (emphasis added).

This claim language suggests that the patentee used the term "relative movement" in accordance with its normal and accustomed meaning, which encompasses all types of movement including "continuous" and "non-continuous" movement. Rexnord Corp., 274 F.3d at 1342. However, Konami argues that the specification teaches that the display parts are, in fact, a series of discrete stationary images rapidly displayed to create the illusion of continuous movement. In support, Konami points to a part of the preferred embodiment describing the allocation of memory that loads the display parts "without interruption." See 8:26-29. The Court finds this excerpt is insufficient to overcome the presumption that "relative movement" should carry a broader meaning, which is in accord with its ordinary and accustomed meaning. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d at 1366.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n10 The Court finds that "movement of one thing with reference to another" is not helpful because it merely confirms the ordinary meaning of "relative movement." Thus, the Court will focus on Konami's "continuous" limitation, and on whether
Konami's proffered support is a one-line description of the process by which display parts appear on the screen in a preferred embodiment. However, the surrounding language indicates that the references to "continuous" movement or movement "without interruption," applies more directly to the concept of "scrolling" than to "relative movement." The surrounding language reads:

A scroll display control section 110 is used to perform scroll display on the display surface of the monitor 3. The stepping position indication data for one set of data, which is set by the rhythm setting section 107, read from the stepping position indication data memory 105, is replaced with image data (hereinafter referred to as "stepping position indication marks") and is temporarily input to a mark memory 111. In this mark memory 111, an amount of two sets of data which are continuous so that the images of the stepping position indication marks are always displayed without interruption on the display surface 31 of the monitor 3 in scroll display is written. The scroll display control section 110 causes a stepping position indication marks from the mark memory 111 to be written as scroll images into a display memory 3a in such a manner that the reading addresses are shifted sequentially at predetermined time intervals. In this manner, in addition to dance images which are not scrolled, stepping indication marks which are scrolled are also transferred in sequence to the display memory 3a, and furthermore, the contents of the display memory 3a are repeatedly read and displayed in known display scanning means at a cycle, such as 1/60 seconds, and on the display surface 31, the stepping position indication mark is scrolled and displayed on the display surface 31 and the dance image is displayed in a moving-picture manner as a background image (emphasis added). 8:19-44.

The emphasis on "scrolling," which appears in dependent claim 32 as a particular sub-category of "relative movement," indicates that this excerpt describes a preferred embodiment including "scrolling" but the more general concept of "relative movement" is not implicated.

As noted above, the patentee used "relative movement" in its normal and accustomed meaning, which includes both "continuous" and "non-continuous" movement. The claims do not suggest that any particular type of movement was contemplated, and although Konami argues that the specification teaches a particular type of movement, that guidance is not particularly strong or clear as to "relative movement" and seems to read more directly on "scrolling." Therefore, the Court finds that this term's ordinary and accustomed meaning controls, and no construction is necessary.

3637

Relative Position

The '754 patent teaches:

a programmable microcomputer control apparatus for controlling the relative motion between a tool and a workpiece comprising ... indicator means for providing at an output digital signals indicative of the relative position between the tool and the workpiece.

Def. Ex. A (Pat.) at col. 14, ll. 41-46. Defendants argue that this is a means-plus function element. Defendants are correct; the element discloses a function (providing output signals indicative of relative position) and does not describe the structure used to accomplish that function. See Cole v. Kimberly-Clark, 102 F.3d 524, 531 (Fed. Cir. 1996) (means-plus-function elements "must not recite a definite structure which performs the described function."). In such cases, the Court must adopt the structures set forth in the specification as a limit on the element.

Defendant also argues that this element must be limited to an indicator which directly measures the relative distance between the tool and the workpiece rather than indirectly calculating this distance by measuring the absolute distances of the tool and the workpiece from some fixed reference point. Plaintiff argues that the indicator successfully indicates the
"relative distance" between the tool and the workpiece regardless of whether it directly measures the distance between the tool and the workpiece, or indirectly determines their relative distance from each other by reference to some fixed point. Plaintiff therefore argues that the language of this element does not support such a distinction. To the contrary, plaintiff argues that the patent specification mandates against it.

Defendants contend that plaintiff relied on a distinction between direct and indirect calculation of the distance between the tool and the workpiece by distinguishing between devices that measure "relative" and "absolute" position in the prosecution history. For example, Hurco distinguished the Kokai patent by stating: "Kokai discloses current position register 7 storing absolute position, but no apparent indication of relative position," See Def. Ex. D at HA022961, while simultaneously claiming that the '754 patent "requires the indication of the relative position of the tool and the workpiece."

In response, plaintiff notes that although the '754 patent uses the phrase "relative position," the patent's specification itself describes the position of the workpiece as being determined by reference to an absolute, fixed point on the machine tool table. In particular, the specification states:

When the program is in data block zero the table zero may be established over the full range of table travel by pushing table zero [button] 222 when the table is in the desired location. Programmed coordinates are then measured from the point.

Def. Ex. A (Pat.) col 6, ll. 30-34. Plaintiff therefore argues that the phrase “indicative of the relative position between the tool and the workpiece” must be construed to include systems that measure the location of the workpiece from some fixed point on the machine tool table. Although plaintiff cannot explain the prosecution history excerpt defendant cites regarding "absolute position," the exact meaning of this excerpt is unclear, and plaintiff's interpretation seems to accord better with the language of the specification itself. The Court therefore rejects defendants' proposed limitation.

2. Claims 1, 17 & 26 -- "Relative To"

In the course of the December 10, 1999 Markman hearing and in pre-hearing filings, it became apparent that the meaning of "relative to" is disputed. CIVIX contends the term "relative to" was inserted in the '525 patent only to address the patent examiner's concern about relativity. (Dec. 10, 1999 Tr., p. 14). CIVIX contends that the '525 patent makes clear that the transmitted information must be displayed relative to the positional coordinates. (Dec. 10, 1999 Tr., p. 15). Defendants argue that "relative," as used in the '525 patent, is opposed to "absolute" positioning along universal latitude and longitude coordinates.

CIVIX directs my attention to the amendments made to the '525 patent in response to the patent examiner's initial rejection of the claims as indefinite. On October 2, 1996, the PTO issued a First Office Action rejecting each of the thirty-seven claims pending in the '525 patent's application. (Detailed Action, CIV 0000214). In so doing, the examiner stated:

The use of terms "positional coordinates" and "identification of a position," as recited in line 4 and 11 of claim 1 (and in independent claims 17, 26, and 35) is unclear because the position of an element (or an item) can be absolute or relative. If the position is meant to be relative it is necessary to distinctly point out the relativity.

(CIV 0000214) (emphasis added). In response, the inventors submitted the following amendments addressing relativity (emphasis shows language added by amendment):

Claim 1: (C) means for transmitting a portion of the information in the database to the user via the link upon receipt of a request signal representative of a selected category and geographic vicinity, the transmitted portion of the information including identification of a position for each of the items of interest within the selected category and geographic vicinity and relative to the positional coordinates and other items of interest within the vicinity, and

Claim 17: (B) means for transmitting a portion of the information to the user via the link upon receipt of a request signal representative of a geographic vicinity and a selected category of the items of interest, the transmitted portion of the information including identification of a position for each of the items of interest within the selected category and
geographic vicinity, the position for each of the items of interest within the selected category and geographical vicinity being defined relative to the positional coordinates and other items of interest within the selected category and geographic vicinity.

Claim 26: (B) means for generating a request signal representative of a selected category and a selected geographic vicinity of the items of interest in response to inputs by the user, the remote access port having a user interface for accepting the inputs and for indicating to the user the position of each of the items of interest within the selected category and geographic vicinity, the position for each of the items of interest within the selected category and geographic vicinity being defined relative to the positional coordinates and other items of interest within the selected category and geographic vicinity.

(CIV 0000224-0000227). In the "Remarks" section concerning the above amendments, the inventors state that the amendments make clear that the items of interest are spatially related to each other and relative to the positional coordinates selected for the geographical vicinity. (CIV 0000227). Given the clear concern by the patent examiner, the inventors chose relative positioning rather than absolute positioning.

In response to these amendments, the Examiner allowed each of the thirty-seven claims of the '525 patent and provided his reasons for doing so in an Examiner's Statement of Reasons for Allowance. The Examiner emphasized that a primary factor distinguishing the claimed invention from prior art was that the position of the items of interest were defined, not absolutely, but rather in relation to the positional coordinates and other points in the selected vicinity:

The prior art does not teach or fairly suggest an apparatus or a method for . . . remotely accessing the database through a user interface to obtain information that includes the position for each of the items of interest within the selected category and geographic vicinity being defined relative to the positional coordinates and other items of interest within the selected category and geographic vicinity as recited in all independent claims.

(Examiner's Statement of Reasons for Allowance, P 1.1, CIV 0000287) (emphasis in the original). Accordingly, it is reasonable to infer that the '525 patent was issued because the positions of items of interest were defined in relative rather than absolute terms.

Because the term "relative" remains somewhat ambiguous in light of the intrinsic evidence, both sides have submitted expert declarations assisting in my technical understanding of absolute versus relative positioning. See Phillips Petroleum, 157 F.3d at 870. However, I heed Vitronic's warning that such opinion testimony on claim construction should be treated with the utmost caution. See Vitronics, 90 F.3d at 1585.

In support of its position, CIVIX submits the declaration of Rebecca McKinley. She testifies that the concept of "absolute" positioning means the use of precise measurement such as that involving surveyors instruments. (McKinley Declaration, P 6). She further states that the assignment of a latitude/longitude coordinate pair does not necessarily constitute absolute positioning. (McKinley Declaration, P 7). Instead, she contends that a latitude/longitude location would ordinarily suggest a relative location to other objects defined by this same coordinate system. (McKinley Declaration, P 7).

Defendants submit contrasting declarations supporting their view on absolute versus relative positioning. For example, Timothy Woods testifies:

The terms "absolute position" or "absolute coordinates" typically refers to positions defined in relation to the origin of a generally accepted coordinate system (e.g., 35 degrees latitude, 45 degrees longitude specify a position in relation to the equator and prime meridian.) By contrast, "relative positioning" or "relative coordinates" refers to positions defined in relation to an arbitrary point, not the origin of a generally accepted coordinate system. For example, the location of a drug store can be specified without knowing its absolute latitude and longitude, as two miles north and six miles east of a shopping mall whose location is otherwise known. In that case, "two miles north" and "six miles east" specify the relative position of the drug store.

(Wood Declaration, P 6). This is confirmed by the Defendants' other submitted declarations of Robert French and Robert Mavis. This view is further confirmed by recent United States Geological Survey documents that suggest ways of teaching students about mapping. http://rockyweb.cr.usgs.gov/public/outreach/topoteach.html. One education suggestion addresses "absolute versus relative location," and recommends that this notion be taught to elementary students:
Discuss absolute location versus relative location. What is the difference between 42 07 31'' 1at / 101 15 31'' long versus the phrase "northeast of Pleasant Grove"? When is absolute location important, and when is relative location important?

CIVIX makes no argument that its product uses latitude/longitude positioning. Instead, when I presented CIVIX with a simple hypothetical concerning these positioning concepts, CIVIX provided insight into their concept of "relative" positioning:

THE COURT: You know, if you have an air observer, you may only have to drop five zero and then fire for effect the whole battery. But that is a known point or position defined by an acceptable method of latitude and longitude.

You could also be from Rocky Ford, like I am, and somebody drives up and says, "Where's Maud's place?" And you say, "Well, you go down this lane about a mile and a quarter, hang a left through the cemetery. When you get through the cemetery turn right about a quarter of a mile and Maud's is on the right up the lane."

MR. SHEIKH [CIVIX]: Uh-huh.

THE COURT: That defines her location.

MR. SHEIKH [CIVIX]: Yeah... I would say it's much closer to showing your second example, you know, up there to the right, past the cemetery, than your military analogy.

Evidence was also presented that instead of latitude/longitude positioning, CIVIX uses an internal positioning grid system specific to each geographic vicinity. (Mavis Declaration, P 6). The items of interest are then located relative to the positional coordinates that specifically define the geographic vicinity.

I conclude that the term "relative to" denotes the concept of relative positioning as opposed to absolute positioning. CIVIX does not employ a universal system of latitude and longitude coordinates. Instead, it uses its own internal grid system and the information transmitted to a user of the system displays the items of interest only relative to the positional coordinates within this grid system.
Various methods of manufacturing MOS transistors have been described, whereby a semiconductor is produced by forming a thin layer of dielectric material (the oxide in the illustration) on a silicon substrate, then depositing gate electrode material such as polysilicon on the dielectric layer, "doping" the polysilicon with activating ionic substances so that it will conduct electricity, and vertically implanting or doping the source and drain regions of the silicon substrate with ions so that they become conductive. The portion of the substrate under the gate electrode is shielded from the vertical ion implantation, whereby after implantation the edges of the source and drain regions are generally vertically aligned with the sides of the gate electrode.

After implantation, the entire structure is heated to activate the ions in the implanted regions, as is necessary to make the regions conductive. This step leads to an undesirable consequence because during this heating process the implanted ions tend to diffuse through the substrate. Diffusion under the gate electrode causes buildup of an electric charge known as "Miller capacitance," which reduces the transistor's operating speed. The '943 patent is directed to a MOS transistor fabrication method that reduces the occurrence of Miller capacitance.

In accordance with the '943 method, dielectric oxide layers are thermally grown on the top and sides of the gate electrode. This oxide serves as a mask during the ion implantation of the substrate, thereby spacing the source and drain regions from the region under the gate, as shown in Fig. 1 of the '943 patent:

The dielectric oxide layers are differentially grown, meaning that the oxide (18) grown on the top and sides of the gate electrode (16) (POLY for polysilicon) is thicker than the oxide grown over the source and drain regions (20 and 22) of the substrate. The grown oxide on the top and sides of the gate electrode shields the gate electrode and the underlying portions of the substrate from ion implantation during creation of the source and drain regions, forming a gap that is free of implanted ions. Upon heat activation there is some migration of ions, but the conditions are controlled whereby there is substantially zero overlap in the vertical alignment of the gate electrode and the implanted source and drain regions. Since the ions do not migrate beyond the gap into the area underneath the gate electrode, Miller capacitance is avoided and operating speed is increased. Claim 1 of the '943 patent states the claimed process:

1. A method for fabricating on a substrate an MOS transistor having a gate electrode and a self-aligned source/drain region with zero overlap comprising:

   (a) forming a doped polysilicon gate electrode upon but insulated from the substrate; then

   (b) differentially thermally growing an oxide to serve as an implant mask having controlled thickness on both the top and sides of the gate electrode whereby a relatively thicker layer of oxide is developed on the top and sides of the gate electrode and a relatively thinner layer of oxide is developed on the intended source and drain regions of the substrate; then

   (c) anisotropically etching said oxide;

   (d) implanting a source/drain region in the substrate such that said implant mask shields an underlying portion of the substrate from implantation to result in a gap between a side edge of the gate electrode and a side edge of the implanted region; and then

   (e) heat driving the implanted source/drain region until its side edge is substantially aligned with the previously separated side edge of the gate electrode, whereby the source/drain edge is aligned with the gate electrode edge and there is substantially zero overlap.

EMI charged that certain of Intel's MOS transistor fabrication methods infringe claim 1, literally or under the doctrine of equivalents.

INFRINGEMENT
Determination of infringement entails a two-step analysis wherein the claims are first construed by the court as a matter of law, following which the construed claims are applied to the accused device or method, a question of fact. Markman v. Westview Instruments, Inc., 52 F.3d 967, 976, 34 U.S.P.Q.2D (BNA) 1321, 1326 (Fed. Cir. 1995) (in banc), aff'd, 517 U.S. 370, 38 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). In Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1455, 46 U.S.P.Q.2D (BNA) 1169, 1173 (Fed. Cir. 1998) (in banc), the Federal Circuit confirmed that any disputed questions concerning the meaning and scope of patent claims, including the meaning of technologic and other terms ("the totality of claim construction") are treated as questions of law and are determined de novo on appeal, without deference to the decision of the trial court.

On appeal of the district court's grant of summary judgment we first must construe the claims, and then apply the rules governing summary judgment to the district court's rulings on the factual issues of infringement. When disputed questions of material fact underlie the summary judgment "the evidence of the nonmovant is to be believed, and all justifiable inferences are to be drawn in his favor." Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 254, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986). The appellate tribunal must assure itself that there is no reasonable version of the facts, on the summary judgment record, whereby the nonmovant could prevail, recognizing that the purpose of summary judgment is not to deprive a litigant of a fair hearing, but to avoid an unnecessary trial. See id. at 250. On this basis the grant of summary judgment is reviewed de novo on appeal. See, e.g., Stark v. Advanced Magnetics, Inc., 29 F.3d 1570, 1572-73, 31 U.S.P.Q.2D (BNA) 1290, 1292 (Fed. Cir. 1994).

The Markman Hearing

Construction of the claims by the trial court is often conducted upon a preliminary evidentiary hearing, called a Markman hearing in homage to the decision, cited supra, that established that this step must be performed by the judge, not the jury. This case illustrates the resolution of most of a complex infringement case with no more trial than a two-day Markman hearing.

At the Markman hearing the district court heard extensive testimony from the technical experts on the various issues and arguments concerning the scope of the claims in the context of the accused structures, and made findings thereon in construing the claims. The Federal Circuit has admonished that claims should preferably be interpreted without recourse to extrinsic evidence such as expert testimony, other than perhaps dictionaries or reference books, and that expert testimony should be received only for the purpose of educating the judge. See Markman, 52 F.3d at 983, 34 U.S.P.Q.2D (BNA) at 1133 (expert testimony can not "relieve the court of its obligation to construe the claims according to the tenor of the patent. This opinion testimony also does not change or affect the de novo appellate review standard for ascertaining the meaning of the claim language.") In Cybor the court reaffirmed that extrinsic evidence including expert testimony is not to be relied upon for purposes of claim interpretation, other than to aid the judge in understanding the technology; such evidence is only "an aid to the court in coming to a correct conclusion as to the true meaning of the language employed in the patent." 138 F.3d at 1454 n.3, 1455-56, 46 U.S.P.Q.2D (BNA) at 1173 n.3, 1174.

At the hearing the court received the testimony of expert witnesses for both sides. The witnesses explained the technology of MOS field effect transistor fabrication, analyzed the cited references, and testified as to the technologic facts of the patented and the accused processes and their effect. The expert witnesses discussed the specification and the prosecution history and the meaning of certain rejections, arguments, and amendments during patent prosecution. The expert witnesses expressed their views on the meaning and scope of the claims, as well as on legal and technologic issues relating to prosecution history estoppel and equivalency.

Following the Markman hearing the district court construed the scope of the claims, with respect particularly to the relative thickness of the grown oxide on the top of the POLY gate. This construction was dispositive of the issue of literal infringement. The district court granted Intel's motion for summary judgment that there was not literal infringement, and a few weeks later upon Intel's renewed motion the court granted summary judgment that there was not infringement under the doctrine of equivalents. EMI argues that the district court incorrectly construed the claims, denying the patented invention its proper scope. EMI states that the court's overly narrow claim construction incorrectly excluded the accused Intel processes.

Several complex and disputed technologic questions have been raised concerning the scope of the claims and their construction, particularly in the context of the accused structures. In our de novo review we have considered the analysis
and conclusions of the district court, as well as the testimony and opinions of the expert witnesses, in resolving these questions. Although both sides have attempted to provide basic education in this field of technology, our determination of the issues on appeal has drawn on the record of the Markman hearing and the testimony of the expert witnesses, including their conflicting views of the significance of various distinctions drawn during patent prosecution with respect to the prior art, as well as with respect to the accused Intel methods and their relation to the EMI method and prior art methods.

The Oxide Thickness, Claim Clause (b)

The district court construed clause (b) to require that the dielectric oxide grown on top of the gate electrode must be sufficiently thick of itself, without additional deposited dielectric, to serve as an implant mask for the gate electrode. This requirement is not stated in the '943 specification, but Intel argued that it is implicit in the patented invention, and that this can be discerned from the prosecution history and the prior art.

The issue was debated by the expert witnesses, who disputed the purpose of the grown oxide on top of the gate, applied the prior art to set limits to the top oxide thickness, and discussed the implications for Intel's process. Drawing heavily on this testimony, the district court construed claim clause (b) to require the following characteristics of the grown oxide on the top and sides of the gate, some of which are stated in the claim and some of which are not:

1) the grown oxide must be thick enough on top of the gate electrode to serve as a mask for the implant of step (d);

2) the grown oxide must be thick enough on the side of the gate electrode to block the implant of step (d), thereby making a "gap;" and

3) the top oxide thickness must be in a proportion of at least 1.77 to 1 to the substrate oxide thickness.

EMI assigns several errors to this claim construction. First, EMI argues that clause (b) does not require that the grown oxide on top of the gate electrode be sufficiently thick by itself to serve as a mask during implantation of the source/drain region. This aspect is relevant to the issue of infringement, for Intel adds dielectric to the top of the gate in order to achieve this masking result. EMI states that the doping (implanting) of the gate electrode itself is not part of the '943 invention, and that it is irrelevant to the construction of the claim to consider how the top of the gate is masked. EMI states that neither the specification nor the prosecution history concerns the mask thickness of the oxide on top of the gate, or whether that oxide is grown, or additional dielectric is deposited, or both. Thus EMI argues that the district court incorrectly construed the claim by imposing the enumerated limitations on the claim element of clause (b).

EMI points out that clause (b) as written requires only that the oxide grown on the top and sides of the gate electrode has a "controlled thickness," thicker than the oxide grown on the substrate (this is the agreed meaning of "differentially" growing), and requires only that the grown oxide on top and sides "serves as an implant mask" during implanting of the source and drain regions. EMI states that this does not mean or require that the grown oxide must be sufficiently thick on top of the gate to serve as a complete implant mask to the gate electrode itself, which has already been doped. EMI states that the '943 claims do not exclude Intel's deposit of additional oxide on the top of the gate to add to the masking effect of the grown oxide. EMI argues that the phrase in clause (b) "having controlled thickness on both top and sides" refers, grammatically and technologically, to the term "oxide," not the term "implant mask." EMI states that the '943 patent is directed to masking the substrate during ion implantation of the drain and source regions, and that it is irrelevant how the top of the gate is shielded during this step.

Thus EMI argues that clause (b), correctly construed, requires only that the differentially grown oxide must have controlled thickness on the gate electrode as compared with the substrate, but does not also require the grown oxide on top of the gate electrode to serve as a total mask to the top of the gate during the implantation of the substrate in accordance with clause (d). EMI argues that the specification supports the claim construction that only the oxide grown on the sides of the gate electrode must serve as a complete mask to the underlying substrate, pointing out that column 3, lines 42-44, of the '943 patent states that "the oxide 18 on the sides of the gate electrode acts as an implant mask to shield underlying portions of the substrate from implantation."

During patent prosecution the claims were rejected on the ground of obviousness based on U.S. Patent No. 4,182,023 (the Cohen patent) in light of U.S. Patent No. 4,356,623 (the Hunter patent). The Cohen patent describes the implanting of MOS...
source and drain regions when there is formed on top of the gate electrode a layer of oxide slightly larger than the gate electrode, thereby providing an overhanging mask that shields a portion of the substrate below the overhang during the vertical implantation of ions into the source and drain regions. The Hunter patent describes depositing an oxide layer over the top and sides of the gate electrode, then etching away the oxide on the top of the gate (so that the top can be implanted with dopant), leaving the oxide on the sides of the gate to serve as an implant mask for the substrate. To overcome the rejection on the combination of Cohen and Hunter, EMI amended clause (b), which had initially stated "forming an implant mask of a controlled width on the sides of the gate electrode" without mentioning the top of the gate electrode, to "forming an implant mask of a controlled thickness on both the sides and on the top of the gate electrode." EMI's patent attorney pointed out to the examiner that the Hunter patent required etching away the oxide on top of the gate electrode and,

if enough oxide is etched away to permit implanting the source and drain, because there is no differential, between the gate oxide thickness and the source/drain oxide thickness, the gate would similarly be implanted. This too is a severe problem. [Emphasis in original.]

Thus EMI stressed to the PTO that in its invention failure to totally mask the gate would result in a "severe problem."

Again rejecting the pending claims, the examiner next cited the Steinmaier patent (U.S. Patent No. 4,139,402) in view of the Cohen patent. Steinmaier shows grown oxide on the top and sides of the gate, and was distinguished by the applicant's stressing that in the '943 invention the oxide was differentially thermally grown, that the gate was already doped before the oxide was grown, and that the oxide in Steinmaier was too thin to serve as an implant mask for the doped polysilicon or to prevent diffusion of ions from the source and drain regions into the area under the gate. The rejection was also based on the Stoffel patent (U.S. Patent No. 4,287,661), which showed an implant mask having deposited oxide on top of the gate and grown oxide on the sides of the gate and on the substrate. EMI argued that Stoffel was distinguishable on the basis that,

the top of the gate is covered with a coterminous layer of deposited silicon oxide. Next, to get to Fig. 4, a thermal growth occurs as described in column 4, lines 15-27. Clearly this oxidation is entirely of polysilicon, because polysilicon is the uppermost layer. There is no differential growth because there is only one substance being oxidized. (A difference in thickness results only because there is the added thickness of deposited silicon oxide 32.) [Emphasis in original.]

At the same time, claims covering alternate embodiments, including those to composites of two dielectrics to mask the gate, were cancelled and claim 1 was amended and limited to "(b) differentially thermally growing an implant mask of oxide . . . on the top and sides."

The oxide grown under the conditions of the '943 patent was consistently described to the examiner as having the advantage of producing a "relatively thicker" oxide covering the gate electrode. Although it is undisputed that Intel's grown oxide is also "relatively thicker" on the gate, it was stipulated that it is not thick enough to mask the top during ion implantation, and requires a supplemental deposit of dielectric material for that purpose. We observe that EMI's claims all state that the gate electrode is already "doped" before implantation of the source/drain region, see clause (a) of claim 1, thus requiring that the top be masked during implantation of the source/drain regions.

With the guidance of expert testimony on all of these issues raised by the prior art and the prosecution history, the district court held that the differentially thermally grown oxide on top of the gate electrode in the '943 patent's process must be thicker than the oxide grown on the substrate by a ratio of at least 1.77 to 1. This ratio does not appear in the '943 specification, but is derived from the Steinmaier reference, which was distinguished during prosecution as inadequate to satisfy the masking requirements of the '943 process because the differential available from Steinmaier was only 1.77 to 1. Thus the district court placed this numerical threshold on the term "relatively thicker" in claim clause (b). EMI argues on appeal that the specification and claims require only that the oxide grown on top of the gate electrode is relatively thicker than the oxide grown over the substrate, that the prosecution history did not focus on the top thickness of the mask, which is irrelevant to the '943 invention, and that the numbers extracted from the prior art are inapty imported into the '943 claims.

Although we agree with EMI that the 1.77 to 1 ratio is not the only way of defining "relatively thicker," it was presented to the examiner, in distinguishing the Steinmaier reference, as a ratio below which differential thermal growth is not deemed to be achieved. It was not incorrect for the district court to construe the claims as requiring at least the relative thickness that was invoked to distinguish the '943 method from the prior art. In all events, it is clear that the oxide grown on top of the gate must be thick enough to serve as a mask for the gate during the implant step (d), for this was the basis on which EMI
overcame the final rejection on the Cohen and Steinmaier references; and EMI concedes that the differentially thermally grown oxide of Intel, without additional dielectric, does not mask the gate during step (d).

3640

f. "Relay having an operational position and a test position"

Claim 5 requires a "relay having an operational position and a test position." The court begins by construing "operational position" and "test position." As the parties agreed, the claimed relay is the element that separates the high voltage delivery system from the rest of the defibrillator. In one position, which is referred to in the specification as the "normally closed" or "closed" position (374 Patent at 9:13-14, 10:24-25), the high voltage delivery system is capable only of self-tests in which it sends a current through a test load. 374 Patent at 11:30-42. In this position, the defibrillator cannot shock a patient. 374 Patent at 8:34-38.

In another position, which is referred to as "normally open" or "open," the high voltage delivery system can deliver a shock to a patient, as the parties agree. In addition, however, the defibrillator can conduct other self-tests with the relay in open position. E.g., 374 Patent at 9:4-21 (describing the "Defibrillator Connector/Relay self-test"), 10:14-22 (describing the "HV Isolation Relay self-test").

The "test position" of Claim 5 is the relay position in which the high voltage delivery system can only perform self-tests and cannot shock a patient. The "operational position" is the relay position in which the high voltage delivery system can deliver shock to the patient, although the defibrillator can perform other relay self-tests in this position as well.

The parties' dispute over this term centers on whether the relay may consist of a combination of relays and can have more than two positions, as Philips contends, or whether the relay is a single relay with only two positions, as Defibtech contends.

Philips can point to no intrinsic evidence that discloses more than one relay or more than two positions. Instead, it relies on three arguments: that the specification does not exclude such relays, that dictionary definitions of "relay" do not exclude such relays, and that the inventors' decision to claim a "relay having an operational position and a test position" is no different than using the open-ended terms "comprising" or "including."

The court finds Philips' first two arguments unavailing. The specification speaks only of a relay with two positions. n10 It does not state that such positions are preferred, and it does not suggest that a relay with more than two positions could have any function in this invention. As for Philips' dictionary definitions, the court declines to rely on them for the reasons stated in its prior order. October 25 order at 5.

As to Philips' third argument, the term "having" does not carry the presumption of open-ended interpretation that accompanies the term "comprising." Crystal Semiconductor Corp. v. Tritech Microelectronics Int'l, Inc., 246 F.3d 1336, 1348 (Fed. Cir. 2001). Instead, a court must look to the specification to determine what the inventors intended. Lampi Corp. v. Am. Power Prods., Inc., 228 F.3d 1365, 1376 (Fed. Cir. 2000). As already noted, if the inventors intended "having" to be non-limiting, n11 they left no hint in the specification. The specification speaks uniformly of a single two-state relay. The court construes the term accordingly. A "relay having an operational position and a test position" is a single relay with only an operational position and a test position, where "operational position" and "test position" have the meanings the court provided above.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n10 The specification also teaches that the relay may become stuck in a position between the open and closed position. 374 Patent at 10:26-28 (discussing possibility that relay could "fail[] to move completely to the normally closed position").

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

As to Philips' third argument, the term "having" does not carry the presumption of open-ended interpretation that accompanies the term "comprising." Crystal Semiconductor Corp. v. Tritech Microelectronics Int'l, Inc., 246 F.3d 1336, 1348 (Fed. Cir. 2001). Instead, a court must look to the specification to determine what the inventors intended. Lampi Corp. v. Am. Power Prods., Inc., 228 F.3d 1365, 1376 (Fed. Cir. 2000). As already noted, if the inventors intended "having" to be non-limiting, n11 they left no hint in the specification. The specification speaks uniformly of a single two-state relay. The court construes the term accordingly. A "relay having an operational position and a test position" is a single relay with only an operational position and a test position, where "operational position" and "test position" have the meanings the court provided above.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
n11 As Defibtech noted at oral argument, the inventors used the term "having" only twice in the 73 claims of the 374 Patent, whereas they used the presumptively open-ended term "comprising" more than 60 times.

--- End Footnotes ---

3641

Turning now to the relaying step, claim 14 reads as follows:

14. A method for automatically regulating the release of the drill string of a drilling rig drill, comprising the steps of:

   relaying said selected signal or signals to a drill string controller which regulates the release said drill string in response to said selected signal or signals.

'142 patent, col. 28, ll. 34-38 (emphasis added).

As outlined above, nothing in the claim language requires or even suggests the use of pneumatically operated valves in performing the relaying step. Rather, the only discussion of pneumatically operated valves in the intrinsic record comes from the specification: "In the preferred embodiment, valves 236-239 are pneumatic valves that operate as relays to supply compressed air to air motor 204." '142 patent, col. 7, ll. 35-37. This disclosure and corresponding Figures do not limit the invention as a whole to the use of pneumatically operated valves; rather they merely list such valves as but one example of relays operable in the present invention. See C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 864 (Fed. Cir. 2004) ("Statements that describe the invention as a whole, rather than statements that describe only preferred embodiments, are more likely to support a limiting definition of a claim term.") (citing Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998)); SanDisk Corp. v. Memorex Prods., Inc., 415 F.3d 1278, 1286 (Fed. Cir. 2005) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.") (quoting Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988)); Gillette, 405 F.3d at 1374 ("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification.") (quoting Texas Instruments, Inc. v. U.S. Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed. Cir. 1986)); Gart v. Logitech, Inc., 254 F.3d 1334, 1342 (Fed. Cir. 2001) (noting that "drawings [depicting the preferred embodiment] are not meant to represent 'the' invention or to limit the scope of coverage defined by the words used in the claims themselves."); see also '142 patent, col. 24, ll. 27-35 (stating the present invention is not limited to the preferred embodiment).

Moreover, the specification's disclosure of valves that "operate as relays" implicitly suggests that "relay" has a broader meaning than simply the preferred pneumatically operated valves. To illustrate, the applicant could have used terminology such as "relays are pneumatically operated valves" that expressly disavows alternative structures. As written, however, the specification contemplates that other structures may "operate as relays" in addition to the preferred pneumatically operated valves. Hence, the intrinsic record does not support the district court's interpretation of the relaying step.

Finally, the extrinsic evidence in this case confirms that the relaying step is not limited to pneumatically operated valves. For example, Pason's expert, presumably one of ordinary skill in the art, testified that "relaying" in claim 14 was not limited to the use of pneumatically operated valves:

   Court: It's not your opinion, is it, that claims 11 and 14 are limited to a pneumatic control system -

   Expert: No. Well -- no. It's not limited to a pneumatic control system as the way they're written, that's true.

In addition, Pason's counsel at oral argument similarly conceded that relaying in claim 14 should not be limited to pneumatically operated valves. Hence, there is no support, either in the intrinsic or extrinsic record, for the district court's interpretation of the relaying step. Thus, as with the selecting step, the district court's interpretation of the relaying step is unduly narrow.
10. “Releasing”

“Releasing” is utilized in asserted claims 1, 9 and 11 of the ‘554 Patent and 1, 15, and 29 of the ‘335 Patent. The Plaintiff asserts that the “releasing” does not need construction. Alternatively, if construed, the Plaintiff asserts that the proper construction is “freeing.” The Defendants assert that the term should be construed as “communicating to said Web server that it may now process other requests.”4 A central point in the dispute between the parties is the Plaintiff’s arguments that releasing can implicitly occur as a result of routing without communication to the Web server. The Defendants assert that there must be communication to the Web server.

The Plaintiff asserts that the term “freeing” is supported by the specification and notes that the specification states that the result of routing is that the Web server is free to continue servicing client requests. In particular, the Plaintiff points out that the specification states “Web server executable 201(E) is thus free to continue servicing client requests on Web server 201 while the request is processed ‘off-line.’” Col. 5:16-18. Thus, the Plaintiff asserts that the specification implies that releasing is an automatic consequence of routing the request to another processing element and that nothing in the specification requires communication to the Web server to effectuate the release.

The Defendants assert that the ‘335 Patent prosecution history shows that merely routing a request from a Web server to a Page server and thereby implicitly releasing the Web server was disclaimed by the Applicants during the prosecution history as being different from releasing. The Plaintiff counters by asserting that the full context of the prosecution history quote in question does not stand for the proposition asserted by the Defendants. The portion of the prosecution history in question includes:

At no time does Rogers teach or suggest ‘concurrently’ processing other requests or ‘releasing said Web server to process other requests’ because merely retrieving data from multiple sources does not teach or suggest these elements. Response to Office Action, Nov. 27, 2001 at 9.

The Court is persuaded that by reviewing the full context of the portion of the prosecution history in question a clear disavowal was not made by the Applicants. Thus, the prosecution history does not mandate that releasing cannot implicitly occur due to routing from a web server to a page server. However, the Defendants raise a more relevant argument with regard to the claim language itself. “Releasing” is used in each claim as part of the phrase “said page server receiving said request and releasing said Web server to process other requests.”5 It is therefore the Page server that does the releasing. The larger context of the use of releasing in the claims themselves indicates that the Page server has a role in the releasing as in the claims themselves it is the Page server that releases the Web server. This language also conforms to the Summary of Invention and Abstract. Col. 2:25-26; Abstract, line 8.

The Court is thus persuaded that the Defendants are partly correct that as required by the claim language itself the Page server takes some action to releasing the Web server. However, the Defendants do not provide adequate support in the specification or elsewhere to mandate that such action is limited to communication from the Page server to the Web server. As there could be other actions that the Page server may take to affirmatively release the Web server, it would be inappropriate to limit the claim to one type of action, particularly when support is lacking in the record for that particular type of action. The specification does not necessarily limit the claims to a particular technique by the Page server as to how the claimed release by the Page server is accomplished. For example, the limitations proposed by Defendants could be argued to not include Page server actions that are communications from the Page server to other intermediate elements (such as the Dispatcher) or Page server actions that involve affirmatively not sending some expected regular communication. The Court therefore interprets “said page server receiving said request and releasing said Web server to process other requests” to mean “said page server receiving said request and said page server performing an act (separate from merely receiving the request) to free the Web server to process other requests.” Claims 9 of the ‘554 Patent and claims 15 and 29 of the ‘335 Patent are likewise construed with the substitution of “second
computer system” and “HTTP-compliant device” respectively for “Web server.”

The Court is of the opinion that the findings and conclusions of the Magistrate Judge are correct. Therefore, the Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court.

Relieving the institution of the administrative burden of processing forms and payments.

Judge Hubel construed the term "relieving" to mean the "elimination of anything the institution must do to use the data." Construction Order 1 at 74 (emphasis in original). Thereafter, Plaintiff argued that "relieving the burden" meant merely "to lessen the burden." This Court, however, rejected that construction and confirmed "relieving" means "[t]he described acts of the third party eliminate the administrative burden to the institution of processing forms and payments."

"Optical remodulator" or "remodulator" means "an optical interface between space-division transmission and wavelength-division transmission."

The parties also disputed the construction of several terms from the Civix patents. After briefing, and a Markman hearing on March 14, 2005, the Court made the following claim construction rulings. "Spatial detail" means "geographic information relating to an area or region." "Internet" means "a system of linked computer networks, worldwide in scope, that typically is associated with using TCP/IP as a standard protocol" and "internet" means "a group of networks that have been connected by means of a common communications protocol." "Remote" or "Remotely" means "separated by an interval or distance with "separated" meaning "to be set or kept apart."

3. "remote command center"

The phrase "remote command center" appears in several sections of claim 17. Plaintiff proposes to define the terms as, "a dedicated location for monitoring and managing the care of hospitalized patients, which location is apart from the geographically dispersed ICUs." Defendants counter with, "a dedicated center for monitoring and directing intervention of hospitalized patients by health care professionals, which center is apart from the geographically dispersed ICUs, twenty-four hours a day 7 days a week." These proposals differ in numerous respects.

At the outset and for reasons set forth above, we reject defendants' addition of a 24/7 temporal component. Thus, the remaining three disputes are as follows: "location" versus "center;" "managing the care" versus "directing the intervention;" and the proposed addition by defendant of "by health care professionals."

Plaintiff has not set forth a specific argument regarding its use of "location" versus "center" in its brief. (Pl.'s Br., pp.16-18.) At the Markman hearing, plaintiff argued that the remote command center is a location and that the best support for this
interpretation is the frequency with which the word "location" appears in the patent itself. (Hr'g., p. 107.) Defendants spend little time on this issue, asserting only that a "location" is an unnecessary and inaccurate definition for "center," which has its own commonly understood connotation. (Defs.' Br., p. 15.) We prefer plaintiff's argument and its reliance on intrinsic evidence and determine that the construction will begin: "a dedicated location."

Next, plaintiff seeks the construction "managing the care" as opposed to defendants' proposed "directing intervention." Plaintiff argues that defendants' construction would improperly limit the meaning of the claim term to intervention. (Pl.'s Br., p. 17; Hr'g., pp. 112-13.) Defendants assert that plaintiff represented its invention as different from prior art because it directed the intervention of care. (Defs.' Br. at 14; Hr'g., pp. 133, 159.) Defendants seem to urge the Court to apply the "disclaimer doctrine," supra, to narrow the meaning of the disputed claim term. Defendants also point the Court to examples in the specification where the phrase "directing intervention" is used. Plaintiff's counter that the phrase "proactively intervening" was taken out of the claim terms and the Court cannot now use the specification to add a limitation. (Hr'g., pp. 159-60.)

The Court finds that defendants' construction "directing intervention" would improperly narrow the meaning of "remote command center." The specification does not justify the addition of this language to the claim construction and defendants have provided no evidence that plaintiff has disclaimed a broader meaning. Therefore, the Court adopts the construction: "managing the care."

Lastly, defendants ask the Court to add the language, "by health care professionals" (or alternatively, "by intensivists," "by intensivist-led care team," or "by doctors and nurses") to the definition of remote command center. Plaintiff objects, arguing that "intensivist" was specifically taken out of the claim terms during the patent approval process and that it would be impermissible to now add it back in. (See Hr'g., pp. 121, 123, 126.) Plaintiff cites Kistler Instrumente AG v. United States, 628 F.2d 1303, 1308, 224 Ct. Cl. 370 (Ct.Cl.1980) and United States v. Telectronics, Inc., 857 F.2d 778, 782-83 (Fed. Cir. 1988) to support this proposition. A review of this precedent supports plaintiff's proposed construction. The phrase "by health care professionals" will not be included in the claim construction.

In sum, in defining remote command center, the Court adopts plaintiff's proposed construction for "remote command center" in its entirety. "Remote command center" is construed as: "a dedicated location for monitoring and managing the care of hospitalized patients, which location is apart from the geographically dispersed ICUs."

3648

1. Remote link adapters; RLA devices

The term "remote link adapters" appears in claim 12 of the '121 patent by virtue of its dependence from claim 11, and the term "RLA devices" appears in claim 52 of the '121 patent. The defendants ask the court to limit RLA devices to those that receive vestigial sideband (VSB) broadcasts and thereafter route the decoded data to data terminal equipment ("DTE"). The defendants improperly support their proposed construction with non-limiting passages from the 774 patent specification and prosecution history. The plaintiff asks the court to construe the term "RLA devices" to include the addressing and data detecting features that are characteristic of a modem. The court has considered the parties' briefing and is not persuaded to adopt either proposed construction.

The defendants suggest that certain claim limitations in the '121 patent family are limited by the disclosure and prosecution history of the '774 reissue patent because the '774 patent is incorporated by reference within the specification of the '121 patent family. Upon review of the '121 patent specification, however, the court is unable to locate an explicit incorporation of the '774 patent by reference, or an incorporation of its underlying application (serial number 08/340,733). n9 Therefore, the defendants are apparently basing their assertion solely on the incorporation by reference of the parent application to the '774 reissue patent, U.S. Patent No. 5,347,304 ("the '304 patent), within the specification of the '121 patent family. Although the court does not necessarily endorse the defendants' argument as to the effect of such an incorporation by reference, for the reasons explained below, the court does not need to decide this issue.
n9 Additionally, the defendants' brief fails to include a pinpoint citation to any supporting text.

The '304 patent is incorporated by reference into the '121 patent specification with the following language:

U.S. Pat. No. 5,347,304 (1994) assigned to Hybrid Networks, Inc., and describing an example of an RLA is hereby expressly referenced and incorporated herein in its entirety.

'774 patent at 5:59-62 (emphasis added). Assuming that the above incorporation of the '304 patent effectively incorporated the '774 patent by reference, such incorporation fails to limit the claims of the '121 patent because the patentees expressly incorporated only "an example of an RLA" from the '304/'774 patent. '774 patent at 5:60-61. Cook Biotech, Inc. v. Acell, Inc., 460 F.3d 1365 (Fed. Cir. 2006) is distinguishable for two reasons. First, the patentees in Cook. expressly incorporated the entire disclosure of the limiting patent within the patent specification at issue. This is in contrast to the incorporation at hand, which serves to incorporate the '304 patent disclosure as only an illustrative example or embodiment. Id. at 1375-76. Second, the limiting language in Cook was found solely in the disclosure of the incorporated patent disclosure; not in both its disclosure and prosecution history. Id. Therefore, under the facts of this case, the court rejects the defendants' argument that certain claim terms of the '121 patent family are limited by the incorporation of the '304 patent. The court will, however, examine the disclosure of the '304 patent for guidance on the construction of certain claim terms, as is appropriate.

The term "remote link adapter" or "RLA" was coined in the '304 patent specification. It is repeated used in the specification of the '121 patent family. As discussed above, the disclosure of the '304 patent specification was incorporated by reference within the specification of the '121 patent family to show an example of an RLA. See '121 patent at 5:59-62. Although the patentees incorporated the '304 patent as merely an example of an RLA, the '304 patent expressly describes several RLAs, and each description is consistent with the '121 patent specification. Thus, each description includes "a hybrid interface, a user interface, and a control means." See '774 patent at 2:15-16. An illustrative implementation of an RLA is shown in Figure 3 of the '774 patent as follows: [SEE FIG. 3 IN ORIGINAL]

As shown, the RLA includes a hybrid interface 22, a user interface 20, and a control means or engine 24. The hybrid interface is described as a high speed (approximately 10 Mbps) RF modem to receive broadcast channel signals. See '774 patent at 3:62-63. The engine 24 includes a microprocessor and memory to decode the incoming digital data. See id. at 3:65 - 4:3. The user interface 20 provides an output port for connection of data terminal equipment, such as a personal computer. Id. at 3:47-51, 60-62. The interface port is described as an Ethernet interface. Id. at 4:3-7.

The defendants propose definitions that require the RLA to decode data addressed to it "for routing to the DTE in contrast to using the media access layer" (i.e., MAC address). The plaintiff counters that there is no basis to restrict the RLA to a "router." The parties agree that a router is a device performing a communication function at Network Layer 3 Protocols (e.g., Internet Protocol) rather than at a Link Layer 2 Protocol (Data Link Layer), which includes Media Access Control (MAC) rules. However, the plaintiff proposes a definition that includes both MAC addressing and IP addressing (i.e., layer 3 protocols).

The written description of the '774 patent indicates that the protocol rules used by the RLA "described in accordance with this invention" serve to "filter" the packets of digital information being broadcast based upon a unique digitally encoded address. '774 patent at 4:44-50. This filtering is indicated as detecting packets with a particular address, which are then forwarded to the DTE for further processing. Id. at 4:60-65. There is no mention of "routing" of digital data packets among several DTE. The operation of the RLA is further described as establishing a link layer connection over the downstream broadcast channel. Moreover, the connection is characterized as one that "looks like a transparent remote Ethernet bridge and, therefore, is compatible with all upper layer protocols (e.g., TCP/IP, AppleTalk, ISO, DECNET, etc.) that can run over Ethernet." Id. at 5:42-45. Thus, according to the written description, it is not necessary that the RLA perform a routing function.

As discussed above, any statements regarding "routing" made by the patentees during prosecution do not limit the scope of the claims. Instead, the RLA may operate on the basis of only a MAC address to perform filtering. Therefore, the court construes the terms "remote link adapters" and "RLA devices" to mean "a device that has a unique address and includes a hybrid interface, a user interface, a microprocessor, and memory to detect data at a rate of 10 or more megabits per second."
Disputed Claim Term	Anthurium's Proposed Construction
Remote computer	A computer associated with a scribe
Disputed Claim Term	Defendants' Proposed Construction
Remote computer	A computer and software system for human user interaction that is physically close to the scribe or his principal place of business and includes an information system that stores databases of information used to process jobs, and that is physically remote from the central computer.

Much like "local" and "central" computer, the defendants seek to impose the same general limitations upon the present term. The defendants seek to impose both a system and geographic proximity limitation. Also, like above, the patent imposes abstract terminology. Here, the parties generally agree that the "remote computer" refers to the scribe's computer.

As discussed above, the Court is unwilling to impose a geographic proximity limitation on the term. The Court does impose a system limitation for the same reasons discussed above.

As such, the Court defines "remote computer" as follows: "a computer associated with a scribe that includes an information system that stores databases of information used to process jobs."

--- Footnotes ---

13 Claim 1 of the "523 patents recites

1. A system for providing a retrievable record of flight performance of an aircraft comprising:

   a ground data link unit that obtains flight performance data representative of aircraft flight performance during flight of the aircraft, said ground data link unit comprising:

   a) an archival data store operative to accumulate and store flight performance data during flight of the aircraft, and

   b) a widespread spectrum transceiver coupled to said archival data store, and comprising a transmitter that is operative
after the aircraft completes its flight and lands at the airport to download the flight performance data that has been accumulated and stored by said archival data stored during flight over a wideband spread spectrum communication signal that comprises a signal in the range of about 2.4 to about 2.5 Ghz:

an airport based wideband spread spectrum transceiver comprising a receiver that receives the wideband spread spectrum communication signal from the aircraft and demodulates the signal to obtain the flight performance data;

an airport based archival data store coupled to said airport based wideband spread spectrum transceiver that receives and stores the demodulated flight performance data;

an airport based processor coupled to said archival data store for retrieving flight data performance for the airport based archival data store:

a remote flight operations control center; and

an airport based communication network operative connecting said remote flight operations control center and airport based processor to allow the remote flight operations control center to receive and analyze the flight performance data.

The specification of the '523 patent provides substantial guidance as to the meaning of the term "remote flight operations control center." The specification states that the remote flight operations control center is a location "where flight performance data from plural aircraft parked at different airports may be analyzed and from which the uploading of in-flight data files may be directed by airline systems personnel." U.S. Patent No. 6,108,523 col.1 1.18-22 (filed Feb. 17, 1999). The specification further states that "[t]he airport base station forwards flight performance data files from various aircraft by way of a separate communications path . . . to a remote flight operations control center for analysis," and that the flight operations control center "supports a variety of airline operations including flight operations, flight safety, engineering and maintenance and passenger services, includes a system controller segment and a plurality of FOQA workstations . . . ." Id. col.3 1.1-4, 8-12. The detailed description states that the flight operation control center "allows flight performance systems analysts at the control center to evaluate the aircraft data files conveyed to the flight operations control center from the airport base station segments " Id. col.7 1.54-61. The "remote flight operations control center" limitation of the '523 patent therefore refers to a location, distinct from the airport base station, supporting a variety of airline operations including flight safety, flight operations, engineering, maintenance, passenger service, a system controller segment and FOQA workstations, where analysts can evaluate aircraft data files conveyed from the airport base station.

5. Remote locations

"Remote locations" was defined in the previous order as part of the 992 patent claim construction. The Court includes the construction for the 992 patent in the 702 patent claim construction with its justification outlined in the previous order. The term "remote locations" means positions or sites distant in space from some identified place or places.
Therefore, the Court finds "remote locations" to have its ordinary meaning "positions or sites distant in space from some identified place or places." In claims 1 and 41 of the '992 Patent, the term "remote locations" means "positions or sites distant in space from the transmission system."

In light of the Court's determination that the Preamble of Claim 19 is limiting, the Court reexamines its construction of the phrase "remote locations," which is one of the limiting terms.

The Court construes "remote locations" as follows: In a distribution method as disclosed in Claim 19 of the '992 Patent, in which a transmission system sends information to receiving systems at remote locations in response to a user's request, the phrase "remote locations" means "positions or sites distant in space from the transmission system."

--- Footnotes ---

This construction also applies to the phrase as it appears in Claim 41 of the '992 Patent and Claims 2 and 5 of the '275 patent.

--- End Footnotes ---

2.

The terms "remote payment card network" and "remote payment network" appear in Claims 1 and 13 of the 298 Patent and Claims 1 and 6 of the 456 Patent. The parties agree that the definition of "debit card network," found in the specifications of each patent, provides guidance with respect to the meanings of these terms:

A debit card network is a third party processor that will process the transaction for a fee, providing connectivity to either the financial institution that issued the debit card number, or another debit card network that has the capability to connect with the financial institution that issued the debit card number.

Those skilled in the art are aware that a debit card network, i.e., Pulse in Houston, Tex., MOST in Washington, D.C., Honor in Maitland, Fla., etc., process primarily ATM (Automated Teller Machine) transactions, and do not rely on the Automated Clearing House (ACH) to process individual transactions.

(Plf. App., Exh. 1 at 14 & Exh. 3 at 40). The patent specifications also make clear that the term "debit card" means both debit and credit cards. (Id., Exh. 1 at 11 & Exh. 3 at 37). Thus, a "debit card network" refers to a debit card network or a credit card network. Having previously construed the term "payment number" to include both debit card numbers and credit card numbers, the court construes "payment network" and "payment card network" to include both debit card networks and credit card networks.

BMC is satisfied with a construction of "remote payment card network" and "remote payment network" that mirrors the definition of "debit card network." Paymentech suggests a more restrictive definition, limiting these terms to "a third party network separate and apart from the payee's agent's system and from the debit or credit card issuing financial institution and not comprising an automated clearing house." (Def. Op. Br. at 9). However, such a limitation would be improper. If the patent specification expressly defines a term, that definition controls. See3M Innovative Properties Co. v. Avery Dennison Corp., 350 F.3d 1365, 1374 (Fed. Cir. 2003), cert. denied, 124 S. Ct. 2877, 159 L. Ed. 2d 777 (2004); Renishaw, 158 F.3d at 1249. Nothing in the specifications of the 298 Patent or the 456 Patent supports the construction advocated by Paymentech. The court should construe the terms "remote payment card network" and "remote payment network" to mean "a third party processor that will process the transaction for a fee, providing connectivity to either the financial institution that issued the payment card number, or another payment card network that has the capability to connect with the financial institution that issued the payment card number."
2. Element [A] - "Remote Server"

WeddingChannel argues that a "remote server" is a computer system that provides services to other computers on a network and may be accessed by the central server over the network. In contrast, the Knot argues that a "remote server" is a computer unit, separate and independent from the central server, that provides services to other computers on a network.

WeddingChannel argues that its construction is supported by the intrinsic evidence. According to WeddingChannel, Figure 1 of the specification shows that remote server 142 can store registries (from registry database providers) that are accessible to the central server (computer system 100) over the internet through network interface 112. Pat. at col. 11, ll. 34-37. According to WeddingChannel, this disclosure shows that the remote server is coupled to a network and may be accessed by the central server over the network. WeddingChannel also points out that element [H] of claim 1 recites instructions in the central server for identifying a registry item in a registry where the registry is "stored in one or more remote servers."

The Knot argues that the specification supports its argument that the "remote server" is a computer unit that is separate and independent from the "central server," which is itself a single computer unit. The Knot points out that Figure 1 depicts the central server (system 100) and remote server 142 as separate elements, connected only by network interface 112. The Knot argues that WeddingChannel's construction is impermissible because it attempts to read this limitation out of the claim. See, e.g., Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1582 (Fed. Cir. 1996).

In essence, the Knot has argued that the specification provides that the central and remote server must each be single, physically integrated computer units that are connected by a network. Based on the foregoing construction of the term "server," this construction of the term "remote server" is impermissible. Rather, Figure 1 demonstrates that the remote server and the central server are separate computer systems, and that the remote server is accessible by the central server via a computer network. Therefore, WeddingChannel's construction of the term "remote server" is adopted.

a. "remote server assembly"

Citrix contends that the proper construction of the term "remote server assembly" is: "[a] computer that is in a network usually shared by multiple users; it is separate from the user and local computer assembly, but is accessible to the user and the local processor assembly via an online connection." Rothschild proposes that the disputed term means: "[a] computer that is in a network usually shared by multiple users; it is separate from a user computer but can communicate with a user computer via an online connection." These two proposed constructions are similar, but have two key distinctions: (1) Rothschild suggests that the "remote server assembly" need be separate only from the user, while Citrix contends that the "remote server assembly" must also be separate from the local processor assembly; and (2) Rothschild's construction requires only that a user be able to communicate with the remote server assembly via the on-line connection, whereas Citrix claims that the remote server assembly must also be accessible to the user and the local processor assembly.

In addition to the claim language itself, Citrix points to the '534 Patent specification as support for its construction. For example:

The local processor and the remote server assembly are connected in data transmitting and receiving communications with another, such as through a typical on-line connection. Moreover, the local processor assembly is structured to access the primary site address in order to achieve the data transmitting and receiving communication with the remote server assembly, and in particular, so as to be able to access the primary site data contained at the primary site address.

* * *

The local processor assembly 25' is coupled, preferably through a conventional on-line connection, [in] data transmitting
and receiving communication with the remote server assembly 50. As such, the local processor assembly 25' is structured to access the primary site address [of the remote server assembly] and thereby achieve the data transmitting and receiving communication with the remote server assembly 50 and especially with the primary site address which contains the primary site data sought to be accessed and interfaced by a user of the local processor assembly 25'.

According to Citrix, these passages reveal how the '534 Patent specification uses "remote" to identify the computer assembly that is "remote" -- i.e., located away -- from the user and the local processor assembly and, therefore, must be accessed using an online connection. It also contends that these portions of the specification explain that not only must a user be able to communicate with the remote server assembly via the on-line connection, but the remote server assembly must also be accessible to the user and the local processor assembly.

Citrix points to extrinsic evidence in the form of dictionary definitions and expert testimony to confirm that its proposed construction of "remote server assembly" is consistent with the term's customary meaning to one of ordinary skill in the art. For example, Citrix points to the dictionary definitions found in technical dictionaries:

remote: adj. Not in the immediate vicinity, as a computer or other device located in another place (room, building, or city) and accessible through some type of cable or communications link. (Microsoft Computer Dictionary, 4th ed. 1999)

remote system/remote computer system: n. The computer or network that a remote user is accessing via a modem. (Id.)

remote: located on a computer far away from the user. Contrast "local." (Dictionary of Computer and Internet Terms, 9th ed. 2006)

remote: controlled, operated, or used from a distance, as by modem or over cables. (Dictionary of Computer Words, Revised Edition 1995)

Citrix also relies on the testimony of its expert Dr. Newman, who testified at the Markman hearing that a "remote server assembly" is a computer that is not local to the user.

Rothschild claims that its proposed construction is correct because the '534 Patent does not describe the term "remote server assembly" in connection with a user. Rothschild, relying on the same portions of the specification cited by Citrix above, contends that Citrix's definition is too limiting because the "remote server assembly" need only be remote from the "local processor assembly," not from a user who may or may not be present at the "local processor assembly." Rothschild also relies on its expert, Dr. Rajkumar, who testified that a "user computer" does not require that a user necessarily be present at the computer.

Rothschild's position that the remote server assembly need not be separate from the local processor assembly contradicts the accepted meanings of "remote" and "local," as well as the '534 Patent's oft-repeated descriptions that the remote server assembly is "remote" from the local processor assembly and must therefore be accessed from the local processor assembly via a connection such as telephone or broadband line. Rothschild's position also is contradicted by Rothschild's proposed construction of "local processor assembly," which is "a computer at a location distinct from the remote server assembly," and by its own expert who testified at his deposition that he would insert the phrase "local computer assembly" in Rothschild's construction of "remote server assembly" to make clear that the "remote server assembly" is separate from the "local computer assembly."

Rothschild's position that the local processor assembly need not be able to access the remote server assembly is likewise flawed. Rothschild's contention that the user need only be able to communicate with, not access, the remote server assembly is contradicted by the accepted technical meanings of "remote" set forth above and the '534 Patent's repeated explanation that the local processor assembly must be able to access the primary site data stored on the remote local processor assembly n1. And if the local processor assembly could only communicate with the remote server assembly (say, send the remote server assembly an e-mail), the display system would not work -- indeed, Claim 1 explicitly requires that the local processor assembly "be structured to access" the remote server assembly's primary site address. Moreover, Rothschild's contention that the user can somehow communicate with/access the remote server assembly but the local processor assembly cannot
contradicts the definitions set forth above, the descriptions provided in the '534 Patent, and Claim 1's requirement that the local processor assembly be able to access the remote server assembly. Accordingly, the Court construes "remote server assembly" as "a computer that is in a network usually shared by multiple users; it is separate from the user and local computer assembly, but is accessible to the user and the local processor assembly via an online connection."

n1 In its reply claim construction brief, Rothschild concedes that "the remote server assembly manipulates data on the local processor assembly in order to initiate access to data located on the local processor assembly."

--- Footnotes ---

2. Remote site(s); remote locations

The term "remote site(s)" appears in claims 11 and 24 of the '774 patent, and the term "remote locations" appears in claim 24 of the '774 patent by virtue of its dependence from claim 20. The disagreement between the parties stems from each party's inclusion of the term "remote link adapter" within their proposed construction. As such, the plaintiff again asks the court to require the terms in dispute to include a modem, and the defendants again request that the court limit the above terms to include a router. The court rejects those constructions and construes the terms to mean "end-user locations, such as homes, offices, or schools, that have end-user equipment and a remote link adapter."

--- End Footnotes ---

3656

F. "Remote System Controller"

The term "remote system controller" appears in claim 16 of the '253 patent and claim 1 of the '943 patent. ABC asserts that a "remote system controller" is "one or more computer elements separate from, and facilitating communication between a local and a remote computer, and validating logon commands to control access between a plurality of local and remote computers." 166 WebEx contends that the term "remote system controller" should be defined as "a computer or controller that checks validity of logon commands and interfaces signals between the local portion/computer unit and the remote computer unit to operate the remote computer unit, but excluding devices that forward packets without regard for content and websites." 167

--- Footnotes ---

166 ABC's Brief, Docket Entry No. 154, at 19.

167 WebEx's Brief, Docket Entry No. 156, at 8.

--- End Footnotes ---

1. "Computer Elements" or "Computer or Controller"

ABC contends that a remote system controller is made up of "one or more computer elements." ABC, however, does not cite any evidence that clearly supports this description. Instead, the evidence cited by both of the parties supports WebEx's position that a remote system controller consists of "a computer or controller."

The common specification of the '943 patent and the '253 patent explicitly states that "[t]he remote system controller can be any type of computer or controller which is capable of receiving signals transmitted from at least one local portion . . . and supplying such signals to at least one of the remote computer units to permit bi-directional communication therebetween."
168 The specification also gives a more specific example of a remote system controller, explaining that "the remote system controller can be a network control computer which stores a list of access codes for individuals authorized to use the remote computer units." 169 In light of this intrinsic evidence, the court concludes that a remote system controller consists of "a computer or a controller."

2. Functions of a Remote System Controller

a. Validating Logon Commands

The parties agree that the remote system controller checks the validity of logon commands. 170 This limitation is supported by the language of claim 16 of the '253 patent 171 and claim 1 of the '943 patent. 172 Accordingly, the court will include this limitation in the definition of remote system controller.

b. Interfacing the Local Portion/Computer Unit with the Remote Computer Unit

ABC contends that the remote system controller "facilitat[es] communication between a local and remote computer." 173 WebEx asserts that the remote system controller "interfaces signals between the local portion/computer unit and the remote computer unit." 174

Claim 1 of the '943 patent describes the action performed by the remote system controller as "interfacing . . . the local computer unit with the remote computer unit," 175 and claim 16 of the '253 patent similarly describes the action as "interfac[ing] each individual's local portion with the individual's remote computer unit." 176 The language used in the claims is slightly different from that proposed by the parties to describe the function performed by the remote system controller. Although the differences are minor, for consistency's sake, the court will define remote system controller using the same terminology employed in the claim language itself. Consistent with the claim language, the court's definition will describe the action performed by the remote system controller as "interfacing the local portion/computer unit with the
c. Operating the Remote Computer Unit

WebEx's proposed definition states that the remote system controller validates logon commands and interfaces the local computer unit with the remote computer unit "to operate the remote computer unit." ABC's proposed definition does not include any such phrase to explain the purpose of validating logon commands and interfacing the local computer unit with the remote computer unit.

Because ABC's definition fails to mention the purpose of logon command validation and interfacing the local computer unit with the remote computer unit, WebEx contends that ABC's definition is incomplete. On the other hand, ABC argues that this aspect of WebEx's proposed definition is misleading because it suggests that the remote system controller, and not the local computer unit, operates the remote computer unit. 178

The court agrees with WebEx that the definition is more accurate, complete, and helpful if it explains why the remote system controller checks the validity of logon commands and interfaces the local computer unit with the remote computer unit. The court also agrees with ABC, however, that WebEx's definition could be understood to suggest that the remote system controller, as opposed to the local computer unit, operates the remote computer unit. Therefore, to avoid any confusion, the court will adopt language similar to claim 1 of the '943 patent, which explains that the remote system controller validates logon commands and interfaces the local computer unit with the remote computer unit "to permit the local computer unit to operate the remote computer unit . . . ." 179

3. Location Limitations

ABC's proposed definition includes the limitation that the remote system controller must be "separate from . . . a local and a remote computer." WebEx's definition does not include this limitation on the location of the remote system controller.

Claim 1 of the '943 patent explicitly provides that the remote system controller must be "remote from the local computer unit and the remote computer unit." The language of claim 16 of the '253 patent, however, does not include the same explicit limitation. Claim 16 describes the remote system controller as part of the "remote portion" of the split personal computer system. By use of the term "remote," claim 16 strongly suggests that the remote system controller, a component of the remote portion, must be located separately from the local computer unit. It does not, however, suggest that the remote system controller must necessarily be located separately from the remote computer unit as required by claim 1 of the '253 patent.
the '943 patent, and leaves open the possibility that the remote system controller could be co-located with the remote computer unit.

180 '943 patent, claim 1 (as amended).

181 '253 patent, claim 16 (as amended) ("the remote portion comprising: a remote system controller . . .").

The specification of the '253 patent provides additional guidance. It explains that the "remote portion 22" -- of which the remote system controller is a part -- is the portion of the split personal computer system that is "disposed remotely with respect to the local portions," and "is provided with a plurality of remote computer units 24." 182 Furthermore, Figure 1 of the '253 patent depicts the remote portion (22) as consisting of the remote system controller (26), along with multiple remote computer units (24a, 24b). 183 This strongly indicates that the remote system controller need only be located separately from the local portion(s), but may be co-located with the remote computer unit(s) as part of the "remote portion."

182 '253 patent, col.4 ll.47-55.
183 See '253 patent, Figure 1.

Because the two asserted claims that include the term remote system controller do not both require that the remote system controller be located separately from both the local computer unit and the remote computer unit, the court will not include ABC's proposed "separate from" limitation in its definition. The language of each claim sufficiently describes the necessary location of the remote system controller. Therefore, the court need not include any limitation regarding the location of the remote system controller in the definition of the term.

4. Exclusions

WebEx asserts that ABC disclaimed two categories of devices from the scope of the term remote system controller during the prosecution of the asserted patents, and that these exclusions should be reflected in the court's definition of the term. Each alleged disclaimer will be addressed.

a. Switches, Routers, and Other Similar Passive Devices WebEx first asserts that during the reexamination of the '253 and '943 patents, ABC distinguished the claimed remote system controller from switches, routers, and other such passive devices that appeared in a particular prior art reference known as "Crawford," thereby excluding them from the scope of the term remote system controller. 184 ABC does not deny that it disavowed the passive devices from the scope of the term remote system controller. Instead, ABC contends that the court need not note the exclusion of passive devices in the definition of remote system controller because a remote system controller, which receives and checks the validity of logon commands, by definition, is not a passive device. 185

184 WebEx's Brief, Docket Entry No. 156, at 10-11.
The only components in Crawford that interfaces the customer computer with the online replica computer are the switches and routers detailed in Figure 4 . . . . Switches and routers, however, are not a 'remote system controller' as recited in claim 16.

As previously discussed, switches and routers are devices that are capable of determining the source and destination of data packets, and forward the data packets accordingly . . . . These routers, switches, and the like are merely passive conduits for data. They merely forward the data packets without regard for their content. As such, it is unclear to the Patent Owner how a router or switch could read on a 'remote system controller' as recited in claim 16. 186

Similarly, during the reexamination of the '943 patent, ABC stated in a Response to Office Action:

[T]he only component in Crawford that interfaces the customer computer with the online replica computer are the switches and routers detailed in Figure 4 . . . . But switches and routers are not the same as the 'remote system controller' or 'network control computer' in the Patent Owner's claims.

Generally, these types of switches and routers are devices that are capable of inspecting data packets, determining the source and destination of the data packets, and forwarding the data packets . . . . [S]uch switches, routers, and the like are merely passive conduits for the commands received and transmitted by them. Specifically, they merely forward data packets without regard to the contents, senders, or recipients of the data packets. As such, it is unclear to the Patent Owner how a mere switch or router could be considered to 'receive' a valid logon command as recited in independent claims 1 and 2. 187

--- Footnotes ---

186 Response to Office Action in Ex Parte Reexamination, at 13, Ex Parte Reexamination of U.S. Patent No. 6,360,253, Control No. 90/008,052 (Feb. 19, 2008) (included in WebEx's Brief, Docket Entry No. 156, at Exhibit 4H).

--- End Footnotes ---

The court agrees with WebEx that these statements by ABC constitute "a clear and unmistakable disavowal of scope during prosecution." Computer Docking Station Corp., 519 F.3d at 1374 (quoting Purdue Pharma L.P., 438 F.3d at 1136). Accordingly, ABC cannot recapture the disavowed devices to prove infringement. See id. at 1379 ("[The plaintiff] cannot recapture claim scope disavowed during prosecution to prove infringement."). To ensure that ABC does not attempt to recapture the disclaimed devices, the court will note the exclusion in its definition of remote system controller. Even if such devices are already excluded by the definition as ABC suggests, the court sees no reason not to make the exclusion explicit.

b. Websites

WebEx asserts that ABC also disclaimed websites from the scope of the term remote system controller during prosecution. 188 ABC counters that it did not clearly and unmistakably disavow websites from the scope of the term remote system controller; and therefore, an express exclusion of websites from the definition of remote system controller is unwarranted. 189

--- Footnotes ---

188 WebEx's Brief, Docket Entry No. 156, at 11-12.

--- End Footnotes ---

The term "website" does not appear in the common specification of the '253 and '943 patents. 190 In October of 2004 ABC
submitted an amendment to the application for the '943 patent canceling all prior claims and submitting three new claims, numbered 45, 46, and 47, that included the term website either in addition to or in place of the term remote system controller. 191 Specifically, ABC proposed two method claims -- proposed claims 45 and 46 -- including the step of "establishing a remote system controller as a website on an internet," and another method claim -- proposed claim 47 -- including the step of "operating a website." 192

--- Footnotes ---
190 See '253 patent; '943 patent.
192 Id.
--- End Footnotes ---

The Examiner rejected these new proposed claims because the specification, which does not mention the term "website," failed to adequately describe the claimed invention or enable one skilled in the art to make and/or use it. 193 See 35 U.S.C. § 112, P 1 ("The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains . . . to make and use the same . . .").

--- Footnotes ---
--- End Footnotes ---

In response to the Examiner's rejection of the new claim language including the term "website," ABC withdrew its proposed claim 45 and modified claims 46 and 47 to remove the term website. 194 Proposed claim 46, which became claim 1 of the issued '943 patent, was amended from "establishing a remote system controller as a website on an internet" to simply "establishing a remote system controller." 195 Proposed claim 47, which became claim 2 of the issued '943 patent, was amended from "operating a website" to "operating a network control computer." 196 ABC stated that although it disagreed with the Examiner's conclusion that the specification did not support the claim language including the term "website," ABC agreed to remove the term "in an effort to expedite the allowance of claims 46 and 47 . . . ." 197

--- Footnotes ---
195 Id. at 2.
196 Id. at 3.
197 Id. at 4-5.
--- End Footnotes ---

The court concludes that ABC did not make "a clear and unmistakable disavowal of scope during prosecution" with regard to websites. Computer Docking Station Corp., 519 F.3d at 1374 (quoting Purdue Pharma L.P., 438 F.3d at 1136). To the contrary, ABC maintained at the time it removed the term "website" from the claim language that the concept of a website was adequately disclosed in and enabled by the specification. ABC's withdrawal of the term "website" from the claim
language was "merely a part of the 'ongoing negotiation' process with the PTO, and not an indication that [ABC] intended to
Accordingly, the court will not specifically exclude websites from the definition of remote system controller.

5. Conclusion

The term "remote system controller" means "a computer or controller that checks the validity of logon commands and
interfaces the local portion/computer unit with the remote computer unit to permit the local portion/computer unit to operate
the remote computer unit, but excluding passive devices that merely forward data packets without regard for their content." 4

A. "Remote System Controller"

The term "remote system controller" appears in claim 16 of the '253 patent and claim 1 of the '943 patent. ABC initially
argued that the term should be construed as "one or more computer elements separate from, and facilitating communication
between a local and a remote computer, and validating logon commands to control access between a plurality of local and
remote computers." 3 The court concluded that the term means "a computer or controller that checks the validity of logon
commands and interfaces the local portion/computer unit with the remote computer unit to permit the local
portion/computer unit to operate the remote computer unit, but excluding passive devices that merely forward data packets
without regard for their content." 4

3 Plaintiff ABC's Opening Claim Construction Submission, Docket Entry No. 154, at 19 (emphasis added).

4 Memorandum Opinion on Claim Construction, Docket Entry No. 190, at 83-84 (emphasis added).

The court adopted the phrase "a computer or controller" over the phrase "one or more computer elements" preferred by
ABC because ABC offered no argument or evidence in support of this aspect of its proposed definition and because the
common specification of the '943 and '253 patents explicitly states that "'[t]he remote system controller can be any type of
computer or controller . . . ." 5 ABC now asks the court to clarify or reconsider its ruling and declare that a remote system
controller "is not limited to a single device or any particular hardware or software configuration so long as the hardware or
software work together to perform the functions identified for the remote system controller." 6

5 Id. at 73 (quoting '253 patent, col.5 ll.9-14; '943 patent, col.5 ll.13-18 (emphasis added)).

6 ABC's Motion, Docket Entry No. 191, at 5.

1. Not Limited to a Single Device

ABC first asserts that the term "remote system controller" cannot be limited to a single device because the term appears in
"comprising" claims and is preceded by the article "a." See Baldwin Graphic Sys., 512 F.3d at 1342 (explaining that "an
indefinite article "a" or "an" in patent parlance carries the meaning of "one or more" in open-ended claims containing the
transitional phrase "comprising.""

This argument is inapt. Assuming arguendo that the cited rule of claim construction applies, the claims at issue would be construed to cover accused devices that include "one or more" remote system controllers. The rule, however, does not offer any guidance as to the composition of each particular remote system controller. The rule does not suggest that a particular remote system controller may consist of multiple devices as ABC contends.
ABC next argues that neither the claim language nor the specification limits the term "remote system controller" to a single device or any particular hardware or software configuration. In support of this argument, ABC points out that the common specification of the '253 and '943 patents states that "[t]he remote system controller can be any type of computer or controller . . . ." 7 ABC then cites extrinsic evidence that it contends shows that a computer and/or a controller may consist of more than one device.

7 '253 patent, col.5 ll.9-14; '943 patent, col.5 ll.13-18 (emphasis added).

ABC cites several dictionary definitions of the word "computer" and contends that they define the word based only on functionality and do not limit it to any particular physical embodiment. See Microsoft Press Computer Dictionary 75 (1991) ("Any machine that does three things: accepts structured input, processes it according to prescribed rules, and produces the results as output. Computers exist in a remarkable range of sizes, shapes, abilities, and applications.") (included in ABC's Motion, Docket Entry No. 191, at Exhibit 1); Webster's New World Dictionary of Computer Terms 108 (5th ed. 1994) ("A device capable of solving problems or manipulating data by accepting data, performing prescribed operations (mathematical or logical) on the data, and supplying the results of these operations.") (included in ABC's Motion, Docket Entry No. 191, at Exhibit 2); Random House Webster's College Dictionary 271 (1998) ("A programmable electronic device designed for performing prescribed operations on data at high speed, esp. one housed with or linked to other devices for inputting, storing, retrieving and displaying the data.") (included in ABC's Motion, Docket Entry No. 191, at Exhibit 3). As WebEx points out, however, each of these definitions defines the word "computer" in terms of a single device or machine, not in terms of multiple or plural devices or machines.

With regard to the word "controller," ABC cites a number of cases that hold that a "controller" may consist of more than one device or element. 8 ABC relies primarily on Automated Technologies, Inc. v. Microfil, LLC, 244 F. App'x 354 (Fed. Cir. 2007). In Automated Technologies the Federal Circuit affirmed the District Court's definition of "controller" as a "single control system that regulates the entire process," but contrary to the District Court, the Federal Circuit clarified that the "controller need not be limited to a single device . . . ." Automated Techs., 244 F. App'x at 357-58. Unlike the patents at issue in this case, however, the patent at issue in Automated Technologies did not disclose any "single device . . . which performs or is capable of performing all of the functions recited" in the claim language. Id. at 357. In fact, the specification described "at least two structures that perform control functions." Id. In the '253 and '943 patents, the specification always refers to the remote system controller as a singular device or element that alone performs all of the functions required of it by the claim text. 9

8 Two of the cases cited by ABC do not hold that a "controller" may consist of more than one device or element. In Animatics Corp. v. Quicksilver Controls, Inc., 102 F. App'x 659, 666 (Fed. Cir. 2004), the Federal Circuit concluded that the trial court erred by requiring that the "PID controller" be a physically separate circuit than the "microprocessor," but did not discuss whether the "PID controller" could consist of multiple devices or elements. In Goss International Americas, Inc. v. K&M Newspaper Services, Inc., 469 F. Supp. 2d 547, 557-59 (N.D. Ill. 2006), the court concluded that the "control means" element of the asserted claim was not to be interpreted pursuant to 35 U.S.C. § 112, P 6 because the claim recited the structure necessary to perform the stated function -- a "main controller" and a "plurality of sheet material feed controllers" -- but the court did not discuss whether the two types of controllers could consist of multiple devices or elements. The Goss court stated, however, that a person of ordinary skill in the art would understand the term "sheet material feed controller" to mean "a device used to control the operation of a sheet feeder." Id. at 558 (emphasis added). Therefore, the court does not find these cases relevant to this claim construction dispute.

9 See '253 patent; '943 patent.
Nor does the court find the other relevant cases cited by ABC to be persuasive. In Dane Industries, Inc. v. Ameritek Industries LLC, No. 03-3488, 2004 WL 5683721, at *3 (D. Minn. May 4, 2004), the court defined "controller" as "at least one mechanism or device." But unlike this case, the primary dispute between the parties was apparently not whether the "controller" at issue could consist of multiple components. Instead, the court discussed only whether the components of the controller should be referred to as an "electrical circuit or group of electrical circuits" or as a "mechanism or device." Dane Indus., 2004 WL 5683721, at *3.

In DisplayLink Corp. v. Magic Control Technology Corp., 615 F. Supp. 2d 1051, 1062-63 (N.D. Cal. 2009), the court defined the term "VGA controller" as "a component or components that control the routing of VGA signals pursuant to the VGA standard" (emphasis added). The court, however, did not explain why it interpreted the term to cover multiple components. Conversely, the court, also without explanation, defined the term "USB controller" in a singular manner as "a device that receives a USB display signal, holds it until it receives a bus command, and then forwards the USB display signal out on a FIFO basis." DisplayLink Corp., 615 F. Supp. 2d at 1062 (emphasis added).

ABC also cites the deposition testimony of Srinath Anantharaman, a former employee of WebEx who is the named inventor on a patent application filed by WebEx that involves technology similar to that claimed in the patents at issue in this action. Anantharaman agreed that the "central computer system," as described in WebEx's patent application, was a "type of controller." He then testified that the "central computer system" could include different types of servers, and then explained that different servers "could be one computer having seven different server demons or, you know, thousands of computers running lots of server demons." 11

Assuming that Anantharaman is one of ordinary skill in the art, the court agrees that this extrinsic evidence suggests that a person of ordinary skill in the art could understand that a controller may consist of multiple devices, i.e., multiple computers. But as WebEx points out, the same dictionaries cited by ABC for their definitions of the term "computer" unanimously define the term "controller" in terms of a single device, unit, or mechanism. See Microsoft Press Computer Dictionary 83 (1991) ("A device upon which other devices rely for access to a computer subsystem.") (included in WebEx's Response, Docket Entry No. 196, at Exhibit 1); Webster's New World Dictionary of Computer Terms 127-28 (5th ed. 1994) ("The electronic board or unit that regulates the operation of a peripheral device.") (included in WebEx's Response, Docket Entry No. 196, at Exhibit 2); Random House Webster's College Dictionary 288 (1998) ("a regulating mechanism") (included in WebEx's Response, Docket Entry No. 196, at Exhibit 3). Therefore, at best for ABC, the extrinsic evidence with respect to the word "controller" is mixed. More importantly, ABC has failed to point to any specific intrinsic evidence that supports its position. The court is not persuaded that it should clarify its definition by declaring that a "remote system controller" is not limited to a single device.

2. Not Limited to Any Particular Hardware or Software Configuration

The concepts of hardware and software were not mentioned in either party's opening claim construction brief or response brief with regard to the term "remote system controller." Accordingly, the court did not consider whether it should define "remote system controller" in such terms. ABC now asserts that a remote system controller "is not limited to . . . any particular hardware or software configuration so long as the hardware or software work together to perform the functions identified for the remote system controller." 12

--- Footnotes ---

10 Videotaped Deposition of Srinath Anantharaman, at 112 (May 21, 2009) (included in ABC's Motion, Docket Entry No. 191, at Exhibit 4).

11 Id. at 117.

--- End Footnotes ---

12 ABC's Motion, Docket Entry No. 191, at 5.
In support of this aspect of its proposed clarified definition, ABC cites two cases. In Automated Technologies the Federal Circuit held that the term "controller," in addition to not being limited to a single device, was also not limited to "any particular hardware or software." Automated Techs., 244 F. App'x at 358. Although the Court of Appeals explained in great detail why it concluded that the "controller" was not limited to a single device, it did not explain why it also noted that the controller was not limited "to any particular hardware or software." See id. at 357-58. Therefore, the court does not find this case particularly helpful or persuasive.

The second case cited by ABC can be clearly distinguished from the case at bar. In Witness Systems, Inc. v. Nice Systems, Inc., No. 1:06-cv-126-TCB, 2008 U.S. Dist. LEXIS 38061, 2008 WL 2047633 (N.D. Ga. May 10, 2008), the Special Master had previously defined the term "communication traffic controller" to mean "a device that manages information flow within the monitoring system." 13 Witness Sys., 2008 U.S. Dist. LEXIS 38061, 2008 WL 2047633, at *4. The parties disputed whether the term "device" as it appeared in the Special Master's definition of "communication traffic controller" encompassed only hardware or both hardware and software, and asked the Special Master to resolve the dispute. 2008 U.S. Dist. LEXIS 38061, [WL] at *5. The Special Master pointed to specific citations from the abstract and figures of the asserted patents that suggested that the device at issue could include both hardware and software. Id. Accordingly, the Special Master concluded that the term "device" "encompasses elements of hardware and software," id., and the court adopted the Special Master's recommendation. 2008 U.S. Dist. LEXIS 38061, [WL] at *1-2. In this case, ABC has not pointed to anything in the specification or claim language of the '943 and '253 patents that suggests that the remote system controller may consist of any combination of hardware or software.

13 The court notes that the definition of "communication traffic controller" as "a device . . ." by the Special Master in Witness System suggests, contrary to ABC's position, that the term "controller" does not necessarily connote multiple devices.

The court will not adopt a definition stating that the remote system controller is not limited to any particular hardware or software configuration based solely on the definitions adopted by other courts in unrelated cases dealing with different patent terms merely because they happened to include a single common word, i.e., "controller." ABC has failed to persuade the court that it should clarify, alter, or augment its definition of the term "remote system controller" in the manner suggested.

The same is true of the phrase "remote terminal means" found in the following claim language:

plural remote terminal means, each including (a) modem means for effecting input/output digital data communications with said central computer means via the telephone lines of a telephone network, (b) local memory means for locally storing digital data representing at least the first portion of the selected block of information received via said modem means from the central computer and for processing digital data, (c) display means for visually displaying such a locally stored first portion of a block of information and (d) keypad means connected to communicate data to at least said local memory means for manual entry of keyed digital data; and

further memory means being provided as part of said local memory means at each of said remote terminal means for receiving and storing said second portion of the selected block of information in response to the selection of the block and when its respective first portion is transmitted thereto, said local memory means utilizing keyed digital data of less extent than any one of said complete addresses for another block of information but nevertheless uniquely indicative of one of the complete addresses contained in said second portion of the block of information which contains the first portion then being displayed for selectively accessing said further memory means and for supplying data to be transmitted by said modem means and indicative of the complete address of the next block of information which is to be retrieved and utilized for
display purposes.

662 patent, col. 6, 11. 25-56. The claim language discloses the structure of the remote terminal means. It describes the component parts of a terminal. The phrase starts "plural remote terminal means, each including . . ." -- in other words, the remote terminals are comprised of the component parts that follow that language. The function of the remote terminal means, although it is not stated in the usual means-plus-function format, is to store, retrieve and display at a remote site digital information obtained from the computer means. The explanation of these components contains sufficient structure to perform this function. Therefore, the claim language overcomes the means-plus-function presumption.

In Turbocare, the Federal Circuit found that "radial positioning means" in the following claim language was not a means-plus-function:

a radial positioning means comprising a compressed spring means biased against said ring segments to forcibly cause said segments to move to said large clearance position, while working fluid which is freely admitted to the annular space between said casing and said ring segments toward said small clearance position, whereby at low speed and small turbine loads the spring forces will predominate, while at high flows and high working fluid pressure the pressure forces will predominate.

264 F.3d at 1119. The structures for performing the function of positioning the ring segments were the compressed spring means and the working fluid. Id. Similarly, in the case at hand, I find that the component parts listed in the claim language describing the remote terminal means state its structure. Unlike in Turbocare, I have decided that some of these component parts are means-plus-function terms. However, I do not find that this distinction makes the meaning of the remote terminal means a means-plus-function where radial positioning means was not. The structure of the component parts is present -- it is just found in a different part of the patent, in the specification, rather than in the claim language. Hence, I find that the phrase "remote terminal means" is not a means-plus-function.

3660

6. "Remote Terminals"

The parties dispute the meaning of the term "remote terminals," which appears in claims throughout the body of patents to Katz. The parties agree that the term refers to traditional telephones, but the plaintiffs contend that the term may comprise other devices as well, such as wireless phones or a computer that can access the telephone network.

The plaintiffs contend that a person of ordinary skill in the art reading the Katz patents would understand that "remote terminals" could refer to devices other than traditional telephones. The defendants argue that there is no support in the specifications for any device other than traditional telephones.

The claim language in the patents does not support the defendants limited definition. Claim 96 of the '707 patent is exemplary of many of the claims that contain the term "remote terminals." Claim 96 provides for "an analysis control system for use with a communication facility including remote terminals for individual callers, wherein each of said remote terminals may comprise a conventional telephone instrument including voice communication means and digital input means in the form of an array of alphanumeric buttons for providing data." The use of the words "may comprise" indicates that remote terminals includes, but is not limited to, traditional telephones.

The specification does not limit "remote terminals" to conventional telephones only. In Column 3, line 55 through Column 4, line 18 of the '707 patent, Katz describes the remote terminal illustrated in Figure 1. Although Katz describes what would be considered a traditional or conventional telephone, the specification is clear that the remote terminal in Figure 1 is the illustrative embodiment and that the description of it is exemplary.

The prosecution history cited by the defendants does not restrict the definition of "remote terminals." In the prosecution history of the '968 patent, in an Amendment dated March 2, 1988, Katz attempted to distinguish his patent from other patents containing, among other devices, "a special form of terminal apparatus at a data source" by noting that "contrary to the operations of the systems described in the above references, applicant's system interfaces with a conventional telephone.
instrument." (Ex. 33). Katz went on further to explain regarding "special-purpose telephone instruments" that "clearly, such telephones could be employed in cooperation with applicant's system; however, a very significant feature of applicant's system is its ability to function cooperatively with a conventional telephone instrument. Accordingly, specific forms of transaction telephone instruments or data phones are not deemed to be particularly applicable to the claims as set forth herein. . ." Contrary to the defendants' contention, the Court concludes that this statement by Katz indicates that his system could accommodate conventional telephones, as well as other devices, not that it was limited to use with conventional telephones.

Thus, the Court concludes that there is nothing in the claim language, specifications, or prosecution history that indicates that "remote terminals" can only include conventional or traditional telephones and not wireless phones or computers connected to the telephone network. Based on the foregoing, the Court construes "remote terminals" to mean: a device or instrument for connecting callers to the telephone network for voice and digital communication, including, but not limited to, conventional telephones.

"remote user"

The '639 patent defines the term "remote user" as follows: "the remote user may either be a telecommuter or a road warrior, or may be a resident in a branch office, also referred to as a remote small office" who accesses a corporate office from a physically distant location over a transmission media.

The claimed invention described in claims 1, 14 and 39 provides a "remote user" with a "virtual presence" to a corporate office. The claimed invention can be practiced with connectivity between one or more remote users and the corporate office. The Court rejects plaintiff's proposed construction of "remote user" since it omits the reference to a resident in a branch office.

The joint claim construction chart indicates that initially defendant proposed the same construction (docket no. 76); defendant revised its interpretation in connection with the hearing.

Although defendant originally did not dispute plaintiff's proposed definition of "remote user," Lucent did object at the hearing. The Court rejects the argument (docket no. 114 at 2) that claim 40 limits the consistent definition of "remote user" in claims 1, 14 and 39.

The term "remote user stations" appears in claims 35, 36, 37 (by virtue of its dependency), and 38 (by virtue of its dependency) of the '774 patent. The term "remote clients" appears in claims 12 (by virtue of its dependency), 39, and 52 of
the '121 patent and in claim 119 of the '845 patent. The plaintiff asserts that the above terms should be construed as an RLA and a DTE. The defendants assert that the above terms should be construed as an RLA.

With respect to the '774 patent, the term "remote user stations" appears only in the claims. A review of claim 25 shows that the term "remote user station" is used separately from the term "remote interface." Additionally, the term "remote interface" is further defined to include an example of an RLA. Because the two terms are separately used, a "remote user station" does not necessarily include an RLA.

With respect to the '121 patent, the term "remote client" appears only in the claims and figures. Claims 8 and 9 each use the terms "remote clients" and "remote link adapters." Therefore, the term "remote clients" is not necessarily inclusive of a "remote link adapter." The same rationale holds true for claim 9 of the '845 patent.

Because neither a "remote user station" nor a "remote client" necessarily includes an RLA, the court construes those terms to mean "data terminal equipment located at an end-user location."

3663

This Court entered an Order on Claim Construction (Dkt. # 71) in this patent case on March 2, 2006. The factual background of this case is set forth in detail in that Order. Also in that Order, the Court construed the term "remote vendor network site," contained in Claims 1, 6 and 7 of the patent at issue, as "the location of information regarding a particular vendor that is remote to the local user and that may include real vendor sites, real internet vendor sites, or virtual internet vendor sites, including sites that have no connection on the internet but have information loaded onto, accessible from and local to the database." The Court rejected defendants' proffered construction, which defined the term as "a server application, such as a website, that accepts connections from client programs at a specified network location, such as a website address, and allows retrieval of information about products, such as by 'navigating' a series of web pages; it is owned and operated by an entity which accepts payment in exchange for such products and which is a different commercial entity from that which provides the database and database interface; it is on a different computer from the database and associated database interface." Ex. B at 3, Disputed Claim Terms, attached to Amended Joint Claim Construction Statement (Dkt. # 66).

Defendants have presented no evidence that the previous construction was erroneous as a matter of law or that new evidence exists to justify a reconsideration or modification of the previous construction. See Adams v. Reliance Standard Life Ins. Co., 225 F.3d 1179, 1186 n.5 (10th Cir. 2000) (motion for reconsideration should be granted only to correct manifest errors of law or to present newly discovered evidence). Rather, their argument appears to be merely a second bite of the claims construction apple-asking this Court to impose a limitation on a term that has been previously rejected. For example, although the patent certainly contemplates vendor sites being owned and operated by a vendor, nothing in the patent precludes such a site from being owned and operated by a third-party who is under contract with the vendor to operate its site. The patent also allows for a remote vendor site that is owned by the vendor, but not operated by the vendor or some other combination of ownership and operation. Use of the term "vendor's site," while indicating possession, also indicates description of the site, and does not necessarily indicate ownership and operation, as defendants posit. Although defendants' description may well be the most common example of the term "remote vendor network site," it is not the only possible description. The patent does not so limit itself or require such a construction.

For the foregoing reasons, Defendants' Motion for Clarification or Reconsideration (Dkt. # 77) is DENIED.

3664

Remotely accessible

In its briefing, Lantronix argued "remotely accessible" should be construed to mean "able to be electrically accessed from outside the connector." Digi contended "remotely accessible" should be construed to mean "able to allow the connector to receive instructions from one of the external electronic devices." Lantronix agreed with Digi's construction except for the
italicized language. Lantronix contended the "to allow" language requires that there is some other entity or piece of equipment that is "allowing," or giving permission to, the connector to receive instructions. Digi did not counter Lantronix's argument regarding the "to allow" language and offers no support for it.

During the hearing, the parties agreed, as Lantronix proposed, "remotely accessible" should be construed as "able to be electrically accessed from outside the connector." The Court agrees that, based on the claim language and specification, Lantronix's proposed construction is accurate.

3665

4. remotely located (claims 1, 3-6)

Plaintiff's Construction: Not directly physically attached, and at a different location

Defendant's Construction: Not located within the same physical device.

Are two devices "remotely located" only if they are at different locations or is it sufficient that they not be part of the same device? Certainly, the common understanding of "remote" would suggest that there must be some distance between the two devices and that two devices are not "remotely located" if they are in the same closet, as defendant suggests. If the inventor wanted to convey the simple requirement that the two devices be separate, he could have said so much more clearly. Defendant points to no language in the claims or the specification suggesting a special meaning of "remote"; its arguments relying on the prosecution history are not persuasive. Further, as plaintiff points out, the purpose of the invention is to permit monitoring of a port from a location other than where the port is. Thus, defendant's reading of this term could render the invention meaningless. I agree with plaintiff that "remotely located" means "at a different location." (Plaintiff's additional proposed phrase of "not directly physically attached" is redundant and therefore unnecessary.)

3666

8. Claim 9 - "Remotely Located"

In Claim 9 the reference to more than two stations that are "remotely-located" means that there are more than two stations that use different central processing units. (Tr. 75-76). Thus, two stations in the same physical room, each served by a different CPU, would be "remotely located" while two stations in two different cities using a common CPU (wherever the CPU might be located) would not be.

3667

5. Includes Relationship/Excludes Relationship/Removes Relationship/Requires Choice Relationship/Optional Relationship

The parties have grouped these terms together. The dispute is whether the "relationship" language requires a construction which imposes a "left-hand side" and "right-hand side" limitation to the terms. Trilogy contends that the term "includes relationship" means "a classification in which a second set of one or more elements is included when all members of a first set of one or more elements exist in a configuration." Selectica contends that the term "includes relationship" means "a relationship that causes the elements on the right-hand side of the relationship to be included in the configuration when all elements of the left-hand side of the relationship are already included."

In discussing the relationship terms, the patents state "[a] relationship relates a first set of parts with a second set of parts." 651 patent, col. 2, 11. 13-14. The patents also state:

    Preferably, the part relationships are: included, excluded, removed, and requires choice. An included part is included automatically. A part is excluded from the configuration when it inclusion would result in an invalid configuration. A part
may be removed when another part is added. Thus, when a first part exists in the configuration and a second part is added, the first part is removed from the configuration. The requires choice relationship is used to allow a set of choices to be made from a group of parts.

'651 patent, col. 2, 11. 23-31. For essentially the reasons discussed previously, the court adopts the following constructions of these terms:

"includes relationship" means "a relationship that causes the elements on the right-hand side of the relationship to be included in the configuration when all elements of the left-hand side of the relationship are already included;"

"excludes relationship" means "a relationship that causes the elements of the right-hand side of the relationship to be excluded when all elements of the left-hand side are already included;"

"requires choice relationship" means "a relationship in which a number of elements must be chosen from a second set of elements on the right-hand side of the relationship when all elements of the left-hand side are already included;"

"removed relationship" means "a relationship that causes the elements of the right-hand side of the relationship to be removed when all elements of the left-hand side are already included;"

"optional relationship" means "a relationship in which a number of elements may be chosen from a second set of elements on the right-hand side of the relationship when all elements of the left-hand side are already included."

3668

ii. Removing a defective image element to produce a void at said particular position

IPI proposes that the phrase "removing a defective image element to produce a void at said particular position" means eliminating a defective image element, such as through the replacement of the defective image element with a valid image element. Sony interprets the phrase to mean eliminating a defective image element from the image to produce, at the specific position, a location with no image information. It argues that if one simply removes an element from the image, that particular location becomes a point that no longer contains image information.

IPI's construction overlooks the distinct steps set forth in claim 145 by attempting to combine the determining/removing step added by dependent claim 159 with the final "filling the void" step of claim 145. In other words, IPI's construction of the disputed term in claim 145 effectively would render dependent claim 159 superfluous. Moreover, Sony's construction makes intuitive sense and is consistent with the specification, which provides that locations with no image information constitute one possible type of void. The Court therefore adopts Sony's proffered definition: eliminating a defective image element from the image to produce, at the specific position, a location with no image information.

3669

(1) In Claim 25 of the '901 patent, "removing added pulses occurring after normal sync pulses" means "removing one or more added pulses such as added AGC pulses and/or added pseudo-sync pulses."

3670

g. "removing said fuse portion from said interconnect line by exposing said optically absorptive refractory metal to directed energy source that explosively removes said fuse portion without damaging the substrate"

EMI contends that the phrase "without damaging the substrate" means causing no damage to the silicon substrate by the explosion. The section of the specification that supports this proposed construction, however, discloses other structures not
to be damaged by the explosion, such as underlying polysilicon structures or a nearly metal fuse. It would be improper to limit the claim to "causing no damage to the silicon substrate," as other characteristics of the preferred embodiment would be foreclosed. See Vitronics, 90 F.3d at 1583. Rather, the court holds that the claim language needs no clarification, as it is clear on its face.

GO BACK

3671

H. Renderer

Plaintiff offers the following construction for this term:

something that may be implemented entirely in software or may include a dedicated hardware processor along with a software package running on a general purpose processor, which performs one or more steps of the recited method and assists in the display of the terrain based on the data provided.

Defendants contend that it is not nearly so broad, offering the following construction instead:

a software and/or hardware object that performs each of the following steps: (1) determines the coordinates of the terrain data required to create an image and sends the needed coordinates along with a specified resolution level to another object; (2) receives the data blocks corresponding to the provided coordinates; and (3) uses the received data blocks to create an image.

Claim 1 teaches a "method comprising: receiving from the renderer one or more coordinates in the terrain along with indication of a respective resolution level" and "providing the renderer with a first data block . . . from a local memory." (col. 16, 11. 31-37) Claim 12 provides for an "apparatus for providing data blocks . . . to a renderer . . . comprising: a local memory which stores data blocks corresponding to coordinates proximal to a current viewpoint of the renderer" and "a
processor which receives one or more specified coordinates along with indication of a respective resolution level from a render, [and] provides the renderer with a first data block." (col. 18, 111. 12-13, 16-18, 21-24) This language shows that important aspects of the method run through the renderer. But according to Claim 9, the renderer does not simply act as a go-between, providing coordinates and receiving data blocks, it also has the undisputed job of ultimately converting the information into an image and rendering the view from the current viewpoint. (col. 17, 11. 65-67)

The specifications provide a similar picture of the renderer's three functions in the preferred embodiment with references to render', renders', and rendering program'.

In some preferred embodiments of the present invention, the processor runs a rendering program which displays the three dimensional images based on the viewpoint, the size of the displayed image and the blocks received from the server. The rendering program orders the blocks it needs using a cache manager, which is preferably a software routine running on the processor. If the cache manager has the ordered block, it provides it to the rendering program. However, if the block is not carried by the cache manager, it is ordered from the server, and a replacement block from a lower resolution level is passed to the rendering program.

When the rendering program requires a block including a new point or area for display, the cache manager first requests the block of the lowest resolution level which covers the area with the least detail and then requests subsequent blocks with successively increasing detail, until the block with the level of detail required by the rendering program is sent. The rendering program renders the three-dimensional image using the blocks it has on hand. Each time another block is received, the image is rendered again. Thus, the user sees an image at substantially all times and is not prevented from moving the viewpoint while additional data is being sent from the server.

There is therefore provided in accordance with a preferred embodiment of the present invention, a method of providing data blocks describing three-dimensional terrain to a renderer, the data blocks belonging to a hierarchical structure which includes blocks at a plurality of different resolution levels, the method including receiving from the renderer one or more coordinates in the terrain along with indication of a respective resolution level, providing the renderer with a first data block which includes data corresponding to the one or more coordinates, from a local memory, and downloading from a remote server one or more additional data blocks which include data corresponding to the one or more coordinates if the provided block from the local memory is not at the indicated resolution level.

Preferably, the method includes downloading excess blocks not currently needed by the renderer to fill up the local memory when not downloading blocks required by the renderer.

Preferably, the renderer renders a view from a current viewpoint.

Detailed descriptions of the figures in the patent further substantiate that the renderer performs at least three functions: it determines the coordinates needed; receives the appropriate data blocks; and renders an image with the data provided. (See, e.g., col. 11, 11. 19-24 ("Processor preferably . . . comprises a renderer, which calculates the view from the viewpoint and continuously renders the view on display" and "determines the coordinates of the pixels it needs in order to render the view and requests the descriptions of these pixels from a cache manager."); col. 12, 11. 58-63 ("Renderer uses blocks from cache manager to render the required view on display. Preferably, when cache manager provides a block of a lower resolution level than that requested by renderer, the renderer uses the provided block to interpolate a higher resolution-level block."); col. 14, 11. 10-13 ("Preferably, renderer determines the exact blocks needed and calls for them using their (x, y) coordinates and their resolution level. Alternatively or additionally, renderer specifies, for each resolution level, the coordinates of the boundaries of the necessary areas, and cache manager determines the identities of the required blocks."); see also col. 14, 11. 27-46; col. 15, 11. 33-46.)

The parties do not dispute that the renderer is an object that may be implemented entirely in software or may include hardware, (Transcript, p. 22), for as the specification describes:

Preferably, renderer is as described in the above mentioned U.S. patent application Ser. No. 08/939,948. n5 Alternatively or additionally, renderer may operate in accordance with any other method known in the art. Renderer is preferably
implemented entirely in software. Alternatively, renderer includes a dedicated hardware processor, such as a 3D graphic accelerator, along with a software package running on general purpose processor which provides blocks to the dedicated hardware processor.

(col. 13, 11. 8-17)

n5 "It is appreciated that the [terrain rendering] method of FIGS. 1A-1C may be implemented partly in computer hardware and partly in software, or entirely in custom hardware. Preferably, the apparatus of the present invention is implemented in suitably programmed computer hardware comprising, for example, a Pentium-Pro/MNX based central processing unit (CPU)." (583 Patent, col. 6, 11. 4-10)

The parties also agree that the renderer receives data blocks corresponding to the specified coordinates and uses the data provided to display real-life images of terrain or three-dimensional images of an object or material. n6 (Transcript, p. 22) The Plaintiff disputes, however, whether the renderer is limited by the three steps identified by the Defendants and whether something else, namely the cache manager, may perform those steps. More specifically, the essence of the debate crystallized during the Markman hearing into understanding the impact of the statement in the specification that "alternatively, cache manager determines the identity of the required blocks and/or sub-blocks." (col. 11, 11. 26-27) (Transcript, pp. 24, 27, 31-33)

n6 The Plaintiff insists on the verb "assists" (Pl. Brief, p. 10), citing to col. 11, 11. 19 -- col. 13, 11. 17 and Figs. 5, 8. I do not agree that the word "assists" is necessary. It is clear from the specification that it is the renderer that renders the view. See col. 11, 11. 19-21 (The renderer "calculates the view from the viewpoint and continuously renders the view from the viewpoint and continuously renders the view on display."); col. 12, 11. 58-59 ("Renderer uses blocks from cache manager to render the required view on display."); and col. 12, 11. 66-67, col. 13, 11. 1-7 ("When cache manager finishes downloading an additional block of a higher resolution level from server, the block is provided to renderer, which updates the rendered view accordingly. Preferably, when the viewpoint is in motion, renderer updates the view at least ten times per second so that the user has a perception of constant movement, although other rates of update may also be used. Preferably, renderer renders the view each time from scratch without using previously-rendered views.") To the degree that other components are required for the renderer to render the view, such assisting components do not detract from the renderer's function of using the received data block to display an image.

It is clear from Claims 1 and 2 that in describing both the method and the apparatus, a part of the system (the processor in Claim 12) "receives one or more specified coordinates along with indication of a respective resolution level from a renderer[.](col. 16, 11. 32-34; col. 18, 11. 20-23)" (emphasis supplied). This step is also described in the specification as the "renderer determines the coordinates of the pixels it needs in order to render the view and requests the descriptions of these pixels from a cache manager." (col. 11, 11. 21-24) As a result, something must perform the function of determining which data blocks correspond to the coordinates identified as required by the renderer so that the appropriate data block may be sent to the renderer. Preferably, it is the "renderer [that] determines which blocks and/or sub-blocks include the required pixels", (col. 11, 11. 24-26), and therefore the "cache manager downloads from server the blocks and/or sub-blocks required by renderer . . . " (col. 11, 11. 62-63) Alternatively, however, it is the "cache manager [that] determines the identity of the required blocks and/or sub-blocks" from the coordinates received from the renderer. (col. 11, 11. 26-27) But, in both embodiments of the method, it is clear that the renderer at least performs the function of determining and specifying to another object what coordinates are required along with identifying the respective resolution level.

Construction: (renderer) software and/or hardware object that performs at least the following functions: (1) determining and providing to another object the required coordinates in the terrain along with a respective resolution level; (2) receiving the data blocks corresponding to the specified coordinates; and (3) using the received data blocks to display a three-dimensional
"Re-Ordering Packets from Different Conversations on Said Common Link When the Detected Congestion Exceeds a Predetermined Mild Congestion Threshold While Maintaining the Order of Transmission for Each Conversation"

Alcatel's proposed construction for this phrase is "arranging packets from different conversations and preparing them for transmission on the common link without affecting the sequencing of packets within such conversation when the number of packets queued on a common link exceeds a predetermined mild congestion threshold." Cisco's proposed construction is "selecting packets for transmission from among more than one conversation by choosing the packet with the earliest transmission time as determined by the packet's size."

Cisco's proposed construction improperly imposes limitations in claim 8 that are explicitly stated in claim 12. Claim 12 states: "A method as claimed in claim 8, wherein the time when a packet in each conversation would be transmitted is computed on the basis of packet size assuming each conversation had a dedicated link, and the order of transmission is arranged so that the packets with the earliest start of transmission time are sent first." Therefore, the principles of claim differentiation instruct the Court to reject Cisco's proposed construction. See Envtl. Designs Ltd. v. Union Oil Co. of Cal., 713 F.2d 693, 699 (Fed. Cir. 1985) (holding that it is improper for courts to read into an independent claim a limitation explicitly set forth in another claim). Nowhere in the plain meaning of the language used in claim 8 does it require that the packet with the earliest transmission time be determined based on the packet's size.

Alcatel contends that its proposed construction is proper in the context of the claim in which it appears. See Hockerson-Halberstadt, Inc. v. Converse, Inc., 183 F.3d 1369, 1374 (Fed. Cir. 1999) ("Proper claim construction . . . demands interpretation of the entire claim in context, not a single element in isolation."). In claim 8, the claim language makes clear that the purpose of re-ordering packets is "to achieve fair allocation of bandwidth among different conversations." Watt, at 8:4-6. The preferred embodiment supports this construction by describing a method for re-ordering packets "to attempt to provide a fair allocation of bandwidth to all conversations," whereby the packets from multiple conversations may be re-ordered across a whole link, but not reordered within each conversation. Figure 4 is shown as an example of this re-ordering technique. See Watt, at 6:12-17. Cisco's proposed construction, on the other hand, seeks to limit the claim to the preferred embodiment.

Cisco argues, however, that one of ordinary skill in the art would not be aware of any particular methods for such re-ordering of packets (where packets are re-ordered along a link shared by multiple conversations but the order of packets within each conversation remains the same) other than the method described in the preferred embodiment and the file history (by choosing the packet with the earliest transmission time as determined by the packet's size). In support of this contention, Cisco cites the expert report of its expert, Anthony Acampora. However, nowhere in that report does Acampora claim that one of ordinary skill in the art would not be aware of any method for re-ordering of packets in the manner discussed above other than the method described in the patent. Acampora merely asserts that the patent specification provides only one such method. See Acampora '532 Report, at 10. Furthermore, in the declaration of Alcatel's expert, David Lucantoni, he declares that one of ordinary skill in the art would have known of other methods to accomplish such re-ordering, and provides an example of such a method. See Lucantoni '532 Decl., at PP 47-49.

Therefore, in light of the rules of claim construction, the language of the patent, and the expert testimony used to clarify any potential ambiguity, this Court will not limit the disputed term to only the method disclosed in the preferred embodiment, and specifically claimed in claim 12. Thus, the Court construes "re-ordering packets from different conversations on said common link when the detected congestion exceeds a predetermined mild congestion threshold while maintaining the order of transmission for each conversation" as "arranging packets from different conversations and preparing them for transmission on the common link without affecting the sequencing of packets within such conversation when the number of packets queued on a common link exceeds a predetermined mild congestion threshold."
1. "Repetitive Sequentially Varying Relationship"

The parties dispute the interpretation of "repetitive sequentially varying relationship" as stated in the preamble of Claim 1. Plaintiff Faroudja would like the Court to construe "repetitive sequentially varying relationship" to mean "a varying repeating relationship between sequences of video fields derived from film frames in which the field/frame rates do not match and the field rate is greater than the frame rate." Final Chart at 1. Defendant Dwin, on the other hand, proposes a slightly different construction: "'repetitive sequentially varying relationship' means a video signal produced such that the ratio of video fields to film frames changes between different ratios within the video signal in a predetermined repetitive pattern." Final Chart at 1. The Court adopts Dwin's interpretation as the more legally proper construction of "repetitive sequentially varying relationship."

In construing "repetitive sequentially varying relationship," the Court is guided by general principles of claim construction and begins with the phrase's ordinary meaning. See Vitronics, 90 F.3d at 1583 (instructing the court to look first at the words themselves). The Court may look to other words in the preamble to provide contextual support for the proper interpretation. At first blush, this phrase appears to lack any obvious "ordinary or customary meaning." See Wolverine World Wide, Inc. v. Nike, Inc., 38 F.3d 1192, 1196 (Fed. Cir. 1994). However, its meaning becomes evident when the Court considers the phrase in context.

First, the "relationship" at issue is the relationship between video fields and film frames. This relationship is better expressed as a ratio. The parties do not appear to disagree that this is the relationship to which the preamble refers. See Plaintiff's Opening Claim Construction Brief at 8:6-7; Defendant's Claim Construction Brief at 7:4-5. This ratio, when monitored for a particular sequence, must be "varying" in that the number of video fields derived from a single film frame must change. In addition, the ratios must vary repeatedly within a particular sequence. The sequence referred to is a sequence of video fields. See Plaintiff's Opening Construction Claim Brief at 8: 6 ("sequences of video fields"); Defendant's Claim Construction Brief at 7:4-5 ("video field sequence").

The '287 specification supports this interpretation as seen in the examples shown in Figures 1 and 7. See '287 patent Figs. 1, 7. These diagrams illustrate the relationship between the video fields and the film frames specifically in the context of a 3:2 pull down film-to-video conversion. 3 For example, in Figure 1, the relationship between the video fields and the film frame is 3 (fields) to 1 (frame) for the first film frame or 3:1; 2 (fields) to 1 (frame) for the second film frame or 2:1; 3 (fields) to 1 (frame) for the third film frame or 3:1; 2 (fields) to 1 (frame) for the fourth film frame, and so forth. Thus, the relationship of video fields to film frame within this video field sequence varies sequentially between 3:1 and 2:1 in a repetitive pattern: 3, 2, 3, 2, etc.

--- Footnotes ---

3 The 3:2 pull down method is a common technique used to convert film to video. Other techniques, such as a 4:3:3 pull down method, would involve a transfer process whereby four video fields are derived from the first film frame, three video fields from the second frame, three fields from the third frame, four fields from the fourth frame, and so forth. In such a system, the ratio of video fields to film frames would vary sequentially between 4:1 and 3:1. Film that was transferred to video using a 4:3:3 pull down method would be distinguished by a repetitive predetermined pattern of 4, 3, 3, 4, 3, 3, etc. Using such a process instead of the 3:2 pull down method would also meet the limitations of the preamble of Claim 1 as construed.

--- End Footnotes ---

Faroudja accuses Dwin of trying to "import an example of a repetitive sequentially varying relationship, namely the 3:2 pull down method, into the claim interpretation." Plaintiff's Opening Claim Construction Brief at 6:28-7:1. Although Dwin may have attempted this at one time, see Joint Claim Construction ("JCC"), p. 1, col. 3, it does not appear that Dwin does this now, see Final Chart, p. 1, col. 3. However, to the extent that either party proposes to import an example of a repetitive sequentially varying relationship into the claim interpretation (e.g. such as the repetitive sequentially varying relationship associated with the 3:2 pull down method), their interpretation must be denied. The illustrations provided in the
specification provide only one example of a repetitive sequentially varying relationship. The interpretation of "repetitive sequentially varying relationship" is not limited to the specific relationship which arises from the use of 3:2 pull down techniques and encompasses any varying relationship of video fields to film frame that repeats sequentially.

Faroudja's proposed interpretation of "repetitive sequentially varying relationship" is "a varying repeating relationship between sequences of video fields derived from film frames in which the field/frame rates do not match and the field rate is greater than the frame rate." Final Chart, p. 1, col. 2. The language, "in which the field/frame rates do not match and the field rate is greater than the frame rate," is superfluous. Faroudja has stated that the relationship between video fields and film frames is a "varying repeating relationship." It is unnecessary to repeat this limitation again by stating that the "field/frame rates do not match". Also, Faroudja attempts to import a limitation from another part of the preamble which already requires the field rate to be greater than the frame rate into the construction of this phrase. See '287 patent at 8:1-10 ("the video fields having been produced at a greater rate than the film frame rate"). Such a limitation which requires the field rate to be greater than the film rate is not required for the interpretation of the phrase "repetitive sequentially varying relationship," nor is it a limitation supported by plain language or the specifications.

Although the Court does not believe that the parties’ proposed interpretations differ much in substance, the Court adopts Dwin’s proposed construction of the phrase "repetitive sequentially varying relationship" as correct.

3675
On Demand

Claim 3's language requires the recording circuit to be capable of "replaying the recorded information upon demand." Its plain language does not, as Zircon contends, require that a covered device record upon demand. I hold that the on-demand limitation in Claim 3(C) is restricted to a device's play function and does not include the record function.

3676
d. "Image, replicating a control interface"

Claims 1 and 13 disclose an "image, replicating a control interface particular to the first and second remotely controllable surgical devices, for display on the touchscreen to receive inputs and to display a status of the first and second remotely controllable surgical devices." 539 Pat. col.10 ll.18-21; id. at col.11 ll.11-14. Claim 23 recites a method for "providing an image replicating the control interface of the first and second remotely controllable surgical devices for display on the touchscreen and for receiving input commands." '539 Pat. col.12 ll.17-20.

The Parties respectively propose a single construction for all three claims. The Court adopts this framework because of the similarity of the claims' language. KSEA proposes construing this term as a "replica of the control panel/faceplate," while S&N proposes an "exact replica of each device's control panel that allows the touchscreen to receive and display the exact same input and status as the devices' actual control panels." (Proposed Constructions Chart 10.)

The Court adopts KSEA's proposed construction because it accurately describes the disclosure. The ordinary meaning of replica does not necessarily require exactness, see Webster's New International Dictionary 1925 (3d ed. 1986), and S&N has cited no authority for the proposition that one skilled in the art would understand "replica" to require exactness.

Further, S&N's argument based on the '539 Patent's prosecution history is incorrect. "The doctrine of prosecution disclaimer attaches where an applicant, whether by amendment or by argument, 'unequivocally disavowed a certain meaning to obtain [the] patent.'" Schindler Elevator Corp. v. Otis Elevator Corp., 593 F.3d 1275, 1285 (Fed. Cir. 2010) (quoting ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988)). "An argument made to an examiner constitutes a disclaimer only if it is clear and unmistakable;[;] an ambiguous disclaimer will not suffice." Id. (quoting Purdue Pharma L.P. v. Endo Pharms., Inc., 438 F.3d 1123, 1126 (Fed. Cir. 2006); Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1375 (Fed. Cir. 2008)).
In the prosecution history to which S&N points, the applicant stated that the "touchscreen 24 is capable of displaying exact replicas 26 and 28 of device control interfaces supplied by various manufacturers." (See Def.'s Opening Claim Construction Br. Ex. G, May 26, 2004 Resp. to Official Action 11 (emphasis added).) This language indicates that the touchscreen may display exact replicas, not that it only displays exact replicas. S&N has failed to show that the patentee "clear[ly] and unmistakabl[y]" disavowed a touchscreen that displays inexact replicas. Schindler Elevator Corp., 593 F.3d at 1285.

The Court construes the "image, replicating a control interface" term as a "replica of the control panel/faceplates."

2. Replying Agent

A "replying agent" is an agent that performs a transfer operation with the bus owner.

2. "Report Algorithm" (042 Patent)

"Report algorithm" appears in both independent claims of the '042 patent. Yodlee asserts that this term needs no construction, and alternatively proposes that it be construed to mean "a sequence of operations followed by the system in order to generate a requested report." CashEdge asserts that this term should be defined to mean "the distinct algorithms for accessing Internet sites to extract raw data relating to the request and for defining the resulting report." The Court agrees with Yodlee that CashEdge's definition leads one to believe that the report algorithm performs data extraction, which is not the case; the claims make clear that the data gathering system extracts the data according to the needs of the report algorithm. '042 patent, col. 25, lines 34-43. Adoption of the term "distinct" is also redundant, as the claims make clear that each report request is associated with its own report algorithm. Id. at col. 25, lines 27-30; col. 26, lines 16-20. However, the Court agrees with CashEdge that definition of report algorithm should refer to its role in data extraction. In line with one of the dictionary definitions advanced by Yodlee, the Court construes "report algorithm" to mean "a set of rules followed by the system to determine what data is to be extracted by the data gathering system and how that data is to be processed by the report processor in response to a report request."

B. Noninfringement of Claims 7 and 8 of the '033 Patent

On appeal, MicroStrategy argues that the district court misconstrued claim 7 of the '033 patent, and that, therefore, the district court's infringement analysis of claim 7 was incorrect.

Claim 7 recites:

A network-based system for enabling users connected via a network user interface over the network to an OLAP system to asynchronously submit requests for reports to be processed by an OLAP system, the network-based system comprising:

- report receiving means for receiving a request from an instance of the network user interface for the OLAP system to process a report;
- storage means for storing a report entry for reports that have been requested, including reports requested by other users and reports that are being processed;
- report control means for adding a request by that user to the report entry of a particular report in the report list if the
on-line analytical processing means for generating requested reports.

In construing the claim, the district court held that the preamble, particularly the term "asynchronously," was a limitation. MicroStrategy, 410 F. Supp. 2d at 358. The district court then construed the asynchronously submitted requests referred to in the preamble to be the requests that the report control means checks against the list of previously submitted requests for substantial similarity. Id. On appeal, MicroStrategy does not disagree that the term "asynchronously" is a limitation of the claim; however, it contends that the district court erred in construing the "report control means" to operate in response to asynchronously submitted requests. MicroStrategy argues that the preamble of claim 7 only requires that the system enable users to asynchronously submit requests, and that this does not foreclose the system from also enabling users to synchronously submit requests. In other words, MicroStrategy contends that the requests referred to in the body of claim 7 need not be the asynchronously submitted requests referred to in the preamble. Instead, MicroStrategy contends that the requests referred to in the body could be synchronously submitted and unrelated to the asynchronously submitted requests mentioned in the preamble.

In support, MicroStrategy cites claims 17 and 21 of the '033 patent, which recite "method[s] of asynchronously processing requests for reports to processed by an OLAP system." According to MicroStrategy, the difference in claim language between claim 7 and claims 17 and 21 indicates the patentee did not intend to limit claim 7 to asynchronously submitted requests. This argument, however, is unpersuasive.

The Summary of the Invention of the '033 patent clearly states that one "object of the invention is to provide a system and method enabling users to asynchronously request reports in a multi-user networked OLAP system that compares each request with all requests already processed or being processed by the system to avoid duplicative processing of requests." '033 patent, col. 4, ll. 16-21 (emphasis added). Similarly, figures 1 and 2 of the '033 patent illustrate the comparison of the newly submitted request to previously submitted requests as part of the asynchronous operation of the OLAP. Lastly, during reexamination of the '033 patent, MicroStrategy stated that "[e]ach independent claim [including claim 7] recites a feature that specifies asynchronous operation," not merely asynchronous capability.

In light of these statements and disclosures, which inextricably link the comparison of new requests against previously submitted requests with the asynchronous submission of requests to the OLAP, the district court did not err when it construed the requests handled by the report control means to be the asynchronously submitted requests mentioned in the preamble of the claim. The district court's grant of summary judgment of noninfringement was, therefore, not erroneous.

3680

"Report processor" also appears in both independent claims of the '042 patent. Yodlee asserts that the term need no construction, and alternatively proposes that the term be construed to mean "a computing device used to process the gathered data necessary to generate the requested report." CashEdge asserts that the term should be defined as "a processor that processes raw data according to a report algorithm into meta-summarized information defined by the report algorithm." CashEdge's definition needlessly involves construing the term "report," which the Court has already construed. The Court finds that the meaning of this term is clear in light of the surrounding claim language and the construction of "reports" and "report algorithm" and declines to construe "report processor."

GO BACK

3681

"Report request" and "user request" appear in both independent claims of the '042 patent. Yodlee again asserts that no
construction is needed, while CashEdge proposes a definition that would read "one of a plurality of possible requests each associated with an individual one of a plurality of report algorithms such that the user can request an array of completely different results." The surrounding claim language makes clear that each report request is associated with one report algorithm. Id. at col. 25, lines 27-30; col. 26, lines 16-20. CashEdge's construction is thus redundant; the Court declines to construe this term.

3682

1. "Reports"/"Presenting Reports From the Data" ('042 Patent)

"Reports" and "presenting reports from the data" appear in both independent claims of the '042 patent. Yodlee contends that these terms need no construction. Alternatively, Yodlee proposes that "reports" be construed to mean "presentation of user data to the end user," while CashEdge seek to construe the phrase "presenting reports from the data" as "presenting calculated and solution-oriented results derived from data." The specification describes the report that is presented to the end user as containing some kind of analysis as opposed to raw data. '042 patent col. 3, lines 18-27, 45-49. Furthermore, the applicant described the report as a "meta-summary" involving interpretation and calculation of data in order to report a solution-oriented result in order to distinguish it from prior art that merely presented data to the end user. CashEdge Ex. 14 at CE 00003509-00003510. The specification repeatedly refers to the report as consisting of "metasummarized" and calculated data, doing so in descriptions of the invention as a whole, and not just in descriptions of the preferred embodiments. See, e.g., '042 patent abstract; col. 1, lines 22-30. Accordingly, the Court adopts CashEdge's construction.

3683

6. "repositioning the spraying device relative to the conveying device to the relative synchronized position based upon the stored positions"

The last contested phrase of Claim 1 is the "repositioning step." Durr suggests that this step be construed as "moving the spraying device and/or conveying device to reestablish the specific relationship between the spraying device and the conveying device based upon the stored positions." (Am. Joint Claim Construction Chart at 4, FANUC Ex. 1) FANUC does not dispute that "repositioning" should be construed as "moving," nor does FANUC disagree that either the spraying device or the conveying device, or both, can be moved in the repositioning step. Thus the court will adopt the use of the phrase "moving the spraying device, the conveying device, or both" in its construction.

FANUC, however, characteristically argues that in construing the remainder of this phrase, the court should specify exactly how the "relative synchronized positions" should be calculated. Specifically, FANUC argues that the repositioning step should be construed as follows:

After actuation of a restart switch or the like: 12 (1) retrieving the four stored positions from the storage medium; (2) calculating a travel path for the spraying device using those four stored positions; (3) determining which is more desirable: (a) to resume at the specific paint-impact point located in the program sequence before the point of interruption, or (b) to resume at the specific paint-impact point located in the program sequence after the point of interruption; and (4) moving the spraying device and/or the conveying device so that the spraying device occupies a position relative to the conveying device at the selected paint-impact point.

(Am. Joint Claim Construction Chart at 4, FANUC's Ex. 1.) The court, however, will reject FANUC's attempt to add specificity to what is a clearly written in broad terms. See Liquid Dynamics Corp., 355 F.3d at 1368. FANUC attempts to justify importing this host of limitations into the repositioning step by arguing that it found this language in the Patent specification. However, "[i]n examining the specification for proper context, . . . this court will not at any time import limitations from the specification into the claims." Varco, L.P. v. Pason Systems USA Corp. 436 F.3d 1368, 1373 (Fed. Cir. 2006) (quoting CollegeNet, Inc. v. ApplyYourself, Inc., 418 F.3d 1225, 1231 (Fed. Cir. 2005)). The language that FANUC
seeks to import is indeed found in the preferred embodiment. The Federal Circuit has repeatedly "cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification." Id. at 1375 (citing a string of cases in support of this proposition). The court finds nothing in the claim language or the specification that would justify importing the detailed steps which FANUC proposes into Claim 1. Rather, as Durr suggests, the court will construe the repositioning step more generally, as it is listed in general terms in the claim itself.

--- Footnotes ---

13 The court is not persuaded by FANUC's argument that the '538 Patent's scope is coextensive with the preferred embodiment. (See FANUC's Resp. at 2, citing Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) and Honeywell Intern., Inc. v. ITT Industries, Inc. 452 F.3d 1312 (Fed. Cir. 2006)). The inventors here, however, did not give clear indication that the Patent's scope is limited to the preferred embodiment. FANUC unavailingly tries to analogize this case to Honeywell by arguing that "the '538 patent's written description discloses only one preferred embodiment and uses the term 'invention' in the singular form nine times." (FANUC Resp. Br. at 2.) All but two of those citations, however, are not found in the preferred embodiment but in the general description of the invention, the abstract or the background art. The preferred embodiment of the '538 Patent is clearly labeled as such, and the specification explicitly states that "[i]t is . . . to be understood that within the scope of the appended claims the invention may be practiced otherwise than as specifically described." (538 Patent 3:35-37.) Contra Honeywell, 452 F.3d at 1318 ("[T]he written description does not indicate that a fuel filter is merely a preferred embodiment of the claimed invention.").12 The court will quickly reject FANUC's proposal that this step begins "after actuation of a restart switch or the like." Although FANUC contends this language is taken directly from the specification, the language refers to the resumption step, and is not appropriately imported into the repositioning step. (See '538 Patent at 3:4-7 ("This resumption of the programmed coating operation may be initiated by the operating crew by manual actuation of a restart-switch or the like after the cause of the emergency shut-down has been eliminated.").)

--- End Footnotes ---

Thus, consistent with the court's previous constructions and the intrinsic evidence, the court will construe this step as follows: "moving the spraying device, the conveying device, or both to reestablish the correlation between the spraying device and the conveying device based upon the stored positions."

D. "repository"

Claim 26 contains the disputed term "repository": "retrieving one or more predetermined responses corresponding to the interpretation of the electronic message from a repository for automatic delivery to the source." The specification discusses "repository" in the following sentence: "[O]ne or more predetermined responses . . . are retrieved from a repository (or database), preferably the archive 32 (step 116a), of the automatic message reader 30 for automatic delivery to the source 52." (947 patent, 9:26-29) (emphasis added). Bright Response argues that this term should be construed as "a place where electronic information is stored." The defendants' proposed construction is "database."

The defendants argue that the specification defines "repository" as "database": "one or more predetermined responses . . . are retrieved from a repository (or database)." (947 patent, 9:26-27). But this passage is not defining the term "repository"; it provides an embodiment of the term. Nowhere in the specification or claims does the patent disclaim other potential repositories, such as a text file. Thus, the term should be construed according to its customary meaning as understood by a person having ordinary skill in the art. See Phillips, 415 F.3d at 1312-13. The dictionary definition of "repository" is "a place, room, or container where something is deposited or stored." Merriam-Webster's Collegiate Dictionary 1056 (11th ed.). In the context of the field of invention, it is clear that data is being stored. Therefore, the court construes "repository" to mean "a place where data is stored."
A. "a representation of an intra-oral radiograph holder"

This terms appears in Claims 1, 2, and 4 of the patent as follows:

1. A method of displaying stored intra-oral radiographs, comprising:
   displaying a representation of an intra-oral radiograph holder including target intra-oral radiological sites arranged according to anatomical location of said sites;
   . . .

2. A method for storing and displaying intra-oral radiographs, comprising:
   generating and displaying intra-oral radiographs of dentition; generating and displaying a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;
   . . .

4. A device for storing and displaying intra-oral radiographs, comprising:
   a display; means for generating and displaying on said display a representation of an intra-oral radiograph holder including selectable intra-oral radiological site arranged according to anatomical location of said sites; . . .

The parties agree that a radiograph is an image produced by x-rays and that "intra-oral radiographs" are images produced by x-rays captured by a film or sensor placed within the mouth. Plaintiffs contend that "a representation of an intra-oral radiograph holder" should be construed as "a representation of a device having a plurality of windows or image placeholders, arranged in anatomical order, for displaying intra-oral dental x-ray images." Plaintiffs assert that the invention appropriates the organizational and interpretational advantages of film holders, but does not incorporate their aesthetic or non-functional characteristics, and thus a representation of an intra-oral radiograph holder is simply a representation of a device having a plurality of windows or image placeholders, arranged in anatomical order, for displaying intra-oral dental x-ray images.

Defendants argue that "a representation of an intra-oral radiograph holder" should be construed as "a representation of what those skilled in the art would recognize as a collection of one or more positions organized in the format of a conventional intra-oral radiograph holder." Defendants rely primarily on the prosecution history to support their position, claiming that Plaintiffs' proposed construction is inconsistent with the prosecution history by side-stepping the addition of the "representation of an intra-oral radiograph holder" language and returning to the anatomical arrangement rejected by the PTO. Defendants argue that the prosecution history contains a substantive narrowing amendment and the Court must reject Plaintiffs' efforts to reclaim surrendered rights. Defendants argue that Plaintiffs seek to isolate one attribute of an intra-oral radiograph holder-anatomical arrangement -- as its entire definition. Defendants assert that the original patent application claimed all anatomical arrangements of radiographs and was deemed unpatentable due to prior art. In response, Plaintiffs amended the claims to include "a representation of an intra-oral radiograph holder," and this critical limitation was an explicit disavowal of claim scope and prohibits Plaintiffs from asserting any construction that excludes an intra-oral radiograph holder. Defendants further argue that Plaintiffs' proposed construction would expand the scope of the claims to include arrangements that are not film holders, such as the dental arch representations displayed in Figures 6 and 7 of the patent, but this cannot be correct because the specification clearly distinguishes dental arches from intra-oral radiograph holders. See 579 patent, col. 2, lines 27-31 ("The preferred application for the present invention is in intra-oral radiology. In such an application, sets of stored radiographs are displayed by using a representation of a dental film holder, or of dentition such as a dental arch.").
The Court finds that both sides have strong arguments regarding the proper construction of this term. Defendants argue that what was patented was a representation of a film holder familiar to dentists. There is some language in the specification and prosecution history to support this view. On the other hand, Plaintiffs point to the specification, noting that it emphasizes the organizational and interpretational characteristics of a film holder, and contend that the language of column 4, lines 56-61, which "emphasizes that other anatomical connotations can be applied to the various portions of the [intra-oral radiograph holder] icon,. . . so long as the anatomical sites represented by the icon . . . appear in normal anatomical relation to one another" means that the patent is broad enough to encompass all kinds of representations, not just conventional film holders, provided that the anatomical locations that are designated by the sites in the icon are arranged in anatomical order. Plaintiffs also contend that their construction is consistent with the prosecution history, and that when amending the claims, the applicant's incorporation of claim 4 into claim 3 expressed the patent attorney's understanding that claim 3, as amended, was the same as original claim 4, which noted that an image of an intra-oral radiograph holder was one method of displaying "a representation of target intra-oral radiological sites arranged according to anatomical location of said sites."

The claim refers to "a representation of an intra-oral radiograph holder" three times. Each time, the phrase is followed by "including selectable intra-oral radiograph sites arranged according to anatomical location of said sites." Thus, the claim itself makes clear that the holder representation includes selectable "intra-oral radiological sites" arranged according to their anatomical location. In addition, because the intra-oral radiological sites are arranged according to their anatomical location, the sites must have an "anatomical location." These limitations contained in the claim language itself are consistent with the description in the specification, which states that (1) film holder positions ("selectable intra-oral radiological sites") correspond to particular anatomical sites within the dental arch, Col. 6, lines 18-20, (2) each mounting position in a dental film holder corresponds to a particular anatomical site or anatomical region, Col. 1, lines 27-30, (3) mounting positions in the film holder have anatomical significance, Col. 2, lines 36-37, and (4) the anatomical sites ("selectable intra-oral radiological sites") in the holder representation appear in normal anatomical relation to one another, Col.4, lines 60-61. Plaintiffs' proposed construction of "intra-oral radiograph holder" expressly incorporates the anatomical arrangement limitation contained in the claim language, but does not expressly incorporate the feature that each position in the film holder representation correspond to an anatomical location. This may be implicit, however, in the fact that windows can only be arranged in anatomical order if they have anatomical significance. Further, this limitation is incorporated into their definition of "intra-oral radiological sites" as "icons or sites included in a representation of an intra-oral radiograph holder designating respective anatomical regions of the dental arch," which is discussed in the next section.

The specification makes clear that the term used in the claim, "an intra-oral radiograph holder," is a film holder, or film mount, and that it is "well known" in the field of oral radiology to mount dental radiographs in a film holder. The specification does not expressly equate a representation of an intra-oral radiograph holder to a "conventional" film holder. Rather, the background of the invention describes film holders by stating that (1) "such film holders can hold as few as one dental radiograph, n3 or as many as 20 or more radiographs," (2) "each mounting position in a dental film holder corresponds to a particular anatomical site or anatomical region," (3) "film holders present films taken of these anatomical landmark sites in positions that are consistent from holder to holder." The "summary of the invention" states that "use of a representation of a dental film holder permits a dentist to use his or her knowledge of the anatomical significance of the positions of the mounting positions in the film holder." Thus, these portions of the specification indicate that the relation between positions in a film holder and anatomical locations is consistent and that dentists would know them. However, though the specification describes the use of a representation of "a full mouth examination 20-film holder" in the detailed description of the preferred embodiment and specifies which film positions contained in the representation relate to which anatomical site, it "emphasizes that other anatomical connotations can be applied to the various portions of the icon appearing in icon field 53 [the representation of the film holder], without departing from the spirit and scope of the present invention, as long as the anatomical sites represented by the icon in icon field 53 appear in normal anatomical relation to one another." Thus, this language supports Plaintiffs' position that the only mandatory characteristics of a representation of an intra-oral radiograph holder, or film holder icon, are that the positions within the icon/representation represent anatomical sites and appear in normal anatomical relation to one another.

n3 The Court notes that, while the description of film holders states that they can hold as few as one dental radiograph, the invention does not include representations of intra-oral radiograph holders with only one position. The claim language requires that the film holder representation include intra-oral radiological sites, a plural term requiring there to be more than one position. Further, positions in the holder representation may only be arranged according to anatomical location if there
is more than one. This limitation is supported by the specification as well, which states that "sets of stored radiographs are displayed by using a representation of a dental film holder." Column 2, lines 28-30. Thus, while the specification describes attributes of film holders, not all of those attributes are necessarily true of a representation of an intra-oral radiograph holder.

Turning to the prosecution history, the original patent application demonstrates that the patentee believed that displaying "an image of an intra-oral radiograph holder" was one method for displaying a representation of target-intra-oral radiological sites according to anatomical location of said sites, while displaying an image of dentition was a second method. In its amendment, the patentee removed the image of dentition and retained the image of an intra-oral radiograph holder, noting that "all claims remaining in this application require the display of an intra-oral radiograph holder." The patentee further noted in its letter of explanation accompanying the amended claims that, "as explained in the Specification, dentists are familiar with such radiograph holders, and are trained to associate certain positions in the holder with specific portions of dentition." This language is consistent with the specification's statement that "use of a representation of a dental film holder permits a dentist to use his or her knowledge of the anatomical significance of the positions of the mounting positions in the film holder." The Court must thus consider whether this language limits the term intra-oral radiograph holders to "conventional" film holders (those with which dentists are familiar and for which dentists are trained to associate certain positions in the holder with specific portions of dentition), as Defendants urge.

As noted, the language in the specification seems to be somewhat contradictory, noting that film holders present films taken of anatomical landmark sites in positions that are consistent from holder to holder and that dentists have knowledge of the anatomical significance of the positions of the film holder, while simultaneously stating that "other anatomical connotations" can be applied to the icon positions, as long as the anatomical sites represented by the positions appear in normal anatomical relation to one another. However, the specification's "emphasis" that other anatomical connotations may be applied to the positions in the representation of the film holder can only be construed as the patentee's disavowal of a limitation that would require the positions of the film holder representation to correspond to particular anatomical locations in the mouth. In other words, though the positions must correspond to anatomical locations in the mouth, they do not necessarily have to correspond to the anatomical locations conventionally assigned to them. Thus, although dentists are trained to associate film holder positions with specific anatomical locations and the invention purports to take advantage of this training and knowledge, it is not strictly limited to use of representations of conventional film holders. To be sure, the patentee's language in the amended patent application correspondence with the PTO is consistent with the notion that a representation of an intra-oral radiograph holder is a representation of a film holder with which dentists are familiar and for which they have been trained to associate the mounting positions with specific anatomical locations. However, the Federal Circuit has instructed that the prosecution history, though useful, is less reliable than the specification, which appears to disavow such a strict limitation. n4 Further, when distinguishing Aisaka, the patentee's use of more circumscribed language in describing the use of film holders did not expressly disavow the language of the specification that other anatomical connotations could apply to the positions in the holder representation. Rather, the only thing the patentee clearly disavowed was a representation of anatomy: "While the Aisaka et al. reference contemplates the display of a representation of anatomy (for example, a stomach in Fig. 2A or a lung in Fig. 7C), there is no suggestion in Aisaka et al., or in any of the art of record, to display a representation of an intra-oral radiograph holder, and the use of that representation to store and retrieve dental radiographs." Thus, the prosecution history does not limit the invention to representations of conventional film holders.

n4 The Court notes, however, that in this case the specification seems less reliable because it is a description of the originally submitted invention, which included a representation of dentition, and thus some of the language in the specification either does not apply or was written broadly enough to cover both the image of an intra-oral radiograph holder and image of dentition originally included as methods for displaying target intra-oral radiological sites arranged according to anatomical location of said sites.

The extrinsic evidence does not contradict this construction. Defendants read testimony from David Bahler into the record during the Markman hearing:
Q: What do you recall generally about the technology that is at issue at the patent in suit?

A: Generally, it is a method and perhaps an apparatus for displaying intraoral radiographs on a computer display -- actually, dental x-rays on a computer display in a way that is recognizable to dentists, generally.

Defendants argue that this testimony establishes that the film holders must be recognizable to dentists as conventional film holders. However, the testimony states only that the invention involves displaying x-rays in a way that is recognizable to dentists. Use of a representation of a film holder would be recognizable to dentists, regardless of whether they recognized the specific representation as a "conventional" film holder.

The Court finds that Plaintiffs' proposed construction is more consistent with the claim and specification, though it unnecessarily incorporates limitations that are already contained in the claim language. Were the Court to use Plaintiffs' proposed construction, claim 2, for example, would read "generating and displaying [a representation of a device having a plurality of windows or image placeholders, arranged in anatomical order, for displaying intra-oral dental x-ray images] including selectable intra-oral radiological sites arranged according to anatomical location of said sites." Thus, Plaintiffs' construction would create redundancy. The specification (and prosecution history) makes clear that "a representation of an intra-oral radiograph holder" is simply "a representation or image of a dental film holder." And, a dental film holder is a device for mounting dental x-rays.

The Court has attempted to follow the applicable claim construction guidelines from the Federal Circuit, and finds that, based on the claim language, the specification, and the prosecution history, an ordinary artisan (a dentist) would construe the term "representation of an intra-oral radiograph holder" in claims 1, 2, and 4 as "a representation or image of a dental film holder (a device for mounting two or more dental x-rays)."

C. Representative

The term "representative" appears in claims 34, 37, 40 and 42 of the '580 patent. Microsoft's proposed definition of the term is "that replaces (without loss of meaning) or is equivalent to." AT&T's proposed definition of "relates to, represents, or describes." (Joint Letter, Ex. B.; Tr. 108-09, 117.) AT&T also stated at the Markman hearing that it "would be fine with something like represents, typifies or describes." (Tr. 118-19.)

"Dictionary definitions may establish a claim term's ordinary meaning" that "would have been attributed by those of skill in the relevant art." Texas Digital Sys., 308 F.3d at 1202 (quoting CCS Fitness, 288 F.3d at 1366); accord Vitronics, 90 F.3d at 1584 n.6. In doing so, "the intrinsic record must always be consulted to identify which of the different possible dictionary meanings of the claim terms in issue is most consistent with the use of the words by the inventor." Texas Digital Sys., 308 F.3d at 1203. Moreover, "if more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all such consistent meanings." Texas Digital Sys., 308 F.3d at 1203 (citations omitted).

Webster's Dictionary defines "representative" as "one that in some way corresponds to, replaces, or is equivalent to someone or something else," and as "serving to represent, portray, or typify." Webster's Third New Int'l Dictionary of the English Language Unabridged at 1926 (G.&C. Merriam Co. 1981). The American Heritage Dictionary defines "represent" as "to stand for; symbolize." Am. Heritage Dictionary at 1104 (Am. Heritage Pub. Co., Inc. 1973). AT&T also presented additional definitions from Webster's dictionaries: "serving to represent, portray or typify; serving as a characteristic example; illustrative of the class; serving as a typical or characteristic example." (Tr. at 109.)

The specification and the prosecution history do not indicate any intent by the patentees to deviate from the plain meaning of the term. See Altiris, 318 F.3d at 1370-71 (citing Teleflex, 299 F.3d at 1327). Reading the term in light of the specification, several dictionary definitions are consistent with the use of the claim terms. Altiris, 318 F.3d at 1369 (citing Texas Digital Sys., 308 F.3d at 1203). Accordingly, this Court incorporates those consistent terms and construes "representative" as "one that in some way symbolizes, represents, replaces, or is equivalent to something else." See Texas Digital Sys., 308 F.3d at 1203.
3. "having at least one representative child node represent a subset of the child nodes" Used in Claim 9.

In spite of their agreement on the preceding two similar terms, the parties differ on this claim term. Cisco proposes "having at least one child node be a graphical representation of multiple child nodes." Telcordia suggests "at least one representative child node represents a subset of the child nodes located on the same level of the hierarchy." Initially, the parties disputed all three claims, with the difference in each being that Telcordia wanted all of them to contain the limitation "on the same level of hierarchy," as seen in its proposal for Claim 9. After the briefs were filed, Telcordia agreed that such limitation was not needed for Claim 1, and Cisco agreed that the limitation was appropriate for Claim 6. Needless to say, the briefs of the parties do not provide any guidance as to whether Claim 9 should be construed similarly to Claim 1 or to Claim 6.

Since the parties have agreed on the construction of the similar terms in Claims 1 and 6, a comparison of the language of the three claims is helpful. All three of the claims describe the limitation of the number of nodes/objects around another node/object. All three claims also describe using one object to represent multiple objects. For clarity, this will be referred to as the "representative node." The question is whether in Claim 9 this representative node can only represent nodes on the same level of hierarchy (as agreed for Claim 6) or can represent nodes on more than one level (as agreed for Claim 1).

Unlike Claim 1, Claim 6 and Claim 9 refer to child objects or nodes representing other child objects or nodes. Claim 1's only limitation is that "one object represents multiple objects" with no limitation that the represented objects be "child" objects. Claim 9 is therefore more like Claim 6, in which the parties have agreed the "representative node" represents only nodes on the same level of the hierarchy.

Cisco argues that the representative child node of Claim 9 could also be a parent node and represent children and/or grandchildren nodes on lower levels, so that it would be like Claim 1, in which "one object represents multiple objects." A close examination of the claim language shows that this is a tortured interpretation.

Claim 9 describes "a method for displaying hierarchical data" in which the second step describes a plurality of child nodes being arranged "adjacent to the parent node . . . ." '304 patent, col. 21, ll. 45-46. (emphasis added). Grammatically, the use of the definite article "the" generally indicates a single or unique parent node.

Continuing on in the second step, each child node depends from "the parent node in the hierarchy . . . ." '304 patent, col. 21, ll. 46-48. (emphasis added). Then we get to the term in dispute which is contained in the following phrase:

. . . limiting the number of child nodes depending from the parent node to within a predetermined number of child nodes by having at least one representative child node represent a subset of the child nodes . . .

'304 patent, col. 21, ll. 53-56. (emphasis added). The emphasized terms raise two points.

First, the definite article "the" is again used with "parent node." The patentee had unbridled discretion in his choice of words, and he chose to use the definite article each time "parent node" is used in this claim. This is an odd choice if he intended the representative child node to also be a "parent node."

Second, the nodes which depend from the parent, the nodes whose number is predetermined, the "representative node," and the nodes which it represents, are all "child nodes." Cisco argues that this is some sort of generic use of "child." But the specification is very consistent in using "child" to refer to a node depending directly from a parent. An indirect node, or a node more than one hierarchical level below a given parent node is referred to as a "grand-child" or "great-grand-child."

'304 patent, col. 8, l. 51; col. 9, ll. 61-63; col. 10, ll. 4-6; col. 11, ll. 13-14 & 20-21; and col. 14, ll. 55-57.

Likewise, the other claims are also consistent in using "grand-child" when referring to nodes more than one level down from a "parent." See '304 patent, Claim 7, col. 21, ll. 1-5; '304 patent, Claim 11, col. 22, ll. 10-17; and '304 patent, Claim 33, col. 24, ll. 16-17. Claims 11 and 33 are also significant because they describe limiting the number of "child or grand-child objects," whereas Claim 9, like Claim 6, speaks only of limiting the number of "child" nodes or objects. The use of different
language in the claims supports the interpretation that the "child nodes" of Claim 9 are on the same hierarchical level, just as the parties have agreed the "child objects" of Claim 6 are on the same hierarchical level.

Cisco contends that the prosecution history suggests that the 'virtual' hierarchy enabling one object to represent multiple levels was used to overcome the prior art, U.S. Patent No. 6,144,962 ("the Weinberg patent"). The applicant argued that "a 'virtual' hierarchy that includes objects that represent multiple objects" was a critical feature distinguishing their invention over that of Weinberg. Application, January 13, 2003, Bates stamped 00000508-509, p. 10, Exhibit F of Cisco's Opening Claim Construction Brief, [Doc. # 51, Attachment # 3]. Such a statement relates to the phrase in Claim 1, which Telcordia agrees, may encompass multiple objects on multiple levels. However, when discussing the claim at issue, the applicant argued that "a parent node in the hierarchical structure of objects has child nodes that exceed that predetermined number, a single object may be created to represent a subset of the child nodes . . . ." Id. Although this does not, as Telcordia suggests, unambiguously restrict the claims to one child node representing other child nodes that are on the same level, it certainly indicates that the applicant recognized a distinction between a claim using merely "one object" to represent "multiple objects," and a claim with the additional limitation that one "child node" or child object represents other "child nodes" or "child objects." The court construes this disputed term as follows:

"having at least one representative child node represent a subset of the child nodes" means "at least one representative child node represents a subset of the child nodes located on the same level of the hierarchy."

The parties dispute the following three terms: (1) "value that is representative of amount of time to transpire" used in the '916 patent; (2) "value which is representative of a delay time" used in the '263, '365, and '195 patents; (3) "value which is (or code being) representative (or indicative) of a (preprogrammed) number of clock cycles" used in the '263,'443, '214, '918, '592, '152, '120, and '916 patents. Hynix proposes each of these terms be defined as "information representing a particular access time." JCCS, Ex. A at 26-28. Rambus contends the terms are self-explanatory in light of their context within the claims. Rambus is correct The court finds the patents used these terms in a manner equivalent to delay time code or "delay time." The problems discussed with Hynix's proposed construction of "access time register" and "delay time" apply equally to its construction of these terms.

Accordingly, the court adopts Rambus's proposed construction for each of these terms. Each term is interpreted to represent a value conceptually similar to the delay time code and "delay time" discussed above. "Value that is representative of amount of time to transpire" is construed as "information that indicates an amount of time which is to occur." JCCS, Ex. A at 26. "Value which is representative of a delay time" is construed as "information which indicates a delay time." Id. "Value which is (or code being) representative (or indicative) of a (preprogrammed) number of clock cycles" is construed as "information which indicates a number of clock cycles."

Data General maintains that "represented address of said addresses" refers simply to one of the addresses represented by an ordinary unresolved pointer. IBM contends that the phrase refers to two different kinds of logical addresses, of which the second kind of address is used to represent the first.

Claim 10 recites in the third paragraph:

said data items include ordinary unresolved pointers, each one of said ordinary unresolved pointers representing a represented address of said addresses …

An ordinary unresolved pointer does not itself contain one of "said addresses", which specifies a location in the memory means, but rather represents a "said addresses", which is subsequently to be determined. The address for which the pointer is a proxy is the "represented address." Thus, "represented address" is the address into which the pointer will eventually be resolved and "said addresses" refers to the set of addresses specifying locations in the memory means of which the "represented address" is one.

Data General argues that Claim 10 does not expressly claim any specific kind of address -- physical, logical or otherwise. IBM responds that "represented address of said addresses" refers to logical addresses and, more specifically, that "said addresses" found in memory commands are a particular kind of logical address, AON-offset addresses, which are resolved into a second kind of logical address, UID-offset addresses.

The Common Specification describes the use of logical addresses in the computer system at issue as follows:

CS 10110's addressing mechanisms are based, first upon UID addressing of objects. That is, all information generated for use in or by operation of a CS 10110, for example, data and procedures, is structured into objects and each object is assigned a permanent UID.

Effectively, UID addressing means that the address (or memory) space of a particular CS 10110 includes the address space of all systems, for example, disc drives…. 2

U.S. Patent No. 4,455,602 ("the '602 Specification" or "Common Specification"), col. 72, ll. 13-17, ll. 24-26 (emphasis added). 3

--- Footnotes ---
2 "UIDs" stands for Unique Identifiers, one aspect of the described logical addressing system. U.S. Patent No. 4,455,602 consists primarily of a specification, which is incorporated by reference in numerous patents, including both the '603 and '797 Patents.
--- End Footnotes ---

The Common Specification clearly describes the use of logical addresses in connection with the resolution of unresolved pointers:

The Pointer Resolution System translates pointers, i.e., data items which contain location information, into UID-offset addresses.

'602 Specification, col. 327, ll. 15-17.

Although the Common Specification describes the use of logical addresses in its addressing system, limitations from the specification should not necessarily be read into the claims. See Sjolund v. Musland, 847 F.2d 1573, 1581-82 (Fed. Cir. 1988). While "represented address of said addresses" may be logical addresses, they are not limited to logical addresses.

This Court concludes that "said addresses" refer to the addresses in memory commands specifying a location in memory means and "represented address" is the address derived from the ordinary unresolved pointer.
Hamilton next argues that the court failed to set forth its construction of the terms "representing," "indicative of," and "of the patient." Claim 1 requires means for processing data "representing . . . measured levels of carbon dioxide and oxygen levels of the patient." Claim 16 requires the step of "measuring levels of carbon dioxide and oxygen of the patient and providing a first pair of data signals indicative of the same." Dr. Tehrani responds that the court defined the first two terms according to their ordinary meanings and that the meaning of the third term "of the patient" was not in dispute and therefore did not require construction.

Both sides rely on dictionary definitions of the term "representing." Hamilton argues that "representing" should be construed to mean "equivalent to," and that Dr. Tehrani used the term "representing" because it would be improper to use the term "equivalent" to refer to digital data signals that correspond to a physical measurement. Dr. Tehrani proposes broader terms such as "to stand for" or "symbolizing" as the proper definition of the term "representing." The district court acknowledged the dispute over the term, but failed to state explicitly which party's proposed definition it adopted. We find it implicit in the district court's opinion, however, that it chose the broader definition of "to stand for" or "symbolizing" because its analysis is not consistent with the narrower definition of "equivalent to."

We look to the ordinary meaning of the term "representing" because the record does not suggest that the applicant assigned a special meaning to the term. When a term has multiple dictionary definitions, we must consult the intrinsic record "to identify which of the different possible dictionary meanings of the claim terms in issue is the most consistent with the use of the words by the inventor." Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002). We agree with Dr. Tehrani that the ordinary meaning of "representing" is broad enough to include "symbolizing" or "to stand for," and that the '268 patent did not assign the term a narrower meaning. On the other hand, the statement that one item "represents" another cannot be interpreted so broadly as to include any case in which the two items are related in some way. Rather, the first item must be directly related to and stand for, or be a reasonable proxy for, the latter item.

THREE 3691
THE "PULSE WIDTH" LIMITATION

Independent claims 1, 9, and 14 of the '751 patent require a pulse generator that generates "a pulse . . . a width of said pulse representing a coordinate position of said joystick device." In its August 22 opinion, the Court defined "pulse" as "a single cycle of variation in the logical level of a signal" in accordance with its ordinary meaning to one skilled in the art. The Court also construed the phrase "a width of said pulse representing a coordinate position of said joystick device" as "the width of the pulse, as assessed in time or distance, represents a coordinate position of the joystick device." Therefore, the limitation, read together with its construed definitions requires an infringing product to produce "a single cycle of variation in the logical level of a signal, a width of the single cycle of variation, assessed in time or distance, represents a coordinate position of said joystick device." For ease of reference this limitation will be referred to as the "pulse limitation."

Context of Dispute

In order to put the parties' dispute regarding the pulse limitation into an understandable context, a brief explanation of the accused devices is warranted. 2 There is no dispute over the operation of the accused devices. The Microsoft Xbox game controllers implement miniature joysticks or "thumbsticks." The Xbox thumbstick is connected to a potentiometer that generates particular voltage signals depending on the unique position of the thumbstick. The analog voltage signal is then converted into a digital signal using either an 8-bit or 10-bit 3 successive approximation analog to digital converter ("SAADC"). The SAADC compares the analog voltage arriving from the potentiometer with successive approximations of voltage to arrive at a corresponding 10-bit digital representation of the thumbstick's position.

Footnotes

2 This is particularly true because Fenner attempts to frame its "interpretations" regarding claim terms and the Court's construction as questions of fact.

3 Early versions of the Xbox used an 8-bit rather than 10-bit SAADC. The distinction between the two is irrelevant for the purposes of this opinion. For the purposes of illustration, the remainder of this opinion will refer only to the 10-bit SAADC.
The 10-bit digital word is then transmitted over a carrier signal (either through USB wired bus or radio technology) with two logic levels. A low logic level would indicate a "0" and a high logic level would indicate a "1." The 10-bit "digital word" indicates the particular position of the thumbstick to the processor. In some accused devices, an encoding scheme is used rather than transmitting high logic for a "1" and low logic for a "0." An encoding scheme does not change the nature of the 10-bit digital word. Rather, the same 10-bit digital word is encoded during transmission. For example, in some products, Microsoft uses NRZI encoding, which is a coding scheme that uses two logic levels and where a logic "0" bit is indicated by any transition between the logic levels. Alternatively, Logic "1" bits are indicated for portions of the signal (whether high or low) where there are no transitions for multiple clock cycles (i.e. a logic "1" bit is indicated for each clock cycle where there is no logic transition). Whether or not encoding is used, the 10-bit word is re-assembled when it is received at the console. The processor may then interpret the 10-bit word to calculate the corresponding position of the thumbstick.

The Nintendo Gamecube and Wii consoles operate similarly, converting the analog voltage signal into an 8-bit digital signal. Both of the Nintendo accused products use encoding. In particular, the analog to digital converter (ADC) in the Gamecube creates a short pulse to indicate a "0" and a slightly longer pulse to indicate a "1." Eight of these successive pulses creates an 8-bit digital word that corresponds to a particular thumbstick position. The Wii game controller, in turn, generates no pulse over a clock cycle to indicate a "0" and a short pulse to indicate a "1."

Claim Construction

Fenner makes several arguments for how this limitation is achieved by the 8 or 10-bit digital pulses created by the accused devices. As an initial matter, the parties agree that all of the accused devices produce pulses with a width assessed in time or distance. For instance, the Wii and Xbox controllers will produce the 8-bit word "01100000" by producing no variation for the first clock cycle, a variation in the logical level for the two following clock cycles, then a return to the original logical level for the remaining 5 clock cycles. 4 Therefore, the "width," of the variation in the logical level, measured by time, is two clock cycles. Similarly, the "width" of the "pulse" in the 8-bit word "00110000" would also be two clock cycles.

4 Of course, this is merely exemplary because the 8-bit "digital word" may be produced in the carrier signal in a variety of ways depending on the encoding.

Fenner argues that the accused devices meet the "pulse limitation" simply because each device creates a pulse with a width that can be measured, and sometimes, based in part on this measurement, the position of the joystick can be determined. Defendants argue that the pulse width has no relevant meaning in the accused devices, but rather, it is the representative "digital word" that reveals joystick position. The dispute centers around the meaning of the word "represents" in the Court's construction of the pulse limitation. Fenner uses the term to mean that pulse width "provides some information about" or "symbolizes" a coordinate position of the joystick device. 5 Defendants suggest that the term means that the pulse width "fully communicates" a position of the joystick device. Thus, the critical question is a claim construction dispute regarding whether a "pulse width" must provide all the information necessary to determine a particular joystick position.

5 Though Fenner has vigorously argued that "represents" has its plain meaning and needs no further construction, it consistently uses the term to mean different things. Sometimes it even indicates that the term means "directly corresponds" or "fully communicates." See Fenner's Response to Microsoft's Motion for Summary Judgment of Non-Infringement, Docket No. 226 at 21 ("A reasonable juror could find that the pulse and pulse widths of each of Microsoft's pulses correspond to a distinct joystick coordinate position").
The Court's original claim construction opinion rejected Defendants' argument that "represent" meant that a pulse width required a "direct relation" to the joystick position. See Memorandum Opinion, Docket No. 142 at 12-13 (August 22, 2008) ("Claim Construction Opinion"). Defendants' argument, at that time, was that "represent" required the relationship between the joystick position and pulse width be such that there was a direct mathematical correspondence between the position of the joystick and the width of a pulse. The specification did not require such a mathematical relationship. See id.

For example, a larger pulse would indicate a joystick in the forward position and a smaller pulse would indicate a joystick in the backward position.

However, intrinsic evidence strongly suggests that the width of a pulse must communicate all the information necessary to determine a joystick position. Foremost, all of the claims (as well as the Court's construction) require that the pulse width represents "a coordinate position." The words "coordinate position" require precision beyond that of a simple "position." "Coordinates" are precise and not general or simply indicative. In addition, the use of the article "a" reveals that the claims call for only a single "coordinate position." In respecting the patentees' specific claim language to relate the pulse width with a single specific joystick position, the Court cannot construe the word "represent" as Fenner suggests. To do so would completely marginalize the meaning of these specific terms.

Furthermore, the patent's abstract further supports this conclusion. A patent's abstract may often be helpful in determining the proper meaning of claim terms. See Netcraft Corp. v. eBay, Inc., 549 F.3d 1394, 1398-99 (Fed. Cir. 2008) (citing several statements in the abstract for construing disputed claim limitations). Here, the abstract recites that the claimed invention operates by "outputting a digital pulse signal to a processor which signifies a joystick coordinate value." '751 Patent, Abstract. Importantly, the abstract does not indicate that the pulse only provides some information about joystick position, but rather, that the pulse "signifies . . . a joystick coordinate value." The words "coordinate value" unambiguously require that the pulse signal pinpoints the position of the joystick with a degree of mathematical particularity. Furthermore, the use of the article "a" and the use of the term "value" in the singular indicate that the pulse information does not generally determine a subset or group of possible joystick positions, but a singular joystick position.

Similarly, the summary section of the patent supports this interpretation by also using the words "a joystick coordinate position" to describe the information gleaned from the pulse. Id. at 2:2-3. Indeed, this language is almost identical to the language used in the claims themselves. Additionally, in describing the operation of the preferred embodiment the specification explains that "[t]he duration that PCin remains at a logic "1" level indicates the joystick potentiometer resistance for the corresponding coordinate axis." Id. at 4:36-38. The use of the phrase "corresponding coordinate axis" also indicates that the pulse information provides a degree of particularity that precludes Fenner's interpretation. Also, the argument that the invention encompassed methods other than calculating the "duration" of a pulse to determine joystick position is not supported anywhere in the file history, written description, or claim language.

Lastly, a corollary to Fenner's position is that the "width" of a pulse combined with other data (such as the position of the pulse within a given 8 or 10-bit word) does, in some circumstances, indicate a particular joystick position. Fenner's arguments indicate that it views the term "represent" as meaning "pulse width" can be included in some multi-variable
formula that, in some circumstances, will produce a particular coordinate position of the joystick. However, the prosecution history indicates that the width of the pulse itself—without the necessity of other information—constitutes the relevant data for determining joystick position. During prosecution, independent claims 1, 9, and 14 were amended to include the limitation that "the capacitance value of said capacitor [is] a function of said predetermined threshold that prevents deviation of the width of said pulse from expected values." Prosecution History, 12/19/01 Amd., at 2, 4, 6. This language regarding the expected width of a pulse is also repeated in the claims and confirms that "pulse width" itself has an expected value for a particular joystick position (this would not necessarily be the case if the pulse width were merely a component in a multi-variable position indicator). Further, the claim amendment is particularly instructive when coupled with the language in the specification explaining that "pulse width, which represents rise time, however, should not be less than or exceed expected minimum or maximum pulse width values . . . to ensure optimal joystick position sensing . . . ." '751 Patent at 4:64-67. This language clearly indicates that pulse width, and not other data, is what is "sensed" to determine joystick position.

Thus, it is clear from the context of the patent and claims that the term "represents" means more than "provides some information about," "symbolizes," or even "suggests." Rather, one skilled in the art would understand that the width of a pulse must itself provide the information necessary to determine joystick position. Accordingly, the Court amends the definition of "a width of said pulse representing a coordinate position of said joystick device" to mean "the width of the pulse, as assessed in time or distance, provides all the information necessary to determine a coordinate position of the joystick device."
2. “Request”

“Request” is utilized in asserted claims 1, 9, 11 of the ‘554 Patent and 1, 15, and 29 of the ‘335 Patent. The Plaintiff asserts that the proper construction of “request” is “a message that asks for content.” The Defendants assert that the term should be construed as “a message containing a URL that asks for a Web page specified by the URL.”

The Court first notes that the term “request” generally appears in the claims in different circumstances. In some claims (for example claim 1 of the ‘554 Patent), request is first utilized with relation to “a dynamic Web page generation request” and multiple references are then made to “said request.” Such claims also use the term “other requests” which imply a request different from “said request.” Other claims (for example claim 15 of the ‘335 Patent) begin with the general use of “a request” but later refer to “dynamically generating a page in response to said request.” These claims also refer to “other requests.” As noted in the specification, a request can refer to static Web pages (such as a static document) or dynamic Web pages (such as a Web page dynamically generated by an application). Col. 1:38-56, Col. 4:16-32 Thus, in its general use, request is not limited to dynamic or static requests. It is also noted that both types of claims consistently refer to either “Web page” generation or “page” generation. The specification uniformly refers to pages in the context of Web pages. Thus, it is not unreasonable that in light of the consistent specification one would interpret “requests” as relating to requests for Web pages.

The primary point of distinction between the proposed constructions relates to inclusion of “URL” in the construction of request. The specification notes that “a Web browser allows a Web client to request a particular Web page from a Web site by specifying a Uniform Resource Locator (URL). A URL is a Web address that identifies the Web page and its location on the Web.” Col. 1:29-32

The Defendants cites numerous places in the specification text in which “URL request” is utilized to refer to what is requested. The Plaintiff asserts that a request may be made at multiple points, such as shown in Figure 4 between the Web client and Web server, between the Web server and the Dispatcher and between the Dispatcher and the Page servers. The Plaintiff further argues that once a message is received by a Web server a full URL is not utilized subsequently, such as by Page servers.

The Defendants counter by noting numerous specification citations to the term “URL request” including “route the URL request to a Page server” and “the dispatcher sends the URL request to an appropriate Page server.” Col. 6:9-10, Col. 8:38-39, See Defendants’ Brief at 13-14. The Plaintiff responds that there is no teaching in the specification that a page server utilizes a URL. Moreover, the Plaintiffs assert that it would be illogical for a request provided to the page server to utilize a URL as such address would refer to the Web server.

The Court notes that within the claims “request” is used in context of multiple steps of the page generation process. For example, within claim 1 a request may be provided to a Web server while “said request” is also received by a Page server. The specification provides varied and not always consistent uses of the terms “request” and “URL request.” As noted above, URL request is often utilized. However, the more general term “request” is also often utilized. Col. 2:1-12; Col. 2:18-35; Col. 4:33-53; Col. 5:8-59; Col. 6:20-32; Col. 7:5-6. In at least two of these instances, language stating “requests or ‘hits’” is utilized. Col. 4:38-39; Col. 7:5-6. Further, the Defendants have not shown within the specification that a Page server utilizes a URL. Thus, even when “URL request” is provided in the specification it is not clear that such request is required to contain a URL or is merely a request generated from an initial URL provided at a Web client. To require “request” to include a URL would thus include limitations that the specification does not clearly support and clearly require.

The remaining dispute between the parties relates to the use of “content” verse “Web page.” This dispute relates to the underlying meaning of the term Web page as discussed above and thus does not need to be re-addressed. As the Court has noted, the context of the patent is uniformly directed towards Web page requests. Under the guidance provided in Phillips, it is appropriate when viewing the specification and the language of the claims themselves to limit “request” to Web page
applications. Thus, the Court construes "request" to mean "a message that asks for a Web page" (with the term Web page having the construction provided herein).

3694

The Court is of the opinion that the findings and conclusions of the Magistrate Judge are correct. Therefore, the Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court.

3695

f. "request"

Claims 1, 7, 11, and 14 refer to the term "request." This term is not highly contested, and the Court finds the proposed interpretations of the parties very similar. A "request" is a communication, message or directive that asks a remote computer for a response, including the download of electronic data. "To request" is to send such a message. This is an active term, not a passive one. This interpretation is consistent with the ordinary meaning of the claim language and the patent specification.

3696

B. Read Request

The district court construed "read request" to mean "a series of bits transmitted over the bus that contain multiplexed address and control information needed to request a read of data from a memory device." The court similarly construed "write request" and "transaction request" by replacing the language "needed to request a read of data from a memory device" with "needed to request a write of data from a memory device" and "needed to perform a transaction over the bus with a memory device."

Claim 18 of the '918 patent is representative of the claims reciting a "read request:"

18. A method of operation of a synchronous memory device, wherein the memory device includes a plurality of memory cells, the method of operation of the memory device comprises:

- receiving an external clock signal;

- receiving first block size information from a bus controller, wherein the first block size information defines a first amount of data to be output by the memory device onto a bus in response to a read request;

- receiving a first request from the bus controller; and

- outputting the first amount of data corresponding to the first block size information, in response to the first read request, onto the bus synchronously with respect to the external clock signal.

'918 patent, col. 26, ll. 13-27 (emphases added). The relevant claim language thus recites only that data is output onto a bus in response to a "read request."

Both parties agree that the term "read request" has no unambiguous ordinary meaning to one of skill in the art. Infineon argues that because the claims contemplate a response to a "read request," the "read request" must contain all information necessary to perform the requested read. Thus, Infineon argues that the "read request" must include both address and control information. Rambus agrees that in order to actually perform a read the device must be given address and control
information. Rambus asserts, however, that such address and control information is part of the "request packet," not the "read request" Rambus argues that "read request" refers only to an instruction to the memory device to perform a read action. According to Rambus, the "read request" is one component of the "request packet" -- comprising the first four bits of the packet. Figure 4 of the '918 patent illustrates a "request packet."

[SEE FIGURE 4 IN ORIGINAL]

As shown above, the "request packet" has multiple fields, including an AccessType field, Address fields, and a BlockSize field. Rambus contends that the four-bit AccessType field contains the "read request." The first bit instructs the memory device to perform a read; the next three bits tell the device what type of read to perform (e.g., page read, normal access read, etc.).

The district court interpreted the claim language requiring a response to a "read request" to mean that the "read request" must include address and control information. To the contrary, the claim language itself shows the fallacy of holding that outputting data in response to a "read request" necessarily implies that the read request must contain all information necessary for a memory device to respond. Claim 18 recites receiving a "block size" that defines an amount of data to be output onto a bus in response to a read request. By specifying the "block size" as separate from the "read request," claim 18 indicates that the block size is not part of the read request. Nevertheless, block size, which tells the device how much data to read, is necessary to permit the device to respond to a read request. n5 Thus, even though the device needs a block size to respond, such block size is not part of the read request. See '918 patent, col. 24, l. 58-col. 25, l. 3 (Claim 1 recites providing a "block size" to the memory device in one limitation and issuing a "read request" to the memory device in another limitation.).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n5 To tell the memory device what data to read, the controlling device (e.g., the CPU) may provide a start and stop point for the data location, or provide a start point and a value for how much data to read (i.e., block size). The claimed invention uses the "block size" method.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In addition, the district court's interpretation of "read request" conflicts with other passages of the specification. While the memory device must respond to a read request, the specification indicates that the address and control information is part of the request packet -- not the read request. In other words, the specification does not use read request and request packet interchangeably. Rather, it shows a difference between a read request and a request packet. Each reference to address and control information consistently indicates that such information is a part of the request packet, which the specification defines as "a contiguous series of bytes containing address and control information." '918 patent, col. 8, l. 59-col. 9, l. 4; see also col. 9, ll. 24-43; col. 6, ll. 61-62 (defining request packet as "a sequence of bytes comprising address and control information"); col. 9, ll. 11-13 (request packet has control information). Other than in the abstract and the claims, the term "read request" appears only twice in the specification. See id., col. 9, l. 2 & col. 12, ll. 33-35. Neither reference to "read request" suggests the presence of address and control information. The specification merely indicates that the "read request" requests data from a memory device and specifies what type of read (e.g., page mode, normal mode, etc.) to perform. See id., col. 9, l. 39-col. 10, l. 39; col. 8, l. 66-col. 9, l. 3 & Figure 4.

Moreover, the dependent claims demonstrate that a read request is distinct from a request packet. Dependent claims 27 and 28, which depend from claim 18, recite:

27. The method of claim 18 wherein the first block size information and the first read request are included in a request packet.

28. The method of claim 27 wherein the first block size information and the first read request are included in the same request packet.

id., col. 27, ll. 6-11. Although one of ordinary skill would know that a memory device needs a block size and address and control information to respond, the claims do not state that such information forms a part of the read request. In fact, the
claims do not even require that such information be part of the same request packet. Even though the memory device needs this information, the claims need not recite every component necessary to enable operation of a working device. Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1303, 50 USPQ2d 1429, 1435 (Fed. Cir. 1999) (applicant need not claim every feature of a working device). The district court's construction would render claim language in dependent claims 27 and 28 meaningless. This court disfavors such a construction. Comark Communications, 156 F.3d at 1187; Wright Med. Tech., Inc. v. Osteonics Corp., 122 F.3d 1440, 1445, 43 USPQ2d 1837, 1841 (Fed. Cir. 1997).

The district court also relied on a statement made during prosecution as an admission by Rambus that a "transaction request" includes "identification information." At the time of this statement, however, pending claim 186 (issued claim 1 of the '918 patent) referred to "a transaction request including identification information." The examiner amended the claim by inserting the word "packet" after each occurrence of "request" in pending claim 186, which in fact clarifies that identification information is part of a request packet, not a "transaction request." Notably, the examiner did not make such amendments to pending claims 200 and 208, which recited "identification information and a read request." See also '804 patent, col. 26, ll. 4-5.

Finally, this court perceives no justification for including multiplexing as a part of the meaning of "read request." Multiplexing, if necessitated by the claims, is applicable to the construction of the term "bus," not "read request." The claims do not support reading multiplexing into "read request."

From the correct perspective of one of skill in the art at the time of invention, the term "read request" means a series of bits used to request a read of data from a memory device where the request identifies what type of read to perform. The terms "write request" and "transaction request" mean, respectively, a series of bits used to request a write of data to a memory device and a series of bits used to request performance of a transaction with a memory device.

5. "request for access to the metadata"

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>FotoMedia's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;a request for access to the metadata&quot;</td>
<td>a request to, for example, view, add, edit, modify, read, write, etc., metadata, wherein the request may be made independently, or in conjunction with any other request elements</td>
<td>a request to access one or more metadata apart from a request for the image</td>
</tr>
</tbody>
</table>

The parties dispute whether a request for metadata may accompany a request for any other type of information, i.e. whether "combined" requests are within the scope of this term. According to the defendants, claim differentiation requires that "a request for access to the metadata" is limited to requests for metadata, not anything else. The defendants contend that the applicants clearly differentiated requests that seek only metadata from requests that seek both metadata and the image. See '231 patent, Cls. 25, 33. Therefore, defendants argue, only the later claims, namely 25 and 33, should be entitled to the scope of the "combined" requests. In addition, the defendants point to dependent claim 3, which adds the additional limitations "allowing the user to read, write, or modify the metadata." According to the defendants, Fotomedia's proposed construction, including read, write, and modify in the independent claim term, would render claim 3 meaningless.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 The defendants also contend that the patentee highlighted this ability during his deposition. The Court agrees with Fotomedia that inventor testimony is irrelevant here.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
Fotomedia points to the specification for support that a request for access to metadata may be made in conjunction with any other request: "After the metadata elements in the image file has [sic] been populated with data and stored on a server or other device, users may make requests from the server to access the image and its metadata." '231 patent col. 3, l. 65 - col. 4, l. 2. Furthermore, Fotomedia argues, claims 3, 24, and 33 have other differences in scope than the one highlighted by the defendants.

The Court finds the doctrine of claim differentiation applicable here. The patentee knew how to refer to a request for access to both metadata and the image. The Court cannot now interpret both of these claim terms to mean the same thing.

"A request for access to the metadata" is "a request to access one or more metadata elements apart from a request for the image."

6. Request(s)/private branch exchange service requests

Several of the claims of the '864 patent recite the terms "request(s)" and "private branch exchange service requests."

Foundry contends that only the term "request(s)" needs to be construed because the parties agree on the meaning of "private branch exchange services." Thus, Foundry submits that "request(s)" should be construed in accordance with its ordinary meaning. Lucent argues that both "request(s)" and "private branch exchange service requests" should be construed to mean "control signals requesting the initiation of private branch exchange services."

After considering the language of the claims, the court concludes that Foundry is correct. Lucent's proposed construction of "request(s)" does not make sense in the context of all the claims in which the term appears. For instance, claim 53 recites "a request sent through said first network by providing telecommunication services that correspond to said request." Further, claim 70 recites "providing telecommunication services in response to a request . . ." As will be discussed below, "telecommunication services" are not limited to "private branch exchange services." Thus, in the context of these claims, Lucent's definition would improperly limit the claims. The court therefore construes "request(s)" consistent with its ordinary meaning - "a command, generated by a requester, to initiate an action on a responder." See IEEE Standard Dictionary of Electrical and Electronics Terms (6th ed. 1997). Accordingly, the court construes "private branch exchange service requests" to mean "a command, generated by a requester, to initiate private branch exchange services."

3699

C. "Read Request," "Write Request," and "Transaction Request"

The next three disputed terms are closely related, and, as the parties agree, it is appropriate to accord joint consideration. The purpose of memory devices (i.e., a DRAM) is to store data for later use. To this end, when a controller (or master) accesses the memory device to either store or retrieve data, it must send that device an instruction indicating what type of transaction is to be performed. At the most basic level, a read request is an instruction to the memory device to read data from the memory cells; a write request instructs the memory device to write data to the memory cells; and a transaction request instructs the memory device to perform some function, which could include reading or writing data. The controversy surrounding these terms involves whether these requests must contain not only the instruction of what action to perform (found in an "AccessType" field), but also must include address information indicating where in the memory cells the data should be read or written. Rambus contends that read, write and transaction requests contain only the instruction of what action to perform. For example, it proposes that read request be defined as "an instruction to read data from specified memory cell(s) of the memory. This instruction is specified by a binary code 30 provided to the memory device during a single clock cycle and received by the memory device in response to a clock transition."

Footnotes

30 Binary code, a term not in dispute here, is "a code that makes use of members of an alphabet containing exactly two
Infineon, on the other hand, argues that such requests must contain both the instruction of what kind of action to perform and address information indicating where that action is to occur on the memory device. Address information, containing both row and column identifiers, tells the memory device where the desired data is located (or to be located) within the plurality of the memory cells. In Infineon's construction, a "read request" means 'a series of bits transmitted over the bus that contain multiplexed address and control information needed to request a read of data from a memory device.' In addition to objecting to the failure of Rambus' definition to include address information, Infineon disagrees with the limitations inherent in Rambus' definition, specifically the requirements that the request be a "binary code," that it can be no longer than "a single clock cycle" of information, and that it must be "received in response to a clock transition." In its view, these limitations are not required by the intrinsic evidence, and in some cases are actually inconsistent with the embodiments disclosed in the specification.

1. The Claim Language

Both parties agree that the terms "read request," "write request," and "transaction requests" are not terms of art and were used for the first time in the 1990 '898 application. Therefore, there is no ordinary and accustomed meaning for these terms. Some information, however, can be gleaned from the language of the claims. 31

31 The term "read request" occurs in claims 1, 6, 8, 13, 18, 19 24, 29, and 34 of the '918 patent; claims 1, 2, 6, 14, 15, 16, 18, and 29 of the '214 patent; claims 1, 2, 14, 24, 15, 27, and 30 of the '263 patent; and claim 26 of the '804 patent.

The term "write request" occurs in claims 2 and 20 of the '918 patent.

The term "transaction request" occurs in claims 18 and 25 of the '263 patent.

Infineon uses the language of claim 1 of the '918 patent, claim 1 of the '214 patent, claim 1 of the '263 patent and claim 26 of the '804 patent to demonstrate that all claims require that a device respond to 'read request':

1. A method of controlling a synchronous memory device, wherein the memory device includes a plurality of memory cells, the method of controlling the memory device comprises:

   providing first block size information to the memory device, wherein the first block size information defines a first amount of data to be output by the memory device onto a bus in response to a read request . . .

'918 patent, claim 1 (emphasis added).

1. A method of operating a synchronous memory device, wherein the memory device includes a plurality of memory cells, the method comprising:

   providing first block size information to the memory device, wherein the first block size information defines a first amount of data to be output onto a bus in response to a read request . . .

'214 patent, claim 1 (emphasis added).

1. A synchronous semiconductor memory device having at least one memory section which includes a plurality of memory cells, the memory device comprises:
a programmable register to store a value which is representative of a delay time after which the memory device responds to a read request.

'263 patent, claim 1 (emphasis added).

26. An integrated circuit device having at least one memory section which includes a plurality of memory cells, wherein the integrated circuit device outputs data on an external bus synchronously with respect to first and second external clock signals, the integrated circuit device comprises:

a first internal register to store a value which is representative of a number of clock cycles to transpire before the integrated circuit device responds to a read request. . .

'804 patent, claim 26 (emphasis added).

The claims clearly so provide. Indeed, all but two of the disputed claims containing these terms 32 explicitly state that information is supplied "in response to" a read request, a write request or other transaction request. It is, of course, true, as Infineon contends, that, in order to "respond" to a request (i.e. outputting or inputting data), the desired response can only occur if the selected device is given the information necessary to generate that response. Because one of ordinary skill in the art would understand that both address and control information are required for the memory device to respond to a request, that request must contain more than just the binary code or "AccessType" suggested by Rambus.

Given the nature of the information and the way the invention works, it seems self-evident from the claim language that a request is, as Infineon posits, a series of bits transmitted over the bus containing address and control information. This conclusion is further buttressed by the explanations of Mr. McAlexander. See Markman Hearing, Tr. pg. 417, ll. 18-25 ("certainly the read has to have some control. It tells you what kind of transaction is being requested. If the memory is to respond to that, it must know where to respond from, what address"). Thus, the claim language, although not dispositive, strongly supports the view of read, write and transaction request taken by Infineon.

32 Indeed, of those claims mentioning read request, write request and transaction request, only claims 14 and 29 of the '214 patent do not explicitly mention that the memory device is to respond to the read request and even those mention a read request in such a way as to indicate that the term means there what it means elsewhere (Claim 14 "before executing another read request"); (Claim 29 "after executing another read request.")

2. The Specification

Although not discussed as extensively as other terms, such as "bus," the terms here at issue are the subject of explication in the specification. For example, in the "Comparison With Prior Art" section, the inventors explain:

"Yet another object of this invention is to provide a method for transferring address, data and control information over a relatively narrow bus and to provide a method of bus arbitration when multiple devices seek to use the bus simultaneously."

'918 Patent, col. 3, ll. 35-39 (emphasis added). This statement of object remarks the key role of address, data and control information. And, as explained in the cited text, and above in construing the term "bus," the significance of the invention of the system is to accomplish quickly the commands necessary to initiate a request and secure a response.

Then, in the ensuing "Summary of Invention" discussion, the inventors say that "in this system of the invention, DRAMs and other devices receive address and control information over the bus and transmit or receive requested data over the same bus." '918 Patent, col. 4, ll. 9-11 (emphasis added). Though not explicitly mentioning a "request," this quote lends credence to the basic notion that a memory device should receive both address and control information in order to be able to transmit or receive data.
Then, shortly thereafter, in describing a preferred implementation of the invention, the specification explains how a bus transaction is initiated "by sending a request packet (a sequence of bytes comprising address and control information)." '918 Patent, col. 6, ll. 60-63. This, too, teaches that a request (be it a read request, write request, or transaction request) includes the address and control information necessary to accomplish the request. 33

--- Footnotes ---

33 Again, this conclusion is supported by the expert testimony of Infineon's Mr. McAlexander. See Trans. pg. 417, lines 20-22 ("I found the control and address information were required in every instance that it was addressed in the specification").

--- End Footnotes ---

Having established that the specification contemplates both address and control information are needed for a response, it is necessary to ascertain whether a read request should contain both categories of information. The definition which Rambus presses proposes that a transaction request would consist only of the "AccessType" found in the top row 34 of Figure 4, the preferred embodiment.

--- Footnotes ---

34 As shown in Figure 4, the rows represent time or clock cycles.

--- End Footnotes ---

[SEE FIG.4 IN ORIGINAL]

In the preferred embodiment, the AccessType instruction, which contains the control information specifying the type of request, would be a binary code 4-bits wide. The specification explains:

The AccessType field[sic: field] specifies whether the requested operation is a read or write . . . . In a preferred implementation, AccessType[0] is a Read/Write switch: if it is a 1, then the operation calls for a read from the slave (the slave to read the requested memory block and drive the memory contents onto the bus); if it is a 0, the operation calls for a write into the slave (the slave to read data from the bus and write it to memory).

'918 patent, col. 9, ll. 47-56. Rambus would limit the terms "read request," "write request" and transaction request" to only this AccessType field. In contrast, according to Infineon's interpretation, the requests must contain both the AccessType control information and the address information indicated on the remaining rows of Figure 4. To support its definition, Infineon points to the following passage from the specification:

In a preferred implementation of the invention, to initiate a bus transfer over the bus, a master sends out a request packet, a contiguous series of bytes containing address and control information . . . .

The device-selection function is handled using the bus data lines. AddrValid is driven, which instructs all slaves to decode the request packet address, determine whether they contain the requested address, and if they do, provide the data back to the master (in the case of a read request) or accept data from the master (in the case of a write request) in a data block transfer.

'918 patent, col. 8 l. 66 through col. 9, l. 4. The specification also explains that "in some cases, a slave [memory device] may not be able to respond correctly to a request, e.g. for a read or write. In that situation, the slave should return an error message . . . or a retry message." '918 patent, col. 12, ll. 4-8. These references and others 35 illustrate that the memory should respond to the request. In order to respond, the memory device also must be given address information specifying where the data is to be read or written.

--- Footnotes ---

35 See e.g. '918 patent, col. 8, ll. 48-49 ("a slave should preferable respond to a request in a specified time"); '918 patent,
col. 8, ll. 24-29 ("AddrValid is used to indicate when the bus is holding a valid address request, and instructs a slave to decode the bus data as an address and, if the address is included on that slave, to handle the pending request."

Additionally, though one must understand the technology to comprehend the import of the statement, the specification actually states that address rows are to be accessed during a request. The patent explains that the DRAM sense amps should be pre-charged and "this precharging allows access to a row in the RAM to begin as soon as the access request for either inputs (writes) or outputs (reads) is received and allows the column sense amps to sense data quickly." '918 Patent, col. 10, ll. 21-24 (emphasis added). Because one skilled in the art would recognize that "row" refers to a particular location on the plurality of memory cells, it follows that address information must be conveyed in order to access that row. That address information is contained in "the access request for either inputs (writes) or outputs (reads)."

Rambus' definition would only indicate what type of operation to take place. See Markman Hearing, Tr. pg. 122, ll. 11-13 (testimony of Dr. Huber) ("We don't need the rest of the information [address information] to know that it's a read request"). The specification and the claims, however, clearly demonstrate the memory devices are not only to recognize the requested operation, but also respond to the request. Even Dr. Huber admitted that address information must be received for there to be a response. Dr. Huber took the view that this information could be conveyed at some other unspecified time. See Markman Hearing, Tr. pg. 141, ll. 20-22 (testimony of Dr. Huber). That approach is untenable because nowhere in the specification is it mentioned that address information should be sent at any other time than contemporaneous with the request.

Nor does the specification support the other foundational components of the narrow view of these terms expressed by Rambus.

The construction urged by Rambus essentially attempts to equate the term "read request" with "AccessType," as shown in Figure 4, as the predicate for its requirement that "a read request" must be a binary code, occur in a single clock cycle, and be in response to a clock transition. The specification offers no warrant for such a limited construction, and, as Infineon points out, Rambus here is attempting artificially to limit the invention to the preferred embodiment of Figure 4, which describes a bus transaction that uses the preferred implementation of a 9-bit wide external bus. See '918 patent, col. 9, ll. 26-27 ("Each request packet uses all nine bits of the multiplexed data/address lines"). Because Figure 4 indicates that the AccessType is only 4-bits wide, it is possible for Rambus' proposed definition to occur in a single clock cycle. However, this requirement stems solely from Rambus' view that AccessType is a request. If a request contains both control and address information, then this would not be true. See Markman Hearing, Tr. pg. 431, ll. 8-12 (testimony of McAlexander) ("There is a specific control set of bits called the access type that does occur as a set of bits in a particular single cycle as shown in a preferred embodiment, but all that does is establish the type.") Similarly, there is nothing in the specification to support Rambus' requirement that the transaction request be received by the memory device in response to a clock transition. See Markman Hearing, Tr. pg. 432, ll. 2-9 (testimony of McAlexander) (indicating that nothing in the specification supports this requirement).

Rambus contends that Infineon's construction incorrectly equates "read request" (or "write request" or "transaction request") with a request packet, arguing instead that a read request is actually a component of a request packet. For example, the specification states that "FIG. 4 shows the format of a request packet." '918 patent, col. 4, l. 66. It also explains that, in a preferred implementation, "a master sends out a request packet, a contiguous series of bytes containing address and control information." '918 patent, col. 8, ll. 60-63. The criticism is superficially appealing; however, the confusion results in large part from the fact that the specification uses the term "request" and "request packet" interchangeably. For example, the inventors explain, "FIG. 5 illustrates the format of a retry message 28 which is useful for read requests, . . . All DRAMs and masters can easily recognize such packet as an invalid request packet, and therefore a retry message." '918 patent, col. 12, ll. 33-39. See also '918 patent, col. 12, ll. 49-52 ("The master sends request packets and keeps track of periods when the bus will be busy in response to that packet. The master can schedule multiple requests so that the corresponding data block transfers do not overlap."); '918 patent, col. 12, ll. 58-61 ("Situations will arise, however, where two or more masters send a request packet at or about the same time and the multiple requests must be detected. . . .) That drafting lapse is unfortunate, but it certainly is not dispositive because that text too must be interpreted in perspective of the whole specification.

Considering the claim language and the specification in its entirety and for the reasons explained above, the construction
offered by Infineon is better supported by the patent document. Although that construction results in some overlap in the meanings of request and request packet, that overlap is inherent in the patent specification itself. Indeed, the most significant passage of the specification discussing read requests and write requests indicates that such a request is related to (if not synonymous with) a request packet: "AddrValid is driven, which instructs all slaves to decode the packet address determine whether they contain the requested address, and if they do, provide the data back to the master (in the case of read request) or accept data from the master (in the case of a write request) in a data block transfer." '918 Patent, col. 8, l. 66 through col. 9, l. 4 (emphasis added).

3. The File History

Those constructions derived from the claim language and specification are supported by the fact that, in the prosecution of the '804 patent, Rambus made statements to the PTO relating to the term "transaction request." In February 1999, Rambus submitted a Preliminary Amendment in U.S. Patent App. 08/798,525 (issued as the '804 patent) in which it admitted that transaction requests are not simply a single clock-cycle access-time code. In response to a rejection by the Patent Examiner, Rambus stated that a "transaction request" contains identification information:

When the identification information contained in the transaction request corresponds to the identification value stored in the internal register in a particular memory device on the module, that memory device executes the transaction request. Memory devices on the module having identification values which do not correspond to the identification information contained in the transaction request do not execute or respond to the request.

Supplemental Preliminary Amendment, U.S. Patent App. 08/798,525, p. 12 (emphasis added). Thus, Rambus explicitly represented that a transaction request contains more than just a binary code in the AccessType field: the above passage shows that device identification information also is contained in the transaction request. While this representation does not necessarily imply that Infineon's definition is unquestionably correct, it certainly undermines the construction now urged by Rambus.

4. Claim Differentiation

Claim 15 of the '214 patent refers to a "read request" without further limitation, while dependent claim 22 recites: "The method of claim 15 wherein the first block size information and the first read request are contained in a request packet." Rambus argues that this language distinguishes a "read request" from a "request packet." As stated previously, the specification sometimes uses the terms "request" and a "request packet" interchangeably. Notwithstanding that drafting laxity, the differences in claim 15 and 22 do not refute the notion that a request contains address and control information. These claims simply add a third type of information, block size information, as a component of a request packet.

Given that the claim language clearly illustrates that a memory device is to respond to a read, write or transaction request and that Rambus has not explained how the device would respond without receiving address, data and control information, the claim language on its face supports the requirement that requests contain both address and control information. The specification, while not pellucid, also indicates that a request must contain such information so that it can respond to the request, whether the request be packetized or not. Rambus' narrow definition is not supported by the specification, and indeed, is refuted by the file history. Therefore, it is appropriate to conclude that "read request," "write request," and "transaction request" contain both address and control information indicating what type of transaction to perform and where the data should be located on the memory device.

5. Construction

For the foregoing reasons, the term "read request" is construed to mean "a series of bits transmitted over the bus that contain multiplexed address and control information needed to request a read of data from a memory device." The term "write request" is construed to mean "a series of bits transmitted over the bus that contain multiplexed address and control information needed to request a write of data to a memory device." The term "transaction request" is construed to mean "a series of bits transmitted over the bus that contain multiplexed address and control information needed to perform a transaction over the bus with a memory device."

GO BACK
2. "request for payment instructions"

The differences between the parties' proposed claim interpretations are as follows:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Emergis's Construction</th>
<th>Cable One's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;request&quot;</td>
<td>solicitation of an</td>
<td>a request of the customer to pay</td>
</tr>
<tr>
<td>for payment</td>
<td>opportunity to make</td>
<td>an invoice from one of multiple</td>
</tr>
<tr>
<td>instructions&quot;</td>
<td>payment toward an</td>
<td>customer payment accounts</td>
</tr>
<tr>
<td></td>
<td>outstanding balance</td>
<td></td>
</tr>
</tbody>
</table>

Emergis contends that the specification supports its construction. The specification describes "to request payment instructions" as follows: "[t]his request provides the customer the opportunity to select either the bank account from which the invoice will be paid, or it provides the customer with the option to pay via a debit card, credit card, ATM, stored value card or some source of funds." n40 Further, when the invoicer "requests payment instructions," the customer has the opportunity to do a number of things besides simply choosing among multiple customer accounts, as Cable One proposes. The customer has the opportunity to modify pre-arranged payment instructions by changing the amount to pay, the date for payment, and the source of funds for the payment. n41 Thus, because the language in the specification supports Emergis's construction, the Court will construe the phrase, "request payment instructions" as a "solicitation of an opportunity to make payment toward an outstanding balance."

n40 (4:35-39.)
n41 (7:61-66.)

--- End Footnotes ---

E. Request for Quotations: The claims of the '328 patent refer to a "request for quotation" and/or a "quotation." Noting that neither term is expressly defined in the specification, defendants assert that they are commonly used terms in the field of purchasing and procurement and that "[t]he well-understood ordinary meaning of the term 'quotation' is 'the quoting of current prices and bids for securities and goods; the prices or bids cited.' AMERICAN HERITAGE COLLEGE DICTIONARY 1124 (3d ed. 2000), or 'the naming . . . of current prices . . . of securities or commodities' WEBSTER'S THIRD NEW INT'L DICTIONARY 1868 (2002). Accordingly, a 'request for quotation' may be defined as simply 'a request for the current price of something.' (Defs' Opening Br., at p. 9).

The specification and the file history clearly demonstrate that the use of "quotation" and "request for quotation" is not confined to the narrow dictionary meaning that Defendants seek to impose. For example Figure 2A of the '328 patent refers to "The Price Quotation System" but elaborates with the statement "[t]he system provides a list of options, one of which is 'Do you want to request a price quotation? The buyer selects this option.' (emphasis added). A price quotation was not the only option. When the buyer decides on the item or items in which he is interested, "[t]he Buyer submits the request by selecting an option on the internet site request form" (emphasis added). In due course "[each selected vendor responds to the request(s) by providing its pricing and other information to the quotation system." (emphasis added). This concept is reflected in the description of the invention: " . . . the quotation system would interrogate [sic] the vendor's product database (using suitable software which links or cross references the vendor's inventory to the quotation system product and services lists) and retrieve pricing and other information necessary to respond to the RFQ". (Col. 5, ll. 43-48) (emphasis added). The February 16, 1996 Office Action Response at p. 5 includes the statement that "[t]he quote may include such items as delivery terms, price, etc., none of which are stored in the central database."
In addition figures 7 and 8 of the '326 patent and the implications of claim 12 demonstrate the "quotation" and "request for quotation" include contract terms other than price. Rather, as SST contends, a request for a quote is a request for the price and other terms of a particular transaction "in sufficient detail to constitute an offer capable of acceptance."

**3702**

(2) The words "request for specified content data" in the term "in response to identifying a request for specified content data and a user identifier; (a)...(e)...) do not require construction. The language is unambiguous within the context of the claim. Dow, however, seeks three limitations upon the word "request." First, Dow proposes adding the phrase "wherein the request was transmitted by a browsing device." This addition is unnecessary, because it is redundant with language earlier in the claim ("identifying requests from browsing devices").

Second, Dow proposes that the request include "a format identifier that is separate and distinct from the user identifier." Although claim 1 is unclear on this point - it states only that a format identifier can be "received" and does not indicate whether it must be received with the request or can come from another source - dependent claims 2, 10, and 16 offer clarity. Those claims state that "said format identifier" is "received with said request." If a request, by definition, already includes a format identifier, the language in claims 2, 10, and 16 would be redundant. See Phillips, 415 F.3d at 1314 (finding that the term "steel baffles"...strongly implies that the term 'baffles' does not inherently mean objects made of steel."). Moreover, under the doctrine of claim differentiation, the limitations in claims 2, 10, and 16 that the format identifier is received with the request implies that the same limitation should not be read into claim 1. 4 Phillips, 415 F.3d at 1315 ("[T]he presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation is not present in the independent claim.").

--- Footnotes ---

4 Dow Jones contends that the doctrine of claim differentiation is not relevant, because claim 2 adds an additional requirement that "viewable data is served to a browser" and thus is not rendered "superfluous." Anderson Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1369 (Fed. Cir. 2007). Dow Jones does not extend that argument to claims 10 and 16, however.

--- End Footnotes ---

Claim differentiation is only a guide, Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2007), and "cannot be used to broaden claims beyond their correct scope, determined in light of the specification and prosecution history." Multiform Desiccants, Inc. v. Medzam Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998). Yet neither the specification nor the prosecution history supports Dow's limiting construction. Although the specification teaches that, in the preferred embodiment, a request "will include" a format identifier, '737 Patent, Col. 14, 11. 3-7, mere inclusion of a feature in the preferred embodiment does not disavow claim scope absent "words or expressions of manifest exclusion" or "explicit disclaimers." Gillette Co., 405 F.3d at 1374 (Fed. Cir. 2005)(citing Houser Pharmas., Inc., 366 F.3d at 1352). The specification for the '737 patent does not demonstrate "a clear intention to limit the claim scope" in the manner that Dow Jones suggests, and indeed contemplates that the format identifier could come from at least one other possible source: a user database. '737 Patent, Col. 15, ll. 31-34 and Col. 16, ll. 8-14.

The prosecution history offers no additional guidance. Dow points to a section of the history in which the applicants distinguished their invention from prior art that did not "teach[] serving the same text/graphic content in different viewable page formats -- depending upon receiving requests incorporating respectively different format identifiers." Decl. of Brian Rosenbloom, Ex. M, Amendment, Dec. 16, 2003, at 13. When that section is read within the context of the entire file history, however, it is clear that the distinction the applicants were making between their invention and the prior art centered on the definition of "format," rather than "request." As with the specification, there is no "clear and unambiguous disavowal" of the claim scope in the prosecution history. Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1124 (Fed. Cir. 2004).

Dow's third proposed limitation is that "request" means something other than "a request for a predetermined file" or "a request to retrieve and execute a specified file." As Dow points out, the specification discloses that the prior art included...
retrieving and executing a specified file, specifically a CGI.bin program, in response to identifying a request. '737 Patent, Col. 8, 11. 19-44. Dow contends that this section of the specification "makes clear that the invention does not include a particular feature," and so should be "deemed to be outside the reach of the claims." Honeywell Intern., Inc. v. ITT Industries, Inc., 452 F.3d 1312, 1319 (Fed. Cir. 2006). That contention is rejected. The specification merely distinguishes the prior art from the applicants' invention. The specification does not criticize CGI.bin programs or claim that they would not work in conjunction with the present invention. The applicants did not "disparage" requests to retrieve and execute a specified file.

3. "Request interface [that] receives requests for video programs made over the telephone network."

Technical Background - "Interface"

One of ordinary skill in the art would know that in general terms, the common meaning of "interface" in the field of computer science is a boundary through which information passes. It could be a physical connection between two pieces of hardware, such as a USB port. It could also denote the software that allows information to be transferred from one program to another. An example of this would be the printer driver that allows a printer to begin printing in response to a print command entered on a personal computer. See discussion in Tr. at pp. 73-79.

In the context of the patent-in-suit the incoming interface allows signals from the switched telephone network to be received by the central data facility and converted into the language used by the central processing unit ("CPU"). The distribution interface allows signals from the central data facility to be converted to go out as electronic signals on the telephone network. Tr. at p. 68, l. 6- p. 69, l. 25.

Request Interface

For the definition of this term, Time Warner suggests "a device (distinct from the distribution interface) that receives call-in user requests sent over the switched telephone network, including requests for video programs, from users who are located somewhere other than the remote receiving locations."

USVO proposes "Hardware and/or software that receives data representing a request for a video program, the request being made over a switched telephone network." The parties dispute a number of points, including whether the interface can be software, whether the request interface is distinct from the distribution interface, and whether the requesting party can be located somewhere other than the remote receiving location.

Claim 1 recites a "request interface" that is connected to the central data facility and the telephone network, which receives video programs that are made over the telephone network and communicated to the central data facility. '792 Patent, col. 7, ll. 45-49. Time Warner argues that the request interface must be a hardware device, rather than a software interface, and points to the language in Claim 1 (the request interface is "connected to said data facility and to the telephone network"[emphasis added]) as well as Figure 2 (which they claim depicts the request interface as a physical hardware device) to support their position. USVO, on the other hand, argues that "interface" is commonly understood in the art and the scientific community as encompassing software as well as hardware, and that there is nothing in the claims, specification, or prosecution history to indicate that any other construction was intended.

As discussed above, the common meaning of the term "interface" encompasses both hardware and software connections. For example, the Microsoft Press Computer Dictionary defines "interface" as "[t]he point at which a connection is made between two elements so that they can work with one another," which can be hardware or software. MICROSOFT PRESS COMPUTER DICTIONARY A-421 (1991); see also IEEE STANDARD DICTIONARY OF ELECTRICAL AND ELECTRONIC TERMS 540-41 (6th Ed. 1996)(defining "interface" as a "shared boundary," which can be "[a] hardware of software component that connects two or more components for the purpose of passing information from one to the other.").

At the hearing, Time Warner argued that the use of the terms "connection" or "through" in the claims and specification to refer to the passing of information through the interface implies that the interface must be hardware. The court finds it hard to imagine what alternate phrases the patentees could have used that would have denoted both. Moreover, the definitions
cited above demonstrate that "connection" has meaning in the context of a software interface. Finally, the argument over "hardware only" and "software only" is, to a large extent, a distinction without a difference. Except for a few special purpose devices, such as a music box, hardware without software is a collection of metal and plastic. Software without hardware to run it is just a program on a disc sitting in a package. See Tr. at p. 80, ll. 11-13; p. 105, l. 21 - p. 106, l. 18.

The parties also dispute whether the individual requesting the video can be located somewhere other than the remote receiving location. At the hearing, Time Warner took the position that every embodiment of the invention must allow for remote requests. Tr. at p. 86, ll. 7-15. In their brief, Time Warner cites several portions of the specification which refer to the requests for video programs being called in using an ordinary telephone, rather than a remote receiving unit to support their theory. '792 Patent, col. 2, ll. 61-69; col. 6, ll. 19-30; Figure 1. USVO argues that while a remote request is envisioned by the invention, every embodiment does not have to allow for it and that Time Warner's construction improperly imports limitations from the specification into the claims.

Defendants' position is that they do not import limitations from the specification into the claims because the applicants disclaimed their construction during prosecution by distinguishing the claims over the prior art. For example, the applicants stated that Claim 1 "allow[s] a user to request a program from anywhere other than the receiving unit," and that it gives users "the convenience of being able to order a program from anywhere." Amendment of 5/22/91, Def. Claim Const. Br., Ex. 1-A at 8-9 [Doc. # 152, pp. 9-10 of 12]. However, the language to which Time Warner points only suggests exactly what USVO stated at the hearing: some embodiments of the invention involve remote requests, but this is not required of every single embodiment. Disclaimer during prosecution must be "unequivocal" in order to "narrow[] the ordinary meaning of the claim congruent with the scope of the surrender." Chimie v. PPG Indus., Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005). While the applicants distinguished the prior art on the basis of their invention's additional feature of remote requests, there is no indication that they unequivocally disclaimed the possibility of their invention ever having an embodiment which did not allow for remote requesting.

Finally, Time Warner argues that the request interface is separate from the distribution interface, and that distinction should be part of the court's claim construction. Claim 1 clearly states that these two components must be present ("A system… comprising…a request interface… [and] a distribution interface…")., but not that they have to be distinct. '792 Patent, col. 7, ll. 40-50. They are depicted in Figure 2 as two separate components of the central data facility and described in the specification as performing different functions ("incoming requests for programs are connected to a request interface 28… [o]utgoing programs being transmitted to remote receiving units are routed through a distribution interface 30."). '792 Patent, col. 3, ll. 17-21. While Dr. Mirhan, Defendant's expert, opined that the two interfaces were distinct, he agreed that "you could certainly package various functionalities in different ways." Tr. at p. 72, ll. 18-19. The court will define the term as follows:

"Request interface" means "the connection that permits data to be conveyed from the telephone network to the central processor."

V. "request processor"

In the context of describing what the computer comprises, claim 5 contains the disputed term as follows:

[A] request processor coupled to the communications module, the virtual queue, and the information storage device, for determining a proposed reservation time for a received reservation request responsive to reservation information for previously-made reservations.

(col. 27, ll. 51-56) (emphasis added). The term appears in a similar manner in claims 17 and 18. (col. 31, ll. 1-5, 10-13.) Asserting that "request processor" does not connote any structure to one of ordinary skill in the art, the Defendants argue that the term must be construed as a means-plus-function limitation. However, once again the term "means" is missing from each of the claims and the Defendants have not presented any evidence to overcome the presumption that § 112, P 6 does not apply. That sufficient structure is recited is evidenced by the fact that the claims provide that the "request processor" is coupled to various other hardware contained in the attraction computer. Additionally, in the computer science field, a
"processor" is the part of a computer that does data processing. See The American Heritage Dictionary of the English Language (4th ed. 2000) (defining "processor" as "a. a computer; b. a central processing unit; c. a program that translates another program into a form acceptable by the computer being used."). This connotes some structure. In the context of the present invention, the adjectival phrase "request" gives the structure greater definition. It is not uncommon for devices to take their names from the functions they perform. Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996). Thus, to a person of ordinary skill in the art, "request processor" means part of the computer system that determines reservations based upon information received relevant to reservation requests.

The Plaintiff contends that "request processor" means "hardware and associated software application of computer system that receives requests and determines a proposed reservation position in the virtual queue." This is consistent with the ordinary meaning of "request processor" as set forth in the specification. For instance, the specification describes the "request processor" as follows:

Attraction computer 101 contains a request processor 209 for processing reservation requests received by communications module 211, using information from virtual queue 201, attraction information storage 213, and physical queue monitor 103. Request processor 209 is implemented as a software module running on CPU 120 in attraction computer 102. Request processor 209 operates as described below in connection with the state diagram shown in FIG. 6.

(col. 9, l. 63 to col. 10, l. 3) (emphases added). The Defendants agree that the request processor includes certain software to process reservation requests. Unlike the Plaintiff's more general construction, the Defendants contend that the software must perform in accordance with the algorithms described by Figure 7. However, the specification makes clear that Figure 7 represents how a request may be processed in one embodiment. (col. 22, ll. 23-27; see also col. 24, ll. 51-52 ("Other embodiments may be used in place of the method described by FIG. 7.").) Thus, the limitations set forth in Figure 7 and the corresponding description in the specification will not be read into the claim. The Court finds that the Plaintiff's construction is supported by the claims and the specification and construes "request processor" as "hardware and associated software application of computer system that receives requests and determines a proposed reservation position in the virtual queue."

7. Claims 1, 17 & 26 -- "Request Signal"

CIVIX contends that "request signal" means an electronic representation of one or more queries. Defendants, on the other hand, state that a "request signal" is a "single transmission from the port to the database sent over the communication link which identifies both a selected category and a selected geographic vicinity."

Both Claims 1 and 17 describe "the port generating the request signal in response to inputs by the user which are representative of the selected category and geographic vicinity." (525 Patent, Claims 1 & 17) (emphasis added). Thus, the "request signal" is the result of a user's selection of a category and a geographic vicinity. Each "request signal" must have, therefore, one or more inputs based on each a category and a vicinity. This is supported by other portions of the specification which emphasize that:

The system also provides for transmitting a portion of the information in the database to a user via the link upon receipt of a request signal representative of a selected category and geographic vicinity. . . . Specifically, the port generates the request signal in response to inputs by a user of the system; that signal being representative of the selected category and geographic vicinity.

(525 Patent, Col.2 lines 18-28) (emphasis added).

I conclude that "request signal" is a single electronic representation of a user's selection of at least one category and at least one geographic vicinity. Both categories of information must be in a single "request signal" in the '525 patent.
F. "Requested."

For the sixth and final term, Comcast argues that it should indicate that "requested data packets are the data packets that a subscriber has asked to be transmitted." Finisar contends that the term "requested" should mean "something asked for or sought" irrespective of what or who does the asking or seeking. The plain meaning of the term "requested" is simple enough. It means "asked for" or "sought." Within the context of the patent, however, the parties part company as to who or what makes the request.

--- Footnotes ---
6 The Texas Court construed the term "requested data packets" and not "requested" as addressed here. The term "requested data packets" was held to mean "data packets that are requested by subscribers or subscriber stations" (Melgar Decl. Exh. C at 2).

--- End Footnotes ---

The final two paragraphs of Claim 16 are instructive here. They recited (col. 21:60-68):

at each subscriber stations, storing filter data corresponding to a subset of said indices, said filter data specifying a set of requested data packets which comprises a subset of said transmitted data packets;

at each subscriber station, downloading into a memory storage device those of said received data packets which match said specified set of requested data packets.

From the claim, the filter specifies which packets are requested. The incoming data packets are matched up with the filter data, and the matching packets are downloaded to a storage device.

The use of the term in claim 22 provides further clarification. It recited (col. 22:37-47):

22. The information transmission method of claim 16, wherein said scheduling step includes reserving a portion of transmission bandwidth available for said transmitting step for transmitting portions of said information database requested by subscribers;

said method including receiving requests from subscribers, said requests each specifying a portion of said information database; and

said scheduling step including scheduling transmission of requested portions of said information database.

Claim 22 was drawn to processing requests for information not included in the tiered system, and thus not automatically scheduled for transmission. A portion of the bandwidth for the system can be reserved for such requests. Such requests are scheduled for delivery independent of the tiered system because they ask for data that is not assigned to any tier.

Claim 23 is instructive as well as it was drawn to information requests by subscriber stations. It recited (col. 22:48-65):

23. The information transmission method of claim 16, wherein one or more subsets of said subscriber stations are interconnected via a local area network including a network server;

said method including receiving at said network server said transmitted stream of data packets on behalf of an associated set of subscriber stations, storing data in said network server referencing a specified set of data packets requested by said associated set of subscriber stations, and downloading into a memory storage device associated with said network server those of said received data packets which match said specified set of requested data packets;

whereby overhead associated with receiving the stream of data packets and downloading for storage a specified subset
thereof is shared by a set of subscribers.

In this claim, a set of networked or linked subscriber stations, not the subscribers themselves, makes requests for data packets on behalf of the whole network. The data packets are then downloaded to community storage space. This indicates that in a broad, independent claim such as claim 16, the term "requested" should not be confined to packets explicitly requested by the subscriber.

The specification supports this view as well. A feature of the invention is its ability to generate "look-ahead requests" that anticipate information that the subscriber will want to view before they actually ask for it (col. 16:16-30). The subscriber station requests additional data packets related to that which the subscriber requested. The data packets are then downloaded into storage for quick access by the subscriber. Another feature is the ability to update the system’s software without action by the subscriber (col. 8:47-56). Neither of these features would be possible if no entity other than the subscriber were ever able to make requests.

This order construes the sixth and final term "requested" as programmed for retention in the subscriber's filter.

3707

B. Disputed Claim Term # 2: "a requested time"/"a viewer-requested time"

The second term in dispute is: 7

"a requested time" ('320 Patent, Claim 1)

"a viewer-requested time" ('078 Patent, Claim 10)

. Plaintiff's Proposed Construction: "the time a viewer asks to receive a program"

. Defendants' Proposed Construction: "a specific time of day chosen and scheduled by the viewer where at the time the choice is made the viewer can choose from among multiple available times of day"

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

7 As with the first term in dispute, the parties agree that this term, which is phrased differently in the two patents, has a single meaning.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Defendants argue that Plaintiff's proposed construction, "the time a viewer requests a program," oversimplifies the term by failing to distinguish between the two "times" at issue in the instant patents: (1) the time that a request is made, and (2) the time scheduled by the viewer for the transmission of the chosen program to begin. 8 The Court agrees. As explained by the specification, the instant patents differed from prior art that did "not allow the viewer to determine when the program is to be scheduled." '320 Patent, 2:42-43. Indeed, during the prosecution history of the patents, the applicants distinguished the present invention from prior art that scheduled transmission times (a) by the provider only (meaning that viewers could never schedule the time of the program), or (b) on-demand (meaning that programs are transmitted as soon as possible after the viewer requests the program, but viewers cannot schedule the program at a later, specific time). See '078 Patent, 5/21/90 Resp. to Office Action at 9-10 (noting the examiner's statement that none of the prior art "shows the system where the viewer has control over the time of showing of the selection as claimed by Applicants" and explaining that permitting viewers to control scheduling was a "distinguishing feature" of the '078 Patent). Because of the ambiguity engendered by "a time a viewer requests a program," which can be read in a way specifically disclaimed by the applicants (i.e., a viewer can "request" a time by ordering a program that arrives immediately, but cannot order a program to arrive in the future), the Court declines to adopt Plaintiff's proposed construction. 9

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
8 For example, a person using the system could, at 6:00 p.m., schedule a program for transmission at 8:00 p.m. Thus, Defendants explain, Plaintiff's proposed construction "the time a viewer asks to receive a program" is ambiguous as to which "time" it refers.

9 For the same reason, the Court rejects Plaintiff's argument that the term need not be construed. The prosecution history makes clear that the applicants gave the term a special meaning by distinguishing the patents from prior art. Because a "requested time" could be read in the same ambiguous manner as "a time a viewer requests a program," the Court rejects the argument that the claim is clear on its face.

However, Defendants' proposed construction "a specific time of day chosen and scheduled by the viewer where at the time the choice is made the viewer can choose from among multiple available times of day" is also misleading because the phrase "multiple available times of day" suggests that there is a predetermined number of times from which a viewer can select (e.g., in fifteen-minute increments, or every hour on the hour). Nothing in the specification or prosecution history would require such a limitation. 10 After the Markman hearing, Defendants proposed "a specific time of day chosen and scheduled by the viewer where at the time the choice is made the viewer can choose from any time of day." Defs.' Post-Hearing Resp. 1. The Court finds this construction consistent with the specification and prosecution history, as it clarifies that when the viewer selects the time, the viewer may request any time (including, for example, "right now").

10 Defendants state that they "are not trying to limit the construction [of this term] to any particular times or time increments, e.g., 8:00, 8:15, or 8:30." Defs.' Resp. 25 n.23. Nevertheless, the word "multiple" in this context is ambiguous in that it might suggest a finite number of choices (whether two, three, or even ten) when the system can, at least in theory, accommodate any requested time of day.

11 Plaintiff's response to Defendants' original proposal assumed that "multiple available times of day" would exclude "immediately." See, e.g., Pl.'s Reply 1 ("A viewer can request a program for immediate viewing and view it immediately. Defendants' construction reads this actuality out of the scope of the claims."). This potential ambiguity is remedied, however, by use of the word "any," as the revised construction clearly encompasses "immediately" as a possible viewing time.

CAT proposes that the term "requesting a response of approval or disapproval from the host data processor," as it appears in claims 1 and 20, be construed to mean "a request to verify that sufficient funds are available in the account/card for the proposed debit purchase transaction." (D.I. 44 at 27) SVS contends that the term does not require construction because it is self-explanatory and, thus, should be governed by plain meaning. (D.I. 47 at 31-32) I agree with SVS that the term is self-explanatory, but believe it will be helpful to the jury to state just what that plain meaning is.

CAT relies on dictionary definitions to construe the purportedly related term "requesting authorization of the debit purchase transaction from the host data processor," which appears in Claims 10 and 29, as meaning to "permit" a debit purchase transaction. (D.I. 44 at 27-28) (emphasis added) CAT then relies on claim differentiation to argue that the disputed term -- "requesting a response of approval or disapproval from the host data processor," which appears in claims 1 and 20 -- must be interpreted as something other than "to permit." (D.I. 44 at 28) (emphasis added) The other thing it must mean, CAT concludes, is "a request to verify that sufficient funds are available in the account/card for the proposed transaction." (Id.)

CAT's argument that "approve" really means "verify" is unpersuasive. CAT provides no citations to the intrinsic record in
support of its position. The plain meaning of the disputed term is clear when read in the context of the claims. Accordingly, I recommend the Court construe the term "requesting a response of approval or disapproval from the host data processor" according to its plain meaning, which is "requesting that the host data processor approve or disapprove a debit purchase transaction."

GO BACK

3709

IV. '645 patent

The '645 patent discloses a digital computer system that has devices called agents that are inter-connected by a system bus. The claimed system and corresponding method require one agent, the requesting agent, to request access to a memory stored on another agent, called the replying agent. The requested data is organized as a matrix of memory cells, having column and row coordinates. The "memory controller" of the replying agent processes the request from the requesting agent by asserting a plurality of memory address control signals, including at least one row address strobe ("RAS") signal and one column address strobe ("CAS") signal. This "page mode memory access" operates by the assertion of an entire row of data followed by the assertion and deassertion of multiplecolumn addresses. By the RAS signal accessing an entire row followed by the assertion and deassertion of particular column addresses, this page mode memory access differs from the conventional memory access, which separately accessed each memory cell by asserting its individual row address and column address. In the claimed invention, after the data is accessed, it is then transferred to the requesting agent over the system bus.

LGE alleged infringement of system claims 1-4 and 6 and method claims 12-15 and 17. The trial court granted summary judgment of noninfringement of all asserted claims, concluding that the RAS/CAS signals in defendants' devices did not travel over the system bus. However, the '645 patent claims do not contain a limitation requiring that the strobe signals travel over the system bus. Moreover, the specification does not suggest that the strobe signals must travel over the system bus. To the contrary, Figure 5 shows an embodiment of the invention in which the strobe signals travel only internally within the replying agent, not across the system bus.

In an attempt to impose this limitation on the claims, defendants rely on the prosecution history. While the prosecution history is relevant to claim construction, "it often lacks the clarity of the specification and thus is less useful for claim construction purposes." Phillips, 415 F.3d at 1317 (citations omitted). Here, defendants point to statements in the prosecution history that the prior art does not teach "a page mode type of access over a system bus from a requesting agent to a replying agent." While we agree that this and other statements in the prosecution history lack ideal clarity, we do not find that they rise to the level of disclaiming or limiting the scope of the express claim language. Therefore, the trial court erred in construing the '645 claims to require the RAS and CAS signals to travel over the system bus. In addition, there is a genuine issue of material fact as to whether the accused devices and methods utilize strobe signals. LGE's expert submitted an affidavit that the accused devices employ strobe signals, which precludes summary judgment.

In the alternative, defendants contend that LGE failed to present evidence of an "end of access signal." This signal, which is required by the claims, is generated by the requesting agent and received by a detecting means coupled to the memory address control signal asserting means. When the detection means receives this end of access signal, the operation is halted. Defendants contend that LGE failed to establish the existence of a genuine issue of material fact as to whether the accused devices contain this limitation. However, the trial court did not consider this argument, and we will not address this factual issue in the first instance. LGE also argues that the trial court's construction of the "requesting agent" claim limitation was in error. The court construed this term as "a device coupled to the system bus that requests access to a memory located on a replying agent." Claim Construction Order at 6-9. LGE contends that an industry standard, which was incorporated into the specification by reference, provides the proper claim construction of this term. '645 patent col. 3 ll. 51-56. n3 The incorporated standard explicitly defines the term "requesting agent" as "an agent that has entered into the arbitration function for bus access." Defendants contend, however, that the patentee did not act as its own lexicographer by incorporating this industry standard by reference. The trial court did not accept LGE's proposed construction, concluding that it was a preferred embodiment and did not limit the claimed invention. The difference in the two constructions is temporal: LGE's proposed construction defines an agent as a requesting agent only when it is engaged in arbitration for bus access, whereas the trial court's construction defines a requesting agent regardless of whether it is actively engaged in arbitration.
Although the method and apparatus of the invention will be described herein in the context of a Multibus II environment, it should be appreciated that the invention may be practiced in many digital computer systems having a bus for transferring data between at least two agents interconnected upon the bus.

The operating characteristics of the Multibus II are described in a document entitled "High Performance 32-Bit Bus Standard P1296" which was produced by the IEEE microprocessor standards committee P1296 working group, Jun. 20, 1986, draft 2.0, the disclosure of which is incorporated herein in its entirety.

'645 patent col. 3 ll. 45-56.

We have recognized that the "interpretation of descriptive statements in a patent's written description is a difficult task, as an inherent tension exists as to whether a statement is a clear lexicographic definition or a description of a preferred embodiment." E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 1369 (Fed. Cir. 2003). "Thus in determining whether a statement by a patentee was intended to be lexicographic, it is important to determine whether the statement was designed to define the claim term or to describe a preferred embodiment." Id. We agree with the trial court and defendants that the patentee did not act as its own lexicographer here. Instead, the industry standard was incorporated as a preferred embodiment. The specification makes this clear by explaining that "although the method and apparatus of the invention will be described herein in the context of a Multibus II environment, it should be appreciated that the invention may be practiced in many digital computer systems having a bus for transferring data between at least two agents interconnected upon the bus." '645 patent col. 3 ll. 45-49.

Chimie v. PPG Industries, Inc., 402 F.3d 1371 (Fed. Cir. 2005), does not compel a different result. In Chimie, we were confronted with the claim terms "dust-free and non-dusting." After concluding that these terms were relative and could only be understood by comparison with the prior art, we concluded that only one standard was disclosed in the specification for making such a comparison. We limited these claim terms to the disclosed standard. Here, however, there is no relative term that cannot be understood without reference to an industry standard.

But, this does not end our inquiry. The proper claim construction is "the ordinary and customary meaning . . . that the term would have to a person of ordinary skill in the art in question at the time of the invention, i.e., as of the effective filing date of the patent application." Phillips, 415 F.3d at 1313 (citations omitted). "When prior art that sheds light on the meaning of a term is cited by the patentee, it can have particular value as a guide to the proper construction of the term, because it may indicate not only the meaning of the term to persons skilled in the art, but also that the patentee intended to adopt that meaning." Arthur A. Collins, Inc. v. N. Telecom Ltd., 216 F.3d 1042, 1045 (Fed. Cir. 2000). Although we have concluded that the patentee did not expressly adopt the definition of "requesting agent" in the incorporated industry standard, that standard remains relevant in determining the meaning of the claim term to one of ordinary skill in the art at the time the patent application was filed, and it is treated as intrinsic evidence for claim construction purposes, see V-Formation, Inc. v. Benetton Group SpA, 401 F.3d 1307, 1311 (Fed. Cir. 2005) ("This court has established that 'prior art cited in a patent or cited in the prosecution history of the patent constitutes intrinsic evidence.'") (citations omitted).

Here, the trial court erred by failing to give proper weight to the incorporated industry standard; it failed to consider the standard as intrinsic evidence of the meaning to one of ordinary skill in the art as of the filing date. After considering the standard, in addition to the patent claims and specification, we conclude that LGE's proffered definition based on the standard is correct. Thus, we construe "requesting agent" as "an agent that has entered into the arbitration function for bus access." This construction is entirely consistent with the specification, which provides that "at one time in the operation of the system . . . the requesting agent 12 may be a replying agent, and that the replying agent 16 may at that time be a requesting agent." '645 patent col. 4 ll. 8-11. This language makes clear that the classification of an agent depends upon the function the agent is performing at any given time, i.e., whether it is engaged in arbitration at a given moment.
1. Requesting Agent

A "requesting agent" is an agent that has entered arbitration for bus access, where arbitration is the process by which agents attempt to gain exclusive access to the parallel system bus.

3. Required Data

Hyperion does not offer a proposed construction as it contends that such a construction is unnecessary if the Court adopts its construction for the phrase recited in Section 2. OutlookSoft's proposed construction for "required data" is "all data needed to create a spreadsheet." However, OutlookSoft's proposed construction is too broad. The correct construction for "required data" is "all data necessary to create a spreadsheet that is not contained in the cache."

Requirements

"Requirements," according to First Graphics, means "something that is needed." M.E.P. offers as its proposed construction of the word "the mandatory provisions of the selected standard indicated by the word 'shall.'" M.E.P. cites to National Fire Protection Association guidelines (NFPA 13) for support, but First Graphics properly notes that these guidelines are extrinsic evidence upon which the Court cannot rely unless the intrinsic evidence is ambiguous.

We derive the meaning of "requirements" from the term's ordinary meaning and the intrinsic evidence. A requirement is commonly defined as "something called for or demanded: a requisite or essential condition," Webster's Third New International Dictionary of the English Language (Unabridged) 1929 (1993), and we see nothing in the intrinsic evidence to indicate any deviation from this ordinary meaning. The software integrates layout plans ("generic dimensional requirements") with building standards ("requirement of at least one building standard from which distribution systems can be evaluated") and produces a finished layout plan that complies with the standard. In other words, the computer identifies the requirements of the plan and the standard and generates a layout that meets the requirements. The Court finds that "requirement" means something that is necessary.

5. Includes Relationship/Excludes Relationship/Removes Relationship/Requires Choice Relationship/Optional Relationship

The parties have grouped these terms together. The dispute is whether the "relationship" language requires a construction which imposes a "left-hand side" and "right-hand side" limitation to the terms. Trilogy contends that the term "includes relationship" means "a classification in which a second set of one or more elements is included when all members of a first set of one or more elements exist in a configuration." Selectica contends that the term "includes relationship" means "a relationship that causes the elements on the right-hand side of the relationship to be included in the configuration when all elements of the left-hand side of the relationship are already included."

In discussing the relationship terms, the patents state "[a] relationship relates a first set of parts with a second set of parts." 651 patent, col. 2, 11. 13-14. The patents also state:

Preferably, the part relationships are: included, excluded, removed, and requires choice. An included part is included
automatically. A part is excluded from the configuration when it inclusion would result in an invalid configuration. A part may be removed when another part is added. Thus, when a first part exists in the configuration and a second part is added, the first part is removed from the configuration. The requires choice relationship is used to allow a set of choices to be made from a group of parts.

'651 patent, col. 2, 11. 23-31. For essentially the reasons discussed previously, the court adopts the following constructions of these terms:

"includes relationship" means "a relationship that causes the elements on the right-hand side of the relationship to be included in the configuration when all elements of the left-hand side of the relationship are already included;"

"excludes relationship" means "a relationship that causes the elements of the right-hand side of the relationship to be excluded when all elements of the left-hand side are already included;"

"requires choice relationship" means "a relationship in which a number of elements must be chosen from a second set of elements on the right-hand side of the relationship when all elements of the left-hand side are already included;"

"removed relationship" means "a relationship that causes the elements of the right-hand side of the relationship to be removed when all elements of the left-hand side are already included;" and

"optional relationship" means "a relationship in which a number of elements may be chosen from a second set of elements on the right-hand side of the relationship when all elements of the left-hand side are already included."

Second, MercExchange challenges the district court's construction of the following claim limitation, which appears in claims 10 and 12:

Requiring a seller to establish a seller's account, the seller's account being based at least on the seller's identity and a financial instrument associated with the seller.

In its Markman order, the district court ruled that "a seller's account must be established based at least on the seller's identity and a financial instrument associated with the seller." MercExchange disagrees with the district court's construction on the ground that the comma between the words "account" and "the" in the claim makes the "identity" and "financial instrument" features optional. If the patentee had intended the two to be mandatory, MercExchange argues, the limitation would not have used a comma and would have read: "requiring the seller to establish a seller's account based at least on the seller's identity and a financial instrument associated with the seller."

MercExchange's textual argument is unconvincing. The claim states that a seller must establish "a seller's account," and then, after the comma, the word "seller's account" is used a second time and is directly preceded by the article "the." The use of the definite article indicates that the second use of the term "seller's account" refers to the term directly preceding the comma. We uphold the district court's construction.

E. "requiring assistance from a human operator"

The term "requiring assistance from a human operator" is found in claim 28: "classifying the electronic message as at least one of (i) being able to be responded to automatically; and (ii) requiring assistance from a human operator." The specification states the following:

The interpretation of the E-mail message 11 by the automatic message reader 30 includes classifying the E-mail message
means "a position or positions in the virtual queue for an attraction." Ordinary meaning of the term as well as the specification, particularly attraction. (See col. 12, ll. 51-52; col. 13, ll. 29-32.) Because the Plaintiff's construction is consistent with the term appearing in the specification, the court construes this term as "requiring that a manual reviewer review the electronic message or information derived from the electronic message, or review, revise or compose the response to be delivered to the source." Therefore, in the context of this invention, "reservation" refers to a time or position, secured in advance and recorded in the virtual queue, when the patron may be admitted to a particular attraction. (See col. 12, ll. 51-52; col. 13, ll. 29-32.) Because the Plaintiff's construction is consistent with the ordinary meaning of the term as well as the specification, the Court adopts the Plaintiff's construction. "Reservation" means "a position or positions in the virtual queue for an attraction."
D. "reservation request"

The Plaintiff proposes the following construction: "a signal that initiates the processing of a reservation." The Defendants appear to agree that a "reservation request" is a type of signal or message sent to request a reservation. However, they argue that the Plaintiff's construction is too broad because it does not specify what types of information must be included to identify the signal as associated with requesting a reservation and distinguish it from other transmitted messages. Thus, the Defendants propose the following more detailed construction of the term:

A data message including the following content: (a) an identifier of the message as a reservation request; (b) unique identifier designating the attraction to be reserved; (c) either (1) data designating a particular requested reservation time slot or (2) data representing a request for the next available time slot for the reservation; (d) request ID, which is a unique identification number for the particular request; and (e) a unique PCD ID.

The Plaintiff argues that the Defendants improperly import from the specification examples of data that may be included in a request message. "Reservation request" is not defined in the specification. But the specification does describe the components of a reservation request message, which mirror those proposed by the Defendants, i.e., PCD ID, reservation request identifier, request ID, attraction ID, and time. (col. 15, l. 56 to col. 16, l. 27.) However, that section merely describes one embodiment of the invention and makes clear that it is only preferable for the reservation request to include the specified information. (col. 15, ll. 48-56.) In fact, the inclusion of an identifier of the message as a request is expressly described by the specification as a preferred embodiment. (col. 15, l. 61 to col. 16, l. 4.) Moreover, the specification states that additional information and formatting may be included in the data structure of a reservation request. (col. 16, ll.28-38.) Because this portion of the specification merely describes a preferred embodiment, it cannot be used to limit the construction of the term. see Phillips, 415 F.3d at 1323.

The Defendants also argue that the construction requires a "unique identifier designating the attraction to be reserved." This is known in the specification as an Attraction ID. Construing "reservation request" as inherently including an Attraction ID would render superfluous other portions of the claims. Specifically, claim 5 refers to the PCD generating and the computer receiving a reservation request "specifying a selected one of the attractions" or "specifying the attraction associated with the computer." (col. 27, ll. 31-32, 38-39.) Because the Attraction ID is the mechanism by which the selected attraction is specified or identified, the "specifying" clause following reservation request would be redundant and unnecessary if the ordinary meaning of "reservation request" included this data. Accordingly, this limitation will not be read into the claim.

Although a number of the Defendants' proposed limitations cannot be read into the claim, the specification does support limiting the construction of "reservation request" to some extent. The specification states that "the [reservation] request may specify a particular time of day that the patron is interested in, or it may simply request the next available time for attending the attraction." (col.12, ll. 27-29.) Additionally, the Plaintiff acknowledges that in order to process a reservation, the signal must identify either the patron or the personal communication device associated with the patron. (Pl.'s Resp. to Defs.' Opening Claim Construction Brief at 17-18.) Therefore, the Court construes "reservation request" to mean "a data message that initiates the processing of a reservation that includes at least a patron or PCD identification."

The plaintiff proposes that "reservation request generator" means "a device or process that adds to a message a request for additional time slots" and that "reservation request processor" means "a device or process for receiving and processing requests for additional time slots from a reservation request generator." The defendants contend that the terms do not need construction. However, if the court decides that the terms require construction, the defendants propose that "reservation request generator" means "a device or process that sets reservation bits in a message to request additional time slots" and "reservation request processor" means "a device or process that can grant a request from a remote unit for more time slots in
order for the remote unit to transmit a longer message."

The defendants' proposals improperly limit the terms to preferred embodiments. The court adopts the plaintiff's proposed constructions for both terms.

6. "reservation request generator" and "reservation request processor"

The plaintiff proposes that "reservation request generator" means "a device or process that adds to a message a request for additional time slots" and that "reservation request processor" means "a device or process for receiving and processing requests for additional time slots from a reservation request generator." The defendants contend that the terms do not need construction. However, if the court decides that the terms require construction, the defendants propose that "reservation request generator" means "a device or process that sets reservation bits in a message to request additional time slots" and "reservation request processor" means "a device or process that can grant a request from a remote unit for more time slots in order for the remote unit to transmit a longer message."

The defendants' proposals improperly limit the terms to preferred embodiments. The court adopts the plaintiff's proposed constructions for both terms.

3720

"Transmission bandwidth." Used in two claim terms:

11a. "wherein a portion of the transmission bandwidth available to said transmitter is reserved for transmitting portions of said information database requested by subscribers." Used in claim 7.

11d. "wherein said scheduling step includes reserving a portion of transmission bandwidth available for said transmitting step for transmitting portions of said information database requested by subscribers." Used in claim 22.

The patent describes a system that divides available bandwidth into tiers and transmits information at different repetition rates depending on the demand for, or anticipated demand for, the information. Part of the bandwidth is reserved "for satisfying requests for access to information not provided with the basic subscriber service." See' 505 patent Abstract col. 3, 11. 5-10.

The only dispute between the parties is that DirecTV believes the reserved portion of the transmission bandwidth is to be used only to respond to direct requests from subscribers. Finisar argues that the reserved portion of the bandwidth may be used to provide information requested by subscribers on a general, or long term basis, as well as for responses to particular requests.

The language of this claim phrase is clear and straightforward -- part of the transmission bandwidth, or transmission capacity, available to the transmitter is reserved, or set aside, for transmitting portions of the information database that have been requested by subscribers. The parties appear to be focused on whether "requests" by a subscriber are "direct" requests or "general" or "long term" requests. The specification indicates that requested data may be included in the basic subscriber service. 505 patent, col. 5, 11. 45-65. The specification also indicates that subscriber-requested data is transmitted "in the portion of the . . . bandwidth that is not used for transmitting the regularly scheduled basic programming." 505 patent, col. 4, 11. 55-65. Hence, whether data is "requested" does not appear to depend on whether the request is "direct," "general," or "long term." Rather, requested data is simply data a subscriber has asked to have access to, without regard for whether the request is "direct," "special," "long term," or "general." There is no basis for limiting the use of transmission bandwidth which is "reserved," to direct responses to one time requests for information. Moreover, this claim phrase does not exclude also providing "requested" data using bandwidth that is not reserved. This term will be defined as follows:
"Transmission bandwidth" is "reserved" by setting aside part of the transmission capacity for transmitting portions of the information database that are requested by subscribers.

The thrust of Leviton's "reset lock-out" argument is that the district court improperly held that the function of the reset lock-out is to inhibit the reestablishment of electrical continuity unless the circuit interrupter is operational. Leviton points out that the reset lock-out can also inhibit the reestablishment of electrical continuity if there is an open neutral condition or if the circuit interrupting device is reverse wired. For example, the "reset lock-out" limitation in claim 1 of the '558 patent reads:

said circuit interrupting device further comprising a reset lockout portion that prevents reestablishing electrical continuity in said phase and neutral conductive paths if said circuit interrupting portion is non-operational, if an open neutral condition exists or if a reverse wiring condition exists[;]

'558 patent col.12 ll.20-25 (emphasis added). Thus, according to Leviton, electrical continuity can be reestablished in some embodiment seven if the circuit interrupter is non-operational.

We are not persuaded. Leviton's argument is essentially that the district court's construction requires "or" to be replaced with "and." However, the conditional statement in the excerpt above (i.e., "are set lockout portion that prevents reestablishing electrical continuity . . . if said circuit interrupting portion is non-operational, if an open neutral condition exists or if a reverse wiring condition exists") is exactly the same as the following conditional statement: "a reset lockout portion that permits reestablishing electrical continuity . . . only if said circuit interrupting portion is operational, an open neutral condition does not exist, and a reverse wiring condition does not exist." It is therefore clear that, even in those claims where additional features are incorporated through "or if" statements, the circuit interrupter must be operational in order to reestablish electrical continuity. As such, Leviton has not demonstrated a need to reverse the district court's construction. Because Leviton provides us with no alternative basis on which to disturb the summary judgment of noninfringement entered below, we affirm that portion of the district court's order on appeal.

Leviton argues, citing Dr. De La Ere's declaration, that the term "reset portion" is clear on its face to one of ordinary skill in the art. See Leviton's Memo at 20; De La Ere Declaration P 24, at 12-13. Leviton also contends that "reset portion" is a structural limitation and not a means-plus-function clause subject to § 112, P 6. See id. In support of its position, Leviton cites Col. 3, ll. 5-8 of the '766 patent, which states: "A reset portion is disposed at least partially within the housing and is configured to reestablish electrical continuity in the open conductive paths." The '766 Patent at Col. 3, ll. 5-8; Leviton's Memo at 20. Leviton, in maintaining its position, also asserts that the "reset portion" claim element does not use the word "means." See Leviton's Memo at 20-21. In further support of its position that the "reset portion" claim element is clear on its face and not subject to § 112, P 6, Leviton states that "reset portion" has, over the years, acquired a reasonably well understood meaning in the art that is reasonably associated with a particular structure. See id.

The Court does not agree with Leviton's position that "reset portion" is clear on its face to one of ordinary skill in the art and that it is not a means-plus-function clause. While "means" is not used in the "reset portion" claim element, the presumption that a claim element not containing the word "means" is not subject to § 112, P 6 can be overcome. See Cole v. Kimberly-Clark Corp., 102 F.3d at 531 ("Merely because an element does not include the word 'means' does not automatically prevent that element from being construed as a means-plus-function element."); Personalized Media Commc'n's, LLC v. Int'l Trade Comm'n, 161 F.3d at 704. The Court, agreeing with the Defendants, believes that presumption is overcome here; the relevant claim element does not provide sufficient structure. See Defendants' Memo at 34-35; Defendants' Response at 15-
The Defendants, citing Massachusetts Institute of Technology and Electronics for Imaging, Inc. v. Abacus Software, 462 F.3d 1344 (2006), contend that the presumption that a claim element lacking the word "means" is not a means-plus-function element is overcome here, because the claim does not contain sufficient structure and the words "reset" and "portion," when assessed either independently or in conjunction, do not connote sufficient structure. See id. at 1353 ("[A] limitation lacking the term 'means' may overcome the presumption against means-plus-function treatment if it is shown that 'the claim term fails to 'recite sufficiently definite structure' or else recites 'function without reciting sufficient structure for performing that function.'"). The Defendants note that pertinent dictionaries either do not define those terms or do not define them in a manner that connotes structure. See Transcript at 58:14-60:13 (Fry); Defendants' Markman Hearing Presentation at tabs 31-34, 36-40. The Defendants also point out that Dr. De La Ere testified that "reset portion" did not refer to any specific structure. See Transcript at 60:21-62:17 (Fry); Defendants' Response at 16-17 (citing August 31 De La Ere Deposition at 78:17-79:5). Further, the Defendants note that the Court previously, in its construction of the '558 patent's claims, determined that the "reset means" claim element was subject to § 112, P 6, and that, in the '558 patent, Leviton uses the terms "reset means" and "reset portion" interchangeably. See Transcript at 59:12-21 (Fry); Defendants' Memo at 34-45.

The Court finds the Defendants' position concerning "reset portion" persuasive. The Court believes that the language of the "reset portion" claim element cannot be said to impart sufficient structure. See The '766 Patent, Claim 1. The Court also believes that it is noteworthy that the Defendants’ search did not reveal, nor did Leviton present, evidence that the term "reset portion" or the individual terms "reset" and "portion" impart sufficient structure within the art. See Mass. Inst. of Tech. & Elec. for Imaging, Inc. v. Abacus Software, 462 F.3d at 1354 (analyzing disputed claim element terms together and independently, and finding that § 112, P 6 applied where those terms did not impart sufficient structure and none was otherwise included within the claim). The Court, moreover, acknowledges that Dr. De La Ere conceded that the term "reset portion" does not connote any specific structure, see August 31 De La Ere Deposition at 78:17-79:5, and that Leviton does appear to use "reset means" and "reset portion" interchangeably in Claims 3 and 4 of the '558 patent, see The '558 Patent, Claims 3 & 4, Omega Eng’g, Inc. v. Raytek Corp., 334 F.3d at 1334 ("We presume, unless otherwise compelled, that the same claim term in the same patent or related patents carries the same construed meaning."). Considering the foregoing, the Court concludes that the Defendants have overcome the presumption that § 112, P 6 is not applicable, and that the "reset portion" claim element is a means-plus-function element.

Citing Ventana Med. Sys. v. Biogenix Labs, Inc., Leviton contends that the "reset" language used in Claim 1 of the '766 patent and Claim 3 of the '558 patent is different, and that, therefore the Court's construction of Claim 3 of the '558 patent is irrelevant and the Court should not find that "reset portion" is a means-plus-function element. See Omega Eng’g, Inc. v. Raytek Corp., 334 F.3d at 1334 (stating that, while a parent patent's prosecution history may inform the claim construction of its descendant, the parent patent's prosecution history is irrelevant to the meaning of a descendant's limitation if the two patents do not share the same claim language); Transcript at 14:10-15:17 (Magidoff). The Court notes, however, that the "reset portion" claim element's lack of accompanying structure, and not its language's similarity to that of Claim 3 of the '558 patent, drives the Court's conclusion here.

Because the Court concludes that "reset portion" is a means-plus-function element, it must determine its function. See Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d at 1322. The Court concurs with the function that the Defendants put forth. The language of the "reset portion" claim element is largely identical to that of the "circuit interrupting portion" claim element, for which the Court adopts the Defendants' proposed construction. See The '766 Patent, Claim 1. Moreover, the word "said" indicates that the term "predetermined condition," as used in the "reset portion" claim element, should be construed as it was with respect to the "circuit interrupting portion" element. Phillips v. AWH Corp., 415 F.3d at 1316-17 (stating that use of the term "said" indicates that the term in question has previously been used within the claim and that the earlier understood meaning should be maintained). Given the use of "said," given that the Court adopts the Defendants' construction of the "circuit interrupting portion" construing identical language, given that it is presumed that the same claim term in the same patent or related patents carries the same construed meaning, see Omega Eng’g, Inc. v. Raytek Corp., 334 F.3d at 1334, and given that, while Leviton states that the Defendants' proposed § 112, P 6 function is incorrect, Leviton
does not present the Court with an alternative, see Leviton's Response at 15-17, the Court will adopt the Defendants' proposed construction of the "reset portion" claim element. The Defendants' proposed construction provides:

This claim element is a means-plus-function element in accordance with 35 U.S.C. § 112, P 6. The function to be performed by the "reset portion" is reestablishing electrical continuity between the first and second electrical conductors and between the first and third electrical conductors after the occurrence of a current imbalance (in this case an artificially induced electrical fault) that activates the circuit interrupting portion.

Defendants' Presentation at 88.

Because the Court concludes that "reset portion" is a means-plus-function element, it also must identify the structure that corresponds to the function. See Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d at 1322. The Court finds that the pertinent specification language contained within the '766 patent for completing the function assigned to the "reset portion" is the same structural language contained within the '558 patent for completing the function that was assigned there to "reset means." See The '766 Patent, Col. 8, ll 25-56; The '558 Patent, Col. 8, ll 25-56. Given that the language the Court used to describe the function of the "reset means" in the '558 patent is nearly identical to the language it adopts to describe the function of the "reset portion" of the '766 patent, and given that the relevant specification language is the same in both the '558 and '766 patents, the Court will apply its finding with regard to the structure of "reset means" from the '558 patent to the "reset portion" claim element appearing in the '766 patent. Thus, the necessary structures corresponding to the function assigned to the "reset portion" are: reset button 30; return spring 120; latch number 100; latching finger 102; movable contract arms 50 and 70; reset contacts 104, 106, 52, 62, 56, 66, 72, 82, 76, and 86; coil assembly 90, plunger 92, banger 94, banger dogs 96 and 98; operable ends 116 and 118; and a circuit that senses the "predetermined condition" and causes coil assembly 90 to actuate plunger 92. See The '766 Patent at Col. 8, ll 25-56.

Next, subsection (d) of Claim 1 requires construction. Claim 1(d) states:

| deactivating said generator only upon expiration of said predetermined time period or in response to a reset signal. |

There are two terms in Claim 1(d) that require construction: "deactivating" and "reset signal."

With respect to the "deactivating" term, Agrizap argues that it should be construed as:

any manner of deactivating the generator at the end of the predetermined time period or in response to a reset signal, the end of the predetermined time frame being determined in any manner and the reset signal being produced and sensed in any manner including hardware, software/ firmware or any combination thereof.

(Agrizap's Reply Br., at 14). Woodstream argues that "deactivating means stopping the activated generator" and that "the generator can be deactivated only upon the two enumerated conditions and not any other conditions, i.e., deactivating can occur only upon expiration of the predetermined time period or in response to a reset signal" and "the generator must be capable of being deactivated under both [of these] recited conditions." (Woodstream's Reply Br., at 10-11). In response, Agrizap argues that requiring the deactivation to be performed only by these two conditions and requiring that the generator must be capable of performing both of these conditions are unsupported and unrelated limitations to this claim construction.

This Court will construe "deactivating" as:

the stopping of the activated generator either upon the expiration of the predetermined time period or in response to a reset signal. The activated generator can be deactivated only upon either of these two conditions (expiration of predetermined time period or in response to a reset signal) and the generator must be capable of being deactivated by both of these conditions.

First, the ordinary and customary meaning of "deactivating" means making the activated generator inactive, or more simply, stopping the activated generator. See Webster's 3d. New Int'l Dictionary 579 (3d ed. 1993) (defining "deactivate" as "to
make inactive or ineffective"). The essential disagreement between the parties, however, is not about what "deactivating" means, but rather about how "deactivating" of the activated generator occurs. The words of Claim 1(d) themselves clearly state that deactivation occurs "only" upon (1) the expiration of the predetermined time period or (2) in response to a reset signal. See Phillips, 415 F.3d at 1314 ("[T]he claims themselves provide substantial guidance as to the meaning of particular claim terms."). Therefore, deactivation can occur only upon these two conditions and the generator must be capable of being deactivated by both of these conditions.

The "reset signal" term in Claim 1(d) requires construction. In addition, "reset signal" appears in Claim 1(e) and also requires construction. Claim 1(e) states that:

inhibiting said triggering step once activation of said generator is triggered, until said reset signal is detected.

Essentially, Agrizap and Woodstream are arguing over whether "reset signal" in both Claims 1(d) and 1(e) refers to one specific reset signal, the power on reset signal, or whether the term encompasses various reset signals. Agrizap argued that the "reset signal" term in Claim 1(d) can be "produced and sensed in any manner including hardware, software/ firmware or any combination thereof." With respect to the "reset signal" term in Claim 1(e), Agrizap ignores the "said reset signal" term in the claim construction it provided for Claim 1(e). Woodstream argues that the "reset signal" term in Claim 1(d) is the same as the "said reset signal" term in Claim 1(e) and that the only description of a reset signal in the 636 patent is the power on reset signal. n2 Agrizap responds that Woodstream is erroneously interpreting the specification and prosecution history because the power on reset signal is not the only reset provided for in the specification.

--- Footnotes ---

n2 In addition, Woodstream argues that the patent specification fails to disclose any "reset signal" that deactivates the generator thus making Claim 1(d) invalid under 35 U.S.C. § 112. The invalidity of any claims will be discussed below in the summary judgment section.

--- End Footnotes ---

After analyzing the wording of Claim 1(d) and Claim 1(e) in conjunction with the intrinsic evidence, this Court will construe the "reset signal" term in both Claim 1(d) and Claim 1(e) as: the power on reset signal. The power on reset signal is the signal that is generated upon the powering up of the circuit from its off condition. It is labeled as POR 97 in Fig. 4 and Fig. 5 of the 636 patent.

The "reset signal" term in Claim 1(d) and 1(e) must be interpreted the same way. The ordinary and customary meaning of the word "said" when it is modifying a term is that it means the "above-mentioned" term. Black's Law Dictionary, 1363 (8th ed. 2004). When "said" is used in a document, it refers to something that has been previously mentioned in the document. Greeley Nat. Bank v. Wolf, 4 F.2d 67, 69 (8th Cir. 1925). Here, "said reset signal" in Claim 1(e) must refer to the previously mentioned "reset signal" term in Claim 1(d) because that is the only "reset signal" mentioned prior to Claim 1(e). Thus, the reset signal in Claim 1(d) and 1(e) are the same reset signal.

The construction of "reset signal" as the power on reset signal is supported by the 636 patent. Intrinsic evidence, such as the patent itself, "is the most significant source of the legally operative meaning of disputed claim language." Vitronics, 90 F.3d at 1582. The abstract of the 636 patent states that "the invention will not retrigger until reset by turning it off and then on again, thereby activating the power on reset circuit." (636 patent, abstract). The following statements from the specification show that the power on reset signal is the reset signal that needs to be detected before retrigerring:

Timer Module 112 cannot be retriggered until it is reset via an active low logic signal on POR 97. (636 patent, col. 7, lines 63-65);

Once triggered, the electronic portion 1 cannot be retriggered until power is turned off and then on again via switch 2. (636 patent, col. 6, lines 46-48); and

The logic low value of ARM 93 therefore prevents any retrigger of Timer Chip 18 until the power is cycled off and then on by the user." (636 patent, col. 9, lines 5-10).
Moreover, the prosecution history also shows that Agrizap argued that the "reset signal" is the power on reset signal. See Phillips, 415 F.3d at 1317 (stating that court should consult patent's prosecution history). The following is Agrizap's response to one of the Patent Examiner's questions pertaining to the retriggering of the timer after deactivation:

Applicants [Agrizap] respectfully direct the Examiner to page 21, lines 4-8, where it is explained that when the predetermined time has elapsed, the generator is inactive because the output of the time becomes inactive and that the timer cannot be retriggered until reset via POR. Page 21, line 11 through page 22, line 2 discusses the power on reset circuit and how it operates to initialize the electronic portion, including the arming of the trigger circuit of the resistive switch. Page 24, lines 5-14 discuss how the trigger circuit of the resistive switch becomes disarmed until reset once again by cycling the power and thus activating POR.

(Woodstream's Markman Ex. 2, at 000081). The patent's prosecution history shows that the triggering step is inhibited until reset by the power on reset signal. n3 Thus, the intrinsic evidence supports the construction that the reset signal in Claim 1(d) and 1(e) is the power on reset signal.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

n3 Agrizap tries to argue that the patent's prosecution history shows that there is a difference between the power on reset signal and other reset signals. It contends that the following statement supports its argument: "[Agrizap] amended the claims to differentiate the power on reset (POR) from the individual reset inputs of the time components." (Woodstream Markman Ex. 2, at 000080). These individual reset inputs, however, are not the reset signal addressed in Claim 1(d) and 1(e) for the reasons explained above. Furthermore, having the "reset signal" term encompass many possible different reset signals is inconsistent with the wording of Claim 1(d) and 1(e).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -
Nevertheless, in contrast to the above discussion of the proper construction for "coup message," where the patent specification did not indicate that the "coup message" necessarily had to be unicast in all circumstances, the patent specification does explain that the "resign message" must be unicast in response to a "coup message," otherwise it would conflict with the purpose of the patent. See Li, at 12:61-13:3. Therefore, the Court will construe the term so that it comports with the purpose of the patented invention. See Apple Computer v. Articulate Sys., 234 F.3d at 25.

Additionally, the Court disagrees with Alcatel that the term "resign message" cannot be defined using the word "resign." The Court finds the meaning of the word "resign" to be plain on its face, and, furthermore, the patent itself uses this term to explain the purpose of a "resign message."

Thus, the proper construction for "resign message" is "a message, sent by the active router to inform other routers that the active router will be resigning from its status as active router, which is unicast by the active router in response to the active router's receipt of a coup message, and is otherwise broadcast."

b. "resistance"

LGD contends that the term resistance should be defined as "a circuit component designed to provide opposition to electric current flowing through itself and to minimize current surge in the TFT array from electrostatic discharge." D.I. 376 at Exh. B-8. LGD contends that its construction is appropriate, because the specification indicates that resistance minimizes discharge current surge. LGD also contends that its construction is similar to the construction adopted by the Court in the Tatung case, except that it offers further clarification by (1) replacing the term "resistance" in the construction with its plainly understood dictionary meaning, i.e. "the opposition offered by a body or substance to the passage through it of a steady electric current;" and (2) "clarifying that the current surge must be minimized in the TFT array, to be consistent with the claims and specification." D.I. 384 at 10.

CMO contends that the term "resistance" should be defined consistently with the definition rendered by the Court in the Tatung case. Specifically, CMO contends that "resistance" means "a circuit component that has a specified resistance to the flow of electric current and is used to minimize the current surge from electrostatic discharge." D.I. 376 at Exh. B-8.

In response, AUO contends that the proper construction of resistance is "a circuit component that has a specified ratio between voltage and the flow of electric current, and is used to minimize the current surge from electrostatic discharge." Id. AUO also contends that its construction is consistent with the Court's previous construction, except that the term "resistance" is replaced with the plain technical meaning of the term resistance from the IEEE Standard Dictionary of Electrical and Electronic Terms. AUO contends that LGD's construction eliminates the "specified" value of resistance that the Court incorporated into its prior construction.

In reply, LGD contends that AUO's construction seeks to limit the term "resistance" to a "resistor." LGD contends that this construction is not supported by the specification, and one skilled in the art would not understand the term "resistance" to be limited to a resistor. D.I. 430 at 4.

In the Tatung action, the Court specifically rejected a construction which would "limit 'resistance' to one specific electric component, a resistor." 434 F. Supp. 2d at 298. In so doing, the Court noted that the term "resistance" is used in the claims in a manner somewhat different from its ordinary meaning to one of skill in the art. Id. at 299. Specifically, the Court stated that "[i]n the claims, the term 'resistance' is used consistently to denote only a circuit component used to couple the outer ESD guard ring to the interconnected row and column lines and the pickup pad." Id. (citations omitted). With this understanding, the Court will not depart from its previous construction or rationale, and will define "resistance" as "a circuit component that has a specified resistance to the flow of electric current and is used to minimize the current surge from an electrostatic discharge."
The parties agree that one of ordinary skill in the art would understand "resistance" to mean a physical property of a material or device characterized by opposition to the flow of electric current. (D.I. 135 at 13; D.I. 137 at 9.) They also agree that in the '002 patent, "resistance" is used to denote a circuit component. (D.I. 135 at 13; D.I. 160 at 2.) LPL contends that because "[a]ll circuit components . . . have the characteristic of resistance," the Court should construe "resistance" as "any component used to cause a voltage drop during current flow." (D.I. 135 at 13.) CPT's proposed construction is "[a] resistance, as it is used in the claims, means a resistor, which is a circuit element that has a specified resistance to the flow of electrical current. A resistance does not include switching elements such as transistors and diodes." (D.I. 137 at 9.)

LPL's proposed construction cannot be correct because, as CPT points out, (D.I. 137 at 12), it would exclude the single preferred embodiment that incorporates a "resistance." (See '002 patent, col. 8, ll. 1-48.) The only purposes stated for the "resistance" in that embodiment are to provide an "ESD short for high electrostatic potentials . . . ." (Id., col. 8, l. 31), and to minimize "the discharge current surge . . . ." (Id., col. 8, l. 35). Thus, "resistance" as used in that embodiment, would not fall within the scope of LPL's proposed construction of "any component used to cause a voltage drop during current flow." A claim construction that excludes a preferred embodiment "is rarely, if ever, correct and would require highly persuasive evidentiary support. . . ." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) (citations omitted). The Court finds no such evidentiary support in this case.

On the other hand, CPT's proposed construction unnecessarily limits "resistance" to one specific electric component, a resistor. There is no support in the intrinsic record for such a narrow interpretation. Moreover, a person skilled in the art would certainly understand the meaning of "resistor" so it is logical to conclude that the inventor would have chosen that term had he intended to refer only to that specific component.

LPL correctly notes, (D.I. 163 at 3), that it is improper to import limitations from a preferred embodiment into the claims. See JVW Enterprises, Inc. v. Interact Accessories, Inc., 424 F.3d 1324, 1335 (Fed. Cir. 2005). However, "there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification." Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005) (quoting Comark Commun., Inc. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed. Cir. 1998)). Here, because "resistance" is used in the claims in a manner somewhat different from its ordinary meaning to one of skill in the art, the only guidance as to how the Court should construe the term is how it is used in the single embodiment in which it appears. That embodiment mentions a "resistance" three times:

The [ESD guard ring] line 210 is connected to the other set of gate or source lines by a shunt line 224, a shunt transistor 226 and a large resistance 228, such as 100 K ohms (illustrated schematically). . . . The resistance provides an ESD short for high electrostatic potentials which can be incurred during manufacturing . . . . The resistance minimizes the discharge current surge . . . .

('002 patent, col. 8, ll. 23-34.) In the claims, the term "resistance" is used consistently to denote only a circuit component used to couple the outer ESD guard ring to the interconnected row and column lines and the pickup pad. (See e.g. Id., col. 9, ll. 63-65; col. 10, ll. 6-8.)

Reading the claims in light of the specification, which describes the "resistance" only in general terms, the Court concludes that the patentee intended the claims and this embodiment in the specification to be coextensive at least in regard to the term "resistance", n3 Therefore, the Court will construe "resistance" as "a circuit component that has a specified resistance to the flow of electric current and is used to minimize the current surge from an electrostatic discharge."

--- Footnotes ---

n3 The Court also notes that the patentee explicitly stated that certain elements of the invention could vary from the specific descriptions in that embodiment, but did not include the "resistance" among those elements. ('002 patent, col. 8, ll. 49-62.)
The parties dispute over the meaning of the phrase "resistant to," which appears in independent Claim 1 of the '661 Patent. It also appears in Claims 6, 9, 11, 15, 26, 27, and 29 of the '661 Patent; Claims 22 and 28 of the '783 Patent; Claims 1, 13, 18, and 31 of the '442 Patent; Claim 39 of the '658 Patent; Claims 2, 11, and 31 of the '518 Patent; and Claim 1 of the '884 Patent.

The parties dispute whether "resistant to" refers to "reduce" or "significantly reduce."

The plain and ordinary meaning of "resistant to" suggests that construction of "resistant to" as either "reduce" or "significantly reduce" would be improper. Unlike "reduce" which is used to compare the level of an entity with that entity's previous level, "resistant to" ordinarily describes a relationship between the entity and an external force. The written description of the invention supports this distinction. "Reduction" in S/N ratio involves a lessening of the original quantum of S/N ratio. See '661 patent, col. 4, 11. 1-5. On the other hand, "resistance," is referred to in relation to an "attack," as in "enabling the construction of devices that are significantly more resistant to attack than devices of similar cost and complexity." '661 patent, col. 14, ll. 6-10.

"Resistant to" is also used in the claims in a manner which is consistent with its plain and ordinary use: "resistant to discovery," Claim 1, '661 patent, "resistant to external detection," Claim 1, '442 patent, and "resistant to detection," Claim 13, '442 patent.

The intrinsic evidence does not disclose a particular quantum of resistance as necessary to a definition of the phrase.

The Court construes "resistant to" to mean: "less susceptible to external influence."

B. The Kurimoto Patent

The parties ask the Court to construe the phrase "resistive component" in Claim 1 and 6 of the Kurimoto Patent. Joint Statement at 10. AMD asks the Court to construe "resistive component" as a type of resistance. Id. Oki asks the Court to construe the term according to an abstract definition that is divorced from the language of the patent. See Oki's Opening Claim Construction Brief at 6. The Court chooses to define the disputed phrase as a type of resistance in accordance with the Kurimoto patent's idiosyncratic usage.

1. The Claims of the Kurimoto Patent

Taken out of context, Oki's definition of a resistive component as a component possessing the property of resistance to electrical current seems reasonable. However, a close reading of the language and specification reveals that the patent defines the phrase by implication.

The claims reveal the first cracks in Oki's definition. As noted above, the Kurimoto patent prevents latch-up by introducing a "resistive component" into a complementary metal oxide semiconductor (CMOS) transistor circuit. 986 Patent, at [57]. First, Claim 1 requires that the "resistive component" be "provided" at the source of a "MOS transistor." Id. at col.5 ls.17-18. A MOS transistor is nothing more complicated than the MOSFET described in the construction of the Kurachi patents. See Fair Decl. at P 18. This limitation is consistent with both Oki's and AMD's interpretation since either a component or a resistance could be provided at the source of an MOS transistor.

Second, the "resistive component" must be "serially connected to a parasitic bipolar transistor." 986 Patent col.5 ls. 17-20.
At first glance, this limitation seems to favor Oki's definition because the phrase serially connected seems to indicate structures that are linked together in a chain. However, Claim 11, using the same language as Claim 1, states that a "parasitic resistance" must be "serially connected to a parasitic bipolar transistor." Id. at col.8 ls.9-11. The parties agree that "parasitic resistance" as used in the Kurimoto patents is defined as "a resistance in an integrated circuit that arises inherently due to the nature of the materials used to implement the other elements of the integrated circuit." AMD's Markman Reply Brief at 10; Oki's Claim Construction Reply Brief at 1. Thus, the claims indicate that both a resistive component and a type of resistance may serially connect to a transistor. This parallel language suggests that the patentee is using the disputed phrase to mean something different from the meaning found in a regular dictionary.

The final claim limitation suggests that the resistive component has no separate physical structure. Claims 1 and 6 require the "resistive component" to be "formed from a layout in which a distance between a contact for [the] source of [a] MOS transistor [] and a gate of [the] MOS transistor [] is longer than a distance between a contact for [the] drain of [the] MOS transistor [] and the gate of [the] MOS transistor []." Id. at col.5 ls.21-29; col.6 ls.29-36. The claim language indicates that the resistive component is not present as a result of the addition of some external wire or body. Instead, the resistive component arises from rearrangement of the preexisting structures of the MOSFET. According to Claim 6, this same "asymmetry provid [es] a parasitic resistance." Id. at col.8 ls.7-8. The claim language again uses that the phrases "resistive component" and "parasitic resistance" to mean the same thing.

2. The Specification of the Kurimoto Patent

The specification indicates the patentee uses the phrases resistive component and parasitic resistance interchangeably. Figure 3 of the patent illustrates a preferred embodiment of the invention. Id. at col.2 ls. 13-15; 18-19. Referring to this figure, the specification describes exactly what gives rise to the "resistive component."

As shown in FIG. 3, the arrangement of the contacts . . . is asymmetric with respect to the gate. . . . That is, in this layout of the CMOS output circuit, a distance between each [source] contact . . . and the gate . . . is longer than a distance between each [drain] contact . . . and the gate . . ., so as to render the resistive component . . . high.

Id. at col.4 ls.13-15; 18-19. If resistive component as used in the specification referred to a structure, the phrase "to render the resistive component" high would be nonsense. Nothing in the figure or the patent suggests that the resistive components are physically higher than other components in the patent. However, when resistive component is construed as a type of resistance, the sentence makes sense. According to this reading, placing the source contacts farther from the gate than the drain contacts raises the resistance. Later, the specification again uses the phrase resistive component to refer to a type of resistance. Referring to an embodiment of Claim 5, the specification states that "the number of the contacts . . . on a side of the source . . . being less than the number of the contacts . . . on a side of the drain . . . increases the resistive component at the source." Id. at col.4 ls.30-34. Again, this sentence only makes sense if "resistive component" is read to be a type of resistance. Read properly, the sentence indicates that having less source contacts than drain contacts increases the resistance at the source.

3. Construction of Disputed Terms in the Kurimoto Patent

The specification is dispositive. The Court holds that "resistive component" as used in Claims 1 and 6 of the Kurimoto patent refers to a resistance in an integrated circuit that arises due to the nature or layout of the materials used to implement the other elements of the integrated circuit.
This claim will be construed as: a switch that is physically connected across the electrodes. The switch includes a distinct trigger circuit with a trigger output and an arm/disarm input.

1. Resistor stack (claim 18)

Plaintiff contends that "resistor stack" means "resistor formed as a layered structure," while Defendants contend that this term means "structure having a resistive material between two layers of conductive material that are designed to carry electrical current and absorb infrared radiation."

The "Summary of the Invention" section of the '663 specification describes that "[t]he present invention provides infrared radiation imagers in the form of a monolithic array of bolometers with a high fill factor geometry together with high sensitivity resistance material. Preferred embodiments use . . . an architecture suspending the resistance material over silicon detection circuitry." '663 patent, 2:20-27. The term "resistor stack" in claim 18 refers to the "high sensitivity resistance material" that is suspended over the silicon detection circuitry.

Stack 144 of a preferred embodiment, illustrated in Fig. 4a of the '663 patent, is a structure comprising resistive material (150) between two layers of conductive material (148 and 152), as Defendants' proposed construction requires. See '663 patent, 2:23-26, 3:37-43 The crux of the parties' dispute, however, is whether the term "resistor stack" is limited to this single embodiment disclosed in the specification--a layer of resistive material "sandwiched" between two layers of conductive material.

Defendants argue that the '663 patent only discloses a single embodiment and, therefore, that the inventor did not conceive of any resistor stack other than the single disclosed "sandwich" embodiment. Accordingly, Defendants argue, the claims should be limited to a "sandwich" structure. The Federal Circuit, however, "has expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment. Even when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) (citations omitted). Defendants have not identified any such words or expressions of manifest exclusion or restriction or other intrinsic support for limiting this term to only the preferred embodiment described in the specification.

The Federal Circuit has also made clear that "a particular embodiment appearing in the specification may not be read into a claim when the claim language is broader than the embodiment." SuperGuide Corp. v. DirecTV Enters., Inc., 358 F.3d 870, 875 (Fed. Cir. 2004). The term "resistor stack" appears only in independent claim 18 and dependent claim 20, while other independent claims use the term "stack" modified by subsequent claim language specifically requiring a "sandwich" structure. For example, claim 1 requires a "stack including a first conductive layer, a resistive layer, and a second conductive layer . . . ." Claim 1, therefore, was drafted to more narrowly claim the "sandwich" embodiment that Defendants' proposed construction would require. Claim 18's "resistor stack," however, does not include subsequent qualifying language and was thus intended to be broader than the "sandwich" embodiment.

Indeed, claim 20, which depends from independent claim 18, requires that the "resistor stack" of claim 18 include the relevant elements of the "sandwich" embodiment. If the "resistor stack" of claim 18 was already limited to the "sandwich" embodiment, claim 20 would be redundant and would add no additional limitations. Such a construction would be improper. See 35 U.S.C. § 112, P 4; Robotic Vision Sys. v. View Eng'g, Inc., 189 F.3d 1370, 1376 (Fed. Cir. 1999) ("If claim 1 were limited to separate fabrication of index pads, claim 4 would necessarily be redundant and add no additional limitations. This would again be an absurd construction of claim 4 as a dependent claim of claim 1."). The term "resistor stack" is broader than the "sandwich" embodiment discussed in the specification and specifically claimed in, for example, independent claim 1 and dependent claim 20.

Defendants also rely on the "Modification and Advantages" portion of the specification in support of their proposed construction, which states:
Various modifications of the preferred embodiment devices and methods may be made while retaining features such as [1] a temperature dependent resistor suspended over related processing circuitry for a high fill factor and avoidance of resistor edge passivation, [2] a temperature dependent resistor made of a radiation absorbing material on a transparent high temperature coefficient material, [3] a quarter wavelength filter absorber, and [4] in situ deposition of resistor materials for uniform and reproducible resistors.

'663 patent, 11:9-18. Thus, according to Defendants, the specification lists four features of the devices and methods that must be maintained according to the inventors. Defendants point to the second feature--"a temperature dependent resistor made of a radiation absorbing material [conductive material] on a transparent high temperature coefficient material [resistive material]"--to argue that the disclosed "sandwich" embodiment is a critical feature of the invention that must be present in every embodiment.

However, even assuming Defendants' assertion that this portion of the patent recites features that must be present in any covered embodiment, the cited portion of the specification does not say that the resistor must necessarily be a "sandwich" configuration. Rather, it clarifies that the resistor comprises at least a conductive material on a resistive material, which may or may not contain an additional conductive material to form a "sandwich" structure. This portion of the specification does, however, identify "in situ deposition of resistor materials for uniform and reproducible resistors" as one of the four features. The specification thus clarifies that the resistor "stack" of the present invention may be formed by in situ deposition, i.e., formed as a layered structure.

For all of these reasons, the court construes "resistor stack" to mean "resistor formed as a layered structure."

2. Resistor(s) (claims 22, 26-28, 33, 35-38)

Plaintiff contends that "resistor," as used in the claims, means "element used to offer resistance to an electric circuit," while Defendants contend it means "portion of the resistor stack between the leads." The specification does not purport to alter the ordinary meaning of this common component of an electric circuit, and neither party argues otherwise. The parties' primary dispute concerning this construction is whether a jury would be best aided by a construction defining "resistor(s)" in functional terms or in terms of the location of the circuit component.

When discussing a preferred embodiment, the specification describes that "[a]s shown in Fig. 5a, stack 144 is square with two pairs of elongated openings 160, 162, and 164, 166 defining leads 170 and 174 between interconnects 156 and 158 and the remainder of stack 144 (resistor 141)." '663 patent, 3:46-50. In a preferred embodiment, then, resistor 141 is "the remainder of stack 144" other than the leads and interconnects--the "portion of the resistor stack between the leads," in addition to the remainder of the resistor stack, other than the leads and interconnects, that is not between the leads.

Although "resistor 141," as illustrated in Fig. 4a, is indeed "between the leads," the court finds that construing "resistor" based solely on the label in Fig. 4a is unduly restrictive. For example, the only portion of resistor 141 in Fig. 5a that might arguably be considered a "resistor" under Defendants' proposed construction would be the narrow sliver of resistor 141 running diagonally between the ends of the leads. However, as discussed above, the specification makes clear that resistor 141 is "the remainder of stack 144."

Defendants' proposed construction also defines resistor with reference to "resistor stack," a disputed term that does not appear in the claims in which "resistor(s)," standing alone, appears. Defendants' proposed construction thus potentially imports the additional limitation of a "resistor stack" into the claims containing only the "resistor(s)" requirement. As discussed above, "resistor stack" appears only in independent claim 18 and dependent claim 20; the term "resistor(s)" appears only in claims 22, 26-28, 33, and 35-38. The court declines to construe "resistor(s)" with reference to a disputed term from different claims.

Moreover, the court finds that use of the word "element" in Plaintiff's proposed construction is potentially confusing to a jury. "Component of an electric circuit" is a more precise description of a resistor. In the same vein, rather than offering "resistance to an electric circuit," a resistor offers resistance to the flow of an electric current in an electric circuit.
Because the patentee did not purport to alter the ordinary meaning of "resistor," and because the court finds that Defendants' proposed construction is unduly restrictive and potentially imports the limitation of a "resistor stack," the court construes "resistor(s)" to mean "component(s) of an electric circuit used to offer resistance to the flow of an electric current."

E. "resizing"

- Plaintiff's proposed construction: "changing the size (width/height) of the video"
- Defendants' proposed construction: "changing the frame size"

The term "resizing" is found in claims 1 and 12 of the '655 patent and claims 1, 12, 16, and 19 of the '172 patent. Plaintiff argues for a construction of "changing the size (width/height) of the video" while Defendants argue for "changing the frame size."

Plaintiff supports its construction by quoting from the specification. The specification states that "the method directly resizes the raw video information in the uncompressed format into a size associated with the desired output media format and the desired TV standard ..." 8 Plaintiff then points to a table in the specification that describes video size in pixel height and width (e.g. 720 x 480). 9 In arguing for its construction, Plaintiff emphasizes that the term must be read to allow resizing of both width and height.

Defendant's proposed construction of "frame size" attempts to specify that the "resizing" term refers to the height/width of the video rather than its length. In the briefing and again at the hearing, Defendants sought to distinguish between their construction and Plaintiff's construction by claiming Plaintiff's construction would allow changing the length of the movie. The Court does not share this view of Plaintiff's construction. Plaintiff's and Defendants' definitions are essentially identical in meaning, but Plaintiff's construction is more direct and better supported by the specification. The patents in suit do not use the term "frame size" but instead define the video frame sizes by their height and width. Using Defendants' definition would require adding a term not found in the patent to the claims and then defining that term using the height and width language proposed by Plaintiff for "resizing." Because Plaintiff's proposed construction is well supported and the parties essentially agree that resizing refers to changing the height and width but not the length of the video, the Court adopts Plaintiff's definition of "changing the size (height/width) of the video" for the term "resizing."

ICR alleges that the Harpo website infringes the '252 patent by allowing users to access excerpts from the books selected for OBC. At issue in this decision are the terms "resolution" and "graded resolution" as used in claims 1 and 9 of the patent. These claims read as follows:

1. A method, comprising:

   In a server of a network, storing a plurality of images representing pages of a book, said images stored with a resolution effective to enable said book to be read;
responsive to a request over the network, sending one of said images to a remote node; and
determining if the request for pages exceeds a certain threshold, and sending said information only if said threshold is not exceeded.

9. A method comprising:

receiving, at a client of a network, information about which of a specified plurality of images to be displayed, each of specified plurality of images showing textual information and at least a plurality of said images showing non-textual information, said textual information representative of contents of a book;

displaying said images responsive to said requests; and

wherein each of said images use a graded resolution, which provides readable resolution for readable parts and a different resolution for non-readable parts.

A. Proposed constructions

Claim 1 describes an image stored with a "resolution effective to enable said book to be read." '252 Patent, col. 7:46-47. In its original claim construction brief, Harpo argued that the proper construction of "resolution effective to enable said book to be read" is "a value stored in an image file that is used to determine if a stored image is of sufficient pixel density for reading textual information from images of real pages of a physical book." Def.'s Mem. on Claim Constr. (docket no. 93) at 9. In its March 24 decision, the Court rejected Harpo's contention that the claim language covers only images of the actual pages of a physical book and therefore rejected Harpo's proposed construction.

In the claim construction chart submitted at the May 10 evidentiary hearing, Harpo offered a new proposed construction of "resolution": "pixel density." ICR maintains, as it has all along, that the correct construction is "sharpness to the eye." For the term "graded resolution," Harpo proposes "variations in pixel density"; ICR proposes "variations in image sharpness as perceived by the eye." Joint Claim Construction Chart, Evid. Hrg. Ex. 1.

B. Gray Testimony

At the evidentiary hearing, Harpo presented testimony from Stephen Gray, a computer technology consultant. Gray testified to the basic functioning of a website, including an explanation of how website content and images are stored on servers and rendered as HTML files that are viewable by browser software. During his testimony, Gray was presented with an example of a page from the Oprah.com website that showed a picture of the cover and an excerpt from an OBC book. The page contained an image of the book cover, which Gray explained is stored on a server as an image file. When image files are stored on a server, Gray testified, they include a resolution, which determines the pixel density of the image being stored. He contrasted this with the excerpt of the book as presented on the OBC section of the Oprah.com website, which he described as "actual text," and "different than an image."

Gray testified that the proper construction of the term resolution as used in claims 1 and 9 must reflect the fact that the term is used to refer to images stored on a server. He testified that in his view, the Microsoft Computer User's Dictionary correctly defines resolution when it states: "the resolution of a video display is taken as the total number of pixels displayed horizontally and vertically." Gray concluded that the correct construction of resolution as used in claims 1 and 9 is "pixel density."

In its briefs on claim construction, ICR submitted the affidavit of an expert, J. Carl Cooper. Cooper expressed his opinion that resolution is "sharpness . . . to the eye of the viewer." Pl.'s Resp. to Def.'s LR 56.1 Stat. (docket no. 98), Ex. 2 at 6. Gray testified that he believed that definition did not fit with the context of the '252 patent because "the claims talk about resolution being stored with the image," and the reference to the human eye's perception doesn't ":[map] back to something that is stored with the image on a server."

- 4021 -
Discussion

Claim construction is a question of law requiring the Court to determine the meaning and scope of the patent claims alleged to be infringed. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 970-71 (Fed. Cir. 1995). A court construing a patent should give the words of a claim their ordinary and customary meaning, which is the meaning that the term would have to a person of ordinary skill in the relevant field at the time of the invention. Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005). In determining the meaning of a disputed claim term, a court looks to "the words of the claims themselves, the remainder of the specification, the prosecution history, and extrinsic evidence concerning relevant scientific principles, the meaning of technical terms, and the state of the art." Id. (citing Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1116 (Fed. Cir. 2004)).

Before considering any extrinsic evidence to construe a claim, a court should first examine the intrinsic evidence. This includes the context in which the term is used in the asserted claim; differences among the claims; the written description contained in the patent specification; and, if it is in evidence, the patent's prosecution history. Id. at 1314-17. The intrinsic record "usually provides the technological and temporal context to enable the court to ascertain the meaning of the claim to one of ordinary skill in the [relevant field] at the time of the invention." V-Formation, Inc. v. Bennetton Grp. SpA, 401 F.3d 1307, 1310 (Fed. Cir. 2005).

Though a court's task is to establish a term's meaning to a person of ordinary skill in the relevant field, the scope of inquiry is not unfettered: it must do so "in the context of the written description and the prosecution history," Medrad, Inc. v. MRI Devices Corp., 401 F.3d 1313, 1319 (Fed. Cir. 2005).

The specification of the '252 patent provides helpful context. In the description of a preferred embodiment, the specification states: "[t]he final image can also be graduated. It can include lower resolution portions which show the ornamental portions of the object, and higher-resolution portions which show the readable portions of the object. In one embodiment, the higher-resolution portions are formed from ASCII text." '252 Patent, col. 2:46-52. The '252 patent also describes an embodiment that consists of different "zones" of pictures for different portions of a product being displaced, with "a highly compressed JPEG image portion for the ornamental part, a less compressed JPEG portion for more important parts, and finer resolution parts. The fine resolution part can be ASCII or rich text format type textual information." Id., cols. 2:67-67 & 3:1-3.

ASCII is a text format, not an image. In response to questions at the evidentiary hearing, Gray testified that ASCII text is not expressed or described in pixels. Because the specification of the '252 patent includes ASCII text as an example of high or fine resolution, the construction of resolution as used in the patent claims must be broad enough to include ASCII text as well as images. It would be erroneous to construe resolution in a way that excludes an embodiment described in the specification. See, e.g., Medrad, 401 F.3d at 1319.

In short, as it is used in the '252 patent, resolution is not a concept limited to images. The Court therefore rejects Harpo's contention that resolution is a term that applies only the pixel density with which images are stored on a server.

Pixel density certainly plays a role in resolution. Both parties' experts noted that the term resolution is often applied to monitors and video displays. Monitors that display web pages do so in pixels, and the term resolution in the context of video display is, in fact, measured in pixel density. This is consistent with the Microsoft Computer User's Dictionary definition cited by Harpo, which states that "the resolution of a video display is taken as the total number of pixels displayed horizontally and vertically." Def.'s Mem. on Claim Constr., Ex. E. (emphasis added). The parties agree that resolution on a video display is measured in pixels, and the Court sees no reason to find otherwise.

As used in the '252 patent, however, the word resolution is used in the context of images or representations that are displayed, not the monitor or video screen that displays that image. Harpo's proposed construction, "pixel density," does not fully capture the concept of resolution as it is used in the '252 patent, for the reasons the Court has described.

The Court also rejects Harpo's argument that the term resolution applies only to images (in image formats such as JPEG) as they are stored on a server. The '252 patent specification makes it clear that text, including ASCII text, can be one "fine resolution" way to display readable parts of a product's packaging. '252 Patent, col. 4:1-2. The Court is persuaded, based on the intrinsic evidence, that resolution as used in the '252 patent must be defined by reference to sharpness or clarity to the
viewer rather than by reference to pixel density. To the extent that Gray's affidavit and hearing testimony are to the contrary, the Court rejects them because they fail to fully take account of context, including the specification's description of preferred embodiments.

Harpo also objects to ICR's proposed construction, "sharpness to the eye," on the ground that eyesight varies, and thus what one can perceive differs from person to person. The Court accepts this point. That does not mean, however, that ICR's construction should be rejected out of hand. The Court concludes that the proper construction of the term resolution, as it is used in the claims at issue, is "sharpness or clarity to a person with normal vision." The term graded resolution is thus properly construed as "variations in sharpness or clarity as perceived by a person with normal vision." This, the Court finds, is how a person with ordinary skill in the field would read the terms in light of the context in which they are used and in light of the specification.

Resolution means "the fineness of an image, as measured by the number of image elements or pixels making up the image."

Cytyc contends that "resolution" means "pixel spacing," whereas TriPath argues that this meaning is too restrictive, and the term should be construed as "the act, process, or capability of rendering distinguishable the individual parts of an object or closely adjacent optical images whether it be by magnification or pixel spacing."

At first glance, the answer appears to be straightforward. If the claims use "image", "displaying", and "visual display" in a computer science sense, then "resolution" must be construed as "pixel spacing." Indeed, Cytyc urged and TriPath appeared to concede this line of reasoning in Markman hearings held on September 6-8, 2005. However, a close reading of claim 2 and the written description leads to the conclusion that "resolution" refers to the magnification setting of the automated microscope, not pixel spacing.

Claim 2 provides: "The method of claim 1 wherein such first image is of a lower resolution than such second image." Patent at col. 14, 11. 57-58. The question is whether the "first image" in claim 2 is "of a lower resolution than the second image" because of the magnification setting of the microscope on which the specimen slide is placed or because of the microns per pixel of the digital image captured by the camera and analyzed by the processing system.

Focusing on the claim language, claim 2 reads "wherein such first image is of a lower resolution" (emphasis added). "Of" indicates that the "resolution" refers to the object of the image, not the image itself. Had the patentee chosen a different preposition, such as "at" or "in", then "resolution" would relate to the pixel spacing of the image.

The specification comports with this reading. When describing the image created by the scan, the terms "low resolution" and "high resolution" refer to the magnification setting of the microscope:

The first scan [by the microscope] of the slide is performed at a relatively low magnification, for example 50 power, and is called the low resolution scan. The second scan is performed at a higher magnification, for example 200 power, and is called the high resolution scan. The third scan is referred to as the high resolution rescan and is also performed at a high magnification.

Id. at col. 3, 11. 58-65. See also id. col. 7 11. 1-3 ("During the low resolution scan the objective of the microscope is set, for example, at its 50 magnification power").

The specification uses "resolution" to refer to pixel spacing only when describing the digital image itself. See id. at col. 6, 11. 44-52; col. 7, 11. 49-59. The distinction is clear in the following passage:
Once digitized by the image processor, each analysis field will be represented by a 256 by 242 matrix or array of pixels which corresponds to a resolution of approximately two microns per pixel during a low resolution scan or a high resolution scan, or a 512 by 484 array of pixels corresponding to a one micron per pixel resolution during a high resolution rescan pass.

Id. at col. 6, 11. 44-51. The resolution of the image is the same -- two microns per pixel -- for both the low resolution and the high resolution scans. The resolution of the image changes to one micron per pixel for the high resolution rescan, but the "resolution" of the rescan remains at the same 200 power magnification. Id. at col. 3, 11. 61-65 and col. 14, 11. 13.

Claim 2 includes only the first and second images. As discussed earlier, these represent the low resolution scan and the high resolution scan. Since the specification in the above quoted passage indicates that the images of these scans may be of the same resolution, "resolution" as used in claim 2 must refer to magnification.

In sum, "resolution" is not "pixel spacing", but the magnification setting of a microscope.

F. Resolution Level

In construing "indication of a respective resolution level", the Defendants suggested that resolution level referred to "the amount of detail per unit area." In its Reply Brief, the Plaintiff argued that "the amount of detail" is not tied to a "unit area." However, in the Plaintiff's Memorandum in Support of Motion for Preliminary Injunction, the Plaintiff indicated that "the blocks with the highest resolution level have the most amount of detail per unit area. '189 Patent, col. 3, lns. 6-9." While not specifically addressed at the Markman hearing by either party, Defendants' construction appears appropriate.

Although, the specification anticipates that "the data streaming methods of the present invention may be used to convey large databases of data which are to be displayed graphically, such as in graphic displays of stock values, " (col. 16, 11. 20-24), as opposed to just three-dimensional views of the surfaces, Claims 1 and 12 specifically claim a "method of providing data blocks describing three-dimensional terrain" and an "apparatus for providing data blocks describing three-dimensional terrain." (col. 16, 11. 28-29; col. 18, 11. 12-13) Consequently, classifying data blocks describing three-dimensional terrain "according to the height from which they view the terrain and, therefore, the level of detail which they include," (col. 8, 11. 62-64), requires that the concept of resolution levels include a per unit area dimension. The specification affirms this meaning by stating plainly that "the blocks at lower resolution levels include less detail per unit area, while the blocks of higher resolution levels include more detail per unit area." (col. 3, 11. 6-9) I construe the term "resolution level" as the level of detail of the data per unit area, even though in the preferred embodiment "the resolution level is also dependent on the number of pixels in the image displayed on display. Preferably, the resolution levels are chosen so that an approximate 1:1 ratio is achieved between the number of displayed pixels and the number of data pixels." (col. 11, 11. 32-37) (emphasis supplied)

Construction: (resolution level) the level of detail of the data per unit area.

4. Term 5('645 Patent, Claim 1)

Term: ... the alphanumeric string is resolved without reference to a filename for the given object ...

Court's Construction: ... the alphanumeric string is translated into an IP address without reference to the name of the object ...

The parties do not appear to disagree on the explicit limitation in this term requiring resolution of the string without regard
to the object name. Limelight, however, argues that the term should be further limited to require the name resolution to resolve to the "Internet Protocol address of the optimal content server." (See Docket # 71, 26.) Reading the contested term in light of the rest of the claim demonstrates that the claim itself provides explicit limitations on string resolution. Claim 1 requires that the IP address returned by the contested term be associated with one of the content servers associated with the "close" DNS server selected in the previous step, and also that the content server be selected according to a load-sharing algorithm. ('645 Patent, Claim 1.) The word "optimal" does not appear in the specification (or the claims) of the '645 Patent, and adding it as a limitation, where the claim step itself limits the result of the string resolution, would muddy, rather than clarify, an understanding of the claim step.

In the '776 patent, the last element of each of claims 1, 3, and 24 is construed to be a step or means that energizes, or turns on, a compressor in response to an increase capacity signal and deenergizes, or turns off, a compressor in response to a decrease capacity signal. The claims do not allow for energizing a compressor in response to a decrease capacity signal or deenergizing a compressor in response to an increase capacity signal.

In the specification, where "respective" is used many times, it also means "in the order given." See, e.g., Column 4, line 66 through Column 5, line 4. The prosecution history further supports this interpretation. See JX-776, Response, Bates Nos. 144-45, example showing that a compressor was energized only in response to an increase capacity signal and that a compressor was deenergized only in response to a decrease capacity signal.

The language in claim 1 is exemplary and states that the last step comprises "selectively energizing and deenergizing compressors in response to respective increase capacity signals and the decrease capacity signals." To understand why "compressors" and "signals" are plural, the Court examined other portions of the claims, the specification, and the prosecution history. The next to last element in each of claims 1, 3, and 24 indicates that a single increase capacity signal is generated when more compressor capacity is needed and that a single decrease capacity signal is generated when lesser compressor capacity is needed. The use of the plural "signals" in the last element of claims 1, 3, and 24 reflects a history of operation, i.e., a result of controller operation over a time interval. The Court accepts and adopts Dr. Rhine's testimony that a person of ordinary skill in the art would give this interpretation to the word "respective."

It is the independent control of each compressor of the present invention without regard to the energized or deenergized state of the other compressors in the system which makes the number of combinations of compressors available greater than the number of available compressors.
23 The specific languages is

providing an increase capacity signal when said operating suction pressure exceeds said upper limit and a decrease capacity signal when said operation suction pressure is below said lower limit.

Furthermore, this last element of claims 1, 3, and 24 of the '776 patent is construed to be a step or means for energizing or deenergizing a single compressor at a time and in such a manner that compressors are turned on and off in sequence until the appropriate compressor combination to meet the load demand is eventually achieved. Thus this last element of claims 1, 3, and 24 is not so broad as to cover the situation where a specific capacity signal is generated, the controller analyzes the signal, and in response turns on the specific combination of compressors that matches the load demand without cycling through a sequence of compressors.

The claim further needs interpretation in light of the collective limitations of the words and phrases, "selectively," "in respective response," and "to provide a greater combination of compressors." In combination with other limitations of "respectively" and "to provide a combination of compressors . . .," "selectively" means energizing or deenergizing compressors according to some particular logic or criteria. Thus the claim element takes on the construction indicated supra.

Support is found in the specification, Column 7, 11. 45-51, DX-119:

As described above, it will be evidence that controller circuit 10 will "cut-in" or "cut-out" the next compressor or compressor stage as above described until the combination of stages has an operating capacity closest to matching the system load, i.e., causing the system suction pressure to return to the previously established . . . range as hereinabove described and shown in FIG. 4 [emphasis added].

Similarly, the prosecution history also supports this construction. On page 30, Response, JX-776, Bates Nos. 146), the applicant was commenting upon the example provided on the prior pages which compared the operation of "the invention" to the prior art (in which the example clearly cycled through compressors until the correct capacity match was made) and explained

Successive reiterations of the FIFO strategy enables [sic] the present invention to more efficiently match the system load with the expanded set of compressor combinations available than previous systems, such as in Golber, having only a limited number of combinations available [emphasis added].

The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill in the art at the time would have understood and interpreted the use of "selectively" and "respective" in the claims in the '776 patent as limited with respect to choosing the optimal combination without the cycling through individual compressors until the proper combination for the needed capacity was achieved.

3740

(ii) . . . a plurality of data storage units each having a mechanically driven medium, said media of said different storage units being driven independently of each other, said data storage units storing data words with each data storage unit storing in parallel a respective one of said multi-bit data portions for each data word each data storage unit including an arrangement for writing data portions onto its respective storage media . . .

This limitation deals with "data striping," which is the salient storage feature of the '979 patent. Data striping refers to a process of storing portions of a single unit of data (in this case, the previously defined "data word") in multiple memory units. Striped data is literally spread out over several different storage media, so that all those media must be accessed in order to obtain the entire data unit. To offer a simple example: if the word "cat" were split into its three component parts, and each part were stored in a different memory unit, the word would be striped. This particular limitation calls for striping data so that each data storage unit in the system stores in parallel one multi-bit data portion of each data word. Thus, as noted above, the patent claim contemplates that there will be an equivalent number of data storage units and multi-bit data portions within a data word.
The units in this limitation are specifically referred to as "data storage units." IBM argues, as it did in connection with the '342 patent, that, to fall within the patent, these storage units may store only data and may not contain error correction code. As was true with the '342 patent, TM disagrees.

I find that I must reach a different conclusion with the '979 patent than I did with the '342 patent on this particular point, because there are two significant differences between the two sets of claims. First and foremost, the plain language of the '979 claim is not the same as the language of the '342 claim. The '979 language identifies two types of storage units: "data storage units" (this limitation) and "correction bit storage units" (the next limitation). Second, confirming that the inventor intended the plain meaning of the words he used in drafting the claim, there are no fewer than five prior art distinctions in the patent on the ground that the disks in the '979 invention are dedicated either to data or to memory, while the disks in prior art were not so dedicated. To take one example, in a Preliminary Amendment following the rejection of its original claims, the patentee distinguished a prior art reference in an article by Professors Haran Boral and David J. DeWitt, entitled Database Machines: An Idea Whose Time Has Passed? (A 725), by noting that the article did "not suggest providing a separate error correction storage device . . ." (A 670.) In another submission, TM advised the Patent Examiner that "One general feature of applicants' invention (recited in claim 1) is in storing a data word on one mechanically driven medium (i.e., a disk drive) and storing one or more error correction bits for the data word independently on a medium that is mechanically driven independently from the medium on which the data word is stored (e.g., on a separate disk drive) . . ." (emphasis added). (A 440.)

Finally, the parties disagree about the meaning of the term "storing in parallel" as used in this particular limitation. IBM contends that a necessary construction of the patent is that none of the data storage units can operate independently of the others; they must all be accessed simultaneously (synchronously), in a single operation, in order to store the data word. In support of its argument, IBM points out that, at column five, lines 24-28 of the patent, the inventor writes, "The storage and retrieval of data via all of the SCSI buses to the controllers occurs synchronously in parallel. That is, from the point of view of the bus adaptor, related data is passed in a single operation over all of the SCSI buses at the same time."

TM argues that the phrase "storing in parallel" should be read literally, as applying only to storage, which TM concedes must be across multiple storage media. It urges that this phrase neither literally says nor fairly implies anything about how data are retrieved and contends that data may be accessed asynchronously as well as synchronously within the literal terms of the patent. TM also points out that Thinking Machines's response to the Patent Examiner that "One general feature of applicants' invention (recited in claim 1) is in storing a data word on one mechanically driven medium (i.e., a disk drive) and storing one or more error correction bits for the data word independently on a medium that is mechanically driven independently from the medium on which the data word is stored (e.g., on a separate disk drive) . . ." (emphasis added). (A 608.)

The phrase "storing in parallel" is discussed extensively in the file history, primarily by way of differentiating the '979 patent from other inventions of the time. It appears that the Examiner allowed the claims as proposed because of the addition of the words "in parallel" to the claim in question. Construction of this term, then, would appear to be key to this invention. I find it to be the most difficult question of all those presented to me, precisely because the file wrapper contains references that can be read to support either point of view.

The Court's expert, Professor Lipovski, has written a letter that affords valuable assistance in this regard. Professor Lipovski notes that the SCSI protocol -- which is described in the patent (and therefore constitutes intrinsic evidence), and which all parties agree is pertinent to the reading and writing of data under this patent -- does not have a command to synchronize multiple disks so as to read or write data in parallel (i.e., at exactly the same time). It does, however, have commands that can be sent to multiple disks so that data can be sent to or from the disks on which they are stored using a common clock (i.e., synchronously). This suggests that IBM's construction -- which relies upon the phrase "from the point of view of the bus adapter, related data (i.e., a data word) is passed in a single operation over all of the SCSI buses at the same time" (the SCSI buses are the connections between the adapter and the disk drive units) -- is correct. Moreover, because the SCSI protocol as contained in the patent lacks a command to synchronize multiple disks for reading and writing data in parallel, IBM's construction is not inconsistent with the prior art reference to the Boral article, which distinguished the '979 application as permitting asynchronous data transfer.

Thus, this second limitation will be described to the jury in the following terms:

Second, in the '979 patent, the data portions have to be "striped" in order to be stored. Now just what is "data striping"?
Well, when you stripe data, you split it up so that sub-portions of the basic unit of data are stored in different storage units. To take a very simple example, if we think of the word "cat" as a data word, we would stripe that data word by taking it apart and placing one letter on each of three different disk drives. In order to figure out what the data word said, we would then have to read all three disk drives. By contrast, if you did not stripe the data, you would store all three letters of the word "cat" on the same disk drive.

So in this '979 patent, we have two or more data storage units, each one mechanically driven independently of the others, and each one of those data storage units stores one of those multi-bit portions of our data word. The multi-bit portions of the data word are thus said to be stored "in parallel." For this purpose, the data storage units have to have some way to write the data portions onto their storage media.

The patent claim specifies that each data storage unit stores "a respective one" multi-bit word portion. "A respective one" means exactly one, no more and no less. That means there must be an equal number of data storage units and multi-bit word portions in a system covered by the '979 patent. And the system needs to have the ability to transfer all of these multi-bit word portions over the connections between the disk drives and the adapter -- the so-called SCSI buses -- at the same time.

A. Claim Construction of Element [c.3]

Patent infringement analysis is a two-step process. Cybor Corp. v. FAS Techs., 138 F.3d 1448, 1454 (Fed. Cir. 1998). First, the Court must construe the claim--or in this case the particular limitation--at issue. The proper construction of the claim is a matter of law to be decided by the Court without reference to the allegedly infringing device. Markman v. Westview Instruments, 52 F.3d 967 (Fed. Cir. 1995) (en banc), aff'd 517 U.S. 370 (1996); Pall Corp. v. Hemasure Inc., 181 F.3d 1305, 1308 (Fed. Cir. 1999). "Ascertaining the meaning of the claims requires that they be viewed in the context of those sources available to the public that show what a person of skill in the art would have understood the disputed claim language to mean." MBO Labs., Inc. v. Becton, Dickson & Co., 474 F.3d 1323, 1329 (Fed. Cir. 2007) (internal quotation marks omitted).

When conducting this claim construction analysis, the Court may consider various sources. The starting point for the analysis is the claim language itself. Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999); Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Other than the actual claim language,

[the most relevant source is the patent's specification, which is the single best guide to the meaning of the disputed term. Next in importance is the prosecution history, which is also part of the "intrinsic evidence" that directly reflects how the patentee has characterized the invention. Extrinsic evidence--testimony, dictionaries, learned treatises, or other material not part of the public record associated with the patent--may be helpful but is less significant than the intrinsic record in determining the legally operative meaning of claim language.]

MBO Labs., 474 F.3d at 1329 (internal quotation marks and citation omitted).

Here, the disputed question is whether the proper construction of element [c.3] requires a one-to-one relationship between vend selection switches and vend price establishing devices. Mars argues that it does. Coinco disagrees and argues that there is no requirement of a one-to-one association.

To resolve this question, the Court turns first to the claim language. Element [c.3] requires "a vend price establishing device associated respectively with each of the vend selection switches." The article "'a' normally refers to the singular." North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1575-76 (Fed. Cir. 1993). Accordingly, the claim language can be restated as "one vend price establishing device associated respectively with each of the vend selection switches." Mars argues that the word "respectively" in this sentence mandates the one-to-one relationship between vend price establishing devices and vend selection switches. Coinco disagrees. Coinco maintains that the following illustration depicts a situation wherein a vend price establishing device ("PD") is associated--but not "associated respectively"--with each vend selection switch ("SW"): 
Coinco asserts that the PDs and SWs are not "associated respectively" in the above example because there is overlap--i.e., some selection switches are associated with more than one vend price establishing device. Coinco contrasts this situation with the one depicted below:

[SEE ILLUSTRATION IN ORIGINAL]

Coinco maintains that in this latter illustration, a vend price establishing device is "associated respectively" with each of the vend selection switches, despite the lack of a one-to-one relationship, because each selection switch is associated with only one price establishing device.

Accordingly, the proper construction of claim limitation [c.3] depends on whether the word "respectively" in the limitation requires a one-to-one relationship between PDs and SWs (as Mars contends), or whether it permits multiple SWs to be associated with a single PD as long as no SW is associated with more than one PD (as Coinco contends).

As a general rule, all terms in a patent claim are given their "plain, ordinary and accustomed meaning," Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001), "unless the text of the patent makes clear that the word was used with a special meaning," Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1299 (Fed. Cir. 1999). An example, as provided below, illuminates the ordinary use and meaning of the word "respectively," and indicates that Mars' interpretation of the language as requiring a one-to-one relationship is more sensible.

Compare, for example, the following two sentences: (1) The cat and the dog belong to John and Jane, respectively. (2) The cat, the dog, and the fish belong to John and Jane, respectively. Sentence (1) represents a typical use of the word "respectively." The meaning of the sentence is clear and understandable--the cat belongs to John and the dog belongs to Jane. Sentence (2) by contrast is incoherent. Unlike in sentence (1), it is impossible to be certain which animal belongs to which person. The only difference between the two sentences is that there is a one-to-one relationship between animals and people in sentence (1), but not in sentence (2). The addition of a third animal in sentence (2) eliminates the one-to-one relationship, and renders the sentence effectively meaningless.

This indicates that the word "respectively" generally requires a one-to-one relationship between the words it modifies in order to remain meaningful. Translating this idea back to the context at hand, the word "respectively" in the claim limitation would require a one-to-one relationship between selection switches and vend price establishing devices. Accordingly, the Court finds that the plain language of the claim limitation supports Mars' construction of the claim as requiring such a one-to-one association.

Further support for this conclusion is found in the patent's specification, which, after the claim language itself, has been characterized by the Federal Circuit as the "most relevant source . . . [and the] single best guide to the meaning of the disputed claims." MBO Labs., 474 F.3d at 1329. Figure 1 is a "block diagram of the vending control circuit of the instant invention." '839 patent, col. 2, lines 22-23. The figure reflects a one-to-one relationship between vend price establishing devices and vend selection switches. Specifically, selection switch 74 is associated with price establishing device 96 via motor hold switch 158 and motor 78, and selection switch 90 is associated with price establishing device 136 via an unnumbered motor hold switch and motor 94. Id. at Fig. 1; see also id. at col. 4, lines 43-50; col. 5, lines 36-39. Nowhere in the figure are two or more selection switches associated with a single price establishing device. See id. at Fig. 1; see also Trial Trans. 39/27/19-29/9 (Kesner). This clearly bolsters the conclusion that the proper construction of limitation [c.3] requires a one-to-one relationship between vend price establishing devices and selection switches.

Moreover, the Court's task when construing a claim is to ascertain what a person of ordinary skill would have understood the claim language to mean. MBO Labs., 474 F.3d at 1329. Mars' expert witness, Mr. Kesner, testified that an engineer of ordinary skill would expect from the figure that if another selection switch were added, then another motor hold switch, motor, and vend price establishing device would be added as well, thus maintaining the one-to-one relationship reflected in figure 1. n2 Trial Trans. 39/29/9-19 (Kesner). Coinco offered no contrary evidence indicating that a person of ordinary skill would have understood the claim language any differently. Two of Coinco's witnesses did testify that additional selection switches could be added without having to add additional price establishing devices by creating a diode "or" connection to an existing price establishing device. See Trial Trans. 35/143/11-144/21 (Morley); 37/101/4-10 (Levasseur); see also Mars,
Inc. v. Coin Acceptors, Inc., Civ. Act. No. 90-49 (JCL), 2007 U.S. Dist. LEXIS 20094 (D.N.J. Mar. 21, 2007) (explaining "or" connections). However, the mere fact that one could modify the invention by attaching additional switches to existing price establishing devices does not indicate that such a configuration was covered by the '839 patent. Indeed, the Court sustained an objection by Mars to further questions on this topic for precisely this reason. See Trial Trans. 35/145/1-151/16. Nor does anything in the patent suggest that such a configuration was contemplated by the inventors. See Trial Trans. 39/29/30-31/11 (Kesner). Mr. Kesner testified that if such a configuration had been contemplated, one would expect to see certain features, such as diodes, in the figure 1 diagram of the vending control circuit.

n2 Although trial testimony is "extrinsic evidence," which is considered "less significant than the intrinsic record in determining the legally operative meaning of claim language," MBO Labs., 474 F.3d at 1329, the Court finds this testimony to be helpful--indeed critical--to illuminating and interpreting the meaning of the patent specification and how it would be understood by a person of ordinary skill.

Accordingly, the undisputed evidence indicates that the person of ordinary skill would understand figure 1 as requiring a one-to-one relationship between selection switches and vend price establishing devices. This, in conjunction with the Court's independent interpretation of figure 1 as well as the claim language, supports Mars' interpretation of claim limitation [c.3].

Mars also argues that aspects of the written description as well as "market factors" indicate that the '839 is limited to circuits having a one-to-one ratio of selection switches and vend price establishing devices. See Mars Post-Trial Br. at 14-18. The Court is not persuaded by these arguments. Nor, however, does the Court find that these factors weigh in favor of Coinco's broader interpretation of the patent claim. Notably, Coinco does not argue that these factors support its interpretation. Nor does Coinco point to any other evidence--intrinsic or extrinsic--that supports its position. Accordingly, the only relevant and informative sources of guidance (the claim language and the figure included in the patent specification) weigh in favor of Mars' claim construction position, which the Court accepts.

Alternatively, Coinco's arguments at most present a case of ambiguity in claim construction, and the Federal Circuit has stated that "where the claim is so ambiguous as to support two differing interpretations, and resort to other intrinsic and extrinsic evidence does not resolve the confusion, a court should adopt the narrower of the suggested interpretations." Quickie Mfg. Corp. v. Libman Co., 180 F. Supp. 2d 636, 645 (D.N.J. 2002); see also Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir 1996); Athletic Alternatives, Inc. v. Prince Manufacturing ("AAI"), 73 F.3d 1573, 1581 (Fed. Cir. 1996).

In the AAI case, AAI had patented a stringing arrangement for tennis rackets in which the strings were offset at distances which "varied between" a minimum and a maximum distance from the racket's central plane. AAI, 73 F.3d at 1577. Both parties agreed (1) that the phrase "varied between" unambiguously covered a stringing arrangement in which three or more offset distances were used and (2) that a stringing arrangement which employed only a single offset distance was anticipated by the prior art. Id. at 1577, 1575. The disputed question in the case was whether AAI's claim was sufficiently broad to cover a stringing arrangement which employed exactly two offset distances. The Federal Circuit examined the claim language as well as other intrinsic and extrinsic evidence, but ultimately concluded that the reach of the claim was ambiguous and that it was impossible to tell with reasonable certainty whether it covered a racket with only two offset distances. AAI, 73 F.3d at 1578-81. The Court then found, based on its understanding of the second paragraph of 35 U.S.C. § 112, that to the extent that a claim is ambiguous, a narrow reading which excludes the ambiguously covered subject matter must be adopted. AAI, 73 F.3d at 1581; see also Ethicon Endo-Surgery, 93 F.3d at 1581.

Applying this principle to the instant case, the Court finds that the narrow interpretation of the limitation proffered by Mars must be adopted. This conclusion is bolstered by the facts noted above, namely that both the claim language and figure 1 of the patent favor Mars' position and that Coinco does not point to any evidence demonstrating that its proffered interpretation should be accepted over any other. In sum, the Court finds that the proper construction of claim limitation [c.3] requires a one-to-one relationship between selection switches and vend price establishing devices.

</table>

Via separately asserts in its motion for summary judgment that because there is no "second indicating signal," the "first indicating signal" referenced in this disputed language, claim 1 is indefinite. The court does not find this argument persuasive. As set forth above, the patent specification does not refer to an indicating signal. "Indicating signal" appears twice in claim 1: "first mapping means . . . for asserting an indicating signal . . ." and "bus interface means . . . for responding to the first indicating signal." 369 patent at 13:16-19; 14:3-4. CCCC has presented evidence that a person of ordinary skill in the art would readily understand that the "first indicating signal" is in reference to the prior use of "indicating signal" in claim 1. Dubois Decl. (dkt. # 160) P 13. Via presents no evidence to the contrary.

Further, neither side's proposal provides any particularly helpful clarification to the claim language at issue. However, as CCCC's proposed construction eliminates any reference to the "first plurality of bus masters," the court feels it necessary to construe the use of "first" and "second" in this disputed claim language. Consistent with its discussion of "first" and "second" above in conjunction with the construction of "address space," the court construes "responding to the first indicating signal when said one of said first plurality of bus masters is reading data by placing the generated second address and SNOOP signal on the second bus" to mean "responding to the indicating signal from the first bus when one of the bus masters connected to the first bus is reading data by placing the generated second address and SNOOP signal on the second bus." 7

7 The court notes that elsewhere in claim 1 is recited "said second bus including means for conveying a SNOOP signal with an address appearing on the bus." 369 patent at 13:9-11 (emphasis added).
C. "In Response to Step B), Redisplaying All Data Fields Not Having An Item Selected Therefrom with Data Related Only to the At Least One Item Selected in Step B)"

This phrase appears in claim 1. Contois argues that the claim language is clear on its face, but seeks to add that the data fields without a selected item are "automatically" and "immediately" redisplayed. Otherwise, the proposed claim constructions do not differ significantly.

It is clear from the claim language that the redisplay of the data fields occurs in response to the action of selecting an item from one of the data fields, but the claim language does not support the further limitations of "automatically" and "immediately." In the specification, describing the preferred embodiment, the patentee does point out that displaying a data field after an item is selected is automatically accomplished. '868 Patent, col. 10:7-10. But if the claim language is broader than the written description of an embodiment, then the limitation of the embodiment will not be imported into the claim. Resonate, 338 F.3d at 1364-1365.

Moreover, Contois used the term "automatically" in other claims to indicate that an action was intended to occur automatically. See '868 Patent, col. 16:11-12 ("allowing the user to select media information and to automatically control" in claim 11); col. 16:44-45 ("automatically change the second data field" in claim 12); col. 16:55-56 ("automatically change the third data field" in claim 13). Had Contois intended to limit the redisplay in claim 1 to automatic redisplay, it would have expressly included the term.

The patent does not address the timing of the redisplay of data fields in response to the selection of an item, either in the claims or the written description. Contois has therefore not persuaded the Court to add "automatically" or "immediately" to the plain meaning of the words at issue.

The phrase is construed as "in response to the step b) selection, redisplaying all data fields not having a selected item with data related only to the selected item(s)."

a. "First Response Unit Means"

The first term presented by the parties to the Court for construction from the '984 patent is "first response unit means." The term in context reads "first response unit means for receiving calls in said '800' call mode." The plaintiffs argue that this term is not subject to means-plus-function analysis, despite the use of the word "means."

The Court concludes that "first response unit means" is not subject to means plus function analysis, despite the presumption to the contrary due to the word "means." The article presented by the plaintiffs, entitled "AT&T 2: Reaches Agreement with Rockwell" and dated August 26, 1986, discusses the use of audio response units in merging computer speech technology with automatic call distribution systems. (Ex. 362). The Court concludes that this article demonstrates that the term "audio response unit" or "ARU" was used by people in the art of computer telephony and would have connoted sufficient structure to those of ordinary skill in the art at the time. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996).

The parties also dispute the meaning of the term "800 call mode" which appears in the same limitation. The plaintiffs contend that this term encompasses "800," "888," and other "toll-free" calls. The defendants agree with this construction, but argue that the term encompasses any call in which the charges are reversed and the call is free to the caller, including foreign access calls and "collect" calls.

Column 1, line 66 through Column 2, line 2 of the '984 patent provides that "telephone calls may be accommodated without charge using '800' service or calling mode. Generally, the '800' calling mode accommodates free calls by callers in various areas to a particular station incurring the charges." The Court concludes that it is not proper to determine at the construction
stage whether "foreign access calls" and the like are specifically encompassed in the term "800 call mode." The Court agrees with the parties that the proper construction of "800 call mode" is: a toll-free call, i.e. a call in which the caller is not charged for the call, such as an "800" or "888" call and the like.

Z. "responsive to"

The disputed phrase "responsive to" of claims 5, 17, and 18 is found in the following context: "a request processor . . . for determining a proposed reservation time for a received reservation request responsive to information. . . ." (See col. 27, ll. 51-55; col. 31, ll. 1-4, 10-11.) n6 The Defendants argue that "responsive to" should be construed in this context and not in a vacuum. The Plaintiff, however, contends that "responsive to" should be construed to mean "based on." This construction is consistent with the ordinary meaning of the phrase and, thus, the Court adopts the Plaintiff's construction of "responsive to."

n6 The slight differences in claims 5, 17, and 18 with regard to the phrasing of the surrounding context do not affect the construction of "responsive to."

C. "Responsive to"

This term appears in Claims 2 and 4 as follows:

2. A method for storing and displaying intra-oral radiographs, comprising:

   generating and displaying intra-oral radiographs of dentition; generating and displaying a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;

   storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation along with indicia of respective selected intra-oral radiological sites; and

   subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation.

4. A device for storing and displaying intra-oral radiographs, comprising:

   . . .

   a display;

   means for generating and displaying on said display a representation of an intral-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;

   means, responsive to selection of said selectable sites, for displaying corresponding stored x-ray images.

Plaintiffs argue that "responsive to" should be construed as "in response to," while Defendants contend that the term needs no construction. Defendants' briefing repeatedly asserts primarily that there is no reason to replace the simple phrase "responsive to" with Plaintiffs' proposed language. In their response to Plaintiffs' Opening Claim Construction Brief and in
their presentation to the Court at the Markman hearing. Defendants also asserted that, as used in the 579 patent, "responsive to" is a phrase that modifies the term radiographs (radiographic images), whereas Plaintiffs propose that "responsive to" modifies the claimed acts of storing and displaying. Defendants argue that "the [radiographic] images are responsive to selection' of sites within the film holder representation." Defendants' Response to Plaintiffs' Opening Brief at 19.

Though the Court would generally conclude that this term is plain and requires no construction, the fact that Defendants offer a construction at odds with Plaintiffs' construction leads the Court to conclude that construction of the term is appropriate. The Court finds that a plain reading of the claim language indicates that "responsive to" means "in response to." The Court finds Defendants' construction to be nonsensical, as it does not understand how images can be responsive to selection as Defendants urge. Plaintiffs' construction is further supported by the use of the term in claim 4: "means, responsive to selection of said selectable sites, for displaying corresponding stored x-ray images." There is no term "images" in claim 4 as there is in claim 2, and in claim 4, "responsive to" clearly means "in response to." Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can illuminate the meaning of the same term in other claims. Phillips, 415 F.3d at 1314. Because "responsive to" in claim 4 means "in response to," it supports Plaintiffs' construction of the term in claim 2 as well. Plaintiffs' construction is further supported by the description of the invention in the specification, which makes clear that images are stored after selection, or in other words, in response to selection of the icon in the film holder representation, and that they are similarly retrieved and displayed after selection, or in other words, in response to selection, of positions in the representation.

Accordingly, the Court adopts Plaintiffs' construction of "responsive to" as "in response to."

3. "responsive to a potential of"

Claims 1, 4, 7, 10, 18 and 21 contain the phrase "responsive to a potential of." Toshiba contends that this simple term requires no construction. Jt Cl Const, Ex B at 12. Alternatively, Toshiba proposes that "responsive to a potential of" means "responding to a voltage of." Id. Hynix construes the phrase as "directly supplied with and reacting to the potential of." Id (emphasis added).

Hynix again seeks to import a limitation from the specification based on an exemplary embodiment. In particular, Hynix relies on Figure 13 to argue that the "gates of transistor Q7 are directly supplied with the potential on the bit lines (BL1, BL2, BL3)." Id at 16 (emphasis added). Hynix provides no other support for its proposed "directly" limitation. As noted previously, the court cannot import this limitation into a claim construction based on a preferred embodiment. See Teleflex, 299 F3d at 1326.

Because Hynix's construction is flawed and Hynix has not provided any reason why this seemingly simple term must be construed, the court declines to construe "responsive to a potential of."

5. Issuing a "command" "responsive to a predetermined event" means issuing a command in reply or reaction to the occurrence of one or more conditions chosen in advance. There is no requirement that the command or message be issued immediately following the condition, absent any intervening events, so long as it is issued in reaction to the condition. (See, e.g., '885 patent, col. 26, II. 32-35 (using term "after"))

VII. "CONSTRUCTION" OF CLAIM 33 OF THE '250 PATENT

Claim 33 of the '250 patent is a method claim. Limitation (c) 27 is a step that includes, "selectively adding a current to [a
signal] wherein the amount and/or polarity of said current is responsive to [another signal] . . . . There has been no prior claim construction as to this limitation, and Gennum contends the Court should engage in claim construction now. TLC argues that no claim construction per se is necessary, and that its meaning is clear from the language of the claim. In Gennum's view, TLC is treating this claim as if it contained the word "variable" prior to the term "current." Gennum argues that such a construction would be improper and urges the Court instead to construe the claim such that it would read on a method that adds a fixed amount of current.

For the same reasons that Gennum contends it would be improper to insert the word "variable" before current, it would be equally improper to add the phrase "fixed or variable," which, in essence, is the construction Gennum is advocating. The issue, however, is not one of claim construction. TLC is correct that the language of the claim is sufficiently clear as it stands, and that is the construction it will be given.

While Gennum has presented the issue as implicating claim construction, at heart, the question is only whether a method that adds only a fixed current is within the scope of that claim language, either for purposes of determining infringement or for evaluating whether the claim is valid in light of the prior art. As such, it would be improper to resolve that question as part of construing the claim.

A claim is construed in the light of the claim language, the other claims, the prior art, the prosecution history, and the specification, not in light of the accused device . . . [C]laims are not construed "to cover" or "not to cover" the accused device. That procedure would make infringement a matter of judicial whim. It is only after the claims have been construed without reference to the accused device that the claims, as so construed, are applied to the accused device to determine infringement.

SRI Intern. v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1118 (Fed. Cir.1985).

Although not phrased in such terms, Gennum's argument essentially is that the language of claim 31 "covers" a method that adds a fixed current. That argument can be evaluated, but not as a matter of "claim construction."

**TLC is correct that a method that adds a current in a fixed amount would not infringe this claim.** The feature of adding current in a "responsive" amount also provides a basis for distinguishing this claim from prior art in which only a fixed amount of current was added. This is not the result of construing the claim as if it contained the word "variable," but the simple consequence of the plain words of the claim. As TLC points out, limitation (c) first calls for "selectively adding" current. In other words, current is either added, or it is not. Then, however, the claim requires that any current added be in an "amount and/or polarity" that is "responsive" to a particular signal. If a current is added in an amount that is fixed, the amount is not "responsive" as required by the language of the claim.

Gennum argues that merely adding or not adding current, even in a fixed amount, satisfies the requirement that the current be "responsive." Gennum points out that the claim calls for the amount "and/or" polarity to be responsive and that polarity can only be one of two states (positive or negative). Gennum reasons that if polarity can be "responsive" when it can only be either positive or negative, then amount can be "responsive" if it is either off or on. 28 The flaw in this argument is that even though polarity can only be one of two states, there is a third possibility--if there is no current, there is no polarity. This third "state" of polarity exists when current is not added to the signal, and the "amount" of current added is "none." Once current is "selectively added" to the signal, however, that current must have a polarity that is either positive or negative and an amount other than zero. For that amount to be "responsive" it cannot be always the same, non-zero, value.

--- Footnotes ---

27 Unlike the unlabeled claim limitations in the '869 patent discussed above, the '250 patent labels the four steps of claim 33 as (a) through (d).

28 Gennum notes that some devices may use circuits that change between "low" and "high," rather than "off" and "on." That possibility, however, does not affect the analysis.
Put differently, by saying that a fixed amount of current is "responsive" because it can be either "on" or "off," Gennum has overlooked the fact that the claim only refers to an amount of current that has been selectively added--i.e. that is not "off." Again, the claim reads, "selectively adding a current . . . wherein the amount . . . of said current is responsive . . ." If current has not been added, it has no amount. Thus, TLC is correct to argue, as it does, that a method using an "on/off" circuit to add current would meet the "selectively adding" condition of this claim, but it would not meet the requirement of "wherein the amount . . . is responsive." 29

29 Despite its consistent advocacy that the limitation of claim 33 is met by circuitry that injects a fixed current amount, Gennum's Proposed Findings include a curious distinction in its descriptions of purportedly invalidating prior art references. In the case of three of the references, Gennum proposes a finding that the claim limitation is satisfied where the prior art device "sink[s] a small nearly constant current", "when required in response to the compared signal." Gennum's Proposed Findings at 51:17-19; 54:19-22; and 57:14-16. (Emphasis added). (In the case of a fourth prior art reference, the LM 1881, the circuit is simply described as satisfying the limitation by either injecting current or not. Gennum's Proposed Findings at 48:17-20.) In contrast, Gennum proposes that the Elantec prior art reference meets the claim limitation because "current is selectively added . . . in an amount responsive to the compared signal." Gennum's Proposed Findings at 59:11- 14 (emphasis added). However inadvertent it may have been, the fact that Gennum's proposed findings match the actual claim language when describing the one piece of allegedly prior art that injects a variable current but depart from the claim language when describing prior art circuits with fixed current, further supports the conclusions reached in this section.

Again, this conclusion does not mean that the claim has been "construed" as if it contained the word "variable." Rather, the claim, on its face, requires that when a current is added (i.e., when the current is on, not off), the amount of that current be "responsive" to another signal. 30 As a matter of infringement analysis, or in evaluation of prior art (rather than a matter of claim construction) it is apparent that a circuit that adds a fixed amount of current is not within the scope of this claim, because an unchanging amount of current cannot be said to be "responsive" to another signal. 31

30 While this conclusion appears from the plain language of the claim, it also is consistent with the specification. Gennum argues that the specification does not expressly refer to a variable current being added and that, to the contrary, the description found at column 7, line 55 to column 8, line 4 of the '250 patent, "is an 'on or off' description." Gennum Brief at 18:16-17. The drawings and text of the specification, however, disclose that "OPS" (sometimes mis-written in the specification as "OPS") is an operational amplifier in a closed loop, with an output that varies according to the voltage of the video signal at its negative input. See '250 patent, col. 7, lines 45-51; Figure 2. As part of its argument that this claim should be construed such that a circuit adding a fixed amount of current would be within the meaning of the claim, Gennum points to prosecution history that the word "responsive" was a replacement for earlier language calling for the current to be added in an amount "accurately corresponding" to another signal. In making the amendment, Cooper asserted to the Patent and Trademark Office ("PTO") that "responsive" was the "broader but better defined." It is unclear why Cooper believed the term was "better defined" as it does not appear to be defined anywhere in the patent or the prosecution history. It probably is "broader" in that "responsive" seems unlikely to require as precise a correlation between the amount of current added and the other signal as called for by the prior language. Nevertheless, the mere fact that "responsive" is broader than the prior language does not change the conclusion that a current fixed in amount cannot be considered "responsive."

Trans Texas first argues that the Board erred in construing the term "responsive to the rate of inflation" in the '461 patent and the related terms "as a function of a rate of inflation" and "based on a rate of inflation" in the '673 patent. Trans Texas has treated these terms as equivalent and focused on the "responsive to the rate of inflation" limitation, and we will do likewise.
Trans Texas primarily argues that the Board should have given preclusive effect to the district court's Markman order, which construed "responsive to the rate of inflation" to mean "directly responsive to a market indicator of prior actual inflation and is not meant to include the market's expectation of future inflation." Markman Order at 15. As discussed above, we assume, as Trans Texas argues, that the district court construed the term to require a "continuous, one-to-one correlation with the inflation rate." Appellant's Br. 20; see also Markman Order at 12.

Traditionally, issue preclusion, also known as collateral estoppel, applied only where the same parties to an earlier proceeding were involved in later litigation involving the same issue. See Restatement (Second) of Judgments § 27 (1982); Id. § 29 Reporter's Note. More modern decisions in some circumstances apply issue preclusion even where the parties to the subsequent suit are not the same. See Parklane Hosiery Co. v. Shore, 439 U.S. 322, 326-33, 99 S. Ct. 645, 58 L. Ed. 2d 552 (1979); Restatement (Second) Judgments § 29. The latter doctrine is known as non-mutual collateral estoppel, and it is this latter doctrine that Trans Texas relies on here.

Issue preclusion is not warranted in this case because the PTO was not a party to the earlier litigation. Our case law has identified four prerequisites to the application of issue preclusion: "(1) identity of the issues in a prior proceeding; (2) the issues were actually litigated; (3) the determination of the issues was necessary to the resulting judgment; and, (4) the party defending against preclusion had a full and fair opportunity to litigate the issues." Jet, Inc. v. Sewage Aeration Sys., 223 F.3d 1360, 1365-66 (Fed. Cir. 2000) (emphasis added).

The PTO as "the party against whom the earlier decision is asserted" thus must have been accorded "a 'full and fair opportunity' to litigate that issue in the earlier case." Allen v. McCurry, 449 U.S. 90, 95, 101 S. Ct. 411, 66 L. Ed. 2d 308 (1980); Freeman, 30 F.3d at 1467 (Fed. Cir. 1994). However, the PTO was not even a party to the earlier district court litigation and cannot be bound by its outcome. Trans Texas nevertheless argues that this requirement should somehow be excused because the PTO proceedings were ex parte. This argument simply makes no sense. The PTO is plainly a party to these appeal proceedings, and if it were not treated as a party, there would be no basis for even considering the application of issue preclusion in the first place.

We have never applied issue preclusion against a non-party to the first action. In fact, the Supreme Court has specifically held that "litigants . . . who never appeared in a prior action[] may not be collaterally estopped without litigating the issue. . . . Due process prohibits estopping them despite one or more existing adjudications of the identical issue which stand squarely against their position." Blonder-Tongue Labs., Inc. v. Univ. of Ill. Found., 402 U.S. 313, 329, 91 S. Ct. 1434, 28 L. Ed. 2d 788 (1971); see also Parklane Hosiery, 439 U.S. at 327 n.7 ("It is a violation of due process for a judgment to be binding on a litigant who was not a party or a privy and therefore has never had an opportunity to be heard."); Restatement (Second) of Judgments § 29 Reporter's Note ("The proposition that a non-party cannot be bound by a judgment, unless he is represented by a party or has interests that are derivative from a party, is a rule of Constitutional law.").

Recognizing the general rule against collaterally estopping a non-party, Trans Texas asserts that it somehow represented the PTO's interests in the district court action. However, the "presumption that nonparties are not bound by a judgment" can only be rebutted in limited circumstances, such as when the non-party was in privity with a party, has interests that are derivative from a party, or "participate[d] in an active and controlling way" in the litigation. See 18A Charles Alan Wright, et al., Federal Practice & Procedure § 4449 (2d ed. 2002); Restatement (Second) of Judgments § 29 Reporter's Note. The PTO's interests were not represented in the earlier litigation even though Trans Texas there urged that the district court reject the construction that the district court adopted. Since the PTO was not a party to the district court litigation, issue preclusion does not apply.
Contrary to Trans Texas's argument, our decision in Freeman does not require the application of issue preclusion. In Freeman, we held that a patentee in a PTO proceeding was barred by issue preclusion from asserting a claim construction already rejected in a district court infringement action brought by the patentee against a third party. 30 F.3d at 1469. Nothing in Freeman suggests that issue preclusion could be applied against the PTO or another non-party to the infringement proceeding.

Footnotes

7 In light of our resolution of Trans Texas's issue preclusion argument, we have no need to decide whether non-mutual collateral estoppel against the government would be permissible at all in the circumstances of this case. See United States v. Mendoza, 464 U.S. 154, 104 S. Ct. 568, 78 L. Ed. 2d 379 (1984).

Footnotes

8 Trans Texas also points out that some of the deposit accounts in Mukherjee had features requiring: (1) that a threshold value be exceeded before any inflation-adjustment was made; (2) a proportional adjustment (i.e., every one point inflation increase leads to a one-half percent inflation-adjustment). Trans Texas argues that these accounts were not "directly responsive" to the rate of inflation. This is beside the point given the disclosures described in the text above with respect to other accounts that did not include such limiting features.

Footnotes

Trans Texas's argument is not persuasive. Claims are given "their broadest reasonable interpretation, consistent with the specification, in reexamination proceedings." In re Yamamoto, 740 F.2d 1569, 1571 (Fed. Cir. 1984). The term "responsive to the rate of inflation" is defined in the specification as "mean[ing] directly responsive to a market indicator of prior actual inflation and it is not meant to include the market's expectation of future inflation." '461 patent col.3 ll.11-14. As the Board noted, the specification's definition only requires that the inflation adjustment be "directly responsive" to a market indicator of inflation. There is nothing in the specification or the prosecution history that requires an immediate inflation-adjustment every time the rate of inflation increases. Trans Texas argues that immediate responsiveness is the only construction consistent with the specification because "each of the examples in the '461 specification . . . [is] adjusted on a one-for-one basis." Appellant's Br. 19. Even if the examples are so limited (which the PTO disputes), Trans Texas's argument conflicts with our decision in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc). In Phillips, we held that while "the specification [should be used] to interpret the meaning of a claim," courts must not "import[] limitations from the specification into the claim." Id. at 1323. We specifically noted that it is improper to "confin[e] the claims to th[e] embodiments" found in the specification, as Trans Texas asks us to do. Id.

Under Phillips, dictionary definitions are also pertinent. See id. at 1318 ("[T]he court has observed that dictionaries . . . can be useful in claim construction."). The dictionary definition of "directly" confirms that the specification's requirement that the adjustment be "directly responsive" to a market indicator does not require that an inflation-adjustment occur immediately after any increase in the reported rate of inflation. While some definitions define "directly" as "simultaneously and exactly or equally" or "immediately," other definitions define it as "after a little: in a little while: shortly, presently."
Webster's Third New International Dictionary Unabridged 641 (2002). In view of the latter definitions, we conclude that the broadest reasonable interpretation of "directly responsive" is not limited to situations in which the inflation-adjustment occurs immediately after any increase in the reported rate of inflation, but also includes situations in which the inflation-adjustment occurs "a little while" after an increase in the reported rate, such as when the increase reaches one percent. The Board did not err in concluding that the broadest reasonable interpretation of the term "responsive to the rate of inflation" (and related terms) is not limited to a continuous, one-to-one relationship but also includes a delayed relationship, in which adjustments are made in one percent increments.

3752

10. "responsive to revision selection list"

Disputed Term the computer program accesses a revision selection list of revised publications and identifies maintenance required by the publications, the computer program being responsive to the revision selection list for updating the compliance record for the identified profile to include maintenance required based on revisions to the publications.

Plaintiff's Construction reacting to changes in a selection list

Defendant's Construction automatically updating based on revisions to the publications

The focus of the parties' final dispute with respect to Claim 9 relates to the effect of the revision selection list on the computer program. On the one hand, Plaintiff contends that the program reacts to changes in the list, while Defendant asserts that the program is automatically updated as a result of changes to the list. (Jt. Stmt. at 27.) In support of its proposed construction, Plaintiff relies on the Tdata decision which ruled that, "The language 'responsive to the revision selection list for updating maintenance required' means 'reacting to changes in a selection list for revising information related to required maintenance.'" Tdata, Slip. Op. at 20. However, the TData court provides no analysis to support its construction other than noting that "the clause refers back to the words 'revision selection list' set forth earlier in the same claim....” Id. Given its lack of any meaningful analysis, the Tdata court's construction is neither helpful nor instructive on this point.

In contrast, the Court finds that the Defendant's proposed construction accurately describes the interaction between the computer program and the revision selection list under the '806 Patent. The language set forth in Claim 9 clearly states that the computer program is used to access the revision selection list, which is a list of revised publications and the maintenance specifically required by those publications. Based on the information contained in the revision selection list, the program updates both the maintenance requirements and the compliance record for the particular equipment, which corresponds to profile being utilized by the user. Thus, the program is not merely "reacting to changes in the selection list," as suggested by Plaintiff. Rather, upon revision to a publication in the database, the program updates the maintenance requirements and compliance record.

Based on the above, the Court construes "responsive to the revision selection list" as "updating based on revisions to the publications."

5 Defendant did not provide support to include the limitation "automatically" updating.

3753

7. "restrict unit functions to authorized users" (Claim 2)

Defendants seek to construe "restrict unit functions to authorized users" as "the persistent unique hardware identification is
used to prevent unauthorized users from accessing, controlling, operating, or programming the unit." Keystone argues that defendants attempt to improperly narrow the claim limitation by proposing that "restricting unit functions" requires preventing users from "accessing, controlling, operating or programming" the unit. Plaintiff argues there is no support for this limiting definition in the intrinsic evidence. Keystone's proposed construction of the term instead is "prevent the unit from performing one or more actions for unauthorized users."

Defendants argue that the inventor has emphasized the importance of the theft deterrence feature, noting that the "entire system can only be accessed by authorized users," the authorization being based on the "persistent unique hardware identification" of the unit. Therefore, defendants argue both these aspects must be included in the claim construction. However, the claim itself recites that "the persistent unique hardware identification is used to restrict unit functions." It would be redundant to include the basis of the restriction in the construction of this term as well. The Court agrees with defendants that the inventor anticipated complete restriction of unauthorized access and not partially permitted access as claimed by the plaintiff. The Court therefore construes this term to mean "prevent the unit from operating for unauthorized users."

3754

3. "Image Data Resulting From A Number Of Previous Processing Operation[s] During The Stroke"

The fifth element of claim 64 recites that "each processing operation after an initial portion of the stroke comprises processing image data resulting from a number of previous processing operation[s] during the stroke." Adobe contends that the phrase "image data resulting from a number of previous processing operation[s] during the stroke" means image data that "is not the original image data that existed prior to the very first processing operation in the stroke." The court agrees. It is clear from the claim language itself that "image data resulting from a number of previous processing operation[s] during the stroke" simply cannot be image data that existed before the first processing operation. During the initial processing operation, the image data as it existed before the occurrence of that processing operation is modified. By definition, something that is modified does not exist in its original state.

Quantel objects to Adobe's proposed construction on the ground that Adobe's construction would appear to mean that "image data resulting from a number of previous processing operation[s] during the stroke" could not include any original data. The court holds only that "image data resulting from a number of previous processing operation[s] during the stroke" cannot be image data precisely as it existed before the initial processing operation because such data is modified during the processing operation. This construction does not exclude the possibility that some of the original image data may be part of the "image data resulting from a number of previous processing operation[s] during the stroke."

3755

The Court construes "resume signal" as a "signal used for the purpose of exiting a low-power state." Here again, the Court's construction is essentially Plaintiff's proposed construction except it substitutes the words "low-power state" where Plaintiff incorporates its construction of low-power state.

A. Parties' Construction Arguments

Plaintiff seeks a construction of "resume signal" as a "signal used for the purpose of exiting a [low-power state]." Plaintiff cites to the specification for support here. See '323 patent, 5:47-48 ("To return a unit that is in low power mode to full power operation, a resume signal is sent to the unit."); 5:60-62 ("Upon receipt of the resume signal, the receiving ADSL unit returns to the signal processing 111, transmitting 112, and receiving 113 circuitry to full power mode."). But Defendants argue in return that Plaintiff's construction is improper because it may allow a signal sent after the power up sequence has began to qualify as a resume signal. Therefore, Plaintiff's construction might be read improperly to cover any signal transferred between units during the power up sequence rather than the first signal sent over the loop that initiates the power up sequence.
Defendants seek a construction that reads a "signal that starts the process of restoring circuitry to an operational state." Defendants argue that the resume signal must "start[] the process" of activating the return to full power mode. As noted above, Defendants argue this is different than Plaintiff's construction which would allow a signal sent after the power up sequence begins to also qualify as a resume signal. Defendants also state its construction is supported by the specification. See '323 patent, claims 7 & 16 ("detect a resume signal . . . and then initiate the power up sequence for the first circuitry" and "detect a resume signal . . . and then to initiate the power up sequence for the first circuitry") (emphasis added).

B. Analysis

The Court disagrees with Defendants that the resume signal "starts the process" of restoring the circuitry to an operational state. The specification makes clear that in fact the "start-up signal" starts the process and not the "resume signal." See '323 patent, 6:19-22 ("To return the loop 220 to an active state, a start-up signal is sent to the CPE (step 301) . . . . The CPE ADSL unit then transmits a 16 kHz resume signal . . . .") (emphasis added); '323 patent, Figure 3 (illustrating that the "start-up signal" comes before the "resume signal" on the flow chart showing how full power mode is resumed). Further, the Court disagrees with Defendants' construction where it uses the language "operational state" because it implies there is a non-operational state for the circuitry. As the Court stated above when construing "low-power state," the specification never requires or mentions the circuitry being in a non-operational state. To the contrary, the specification inserts the qualifying word "fully" when discussing "reaching a fully operational state," which implies there may be some middle ground between operational and non-operational. '323 patent, 6:1-2.

The Court primarily agrees with Plaintiff's proposed construction of "resume signal." The Court is unconvinced of Defendants' argument that this construction is improper because it may allow a signal sent after the power up sequence has begun to qualify as a resume signal. In fact, as discussed above, since the power up sequence begins with the start-up signal, the resume signal by definition may be a signal sent after the power up sequence has begun. The specification supports the Court's construction. See '323 patent, 6:30-33 ("If the COT unit is in a low power state, it will return to full power operation upon detection of the resume signal from the CPE unit . . . ."). Therefore, the Court construes "resume signal" as a "signal used for the purpose of exiting a low-power state."

4. Reticle Image or Pattern

The final disputed claim term is "reticle image" or "reticle pattern," which appears in claims 1-14, 17-19, and 22 either expressly or by reference. As used in the '908 Patent, the term "reticle image" or "reticle pattern" means one of a series of lines, dots or crosshairs, capable of serving as a reference for centering or otherwise adjusting an optical element in a telescope.

The parties' dispute over this term concerned Glatter's assertion that the reticle image was required to be "axially symmetric." (Def.'s Opp. Br. at 3.) It was initially unclear what Glatter meant by "axially symmetric," whether he meant symmetric about one axis or two, and if it were two whether those reference axes had to be at right angles to one another. It appears that Glatter meant the last possibility, the sort of two-dimensional crosshair images that appear in Figures 6-8 and 12-15: two lines lying at right angles to one another, or a shape that is symmetric about each of those lines. (Markman Tr. at 35:10-14.) Such images, especially when they contain spaced gradations, function well as a reference tool for (1) determining the center of an optical element, (2) determining whether an optical element's angular orientation is perpendicular with the laser beam's path, and (3) measuring the difference made by a particular adjustment. However, there is an issue as to whether or not "reticle image," as used in the patent, is limited to such a specific image.

n8 Plaintiff called "axial symmetry" "line symmetry," which means having the quality of being equally distributed on either side of a single dividing line in two dimensions. (Markman Tr. 35:15-18.)
Looking first to the claims, claim 1(a) provides "a reticle image having one of a series of lines, dots, or crosshairs." '908 Patent at 6:31-32. Glatter's brief cites an online dictionary definition for "reticle" as "a network of fine lines, dots, cross hairs, or wires in the focal plane of the eyepiece of an optical instrument." (Def. Opp. Br. at 3)(citing http://www.hyperdictionary.com.) Glatter comments that in light of his definition of the word reticle, the phrase "reticle image having one of a series of lines, dots, or crosshairs" in claim 1 is redundant. (Id.) The Court agrees with Glatter's comment, which indicates that claim 1 contains the definition of "reticle image," as used in the patent. Therefore, the patent contains a clear definition of the term in claim 1, which contains no limitation of "axial symmetry."

Next, the term "axially symmetric" does not appear anywhere in the '908 Patent. However, figures 6-8 and 12-15 in the '908 Patent contain reticle images that happen to be "axially symmetric" by Glatter's definition. Additionally, the only references to specifically shaped reticle images are to images that happen to be axially symmetric. '908 Patent at 2:21-27, 3:13-6:27. Nonetheless, the figures and descriptions are limited to the preferred embodiment, and courts should "avoid the danger of reading limitations from the specification into the claim[s]." Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331, at *15. There are examples of common geometric images, "composed of one of a series of lines, dots, or crosshairs" that are not "axially symmetric," according to Glatter's definition. n9 Therefore, the problem with imposing "axially symmetric" on the term "reticle image" is the danger that it unduly limits the scope of the patent by "confining the claims to [the preferred] embodiments." Id. There is nothing in the patent's specification that limits term "reticle image" to "axially symmetric" images.

n9 The most glaring example would be a triangular pattern or crosshair with three lines, equally spaced from one another in a two-dimensional plane, coming from a center point. Such an image would not be "axially symmetric" - having lines spaced at ninety degrees from one another, or shapes symmetric about such lines - but could serve the same function according to the patent. (The same would be true of any crosshair with an odd number of equally spaced lines stemming from its center.) Other examples of common patterns that are not "axially symmetric," or symmetric about any line, are those that only exhibit point symmetry - shapes wherein all of the components can be reflected through a center point and form the same image. These can include shapes that are not axially symmetric, like the letters "Z" and "S," and any geometric shape with a single diagonal line (that does not run along an axis of symmetry existing in the shape alone) passing through it, e.g., a rectangle with a diagonal passing from one corner to he opposite corner through its center.

Nonetheless, Glatter argues that a person of ordinary skill in the art would interpret the term "reticle image" to be limited to "axially symmetric" images. (Id. at 1-2.) It is clear that a person of ordinary skill in the art would be familiar with the term reticle. In fact, some definitions of the term reticle reference telescopes. The Oxford English Dictionary (2d ed. 1989), for example, defines "reticle" as "[a] set of parallel wires, threads, etc., with others intersecting them at right angles, or of lines similarly ruled upon a sheet of glass, placed in the object-glass of a telescope, in order to facilitate accurate observations." However, Webster’s Third New Int’l Dictionary 1938 (1986), similar to Glatter's proffered dictionary definition, supra, defines "reticle" as "a system of lines, dots, cross hairs or wires in the focus of the eyepiece of an optical instrument (as a gunsight, microscope, telescope, or transit) used typically for estimating speed or distance, for measuring or counting, or as a centering or aiming device." The issue is whether one of ordinary skill in the art would understand the term reticle to be limited to "axially symmetric" patterns or images. The above dictionary definitions of "reticle" differ on the issue, because one presents examples that are "axially symmetric," as Glatter uses the term, while the other is silent as to that limitation. Thus, there is no clear indication that one of ordinary skill in the art would presume that limitation. Since there is no limitation in the claims, no limitation in the specification, and no mention of axial symmetry in the patent or the dictionary definition, this Court will not impose that limitation on the term "reticle."

- 4042 -
The issue regarding this term is whether it allows for multiple accesses, as SAP suggests, or one access, as Versata argues.

In support of its limitation, Versata points to portions of the specification that "consistently describes the use of an access to a data source in order to retrieve information." Pls.' Opening Brief at 14; see, e.g., '350 Patent, col. 19, ll. 7-22; Figs. 15A-C; col. 8, ll. 17-30. Furthermore, Versata cites to claim 20 of the '350 patent. Specifically, the cited portion states, "using a query to a data source." Finally, Versata cites one instance in which the patentee discusses a disadvantage of prior art--that being multiple database queries.

As argued by SAP, however, Versata's assertions are not persuasive. First, Versata overlooks the rule "that 'a' or 'an' can mean 'one or more.'" See Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1342-43 (Fed. Cir. 2008). Second, claim 20 is a dependent claim, and construing all the claims in such a limiting manner would not be consistent with the doctrine of claims differentiation. See Phillips, 415 F.3d at 1315. Finally, those portions of the specification cited by Versata in support of its limitation do not rise to the level required to find that the patentee disclaimed multiple accesses and/or expressly claimed only a single embodiment.

For these reasons, the court adopts SAP's construction.

### Claim Construction

On February 16, 2006, the Court held a claims-construction hearing in this matter. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The Court considered the '136 Patent and prosecution history, the parties' Markman briefs, the applicable law regarding, inter alia, claim construction, indefiniteness, and means-plus-function claims, and the argument of counsel. On May 25, 2006, this Court rendered a claims-construction order (Doc. # 292), which construed the terms as following:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Construed Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Debit Card&quot;</td>
<td>&quot;a prepaid card for exchange of value&quot;</td>

<td>&quot;stored on the terminal prior to the consumer presenting the debit card to the merchant&quot;</td>
</tr>
</tbody>
</table>
"Relates . . . in a predetermined manner"  "prior to a transaction, ID information stored on the debit card and ID information stored on a terminal are capable of being matched"

"Matching" and "Matched"  "determining whether ID information stored on the debit card and corresponding ID information stored on the terminal are equal or identical"

"Retrieving via the terminal"  "locating and returning, by means of the terminal, ID information and a card number stored on the debit card"

"Computer" and "Computer means"  "a data processing device"

"Transmitting to a computer"  "sending by means of a signal path to a computer"

"Validation" and "Valid"  "indication of whether the ID information stored on the debit card matches the corresponding ID information stored on the terminal"

"Computer means disposed remotely"  "a computer that is located apart from a terminal and connected to the terminal by a signal path"

"Card reader means"  "a device, included as part of a terminal, used for retrieving ID information from a debit card"

"Communication means function"  "transmitting the ID information stored on the debit card and the ID information stored on the terminal to the computer means"

"Communication means structure"  "a modem or a signal path"

"Selected from a group of ID information" (Claim 2)  "chosen from one of the following ID information"

--- Footnotes ---

n2 "ID," as used throughout this opinion, in whatever context, is shorthand for "identification."

--- End Footnotes ---

9. "Return Electrode."
As contrasted with an active electrode, the term "return electrode" means "an electrode having a larger area of contact than an active electrode, thus affording a lower current density." 4

4 The court notes that the area of contact in the present invention contacts the electrically conductive fluid. In the prior art, the area of contact contacted the body.

4045
construction of "revenue projection" which is more general: "a forecast of receipts of money."

For claim 8 of the '464 patent, Grantley proposes "software or any hardware programmed to calculate the total dollar value of orders for future advertising time for multiple stations. The 'system' does not include a human being attempting to perform the task or function manually." For the remainder of the claims, Grantley suggests that their meanings are self-evident from the words of the claims themselves, from the proposed construction of the term in claim 8 of the '464 patent, and from the construction of phrases like "billing system" and "means for generating a revenue projection." Clear Channel suggests that the phrases are indefinite or not capable of being construed.

Since the parties have withdrawn the phrase "means for displaying revenue projections" as a term to be construed, the real dispute between the parties is the meaning of revenue projection as it is used in each particular context. For example, claims 8 and 11 of the '464 patent cover a "system for generating [and displaying] revenue projections." 3 Claim 11 of the '824 patent and claims 12 and 18 of the '187 patent use the phrase "generate a revenue projection." Claim 13 of the '824 patent covers "determining projected future revenues."

Indefiniteness

Validity analysis is not a regular component of claim construction. The oft-cited maxim that "claim language should generally be construed to preserve validity, if possible," Tate Access Floor Inc. v. Interface Arch. Res. Inc., 279 F.3d 1357, 1367 (Fed. Cir. 2002)(emphasis in original), applies only in the case where the court concludes, after applying all the available canons of claim construction, that the term at issue is still ambiguous. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 911 (Fed. Cir. 2004).

In that situation, claims can be construed to preserve their validity "where the proposed claim construction is 'practicable,' is based on sound claim construction principles, and does not revise or ignore the explicit language of the claims." Generation II Orthotics, Inc. v. Medical Tech. Inc., 263 F.3d 1356, 1365 (Fed. Cir. 2001). As a general rule, however, claims need not be plain on their face in order to avoid condemnation for indefiniteness; rather, what [the court will ask] is that the claims be amendable to construction, however difficult that task may be…. [t]he test for indefiniteness does not depend on a potential infringer's ability to ascertain the nature of its own accused product to determine infringement, but instead on whether the claim delineates to a skilled artisan the bounds of the invention.

Smithkline Beecham Corp. v. Apotex Corp., 403 F.3d 1331, 1340-41 (Fed. Cir. 2005).

Here, there is little dispute between the parties as to the meaning of "revenue projection" as it is commonly understood. The court should only undertake a validity analysis if it finds the term ambiguous after employing the canons of claim construction. See Liebel-Flarsheim, 358 F.3d at 911. Such is not the case here. As noted supra, the specifications of the patents-in-suit incorporate by reference two publications by the inventor Mr Fox, which are described as exemplifying "sound economic principles and station management practices" that can be used to design demand curves. '691 patent, col. 8, ll. 42-56. 4

4 "This [designing demand curves] can be accomplished by close adherence to sound economic principles and station management practices such as those set forth in Pricing & Rate Forecasting Using Broadcast Yield Management, B. Shane Fox, published by the National Association of Broadcasters, 1992, and Broadcast Revenue Management: Pricing Inventory Management in Today's Broadcast Environment, B. Shane Fox, published by the National Association of Broadcasters, 1997, the contents of which are incorporated by reference herein."
These Fox references define, for example, what a yield management system does ("creates demand projections for each future broadcast day based upon the booking patterns of previous periods"), explains how broadcast companies develop pricing strategies, and describes the price forecasting process. See B. Shane Fox, Pricing & Rate Forecasting Using Broadcast Yield Management 1, 38-47, Chapter III (pp. 49-108) (National Association of Broadcasters, 1992). For example, the key to profitable pricing is to determine the level of cost which can profitably be incurred, "given the revenue that is expected to be earned from the number and type of advertisers." Id. at 31. In short, both publications provide a methodology for predicting or forecasting prices and revenues, taking into account inventory, pricing history, and demand.

The proposed construction of "revenue projection," then, is based on the specification and the references it incorporates, and explicitly takes into account the language of the claims. While the court is cognizant of Clear Channel's concerns, broad claims are not indefinite where, as here, they can be construed in a non-ambiguous manner. See, e.g., In re Gardner, 427 F.2d 786, 788, 57 C.C.P.A. 1207 (C.C.P.A. 1970)("Breadth is not indefiniteness.").

Prosecution Disclaimer

Clear Channel also argues that the patentee disavowed many of these common definitions of revenue projection during prosecution. Tr. at p. 41, ll. 9-13, p. 42, ll. 6- p. 44, l. 13. Specifically, Clear Channel points to applicant's statement distinguishing his invention over a prior art reference (U.S. Patent No. 5,615,106 to Eder, hereinafter "the Eder patent") on the basis that "means for generating revenue projection for some or all media stations based upon orders for advertising time segments recorded in the traffic billing system for each selected media station" refers to the "amount of money represented by actual orders placed for future advertising time for multiple stations." 6/17/04 Statement of Applicant, Pl. Cl. Const. Br., Ex. S, at 6 [Doc. # 56, p. 7 of 17]. According to Clear Channel, this means that revenue projection can only encompass the money deriving from selling future advertising time, and that the applicant disclaimed money deriving from accounts receivable (i.e., existing orders which have not yet been paid for).

In order to limit the scope of a claim, a prosecution disclaimer must be "both clear and unmistakable to one of ordinary skill in the art." Elbex Video, Ltd. v. Sensormatic Elec. Corp., 508 F.3d 1366, 2007 U.S. App. LEXIS 27399 at *11-12 (Fed. Cir. Nov. 28, 2007)(citing cases in which no clear disclaimer was present). The court does not think that such a clear disavowal occurred in this case. The applicant actually distinguished the prior art reference on the grounds that the forecast referred to by Eder was a "prediction, i.e., an attempt to extrapolate future sales and cash receipts based on past trends and history," rather than based on actual reservations, as the applicant's invention was. 6/17/04 Statement of Applicant, Pl. Cl. Const. Br., Ex. S, at 10 [Doc. # 56, p. 11 of 17]. So long as the order or reservation occurred and was for future advertising time at the time it was placed, it appears to have been contemplated by the applicant and included in his invention. The court will define this term as follows:

"Revenue Projection" means "a forecast of receipts of money"

GO BACK

3762

7. being subject to application of a reverse-bias voltage

Fairchild contends that this phrase "being subject to application of a reverse-bias voltage" means "experiencing a bias voltage applied to a semiconductor junction with polarity that permits little or no current to flow." (D.I. 156 at 13). Fairchild contends that the specification does not require the "top layer" or the "surface adjoining layer" to be connected to the ground.

Power Integrations contends that "reverse bias voltage" means "a voltage applied across a rectifying junction with a polarity that provides a high-resistance path." Power Integrations further contends that a proper construction of this phrase means that "the surface adjoining layer of material and the substrate recited in the claims are connected in some way to 'ground.'" (D.I. 152 at 34). Stated another way. Power Integrations contends that the top layer and the substrate are connected together, and thus grounded.
Reviewing the claim language in light of the specification of the '075 patent, the Court concludes that the term "reverse bias voltage" means "a voltage applied across a rectifying junction with a polarity that provides a high-resistance path." Indeed, it does not appear to the Court that the parties substantially dispute that this definition of the term is the more technically accurate definition. (D.I. 166 at 19; D.I. 152 at 34). Rather, the parties' disagreement centers on the issue of whether "reverse bias voltage" requires the surface adjoining layer of material and the substrate recited in the claim to be connected to the ground. The specification of the '075 patent clearly states that the "top layer is either connected to the substrate or left floating." '075 patent, col. 2, ll. 61-63. Accordingly, the Court concludes that the patent does not provide for a grounding limitation, and therefore, the Court concludes that "reverse bias voltage" means "a voltage applied across a rectifying junction with a polarity that provides a high-resistance path."

3763

"Reverses at Least One of the Magnetization Directions"

Plaintiffs suggest the term "reverses at least one of the magnetization directions" in claims 1 and 23 should be construed to mean "moving at least one of the magnetization directions towards a contrary direction or tendency." Defendants propose, "causes at least one of the magnetization directions to point in the opposite of its previous direction, resulting in a parallel or antiparallel alignment." Basically, the parties disagree as to whether the change in magnetization must be a full 180[degrees] rotation from its original position, or whether some lesser degree of rotation is sufficient. To resolve this ambiguity we must analyze the term within the context of the claims and the specification, reading both "with a view to ascertaining the invention." Astrazeneca AB v. Mutual Pharm. Co., Inc., 384 F.3d 1333, 1337 (Fed. Cir. 2004).

As always, we begin by looking at the claims themselves. Vitronics, 90 F.3d at 1582. Both claims 1 and 23 state: "… wherein applying a small magnitude of electromagnetic energy to the junction reverses at least one of the magnetization directions and causes a change in the resistance by at least 10% at room temperature." '922 patent at 8:50-54; 10:33-37. This claim language suggests that any reversal must be sufficient to "cause a change in the resistance by at least 10% at room temperature." As discussed above, the change in resistance is a function of the relative magnetization directions of the FM layers, with resistance increasing as the layers move toward an antiparallel alignment and decreasing as they move towards a parallel alignment. This emphasis on resistance change is consistent throughout the patent.

Claim 27, which is a dependent claim based on independent claim 23, explains how the invention can be put to use as a memory device: "[t]he memory device of claim 23, wherein the resistance of each junction indicates a binary state such that the change in resistance correspondingly changes the binary state, and such state can be maintained without the electromagnetic energy." Id. at 10:49-53. This claim suggests that the 10% change in resistance, not the orientation of magnetization directions, is the more important aspect of claims 1 and 23, because it is the change in resistance, and not the alignment of the magnetization directions, which translates into the binary data necessary for memory usage. The Background and Summary of the Invention sections only bolster this conclusion.

The Background states:

Scientists, for many years, have known in theory about the fundamental dynamics of the tunnel resistance arising from conduction electron spin polarization. However, the past efforts in this area have failed to produce an adequate level of change in the tunneling resistance ([Delta]R/R) for any practical and effective use of the phenomenon. Consequently, a need exists for an FM-I-FM trilayer junction construction in which the magnitude of the junction resistive change is at least 10%. Such a junction would then find practical use as a memory or sensor device.

Id. at 2:3-12 (emphasis added). This passage demonstrates that the key attribute of the present invention which differentiates it from the prior art is its ability to achieve at least a 10% change in resistance at room temperature, not its ability to achieve some particular alignment of magnetization directions.

The Summary of the Invention also describes the current invention as a solution to the inadequate resistance change in prior-art devices: "In the present invention, some of the problems leading to low values of resistance change ([Delta]R/R) … have been solved. Over a ten percent change in the tunneling resistance … has been observed in devices constructed in accordance with the invention." Id. at 2:44-49 (emphasis added). The Summary goes on to conclude that "the present
The invention provides a spin polarized electron tunneling device and method which overcomes the past ineffectiveness for application in nonvolatile memory or sensor elements.” Id. at 2:61-64. As in the Background section, the professed utility of the invention is its application in electronic data storage, and the essential attribute which permits such application is its ability to achieve at least a 10% change in resistance. Accordingly, when considering how a person of ordinary skill in the art would understand the term "reverses at least one of the magnetization directions,” we consider how that term contributes to this ultimate purpose.

The patent describes the invention as being designed to achieve at least 10% change in resistance at room temperature, thereby solving the problem of low resistance change which plagued the prior art. The application of electromagnetic force and resultant change in magnetization direction are simply steps in the process by which that resistance change is achieved. By applying electromagnetic energy in the right quantity, the magnetization direction of the FM layer with the lower coercive force begins to turn towards an opposing position. As this rotation occurs, the resistance of the junction changes. When the magnetization direction of one of the FM layers turns towards an antiparallel alignment the resistance increases, and as it turns towards a parallel alignment the resistance decreases. As Fig. 3A makes clear, this process is a continuous one wherein the degree of resistance and alignment of magnetization directions can be measured at varying points over time. A movement from parallel to antiparallel, or vice-versa, would correspond to the greatest possible change in resistance. However, nothing in the claims or the specification limits the invention to only those two alignments.

The specification describes a number of tests during which devices constructed in accordance with the invention were able to achieve resistance changes of 10% or higher. Id. at 5:32-37. These tests measured change in resistance between the parallel and antiparallel states. See id. Fig. 3A. Defendants argue that these examples demonstrate that the term "reverses" should be restricted to a change in magnetization direction which causes a full 180[degrees] rotation between completely parallel and antiparallel alignments. We disagree that the claims are so limited.

The tests described in the specification were conducted in order to demonstrate the maximum change in resistance that could be achieved with particular devices under particular conditions. Because resistance is highest at antiparallel and lowest at parallel, a researcher attempting to demonstrate the maximum resistance change for a particular device would necessarily use the parallel and antiparallel alignments as the ends of the resistance spectrum within which change would be measured. However, the claims in question do not specify a maximum change in resistance of 10%, but rather a change in resistance of at least 10%. The specification describes devices embodying the invention which were capable of achieving resistance changes of as high as 11.8%. Id. at 5:36-37. If a device achieves a change in resistance of greater than 10% when the magnetization direction is turned a full 180[degrees] from parallel to antiparallel (or vice versa), then that device will necessarily achieve "a change of resistance of at least 10%" before the full 180[degrees] rotation is complete, that is, when the magnetization direction is turned by less than 180[degrees].

In sum, by interpreting the word "reverses" within the context of the entire patent, we find that a person of ordinary skill in the art at the time of the invention would interpret the term "reverses at least one of the magnetization directions” to mean a turning or change of the magnetization direction of at least one of the electrodes or film layers, towards an opposing alignment, to such a degree as necessary to achieve at least a 10% change in resistance.

Defendants raise two objections to such a construction, neither of which is persuasive. First, defendants claim that such a construction runs contrary to the ordinary meaning of the word "reverse" and would allow the absurd result that a 1[degrees] rotation could be deemed a "reversal" so long as it achieves at least a 10% change in resistance. The problem with this argument is that there is no evidence that a 1[degrees] rotation or change is capable of causing a 10% change in resistance. To the contrary, the highest reported change in resistance using a device constructed according to the patent is 11.8%, and that was measured across a full 180[degrees] rotation. None of the examples described in the patent indicates that a change in resistance of at least 10% is possible with anywhere close to a 1[degrees] rotation of magnetization direction. See 'Id. Fig. 3A.

Second, Defendants argue that, by interpreting "reverses" to mean a change in direction which causes a 10% change in resistance, the word "reverses" is rendered superfluous. This is incorrect. The term "reverses" is necessary to explain the means by which the change in resistance is achieved.
9. "revision selection list"

Disputed Term The system of claim 8 wherein the technical database further comprises a cumulative index of revisions to publications and the computer program accesses a revision selection list of revised publications and identifies maintenance required by the publications, the computer program being responsive to the revision selection list for updating the compliance record for the identified profile to include maintenance required based on revisions to the publications.

Plaintiff's Construction a list of items having revisions, for example, revised publications, from which one or more items may be selected

Defendant's Construction a list of revised publications from which individual revised publications can be selected but excluding an up-to-date list

The first question presented regarding this term is whether the "list" (which is part of "revision selection list") referenced in Claim 9 is limited to "publications," as advocated by Defendant, or alternatively, whether the "list" refers more generally to "items" in the database that have been revised as claimed by Plaintiff. Neither party is entirely correct. The language of Claim 8 as well as the patent specification clearly state that the revision selection list refers to changes or updates to "publications." Claim 9 expressly provides that the system tracks any "revisions to publications" and allows the user to identify, perform and comply with any "maintenance required based on revisions to publications." ('806 Patent at 83:47-84:4 (emphasis added).) Thus, the Court construes "revision selection list" to mean a list of "revisions to publications" as proposed by Plaintiff--as opposed to either "a list of items having revisions" or "a list of revised publications," as advocated by Defendant.

With respect to the issue of what the user may select from this list of revisions to publications, Defendant argues that Claim 9 includes a limitation that the user cannot select revisions to publications from an "up-to-date list." (Jt. Stmt. at 26.) As support, Defendant relies on the description of the preferred embodiment, and in particular, the discussion concerning changes in maintenance and repair publications. (Id. (citing '806 Patent at 61:19-58).) However, there is no discussion of an "up-to-date list" in this section of the patent. But even if there were, the law is clear that a court should "not ordinarily rely on the preferred embodiments alone as representing the entire scope of the claimed invention." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1370 (Fed. Cir. 2002). Thus, the Court construes "revision selection list" to mean "a list of revised publications from which individual revisions to publications can be selected."

G. Revision Status

In Claim 1, the method calls for "storing and maintaining" a "main revision status" in the main computer's memory and a "remote revision status" in the remote computer's memory. '490 Patent, Col. 21, ll. 57-59, 63-66. Both of these terms' definitions are suggested in the claim itself as "indicating the revision level of the constant [remote] data stored in the main [remote] computer." Id. Because the revision status is "stored and maintained," or transmitted from one computer to the other, it must comprise information similar to the data files referred to elsewhere in the patent. Hill's proposed definition of revision status is "something that indicates the last time an item was revised." Compuserve proposes a definition containing more details:

"A main revision status" is a single current version level number or symbol and is capable of being associated with multiple files. When compared through remote revision status, it permits identification of all constant data files on the main computer necessary to achieve synchronization with the constant data on the remote computer.

Def's Brf. at 27. Its proposed definition for "remote revision status" is virtually the same with respect to the remote computer. Essentially, three elements have been added by Compuserve that the Court will address: 1) the notion of a "single
The next term is "ring oscillator." The plaintiffs contend that this term means "an oscillator having a multiple, odd number
of inversions arranged in a loop." The defendants propose "an [oscillator] having an odd number of inverting logic stages connected in a loop." The main dispute is whether a ring oscillator is required to have multiple inverters or whether it can have just one.

The plaintiffs argue that a single inverter would not be appropriate because it could not maintain an oscillating output. The defendants, on the other hand, rely on extrinsic evidence to support their proposed construction. Specifically, the defendants cite to a semiconductor textbook depicting a ring oscillator with only one inverter.

The plaintiffs have the better argument. The extrinsic evidence cited by the defendants also supports the plaintiffs' construction. It states that timers are built as "chains of inverters," not just one inverter. Defendants' Claim Construction Brief, Ex. U, MEAD & CONWAY, INTRODUCTION TO VLSI SYSTEMS (1980), at 234. Accordingly, the Court adopts the plaintiffs' proposed construction.

---

7. Rise Time

Rise time is the time it takes a signal to rise to substantially its final steady value. Rise time as used in claim 1 of the '892 patent refers to the rise time of the clock pulse.

---

A. The Pocrass '317 Patent

Claim 1 of the Pocrass '317 patent is set forth below. The parties dispute the meaning of the underlined language:

1. An RJ type modular connector for receiving a plug to form an electrical connection in data communication or telecommunication applications comprising:

   a housing formed by front, rear, top and bottom wall and having a plug receiving opening formed with the front wall thereof;

   at least one light emitting source integrally secured within said housing adjacent the plug receiving opening thereof to provide visual verification of the status of the electrical connection;

   a plurality of conductor wires, including conductor wires from said light emitting source, extending through one of said housing walls arranged in a predetermined spaced-apart array, adapted for insertion within a corresponding array of spaced holes in a printed circuit board.

1. Whether the claim is limited to "RJ type modular connectors"

The parties dispute whether the specification indicates that the invention is directed to RJ type modular connectors in particular or electrical connectors in general. While "RJ type modular connectors" are mentioned in the preamble, Maxconn asserts that the language does not function as a limitation, and that the claims themselves describe the particular connector of the invention. Conversely, Plaintiffs argue that the claim should be read as limited to RJ type modular connectors. 1

---

1 An RJ modular connector is a specific type of electrical connector which receives a plug containing several conductor wires to form an electrical connection with each wire.
The determination of whether preamble recitations are structural limitations or mere statements of purpose or use "can be resolved only on review of the entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Corning Glass Works v. Sumitomo Electric U.S.A., 868 F.2d 1251, 1257 (Fed. Cir. 1989). Where a patentee uses the claim preamble to recite structural limitations of his claimed invention, the PTO and courts give effect to that usage. See id. On the other hand, where a patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use for the invention, the preamble is not a claim limitation. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995); Kropa v. Robie, 38 C.C.P.A. 858, 187 F.2d 150, 152 (C.C.P.A. 1951). To determine whether the preamble provides a limitation to the invention claimed, the court should assess whether the claim preamble gives "life and meaning" to the claims. See Kropa, 187 F.2d at 152. The court may look to the patent specification to determine whether the claimed invention includes preamble recitations. See Bell Communications, 55 F.3d at 621; Vaupel Textilmaschinen KG v. Meccanica Euro Italia SPA, 944 F.2d 870, 880 (Fed. Cir. 1991); Corning Glass Works, 868 F.2d at 1257.

In the Pocrass '317 patent, the patentee uses the claim preamble to recite structural limitations of the claimed invention. The specification makes it clear that the invention of the '317 patent is limited to electrical connectors known as RJ type modular connectors. As background to the invention, the inventor repeatedly states that his invention relates to RJ connectors. Pocrass '317 patent, col. 1:12-25. The inventor also states that he has "invented an RJ connector with at least one LED integrated into the module," Pocrass '317 patent, col. 1:26-27, and that "it is the object of the present invention to provide an RJ connector including an LED formed integral therewith," Pocrass '317 patent, col. 1:45-47. In addition, in the prosecution history, the term RJ type connector was specifically relied upon in arguments to distinguish the claims over the prior art.

Accordingly, the claim should be construed such that "RJ type modular connectors" serves as a limitation to the claim. The Court adopts Plaintiffs' interpretation as follows: "a connector for receiving a plug to form an electrical connection of the type referred to as an RJ modular connector." At oral argument, Maxconn did not dispute this interpretation.

5. "Roaming terminal/device" ('311, Claim 14; '366, Claims 7, 24; '771, Claims 1, 2, 3)

At oral argument, Broadcom proposed the compromise construction of "roaming" as "designed to be able to be moved" (R. at 169 (May 6, 2004)), while Agere proposed "designed to move" (id. at 174). 33 Regarding Broadcom's construction, the Court agrees with Agere that there is some ambiguity in the phrase "able to be moved," which could theoretically refer to anything not carved in bedrock. The Court, however, does not find Agere's construction to be a viable alternative. Agere supports its position with the testimony of Dr. Goodman, who cites a portion of the specifications referring to "mobile portable transceiver units being moved about a warehouse." ('771 patent, col. 3, ll. 41-43 (emphasis added)). 34 The Court agrees that this phrase is instructive, although not in the manner Agere suggests. The two adjectives "mobile" and "portable" are both defined by Webster's dictionary as "capable of being moved." See WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1450, 1768 (1993) (defining mobile as "capable of moving or being moved" and portable as "capable of being carried[,] easily or conveniently transported"). The "being moved" language in the specification is not to the contrary, for when placed in context it refers to the fact that the "mobile portable transceiver units" "may be communicative with" their base stations while the former are "being moved." ('771 patent, col. 3, ll. 41-43.) In other words, the specifications describe devices that are capable of being moved while still remaining in contact with the network. Thus, the Court finds that the most appropriate construction of "roaming terminal/device" is "a terminal/device that is free from cable connections and designed to be able to be moved while receiving or transmitting signals."

33 To the extent that Agere has not abandoned its original construction of "roaming" as "moving" (R. at 165 (May 6, 2004)), the Court finds that this construction is unsupported by the claim language. The '771 patent teaches "roaming terminals" that receive transmissions from base stations. There is no doubt that these transmissions can occur even if the "roaming terminal" happens to be stationary at the time of transmission, as is often the case with, for example, laptop computers.
Agere's construction, however, would require the opposite--the transmissions could occur only when the terminals were moving, for otherwise the terminals would not be "roaming" at that time. This construction is therefore contrary to the functioning of the patent as a whole. The only extrinsic support Agere provides for its argument is a Webster's Dictionary definition of "to roam" as "to move." As discussed below, however, this definition supports construing the term to specify that transmissions may be received while the terminal is in motion, rather than that the terminal itself must be in motion while receiving transmissions. Agere's original proposed construction is therefore without evidentiary support and is accordingly rejected.

34 Although Agere disputes Broadcom's use of the '771 patent specifications to interpret the '311 and '366 patents in other contexts, the parties seem to agree that the customary meaning of the instant term is consistent throughout these patents. To the extent that Agere maintains its objection, the Court notes that its analysis of the "roaming" term is primarily dictionary-based and equally applicable to all three patents.

--- Footnotes ---

--- End Footnotes ---

The Court adopts the definition from the article cited by both parties. A "role" is "an intermediary designation that brings
Plaintiffs also ask the Court to construe the term "rolling spot." (R. 82, Pls.' Mem. at 22-23.) According to Plaintiffs, "rolling spot" was known in the financial art as a proprietary contract: the CME's Rolling Spot contracts. (R. 82, Pls.' Mem. at 22.) Thus, they contend that the '923 patent's use of the term "rolling spot" should be understood as referring to CME's trademarked Rolling Spot Currency contracts and construed accordingly. 20 (Id. at 23.) To construe the term "rolling spot," the Court must engage in a two-step inquiry to determine: (1) whether "rolling spot" as used in the claims refers to CME's Rolling Spot contracts; and (2) if "rolling spot" refers to CME's Rolling Spot contracts, how the term should be construed in light of that relationship. The Court addresses each question in turn.

Support for Plaintiffs' position with regard to the first question can be found in the intrinsic record. In the '584 provisional application, Garber notes that "Rolling Spot Currencies are contracts of the Chicago Mercantile" and that the CME "retain[ed] exclusive rights" to the use of the Rolling Spot name. (R. 82, Pls.' Mem., Ex. 6 at 13.)

In light of this relationship, the Court finds that a construction of the term "rolling spot" must be based on how a person of ordinary skill in the art at the time of the invention would have understood CME's Rolling Spot Currency contracts. As part of their arguments related to the proper construction of the term "rolling spot," Plaintiffs, relying upon Manual of Patent Examining Procedure ("MPEP") 2173.05, first contend that any claim containing the term "rolling spot" is indefinite because it uses a trademark as a claim limitation. (R. 82, Pls.' Mem. at 23.) Paying heed to the Federal Circuit's instruction that claims should be construed to sustain their validity, Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999), the Court finds it unnecessary to find that the claims containing the term "rolling spot" are invalid on indefiniteness grounds. Instead, the Court will construe the term "rolling spot" as a person of ordinary skill in the art at the time of the invention would have understood the term. Based on the conclusion that the term "rolling spot" refers to CME's Rolling Spot Currency contracts, the term will be construed in accordance with how CME's Rolling Spot Currency contracts were defined at the effective filing date of the patent application. 22
Such a definition can be found in chapter 35 of the CME Rulebook in effect at the effective filing date of the patent application.

5. root bus controller

Claim 1, as noted above, indicates that when the computer system of the patent comprises more than 2 bus controllers, one of the bus controllers is a "root bus controller" that connects the remaining bus controllers, which are in a binary tree configuration, to the host computer. Plaintiff construes this disputed term to mean "any bus controller that is the highest level bus controller in the tree or subtree," Pl. Br. at 21, thus incorporating its view that "binary tree computer system" includes a partitionable portion such as a "subtree." Pl. Reply at 21. 6 Defendant asserts that the term is best defined as "one bus controller at the highest order position of the binary tree computer system that connects the binary tree to the host computer and which has no parent bus controller." Def. Br. at 23; Def. Reply at 23. Both parties thus essentially agree that the root bus controller is the "highest order" bus controller in the system, and therefore has no parent bus controller. Claims 1 and 7 also clearly indicate that the root bus controller as the link between the binary tree of bus controllers and the host computer. Hence, the principal dispute is whether a bus controller of a portion of the system could be designated the root bus controller.

Since the Court has already construed "binary tree computer system" to not include a partitionable portion thereof, such as a subtree, plaintiff's arguments emphasizing that a binary tree can be divided into subtrees is unavailing, see Pl. Reply at 22-23, as there is no support in the patent for the idea that the parent node of a subtree could be designated a "root bus controller." That the root bus controller is located at the highest order of the binary tree computer system itself is unequivocally established by both Claims 1 and 7, which specify that there be "one" root bus controller. '024 Patent at 7:17; 8:18. The specification also repeatedly refers to "one" bus controller that connects the binary tree to the host computer. See id. at 1:52-53; 2:41-42; and 2:51-53.

Plaintiff cites Professor Stolfo’s testimony as extrinsic evidence that "every node can be a root." Pl. Reply at 24, Ex. L, at 190. Although the court may consider expert testimony in claim construction, see Phillips, 415 F.3d at 1318, here plaintiff seeks to take Professor Stolfo’s assertion that every node can be a root out of its original context of a discussion of a binary tree configuration and extrapolate from it support for the notion that any bus controller can also be a root bus controller. This contradicts the portion of the written record that the root bus controller links the binary tree to the host computer. '024 Patent at 7:18-19. Arbitrarily designating a particular bus controller to be a "root bus controller" would violate this requirement, and thus the Stolfo testimony, as applied in this context, must be discounted. See Phillips, 415 F.3d at 1318 ("[A] court should discount any expert testimony 'that is clearly at odds with the claim construction mandated by the claims themselves'. . . ") (citation omitted).

Accordingly, the Court hereby reaffirms its construction of "root bus controller" as the bus controller at the highest order position of the binary tree computer system that connects the binary tree to the host computer and which has no parent bus controller.
13. Rotary Switches

The term "rotary switch" is identified in dependent Claim 4 as a permissible structure for the "user actuated switching means" identified in Claim 1. Because it is not defined, except generically by reference to a "conventional rotary selector switch," see Col. 3, ll. 11-12, it must be given its ordinary meaning to one skilled in the art and is not limited by the embodiment shown in the specification. Citec has referred the Court to the definition contained in the Encyclopedia of Electronics, 2nd Edition: "Rotary switches switch alternate circuits in a sequence dictated by a coaxial shaft with a rotary-detent action. A pointer knob selects the options." The Court construes "rotary switch" to mean a switch that alternates circuits in a sequence dictated by a coaxial shaft with a rotary-detent action, depending on the position of the pointer knob.

This court has repeatedly stated that while claims are to be construed in light of the specification, they are not necessarily limited by the specification. See Markman, 52 F.3d at 980. Claims terms are also to be interpreted so as to give the terms their ordinary meaning, absent some clear special definition. See Vitronics, 90 F.3d at 1582; Athletic Alternatives v. Prince Mfg., Inc., 73 F.3d 1573, 1578, 37 U.S.P.Q.2D (BNA) 1365, 1370 (Fed. Cir. 1996). "Generally, particular limitations or embodiments appearing in the specification will not be read into the claims." Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867, 228 U.S.P.Q. (BNA) 90, 93 (Fed. Cir. 1985); SRI Int'l, Inc. v. Matsushita Elec. Corp., 775 F.2d 1107, 1121 n.14, 227 U.S.P.Q. (BNA) 577, 585 n.14 (Fed. Cir. 1985) (in banc) (merely because "a specification describes only one embodiment does not require that each claim be limited to that one embodiment"); Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277, 35 U.S.P.Q.2D (BNA) 1035, 1040-41 (Fed. Cir. 1995) ("[A] patent claim is not necessarily limited to a preferred embodiment disclosed in the patent."). Enercon has shown no reason to depart from this well established rule.

Only in the preferred embodiment is the more specific "rotational transformation" procedure described as a method to rotate the waveform. The remainder of the specification uses the words "rotate" and "shift" interchangeably. As the ITC noted, NWP's chief technology officer also used the words "rotate" and "shift" interchangeably in describing the operation of the patented device. Even Enercon's own expert admitted that he had heard the terms used interchangeably.

We have also considered Enercon's extrinsic evidence purportedly demonstrating what the term "rotate" means to one of skill in the art and find it to be unhelpful at best and misleading at worst. Submitted as part of Enercon's claim construction argument, the Mohan, Ooi and Thorburg references make no mention of the disputed claim term. Not only does the text of the references not purport to aid in determining the meaning of the term "rotating," but the argument accompanying the citation of these references in Enercon's brief apparently attempts to show that several of the limitations of claim 131 can be found in the prior art. Because the validity of the '039 patent was not appealed to this court, these references may not be considered for that purpose.
As we have stated above, the specification clearly uses the terms "rotate" and "shift" interchangeably. In addition, all parties agreed that the phrase "rotating the reference waveform" indicates a shift in phase of the desired waveform. Because we see no evidence to indicate that the term "rotate" was intended to refer to the specialized method of performing a phase shift known as a "rotational transformation," we hold that the term "rotating" is to be given its ordinary meaning. We therefore hold that the ITC was correct in interpreting the term "rotating" to mean merely a phase shift in the desired waveform.

Enercon argues that the term "rotating" is limited to a special type of phase shift that is disclosed in the written description of the '039 patent. All parties agree that the process of "rotating" a waveform results in a phase shift of the waveform in a plot against time. However, Enercon argues that the term "rotating" in claim 131 refers not to the generic process of phase shifting a waveform, but to a specific process used to perform the rotation known as a "rotational transformation." Enercon relies primarily upon the specification of the '039 patent to support its interpretation. Enercon asserts that because the only method disclosed in the specification for performing a rotation is a rotational transformation which is described as part of the preferred embodiment at col. 17, ll. 29-45 of the '039 patent, the term "rotating" must be limited to this method of performing the rotation. Enercon finally points to other, extrinsic sources which also purport to describe a rotation as a "transformation."

This court has repeatedly stated that while claims are to be construed in light of the specification, they are not necessarily limited by the specification. See Markman, 52 F.3d at 980. Claims terms are also to be interpreted so as to give the terms their ordinary meaning, absent some clear special definition. See Vitronics, 90 F.3d at 1582; Athletic Alternatives v. Prince Mfg., Inc., 73 F.3d 1573, 1578, 37 U.S.P.Q.2D (BNA) 1365, 1370 (Fed. Cir. 1996). "Generally, particular limitations or embodiments appearing in the specification will not be read into the claims." Loctite Corp. v. Ultrasense Ltd., 781 F.2d 861, 867, 228 U.S.P.Q. (BNA) 90, 93 (Fed. Cir. 1985); SRI Int'l, Inc. v. Matsushita Elec. Corp., 775 F.2d 1107, 1121 n.14, 227 U.S.P.Q. (BNA) 577, 585 n.14 (Fed. Cir. 1985) (in banc) (merely because "a specification describes only one embodiment does not require that each claim be limited to that one embodiment"); Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277, 35 U.S.P.Q.2D (BNA) 1035, 1040-41 (Fed. Cir. 1995) ("[A] patent claim is not necessarily limited to a preferred embodiment disclosed in the patent."). Enercon has shown no reason to depart from this well established rule.

Only in the preferred embodiment is the more specific "rotational transformation" procedure described as a method to rotate the waveform. The remainder of the specification uses the words "rotate" and "shift" interchangeably. As the ITC noted, NWP's chief technology officer also used the words "rotate" and "shift" interchangeably in describing the operation of the patented device. Even Enercon's own expert admitted that he had heard the terms used interchangeably.

We have also considered Enercon's extrinsic evidence purportedly demonstrating what the term "rotate" means to one of skill in the art and find it to be unhelpful at best and misleading at worst. Submitted as part of Enercon's claim construction argument, the Mohan, Ooi and Thorburg references make no mention of the disputed claim term. Not only does the text of the references not purport to aid in determining the meaning of the term "rotating," but the argument accompanying the citation of these references in Enercon's brief apparently attempts to show that several of the limitations of claim 131 can be found in the prior art. Because the validity of the '039 patent was not appealed to this court, these references may not be considered for that purpose.

As we have stated above, the specification clearly uses the terms "rotate" and "shift" interchangeably. In addition, all parties agreed that the phrase "rotating the reference waveform" indicates a shift in phase of the desired waveform. Because we see no evidence to indicate that the term "rotate" was intended to refer to the specialized method of performing a phase shift known as a "rotational transformation," we hold that the term "rotating" is to be given its ordinary meaning. We therefore hold that the ITC was correct in interpreting the term "rotating" to mean merely a phase shift in the desired waveform.
Like thoroughfare, the term route is prevalent throughout the disputed claims in the '615 patent. Plaintiff defines "route" as "course of travel" and defendant defines it as "course of travel from one place to another." This term does not require much discussion. I will adopt plaintiff's definition and construe "route" as "course of travel" because it is implicit in the concept of "travel" that one is going from one place to another; defendant's definition is redundant.

C. "Route" and "Routing"

The verbs "route" and "routing" are used in the '561 Patent, claims 1 and 24; the '429 Patent, claims 2 and 24; and the '084 Patent, claim 1. In the Vonage case, Sprint contended that these terms meant direct/directing through a communication system, while Vonage argued that they meant deliver/delivering to the destination through a communication system. See 518 F. Supp. 2d at 1311. The Court decided that both parties were partially correct in their arguments, as follows:

The intrinsic record concerning use of these claim terms comports with the widely accepted meaning of these commonly understood words. On the one hand, "route" means to "direct" or "send". But, to "route" something does not mean to direct or send it aimlessly. Rather, it means to send it by a selected route, or in a specified direction, or by selecting a course to be followed for final delivery, or by dispatching it to its appropriate destination. In this sense, the term "route" is consistent with the specification language relied on by Vonage, in which various items are routed for delivery to their destinations. At the same time, however, neither the plain meaning of the word nor the specification indicates that "routing" requires that the item actually be delivered to its final destination.

Accordingly, the court construes the claim terms "route" and "routing" consistently with their commonly understood meaning, which is also consistent with the intrinsic record, to mean direct/directing through a communication system by a selected route or in a specified direction.

Id. at 1311-12 (citations omitted) (citing Webster's Third New International Dictionary at 1981 (unabridged ed. 1993)).

In the present case, Sprint argues in favor of the same construction made by the Court in Vonage. Big River argues that the proper construction would not include the alternative meaning "in a specified direction;" thus, Big River urges the Court to construe "route" and "routing" to mean direct/directing through a communication system by a selected route. The Court rejects this argument by Big River.

First, Big River cites to various dictionaries that appear to define the verb "route" to include directing or sending by a selected route, but do not appear to include sending in a specified direction as a meaning of the word. The Court concludes, however, that the ordinary meaning of "routing" may include sending in a particular direction, as shown in the unabridged dictionary cited by the Court in Vonage. Indeed, one of the dictionaries cited by Big River includes "direct"--which is obviously related in meaning to "direction"--as a synonym for the verb "route". See Webster's, supra, at 640 (definition of to "direct" includes to aim or guide); see also id. at 45 (definition of to "aim" includes to point in a particular direction). The main point of the Court's prior construction was that to be "routed", something must be directed, though not aimlessly, and the Court's construction of the term to include directing by a selected route or in a specified direction accurately captures that meaning.

Second, Big River relies on the specifications' references to the concepts of a communication path and virtual connections, in arguing that a specific route or course is required in the inventions. The Court again rejects Big River's attempt to limit the patents' claims in those ways. See supra Part III.A, IV.B. Moreover, as Sprint points out, the claims specify that the "routing" is to network elements, not along communication paths.

For these reasons, the Court retains its prior construction of the terms "route" and "routing" to mean direct/directing through a communication system by a selected route or in a specified direction.
A. "Route" and "Routing"

Claim 1 of the '561 patent recites the claim term "route" and claim 19 of the '294 patent recites the claim term "routing." Sprint contends that these claim terms should be construed to mean direct/directing through a communication system. Vonage contends that they should be construed to mean deliver/delivering to the destination through a communication system.

Sprint points out that the specifications disclose routing devices, such as signaling transfer points and switches, that process signaling messages by directing messages through the communication system. Sprint contends that the specifications disclose that these devices do not deliver the routed messages to the end-user or destination, but rather serve to direct such messages from element to element within the network based on an identifier contained in the message. For example, "the route function of the MTP 3 would forward the message to CCM 250," '294 Patent at 6:34-35; the signal transfer point (STP) "reads portions of the signaling information and either discards or routes the information to a network element," '561 Patent at 2:15-25; and the communication control processor (CCP) "will route calls over the broadband network to another narrowband switch," id. at 21:10-11.

Vonage relies on other portions of the written specifications which use the term "route" in the context of delivering the signaling message to its final destination: "CCM 250 would be identified by its own signaling point code. STP 260 would route signaling messages addressed to this point code to CCM 250." '294 Patent at 6:23-26; see also id. at 9:55-56 ("STP 520 would be configured to route the IAM to CCIM 534."). The '294 patent specification also uses "route" in terms of delivering voice to a destination, stating that "[t]he LAM would indicate that a call was being routed to user 516 and would identify the selected virtual connection being used to reach mux 530." Id. at 10:5-7. Additionally, the '561 patent specification states that STP "routes the signal to CCP 350." '561 Patent at 11:38-39. Thus, Vonage contends that the specifications clearly use "routing" to mean delivering to a destination.

Upon consideration of the parties' arguments, the court believes that both parties are partly correct as to the proper construction of the disputed claim terms "route" and "routing." The intrinsic record concerning use of these claim terms comports with the widely accepted meaning of these commonly understood words. See Phillips, 415 F.3d at 1314 ("In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words."). On the one hand, "route" means to "direct" or "send." Webster's Third New International Dictionary 1981 (unabridged ed. 1993) (listing "direct" and "send" as synonyms for "route"). But, to "route" something does not mean to direct or send it aimlessly. Rather, it means to send it by a selected route, or in a specified direction, or by selecting a course to be followed for final delivery, or by dispatching it to its appropriate destination. Id. (listing various definitions for the term "route"). In this sense, the term "route" is consistent with the specification language relied on by Vonage, in which various items are routed for delivery to their destinations. At the same time, however, neither the plain meaning of the word nor the specification indicates that "routing" requires that the item actually be delivered to its final destination.

 Accordingly, the court construes the claim terms "route" and "routing" consistently with their commonly understood meaning, which is also consistent with the intrinsic record, to mean direct/directing through a communication system by a selected route or in a specified direction.
host can be modified at any time to capture additional fares, even after the vehicle has begun traveling its route. Defendants' Brief at 27. According to the defendants "[d]ynamic does not imply that the routes are constantly changing, but merely that a salient feature of the routes is that they can be changed to accommodate transportation requests as received." Defendants' Brief, at 28. Consistent with the court's view that the patents describe real-time methods, the court construes the term "route" to mean "a course or pathway that is capable of changing based on received transportation requests."

D.

In independent Claims 3, 7 and 11, the terms "route" or "routing" is used. The customary meaning of "route" in computer technology means "forwarding data to its destination." See, Computer Desktop Encyclopedia, [9th Ed. McGraw-Hill]. Mediatics rejects this definition while suggesting that it agrees with LaserDynamics' definition of "route." It argues that "route," as revealed in the Patent, is the process of "selecting one of a plurality of available data paths and sending the recorded data through the selected path." Interestingly, the definition proffered by Mediatics includes what may be referred to as a "routing protocol" or a built in formula for determining the path that data must take. The term "routing," in its most basic meaning, is simply the forwarding of data without regard for the technology that directs the method or protocol. Therefore, the Court adopts the industry's ordinary meaning for the term. See Texas Digital Systems, Inc., 308 F.3d at 1202-03.

"The Router Will Attempt to Become the Active Router"
"The Physical Router Will Attempt to Become the Active Router"
"The Ability to Issue Coup Messages Can Be Disabled at Least Temporarily"
"Disable, at Least Temporarily, the Router's Ability to Issue a Coup Message"

The Court agrees with Cisco that these terms are plain on their face and do not require additional construction.

"routes"

The term "routes" means to choose an appropriate destination from two or more possibilities and to direct based on that choice.

The VPS routes by directing a voice or data communication meant for a particular remote user over the transmission media to the appropriate remote user communications device. Communications are "routed from either the telephony server or the [LAN] to said user communications device" by means of the "transmission media." Routing implies a choice between alternative destinations. Although plaintiff's proposed construction requires "routing" to be based on "identification information," and although a person with ordinary skill in the art would understand how an IP address is used in data routing, the patent does not specify a single method of routing. 145

145 Witt testimony, Tr. 557-61.
The term "automatically routes" or "automatically routing" as used in claim 39 means that routing, as defined above, is accomplished without the further intervention or instruction to the user communication device or by the remote user.

1. Routine

The term "routine" appears throughout the disputed claims of patent '042. Plaintiff maintains that it means "software instructions or algorithm." Defendant defines it as "a set of procedures or programmed instructions." The term is not defined in the specification. However it is clear from the claim language itself that it means "a set of procedures for providing route guidance" and I construe it in this manner.

12 The term to be construed appears in claim 1 of the '703 Patent. Akamai is asserting that claim 5, which is dependent on claim 1, is infringed by Limelight.
Exhibit 96.) In that case, Akamai argued "[a] 'routine' has its ordinary meaning of a set of instructions, e.g. a computer program or process." (Id.) "E.g.," however, denotes an example and is therefore not limiting. 14

While the hash value calculations described in the preferred embodiment would be difficult to calculate manually, simpler embodiments might be more amenable to hand calculation. For example, the specification describes an alternate method for modifying the object URL with a serial number which contains information about the object. ('703 Patent, col.6 l.65 - col.7 l.29.) Therefore, there is insufficient support in the specification to limit the "routine" which modifies object URLs solely to automated or computer programs.

A "routine" is a computer program or a portion of a computer program designed to accomplish a defined task. In this case, the contribution data packet is accepted by the physically separated contribution-accepting devices, using a routine which allows it to accept information representing one or more contributions.

Plaintiff proposes that “routing” is an “easily understood term that does not require construction by the Court.” (Plaintiff’s Opening Claim Construction Brief 32:21-22.) Defendants, on the other hand, propose that “routing” means “sequencing (order) and timing.” (Joint Constructions 1.)

Courts customarily give terms in a patent their ordinary meaning. Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002) (“The terms used in the claims bear a ‘heavy presumption’ that they mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art.”). Still, “the specification may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess. In such cases, the inventor’s lexicography governs.” Phillips, 415 F.3d at 1316. A court may find that a specification gives a term a meaning contrary to its ordinary meaning if the specification “communicates a deliberate and clear preference for this alternative definition.” Kumar v. Ovonic Battery Co., Inc., 351 F.3d 1364, 1368 (Fed. Cir. 2003.)

The ordinary meaning of “routing” is “sending or forwarding by a particular route.” American Heritage Dictionary, Fourth Ed., 2006. Defendant contends that the ‘403 patent has given “routing” a definition more specific than its ordinary meaning. The Court disagrees. Defendants cites parts of the specification that purportedly define “routing” as “sequencing (order) and timing.” For instance, the specification states that “the present invention provides flexibility in the funding source selection, and routing, i.e., sequencing and timing.” (‘403 Patent 22:39-41.) The specification also states that “[i]f multiple sources are to receive the credit application, then the timing and order of sending is also selected, that is, the
routing of the credit application.” (Id. at 22:46-48.) While these two quotes seem to indicate that “routing” refers only to sequencing and timing, they conflict with the rest of the patent. For instance, the patent refers to “the inventive system routing the application to all requested funding sources,” and “routing means for selectively forwarding the credit application data to remote funding sources.” (Id. at 8:54-56, 15:39-43.) These quotes indicate that the destination of the application data is also a part of “routing.” To define “routing” as “sequencing (order) and timing” would render these quotes, and others, senseless.

More generally, the entire invention is frequently referred to, in shorthand, as a “credit application and routing system.” (See, e.g., id. at 37:50.) The stated goal of the patent is to enable dealers to forward credit application data to selected funding sources in selected sequences. But defining “routing” as Defendants request would eliminate the “selection of funding sources” aspect from the short description of the invention.

Defendants argue that the Federal Circuit has held that the use of “i.e.” is definitional. (Defendants David L. Huber and Finance Express LLC’s Opening Claim Construction Brief 7:9-10 (quoting Abbott Labs v. Novopharm Ltd., 323 F.3d 1324, 1327, 1330 (Fed. Cir. 2003).) But the Federal Circuit in Pfizer, Inc. v. Teva Pharmaceuticals, 429 F.3d 1364, 1373 (Fed. Cir. 2005), limited that holding, cautioning that the “i.e.” should be read in light of the patent as a whole. “I.e.,” as used in this patent, is not definitional. Instead, it appears to supply examples. For instance, the patent refers to “selecting the funding sources for a type of credit application, i.e., finance versus lease, ‘A’ quality versus ‘B & C’ quality.” (‘403 Patent 10:41-44.) Also, the patent refers to the ability to check “account status, i.e., current charges, transactions processed, etc.” (‘403 Patent 5:59-60.)

Considering the patent as a whole, it does not show a “deliberate and clear preference” for Defendants’ proposed definition. Kumar, 351 F.3d at 1368. Accordingly, the claim term is construed to mean: “sending or forwarding by a particular route.”

A. Function of Routed and Routing

Lottotron takes claim 1 1 of the ’047 patent as an example of a claim that uses the terms "routing" and "routed." Clause (a), which contains the term "routing," is a mean-plus-function limitation. From the face of the claim, the ACD means performs two functions: (1) it receives incoming messages from subscribers and (2) routes each of said messages according to which one of said plurality of different wagering formats is requested by a caller. Lottotron contends that the term "route" should be treated as equivalent to "transmit." Scientific Games contends that routing, in addition to transmission, requires "(i) an identification of a characteristic of the calls, communications or messages" and "(ii) a selection of a destination for the calls, communications, or messages depending on the identified characteristic." Scientific Games ("S.G.") Br. at 4.
Neither the specification nor prosecution history clearly spells out the definition of "routing" and "routed." I will presume, as the parties do here, that the terms carry the ordinary meaning as understood by persons of ordinary skill in the art. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366-67 (Fed. Cir. 2002). Despite the agreement that dictionaries may be used to help construe the terms, see Lottotron Repl. at 4; S.G. Br. at 10, the parties interpret the significance of the dictionary definitions differently. Scientific Games suggests that the dictionary definitions are wholly consistent with its construction that requires the ACD means to identify a characteristic of the message, select a destination for such message, and transmit the messages. Scientific Games notes that the verb "route" is defined to mean: "to send by a certain route," or "to assign a route to," Webster's II New Riverside Dictionary 595 (Revised ed. 1996) (emphasis added); "to send or forward by a particular route," Webster's Encyclopedic Unabridged Dictionary of the English Language 1676 (1996) (emphasis added); "to send by a select route," or "to divert in a specified direction," Merriam Webster On-Line, at http://www.merriam-webster.com (last visited June 19, 2003) (emphasis added). In addition, defendant observes that Newton's Telecom Dictionary defines "routing" as "the process of selecting the correct circuit path for a message." Newton's Telecom Dictionary 618 (14th ed. 1998) (emphasis added).

Lottotron argues that Scientific Games' definition is wrong because, inter alia, it ignores the ordinary definition of the term, which "does not inherently require 'identification' or 'selection,'" Lottotron Repl. at 4, and because it imports limitations from one embodiment in the specification into the claim term. Id. at 5. Further, Lottotron notes that it would be entirely consistent to substitute the word "transmit" in place of "route" in the specification.

Neither party disputes that the term "route" or "routing" in the claims entails transmitting messages. The issue that must be resolved here concerns whether one skilled in the art would understand "routing" to also include identifying a characteristic of the message and selecting a destination for the message based on the characteristic. Although "dictionaries . . . are particularly useful resources to assist the court in determining the ordinary and customary meanings of claim terms," Tex. Digital Sys. v. Telegenix, Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002), the Federal Circuit "cautioned against the use of non-scientific dictionaries 'lest dictionary definitions . . . be converted into technical terms of art having legal, not linguistic significance.'" Bell Atlantic Network Services, Inc. v. Covad Communications Groups, Inc., 262 F.3d 1258, 1267 (Fed. Cir. 2001) (quoting Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998)). The communications systems and protocols claimed and described in the Scagnelli patents relate to the telephonic communications art, see Classification Search 379 listed on '416 patent, '619 patent,'047 patent, and '865 patent, and hence, telecommunication dictionaries appear to be a natural and reasonable place to begin my inquiry into the ordinary meaning of the terms "route" and "routing." See Vitrionics, 90 F.3d at 1584 n.6 ("Technical treatises and dictionaries . . . are worthy of special note. Judges are free to consult such resources at any time . . . and may also rely on dictionary definitions when construing claim terms."). As noted above, Newton's Telecom Dictionary defines "routing" as "the process of selecting the correct circuit path for a message." Newton's Telecom Dictionary 618 (14th ed. 1998) 3. The Glossary of Telecommunications Terms published by the National Communications System Office of Technology and Standards defines "routing" to mean "the process of determining and prescribing the path or method to be used for establishing telephone connections or forwarding messages." Federal Standard 1037 C: Glossary of Telecommunication Terms, Office of Technology and Standards, at http://www.its.bldrdoc.gov/fs-1037/ (1996); see also T1 Glossary 2000: Glossary of Telecommunication Terms, American National Standard for Telecommunications, at http://www.atis.org/tg2k/t1g2k.html (2001) (adopting 1037 C Federal Standard definition of "routing"). The definitions clearly suggest that "routing" must specify the path on which to transmit the message. Assuming my reliance on these specialized dictionaries is misplaced, I would add that the standard English dictionaries also support the view that the process of "routing" a message must entail determining the particular route that the message will follow. The particularity of the route would be lost if the ACD means lacked the ability to specify the path on which to transmit the message. See, e.g., Webster's Encyclopedic Unabridged Dictionary of the English Language 1676 (1996) (defining "routing" to mean "to send or forward by a particular route" (emphasis added)).
which issued in 1995 and the other three patents-at-issue, which issued in 1999, and thus I may rely on dictionary definitions up through approximately 1999, when the later three patents issued. See Inverness Medical Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1370 (Fed. Cir. 2002).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

Lottotron contends that the selection of the destination arises not from the ACD means, but rather from the wagerer. Although Lottotron is in some respects correct that the destination of the transmission is specified by the wagerer when there are a "plurality of different wagering formats," '047 patent (claim 1), that choice must be translated to the ACD means, which specifies the appropriate subsystem of the invention to transfer the call. One must discriminate between the selection by the subscriber, and the selection taken by the ACD means to effectuate the request placed by the subscriber. If the ACD means lacked the capacity to specify which, among the plurality of wagering formats subsystems to transfer the call, the lottery wagering system would be inoperative. In other words, the wagerer could make his selection, but if the ACD means did not have the ability to specify the appropriate subsystem to which the call was to be transferred, the invention would be unable to "route each of said messages according to which one of said plurality of different wagering formats [was] requested by [the] caller." '047 patent (claim 1).

Scientific Games contends that the specification supports its position that the process of routing further includes the step of identifying a characteristic of the call or message. None of the definitions from the standard English or technical dictionaries, however, inherently requires "routing" to include such a step. Scientific Games notes that if a subscriber called, for example, 1-800-ENROLL, the disclosed ACD should transfer the call to the enrollment VRU, whereas if the caller dialed 1-800-WAGER, the ACD should transfer the call to the wagering VRU. From the described process, Scientific Games concludes that the ACD, and hence the ACD means, must identify the number dialed, e.g., 1-800-WAGER or 1-800-ENROLL. Scientific Games assumes that the ACD corresponds to the ACD means. It would be improper, as Scientific Games seeks to do here, to look at the structure described in the specification and attempt to superimpose the function performed by it onto the function recited in the means-plus-function clause. See Micro Chem., Inc. v. Great Plains Chem. Co., 194 F.3d 1250, 1258 (Fed. Cir. 1999). Furthermore, it would be a cardinal sin of patent law for a court to "read into a claim a limitation from a preferred embodiment, if that limitation is not present in the claim itself." Bayer AG v. Biovail Corp., 279 F.3d 1340, 1348 (Fed. Cir. 2002); see also CCS Fitness, 288 F.3d at 1366 ("An accused infringer . . .cannot [narrow a claim term's ordinary meaning] by simply pointing to the preferred embodiment or other structures or steps disclosed in the specification or prosecution history.").

Scientific Games further argues that the addition of the "routing" limitation according to the requested wagering format to overcome prior art adds weight to its argument that "routing" includes more than simply transmitting a message. I see no evidence that the inventors sought to differentiate their inventions from prior art on the ground that prior art that "routed" calls did not identify a characteristic of the incoming message. Indeed, the patent examiner acknowledged the existence of prior art that routed incoming calls based on the subscriber's financial institution information to make electronic fund transfers. See, e.g., Walsh Exh. I, Tab 30 (11/17/98 Office Action Summary for '047 patent) at 5. The examiner found that the amended claims were patentable because the prior art neither disclosed nor suggested "routing incoming calls based upon [the] wagering format requested." Id. (emphasis added); see also Gulia Exh. E, Tabs 6, 7 (Amendment and Notice of Allowance in '619 patent) (allowing claims after inventors amended claim to "route each of said communications [according] to one of a plurality of different wagering formats as requested by a subscriber."); Gulia Exh. F, Tabs 6, 8 (Office Action and Amendment in the '865 patent). In the examiner's view, the basis for routing the calls was the principle distinguishing feature that made the claims allowable over prior art. I find nothing in the intrinsic evidence that precludes the claimed invention from having a separate element that identifies a property of the incoming call, and conveys such information to the corresponding structure that performs the routing function, so that it may route the call in accordance with the wagering format selected by the caller. The ramifications of the amendment cannot be stretched so far as to suggest that the inventors sought to distinguish their inventions from prior art on the basis that routing must include identifying a characteristic of the message from the subscriber, as Scientific Games perhaps implies in its argument. I find no limitation in the claim language nor any clear statement in the specification or prosecution history that redefines the definition of "routing" to include the task of identifying a characteristic of the incoming message from subscribers.

In sum, I concur with defendants that "routing" must entail more than simply transmitting calls, contrary to plaintiff's argument. Rather, "routing" further includes specifying the path on which to transmit the subscriber's call. For the foregoing reasons, the term "routing" in the context of the claims is construed to mean:
(1) specifying the path for a subscriber's incoming message according to a characteristic of the incoming message; and
(2) transmitting the incoming message on the specified path.
Messages are "routed" if they arrive at a destination via a "routing" process as defined above.

Routing Information

Fenner argues that "routing information" should mean "information indicating the next path for the data packet to take" and Defendants offer the compromise construction "information indicating the next outbound communication link for the data packet to take." n9 The Court construes the term to mean, "information indicating the next physical media path (as construed herein) for the data packet to take." The Court selects "physical media path" instead of "link" or "path" to maintain consistency among the constructions.

n9 Defendants' original construction is, "identification of the physical media path that has been associated with the mobile receiver's IP address."

11. "ROUTING SUCH STREAM TO ONE OR MORE USERS"

AOL: "Sending the stream over a network path to one or more users."
TWM: No construction required.
In the alternative, "Sending the stream over the communications network to one or more users."

AOL contends that the ordinary meaning of "routing," a term of art in communications networking, is "the process of selecting the correct path for a message." TWM counters that AOL's definition requires that every packet in a stream follow the same path from origin to destination. According to TWM, this would exclude the preferred embodiment, and is, in fact, inconsistent with how the Internet works.

As the Court recalls from AOL's own tutorial, routers act as "interchanges" or "on/off ramps" on the highway, and, a "stream" consists of packets. AOL's proposal, then, seems to require all the packets in a stream to move through the same path from the server to the user. This definition violates bedrock computer networking principles that each individual packet ultimately follows one particular path and that all the packets of a stream need not follow the same path. See KUKROSE & ROSE, COMPUTER NETWORKING 313 (2005). An ordinary skilled person would have this understanding of computer networking. With that understanding, the disputed language in the claim needs no construction.

4. "row"

Claims 9 and 19 of the '046 Patent claim, in pertinent part:

a first conductive strip of material overlying and electrically contacting central portions of a first row of said source regions . . . ; and
a second conductive strip of material overlying and electrically contacting central portions of a second row of drain regions adjacent to said first row of said source regions . . .

('046 Patent at 8:32-39, 10:19-28.) Micrel contends that "row" be construed as "a linearly organized group," and MPS argues it should be construed as "a straight line." Other than the above quoted language from Claims 9 and 19, the '046 Patent does not describe or discuss "row" and thus, provides no guidance on its meaning. Both Micrel and MPS point to various dictionary definitions which define row as follows: (1) "a number of objects arranged in a usu. straight line;" (2) "a continuous extent of length, straight or curved, without breadth or thickness;" (3) "a number of people or things arranged as to form a line, esp. a straight line;" and (4) "a series of objects place next to each other, usually in a straight line." (See Final Joint Claim Construction and Prehearing Statement, Ex. A at 5.) While all of these definitions would include a "straight line," none of them require that a row be limited to a straight line. Thus, these definitions provide support for the broader construction proposed by Micrel, "a linearly organized group." Because the ordinary meaning of "row" includes, but is not limited to straight lines, and because there is nothing in the '046 Patent which limits row to straight lines, Court adopts Micrel's proposed construction for row. According, the Court construes "row" to mean "a linearly organized group."

Rule

JuxtaComm argues "rule" means "one or more statements." Defendants contend "rule" means "one or more statements that are executed from top to bottom to perform a specific operation to achieve a desired result." Thus, the parties dispute whether rules must be "executed from top to bottom to perform a specific operation to achieve a desired result."

The specification states:

The purpose of a rule is to perform a specific operation to achieve a desired result. A rule is one or more statements. These statements are executed from top to bottom and when the last statement within the rule has been executed, or an Exit statement is encountered, the rule ends.

Col. 5:22-27. The additional language that Defendants seek to include in the construction concern the purpose of a rule and how the rule statements are executed. Those aspects of the disclosure do not further define what a rule is. Additionally, those limitations would exclude disclosed embodiments that use conditional processing or looping. See Fig. 9; col. 7:33-35; 8:54-60. Accordingly, the Court does not include those limitations in its construction. The Court construes "rule" as "one or more statements."

Rule set processor responsive to said script processor

JuxtaComm argues "rule set processor" should be construed to mean "software that processes rule sets." Defendants contend "rule set processor" should be construed as "a software component invoked by the script processor to execute rule sets."

Although the parties briefed the term "rule set processor," at the claim construction hearing they agreed the dispute includes the meaning of "responsive to said script processor." Accordingly, the Court will address and construe the entire phrase.

Defendants contend the rule set processor is an entirely separate component of the system. Defendants also seek to replace "responsive to," used in the claims, with "invoked by," used in their construction. Defendants seek to improperly limit the term to the disclosed embodiments and characterizations of the written description rather than what is recited in the claim.

Although the claim sets forth "script processor" and "rule set processor" as separate claim limitations, such a recitation does not require them to be separate physical components as indicated by Defendants' proposed construction. Nothing in the intrinsic evidence indicates that the two processors, admitted to be software, cannot be folded together and implemented as
a single module. While the system functional diagram of Fig. 2 relied upon by Defendants shows the processors as separate functional blocks, the depiction does not restrict an implementation of the system to separate components or modules.

As to Defendants' request to include "invoked by" in the claim construction in place of "responsive to," the contention is that the terms are synonymous. If that is so, as JuxtaComm says, there is no reason to replace the term "responsive to." Moreover, the use of the term "invoked" in dependent claim 9 suggests to one skilled in the art a difference in scope between the two terms regardless of the presence of other possible limiting recitations in the dependent claim that form a basis for claim differentiation.

Accordingly, the Court construes "rule set processor responsive to said script processor" as "software component that processes rule sets responsive to said script processor."

F. a set of cell selection rules

Ricoh contends that the disputed term is defined as "a plurality of rules for selecting among the hardware cells from the hardware cell library, wherein the rules comprise the expert knowledge of highly skilled designers formulated as prescribed procedures." Aeroflex contends that the term is properly defined as "a set of rules embodying the knowledge of expert designers for application specific integrated circuits, each rule having an antecedent portion (e.g. IF) and a consequent portion (e.g., THEN), which enables the expert system to map the specified stored definitions for each logical step and decision represented in the flowchart to a corresponding stored hardware cell description."

Aeroflex states that its proposed construction is consistent with contemporaneous technical dictionaries, treatises, and the prior art. See Ex. 15 at 74-75, Ex. 17 at 10-11, Ex. 14 at 10, 53, Ex. 18 at 8, Ex. 20 at 14-15, Ex. 21 at 269, "The two parts of a rule are a premise and a conclusion, a situation and an action, or an antecedent and a consequent. These statements are written in an IF-THEN format." Ex. 15 at 74, Louis E. Frenzel Jr., Understanding Expert Systems. The technical dictionary provided by Aeroflex defines "rule" as follows: "(If-Then Rule). A conditional statement of two parts." Ex. 21, Paul Harmon, Expert Systems: Tools & Applications. Aeroflex also argues that the patent's specification requires that the "rules" not only embody expert knowledge, but that the expert knowledge also be used for mapping the specified definitions in the flowchart to the hardware cell descriptions. Aeroflex Responsive Brief at 48; see '432 patent, cal. 8:21-23; 8:34-37.

Ricoh contends that the general usage dictionary definition of "rule" should apply. Also, while Ricoh admits that the preferred embodiment of the '432 patent disclosed that "rules" could be in the format of "an antecedent portion (IF) and a consequent portion (THEN)," it also asserts that nothing in the public record justifies restriction of the claimed "rules" to the exemplary format disclosed as the preferred embodiment. Richo additionally contends that the '432 patent states specific rules in the specification that are not stated in the if/then format. See '432 patent, col. 12:31-35. Moreover, Ricoh also disagrees with Aeroflex's inclusion of the following requirement: "embodying the knowledge of expert designers for application specific circuits." Ricoh argues that to the extent Aeroflex is attempting to create a distinction between the knowledge of designers for ASICs and the knowledge of designers skilled in VLSI design, the claim should be construed broadly to include either skill. See, e.g., '432 patent, col. 2:58-61 ("The KBSC utilizes a knowledge based expert system, with a knowledge base extracted from expert ASIC designers with a high level of expertise in VLSI design . . ."); col. 4:8-11 ("In the KBSC system of the present invention, however, integrated circuits can be designed at a functional level because the expertise in VLSI design is provided and applied by the invention.")

Based on Aeroflex's citation to the technical dictionary, it appears that "rule" as used in the '432 patent would have had a particular meaning to one of ordinary skill in the art. Therefore, to the extent Ricoh's definition relies on a general dictionary definition, it must be rejected. See Vanderlande Industries Nederland BV v. I.T.C., 366 F.3d 1311, 1321 (Fed. CIT. 2004). The technical dictionary definition offered by Aeroflex demonstrates that the ordinary meaning of "rules" when used to refer to rules that are contained in the knowledge base of a rule-based expert system must include an "IF-THEN" component. The Court is not persuaded that column 12, lines 31 to 35 of the '432 patent state "rules" as that term is understood in the patent. Rather, lines 31 to 35 appear to be discussing other actions that a user could take if additional rules were present.

However, the Court finds little support for Aeroflex's argument that claim 13 requires that the rules stored in the knowledge
base of the rule-based expert system embody the expert knowledge for mapping the specified definitions in the flowchart to the hardware cell descriptions. Certainly, the plain language of claim 13 does not dictate that the "rules" encompass the "mapping" function. Moreover, while the patent's specification does suggest that the rules might play such a role in the preferred embodiment, see '432 patent, col. 8:34-37, such a conclusion is not compelled from the specification language. In any event, the Court should not "limit[] the claimed invention to preferred embodiments or specific examples in the specification." Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997).

Furthermore, Ricoh correctly states that the definition should not make a distinction between the knowledge of designers for ASICs and the knowledge of designers skilled in VLSI design. The specification clearly contemplated that both sets of knowledge would be included in the knowledge base. See '432 patent, col. 2:58-61; col. 4:8-11. Furthermore, Aeroflex's attempt to include the following language in the definition - "for each logical step and decision represented in the flowchart" - should be rejected for the reasons discussed supra. Accordingly, the Court construes "a set of cell selection rules" as a set of rules embodying the expert knowledge of highly skilled VLSI designers, each rule having an antecedent portion (e.g., IF) and a consequent portion (e.g. THEN).

3794

"run-time executor"

Claims 1 and 12 of the '362 patent contain the term "run-time executor." The parties agree that the term has no ordinary meaning and that it is not specifically described in the patent. Defendants claim, based on these two facts, that the term is indefinite. Typhoon argues that the term was used, and indeed meant to be used, interchangeably with the term "run-time utility."

As noted above, the '362 patent is a continuation of the '057 patent, which in turn claims priority to U.S. Application No. 07/271,237 filed on November 14, 1988. The term "run-time executor" was first used in new claims added to the '057 patent application on January 28, 1994. See Amendment dated January 28, 1994, Defendants' Motion for Summary Judgment Ex. 3, Docket No. 354-4 at 6-8, 10. After those claims were rejected by the patent examiner for lack of a written description, the applicant replaced the term "run-time executor" with the term "run-time utility" described in the specification. See Office Action dated March 17, 1994, Defendants' Motion for Summary Judgment Ex. 4, Docket No. 354-5 at 3; Amendment dated May 31, 1994, Defendants' Motion for Summary Judgment Ex. 6, Docket No. 354-7 at 6. The term "run-time executor" was reintroduced in the continuation application which led to the '362 patent. See Preliminary Amendment dated October 4, 1994, Defendants' Motion for Summary Judgment Ex. 8, Docket No. 354-9 at 1, 13-15, and 17-18. The claims in the continuation application were not rejected on the basis of lack of a written description. Thus, the term "run-time utility" is used in the '057 patent and the term "run-time executor" is used in the '362 patent.

This history manifests a clear intention by the patentee that the terms "run-time utility" and "run-time executor" are synonymous and interchangeable. C.f. Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1294 (Fed. Cir. 2000) (holding that patentee must use "reasonable clarity and deliberateness" in prosecution history in order for a court to limit the scope of claim terms based on such history). In addition, by the time the continuation application leading to the '362 patent was filed, the PTO also agreed that the patentee used the terms interchangeably. At the time of the original application there was no evidence that "utility" and "executor" had similar definitions. However, given those terms' subsequent history, Defendants' argument that "run-time executor" is insolubly ambiguous has no support. The patent history decisively yields the conclusion that "runtime executor" be given the same definition as "run-time utility." Therefore, Defendants' motion for summary judgment is denied with respect to the term "run-time executor" and the term is defined as "a software program invoked during execution of a data collection application to manage the various tasks involved in executing the data collection application."

3795

8. The term "running time" should be interpreted as follows: "the period of time during which a program is being executed."
2. "safety switch mechanism . . . for connecting a pre-qualified release of a defibrillation shock to patient electrode terminals"

Claim 1 of the '085 Patent discloses a "safety switch mechanism . . . for connecting a pre-qualified release of a defibrillation shock to patient electrode terminals." As to the claim construction of this term, Philips contends that Claim 1 describes a "safety switch that connects a 'pre-qualified release' of a defibrillation shock to patient electrode terminals." Thus, Philips argues that "the safety switch does not close until after the processor receives the defibrillation shock release request and pre-qualifies release of the defibrillation shock." Cardiac Science initially asserted that no construction of this term was required. Just prior to the Markman hearing on this matter, however, Cardiac Science asserted that "safety switch mechanism" should be defined as "a fail-safe device that requires two shock release requests before it will allow the AED capacitors to deliver a defibrillation shock to the electrodes attached to the patient." n5

--- Footnotes ---

N5 Philips objects to Cardiac Science's proposed construction on the terms of the '085 Patent, on the grounds that Cardiac Science's new constructions were barred by the Court's April 28, 2005 Order (Court Doc. No. 172) and because the Court previously denied Cardiac Science's attempt to submit these constructions through additional briefing. (Court Doc. No. 377.) The Court sustains Philips' objections. The Court's April 28, 2005 Order specifically stated that Cardiac Science would submit alternate claim constructions to Philips by April 29, 2005. (April 28, 2005 Order at 1.) The Court stated that, "to the extent that Cardiac Science provides no alternate claim construction for the terms and phrases identified solely by Philips as needing to be construed, it will be precluded from later offering a new construction." (Id.) The Court also denied Cardiac Science's attempt to later submit additional constructions after new counsel took over representation of Cardiac Science on this matter. (January 6, 2006 Order). Clearly, Cardiac Science was not allowed, by virtue of the Court's orders, to provide alternative claim construction after April 29, 2005. Consistent with the Court's January 6, 2006 Order, and in the interest of fairness, the Court is not willing to reconsider these issues at this late stage of the proceedings.

As a result of sustaining Philips' objections, the Court will not consider Cardiac Science's proposed constructions, submitted on the eve of the Markman hearing. Rather, the Court will consider Philips' proposed construction, Cardiac Science's objections to Philips' proposed construction, and Cardiac Science's previous argument that no construction of these terms was required.

--- End Footnotes ---

Philips argues that the safety switch does not close until after the processor receives the defibrillation shock release request and pre-qualifies release of the defibrillation shock. Philips points to Figure 2 of the '085 Patent and to the specification in support of its construction. The patent specification describes the safety switch mechanism as follows:

Processor 30 functions to receive monitoring signals, analyze the signals and if appropriate, close switches 26(a) and 26(b) Signals which are monitored preferably include impedance between electrodes connected to terminals 24(a) and 24(b) and fitted to a patient's chest. The acceptable and appropriate impedance is within the range which should be observable across a patient's chest cavity. Only when the impedance is within preset parameters does the processor 30 allow switches 26(a) and 26(b) to be closed. Processor 30 also monitors and analyses the patient's cardiac electrical output. Only if the monitored cardiac signal, also preferably received from electrodes connected to patient electrode terminals 24(a) and 24(b), is identified as a ventricular fibrillation condition, does the processor 30 allow the switches 26(a) and 26(b) to be closed.

The processor 30 is in communication with a manual trigger switch or "rescue switch" 32. The rescue switch 32 is manually actuated by rescue personnel to signal the processor 30 to release and deliver a defibrillation shock if the processor's criterion [sic] for release and delivery have been met. In effect, the processor serves to control a pre-qualification of release of a defibrillation shock.

The rescue switch 32 also independently closes switches 28(a) and 28(b) to allow the shock to be released. This independent closure serves as a significant safety check against inadvertent shock delivery which might result from a
malfunction at the processor 30. In effect, the independent closure serves as a fail safe device to assure that an emergency medical operator has indeed requested that a defibrillation shock be delivered if the processor's pre-qualification criterion [sic] have been met.

(Id. at c. 4, l: 58-c. 5, l: 21.)

The Court agrees with Philips' proposed construction. The safety switch mechanism is depicted in Figure 2 as switches 28(a) and 28(b). When the processor receives signals from the electrodes that a patient is in fibrillation, the processor recognizes that a shock is appropriate. When the shock is pre-qualified and the rescue switch 32 is manually actuated, the processor closes switches 26(a) and 26(b). And the closure of the rescue switch and safety switches 28(a) and 28(b) allows the shock to be delivered to the patient.

Thus, the Court construes "safety switch mechanism," consistent with Philips' proposed construction, as "the safety switch does not close until after the processor receives the defibrillation shock release request and pre-qualifies release of the defibrillation shock."

3797

3. "safety switch mechanism . . . separately responsive to the defibrillation shock release request signal"

Claim 1 of the '085 Patent describes the safety switch mechanism as "separately responsive to the defibrillation shock release request signal." Philips asserts that this phrase should be construed as "the safety switch responds to the signal from the trigger switch, without input from the monitoring and analysis circuit." In its briefing, n6 Cardiac Science contends that this phrase should be construed consistent with its construction of the previous term. In other words, Cardiac Science asserts that "safety switch mechanism" should be construed as "a fail safe device that requires two shock release requests before it will allow the AED capacitors to deliver a defibrillation shock to the electrodes attached to the patient."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n6 Consistent with the Court's remarks in the previous term, the Court will not consider Cardiac Science's arguments that occurred on the eve of the Markman hearing.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The Court agrees with Philips that the specification requires safety switches 28(a) and 28(b) to close without input from the processor. ('085 Patent at c. 5, ll: 13-21.) The specification describes the manually actuated trigger/rescue switch as the source of the signal to release the defibrillation shock. (Id. at c. 5, ll: 6-11.) Then, the rescue switch independently closes the safety switches to allow the shock to be released. (Id. at c. 5, ll: 13-14.) As noted in Figure 2, the safety switches are not connected to the processor. Thus, the safety switch responds to the signal from the trigger switch without input from the processor (i.e., the monitoring-and-analysis circuit). This is consistent with the specification, which states that the independent closure protects against malfunctions in the processor that otherwise could result in inadvertent shock delivery to a patient. (Id. at c. 5, ll: 14-17.) Accordingly, the Court construes this phrase as "the safety switch responds to the signal from the rescue/trigger switch without input from the monitoring and analysis circuit."

3798

18. Where subsequent uses of a claim term within a claim make reference to the first usage as an antecedent (through the use of introductory definite articles such as "said" or "the"), the claim term must be interpreted consistently across all such uses. See Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1356-57 (Fed. Cir. 1999).

GO BACK
Moll furthermore argues that the trial court "erred . . . by limiting the first and second detecting means as operating only on analog input signals." The claim language, specification, and prosecution history refute Moll's position. The claim covers a "system for minimizing the storage . . . requirements of digital representation of analog signals comprising a means for converting an analog signal to said digital representation . . . first means for detecting the complete absence of said analog signal, second means for detecting the duration of said absence of said analog signal . . .," (emphasis added). "Said analog signal" refers only to "analog signal." The district court was correct that the specification and prosecution history support this construction.

Substep (a) claims as part of the "tracking movement" step, periodically forming largely overlapping images of a field of view of "said array." When an element uses the word "said," it is referring back to a device already disclosed. See Nautilus Group, Inc. v. Icon Health and Fitness, Inc., 308 F. Supp. 2d 1198 (citing Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1356 (Fed. Cir. 1999), cert. denied, 529 U.S. 1037, 120 S. Ct. 1531, 146 L. Ed. 2d 346 (2000)). The phrase "said array" refers to the "two-dimensional array of photosensors" of the device disclosed in step (1).

With reference to FIG. 1, a hand-holdable controller device 10 is shown as including an integrated circuit package 12 for acquiring and processing image data. On the surface of the package is an optoelectric integrated circuit chip 14 having a two-dimensional array 16 of photosensors and having processing circuitry 18. The array and processing circuitry are used to acquire successive frames of image data, permitting the attitude of the device to be tracked.

('804 Patent, Col. 5:3-11.)

A person of ordinary skill in the art would understand that the inventor of the '804 Patent is using the phrase "said array" to mean the two-dimensional array of photosensors and associated circuitry of the hand-held device. Although the written description discusses a 32 X 32 array 2, the device is not limited to an array of a particular size.

We now focus on the correct interpretation of "said assembled data" in the context of the asserted claims of the '715 patent, and conclude that the Commission was correct in ruling that "said assembled data" refers to an entire Sector of CD-ROM data as it is stored in random access memory ("RAM").

The intrinsic record in this case is entirely consistent with this interpretation. The '715 patent contemplates a two-step data "assembly" process as data is read from the CD-ROM disk. First, the bit-by-bit serial stream of CD-ROM data is assembled into 8-bit bytes. Then, as specified by the Yellow Book, a group of bytes of the appropriate size is assembled into a Sector.
and stored in RAM. The written description of the '715 patent confirms this two-step data assembly process:

The drive controller 10 accepts digital data from the CD drive's electronics 12, particularly the microcontroller 29 and DSP 28 in a serial stream, descrambles the data, and assembles it into 8-bit bytes. The controller 10 then stores the data into the DRAM buffer 50. The error correction and detection operations performed by the ECC 40 and EDC CRC 42 on each sector of data are managed by the DRAM controller 38, which insures, through the direction of the host interface or control 44, that a sector of data is being corrected while the transfer of previously corrected sectors of data is occurring in real-time and without interrupting the flow of data from the drive controller 10 to the IDE bus 16.

'715 patent, col. 7, ll. 15-26. In other words, immediately after mentioning that CD-ROM data is normally read from the disk as a serial stream, assembled into 8-bit bytes, and stored in a RAM buffer, the written description acknowledges that error correction functions (abbreviated as "ECC" in the written description) and error detection functions (abbreviated as "EDC" in the written description), in the context of CD-ROM technology, operate on a sector-by-sector basis. Id. at ll. 19-22. Thus, the claim language and the written description both describe a straightforward, sector-by-sector, sequential "assembly line" process. Specifically, the written description states that the "assembled data" (i.e., a Sector of data) is first processed by the "error correction circuitry." When this process is completed, the "cyclic redundancy checker" processes the output of the error correction circuitry and produces "corrected data."

Oak argues that the Commission's interpretation of "said assembled data" was "misguided from the outset." Oak's view is that "according to the specification, 'assembled data' is simply another term for CD-ROM data that is sent from the compact-disc drive's electronics to the controller serially (i.e. one bit at a time) and organized into 8-bit bytes, not an entire 16,000 bit sector of data." (emphasis Oak's). In other words, Oak focuses on the first of the two steps in the data assembly process (i.e., converting a serial bit stream into a stream of 8-bit bytes), and ignores the second step (i.e., grouping a specified number of bytes into a Sector of data).

Based on the intrinsic record, support for the Commission's interpretation of "said assembled data" is overwhelming. First, the Yellow Book leaves no doubt that both error correction and error detection are to be performed on a sector-by-sector basis, and Oak readily admits that "Oak's patent contemplates Yellow Book compliance." Ordinarily skilled artisans would know that not every byte of a Sector is used for purposes of either error correction or error detection. Specifically, the Yellow Book plainly specifies that Reed-Solomon error correction operates on bytes 12 through 2075 of each Sector, while CRC error detection operates on bytes 0 through 2063.

Oak attempts to argue that interpreting "said assembled data" to refer to an "entire sector of data as a unit" would create "insurmountable" problems, because there are actually some bytes in each Sector that are not involved in the error correction or error detection operations at all. This argument has no merit, because it incorrectly assumes that ordinarily skilled artisans will not be able to select the appropriate bytes in the Sector for each of the two operations. Indeed, we believe that it is Oak's interpretation of "said assembled data" that presents insurmountable problems. Oak does not attempt to explain how error correction and detection, as defined in the Yellow Book and claimed in the '715 patent, could be performed on any grouping of data smaller than a Sector.

To support its position that "said assembled data" does not refer to a Sector, Oak relies solely on following portion of the written description:

The drive controller 10 accepts digital data from the CD drive's electronics 12, particularly the microcontroller 29 and DSP 28 in a serial stream, descrambles the data, and assembles it into 8-bit bytes. The controller 10 then stores the data into the DRAM buffer 50.

'715 patent, col. 7, ll. 15-19. From Oak's perspective, this passage is appealing because it does not specify exactly how much data is being stored in the DRAM ("dynamic random access memory") buffer. According to Oak's view, therefore, there is no legally valid reason to narrow the meaning of the claimed term "said assembled data" to any particular size, much less to an entire Sector of data.

In fact, the written description of the '715 patent itself describes how Sectors of data compliant with the Yellow Book can be broken up into their constituent parts and stored in RAM in a way that is conducive to sector-by-sector error correction and detection. The written description makes it clear that Sectors are read out of the CD-ROM disk, one Sector at a time, and...
that the data stored in the DRAM buffer each time a Sector is read takes up exactly 2048 bytes, an amount corresponding to
the User Data in the Sector:

FIG. 19 and FIG. 20 are ECC block pointer/write address counters. PTL and PTH form a pointer used by the ECC logic,
and contain the 12 least significant address bits of the first header byte of the CD-ROM block that is being corrected. Due to
the DRAM page organization of one embodiment of the controller, the value of PTH,PTL will always be 00,00h, making it
unnecessary to read or write PTL or PTH. The starting location of each block is controlled by write block counter registers
WBKL and WBKH (28h and 29h). Error correction is processed on the block before that indicated in the write block
counter (WBKH,WBKL-1). The controller organizes the DRAM into 2048-byte pages, allowing PTL and PTH to remain
unchanged. PTL and PTH are undefined following hardware reset or firmware reset.

'715 patent, col. 12, ll. 1-14 (emphasis supplied). In other words, in the only embodiment described in the '715 patent, there
is a DRAM buffer for storing CD-ROM data that is organized into "pages" of memory, with each page containing exactly
2048 bytes. As mentioned earlier, the Yellow Book specifies that the User Data field in each Sector of data is exactly 2048
bytes long (at least in Sector Mode 01, which is the only relevant operating mode in this case). Lest there be any doubt
about what is being stored in each 2048-byte DRAM buffer page, the '715 patent explains that "the microcontroller writes
the starting address that corresponds to the required starting point in the CD-ROM block," and that "the first byte of User
Data is located at address 00h." '715 patent, col. 11, ll. 27-28; Id. at ll. 31-32.

In other words, the disclosed controller locates the beginning of the 2048-byte User Data field in each Sector of data based
on its knowledge of Sector organization as specified by the Yellow Book, and lines up the data so that the User Data is
stored starting at the first memory location in one of the 2048-byte pages of memory in the DRAM buffer. As each new
Sector is read from the CD-ROM disk, a new page in the DRAM buffer is used to store the User Data in that Sector, and a
set of "pointers" (i.e., high-byte pointer PTH and low-byte pointer PTL) is used to keep track of the particular page in the
DRAM buffer currently being operated on. '715 patent, col. 12, ll. 2-5 ("PTL and PTH form a pointer used by the ECC
[error correction code circuitry], and contain the 12 least significant address bits of the first header byte of the CD-ROM block
that is being corrected.").

In short, we must reject Oak's allegation that "there is no support for [the Commission's interpretation of 'said assembled
data'] in the '715 patent or prosecution history."

3802

37. Claim 7, clause 3, recites the language: storing a plurality of covers for books to be printed in said computer, said covers
being stored in a bit mapped format. The parties do not dispute that this clause requires the covers for the books to be stored
in a bit mapped format. Defendants argue, however, that this clause requires that the covers of books to be printed are stored
in the same computer as the text of the books to be printed. See Doc. 69 at 44. Defendants base their position on their
assertion that the patent in this case encompasses only one computer, rather than a network of computers. The court has
found above that the '213 patent does not disavow or relinquish a broad meaning of the term computer to preclude the use of
a computer network. Therefore the plain meaning of Claim 7, clause 3, does not require that the covers be stored in the same
computer as the text of the books to be printed. Additionally, the specification and prosecution history to not establish that
the inventor intended otherwise.

3803

J. "said http server," as used in claim 1.

Claim 1's preamble states that the claimed invention involves a method of state information transfer "between an http server
and an http client." '670 Patent Claim 1. Subsequent references to "an http server" in the patent claims use the words "said
http server." Here, the parties dispute whether the use of "said http server" refers back to the same http server that receives a
request from an http client. Specifically, plaintiff asserts that no claim construction is necessary, while defendants propose
the claim construction, "the same server from which the user/client requested the HTML document." In this case,
application of Federal Circuit decisions governing the import of "said" when used in claims leads to the conclusion that "said http server" refers to "the same http server that received the request from the http client."

As explained in Baldwin Graphics Systems, Inc. v. Siebert, Inc., 512 F.3d 1338, 1343 (Fed. Cir. 2008), the use of the article "a" in a patent's claims carries the generic meaning of "one or more," as opposed to "the," which indicates a singular. Significantly, the use of "said" in subsequent references "does not change the general plural rule, but simply reinvokes that non-singular meaning." Id. Yet, an exception to this subsequent reference rule is made where "the language of the claims themselves, the specification, or the prosecution history necessitate departure." Id.(citations omitted).

While ordinarily "said http server" as used in the '670 patent refers back to multiple http servers because of the patentee's use of the article "an" in claim 1's preamble, the '670 patent specification provides strong justification to depart from this general rule. Specifically, the specification teaches that a server is a passive entity, which acts only when it receives a request from a client. See, e.g., '670 Patent Specification col. 1 11. 59-62 ("[T]he server serves a passive role, i.e., it accepts commands from the client and cannot request the client to perform any action."); id. col. 711. 12-13 ("Using the teachings of the present invention, when a server responds to an http request . . . ."). It follows that in the context of claim 1, "said http server" will only transmit a file or state object when "said http client" places a request. Logically then, the http server receiving the request must be the same http server that responds to the request.

The specification does not support the view that an http server receiving a request may essentially forward the request to another third-party server, which ultimately sends the desired information to the http client. Nor do the scenarios addressed in the course of the October 16, 2009 claim construction hearing suggest otherwise. Specifically, the parties discussed whether a primary http server receiving a request for an html document might: (i) transmit html text, which contains embedded reference tags directing the http client's Web browser to make additional secondary requests for other files to third-party servers, as depicted in figures 2, 3A, and 3B; or (ii) gather other media, such as images, from other third-party servers, and ultimately transmit a complete, integrated html document to the http client. Importantly, in the first scenario, the http client makes an initial request to the primary http server by entering a URL, and, upon receipt of the unfinished html document, the Web browser automatically makes secondary requests to third-party http servers to complete the Web page, albeit absent any additional affirmative act by the user. Thus, both the primary and third-party http servers transmit files to the http clients only after receiving requests directly from the http client. Similarly, in the second scenario, third-party servers respond to requests made by the primary http server; they do not respond directly to the http client, nor are they necessarily aware of the http client's underlying request to the primary server because the http client has not established a connection with the third-party http server by making a request. Accordingly, only the primary server transmits a file directly to the http client because only the primary server has received a request directly from the http client.

In addition, it must be noted that the parties disagreed in the course of the October 16, 2009 hearing as to whether a third scenario is permitted under the http protocol, namely that an http client makes a request to a primary http server, which then directs a third-party http server to send a file directly to the http client. Such a scenario, however, must be rejected as implausible. The http protocol--upon which the claimed invention builds, but does not alter--does not allow an http server to initiate the establishment of a direct connection with an http client. Instead, only an http client may open a connection to an http server by sending a request. Thus, the parameters of the http protocol exclude the possibility that "said http server," as used in claim 1, refers to an http server that does not receive a request from an http client.

In response, plaintiff argues that the specification includes references to multiple clients and multiple servers. Specifically, plaintiff cites the background of the invention section, see id. col. 1 11. 48-55, and the description of client-server computing, which includes figure 1 A, see id., col. 4 11. 17-27, which make reference to multiple "clients" and multiple "servers." These specification passages, however, at most establish the undisputed proposition that the Internet is a "network of networks," comprised of a veritable panoply of servers and indeed over a billion Internet users. This intrinsic evidence does not elucidate whether "said http server" as used in the '670 patent claims must be the same server that receives that request, and is not inconsistent with the fact that, as noted previously, a Web browser may make multiple requests to both primary and third-party servers in the course of assembling an integrated Web document.

In sum, the specification rebuts the presumption that the use of "an" is a generic use. By contrast, plaintiff's argument--which essentially requires an http server to transmit a state object or file even where it does not first receive an http client request--is inconsistent with the fact that http servers are passive entities. Accordingly, "said http server" is construed to mean "the same http server that received the request from the http client."
3. "said information" (claims 1, 2, 5, 6, 16, 19, 20)

Plaintiff argues that this term means "information submitted by the user to be included in a record." Defendant argues that there is no antecedent basis for this term and the court should invalidate the claim as indefinite. The requirement of antecedent basis is a rule of patent drafting. The Manual of Patent Examining Procedure states that the failure to provide explicit antecedent basis does not always render a claim indefinite. MPEP § 2173.05(e) (8th ed. Rev. 2 May 2004). The Federal Circuit has held that "despite the absence of explicit antecedent basis, 'if the scope of a claim would be readily ascertainable by those skilled in the art, then the claim is not indefinite.'" Energizer Holdings, Inc. and Eveready Battery Co., Inc. v. International Trade Commission, 435 f.3d 1366, 1370-71 (Fed. Cir. 2006)(citing Bose Corp. v JBL, Inc., 274 f.3d 1354, 1359 (Fed. Cir. 2001)).

Within the context of independent claims 1 and 15, "said information" is clearly understood to mean the information submitted by the user to be included in a record. For example, in claim 1, the pertinent part states "said information to be included in said record responsive to said request" while claim 15 states in relevant part "means for receiving said information to be included in said record responsive to said transmitting said request." See claims 1 & 15 of the '940 patent. Accordingly, the court construes "said information" to mean "information submitted by the user to be included in a record."

Claim Construction

HDI's motion for summary judgment of noninfringement was concentrated on claim 1, as representative of the '487 claims:

1. A method of causing an analytical measurement to be made in a reflectance-reading device at the end of a predetermined time period after an analyte reacts with a reagent in a porous, reflectance-reading matrix located in said device, which comprises:

   taking a first reflectance reading from a dry first surface of said porous matrix prior to application of a sample of body fluid suspected of containing said analyte to a second surface of said porous matrix from which said sample can travel to said first surface by capillary action and react with said reagent in said porous matrix if said analyte is present in said sample;

   applying said sample to said second surface of said porous matrix;

   taking an additional reflectance reading from said first surface after said sample is applied to said porous matrix;

   comparing said additional reflectance reading to said first reflectance reading;

   initiating said predetermined time period upon a predetermined drop in reflectance sufficient to indicate that said sample has reached said first surface; and

   taking a measurement reflectance reading at the end of said predetermined time period without having determined the time at which said sample was initially applied to said porous matrix.

The district court construed the claims as limited to a method wherein the initial measurement of the dry reflectance is taken on the same test strip just before the blood is applied, and not on a sample test strip whose reflectance is taken at the factory. The court held that although the HDI method functions in the same way as the claimed invention, the HDI device differs in that it "compare[s] the reflectance readings of the test strips, whether they are wet or dry, to a threshold reflectance reading which is programmed into the meter at the factory."
Lifescan states that there is no material difference between comparing two reflectance readings to each other, and comparing both readings to a third (threshold) reading that was previously taken at the factory. Thus Lifescan states that the district court erred in construing the claims, arguing that neither the '487 specification nor its prosecution history supports the district court's interpretation of the claims to exclude the possibility of infringement. Lifescan states that the reflectance reading taken at the factory constitutes "taking a first reflectance reading" as called for by claim 1, and that when this reading is compared with the additional reflectance reading taken by the HDI device after the blood sample has been applied, this literally constitutes "comparing said additional reflectance reading to said first reflectance reading," as the patent requires. Lifescan argues that direct comparison is not the only way of comparing values, and that HDI's method of comparing both reflectance readings to a factory-determined "standard" is the same as or equivalent to comparing them to the initial reading by the Lifescan meter. In both devices it is the amount of drop in reflectance that is measured, but in the HDI device both the initial "wet" reflectance after the plasma penetrates to the far side of the matrix, and the reflectance after the incubation period, are compared to the "standard" instead of directly to each other.

Lifescan argues that neither the specification nor the claims of the '487 patent requires that the reflectance readings be compared directly to each other, and that the district court erred in finding the claims to be so limited. Lifescan states that the district court improperly read into the claims the details of its preferred embodiment, although these details are not required by the specification, are not included in the claims, and are not required to preserve the validity of the claims. See E.I. DuPont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433, 7 U.S.P.Q.2D (BNA) 1129, 1131 (Fed. Cir.) (prohibiting reading limitations from the specification into the claims "wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim"), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988); Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867, 228 U.S.P.Q. (BNA) 90, 93 (Fed. Cir. 1985) ("Generally, particular limitations or embodiments appearing in the specification will not be read into the claims.").

Lifescan is correct that the claims do not include a limitation to how the reflectance readings are compared. Nor do the claims require that the reflectance readings be compared directly to each other instead of comparing each to a "standard" reflectance. However, the claims state that the dry and wet reflectances are taken from the same strip. Claim 1 states: "taking a first reflectance reading from a dry first surface of said porous matrix." The district court held that the claims can not be literally infringed when the dry reflectance reading is not taken from the same test strip that is used in the test, but is measured in advance at the factory. We conclude that the district court correctly interpreted the claims. Thus by programming its reflectance meter with a predetermined dry reflectance, HDI did not literally infringe the '487 patent. We affirm the summary judgment that the claims are not literally infringed.

**D. Said Scanning Head**

The parties dispute whether the scanning head that samples the output signals must also produce or generate the characteristic signal samples that it uses for comparison. The relevant portion of claim 1 states: "a memory for storing characteristic signal samples produced by scanning said preselected segments of bills of different denominations with said scanning head." '196 Patent, Col. 32, ll.5-8. Glory argues that the characteristic signal samples must be produced and stored by the specific scanning head that is present in the device. Cummins argues that such a construction is improperly narrow, and that the scanning head need only have a memory for storing the signal samples.

The Court agrees with Glory's proposed construction. The use of "said scanning head" is a reference to a term of art in patent law in which the court must identify the antecedent basis for an element preceded by "said." See Gemstar-TV Guide Int'l, Inc. v. ITC, 383 F.3d 1352, 1379 (Fed. Cir. 2004). The "scanning head" is a specific, defined element in Claim 1; therefore, the plain language of the claim requires the characteristic signal samples to be produced and stored by that particular scanning head. Cummins could have drafted this claim differently so as to allow the scanning head to receive pre-programmed characteristic signal samples, but Cummins did not draft the claim in such a way. Courts may not redraft the plain language of a claim. Chef Am., Inc. v. Lamb-Weston, Inc., 358 F.3d 1371, 1374 (Fed. Cir. 2004). The language of the claim requires the patented device to produce and store the master characteristic patterns.
5. "said silicon surface"

Agere argues that the phrase "said silicon surface" in claim 2 should be construed as "a silicon surface." Atmel does not propose a construction of the phrase "said silicon surface," but rather contends that the phrase lacks an antecedent basis and is therefore indefinite and invalid. Because there is no actual dispute over the construction of the term "silicon surface," no construction is necessary at this time. Rather, the issue here is whether the term "silicon surface" is rendered indefinite and therefore invalid by the existence of the preceding word "said."

Atmel is certainly correct, and Agere appears to acknowledge, that the phrase "said silicon surface" lacks an antecedent basis (i.e., there is no prior reference to a "silicon surface" in the claims). However, this does not necessarily render the phrase invalid for indefiniteness. The definiteness requirement arises out of 35 U.S.C. § 112, which requires that the specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention. 35 U.S.C. § 112, P 2.

Under 35 U.S.C. § 282 …, a patent is presumed valid, and at trial [the defendant has] the burden of proving facts by clear and convincing evidence showing that the patent is invalid. Compliance with the definiteness requirement is a question of law which we review de novo. Whether a claim is invalid for indefiniteness depends on whether those skilled in the art would understand the scope of the claim when the claim is read in light of the specification.

Here, when claim 2 is read in light of the specification, it is clear that "said silicon surface" means "a silicon surface." For example, the specification states: "We have found that tungsten can be blanket deposited with good adhesion over a dielectric covering a portion of a silicon surface …. The glue layer film may be deposited, through openings in the dielectric, directly on the silicon or on a conducting material, such as a silicide, overlying the silicon." '335 Patent at col. 3:3-10. Thus, the patentee expressly contemplated that the glue layer would be used both where the exposed underlying material beneath the dielectric is simply a silicon surface, and also where the exposed underlying material beneath the dielectric is a metallic silicide overlying a silicon surface. These two possible scenarios identified in the specification comport perfectly with the two scenarios addressed in claims 2 and 3, which assert "[a] method as recited in claim 1 in which said [exposed underlying] material comprises said silicon surface," and "[a] method as recited in claim 1 in which said [exposed underlying] material comprises a metallic silicide," respectively. '335 Patent at col. 6:7-10. Therefore, the Court concludes that those skilled in the art would understand the scope of the claim when read in light of the specification, and thus Atmel's argument that the claim is invalid for indefiniteness is rejected.

C. What Constitutes the Uppermost Surface of the Insulation Layer?

The parties dispute whether formation of the first and second gate electrodes must occur on exactly the same surface. The claim recites, in relevant pan:

selectively forming a plurality of spaced-apart first gate electrodes on the uppermost surface of said at least one layer of insulation material;

selectively forming a plurality of second gate electrodes on said uppermost surface of said at least one insulating layer between said plurality of spaced-apart first gate electrodes, each of said second gate electrodes substantially occupying the space between adjacent first gate electrode;
According to the claim, the process forms the second gate electrodes on "said uppermost surface of said at least one insulating layer between said plurality of spaced-apart first gate electrodes."

The language "said uppermost surface of said at least one insulating layer" refers to the same place where the process previously formed the first gate electrodes. This language specifies the positioning of the second gate electrodes, but does not limit or specify the number of steps involved in formation of these electrodes. Dr. Wen testified that one skilled in the art would understand that the '674 process envisions many steps not specified in the claim 1 procedure. Dr. Fordemwalt agreed, as well, that the '674 process envisions many intermediate steps. Transcript at 344-45. Counsel for Loral questioned Dr. Fordemwalt, "You could have steps that would add a few additional layers [of insulation]." Dr. Fordemwalt responded that "we are talking a lot of layers." Id. In fact, Dr. Fordemwalt agreed that these intermediate steps may involve cleaning or regrowing portions of the exposed surface of the insulation layer. Id. The nature of the '674 process teaches one skilled in the art that "the uppermost surface of said at least one layer of insulation material" would not and could not be the identical atomic surface originally formed. As Dr. Wen explained, "in a semiconductor process environment, it is basically extremely difficult, if not impossible, to preserve the real atoms on a layer-by-layer basis on the surface of a layer . . . it is virtually impossible to have the same exact atoms on the surface." Transcript at 242.

With this understanding of the process from the vantage of a skilled artisan, the claim describes the position for formation of the second gate electrodes between the first gate electrodes. The claim requires this formation on the same material at roughly the same thickness as the material under the first gate electrodes. Transcript at 242-43. One skilled in the art would not understand this language to describe the formation of the second gate electrodes on the exact atomic surface of insulation material on which the first gate electrodes were formed. Nothing in the specification or prosecution history suggests limiting this positioning description to an exact atomic layer formed earlier in the multi-stepped process. Consequently, the court concludes "said uppermost surface of said at least one insulating layer" requires formation of the second gate electrodes between the first gate electrodes on the upper surface of the same continuous insulation layer upon which the first gate electrodes were formed.

The Commission held the claim invalid because the term "said zinc anode" lacked an antecedent basis, and because of the claim's imprecise statement of the role of the test parameters. EBC argues that these flaws do not render the claim "insolubly ambiguous," in the words of Marley Mouldings, Ltd. v Mikron Industries, 417 F.3d 1356, 1361 (Fed. Cir. 2005), which held that when a claim "is not insolubly ambiguous, it is not invalid for indefiniteness." See also Bancorp Servs., L.L.C. v Hartford Life Ins. Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004) ("We have held that a claim is not indefinite merely because it poses a difficult issue of claim construction; if the claim is subject to construction, i.e., it is not insolubly ambiguous, it is not invalid for indefiniteness.").

EBC argues that a person of ordinary skill in this field would readily understand the claim despite imperfect drafting, for the specification makes clear that the test parameters included in the claim do not mean that every cell must be discharged for 161 minutes. EBC points out that the '709 patent is directed to a standard electrolytic alkaline cell, and that the specification clearly states that the purpose of the test is to identify zinc anode material used in the invention. Claim definiteness is analyzed "not in a vacuum, but always in light of the teachings of the prior art and of the particular application disclosure as it would be interpreted by one possessing the ordinary level of skill in the pertinent art." In re Moore, 58 C.C.P.A. 1042, 439 F.2d 1232, 1235 (CCPA 1971). The definiteness inquiry "focuses on whether those skilled in the art would understand the scope of the claim when the claim is read in light of the rest of the specification." Union Pac. Res. Co. v. Chesapeake Energy Corp., 236 F.3d 684, 692 (Fed. Cir. 2001). Although neither the Commission nor the courts can rewrite claims to correct material errors, the issue here is not correction of error, but understanding of what the claim covers. When the meaning of the claim would reasonably be understood by persons of ordinary skill when read in light of the specification, the claim is not subject to invalidity upon departure from the protocol of "antecedent basis."

The requirement of antecedent basis is a rule of patent drafting, administered during patent examination. TheManual of Patent Examining Procedure states that "obviously, however, the failure to provide explicit antecedent basis for terms does not always render a claim indefinite." MPEP § 2173.05(e) (8th ed. Rev. 2, May, 2004). In Slimfold Manufacturing Co. v. Kinkad Industries, Inc., 810 F.2d 1113, 1117 (Fed. Cir. 1987) the court held that "the missing antecedent clause, the absence of which was not observed by the examiner of the original patent or by Kinkad in its reissue protest documents, did not fail to inform the public during the life of the [274] patent of the limits of the monopoly asserted." The Slimfold
court held that addition of the missing antecedent basis during reissue was not a substantive change. Whether this claim, despite lack of explicit antecedent basis for "said zinc anode," nonetheless has a reasonably ascertainable meaning must be decided in context. In prosecuting the '709 patent, the examiner made several objections to the claims, but the claims were not rejected or objected to on the ground of lack of antecedent basis. In Bose Corp. v. JBL, Inc., 274 F.3d 1354, 1359 (Fed. Cir. 2001) the court held that despite the absence of explicit antecedent basis, "If the scope of a claim would be reasonably ascertainable by those skilled in the art, then the claim is not indefinite." Moreover, we noted in Slimfold that an antecedent basis can be present by implication. Slimfold, 810 F.2d at 1116. See Cross Medical Products v. Medtronic Sofamor Danek, 424 F.3d 1293, 1319 (Fed. Cir. 2005).

Neither the Commission nor the Intervenors argued that they did not understand the intended scope because of the absence of an antecedent. The Commission erred in holding that the need to construe a claim, or the proffer of alternative constructions, renders the claim indefinite. A claim that is amenable to construction is not invalid on the ground of indefiniteness. In Exxon Research & Engineering, 265 F.3d at 1375, the court stated that "if the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds." See also Novo Indus., L.P. v. Micro Molids Corp., 350 F.3d 1348, 1353 (Fed. Cir. 2003) (determining whether claim is "amenable to construction"); Honeywell Int'l, Inc. v. ITC, 341 F.3d 1332, 1338 (Fed. Cir. 2003) (a claim is not indefinite because it is hard to construe). Here, it is apparent that the claim can be construed. In that regard, we conclude that "anode gel" is by implication the antecedent basis for "said zinc anode." The Commission's holding of invalidity on the ground of indefiniteness is reversed.

GO BACK

3810

10. "sale calendar module which allows the user to search the auction data and to display on the video monitors at the workstations a list of one or more auctions by date, by location, and by vehicle sale type"

Claim 1(e) recites a "sale calendar module which allows the user to search the auction data and to display on the video monitors at the workstations a list of one or more auctions by date, by location, and by vehicle sale type." ('873 patent col. 11,11.27-30.) AMS and BidSoft propose the following definition: "a computer program for searching a motor vehicle auction database and viewing data concerning future vehicle auctions; the program allowing the user to search the auction database for vehicle auctions matching a user-selected parameter, wherein the parameters available to the user must include date, location, and vehicle sale type." Under Manheim's proposed construction, the term would mean "a portion of a program that performs the particular tasks of allowing users to search the auction data and displaying a list of auctions sorted by date, location or vehicle sale type."

The first issue the Court must resolve with respect to this term is whether the phrase "by date, by location, and by vehicle sale type" modifies "search the auction data," as AMS and BidSoft argue, or "display" as Manheim contends. It is Manheim's position that the claim phrase represents two distinct elements related to the sale calendar module: first, the user must be able search the auction data, and second, the results must be displayed by date, location, and sale type. Thus, according to Manheim, the phrase "by date, by location, and by vehicle sale type," modifies only "to display on the video monitors at the workstations a list of one or more auctions," and not "search the auction data." In contrast, AMS and BidSoft argue that while the claim term as it appears is ambiguous in this regard, the inventors resolved this ambiguity during prosecution by expressly stating that the sales calendar module "allow[s] the user to search a 'calendar' of different auction sales by location, date, and/or sale type." ('873 patent file history, Oct. 17, 1997 Response and Amendment [377-7] at 5.)

Upon review of the intrinsic evidence, the Court agrees, at least for the most part, with AMS and BidSoft. The inventors' statements during prosecution make clear that users must be able to search the auction data by the claimed parameters. (See id. ("Applicant believes that the term 'sale calendar' is appropriate for the functions performed by this module: allowing the user to search a 'calendar' of different auction sales by location, date, and/or sale type."); id. at 7 ("[T]he system of Applicant's Claim 1 includes a 'sale calendar' module that allows the user to search for different auctions by date and location.").) This understanding of the claim language is confirmed by the specification. Notably, the flow chart diagrams showing the sequence of events associated with the sale calendar module clearly indicate that the search parameter--e.g., sale type or location--is selected by the user to generate an SQL query which is then transmitted to the server which returns results matching the selected parameter--that is, to search the auction data--which are then displayed on the video monitors. (See '873 patent, Figs. 2A1 to 2E.)
Accordingly, the Court agrees with AMS and BidSoft that the term "by date, location, and vehicle sale type" modifies "search the auction data" and adopts the following construction: "a portion of a program which performs the particular tasks of allowing the user to query a motor vehicle auction database for auctions matching a user-selected parameter, wherein the parameters available to the user must include date, location, and vehicle sale type, and displaying the results of that search on the video monitors at the user workstations."

AMS and BidSoft contend that the term "sale catalog review routine" appearing in claim 6 should mean "a user application residing on the user's PC workstation allowing the user to search the vehicle condition information and to display the results of the search on the video monitor of the user's PC workstation." Manheim counters that the term should mean "a portion of an application that allows users to display a list of sale dates and sale inventory associated with a selected motor vehicle auction." Much as with the term "market reports routine," the Court finds none of the proposed constructions appropriate.

Claim 6, which is dependent of claim 1, claims "The system of claim 1 wherein the auction data includes vehicle detail information . . . and the set of user application modules includes a sale catalog review routine whereby the user can search the auction data and display the vehicle detail information." Therefore, the plain language of claim 6 requires that the user be able to search the auction data and display on the user's workstation "the vehicle detail information." The parties agree that "vehicle detail information" means "information about minute and distinct aspects of the vehicle," and that "such information may include options, status, dates, charges, notes, and condition information." Therefore, the "sale catalog review routine" must be capable of searching and displaying this information.

With respect to AMS and BidSoft's proposed construction which would require that the "sale catalog review routine" be a "user application residing on the user's PC workstation," the Court declines to impose such a limitation for the reasons set forth in the Court's discussion of "market reports routine," supra.

In view of the plain language of the claims, the Court concludes that the term "sale catalog review routine" in claim 6 shall mean a "portion of a program that performs the particular task of allowing the user to search the auction data and display on the user workstation information about minute and distinct aspects of the vehicle, where such information may include options, status, dates, charges, notes, and condition information."
The defendants argue that the district court construed and instructed the jury on "sales information" too broadly. They argue that the patent specification and prosecution history require that "sales information" always includes information that is promotional in nature, and that the term is not met by the provision of only price and identifying information such as title or ISBN. ODMC responds that the claims are not limited to the embodiment illustrated in the specification, and that "sales information" is infringed even when there is no promotional information included with the identifying information. In finding infringement the jury necessarily accepted the ODMC view, for the orders to Lightning Source carry only identifying information, and Lightning Source provides no promotional information.

In general, the scope and outer boundary of claims is set by the patentee's description of his invention. Phillips, 415 F.3d at 1313-14. The specification makes clear that sales information is that which would help the consumer to choose a book. We agree with the defendants that the prosecution history requires this claim construction, for the inclusion of promotional information was a material distinction from the prior art. Mr. Ross stressed that in his invention a customer can browse among books based on information concerning the substantive content of the book. The specification identifies "descriptive material such as a synopsis, plot outline, author's biographical summary, etc." as promotional information. Col. 6, lines 18-21. ODMC stressed this distinction from the prior art on reexamination:

It is submitted that in no way is a job file descriptor to be confused with means for allowing a customer to browse among a multiplicity of books stored on Patent Owner's system and to select the book of interest for on-demand printing and delivery to the customer.

The reexamination examiner agreed, stating as the ground of patentability that:

The prior art does not disclose or suggest the storing of sales information for customer review which provides descriptive information relating to stored books in a computer in combination with the customer selection of books or portions of books, . . . .

ODMC states that the term "sales information" is met by identifying information such as title or ISBN alone, for the specification states that the computer stores a "Book Attributes Description" and lists eleven attributes that "include the title of the book, its ISBN number and other information (as shown in FIG. 5) which help to describe the book and to provide the potential customer [with information] about the book." Col. 11, lines 3-9. ODMC argues that the ISBN is sufficient sales information, and that this claim term is met whether or not promotional material such as book reviews are also made available to customers. ODMC argues that the jury necessarily so found, in finding infringement.

The defendants argue that ODMC disavowed this interpretation in order to obtain the patent, and represented to the patent examiner that the inclusion of promotional material is what distinguishes this invention from the prior art. We agree with the defendants that "sales information" requires that promotional information is stored in the computer that is made available to the customer. The ISBN or the title and author are file identifiers, not promotional information. The jury instruction, if read to mean that identifying information alone can satisfy the "sales information" term, is incorrect.

We conclude that on the correct construction of "sales information," claim clauses [3] and [4] cannot be met by Lightning Source's activities, for it was not disputed that the books ordered from Lightning Source were ordered solely upon identifying data such as title or ISBN, without promotional information from Lightning Source. ODMC argues that Amazon.com provides sales information, producing joint infringement as to the 10% of Lightning Source's production that is ordered by Amazon. We discuss this aspect in Part II, infra.

3813

A. "SAMPLE WELL"

Roche contends that "sample well" means: "the reaction zone, i.e., a reservoir, or other structure or area, that receives a sample fluid." The crux of Roche's argument that the "sample well" is simply the reaction zone is because that is how "sample well" is referred to in the specification of the 609 patent. The patent states in the Background of the Invention
section: "Biosensing instruments used for the detection of analyte levels in blood (such as glucose and cholesterol) often employ disposable sample strips that include a well or reaction zone for receiving a blood sample." Id. col. 1, ll. 13-16. Moreover, the patent teaches: "Sample strip 18 contains a well 20 (i.e., a reaction zone). . . ." Id. col. 4, ll. 31-32.

Although Apex Defendants take no position on this term, HDI contends that "sample well" means: "a well, i.e., an open-topped container or reservoir into which an analyte-containing fluid sample is emplaced." HDI finds support for the "sample well" to have an open top in Figure 3, and in the following passage from the specification: "[A] glucose determination is made by initially emplacing in well 20, a sample of blood." Id. col. 5, ll. 48-50. Figure 3 shows an example of a sample strip inserted into a meter. HDI also supports its construction for the term "sample well" with the testimony of its expert, Professor Anthony P.F. Turner ("Dr. Turner"), who opines about the difference between a "well," which requires only one opening, and "contemporary capillary-fill devices," which require a second aperture to allow air to escape. Turner Rep. P 36. Dr. Bruce K. Gale ("Dr. Gale"), also testified that he would not describe a "microfluidic channel" as a "well," apparently to distinguish one of the allegedly infringing devices. Gale Dep. at 148.

Similarly to HDI, Biosite contends that "sample well" means: "a chamber or other discrete space in a device defining a container or reservoir into which an analyte-containing fluid sample is emplaced." Biosite also wants to include other parameters in this definition: "In claim 1 of the 609 patent, the sample well is required to contain an analyte reactant, and further required to be the location in which reactions occur between the analyte-containing fluid sample and the analyte reactant." In other words, Biosite contends that the proper construction for "sample well" includes the specification that the "sample well" "must contain an analyte reactant and be the location where reactions occur." Biosite Br. at 35 n. 13. The Court finds that the later requirements are unnecessary given the recitation of these elements in claim 1 itself. In other words, "sample well" need not be further defined by what occurs there or what is contained there, because the remainder of claim 1 has elements that explicitly state what is required. Moreover, other claims also use the term and also clearly state the requirements of the "sample cell." See 609 Patent, claims 4 & 6.

The Court finds that the proper definition for "sample well" is "a container or reservoir for the sample," which best comports with the plain meaning of the term in the 609 patent. Beginning with the claims of the 609 patent the term "sample well" appears in four independent claims of the patent, claims 1, 4, 6, and 12. The plain meaning of the term in the context of those claims is a reservoir or container for a sample. There is no reason to interpret the term "sample well" to include limitations that appear otherwise in the claims. All of the independent claims particularly describe the contents of or the purpose for the "sample well" of that claim. For example, claim 4 states, that the sample strip "includes a sample well with an analyte reactant therein" and that a current output occurs at a second electrode on the sample strip "when an analyte containing fluid is present in said sample well. . . ." 609 Patent, col. 9, ll. And, claim 6 requires that the sample strip include "excitation and sense electrodes and a sample well bridging thereacross [sic], said sample well including an analyte reactant. . . ." Id. col. 10, ll. 7-9. See also, col. 11, l. 23 to col. 12, l. 6 (claim 12). In other words, adding to the plain meaning of "well" what must also be included therein or what must happen therein is redundant.

The specification also supports a plain meaning definition for "sample well." The 609 patent teaches that the invention includes a meter that "is enabled to receive a sample strip that includes a sample well. . . ." 609 Patent, Abstract. Further, in the abstract the 609 patent teaches that the meter senses a current from the sample strip "when an analyte containing fluid is present in the strip's sample well." Id. Both usages are repeated in the Summary of the Invention section of the patent. See id. col. 3, ll. 36-45. Neither one of these usages require that the sample well have an open top nor do they require that the sample be "emplaced" therein. Both merely require that the well exist and that the meter sense when fluid or a sample is present in the well.

Another section of the 609 patent that describes the "sample well" states: "Sample strip 18 contains a well 20 (i.e. reaction zone) that encompasses a pair of conductive electrodes 24 and 26. A layer (not shown) of enzymatic reactants overlays electrodes 24 and 26 in well 20 and provides a substrate on which an analyte-containing fluid sample may be emplaced." Id. col. 4, ll. 31-36. The 609 patent also teaches that "a glucose determination is made by initially emplacing in well 20, a sample of blood." Id. col. 5, ll. 48-50. A similar description is also found later in another section of the Detailed Description of the Invention. That description states, in relevant part:

If the leakage current (sensed by sense amplifier 50 and fed to microprocessor 59 via A/D converter 52) is found to be less than a threshold (key), microprocessor 59 indicates via display 12, that the user may apply a drop of blood to well 20.
Time delay \(d\) enables the drop of blood to entirely wet the enzyme layer within well 20. If the voltage senses at time 70 is below a sample size threshold 72 (key), the test is aborted as the volume of blood is determined to be insufficient to assure complete hydration of enzymatic reactants within well 20.

"609 Patent, col. 6, ll. 41-68 to col. 7, l. 1. These descriptions also use the term "well" to mean a container or reservoir for the sample.

In the first description, the patent provides an example description of the well -- "a reaction zone" -- however, this is just an example, as indicated by the "i.e." before the term "a reaction zone." Id. col. 4, l. 32. Moreover, there is no indication in the claims or elsewhere in the patent that the construction of the term "sample well" should be narrowed to "reaction zone." The same section also uses the word "emplaced," which both HDI and Biosite contend limits the term "sample well," similarly to the requirement at column 5 where the process of measurement requires emplacing blood into the well. There is nothing in these descriptions, however, that limit the term "well" to require what is put inside the well. In other words, adding a phrase defining what is emplaced in the well to the definition of well unnecessary imports a requirement from the specification into the claim.

Moreover, a close reading of the specification teaches that the sample may be emplaced on a substrate in the well, id. col. 4, ll. 35-36, not that the sample is emplaced in the well. In other words, it is possible for the sample to be carried to the well, container, or reservoir, through a substrate or other means that wicks the fluid to the well. Furthermore, the patent clearly teaches that the emplacement is not mandatory by using "may" rather than "shall." Similarly, in the last passage quoted above, it is clear that the sample reaches some reactant layer within the well, however, there is no language that would limit the plain meaning of the term well either to have an open top or to have the sample emplaced therein.

For these reasons, there is nothing in these passages that convinces the Court that the inventors intended to limit the plain meaning of the term "sample well." The Court finds that the term "sample well" means: a container or reservoir for the sample.

The court begins the infringement inquiry where its November 2004 claim construction order left off. In that order, the court held that the various "performing procedures" terms of 366 Patent must be given their ordinary and customary meaning. First Claim Construction Order at 10. Furthermore, having not been asked by the parties to construe the meanings of the terms "satisfying" or "request," the court assumes that those terms are also intended to carry their ordinary lay meaning in the claims at issue. See CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002) (citation omitted) (noting that courts must "indulge a heavy presumption' that a claim term carries its ordinary and customary meaning") (citations omitted). Like the verb "to perform," the ordinary meaning of "to satisfy" encompasses a wide range of actions. Nonetheless, at least one dictionary definition suggests that "satisfying" a request involves "fulfilling" or "complying with" that request. 14 The Oxford English Dictionary 505 (2d ed. 1989) (definition of "satisfy"). This definition accurately reflects the sense in which the term "satisfying requests" is used in the 366 Patent. The preferred embodiment of the invention discloses a "first processing unit" (the "local host") that responds to a class of non-NFS requests from client computers on a data network. 366 Patent, 10:60-11:53. According to the specification, the local host computer "has three main purposes: to run Unix, to provide standard ONC [i.e., Sun Open Network Computing] network services for clients, and to run a Server Manager." Id. at 10:61-63. By carrying out these tasks in response to requests from clients on the data network, the local host computer performs procedures for "satisfying" -- i.e., for fulfilling-such requests.

The court thus construes the claim term "satisfying requests" according to its ordinary meaning: that is to say, "fulfilling" or "complying with" requests.

Because the parties have presented no evidence that the claim terms "satisfying" and "request" have specialized meanings in the field of network file server architecture, it is proper to rely on nontechnical dictionary definitions to determine the ordinary meaning of those terms. See Gemstar-TV Guide Int'l, Inc. v. ITC, 383 F.3d 1352, 1366 (Fed. Cir. 2004) (citing Inverness Med. Switz. GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1369 (Fed. Cir. 2002)).
Of course, if "satisfying" a request means "fulfilling" or "complying with" that request, it necessarily follows that the claimed second processing unit, which does "not satisfy any requests from said network which are within said predefined non-NFS class of requests," does not fulfill or comply with requests that fall within that predefined class. Obviously, a request that is not directed toward or routed through a processing unit is "not satisfied" by that processing unit. However, as the preferred embodiment of the claimed invention illustrates, it is also possible for a processing unit to receive and transfer a client's request without "satisfying" that request. Indeed, the specification describes a "second processing unit" that receives non-NFS requests, identifies the nature of those requests, and passes them to the host computer for processing. 366 Patent, 8:18-22, 9:49-50. If the claims of the 366 Patent are construed to read on the preferred embodiment of the invention, as they almost always must be, see Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996), the actions taken by the disclosed file server to recognize and transfer non-NFS requests cannot be deemed to "satisfy" those requests. Thus, a request may be "not satisfied" within the meaning of claim 1 if it is received, recognized as a request within a predefined non-NFS class of requests, and transferred without taking any action for the purpose of fulfilling or complying with that request.

On January 24, 2004 this court conducted a limited claim construction for the '741 Patent and accompanying certificates, construing the word "saturation" to mean "the state in which the ratio of collector-current to base-current is forced lower by excess base current" and the phrase "in saturation" to mean "the working of the covered invention consistently at a state of forced current gain." Memorandum & Order, No. C 94-1633 MHP, slip op. at 12, 17 (Jan. 22, 2004).

II. "price being . . . scaled to the performance of the buyer" 6

Plaintiff argues that the standard for scaling a price can be a formula, ratio, table or algorithm. OPENING at 7-9. Plaintiff
adds that this standard is not limited to a predetermined table of prices. Id. at 8-10. Plaintiff also argues that a lower price does not "always" correspond to a better performance at the PDA. Id. at 12-13. Defendants contend that the specification discloses that the scaling occurs according to a scaled set of prices. RESPONSE at 13-14. Defendants also argue that a lower price always corresponds to a better performance at the PDA. Id.

As set forth above, claim 1 of the '253 patent discloses that the price of the product or service is determined "based at least partially upon the data received, said price being within the price range and scaled to the performance of the buyer." '253 patent at 9:31-49 (claim 1). As Plaintiff points out, the claim language indicates that the price is not exclusively determined based on the buyer's performance. Id. at 9:44-46. The specification discloses:

The ultimate price [of the product or service] (within the range) is determined based upon the buyer's performance rating, or score, which the buyer receives from participating in a collateral activity. Thus, if a buyer performs poorly at the activity, the price will be higher, whereas if the buyer does well, the price will be lower.

'253 patent at 2:23-28. The specification also discloses that the scaling may occur according to a price-determining or mapping algorithm, a table of values, or a score comparison among players. '253 patent at 7:42-49, 57-62, 8:10-13. With respect to scaling, the specification also discloses that "a price determining algorithm associated with a PDA may involve considerations of the number of players or buyers involved, and the skill level of those players." Id. at 8:10-13. In order to take into account such variables as the number of players or the skill level of the players, the scaling cannot be limited to only a predetermined set of graduated prices and corresponding performance levels, as Defendants argue. Moreover, as previously noted, the specification explicitly discloses scaling methods that are not so limited.

Plaintiff argues that a better price does not always correspond to a higher score. OPENING at 12-13. The specification consistently indicates that if a buyer performs poorly at the activity, the price will be higher, whereas if the buyer does well, the price will be lower. See '253 patent at 2:26-28, 52-56, 3:64-67, 4:1; see also id. at 5:39-67; 7:40-52; 8:14-23, 46-58. While the specification does note that considerations other than score may be taken into account, it limits these considerations to the number of players involved and the skill level of the players. Id. at 8:10-13. The specification neither lists other considerations, nor indicates that this list is non-exhaustive. The listed considerations do not indicate that a better price does not always correspond to a higher score.

Moreover, the prosecution further supports this conclusion. The "scaling" limitation was disclosed at the point of novelty during prosecution. RESPONSE, SISTOS DEC., EXH. 2 at 48. Later, the applicant indicated that "[t]ypically, the better the buyer performs during the PDA, the lower the price will be of the product being purchased" and "price is scaled . . . such that the better the buyer performs during the PDA, the lower the price will typically be of the product being purchased." Id. at 118, 129. The applicant also emphasized that "[t]he PDA is directly connected to the price of the product" and claim 1 "recited [a] direct link between a Price-Determining-Activity (PDA) and the price of the product." Id. at 125, 129 (emphasis omitted). The decision of the BPAI also reflects these contentions: "if a buyer performs poorly at the activity, the price will be higher, whereas if the buyer does well, the price will be lower." Id. at 149. Therefore, the intrinsic record indicates that a buyer's score or performance level is directly connected to the price of the product and a better performance results in a lower price.

Plaintiff argues that this is not always the case and sets forth a number of hypothetical formulas where a better performance would not necessarily result in a lower price. OPENING at 12-14; REPLY at 9-11. However, such speculation does not change the disclosures set forth by the patentee in the intrinsic record. The patentee specifically emphasizes the "direct connection" and "direct link" between a better performance and a lower price. Id. at 118, 125, 129. The statements are unambiguous, and Plaintiff points to nothing in the intrinsic record that indicates that a better performance could ever result in a higher price. Therefore, the Court finds that the proper construction of the term "price being . . . scaled to the performance of the buyer" is "price being adjusted by a ratio, table, or algorithm, wherein a lower price always corresponds to a better performance or better performance level in the PDA and a higher price always corresponds to a worse performance or worse performance level in the PDA."
The court shall apply the ordinary definition of the phrase "scaled voltage." Thus, the phrase "scaled voltage" shall be construed to mean "a voltage that is some fraction of the input voltage."

The parties dispute the meaning of the claim term "scanner." The first element of claim 1 recites, in pertinent part, "a scanner for producing from said color original a set of three tristimulus appearance signals dependent on the colors in said original." '919 patent, col. 15, ll. 34-36 (emphasis added).

The district court concluded that the scanner must have "relative movement between the scanning element and the object being scanned." We agree.

"Claims must be read in view of the specification, of which they are a part." Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005) (en banc) (internal quotations omitted). Indeed, the specification is "[u]sually . . . dispositive" and "is the single best guide to the meaning of a disputed term." Id. In this case, however, the specification does not define the term "scanner" either explicitly or implicitly. The most that can be said is that the specification is not inconsistent with a relative movement requirement. The specification discloses only one type of scanner, a "Hell Model 299," which is a drum scanner that rotates a two dimensional original image past a scanning element. '919 patent, col. 5, ll. 40-43. The drum scanner operates by moving the original past a scanning element, and thus requires "relative movement between the scanning element and the object being scanned."

Under such circumstances it is appropriate for us to look to dictionary definitions of the terms. See Phillips, 415 F.3d at 1322 ("Dictionaries or comparable sources are often useful to assist in understanding the commonly understood meaning of words and have been used both by our court and the Supreme Court in claim interpretation."). Dictionary definitions of "scan" and "scanner" at the time the patent application was filed in 1982 confirm that these terms require relative movement between a scanning element and an object being scanned. For example, the 1968 version of Webster's Third New International Dictionary defines "scan" as "to cause a narrow beam of light to . . . traverse (an object) in order to translate light modulations into a corresponding electrical current." Subsequent dictionary definitions include the same limitation. The 1984 edition of McGraw-Hill Dictionary of Scientific and Technical Terms defines "scanner" as "[a]ny device that examines an area or region point by point in a continuous systematic manner, repeatedly sweeping across until the entire area or region is covered." The definition in the 2002 version of Webster's is identical to the definition in the 1968 version. Thus the definitions, both before and after 1982, require relative movement.

MIT argues that "flying spot scanners" existed in 1982 (although not referenced in the specification) and lacked the relative movement limitation. Thus, MIT urges that to a person of ordinary skill in 1982, a scanner would not have required relative movement. In a "flying spot scanner," "[a] moving spot of light, controlled either mechanically or electrically, scans the image field to be transmitted." Electronics and Nucleonics Dictionary 249 (3d ed. 1966) (emphasis added); see McGraw-Hill Dictionary of Scientific and Technical Terms 784-85 (5th ed. 1994) (defining "flying-spot scanner" as "[a] scanner used for television film and slide transmission, electronic writing, and character recognition, in which a moving spot of light, controlled mechanically or electrically, scans the image field, and the light reflected from or transmitted by the image field is picked up by a phototube to generate electric signals"). A 1982 dictionary of computing defines a "flying spot" as "[a] point of light or the end of an electron beam that is movable at high speed back and forth across a field." Frank. J. Galland, Dictionary of Computing 107 (1982). This type of scanner is disclosed in U.S. Patent No. 2,790, 844 (the "844 patent"), filed on May 11, 1954. '844 patent, col. 4, ll. 33-44, 63-65. MIT argues that because a flying spot scanner has no mechanical movement, it is an example of a scanner that is inconsistent with the district court's relative movement limitation. Although the mechanical components of a flying spot scanner may remain fixed, the scanner operates by sweeping a light beam across the object to be scanned. See McGraw-Hill definition; '844 patent, col. 4 ll. 33-44, 63-65. We agree with the district court that the light beam qualifies as a scanning element, and thus that the flying spot scanner operates with movement between the scanning element and the object being scanned.
Plaintiffs similarly argue that television cameras, which were available in 1982, are "scanners" that operate without relative movement. We disagree. Although a camera may achieve the same result as a scanner, the dictionary definitions confirm that a "scanner," as it was understood in 1982, required relative movement between a scanning element and the object being scanned. Plaintiffs assert that U.S. Patent No. 4,037,249 (the "Pugsley" patent) used the term "scanner" to refer to a camera and thus reveals that in 1982 a person of ordinary skill in the art viewed a camera as a type of scanner. However, the specification of the Pugsley patent explicitly distinguishes between a camera (which does not require relative movement) and a scanner (which does) when it states that "it is usual to form three separate images by photographing or scanning the original." Pugsley patent, col. 1, I. 27 (emphasis added). n2

n2 MIT relies on three other patents as supposedly recognizing that a camera is a type of scanner. But these references either make clear that a scanner is distinct from a camera, see U.S. Patent Nos. 4,393,398 (employing "a cathode ray tube scanner or a color television camera"); 4,328,515 ("a scanning unit can be employed which works with a color television camera"), or are ambiguous, see U.S. Patent No. 4,349,279 (referring both to "an electronic color scanner in the form of a color camera" and to a "color scanning device in the form of a color scanner or a primary color camera").

We conclude that a camera that operates without relative movement is not a scanner within the meaning of the '919 patent. Go Back
Here, the district court (relying on the '919 specification, expert testimony, and technical references) concluded that in 1982 a person of ordinary skill in the art would have known of two general types of scanners, drum scanners and flatbed scanners. Both these scanners require close proximity between the color original and the scanner. We see no basis for disturbing this conclusion and agree that the term scanner should be defined by what was known in the art at the time. Plaintiffs argue that in 1982 cameras were scanners that did not require close proximity, but as we noted above, a camera that lacks the relative movement limitation is not a scanner. We conclude that the term scanner in 1982 should be construed to include a requirement of close proximity.

B. Ref. No. 78

*Image document scanner* or *document image scanner.*

These phrases are recited in or referred to in Claims 13 and 18.

Defendants' major dispute with Plaintiff's claim construction is that conventional ballot readers are not capable of imaging a document or ballot. Plaintiff agrees with Defendants on this point, as does the patent specification. "It is noted that such conventional ballot readers employ sensors positioned on a fixed grid pattern . . . and such readers do not image a ballot . . . ." (Col. 17, ll. 62-67.) Consequently, Plaintiff has offered to modify its construction by adding the following disclaimer: "Excluding non-imaging conventional ballot readers which employ sensors positioned on a fixed grid pattern."

The specification provides that ballot readers "may utilize all or part of conventional ballot readers and/or may utilize parts of conventional office equipment such as copiers, scanners, facsimile (fax) machines, and other commercial imaging and/or scanning devices and the like, e.g., for imaging and/or optically reading the information contained on an optically-readable paper ballot." (Col. 17, ll. 50-57.) Claim 18 of the '313 Patent provides that the document image scanner includes a copier, scanner, fax machine, commercial imaging device, and a commercial scanning device. This language is consistent with Plaintiff's use of the phrases "are part of" and "not limited to."

For the foregoing reasons, the Court construes the phrase as set out in Ref. No. 78 as follows:

The document image scanner includes, but is not limited to, optical readers, commercial imaging scanners, and all or part of conventional ballot readers, (excluding non-imaging conventional ballot readers which employ sensors positioned on a fixed grid pattern) conventional office equipment such as copiers, scanners, facsimile (fax) machines, and other commercial imaging and/or scanning devices, and the like.

H. *scanning a symbol comprising of a data field of information data cells and orientation means for indicating an orientation of the field*

The disputed phrase "scanning a symbol comprising of a data field of information data cells and orientation means for indicating an orientation of the field" appears in claim 27 of the '524 Patent. The parties contend that this is a step-plus-function limitation subject to 35 U.S.C. § 112, P 6, but disagree on how much of the disputed phrase is subject to section 112, P 6. 4 The Court rejects the parties' arguments in this regard and concludes that the disputed phrase is not subject to construction under the provisions of 35 U.S.C. § 112, P 6.

4 Similar to means-plus-function limitations, step-plus-function limitations are construed pursuant to 35 U.S.C. § 112, P 6. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1581 (Fed. Cir. 1997). The term "steps" refers to the generic description of elements of a process, and the term "acts" refers to the implementation of such steps.
Claim 27 of the '524 Patent provides as follows:

A decoding process, comprising the steps of: (a) scanning a symbol comprising a data field of information data cells and orientation means for indicating an orientation of the field; (b) identifying the location of the data cells; and (c) decoding the symbol from the located cells.

The phrase "comprising a data field of information data cells and orientation means for indicating an orientation of the field" in the disputed phrase modifies the word "symbol." Thus, use of the term "orientation means" does not describe a step in the decoding process structure; it merely describes the components of the symbol to be scanned in the scanning step of the decoding process. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1581 (Fed. Cir. 1997) (holding that the step of "passing the analyte slug through a passage" was not subject to section 112, P 6 because the term "passage" referred to the place where the recited function occurs rather than the structure that accomplishes the function). Consequently, the disputed phrase's use of the word "means" does not raise a rebuttable presumption in favor of interpretation pursuant to 35 U.S.C. § 112, P 6. See Sage Prods., 126 F.3d at 1427. Pursuant to the ordinary and customary meanings of the language used in claim 27, the decoding process includes (a) scanning a symbol; (b) identifying the location of the data cells; and (c) decoding the symbol from the located cells. The two-step construction method applicable to means-plus-function limitations pursuant to section 112, P 6 are inapplicable here. Instead, the Court gives the terms of the disputed phrase their ordinary and customary meaning and concludes the proper construction of the disputed phrase is "scanning a symbol."

### I. "Scanning Process"

<table>

<td>Scanning Process</td>
<td>The process by which the bar code is read that requires a link or call to a database</td>
<td>Ordinary meaning, i.e. the process by which the bar code is scanned</td>
</tr>
<tr>
<td>Claims 1 and 10</td>
<td>Alternatively: the process by which the bar code is read and decoded</td>
<td></td>
</tr>
</tbody>
</table>

Plaintiff contends that the term "scanning process" requires a link or call to a database. Plaintiff argues that the patent discloses two embodiments, one where the bar code itself represents information and a second where the bar code represents an address in a database where the information is stored. Plaintiff notes that independent claims 1 and 10 include a "scanning process" whereas claim 17 does not. Plaintiff argues that claims 1 and 10 are directed to the second embodiment and thus the term "scanning process" implicates a link or call to a database. Plaintiff contends the specification supports this construction.

Defendants contend the term does not require construction and that Plaintiff's proposal improperly imports an alternative embodiment into the claims. Defendants argue that the term simply refers to the process of reading a bar code to obtain the information encoded in a bar code portion or part - a process familiar to a lay jury. Alternatively, Defendants propose construing the term as "the process by which the bar code is read and decoded." Defendants argue that regardless of the particular scanning method utilized, a scanning process obtains only the information encoded within the bar code itself. That is, although the information encoded in a bar code may be a reference to a database, a call to a database is not part of the scanning process. Defendants argue that Plaintiff's present argument is inconsistent with its argument during reexamination where Plaintiff represented claim 17 implicitly included a scanning process involving a call to a database. Defendants further argue that the doctrine of claim differentiation bars Plaintiff's proposal because proposed claims in Plaintiff's reexamination and reissue applications explicitly recite a call to a database. Finally, Defendants argue that Plaintiff's proposal is legally improper as it would render the claims invalid by importing a method step into an apparatus claim.

In its reply, Plaintiff argues that Defendants' inclusion of decoding in its alternative proposal is improper because the described scanning process reads a bar code but does not decode it. Plaintiff identifies an express limitation in claim 17, but
absent from claims 1 and 10, that the information is encoded. Plaintiff argues its present argument is not inconsistent with the positions it has taken during reexamination, there is no authority for applying the doctrine of claim differentiation to pending claims, and in any event claim differentiation would be inapplicable because the pending claims do not depend from any of the present independent claims. Finally, Plaintiff contends that its construction would not introduce a method step to its apparatus claims; rather its proposal simply makes clear that the apparatus is capable of being used to call to a database.

As an initial matter, the Court declines to consider whether Plaintiff's present argument is inconsistent with its position before the PTO in the co-pending reexamination. Although a position taken before the PTO may bar an inconsistent position in subsequent litigation, see Intermatic, Inc. v. Lamson & Sessions Co., 273 F.3d 1355, 1367 (Fed. Cir. 2001), vacated on other grounds, 535 U.S. 722, 122 S. Ct. 1831, 152 L. Ed. 2d 944 (2002), Defendants fail to cite to, and the Court is unaware of, any authority applying this principle where the reexamination was still pending. See Edizone, L.C. v. Cloud Nine, No. 1:04-cv-117, 2008 U.S. Dist. LEXIS 15792, at *5-6 (D. Utah Feb. 29, 2008) (finding the same). Similarly, consideration of any proposed amendments or new claims is inappropriate. See Id. at *6 (“Even though the PTO ‘will treat the proposed amendments as though they have been entered, the proposed amendments will not be effective until the reexamination certificate is issued and published’” (quoting 37 C.F.R. § 1.530(k))). Thus, Defendants' arguments are inapplicable to the present facts.

Likewise, the Court is not persuaded by Plaintiff's argument differentiating claims 1 and 10 from claim 17 on the basis of the inclusion of the term "scanning process." The ’377 patent teaches "[t]he bar codes can represent the information itself, or can represent an address from a look up database which includes more information about a bar code." ’377 Patent col. 1:33-35. The specification goes on to describe numerous methods of scanning a bar code. See, e.g., ’377 Patent col. 2:3-7 (disclosing the use of a camera to scan a bar code). Nothing in the specification, the claim language, or the differences between claims 1, 10, and 17, compels the conclusion that the term "scanning process" must be associated with bar codes used to call or link to databases.

The Court finds that the term "scanning process" refers to a process by which information is derived from a bar code. This process may or may not include calling or linking to a database. Compare ’377 Patent cols. 1:32; 3:56-62; 4:24-33; 5:29-31 (describing embodiments where the bar code represents information itself) with ’377 Patent cols. 1:33-35; 3:63-64; 4:33-37; 4:49-64; 6:36-38) (describing embodiments where the bar code represents a database address from which information may be obtained). Although the inventions of claims 1 and 10 are capable of being used to call or link to a database, the claims do not require interaction with a database. 1 The Court will not import limitations from the specification into the claim language. See Phillips, 415 F.3d at 1323 (warning against limiting claims to specific embodiments disclosed in the specification).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 The Court recognizes the parties dispute whether the claim language is indefinite for importing a method step into an apparatus claim. Defendants filed a summary judgment motion on that matter (Doc. No. 115). The Court declines to address the matter here and instead will consider it in the context of the summary judgment motion.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

Having resolved the parties' claim scope dispute, the Court must now determine how best to communicate the term to a lay jury. The Court finds that the term does not have a plain and ordinary meaning that would be readily understood by a lay jury. The Court will essentially adopt Defendants' proposal and therefore construes the term "scanning process" as "the process by which the bar code is read."
scanned and the incident beam of P-polarized light such that the entire surface is inspected. Id. ADE further argues that the '525 written disclosure teaches many different ways of "scanning the surface of the workpiece" such as through translation or rotation of the workpiece or movement of the beam of P-polarized light. Id. KLA attempts to limit "scanning the surface of the workpiece" to a deflection of the beam of P-polarized light across the surface of the workpiece in a relatively narrow scan path. D.I. 344 13-20. Furthermore, KLA asserts, this proposed construction is different from one that permits the workpiece to be translated or rotated during a scan. Id.

This court is not inclined, as KLA suggest, to limit "scanning the surface of the workpiece" to "scanning" along a relatively narrow scan path without also encompassing other relative movement between the workpiece and directed beam of P-polarized light. "Scanning" is a broad term, similar to "workpiece," that brings to mind many different concepts. The context in which the word is used in the claim, though, is not helpful because it does not indicate how "scanning" is accomplished. One skilled in the art, therefore, must turn to the remainder of the intrinsic record to determine what the inventors intended.

The '525 disclosure teaches several ways to perform a surface scan of a workpiece. '525 at 5:15-7:5. During some of these scans, the workpiece is translated and rotated along its material path as it is inspected. Id. Figures 2 and 5, reproduced below, support translation and rotation of the workpiece during scanning.

One skilled in the art would recognize in Figure 2 that the curved arrow in the center of the silicon wafer with the Greek symbol [SEE GREEK SYMBOL IN ORIGINAL] attached thereto represents that the wafer (or workpiece) is undergoing rotation. Again, in Figure 5 this can be seen, however, Figure 5 also depicts a translation of the wafer (WAFER FLOW) during a scan by the beam of P-polarized light (LASER BEAM).

Claim 1 of the '525 patent does not limit "scanning" to any particular type of scan; instead, the claim plainly states that one step in the disclosed inspection method is to scan the surface of the workpiece at the inspection station. '525 at 12:19-25. In contrast, KLA would have this court read a non-existent limitation into the phrase "scanning the surface of the workpiece" from dependent claim 21. D.I. 344 at 13-20. 35 U.S.C. § 112, P4 does contain the requirement that a dependent claim further narrow the independent claim from which it depends. Dependent claim 21, however, fulfills this requirement.

Simply because dependent claim 21 explicitly provides that the workpiece is translated and rotated during the surface scan does not raise the negative limitation that "scanning" in claim 1 excludes this possibility. ('525 14:17-22) See Marsh-McBirney, Inc. v. Montedoro-Whitney Corp., 882 F.2d 498, 504 (Fed. Cir. 1989) ("Narrow claim limitations cannot be read into broad [claims] whether to avoid invalidity or to escape infringement.") (quoting Uniroyal Inc. v. Rudkin-Wiley Corp., 837 F.2d 1044, 1054 (Fed. Cir. 1988). Thus, the presence of a limitation to "scanning" in dependent claim 21 does not prevent the broad word "scanning" in independent claim 1 from encompassing other relative movement between the workpiece and the beam of P-polarized light. Some movement must exist between the light beam and the surface to inspect the entire surface "scanned" and effectuate the inventors' invention. Claim 1 of the '525 patent ensnares all such movement whereas dependent claim 21 specifies that the movement is translation and rotation. Any other construction is simply illogical and inconsistent with the invention taught in the '525 patent.

KLA, however, points to the fact that the written description describes the beam of P-polarized light as "narrow" and attempts, therefrom, to read this limitation into the word "scanning" in claim 1. Patent claims define and limit the invention. Claim 1 does not limit "scanning" to a narrow scan path. This court will not read such a limitation into the claim. Since a clear meaning of "scanning the surface of the workpiece" is readily ascertainable from the written description, no extrinsic evidence need be considered. Interactive Gift, 231 F.3d at 866; Hockerson-Halberstadt, 222 F.3d at 955 (citing Key Pharms., 161 F.3d at 716). This court, therefore, construes "scanning the surface of the workpiece" to mean that the entire surface of the workpiece is inspected through relative motion of the incident beam of P-polarized light and/or the workpiece being inspected.

3825

2. Group/ set of software scheduled instructions.
Intergraph argues this term carries its ordinary meaning to one skilled in the art. Intel again inserts elements from other claims to define "group of software scheduled instructions" as a set of 2 or more instructions within the same VLIW which have a common group identifier and which are executed simultaneously. The Court construes "groups of software scheduled instructions" and "sets of software scheduled instructions" as sets of one or more instructions that have been identified by software as being capable of being processed in parallel. '003 patent at 3:61-63.

3. '769 Patent Claim 23: "scheduled time"

Claim 23 similarly describes the method of updating subscriber databases. The claim contains four elements, only the first of which is in dispute:

Each subscriber station calling at a scheduled time a rate provider having billing rate parameters for each calling station, wherein the scheduled time for each call is such that the calls from each calling station are substantially spaced apart from each other.

Unlike Claims 1 and 11, Claim 23 uses the term "scheduled time" rather than "predetermined date and time" to limit contact between the calling station and the rate provider. Contact must be scheduled, according to the claim, so that calls are "substantially spaced apart in time from each other." Neither party raises an argument that this distinct language should have a distinct meaning. Rates and MediaCom each insist that "scheduled time" has a meaning equivalent to "predetermined date and time".

Notwithstanding the parties' positions, different usages in different claims are presumed to have different meanings. Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987). Because Claim 23 uses a different term, and imposes the additional requirement that calls be spaced apart, this Court must ascertain the meaning of this language. The specification explains that the spacing of calls is advantageous because it prevents the calling stations from overloading the rate provider by calling in all at once. It is difficult to conceive of any way to ensure that calls from numerous calling stations are spaced apart from each other without central direction. If individual calling stations independently were to select times to call in, even if they selected those times far in advance, there would seem to be no way to eliminate the possibility, however remote, of overloading the rate provider.

Rates argues that, even if individual users set their own call-in schedules, those decisions would be random and independent of one another, and so satisfy the requirement that the calls be scheduled so that they are spaced apart. That is an argument properly addressed to factual questions of infringement, and not claim construction. It suffices to construe Claim 23 to encompass a method in which the time for calling the rate provider is determined and planned in such a way as to ensure that there are substantial intervals of time between each call received by the rate provider from all users.

27. Scheduling

This term appears in claims 8 and 9 of the '037 patent, asserted against ADI. In its brief, ADI asks the court to construe the term "scheduling" to mean "adding to each of the branch instructions computer code that assigns an instruction firing time." Biax argues that the term needs no construction and, in any event, the term "scheduling" is broader than adding an instruction firing time. The court agrees with Biax. Scheduling could also embrace the concept of re-ordering instructions. Accordingly, the court declines to limit the term as proposed by ADI. The term "scheduling" is entitled to its ordinary meaning and needs no construction.
2. "scrambling"

The plaintiff argues that "scrambling" means a modification of a signal. Joint Claim Construction Brief, Exh. B. The defendants argue that it means modifying an analog signal so as to render it unusable. Id. The dispute is over whether "scrambling" applies only to analog signals, as the defendants contend, or applies to both analog and digital signals, as the plaintiff contends.

Again, claims are to be construed in light of the specification. Vitronics, 90 F.3d at 1582. With respect to whether "scrambling" applies only to analog signals, or also to digital signals, the specification discloses the following:

Currently, this unscrambling occurs in an expensive digitally controlled decoder such as the M/A-Com Video Cipher II or the familiar cable black box.

'066 Patent, col. 1, lines 16-19 (emphasis added).

The Declaration of Henry H. Jenkins 3 and its attachments establish that the Video Cipher II technology disclosed in the '066 Patent involved "scrambling" of both analog and digital signals. In particular, a January 1986 article in the Satellite Orbit, published prior to the filing of the '066 Patent, states:

The VC I system is a Cadillac scrambling system that digitally encrypts the audio and video signals. CBS currently is using VC I to scramble its feed on Telstar 302, transponder 19. HBO found that the VC I system, however, was too expensive and asked M/A-Com to design a scrambling system that was more affordable. In making the new system, M/A-Com decided to use analog scrambling of video signal (a more traditional method), while digitally encrypting the audio signal. This new system was dubbed Video-cipher II.

Declaration of Henry H. Jenkins (the "Jenkins Decl."). Exhibits to Broadcast's Consolidated Brief In Opposition to Defendants' Opening Brief on Claim Construction, at Exh. A (emphasis added). Another pre-filing article attached to the Jenkins Declaration explains:

The scrambled satellite signals in question are currently descrambled by M/A-Com Video Cipher II and Oak Orion equipment. Although industry insiders expressed little surprise that the VC II video—which is analog encrypted—was cracked, they doubted that the audio—which is digitally encrypted—would fall victim to such "low cost" alternatives as Anderson and others propose.

Id. at Exh. B (emphasis added).

--- Footnotes ---

3 Mr. Jenkins is the inventor named in the '066 Patent.

--- End Footnotes ---

One skilled in the art would understand the term "scrambling" to apply to both analog and digital signals. I reject the defendants' position that it applies only to an analog signal. I construe the term "scrambling" to mean modifying a signal so as to render it unusable until unscrambled.

3. "unscrambling"

The plaintiff argues that "unscrambling" means returning a modified signal to its previous unmodified state. Joint Claim Construction Brief, Exh. B. The defendants argue that it means restoring a scrambled signal to its original unscrambled condition. Id. If I had construed "scrambling" to be limited to an analog signal as the defendants urged, a distinction would exist between the competing proposals. In view of my construction of "scrambling" to include both analog and digital signals, however, the parties agree that "unscrambling" is simply the reversal of the scrambling process. I construe "unscrambling" to mean restoring a modified signal to its unmodified condition.

GO BACK
1. "scrambling transmitter"

The plaintiff contends that the term "scrambling transmitter" means a transmitter that includes a scrambling circuit. Joint Claim Construction Brief, Exh. B. The defendants assert it means a transmitter that scrambles and transmits an analog signal. Id. The sole disagreement appears to be whether "scrambling" is limited to analog signals only, a construction I already have rejected.

I construe the term "scrambling transmitter" to mean a transmitter that includes a scrambling circuit.

Screen process

The Court modifies AVG's proposed construction and construes "screen process" to mean "a process indirectly monitoring instructions regarding window control operations and using said instructions to generate and maintain in memory a subrectangle list." Microsoft criticizes AVG's proposed construction arguing that the claim language of "maintaining a subrectangle list" does not necessarily include "monitoring instructions regarding window control operations." Microsoft supports their argument by claiming that the specification describes two embodiments—one in which the screen process monitors the operator's instructions and one in which the display operating system monitors the operator's instructions and sends that information to the screen process—and the inventor chose to claim only the latter embodiment. Compare Col. 2:53-56 with 7:1-8:16. AVG argues that the specification's later description is a more detailed recitation of its earlier description, and that the screen process may indirectly "monitor" the operator's instructions by receiving information from the display operating system.

The Court agrees with AVG that the patent discloses only one embodiment, but in two levels of detail. The specification generally describes the screen process as monitoring the operator's instructions and then goes on to describe in more detail how this occurs. Specifically, the display operating system monitors the operator's instructions and then communicates that to the screen process. The plain language of the claim requires "a screen process for maintaining a subrectangle list." In this context, "maintaining" the subrectangle list means keeping the list current with information regarding window control operations. Thus, "maintaining" is not possible without cognizance regarding window control operations. Therefore, "maintaining" must include some sort of monitoring, albeit indirect, of instructions regarding window control and necessarily uses those instructions.

Script and Script processor

Although the parties briefed these terms separately, Defendants seek the same limitations, for the same reasons, in both terms. Accordingly, the Court will address them together. JuxtaComm contends a "script" is "a group of commands to control data movement into and out of the system, and to control data transformation within the system." Defendants contend a "script" is "a series of text commands interpretively run by the script processor, such that one command at a time is translated and executed at runtime before the next command is translated and executed, and that control data movement into and out of the system and control data transformation within the system." Both sides agree that scripts are commands that control data movement into and out of the system and control data transformation within the system. Defendants seek to further limit "script" to text commands as opposed to graphical commands. Defendants also seek to limit scripts to being interpretively run by translating and executing one command at a time.

JuxtaComm contends the Court should construe "script processor" as "software component that processes a script." Defendants contend the Court should construe the term as "a software component that interpretively runs scripts by
translating and executing one script command at runtime, before translating and executing the next script command." Both sides agree a script processor is a software component that processes or runs scripts, but Defendants seek to add the same additional limitations to the construction as they sought with "script."

The specification expressly defines "script": "Scripts 55 must be defined to control data movement into and out of the system, and to control data transformation within the system." Col. 5:65-67. Defendants seek to further limit scripts to text commands and to being interpretively run by translating and executing one command at a time.

Defendants contend script should be limited to textual commands because graphical or visual scripts are not described in the patent and all of the examples in the patent are of text commands. The claims are not limited to textual scripts, and the Court will not import implied limitations from the specification when the claims are not so limiting. Defendants are correct that the '662 patent does not specifically disclose graphical or visual scripts. While all of the preferred embodiments described in the '662 patent are textual scripts, nowhere in the '662 patent or its claims does the inventor disavow coverage of other scripts. Defendants are unable to point to any place in the specification or prosecution history where the patentee clearly disavowed such coverage. Accordingly, the Court will not import the limitations of the preferred embodiments into the claims, and the Court rejects Defendants' limitation that would limit scripts to textual commands.

Defendants argue that scripts should be limited to being interpretively run by translating and executing one command at a time, rather than being compiled. Defendants contend that this is the ordinary meaning of script and that any other meaning was disclaimed during prosecution to overcome a rejection in light of Morgenstern.

In the specification, a script is one item of metadata in the metadata database. Col. 4:32-39. A script is "run" on the script processor. Col. 4:41-43. There is no indication in the written description of a requirement for running a script using an interpreter; nor is there any indication that a script in the metadata database cannot be compiled by the script processor. A script is indicated as being nothing more than a task oriented program (batch file set of commands) that controls data transformation by the rules processor and the movement of data. The specification does not speak to exactly how the script is being "run." In general, a script is a program that is executed by another program rather than being directly run on the hardware processor. Accordingly, the specification does not limit "scripts" to being interpretively run.

As originally filed, the claims recited "a script processor for controlling data transformation . . . ." The examiner rejected the claims as being obvious over Morgenstern and Mitchell. In making the rejection of claim 2, which is claim 1 of the issued '662 patent, the examiner confusingly referred to "browser," while citing to the disclosure in Morgenstern of the information bridge mediator 60, as being a "script processor" for controlling data transformation. See Office Action April 3, 2000 at 3, P 6. Morgenstern is diagramed as:

[SEE FIG. 2 IN ORIGINAL]

What Morgenstern describes is data transformation using transformer engine 66 of bridge 60, which is a compiled program of transformation rules that are executed on the computer processor. The code for bridge 60 is built during a system generation phase. The source and target data structure specifications are applied to a transformation generator 42, which generates code files that describe the transformation rules to be applied. The code is then compiled for running on the computer processor. Morgenstern does not have a batch file that is pulled from a database during run time to control the transformation.

In response to the obviousness rejection, the applicants amended claims 2 and 18 to recite that the script processor "utilizes metadata" to control data transformation. They generally characterized Morgenstern as describing a generation module 30 which outputs a compiled information bridge 60 adapted to convert data from a source format to a target format. They then argued that Morgenstern teaches a different methodology.

The applicants also made separate arguments in regard to claims 2 and 18. The arguments in regard to claim 18, which recites "executable code for providing a script processor . . . to control data transformation," were that metadata (i.e., a script) stored in a database is utilized to "interpretively convert data from a source to a target." This statement does not say "interpreatively convert the metadata (script)." In context, the applicants' argument was not making a distinction between "compiling" and "interpreting," but rather it was indicating that there is use of a sequence of commands (scripts generated by a user) extracted from a database that are processed by a script processor program before execution by the computer.
processor rather than being executed directly by the computer processor. In arguments related specifically to claim 2, the applicants reference the absence in both Morgenstern and Mitchell of "scripts or a scripts processor," 9/05/2000 Response at 7. In other words, in contrast to Morgenstern, a sequence of commands pulled from a database is being carried out by another program (script processor) rather than by the computer processor.

The prosecution history does not evidence a clear restriction of "script processor" to a program that is interpreting a script for execution rather than compiling a script for execution. The distinction that was made over Morgenstern is that of using an intermediate program (script processor), whether it is an interpreter or a compiler, that executes a script program pulled from a database. The compiler program in Morgenstern, col. 8:58-61, could be labeled a script processor. However, the automatically generated code that is compiled, even if labeled a "script," is produced by the transformer generator 42 and is not pulled from a database. Thus, even if the transformer generator 42 would be labeled a "configuration management user interface," absent from Morgenstern would be a database storing scripts. Finally, if "interpreatively run" was necessary and being used to distinguish Morgenstern, the examiner would have required the claims to be amended to state that limitation. Accordingly, the Court will not limit "script" based on the prosecution history.

Accordingly, the Court adopts JuxtaComm's proposed construction and construes "script" as "a group of commands to control data movement into and out of the system, and to control data transformation within the system." The Court also adopts JuxtaComm's proposed construction and construes "script processor" as "software component that processes a script."

D. "Scroll Sequence"

Claims 37 and 38 use the phrase "scroll sequence." Claim 37, for example, describes a "memory means for storing a marker value for at least one of said channel tuning designations, and means for retaining said channel tuning designations in a plurality of scroll sequences ….") (Doc. # 1, Exh. A at col. 30).

Beery asserts that the phrase "scroll sequence" does not require a viewer to program it, but more broadly refers to one or more channel tuning designations which are retained in the memory means.

Thomson argues that a scroll sequence must consist of entries made by a viewer. Thomson bases this contention on the specification by arguing, "Scroll sequence is … given a specific meaning in the '952 patent's explicit description of 'scroll sequence' using the precise special definitions given to 'cue' and 'select code.'" (Doc. # 272 at 11). Thomson reasons, "a 'scroll sequence' is expressly described by the '952 patent as a 'cue' with a 'marker bit' or 'scroll marker.' The 'scroll sequence,' like the 'cue,' … is … defined by the '952 patent to include 'the listing in memory of various programmed entries made by the viewer, wherein each select code is stored along with its corresponding channel code and display code." (Doc. # 193 at 17 (original italics)).

The manner in which the phrase "scroll sequence" appears in the context of the '952 patent provides no hint about its meaning. Indeed, it is a technical phrase inviting reference to the specification to learn its meaning. See Zebco Corp., 175 F.3d at 990 (and cases cited therein).

Contrary to Thomson's contentions, the phrase "scroll sequence" is not specifically defined in the specification, for several reasons. First, it is not among the four terms and phrases explicitly listed and defined in the specification. This list includes only "channel code," "select code," "display code," and "cue." By not including in this list a clear and explicit definition of the phrase "scroll sequence," Beery did not act as his own lexicographer with regard to this phrase. See Zebco Corp., 175 F.3d at 990.

Second, the specification's description of the term "scroll" beginning at column 9, line 16 does not contain a sufficiently explicit and clear limitation of "scroll sequence" to only be a feature capable of use by viewers. This is so because the specification describes the "scroll" as a feature of the preferred embodiment. This portion of the specification states, in part, "Yet another feature of the preferred embodiment is the ability of the operator to designate only certain channels to be placed into a 'scroll' so that the operator may later 'scroll' by actuating a single key through a number of frequently watched
channels. Those channels to be placed in the scroll are flagged with a marker bit ...." (Doc. # 1, Exh. A at col. 9). The specification continues using the term "operator" to describe how entries are programed into a scroll. See id. Use of the term operator in this description of the preferred embodiment does not require the scroll sequence to be used by viewers only but is merely an example of how this particular preferred embodiment can be used. Without such a requirement, the preferred embodiment merely serves as an example of how this feature can be used. "Claims are not to be interpreted by adding limitations appearing only in the specification .... Thus, although the specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments." Electro Medical Sys. SA v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994). Because the claim language of the '952 patent does not limit the phrase "scroll sequence" to use by viewers only, the specification's use of the term "operator" when describing the preferred embodiment provides no ground for limiting the "scroll" feature to use by viewers only. 

In addition, Thomson's focus on the specification's use of the terms "cue" and "viewer" along with the phrase "select code" does not convince the Court that the specification sets a more limited definition of the phrase "scroll sequence." Although the specification's preferred embodiment of a "scroll" includes a program that enters the channel code, select code, display code, and scroll marker into the channel selection cue, see Doc. # 1, Exh. A, col. 9 at 11. 27-29, and although both "cue" and "select code" are specifically defined in the specification to include use by the "viewer," the specification's use of the broader term "operator" to describe the preferred embodiment of the "scroll" establishes that the scroll feature is not limited by the narrower definitions of "cue" and "select code." To hold otherwise would require limiting the term "operator" to viewers only; a limitation that is not supported by the claim language or the specification, see supra, § VI(B).

Lastly, this construction of the phrase "scroll sequence" naturally aligns with the patent's description of the invention, which again is a reissue patent that not only includes but goes well beyond the apparatus described in the '734 patent. See Renishaw, 158 F.3d at 1243. Thomson's proposed limitation of "scroll sequence" to use by viewers only ignores this broader reissued nature of this reissue patent.

Accordingly, the phrase "scroll sequence" as used in the '952 patent does not require a viewer to program it but more broadly refers to one or more channel tuning designations, which are retained in the memory means.

"Scrolling" appears in dependant claim 32, and variations of the word "scroll" are found throughout the specification describing a particular type of movement in the preferred embodiment. See 8:19-44 supra. The parties agree that "scrolling" means, "moving viewable elements from a first displayed location to a second displayed location," but the parties disagree about how to characterize the movement between the first and second displayed location. Defendants argue for, "moving viewable element from a first displayed location to a second displayed location in a manner reflecting the path traveled (emphasis added)," while Konami argues for "moving viewable element from a first displayed location to a second displayed location in a continuous manner (emphasis added)." The Court finds that "scrolling" implies "continuous" motion.

"Scrolling" appears in independent claim 32, which reads, "[a] method according to claim 28 wherein said step of displaying said second display parts comprises scrolling said second display parts." Claim 28 states that there is "relative movement" between matching "first and second display parts," and claim 32 narrows claim 28 by stating that the "second display part" is "scrolling." Unlike the more general "relative movement" appearing in independent claim 28, the term "scrolling" describes movement that is "continuous." First, "scrolling" is generally understood to mean the movement of text or graphics on a display similar to an unrolling scroll, which implies continuous motion. Generally, the movement can be in any direction, but the necessary implication is that the movement is "continuous." Second, the above quoted specification excerpt, when read in conjunction with claims 28 and 32, supports the notion that scrolling is a narrower type of relative movement that necessarily implies continuity. Thus, the Court adopts Konami's construction.

The phrase "scrolling" as used in the '952 patent does not require a viewer to program it but more broadly refers to one or more channel tuning designations, which are retained in the memory means.
Defendants offer no support for the "tight and perfect fit" limitation in the language of the claims or the specification. Instead, they refer to a dictionary definition of "seal." See Mosko Dec., Exh. X at 1052. Absent any motivation to impose the requirement of a tight and perfect fit in the intrinsic record, the court finds that the phrase "sealing structure" means "a structure, made after the second substrate is laid on the first, which may help to contain the liquid crystal material within the cavity between the two substrates or to keep impurities out."

C. "To perform a search"

We next turn to the phrase "a search on at least said updated television programming information contained in RAM." In construing this claim language, the district court quoted a portion of the specification and summarily stated, "it is clear from the language of the claim and the specification that the search is of all the information contained in the RAM in order to produce the subset of data specified by the viewer." SuperGuide Corp., 169 F. Supp. 2d at 511. The district court noted that the invention, as described in the specification, also envisions storing information other than television scheduling information, and that the claim states that the search will be conducted on "at least said updated television programming information." The court therefore construed the disputed phrase to mean "a user-directed examination by the microcontroller of all the television programming information stored in the random access memory of the system and the retrieval of a subset of that information which meets the criteria specified by the user for display on the television set." Id. at 526.
