Supplemental Preliminary Amendment, Patent App. No. 08/798,525, p. 12, n. 1. Rambus maintains that the express exclusion of the delay locked loop system and the latency invention from the scope of the attorney's remarks makes it "preposterous" to read a device ID register limitation into the claims currently before the court. Instead, during the Markman hearing in this case, Rambus' expert Dr. Huber contended that the limitation applies to every other claim of the patent (claims 1-25) but not claim 26. This conclusion, according to Dr. Huber, is an obvious conclusion based on the fact that
claim 26 includes the inventive technologies mentioned as additional and/or inventive features in the footnote.

Notwithstanding Rambus' current attempt to carefully craft its limitations without much support in the patent history, the footnote does not imply that the statement excludes claim 26, but rather establishes that, in addition to the device ID register, Rambus believed that it claims possessed other inventive features. The last sentence of the footnote shows that Rambus chose not to rely on those additional inventive features when distinguishing the claims from prior art. See id. ("these additional and/or other inventive aspects, although forming a basis for patentability in their own rights, will not be the focus of these Remarks"). Therefore, it is appropriate to read "integrated circuit device" as containing a device ID register, interface circuitry to receive a request from an external bus, and comparison circuitry to determine whether the identification information in the request corresponds to the identification register of the device.

Moreover, Rambus' suggested requirement that the integrated device be constructed on a single monolithic substrate is not supported by the specification and actually is undermined by the doctrine of claim differentiation. Claim 182 of the Preliminary Amendment to Patent App. No. 08/222,646, claim 6 of Patent No. 5,638,334 and claim 18 of Patent No. 5,657,481 all included the limitation that the device was "on a single semiconductor substrate." Claim 26 of the 804 patent contains no such limiting language and the doctrine of claim limitation warns against reading such a limitation into the disputed claim language unless the intrinsic evidence counsels otherwise.

3. Construction

Thus, the patent history supports the construction that an integrated circuit device, as used on claim 26 of the '804 patent, must have a device ID register, interface circuitry and comparison circuitry.

2269

A. "integrated computer software application"

- Plaintiff's proposed construction: "computer codes or instructions that are compatible and interoperate"
- Defendants' proposed construction: "one or more computer applications combined to create a single program"

The term "integrated computer software application" is found in claims 1 and 18 of the '655 patent and claims 16 and 18 of the '172 patent. The parties agree that this term, found in the preamble of the above claims, acts as a limitation on those claims because the patentee relied on the term to distinguish those claims over the prior art.

Plaintiff asks the Court to construe "integrated computer software application" as "computer codes or instructions that are compatible and interoperate." To support this position, Plaintiff points to the background of the invention which describes incompatibility as a "plague" in the field and that prior art methods have required the use of multiple incompatible applications to edit and convert video information. The specification states that "the invention provides an integrated software application" that can be installed on a personal computer. The claims at issue also list a number of "codes directed to" various functions.

4 '655 Patent, 2:25-44.

Defendants argue that mere compatibility or interoperability are not sufficiently limiting for this construction. Instead, they seek to construe "integrated computer software application" as "one or more computer software applications combined to create a single program." Defendants argue that although plaintiff's construction solves the "compatibility" problem mentioned in the background to the invention, it ignores the requirements of the prior art it describes as "complex," "time
consuming," "taking up a large amount of memory," and requiring "a high degree of skill." Defendants argue that compatibility alone cannot satisfy the "integrated computer software application" and that the claim must be limited to "collections of computer programs" that "work as a unit."

Plaintiff's requested definition is too broad, and Defendants' may be misunderstood by a jury. Many modern computer programs are written as a collection of many smaller programs designed to work together and controlled by a master program or application. Defendants' definition captures this idea, but uses the terms "applications" and "program" in a way that may tend to confuse a jury. Additionally, the claims that contain this limitation also contain lists of "codes directed to" various functions and a definition that includes the term "code" will be clearer. The plaintiff indicated during the claim construction hearing that the software must function as a unit. The Court's construction captures the requirement that the integrated application be a single system or application.

6 See e.g. '655 patent 2:23-53.
--- End Footnotes ---

9. Integrated Data and Video Storage

The memory module has memory elements configured to store bits representing data and memory elements configured to store bits representing video information.

A. "Integrated memory" (claims 20, 22-23)

The parties dispute the meaning of "integrated memory" in independent claim 20 and dependent claims 22 and 23. Samsung argues that this term should not be construed because it appears in the preamble to claim 20 and is not a limitation on this claim. The Court disagrees. The '990 patent refers to "memory" in the preambles to claims 1-14 but refers to "integrated memory" only in claim 20, 22, and 23. The Court will assume that "integrated" was inserted before "memory" in the preamble to claim 20 in order to differentiate the type of memory disclosed in this claim. See Innova/Pure Water, Inc. v.
Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1119 (Fed. Cir. 2004) ("[W]hen an applicant uses different terms in a claim it is permissible to infer that he intended his choice of different terms to reflect a differentiation in the meaning of those terms.").

The parties dispute whether the "integrated memory" in claim 20 is limited to memory that is fabricated in a single integrated circuit. AMD's proposed construction of "integrated memory" is "a memory fabricated in a single integrated circuit." Samsung proposes "a memory containing one or more integrated circuits." The Court finds that AMD's construction has more support in the intrinsic evidence.

The '990 patent discloses both memories formed in one integrated circuit and memories without this limitation. For example, independent claim 1 teaches "a memory," while dependent claim 6 teaches, "The memory of claim 1 wherein said memory is fabricated in an integrated circuit." 13:13 and 14:16-17; see also Claims 8 and 14. The specification also states that "some embodiments are not integrated into one integrated circuit." 13:8-9. Under AMD's proposed construction, the inclusion of the word "integrated" teaches that claim 20 discloses memory fabricated in a single integrated circuit. Samsung's proposed definition renders "integrated" superfluous because memory is necessarily fabricated in at least one integrated circuit. Accordingly, the Court adopts AMD's proposed construction of "integrated memory." 3

--- Footnotes ---

3 As the meaning of this term is evident from the intrinsic evidence, the Court need not consult the expert opinions offered by both parties. See Decl. of Andrew Wolfe (for AMD) and Decl. of Richard Pashley (for Samsung).

--- End Footnotes ---

"integrated voice and data multiplexer" is construed to mean "a device that combines voice and data on a single path."

Lucent contends that this phrase means "a device that combines voice and data traffic on a single path." (D.I. 396 at 27.) Extreme contends that this phrase means "a device arranged with a voice queue for storing received voice packets, a data queue for storing received data packets, and a block dropping congestion controller for dropping low order voice blocks when congestion occurs at the multiplexer." (D.I. 395 at 21.) In support of its contention, Extreme cites statements in the Summary of the invention section of the specification ('650 patent at 2:68-3:2, 3:34-36.)

Although that language can reasonably be understood as constituting a general description of the invention, the Court finds that it does not clearly define the term "integrated voice and data multiplexer," representing a clear disavowal of claim scope. Thus, in the Court's view, the Court's construction is consistent with the plain language of the claim and the specification.

---

"Integrated whole"

Intacta argues that the term "integrated whole" is properly construed to mean that "the entire file to be encoded must be present on the page and that the file cannot be compressed to eliminate portions of the file." (Def.'s Mot. for Summ. J. at 16.) Datastrip responds that "integrated whole" should be construed to mean "that the data lines encode data to be read as a unity, in contrast to information stored in particular positions that can be read or searched for individually." (Pl.'s Opp'n to Summ. J. at 19.)

Beginning with the ordinary meaning of the words, "integrated" means "composed of separate parts united together to form a more complete, harmonious, or coordinated entity." Webster's 3d New Int'l Dictionary 1174 (1976) [hereinafter "Webster's"]'). Used as a noun, "whole" means "a complete amount of sum: a number, aggregate, or totality lacking no part,
member, or element;" "something constituting a complex unity: a coherent system or organization of parts fitting or working together as one." Id. at 2611. The patent specification does not indicate that the applicant provided any alternative definition of "integrated whole;" however, Datastrip submits that the prosecution history sheds light on the meaning of the words. The Court agrees.

As originally proposed in the patent application, claim 1 did not contain the phrase "data lines being an integrated whole." (See Toone Decl. Ex. D, at D-31 (showing original language).) Instead, the claim element read, "said plurality of data lines together defining an encoded portion of said data strip." (Id.) Later, however, the Patent Office rejected claim 1, asserting that the claim was obvious in light of three prior art references: the Levasseur patent, the Gokey patent, and a Patent Cooperation Treaty publication. (Id. at D-176.) In response, the applicants amended the proposed claim, adding "integrated whole" as it exists today, and explaining:

Claim 1 is directed to the sequential, unified, and contiguous encoding of data. Thus, the claim is distinguished from a data-encoding structure which is for "look-up" reference purposes, i.e., where the structure is not read as a whole, but is used only for finding a particular item of data …. 

…

Levasseur is not a data strip to be read as a whole, but [] a microfiche film [to] look up particular information …. 

…

What Levasseur actually teaches, as set forth in our prior amendment, is that his rows and groups should be spaced. By contrast, the information portion of Applicants' invention contains a unitary block of information to be read as a whole.

(Id. at D-175 to -177 (internal citations omitted).) Consistent with the ordinary meaning of the words, the prosecution history illustrates that "integrated whole" is included in the claim to distinguish prior art that could be read in a piecemeal fashion and used "for look-up purposes." (Id. at D-177.) Unlike data stored in look-up fields, therefore, the "integrated whole" of the data strip contains a unitary block of information.

Intacta argues for a different meaning, "that the entire file to be encoded must be present on the page and that the file cannot be compressed to eliminate portions of the file." (Def.'s Mot. for Summ. J. at 24.) While Intacta acknowledges that the words "integrated whole" were added to overcome references cited by the Patent Examiner, Intacta does not reconcile the prosecution history with its requested meaning of the words. Instead, Intacta's proffered meaning places emphasis on the "file" that will be represented in a data strip, a meaning unsupported by the language, the specification, or the prosecution history. The Court concludes that the plain meaning of the words and the prosecution history support the following construction: "integrated whole" means that the data lines encode data to be read as a unity, in contrast to information stored in particular positions that can be read or searched for individually.
acts recited in the specification or their equivalents.

The Court will address the latter contention first. The text of this disputed claim is as follows:

integrating constant data related to the at least one product with the variable data related to the at least one product in the remote computer to generate the information data related to the at least one product including both constant data and variable data.

'490 Patent, Col. 22, ll. 12-16 (emphasis added). Although Compuserve failed to identify the function this step is supposed to perform, the Court has italicized the language in the step that might fill this requirement. See O.I. Corp., 115 F.3d at 1583 (unless step is "individually associated" with a function to be performed by that step, it does not implicate 35 U.S.C. § 112, P6). The emphasized text, however, does not recite a specific function with which this step is associated. Instead, it is a repetition of the statement of purpose for the overall method that is recited in the preamble of the claim, which does not constitute a function for the steps that follow. Id. The preamble for Claim 1 recites "[a] method for generating information related to a product . . . " '490 Patent, Col. 21, ll. 55-56. Thus, 35 U.S.C. § 112, P6 does not require that the Court limit "integrating" to the acts recited in the specification or their equivalent.

With respect to the "mandatory nature" of a map file, the Court does not agree. The claim does not state that the integration step is to be accomplished in accordance with some instructions located either on the main or the remote computer. It is only in the dependant claims that the idea of using a map file for positioning the data during the integration step is introduced. According to the testimony of Dr. Dunsmore, one of ordinary skill in the art would know various ways of integrating data to create a meaningful computer display. Tr., Vol. I at 96. Dr. Dunsmore summarized his definition of integrate as "bringing together the various types of data, constant data and variable data, and placing them in the viewing area so that they are meaningful and functional to the person requiring information from the electronic catalog." Id. at 99.

Although Dr. Dunsmore agreed that "merging" would be a synonym for this process, the Court finds that merging does not constitute an adequate definition of the word "integrate." This is because the intention of the inventor is to provide the customer with instantaneous access to the most up-to-date product information and to reduce on-line computer time. The latter objective is not pertinent to the integration step, because that step seems to be performed only on the remote computer. Thus, the Court finds that to provide instantaneous access to the most current product information, that information must be displayed for the customer in a meaningful and functional way. It also must be composed of the constant and variable data, which are key components of the distributed data design catalog system. The only mechanism for accomplishing this is the integrating step, which merges the constant data and variable data related to the selected product to generate the information data. For this reason, the Court construes the meaning of the claim term "integrating" to mean "merging or uniting in a meaningful way," which works when substituted in the claim as follows:

[merging or uniting] constant data . . . with the variable data . . . in the remote computer [in a meaningful way] to generate the information data . . .

2. "integrating the received ORMS data from the ORMSs of the fulfillment partners"; "integrate the received ORMS data from the ORMSs of the fulfillment partners" 5

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 ORMS stands for Order Request Management Systems.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Disputed Claim Term | Versata's Proposed Construction | SAP's Proposed Construction
"integrating the received ORMS data from the ORMSs of the fulfillment partners"; "integrate the received ORMS data from the ORMSs of the fulfillment partners".

The dispute over the construction of this phrase is straightforward. Versata seeks to add language to SAP's construction and define the term by addressing its use.

As argued by Versata, the patent, in multiple instances, discusses the receipt of a single, integrated source of information. See '235 Patent, col. 7, ll. 16-21 ("integrates . . . providing a single integrated source"); col. 10, ll. 8-11 ("integrated order status"); col. 17, ll. 47-52 ("integrated to provide an overall order status"). Furthermore, Versata suggests that the specification expressly defines integration of the ORMS data as encompassing more than just the storing of information in a centralized store, but also as providing a single source of information for the order status.

The term centralized is used to describe the order request servicing system 110 not because of its physical location, but because communications between client systems 105 and order request management systems 120 pass through the order request servicing system 110. The centralized nature of the communications provides the client with a single integrated source of order information, the order request servicing system 110. '235 Patent, col. 7, ll. 66-col. 8, l. 6 (emphasis added).

SAP argues, first, that Versata is improperly defining the term by its use, rather than simply by what the term means. Second, SAP asserts that a number of Versata's examples do not support the premise for which they are cited.

SAP's arguments are unpersuasive. The claims, when read in the context of the specification, support such a construction. The inclusion of "to provide a single source of information" adequately describes the scope of the claim limitation in the context of the patent as a whole.

For these reasons, the court defines the above terms as "storing in the same database, or otherwise combining, received ORMS data to provide a single source of information."
requires the structure disclosed in the specification that comprises a circular polarizer or a quasi-circular polarizer or an equivalent structure to accomplish the function of polarizing the incident light. A circular polarizer is a linear polarizer combined with a quarter-wave delay plate wherein the in-plane principal axes of the delay plate are oriented at 45[degrees] from the transmission and absorption axes of the linear polarizer. A quasi-circular polarizer is a structure that is very close to that of a circular polarizer and results in light that is polarized very close to circularly.

--- Footnotes ---

12 Samsung does not propose a construction for the entire phrase based on its argument that the entire phrase is two phrases for which Samsung provides separate proposed constructions. CEA does not propose a construction for the, two separate phrases Samsung argues must be construed based on its argument that the entire phrase requires a single construction.

--- End Footnotes ---

Samsung proposes that the second portion of the disputed phrase, "the thickness of the layer and each polarization means are intended to bring about a compensation of the birefringence of the liquid crystal layer in its homeotropic structure so that the cell has a high contrast for said structure in the case of an oblique observation performed in a given observation plane," should be construed as a separate claim term. It proposes that this phrase be construed as:

The claimed thickness of the liquid crystal layer is 2e[o]. This thickness, 2e[o], is defined as twice the thickness of the liquid crystal layer at which the polarization ellipse that is the result of an obliquely incident light wave traveling in the observation plane through a circular polarizer has its major axis rotated by the birefringence of the liquid crystal layer to align with the observation plane.

The court agrees with Samsung that the disputed phrase should be construed separately. The court adopts Samsung's proposed constructions because they are supported by the specification.

The claim language containing the disputed phrase recites, in pertinent part: "wherein the cell also comprises, at least on said side, a means for polarizing the incident light, and wherein the thickness of the layer and each polarization means are intended to bring about a compensation of the birefringence of the liquid crystal layer . . . ." 13 Samsung is correct that, grammatically, the separation of "means for polarizing" and "thickness of the [liquid crystal] layer" with commas and the inclusion of each in separate "wherein" clauses indicates that those are separate phrases requiring separate constructions.

--- Footnotes ---

13 '028 patent, claim 1, 7:61-67 (emphasis added).

--- End Footnotes ---

With regard to the "means for polarizing the incident light," the structures clearly linked to the function of polarization means are circular polarizers or quasi-circular polarizers. 14 Figure 4 illustrates quarter wave delay plate 24 having principal indices L[2] and R[2] offset 45[degrees] from the absorption axis P[2]. Also, the court agrees with Samsung that a quasi-circular polarizer is not a structure distinct from a circular polarizer but "is a term that accounts for less-than-perfect circular polarization in real world, commercially-available circular polarizers." 15 Describing the quasi-circular polarization illustrated in figure 6B, the specification states:

At the exit from the first plate 23, the wave has a quasi-circular polarization and is [a] polarization ellipse, which is very close to a circle, is inscribed in a rectangle R[p] whereof the sides are substantially equal and whereof two adjacent sides respectively have as the mid perpendicular the axes X and Y (FIG. 6B). 16

--- Footnotes ---

14 See, e.g., '028 patent, 2:33-35 ("[T]he cell comprises first and second polarization means on either side of said assembly and equivalent to quasi-circular polarizers . . . ."); '028 patent, 2:48-68 ("[T]he first and second polarization means
respectively comprise a first pair having a first linear polarizer and . . . a first delay plate, and a second pair having a second linear polarizer and . . . a second delay plate . . . . [T]he first and second pairs behave in the same way as quasi-circular polarizers . . . .

'T028 patent, 3:14-16 ("[T]he polarization means being able to circularly polarize an incident plane light wave propagating in the homeotropy direction . . . ."); '028 patent, 3:26-40 ("[T]he polarization means comprises a linear polarizer and . . . a delay plate . . . chosen so as to form, with the linear polarizer, a circular polarizer with respect to an incident plane light wave propagating in the homeotropy direction."). See B. Braun Med. v. Abbott Lab., 124 F.3d 1419, 1424 (Fed. Cir. 1997) (stating that the "structure disclosed in the specification is 'corresponding' structure only if the specification or prosecution history clearly links or associates that structure to the function recited in the claim"). The court disagrees with CEA that the structures of polarizers other than circular (or quasi-circular polarizers) are described in the specification. As noted by Samsung, the alternative embodiments cited by CEA ('028 patent, 7:46-48; 7:57-8:2) could reasonably be understood as stating a material (liquid crystal) from which a quarter wave delay plate could be made or (in the combined delay plate embodiment) a rearrangement of two circular polarizers.

15 D.I. 700 at 17.

With regard to "the thickness of the [liquid crystal] layer" the specification recites: "[a] definition will now be given of the thickness of the liquid crystal layer 18 leading, combined with polarizers 21, 22 and delay plates 23, 24, to a compensation of the birefringence of the liquid crystal layer, under oblique incidence and in the observation plane P. . . . According to the invention, the thickness of the liquid crystal layer 18 is taken to be double said particular thickness e[0] . . . ."

17 '028 patent, 5:37-6:33. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002) (A patentee may act as "his own lexicographer and clearly set forth a definition of the disputed claim term in either the specification or prosecution history."). In a prior art statement discussing U.S. Patent 3,960,438 ("the '438 patent"), the applicant stated that the '438 patent "describes reflective devices using ambient light. One of the embodiments of these devices comprises an electrically controlled birefringence cell, as well as a reflecting surface on one side of the cell and a circular polarisation [sic] means on the other side of the cell. In this document, the thickness of the liquid crystal film lays no part whereas it is of vital importance in the invention." D.I. 701, Ex. 3A at 2 (emphasis added).

18 The court disagrees with CEA's argument that Samsung's proposed construction improperly excludes other embodiments purportedly recited in the specification. The court also rejects CEA's arguments that claim differentiation precludes adoption of Samsung's proposed construction. See Laitram v. Rexnord, 939 F.2d 1533, 1538 (Fed. Cir. 1991) ("[Laitram's argument that [dependent] claim 24 prevents claim 21 from being interpreted as statutorily mandated by section 112(6) must be rejected. . . . [T]he concept of claim differentiation . . . states that claims should be presumed to cover different inventions. This means that an interpretation of a claim should be avoided if it would make the claim read like another one. Claim differentiation is a guide, not a rigid rule. If a claim will bear only one interpretation, similarity will have to be tolerated. Simply stated, the judicially developed guide to claim interpretation known as 'claim differentiation' cannot override the
The court adopts Samsung's proposed definition of "the thickness of the layer and each polarization means are intended to bring about a compensation of the birefringence of the liquid crystal layer in its homeotropic structure so that the cell has a high contrast for said structure in the case of an oblique observation performed in a given observation plane" and construes that phrase to mean:

The claimed thickness of the liquid crystal layer is 2e[ο]. This thickness, 2e[ο], is defined as twice the thickness of the liquid crystal layer at which the polarization ellipse that is the result of an obliquely incident light wave traveling in the observation plane through a circular polarizer has its major axis rotated by the birefringence of the liquid crystal layer to align with the observation plane.

D. "Intensity" as Used in Claim 11

Defendants contend that the term "intensity" in claim 11 should be construed as the Court construed that term in the context of the '339 patent — namely, as "the area under the spectrographic graph of reflectance (percent) versus wavelength occupied by the specified color." In the context of the '339 patent, the Court assumed, arguendo, that the term "intensity" has an ordinary and accepted meaning among persons of ordinary skill in the field of color science, as Plaintiff now contends. However, the Court concluded, based on the specification, that the patentee had given the term "intensity" an unconventional meaning, employing it as a synonym for the term "quantity," meaning the areas under the spectroscopic graph. [122] at 14-15. See also Bell Atlantic, 262 F.3d at 1269-70 (courts "must look at the intrinsic evidence to determine whether the patentee has given [a] term an unconventional meaning"); ResQNet.com, Inc. v. Lansa, Inc., 346 F.3d 1374, 1378 (Fed. Cir. 2003) ("a patent applicant may consistently and clearly use a term in a manner either more or less expansive than its general usage in the relevant community, and thus expand or limit the scope of the term in the context of the patent claims"). The Court's construction of the term "intensity" with respect to the '339 patent was based on the statement in the specification that "[t]he relative quantities or intensities of each colour can be determined by comparing the areas under the spectroscopic graph of reflectance (percent) versus wavelength occupied by the specified colour." '339 patent, col. 3, ll. 8-11. The Court reasoned that the patentee's inclusion of the term "intensities" in that definitional sentence indicated that the patentee intended to redefine that term to mean the area under the spectroscopic graph.

The '018 patent has the same specification as the '339 patent. And the claims of the '018 patent offer no other definition of the term intensity. Therefore, the Court's prior analysis applies with equal force here. Moreover, Defendants' position that the claim term "intensity" should be construed to carry the same meaning in both the '339 patent and the '018 patent finds support in Federal Circuit precedent, which teaches that courts should "presume, unless otherwise compelled, that the same claim term in the same patent or related patents carries the same construed meaning." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1334 (Fed. Cir. 2003) (finding that disavowal of claim scope made in parent application carried over to a first continuation-in-part application that used the same disputed term for which the disavowal applied); see also NTP, Inc. v. Research in Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2005) ("[b]ecause NTP's patents all derive from the same parent application and share many common terms, we must interpret the claims consistently across all asserted patents"); Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990) ("the construction of the term 'diffuse light' contained in [the parent patent], is relevant to an understanding of 'diffuse light' as that term is used in [the continuation-in-part patent]"); but see IP Innovation L.L.C. v. Sony Electronics, Inc., 2005 U.S. Dist. LEXIS 17962, 2005 WL 2035578, at *7 (N.D. Ill. Aug. 18, 2005) (noting that the presumption that a claim term in related patents carries the same meaning may be overcome by evidence that the patentee clearly assigned different meanings to a term that appears in two related patents).

Plaintiff objects to Defendants' proposed construction, noting that it is identical to the parties' agreed upon construction of the claim limitation "area under a graph," as it is used in claim 27. According to Plaintiff, the doctrine of claim differentiation precludes the Court from construing the two claims to cover identical subject matter. The Court disagrees; as explained below, under the present circumstances, the doctrine of claim differentiation is not sufficient to overcome the presumption that the claim term "intensity" should be given the same construed meaning in the two related patents.
Claim differentiation is a claim construction tool that "takes on relevance in the context of a claim construction that would render additional, or different, language in another independent claim superfluous." Curtiss-Wright, 438 F.3d at 1381. Here, Plaintiff correctly notes that Defendants' proposed construction of claim 11 would render claim 27 superfluous. But the Federal Circuit "has acknowledged that two claims with different terminology can define the exact same subject matter." Id. at 1380. In view of that possibility, the court "has cautioned that '[c]laim differentiation is a guide, not a rigid rule.'" Id. at 1381. See also Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991) ("If a claim will bear only one interpretation, similarity will have to be tolerated.") (quoting Autogiro Co. of America v. United States, 384 F.2d 391, 404, 181 Ct. Cl. 55 (Ct. Cl. 1967)). Moreover, claim differentiation "can not broaden claims beyond their correct scope." Fantasy Sports Props. v. Sportsline.com, 287 F.3d 1108, 1115-16 (Fed. Cir. 2002) (quoting Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362 (Fed. Cir. 2000)).

Here, the specification — combined with the presumption in favor of giving claim terms the same meaning in related patents — persuades the Court to construe the term "intensity" to mean "the area under the spectroscopic graph of reflectance (percent) versus wavelength occupied by the specified color." The Court finds no support for Plaintiff's proposed construction of "intensity" — namely, "the amplitude or height of reflected light for a given wavelength on a spectral curve" — in the specification. Because the specification supports only one interpretation, the similarity between claims 11 and 27 must be tolerated. Laitram Corp., 939 F.2d at 1538.

7 As Defendants note, Plaintiff's claim differentiation argument is somewhat undermined by its own proposed constructions, which construe certain independent claims to have identical — or nearly identical — meanings. In particular, according to Plaintiff, both "dominant intensity" (claim 19) and "area under a graph of reflectance (percent) versus wavelength" (claim 27) are measured by calculating the area under the spectroscopic curve. See Pl. SOF at P 14. Plaintiff also proposes construing "intensity" (claim 11), "peak reflectance percentage" (claim 7), and "peak intensity" (claim 15) to mean essentially the same thing — the height of the spectroscopic curve.

--- Footnotes ---

7 As Defendants note, Plaintiff's claim differentiation argument is somewhat undermined by its own proposed constructions, which construe certain independent claims to have identical — or nearly identical — meanings. In particular, according to Plaintiff, both "dominant intensity" (claim 19) and "area under a graph of reflectance (percent) versus wavelength" (claim 27) are measured by calculating the area under the spectroscopic curve. See Pl. SOF at P 14. Plaintiff also proposes construing "intensity" (claim 11), "peak reflectance percentage" (claim 7), and "peak intensity" (claim 15) to mean essentially the same thing — the height of the spectroscopic curve.

--- End Footnotes ---

2279

13. Interactive network sessions; interactive asymmetric communication in a session; interactive session; interactive communication

The above terms are present in certain claims of the '121 and '845 patents. The plaintiff proposes "any established communication connection between a host computer and a remote location" as a construction, while the defendants propose "connection which assigns an upstream channel to a single remote link adapter." The court has reviewed and considered the parties' arguments and construes each of the above terms to mean "an established communication connection where information or commands are exchanged between a host server and a remote client in real time."

---

2280

A.1.b. "format" and "interactive operating process format"

Kate's and Verizon's asserted interpretations of "interactive operating process format" are almost identical. Verizon contends, however, that "format" requires a single computer program operative to interact with callers, while Katz alleges that "format" may include a plurality of linked computer programs.

The term "interactive operating process format" means a call process flow implemented by at least one computer program that sets forth the content and sequence of steps to gather information from and convey information to callers through pre-recorded prompts and messages. The call process flow, according to the Court's interpretation, may be implemented by
several linked or independently -- executable computer programs. Webster's defines "format," in relevant part, as "a general plan of organization or arrangement (as of a television show)." See Webster's Ninth New Collegiate Dictionary 485 (9th ed. 1991). "Format" or "interactive operating process format," in the context the 734 patent provides, appears to refer to an interactive process implemented in computer program code, while a "plurality of interactive operating process formats" refers to multiple interactive processes, each implemented in computer program code. Specifically, the Court's review of the 734 patent specification suggests that a format refers to the call process flow itself, regardless of whether the call process flow is embodied in one or several computer programs. See 734 patent, Col. 3:20-23 ("calls are selectively accepted and interfaced so as to accomplish a desired operating format, for example, a contest or a game."); Col. 5:34-36 ("assume that the system CS is programmed to accommodate a relatively simple game format, that is, a sponsored contest for the promotion of a product."). In addition, that the processing of calls is distributed among different components in the system disclosed in the 734 patent also suggests that a "format" can be implemented by more than one computer program. Lastly, the language and structure of claim 81 of the 734 patent does not suggest a contrary interpretation. Verizon's asserted interpretation is unnecessary to resolve the alleged ambiguity resulting from Katz' interpretation of "format."

9. Interactive voice prompting

Foundry submits that "interactive voice prompting" does not require construction. Lucent, however, argues that "interactive voice prompting" should be construed to mean "audible prompts provided by a caller by the system which describe and solicit control inputs for utilizing PBX services." In support of its proposed construction, Lucent relies on a portion of the specification which provides as follows: "[I]t would be desirable to provide a telecommunication platform and network that provides voice prompting to a user, enabling the user to perform network services such as voice communication simply by following a voice prompt rather than by memorizing complex keystroke sequences." '864 patent, col. 1, ll. 51-56.

The court concludes that the specification does not support limiting "interactive voice prompting" to prompts that "describe and solicit control inputs for utilizing PBX services." In fact, the specification provides that voice prompting enables the user to perform network services such as voice communication. Accordingly, the court construes "interactive voice prompting" to mean "audible prompts provided to a user that enable the user to perform network services." See '864 patent, col. 1, ll. 51-52.

5. "intercepting"

SuperSpeed proposes the term means "to stop, deflect, or interrupt the progress or intended course of." IBM proposes the term means "cutting off from the intended destination." In the Oracle Litigation, the parties agreed to SuperSpeed's current proposal, and Judge Gilmore adopted that agreement in her claim construction ruling. IBM's construction would necessarily mean that the instruction does not reach its final destination. This is not what is disclosed in the patent.

The read and write instructions must be intercepted for the cache driver to determine which data should be read from or written to the cache. The read instruction, for example, must be sent to the disk when the data is not found in the cache. ['226 Patent, 4:47-51]. The write instruction must be sent to the I/O device to write the data to the non-volatile storage. As SuperSpeed points out, the "interception" does not cut off the instruction from the target, but only stops it or interrupts it before sending it to the appropriate I/O device. ['226 Patent, 4:47-51] (noting that, after interception, when the data sought by a read instruction is not in the cache "the disk is accessed normally for the reqd data"); and '226 23:32-45 (noting that, after interception, a write instruction is ultimately "sent to the disk I/O device"). SuperSpeed argues, therefore, IBM's proposed construction excludes the preferred embodiment. When a construction excludes the preferred embodiment, it "is rarely, if ever, correct." Vitronics, 90 F.3d at 1583.

IBM responds its proposed construction does not exclude the preferred embodiment. It argues that the "instruction" is intercepted, and then a new instruction is sent after the cache driver determines what to do with the data. IBM's argument is
unpersuasive. There is no support for IBM'S proposition that the original read or write instruction can not be passed along by the cache driver. The above passages suggest as much. IBM is correct that the specification describes a situation where the driver modifies the instruction. See '226 Fig. 5G at block 496 (showing that the invention will “adjust [the] I/O transfer request to intercept completion at 'READ COMPLETE'” for a read instruction for which no data is in the cache). That, however, is not necessary in all cases.

The term "intercepting," therefore, means "to stop, deflect, or interrupt the progress or intended course of."
The Defendants' primary support for their position is the language of the specification that states "executable processing it" should be added to the end of the definition as proposed by the Defendants. What is left for the Court to determine is whether the phrase "instead of the Web Server handling of a request at a said HTTP-compliant device." phrase "intercepting said request at said HTTP-compliant device" means at least "intercepting the handling of a request at a Web server" and the phrase "the Web server..." (claim 15 of the '554 Patent) means at least "intercepting the handling of a request at a Web server" and the phrase "intercepting said request at said Web server" (claims 1, 9, and 11 of the '554 Patent) and "intercepting said request from said Web server to a page server," and "wherein said routing step further includes the steps of intercepting said request at said Web server, routing said request from said Web server to a dispatcher, and dispatching said request to said page server." This conforms with the specification, which states that the request is initially routed from the Web Client 200 to the Web Server 201. Col. 4:54-60. Also, Figure 4 appears to show the request going to the Web server executable 201(E). A construction that has the request bypassing the Web server is therefore not appropriate.

As to whether the beginning phrase of the construction should include "stopping, deflecting, or interrupting" as proposed by the Plaintiff, the Plaintiff provides little support for such language other than a general purpose dictionary. Although the Plaintiff asserts that the Defendants’ construction requires bypassing the Web server, the Court does not interpret the phrase “diverting” to require such bypassing. However, the term “diverting” seems to carry an additional connotation that the request is sent somewhere else. When looking at the claims, however, the concept of the request being sent elsewhere is included in the “routing said request” (claims 1, 9, and 11 of the ‘554 Patent) or “transferring said request” (claim 15 of the ‘335 Patent) limitation that immediately follows the intercepting phrase. Thus, the Court does not feel that either construction adds clarity to the meaning of the concept of “intercepting” as used in the claims. Moreover, the parties have not pointed to anything in the intrinsic record that suggests which is more accurate: “diverting” or “stopping, deflecting or interrupting.” These terms are not used in the specification and each in turn may need their own construction. The Court is not convinced that the term “intercepting” needs construction itself or that the constructions proposed by the parties add any needed clarity.

More helpful would be to construe the entire intercepting phrase: “intercepting said request at said Web server” (claims 1, 9, and 11 of the ‘554 Patent) and “intercepting said request at said HTTP-compliant device” (claim 15 of the ‘554 Patent). The specification describes the Interceptor as intercepting “the handling of a request.” Col. 8:31-32. To conform with the description provided within the specification, the phrase “intercepting said request at said Web server” (claims 1, 9, and 11 of the ‘554 Patent) means at least “intercepting the handling of a request at a Web server” and the phrase “intercepting said request at said HTTP-compliant device” means at least “intercepting the handling of a request at a said HTTP-compliant device.”

As to whether the beginning phrase of the construction should include “stopping, deflecting, or interrupting” as proposed by the Plaintiff, the Plaintiff provides little support for such language other than a general purpose dictionary. Although the Plaintiff asserts that the Defendants’ construction requires bypassing the Web server, the Court does not interpret the phrase “diverting” to require such bypassing. However, the term “diverting” seems to carry an additional connotation that the request is sent somewhere else. When looking at the claims, however, the concept of the request being sent elsewhere is included in the “routing said request” (claims 1, 9, and 11 of the ‘554 Patent) or “transferring said request” (claim 15 of the ‘335 Patent) limitation that immediately follows the intercepting phrase. Thus, the Court does not feel that either construction adds clarity to the meaning of the concept of “intercepting” as used in the claims. Moreover, the parties have not pointed to anything in the intrinsic record that suggests which is more accurate: “diverting” or “stopping, deflecting or interrupting.” These terms are not used in the specification and each in turn may need their own construction. The Court is not convinced that the term “intercepting” needs construction itself or that the constructions proposed by the parties add any needed clarity.

More helpful would be to construe the entire intercepting phrase: “intercepting said request at said Web server” (claims 1, 9, and 11 of the ‘554 Patent) and “intercepting said request at said HTTP-compliant device” (claim 15 of the ‘554 Patent). The specification describes the Interceptor as intercepting “the handling of a request.” Col. 8:31-32. To conform with the description provided within the specification, the phrase “intercepting said request at said Web server” (claims 1, 9, and 11 of the ‘554 Patent) means at least “intercepting the handling of a request at a Web server” and the phrase “intercepting said request at said HTTP-compliant device” means at least “intercepting the handling of a request at a said HTTP-compliant device.”

What is left for the Court to determine is whether the phrase “instead of the Web Server executable processing it” should be added to the end of the definition as proposed by the Defendants. The Defendants’ primary support for their position is the language of the specification that states
“instead of Web server executable 201(E) processing the URL request, however, interceptor 400 intercepts the request and routes it to Dispatcher 402.” Col. 4:58-60. The Defendants argue that this language provides no room for partial processing of a request by Web server executable. The Court, however, finds such language ambiguous. The Defendants would like to interpret this cited quote (“instead of the Web server executable 201(E) processing the URL request”) to mean “instead of the Web server executable 201(E) processing any of the URL request” wherein the Plaintiff would like to interpret this citation to mean “instead of the Web server executable 201(E) completely processing the URL request” The specification, however, provides little guidance.

As discussed above, however, the specification does establish that a Web server may be software. Further, the specification establishes that the Web server does perform at least some action with relation to a request, namely receiving a request. Col. 4:55-58; Col. 8:28-31; Figure 4; Figure 5. Further, it is noted that in at least one embodiment the interceptor 400 is “an extension of the Web server 201” and the interceptor 400 also performs actions on a request. Col. 4:59-62. As Defendants have asserted that their proposed claim language would exclude the Web server from any processing of the request, their proposed claim language would impermissibly exclude the embodiments disclosed within the specification. Thus, the Court declines to add the additional limitation sought by the Defendants.

For these reasons, the Court finds that “intercepting said request at said Web server” means “intercepting the handling of a request at a Web server” and the phrase “intercepting said request at said HTTP-compliant device” means at least “intercepting the handling of a request at a said HTTP-compliant device.”

The Court is of the opinion that the findings and conclusions of the Magistrate Judge are correct. Therefore, the Court hereby adopts the Report of the United States Magistrate Judge as the findings and conclusions of this Court.

The plaintiff contends that the term "interchangeable with other cards requires no construction, but if construction is necessary it offers the synonym of "exchangeable with other cards." Defendant EchoStar argues that the term means that each card implements an unscrambling technique and can be physically exchanged with other cards that implement different unscrambling techniques. The DIRECTV defendants argue for a construction that the user exchangeable card that unscrambles a signal scrambled according to a particular scrambling technique can be readily exchanged with at least one other user exchangeable card that unscramble a signal scrambled according to a separate and distinct scrambling technique.

Since the scrambling circuit 31 can put out a wide variety of scrambled signals there is correspondingly a significant number of user exchangeable circuit cards 150, each card incorporating an electronic circuit 151 for decoding one particular scrambled signal.

‘066 Patent, col. 3, lines 21-25. The specification also provides that "the electronic circuit 151 provides the key for the unscrambling circuit 120, carefully chosen to decode a particular type of signal from the scrambling circuit 31." Id. at col. 3, lines 18-20 (emphasis added).

Thus, for a card to be exchanged it must be carefully chosen to incorporate a decoding circuit for the particular scrambled signal.
I construe the term "interchangeable with other cards" to mean that a user card that unscrambles a signal scrambled according to a particular scrambling technique can be readily exchanged with at least one other user card that unscrambles a signal scrambled according to a matching scrambling technique.

Verizon contends that "interconnect switch means" should be interpreted as a means-plus-function element under 35 U.S.C. § 112, P 6. The term switch under other circumstances, Verizon alleges, would normally overcome the presumption entailed by use of "means" in the claim language; however, the term switch does not connote sufficient structure for performing the additional function of "providing format data." Verizon Brief at 52; Waite 1/14/03 Decl. P 17. Katz, on the other hand, contends that "interconnect switch means" connotes sufficient structure to avoid application of 35 U.S.C. § 112, P 6.

"Interconnect switch means" means a device including hardware and associated software that can switch or route telephone calls or signals from one location or connection to another. A presumption exists that interconnect switch means is a means-plus-function element, as the element includes "means" and is linked to the functions of "providing format data" and "controlling connections." See Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302-03 (Fed. Cir. 1999). However, the term "switch" connotes sufficient structure for performing the recited functions of "providing format data" and "controlling connections." See Rodime, 174 F.3d at 1304 ("This court's case law, however, does not require such an exhaustive recitation to avoid § 112, P 6. Instead, the claim need only recite "sufficient" structure to perform entirely the claimed function."); see also id. ("Rather, in the words of Laitram, the structure specified in [the] claims . . . tells what the means "is structurally.") (citations omitted); Altiris, 318 F.3d at 1376 ("In the cases where we have found sufficient structure in the claims, the claim language specifies a specific physical structure that performs the function.").

10 The language "providing format data" and "controlling connections" in this context is best understood as a functional limitation of the interconnect switch.

"Interconnected by [a computer network or public packet switched computer network]"

This term means "to be connected by a [computer network or public packet switched computer network]." Like Amazon's proposed construction of "connected to . . .", its proposed construction of "interconnected by [a computer network or public packet switched computer network]" is too restrictive because it requires that each computer be able to exchange messages with each of the other computers. This is unsupported by the intrinsic evidence.

The term "interconnecting" first appears in the following language of claim 1: "a call pod for interconnecting a plurality of headsets of the plurality of participants." (JA, Ex. 1, '611 Patent, at 3:63-64.) Callpod argues that the term means "connecting, which includes connecting physically, through the use of a cord, adaptor, or wireless connection." Defendants claim that the term means "physically connecting."

The specifications of the '611 patent provide an illustrative embodiment where the telephone "may be coupled to the call
Therefore, the plain language of the patent shows that the patent does not necessarily require a physical connection because of the permissive nature of the phrase "may be coupled . . . by use of an interconnecting cable." The cable is one potential way of accomplishing the interconnection contemplated by the '611 patent, but it is not the exclusive way. In fact, the plain and ordinary meaning of "interconnect" in the telecommunications context only refers to "the linkage used to join two or more communications units," without reference to a physical connection. (JA, Ex. 4, Ex. 5) (industry definitions from the National Communications System Technology & Standards Division's Glossary of Telecommunication Terms and the Telecom Glossary). Moreover, if the term "interconnecting" meant "physically connecting," the term "cable" would be either redundant or unnecessary in the text of the patent. Additionally, the patent expressly discloses a wireless method of interconnecting when it provides "the method includes the steps of providing a call pod for interconnecting a plurality of headsets of the plurality of participants, operably connecting a headset interface of a wireless telephone with a wireless audio interface of the call pod and forming a two-way voice path among the plurality of headsets and the wireless interface within the call pod." (JA, Ex. 1, '611 patent, at 1:44-50.) The plain language of the '611 patent does not limit the term "interconnecting" to a physical connection only. Therefore, the Court construes "interconnecting" to mean "connecting, which includes connecting physically, through the use of a cord, adaptor or wireless connection."

6. "Interconnecting said transceiver and one of said voice circuits for supplying paging signals." A single RIM connected to a single voice circuit and a single transceiver is downloaded with instructions from the central control station for operation as the central channel. (554 patent, col. 14, lns. 61-68; col. 31, lns. 23-36)

6. "interface/an interface for interfacing"

The parties dispute whether the "interface" includes circuitry. The parties further dispute what devices the "interface" connects and whether the connection is an electrical connection.

The preamble of claim 11 of the '141 patent recites an "interface for interfacing said [computer system device] with a second computer system device." Defendants contend that in the context of this claim, the interface is the signal lines that electrically connect the elements. Defendants also point to language in the Abstract, which, states that "[t]he interface includes a clock signal, a bus, an address latch enable signal, peripheral device ready signal, a command signal, a device selected back-off signal, and a reset signal." Defendants further contend that the detailed description calls for a set of distinct signal lines. '807, 4:57-5:9; '1414:61-5:13. Defendants argue that these examples support a construction that includes sets of distinct signal lines.

The term "bus" means "a set of signal lines" and throughout the claims, the term "interface" refers to a bus and, in addition, distinct signal lines. Claim 11 of the '141 patent states that the "interface" comprises "an address-data bus." Claim 16, which depends from claim 11, as well as claim 8 of the '807 patent refer to an "interface" comprising or further comprising "a bus" and other signal lines. 12 OPTi attempts to read "circuitry" into the construction, but this limitation is not supported in the claims or the specification. All circuitry, other than the interface signal lines themselves, is in the devices, not the interface. '807 Claim 1 ("method of interfacing a host system with a peripheral device..."); Claim 8 ("interface structure for interfacing a host platform with a peripheral device..."); '141 Claim 18 ("method of interfacing a host system with a peripheral device..."); Claim 11 ("interface for interfacing said device with a second computer system device..."). The specification discloses that the host platform interface circuitry is coupled to the interface, not a part of the interface. '807, 7:14-17; '141, 7:17-21. Further, claim 11 only claims that the interface "carries" multiplexed information. The claim itself does not require the interface itself to perform any multiplexing function. '141 patent, claim 11. Plaintiff, therefore, attempts to include limitations not found in the claims. Accordingly, the court construes the term "interface/an interface for interfacing" to mean "a bus for communicating between the host and peripheral devices."
12 Claim 11 of the '141 patent states that the "interface" comprises "an address-data bus." Claim 16 states that the interface further comprises "a clock signal line; an ALE signal line; an IOCHRDY signal line; a device selected backoff signal line; and a CMD # signal line." (emphasis added). Claim 8 of the '807 patent refers to an "interface" comprising "a bus" and other signal lines (emphasis added).

c. "Interface"

Claims 1, 13, 18, 23, and 27 disclose an "interface," which is followed by varying limitations relating to the remotely controllable surgical devices, the conversion of command protocols, and the transformation of inputs into commands. See generally '539 Pat. cols.9-13.

KSEA proposes the following construction:

[The interface is] connected between the touchscreen controller and the first remotely controllable surgical device, for converting the controller command protocol to the first and second command protocols, and for transforming inputs received by the touchscreen into commands for controlling the first and second remotely controllable surgical devices.

(Proposed Constructions Chart 10.)

S&N offers as follows:

[The interface] converts the protocols used by the touchscreen controller into the protocols used by the remotely controlled devices and transforms inputs on the touchscreen into control commands for the devices, to allow remote control of the devices, even if the system was not originally designed to control those devices.

(Id.)

--- Footnotes ---

11 KSEA's opening brief proposes this construction as to Claims 1, 13, and 18, but its responsive brief additionally proposes this construction as to Claims 23 and 27.

--- End Footnotes ---

Following the Markman hearing, the Parties agreed that "interface" should be defined as a "device that enables communication." (Agreed-Upon Constructions Chart 3.) The Court adopts this construction of "interface."

Neither proposed construction appears to be appropriate, however, with regard to the claim language following "interface." KSEA's proposed construction essentially quotes Claims 1, 13, and 18. This is redundant as to those claims, and potentially inaccurate as to Claims 23, and 27. S&N contends that the "interface" allows remote control of devices even if the system was not originally designed to control those devices. This argument is based on language from the prosecution history and the specification suggesting that the system can accommodate surgical devices that were not originally designed to work with the system. S&N misreads this language to suggest instead that it is the system that was not originally designed to control those devices. S&N's reading is inconsistent with both the language itself and the premise underlying the system. Even the system's programmed ability to update its knowledge of new devices implies that the system was "originally designed" to be able to control such devices.

The Court construes "interface" as a "device that enables communication," and declines to further construe this aspect of Claims 1, 13, 18, 23, and 27 on the present record. The Parties may submit supplemental briefing on further construction of the terms within twenty-one (21) days of the entry of this Order.

GO BACK
XII. "[A] communications interface operative to transmit commodity bids and offers from at least one financial institution"; "a principal market maker computer coupled to the communications interface"

Plaintiffs provide the following proposed construction for the claim term "communications interface": "an apparatus directly connecting one or more financial institutions to the principal market maker computer for communication between the financial institutions and the principal market maker computer." (R. 82, Pls.' App., Ex. 1 at 8.) TRG asks the Court to construe the terms "financial institution" and "interface." (R. 85, Def.'s Mem. at 21.) The Court rejects Plaintiffs' proposed construction and partially accepts the proposals set forth by TRG.

Plaintiffs' proposed construction is unacceptable because it imports limitations to the claim terms. Specifically, they seek to impermissibly insert the word "directly" into the construction of the claim. In their brief, Plaintiffs fail to clearly point to any support in the record indicating that a person of ordinary skill in the art would have understood the term "communications interface" as requiring an apparatus providing a direct connection. To the extent that Plaintiffs' argument depends upon a figure showing financial institutions accessing a PMM computer directly via a modem, it fails as the patent figures cannot be used to import claim limitations. See, e.g., Playtex, 400 F.3d at 907 (finding that a district court's reliance on figures to limit claim to a preferred embodiment was improper).

TRG relies upon a financial dictionary in defining the term "financial institution." (R. 85, Def.'s Mem. at 21 (citing Barron's Dictionary of Finance and Investment Terms 186-87 (4th ed. 1995).) Because this proposed construction reflects the term's ordinary and customary meaning, the Court construes "financial institution" to mean an "institution that collects funds from the public to place in financial assets such as stocks, bonds, money market instruments, bank deposits, or loans." (Id.)

Given the technical context in which it is used, the Court finds TRG's use of a general purpose dictionary to construe the term "interface" is inappropriate. 23 In the absence of any intrinsic evidence establishing its ordinary meaning, the Court relies upon a technical dictionary and construes the term "interface" as follows: "an electronic device that enables one piece of gear to communicate with or control another." 24

--- Footnotes ---

23 TRG uses Merriam-Webster's Collegiate Dictionary and proposes that the term "interface" be construed to mean "the place at which independent and often unrelated systems meet and act on or communicate with each other." (R. 85, Def.'s Mem. at 21.)

--- End Footnotes ---
pointing out three figures where it asserts the interfaces are not necessarily planar:Figures 5 and 9 have interfaces with non-continuous, non-contiguous segments with curved edges, and Figure 6 has interfaces with non-continuous, non-contiguous edges. (PMTResp. Br. at 14 & n45).

2. Defendants' Interpretation

Defendants effectively assert that "interface" should be defined as "a common boundary where two surfaces touch." 21 (R. 120 at 19-20; R. 199 at 25 to R. 200 at 6). Defendants base their definition, in part, on their interpretation of language in claims 14 and 17 which describes a cross-section of the voltage sustaining layer parallel to the first and second interface. (R. 121 at 14-21; R. 201 at 3-12) (referencing Chen Patent, col. 8, In. 43-51; col. 9, In. 10 to col. 10, In. 2). Defendants argue that the terms "cross-section" and "parallel" taken together in their ordinary, 22 geometric meaning require a physical boundary between the contact layer and voltage sustaining layer. (R. 121 at 18 to 122 at 12; R. 201 at 3 to 202 at 22) (referencing Chen, col. 2, In. 1-4, 8). Further, defendants assert that the language in claim 3 describing interfaces as perpendicular to the plain of the dielectric layer are an even clearer indication that "interface" must be a structural term. (R. 291 at 20-25) (referencing Chen Patent, col. 6, In. 65-66). Finally, defendants contend that the Court should reject PMT's proposed definition of "contacting" because it is based on language in the patent where the term "contact" is used as a noun, as in metal contact, and has no reference to use in the patent of the verb "contacting." (R. 123 at 16-24; R. 205 at 1-20) (referencing, e.g., Chen Patent, col. 6, In. 25).

-- Footnotes --

21 The definition given is Infineon's exact proposed definition. ST's exact proposed definition is, "an internal surface forming a common boundary between adjacent semiconductor portions. (R. 199 at 25 to R. 200 at 1 and ST slide # 54).

22 ST urges the Court to examine the extrinsic evidence of a common dictionary to ascertain the meaning of "interface." ST proposes that the court examine WEBSTER'S COLLEGIATE DICTIONARY 610 (10th ed. 1996), wherein "interface" is defined as "a surface forming a common boundary of two bodies, spaces or phases." (R. 200 at 6-11). ST contends this is how a person of ordinary skill in the art would understand "interface." (R.200 at 4-6).

-- End Footnotes --

Infineon argues separately that, during prosecution, the examiner issued a § 112 rejection based on "contact" meaning "touching," and Chen acquiesced in this definition by responding to the objection without contesting the use of the term in that way. (R. 124 at 1-13).

ST separately contends that the Court should reject PMT's proposed definition as indefinite because it imposes no structural limitation on the term "interface," which it asserts must be construed in conjunction with "contacting." (R. 200 at 12-18; R. 202 at 14-17; R. 186 at 8-11). Finally, ST points out that every figure in the Chen Patent shows "interface" as a common boundary. (R. 201 at 25 to 202 at 5 and ST slide # 58).

3. Recommended Interpretation

The Special Master recommends that "interface" be defined as it would be by one of ordinary skill in the art of semiconductor technology as, "the common boundary between regions or layers in the device." Such boundary can ordinarily be mechanical, electrical, or functional. 23 However, the term is used throughout the claims to mean the common boundary between the "contact layer" and the "voltage sustaining layer." (See, e.g., Chen Patent, col. 7, In. 68 to col. 8, In. 5). Given the overall structure of the Chen MOS devices, these two layers will touch each other, see, e.g., Chen Patent, col. 5, In. 52-58 (describing the formation and relationship of the various elements), even if that boundary is perhaps elusive because it can only be ascertained by referencing the definitions of two other elements (i.e., the contact layer and the voltage sustaining layer) that are defined in terms of their function, rather than their structure. Nevertheless, in the Chen patent, this interface is necessarily physical because it is a junction between two semiconductor layers, the contact layer and the voltage sustaining layer.

-- Footnotes --
13. Telephone network interface

The parties dispute the meaning of the term "telephone network interface." Foundry contends that the ordinary meaning of the term "interface" is "a shared boundary." Lucent argues, however, that "telephone network interface" should be construed to mean "a physical connection for communicating with a telephone network." At issue is whether an "interface" requires a physical connection. The court construes "telephone network interface" to mean "a shared boundary between a telephone network and another system or device across which information is passed." See IEEE Standard Dictionary of Electrical and Electronics Terms (6th ed. 1997).

5. "Interface Engine"

Plustek asks the Court to construe this term as "an interface module located outside of the main case that houses the image sensing module and the motion mechanism."

Syscan argues it should be "a control circuit that receives system control signals and electrical power from the computing device and generates logical control signals for the image sensing module and motion mechanism and provides electrical power to the image sensing module and motion mechanism."

The interface engine and the control circuit are electronic components that control the operation of the image sensor and the illumination source as well as the motion mechanism. See e.g., Dang Decl., P 2, Ex. A ('124 Patent), Fig. 3, 6:32-34, ("interface engine 312 provides an interface between image sensing module 302 and computing device 314.") 11:9-13 (claim 5) ("the interface engine provides a power supply and control signals to the image sensing module and the motion mechanism to operate when the interface engine [is] coupled to the computing device."). Fig. 5, Therefore, the interface engine and the control circuit must be located outside of the main case. SciMed Life Systems, Inc., 242 F.3d at 1341; see also CCS Fitness, 288 F.3d at 1367.

The Court construes this claim as "an interface module located outside of the main case that houses the image sensing module and the motion mechanism."

2. "interface" Terms

* * *

All of the asserted claims contain limitations relating to "interfacing" the binary true random sequence of signals to a general purpose computer.

There are three central disputes regarding the construction of the above terms. First, the defendants argue that the "interfacing" phrases require "directly conveying . . . itself to the data bus." The defendants argue that such limitation conveys to the fact finder the idea that the claims describe conveying the same true random sequence referred to earlier in the claim to the data bus, not a physical connection. Quantum argues that it improperly implies that any connection must be
physically and directly to the data bus. Although the defendants state this is not intended by their construction, the court agrees with Quantum with respect to "directly." As argued by Quantum, the preferred embodiment does not include a direct connection to the computer's data bus. '364 Patent, col. 1, ll. 50-53; '242 Patent, col. 1, ll. 58-61. Nor does the term require that the same sequence be directly conveyed to the data bus. The imposition of the limitation, "directly" on every instance of interfacing would improperly limit the scope of the claim language.

Turning to the "data bus" limitation, the defendants cite to the specification and the prosecution history for support. As argued by the defendants, the heart of the present invention is providing a computer the ability to access and use binary true random sequences when applications or hardware require it. See '242 Patent, Background of the Invention. This is accomplished via the interface between the RNG and the computer. In order for the computer to utilize such sequences, they must be readily available, as on the "data bus." However, a "data bus" is not the only type of bus utilized by a computer to transfer data; for example, computers may also use various other types of buses. Thus, one of ordinary skill in the art in 2002 would understand that the sequence is conveyed to a bus in the computer for use by the computer. See '242 Patent, col. 20, ll. 1-3; col. 8, ll. 47-50; col. 24, ll. 57-58; see also Ex. 17 to Defs.' Claim Construction Brief at A-1 (stating, "[f]or example, every computer requires a bus that transmits data from one part of the computer to another").

The second disputed issue regards the defendants' imposition of "hardware and software" as a limitation to the phrases using interface as a noun. The claims and embodiments in the specification suggest that an interface may be software, firmware, or hardware. See '242 Patent, cl. 5 (stating, "an interface selected from the group consisting of a device driver, a portion of the operating system of said general-purpose computer, a portion of a Windows TM operating system, a program stored in the bios memory of said general-purpose computer, a program in firmware, and a TSR program."); col. 20, ll. 24-28; col. 20, l. 3 (describing a connection using a parallel port connecting cable); col. 24, ll. 23-33; col. 24, ll. 55-58 (describing a connection using "connector 510").

Finally, the parties dispute the inclusion of a use limitation. The court cannot find sufficient support in either the claims or the specification to warrant requiring a particular use for the true random binary sequences. Notwithstanding the lack of support, the term suggested, "user program," is undefined and ambiguous. While "user programs" may supply the majority of the demand for the sequences, there is no such support for requiring such limitation in the context of the intrinsic evidence.

The court defines "interfacing said binary true random sequence of signals to a general purpose personal computer" and "interfacing said binary true random sequence of signals to a computer" as follows: "directly or indirectly conveying the binary true random sequence of signals to a bus in a general purpose computer."

The court defines "interface for applying said binary true random sequence of signals to said general-purpose computer" and "true random number generator circuit interface" as follows: "software, firmware, and/or hardware to directly or indirectly convey the binary true random sequence of signals to a bus in a general purpose personal computer."

Interface is "the point at which a connection is made between two elements so that they can work with each other." MICROSOFT COMPUTER DICTIONARY 257. "Menu" is "[a] list of options from which a user can make a selection in order to perform a desired action . . . ." Id. at 303. Both parties seem to agree that "interface in the form of a plurality of menus" includes a computer screen with windows and dialog boxes which contain menus. Rockwell adds "icons, pictures or symbols" as part of menu. Apropos says, "menus" exclude "icons, pictures or symbols" and adds that the term includes "successive" menus presenting lists which enable the user to make successive selections and access dialog boxes to enter instructions. Apropos relies on the specification, which certainly does describe successive menus. The claim itself uses "plurality" which is, in this context, more than one, presumably. Concerning the scope of "menus," the court relies on the specification and illustrations which refer entirely to menus as lists containing words. See, e.g., Figs. 3 and following. Rockwell has pointed to no evidence that an icon is functionally the same thing as a menu. Therefore, the court defines "interface in the form of a plurality of menus" as a connection that provides a user with one or more screens with two or more menus (but not icons, pictures or symbols) to permit the user to make selections from the menus in order to enter
1. "Interface means" in claims 1 and 7

We agree with the district court's ruling, unchallenged by the parties, that the limitation "interface means for transferring a control program and control parameters from an external medium into said alterable memory and for recording the control parameter contents of said memory onto an external medium" in claims 1 and 7 is subject to § 112, P 6. 1 IMS asserts that the district court erred in its construction of the limitation by identifying the tape cassette transport as the relevant corresponding structure found in the specification. IMS further argues that, even if the tape cassette transport is the corresponding structure, the district court erred by concluding as a matter of law that the floppy disk drive in the accused Haas controls cannot be equivalent to the disclosed tape cassette transport.

1 That the term "means" is used in a limitation does not necessarily mean that the limitation is properly a § 112, P 6 limitation. See, e.g., York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1574, 40 U.S.P.Q.2d (BNA) 1619, 1623 (Fed. Cir. 1996).

The "interface means" limitation recites two functions, i.e., "recording" a control program and control parameters from an alterable memory onto an external medium, and "transferring" a control program and control parameters from the external medium into alterable memory. IMS contends that the corresponding structure in the specification, disclosed in the written description, is a tape cassette peripheral interface adapter ("PIA") because that is the only structure that performs the "transferring" function. In making its argument, however, IMS virtually ignores the "recording" function and misapplies the meaning of "transferring" in the context of the claim.

The claimed interface means records data from the alterable memory to an external medium and transfers data from the external medium to the alterable memory. The external medium disclosed in the written description is a tape cassette, and the alterable memory disclosed is a RAM. Thus, the structure corresponding to the "recording" and "transferring" functions must record data residing in the RAM onto the tape cassette and transfer data from the tape cassette to the RAM. IMS correctly states that the written description associates the PIA with these functions: "PIA 77 provides the interfacing [sic] with a tape cassette which is utilized to load RAM 36. Also, a subsequently inserted cassette may be utilized to record stored RAM program data through PIA 77." 754 patent, col. 4, ll. 46-48. The written description, however, also associates a tape cassette transport with the functions of transferring data from the tape cassette to the RAM and recording data from the RAM onto the tape cassette: "A tape cassette transport apparatus is shown generally at 225 for receiving a magnetic tape cassette operable to read or write data to or from the RAM memory. With mode switch 203 in the tape auto mode, the data block entries may be recorded onto a tape cassette." 754 patent, col. 6, ll. 49-52. In view of both of these passages, it is apparent that both the PIA and the tape cassette transport are necessary for transferring data from the tape cassette to the RAM and recording data from the RAM onto the tape cassette.

IMS argues that the "transferring" function is only an "interfacing" function between the RAM and the tape cassette transport. But the claims require the interface means to transfer data to the RAM from an external medium, i.e., a tape cassette, not just from the tape cassette transport. The disclosed PIA performs only part of the "transferring" function, i.e., transferring from the tape cassette transport to the RAM. The tape cassette transport itself transfers data from the tape cassette to the PIA, and therefore both the PIA and the tape cassette transport are part of the disclosed structure corresponding to the "transferring" function of the interface means.

Similarly, the interface means must record data from the RAM onto the tape cassette. The tape cassette transport receives data from the RAM via the PIA and completes the recording function by recording data onto the tape cassette. The PIA and the tape cassette transport together perform this function and thus are both part of the disclosed structure corresponding to the claimed interface means.
IMS also argues that, under the doctrine of claim differentiation, the interface means cannot be limited to a means for "reading" and "writing" because claim 2, which depends from claim 1, places that additional limitation on the interface means: "said interface means includes means for reading from and writing onto a magnetic stored information input." IMS further argues that the "interface means" cannot be limited to a tape cassette transport because claim 3, which depends from claim 2, specifically claims a tape cassette transport as the means for reading and writing.

We reject IMS's argument that the doctrine of claim differentiation requires that the corresponding structure of the interface means of claim 1 be limited to the disclosed PIA. The scope of claim 3 is clearly narrower than that of claim 1 because claim 3 covers only a tape cassette transport, whereas claim 1 covers a tape cassette transport and its equivalents in accordance with § 112, P 6. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538, 19 U.S.P.Q.2D (BNA) 1367, 1371 (Fed. Cir. 1991) (holding that claim differentiation is maintained when the disclosed structure corresponding to an independent § 112, P 6 claim is recited in a dependent claim). The scope of claim 2 is also narrower than that of claim 1, at least because it limits the external medium to a magnetic stored information input.

Furthermore, the proper claim construction does not give the same meaning to "recording" in claim 1 and to "writing" in claim 2 as IMS contends. Rather, the "reading" and "writing" functions in claim 2 are the parts of the "transferring" and "recording" functions of the "interface means" that are performed by the disclosed tape cassette transport, rather than the PIA. In any event, it is permissible for claim 1 and claim 2 to have similar scope after each is correctly construed in light of the structures disclosed in the written description, because the judicially-created doctrine of claim differentiation cannot override the statutory mandate of § 112, P 6. See id. (noting that claim differentiation is a guide, not a rigid rule).

In sum, we conclude that the proper construction of the "interface means" limitation covers the disclosed structure, which includes the PIA and tape cassette transport, and its equivalents in accordance with § 112, P 6. IMS argues alternatively that, even under this claim construction, the district court erred by finding that, as a matter of law, Haas's floppy disk drive could not be an equivalent to the disclosed tape cassette transport. We shall address this issue infra in connection with our infringement analysis.

2299

ii. Communications Interface Means

The first question is whether or not the claim element "communications interface means" is a means-plus-function element. Multi-Tech argues § 112, P 6 does not apply because the term "interface" denotes structure. The claimed function for this element is to connect the personal computer to the communications module for transferring data. The claim recites the communications interface as the structure accomplishing this connection. An "interface" is the point at which a connection is made between two elements so that they can work with one another. Lewis Decl. Ex. 6 (Microsoft Press Computer Dictionary 192 (1991)). "In hardware, interfaces are cards, plugs, and other devices that connect pieces of hardware with the computer so that information can be moved from place to place." Id.

Microsoft 5 argues that the term "interface," standing alone, is not a sufficiently definite structure to overcome the presumption that § 112, P 6 applies, relying on IMS Tech., Inc. v. Haas Automation, Inc., 206 F.3d 1422, 1430 (Fed. Cir. 2000) (holding that the claim element "interface means for transferring . . . and for recording . . ." was subject to the § 112, P 6 presumption). However, unlike IMS, Multi-Tech directly challenges the means-plus-function status of the claim, and, furthermore, the term "interface" does not stand alone, but is modified. The term "communications interface" identifies a structure sufficient to perform the claimed function. This claim element is not a means-plus-function element requiring interpretation under § 112, P 6; it will be construed under the ordinary rules of claim construction.

5 For purposes of brevity, it is understood that Net2Phone joins Microsoft in its arguments regarding claim construction in this case. Net2Phone Br. at 1.

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -
i. Telephone Line Interface Means

The parties dispute whether this claim element is in means-plus-function format. As above, the reference to "telephone line interface" is a specific reference to a type of interface, namely a "telephone line" interface, that identifies a structure sufficient to perform the claimed function of connecting the invention to a telephone line. Therefore, this claim element is not a means-plus-function element requiring interpretation under § 112, P 6, and will be construed under the ordinary rules for claim construction.

"As a general rule, all terms in a patent claim are to be given their plain, ordinary and accustomed meaning to one of ordinary skill in the relevant art." Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001). A "telephone line" means a standard telephone line, or a POTS (plain old telephone service) line. The specification supports this construction. "Hardware components 20 communicate over a standard telephone line 30 to one of a variety of remote sites. . . . Those skilled in the art will readily recognize the wide variety of communication interconnections possible with the present system by reading and understanding the following detailed description." '289, col. 5: 62-col. 6:11. The telephone line interface means is a physical interface for connecting to a telephone line. "The telephone line interface circuit 309 seizes the telephone line to make the telephone connection." '289, col. 10: 16-18. This distinguishes the telephone line interface from the telephone line itself. Claim 1 indicates that the interface is an element that comprises the "communications module," and therefore must be a part of the module. The specification explains that the invention's functions are "all implemented in the hardware components of FIG. 3." '289, col. 9: 21-23. "A telephone connection is established through the telephone line interface circuit 309 and communication is enabled." Id. at col. 9: 37-39.

Microsoft argues that because incoming information is "received through the telephone line interface circuit 309 and passed to the main controller circuit 313 via data pump DSP circuit 311," the telephone line interface means cannot be a telephone jack alone. Id. at col. 13: 29-32. Microsoft suggests the interface means must be both "a data pump modem and a jack." Microsoft Br. at 32 (emphasis in original). Multi-Tech argues that the telephone line interface circuit 309 is "distinctly separate" from the data pump circuit 311. Multi-Tech Reply Br. at 21. The claim language identifies a "telephone line interface means," which is shown in the specification in Figure 3 to be separate from the data pump DSP circuit 311. '289 FIG. 3. While the data pump modem may work in conjunction with the telephone line interface, the interface itself is distinct from the modem.

i. Telephone Voice Interface Means

The parties also dispute whether this claim element is in means-plus-function format. As explained above, the reference to "telephone voice interface" identifies a structure sufficient to perform the claimed function of receiving local voice signals and conveying remote voice signals. Therefore, this claim element is not a means-plus-function element requiring interpretation under § 112, P 6, and is instead construed under the ordinary rules for claim construction. Claim 1 of the '470 Patent and claim 1 of the '532 Patent require a "voice interface means" that is substantially similar, therefore construction of that element in those Patents should comport with the following analysis.

Like the telephone line interface means, the telephone voice interface means is described in the claim as an element comprising the communications module. It is separate from the computer. Microsoft argues that this preempts the voice interface means from being a speaker and microphone plugged directly into the personal computer, because such an interface is not disclosed in the patent. However, because § 112, P 6 does not apply to this claim element, the type of interface is not limited only to the corresponding structures disclosed in the specification.

The specification identifies that the telephone voice interface means may include a "telephone handset 301, a telephone headset 302, and a hands-free microphone 303 and speaker 304." '289, col. 8: 19-21. The specification makes clear that
these alternatives relate to the preferred embodiment, thus other alternatives are not excluded by the specification language. However, the specification states that any of the listed telephone interfaces "connect to the digital telephone coder-decoder (CODEC) circuit 305," which is an internal component of the communications module. Id. col. 8: 21-24; id. FIG. 3. Likewise, on the receiving end, the CODEC enables the handset, microphone and speaker operation, and "transmits to" the telephone interface directly. Id. at col. 9: 34-37, 51-55. Reading the claim in light of the specification, the telephone voice interface means is not meant to be connected directly to the personal computer, which is instead connected to the serial interface circuit 315. Id. at col. 8: 65-66.

Multi-Tech argues that the claim also covers a microphone and speaker plugged directly into a personal computer, because the claim language does not state any requirement identifying into where the telephone voice interface means must be plugged. However, the claim itself does list the telephone voice interface means as a component part of the communications module. '289, claim 1.

Verizon alleges that "interface switching structures" in claim 21 of the 551 patent is subject to means-plus-function analysis under 35 U.S.C. § 112, P 6. Katz disagrees, reasoning that "interface switching structure" connotes sufficiently definite structure to one of ordinary skill in the art. See Lucantoni 1/15/03 Decl. P 25. Rather, "interface switching structure," Katz contends, means "a device including hardware and associated software that can connect the Katz system to the telephone facility such that information from the telephone facility and remote terminals may be provided to and received by the Katz system, and that can switch or route telephone calls or signals from one location or connection to another." Katz Brief at 81.

The absence of the word "means" shapes the remainder of the analysis, invoking a presumption that "interface switching structure" should not be construed as a means-plus-function element. Mas-Hamilton, 56 F.3d at 1213. The Federal Circuit nevertheless requires an inquiry as to whether the claim language recites sufficiently definite structure or a merely "function to be performed." Id.; CCS Fitness, 288 F.3d at 1369. In addition, recent Federal Circuit case law clarifies that Verizon has the initial burden to come forward with evidence to rebut the presumption. See Apex, supra, 325 F.3d at 1372. Accordingly, Verizon must show that "the limitation, as understood by one of ordinary skill in the art, demonstrates that the claim term fails to recite sufficiently definite structure or else recites a function without reciting sufficient structure for performing that function." Apex, 325 F.3d at 1373.

Verizon alleges that, while the terms "interface structure" or "switching structure" may connote sufficiently definite structure, the term "interface switching structure" has no generally understood meaning in the art and, thus, fails to connote sufficiently definite structure. Verizon Suppl. Brief at 2; Waite 1/14/03 Decl. P 43. Verizon further alleges that the term "interface switching structure" fails to recite sufficient structure for performing the recited function of "receiving called terminal digital data (DNIS) signals automatically provided by the telephone facility to identify the select operating format." See Verizon Brief at 81; Verizon Suppl. Brief at 3; Waite 1/14/03 Decl. PP 35, 43. Verizon also alleges that interpreting the "interface switching means" as a means-plus-function element is consistent with the 551 patent specification, which does not specifically disclose an "interface switch" or the function of interface switching. See Verizon Brief at 82. Furthermore, the structures that most closely correspond to "interface switching," according to Verizon, are two separate structures—namely, interface 20 and switch 21. See also Verizon Suppl. Brief at 3.

The parties have cited a number of technical references defining the terms "interface," "switching" and "switch" to aid the Court's analysis of "interface switching structure." See, e.g., Rooklidge 5/12/03 Decl. Ex. 1; Lucantoni 5/12/03 Decl. Exs. A & B. The 551 patent appears to use the term "switch" and "switching" in a manner consistent with its ordinary meaning in the art. See, e.g., Rooklidge 5/12/03 Decl. Ex. 1 (SWITCH: A mechanical, electrical or electronic device which opens or closes circuits, completes or breaks an electrical path, or selects paths or circuits.). In addition, based on these definitions the term "switching structure," standing alone, appears to have a well understood meaning in the art as a name for structure and therefore connotes "sufficiently definite structure" to avoid application of 35 U.S.C. § 112, P 6. In addition, it appears that the 551 patent uses the term "interface" in a manner consistent with its ordinary meaning. See Lucantoni 5/12/03 Decl. Ex. B ("interface" means "2. A shared boundary between two functional units defined by specific attributes, such as functional characteristics, common physical interconnection characteristics, and signal characteristics. 3. A point of

- 2656 -
communication between two or more processes, persons, or other physical entities."); see also Rooklidge 5/12/03 Decl. Ex. 1 ("INTERFACE: 1. A mechanical or electrical link connecting two or more pieces of equipment together.").

As both parties appear to agree, the term "switching structure" enjoys a well understood meaning as a name for structure to one of ordinary skill in the art. See Lucantoni 5/12/03 Decl. P 3, Ex. A. In addition, "interface," as a qualifying term, does not affect the sufficiency of the recited structure, but "further narrows the scope of those structures covered by the claim and makes them more definite," requiring that the interface switching structure provide a point of communication between the Katz system and the remote terminals connected to the communication facility. Apex, 325 F.3d at 1374. In addition, it appears that the term "interface switching structure" connotes sufficient structure to perform the function of receiving DNIS signals to select an operating format. See Lucantoni 5/12/03 Decl. P 8. In the absence of more compelling evidence, the presumption that "interface switching structure" is not a means-plus-function element stands. Apex, 325 F.3d at 1373; see also CCS Fitness, 288 F.3d at 1370 ("a term need not connote a precise physical structure in order to avoid the ambit of that provision."); See also Rodime, supra, 174 F.3d at 1304; Altiris, 318 F.3d at 1376. Accordingly, "interface switching structure" means a device including hardware and associated software that can connect the Katz system to the telephone facility such that information from the telephone facility and remote terminals may be provided to and received by the Katz system, and that can switch or route telephone calls or signals from one location or connection to another.

i. Definition of "Interactive Review"

As discussed below, I construe "interactive review" as used in claim 11 to mean "review by a human of the results from an initial classification." TriPath defines the term as "subsequent human examination of selected objects within a specimen via interaction with a machine, such as by a series of human commands and associated machine responses." Docket No. 218 at 2. Cytyc proposes no definition, but it insists that the term does not incorporate human classification of a specimen. That question was resolved, it claims, by the Markman Order, which excluded human review from the definition of "classifying the specimen."

A fully-automated system cannot infringe the asserted claims of the Rutenberg '377 patent. For clarity, I should briefly rehearse the conclusions of the Markman order. Although I did not explicitly state it then, I construe claims 11 and 16 to patent a method that must include some further human classification of the specimen. See claims 11(b)(ii); 16(b)(ii) ("further classification by a human"). Nonetheless, I concluded in the Markman hearing that a machine, rather than a human, might perform the final classification in the technology that the '377 patent claims. That conclusion is consistent with the fact that claims 11 and 16 contemplate at least some -- not necessarily final -- human classification.

With this in mind, I will construe "interactive review" as stated in the '377 patent as "review by a human of the results from an initial classification." The word "interactive" in common usage suggests influence or reciprocity between two different entities. See Webster's Third New International Dictionary (1986). Given the language in the claim stating that the method provides for "interactive review . . . including identifying objects . . . for further classification by a human," at least one of the interacting entities should be a human. 24
24 Counsel for TriPath asserted during the summary judgment hearing that "to prove infringement of the claim, you do not have to prove human use." See Tr. at 134 (LaPorte statement). I interpret this statement to mean not that a fully-automated system can infringe claims 11 and 16, but instead that TriPath need prove only that the infringing technology prepare the specimen for some further human classification.

The term "review" denotes an examination. Technically, a review is the examination of something that has already been examined in one form or another. The common usage of the term may sometimes be broader; some portion of the population will often use the term "review" to denote an initial examination. In the context of this claim, however, there is no dispute that the interactive review occurs subsequent to an initial examination by a machine. Thus, I adopt a modified version of TriPath's proposed definition for "interactive review": examination by a human of the results of an initial examination.

Contrary to Cytyc's argument, the definition of "interactive review" is not limited by the claimed steps of claims 11 and 16. Claims 11 and 16 describe methods (including classifying the specimen) that merely "provide" for further interactive review. Claim 11 reads, "A method for providing interactive review of objects in a specimen indicative of the highest likelihood of abnormality. . . comprising . . . obtaining the specimen" and "classifying the specimen." Thus, the definition of "classifying the specimen," which here is only a method of preparing a slide for interactive review, is not relevant to the definition of "interactive review."

ii. "Interactive Review" as Limiting Claim 11

I also construe the term "interactive review," which occurs in the preamble of claim 11, as claim-limiting. A preamble "limits the invention if it recites essential structure or steps, or if it is 'necessary to give life, meaning, and vitality' to the claim." Catalina Marketing Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002) (quoting Pitney Bowes, Inc. v. Hewlett Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999)). "Conversely, a preamble is not limiting 'where a patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use of the invention.'" Id. (quoting Rowe v. Dror, 112 F.3d 473, 478 (Fed. Cir. 1997)).

I concur with Cytyc that "interactive review" is an introductory descriptive term that does not add meaning to the body of claim 11. As stated above, the claimed method only prepares the specimen for interactive review. Ordinarily, where the preamble describes the purpose of the method, as it does here, it is not considered limiting. See Catalina Marketing, 289 F.3d at 809.

There is, however, an exception to the life-and-vitality test when the applicant has explicitly relied upon a feature in the preamble during prosecution to distinguish it from prior art. Id. at 808 ("[C]lear reliance on the preamble during prosecution to distinguish the claimed invention from the prior art transforms the preamble into a claim limitation because such reliance indicates use of the preamble to define, in part, the claimed invention."). TriPath argues that the exception applies here, and I agree.

The evidence shows that the patentee attempted to distinguish his invention from fully automated systems during the prosecution process. See Amendment at 8 (March 14, 1994) (Daniel Decl. Ex. 13, Tab 30). The premise of the '377 invention, as explained by the applicant, is that humans are more adept than machines at visual recognition and classification. Id. at 6. The purpose of the method is not to analyze or categorize a specimen completely, but merely to save the cytotechnologist's time in the overall analysis. Id. Because the claim contemplates some manual review, the applicant described his invention as "semi-automated," specifically making use of the term "interactive." Id. at 7. The applicant claimed that this "interactive" feature of his invention was contrary to the trend of prior art classifiers, which sought to remove the human factor from the classification process altogether. Id.

The applicant relied "clearly and unmistakably" upon the interactive nature of the invention to distinguish it over the prior art. See Catalina Marketing, 289 F.3d at 809. Thus, "interactive review" is a claim limitation, and it must be present in the Tanaka references in order to prove anticipation.
j. "interface ports for interprocessor communication"

The plaintiffs contend that no construction is necessary. Alternatively, if a construction is needed, then the plaintiffs propose "channels through which data can be transferred between two separate processing units." The defendants propose "channels through which data is transferred between two separate processing units." The dispute is whether the interface ports may be used for purposes other than to transfer data.

The defendants argue that the plaintiffs' construction would allow the interface ports to be used for any purpose and render the words "for interprocessor communication" meaningless. The plaintiffs contend that the specification describes interface ports for use other than interprocessor communication. See '148 patent, 9:64-10:12.

One of ordinary skill in the art would understand that interface ports are not limited solely to the transfer of data. The Court construes the term to mean "channels through which data is allowed to be transferred between two separate processing units."

a. "Interface Structure"

The first of these terms the parties wish the Court to construe is "interface structure." The claim limitations in which this term appears read "an interface structure coupled to said communication facility to interface said remote terminals for voice and digital communication." In some of the claims, the limitation goes on to provide that the interface structure includes "means to provide caller data signals representative of data relating to said individual callers developed by said remote terminals." Other claims contain limitations which further provide that the interface structure includes means "for receiving said calling number identification data." 9

--- Footnotes ---

7 The term "interface structure" appears in the following claims under consideration at the Markman hearing: Claim 51 of the '309 patent, Claims 33, 104, 117 and 192 of the '707 patent, and Claims 49, 50, 65, and 171 of the '863 patent.

8 Claims which include this or similar language are Claims 51 of the '309 patent, Claims 104 and 117 of the '707 patent, and Claims 49, 65, and 171 of the '863 patent.

9 Claims which include this or similar language are Claims 104, 117, and 192 of the '707 patent and Claims 49, 65, and 171 of the '863 patent.

--- End Footnotes ---

The dispute between the plaintiffs and the defendants centers around whether "interface structure" is subject to means-plus-function analysis under 35 U.S.C. § 112, P 6. The plaintiffs maintain that the term does not implicate 35 U.S.C. § 112, P 6 and should be construed to mean "a hardware device with associated software that establishes an interactive connection between a caller's telephone and a computer system." (Pls.' Brief at 50). The plaintiffs argue that under Personalized Media Communications, LLC v. International Trade Commission, 161 F.3d 696, 704-705 (Fed. Cir. 1998), a term that is defined in terms of its function or that does not bring to mind one well-defined structure is not necessarily subject to means-plus-function analysis. In Personalized Media, the Court of Appeals for the Federal Circuit held that the term "digital detector" was not subject to means-plus-function analysis because it conveyed to one of ordinary skill in the art "a variety of structures known as detectors." Id. at 705. The plaintiffs argue that the term "interface structure" is akin to "digital detector" in that it is a sufficient recitation of structure so as to avoid the application of means-plus-function analysis. The plaintiffs argue that a specific set of structures corresponding to "interface structure" was known to those of ordinary skill in the art at
the time of the prosecution of the Katz patents.

The defendants argue that the term "interface structure" is written in functional language, fails to sufficiently connote structure to those of ordinary skill in the art, and as such, it subject to analysis under 35 U.S.C. § 112, P 6. The defendants contend that Katz simply used the term "structure" instead of "means" to attempt to avoid the application of 35 U.S.C. § 112 P 6. The defendants maintain that "interface structure" is a generic term which does not inform a person of ordinary skill in the art what structure is being conveyed by the term.

Because the term "interface structure" is not drafted in "means for" form, the Court presumes that it is not subject to the requirements of 35 U.S.C. § 112 P 6. See Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213 (Fed. Cir. 1998). The critical factor in determining whether a term in a limitation which does not invoke "means for" language is subject to means-plus-function analysis despite the presumption to the contrary is whether the term brings to mind a set of structures to those of ordinary skill in the art, and not whether the term is written in functional language. See Personalized Media, 161 F.3d at 704-705. To determine whether this term would connote sufficient structure to those of ordinary skill in the art, this Court must refer to references in the computer telephony field contemporary with the prosecution of the Katz patents. See Greenberg, 91 F.3d at 1583 (consulting dictionaries to determine that the term "detent" denoted a device generally understood to those in the mechanical arts).

In an article in the AT&T Technical Journal regarding the Conversant 1 Voice System, 10 "trunk interface units" are described as connecting incoming trunks from a central office in the telephone network, and "line interface units" are described as initiating or receiving calls over ordinary telephone lines. (Ex. 366). In an 1985 article entitled "The AT&T Multi-Mode Voice Systems-Full Spectrum Solutions for Speech Processing Applications," the authors refer to "telephone interface units (either line or trunk circuits)" as being a component of a basic system for speech processing applications using the telephone network and centralized databases. (Ex. 358). Other references in the record indicate that "interface structure" connoted structure to those of ordinary skill in the art: Exhibit 355, an article regarding Periphonics Voicepac, describes a particular brand of device used as an interface; Exhibit 405, a 1986 article on the Conversant 1 Voice System, discusses the function of line and trunk interfaces; Exhibit 250, the 4,866,756 patent to Crane et al., incorporates a "telephone interface component" to transmit audio response signals; and Exhibit 235, the 4,797,911 patent to Szlam et al., incorporates "trunk interface units" into its customer account online servicing system.

10 The date of this article is unclear in the record, but there is some indication in the article that the manuscript was revised in 1986.

One technical dictionary cited by the plaintiffs was helpful in assisting the Court determine what "interface structure" meant to those in the art. In the Dictionary of Computing and New Information Technology by A.J. Meadows, et al. (1982), the term "interface" is defined as being "used as a general term to describe the connecting link between the two systems. Most frequently refers to the hardware and software required to couple together two processing elements in a computer system." (Ex. 481).

While the testimony of the experts at the Markman hearing is not as weighty as prior art and technical references in determining the state of the art at the time of the prosecution of the Katz patents, it is consistent with the above references in indicating that "interface structure" had meaning and brought to mind a set of structures to those in the field. See Morganstein Testimony, Transcript Volume 1 at 173, line 24 to 176, line 2 (testifying that the term "interface structure" would have had meaning to a person of ordinary skill in the art who had read the Katz patents and would have brought to mind a range of structures such a person could have used to build the Katz inventions); Larky Testimony, Transcript Volume 3 at 64 lines 12-15 (testifying that he recognized that the term "interface structure" referred to "some physical structure" but not a specific structure).

Based on the above references and expert testimony, the Court concludes that although the term "interface structure" is written in functional language, the limitation sufficiently connotes structure such that 35 U.S.C. § 112, P 6 does not apply. That is, I conclude that, based on the cited prior art, references, and testimony of the experts at the Markman hearing, the
term "interface structure" would have called to mind a specific set of structures to a person of ordinary skill in the art such that such a person would be able to build the Katz inventions.

Having concluded that the term "interface structure" is not subject to 35 U.S.C. § 112, ¶ 6, the Court must construe the meaning of the term according to the regular rules for claim construction. The meaning of "interface structure" to those of ordinary skill in the art at the time has been discussed above. In addition, in Column 4, line 52 to Column 5 line 15 of the '707 patent, Katz discusses the function and components of the interface structure and states that "the interface 20 incorporates modems, tone decoders, switching mechanisms, DNIS and ANI capability (call data analyzer 20a) along with voice interface capability" and that the "interface 20 provides the connection of the first lines to a switch 21 which are in turn coupled to first function units, or processors PR1 to PRn." This description of the interface in the specification is consistent with the ordinary meaning of the term "interface structure" to those of skill in the art. Based on the foregoing, I construe the term "interface structure" in the Katz patents to mean "the hardware and software required to connect the processors upon which the Katz system is running to the communication facility such that information from the communication facility and the remote terminals may be provided to and received by the Katz system." For the claims listed in footnote 8, supra, the Court construes the term "interface structure" to also include the means to perform the specific function of providing caller data signals representative of data developed at the remote terminals. For the claims listed in footnote 9, supra, the Court construes the term "interface structure" to also include the means to perform the specific function of receiving calling number identification data.

2306

9. Interface/Interface Switch: A device or system, which includes a processor, that transmits electronic mail messages to a wireless system for delivery to a mobile processor.

2307

B. "First interface to the computer system"

Claim 1 of the '025 patent states in part: "A computer system for creating and publishing customized electronic advertisements, for a seller, to internet media venues owned or controlled by other than the seller, comprising: a first interface to the computer system through which each of the internet media venues is prompted to input presentation rules for the internet media venue for displaying electronic advertisements on the internet media venue." (emphasis added). FM contends that "first interface to the computer system" means "software that enables the internet media venue user to interact with the computer system." In contrast, Google argues that this term means "software or hardware at the internet media venue location that enables a person working on behalf of the internet media venue to interact with the computer system." The primary differences between FM's and Google's proposed definitions are the location of the interface and the inclusion of hardware.

Google's proposal requires the first interface to be physically located at the internet media venue location. Google points to several passages in the specification that describe the internet media venues installing software on their local computers to implement the first interface. [See, e.g., '025 Patent, 54:63-67 ("[The entity operating the invention] sends [the internet media venue] the necessary software to be installed on their computer. A computer operator at [the internet media venue] installs the software on their computer that is then configured as Media Interface ["])]. These specification passages cited by Google refer to the preferred embodiment of the invention. Claims should not be limited to the scope of the preferred embodiments of an invention. Phillips, 415 F.3d at 1323. Unlike the specification's description of the preferred embodiment, the plain language of the claim does not require that the interface be physically located at any particular computer. Thus, the court will not impose a location requirement.

Google also contends that the interface consists of "software or hardware." Although the specification includes text and figures describing the interface as having both software and hardware, [see, e.g., '025 Patent, Fig. 2e & 31:48-57], the court agrees with FM that the invention is a software invention, and the hardware illustrates the intended operating environment for the software. Because the intrinsic evidence does not clearly specify whether the claimed interface must contain
hardware, reference to extrinsic evidence is helpful. Computer dictionaries published around the time the first FM patent was filed define "interface" as including software only. See Microsoft Press, Microsoft Computer Dictionary 241 (4th ed. 1999) (defining "interface" as "software that enables a program to work with the user . . . , with another program . . . , or with the computer's hardware"). This extrinsic evidence thus indicates that persons of ordinary skill in the art would not regard the term "interface" as requiring hardware. When read as a whole, the patent discloses a software invention. Although hardware is necessarily required to operate the software, there is no indication that the inventors intended to claim hardware. Therefore, the court construes this claim to mean "software that enables the internet media venue user to interact with the computer system."

C. "Second interface to the computer system"

Claim 1 of the '025 patent states in part: "A computer system for creating and publishing customized electronic advertisements, for a seller, to internet media venues owned or controlled by other than the seller, comprising: . . . a second interface to the computer system through which a seller is prompted to input information to select one or more of the internet media venues and prompted to input information to create an electronic advertisement for publication to the selected internet media venues." (emphasis added). FM contends that "second interface to the computer system" means "software that enables the seller user to interact with the computer system through which the seller user is prompted to enter information to select one or more internet media venues." In contrast, Google argues that this term means "software or hardware at the seller location through which the seller is prompted to enter information to the computer system to enable the seller to select one or more internet media venues."

The arguments regarding the location and hardware requirements for the first interface, discussed in Section B, apply with equal force to this second term. In addition, Google contends that prosecution history estoppel requires this second interface to be at the seller's location. Google quotes a portion of the patentee's response to a claim rejection: "What is not common in the art are open-access presentations that are created and published from data input into a remote program at a Sellers [sic] location." [025 Prosecution History, Amend. dated Jan. 10, 2000, at 10] (emphasis added). The next sentence, however, distinguishes the claimed invention from the prior art based upon the lack of a code editor, not through location: "The creation of multiple open-access presentations being done without the Seller making the changes within a code editor is new to the art . . . ." Id. (emphasis added). This prosecution history does not show a clear disavowal of all locations other than the seller's location. See Cordis Corp. v. Boston Scientific Corp., 561 F.3d 1319, 1329 (Fed. Cir. 2009) ("A disclaimer must be 'clear and unmistakable,' and unclear prosecution history cannot be used to limit claims.").

Google also contends that the claim language requires the seller to select particular Internet websites as media venues. Google relies heavily on statements made during prosecution, particularly in the re-examination proceedings. The court rejects this construction. Claim 1 requires the seller "to input information to select one or more of the internet media venues." By contrast, claim 24 requires "the computer system of claim 20, wherein the selection information includes identification of individual internet media venues." And claim 20 requires that "the selection information input by the seller targets one or more internet media venues." (emphasis added). These dependent claims require the seller to input information more specific than what claim 1 requires. The statements in the re-examination, particularly those related to the Aaddzz reference, indicate that the seller had no ability to select the internet media venues. For example, the patentee argues, "Aaddzz will figure out the best pages, not just sites, for your ad. Aaddzz will use ad performance data . . . to statistically determine the best pages." [045 Re-exam Response, dated Dec. 23, 2008, at 28 (quoting Aaddzz Highlights reference)]. The court has also reviewed the patentee's statements concerning the Mason and Brown references. These statements do not amount to a disavowal of claim scope to the extent that Google's limitation is appropriate.

As such, the court defines the term "second interface" to mean "software that enables the seller user to interact with the computer system through which the seller user is prompted to enter information to select one or more internet media venues."
F. "interfacing"

The Patents state, "a first connecting device for interfacing the host device with the interface device via the multi-purpose interface of the host device; and a second connecting device for interfacing the interface device with the data transmit/receive device . . . ." '399 Patent, col.12:51-55; '449 Patent, col. 11:54-58. Papst suggests that "interfacing" refers to "establishing communication with the computer," i.e., electronic data communication and not physical connection. Papst's App. at 3; see also Tr. 1:158-59 (Papst). The Camera Manufacturers insist that "interfacing" means "physically connecting." CMs' Slides at 69.

Papst proposes the better construction. "Interfacing" means establishing communication or enabling communication between two devices. Figure 2, the preferred embodiment of the invention, shows a 10MB/s SCSI interface chip. See '399 Patent, Sheet 2; '449 Patent, Sheet 2. The chip does the work of interfacing with the host computer, while the 50-pin connector to which it is attached does the job of connecting. 14

14 See discussion of the term "connecting device" below.

The Camera Manufacturers object to Papst's proposed construction by pointing out that "interfacing" is what the first and second connecting devices do, while communicating is what the command interpreters do. The Court does not disagree. But the Court does not interpret "interfacing" as communicating. "Interfacing" means making communication possible. "[I]nterfacing isn't really about the physical connections, it's about establishing the communication and in getting information across the boundary." Tr. 1:166 (Papst). Interfacing "is getting the right electrical signals in the right order with the right voltages with the right timing." Tr. 2:13 (Papst). Accordingly, the Court construes "interfacing" as used in the Patent Claims as meaning "establishing communication with."

2. "interface" Terms

All of the asserted claims contain limitations relating to "interfacing" the binary true random sequence of signals to a general purpose computer.

There are three central disputes regarding the construction of the above terms. First, the defendants argue that the "interfacing" phrases require "directly conveying . . . itself to the data bus." The defendants argue that such limitation conveys to the fact finder the idea that the claims describe conveying the same true random sequence referred to earlier in the claim to the data bus, not a physical connection. Quantum argues that it improperly implies that any connection must be physically and directly to the data bus. The imposition of the limitation, "directly" on every instance of interfacing would improperly limit the scope of the claim language.

Turning to the "data bus" limitation, the defendants cite to the specification and the prosecution history for support. As argued by the defendants, the heart of the present invention is providing a computer the ability to access and use binary true random sequences when applications or hardware require it. See '242 Patent, Background of the Invention. This is
accomplished via the interface between the RNG and the computer. In order for the computer to utilize such sequences, they
must be readily available, as on the "data bus." However, a "data bus" is not the only type of bus utilized by a computer to
transfer data; for example, computers may also use various other types of buses. Thus, one of ordinary skill in the art in
2002 would understand that the sequence is conveyed to a bus in the computer for use by the computer. See '242 Patent, col.
20, ll. 1-3; col. 8, ll. 47-50; col. 24, ll. 57-58; see also Ex. 17 to Defs.' Claim Construction Brief at A-1 (stating, "[f]or
every example, every computer requires a bus that transmits data from one part of the computer to another").

The second disputed issue regards the defendants' imposition of "hardware and software" as a limitation to the phrases using
interface as a noun. The claims and embodiments in the specification suggest that an interface may be software, firmware,
or hardware. See '242 Patent, cl. 5 (stating, "an interface selected from the group consisting of a device driver, a portion of
the operating system of said general-purpose computer, a portion of a Windows TM operating system, a program stored in
the bios memory of said general-purpose computer, a program in firmware, and a TSR program."); col. 20, ll. 24-28; col. 20,
l. 3 (describing a connection using a parallel port connecting cable); col. 24, ll. 23-33; col. 24, ll. 55-58 (describing a
connection using "connector 510").

Finally, the parties dispute the inclusion of a use limitation. The court cannot find sufficient support in either the claims or
the specification to warrant requiring a particular use for the true random binary sequences. Notwithstanding the lack of
support, the term suggested, "user program," is undefined and ambiguous. While "user programs" may supply the majority
of the demand for the sequences, there is no such support for requiring such limitation in the context of the intrinsic
evidence.

The court defines "interfacing said binary true random sequence of signals to a general purpose personal computer" and
"interfacing said binary true random sequence of signals to a computer" as follows: "directly or indirectly conveying the
binary true random sequence of signals to a bus in a general purpose computer."

The court defines "interface for applying said binary true random sequence of signals to said general-purpose computer" and
"true random number generator circuit interface" as follows: "software, firmware, and/or hardware to directly or indirectly
convey the binary true random sequence of signals to a bus in a general purpose personal computer."

2. "first inter-layer insulating film" and "second inter-layer insulating film"

Because the underlying issues for these two terms are interrelated, the court construes them together. The principal dispute
between the parties is whether these two "inter-layers" are parts of the same "insulating film" at issue in the previously-
construed term. Toshiba argues, based on the claim language, "[b]ecause the bit line contact hole is made in the 'insulating
film covering the surface of said substrate on which the MOSFET is formed,' and because that same bit line contact hole
consists of first and second contact holes that are made in first and second inter-layer insulating films, the 'insulating film
covering the surface of said substrate on which the MOSFET is formed' must be comprised of the first and second inter-
layer insulating films." Toshiba Br at 7. Accordingly, Toshiba proposes that "first inter-layer insulating film" should be
construed as "that portion of the insulating film which covers a portion of the surface of a substrate on which the MOSFET
is formed" and that "second inter-layer insulating film" should receive the same construction with the word "that" replaced
by "another." Jt Cl Const, Ex A at 13, 16.

Toshiba's proposed constructions, however, do not follow inexorably from the claim language. Merely because the claim
recites "the bit line contact hole [is] made in an insulating film" does not preclude the bit line contact hole from additionally
including "a first contact hole made in a first inter-layer insulating film" and "a second contact hole made in a second inter-
layer insulating film." In other words, the claim could readily be interpreted, as Hynix contends, as requiring the contact
holes to pass through three different insulating films: the "insulating film which covers a portion of the surface of a
substrate," the "first inter-layer insulating film" and the "second inter-layer insulating film." Such a construction is correct
for at least three reasons.

First, the claim itself suggests that the inter-layer insulating films are separate from the previously recited insulating film
because the claim uses the indefinite article "a" before mentioning the inter-layer films. '579 patent at claim 1 ("said storage
Second, it would seem anomalous to conclude that the "inter-layer insulating films" are necessarily part of the same "insulating film" given that Toshiba concedes that the two inter-layers are separate films and are deposited at different times, Toshiba Rep at 3, and at least one embodiment in the specification describes the films as separate and distinct from one another. See FIG 1(b) (separate inter-layer insulating films 13 and 23). Moreover, construing the "inter-layer insulating films" as part of the "insulating film" would either render superfluous the "inter-layer" limitation or would create an incoherent situation in which a unitary "insulating film" is somehow composed of discontinuous parts.

Finally, the specification consistently describes embodiments in which a film comprising silicon oxide, a well-known insulator, is deposited on the source and drain regions of the substrate surface and is subsequently removed via etching to create storage node contact holes and bit line contact holes. See '579 patent at 7:28-39, 9:54-60, 10:31-36, 13:21-27, 14:5-10, 19:56-60, 20:32-37. Compare FIGS 3(b), 12(b), 21(b) and 46(b) with FIGS 4(b), 16(b), 25(b) and 50(b), respectively (silicon oxide film 9 is removed to form a first storage node contact hole 14 and a first bit line contact hole 15). This insulating film is deposited separately from the inter-layer insulating films, which the specification consistently describes as being deposited later. E.g, id at 7:28-33 ("[A] silicon oxide film 9 of about 20 nm thickness is formed on the thus obtained substrate by the thermal oxidation method and then a silicon oxide film 13 as an inter-layer insulating film is deposited on the entire substrate by the CVD method."). The presence of this separate silicon oxide film strongly suggests that the "insulating film" through which the contact holes pass is separate from the "inter-layer insulating films."

Accordingly, the court adopts Hynix's proposed constructions, thereby construing "first inter-layer insulating film" as "a first insulating film that is located between layers and that is separate from and not a part of an insulating film covering the surface of said substrate on which the MOSFET is formed" and construing "second inter-layer insulating film" the same way but with "second" replacing "first."

2312

1. Construction of "Second Interlayer Dielectric Film"

The claims of the patent contain no express limitation on "second interlayer dielectric film." CMO nonetheless claims that the specification indicates that the second interlayer dielectric film must have a planarized surface, and if the term cannot be so construed then the patent must be deemed invalid for lack of enablement and inadequate written description.

The abstract states that the claimed contact structure "assure[s] a uniform cell gap among different cells if the interlayer dielectric film thickness is nonuniform across the cell or among different cells." 480 Pat. Abstract. The abstract further states that "[t]he cell gap depends only on the size of the spacers, which maintain the cell gap." Id. From the outset, therefore, the patent explicitly contemplates variations in interlayer dielectric film thickness not only among different cells but within the same cell.

Reviewing the specification, the uniformity of the "cell gap"--the space between the substrates--and its relation to the nonuniformity of the interlayer dielectric film features prominently in the description of the relevant prior art, the summary of the invention, and the description of the invention. The relevant passages are analyzed below.

The description of the related art states that "[i]t is common practice to use standardized spacers as the insulating spacers," such that the cell gap in the pixel region will be "substantially uniform" so long as the spacers have a uniform diameter. Id. col. 2 ll. 38-42. The patent draws a distinction between the cell gap in the pixel region ("Gp") and the cell gap in the common contact region ("Gc"), stating that while substantial uniformity in the pixel region can be attained using spacers of uniform diameter, it is difficult to avoid nonuniformity in the common contact region cell gap. Id. col. 2 ll. 42-44. The patent states that, while the Gp cell gap is determined by the diameter of the spacers, "the cell gap Gc in the common contact portion depends only on the film thickness t of the interlayer dielectric film." Id. col. 2 ll. 45-49. As the patent explains: "Consequently, to make the cell gap Gc uniform among liquid-crystal cells, it is necessary that the film thickness t of this interlayer dielectric film 18 be uniform among cells. However, this is impossible to circumvent." Id. col. 2 ll. 49-53. This latter sentence apparently refers to the lack of uniformity which seemed to plague the prior art.
The relevant art description goes on to explain that the thickness of the interlayer dielectric film "may differ from location to location on the same substrate. In this case, the film thickness t may differ among different common contacts even on the same substrate." Id. col 2 ll. 55-69. This variation in thickness creates nonuniformity both in the pixel cell gap Gp and the common contact cell gap Gc. Id. col. 2 ll. 60-65. This nonuniformity in the cell gap is later identified as a "problem" that prevents a display from being provided because it is impossible to properly connect the counter electrode. Id. col. 3 ll. 3-18.

Given the problem of nonuniformity in the prior art, the stated object of the invention is "to provide a contact structure which is free of the foregoing problems, provides less nonuniform cell gap among different cells if the thickness of the interlayer dielectric film is nonuniform across the cell or among different cells, and reduces poor electrical contacts which would normally be caused by conducting spacers." Id. col. 3 ll. 22-28.

Turning to the primary example given in the written description ("Example 1"), the description addresses the second interlayer dielectric film as follows: "The organic resinous material acts to planarize the surface of the second interlayer dielectric film 319. This is important to make the cell gap uniform. In the present example, polymide was deposited as the second interlayer dielectric film 319 to a thickness of 1 [mu]m." Id. col. 10 ll. 19-23. After the second interlayer dielectric film is planarized, contact holes are formed in the second interlayer dielectric film to provide access to the drain electrode and internal conducting lines. Id. col. 10 ll. 24-27. After the holes are formed, a "thin metal film which would later be made into pixel electrodes 322 and a conducting pad 323" are formed. Id. col. 10 ll. 50-51. Judging from the drawings, the conducting pad is formed on top of the second interlayer dielectric film and the internal conducting lines after the contact holes are created. The contact holes appear to be created only in the common contact portion--the pixel portion remains intact and thus planarized.

After this structure is created, and after some additional steps are performed preparing the substrates to be joined, the cell gap is created as follows. Non-conducting (insulating) spacers with a diameter of 3 gm are applied to the pixel region. Id. col. 11 ll. 47-49. Additionally, conducting spacers with a diameter of 3.5 gm are applied to the common contact region. Id. col. 11 l. 49. When the two surfaces are clamped together creating a cell gap of 3 gm, the conducting spacers are crushed, creating a larger surface in contact with the electrodes and conducting pads, leading to a better electrical connection. Id. col. 11 ll. 53-59. So long as the conducting spacers are greater than 3 [mu]m, they are able to be compressed to conform with the cell gap created by the insulating spacers. Discussing the planarity, the patent elsewhere states that "it is important to flatten the surface of the second interlayer dielectric film 319 on which the pixel electrodes 322 are formed in order to make uniform the cell gap." Id. col. 12 ll. 3-7. The patent goes on to describe a particular process for planarizing the second interlayer dielectric film in the pixel region.

This detailed discussion, and the comments regarding the importance of a flat second interlayer dielectric film, appear in the description of "Example 1." The patent provides two additional examples, neither of which discusses the second interlayer dielectric film in any meaningful way. The second example is "a modification of the common contact portions of Example 1," in which the electrical resistance of the counter electrode and conducting spacers is reduced, and contains no mention of the cell gap. Id. col 12 ll. 58-64. The third example is "a modification of Example 2," adding openings to the connecting pad at various places so that the conducting spacers can be visually checked. Id. col. 13 ll. 25-36. The third example provides guidance as to the spacing and size of the openings in order to maintain the cell gap. Id. col. 13 ll. 46-51. The patent goes on to state that "[i]n Examples 2 and 3, the cell gap in the common contact portions is made uniform," without elaborating on how the cell gap would be made uniform without planarizing the second interlayer dielectric film of the pixel region. Id. col. 13 ll. 36-64.

The written description concludes with this curious passage:

The common contact structure in accordance with the present invention can eliminate variations of the cell gap among liquid-crystal cells even if the film thickness varies among interlayer dielectric films. Also, poor contacts due to conducting spacers can be reduced.

In particular, in accordance with the present invention, the cell gap depends only on the size of conducting spacers. Therefore, where the conducting spacers are uniform in size, the cell gap between opposite substrates or plates can be made uniform among different liquid-crystal cells, if the thickness of the dielectric film electrically insulating the first and second conducting films is different among different liquid-crystal cells.
Id. col. 14 ll. 13-26 (emphasis added). This passage is odd in that the specification explicitly discloses conductive spacers of varying diameters which are crushed to conform to the cell gap created by insulating spacers. Furthermore, even if the conducting spacers are of uniform diameter, they could only maintain a uniform cell gap if the common contact region is planar. And yet, the patent explicitly contemplates variations in the thickness of the interlayer dielectric films.

SEL’s explanation for this apparent inconsistency is that, in the described embodiment, the second interlayer dielectric film need only be planarized in the pixel region. The 3-[mu]m insulating spacers are applied to the pixel region, where the second interlayer dielectric film is uniform. The 3.5-gm conducting spacers are applied to the common contact portion, and are crushed when the electrode is formed, conforming to the 3-[mu]m cell gap created by the insulating spacers. Because the cell gap is defined by the 3-[mu]m spacers applied to a uniform second interlayer dielectric film, any nonuniformities in the second interlayer dielectric film in the common contact portion will be corrected by the compressibility of the conducting spacers. This is consistent with the passage regarding planarity, which states that "it is important to flatten the surface of the second interlayer dielectric film 319 on which the pixel electrodes 322 are formed in order to make uniform the cell gap." Id. col. 12 ll. 3-7. In the drawings, "322" indicates the region where the insulating spacers (402), not the conducting spacers (401), are located. Id. Fig. 6.

Accordingly, the second paragraph quoted above is inaccurate. Accepting SEL’s explanation, which is borne out by the patent, the cell gap is still tied to the insulating spacers. It is explicitly not tied to the conducting spacers, which must be larger than the intended cell gap in order for the patented invention to function properly. The court need not dwell on this error, however. It is sufficient to hold that the asserted claims of the ’480 Patent cover nonuniform second interlayer dielectric films in the common contact portion of the matrix. 2

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
2 CMO's citations to Shunpei Yamazaki's deposition testimony do not change this result. Yamazaki testified at length about planarization, but nothing in his testimony indicates that the common contact region must be planarized for the surface to be effective.

2313

Intamin sued Magnetar alleging that the Soft Stop brakes infringe claim 1 of the ’350 patent. Claim 1 of the ’350 patent reads:

A braking device for use with an amusement apparatus having a fixed device part, at least one running rail secured to the fixed device part, and a movable device part including at least one traveling gear configured for movement along the at least one running rail, the braking device comprising:

an eddy current brake assembly including:

a conducting part having at least one conductive rail configured for attachment to the fixed device part, said at least one conductive rail being adapted to extend the length of the fixed device part;

an energizing portion having at least one yoke aligned in correspondence with each said at least one conductive rails, each said yokes including a pair of yoke arms for receiving said at least one conductive rail there between;

at least one pair of carrying rails extending a predetermined distance along the direction of said at least one conductive rail, each said carrying rails being mounted on corresponding yoke arms of said plurality of yokes;

a plurality of magnet elements mounted on each of said carrying rails with alternating polarities, said plurality of magnet elements being further arranged such that the poles of magnet elements mounted on one carrying rail have opposite polarities from the poles of magnet elements mounted on a corresponding carrying rail of said at least one pair of carrying rails; and
an intermediary disposed between adjacent pairs of said plurality of magnet elements;

wherein:

an interferric gap is defined between each said yoke arms and the at least one conductive rail, and

movement of the movable device part, relative in the fixed device part, induces eddy currents that create a magnetic brake force between said conducting part and said energizing part.

'S50 patent col.8 ll.29-65.

Seeking summary judgment of non-infringement, Magnetar asserted that its brakes did not infringe this claim because they did not include an "intermediary," because they were not "attached to the fixed device part," and because they did not include a "conductive rail" "adapted to extend the length of the fixed device part." The district court agreed that Magnetar's brakes did not contain an intermediary. Intamin,Ltd. v. Magnetar Techs. Corp., SA CV 04-511-GLT, slip op. at 7 (C.D. Cal. Jan. 25, 2005) (Initial Decision). The district court further found that Magnetar's brakes could not infringe, either literally or under the doctrine of equivalents, the limitation requiring attachment to the fixed device part. Id. at 8-10. Finally, the district court also determined that Magnetar's Soft Stop brakes did not infringe literally a limitation requiring the conductive rail to "extend the length of the fixed device part." Id. at 10-12. The district court opined that Magnetar's Soft Stop brakes may infringe this limitation under the doctrine of equivalents but did not reach that issue because the absence of other limitations already showed that Magnetar's brakes did not infringe the '350 patent. Id. at 12-13. Thus the district court granted summary judgment of non-infringement. Id.

Magnetar also alleged that Intamin's complaint violated Rule 11(b). Magnetar argued that Intamin filed its complaint as retaliation for Magnetar's president's public criticism of Intamin's brakes. Magnetar also argued that Intamin's complaint was frivolous. Intamin responded that its law suit was not retaliatory and was adequately supported by pre-filing investigations. Initially, the district court granted Rule 11 sanctions. Id. at 13-16. Upon reconsideration, the district court affirmed its finding that Intamin filed the complaint for an improper purpose but vacated its decision that Intamin's pre-filing investigation was frivolous. Intamin, Ltd. v. Magnetar Techs. Corp., SA CV 04-511-GLT, slip op. at 6-7 (C.D. Cal. Mar. 11, 2005) (Reconsideration Decision). Magnetar then moved for attorneys' fees. Intamin, Ltd. v. Magnetar Techs. Corp., SA CV 04-511-GLT, slip op. at 2 (C.D. Cal. Apr. 25, 2005) (Fee Decision). In opposition to Magnetar's motion for attorneys' fees, Intamin argued that, under Ninth Circuit law, a meritorious (non-frivolous) complaint cannot have an improper purpose. Id. As such, Intamin argued that the district court could no longer award sanctions. Id. The district court agreed and vacated its sanctions. Id. at 2-3.

As noted, the district court found on summary judgment that Magnetar's accused brake system did not infringe Intamin's patent. Initial Decision, slip op. at 7. Intamin petitioned for reconsideration of the court's finding of non-infringement. The district court affirmed its finding of non-infringement. Reconsideration Decision, slip op. at 8. Intamin appeals the district court's grant of summary judgment of non-infringement. Magnetar cross-appeals the district court's decision to vacate the Rule 11 sanctions.

II

This court reviews a grant of summary judgment without deference. Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 149 F.3d 1309, 1315 (Fed. Cir. 1998). On appeal, the parties dispute the district court's construction of the claim limitation requiring "an intermediary disposed between adjacent pairs of said plurality of magnets." The parties also dispute the district court's claim construction of a second limitation found in claim 1 of the '350 patent: "said at least one conductive rail being adapted to extend the length of the fixed device part." Like summary judgment itself, this court reviews claim construction without deference. Cybor Corp. v. FAS Techs. Inc., 138 F.3d 1448, 1456 (Fed.Cir. 1998) (en banc).

Regarding the limitation requiring an "intermediary," the dispute rests on whether the intermediary between adjacent pairs of magnets can itself be a magnet. The use of the word "said" in a claim refers to an earlier use of the term in the claim. See Bell Communications Research v. Vitalink Communications Corp., 55 F.3d 615, 621 (Fed. Cir. 1995). Here, the claim proceeds from the following definition: "a plurality of magnet elements mounted on each of said carrying rails with
alternating polarities, said plurality of magnet elements being further arranged such that the poles of magnet elements mounted on one carrying rail have opposite polarities from the poles of magnetic elements mounted on a corresponding carrying rail of said at least one pair of carrying rails." '350 patent col.8 ll.49-55. Thus, according to claim 1, the magnets surrounding the intermediary have at least "alternating" polarities.

Intamin argues that adjacent pairs of magnets with alternating polarities must mean two magnets on the same rail with opposite polarity, as shown in Figure 6 of the '350 patent. Thus, according to Intamin, anything between the magnets of opposite polarity is an intermediary, whether magnetic or not. Magnetar argues that "adjacent pairs of magnets" means any two magnets next to each other or abutting each other on the rail, as shown in Figure 6. Further, according to Magnetar, the term "alternating" does not require that such magnets have opposite polarity as shown in Figure 6. Thus, because adjacent magnets are any two magnets abutting each other on a single rail, Magnetar argues that another magnet cannot be an intermediary. Under its interpretation, Magnetar's Soft Stop brakes would not infringe claim 1 because they lack an intermediary.

The district court construed the term "intermediary" without determining the meaning of "adjacent magnets with alternating polarities." The parties disagree therefore about the meaning the district court actually gave to the term "intermediary." Intamin argues that the district court determined that the intermediary could not be magnetic, thus precluding infringement. Magnetar disagrees that the district court made such a determination.

In any event, the parties agree that this court cannot interpret "intermediary" without addressing the polarities of the adjacent magnets. Specifically, an intermediary cannot be another magnet if this court construes "adjacent pairs of magnets" as two magnets abutting each other with polarities that alternate at some degree such as found in a Halbach array. In other words, an intermediary can only be a magnet if the limitation "alternating polarities" means "opposite polarities." Under that interpretation, some magnets become "adjacent pairs" and other magnets in between become "intermediaries." In addition, "adjacent pairs of magnets" with opposite polarities, as in Figure 6, would need some separation. 1 Intamin argues that another magnet can provide this separation.

--- Footnotes ---

1 At oral argument, Intamin's counsel, in response to a question regarding the meaning of and the necessity for an "intermediary," stated that "the intermediary serves the purpose to provide spacing and support for the magnets of the magnet elements which are the magnets of alternating polarity [because] for physics reasons there has to be spacing between those two magnets of alternating polarities and also the magnets are so strong that if there in not something in between they tend to spin into a new location." Thus, whether another magnet can be an intermediary may depend on whether it can serve as a spacing and support element. Arguably, none of Magnetar's magnets are used as spacing and support elements; rather, all are necessary to create the one-sided flux of the Halbach array.

--- End Footnotes ---

The district court adopted Magnetar's proposed claim construction: "In short, ordinary meaning supports Defendant's construction, and neither the specification nor the prosecution history changes the ordinary meaning." Initial Decision, slip op. at 4. On its face, the district court construed the term "intermediary" to mean "a member between others." Id. at 3-4. In reaching that conclusion, the district court dismissed Intamin's proposed claim construction that the intermediary can be a magnet between two other magnets. Id. In fact, the trial court specifically points to language in the patent that the intermediary is non-magnetic. Id. Thus, the district court apparently construed the term "intermediary" to mean something non-magnetic between the adjacent magnets.

The first step in an infringement analysis is the determination of the scope of the claims. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). This court construes claims according to the principles set forth by this court in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc). As such, the court consults primarily the claims themselves in context, with much of that context supplied by the specification and the prosecution history. Id. at 1312.

In this case, the claim language itself does not require a non-magnetic "intermediary." Just as in the Phillips case itself, the claim uses a broad term with an understandable meaning. As the district court noted, the term "intermediary" standing alone
means a "member between others." Initial Decision, slip op. 4. This term takes on additional meaning, however, in the context of magnetized members. The context of the rest of the patent helps show that additional meaning, namely whether the intermediary may be magnetic.

In Phillips, this court noted that dependent claims can supply additional context for construing the scope of the independent claims associated with those dependent claims. 415 F.3d at 1314. An independent claim impliedly embraces more subject matter than its narrower dependent claim. In this case, dependent claim 2 modifies the term "intermediary." Claim 2 of the '350 patent discloses "[t]he braking device of claim 1 wherein said intermediary is magnetic." This dependent claim shows both that the claim drafter perceived a distinction between magnetic and non-magnetic intermediaries and that independent claim 1 impliedly embraced non-magnetic intermediaries. See Innova/Pure Water, Inc. v. Safari Water Filtration Sys. Inc., 381 F.3d 1111, 1123 (Fed. Cir. 2004).

The district court initially did not consider the context supplied by claim differentiation because Intamin did not raise this argument until reconsideration. Reconsideration Decision, slip op. at 2. Even without the enlightenment supplied by claim differentiation, however, the overall context of claim 1 does not limit the broad language to non-magnetic intermediaries. At one point, the '350 patent describes an embodiment of the invention with a "non-magnetic" intermediary. '350 patent col.4 ll.16-18. The district court seized on this disclosure to limit the term "intermediary" to non-magnetic substances only. Initial Decision, slip op. at 4. As this court has repeatedly noted, see SRI Int'l v. Matsushita Electric Corp., 775 F.2d 1107, 1121 (Fed. Cir. 1985) (en banc) (plurality opinion), a narrow disclosure in the specification does not necessarily limit broader claim language. Phillips, 415 F.3d at 1323. The overall context of the patent, in this case, does not specifically disavow magnetic intermediaries. See e.g., SciMed Life Sys. Inc. v. Advanced Cardiovascular Systems Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001). The single reference does not expressly limit the entire invention but only describes a single embodiment. Moreover, the term "intermediary," like the term "baffle" in Phillips, embraces more than the limited specification disclosure.

Thus, this court finds that the term "intermediary" can embrace magnetic substances, albeit only if the additional term requirement of "alternating polarity" allows for it. Accordingly, this court vacates the district court's construction of this term. However, this court has not reached an additional question on which the trial court has yet to provide a decision for review. Specifically this court remands to permit the district court to determine whether the patent limits the term "adjacent magnets of alternating polarity" to magnets of opposite polarity. With the understanding that an "intermediary" may be magnetic, the trial court may revisit its finding of non-infringement.

2314

b. "an intermediate memory is provided for the audio information picked up over the data communications line"

AMI contends that "an intermediate memory ...") means that "electronic storage media is included in the jukebox to temporarily store musical selections received from the central music store over the data telecommunications line." Opening Brief at 32. The parties' dispute centers on whether the intermediate memory must be physically separate from memory used to store frequently played songs.

The claims disclose that intermediate memory and memory for frequently played songs are two different things and serve two different purposes. The specification also teaches that the two memories are "separate." Id., Ex. 18 at 2:63-67. It does not say, however, that the memories must be "physically separate" as Ecast argues. Nor does the claim include or suggest such a limitation. The
intermediate memory may be physically separate from the memory for frequently played songs, or it may be a separate area on the same memory device (e.g., a partition or subfolder).

The Court therefore construes “an intermediate memory...” to mean that “electronic storage media is included in the jukebox to temporarily store musical selections received from the central music store over the data telecommunications line.”

B. Interconnected

Plaintiff FortuNet's Proposed Construction
Defendants Melange and Planet Bingo's Proposed Construction
To connect with one another. Connection providing two-way communication between the slave and master.

Noting the claim term is "interconnected" and not just "connected," Defendants argue this term requires that the flow of information between the master and slave devices be bi-directional, that is, both the master sending information to the slave, and the slave sending information to the master. Additionally, Defendants assert the patent states the slave game device's minimal configuration includes a transceiver to permit both the receipt and transmission of information with the master game device over the network. Defendants also note the specification states communication between the master game device and the slave game device is bi-directional. According to Defendants, the patent does not teach a game where communication between master and slave is one way.

FortuNet asserts the claim's terms require only one-way communication, master to slave. First, FortuNet argues that dependent claim 6 adds to independent claim 1 the limitation of the slave sending information to the master, suggesting that is not a limitation of claim 1. Second, FortuNet notes that although the specification discusses the slave sending game information to the master, that is a description of the preferred embodiment, not a definition of “interconnected.” Finally, FortuNet argues that the specification states the slave game device can execute games independently, absent communication with the master. FortuNet argues requiring bi-directional flow of information would contradict this language in the specification.

The Court begins with the claim language which states the "master game device provid[es] data for playing said games; and at least one of said two different distinct and independent games being at least partially responsive to said data from said master game device." (JA0011, Col. 6 at 26-30.) By its terms, the claim describes one-way communication where the master sends data to the slave. A review of the specification does not alter this interpretation. Although the specification mentions bi-directional communication, it does so in the context of describing the preferred embodiment. (JA0010, Col. 3 at 66-68, Col. 4 at 1-10.) In discussing the bi-directional nature of the communication, the specification states the slave will send "game status information and accounting data" back to the master. (JA0010, Col. 3 at 67-68, Col 4 at 1-2.) This is a direct reference to dependent claim 6, which adds the limitation that the slave send "accounting data and the current status" of at least one of the games back to the master. (JA0010, Col. 6 at 56-59.) Nothing in the prosecution history suggests the patentee limited or altered the meaning of this term to require bi-directional communication.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

n1 Dependent claim 6 states: "The combination in claim 1, wherein said slave game device transmits to said master game device accounting data and the current status of at least one of said two different distinct and independent games." (JA0011, Col. 6 at 56-59.)

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

In construing a patent's terms, the Court should not limit the patent to the preferred embodiment description. Comark
Communications, Inc., 156 F.3d at 1187. Additionally, a limitation in a dependent claim generally implies the limitation is not in the independent claim. Nazomi Communications, Inc., 403 F.3d at 1370. The Court therefore will not limit claim 1 to the preferred embodiment or read dependent claim 6's limitation into independent claim 1. The Court therefore holds "interconnected" in independent claim 1 means "connected with one another."

2316

A. Construction of "Interconnecting"

LPL contends that the term "interconnecting" should be construed as "shorting." (D.I. 135 at 12.) LPL argues that "interconnecting' was used throughout the entire intrinsic record in a manner consistent with this single meaning." (Id.) CPT contends that "shorting" is impermissibly vague because the specification uses that term in a variety of contexts. (D.I. 144 at 6.) CPT proposes instead the construction "electrically connecting with conductors." (D.I. 164 at 1.)

The Court agrees with CPT that LPL's proposed construction is vague. Substituting "shorting" for "interconnecting" would not clarify the meaning of "interconnecting," but rather would make it more ambiguous. In the '002 patent's specification, "short" is used in at least four different ways: the path taken by an unintended, destructive discharge of a static potential ("002 patent, col. 2, ll. 57-62); a physical defect in electrical components resulting in an unintended current pathway (Id., col. 4, ll. 27-28); a deliberate re-routing of an electrostatic discharge via a shunt transistor (Id., col. 7, ll. 35-41); and a deliberate connection between electrical elements to provide an alternate current pathway (Id., col. 5, ll. 65-68). Only the last of these is consistent with LPL's proposed construction of "interconnecting".

LPL contends that CPT's proposed construction of "electrically connecting with conductors" improperly limits the term "interconnecting" to a single embodiment by specifying that the electrical connection must be made with conductors. (D.I. 158 at 2.) However, the consistent use of a claim term by the inventor in the specification may serve to limit the scope of a claim. Nystrom v. Trex Co., Inc., 424 F.3d 1136, 1145 (Fed. Cir. 2005). Here, CPT's proposed construction is consistent with the inventor's use of "interconnecting" throughout the '002 patent's specification. n1 "Interconnecting" is consistently described or illustrated in figures as using "lines", "shorts", or "jumpers", i.e. conductors, to connect electrical elements. (See e.g., '002 patent, col. 5, ll. 65-68; col. 6, ll. 6-9; col. 6, ll. 42-43; col. 8, ll. 5-7.) Therefore, the Court will construe "interconnecting" to mean "electrically connecting with conductors."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

n1 Defendants' proposed construction is also consistent with the use of "interconnecting" in U.S. Patent 4,820,222 ("the '222 patent), which has the same inventor as the '002 patent and is incorporated by reference in the '002 patent. ('002 patent, col. 2, ll. 30-36.)

2317

A. "interconnecting each one of said processor systems through a network for data communications with each other one of said processor systems"

The dispute here is whether the language of the interconnecting step requires that each processor have some sort of direct connection with each other processor, or whether indirect connections are possible. nCUBE argues that the language each one … with each other one, along with supporting evidence from intrinsic and extrinsic sources, leads to the conclusion that the patent requires direct connections among the processors. SeaChange argues that claim 37 itself contains no such limitation, and that the intrinsic record does not support implying one.

1. Claim Language
The place to start is, as always, the language of the claim. It is the Court's view that a plain reading of the claim does not reveal the limitation advanced by nCUBE. It is true that the language requires the "interconnection" of each processor with each other processor. However, that "interconnection" is accomplished "through a network of data communications." There is nothing in this broad language that would lead the Court to conclude that there is a limitation requiring a direct connection.

However, there is some evidence supporting the opposite conclusion. Claim 1 of the patent is identical to claim 37 with one exception. Instead of "interconnecting each one of said processor systems through a network of data communications with each other one of said processor systems" it teaches "interconnecting each one of said processor systems in a point-to-point two way channel interconnection with each other one of said processor systems." ('312 patent col. 17, 11. 49-61) (emphasis added). The language in claim 1 expressly requiring a form of direct connection stands in sharp contrast to the broad language of its fraternal twin, claim 37. The doctrine of claim differentiation is sometimes helpful in interpreting claim language. It says in essence that where two otherwise identical claims differ in a certain term, it is generally presumed that a different meaning was intended. See Beachcombers v. Wildewood Creative Prods., Inc., 31 F.3d 1154 (Fed. Cir. 1994). The doctrine is not always controlling; each independent claim of a patent stands on its own, and if a proper construction of two differently worded claims leads to the conclusion that they mean the same thing, than the doctrine of claim differentiation must step aside. See Multiform Dessicants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998). However, it is a useful channel buoy for the Court in navigating through the construction analysis.

2. Specification

Turning to the specification, the parties appear to be in agreement that the specification discloses a point-to-point system as the only embodiment of a "network." That embodiment certainly appears to correspond with the teaching of claim 1. However, as discussed, the language of claim 1 is narrower than that of claim 37. It is well settled in patent law that the claim should not be limited to the preferred embodiment absent some contrary indication. See American Permahedge, Inc. v. Barcana, Inc., 105 F.3d 1441 (Fed. Cir. 1997). Moreover, the specification need not disclose what is well known in the art. Presently, in determining what is known in the art, the Court only has the benefit of the declaration of Dr. Wilkes, who indicates that other forms of "networks" besides a point-to-point configuration are well known. (D.I. 80 at P 14.) This fact supports a conclusion that the point-to-point embodiment disclosed in specification should not limit claim 37.

The Defendant argues that the Court should not adopt a broad meaning of "network" because to do so would run afoul of validity issues. 2 In its able defense of this position, nCUBE cited at oral argument Gentry Gallery, Inc. v. The Berkline Corp., 134 F.3d 1473 (Fed. Cir. 1998). In Gentry, the defendant argued that certain claims of the patent-in-suit that taught a sectional sofa where the location of the controls for the sofa was not limited to a console were invalid under the written description requirement of 35 U.S.C. § 112 P 1. The specification of the patent at issue disclosed the location for the controls of a sectional sofa with side-by-side recliners. The disclosure clearly identified a certain location (on a console) for the controls, allowing only for minor variations. The Federal Circuit concluded that this narrow disclosure combined with the fact that the only discernible purpose for the console was to house the controls as well as the statement "another object of the present invention is to provide … a console positioned between [the reclining seats] that accommodates the controls for both of the reclining seats" indicated that the challenged claims did not comply with section 112. Id. at 1479. Contrast those facts with the instant case where the stated purpose of the invention is improved/increased mass storage delivery bandwidth operating using a reliable and fault tolerant protocol. ('312 patent col. 2, 11. 6-10.) A broader understanding of "network" does not conflict with the object of the invention or render useless a part of the invention as was the case with the console in Gentry Gallery. 3

--- Footnotes ---

2 The Defendant is concerned with both the enablement and written description requirements. These are distinct issues, as an invention may be described without the disclosure being enabling. See Gosteli v. McCombie, 1986 Pat. App. LEXIS 28, 230 U.S.P.Q. 205, 209 (Bd. Pat. App. & Int’f 1986).

3 The Court understands nCUBE’s argument presented through the Wilkes' Declaration about the effect of the phrase "novel topology" on the analysis. (D.I. 80 at P 14.) However, the Court is not persuaded that this phrase is directed at the type of network as opposed to another aspect of the invention.
The Court is also not persuaded that its construction necessarily implicates enablement. At oral argument, the parties each discussed various Federal Circuit enablement cases and their impact on this issue. Stated simply, enablement requires that the disclosure be sufficiently clear to enable one of skill in the art to make and use the invention without undue experimentation. If one accepts that other forms of networks are well known in the art, then a skilled artisan should be able to make and use without undue experimentation the invention in an environment other than a point-to-point system.

The Court has briefly addressed validity issues because they sometimes bear on claim construction. The Court's conclusion that they do not affect its analysis here is not meant to foreclose any defense available to nCUBE at trial, including assertions that the construction of certain terms form part of a chain of clear and convincing evidence that the asserted claims are invalid.

3. Prosecution History

Moving finally to the last piece of intrinsic evidence, the Court is not persuaded that the limitation on the type of network is found in the prosecution history.

4 Dictionaries are in that strange netherworld between the realms of intrinsic and extrinsic evidence. Because the Court concludes that the claims, specification and prosecution history are clear, it will not resort to dictionary definitions.

The '312 patent issued from an application filed on October 24, 1995. (D.I. 81 at NC004218.) The original application recited 39 claims, all of which taught the "point-to-point two way channel interconnection" method discussed above. On September 26, 1996, the applicants submitted a Preliminary Amendment seeking to add 36 new claims. These additional claims used the "through a network for data communications" language in place of the "point-to-point two way channel interconnection" language found in the original claims. The stated purpose of the amendment was "to more fully cover the scope of the invention." (D.I. 81 at NC004307.)

5 nCUBE contends that this language is boilerplate and presumably meaningless. (D.I. 79 at 5.) It is the Court's view that it means what it says.

In an office action dated December 12, 1996, the examiner rejected the pending claims. The relevant part of this rejection was obviousness under 35 U.S.C. § 103. The examiner concluded that the relevant claims were unpatentable over United States Patent No. 5,202,980 ("Morita") in view of United States Patent No. 5,072,371 ("Benner"). The examiner found that Morita taught the claimed method for redundant storing of data in a distributed computer system where the processors of the computer system consisted of a processor and mass storage subsystem. The examiner observed that Morita did not disclose at least three processors in the distributed computer system or the point-to-point configuration, but that this limitation could be found in Benner. Benner taught a distributed processing system with more than two processor systems where each processor unit comprised a processor and mass memory. Benner also disclosed interconnection of the processors in the point-to-point two way channel configuration. Therefore:

it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify Morita et al.'s [sic] by incorporating more than two processors in the distributed computer system and interconnecting these processors in a point-to-point two way channel as disclosed by Benner et al. This modification would have been obvious because a person having ordinary skill in the art would have been motivated to provide more processors and increase the system processing power in the case of parallel processing; and a person of ordinary skill would have been motivated to interconnect each of the processor [sic] in point-to-point to facilitate data exchange among the processors, and also because
[it] is suggested by Benner et al.

(D.I. 81 at NC004311-12.)

The applicant responded on June 12, 1997. (D.I. 81 at NC004331.) In the remarks section, the applicant stated:

with respect to the prior art rejection, the Examiner grouped various claims and rejected the group claims. Applicant submits that with respect to each group of claims that certain of the claims in the group add further patently distinct features to the invention and thus are further patently distinct over the applied references. For simplicity, however, Applicant will in general treat a single claim as being representative of the group of claims but reserves its right to later argue that additional ones of the claims are patentably distinct over the combination of references.

(D.I. 81 at NC004359-60.)

The applicant then proceeded to distinguish the prior art from the invention, using claim 1 as an exemplar. The applicant first addressed Morita, contending that Morita did not disclose at least three processors, a point-to-point interconnection, or a processor system that stores data in the manner recited by claim 1. Next, the applicant challenged the assertion by the examiner that Benner taught "more than two processor systems…" and "point-to-point two way channel interconnection."

nCUBE relies heavily on the statements made regarding the Benner art. The applicant stated:

Applicant's claim 1 recites a method in which … processor systems are interconnected using a point-to-point two-way channel interconnection with each one of the other processor systems. That is, any one processor system can communicate directly with any one of the other processor systems.

(D.I. 81 at NC004360-61) (emphasis added).

Also:

Benner describes a parallel computing system of the hypercube type. As such … Benner does not describe that each of the processor systems are interconnected in a point to point way with each other one of the other processor systems as recited in Applicant's claim 1.

(D.I. 81 at NC004362) (emphasis in original).

nCUBE urges the Court to draw the following conclusions from the quoted language and similar passages in the prosecution history: first, that the applicant limited the scope of claim 37 (application claim 40) to its argument over claim 1 by grouping claim 37 with claim 1 and using claim 1 as illustrative of all claims in the group; second, that in distinguishing claim 1 over the prior art, the applicant affirmatively disclaimed a hypercube and affirmatively claimed a direct connection among processors.

Although nCUBE's argument has merit, the Court ultimately cannot agree with its contention. In the Court's view, a member of the public reviewing the entire intrinsic record would be aware that the statements made by the applicant in the relevant portions of the prosecution history could not pertain to claim 37 (application claim 40). First, the plain language of claim 1 and claim 37 indicates that claim 37 is broader in scope. Second, the file wrapper clearly indicates that claim 37 (application claim 40) was added to more fully cover the invention. Third, it was the examiner who originally grouped the claims. The applicant clearly indicated that its response was drafted with similar grouped arguments in an effort to achieve simplicity. Moreover, the applicant expressly stated that it believed that the individual claims were patentable independent of claim 1, and that the applicant reserved its rights in that respect. Finally, the arguments made in response to the rejection clearly
addressed the subject matter of claim 1 both in substance and nomenclature.

There is one additional piece of the documentation concerning the prosecution of the '312 patent that may shed additional light on the question. In a declaration accompanying its reply brief, nCUBE presented to the Court a document produced by SeaChange in discovery. This document appears to be a supplemental amendment to the application leading to the '312 patent. The document contains an attestation by an employee of the prosecuting attorney that it was mailed to the Patent Office on June 25, 1997. However, both parties have represented to the Court that the supplemental amendment does not appear in the '312 file wrapper.

As an initial matter, this unusual document raises questions of what place, if any, it should play in the intrinsic record of the patent. On the one hand, the public policy rationale counsels its exclusion; of what use is it to the public if the public is unaware of its existence? On the other hand, it sheds light on the applicant's intentions during prosecution.

At oral argument, both parties argued that this document supported their contentions. In the Court's view, the document supports SeaChange's argument that the applicant's illustrative use of claim 1 in arguing nonobviousness in view of Morita and Benner was not intended as binding for all of the pending claims. Moreover, it indicates that the "reservation of rights" language was not a mere formality. Also, it is the Court's opinion that the substance of the document supports SeaChange's argument that claim 37 should not be limited to the same scope as claim 1. For example, the document observes that "claim 40 could have been separately argued [from the claim 1 grouping] since some of the limitations in claim 1 are not part of claim 40." (D.I. 92, Exh. C at 2.) The document also emphasizes that the interconnection of processors, "each one to the other one", is through a network, language which does not necessarily imply a "direct" connection as urged by nCUBE.

In any event, because the document's place in the intrinsic record is open to question, the Court will not rely on it for purposes of claim construction.

In summary, after a consideration of the intrinsic record, the Court cannot conclude that the phrase in issue should be construed in the limited fashion urged by nCUBE. Accordingly, the Court construes "interconnecting each one of said processor systems through a network for data communications with each other one of said processor systems" to mean establishing data communication between every pair of processor systems in the distributed computer system using any kind of network.

4. Port/Interface

The plaintiff proposes that "port" means "a connection channel" and that "interface" means "the hardware, software, and/or firmware that allows the exchange of data between devices." The defendants propose "a data communication interface" as the construction for both terms because they contend that "port" and "interface" are identical. To support their contention, the defendants cite to portions of the specification where "port" and "interface" have been used interchangeably. However, in the claims, "port" and "interface" are used separately. E.g., '202 patent, claim 1. Therefore, they are presumed to mean different things. See Innova/Pure Water, Inc., 381 F.3d at 1119. Furthermore, one of ordinary skill in the art would understand "port" to be a type of "interface" (e.g., a "parallel port" is a type of "interface"). Accordingly, "port" means "the physical connector that allows for the connection and data exchange between devices" and "interface" means "the hardware that allows for data exchange between devices."

2319

a. "circuit" limitations

The "circuit" limitations are contained in the asserted claims of the '096 and '264 patents as identified in section I, supra. Initially, all the claim limitations at issue lack the term "means," accordingly, we presume that § 112 P 6 does not apply. CCS Fitness, 288 F.3d at 1369, 62 USPQ2d at 1664. We next must determine whether Raritan has shown that the limitation,
as understood by one of ordinary skill in the art, demonstrates that the claim term fails to recite sufficiently definite structure or else recites a function without reciting sufficient structure for performing that function. Id. In the absence of sufficient evidence, the presumption stands. Raritan failed to meet this evidentiary burden.

The threshold issue for all the limitations involving the term "circuit" is whether the term itself connotes sufficient structure to one of ordinary skill in the art to perform the functions identified by each limitation. The district court determined this term, by itself, did not connote sufficient structure and prematurely ended its analysis at this threshold issue. While we do not find it necessary to hold that the term "circuit" by itself always connotes sufficient structure, the term "circuit" with an appropriate identifier such as "interface," "programming" and "logic," certainly identifies some structural meaning to one of ordinary skill in the art.

The term "circuit" is defined as "the combination of a number of electrical devices and conductors that, when interconnected to form a conducting path, fulfill some desired function." Dictionary of Computing, 75 (4th ed. 1996).n1

In light of this definition, it is clear that the term "circuit," by itself connotes some structure. In the absence of any more compelling evidence of the understanding of one of ordinary skill in the art, the presumption that § 112, P 6 does not apply is determinative. Raritan's evidence consisted of district court decisions addressing the meaning of the term "circuit means" and Apex's description of the preferred embodiments in the specification. We find that this evidence is not sufficient to rebut the § 112, P 6 presumption. This evidence fails to show by a preponderance of the evidence that one of ordinary skill in the art believes the term does not recite sufficiently definite structure.

Moreover, claims are interpreted in light of the specification and with the knowledge of one of ordinary skill in the art. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 USPQ2d 1573, 1576-77 (Fed. Cir. 1996). The written description discloses only the preferred embodiments of the various circuit limitations and does not use these terms "in a manner clearly inconsistent with the ordinary meaning" as understood by one of ordinary skill in the art. Tex. Digital, 308 F.3d at 1204, 64 USPQ2d at 1819 (stating if the specification uses the words in a manner clearly inconsistent with the ordinary meaning of a dictionary definition, the inconsistent dictionary definition must be rejected).

The prosecution history also does not suggest that the ordinary meaning of the term "circuit" does not apply. Lastly, the expert testimony submitted by Raritan, including the testimony of Drs. Hoff and Liaw shows only that the term "circuit" is understood by one of ordinary skill in the art as a very broad term and that one of the accused products included several of the circuit elements.

Moreover, every use of the term in the asserted claims includes additional adjectival qualifications further identifying sufficient structure to perform the claimed functions to one of ordinary skill in the art. See Personalized Media, 161 F.3d at 705, 48 USPQ2d at 1888 ("An adjectival qualification ('digital') placed on an otherwise sufficiently definite structure ('detector') does not make the sufficiency of that structure any less sufficient for purposes of § 112, P 6. Instead, it further narrows the scope of those structures covered by the claim and makes the term more definite."). The district court therefore erred in its interpretation of all the limitations as means-plus-function limitations by failing to consider the limitations as a whole.

While this court is plainly aware that claim construction is a question of law, we decline to construe every claim limitation because the record has not been sufficiently developed. As is the case with other aspects of patent law, e.g. obviousness, a proper determination of whether the claim limitations should be construed as means-plus-function limitations requires an
understanding of one of ordinary skill in the art. In this situation, it is appropriate to look to extrinsic evidence, including but not limited to dictionaries and expert testimony to assist the trier of fact in understanding the evidence. Greenberg, 91 F.3d at 1583, 39 USPQ at 1786. In particular, the record should reflect the ordinary meaning of the claim limitations, as a whole, and whether these limitations suggest sufficiently definite structure to one of ordinary skill in the art. Despite this need for further development, the record does contain sufficient evidence to address the "first interface circuit" and "second interface circuit" limitations.

The relevant definition of the term "interface" is: "the signal connection and associated control circuits that are used to connect devices." Dictionary of Computing, 250 (4th ed. 1996). Moreover, an "interface circuit" is defined as "a circuit that links one type of logic family with another or with analog circuitry." Rudolf F. Graf, Modern Dictionary of Electronics, 385 (7th ed. 1999). This dictionary definition specifically provides several examples of an interface circuit, including a line driver and analog to digital converters. Thus, the ordinary meaning of this term connotes specific structures to one of ordinary skill in the art. The written description and prosecution history provide no evidence that the inventors intended the term "interface circuit" to have a meaning contrary to this ordinary meaning. Raritan relies solely on its arguments that the term "interface circuit" is a generic term and that the written description, by only showing one embodiment, clearly sets forth a limited definition of "interface circuit." We reject Raritan's classic attempt to limit the scope of a claim limitation to the preferred embodiment. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 48 U.S.P.Q.2D (BNA) 1001 (Fed. Cir. 1998).

Because Raritan has failed to rebut the presumption that § 112, P 6 does not apply, we hold that the terms "first interface circuit" and "second interface circuit" are not means-plus-function limitations. The term "interface circuit" means any circuit that links one type of logic system with another.

The district court should conduct a similar analysis with respect to the remaining "circuit," "interface," and "unit" limitations. Upon remand, the district court must determine the ordinary meaning of these limitations and whether this ordinary meaning defines sufficiently definite structure. Raritan has the burden of going forward with evidence to prove that § 112, P 6 applies. Raritan must prove by a preponderance of the evidence that the limitations, as a whole, do not connote sufficiently definite structure to one of ordinary skill in the art. We decline to conduct this analysis for the district court because the record is underdeveloped as to the ordinary meaning of these limitations as a whole and construing the claims based on this limited record could be prejudicial to the parties.

2320

A. "interface device"

The Camera Manufacturers propose that the term "interface device" be construed to mean "a stand-alone device that a user can readily physically connect to and disconnect from a host device and a data transmit/receive device and that directs communication between these devices when they are connected." Tr. 1:104 (CMs). They assert that the invented "interface device" is for communicating between a host device and a data transmit/receive device, i.e., the invention is neither the host nor the data transmit/receive device, but rather a separate device that enables active communication between the other two. Papst retorts that "interface device" should be construed to mean the structure defined in the body of the Claims and that nothing in the Claims requires the interface device to be separate from the data transmit/receive device. 5

5 Papst recognizes that the data transmit/receive device may be separate from the interface device. It appears to argue, however, that according to the invention the interface device and the data transmit/receive device could be in a single device. See Tr. 1:123 (Papst) ("[T]he data transmit/receive device, you know, that's the part that doesn't have to be part of the interface device. . . . [T]his claim would be infringed whether or not you include the data transmit/receive device in the final product."). Papst does not contend that the interface device could be inside the chassis of the host device, the computer.
What is claimed is:

1. An interface device for communication between a host device, which comprises drivers for input/output devices customary in a host device and a multi-purpose interface, and a data transmit/receive device, the data transmit/receive device being arranged for providing analog data, comprising:

   a processor;

   a memory;

   a first connecting device . . . ; and

   a second connecting device . . . .

'399 Patent, col. 12:41-53 (emphasis added); '449 Patent, col. 11:45-57(same). The preamble to Claim One is the portion in italics above. Papst asserts that the term "interface device" as set forth in the preamble does not limit the Claim and thus the term should not be construed by the Court. Specifically, Papst contends that the preamble uses the words "[a]n interface device . . . comprising," thereby indicating that the invention is defined in the body of the Claim, i.e., "a processor; a memory; a first connecting device . . . ; and a second connecting device . . . ." '399 Patent, col.12:48-54; '449 Patent, col. 11:51-57. Papst further argues that to construe the term "interface device" in the preamble would be to improperly import limitations from the specification into the Claim. See Phillips, 415 F.3d at 1323. 6

6 Despite its position that the term "interface device" should not be construed, Papst concedes that the terms "host device" and "data transmit/receive device" which are also found in the preamble "may benefit from further explanation because some actual claim elements are defined in terms of their relationship to those terms." Papst's Markman Br. at 15.

The preamble to Claim One serves as a claim limitation for three reasons. First, "[i]f the claim preamble, when read in the context of the entire claim, recites limitations of the claim, or if the claim preamble is necessary to give life, meaning, and vitality to the claim, then the claim preamble should be construed as if in the balance of the claim." Pitney Bowes, 182 F.3d at 1305 (internal quotation omitted). In these Patents, the preamble is limiting because it describes structures that comprise the invention and the relationships among those structures: "An interface device for communication between a host device . . . and a data transmit/receive device." See '399 Patent, col. 12:42-45; '449 Patent, col. 11:46-49.

Second, where a preamble provides an antecedent basis for terms found in the body of the claims, it acts as a "necessary component of the claimed invention" and serves as a claim limitation. Bicon, Inc. v. Straumann Co., 441 F.3d 945, 952-53 (Fed. Cir. 2006). Here, the body of the Patents repeatedly refers back to the structures first identified in the preamble by using the word "the" and thus incorporates the terms by reference. See, e.g., '399 Patent, col. 12:50-52 ("a first connecting device for interfacing the host device with the interface device . . ."); '449 Patent, col.11:53-55 (same).

Third, where a preamble is used during prosecution of the patent to distinguish prior art, the preamble may serve as a claim limitation. In re Cruciferous Sprout Litig., 301 F.3d 1343, 1347 (Fed. Cir. 2008). In the prosecution history for the '399 Patent, Mr. Tasler distinguished prior art (the McNeil patent, U.S. Patent No. 5,499,378) by amending the preamble to state ". . . and a data transmit/receive device, the data transmit/receive device being arranged for providing analog data . . . ." CMs' Markman Br., Ex. C ("'399 File History") at 4-7 (underlined in original to show additional phrase). The preamble, as amended to distinguish prior art, serves as a claim limitation.

In sum, because the preamble describes the structure of the invention and gives meaning to Claim One, it must be interpreted as a claim limitation. Accordingly, the term "interface device" as used in the preamble should be construed.

The body of Claim One of the Patents indicates that the "interface device" is a standalone device. The '399 Patent describes
the communication (via the interface device) between a host device and a data transmit/receive device as involving a first command interpreter that, when asked by the computer "as to a type of a device attached to the multi-purpose interface of the host device [computer], sends a signal, regardless of the type of the data transmit/receive device attached to the second connecting device of the interface device . . . that it is an input/output device customary in a host device." '399 Patent, col. 12:66-67 & col. 13:1-5. The '449 Patent is similar:

the interface device is configured by the processor and the memory in such a way that the interface device, when receiving an inquiry from the host device as to the type of a device attached to the multi-purpose interface of the host device, sends a signal, regardless of the type of the data transmit/receive device attached to the second connecting device of the interface device, to the host device which signals to the host device that it is a storage device customary in a host device . . . .

'449 Patent, col. 11:59-67. In both Patents, the language "regardless of the type of the data transmit/receive device attached" strongly indicates that various kinds of data transmit/receive devices could be attached and that, therefore, the interface device was neither a permanent part of the data transmit/receive device nor of the host device/computer.

Similar language is repeated throughout both Patents. See, e.g., '399 Patent, Title, Abstract & col. 3:43-44 ("regardless" language); '449 Patent, Title, Abstract & col. 4:6-7 (same); see also '399 Patent, col. 3:24-27 ("It is an object of the present invention to provide an interface device for communication between a host device and a data transmit/receive device whose use is host device-independent . . . ."); '449 Patent, col. 3:20-23 ("It is the object of the present invention to provide an interface device for communication between a host device and a data transmit/receive device whose use is host device-independent . . . .") (emphasis added).

That the data transmit/receive device must be a separate device from the invention is not mere happenstance but an integral aspect of what was invented. Whatever uncertainty on this point may exist after studying the Claims is eliminated upon a review of the specification. The specification always describes three separate devices: the computer, the data transmit/receive device (an I/O device), and the interface device. See, e.g., '399 Patent, Title, Abstract, col. 1:1-14, col.3:25-28, col. 5:30-32, col. 5:47-63, Figs. 1-2 and accompanying text; '449 Patent, Title, Abstract, col. 1:1-17, col. 3:21-23, col. 4:35-36, col. 4:40-63, Figs. 1-2 and accompanying text; see also '399 Patent, col. 5:56-60 (describing Figure 1 as showing that the "second connecting device can be attached by means of an output line 16 to a data transmit/receive device which is to receive data from the host device or from which data is to be read, i.e. acquired, and transferred to the host device."); '449 Patent, col. 4:55-59 (same).

As explicitly explained in the specification, one of the problems with prior art, when attached "to a device whose data is to be acquired," was that "it is often very difficult to implement such interfaces for portable systems and they offer few possibilities for adaptation with the result that such systems offer little flexibility." '399 Patent, col. 1:21-22 & 31-34 (emphases added); '449 Patent, col. 1:22-23 & 32-35 (same). And yet portability and flexibility were critical because "[t]he devices from which data is to be acquired cover the entire electrical engineering spectrum." '399 Patent, col. 1:34-35; '449 Patent, col. 1:35-36. "[A]n interface may be put to totally different uses. It is therefore desirable that an interface be sufficiently flexible to permit attachment of very different electrical or electronic systems to a host device by means of the interface." '399 Patent, col. 1:56-59 (emphasis added); '449 Patent, col. 1:57-60 (same).

The invention was designed to answer these shortcomings of prior art and to provide a "flexible interface" that would allow communication between a computer and "an analog I/O device . . . regardless of the type of the I/O device." '399 Patent, Title; '449 Patent, Title. The specification touts the "enormous" benefit of allowing communication between a computer and many different types of data transmit/receive devices:

In the interface device according to the present invention an enormous advantage is to be gained, as apparent in the embodiment described in the following, in separating the actual hardware required to attach the interface device 10 7 to the data transmit/receive device from the communication unit . . . as this allows a plurality of dissimilar device types to be operated in parallel in identical manner.

'399 Patent, col. 8:23-31 (emphases added); '449 Patent, col. 7:23-31 (same). It is well-settled that "[w]hen a patent thus describes the features of the 'present invention' as a whole, this description limits the scope of the invention." Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1308 (Fed. Cir. 2007). The description in the specification, therefore,
necessarily limits the scope of the '399 and '449 Patents when it refers to the enormous advantage of "the present invention," to allow a plurality of dissimilar input/output devices to be accessed.

7 At times, the specification refers to the invention, its various components, and the devices to which it connects by numbers shown in Figure One as follows: interface device 10; host device 11; first connecting device 12; digital signal processor 13; memory 14; second connecting device 15; and data transmit/receive device 16. See '399 Patent, Sheet One; '449 Patent, Sheet One.

The specification also explains that the interface device provides a "universal solution" without regard to the types of data transmit/receive devices from which data may be acquired. '399 Patent, col. 12:37-40 ("The interface device 10 thus provides a universal solution which can cover the entire spectrum of possible data transmit/receive devices."); '449 Patent, col. 11:41-44 (same). Examples of transmit/receive devices that can be connected to a computer via the interface device include a "diagnostic radiology system in a medical engineering environment" and a "multimeter." '399 Patent, col. 1:34-54; '449 Patent, col. 1:35-55. The specification also notes the advantage to users of the interface device that they can obtain data from almost any data transmit/receive device with little prior knowledge:

By creating and editing a configuration file, normally a text file which is simple to understand with little prior knowledge, users of the interface device 10 are able to perform essentially identical operator actions for almost any data transmit/receive devices which can be attached to the second connecting device via the line 16, thus eliminating a source of error arising from users having to know many different command codes for different applications.

'399 Patent, col. 7:37-45; '449 Patent, col. 6:37-45; see also '399 Patent, col. 1:34-46 (explaining that the interface device could be used to simplify the data read/acquisition work of field technicians); '449 Patent, col. 1:35-47 (same).

As one learns from studying the Patents, the purpose of the invention was to allow fast communication between dissimilar data transmit/receive devices and computers, without the need for special software drivers. Thus, the invention cannot properly be limited to an interface device that is incapable of allowing a plurality of dissimilar transmit/receive devices to be connected or that cannot be flexible and portable to allow a plurality of dissimilar transmit/receive devices to be attached. This conclusion is further buttressed by the identical Figures that accompany each Patent. Figure 1 of each Patent "shows a general block diagram of the interface device according to the present invention," see '399 Patent, col. 5:38-39; '449 Patent, col. 4:41-42, and the Figure indicates that the data transmit/receive device is off the sheet, out of sight, not part of the Figure, and not part of the invention. '399 Patent, Sheet 1 ("to data transmit/receive device"); lower case substituted); '449 Patent, Sheet 1 (same). Figure 2 of each Patent, which depicts a preferred embodiment of the invention, also indicates that the data transmit/receive device and the host device/computer are separate and apart from the invention. '399 Patent, Sheet 2; '449 Patent, Sheet 2. The specification and Figures further indicate that the interface device is separate from the host computer and the transmit/receive device because it is designed to plug into an electrical outlet. See '399 Patent col. 9:65-66 ("The complete interface device 10 is supplied with power by an external AC/DC converter 1800 . . . ."); '449 Patent, col. 8:65-66 (same); see also '399 Patent, Sheet 2; '449 Patent, Sheet 2.

The prosecution history of the '399 Patent also supports the conclusion that the interface device is a stand-alone device. Mr. Tasler amended Claim One to add the phrase, "wherein the first command interpreter is configured in such a way that the command interpreter, when receiving an inquiry from the host device as to [the] a type of a device attached to the multi-purpose interface of the host device." '399 File History at 7 (underlined in original to show additional phrase; brackets in original to show deleted word). 8 The change from "the device" to "a device" is a change to more general language, indicating that the interface device was intended to be attached to, and detached from, various types of input/output devices. Mr. Tasler also explained to the PTO that "it is clear that the data transmit/receive device to be connected to the second connecting device of the subject interface provides analog data." Id. at 5 (emphasis added). The statement that the data transmit/receive device is "to be connected" similarly indicates that the inventor did not intend the interface device to be permanently affixed to a single data transmit/receive device, as it is "to be connected" to various data transmit/receive devices.
Papst argues that interpreting "interface device" to mean a stand-alone device would "improperly import[] the limitations from the specification to the claims. The claims don't say stand alone, they don't say physically connect, or readily connect or disconnect . . . ." Tr. 1:84 (Papst). The Court disagrees. The interface device, as discussed further below, "sends a signal, regardless of the type of the data transmit/receive device attached to the second connecting device of the interface device." '399 Patent, col. 13:1-5; '449 Patent, col. 11:63-65. Claim One contemplates and intends that a variety of transmit/receive devices may be connected to the interface device, which is also connected to the computer. To fulfill claim One, the "interface device" must, therefore, be a "stand-alone device."

Finally, two limitations in 879 patent claim 1 recite "interface means" for establishing network operational activity and communicating information. Datapoint urges that, despite the invocation of "means" language, "interface means" should not be subject to 35 U.S.C. § 112 P6. A rebuttable presumption exists that a claim limitation that uses "means" functional language is subject to § 112 P6. See Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1364, 54 U.S.P.Q.2D (BNA) 1449, 1452 (Fed. Cir. 2000). The patentee can rebut this presumption by demonstrating that the claim recites sufficient structure to perform the claimed function. Id. The only evidence Datapoint presents allegedly supporting its argument is its conclusory statement that "the term 'interface' connotes a well known structure," coupled with sundry citations to the specification. The Master's construction was not erroneous, as the claim hardly recites sufficient structure to perform the identified function. We are satisfied, given the quantum of evidence adduced by Datapoint, that the Special Master properly read the term "interface means" as subject to the provisions of 35 U.S.C. § 112 P6.
not describe any embodiment where electronic components that control the scanner are within the main case. Although this consideration is not dispositive, see Phillips v AWH Corp, 415 F3d 1303, 1323 (Fed Cir 2005) (warning against confining claims to particular embodiments in the specification), it nonetheless tends to confirm that by distinguishing prior art scanners in which the main case housed more than the minimum components needed to operate, the patentee did not contemplate embodiments of the '309 patent in which the main case enclosed the interface module.

The court concludes that the patentee limited the scope of the invention to scanners where the "scanner itself" contains "only" the minimum components needed to operate, viz, a motion mechanism and an image sensing module. By "scanner itself," the patentee meant the main module, depictions of which appear in the diagrams of the invention. The court finds that the patentee did not intend the invention to encompass scanners where the main case housed components in addition to the image sensing module and the motion mechanism.

Aside from the location of the interface module, plaintiff proposes that the term be construed to account for the fact that the interface module "comprises a control circuit that receives system control signals from the computing device and generates logical control signals for the image sensing module and the motion mechanism to operate in synchronization." Accounting for these features in the construction of the term "interface module" would render limitations contained in claim 7 superfluous. Plaintiff further proposes that the construction of this term accounts for the fact that the interface module "draws a power supply from the computing device to energize the image sensing module and the motion mechanism to operate." Claim 1 already includes this limitation, suggesting the patentee did not contemplate that this feature was inherent in the term "interface module." See Phillips, 415 F3d at 1325 ("The inclusion of such a specific limitation on the term 'baffles' in claim 2 makes it likely that the patentee did not contemplate that the term 'baffles' already contained that limitation.").

The court construes "interface module" as "interface engine located outside of the main case that houses the image sensing module and motion mechanism."

D. "Interface therebetween"

For this seemingly simple term, Hyperion proposes a long and complicated construction: a "component that maps the data
types of a relational database request (or a standard data type used to represent the relational database request) into the data types used in a multidimensional database aggregation module." Joint Cl Const at 27. HyperRoll counters that any construction of this term would be inappropriate because Hyperion "did not assert that the term 'interface therebetween' needed construction in its original Pat[ ]L R 4-1 contentions." Joint Cl Const at 27. If the term is construed, HyperRoll proposes the definition, "an interface between the aggregation module and the query processing mechanism." Id at 27-28.

Hyperion contends that "the 'interface' HyperRoll argued to the PTO was obviously different than the traditional 'interface.'" Doc # 197 (Hyperion Reply Br) at 6. In particular, Hyperion points to a specific embodiment of the interface described in the specification and contends that FIG 6A was "amended by HyperRoll to depict the SQL Interface in order to convince the PTO to allow the claims." Hyperion Br at 13.

First, Hyperion is incorrect in contending that HyperRoll amended the drawings to distinguish the invention from the prior art. The examiner had stated "that the applicants need to ensure that the interfaces are supported in the specification, claims, and Figures." Doc # 193, Ex C at 2. In response, the applicants added the "SQL Interface" to FIGS 6A and 13 and added the "over an interface therebetween" language to claim 1. Id at 4, 7, 19. The prosecution history does not suggest that this claim limitation only encompassed the SQL Interface depicted in the exemplary embodiments shown in FIGS 6A and 13.

More importantly, Hyperion's proposed construction impermissibly limits this term to an exemplary embodiment and fails to recognize that the specification states that a variety of interface types can be used:

604 patent at 11:43-50. Although the "standard interfaces" described here apparently are SQL interfaces, this broad language indicates that the "interface" need not be as limited as Hyperion suggests.

Moreover, Hyperion's proposed construction would render superfluous dependent claims 13 and 14, which specify respectively that the "interface" in claim 1 can be a "standard interface" and that the "standard interface is selected from the group consisting of OLDB, OLE-DB, ODBC, SQL, API, JDBC, etc.). In this case, the support mechanisms of the RDBMS and SQL handler include components that provide communication of such data over these standard interfaces. Such interface components are well known in the art.

604 patent at 11:43-50. Although the "standard interfaces" described here apparently are SQL interfaces, this broad language indicates that the "interface" need not be as limited as Hyperion suggests.

On the contrary, HyperRoll's simpler construction mirrors the language in claim 1, as the "interface therebetween" is described as an interface between the query processing mechanism and the aggregation module. '604 patent at claim 1. Accordingly, the court adopts HyperRoll's proposed construction.

6. Interfacing a processing device with a synchronous DRAM

The plaintiff proposes that "interfacing a processing device with a synchronous DRAM" means "reading and writing to the synchronous DRAM by a processing device." The defendants urge that the disputed phrase means "translating memory requests into synchronous DRAM commands." At issue is whether "interfacing" requires translation, In its reply brief, the plaintiff argues that the defendants' proposed construction introduces a notion of translation, which is inconsistent with the ordinary meaning of the term "interfacing." On the other hand, the defendants contend that the disclosed controller receives memory requests and translates them into SDRAM commands. The court construes the phrase "interfacing a processing device with a synchronous DRAM" to mean "enabling reading and writing to the synchronous DRAM by a processing device."
Interleaving and Interleaved mean "the merging of two different frames of an image, with or without overlap, such that a given line of the merged image includes alternating image elements from each frame."

9. "storing the FECC codewords in an interleaved manner, the interleaving being different for the codewords of the different data channels"

The next disputed term also appears in Claims 15 to 18. Defendants assert that disputed term [33] means "storing the FECC codewords such that interleaving is different for the codewords of the different data channels." (Chart at 11). Plaintiff asserts that the term means "all FECC codewords, which are coded from stored signals of each of two or more different data channels, are stored in an interleaved manner, with the interleaving being different for each of the two or more different data channels." (Id.). Thus, Plaintiff seeks to incorporate two limitations in the construction of the term: 1) "all FECC codewords" and 2) the codewords are "coded from stored signals." (See Tr. at 156:18-22).

Plaintiff essentially bases its arguments on its reading of the claim language. Plaintiff submits that the storage process applies to "all" of the FECC codewords because "the claim makes no reference to any of these codewords being stored in any other manner." Pl.'s Opening Br. at 42. Similarly, Plaintiff contends that the process of "sequentially FECC coding the stored signals" must apply to all stored signals "because no other reference is made to any other coding process involving these signals." (Id.).

The Court finds Plaintiff's arguments insufficient to overcome the general prohibition against importing limitations into the claim. See Storage Tech. Corp. v. Cisco Sys., Inc., 329 F.3d 823, 831 (Fed. Cir. 2003). The Court notes that the word "all" does not appear in the claim itself. Nor has Plaintiff referenced any of the patent's disclosure that would suggest to the Court that such a narrow construction is proper. Plaintiff's construction is based on its own interpretation of the claim, and the Court disagrees with such an interpretation. Additionally, in a rather conclusory manner, Plaintiff contends that its construction should be adopted based on "antecedent basis." (See Tr. at 158:10-15). Again, the Court notes that the term "all" does not appear anywhere in this claim. Therefore, Plaintiff's antecedent basis argument for importing "all" as a limitation is inapt and is rejected.

Accordingly, the Court concludes that disputed term [33] "storing the FECC codewords in an interleaved manner, the interleaving being different for the codewords of the different data channels" means "storing the FECC codewords such that interleaving is different for the codewords of the different data channels."

V. "Intermediate Nodes"

This term appears in the phrase "measuring an alternative cost of transmitting the message from the source to the destination along at least one alternative path, the alternative path passing through one or more intermediate nodes not on the default path." Plaintiff proposes that "intermediate nodes" refers to "network connection points that have additional functionality for exploiting overlay routing, and that cooperate to provide forwarding to paths overlaid over the underlying network." Defendant proposes "intermediate devices such as switches and routers that include additional processing capabilities for measuring and recording information about the alternative paths."

As these competing constructions indicate, the parties agree that "intermediate nodes" are nodes that have special processing capabilities that facilitate identification and utilization of alternative paths. Plaintiff objects to defendant's proposed construction because nodes, in plaintiff's view, are not limited to switches and routers, and because the claim language does not support a limitation whereby the nodes must be capable of "measuring and recording information." These objections are
well-taken. Defendant concedes that switches and routers are merely examples of nodes, and there is no basis for limiting the definition of "intermediate nodes" to include only those nodes that can record information. The prosecution history indicates only that the intermediate nodes must have processing capabilities "such as . . . custom software for measuring and recording information," not that a node cannot be an "intermediate node" unless it can measure and record information.

Defendant objects to plaintiff's proposed construction because it defines intermediate nodes in terms of an overlay network. In defendant's view, this construction impermissibly reads in a limitation from a preferred embodiment. While the patent does state that "in a preferred embodiment, . . . intermediate nodes are referred to as an 'overlay network,'" Col. 2:37-39, plaintiff's proposed construction of "intermediate nodes" refers only to "overlay routing" and "paths overlaid over the underlying network." Defendant does not dispute that the alternative paths described by the patent are "overlaid" atop the underlying network; indeed, the patent is titled "On-Demand Overlay Routing for Computer-Based Communication Networks." Accordingly, plaintiff's proposal does not import any unacceptable limitation into the construction of "intermediate nodes."

The Court will adopt plaintiff's proposed construction of this term.

2329

9. "Intermediate results file"

The parties dispute the meaning of the term "intermediate results file." Defendants assert "intermediate results file" should be construed to mean "a persistently saved file that includes a partial set of records that respond to the query." Plaintiff asserts the term is entitled to its ordinary meaning, but if the Court deems construction necessary, "intermediate results file" should be construed to mean "a file that includes one or more records or fields used to respond to the query."

Because "intermediate results file" has no ordinary meaning, the Court must construe the term. The first issue is whether an "intermediate results file" must be "persistently saved." The Court agrees with Plaintiff that nothing in the claims limits "intermediate results file" to a file that is "persistently saved." The term "file," as construed in the previous section, does not require persistent storage. In addition, the specification describes an embodiment in which "the memory of the distributed database system 160 is volatile memory, which means that stored data is lost when power is removed." Col. 6, at 46-52. Plaintiff's argument is also supported by the fact that dependent claims 7, 20, and 21 expressly require "persistent storage devices." See Enzo Biochem, Inc. v. Applera Corp., 599 F.3d 1325, 1342 (Fed. Cir. 2010) ("[T]he presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim."). Defendants rely on an example in the specification of one phase of a database query command, which states the "intermediate results file is saved for combining with the other intermediate results files." Col. 12, lines 49-53 (emphasis added). However, this does not indicate that an "intermediate results file" must be "persistently saved." Indeed, Defendants do not provide the Court with a definition for "persistently saved," except to argue it does not mean what Plaintiff contends it means - that the file must be able to survive a power outage.

The second issue is whether an "intermediate results file" contains "one or more records or fields" or "a partial set of records" in response to a query. The Court agrees with Plaintiff that Defendants' construction is too limiting. It is possible that an "intermediate results file" could contain a complete set of records, rather than a "partial" set. Defendants' construction does not take this possibility into account.

Therefore, the Court adopts Plaintiff's construction and construes "intermediate results file" to mean "a file that includes one or more records or fields used to respond to the query."

2330

7. "the I/O connectors including the one or more data transmission ports and to all components requiring intermittent access provided for the computer"
This term appears in the '408 patent claims 1 and 9. Rackable asserts that "the I/O connectors including the one or more data transmission ports and to all components requiring intermittent access provided for the computer" means "features that would normally be accessed from the rear of the main board in a standard computer, such as the I/O connectors, and accessible data drives if present." Supermicro contends that "the I/O connectors including the one or more data transmission ports and to all components requiring intermittent access provided for the computer" is indefinite under 35 U.S.C. § 112(2) due to the word "intermittent," or alternatively means "the i/o connectors including the one or more data transmission ports and all parts of the computer that require occasional access by the user or operator."

The essence of the dispute here again appears to concern the meaning of the word "intermittent," and also which parts of a computer require access.

As with disputed term four, "components requiring intermittent physical access," Rackable appears to focus on the type and extent of I/O connectors described by the phrase; whereas, Supermicro focuses on the type of access. Rackable again argues that contrary to Supermicro, not each and every attachment to a computer requires "intermittent" physical access. It asserts that instead, as with term four, the "components requiring intermittent access" include only "physical input and output sockets that are found on the main board, and various data drives or storage devices if they are present."

Supermicro again, as with term four, argues that the phrase is indefinite, based on the term "intermittent."

For the reasons set forth above with respect to term four, the court concludes that “the I/O connectors including the one or more data transmission ports and to all components requiring intermittent access provided for the computer,” is indefinite under 35 U.S.C. § 112 based on its use of the term "intermittent."

GO BACK

2331

4. "components requiring intermittent physical access"

This term appears in the '366 patent claims 15, 16, and 39.

Rackable asserts that "components requiring intermittent physical access" means "features that would normally be accessed in use from the rear of the main board in a standard computer chassis, such as I/O connectors, and accessible data drives if present." Supermicro contends that "components requiring intermittent physical access" is indefinite under 35 U.S.C. § 112 due to the word "intermittent," or alternatively, means "parts of the computer requiring occasional physical access by a user or operator."

Supermicro again argues that this phrase is indefinite, based on the term "intermittent." It argues that the term does not adequately describe the degree of access required, and is therefore ambiguous. Supermicro further asserts that Rackable's definition itself makes the phrase increasingly vague and ambiguous. It argues that the terms "normally" and "standard" are themselves subjective and ambiguous. Alternatively, Supermicro argues that the term "intermittent" should be replaced with "occasional," based on the dictionary definition of "intermittent."

Rackable responds that Supermicro's "reason for pretending there is ambiguity is [to] move the claims away from main board features to instead require non-main board features, such as the socket for the power plug, to be on front, even though the socket is not a main board feature, the plug and power source is not a peripheral device, and the front panel power and reset buttons confirm the lack of need for intermittent access to a socket."

The '366 patent abstract, suggests that "intermittent" is synonymous with "periodic." It provides in part:

By placement of access space to all elements which require periodic attention at the front of each computer, the need for significant space at the rear of the computer is eliminated.

'366 patent. Additionally, in the summary of the invention, the specification provides, regarding the elements that should be located at the front of the computer, that: "Desirably, those [attachments] which require physical access periodically or would significantly hinder forward removal of the machine from a rack in which it may be placed are provided for at the
front of the chassis." '366 patent, 4: 9-12.

However, the patent's reference to "periodic" does not save the term from indefiniteness. That is because both terms -- "periodic" and "intermittent" -- suggest time frames, and a certain regularity that depends on a user's purpose. However, as discussed above regarding the term "front," because a user's purpose is highly subjective and variable, the terms "periodic" and "intermittent" do not provide the type of "objective anchor" required by 35 U.S.C. § 112.  n1

--- Footnotes ---

n1 The court also rejects Supermicro's alternative construction of "intermittent" as "occasional." Both "intermittent" and "periodic" suggest some regularity, which is not reflected in the term "occasional."

--- End Footnotes ---

For these reasons, the court declines to adopt either parties' construction, and concludes that "components requiring intermittent physical access" is indefinite under 35 U.S.C. § 112.

A. The Meaning of "Intermittent Power" in the 763 Patent

Excellent Inventions has proposed a construction for "intermittent" in both patents as "stopping and starting at irregular intervals." This proposed construction relies on the primary purpose of the invention -- "to simulate, through a controlled device, natural wind which itself starts and stops at irregular intervals" -- and the prosecution history of the later 416 Patent. (Docket Entry No. 23, p. 7). Homedics contends that the 763 Patent does not support construing the claim term, "a motor for generating intermittent power," to mean only power generated at irregular intervals. The Homedics proposed construction of "a motor for generating intermittent power" is a "a motor that operates at intervals -- both regular and irregular."

This court finds that the term "intermittent power" in claim two of the 763 Patent means power generated at intervals, regular or irregular. In so determining, the court looks to the intrinsic evidence of the patent, "the patent itself, its claims, written description, and, if in evidence, the prosecution history." Elkay Manufacturing Co. v. Ebco Manufacturing Co., 192 F.3d 973, 976-77 (Fed. Cir. 1999). Excellent Inventions correctly argues that generally, a claim term must usually be given a consistent construction throughout a patent. Georgia Pacific Corp. v. U.S. Gypsum Co., 195 F.3d 1322, 1331 (Fed. Cir. 1999) (unless a patent otherwise provides, a claim term cannot be given a different meaning in the various claims of the same patent); Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995) (holding that claim term found in different claims must be interpreted consistently). But Excellent Inventions's reliance on isolated statements from the prosecution history of the 416 Patent Application to construe a claim term from the 763 Patent is misplaced for several reasons.

First, the claims are different. Claim one of the 416 Patent calls for "a control circuit for controlling said power source to generate intermittent wind thereby causing said chimes to emit sound"; claim two of the 763 Patent calls for a "motor for generating intermittent power." "There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims." Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987).

Second, the prosecution history of the 763 Patent is not before this court. Any later action by a patentee cannot change the construction of a patent claim. Instead, patent claims should be construed as if the case was brought the day after issuance. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) (holding that not even a patentee's later actions may change the proper construction of a patent, in order to permit public reliance on the record). "Although prosecution history can and should be used to understand the language used in the claims, it . . . cannot enlarge, diminish, or vary the limitations in the claims." Markman, 52 F.3d at 979 (quoting Goodyear Dental Vulcanite Co. v. Davis, 102 U.S. 222, 227, 25 L.Ed. 149, 1881 Dec. Comm'r Pat. 131 (1880)). When the specification and the prosecution history conflict, any ambiguities must be resolved in favor of the specification and the claims. See Biogen, Inc. v. Berlex Labs., Inc., 318 F.3d 1132, 1140 (Fed. Cir.2003).
Nothing in the claim itself limits the term "intermittent power" to "power that occurs or is generated at irregular intervals." See Liebel-Flarsheim Co., 358 F.3d 898 at 904-05; In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994) (improper for patentee to import "extraneous" limitation to avoid anticipation apart from any need to interpret particular words or phrases in the claim). Excellent Inventions relies on the invention's purpose -- to simulate the inherently irregular nature of natural wind -- to support its construction that "intermittent" power means power that occurs at irregular intervals. Excellent Inventions points out that the specification "describes how natural wind can be simulated through a program using predetermined frequency or timetable or any other programmed order." (Docket Entry No. 15, p. 7). The portion of the specification cited describes the power source, as follows:

The power source 12 is controlled by a control circuit 16 that induces electrical power to the post at predetermined times or randomly depending upon the desired sound. A random generator 17 in circuit 16 is capable of causing the power source to operate at different times to create the kind of random sounds a wind chime might make in response to actual natural wind. The control circuit 16 may also be programmed to create movement on the chimes on a predetermined frequency or timetable or any other programmed order.

(Docket Entry No. 24, Ex. A, col. 2, 11. 43-52)(emphasis added). The words "may also," make clear that a "predetermined frequency" and "programmed order" are different from "random." The specification makes it clear that the circuit that controls the motor can be set to predetermined intervals or "randomly." Although the preferred embodiment uses a "random generator" "designed to achieve a realistic wind generation," (Id., col. 3, 11. 9-11), the description concludes by stating that "it would be well known in the art to create a motor that activated the fan in a more recurrent fashion or continuously." (Id., col. 3, 11. 9-21).

Because the intrinsic evidence resolves the meaning of the term in dispute, it is unnecessary to examine extrinsic evidence. See Vitronics, at 90 F.3d 1576, 1583. n5 "Intermittent power" as used in the 763 Patent means "power generated at irregular or regular intervals."

n5 Webster's Ninth New Collegiate Dictionary's definition of "intermittent" provides support for this court's construction: "coming and going at intervals: not continuous." Dictionary.com defines "intermittent" as "stopping and starting at intervals." Considered in the context of the intrinsic evidence, the dictionary definition provides a reliable interpretation. See Phillips, 415 F.3d 1303, 2005 WL 1620331 at *11.

GO BACK

B. The Meaning of "Intermittent Wind" in the 416 Patent

Homedics argues that the term "said power source to generate intermittent wind" in claim one of the 416 Patent" should be construed as "said power source to generate wind at random intervals." Excellent Inventions contends that it is error to construe "intermittent" in the 416 Patent as limited to "random intervals" and argues that the proper definition of "intermittent wind" is "wind stopping and starting at irregular intervals."

The term "random" is not found within claim one, which refers to a control circuit for controlling said power source to generate intermittent wind" that cause chimes to emit sound. The term "random" is found within claim two, which refers to "chimes that move in response to wind from programmed power generated by said power source to simulate random wind." The summary of the invention and the detailed description of the preferred embodiments use the word "intermittent" to describe power generated in some of the different embodiments and to describe wind; the word "random" is used to describe a type of generator and to describe the nature of actual wind. The preferred embodiments include magnetically-powered wind chime that can operate "at predetermined times or randomly"; water-generated movement of the chimes that occurs when water "intermittently" passes the chimes; wind-generated movement of the chimes in which the wind is created by a "random generator" driving a motor that in turn drives a fan that causes the chimes to move, in a fashion that can be "more
recurrent or continuously" or "at irregular intervals that may also rotate at different speeds or in different directions to create the effect of random wind moving the chimes." A fourth preferred embodiment uses a wind generator powered by water moving across wheels at "intermittent times" to drive the fan "intermittently." A fifth embodiment uses an ionic wind generator to move the chimes, using a "random generator" to create the sensation of "intermittent wind." (Docket Entry No. 24, Ex. B, col. 4, 11. 16-18).

During the prosecution of the 416 Patent, Petruzzi argued to the examiner that it was not invalidated by the Japanese Patent, which claimed a chime that operated at regular intervals to mark time. Petruzzi stated:

Japanese patent JP 11084037 published March 26, 1999 showing an alarm clock that signals an alarm with a chime moved by generated wind and a regular half hour or hourly chiming function. It fails to show or teach the use of an intermittent or random generator or programmable circuit for simulating the random nature of actual wind.

(Docket Entry No. 24, Ex. E, p. 3). Petruzzi contrasted a chime moved by wind generated at predictable, regular, preset intervals from a chime moved by wind created by an "intermittent or random generator or programmable circuit." Wind generated by an "intermittent or random generator or programmable circuit" is contrasted to the kind of regular, predetermined chiming noise necessary to function as an alarm clock. Wind that is generated at regular, predetermined intervals can be used to operate chimes that serve as an alarm clock, but this is in contrast to "intermittent wind" that simulates the "random nature of actual wind." "Random wind" can be created by either an "intermittent or random generator or programmable circuit." Petruzzi made it clear that "intermittent wind" meant wind that was not continuous nor regular. The prosecution history does not, however, require the conclusion that "random" only means at intervals, whether regular or irregular, as opposed to occurring in a manner that is so irregular as to be lacking in pattern or predictability.

The specifications support a construction that "intermittent wind" means wind that blows at irregular intervals, while "random" appears to mean irregular or unpredictable occurrences that can be continuous or at intervals. Several of the specifications show that "random wind" includes wind that may blow continuously, but at varying and unpredictable speeds and directions. (See Docket Entry No. 24, Ex. B, Fig 4 and col. 3, 11. 26-44). By contrast, "intermittent wind" means wind that blows at intervals, that are defined in the 416 Patent to mean only intervals that are irregular. (See Id. col. 2, 36-67, col. 3, 1-6, col.3, 26-45, col. 4, 1-17).

Footnotes

n6 Webster's Ninth New Collegiate Dictionary defines "random" as "... lacking a definite plan, purpose or pattern." On Dictionary.com, "random" is similarly defined as "having no specific pattern, purpose or objective." McGraw Hill's Scientific and Technical Dictionary defines random paired with several other words, including:

random forecast [METEOROLOGY] A forecast in which one of a set of meteorological contingencies is selected on the basis of chance; it is often used as a standard of comparison in determining the degree of skill of another forecast method.

random mating [GENETICS] A mating system in which there is an equal opportunity for all male and female gametes to join in fertilization.

By attempting to find a reliable dictionary definition of "random," this court runs into two of the problems the Federal Circuit warned of in Phillips: that the extrinsic evidence is less useful than intrinsic evidence because it is not created "for the purpose of explaining the patent's scope and meaning" and "there is a virtually unbounded universe of potential extrinsic evidence of some marginal relevance that could be brought to bear on any claim construction question." Phillips, 415 F.3d 1303, 2005 WL 1620331 at *11.

This court concludes that "intermittent wind" in claim one of the 416 Patent means wind that blows at irregular intervals.
The Court modifies MEI's proposed construction and construes the term as "the internal circuit which is protected by the surge protection apparatus." Samsung's proposed construction--"a circuit that is protected by the surge protection apparatus and is internal to the semiconductor integrated circuit"--imports limitations from claim 2 that do not appear in claim 1. There is no basis for importing a "semiconductor integrated circuit" limitation into the term. See '588 Patent Figs. 1, 2, 3, 5, 6, 10-12 (illustrating circuit diagrams that are not limited to semiconductor integrated circuits).

DE proposes that "international shipping information" be construed as "any information related to shipping a product internationally from its point of origination to its point of destination." Dell contends that the term means "information identifying all shipping options for each leg of the transport route."

Dell observes that the Detailed Description of the Preferred Embodiments section describes "the transaction system contains or interacts with various databases, including ... shipping information, including all options for each leg of a journey between product origination and customer destination." '020 Patent, col. 4, ll. 13-15. This reference to the shipping information is similar to the language of the claim itself. The specification also describes that "at step 132 a determination of the discrete legs or links of the overall transport route are determined based upon shipping data contained in the fifth data base and processing center." Id. at col. 8, ll. 32-35. This determination is based upon a standard shipping route, which can be determined by the vendor, "requested by the customer," or decided by some combination of the two. Id. at col. 8, ll. 36-37. In the example described, the customer "has options of how the [product being shipped] will be taken from the warf [sic], through U.S. Customs, and to the final destination." Id. at col. 8, ll. 27-29. The specification explains that, "thus, between the vendor and the customer each discrete leg of the transport route is determined (step 132), as well as the costs accompanying each of those discrete legs of the journey (step 134)." Id. at col. 8, ll. 30-33. As the specification describes, the customer's options are based upon the database of international shipping information, which must contain at least shipping options and associated costs. Although it is a recognized principal of claim construction that a preferred embodiment "cannot limit broader claims that are supported by the written description," the court does not attempt to do so in this case. Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999) (emphasis added). The court merely construes the claim term, "international shipping information," in the context of the specification. No broader concept of "international shipping information," without shipping options and associated costs, was described as embodying the invention. See id. (citing Adams v. United States, 383 U.S. 39, 49, 86 S. Ct. 708, 15 L. Ed. 2d 572, 174 Ct. Cl. 1293 (1966) ("it is fundamental that claims are to be construed in light of the specifications and both are to be read with a view to ascertaining the inventions").

The court therefore construes "international shipping information" as "any information, including at least shipping options and associated costs, related to shipping a product internationally from its point of origination to its point of destination."
March 14, 2005, the Court made the following claim construction rulings. "Spatial detail" means "geographic information relating to an area or region." "Internet" means "a system of linked computer networks, worldwide in scope, that typically is associated with using TCP/IP as a standard protocol" and "internet" means "a group of networks that have been connected by means of a common communications protocol." "Remote" or "Remotely" means "separated by an interval or distance" with "separated" meaning "to be set or kept apart." (R. 273-1.)

1. Internet

The parties appear to attach no significance to the fact that the disputed term is capitalized in one instance and not in another, so I will assume "Internet" is a proper noun in both cases. The crux of the dispute between the parties over this term is whether private networks are specifically excluded from "the Internet." Skyline argues that the Internet excludes "private networks even if they use internet protocols or have connections to the Internet." I find this exclusion too broad, but agree that some private networks may not be part of the Internet.

In ordinary usage, the Internet refers to the communication network composed of a multitude of interconnected smaller networks, which communicate via Internet Protocols. Some of the smaller networks are fully public, some are private, and most fall somewhere in between. An argument that "private networks" are not part of the Internet would be surprising to any home user who has a password protected wireless network. Clearly the home wireless network is private, in that only authorized users may log on, but it is also a part of the Internet. In fact, the Internet is composed largely of interconnected private networks, where access to any particular network is controlled via passwords or other authentication techniques.

However, there does seem to be a distinction between a private, in the sense of authenticated, network, and a wholly self-contained group of computers or other devices communicating only with one another. All parties in the November 1, 2006 Claim Construction hearing agreed that three computers hardwired to each other, and communicating only among themselves, were probably not part of "the Internet," even if they communicated via Internet Protocol. See Nov. 1, 2006 Transcript at p. 75:19-22. Although the public nature of the Internet should be captured in the idea of a "publicly accessible network," I will included a specific limitation on wholly self-contained private networks, to clarify that these are not part of "the Internet." However, if the private network is not wholly self-contained, in that it has a link to the broader Internet, I find that the network is part of the Internet, at least for the purposes of Claim 22 (which only requires a "connection to the internet"). For Claim 8, at least some portion of the download must happen over the broader Internet for the claim language to be satisfied. In general, I also agree with Skyline that the Internet is a single entity (the Internet), not several (an Internet).

n17 However, this construction is not intended to exclude networks such as Intenet2, which are built on separate physical infrastructure, but are essentially updated and experimental versions of the current Internet. Should more than one mesh of networks come to have the characteristics of "the Internet" as described, the term should be read to describe all such networks.

Construction: (Internet) The publicly accessible network capable of relaying information via Internet Protocol, either alone or in conjunction with one or more other protocols, but not including a wholly self-contained private network of devices communicating only with each other.
relating to an area or region."

"Internet" means "a system of linked computer networks, worldwide in scope, that typically is associated with using TCP/IP as a standard protocol" and "internet" means "a group of networks that have been connected by means of a common communications protocol." "Remote" or "Remotely" means "separated by an interval or distance" with "separated" meaning "to be set or kept apart." (R. 273-1.)

First and foremost, the analytical focus of claim construction must begin, and remain centered, on the language of the claims themselves. Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1201-02 (Fed. Cir. 2002) (quoting Interactive Gift Express, Inc. v. CompuServe, Inc., 256 F.3d 1323, 1331 (Fed. Cir. 2001)). Because the claim language is chosen by the patentee to "particularly point[] out and distinctly claim[] the subject matter" of the invention, 35 U.S.C. § 112, P 2, the claim terms chosen by the patentee carry a presumption that "they mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art." Tex. Digital, 308 F.3d at 1202. In the absence of an express intent to impart a novel meaning to the claim terms, the words are presumed to take on the ordinary and customary meanings attributed to them by those of ordinary skill in the art. See, e.g., Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002). The ordinary and customary meaning of a claim term may be determined by reviewing a variety of sources, including the claims themselves, see Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1357 (Fed. Cir. 1999); dictionaries and treatises, Tex. Digital, 308 F.3d at 1202; and the written description, the drawings, and the prosecution history, see, e.g., DeMarini Sports, Inc. v. Worth, Inc., 239 F.3d 1314, 1324 (Fed. Cir. 2001).

While certain terms may be at the center of the claim construction debate, the context of the surrounding words of the claim also must be considered in determining the ordinary and customary meaning of those terms. See Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 334 F.3d 1294, 1299 (Fed. Cir. 2003); Hockerson-Halberstadt, Inc. v. Converse Inc., 183 F.3d 1369, 1374 (Fed. Cir. 1999).

ACTV, in arguing that the ordinary and customary meaning of the term URL encompasses both relative and absolute URLs, provides a document entitled Request for Comments 1808 ("RFC 1808"), from the World Wide Web Consortium ("W3C"), an industry working group, as authoritative support for this position. RFC 1808 discusses both absolute and relative URLs, noting that a relative URL "is a shortened form of that for [an] absolute [URL]" and that a relative URL is "a compact representation of the location of a resource." In response, Disney offers an earlier document entitled Request for Comments 1738 ("RFC 1738"), from the same organization, in support of its argument that URL encompasses only absolute URLs. Specifically, RFC 1738 indicates that a URL has a typical syntax requiring both a protocol type and a resource locator. RFC 1738 also distinguishes between "relative links," in which the expression of a related resource is described "in the same place as this one except with the following relative path," and general URL syntax, which provides "an abstract identification of the resource location."

As this court has previously noted,

dictionaries, encyclopedias and treatises, publicly available at the time the patent is issued, are objective resources that serve as reliable sources of information on the established meanings that would have been attributed to the terms of the claims by those of skill in the art. Such references are unbiased reflections of common understanding not influenced by expert testimony or events subsequent to the fixing of the intrinsic record by the grant of the patent, not colored by the motives of the parties, and not inspired by litigation. Indeed, these materials may be the most meaningful sources of information to aid judges in better understanding both the technology and the terminology used by those skilled in the art to describe the technology.

Tex. Digital, 308 F.3d at 1202-03.

As a preliminary matter, we consider whether the RFCs presented by the parties rise to the level of unbiased, contemporaneous reflection of the common understanding of the technical terms in question as to be considered a reliable source of information on the meaning attributed to those terms by those skilled in the art. The purpose of the W3C organization is "to lead the World Wide Web to its full potential by developing common protocols that promote its evolution and ensure its interoperability." About the World Wide Web Consortium (W3C), at http://www.w3c.org/Consortium/
visited Aug. 7, 2003) ("W3C Website"). To this end, members of W3C (including various industry groups, manufacturers, and others, each with their own conceivable interests in the agenda) are involved in developing standards to describe the various building blocks of the Internet. Id. Both RFC 1738 and RFC 1808 are working papers generated during standardization discussions by one subset, or working group, within W3C. See, e.g., Uniform Resource Locators (RFC 1738), at http://www.w3.org/Addressing/rfc1738.txt (T. Berners-Lee et al. eds. Dec. 1994) ("This document specifies an Internet standards track protocol . . ."). The purpose of the RFCs is thus to collect commentary and to select language to facilitate a common understanding, or to select a standard, from a variety of competing technologies and vocabularies and from a variety of potentially competing interests. Indeed, the acronym "RFC" suggests that end: "Request for Comments." This purpose is in sharp contrast to the role of dictionaries and treatises, which aim not to select or give meaning to a word or phrase, but to report the meaning already established and commonly understood by those skilled in the art. See, e.g., Samuel A. Thumma & Jeffrey L. Kirchmeier, The Lexicon Has Become a Fortress: The United States Supreme Court's Use of Dictionaries, 47 Buff. L. Rev. 227, 291 (1999) (stating that first resort to a dictionary may be appropriate in determining meaning because "dictionaries are designed to reflect usage." (emphasis added)).

Both parties offer these RFC documents as authoritative, unbiased sources relating to the meaning of the expression URL. Because the RFCs were not designed to reflect common usage, but rather to assign language to facilitate further conversation, and because of the seeming contradictions between RFC 1738 and RFC 1808, we conclude that both documents are extrinsic evidence, and in light of the discussion below, we decline to rely on them in our claim construction analysis. See Vitravox Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) ("[I]f analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term . . . it is improper to rely on extrinsic evidence."). It should be understood, however, that there is no general prohibition on the use of publications from standards-setting organizations to aid in determining the ordinary and customary meaning of technical terms. Where such a document reflects common usage by those skilled in the relevant art, the document may indeed be an appropriate reference. Where, as in this case, the documents of the standards-setting organizations do not reflect common usage, but purport to select language to be used in the future, elevation of these Requests for Comments to the same authoritative, unbiased level as dictionaries is improper.

In the present case, the construction of URL is principally informed by the plain language and surrounding context of the claims themselves. See Brookhill-Wilk, 334 F.3d at 1299. The claims recite that a URL "specifies one or more Internet addresses of the information segments which relate specifically to the content of the video and audio signals of the programming." '181 patent, col. 59, ll. 8-12 (emphasis added). In construing the claim term URL, these additional terms contained in the claimed means-plus-function expressions provide context for the term URL and must themselves be construed. See, e.g., Hockerson-Halberstadt, 183 F.3d at 1374 ("Proper claim construction, however, demands interpretation of the entire claim in context, not a single element in isolation."). Thus, even though the district court's constructions of "Internet address" and "information segments" were not explicitly appealed, we must also construe those terms to properly construe the appealed term URL.

The district court's construction of "information segments" as "simply referring to parts into which information on the Internet is commonly divided" is supported by the claim language and the specification. See Markman Memorandum, 204 F. Supp. 2d at 653; '181 patent, col. 3, l. 6, col. 6, l. 12; '664 patent, col. 3, l. 31, col. 8, l. 32; '768 patent, col. 3, l. 33, col. 8, l. 55. These parts are exemplified by, but not limited to, items such as web pages, audio clips, and images. See id. However, the district court's construction of the term "Internet address," as "a particular host on the Internet, specified by a uniform resource locator that is unique to that host," Markman Memorandum, 204 F. Supp. 2d at 654, is not supported by the claim language or specification, and relies on circular reasoning related back to URL. Rather, the context of the term "Internet address" informs that it is simply a reference to a location of the information segment on the Internet. There is no support for the district court's added requirements that the "Internet address" be a particular host or that it be unique. A URL, then, as defined by the language and context of the claims, is something that identifies the location of relevant information segments. This can include web pages, audio clips, images, and the like. It can be an absolute URL or a relative URL, as long as it specifies one or more Internet addresses of information segments relating to Internet content.

1. As to claim 1, set forth in its entirety, with the disputed language emphasized: 3
1. A system for providing automatic access to preselected locations on the Internet, comprising:

   a published compilation of preselected Internet locations, said published compilation including a unique predetermined multi-digit jump code assigned to each of said preselected Internet locations published therein;

   a predetermined published Internet location having an address published in said published compilation, said predetermined published Internet location including means for capturing a desired multi-digit jump code assigned to each preselected Internet location after said multi-digit jump code has been entered by a user after accessing said predetermined published Internet location;

   means to accessing said predetermined published Internet location;

   means for receiving said desired multi-digit jump code from said means for capturing and means for converting said received multi-digit jump code to a URL address corresponding to the desired preselected Internet location; and

   means for automatically accessing said desired preselected Internet location using said URL address corresponding to said desired preselected Internet location, whereby said user need only enter said desired preselected Internet location without having to enter said corresponding URL address.

   - - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 The patent in suit is U.S. Patent No. 6,049,835 ("the '835 patent").

2 The '835 patent, directed towards a system (and a method) for providing automatic access to preselected Internet locations, proves the maxim that the simpler the invention, the more complicated the language used to describe and analyze it.

3 The disputed language of claim 11 is essentially the same, the only difference being that claim 11 is a method claim, rather than a system claim.

   - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

2. The '835 patent is directed to providing to "users of the World Wide Web portion of the Internet" "a specialized Web site which can be used in conjunction with published jump codes to readily and automatically access other Web sites or Internet locations, without the user having to remember or input the URL 4 of the desired Web site." (Col. 4, ll. 33-48) According to the preferred embodiment of the invention, 5 a user of the Web enters a specialized Web site by entering the URL of the specialized Web site. The URL of the specialized Web site must be disseminated in conjunction with the dissemination of jump codes for desired Web destinations, which codes are obtained from a printed publication. (Col. 5, ll. 39-44) The invention describes the printed publication as containing "a plurality of reviews of Web sites, each of which has a corresponding four digit jump code associated therewith." (Col. 5, ll. 57-61) After the user is on-line with the specialized Web site and enters the desired jump code, the specialized Web site is described as including a software program that is capable of accepting the jump code and "search[ing] through its database of URLs" in order to "find[ ] the URL which is linked to the input jump code. The software then links the user either directly to the desired Web site, or alternatively, first to a brief written review of the Web site." (Col. 7, ll. 6-10; see also col. 5, ll. 34-65)

   - - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 According to the patent, "[e]very Web site has an exact address or location on the Web. Such addresses are known as a Uniform Resource Locator or URL. URLs consist of a confusing string of subdirectories, files or executable commands, separated by slashes, which are extremely difficult to work with and which must be typed into the user's Web browser exactly as they appear, including the use of upper and lower-case letters, in order to go to a Web site." (Col. 3, ll. 53-60)

5 The only embodiment described.

   - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -
3. It is clear from the specification that the user chooses his/her desired Web sites through the materials contained in the printed publication and accesses said Web sites through entry of the four digit jump codes; i.e., the point of the invention is to allow users of the Web to browse the Web without having to use any URLs except that of the specialized Web site. This idea is captured in the claim language which describes "a URL address" as "corresponding to," not being the same as, a "preselected Internet location" (see col. 8, ll. 29-32), just as one's house is distinct from one's street address. Although the inventor used the words "Internet location" interchangeably with "URL," the specification also provides that, in addition to Web sites, "any other type of subject matter contained on the Internet which has a URL" can be accessed using the jump codes. (Col. 6, ll. 1-3) (emphasis added)

--- Footnotes ---

6 (See, e.g., col. 3, ll. 53-55; col. 4, ll. 29-30, 34-35, 39, 44)

--- End Footnotes ---

4. Therefore, the phrase "a published compilation of preselected Internet locations" is construed to mean "a publicly accessible collection of information which corresponds to preselected Web sites (or to any other type of preselected data found on the Internet) which have unique URL addresses, the URL addresses being associated with diverse individuals or entities." 7

--- Footnotes ---

7 In describing the claimed invention to the patent examiner, the inventor explained that his invention provides Internet users with the ability to reach any and all Internet locations on any of the servers connected to the Internet, as opposed to the single merchant server utilized by the [prior art] Levergood et al. system. (D.I. 138 at 061792-92) (emphasis added) Likewise, in distinguishing the claimed invention from other prior art, the inventor explained:

[W]hile Edelstein et al. proposes that information providers advertise the electronic addresses of their resources, it does not follow that information providers would have been motivated to publish a compilation, which would almost certainly include the electronic addresses of their competitors' resources. Instead, the advertisement taught by Edelstein et al. would take the form of an advertisement for a single company with the electronic address of the company's resource, just as companies today advertise their own (not their competitors') resources by their URLs. (Id. at 061834) (emphasis added)

--- End Footnotes ---

5. The phrase "a predetermined published Internet location" is construed to mean "a predetermined Web site (or any other type of data found on the Internet): (a) which has a unique URL address included in the published compilation; and (b) which serves to provide access to other preselected Internet locations." 8

--- Footnotes ---

8 I.e., the specialized Web site described in the specification.

--- End Footnotes ---
second user Internet point

The parties disagree on the meaning of "second user Internet point."

Dell argued that the ordinary meaning should suffice. Lucent proposed: "any terminal used by a site user via the Internet to access all or part of the multi-level managed information at the web site."

The court construes "second user Internet point" as follows:

"a terminal connected to the Internet through which the second user accesses the web site."

The concept of an "Internet portal" is central to Yodlee's patents, and the term appears in one of the above forms in every independent claim of the above patents.

1. ‘077 Patent

For the '077 patent, CashEdge construes "Internet portal" to mean "a website, requiring a username and password entered by the users for access, utilized as an entry point for other web sites," while Yodlee construes it to mean "a website, requiring user authentication, used to connect with Internet destination on behalf of end users and retrieve personal information." The term is described within Claim 1 as extracting personal information from other sites and presenting it to the end user, and not as an entry point for other sites. The Court adopts Yodlee's construction.

2. ‘451 Patent

For the '451 patent, Yodlee proposes that "Internet portal" be construed to mean "a website, requiring user authentication, used to connect with Internet destinations on behalf of end users and retrieve personal information and/or perform tasks specified by the user." CashEdge proposes "[a] website, requiring user authentication, used to connect with Internet destination on behalf of end users and retrieve personal information." The components of the Internet portal system are described in claim 1 of each patent, and each involves retrieval of information from other sites. '451 patent col. 9, line 50 -- col. 10, line 3. The Court adopts Yodlee's construction, as it is line with this description.

3. '042, '073, and '766 Patents

For the '042, '073, and '766 patents, Yodlee proposes that the Court construe "Internet portal" as "a website, requiring user authentication, used to connect with Internet destinations on behalf of end users," while CashEdge proposes "[a] website, requiring a username and password entered by the user for access, utilized as an entry point for other web sites." The parties agree that their constructions are very similar; the main point of contention is over whether "Internet Portal" must involve "a username and password" or can involve the broader "user authentication."

The Court adopts Yodlee's proposed construction. Claim 1 of the '073 patent refers only to a "log on by a user" and does not limit the manner in which the log on is conducted. Further, the patents refer to means of user authentication other than "a username and password entered by the user." See '073 patent, Abstract (referencing use of "a Smartcard or embedded password" for logging on); '042 patent at col. 10, lines 14-21. Because the patents do not limit the manner in which as user may log on, the Court adopts Yodlee's proposed construction. n2

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n2 This construction is slightly different from the construction of "Internet Portal" in the '077 and '451 patents.
Internet protocol (IP) address for identifying a mobile

Defendants submit this phrase should mean, "the IP address identifies the mobile for routing purposes to each node that routes the data packet to the mobile." Initially, Fenner argued the phrase should not be construed, but eventually agreed to the first part of Defendants' construction, "the IP address identifies the mobile for routing purposes." However, Fenner persists that Defendants' last clause "to each node that routes the data packet to the mobile" is inappropriate, and the Court agrees.

Defendants' additional language implicates a system of nodes by requiring the IP address to identify the mobile to each node that routes the data packet to the mobile. However, the claimed invention deals mostly with the operation of individual nodes. Independent Claims 1, 4, and 6 begin with, "in a communications node of a system" and the subsequent claim elements are not directed toward multiple nodes suggesting that the node is the focus of the claims. For example, the elements of claim 1, the "receiving", "storing", "looking up" and "forwarding" elements, are described within the specification as occurring at a single node (Figure 2 is described as "a schematic representation of the circuitry in an individual system node . . ."). 7:19-20. Claim 14 is structured differently, but is nonetheless focused on, "a message handling node for routing a data packet between two or more networks." Although the specification and prosecution history discuss the broader communication system, that discussion was largely contextual, providing a framework within which to place the claimed invention, but the invention itself is narrower. The larger system, to the extent it is not claimed, should not be read into an invention claiming a sub-part of that larger system.

Defendants counter that the specification and prosecution history referencing a larger system can be limiting in certain circumstances. Citing Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340 (Fed Cir. 2004), Defendants argue that Fenner publicly characterized the present invention as using an IP address to identify a mobile user to each node in the system to facilitate communication between a source and destination across a communications system. Having characterized the invention one way in the specification and to the PTO, Defendants argue, Fenner should not be allowed to characterize the invention in a different way before the Court. However, unlike in Multi-Tech, the prosecution history and specification of the '670 patent do not lead to the "inescapable conclusion" that the IP address identifies the mobile to each node that routes the data packet to the mobile. See SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1342.

In Multi-Tech, the Federal Circuit read a limitation appearing almost exclusively in the specification and prosecution history into the claims, requiring that the invention use a telephone line to transmit data packets. Multi-Tech Systems, 357 F.3d at 1349 (noting the specification referred to "data transmission 'over' or 'through' a telephone line roughly two dozen times.") In that case, and several like it, the Court found it appropriate to read limitations described in the specification and prosecution history into the claim because the limiting feature went to the heart of the invention or the specification limited the invention to embodiments with the particular feature. See Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1369-70 (Fed. Cir. 2003); Watts v. XL Sys., Inc., 232 F.3d 877, 882-83 (Fed. Cir. 2000). Here, the prosecution history excerpts Defendants cite are general, providing a big picture framework for the invention, and while the specification describes the larger system as Defendants contend, those descriptions are not so unequivocal as to preclude other embodiments or limit the claims.

As it is not clear that the specification and prosecution history limit the claimed invention, the Court will construe "Internet protocol (IP) address for identifying a mobile" to mean "the IP address (as construed herein) identifies the mobile for routing purposes.

B. The '532 Patent
The parties agree that claims 1, 2 and 3 of the '532 patent are similar to claims 1, 8 and 9 of the '281 patent, except for the language discussed below. Unless otherwise noted, therefore, all terms are construed consistently with the construction given the terms in the '281 patent.

1. Claim 1

Claim 1 of the '532 patent states in its entirety (with additional disputed terms highlighted):

A cinematic work having an altered facial display made in accordance with a process that includes substituting a second animated facial display for a first animated facial display and in which the displays have lip movements corresponding to the languages used and wherein the languages of the two displays are sufficiently different to result in different lip movements for each display, and which process further comprises:

- generating data in digital form representing the configuration of the second facial display over a plurality of cinematic frames,
- generating data in digital form representing the configuration of the first facial display over a plurality of cinematic frames, and
- altering under the control of both sets of said data and a programmed digital computer which provides numerical interpolation of lip distance data the configuration of said first facial display to produce substantially the configuration of the second facial display.

The defendants contend that "numerical interpolation of lip distance data" is limited to numerical interpolation of lip distance data to determine "working curves" from "standard curves." Bloomstein contends that the phrase refers both to the interpolation of working curves from standard curves and more generally to the interpolation of lip positions between frames of the cinematic work. The ordinary meaning of "lip distance" could be either the distance a lip moves from one frame to the next, the distances between the lips in a given frame (i.e. height and width), the distance along a lip curve, or some combination of these. The court therefore looks to the specification to resolve the ambiguity.

The specification expressly contemplates three kinds of interpolation: interpolation of movements for intermediate frames, interpolation of working curves from standard curves according to height and width data, and interpolation of intermediate points on working and standard curves according to control point data. Joint Memorandum, Ex. 1 at column 9:10-10:13. The defendants concede that several types of interpolation are discussed in the specification, but argue that "lip distances" refer only to the four "distances" disclosed in the specification: the upper height, lower height, inner width and outer width pictured in FIGURES 3 and 4. Id. at column 5:10-19. However, the mere reference to "lips" and "distances" in the same paragraph is not a clear enough definition of "lip distances" to further limit the ambiguous claim language.

The defendants also argue that the prosecution history precludes Bloomstein's broad interpretation. Bloomstein originally claimed "curve interpolation which provides numerical interpolation of lip distance data between control curves," but the examiner required the claim be modified to its present, ambiguous form. Defendant's Memorandum, Ex. B. at B-38, B-41. This argument has merit. The only "curves" disclosed in the specification are the standard curves and working curves that define the lip contour. The "distance . . . between control curves" can only refer to the heights and widths of the distance between these lip curves. The court agrees with the defendants that the interpolation step of claim 1 refers only to interpolation of working curves from standard curves according to the lip position data.

2. Claim 2

Claim 2 of the '532 patent states in its entirety (with additional disputed terms highlighted):

A cinematic work in which a second language and associated lip movements are substituted for a first language and associated lip movements in a cinematic work made up of a number of frames and wherein the two languages have different lip movements, made in a process including

- generating data in digital form representing the lip movements of the respective languages,
graphically interpolating lip distance between control data,
transmitting said data to a programmed digital computer, and
under control of said computer, and in accordance with said data, modifying the light intensities at selected areas of the frame to alter the lip movements of the first language to a configuration substantially corresponding to the lip movements of the second language.

Unlike claim 1, claim 2 is not limited to interpolation of distances between "curves" by the prosecution history. Instead, claim 2 uses the terms "lip distance between control data." This language is broader than claim 1, and may encompass each type of interpolation disclosed in the specification. 10

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

10 The court expresses no opinion at this time as to defendant's argument that the interpolation steps of claims 1 and 2 are fatally indefinite under 35 U.S.C. § 112(2).

5. What is the Proper Construction of the Term "Interpolator" in Claims 1 and 10 of the '481 Patent?

Claims 1 and 10 of the '481 patent use the term "interpolator." nVidia contends that the term "interpolator" should be interpreted according to the plain meaning of the term, and that it means something which interpolates. Silicon Graphics contends that interpolator means dedicated circuitry that performs interpolation, or a specific device within which the texture values to be assigned to pixels are calculated.

The '481 patent's specification provides a summary of the invention that states: "included within the same semiconductor chip [as the cache] is one or more interpolators. These interpolators produce an output texel by interpolating from the textures stored in memory." U.S. Patent No. 5,706,481, col. 2, ll. 47-50. The patent also describes the invention as "an apparatus and method for integrating texture memory and interpolation logic for performing texture mapping in a computer display system . . . ." Id. at col. 3, ll. 35-37.

Neither the patent's specification, claims nor prosecution history provide support for Silicon Graphics's argument that the interpolator means either "dedicated circuitry" or "a specific device" for interpolating pixels. Accordingly, the court looks to the ordinary meaning of the term. Johnson Worldwide Associates, Inc. v. Zebeo Corp., 1999 WL 243570, *3. The ordinary meaning of the term "interpolator" is to interpolate. nVidia provides the definition for interpolate in The American Heritage College Dictionary, which is as follows: "4. Math. To estimate a value of (a function or series) between two known values." The American Heritage College Dictionary, 710 (3d Ed.).

The court construes the term "interpolator" according to its ordinary meaning, and finds the term means something which interpolates.

7. "interpretation by the local computer"

Disputed Anthurium's Proposed
Claim Term Construction
Interpretation by the local computer to produce a set of computer readable job processing requirements.

Disputed Claim Term: Defendants' Proposed Construction

The central issue regarding this phrase is whether the Court should limit it to "logical reasoning," as the defendants suggest; indeed at the base of the disagreement is the definition of "interpretation." Claim 1 of the '998 patent indicates that "interpretation by the local computer" forms the basis of the "computer-readable job processing requirements." '998 Patent, cl. 1. The parties agree on the construction of "computer-readable job processing requirements," defining the phrase to mean "requirements for how a job is to be performed that are in a computer-readable form."

The defendants point to both the specification and the prosecution history for support. The only time the specification of the '998 patent mentions "interpretation" occurs in reference to Figures 2 through 60 of the appendix to the '998 patent. The specification discusses a rule-based system for translating user inputs. An example is shown in Figure 19 of the appendix. Additionally, the defendants assert that the prosecution history supports their proposed construction. During prosecution, the Examiner issued an Office Action in which he rejected claims 15-31 as being both (1) "not patentable distinct" over the '124 patent, and (2) obvious under 35 U.S.C. § 103 in light U.S. Patent Nos. 5,875,436 ("the Kikinis patent") and 5,828,730 ("the Zebryk patent"). Defs.' Ex. 4 at 253-55. In response to the Office Action, the patentee stated, "Applicant [] respectfully submits that neither Kikinis nor Zebryk discloses, teaches, or suggests job processing requirements that are based on interpretation by the local computer of the job instructions." Defs.' Ex. 4 at 26. In the subsequent Notice of Allowance, the Examiner states, "Kikinis and Zebryk [] does not teach the job includes a record including job processing requirements as interpreted by the local computer. Specifically, that the local computer interprets the job for processing requirements based on the job was not taught being done by the local computer, but by the server computer." Defs.' Ex. 4 at 7. The defendants thus argue that Anthurium's inclusion of "processing" is overly broad and seeks to recapture what the patentee unambiguously surrendered during prosecution. They point to the '124 patent, which indicates that the local computer of that patent "merely 'generates' a job packet." Defs.' Claims Construction Brief at 17. They assert that "interpretation" must mean something more that what was overcome in the prior art, specifically the '124 patent's use of "generate."

The prosecution history, however, does not present a clear disclaimer of claim scope. See Northern Telecom Ltd. v. Samsung Elecs. Co., Ltd., 215 F.3d 1281, 1294 (Fed. Cir. 2000). In her response, the patentee did not argue that the "local computer" performs "logical reasoning." In the Notice of Allowance, the Examiner did not elucidate what is meant by "interpretation." In fact, the crux of the allowance was the fact that prior art teaches "job processing requirements" as being done by a "server computer," whereas the '998 patent teaches "job processing requirements" as being done by a "local computer." There is no clear and unambiguous reason to infer that such job processing involves "logical reasoning," as the defendants suggest. Furthermore, the specification supports Anthurium's construction. See '998 patent, col. 6 ll. 20-33.

The Court defines "interpretation by the local computer" as follows: "processing the job instructions to produce a set of computer readable job processing requirements."
8. "interpreting" (’181 patent, claim 1; ’664 patent, claim 1; ’768 patent, claims 1 and 19)

Although "interpreting" on its face means analyzing and translating, defendants seek to limit the term's use here solely to the function illustrated in Figure 3 of all three patents of determining whether an incoming URL was previously received, and, if not, performing error checking and correction before sending it to a web browser. Defendants point to a description of the preferred embodiment that states that the client software "interprets the URL and determines whether the URL has been received previously . . ." ’181 patent, col. 5, 11. 20-22; see also ’664 patent, col. 7, 11. 44-46; ’768 patent, col. 7, 1. 67 - col. 8, 1. 2. However, quite aside from the fact that there is no reason to read this sentence as dispositive for all forms of interpreting involved in these patents, defendants' definition would make the second part of the quoted sentence redundant. Furthermore, the term "interprets" is elsewhere used in the patents in ways entirely different from defendants' proposed definition. Thus, other parts of the specification refer to client software that "retrieves the URLs, interpret[s] these URLs and direct[s] the JAVA enabled browser to retrieve the relevant Web page." Accordingly, the Court concludes that, in accordance with the function of the patented invention, "interpreting" refers to any kind of analyzing and translating utilized to enable the browser to effectively retrieve the relevant Web page.

**2348**

Claim 1 recites, in part, an "interrogator/reader" that includes a "field generator" and a "receiver." ’563 patent, col.9 ll.2-34. RFID argues that the claim uses the open-ended term "including," which, similar to "comprising," raises a presumption that the "interrogator/reader" is not limited to a "field generator" and a "receiver" and may include a transmitter. RFID Br. at 11-16 (citing SanDisk Corp. v. Memorex Prods., Inc., 415 F.3d 1278, 1284 (Fed. Cir. 2005) ("As a patent law term of art, 'includes' means 'comprising.' Neither includes, nor comprising, forecloses additional elements that need not satisfy the stated claim limitations.").

Claim 15 recites a method that, in part, requires "generating a field . . . with an interrogator/reader." ’563 Patent, col.10 l.55-col.11 l.16. The claim also requires the step of "receiving periodic signals transmitted by each field activated apparatus associated with each item within the range of the field." Id. While it is possible another structure could receive the periodic signals, claim 1 and the specification provide that the interrogator/reader comprises a receiver that receives each field activated apparatus's periodic signal. Id., col.9 ll.2-34, col.3 ll.18-41 (describing the interrogator/reader as designed to generate an RF field and receive signals from the RFID tags).

The specification does not rebut RFID's alleged presumption that the interrogator/reader can include a transmitter. The specification, however, does not strengthen RFID's argument, as it only describes the interrogator/reader's receiving and field generation capabilities. See, e.g., ’563 Patent, col.3 ll.23-25 (stating the system includes "an interrogator/reader designed to generate an RF field capable of activating the RFID's"); id., col.3 ll.32-38 (describing interrogator/reader capabilities as generating a field and receiving signals from RFID tags); id., col.4 ll.36-40, col.5 ll.11-14 (describing interrogator/reader's receiving capability); id., col.7 ll.7-23, ll.34-53, col.8 ll.13-18, ll.55-58 (describing interrogator/reader's field generation capability).

During prosecution before the United States Patent and Trademark Office ("PTO"), the patent examiner rejected claims 1 and 15 of the ’563 patent as obvious under 35 U.S.C. § 103(a) in view of U.S. Patent No. 5,686,902 ("the Reis patent") and U.S. Pat. No. 5,539,394 ("the Cato patent"). The Reis and Cato patents disclose an interrogator that contains a transmitter that communicates with RFID tags. See Reis patent, Fig. 2, col.6 ll.39-61, col.9 l.39-col.11 l.153; Cato patent, Fig. 2, col.3 ll.31-64. In both Reis and Cato, an interrogator sends polling commands to the tags. The applicant differentiated its claims from this prior art on the ground that the claimed interrogator/reader was simple, unlike the complex readers of the prior art that contained and used a transmitter to send commands to the tags.

The district court found:

"The applicant stressed, in the Preliminary Statement sections in its responses to the 35 U.S.C. § 103(a) rejection, that the applicant's invention only requires a field to poll the inventory and the interrogator/reader "is simply a receiver and field generator in its simplest form." Id. at Ex. 5D at 11; id. at 5F at 11 ("The present invention does not require the interrogator/reader to do anything more than receive transmitted signals from tags within the activation zone of a field generated by the interrogator/reader."); id. (stating ")[t]he Reis and Cato Patents simply do not disclose, teach or suggest an
inventory system where the interrogator/reader only received transmitted tag signals); see also id. at Ex. 5F at 9 ("the interrogator/reader is nothing more than a receiver that receives a signal[]], determines the unique code associated with the signal and forwards the code to the computer for updating the inventory list"). To specifically distinguish[] the present invention from the Reis and Cato Patents to transverse the 35 U.S.C. § 103(a) rejection, the applicant stated "[t]he [claimed] method . . . requires no polling and no transmission from the interrogator/reader, the field performs the polling, and the tags emit their uniquely modulated signals to the interrogator/reader when activated by the field . . . ." Id. at Ex. 5D at 15. Additionally, the applicant stated "[a]ll anticollision processing is handled at the tag level and not at the interrogator/reader level," which is consistent with the applicant's statements that distinguished the interrogator/readers disclosed in the Reis and Cato Patents on the basis that those interrogator/readers transmit data to the RFID tags. Id. at Ex. 5D at 11; id. at Ex. 5F at 9. In light of such distinctions, the applicant concluded the Reis Patent, the Cato Patent, or the combination of the two patents, does not disclose, teach, or suggest such a simple inventory control system and as a result did not render obvious the applicant's claims. Id. at Ex. 5D at 15; id. at Ex. 5F at 14.

The applicant made similar statements in response to a similar rejection during prosecution of the '563 Patent's parent application [analogous to the unamended application that became the '563 patent], which also claims an "interrogator/reader." The applicant stated "[t]he Reis [Patent] uses tag technology that requires the interrogator to send signals to the tags and receive signals from the tags in such a way as to minimize or eliminate simultaneous tag signal transmission." Id. at Ex. 4E at 12. With regard to the applicant's invention, "[i]n distinction, the present technology only requires that the interrogator generate a field and receive tag signals . . . ." Id. The applicant further stressed that this distinction was "fundamental." Id. That the Examiner did not rely on these statements, as the parent application never issued, does not negate the effect of the applicant's disclaimer. See Springs Window Fashions LP v. Novo Indus., L.P., 323 F.3d 989, 995 (Fed. Cir. 2003).

In light of these statements during prosecution, RFID cannot now contend that the claimed interrogator/reader is anything more than "simply a receiver and a field generator in its simplest form." See Computer Docking, 519 F.3d at 1376-70 ("portable computer" limitation in preamble of claim determined to mean "a computer without a built-in display or keyboard" due to prosecution statements distinguishing prior art as "requiring a portable display and keyboard," whereas the invention did not require a built-in display and keyboard); Innovad Inc. v. Microsoft Corp., 260 F.3d 1326, 1332 (Fed. Cir. 2001) (despite lack of explicit claim limitation prohibiting device from having a keyboard, devices with keyboard were beyond scope of the claims due to disclaimer in specification).

Accordingly, this court finds the district court properly found that the applicant's statements before the PTO, in total, clearly rebut RFID's argument that the interrogator/reader can include a transmitter and disclaim an interrogator/reader that includes a transmitter. This court affirms the district court's claim construction and summary judgment of noninfringement, finding the claim term "interrogator/reader" to mean "an interrogator/reader that includes a field generator and a receiver, but not a transmitter."

2349

i. Interrupts

Plaintiff Gobeli and Defendant Apple argue that an interrupt is "a hardware signal which literally interrupts the computer and causes control to be transferred to the interrupt handler." Defendant Sun believes the proper construction of "interrupt" is "one of a plurality of hardware signals, wherein each such signal corresponds to an external process and controls which of a plurality of defined routines is executed by the interrupt handler."

Plaintiff's and Apple's definition is taken verbatim from the specification at Col. 1, 11. 37-40. Thus, the Court agrees with Gobeli's and Apple's proposed construction.
1. Claim Construction

Boss argues that the district court erred in construing "wherein said controller is operative to interrupt power to the load responsive to said code-providing device being operatively disconnected from said controller." Specifically, Boss contends that "interrupt" should be given its ordinary and accustomed meaning of "to break off" or "to shut or cut off." Bombardier responds by arguing that the inventors gave a special definition to the term "interrupt" that does not involve simple "on-off" control of electrical power.

To interpret "interrupt," we first consult "the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). "Although words in a claim are generally given their ordinary and customary meaning, a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history." Id. "Thus, …it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Id. In fact, the specification "is the single best guide to the meaning of a disputed term." Id. However, "the court may also consider the prosecution history of the patent, if in evidence." Id. "In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances, it is improper to rely on extrinsic evidence." Id.

In this case the specification of the '206 patent clearly gives the term "interrupt" a special definition. In the "Background of the Invention" section, the specification states:

In the prior art, means have been provided to prevent unauthorized usage of electrical appliances and similar electrically operated devices, primarily through key operated electro-mechanical circuit interrupt devices. However, such devices conventionally provide for on-off control only, meaning that the device completely interrupts the flow of electrical power to the appliance while in the interrupt or "locked" state, and it connects the appliance to the electrical supply in the operative or "unlocked" state.

'206 patent, col. 1, ll. 33-42. The "Summary of the Invention" section goes on to distinguish the invention from the prior art discussed in the Background of the Invention:

In accordance with one aspect of the invention the appliance or device retains a connection to the power supply while in interrupt or "locked" mode; complete power shutoff only occurs when a preset electrical current is exceeded, thus allowing operation of the appliance's auxiliary electrical equipment while the interrupt device is in the interrupt mode.

Id. at col. 1, ll. 51-57. The specification therefore distinguishes between simple on-off interruption of electrical power and interruption of electrical power that occurs in two stages. In the first stage, a device retains a connection to a power supply such that auxiliary electrical equipment continues to operate. In the second stage, power to the device is completely shut off in response to current exceeding a preset limit. Thus, according to the specification, when electrical power is "interrupted," current is allowed to flow to the device up to a preset limit during a first stage of operation, and when the preset limit is exceeded, a second stage of operation is entered in which power to the device is completely shut off. In these ways, the specification clearly sets forth a definition of "interrupt" that is more detailed than simple on-off control.

The preferred embodiments are consistent with this definition of "interrupt." "While it is of course improper to limit the claims to the particular preferred embodiments described in the specification, the patentee's choice of preferred embodiments can shed light on the intended scope of the claims." Astrazeneca AB v. Mut. Pharm. Co., 384 F.3d 1333, 1340 (Fed. Cir. 2004). The "Detailed Description of the Invention" section of the '206 patent discloses a preferred embodiment of the invention in the form of an interrupt device coupled to a household appliance such as an electric stove. This section describes the operation of the interrupt device and the stove:

In the preferred embodiment, when the appliance 11 is in the interrupt mode, auxiliary functions, such as a clock and/or
light, remain operational, so long as their combined current draw is less than the "current threshold". When an unauthorized person attempts to use the heating functions of the appliance 11, which draw a comparatively greater current, the current threshold will be exceeded and the relay contacts 20 or 21 will be opened, disconnecting the main power supply from the appliance while still supplying power to the microcontroller 26 through DC power supply 25.

It will be understood that in the described embodiments the device in the interrupt mode does not actually cut off power to the appliance, i.e. interrupt the main power supply, until the current threshold is exceeded by turning on a high current-drawing component of the appliance 11, such as a heating element.

Thus unauthorized attempts to use the appliance in the described embodiment wherein the interrupt device is operatively connected with a stove, are immediately obvious from the fact that the auxiliary clock and light functions of the stove no longer operate.

'206 patent, col. 6, ll. 3-23. This description confirms that, in the context of the invention, interruption of power to an electrical device involves two stages: a first stage in which auxiliary functions remain operational so long as a combined current draw is less than a current threshold, and a second stage in which power to the device is completely disconnected in response to the current threshold being exceeded.

In contrast to the way in which the specification distinguishes the invention's concept of a two-stage interruption of electrical power from the simple on-off interruption of electrical power in prior art devices, Boss argues that we should construe "interrupt" as "to break off" or "to shut or cut off." To support this construction, Boss points to a dictionary as well as the prosecution history of the '206 patent. Neither the dictionary definition nor the prosecution history, however, overcomes the particular meaning of "interrupt" clearly set forth in the specification. While at least one dictionary defines "interrupt" as "to break off" or "to shut or cut off," as discussed above the specification clearly sets forth a definition of "interrupt" that is not limited to a simple on-off control of electrical power. Furthermore, while it is true that during prosecution the applicants twice used the phrase "cut off" interchangeably with the term "interrupt," this usage does not operate to erase the clear definition of "interrupt" found in the specification of the '206 patent. Moreover, this usage of "interrupt" is consistent with the second stage of the interrupt mode described in the specification: complete disconnection of power.

Boss also attempts to distinguish claim 7's use of the term "interrupt" from use of the phrase "interrupt mode" found elsewhere in specification, including other claims. Use of the term "interrupt" in the context of claim 7, however, is consistent with use of the phrase "interrupt mode" in the remainder of the specification. For example, the specification describes how the interrupt device switches to the interrupt mode:

the interrupt device is switched to the interrupt mode in one of three ways: …2) the authorized person detaches or uncouples the key pad 27 from the main body 10 by disconnecting plug 42 on cord 41 from the receptacle 43 in the key pad 27 ....

'206 patent, col. 5, ll. 61-67. This description makes clear that one of the ways in which the interrupt device switches to the interrupt mode is when a key pad is detached, uncoupled, or disconnected from the interrupt device. Similarly, claim 7 recites "wherein said controller is operative to interrupt power to the load responsive to said code-providing device being operatively disconnected from said controller." "Interrupt" as it is used in claim 7 is therefore fully consistent with the "interrupt mode" discussed elsewhere in the specification.

Because the specification makes clear that the invention involves a two-stage interrupt mode, the intrinsic evidence binds Boss to a narrower definition of "interrupt" than the extrinsic evidence might support. See Astrazeneca, 384 F.3d at 1338. See also SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001) ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question.").

In sum, "interrupt" requires: (1) providing electrical current to a device up to a preset threshold so that auxiliary components may continue to operate; and (2) completely shutting off electrical current to the device when the electrical current exceeds the preset threshold. The district court did not err in its claim construction.
4. interrupting n2 (claim 8)

n2 The parties offered the term "interrupting . . . and resuming" for construction, but I have omitted "resuming" because the parties' briefs and arguments at the hearing made it clear that the meaning of "resuming" is not in dispute.

Plaintiff's construction: stopping temporarily or suspending the execution of a program or process upon receipt of an interrupt signal at any time, so that another program or process can be performed

Defendants' construction: temporarily stopping a formatting operation

For this term, it is plaintiff that proposes the much more complicated construction. While defendants propose the ordinary, non-technical meaning of "interrupting," plaintiff seeks to include the purpose of the interruption ("so that another program process can be formed"), its timing ("at any time") and that the interruption occurs as the result of an "interrupt signal."

As an initial matter, it seems unusual to include the purpose of the interrupting in the definition of interrupting because it limits the term's meaning to a particular type or subset of interrupting that is not suggested by the word alone, at least its ordinary meaning. In any event, including the purpose of the interruption in the construction would be redundant because the surrounding claim language shows that the formatting process is interrupted in order to "enabl[e] the execution" of another process. There is no need to repeat this in the construction of a particular term in the claim.

With respect to plaintiff's proposal that the interruption occur "at any time," the language of the claim itself does not limit the timing of the interruption, so this part of plaintiff's proposal should be adopted unless defendants can point to something in the specification restricting the interruption to a particular time. Because defendants did not object to this part of plaintiff's construction in their briefs or at the hearing, I will adopt it.

The biggest dispute surrounding this term is whether the claim requires that the "interrupting" occur in response to an "interrupt signal." It is plaintiff that must make a case to include this term because the claim does not include a reference to an "interrupt signal." In fact, as defendants point out, there is no mention of an "interrupt signal" anywhere in the entire patent.

At the hearing, plaintiff modified its position somewhat by saying that the precise words "interrupt signal" are not important, but rather what matters is that the construction include the idea that the formatting process is suspended in response to a read or write request. In support of this position, plaintiff cited several passages in the specification:

"the background formatting means may include means for interrupting the formatting process when a request for recording user data is made," '955 Patent, col. 3, Ins. 20-23;

"the background formatting means may include means for interrupting the formatting process when a request for reproducing data recorded in a designated area is made," '955 Patent, col. 3, Ins. 40-43;

"the controller 9 serves to interrupt the formatting operation when a request is made for reproducing user data recorded in a designated area during the formatting operation in the background process," '955 Patent, col. 7, Ins, 11-13.

Plaintiff is correct that in each of these passages, there is a reference to "interrupting . . . when a request is made," but these references do not define "interrupting" to mean that the process is stopped in response to a request. In other words, the references suggest that the interruption occurs after a request, but they do not suggest that the making of a request is inherent in the meaning of "interrupting" as it is used in the patent. They are separate concepts.
Further, even if I concluded that each of the cited references defined "interrupting" in the manner suggested by plaintiff, it would not necessarily follow that "interrupting" has the same meaning in claim 8. This presents another question whether the specification is being used to interpret the claim or to import limitations into the claim. The first two citations say only that the background formatting process "may" include a means for interrupting when a request is made; it does not require it. The third citation is in the context of a discussion of one of the preferred embodiments; it does not purport to be a requirement for all embodiments.

It would have been easy enough for the inventor to include plaintiff's suggested limitation in the claim itself. Rather than its current form, the relevant portion of claim 8 could have stated (as plaintiff's references in the specification do), that the device "enabl[es] execution of at least one of a recording process and a reproducing process by interrupting the formatting process in response to a request . . . ." The omission of this phrase strongly suggests that it is not part of the claim and should not be read back into it.

Notably, claims 10 and 12 of the '955 patent do include language that interrupting occurs "when a request . . . is made." '955 Patent, col. 13, Ins. 52-53, 66-67. Plaintiff believes that claims 10 and 12 support its position, but I think it is just the opposite. The presumption in claim construction is that inventors choose their words carefully. Phillips, 415 F.3d at 1314 ("Differences among claims can also be a useful guide in understanding the meaning of particular claim terms."). The inventor's decision to expressly state in claims 10 and 12 that the interruption occurs in response to a request indicates that the omission in claim 8 was purposeful. Also, if "interrupting" in the context of the '955 patent inherently means that it occurs in response to a request, as plaintiff says, there would be no need to include the additional language in claims 10 and 12, unless the term means one thing in claim 8 and another in claims 10 and 12. This would conflict with the presumption that the same term has the same meaning throughout the patent, Phillips, 415 F.3d at 1314, a presumption that plaintiff has not even attempted to overcome.

Accordingly, I will adopt defendants' proposal, with the proviso that the interruption may occur at any time.

**Court's construction: temporarily stopping a formatting operation, which may occur at any time**

---

**2352**

- "interval" is construed to mean "a period of time." Lucent contends that this term, in the phrase "accumulating a count of bytes of data arriving at a node per interval," means "a period of time." (D.I. 396 at 6.) Extreme contends that this term means "a fixed period of time between successive decrements to the value of count in the accumulator for each virtual circuit being monitored." (D.I. 399 at 8.) Foundry contends that this term means "the period between successive decrements to the value of COUNT in the accumulator; this is a fixed interval for each virtual circuit being monitored and may differ among the virtual circuits. (D.I. 385 at 13.) In support of their contentions, Defendants point to the description of parameter "I" in the specification. ('810 patent at 7:7-10.) The Court finds that Lucent has not clearly defined the term "interval" by way of describing this parameter. Thus, in the Court's view, the Court's construction is consistent with the plain language of the claim and the specification.

**GO BACK**

---

**2353**

6. "intervention"

The parties partially agree that "intervention" means "an action by a health care provider." They disagree on how to characterize the nature of that action. Plaintiff submits the remaining construction as: "to manage the care of an individual patient." Defendants differ with: "to change a patient's care." Defendants' argument here is reminiscent of its position regarding the construction of "remote command center," where they asked the Court to adopt the narrower meaning of "directing the intervention" over plaintiff's proposed "managing the care." Here, similarly, "changing" a patient's care is more restrictive than "managing" a patient's care in that managing can encompass a "change" of care (i.e., implementing new or different symptoms or care methods) or monitoring existing conditions. As plaintiff noted, reinserting a clogged breathing tube has not "changed" the care but "managed" the care and this type of intervention was clearly contemplated in
the claim. (Hr’g., p. 183.) Read as a whole, claim 17 describes a method for providing expert critical care, which in our view is expansive and does not limit the intensivists to only "changing" the care. Indeed, defendants have not pointed to any specific intrinsic evidence that would support such a limiting role. "Intervention" is construed as: "an action by a health care provider to manage the care of an individual patient."

ii. "Interworking Device"

Turning to the second disputed claim term in the '294 Patent, "interworking device," the court once again begins its task of claim construction with the language of the claims themselves. According to the claim language, the interworking device performs the task of "convert[ing] the narrowband communication signal into packet format." In other words, explicit within the claim language itself is that the "interworking device" is a device that interworks or converts between two communication formats -- specifically, between a narrowband format (such as used in the PSTN) and a packet format (such as ATM or IP). The claim language itself does not limit the packet format to ATM, but rather could encompass the IP technology employed by Vonage.

Based on this claim language, Sprint argues that the court should construe the claim term "interworking device" to mean a device that converts narrowband communication signals into a packet format.

In support of Vonage's argument that the court should construe the claim term "interworking device" to mean ATM interworking multiplexer, Vonage once again relies on language contained throughout the specification. It is true, as Vonage contends, that the specification repeatedly discloses in numerous important respects that an ATM interworking multiplexer is the one and only "interworking device" claimed in the specification. The disclosures in the specification are not merely limited to preferred embodiments or versions of the invention. Reading the claim term in view of the specification, it seems that the only logical conclusion that could be reached by one of ordinary skill in the art is that the inventor intended the term "interworking device" to mean an ATM interworking multiplexer. The abstract describes the invention as a system for providing virtual connections "through an ATM interworking multiplexer" whereby the signaling is transferred to the "ATM interworking multiplexer" and the "multiplexer" converts the information. The background of the invention describes the need to improve upon ATM switch technology, and explains that although ATM multiplexers are being developed "these muxes" are not used to select virtual connections on a call-by-call basis. It concludes that "there is not a telecommunications system that can provide ATM switching on a call by call basis without relying on the call processing and signaling capability of an ATM switch." The summary of the invention clearly and unequivocally discloses that an ATM interworking multiplexer is the claimed interworking unit which allows virtual connections on a call-by-call basis without requiring the call processing and signaling capability of an ATM switch. The summary states as follows:

. . . The system comprises an ATM interworking multiplexer and a signaling processor linked to the ATM interworking multiplexer. The method [receives, processes, generates, and transmits] new signaling to the ATM interworking multiplexer. The method also includes receiving the user information for the call from the particular connection into the ATM interworking multiplexer. . . .

. . . The system includes an ATM interworking multiplexer to receive user information from a connection . . . . The system could also include an ATM cross-connect system connected to the ATM interworking multiplexer and configured to provide a plurality of virtual connections to the ATM interworking multiplexer.

The invention also includes an ATM interworking multiplexer for providing calls with virtual connections . . . .

ATM interworking multiplexer (mux) 130, mux mux 140." Id. col. 3, ll. 43-44. Thereafter, the written description refers to 130 and 140 as disclosed in Figure 1 as, simply, "mux." The description of Figure 1 concludes that "from the above discussion, it can be seen that multiple virtual connections can be pre-provisioned through an ATM cross-connect system to interconnect ATM interworking multiplexers." Id. col. 5, ll. 26-29. Similarly, Sprint points out the disclosure that "Fig. 3 shows one embodiment of the mux that is suitable for the present invention, but muxes that support the requirements of the invention are also applicable." Id. col. 8, ll. 3-5. Again, however, it appears that the use of the term "mux" is nothing more than a continued use of this term as a shorthand version of the term ATM interworking multiplexer, as this section is entitled "The ATM Interworking Multiplexer." Id. col. 8, l. 1.

The written description in this case is much like the one at issue in Honeywell International, Inc. v. ITT Industries, Inc., 452 F.3d 1312 (Fed. Cir. 2006). There, the Federal Circuit agreed with the district court that the claim term "fuel injection system component" was limited to a fuel filter. Id. at 1318. The court concluded that "the written description uses language that leads to the conclusion that a fuel filter is the only 'fuel injection system component' that the claims cover, and that a fuel filter was not merely discussed as a preferred embodiment." Id. The written description referred to the fuel filter as "this invention" or "the present invention" on at least four occasions; it did not indicate that a fuel filter was merely a preferred embodiment, but rather it was the only component disclosed as having the claimed features; and limiting the claim term to a fuel filter comported with the discussion of the prior art problem addressed by the patented invention. Id. Similarly, here, the entirety of the written description, and particularly the disclosures in the summary of the invention, establish that an ATM interworking multiplexer is the only type of "interworking device" contemplated by the invention, and not merely a preferred embodiment. Given the clarity of the written description concerning the meaning of the claim term "interworking device," then, the court construes this claim term to mean ATM interworking multiplexer.

The parties seek construction of the term "interworking unit," which may be found in the '429 Patent, claims 1 and 23, and the '084 Patent, claim 1. Sprint construes the term to mean device that converts narrowband communication signals into a packet format. Big River asks the Court to construe the term to mean ATM interworking multiplexer, with ATM referring to Asynchronous Transfer Mode, as the Court did in the V onage case. See 500 F. Supp. 2d at 1314-16. The Court agrees with Big River that the Court's prior construction of this term should be retained.

In V onage, the Court construed the terms "interworking device" and "interworking unit" to mean ATM interworking multiplexer. See id. The Court agrees with Sprint that the claim language itself does not limit the packet format to ATM, but could also include IP technology. See id. at 1314. Nevertheless, the Court chose to limit the scope of the claims, as follows:

"[T]he specification repeatedly discloses in numerous important respects that an ATM interworking multiplexer is the one and only "interworking device" claimed in the specification. The disclosures in the specification are not merely limited to preferred embodiments or versions of the invention. Reading the claim term in view of the specification, it seems that the only logical conclusion that could be reached by one of ordinary skill in the art is that the inventor intended the term "interworking device" to mean an ATM interworking multiplexer.

Id. at 1314-15. The Court then supported that construction with numerous references to the '301 Family specification, particularly the summary of the invention, that state explicitly that the claimed invention (and not merely an embodiment) involves use of an ATM interworking multiplexer. See id. at 1315 (citing, e.g., '301 Family at 2:14-50).

Sprint asks the Court to reconsider its ruling on this issue from V onage. Sprint again stresses the absence of any language in the claims themselves that would limit their scope to ATM interworking multiplexers, as well as the absence of any express disclaimer of scope in the specification. See Medegen MMS, Inc. v. ICU Med., Inc., 317 Fed. Appx 982, 987-88 (Fed. Cir. Nov. 20, 2008) (unpub. op.) (cited by Sprint) (reversing district court, which had construed patent term consistent with specification's description of a single embodiment of the invention). As noted above, however, under the law of the Federal Circuit, the lack of an express disclaimer is not necessarily fatal where, as here, the specification repeatedly and consistently describes the entire invention (and not merely one or more embodiments) in a particular manner, thereby supporting a limiting construction of otherwise-broad claim language. See supra Part II.
The Court has again reviewed the '301 Family specification, and it again concludes that a person with ordinary skill in the art would conclude from that specification that the claimed invention is limited to the use of an ATM interworking multiplexer. For example, in its third sentence, before any embodiments or versions are discussed, the summary of the invention flatly states that "[t]he system comprises an ATM interworking multiplexer and a signaling processor linked to the ATM interworking multiplexer." ('301 Family at 2:12-15.) Other portions of the specification, and particularly the summary, are definitive on this point, as noted by the Court in V onage.

Sprint repeats its argument from V onage that the specification contains language suggesting that the interworking unit could be any "muxing" system. As the Court noted in rejecting this argument previously, the specification does not define "mux" or "muxing system" except for its apparent use of those terms as a shorthand version of the term "ATM interworking multiplexer." See V onage, 500 F. Supp. 2d at 1315-16. Nor has Sprint provided any other definition of the word "mux" in its submissions to the Court. Thus, there is no basis to conclude that the references to alternative "muxing systems" were intended to contemplate various non-ATM multiplexers as opposed to different ATM multiplexers. Therefore, the Court concludes that the references to "muxes" do not overcome the specification's repeated description of the invention as one that includes an ATM interworking multiplexer.

Nor is the Court persuaded by Sprint's claim differentiation argument. Sprint notes that dependent claims in the patents refer to the method of the independent claims with the additional limitation of "asynchronous transfer mode" communications or connections. ('084 Patent, claim 8; '064 Patent, claim 6.) The Federal Circuit has stressed, however, that the presumption that dependent claims must be narrower than their independent claims is rebuttable, and the presence of such dependent claims is therefore not dispositive:

[W]hile it is true that dependent claims can aid in interpreting the scope of claims from which they depend, they are only an aid to interpretation and are not conclusive. Indeed the presumption created by the doctrine of claim differentiation is not a hard and fast rule and will be overcome by a contrary construction dictated by the written description or prosecution history.

Regents of Univ. of Calif. v. Dakocytomation Calif., Inc., 517 F.3d 1364, 1375 (Fed. Cir. 2008) (internal quotations and citations omitted). In this case, the clear references in the specification to the ATM interworking multiplexer as a part of the claimed invention (and not merely an embodiment) dictates the construction urged by Big River and overcomes any presumption raised by the dependent claims. The consistent descriptions of the invention as a whole also distinguish the present case from Medegen and other cases cited by Sprint.

Accordingly, the Court construes "interworking unit" to mean ATM interworking multiplexer.

2356

B. "intra-oral radiological site(s)"

This term is used in Claims 1, 2, and 4 as follows:

1. A method of displaying stored intra-oral radiographs, comprising:

   displaying a representation of an intra-oral radiograph holder including target intra-oral radiological sites arranged according to anatomical location of said sites;

   selecting one of said target intra-oral radiological sites; and

   displaying a stored intra-oral radiograph corresponding to said selected target intra-oral radiological site.

2. A method for storing and displaying intra-oral radiographs, comprising:

   generating and displaying intra-oral radiographs of dentition;
generating and displaying a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;

storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation along with indicia of respective selected intra-oral radiological sites; and

subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation.

4. A device for storing and displaying intra-oral radiographs, comprising:

   a display;

   means for generating and displaying on said display a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;

   means, responsive to selection of said selectable sites, for displaying corresponding stored x-ray images.

Plaintiffs argue that "intra-oral radiological sites" are "icons or sites included in a representation of an intra-oral radiograph holder designating respective anatomical regions of the dental arch." Defendants contend that it means "intra-oral anatomical sites or regions which may correspond to positions within a radiograph holder."

Defendants argue that the patent requires intra-oral anatomical sites to be arranged "according to anatomical location of said sites," but locations on a display monitor do not have an anatomical relationship to one another, only locations within a patient's anatomy do. Defendants concede that Plaintiffs' construction "appears to be the plain meaning of this claim phrase," but argue that "the specification clearly sets forth a meaning different from the apparent meaning of the claim language." Defendants' Claim Construction Brief at 18. Defendants assert that the specification defines "sites" as "anatomical sites or regions," not positions on the film holder representation. In support of its position, Defendants note that the specification states that "each mounting position in a dental film holder corresponds to a particular anatomical site or anatomical region" and that the abstract "confirms this definition" by stating that "the positions of the film holder correspond[] to anatomical sites readily recognized by dentists." Id. at 19. Further, Defendants argue, the specification discusses how the user can use the film holder representation to select an anatomical site associated with a recently taken x-ray ("The system user selects an image to be displayed by selecting [an x-ray taken by the dentist] . . . .") and explains how the user can select positions within the film holder representation to display an x-ray of an anatomical location, such as a tooth or teeth ("The system user selects an image to be displayed by selecting the appropriate anatomical site . . . .") Thus, Defendants assert, the patentee has acted "as his own lexicographer" and has provided a definition of "intra-oral radiological sites" that means "intra-oral anatomical sites or regions." Last, Defendants argue that Plaintiffs' proposed construction is so broad that, if accepted in conjunction with Plaintiffs' proposed broad construction of radiograph holder, it would include a depiction of a dental arch, a limitation surrendered by Plaintiffs during the patent's prosecution.

Looking to the claim language, in Claims 1, 2, and 4, the "intra-oral radiological sites" must be "arranged according to anatomical location of said sites." Since sites within the mouth have anatomical locations but icons do not, this language lends some support to Defendant's construction. However, the patent's background section explains that "interpretation of . . . mounted radiographs is facilitated by mounting each film in normal anatomic relation to each other." This language indicates that the patentee regarded the films as being arrangeable by anatomical relation, and this functionality in the representation of the film holder was a key feature of the patent. Moreover, the balance of the claim language supports Plaintiffs' construction. The clearest support for Plaintiffs' construction lies in Claim 2. Claim 2 encompasses a method for storing and displaying intra-oral radiographs, comprising "generating and displaying a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites," "storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation along with indicia of respective selected intra-oral radiological sites" and "subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation." Thus, Claim 2 teaches that the intra-oral radiological sites are in the representation of an intra-oral radiograph holder, not within the mouth.
as Defendants urge. Further, Claims 2 and 4 make clear that the "intra-oral radiological sites are "selectable" and that images are stored, retrieved, and displayed "responsive to" selection of "intra-oral radiological sites." Because icons on the computer screen are selectable (by keyboard, mouse click, etc.), and images are stored, retrieved, and displayed in response to selection of the icon, whereas the same cannot be said regarding anatomical sites or regions, this claim language further supports Plaintiffs' construction.

Footnotes

n5 The Court recognizes that there is some ambiguity and inconsistency within the specification regarding use of this term. For example, in column 5, line 27, the specification states that the captured image is stored along with indicia of the associated location in the icon, suggesting that "selected intra-oral radiological sites" is a location in the icon. However, in the abstract, it states that the radiograph is stored "along with indicia of the selected anatomical site," suggesting that an intra-oral radiological site is an anatomical site. However, the balance of the claim and specification support the construction that an intra-oral radiological site is a site within the film holder representation, not a site within the mouth. This construction is consistent with the claim language, while Defendants' construction is not, and thus Plaintiffs' construction is the preferred construction. Vitronics, 90 F.3d at 1582. Moreover, part of the confusion may be due to the fact that the specification describes the original patent application, which included an image of dentition/anatomy as the representation, whereas the final patent does not include these, and thus some of the language was broad enough to cover the patentee's original intention that intra-oral radiological sites would include positions within a film holder that correspond to anatomical sites and positions within a representation of anatomy/dentition.

The Court agrees with Plaintiffs that other language in the specification also generally supports Plaintiffs' construction. The specification states "The display of the stored images is facilitated by use of a representation or icon of anatomical sites, or of the portion of the anatomy, from which the images were taken. The system user selects the image to be displayed by selecting the appropriate anatomical site from the representation of anatomical sites or portion of anatomy . . . ." Column 2, lines 20-26 (emphasis added). Thus, when the specification refers to anatomical site, it means the anatomical site within the representation or icon, not within the mouth.

Thus, when the claim uses the term "intra-oral radiological sites" it refers to the icons in the representation of an intra-oral radiograph holder, and those icons correspond to anatomical sites within the mouth and are arranged according to their anatomical relation to each other. Accordingly, the Court construes "intra-oral radiological sites" as "icons or sites, included in the representation of an intra-oral radiograph holder, that designate respective anatomical regions of the dental arch."

Claim Element 1b

first user intranet point

The parties disagree on the meaning of the above-stated language.

Dell argued that the ordinary meaning should suffice. Lucent proposed: "any terminal on a private network used by a site provider to input multi-level managed information to the web site." The court construes the above-stated claim term as follows:

"a terminal on a private network through which a web site provider accesses a site."
4. "introducing"

Defendant EchoStar asks that I construe "introducing" to mean adding to or superimposing upon, arguing:

The disclosure of the '066 patent is limited to methods for scrambling analog signals, and includes only those methods for "introducing some kind of objectionable interference or distortion into the signal. . . ." All of the methods disclosed . . . do something that adds to or superimposes upon an analog baseband signal.

I have rejected the construction that limits scrambling to analog signals. Although the particular techniques for scrambling described in the specification may be unique to scrambling analog signals, I will not improperly limit the term to an embodiment disclosed in the specification. Texas Digital, 308 F.3d at 1204 (instructing that a court should construe a claim limitation according to its ordinary and accustomed meaning and should not import a characteristic of a disclosed or preferred embodiment into the term); CCS Fitness, 288 F.3d at 1367 ("[A] patentee need not 'describe in the specification every conceivable and possible future embodiment of his invention").

"Introducing" has an ordinary meaning and does not require construction.

GO BACK

2359

3. "Invalidate"

"Invalidate data" was construed by Judge Gilmore in the Oracle Litigation. Judge Gilmore construed "invalidate data" to mean "to indicate previously cached data has been modified." IBM maintains this is the proper construction. SuperSpeed, however, would have the court construe the term to mean "to indicate that a portion of data in a cache is no longer up to date." Here, the parties choose to have only "invalidate" construed because it is used with terms other than "data." For example, claim 4 of the '013 patent uses "communicating invalidate messages."

SuperSpeed argues that Judge Gilmore's construction of "invalidate data" addressed different issues, such that her construction provides no real guidance for this court in construing "invalidate" alone. SuperSpeed raises two issues with IBM's construction. First, SuperSpeed argues IBM's construction requires that the copy of the data in the cache be modified, which excludes the preferred embodiment. Second, SuperSpeed argues that IBM's construction impermissibly limits the claim by requiring "invalidate" to only encompass data that has been modified, and not data that is being modified. SuperSpeed's first argument, that IBM's construction requires that some physical copy of the data be modified, is rejected. IBM's construction does no such thing.

SuperSpeed's second argument concerns how the parties understand "has been modified." SuperSpeed maintains that the construction could be read to require that the modification be complete, which is an unnecessary limitation. SuperSpeed suggests the invalidation could occur before, or simultaneous with, any modification; the specification does not require that the invalidation occur after the write operation to the I/O device has been completed. The specification provides for cached data to be invalidated as part of the process of writing to disk: "[i]n accordance with the embodiment of the invention, when a write access is performed to a disk which is being cached and the disk data area being written was previously read into the cache, i.e. an update operation on the disk data, the current cache buckets for the previous read disk data area are invalidated on all computers on the network. ['226 Patent, 2:45-50]. Nothing in the specification precludes invalidation before the modification has been fully completed. For example, the invalidate message could be sent simultaneously with the write command, or immediately preceding it.

Additionally, the term should not be construed to require a temporal limitation, because some of the claims with the term themselves import the limitation. See Phillips v. AWH Corp., 415 F.3d at 1314 (holding claim context is highly instructive when construing claim terms). For example, claim 4 of the '013 patent requires that the invalidation occur after the data is written to the I/O device; "after data is written to the shared I/O device, communicating invalidate messages to only the computers in the list . . .". Claim 20 of the '013 patent has a similar temporal requirement. If the inventor would have intended the term to import a sequential limitation, there would have been no need to do so in those claims separately.
Judge Gilmore did not have this issue before her when construing "invalidate data" in the Oracle Litigation. Before Judge Gilmore were competing definitions, one of which was SuperSpeed's current proposition, which she rejected. Oracle's, which she also rejected, was "make data unusable." Judge Gilmore crafted her own construction in light of the specification. Judge Gilmore found that "the summary of the invention and specifications are consistent with a claim construction of "invalidate data' that indicates a change or modification of previous data with more recent data." Oracle Litigation (citing '226 Patent, at 2:13-20, 2:45-50; '244 Patent, at 2:15-22, 2:46-52).

The court agrees with SuperSpeed that "invalidate," standing alone, does not import a sequential limitation. The court, therefore, construes "invalidate" to mean "to indicate the modification of previously cached data."

Claims 27 and 35 of the '226 Patent and claims 15 and 22 of the '244 Patent reference directly or indirectly the term "invalidate data." ('226 Patent, at 28:28-29; '244 Patent, at 27:9). Superspeed asserts that the term "invalidate data" means "to indicate that a portion of data in a cache is no longer up to date." (Instrument No. 69, at 11). Oracle asserts that the term "invalidate data" means "make data unusable." (Instrument No. 77, at 8).

Claim 27 of the '226 Patent describes:

A method for accelerating access to data on a network comprising the steps of . . . communicating over the network individually with each computer in the list of computers in the data structure corresponding to said one of said I/O devices to invalidate data in caches on the network corresponding to said one of said plurality.

Claim 15 of the '244 Patent describes a caching system:

wherein at least one of said cache drivers further includes executable interception code for intercepting a write instruction to one of said plurality of I/O devices and executable invalidate code that sends a message to invalidate data through selected ones of the communication channels to the caches of any computer that is caching said one of said plurality of I/O devices.

('244 Patent, at 27:5-11) (emphasis added).

The claims and specifications of the patent do not expressly define the term "invalidate data." The specifications of the preferred embodiment provide, however, that the cache driver sends a message to invalidate data, whenever the operating system changes data on the disk. ('226 Patent, at 3:37-50; '244 Patent, at 3:39-52). Specifically, the specifications provide:

Whenever the OpenVMS [operating] system (14) changes the data on the disk (12), . . . the cache driver (10) uses its remote message communication channels (18) to send a message to each of the remote cache drivers in the list contained in the TCB (16) disc control structure. . . . The cache driver (10) would use this incoming message to invalidate any possible previously locally cached data for the area on the remotely connected disk (12) that has been changed by the remote OpenVMS system.

('226 Patent, at 3:37-50; '244 Patent, at 3:39-52) (emphasis added). This specification indicates that the invention sends a message to "invalidate data" when there is old cached data that corresponds to a change in that data. Thus, the invalidated data corresponds to data that has been changed or modified.
The specifications further indicate that the invalidated cache data is not automatically deleted or removed from the system as a result of being invalidated. Rather, "[t]he invalidated TCMB (24) [cache data] and its cache data bucket (22) are normally placed on the free queue (27) of the associated TCH (26) cache control structure to be used by some future cache data operation." ('226 Patent, at 5:23-28; '244 Patent, at 5:26-30). In other words, the invalidated data is typically moved to another location to be written over at some point in the future. Although nothing in the specifications suggests that the invalidated data is cleared or erased as a result of an invalidate message, nothing in the specifications suggests that the invalidated data may be used again.

However, "if the OpenVMS system (14) indicates there are insufficient available free pages for the OpenVMS system (14), the cache data bucket (22) RAM space is returned to the OpenVMS system (14) free pages and the corresponding TCMB (24) space is returned to the OpenVMS system (14) pool." ('226 Patent, at 5:28-34; '244 Patent, at 5:30-35). The specifications do not specifically state what happens to the invalidated cache data once it is returned to the OpenVMS system pool.

The "Summary of the Invention" in the '226 Patent and the '244 Patent provide two possible ways that an "invalidate data" message may be used in the invention:

In accordance with the embodiment of the invention, once the total cache size has grown to its upper limit further new demands on cache data are handled by cache bucket replacement, which operate on a least recently used algorithm. This cache bucket replacement will also occur if the total cache size is inhibited from growing owing to a high demand on computer main memory by other applications and users of the computer system.

In accordance with the embodiment of the invention, when a write access is performed to a disk which is being cached and the disk data area being written was previously read into the cache, i.e., an update operation on the disk data, the current cache buckets for the previous read disk data area are invalidated on all computers on the network. ('226 Patent, at 2:13-20, 2:45-50; '244 Patent, at 2:15-22, 2:46-52). Thus, the summary of the invention and specifications are consistent with a claim construction of "invalidate data" that indicates a change or modification of previous data with more recent data.

In order to assist the Court, Superspeed has also provided a definition of the term "invalid" from the IEEE DICTIONARY. The IEEE DICTIONARY provides that the term "invalid" is "[a]n attribute assigned to a cache line if there is not an up-to-date copy in the module's cache." IEEE DICTIONARY at 552. (Instrument No. 69, at Exh F). The IEEE DICTIONARY does not provide a definition of the term invalidate. However, the attributes described for the term "invalid" are consistent with the use of the term "invalidate data" in the specification of the patents-in-suit.

Upon a review of the patents-in-suit and the arguments of the parties, the Court finds that the term "invalidate data" means "to indicate previously cached data has been modified."

---

Claim 5 of the '356 Patent involves:

an inverter circuit connected between the DC terminals and the lamp terminals; the inverter circuit being operable to supply an alternating lamp voltage across the lamp terminals....

One threshold issue is whether Nilssen is bound by his assertion before the Patent and Trademark Office ("PTO") that the quoted element is a means-plus-function limitation. And of course it requires no citation to support the Federal Circuit's regular repetition of the proposition that a patent's prosecution history is relevant to claim construction.

In an effort to escape the impact of his own representations to the PTO (quoted hereafter in this section of the opinion),
Nilssen says that those representations were made before In re Donaldson Co., 16 F.3d 1189, 1193-94 (Fed. Cir. 1994) had expressly overruled the earlier caselaw that had countenanced the PTO's practice of not applying Paragraph 6 during its patent examination process. But that is a truly bizarre notion, essentially amounting to:

Don't hold me to what I told the PTO in order to get my patent issued over the examiner's prior rejection of my claims. After all, if the PTO's perceived role vis-a-vis Paragraph 6 had been different then (as the Federal Circuit decided it to be nearly a decade later), I might not have found it necessary to make that representation.

--- Footnotes ---

19 See In re Alappat, 33 F.3d 1526, 1540-41 (Fed. Cir. 1994), explaining the impact of Donaldson on the PTO.

--- End Footnotes ---

Patent prosecution is a serious business—an effort to obtain what was a 17-year monopoly when the Nilssen representation was made to the PTO. Little wonder that the courts early developed the concept of "file wrapper estoppel": the principle that a representation made by an inventor to induce the PTO to grant such a monopoly binds the inventor later, when the construction of the issued patent is in dispute (see, e.g., Cole, 102 F.3d at 531-32).

Here is what Nilssen (acting pro se, it may be noted) wrote in a PTO Appeal Brief (M. Mem. Ex. 10, emphasis in original) in an effort to overcome the examiner's 35 U.S.C. § 112 rejections:

Again using claim 1 as an example, it is clear that the claimed invention is expressed in claim 1 as a combination of two elements, both of which are expressed in the well-accepted format of MEANS AND FUNCTION.

* * *

The second element of claim 1 describes an "inverter circuit" (a means) together with its function (to provide a sinusoidal output voltage at a pair of AC output terminals, etc.) and its connections (one of its AC output terminals being connected with one of the AC input terminals, etc.).

When interpreted in light of the specification, there is no doubt in Applicant's mind but that claim 1 is clearly understandable by a person having ordinary skill in the art.

Trying to blunt the devastating impact of those statements, N. Resp. 6 attacks "Motorola's use of the file history [as] highly misleading" because of the later advent of Donaldson. That is simply nonsense—what is material is that Nilssen himself expressly labeled "inverter circuit" as a means in what he himself acknowledged to be a means-plus-function claim element, and that he expressly went on to urge the examiner to "interpret[][that claim] in light of the specification."

This Court will not permit Nilssen to disavow his own position deliberately undertaken before the PTO just because he now perceives it to his advantage to reverse that position—to frame a metaphor in terms of the current dispute, to make an attempt to shift from DC to AC. It really makes no difference whether conventional analysis might perhaps have produced a different view: Nilssen has set his own terms in this respect, just as a patentee may elect to be his or her own lexicographer, and he will be held to that choice. This Court construes claim 5 of the '356 Patent just as Nilssen himself had urged—that is, in light of the corresponding specification. 21

--- Footnotes ---

20 That metaphor has been chosen rather than its converse—from AC to DC—because the latter is accomplished by a rectifier, and there is nothing of rectitude in what Nilssen has sought to do in this respect. It would seem that this ruling—based as it is on taking Nilssen at his own word—also dispatches Nilssen's other arguments based on Motorola's "effort to read limitations from the specification into the claims" (N. Resp. 4-10). Nilssen's own invitation to the same effect should, it would appear, extend to the specification as included in the issued patent. If this Court is viewed as mistaken in that premise, it will no doubt hear an anguished scream from Nilssen's counsel.
2. Claims 35 & 36 - "inverter circuit"

**Claim 35 of the '409 patent describes:**

An arrangement comprising:

- a source operative to provide, between a first and a second DC terminal, a DC voltage of substantially constant magnitude;
- an inverter circuit connected with the DC terminals and functional to provide an inverter AC voltage between a reference terminal and an inverter output terminal; the inverter AC voltage being of frequency several times higher than 60 Hz and otherwise characterized in having a waveshape consisting of sinusoidally-shaped voltage pulses of alternating polarity; the inverter circuit including a tuned L-C circuit connected in circuit with the inverter output terminal and the reference terminal; the L-C circuit having a tank capacitor parallel-connected with a tank inductor and being resonant at or near the frequency of the inverter AC voltage; the inverter circuit being further characterized in that it includes two alternatingly conducting transistors series-connected between two auxiliary terminals between which exists a unidirectional voltage consisting of sinusoidally-shaped unidirectional voltage pulses, and having an average magnitude substantially equal to that of the DC voltage.

**Claim 36 of the '409 patent describes:**

An arrangement comprising:

- a source providing, between a first and a second DC supply terminal, a constant-magnitude DC supply voltage;
- an inverter circuit having a pair of AC output terminals as well as a first and a second DC input terminal;
- inductor means having a first winding and a second winding; the first winding being connected between the first DC supply terminal and the first DC input terminal; the second winding being connected between the second DC supply terminal and the second DC input terminal; and
- output means connected with the AC output terminals; the output means having lamp output terminals adapted to connect with a gas discharge lamp.

U.S. Patent No. 5,432,409, Claim 36 (emphasis added).

Claims 35 and 36 each use the phrase "inverter circuit." Making essentially the same arguments as they did concerning the patent claims discussed earlier, Nilssen argues that the term should be read in accordance with the commonly understood definition of the term "inverter," while MagneTek argues that the term should be read as limited to full bridge inverters, the type of inverter described in the specification of the '409 patent.

MagneTek's primary argument is that the prosecution history of the '409 patent includes an admission by Nilssen that the patent language is in means plus function form. While Nilssen did make such a statement in prosecuting patent application number 06/787,692, that was not the application that led to the '409 patent. Nor was it a predecessor application of the one that led to the '409 patent. A chart introduced by Nilssen at the Markman hearing, the accuracy of which MagneTek has not contested, reveals that application number 06/787,692 may be best described as a cousin, once or twice removed, of the application that led to the '409 patent. We have attached the chart to this opinion as Appendix A for illustrative purposes. Our conclusion is that Nilssen's statement in prosecuting this separate patent application provides no support for
MagneTek's position here.

We also conclude that claims 35 and 36 are not within the scope of § 112, P6. As was the case with the patents previously discussed, these claims recite structure sufficient to take them out of the means-plus-function arena. This is particularly true of claim 35, which describes a number of the specific components of the inverter.

MagneTek also argues, as it did with the '874 and '919 patents, that because the specification of the '409 patent describes a full bridge inverter, we should construe the claims as limited to that particular type. We reject this argument for the same reasons previously discussed.

In sum, as used in claims 35 and 36, the term inverter means an electrical device that converts DC voltage to AC voltage.

"Inverter Circuit" in the '409 Patent's Claims 9 and 37

Both claims 9 and 37 of the '409 Patent call for an "inverter circuit" that is characterized as "having a pair of transistors series-connected between" the first terminal and the second terminal. Here too N. Mem. 27-28 argues that the meaning of "inverter circuit" is clear to a person skilled in the relevant art, while M. Mem. 25-26 looks to the specification to limit that reference to a "full-bridge inverter circuit." Motorola's narrowing construction can prevail only if the specification explicitly or implicitly defines "inverter circuit" as one of the full-bridge variety (four transistors connected together in two parallel circuits).

But the specification language that Motorola cites is not definitional, either explicitly or implicitly. That language, in the Details of Operation section of the '409 Patent, reads:

The operation of the full-bridge inverter circuit of FIG. 1 may be explained as follows.

That section then goes on to call the Fig. 1 inverter circuit a "full-bridge inverter" once again.

Those references, rather than defining the "inverter circuit" term, simply describe the layout in one of Nilssen's illustrations. Indeed, in the '409 Patent's Summary of the Invention section (also part of the specification, which in most contexts Motorola has stressed as narrowing the corresponding claim elements), Nilssen states (emphasis added):

In its preferred embodiment, the present invention includes an inverter circuit having a pair of DC input terminals and at least two periodically conducting transistors series-connected between an auxiliary negative terminal and an auxiliary positive terminal.

This is an instance in which Motorola can't have it both ways--if the earlier-quoted language really meant that the only inverter circuit referred to in the claim required four transistors (the full-bridge type), the Summary's reference to "at least two…transistors" would be rendered meaningless.

M. Mem. 25 seeks help from a statement in Multiform Desiccants, Inc. v Medzam, Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998):

When the specification explains and defines a term used in the claims, without ambiguity or incompleteness, there is no need to search further for the meaning of the term.

But as already indicated, the differing references to the number of transistors within the same specification can scarcely be said to define one of those references as controlling "without ambiguity." And it is of course conventional wisdom that the "preferred embodiment" of an invention (that is how Fig. 1, which depicts a full-bridge inverter, is described) does not conclusively define the invention's scope--as Gentry Gallery, Inc. v. Berkline Corp., 134 F.3d 1473, 1479 (Fed. Cir. 1998) has put it:
It is a truism that a claim need not be limited to a preferred embodiment.

In sum, the "inverter circuit" limitation in claims 9 and 37 of the '409 Patent will be given the meaning ascribed to it by a person skilled in the relevant art. That means it will not be limited to a particular species of inverter, the full-bridge type.

**2364**

A. '874 Patent, Claim 16 - "inverter means"

Claim 16 of the '874 patent reads as follows:

An arrangement comprising:

rectifier means connected with the AC voltage of an ordinary electric utility power line and operative to provide a unidirectional current to a pair of DC terminals; there existing a DC voltage across the DC terminals; the instantaneous absolute magnitude of the DC voltage being substantially equal to the larger of: (i) the instantaneous absolute magnitude of the AC voltage, and (ii) a substantially constant absolute magnitude that is lower than the peak absolute magnitude of the AC voltage; the rectifier means including at least two energy-storing capacitors; the two energy-storing capacitors being: (i) during a part of each half-cycle of the AC voltage, charged in series by current supplied from the DC terminals; and (ii) during another part of each half-cycle of the AC voltage, discharged in parallel by supplying current to the DC terminals;

inverter means connected with the DC terminals and operative to provide a high-frequency voltage at an inverter output; the high-frequency voltage being of frequency substantially higher than that of the AC voltage and having a first amplitude-modulation; the first amplitude-modulation being characterized by having a first crest-factor; and

lamp means having lamp terminals.

U.S. Patent No. 5,373,874, Claim 16 (emphasis added). This claim does not describe any particular type of inverter. However, the specification of the '874 patent describes in detail the preferred embodiment of the patent, which includes a half-bridge inverter. MagneTek argues that claim 16 should be construed as limited to such an inverter.

The resolution of this issue turns mainly on whether the term "inverter means" as used in claim 16 is stated in means-plus-function form. This terminology comes from 35 U.S.C. § 112, P6, which reads:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Under § 112, P6, were we to conclude that the claim language were indeed in means-plus-function form, then we would have to construe the term "inverter means" as covering only the particular type of inverter set forth in the specification, as well as any equivalent thereof. See, e.g., Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1535 (Fed. Cir. 1991).

"word 'means' is 'part of the classic template for functional claim elements." Rodime PLC v. Seagate Technology, Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999) (quoting Sage Products, Inc. v. Devon Industries, Inc., 126 F.3d 1420, 1427 (Fed. Cir. 1997)). If the applicant uses the word "means" in his claim, then it is presumed that he intended to invoke § 112, P6. Id. There are at least two ways in which this presumption may be rebutted. First, if a claim element uses the word "means" but does not recite a corresponding function, § 112, P6 is not invoked. Id. Second, if the element recites "sufficient structure or material for performing that function," § 112, P6 does not apply. Id.; see also, e.g., Personalized Media Communications,
LLC v. International Trade Commission, 161 F.3d 696, 704 (Fed. Cir. 1998) ("In deciding whether the presumption has been rebutted, the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112, P6"); Sage Products, 126 F.3d at 1427-28 ("Where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format.").

There is no question that "inverter" is a term that describes a type of structure. The parties essentially agree what an inverter is, generically speaking: it is an electrical device that converts DC voltage to AC voltage. See D. Fink & H. Beaty, Standard Handbook for Electrical Engineers at 22-105 (13th ed. 1993); Academic Press Dictionary of Science and Technology at 1138 (definition of "static inverter"). The issue is whether this is enough to remove the claim language from the scope of § 112, P6.

When the purportedly "structural" language really just describes what the device does -- that is, when it "merely serves to further specify the function of the means" -- § 112, P6 may still apply. See, e.g., Personalized Media, 161 F.3d at 704, Unidynamics Corp. v. Automatic Products International, Ltd., 157 F.3d 1311, 1319 (Fed. Cir. 1998); Laitram, 939 F.2d at 1536. Illustrative is Signtech USA, Ltd. v. Vutek, Inc., 174 F.3d 1352 (Fed. Cir. 1999), in which the court held that the phrase "ink delivery means" did not recite sufficient structure to prevent application of P6, "because 'ink delivery' is purely functional language." Id. at 1356. MagneTek does not argue, and we do not believe, that "inverter" is "functional language" in this sense -- even though the function of an inverter is to "invert" electrical current. Rather, the term is well known in the art to be descriptive of a type of electrical device. As the Federal Circuit stated in holding that the term "detent mechanism" was not merely functional, "many devices take their names from the functions they perform. The examples are innumerable, such as 'filter,' 'brake,' 'clamp,' 'screwdriver,' or 'lock.' ... What is important is not simply that a 'detent' or 'detent mechanism' is defined in terms of what it does, but that the term, as the name for structure, has a reasonably well understood meaning in the art." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996). The same is true of the term "inverter" as used here.

It is true, as MagneTek argues, that there is more than one type of inverter, and that the claim here does not say anything about what particular form the inverter is to take. MagneTek contends that the claim thus does not recite "sufficient structure to perform entirely the recited function" and that the use of the term "inverter" alone is not enough to avoid the application of § 112, P6. See Sage Products, 126 F.3d at 1427-28 ("Where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format."). However, the fact that the term "inverter" does not connotate a precise physical structure in the minds of those skilled in the art does not mean that insufficient structure has been stated. Personalized Media, 161 F.3d at 705. As was the case in Personalized Media, which concerned the use of the term "detector," even though the term "inverter" does not specifically evoke a particular structure, it does convey to one who is knowledgeable in the art a variety of structures that are known as "inverters." That being the case, the term "inverter" is a sufficiently definite structural term to preclude the application of § 112, P6; the fact that it may not evoke a particular structure is of no moment. See Personalized Media, 161 F.3d at 705. We conclude for these reasons that the claim element is not stated in means-plus-function format.

MagneTek argues that even if the Court declines to read "inverter means" as a means-plus-function element, we should nonetheless construe the claim as limited to a half-bridge inverter, because that is the type of inverter described in the specification. It relies on, among other decisions, Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998), in which the court stated that where the specification defines a term, there is no need to search for a further meaning. In this case, however, the specification does not contain a definition -- it does not define the term "inverter" in any way other than its ordinary meaning. Rather, it describes a specific type of inverter as part of the preferred embodiment of the patent. The law is clear that limitations found in the specifications are not to be imported into the claims, Rodime, 174 F.3d at 1303; Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998), yet that is precisely what MagneTek is asking us to do. As in Comark, rather than looking at the specification to ascertain the claims' meaning, MagneTek is asking us to look at the specification to limit the claim to the particular structure disclosed in the preferred embodiment. While the line between these two concepts may be a fine one, see Comark, 156 F.3d at 1186, it is one that we will not traverse in this case.

In sum, we conclude that as used in claim 16 of the '874 patent, the term "inverter means" has its commonly understood meaning, that is, an electrical device that converts DC voltage to AC voltage. We recognize that this is a broad reading of the claim, one that may perhaps be too broad to be upheld against a claim of invalidity as this case progresses. MagneTek
has not, however, argued that the possibility of invalidity should lead us to construe the claim language narrowly, and we do
not intend to address arguments the parties have not made. 2 The only issue along those lines raised by MagneTek is that
this claim and others, if construed as Nilssen proposes, raise issues of "enablement" under 35 U.S.C. § 112, P1, which reads:

The specification shall contain a written description of the invention, and of the manner and process of making and using
it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it
is more nearly connected, to make and use the same ....

In arguing that the claims (as construed by Nilssen) do not comport with the requirement of "enablement," MagneTek has
misread § 112, P1: the statutory provision on its face applies only to the specification of the patent, not to the claims. In
short, we reject MagneTek's "enablement" argument.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

2 In addition, it is not clear where such an analysis would lead in this case. See generally Rhine v. Casio, Inc., 183 F.3d
1342, 1345 (Fed. Cir. 1999) (claims are to be construed to sustain their validity; but a court cannot rewrite a claim to
preserve its validity). Without argument by either party on the subject, we are not willing to travel down that road.

"Inverter-Type Power Supply" in the '342 Patent's Claims 3 and 5

Claims 3 and 5 of the '342 Patent include this language:

an inverter-type power supply that is connected with the DC output terminals and operative to provide a high-frequency
AC voltage between a first inverter output terminal and an inverter reference terminal.

Functionally that claim "provide[s] a high-frequency AC voltage...." Structurally that function is accomplished by "an
inverter-type power supply...connected with the DC output terminals...."

Though functionally derived, "inverter" has a well-understood meaning in the art (expressed, e.g., in Standard Handbook for
Electrical Engineers (hereafter "Handbook") 22-105 (Donald G. Fink & H. Wayne Beaty eds., 13th ed. 1993) as "a power
converter in which the normal direction of power flow is from a dc source to an ac load"). In short, "inverter" is an industry
term of art that describes a structure (even though, to be sure, "inverter" is a generic term--note the three types described at
the outset of this opinion--the term describes a particular kind of circuit and is plainly not as devoid of substantive content
(that is, structure) as the term "circuit" alone).

Indeed, though it is entirely true that "inverter" alone does not necessarily "call to mind a single well-defined structure"
( Greenberg, 91 F.3d at 1583 (emphasis added)), the very fact that the claim uses the term "inverter-type" strongly suggests
that inventor Nilssen did not intend to limit himself to a single species of inverter. Instead the claim's "inverter-type"
locution would normally appear to incorporate, quite deliberately, more than one kind of inverter, rather than being limited
by a single example in the specification.

In those terms alone the text of claims 3 and 5 would seem to fall outside the boundaries of Paragraph 6. And if that were so,
the M. Mem. 21 position that the specification limits the claim language would fail for the reasons discussed earlier.

But M. Mem. 23-24 also contends that the prosecution history reveals that Nilssen himself limited his claim to a "full-bridge
inverter." As stated earlier, Cole, 102 F.3d at 531 is exemplary of many cases (see also, e.g., Digital Biometrics, Inc. v.
Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998)) teaching that Nilssen is to be "bound by [his] representations to the PTO
during the prosecution of" his patent. Yet N. Resp. 31 offers an extraordinarily puzzling response to Motorola's argument,
reproduced here in its entirety:

Motorola also cites the prosecution history in an effort to prop up its proposed definition. This is dealt with in a previous
section at pp. 6-9, which establishes that the term "inverter" is not limited to a full-bridge inverter.

That cross-reference is to Nilssen's response to the prosecution history issue regarding claim 5 of the '356 Patent, which has not only been found wanting on that issue but is also quite irrelevant in the present context (it is after all entirely possible that an inventor may choose to use the same term in different ways in two different patents).

As far as this Court is concerned, then, Nilssen has left Motorola's prosecution history argument (M. Mem. 23-24) wholly unanswered in any substantive way. And the detailed nature and bulk of both sides' submissions refutes the notion that Nilssen's failure to provide any real explanation stemmed from any lack of opportunity to do so. This Court is therefore constrained to treat the claim elements at issue (claims 3 and 5 of the '342 Patent) as limited to a full-bridge inverter.

Nilssen first urges, quite correctly, that this Court looked at the wrong portion of his Responsive Memorandum for an answer to Motorola's otherwise persuasive argument that the prosecution history limited the actual claim language. Until it reviewed that prosecution history at Motorola's invitation, this Court was prepared to construe "inverter-type power supply" as encompassing "more than one kind of inverter, rather than being limited by a single example in the specification" (Opinion at 932). But because of what this Court then mistakenly understood to be unrebutted prosecution history, Opinion at 933 felt compelled to limit the claims to "a full-bridge inverter." Now a review of Nilssen's actual response calls for a different conclusion.

M. Mem. 23 (emphasis in original) originally argued that the prosecution history reveals that "the only type of inverter disclosed in the '342 Patent is a full-bridge inverter." That contention was supported by (1) Nilssen's statement in the context of an earlier application 9 that his invention was "concisely described" by a claim consisting of an "inverter means" with the structure of a full-bridge inverter (M. Mem. 23) and (2) Nilssen's statement in the context of a later patent that "to a person having ordinary skill in the particular art to which the claimed invention pertains, it would be clear that the relevant frequencies would be those associated with the full-bridge inverter" (M. Mem. 24). But Nilssen has directed this Court's attention to explanations that materially blunt the force originally ascribed to those statements.

--- Footnotes ---
9 Nilssen's statements are highly relevant because the '342 Patent is a continuation of that application, Ser. No. 7/646,497 (see Related U.S. Application Data of the '342 Patent).

--- End Footnotes ---

Thus it turns out that Nilssen's first statement was made in response to the examiner's challenge that he demonstrate that his claim language was "supported by disclosures in the specification, as required by paragraph 1 of 35 U.S.C., § 112" (N. Resp. 13). In other words, at that point Nilssen was merely highlighting the structure of the full-bridge inverter in the specification to demonstrate that sufficient disclosure existed there to support his claim.

As for the second statement, N. Resp. 13 points out that it was made in connection with a later patent, "a year-and-a-half after the '342 patent issued." Further, that later patent involved the term "substantially higher frequency"--a term that appears nowhere in the '342 Patent. Because the PTO viewed that term as indefinite, Nilssen responded with the words that Motorola quotes. In short, Nilssen says that the later patent involved an issue totally irrelevant to the claims presently at issue.

Motorola does not suggest anything to undercut those representations by Nilssen, and its memoranda offer nothing to rebut Nilssen's consequent arguments. Instead M. Rec. Mem. 7 seeks to fall back on "the reasons explained" in its original memorandum. But as already indicated, those reasons have been undercut by Nilssen's explanations, so that the cited prosecution history has been shown to be non-relevant.
In light of the arguments that were originally presented by Nilssen but were overlooked by this Court in the parties' paper blizzard, reconsideration is granted in that respect. This Court now holds that the phrase "inverter-type power supply" in the '342 Patent's claims 3 and 5 is not limited by the specification. Instead the phrase is given its well-known meaning in the relevant art as described in Opinion at 932.

2. "invertible randomized spreading"

A. Spreading

The independent claims of the '802 patent, in general, require operating on the plural sets of N data symbols to produce modulated data symbols corresponding to a spreading or an invertible randomized spreading of each set of N data symbols. The specification has numerous references to "spread" or "spreading." "The invention deals with the field of multiple access communications using Spread Spectrum modulation." '802 patent, 1:14-15. "Spread Spectrum can be classified as Direct Sequence, Frequency-Hopping or a combination of the two." Id. at 1:18-19. "Commonly used spread spectrum techniques are Direct Sequence Spread Spectrum (DSSS) and Code Division Multiple Access (CDMA) . . ." Id. at 1:21-23. In the Background section, the specification provides that "DSSS is a communication scheme in which information bits are spread over code bits (generally called chips)," and then provides certain advantages of this "information spreading." Id. at 1:25-45. "In this patent, we present Multi-Code Direct Sequence Spread Spectrum (MC-DSSS) which is a modulation scheme that assigns up to N DSSS codes to an individual transceiver where N is the number of chips per DSSS code." Id. at 2:6-10; Abstract. In the Detailed Description section, the specification provides that the computing means "operates on the plural sets of N data symbols to produce modulated data symbols corresponding to an invertible randomized spreading of the stream of data symbols." Id. at 4:2-5. The computing means "includes a source 16 of N direct sequence spread spectrum code symbols and a modulator 18 to modulate each ith data symbol from each set of N data symbols with the I code symbol from the N code symbol to generate N modulated data symbols, and thereby spread each I data symbol over a separate code symbol." Id. at 4:7-13.

The Court finds that spreading is typically understood to one of ordinary skill in the art as enlarging a signal of a particular bandwidth via a code that results in a signal with a wider bandwidth. Various dictionary definitions illustrate that in spread spectrum systems information content is spread over a wider bandwidth than the content of the original information to create a spread signal that has greater bandwidth than the original signal. As part of its intrinsic record, the '802 patent cites an authoritative text, the Proakis reference, that explains that spread spectrum signals have an expanded bandwidth. '802 patent, 1:22-32. Prior art cited during the prosecution of the '802 patent states that "[i]t is well known that spread spectrum techniques utilize bandwidths many times wider than those required by the data in transit" and that the basic data to be transmitted "is spread over a wider bandwidth than that occupied by the data alone." Further, inventor Fattouche wrote an article that confirmed that all spread spectrum techniques use a "pseudo-random sequence to spread the spectrum of the data signal to be transmitted . . . thereby widening the spectrum of the data signal."
In light of the substantial evidence that one of ordinary skill in the art would view the term "spreading" to necessarily include widening the bandwidth of a signal, and when there is nothing in the specification that clearly indicates that the term spreading should have a different meaning, the Court rejects Wi-LAN's arguments that the term should be merely "modulating data symbols by codes of larger bandwidth." While modulating and spreading may be related, the Court finds that spreading does not necessarily mean modulating. The specification and claims of the '802 patent do not equate those terms. For example, the specification provides that the computing means includes a modulator to modulate data symbols to generate N modulated data symbols, thereby spreading each I data symbol over a separate code symbol. '802 patent, 4:7-12. Contrary to Wi-LAN's arguments, the specification does not say thereby "modulating" each data symbol over a separate code symbol. See id. The Court finds that the use of the term "spreading" in the specification and the claims does not change the well-known definition of spreading. Thus, the Court finds that there is no evidence in the specification that the applicants intended to provide "spreading" with a special meaning different from its ordinary meaning.

The specification provides that "DSSS is a communication scheme in which information bits are spread over code bits (generally called chips)." '802 patent, 1:25-27. However, the claims require "data symbols," consistent with Wi-LAN's proposal, not "information bits" as proposed by the Defendants. The Court is not convinced that the definition of spreading should include the limitation of "thereby reducing the effective bandwidth" rather than the well-known understanding that spreading is used "to create a wider bandwidth." The Court finds that the ordinary meaning of the term "spread" is to distribute over a greater area of space or time, to extend or distribute over a region, to scatter, to stretch or extend over a greater area. Thus, the Court construes the term "spreading" to mean "distributing data symbols over codes to create a wider bandwidth of data symbols."

B. Invertible Randomized Spreading

The independent claims, in general, require operating on the plural sets of N data symbols to produce modulated data symbols corresponding to a spreading or an invertible randomized spreading of each set of N data symbols. Thus, the "invertible randomized" term modifies "spreading." In the Detailed Description section, the specification provides that the computing means "operates on the plural sets of N data symbols to produce modulated data symbols corresponding to an invertible randomized spreading of the stream of data symbols." '802 patent, 4:2-5. The specification also provides that Figure 8 is a "schematic showing the Randomizer Transform (RT) where a(1) a(2) … a(N) are complex constants chosen randomly." Id. at 3:12-14. Claim 19 provides that the "direct sequence spread spectrum codes are generated by operation of plural non-trivial transforms on a random sequence of input signals." The prosecution history of the '802 patent is enlightening. In a Response to an Office Action, the applicants stated that the "key here is the randomization of the transformation." August 28, 1995 Amendment and Response to Office Action, p. 15. "With randomized spreading, it is less likely that a pulse will be generated." Id. at p. 16. The applicants provided the following response to another Office Action:

It is well known in the art that a randomizer transform … actually does not generate a perfectly randomized signal, which is impossible, but a near approximation to it, in other words a pseudo-random signal. In fact, it is believed to be well known in the art, and this is the meaning in each of the claims in this application for patent, … that when the term "randomizer," "randomized," or "randomizing" is used in relation to a spreading or transform of a signal, then it is a "pseudo-randomizer," "pseudo-randomized," or "pseudo-randomizing" spreading or transform that is being referred to. The fact that the transform is in each case invertible, means that the transform is known beforehand and a signal encoded by use of the transform can be decoded using the inverse transform.

February 12, 1996 Response to Office Action, pp. 1-2. The Court finds that, based upon the specification, the claims, and the prosecution history, that one of ordinary skill in the art would find that proper codes perform an invertible randomized spreading of the information sequence or stream of data symbols. Further, the Court finds that, at least in the context of spread spectrum techniques, the randomized spreading of a signal is not a perfect randomization of the signal, but only a pseudo-randomization. Thus, "[a]ny one of the P N-point transforms in FIG. 3 consists of a reversible transform to the extent of the available arithmetic precision." '802 patent, 4:29-32. The invertible randomized spreading of a signal is only invertible to the extent of the available arithmetic precision. See id. According to the claim language, the phrase "invertible randomized spreading" requires that the spreading be both "invertible" and "randomized."

Neither of the parties' proposed constructions is particularly helpful. Defendants' proposals merely rearrange the words of the term to be construed and improperly limit the spreading to a particular type of transform where the claim language does not specifically require the use of a transform. On the other hand, Wi-LAN attempts to limit the definition of "randomized"
to "applying complex constants chosen randomly" without clear support in the specification that the term should be so limited. The Court finds that the only reference to "complex constants" in the '802 patent is in the context of the Randomizer Transform shown in Figure 8 and that Wi-LAN's proposed construction decouples the application of "complex constants chosen randomly" from the use of a transform in a specific instance and improperly applies the reference to the generic definition of "randomized." The ordinary meaning of the terms "invert" or "invertible" means to turn upside down, to reverse in position or order, to turn or change to the opposite or contrary, or to turn inward or back upon itself. Based upon the specification, the claims, and the prosecution history, one of ordinary skill in the art would find that the term "invertible" means "reversible." The Court finds that the ordinary meaning of the term "randomize" is to order or select in a random manner or to make random. Based upon the specification, the claims, and the prosecution history, one of ordinary skill in the art would find that the term "randomized" means "pseudo-randomized." Thus, the Court construes the term "invertible randomized spreading" to mean "spreading that is reversible and pseudo-randomized."

GO BACK

E. "Invoice" ('850 Patent)

"Invoice" appears in every independent claim of the '850 patent. Yodlee construes the term to mean "a description of the amount of and/or nature of user interaction with the system." CashEdge asserts that this term need not be construed, and if construed should be given its plain meaning of "itemized bill for services."

Within the patent, the term "invoice" is described as being something that is generated based on the updated accounting data. '850 patent col. 3, lines 35-55; col. 17, lines 7-12. The step of generating an invoice is the final step in "determining revenue," the ultimate goal of the process described in the '850 patent. It thus follows that the invoice must consist of a bill for money owed, a narrower construction than that put forward by Yodlee. The Court agrees with Yodlee that there is no reason to read a requirement that the bill be "itemized" into the language. The Court construes "invoice" to mean "bill for services."

GO BACK

Emergis contends that "invoice account number" means "account number" or "customer number," while Cable One asserts that it means "invoice number." Claim 1 states that the "payment instructions include[] at least a customer invoice account number and an associated customer payment account." Emergis contends that the "customer payment account" is the customer's bank account or other source of funds from which the invoice will be paid, and the "invoice account number" is the number or other identifier associated with the customer's account.

The parties agree that the specification makes a distinction between "customer account identifier" which is equivalent to "customer number" and/or "account number" and "invoice identifier" which is equivalent to "invoice number." The disputed phrase, however, contains terms from both phrases. By including both "account" and "invoice" in this term, the inventor of the patent introduced an ambiguity.

Cable One cites two examples in the specification when "invoice account number" is used interchangeably with "invoice number." In the summary of the invention, the specification states: "the payment instructions include[] at least an invoice account number and an associated customer payment account." n75 In the following paragraph, the specification reads: "the payment instructions include[] at least a customer invoice number and an associated customer payment account." n76 In comparing these two citations, invoice account number and customer invoice number were used interchangeably. Cable One also points the Court to the preferred embodiment in the specification that reads: "The information included in this electronic authorization could include the customer invoice number and an associated customer payment account. In a preferred embodiment, both these items of information are submitted simultaneously with the authorization." n77 Because the inventor used the phrase, "invoice account number" interchangeably with "customer invoice number," and this phrase is never used interchangeably with "account number" or "customer number," the Court determines that "invoice account number" means "invoice number." n78
In support of its position, Emergis cites a Federal Circuit case, Amhil Enterprises Ltd. v. Wawa, Inc., that held when an original modifier is disregarded, but the specification "leaves its reader with the impression that" the term without the initial modifier "mean[s] essentially the same thing" as the phrase without the modifier, then both terms are construed as having the same meaning. n79 Thus, Emergis contends that when "invoice number" is used without "account," "invoice number" means essentially the same thing as "invoice account number." However, the case Emergis cites is distinguishable from this case. In Amhil, the patentee used the phrase, "substantially vertical face" interchangeably with "vertical face." n80 The court found the entire specification as a whole left the reader with the impression that "substantially vertical" and "vertical" mean essentially the same thing. n81 In this case, reading the specification as a whole, the reader is not left with the impression that "invoice account number" means essentially the same thing as "invoice number." In Amhil, the addition of "substantially" was an unnecessary modifier that did not change the essential meaning of the term. In this case, the addition of "account" is a necessary term that changes the essential meaning of the phrase. Therefore, in this case, the Court cannot follow the reasoning of Amhil as Emergis suggests.

The prosecution history also supports Cable One's proposed construction. In the First Office Action, the Patent Examiner objected to the term "invoice account number" in the specification because he found the phrase to be ambiguous. n82 The inventor responded by amending the specification. The phrase, "an invoice number" was changed to "customer invoice number" to clearly show what he meant by the phrase "invoice account number." n83 After these claims were approved by the Examiner, he stated "[t]he prior art does not teach or suggest: . . . the customer entering (receiving in customer authorization interface) the instructions including at least the invoice number and customer's requisite/associated payment account. . . ." n84 Because the applicant never submitted anything afterwards to the Examiner contending that this statement misunderstood the scope of the invention, the Examiner's use of "invoice number" supports construing the term, "invoice account number," as "invoice number." n85 Because both the specification and the prosecution history support Cable One's proposed construction, the Court will construe the phrase, "invoice account number" as "a unique number that is an invoice identifier, i.e., an invoice number."

The prosecution history also supports Cable One's proposed construction. In the First Office Action, the Patent Examiner objected to the term "invoice account number" in the specification because he found the phrase to be ambiguous. n82 The inventor responded by amending the specification. The phrase, "an invoice number" was changed to "customer invoice number" to clearly show what he meant by the phrase "invoice account number." n83 After these claims were approved by the Examiner, he stated "[t]he prior art does not teach or suggest: . . . the customer entering (receiving in customer authorization interface) the instructions including at least the invoice number and customer's requisite/associated payment account. . . ." n84 Because the applicant never submitted anything afterwards to the Examiner contending that this statement misunderstood the scope of the invention, the Examiner's use of "invoice number" supports construing the term, "invoice account number," as "invoice number." n85 Because both the specification and the prosecution history support Cable One's proposed construction, the Court will construe the phrase, "invoice account number" as "a unique number that is an invoice identifier, i.e., an invoice number."
n85 Nazomi Comm'ns, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1370 (Fed. Cir. 2005) (finding that any construction of a term must be consistent with the examiner's findings).

4. "invoice presentation electronics"

The differences between the parties' proposed claim interpretations are as follows:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Emergis's Construction</th>
<th>Cable One's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoice</td>
<td>an electronic facility</td>
<td>a device which provides an &quot;invoice&quot; electronically from the</td>
</tr>
<tr>
<td>presentation</td>
<td>adapted to provide</td>
<td>&quot;invoice&quot; electronically from the</td>
</tr>
<tr>
<td>electronics</td>
<td>customer billing data</td>
<td>invoicer to the customer</td>
</tr>
</tbody>
</table>

Emergis cites the specification to support its construction of this claim. The specification states the automated billing system in the patent includes "invoice presentation electronics adapted to present customer billing data in request for payment instructions related to automated billing." n45 Additionally, for the same reasons it disputed the construction of "presentment," Emergis contends that Cable One's interpretation is too restrictive by using the term "invoice." The specification states that the invoicer has flexibility in determining what customer billing data to provide to the customer, and such information is not restricted to the information on an "invoice." Because the specification supports Emergis's construction, the Court will construe the phrase, "invoice presentation electronics," as "an electronic facility adapted to provide customer billing data."

n45 (5:26-29.)

1. "invoicer"

The differences between the parties' proposed claim interpretations are as follows:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Emergis's Construction</th>
<th>Cable One's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoicer</td>
<td>a person, usually a business, who prepares an invoice detailing the goods and services provided to a customer, and then charges for such goods and services, and receives payment for those goods and services</td>
<td>a person, usually a business, who prepares an invoice detailing the goods and services provided to a customer, and then charges for such goods and services, and receives payment for those goods and services</td>
</tr>
</tbody>
</table>

Emergis contends that Cable One's addition of "receives payment for those goods and services" adds a limitation that requires the business to receive actual payment, and that this limitation is contrary to the intrinsic evidence. Emergis's proposed construction comes from the specification which states that an invoicer is "usually a business, who prepares an invoice detailing the goods and services provided and the charges therefor." n36 Additionally, Emergis argues that the common and ordinary meaning of invoicer is "an itemized list of goods shipped or services rendered, with an account of all costs," n37 and the common and ordinary meaning of invoiced, invoicing and invoices is "to make an invoice of or submit and invoice to." n38 Because the common and ordinary meaning of invoicer only contemplates the sending of an invoice...
and not the receipt of payment, the Court finds that Emergis's construction is more appropriate. Because the Court must give "claim terms their ordinary and accustomed meaning as understood by one of ordinary skill in the art," n39 the Court will construe "invoicer" in accordance with Emergis's proposed definition and omit Cable One's proposed language that requires the invoicer to receive payment. Therefore, the Court will construe the term, "invoicer," as "a person, usually a business, who prepares an invoice detailing the goods and services provided to a customer, and the charges for such goods and services."

--- Footnotes ---

n36 (1:14-16.)
n37 (Doc. 61 at 8 (citing WEBSTER'S II NEW COLLEGE DICTIONARY (2001))).
n38 Id. (citing WEBSTER'S II NEW COLLEGE DICTIONARY (2001)).

--- End Footnotes ---

5. "invoicer billing information"

The differences between the parties' proposed claim interpretations are as follows:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Emergis's Construction</th>
<th>Cable One's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;invoicer billing information&quot;</td>
<td>information relating to the invoicer, which may include the due date, amount due, list of goods and services, late charge</td>
<td>None</td>
</tr>
</tbody>
</table>

Emergis argues that their construction is appropriate because the specification states that "[t]he billing information that may be submitted to the customer includes any combination of the following items: payment due date, amount due, detail of goods/services provided during a billing period, late charges, account information, customer information . . ., invoice identifier, e.g., invoice number." n46 Because the specification supports Emergis's construction and Cable One has not provided an alternative construction, the Court will construe "invoicer billing information" as "information relating to the customer's obligations to the invoicer, which may include the due date, amount due, list of goods and services, late charge."

n46 (6:34-47) (emphasis added).

--- End Footnotes ---

4. "Irrespective of"

SWB asks this court to interpret the term "irrespective of" which appears in disputed Claims 1, 15, 22, 29, 35, and 42 in the '125 patent and in disputed Claims 1 and 3 in the '650 patent to mean "without analyzing the content of." In contrast, Gammino asks the Court to construe "irrespective of" to mean "without regard to." Both Parties point to language in the
specification? which refer to digits in the second plurality as "don't care" values? to support their proposed construction. Likewise, both Parties highlight language in the prosecution history where Gammino stated that his claims are "directed toward preventing international telephone calls regardless of the indicated carrier" to support their proposed construction.

The Court construes the term "irrespective of" to mean "without analyzing the content of;" thus, the Court gives the terms their meaning as proposed by SWB. Both patents describe the digits in the second plurality as "don't care" values; digits that Gammino's patents do not analyze. The patents explain that Gammino's claimed invention does not analyze the content of the second plurality as part of determining whether to block a call:

Table entries may include "don't care" values to indicate digits and locations in the dialing sequence which should not serve as a basis for preventing completion of the telephone call.

125 Patent, col. 4, lines 37-40; '650 Patent, col. 4, lines 41-44.

In fact, during the prosecution of both patents, Gammino distinguished his patents from the Bimonte patent by arguing that Bimonte used the content (e.g. digits) in the second plurality to identify the long distance carrier in order to determine if the call could be carried on the identified carrier. Specifically he stated,

Bimonte discloses evaluating whether a call can be carried on an indicated carrier. By contrast, Applicant's claims are directed toward preventing international telephone calls regardless of the indicated carrier. Bimonte does not perform this claimed function.

In distinguishing his patents from Bimonte, Gammino also stated,

It is to be noted that Applicant's determination, as to whether to prevent establishment of a telephone call, is made irrespective of and independent of the second plurality of dialing digits...

Thus, Gammino argues that his claimed invention operated without analyzing the content of the second plurality of digits. In other words, Gammino's call-blocking determination (i.e. analysis) is made "irrespective of and independent of" the second plurality of digits.

According to Gammino, his patents "regard" the second plurality of digits; therefore, the term "irrespective of" must mean "without analyzing the content of." In his Claim Construction brief, Gammino states:

Under the method, signals in the second plurality are analyzed to determine if particular signals have been entered at particular places in the dialing sequence. As such, the claims contemplate that calls would be prevented regardless of the second plurality but that the second plurality can be dealt with to determine if signals are located at particular places.

Gammino's brief shows that the second plurality of digits are "deal with" and thus regarded to "determine if signals are located at particular places." Gammino agrees that the second plurality is analyzed, but the analysis does not involve the content of the second plurality. The Court will not construe "irrespective of" to mean "without regard to" because Gammino's patents regard the second plurality of digits to determine the their respective location within the dialing sequence. The Court, therefore, construes "irrespective of" to mean "without analyzing the content of".

4. "is"

The claims of the '184 patent require determination of whether the terminating subscriber, or in the case of claim 18 both the originating and the terminating subscriber, "is" PIC'd to a particular IXC. Excel asserts that the term "is," as it is used in the asserted claims, means "at the time of the call referenced in the claim." (D.I. 300 at 50) AT&T does not propose an alternative construction.

In common parlance, "is" is used to indicate "that which is factual, empirical, actually the case or spatiotemporal." Webster's
at 1197. Excel's construction, therefore, is consistent with the ordinary meaning of the term given the context in which it is used. Moreover, Excel's construction is consistent with the language of the independent claims which not only links the PIC indicator to a specific call but also anticipates a single PIC for the terminating subscriber. (‘184 patent, col. 7, lns. 13-16; col. 8, lns. 25-27; col. 8, ln. 67-col. 9, ln. 1; col.12, lns. 14-17)

The court, therefore, shall construe "is" to mean "at the time of the call referenced in the claim." Consistent with this construction, "the PIC for said terminating subscriber" shall be construed to mean the IXC selected by the subscriber to provide 1+ long-distance service to the telephone number called at the time of the call referenced in the claim.

2375

(1) isochronous source, isochronous data source, non-isochronous data source, isochronous data source outputting
isochronous data, isochronous data, non-isochronous data, isochronous, non-isochronous, isochronously, non-isochronously

In proposing constructions for the myriad of isochronous terms, the parties begin from different root terms. Aside from the varying starting points, however, the fundamental dispute is whether "isochronous" excludes packetized data; indeed, the proposed constructions submitted by the parties are substantially similar after removal of the "non-packetized" limitation. Additionally, the parties agree that the term "isochronous" connotes a time-dependency limitation.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Dell and National begin with "isochronous data," and N-Data begins with "isochronous data source." Each of the parties asserts that the specification expressly defines their respective terms. See '261 Patent, col. 1 ll. 23-27.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In support of their inclusion of the "non-packetized" limitation, Dell and National cite to a specific reference in the specification: "[i]n general terms, isochronous data is data which is non-packetized and of indeterminate, potentially continuous duration." Id. (emphasis added). There has been much debate, however, concerning the above-emphasized introductory phrase. The court agrees with N-Data that the introductory phrase, "in general terms," while defining the term in a broad, high-level manner, is not meant to confine the term to the constraints subsequently imposed by the remainder of the sentence, to the exclusion of all other possible variations.

Additionally, notwithstanding the use of "in general terms," the patents contain a number of examples in which isochronous data can be packetized. One key example appears in Figures 3 and 5 of the '820 patent. Figure 3 displays the schematics of an IsoEthernet network expansion card that can be used for isochronous information transfer. In Figure 3, the IsoPhy (isochronous Ethernet physical layer) separates or combines Ethernet and B channel (isochronous) data. See '261 Patent, col 5 ll. 1-2, ll. 29-32; '261 patent, Table III. Figure 5 illustrates an expanded view of blocks 301 and 302 of the IsoBuffer, block 209. Within block 301, there are three other components pertinent to the term at issue, two HDLC Packet Framers/Deframers and one ATM Packet Framer/Deframer. HDLC (High-level Data Link Control) is an information framing protocol used to frame information for isochronous communication over a standard digital telephone line. '820 Patent, col. 1, ll. 63-67. ATM (Asynchronous Transfer Mode) is an alternative information transferring protocol. '820 Patent, col. 2, ll. 35-37. These two protocols "packetize[] or depacketize[] information" and are "disposed in the B-channel data path between isoPhy block 206 and ISA bus 201." '820 Patent, col. 5, ll. 41-45; col. 6, ll. 29-30. Whether or not there is a "transmut[ation]," as Dell suggests, from packetized data on one side to non-packetized data on the other, the integration of such protocols within the isochronous data transfer pathway contemplates packetized isochronous data. A construction that excludes an embodiment is rarely correct. See also U.S. Patent App. 07/969,916, p. 32 ll. 15-18 (parent application acknowledging that isochronous data could be transferred using a bus, such as the P1394, that transfers isochronous data via packets); '820 Patent, col. 1, ll. 38-48 (explaining that telephone conversations, an example of isochronous data, are transferred via small packets); U.S. Patent No. 4,556,970, U.S. Patent No. 4,674,082, U.S. Patent No. 4,866,704, U.S. Patent No. 5,164,938, and U.S. Patent No. 5,200,952 (prior art references cited by the patent examiner that describe packetized transfer of isochronous data).

Accordingly, the court defines "isochronous data" as follows: "data of indeterminate, potentially continuous duration."
The court defines "isochronous data source" as "a device which outputs data of indeterminate, potentially continuous duration in a continuous stream, usually at a substantially constant average data rate."

The court defines "isochronous" as "continuous, with a uniform time period."

The court defines "isochronous source" as "a device which outputs in a continuous stream."

The remaining terms are given their plain and ordinary meaning in light of the previously construed terms.

1. "isolation" / "isolating" / "isolated" ('190, '034, '083, and '702 patents)

SynQor's Proposed Construction
Isolation: "having insulation incorporated to prevent the flow of substantial DC current"
Isolating: "providing isolation"
Isolated: "having isolation"

Defendants' Proposed Construction
"the absence of an electric path permitting the flow of DC current between two points"

SynQor argues that isolation is a well-known term in power electronics and that isolation is provided by using a transformer to insulate the output from the input. SynQor argues that the claim limitation is met if the power converter is configured to provide the function of isolation --allowing power to be transferred from the input to the output while preventing the flow of substantial DC current by using an insulated device, such as a transformer. SynQor argues that Defendants' construction is inconsistent with how persons of ordinary skill would define an isolated converter and would cover any situation where there was no electric path for DC current between two points. SynQor argues that the specification confirms that the term isolation is defined by whether there is insulation, such as a transformer, within the stage that prevents the flow of DC current from the input to the output. See Fig. 2 of the '190 patent. SynQor argues that the specification never defines "isolation" by whether there is a path that might allow electric current to flow somewhere outside of the stage/converter, such as a common ground. Rather, it defines "isolation" as the presence of circuitry within the stage/converter itself that prevents the flow of substantial DC current within the stage/converter.

Defendants argue that isolation is a state or condition that can be changed. Defendants argue that isolation prevents the flow of all, or all but a de minimis amount of, DC current. Defendants argue that isolation is provided by creating an electric barrier between two components such that DC current cannot flow between them. Defendants argue that Figure 2 shows that there is no electric path from the input to the output of the isolation stage. Defendants argue that the term insulation, proposed by SynQor, is not used in the specification and is not descriptive, ambiguous, and circular. Defendants argue that the mere presence of insulation in the circuit does not guarantee that the input and output of the circuit will be isolated because an electrical connection could be provided elsewhere. Defendants further argue that prior art cited during prosecution, part of the intrinsic record of the '083 and '702 patents and listed on the face of those patents, confirms its construction. These prior art references have diagrams and expressly use the terms "isolated" and "non-isolated" when there is the absence or presence of a path permitting the flow of DC current from the input to the output of the circuit. Defendants further argue that the inventor confirmed this understanding during his deposition.

The word "insulation" is not used in the specification or the claims. In the specification, a transformer is used to provide isolation, but the specification never teaches that "isolation" means "insulation." As the prior art shows, a power converter can utilize a transformer, but if the circuit has a separate conducting path it is not viewed as "isolated." Thus, the presence of insulation is not determinative of whether the stage is isolated. The Court rejects SynQor's attempt to insert the term "insulation" and "substantial" to the construction without any clear support for those terms. The dictionary definition of isolation implies a separation or detachment from one component to another component. It is clear from the specification and the parties' construction that the separation is that of electricity, and more specifically, DC current. The parties agree that isolation can allow the flow of a de minimis amount of DC current. The prior art and specification indicates that isolation
for a circuit or stage is that where no electric path exists between the input and output of the circuit or stage. That is, the input is isolated from the output. SynQor's concern, that isolation looks to the internal structure of the converter, circuit, or stage to determine whether it is isolated, is taken into account when the entire phrase of "non-isolating regulation stage" or "isolation stage" is considered. In these contexts, the stage itself must have internal isolation or be isolating itself, not necessarily that the stage must be isolated from another stage or structure. The claims provide that stages, circuits, converters, and transformers can be isolating. Thus, the Court construes the term "isolation" to mean "the absence of an electric path permitting the flow of DC current (other than a de minimus amount) between an input and an output of a particular stage, component, or circuit." The Court finds that the terms "isolating" and "isolated" have the same meaning as the term "isolation."

Isolation Region in Said Substrate

The Court adopts Motorola's proposed construction of "isolation region in said substrate" and construes that term to mean "region in the substrate isolated from noise generated in another region." ST proposes an identical construction except with the word "area" substituted for "region." The Court finds "region" to be clear on its face and thus denies ST's proposal.

8 ST's proposed construction is: "an area in the substrate isolated from noise generated in another area."

Issuing multiple instructions and non-sequential instructions within a given processor cycle when the existence of concurrences is detected (claim 6), and issuing multiple instructions and non-sequential instructions within a given processor cycle when said plurality of concurrently executable instructions are detected (claim 15)

Defendant construes these terms as meaning: "forwarding by the reservation circuit of all instructions for which the Issue Index (I<2>) is equal to zero and the requisite functional unit available where Reservation circuit is defined as a component that has OP, Issue Index, and Functional Unit Status inputs, and an Issue output." Thus, I<2> (which according to defendant includes false dependencies) is an integral part of defendant's construction.
Plaintiff contends that the terms simply mean "issuing multiple and non-sequential instructions when the dispatch stack has detected a plurality of concurrently executable (i.e. data dependency free) instructions." The Court has already determined that there is no requirement that the dispatch stack include an I<2>. Further, the Court has already found that false dependencies are not a limitation in claims 6 and 15. Based in particular on its above reading of the phrases "detecting the existence of concurrences in instructions stored in said dispatch stack" (claim 6) and "detecting the existence of a plurality of instructions which are concurrently executable from those instructions stored in said dispatch stack" (claim 15), the Court agrees with plaintiff. The Court adopts plaintiff's proposed construction.

1. General Issues

Defendants claim that two issues underlie many of the disputed claim terms: first, whether the "auction process" ends with the deadline for bid submission such that all claimed steps must occur before bids are submitted; and second, whether the bidder's computer must perform the "computing", "submitting", "transmitting", and "communicating" steps.

The first issue is admittedly the same issue decided adversely to defendants in the summary judgment context. As such, for the reasons discussed immediately above, the court will not address it yet again.

The second issue is also easily disposed of by reading the plain language of the claim. Sometimes the claim explicitly states that a step must be performed on the bidder’s computer, e.g., "inputting . . . into said bidder's computer" and "submitting . . . from said bidder's computer". Other times the claim explicitly states that a step is performed elsewhere, e.g., "communicating . . . to said issuer's computer" and "displaying, on said issuer's computer". Still other times there is no designation as to the location of a step. For instance, the "automatically computing" step is given no location. This step could be performed on the bidder's computer, where the bid data has been inputted, or, at some other location where the data has been transferred for the purpose of computation. As such, there is no merit to defendants' argument that all steps of Claim 1 must be performed on the bidder's computer.

2. Claim Construction - Claims 1, 14, 20, and 31

We turn now to construction of the allegedly disputed terms. Before doing so, we note that although we accept that it is an unfortunate convention of patent litigation practice to exacerbate the claim construction task, in this case, the process has been particularly abused. Defendants originally contended that approximately four terms would need to be construed; the claim construction chart contains twenty-five. Repeatedly, when defendants cite to intrinsic evidence, the citations do not support the position advanced, and sometimes do not even address the topic at issue. Moreover, as noted above, defendants, who are the ones seeking construction of these terms, fail to specifically identify the context in which any particular construction of a term is important to the case, as the court explicitly instructed them to do. The court has looked past these shortcomings and has carefully considered each of defendants' claim construction arguments. Unfortunately, even putting all of this aside, they are largely without merit.

CLAIM 1:

As an initial matter, we find that construction of the preamble is necessary. The preamble describes the components of "an electronic auction system". The components are used in the steps that comprise the "electronic auctioning process." The entire claim must be read as a whole.

TERM # 1: "electronic auction system" - Defendants reiterate the temporal limitation argument that they lost on summary judgment. We need not address it again. This term means: "The equipment and procedure used to sell fixed income financial instruments to the highest bidder using computers."

TERM # 2: "issuer" - The parties agree that this term means: "An entity offering fixed income securities for sale."

TERM # 3: "issuer's computer" - As with most terms asserted by defendants as being in need of construction, this is not a
complicated term to construe. We need not look beyond the claim itself to conclude that defendants' proposed construction is invalid. Although the issuer's computer does perform the act of "displaying" in the process steps, it also performs the step of receiving a message associated with said submitted bid. Therefore, it would be improper to define this term by limiting it to the displaying step, as defendants propose. This phrase means: "A computer used by the Issuer to access an electronic auction."

Disputed Claim Term 4: First Code Module Issues a First Command to Retrieve a Second Code Module

The plain meaning of this phrase is that the first code module (described above) issues (gives) a command (an order, instruction or direction) that a second code module (a different computer program) be retrieved (fetched from some other location -- that is, the second code module, unlike the first code module, is NOT already embedded in the Web page). This definition appears to describe quite accurately what happens during the patented process; it conforms to the specification in every particular. Indeed, the term appears to be self-defining.

Tacoda's proposed definition of the disputed claim term as follows: "The first code module performs a program instruction contained within the first code module to request the downloading of a second code module from a location on a network." This appears at first blush to be a more convoluted way of articulating the plain meaning of the phrase -- although there is a twist.

Modavox, on the other hand, clearly seeks to expand the scope of its patent by defining this term as follows: "An instruction by a code module that initiates the transfer or retrieval of another code module." While not quite grammatically accurate ("an instruction" is a noun; the term to be defined is not a noun), it, too, seems to capture the general idea of the claim -- although it uses the term "retrieval" in the definition of "retrieve."

The only meaningful difference between these two definitions is whether the first command that is issued by the first code module -- the command to retrieve the second code module -- can be located somewhere other than within the first code module. Tacoda says the command, "Fetch the second code module" must be located (i.e., programmed) within the first code module itself. Modavox insists that the process of retrieving the second code module could encompass multiple steps, with the ultimate "Fetch" command being located somewhere outside the first code module. For example, the first code module could be programmed to link up to a remote server or a linked web page where the command, "Fetch the second code module" was embedded and (presumably) direct that remote or linked server or page to send out that command, thereby causing the second code module to be retrieved.

The asserted claims themselves do not expressly indicate whether the command that issues from the first code module must be located within that code module or whether the first code module can be programmed to call on a command located elsewhere. However, the specification discloses a preferred embodiment in which the command is contained within the first code module. Modavox argues that Tacoda is attempting impermissibly to limit the scope of its patent to the preferred embodiment; while Tacoda, citing the recent Netscape opinion, argues that nothing in the patent (including the specification) discloses the possibility of any other embodiment -- which augurs for a narrow construction.

In this instance, I agree with Tacoda.

In the context of this invention, the first code module is a computer program that does two things -- issues a command to fetch the second code module and then directs the second code module to execute. Furthermore, the first code module must issue the command to fetch the second code module "automatically" (i.e., without any intervention). The first code module must, therefore, be programmed (i.e., contain the instruction) to issue the "Fetch" command.

There are several obvious flaws in Modavox's definition. First, it is quite clear that, for the purposes of this invention, only one code module -- the one that is embedded in the Web page (i.e., the FIRST code module) -- can issue the command to retrieve the second code module. Modavox impermissibly broadens the scope of its claim in its definition by not specifying that the instruction to retrieve the second code module must issue from the first code module; instead, it uses the formulation "a" code module, which could be any code module (computer program), not just the first code module.
A second flaw is that Modavox adds the word "transfer" to the definition, which introduces an unnecessary complication. The claim language speaks only of "retrieving" the second code module -- not of transferring it. Transfer and retrieval are not the same thing, so adding the word "transfer" to the definition does not make the word "retrieve" any clearer. Nor does "retrieve" require any clarification: in the context of this patent, the specification discloses that the second code module is "assembled" in response to the issuance of the "retrieve" command by the first code module.

Tacoda inserts the concept of downloading into the definition of this claim term. However, it is not wrong to do so. The second code module must end up on the client computer (the one that displays the Web page) -- that is the purpose of "retrieving" it. A person skilled in the art would recognize that a computer program retrieved from a remote server ends up on a client computer via the process known as "downloading." 999

I therefore adopt Tacoda's proposed definition of this term and will instruct the jury that "first code module issues a command to retrieve a second code module" means:

The first code module performs a program instruction contained within the first code module to request the downloading of a second code module from a location on a network.

2382

Item

The Court agrees with Sklar that the term "item" has its plain ordinary meaning and does not require construction. Microsoft argues the term "item" should be construed to mean "a person or thing represented by a record in a searchable database, such as a particular car represented in a database of cars available for sale or a particular web page represented in an URL database." For support, Microsoft points to the '843 patent specification, which states "this invention provides an improved interface for performing computer database searches and filtering search results." '084 patent, Col. 1:12-15. Microsoft argues the asserted claims are not directed to manipulating real world things, but are directed to computer representations, or records, that are considered in the decision-making process. Sklar contends one of ordinary skill in the art reading the claims, the specification, and the file history would understand the term "item" has its plain ordinary meaning.

The Court first looks to the claims themselves to determine what the term means. Phillips, 415 F.3d at 1312. Sklar defined in the body of every asserted claim what is meant by the term "item." For example, the '843 patent states an "item is characterized as being a member of one category." '843 patent, Claim 5. Microsoft's argument to add examples from the specification into the claim language is unconvincing. The specification's written description does not limit the scope of the claimed invention. Markman, 52 F.3d at 980. Furthermore, Microsoft's effort to define "item" as a person or thing represented by a record in a database is unpersuasive. Claim 1 of the '121 patent used the exact language that Microsoft is seeking to insert into the Court's construction. Sklar, however, did not use that language in the claims of the patents-in-suit. The scope "of each individual claim must be examined on its own merits." Lemelson v. TRW, Inc., 760 F.2d 1254, 1267 (Fed. Cir. 1985). Therefore, limitations from one independent claim are not imputed to another independent claim. The preamble of Claim 1 of the '121 patent states:

1. A user interface generated by a digital computer for user selection from among a plurality of items wherein each of the plurality of items is referenced by a record in a database with at least one field in the record defining at least one coordinate for the item, the user interface comprising:

The preamble of Claim 5 of the '843 patent states:

5. A method of presenting a user with selection of items, wherein each item is characterized as being a member of one category selected from a plurality of categories, the method comprising the steps of:

The preamble of Claim 11 of the '094 patent states:

11. A method of presenting a user with a display of a selection of items, wherein each item is characterized in the display as being a member of a category selected from a plurality of categories, the method comprising the steps of:

The "record" or "database" limitations urged by Microsoft are not found anywhere in the claims of the patents-in-suit. The specification portion that was added by the continuation-in-part applications are directed toward a user interface where "databases" are one potential underlying application. The first two sentences of the major textual portion appended during the continuation-in-part applications state: "Fig. 11 illustrates the use of
clustering to optimally fill the display 900. Display 900 is a display which might be used to gain insight into a database of cars available for sale. The term "might be used" makes clear the exemplary nature of the embodiment. The term "item" is not a scientific term or term of art that a lay juror would not understand. "The ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words." Philips, 415 F.3d at 1314. In the specification of the patents-in-suit, the term "item" is used in everyday English. Accordingly, the Court does not construe "item" with the limitation that an item be represented by a record in a searchable database.

2383

(1). "Item" and "Movie" Require No Definition.

Turning now to a closer consideration of "item rental queue" and "movie rental queue," Blockbuster urges the court to define the terms "movie" and "item." A district court need not construe every single disputed word. "Claim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary to explain what the patentee covered by the claims, for use in the determination of infringement." U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997). As these are commonly-understood English words, they need no clarification.

The term "item" is defined explicitly in the specification of the '450 patent, which stated "[a]s used herein, the term 'items' refers to any commercial goods that can be rented to customers" (col. 4:1-3). Absent that, a juror would still understand through everyday experience that "item" used in this context would not include, for example "cups of coffee" which cannot be rented, but could include "bowling shoes" which can be rented to customers. Jurors would also understand that the term "movie," as used in the patents, was intended to include media such as documentaries, television series, cartoons, music videos, concert performance films, and instructional and educational programs. This list was recited in claim 13 of the '381 patent (col. 13:59-64).

2384

(3). Operation of the Queue.

The next point of dispute is whether the queue must be used by the provider. The claims make it clear that the "rental queue" is used to rent items. No further clarification is needed on that point. The claims and specification give less guidance as to whether the provider is the one necessarily using the queue. The claims of both patents reveal that the queue is formed, at least in part, from the customer's input in selecting movies or items. The provider then selects the items to be rented from the queue based on the customer's input and possibly other factors. For instance, the customer can rank items within the ordered list, but the provider uses the queue to determine which item to send based on availability, or based on which customers have generated the most revenue for them, or any number of other criteria.

For example, the specification indicated that customers could select movies that had not yet been released. The customer may state as an item selection criteria that he would like to rent every newly-released movie starring Keanu Reeves. The system would automatically add them to his movie rental queue once they became available. Blockbuster argues that such a system would simply not place those items in any order at all within the queue. Even though those items may not be in a customer-determined order, they would still be arranged in some manner to allow the system to rent items. For instance, they might be placed in order by the system based on availability, relative popularity, or even a sequence as mundane as alphabetical or chronological order. It would not merely be lumped in at random with the customer's other selections.

At oral argument, Blockbuster contended that availability was the only criteria other than customer preference that was taught or enabled by the specification. It contended that availability cannot truly be a criteria because the provider cannot rent what it does not possess. This neglects the possibility that the system could delay sending the top-ranked item until it is available. For instance, if a customer had selected a certain movie as his top choice but that movie was not available, the system could simply wait until a copy of the customer's top choice was returned to send that customer the movie.
Availability can constitute a criteria for ordering the queue.

Accordingly, this order holds that "item/movie rental queue" will mean the sequence from which the provider selects movies or items to be rented. A queue has an order. It includes the ordered list but may also include other items. The queue's sequence can be determined in part by customer preferences but may also use other priorities such as availability, demand, popularity, and delivery constraints. "Items" and "movies" will be given their common meanings with "items" being limited to those things that can be rented.

The parties dispute the proper construction of the phrase "items...containing information" as that phrase is used in Claim 19 of the '992 Patent.

In addition to the phrase "items containing information," the specification of the '992 Patent uses the following related phrases: "items," "information from items," "items in the source material library," "information in the items," "items having information," and "items of information."

In the July 12 Order, the Court construed the phrase "items containing information" as follows:

The Court construes the term "items containing information" to mean "items containing information in analog or digital format." The limitation requiring the information be stored in analog or digital format is necessary as the conversion means element 113 only converts analog and digital inputs into a "formatted data" output. n4

(July 12 Order at 11, citing ’992 Patent, figure 2a.)

n4 The Court inserted this footnote following the definition: "Neither the claims nor the specification of the ’992 patent disclose any structure for converting information in the 'items' to analog or digital form as required by the 'conversation means,' before the items are stored in the library means. The claims and the specification disclose structure (figure 2a (113)), which converts only analog or digital information. Before the items are stored, the information in the 'items' stored in the library means must out of necessity already be in analog or digital format." (July 12 Order at 11, n. 6.)

The current dispute is whether the word "items" as used in the '992 Patent refers to physical items. The specification refers to "items" as follows:

The source material library 111 may include different types of materials including television programs, movies, audio recordings, still pictures, files, books, computer tapes, computer disks, documents of various sorts, musical instruments, and other physical objects. These materials are converted to or recorded on a media format compatible to the digital and analog inputs of the system prior to being compressed and stored in a compressed data library 118.

(’992 Patent, Col. 6:10-19.) The Court finds that a proper reading of the specification renders that the word "items" means physical objects and not the "information" which might be contained in the physical objects. n5 For example, a computer file, would be information. The media used to store the computer file, such as a computer disk or a computer tape, in the source material library would be a physical item containing the information.

n5 A literal reading of Claim 19 is that the user requests "items containing information" (e.g., a video tapes) and that the items are "to be sent" from the transmission system to receiving systems. Thus, under this literal reading, the video tapes
themselves would be sent. However, the specification makes it clear that the invention is not one in which the video tape is sent, but one in which movies are extracted from the video tapes, processed, and only the movies (information) are sent to the receiving systems.

--- End Footnotes ---

The Court defines "items...containing information" as follows:

In a distribution method as disclosed in Claim 19 of the '992 Patent, in which, responsive to requests from a user identifying "items" in a transmission system "containing information," information is sent from the transmission system to receiving systems at remote locations, the phrase "items containing information" means "physical items, such as video tapes, film, or computer disks, which contain audio information, video information or both."

Claim 1 indicates that "job input" is "from the authorized user" and is related to the "job request" and "job instructions." '998 Patent, cl. 1. The central issue regarding this term is whether it is proper to limit the methods by which an authorized user may input job data as the defendant asserts. Plaintiff asserts that nothing in the specification or claims requires that the job input be so limited as the defendants suggest; in fact, it asserts that the invention contemplates that a user may provide a variety of input, "some of which may be data for transcription and/or translation, but some of which may be in the form of instructions and priority details, additional documents and/or multimedia files for attachment to the electronic file, or the designation of additional users who may access the voice file and/or transcription." Anthurium's Opening Claim Construction Brief at 17 (citing '998 Patent, cl. 5, col. 6 ll. 20-33, col. 8 ll. 57-60, col. 11 ll. 44-50, col. 16 ll. 6-17).

Claim 1 of the '998 patent contemplates a "job packet" containing a "digital file" and a "job record." The claim also indicates that the "digital file represents job input from the authorized user." Anthurium's proposed construction fails to distinguish between a "job record" and "job input;" it is simply too broad, when read in the context of claim 1 as a whole. With the exception of the "human user" limitation, the limitation proposed by the defendant encompasses most of the interactions contemplated by the specification and sufficiently distinguish it from a "job record."

As such, the Court defines "job input" as follows: "Data received from the authorized user that is to be transcribed, translated, entered, or assembled." 2

--- End Footnotes ---
3. "job instructions"

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Anthurium's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job instructions</td>
<td>Data from an authorized user to a local computer concerning performance of a job</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job instructions</td>
<td>A communication providing directions for performing the job</td>
</tr>
</tbody>
</table>

This term is not found within the '998 patent specifications. The central issue regarding this term is generally whether the "instructions" are limited to data or communications. Anthurium asserts that the defendants' proposed use of "communication" implies a single interaction. The defendants argue that Anthurium's use of "data" is too broad and is unsupported by the intrinsic record.

The specification implicitly describes the type of information which may comprise "job instructions." In various portions of the specification, the DAD prompts the authorized user for information, such as priority or preview options. Then, based on a set of pre-stored rules and user information stored in the HIS, the HOME interprets the user's input to produce job requirements that are stored in a Job Record. Additionally, the specification indicates the potential for multiple interactions by an author and not merely one solitary interaction. See id. at col. 4, ll. 17-29, col. 6 l. 66-col. 7 l. 2, col. 12 ll. 16-38. As for the preliminary limitation proposed by Anthurium, "from an authorized user to a local computer," the Court finds that such limiting terminology is not necessary given the context in which it is used within claim 1 of the '998 patent.

In light of the specification as a whole, the Court construes "job instructions" as follows: "communication(s) providing information for performing the job."

4. "job packet"

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Anthurium's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job packet</td>
<td>One or more electronic files associated with a job</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job packet</td>
<td>An electronic collection of data sufficient to perform a job</td>
</tr>
</tbody>
</table>

According to the claim language, a "job packet" contains (1) "at least one of a digital file and a reference to the digital file," and (2) a "job record that includes a set of computer-readable job processing requirements that are based on an interpretation by the local computer of the job instructions." '998 Patent, cl. 1. The central issue with respect to this term is whether a "job packet" must contain all the information sufficient to perform a job. In support of its construction, Anthurium cites to
various portions of the specification, which seemingly indicate situations where the "job packet" does not contain all data necessary to perform the job. For instance, the specification states, "[w]hen a job is ready for Transcription, DAD passes the VOX File along with a skeleton Job Record Transaction and the appropriate Template . . . If the Job included any file that was to be sent by the Client and was not, MOM notifies the Client by electronic message, and waits until the missing files are supplied before sending the Job to a Scribe." Id. at col. 6 l. 34-col. 7 l. 2; see also id. at col. 12 ll. 28-38 ("Optionally, the faxed contract would be preserved as an image file, or, if desired, presented to the Scribe as content to be transcribed or processed."). The Court agrees with Anthurium's proposed construction. The defendants rely on a forced reading of claim 1, ignoring a reading which accounts for the specification. The patent clearly contemplates that the "job packet" may provide some of the data necessary to perform a job and that subsequent information may follow, either to correct previous submissions or additions.

The Court defines "job packet" as follows: "one or more electronic files associated with a job."

2389

6. "job record"

<table>
<thead>
<tr>
<th>Disputed</th>
<th>Anthurium's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job record</td>
<td>An electronic file associated with a job</td>
</tr>
</tbody>
</table>

According to the claim language, a "job record includes a set of computer-readable job processing requirements . . ." '998 Patent, cl. 1. The issue regarding this term is whether a record is a description of a job or, as Anthurium suggests, merely a file that accompanies a job. The defendants cite to a portion of the specification for their proposed construction--"[a] carefully designed Job Transaction record allows the record to support many functions. Billing, payroll, tracking royalties, use rights, . . ." '998 Patent, col. 19 ll. 33-39. The defendants argue that the intrinsic record does not support Anthurium's construction. Anthurium suggests that, although a "job record" must be associated with a job, it is not a description of a job.

The Court agrees with Anthurium. The specification passages cited by Anthurium teach against a static description of a job. Instead, the numerous uses of the term indicate an "association" with a job. See '998 Patent, col. 6 ll. 34-37. Furthermore, the support cited by the defendants does not suggest descriptive aspects of a job, but simply associated records accompanying a job.

As such, the Court defines "job record" as follows: "an electronic file associated with a job."

2390

2. "job request"

<table>
<thead>
<tr>
<th>Disputed</th>
<th>Anthurium's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Term</td>
<td>Data from an authorized user to a local computer asking for performance of a job</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Disputed</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Term</td>
<td>A communication received from a human user asking for</td>
</tr>
</tbody>
</table>
Anthurium proposes what it contends is the plain and ordinary meaning of the term. The defendants seek to limit the term to a "human user asking for performance of the job." The defendants' construction seeks to improperly limit the term with little to no support from the specification.

The Court defines "job request" as follows: "data from an authorized user to a local computer asking for performance of a job."

13. "job step data"

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Anthurium's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job step data</td>
<td>Data concerning job steps</td>
<td>Data representing the job steps</td>
</tr>
</tbody>
</table>

The issue regarding this term is the use of "concerning" versus "representing." The Court has considered the arguments and adopts the plaintiff's proposed construction.

9. "job steps"

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Anthurium's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job steps</td>
<td>Events that occur during the performance of a job</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Disputed Claim Term</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job steps</td>
<td>The definition of the job in terms of the series of actions to be performed</td>
</tr>
</tbody>
</table>

The issue regarding this term is whether "steps" should be defined as "series of actions to be performed," as the defendants suggest, or "events that occur," as Anthurium suggests. In support of their construction, the defendants look to both the claims and the prosecution history. Specifically, the defendants look to Claim 14. Claim 14 states, "wherein the central computer generates a set of job steps that define a job based on the job processing requirements, and tracks progress of the job based at least in part on completion of the job steps." '998 Patent, cl. 14. As argued by the defendants, Claim 14 does not add a limitation to "job steps," but "simply restate[s] what 'job steps' are." Defs.' Claim Construction Brief at 27. Regarding the prosecution history, the defendants point to a statement made to the Examiner during the prosecution of the '124 patent. As indicated above, the '124 patent is the parent of the '998 patent and is thus a part of the prosecution history of the '998 patent. In the remarks section, the inventor states, "Kikinis does not teach a central computer that generates a set of job steps that define a job, tracks a current status of the job based on performance of the job steps. This feature of the claimed invention enables a system according to Applicant's claim 12 to determine whether the job steps are being performed in accordance with the job requirements . . . ." Defs.'s Ex. 5 at 119. 4 Anthurium argues that the plain and ordinary meaning of the term should control and cites various portions of the specification. See '998 Patent, col. 6 ll. 49-52, 66, col. 7 l. 2, col. 7 l. 37.
Although the prosecution history of a parent is not dispositive, it is considered intrinsic evidence for the purposes of claim construction and should be considered by the Court. Accordingly, the claims, specification, and prosecution history, when read together, indicate that the following construction of "job steps:"

"the series of actions that defines the job."

5. Construction of "junction"

All of the asserted claims require that the source and drain regions form "junctions" with the channel region. The parties do not agree about what kind of understanding a person of ordinary skill in the art would have had about the term junction as it is used in the '463 patent. Rexnord, 274 F.3d at 1342 (language must be construed as it would have been understood by one of ordinary skill in relevant art, given context and other patent claims). Defendants contend that at the time of the alleged '463 patent invention, people of ordinary skill in the art classified particular interfaces as either junctions or ohmic contacts on the bases of their electrical characteristics. Therefore, they propose construing junctions to mean only rectifying (or non-ohmic) interfaces between two different regions. Plaintiff contends that junction is a term of art used to refer to many different kinds of interfaces or electrical characteristics between different regions, including rectifying interfaces, non-rectifying interfaces, ohmic interfaces and non-ohmic interfaces. In its view, the plain and ordinary meaning of the term should apply: an intersection or interface between two different semiconductor regions, the place where two regions contact each other or come together.

As an initial matter, defendants argue that because many of the asserted claims disclose "junctions in contact," defining a junction generally as the place where two regions contact each other would render the term superfluous. I disagree. The place or point of contact between two objects is different from the state or condition of being "in contact."

Although various portions of the '463 patent claims refer to interfaces between the source and channel semiconductor regions as "junctions" and use the term junction to describe NI, PI and PN interfaces, neither the claims nor the specification further defines this term. Although it is not entirely clear from the undisputed facts whether NI, PI and PN interfaces are always non-ohmic, it does not matter. If the term "junction" is construed broadly to cover all types of contacts, it would make sense for the patent to be specific when it was discussing specific types of non-ohmic junctions. Defendants rely heavily on the fact that the patent specification includes one reference to the conductive layers making "ohmic contact" with the semiconductor layer, but the term is used in a completely different setting from that in the asserted claims. Nothing in the patent claims or specification requires a junction to always be a rectifying or non-ohmic interface. The broader definition also is consistent with that found in the technical literature cited by the parties. Finally, the "admissions" of Yamazaki and Lucovsky cited by defendants are ambiguous at best. Yamazaki definitely defines ohmic contacts only in the context of a different patent (the '636 patent). Lucovsky also discusses ohmic contacts and junctions in the context of the '636 patent. Although initially he seems to state that junctions and ohmic contacts are completely different types of interfaces, he later explains that the two terms are not mutually exclusive and that a semiconductor junction is formed at the interface where two regions of different conductivity type are in contact with one another.

I will adopt plaintiff's proposed construction of the term "junction": an intersection or interface between two different semiconductor regions, the place where two regions contact each other or come together. Although the parties disagree whether the accused channel region forms a non-ohmic or ohmic contact with the source and drain regions, their dispute is irrelevant given the meaning of junction. Because it is undisputed that the accused channel and source and drain regions are semiconductor regions with different conductivity, a junction forms where the regions contact one another. Therefore, plaintiff is entitled to summary judgment on the question whether the accused products satisfy the requirement in claims 1-4, 8-12 and 14 that the channel region forms junctions with the source and drain regions. However, because the parties disagree whether the source and drain regions in the accused products form NI or N+I junctions with the channel region, it will be left for the jury to resolve this question. As a result, I am unable to determine whether the accused products satisfy
the specification provides examples where this objective is achieved using a trilayer device, the same 10% change in resistance at room temperature. See '922 patent at 2:44-49, 61-64. Although the court in Gillette, we also consider the objective of the invention. Here, a professed objective of the invention is to achieve at least a 10% change in resistance at room temperature. See '922 patent at 2:44-49, 61-64. Although the specification provides examples where this objective is achieved using a trilayer device, the same 10% change in resistance at room temperature. See '922 patent at 2:44-49, 61-64. Although the specification provides examples where this objective is achieved using a trilayer device, the same 10% change in resistance at room temperature. See '922 patent at 2:44-49, 61-64. Although the specification provides examples where this objective is achieved using a trilayer device, the same 10% change in resistance at room temperature. See '922 patent at 2:44-49, 61-64. Although the specification provides examples where this objective is achieved using a trilayer device, the same 10% change in resistance at room temperature.
resistance may be achievable using a device with more than three layers. Therefore, we will not read the claims as limiting the invention to only trilayer devices. A review of the remainder of the patent only confirms this conclusion.

Claim 5 recites "[t]he device of claim 1, wherein the junction forms a tunnel junction." Id. at 8:66-67. Similarly, claim 28 states "[t]he memory device of claim 23, wherein each trilayer junction forms a tunnel junction." Id. at 10:54-55. Both claim 5 and claim 28 are dependent claims which modify the independent claims 1 and 23 respectively. According to the doctrine of claim differentiation, the presence of these dependent claims, which add particular limitations not found in the independent claims, raises a presumption that the limitations imposed by the dependent claims are not found in the independent claims. Liebel-Flarsheim, 358 F.3d at 910. Applying that doctrine here, the junctions mentioned in claims 1 and 23 are not limited to tunnel junctions.

Although the term "tunnel junction" is not defined in the claims, it is defined in the Background section of the patent. That section begins by explaining that "[e]lectron tunneling is a quantum phenomenon in which electric current can pass from one electrode through a thin insulating barrier layer into a second electrode." '922 patent at 1:18-20. It then states that "[t]his three layer system-electrode, barrier and counter-electrode-is referred to as a tunnel junction." Id. at 1:20-22 (emphasis added). From this, we can conclude that the term "junction" as used in claims 1 and 23 is not limited to a three layer system of "electrode, barrier and counter-electrode."

Because defendants' suggested construction mirrors the patent's definition of "tunnel junction" it cannot be used to define the term "junction" in claims 1 and 23, as the junction referred to in those claims is not limited to a tunnel junction. In Liebel-Flarsheim, the court stated, "the presumption that an independent claim does not have a limitation that is introduced for the first time in a dependent claim 'is especially strong when the limitation in dispute is the only meaningful difference between an independent and dependent claim, and one party is urging that limitation in the dependent claim should be read into the independent claim.'" 358 F.3d at 910 (quoting SunRace Roots Enter. Co. v. SRAM Corp., 336 F.3d 1298, 1302-03 (Fed. Cir. 2003)). By essentially defining "junction" to mean "tunnel junction," defendants would render the dependent claims 5 and 28 meaningless, thereby violating a fundamental principle of claim construction. See, e.g., In re Cruciferous Sprout Litig., 301 F.3d 1343, 1348-49 (Fed. Cir. 2002); Comark, 156 F.3d at 1187.

Although the claim language strongly suggests that the invention not be limited to trilayer devices, defendants argue that the specification, which exclusively describes tunnel junction devices, 4 supports their proposed construction. According to the defendants, the fact that the specification discusses only tunnel junction devices means we should read the term "junction" in claims 1 and 23 as limiting the invention to only three layers. We disagree.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 For example, Figure 1 depicts a particular species of tunnel junction, the ferromagnet-insulator-ferromagnet ("FM-I-FM") trilayer tunnel junction. See '922 patent at 3:10-12,53-55; 1:22-24.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

As noted above, "[e]ven when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Liebel-Flarsheim, 358 F.3d at 906 (internal quotation marks omitted). Far from demonstrating a "clear intention to limit the claim scope," the patentee here expressly rejected any limitation whatsoever. At column 3, lines 2-7, the patent states:

It will be understood that the particular devices and methods embodying the invention are shown by way of illustration only and not as limitations of the invention. The principles and features of this invention may be employed in varied and numerous embodiments without departing from the scope of the invention.

Similarly, column 8, lines 38-42 read: "[w]hile the invention has been described in connection with specific methods and apparatus, it is to be understood that the description is by way of example and not as a limitation to the scope of the invention as set forth in the claims." Accordingly, the specification provides no support for defendants' attempt to limit the claimed device to only three layers.
Claim Construction

In this case, the question of infringement turns primarily on the interpretation of the phrase "Kaufman-type ion beam source" in claim 1 of the '849 reissue. Litton contends that the appropriate interpretation of "Kaufman-type ion beam source" encompasses any broad-beam, multi-apertured, gridded ion beam source. Litton's proposed construction, however, is inconsistent with the prosecution history of the '849 reissue. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1575, 40 U.S.P.Q.2D (BNA) 1619, 1624 (Fed. Cir. 1996) ("In a literal infringement analysis, prosecution history is relevant to claim coverage."); see also Howes v. Medical Components, Inc., 814 F.2d 638, 645-46, 2 U.S.P.Q.2D (BNA) 1271, 1275-76 (Fed. Cir. 1987).

In the course of prosecuting the '849 reissue, Litton argued that the term "ion beam source" in its original claims could not "properly be construed to refer to any other ion beam gun but the Kaufman gun." Paper No. 15 at 8. Moreover, a declaration accompanying Litton's remarks plainly stated: "Those skilled in the coating arts . . . would reasonably construe these claims to refer . . . only to the Kaufman-type ion-beam guns referred to in the specification of this application." Paper No. 16 at 7. Thus, Litton defined "ion beam source" to mean only the Kaufman-type gun. This definition acquires even more credibility when Litton later amended its claims to cover a "Kaufman-type ion beam source." If, as Litton insisted, one of skill could only construe the broad term to mean a Kaufman-type gun, certainly the specific term encompasses nothing more.

At column 4, lines 44-57, the reissue's specification describes a Kaufman-type ion beam source:

The ion beam gun 4 is a commercially available ion emitting apparatus generally known in the art as a Kauffman [sic] type ion beam gun. The gun's cathode 6 is a thermionic emitter, i.e., it emits electrons by passing an electric current through it which heats the wire. The cathode 6 emits electrons which are accelerated towards the anode 8. The electrons being accelerated from the cathode to the anode strike argon atoms and in so doing dislodge electrons from the argon. The results are positively charged argon ions which are accelerated away from the anode and towards the grids 12 and 14. Permanent bar magnets 10 attached to the anode introduce a magnetic field into the area between the cathode and the anode . . . (Emphasis added.) Thus, this court interprets the phrase "Kaufman-type ion beam source" to include a thermionic (hot-wire) cathode, an anode, grids, and magnets.

This court detects no legally significant distinction between the phrases, "Kaufman-type ion beam source" and "Kaufman-type ion beam gun." During the prosecution of the reissue, Litton used the terms "gun" and "source" interchangeably. For example, in response to one of the examiner's rejections, Litton stated: "Applicants need not add the words 'Kaufman gun' or 'Kaufman source' to claim 1 because claim 1 cannot properly be construed to refer to any other ion beam gun but the Kaufman gun." Paper No. 15 at 8.

In sum, after consideration of the primary sources for construing patent claim meaning, this court interprets the phrase "Kaufman-type ion beam source" to encompass any ion beam gun with the four stated components: a hot-wire cathode, an anode, grids, and magnets.

6. "kernel"

The term "kernel" appears in claims 7 and 11 of the 037 Patent. Claim 7 recites "a multiple facility operating system having a kernel and providing for the message based co-operative operation of [a] plurality of processors." 037 Patent, 56:33-34. Similarly, claim 11 claims an "operating system [that] includes a kernel and a plurality of additional component facilities executed separately from said kernel." Id. at 57:9-11. Plaintiff, citing various technical and general-purpose dictionaries, proposes that the court construe "kernel" to mean "a portion of a computer program that generally resides in memory while the program is running." Defendant, on the other hand, argues for a narrower construction, contending that kernel means "a complete conventional operating system, such as UNIX OS."
The court again first looks to the ordinary and customary meaning of the disputed claim term. Texas Digital, 308 F.3d at 1201-02. In the art of computer science, the term "kernel" is generally defined as "[t]hat portion of an operating system that is kept in main memory at all times," or alternatively, "[a] software module that encapsulates an elementary function or functions of a system." IEEE Dictionary at 599. Ordinarily, the term would not be used to refer to a complete operating system, as defendant's proposed construction would require. Thus, defendant bears the burden of rebutting the presumption that the ordinary meaning of "kernel" should apply.

Defendant attempts to rebut the presumption in favor of ordinary and customary meaning by recourse to the intrinsic record. See Texas Digital, 308 F.3d at 1204. However, neither the patent language nor the prosecution history of the 037 Patent suggests that a kernel must be a complete operating system. Although defendant notes that other peer-level facilities must be "executed separately from the kernel," 037 Patent, 56:41-42, such a limitation is entirely consistent with the ordinary meaning of the disputed term. Similarly, defendant's citations to the prosecution history of the 037 Patent only prove that the non-kernel peer-level facilities do not have a full Unix operating system. See Grewal Decl., Exh. J at 429-31, 460-61. Defendant fails to explain how this would require that the kernel term refer to such an operating system.

Defendant also makes much of the fact that, as discussed above, each of the claimed multi-tasking interfaces includes a "messaging kernel," arguing that because each of these facilities must be "executed separately from the kernel," 037 Patent, 56:41-42, 57:10-11, the term kernel must refer to something other than a messaging kernel, lest the facility be separately executed from itself. The court agrees with this conclusion. As noted above, the messaging kernel is expressly defined in the specification as "an interface that supports direct communication between one [operating system peer-level facility and] another." Id. at 8:24-27. This is not the same manner in which "kernel" is used in claims 7 and 11. However, it does not follow from this conclusion that kernel, as it is used in the claims, must refer to an entire operating system rather than one of its subcomponents.

Nonetheless, defendant's argument points out an important limitation in the definition of "kernel" as it is used in claims 7 and 11 of the 037 Patent. For the non-kernel peer-level facilities to be executed separately from the kernel, the term must refer to the kernel of the host facility. See, e.g., id. at 57:9-11 (claim 11) claiming a "kernel and a plurality of additional component facilities executed separately from said kernel" (emphasis added)). The specification lends further support to this view, describing a preferred embodiment in which the operating system facility (a Sun OS operating system) includes "an operating system kernel portion of the facility." Id. at 14:35-41. Although the patented invention is not limited to this preferred embodiment, the "executed separately from the kernel" limitation in claim 11, read in light of the specification, requires the court to interpret the term "kernel" as it is used in the 037 Patent to refer to the kernel of the host operating system facility. Thus, for the reasons stated above, the court construes "kernel" to mean "a portion of the host operating system facility that resides in memory at all times."

"Signing," "Key," and "Signed File"

As used in the patent claims' language and specifications, the definitions of "signing," "key," and "signed file" are closely related. "Signing" appears in each disputed patent claim (536 Patent: 1,6; 709 Patent: 1,17). The defendants contend that "signing" means "the process of hashing input to compute a hash result and using a cryptographic function with a private key to transform the hash result into a digital signature" (Doc. 62 at 12). The plaintiff argues "signing" means simply "applying a unique identifying characteristic of a unique entity" (Doc. 60 at 12). The plaintiff's significantly elastic definition admittedly encompasses "a lawyer signing a brief" and "an illiterate person marking their X" (Doc. 60 at 11). However, the intrinsic evidence directly contradicts the plaintiff's unbounded construction.

Attempting to distinguish his invention over prior art, the patentee, in the specifications in both patents, expressly and unambiguously defines "signing":

To sign a document, or for that matter any other digital data file, a "signer" must first delimit the borders of the digital data file to be signed. As used herein, the term signer refers to any person who creates a digital signature for a message, such as message 110. The information delimited by the signer, in turn, refers to that message 110. A hash function 120 in the
signer's software is used to compute a hash result 130, which is unique for all practical purposes to the message 100. Thereafter, a signing function 140 is used to transform the hash result 130 into a digital signature 160, but only after input of the signer's private key 150.

(536 Patent at 8:9-20; 709 Patent at 8:5-16). The patentee expressly defines signing as "creat[ing] a digital signature" by hashing a document or "any other digital data file" (536 Patent at 8:9-20; 709 Patent at 8:5-16). This definition reveals that "signing" does not encompass a physical, written signature.

Further, the patents' claims ubiquitously speak of "maintaining trust in the content of a digital data file" by "signing said digital data file," "hashing said signed file to produce a digest," and "signing said digest with a key to produce a certificate" (536 Patent at 40:22-41:21; 709 Patent at 43:4-43:67). The patent's use of "sign" consistently depicts "digital data" as the recipient of a signature, and the patent is unconcerned with the unlimited application of "a unique identifying characteristic of a unique entity." In this context, "signing" obviously means the signing of digital data and the creation of a digital signature. "The claims of a patent define the invention to which the patentee is entitled the right to exclude." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005). Nothing in the patents' claims supports the plaintiff's suggestion that "signing" encompasses a non-digital, handwritten signature.

Because the claims of both patents' limit "signing" to digital signing, the plaintiff's proposed construction is inconsistent with the written descriptions' express definition. As the defendants persuasively argue, one of ordinary skill in the art understands "signing" (as used in the patents) to mean creating a digital (but not a written) signature. Consistent with the patent and its specifications, "signing" means "the process of computing a hash result, which result is converted into a digital signature using a cryptographic function and the signer's private key."

The patents' definition of "signing" contemplates the use of a signer's private "key" (536 Patent at 8:9-20; 709 Patent at 8:5-16). The patents expressly state that a key is not used for encryption:

Thereafter, a signing function 140 is used to transform the hash result 130 into a digital signature 160, but only after input of the signer's private key 150. This transformation is sometimes referred to as a process of encryption. However, such a characterization would be inaccurate, because message 110 itself may, or may not be, confidential.

Further, the specifications state "[s]ystems that generate and employ a secure key pair (i.e., a 'private key' for creating the 'digital signature' and a 'public key' for verifying that digital signature) are typically known as asymmetric cryptographic systems" (536 Patent at 7:48-51; 709 patent at 7:45-49). Consistent with the language of the patents, "key" means "a unique sequence used to create or verify a digital signature."

Finally, the defendants propose that a "signed file" is "a file with its digital signature" (Doc. 62 at 17). The plaintiff argues that a "signed file" means simply "a file with its signature" (Doc. 60 at 16). However, the patents' claims specify that a digital file joined with a date and time is signed to create a "signed file" (536 Patent at 40:37-40, 41:15-18). Accordingly (and perforce the above constructions), a "signed file" means "a file with its digital signature."

A. Licensee unique ID and its generation

<table>
<thead>
<tr>
<th>Claim Terms</th>

<th>Microsoft's proposed construction</th>
<th>Court's construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Licensee unique ID/Security key</td>
<td>A unique identifier associated with a licensee</td>
<td>A one of a kind (i.e. unique) identifier that is entirely the product of data about the user, not the platform,</td>
<td>A unique identifier associated with a licensee</td>
</tr>
<tr>
<td>2. Registration key</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. Enabling key</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Initially, the Court notes that the parties have not entirely agreed that these three terms should be construed synonymously. On June 9, 2006, the parties filed a joint submission in which Microsoft stated the terms were synonymous, while Uniloc took the cautious position that the terms should only be treated synonymously under Uniloc's proposed construction. Because the Court ultimately does not construe these terms to include the limitations set forth by Microsoft, these terms are treated synonymously and references in this decision to the term "licensee unique ID" should be understood to also include the terms "security key," "registration key," and "enabling key."

Uniloc's construction is relatively straightforward, but attacked by Microsoft as "fatally ambiguous" and "completely unsupported by anything in either the intrinsic or extrinsic record." In response, Uniloc argues that Microsoft's construction improperly attempts to read in a host of limitations and "transform these simple two and three-word claim limitations into a 104-word tongue twister." This energetic first battle highlights three main points of disagreement: (1) the meaning of unique; (2) whether the licensee unique ID may be based upon vendor information (such as a product number provided on the vendor label of a compact disc); and (3) whether the licensee unique ID must be based upon prospective user information (such as name, address, credit card number), and not platform information (such as the current time on the computer system).

1. Unique

As the first part of its proposed construction, Microsoft, relying upon a dictionary definition of the word "unique," n3 takes the position that the uniqueness of the identifier must be "one-of-a-kind," somewhat akin to DNA uniqueness. The Court finds, however, that this proposed construction is inconsistent with the language of the '216 Patent itself. The '216 Patent
clearly contemplates that the licensee unique ID will consist of varying levels of uniqueness that are wholly dependent upon
the inputs used to formulate the licensee unique ID. For example, the '216 Patent states:

The algorithm provides a registration number which can be "unique" if the details provided by the intending licenses
upon which the algorithm relies when executed upon the platform are themselves "unique".

'216 Patent, Abstract. Moreover, the '216 Patent provides:

In any event, in particular preferred forms, a serial number (see further on) is included in the registration number
generation algorithm which introduces an additional level of uniqueness into the registration number calculation process.

Id. at col. 6, ll. 23-26.

n3 Microsoft relies upon The American Heritage Dictionary of the English Language, Fourth Edition which provides in
relevant part:

unique (adj.) 1. Being the only one of its kind: the unique existing example of Donne's handwriting. 2. Without an equal
or equivalent; unparalleled. 3a. Characteristic of a particular category, condition, or locality: a problem unique to coastal
areas. b. Informal Unusual; extraordinary: spoke with a unique accent.

Thus, as Microsoft correctly recognizes in its claim construction brief, "the '216 patent suggests that 'unique' is a relative
term[.]"). To construe the word unique to mean no possibility of duplication would simply be inconsistent with the
specification.

2. Vendor and Information

The parties next dispute whether the licensee unique ID may be derived from vendor information. This dispute arises
because Microsoft's proposed construction is premised upon the argument that during the prosecution, Uniloc affirmatively
and categorically disclaimed the use of any information from the software vendor to generate the licensee unique ID.

In resolving this issue, the Court first turns to the language of the '216 Patent and notes that there is no language in the
claims, or anywhere in the specification for that matter, prohibiting the use of vendor information to create the licensee
unique ID. To the contrary, the Court finds language in the specification supporting the notion that vendor information may
indeed be an input to creating the licensee unique ID. For instance, figure 4 of the '216 Patent, which is discussed in the
context of the third embodiment, contemplates that a "PRODUCT NO." may be used in the creation of a registration number.
Moreover, in the sixth embodiment, the '216 Patent provides:

The algorithm, in this embodiment, combines by addition the serial number 50 with the software product name 64 and
customer information 65 and previous user identification 22 to provide registration number 66.

'216 Patent, col. 11, ll. 53-56 (emphasis added). The sixth embodiment also references figure 9, which contemplates that a
"PRODUCT NAME" may be one of the numbers used in the creation of a registration number. Finally, the seventh
embodiment, which references figure 10, provides:

Additionally, product information P derived from media 82 (typically via platform 83) or else via the intermediary of the
user (signified by the small man symbol) is provided to encoder/decoder 84 and to summer 85.

* * *

Summer 85 acts as a local licensee unique ID generating means by combining, by addition, customer information C,
product information P and serial number S in order to provide a local licensee unique ID here designated Y.

- 2749 -
Id. at col. 12, ll. 54-57, 61-64 (emphases added).

Consideration of the prosecution history does not change this result. It is well established that "[t]he prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995). It must also be remembered, however, that the prosecution history represents a dialogue between the PTO and the inventor and thus, often lacks the clarity and usefulness of the specification. See Phillips, 415 F.3d at 1317. Because of these concerns, and to balance the importance of public notice and the right of patentees to seek broad coverage, the Federal Circuit has "consistently rejected prosecution statements too vague or ambiguous to qualify as a disavowal of claim scope." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed. Cir. 2003). Consequently, for prosecution disclaimer to attach, [the Federal Circuit] requires that the alleged disavowing actions or statements made during prosecution be both clear and unmistakable." Id. at 1325-26.

Microsoft first asserts that applicant disclaimed the use of vendor information by pointing to the following statements:

   It is inherent in the system of the present application, as claimed, that the "Licensee Unique ID" is entirely the product of data generated locally as distinct from data added before delivery of the software to the local location for use (thereby distinguishing over Chou) or subsequently from a remote location (thereby distinguishing over Grundy).

The fundamental principles underlying the operation of the present invention are simple yet highly effective. The uniqueness of identity by which each copy of the software to be protected is distinguished from any other copy is provided by each and only each new user: to reiterate the system does not require the introduction of any unique identifiers from any other source, either before delivery of the software for use by the intending user or subsequent to delivery thereof.

UNILOC 0143-44. n4 These statements, when considered in context, are reasonably subject to an interpretation other than the one set forth by Microsoft. Microsoft reads these statements to differentiate local and remote inputs and to disclaim the use of vendor information. In the statements, however, the applicant simply reiterated that the system does not require the use of vendor-supplied information, not that vendor-supplied information is banned absolutely. Moreover, the statements in the prosecution history immediately prior to the cited excerpt could be read to imply that the references to local and remote actually refer to the location of where the licensee unique ID is generated, and not the inputs of the licensee unique ID:

In response, the Applicant submits herewith redrafted claims, the main claims of which include, broadly, the following two distinguishing limitations:

   (a) The "Licensee Unique ID" on which the registration system relies for matching for verification purposes is generated locally, and
   (b) The algorithm used to generate locally the "Licensee Unique ID" is replicated remotely for the purposes of remote generation of a separate "Licensee Unique ID" for matching purposes.

UNILOC 0143. This reading is bolstered by the fact that the PTO and the applicant appear to have agreed during the prosecution that the use of vendor information was contemplated. At one point, the PTO stated:

   There is, however, no indication in Grundy that this information cannot be provided to the local user, nor is there any limitation in the claims which would prohibit vendor information from being part of the authorization process.

UNILOC 0135. In response, Uniloc stated:

   In the Examiner's last paragraph relating to Grundy, the Examiner argues that Grundy does not preclude providing additional information to the local user. The fact, if true, that Grundy does not teach away from providing the information does not therefore mean that Grundy teaches that the information is provided or that doing so would be obvious.

UNILOC 0146. This exchange, at a minimum, could be read as a tacit acknowledgment by the PTO and the applicant that the claims of the '216 Patent allow use of vendor information. When taken in the full context of the prosecution history, as well as the language in the specification, the statements cited by Microsoft are not so clear and unmistakable as to constitute prosecution disclaimer.
3. User and Platform Information

Finally, Microsoft asserts that the specification and prosecution history show that the licensee unique ID "is based only on local information about the user, rather than information about the user's computer [i.e., platform information]." Again, the Court turns to the language of the '216 Patent and notes that there is no language in the claims themselves, or anywhere in the intrinsic evidence for that matter, stating that user information is always a necessary input in the generation of a licensee unique ID. Nor is there any language in the specification implying that platform information may not be used to generate a licensee unique ID. To the contrary, the Court finds language in the claim terms as well as the rest of the specification indicating that platform information may be used in creating the licensee unique ID. For instance, the '216 Patent provides that platform information may be used to create a serial number, which may then be combined with user information to create a licensee unique ID:

After selecting "continue", the registration routine begins the first step in the generation of a security key which will be unique to the current copy of the software and to certain features of the environment in which it runs.

As shown in FIG. 2b, the first step in the generation of the security key comprises the generation of a serial number generated from the current time on the system and, in this example, the last modify date of the software and other information from the computer environment.

'216 Patent, col. 6, ll. 63-67; col. 7, ll. 1-5 (emphasis added). Additionally, claims 13 and 14 provide:

13. The registration system of claim 12, wherein said security key is generated by a registration number algorithm.
14. The registration system of claim 13, wherein said registration number algorithm combines information entered by a prospective registered user unique to that user with a serial number generated from information provided by the environment in which the software to be protected is to run.

Id. at col. 14, ll. 50-56 (emphasis added). The summary of the invention section of the '216 Patent also contemplates use of platform information in generating the security key:

Preferably, the security key is generated by a registration number algorithm.

Preferably, the registration number algorithm combines information entered by a prospective registered user unique to that user with a serial number generated from information provided by the environment in which the software to be protected is to run (e.g., system clock, last modify date, user name).

Id. at col. 4, ll. 4-11 (emphasis added).

The language and structure of the claims also convinces the Court that Microsoft's proposed construction would violate the doctrine of claim differentiation. Claim differentiation "refers to the presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006) (citing Nazomi Communications, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1370 (Fed. Cir. 2005)). In the '216 Patent, independent claim 1 says nothing about the licensee unique ID being generated from user information. Claim 1 states in full:

A registration system for licensing execution of digital data in a use mode, said digital data executable on a platform, said system including local licensee unique ID generating means and remote licensee unique ID generating means, said system
further including mode switching means operable on said platform which permits use of said digital data in said use mode on said platform only if a licensee unique ID first generated by said local licensee unique ID generating means has matched a licensee unique ID subsequently generated by said remote licensee unique ID generating means; and wherein said remote licensee unique ID generating means comprises software executed on a platform which includes the algorithm utilized by said local licensee unique ID generating means to produce said licensee unique ID.

216 Patent, col. 13, ll. 54-67 - col. 14, l. 1. Dependent claims 2 and 6, which depend from claim 1, add limitations to the algorithm inputs discussed in claim 1. Claim 2 provides:

The system of claim 1, wherein said local licensee unique ID generating means generates said local licensee unique ID by execution of a registration algorithm which combines information in accordance with said algorithm, said information uniquely descriptive of an intending licensee of said digital data to be executed in said use mode.

Id. at col. 14, ll. 2-7. And, claim 6 provides:

The system of claim 5, wherein the information utilized by said local licensee unique ID generating means to produce said licensee unique ID comprises prospective licensee details including at least one of payment details, contact details and name.

Id. at col. 14, ll. 19-23. Thus, construing the term licensee unique ID as Microsoft suggests - as requiring that a licensee unique ID always be generated from user information - would simply render claims 2 and 6 meaningless (or at best, partially redundant) and violate the doctrine of claim differentiation.

It is true that every embodiment in the 216 Patent contemplates a licensee unique ID being generated, at least in part, from user information. But of course, the 216 Patent also states that the listed embodiments are "only some embodiments of the present invention and modifications, obvious to those skilled in the art, can be made thereto without departing from the scope and spirit of the present invention." Id. at col. 13, ll. 49-52. Moreover, the general rule is that "persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments." Phillips, 415 F.3d at 1323.

Finally, to the extent Microsoft relies on the prosecution history to support its position, the Court finds that the statements cited by Microsoft are not so clear and unmistakable as to constitute prosecution disclaimer. n5 While the statements do make reference to a licensee unique ID's uniqueness in relation to an end user's identification details, the overarching theme of the statements is not that user information is the only input, or even a necessary input in generating the licensee unique ID. Rather, it could be said that the import of these statements is simply to distinguish the prior art by stressing that under the present invention, the licensee unique ID is generated on the local side (and then matched at a remote location) without, as was necessary under the prior art, the need for "unique identifying numbers prestored in each copy of the software."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n5 In addition to citing that portion of the prosecution history previously relied upon in its vendor information argument, see UNILOC 0144, Microsoft also relies on the following prosecution history statements:

Applicant respectfully submits that Chou is not particularly relevant to the claims of the present application because Chou covers a version of a hardware lock whereby each and every copy of the software to be protected must have unique identity information embedded in it at the time of manufacture so that it can communicate with a local hardware lock. In Chou, all communicating security devices are local. Therefore, with particular reference to pending Claim 1, for example, Chou does not include "local licensee unique ID generating means" as well as "remote license unique ID generating means". Current Claim 1 is therefore clearly patentably distinguished over Chou.

Furthermore, an underlying "behavioral" feature of the present invention is that a single common algorithm is embedded in all copies of software to be protected. Hence, the software protected by the present invention does not need unique identifying numbers prestored in each copy of the software. The uniqueness is ultimately provided by the end users of the software in the course of supplying their own identification details, which details are subsequently checked by use of a matching algorithm at a remote location. This important behavioral feature of Applicant's claimed invention ("local licensee
unique ID generating means") is nowhere to be found in Chou.

UNILOC 0128.

After consideration of the specification, which is "the single best guide to the meaning of a disputed term," see Phillips, 415 F.3d at 1315, and upon consideration of the prosecution history, the Court concludes that Microsoft's suggested limitations should not be part of the construction of the term licensee unique ID. Accordingly, these terms shall be construed as follows: A unique identifier associated with a licensee. n6

n6 Although it was not relied upon, the Court notes that Uniloc's expert, David Klausner, opined that this construction is what one of ordinary skill in the art would understand the term licensee unique ID to mean.

2399

E. Hardware Key and Connected

Claim 1 recites that the invention is comprised of "at least one hardware key connected to the subscriber client computer," and Claims 1 and 24 require that the subscriber client computer "forward [a] predetermined digital identification to [the] first server computer to thereby confirm that [the] hardware key is connected to said subscriber client computer." The parties agree that "hardware key" is used synonymously with the terms "access key" and "hardware access key" in the specification. (D.I. 266 at 27, D.I. 268 at 7). However, they disagree over whether the specification uses the term "connected" interchangeably with "attached."

Plaintiff contends that the hardware key does not need to be an external device, but could also be built into the subscriber client computer. Plaintiff further contends that "connected," as used in the '416 Patent, means only that the access key interface can read the digital ID from the access key. Plaintiff contends that the patent does not require any specific kind of connection between the hardware key and the access key interface.

Defendants contend that a "hardware key connected to the subscriber client computer," as used in the context of the specification, is an external device that physically attaches to the subscriber client computer. (D.I. 268 citing '416 Patent at col. 21, ll. 39-45, col. 7, ll. 61). They further argue that Plaintiff's proposed construction, that the hardware key can be built into the computer, would eliminate the need for the invention to verify the presence of the access key.

After reviewing the term "hardware key" in the context of the specification, the Court concludes that the specification requires that the hardware key be an external hardware device. ('416 Patent, col. 21, l. 40). The Court declines to adopt Plaintiff's proposal that the key can be built into the computer, because the "major function of the [hardware key] is to uniquely identify a user," and the specification teaches that the key should be something "which is known to have been assigned and given to a specific person." n2 (Id., col. 21, ll. 45-46, col. 22, ll. 4-5). A hardware key built in to a computer is computer-specific, not user-specific.

n2 Plaintiff also supports its argument that the hardware key can be built into the computer by pointing to the following language in the specification: "Generally, two factor authentication provides that something is known, such as the name and password and something is held, such as the physical key that is attached to the computer, or built into the computer." (D.I. 266 at 28, citing '416 Patent, col. 21, ll. 49-53; see also Transcript of Markman Hearing, held November 9, 2006 at Pg. 44, l. 5).
This sentence, however, is a general description of two-factor authentication. As such, the sentence explains to the reader of the patent that two factor authentication is comprised of something which is known and something which is either held or built into the computer. By using the descriptive phrase "such as the physical key that is attached to the computer," in this sentence, the patentee indicated that this invention uses the combination of something held and something known-the physical key attached to the computer that had been referenced throughout the paragraph. (See id., col. 21, l. 37 - col. 22, l. 5).

After reviewing the term "connected" in the context of the specification, the Court concludes that it is not synonymous with physical attachment. Though the invention's preferred embodiment involves a hardware key that is physically attached to the subscriber client computer via a port interface, the specification also lists acceptable alternatives to the preferred embodiment which need not be physically attached, including "a credit card, a key, an ATM card, or the like which is known to have been assigned and given to a specific person." (Id., col. 22, ll. 1-5). Therefore, the Court finds that the specification anticipates hardware keys which are not physically attached.

Moreover, even though the inventors did not describe any embodiment of a hardware key that connects wirelessly to the computer, patent claims are not limited to only those features described in the specification, and later-developed technology is commonly allowed to be covered by broad claim terms. Varco, L.P. v. Pason Sys. USA Corp., 436 F.3d 1368, 1375-76 (Fed. Cir. 2006)(citing Sri Int'l v. Matsushita Elec. Corp. Of Am., 775 F.2d 1107, 1121 (Fed. Cir. 1985)("The law 'does not require than an applicant describe in his specification every conceivable and possible future embodiment of his invention.'") (en banc)). Thus, wireless devices are anticipated by the broad language in the claims and specification. Accordingly, the Court construes "connected" to mean "in communication with, inserted in, or attached to."

Although this case concerns whether defendants' accused products infringe independent claims 1 and 5 and dependent claims 3, 4 and 7 of the '273 patent, defendants' summary judgment motions only address independent claims 1 and 5. They claim as follows:

1. A system for providing a built-in function in an ISA-compatible computer in response to activation of a selected combination of user activated keys, comprising:

   a keyboard having a set of conventional alphanumeric and function keys and further having at least one additional function key;

   a keyboard controller connected to said keyboard to monitor said conventional keys and said additional function key to detect when at least one of said keys is activated, said keyboard controller having first and second interrupt signal lines connected to said ISA-compatible computer, said keyboard controller responsive to an activation of at least one of said conventional keys to activate a first interrupt signal to said ISA-compatible computer on said first interrupt signal line, said keyboard controller responsive to an activation of said additional function key in combination with at least one of said conventional alphanumeric keys to generate a second interrupt signal to said ISA-compatible computer on said second interrupt signal line;

   a first conventional interrupt handling routine within said ISA-compatible computer responsive to said first interrupt signal from said keyboard controller to input data scan codes from said keyboard; and

   a second non-conventional interrupt handling routine within said ISA-compatible computer responsive to said second interrupt signal from said keyboard controller to input an identification of said activated alphanumeric key and to perform a predetermined function selected by said identified alphanumeric key.

5. A system for servicing keyboard interrupts in an ISA-compatible computer, comprising:
a keyboard having a plurality of keys including conventional alphanumeric keys, conventional symbol keys, conventional function keys and conventional cursor control keys, said keyboard further including at least one non-conventional function key, said keyboard generating a scan code in response to an activation of at least one of said keys, said scan code varying depending upon which of said keys is activated; and

a keyboard controller coupled to said keyboard, said keyboard controller further coupled to said ISA-compatible computer by first and second interrupt signal lines, said keyboard controller generating a first interrupt signal on said first interrupt signal line upon receipt of a scan code corresponding to one of said conventional keys, said ISA-compatible computer programmed to execute a program to input said scan code in response to said first interrupt signal, said keyboard controller generating a second interrupt signal on said second interrupt signal line upon receipt of a scan code corresponding to said non-conventional function key, said ISA-compatible computer programmed to execute at least one special routine upon receipt of said second interrupt signal.

Defendants first argue that their notebook computers do not infringe the claims because they do not meet the "keyboard" and "keyboard controller" limitations required by independent claims 1 and 5. Doc # 359 at 11; Doc # 341 at 6. Prior to the court's claim construction order, the parties agreed upon the construction of "keyboard" to mean:

An input apparatus containing internal circuitry to output or generate data scan codes." Doc # 227 at 16.

The parties also agreed that these scan codes are sent to a "keyboard controller" for processing, which then transmits interrupts to the computer. Id. Hence, the court construed the term "keyboard controller" to mean:

A component, electronically or functionally distinct from the keyboard, that activates interrupt signals in response to receipt of data scan codes from the keyboard, and, upon request, transmits data scan codes to the computer.

"keyboardless"

The term "keyboardless" appears in claims 1-2, 6-12, and 14 of the '057 patent and claims 1-8, 10, and 12 of the '362 patent. Defendants define the term as "without a physical integrated keyboard." Typhoon suggests that the term means "does not require a keyboard for use since it is equipped with a touch screen." In effect, Typhoon's definition limits the term to devices utilizing a "touch screen." Typhoon's construction is imported from a portion of the specification that mentions that "[t]he portable computer is keyboardless in that it does not require a keyboard for use since it is equipped with a touch screen." '057 Patent at 2:57-59. Ultimately, the parties' dispute centers over whether "keyboardless" is a negative limitation that restricts the invention from utilizing any kind of keyboard.

Initially, Typhoon's definition must be rejected because it is overly restrictive and explains why the preferred embodiment of the invention fits into a "keyboardless" category rather than explaining what "keyboardless" means. O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1360 (Fed. Cir. 2008) ("The purpose of claim construction is to determine the meaning and scope of the patent claims asserted to be infringed.") (internal quotation marks omitted). Defendants are correct that the specification distinguishes integrated from non-integrated keyboards. See '057 Patent at 2:59-61 ("Nevertheless, [the invention] is provided with connections to hookup an external keyboard as well as a full range of peripherals . . . ."). However, inherent in this same distinction is the understanding that peripheral keyboards are mechanical (non-virtual) keyboards. See id. at 2:61-63 ("and is capable of displaying an interactive, simulated keyboard by means of the input/output device").

Similarly, Defendants' use of the word "physical" fails to capture the full meaning of the term as described in the specification. A virtual keyboard displayed on a touchscreen is nevertheless "physical." See The American Heritage College Dictionary 1031 (3d ed. 1997) (defining "physical" as "of or relating to material things"). The specification distinguishes mechanically integrated keyboards from non-mechanically integrated keyboards rather than physical keyboards from non-
physical keyboards. See ‘362 patent at 1:47-49 ("Entry of information is generally performed using a keyboard which is provided integrally in the lap-top computer's housing or as a peripheral."). Accordingly, the meaning of "keyboardless" in light of the specification is "without a mechanically integrated keyboard."

4. "keypad"

Southwest argues that "keypad" means "an input device consisting of buttons," whereas 3T argues that it means a "small hand held keyboard."

Southwest argues that 3T's proposed construction seeks to improperly import limitations from the preferred embodiment. Southwest argues that a reading of the relevant language in the claims and specification reveals that the term "keypad" was never intended to limit it to a "small handheld keyboard." The specification states that "Data processing systems 12 and 14 may be implemented by using any suitably configured computer system such as an IBM compatible or Macintosh" or though a Verifone. '405 patent, 6:19-24. Southwest argues that both types of input devices are represented in Figure 1, with data processing system 12 depicted with a full keyboard and data processing system 14 depicted as a Verifone. Southwest argues that its proposed construction takes into account the different configurations explicitly contemplated in the '405 patent.

3T argues that Southwest's broad definition does not encompass the plain and ordinary meaning of the term keypad nor as used in the specification or claims. 3T argues that a keypad is not identical to a keyboard. Rather, the plain and ordinary meaning of the term "keypad" is "a small often hand-held keyboard." See Webster's Third New Int'l Dictionary, Unabridged, Merriam-Webster, 2002. 3T argues that this definition is consistent with the specification and drawings which discuss and depict a small, handheld keyboard. See '405 patent, 7:22-23 and Fig. 2 ("FIG. 2 is a pictorial representation of a keyboard 19 which may be utilized with data processing system 14.") 3T argues that, similar to the term "controller," the term "keypad" is not used in any other claim. 3T argues that the other claims do not discuss a keyboard or keypad because the data processing system (i.e., a computer) already has a full-size keyboard. Thus, similar to the term controller, the term keypad should be narrowly construed.

The Court finds that Southwest's proposed construction seeks to broaden the narrow term keypad to a type of generic input device. The patentee specifically used the term "keypad" and a keypad is only used in conjunction with the controller in claim 11, which the parties have agreed is represented by item 14 in the specification. Further, Figure 2 is represented in the specification as the keyboard of controller 14. '405 patent, 7:22-23 and FIG. 2. Southwest's construction of the term is overly broad given the traditional understanding of the term "keypad" as well as the usage of the term in the specification. The Court finds that the definition provided by 3T is what one of ordinary skill in the art would understand the term to be based upon the disclosure in the specification. Thus, consistent with 3T's proposed construction, the Court construes the term "keypad" to mean "small hand held keyboard."
Motorola contends its proposed construction for this term comports with the intrinsic record of the '766 patent. (766, Abs.; 2:37-38; 3:8-10). According to Motorola, a telephone keypad is required as Claim 1 was amended twice to distinguish prior art that specifically disclosed other types of input devices, e.g., keyboards. (Docket # 76-47 (Exhibit RR) at 1, 5-11).

VTech's construction focuses on a "user" and what the user can do with the keypad which Motorola asserts is improper. VTech argues that its construction focuses on how Motorola argued the scope of its invention and this claim limitation in response to a rejection by the Patent Office. VTech explains that during the prosecution of the '766 patent, Motorola argued that its alleged invention was different from the prior art cited by the Examiner because, inter alia, the programming of the ringer was accomplished by only using the telephone keypad which is used to dial out. (VTech Ex. 18, pgs. 53-54) ("Such a device is not similar to this invention which is integral to the telephone and uses the telephone keypad to enter the ringer parameters.") (emphasis added).

Following this prosecution response to the U.S. Patent Office, Motorola and the Examiner held an interview wherein the Examiner suggested a claim to Motorola which requires the ring tone to be programmed using the keypad that dials out. Motorola agreed. (Id. at pg. 58) ("Suggested a claim to applicant which requires the melody to be programmed using the keypad that dials out. Applicant agreed to the new claim which would be done by Examiner's Amendment."). Thereafter, the Examiner added a new claim with this claim language and the patent then issued. This claim 1 is now at issue in the instant case. Motorola limited the scope of its alleged invention during prosecution because of prior art similar to its alleged invention. VTech asserts its proposed interpretation is consistent with Motorola's own statements in the prosecution history limiting the scope.

The construction of both parties includes using the same keypad for both dialing and programming. The words "for both" are plain words and not assigned any special meaning in the patent. The phrase also implies it is the same keypad used for both actions, dialing and programming. Motorola asserts that VTech's use of "entirely" could be construed by the jury to require only use of the numerical keys of the keypad.

As for VTech's wish to add a "user" in the interpretation, the prosecution history did not require the recitation of a "user." Rather, the prosecution history shows, in order for the applicant to obtain a granted patent, the Examiner "suggested a claim to applicant which requires the melody to be programmed using the keypad that dials out. Applicant agreed to the new claim..." (Docket # 76-44 (Exhibit RR) at 55). Therefore, there was no reference to a "user."

Motorola adds the word "telephone" to clarify that the keypad is the telephone's keypad and because of statements made in the prosecution history. During prosecution, Motorola made the following statements in order to overcome the prior art references:

Claim 1 provides the capability for a telephone user to program a number of parameters into the telephone to customize the telephone's ring. . . . Programming of these parameters [telephone ring] is accomplished by . . . using the telephone's keypad.

(Docket # 76-44 (Exhibit RR) at 51). Motorola made this statement in the amendment to counter the Festa reference: "The Festa reference is composed of a separate box to customize the ringing of the telephone." Motorola used this same argument to distinguish its invention from the Sano, Suzuki, Inoue, and Matsumoto references. Id.

Adding the word "telephone" in the construction helps to clarify and to distinguish from the prior art references. The agrees with Motorola's proposal.

c. The Court's Construction

Accordingly, the Court construes the term "a keypad for both dialing out and programming said ringer" to mean: "a telephone keypad in which the same keypad is used for both dialing out and programming a ringer."
PolyVision's proposed construction Smart's proposed construction
Image distortion that occurs when the projection axis is not at a right angle with the plane of the display screen.
Image distortion that occurs when the projection axis deviates from a 90 [degrees] angle (i.e., is non-orthogonal) with the plane of the display screen.

The parties' constructions are essentially the same, with the exception that Smart's construction uses the phrase "deviates from a 90 degree angle (i.e., is non-orthogonal)," while PolyVision uses the phrase "is not at a right angle." Smart notes that its construction is proper because it uses a phrase found in the specification ("deviates from a 90 [degrees] angle") and that the mathematical term "non-orthogonal" accurately describes the condition of "keystoning." PolyVision contends its construction is clearer and would be more easily understood by a lay jury. While PolyVision is correct that its construction is clearer, the Court will adopt Smart's definition because it is consistent with the intrinsic evidence and other claim elements rely upon the term "non-orthogonal" to describe keystoning.

2405

4. **Keyword phrase ('461 patent, claims 49 and 53)**

Defendant defines "keyword phrase" as "an element of a predefined list of word phrases, which serves as the anchor [keyword phrase] for a hyperlink" while plaintiffs define it as "a recognized text string that is to be converted into a hypertext phrase." Thus, plaintiffs object to defendant's insertion of the word "predefined" as well as its use of "list of word phrases" rather than "recognized text string."

Plaintiffs argued at the claim construction hearing that in some situations a keyword phrase is created using a rule rather than merely matching from an existing, predefined list of words. For example, plaintiffs noted that if a new patient identification is entered into the system (using a recognized format, such as "patient ID 987654321"), the program would recognize this text string configuration as a keyword phrase even though this particular patient identification (or keyword phrase) did not exist previously. Although the inventor sometimes modified the terms "keyword phrase" with the adjectives "defined" and "predetermined" in the specification, claims 49 and 53 of the '461 patent do not articulate such a limitation. It is well established that "the language of the claim defines the scope of the protected invention." Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619 (Fed. Cir. 1995) (citing Yale Lock Mfg. Co. v. Greenleaf, 117 U.S. 554, 559, 29 L. Ed. 952, 6 S. Ct. 846, 1886 Dec. Comm'r Pat. 169 (1886) and Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 396 (Ct. Cl. 1967) ("Courts can neither broaden nor narrow the claims to give the patentee something different than what he set forth [in the claim].").

Finally, contrary to defendant's assertion, a patient identification number is not a "word phrase" but rather a "text string." Adopting a "list of word phrases" rather than a "recognized text string" as part of the definition of keyword phrase would circumscribe the use of an alphanumeric patient identification number. Moreover, the patent makes it clear that the use of an alphanumeric patient identification is the preferred embodiment. As stated earlier, a construction that necessarily excludes the preferred embodiment "is rarely, if ever, correct." Vitronics, 90 F.3d at 1583. Accordingly, "keyword phrase" means a recognized text string that serves as the hypertext link.

3. **"knowledge-based access to, and management of"**

Disputed Term comprising a program running on a computer to enable knowledge-based access to, and management of, a technical database…. a technical database comprising electronically stored publications which are displayable, the technical database being structured to enable a plurality of access modes comprising name of publication, key word, and identified profile
Plaintiff's Construction access based on knowledge of the user, and control, which includes any and all changes to the database including but not limited to the creation, deletion, and modification of content.

Defendant's Construction using a separate database of external facts and inference rules that enable inferences to be drawn from external facts and then applied to data in a technical database in order to provide access to and management of...

The parties offer divergent constructions of "knowledge-based access to, and management of." ('806 Patent at 83:34-35.) For its part, Plaintiff proposes that the Court follow Judge Frost's interpretation of this term. The Court finds Judge Frost's construction--which is not directly challenged by Defendant--to be logical. Specifically, Judge Frost reasoned that "knowledge-based access" is simply another way of referring to "access based on knowledge," and that the only logical conclusion to be drawn from the claim language is that such knowledge is that of the user. (Slip Op. at 13.) In Judge Frost's view, absent the user's knowledge, "how would a system afford the user access?" (Id.) In addition, the Court notes that Plaintiff's proposed construction is intrinsically supported by the fact that one of the features of the invention is to allow the user to "interact" with the system in order to access a variety of "complex technical information" stored in the database. ('806 Patent at 1:21, 1:51-54.) This function is repeated in the preferred embodiment, which notes the importance of providing an "intuitive graphical user interface." (Id. at 4:10.) The references to "interact" and "intuitive" connote the significance of the user's role in accessing and manipulating stored information and making it accessible through the system. Indeed, a review of documents cited by Defendant actually supports Plaintiff's proposed construction, as evidenced by Mr. Sandifer's opinion that "Management" for a database includes all of adding, editing, and deleting any specific data...." (Lavorgna Decl. Ex. 19 at 25.)

The Court is also persuaded by Plaintiff's construction of the second part of the disputed claim term, i.e., "management of." ('806 Patent at 83:35.) The patent specification states that the system is intended to not only facilitate access to, but also to allow the user to "update" information in the system database, which is consistent with the goal of assisting the user in his or her ability to ensure compliance with regulatory requirements. (Id. at 1:67-2:3.) "The software is designed for interactivity with the database residing on the hard drive of the computer and includes a way for the user to comment and add expertise to the system by allowing the user to opt for the ability to import data...." (Id. at 2:30-34.)

Defendant contends that "knowledge-based access to, and management of" should be construed to mean "using a separate database of external facts and inference rules that enable inferences to be drawn from external facts and then applied to data in a technical database in order to provide access to and management of." (Jt. Stmt. at 11-12.) Aside from the fact that Defendant's proposed construction is unintelligible, none of the various dictionary definitions or various intrinsic and extrinsic evidence cited by Defendant (Jt. Stmt. at 10-15) supports the proposed construction. Thus, the Court construes the disputed claim term to mean "access based on knowledge of the user, and control, which includes any and all changes to the database including but not limited to the creation, deletion, and modification of content."

ANTHROPOMETRIC DATA

Paragraph (h) of claim 1 in the '000 patent claims a "second means for comparing signal derived from step (g) with known anthropometric data to produce an output signal representative of fat, lean tissue and body water." Tanita argues that the "known anthropometric data" refers to measurements of a patient's circumference and limb length measurements and ratios. As described in the specifications, that anthropometric data is imputed into the body composition meter and then used, with the measured impedance signal and the algorithm programmed in the device, to more accurately determine a particular patient's body fat.

Healthport argues, and the court agrees, that "known anthropometric data" should not be limited to patient specific data, but should be construed more broadly to include anthropometric data that is compiled in a database and applies generally to a population. Nothing in the language of the claim limits the data to patient specific data. Figure 21 of the '000 patent is a screen for the input of patient specific anthropometric measurements. However, in the absence of an express disavowal or other limitation regarding population general anthropometric data, the court will not read the specification onto the claim.
A. "Language"

The dispute over this claim term is admittedly narrow. Both sides agree that the term "language" as used in claim 20 of the '881 patent refers to a programming language. Indeed, the intrinsic evidence is clear on this point (see, e.g., cols 1:28-36, 2:52-58, 2:65-3:21, 3:42-45). Where the parties disagree is whether any further limitations apply. Specifically, plaintiff proposes that "language" be construed as "programming that is operable on a network site or a mobile device; examples of languages include HTML, CHTML, wireless markup language (WML), and HDML." Defendants, by contrast, argue that the "plain and ordinary meaning" of "language" as used throughout the '881 patent should apply. According to defendants, this means that a language must "couple network sites and mobile devices," "allow either a single or multiple input entries per page," and be limited to "markup languages." Additionally, defendants assert that a language must "determine which network sites can be accessed" by mobile devices.

Courts must determine the meaning of disputed claim terms from the perspective of one of ordinary skill in the pertinent art at the time the patent was filed. Chamberlain Group, Inc. v. Lear Corp., 516 F.3d 1331, 1335 (Fed. Cir. 2008). While claim terms "are generally given their ordinary and customary meaning," the "claims themselves provide substantial guidance as to the meaning of particular claim terms." Phillips v. AWH Corp., 415 F.3d 1303, 1312, 1314 (Fed. Cir. 2005) (en banc) (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). The specification of a patent is also highly relevant to claim construction. Indeed, claims "must be read in view of the specification, of which they are a part." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed.Cir.1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). Finally, courts should give due consideration to a patent's prosecution history, which "can inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Phillips, 415 F.3d at 1318 (citations omitted). These components of the intrinsic record are the primary resources in properly construing claim terms. Id. at 1317-18.

As stated, the term "language" as used in claim 20 is undoubtedly a programming language. Indeed, the specification provided an express, if not lexicographic, definition of this term as used in the '881 patent (col. 3:42-45):

As used herein, languages refers to programming used to coupling [sic] network sites and mobile devices. Examples of languages include HTML, CHTML, wireless markup language (WML), and HDML.

This straightforward construction — that a language is "programming used to couple network sites and mobile devices" — is all that is necessary to properly construe this term.

The additional limitations and clarifications proposed by the parties are unnecessary in light of the use of "language" in claim 20. First, it is implied from the adopted construction that a "first language" (as used in claim 20) is operable on a mobile device and a "second language" (as used in claim 20) is operable on a network site. Second, the surrounding text in claim 20 makes clear that both the "first language" and "second language" must allow "multiple input entries per page." Since these limitations are set forth expressly in the claim language, it is unnecessary to incorporate them into the construction of "language." Third, while it is true ? as defendants point out — that only markup languages were provided as examples of "languages" by the specification, it would be improper to read such a limitation into the claims. 9 See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 904-05 (Fed. Cir. 2004). Fourth, it is implied from the adopted construction and the intrinsic evidence that the "language" used by a particular mobile device determines which network sites it can access (see col. 1:29-30).

--- Footnotes ---

9 Of course, the fact that claim 20 requires "language[s] that allow[ ] multiple input entries per page" may restrict the programming languages that can satisfy this limitation to so-called markup languages. This, however, does not mean that such a limitation should be read into the construction of "language."

--- End Footnotes ---
In sum, this order construes "language" as "programming used to couple network sites and mobile devices" — exactly as the specification defined it and consistent with its usage throughout the claim language and intrinsic evidence. Any other limitations mentioned above are either implied by this construction, implied by the context of its use in claim 20, or expressly set forth within the asserted claim as separate limitations.

The crux of the parties' dispute as to claim 1 is the definition of "languages." Bloomstein argues that languages can mean two different dialogues in the same tongue, such as English. The defendants counter that considering the absence of a clear definition to the contrary in the claims or specification, the court should construe languages as two different tongues, such as English and Japanese, according to the ordinary meaning of the term.

As a preliminary matter, the first definition of "language" is "the words, their pronunciation, and the methods of combining them used and understood by a considerable community." Webster's New Collegiate Dictionary 646. Subsequent meanings include "audible, articulate, meaningful sound as produced by the action of the vocal organs." Id. The defendants argue in essence for the first definition, while Bloomstein espouses the latter.

However, the definition championed by Bloomstein cannot be pluralized without losing meaning. The claims require that "languages of the two displays are sufficiently different to result in different lip movements." At first glance, even one skilled in the art would wonder why Bloomstein used the plural "languages" instead of the singular "language" if he intended the claim to encompass different dialogues within the same tongue. In that case, the proper usage would be "the language of the two displays is sufficiently different to result in different lip movements." Bloomstein may be correct that the process disclosed in the specification could be used to "dub" one English dialogue to another, but he simply did not claim his invention that broadly. See Markman, 52 F.3d at 979-81 (specification should not be used to expand the scope of the claims).

2 He could also have claimed different "words" or "dialogues," as argued throughout his memoranda, but he did not do so.

In addition, the specification is rife with evidence that Bloomstein intended "languages" to mean a foreign tongue and a target tongue. Bloomstein argues that his repeated use of "foreign" should be discounted because he occasionally surrounded it by quotation marks. However, the use of quotation marks is not a clear definition contradicting the ordinary meaning of "languages." Bloomstein points to no affirmative language in the specification that clearly overcomes the ordinary meaning of "languages." Absent a showing that Bloomstein "acted as his own lexicographer," the ordinary meaning prevails and "languages" means two different tongues. See Id. at 980.

3 The "Background" portion of the patent describes the invention as "particularly applicable for replacing the sound track of a motion picture with a new sound track of a different language while also modifying the lip movements of the actors in the picture to correspond to the new language to be applied to the sound track." Joint Memo., Ex. A at column 1:16-21. Bloomstein argues that the use of "particularly" implies a broader scope of application than cross-language dubbing. However, this mere suggestion of broader scope cannot overcome the claim language and consistent discussion of cross-language dubbing in the specification.

Claim 1 of the '281 patent is representative, reciting:

A method of altering a cinematic work by substituting a second animated facial display for a first animated facial display and in which the displays have lip movements corresponding to the languages used and wherein the languages of the two displays are sufficiently different to result in different lip movements for each display, comprising: generating data in digital form representing the configuration of the second facial display over a plurality of cinematic frames, generating data in digital form representing the configuration of the first facial display over a plurality of cinematic frames of said work, and altering under the control of both sets of said data and a programmed digital computer the configuration of said first facial display to produce substantially the configuration of the second facial display.

Col. 29, ll. 24-40

The trial court held that by "languages" the '281 patent means "two different tongues," so that the use of the patented method to dub in dialogue in the same language used in the original footage cannot literally infringe. We agree. Throughout the specification the invention is described in terms of altering a character's lip movements so that a person speaking in a foreign language is perceived as speaking in English, and the claims do not deviate from this. Because the footage at issue here does not alter any character's lip movements so that they conform with dialogue in a language other than English, the language of the original footage, the trial court correctly held that Lucas and Paramount did not literally infringe the claims of the '281 patent.

2. "large-screen display surface" (claims 17, 21, 38, 41, 57, 58, 71, 72)

PolyVision contends that this term cannot be construed because it is not mentioned or defined in the specification, has no particular meaning in the art, and is indefinite. PolyVision points out that it is well-known in the art that display surfaces for a projector may range from a few inches in diagonal width to over twelve feet in diagonal width, and without further guidance from the claim, any attempt to give meaning to "large-screen" would be arbitrary and lacking any support in the specification. Smart contends that the term is not indefinite and should be given its plain and ordinary meaning: "A display surface that is sufficiently large to be viewable concurrently by one or more groups of users."

"Because [] claims perform the fundamental function of delineating the scope of the invention [pursuant to 35 U.S.C. § 112, P 2], the purpose of the definiteness requirement is to ensure that the claims delineate the scope of the invention using language that adequately notifies the public of the patentee's right to exclude." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005) (internal citation omitted). A claim is not indefinite solely because construction proves to be a difficult task. See Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001). Nor is a claim indefinite even though the construction is one over which reasonable persons can disagree. See id. "Because a claim is presumed valid, a claim is indefinite only if the 'claim is insolubly ambiguous, and no narrowing construction can properly be adopted.'" Honeywell Int'I, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332, 1338-39 (Fed. Cir. 2003) (quoting Exxon Research, 265 F.3d at 1375).

Although the Court believes that this is a close question, it concludes that a person skilled in the art would understand the
First, the specification provides some basis for giving context to the term "large screen." First, it must be large enough so that "several user groups can view the projected screen output." (Col. 4, ll. 42-44.) Second, Fig. 1 is a drawing of the interactive display system, and it shows the display screen as being much larger than the computer screen and the overhead projector, in fact, perhaps 4-6 times as large as those items. This information reveals that the term "large-screen display" is intended to encompass display screens that would be used to present information to large groups of people in a classroom or conference setting. It would exclude the scenario discussed at the hearing of several college students crowding around a small television. Finally, PolyVision's expert, Dr. Robert S. Dezmelyk, indicated that he understood what "large-screen" meant. He said that it would be at the:"larger end of the scale" for digitizers, meaning that it would be larger than a 24 by 36 inch digitizer. (Dezmelyk Dep. at 167.) Dr. Dezmelyk was also able to ascertain whether certain of PolyVision's products had large-screen displays, and he stated that PolyVision's IBID product line had small screens. (Id. at 262.) This provides a sufficient basis to allow this Court or a jury to determine whether the accused product is a "large-screen" device. See Aero Prods. Int'l, Inc. v. Intex Recreation Corp., 466 F.3d 1000, 1016 (Fed. Cir. 2006) (citing the plaintiff's expert's testimony regarding his understanding of the disputed terms as support for the conclusion that the terms would be understandable to a person of ordinary skill in the art).

Avago proposes that "periodically forming largely overlapping images of a field of view of said array" be construed as "images of a field of view of the photosensor array are formed at regular intervals of time. The images overlap such that there are features in common in successive images." Elan submits that "periodically forming largely overlapping images," is impossible to construe because "largely overlapping images" is indefinite. As to the remainder of the claim language, Elan proposes that "a field of view of said array" means "an area of the three-dimensional environment in which the device resides that can be viewed by the array."

The Court does not find "largely" to be indefinite simply because there is no specific quantity by which the images must overlap. As construed consistent with its plain and ordinary meaning, "largely" provides sufficient guidance to a person of ordinary skill in the art. Based on the Court's determination that the device disclosed in Claim 14 is one which may operate in a three-dimensional environment, the Court declines to further construe this phrase.

Matsushita argues "larger than said simple geometric figure" should be construed as "having a greater area than said simple geometric figure." Mediatek argues "larger than said simple geometric figure" should be construed as "having a greater area than the area of the simple geometric figure of the first planarizing pattern so that the number of figures and the amount of data in the planarizing patterns is reduced."

The Court finds, for the reasons stated by Matsushita, "larger than said simple geometric figure" is properly construed as "having a greater area than the area of the simple geometric figure of the first planarizing pattern."

The dispute between the parties as to this term is whether the "laser piloting means" must operate through direct modulation or whether the claim language also covers "laser piloting means" that operate through external modulation. Direct modulation operates by having a driver device that varies the amount of light that emanates from a laser. Because the device operates by directly acting on the laser to modulate its signal, this set up is termed "direct modulation". On the other hand,
external modulation works quite differently. In a set up of that type, the laser is operating at a constant output. Thereafter, the constant output of the laser is run through an external modulator, which operates as a shutter. Depending on how the shutter of the external modulator is varied, the laser signal is subsequently modulated. Pirelli claims that the language of the claim is broad enough to have "laser piloting means" encompass both direct and external modulation. Not surprisingly, Ciena disagrees and contends that Pirelli's "laser piloting means" must operate by direct modulation.

(a) The Claim Language

The "laser piloting means" phraseology is found in claims 1, 8, 13, 14, 15, and 17 of the '073 Patent. Because this language is used in a similar manner in all of the claims, for purposes of convenience, the language of claim 1 will be construed. In relevant part, claim 1 states: "an adjustment module comprising laser piloting means connected to said converting means and to said second transmitter for controlling said second transmitter by said electrical signals within said operating parameters of said optical amplifier."

In Col.1, lines 37-41.

Pirelli asserts that the claim language is broad enough to encompass both direct and external modulation techniques. Specifically, Pirelli points to the language of the claim that states that the "laser piloting means" controls the second laser transmitter. Pirelli contends that this control can be by direct or external modulation. Ciena asserts there must be a direct modulation of the laser by the laser piloting means. This is so because the claim language itself recites that the laser piloting means is "connected" to the second optical signal laser transmitter for the purpose of controlling said second laser transmitter.

(b) The Specification (and Means-Plus-Function Analysis)

Neither party disputes that the "laser piloting means" falls under the means-plus-function rubric of 35 U.S.C. § 112, P6. Under the means-plus-function analysis, the first step is to determine the function of the "means" and the second step is to locate the corresponding structure, or its equivalent, in the specifications of the patent. See 35 U.S.C. § 112, P6. Although the parties agree as to the corresponding structure in the specification, they disagree over the function of the "means".

Pirelli argues that the function of the "laser piloting means" is to control the second laser transmitter. According to Pirelli, the corresponding structure in the specification which performs such a function is a "laser piloting circuit". Col.3, lines 57-62. However, Pirelli asserts that under the equivalents language of section 112, P6, it is a question for the jury whether external modulation is an equivalent method to the direct modulation performed by the laser piloting circuit.

Ciena asserts that the function of the "laser piloting means" is to guide, direct, or pilot the laser of the second optical transmitter. The corresponding structure found in the specification is "laser piloting circuit 20. [ ] a known circuit of the digital type in which direct current modulation is also carried out in order to allow signals coming from service channels connected to the input to be inserted." Col.3, lines 63-67. In addition, Ciena cites the following relevant specification language: "The electrical signal activates the piloting circuit 20 for the adapter laser 22 . . . Circuit 20 is entirely digital and has a circuit portion carrying out direct current modulation . . . ." Col.5, lines 1-6. Ciena points out that external modulation is nowhere mentioned in the specification or claim of the '073 Patent. Therefore, Ciena urges the Court to find that the "laser piloting circuit" is the corresponding structure and that it functions only through direct modulation.

(c) The Prosecution History

During the prosecution of this patent, Pirelli was forced to more clearly define "laser piloting circuit 20". Prosecution History, at 166. Pirelli responded that a laser piloting circuit is "merely a laser modulating circuit well-known in the art and are so described in the specification of the subject application." Prosecution History, at 167. Pirelli went on to provide five examples to the patent examiner in order to more fully define what was meant by a laser piloting circuit. Ciena argues that all of the examples given by Pirelli are laser driver circuits that directly control a laser. Further, Ciena contends that at no time during the patent prosecution did Pirelli suggest that laser piloting circuit is anything different from a direct modulation circuit.

(d) Claim Construction

It is improper claim construction to limit the interpretation of the means-plus-function language to particular means set forth
in the specification. See D.M.I., 755 F.2d at 1573. To do so, would "nullify the provision of § 112[, P6] requiring that the limitation shall be construed to cover the structure described in the specifications and equivalents thereof." Id. (emphasis added). Moreover, "there is and can be no requirement that applicants describe or predict every possible means of accomplishing that function." Id. That being said: The scope of a means-plus-function claim is not limitless, but is confined to structures expressly disclosed in the specification and corresponding equivalents. Thus, [§ 112, P6] prevents an overly broad claim construction by requiring reference to the specification, and at the same time precludes an overly narrow construction that would restrict coverage solely to those means expressly disclosed in the specifications.

"The function performed by the means-plus-function element is a claim construction issue which should be resolved as a matter of law, because it requires the Court to only look at the patent itself. . . . " Motorola, Inc. v. Interdigital Technology Corp., 930 F. Supp. 952, 963 (D.Del. 1996). Similarly, the corresponding structure, or specific means, that carries out the function described in the claim should also be decided as a matter of law as a claim construction issue. See id. The Court in Motorola put forward this helpful analogy as a way to think of how this analysis should be conducted:

For instance, if a patent contains a means-plus-function limitation claiming a "means for fastening" and the specification discloses a "button" as a possible fastening means, under Markman a court must resolve any dispute regarding both the 1) function of the fastening means, and 2) the meaning of the word "button," as a matter of law.

Id. Once the court has construed the function and the specific means, it is a question for a jury what the equivalents are of the specific means or structure identified in the specification. See In re Hayes Microcomputer Prods., Inc., Patent Litigation, 982 F.2d 1527, 1541 (Fed. Cir. 1992); D.M.I., 755 F.2d at 1575; LRC Electronics Inc. v. Mezzalingua Assoc., Inc., 974 F. Supp. 171, 1997 WL 536351, at *7 (N.D.N.Y. 1997); Raleigh v. Tandy Corp., 1997 U.S. Dist. LEXIS 22130, 1997 WL 26299, at *2 (N.D.Cal. January 10, 1997); Motorola, 930 F. Supp. at 963.

The Court is persuaded that, as a matter of law, the function of the "laser piloting means" cannot include external modulating devices, but only includes direct modulation devices. This conclusion is the result of a close reading of the claim language as to the function of a "laser piloting means". Claim 1 states, in relevant part: "an adjustment module comprising laser piloting means connected . . . to said second transmitter for controlling said second transmitter . . . ." Col. 7, lines 37-40. According to the plain language of the claim, and recognizing that "second transmitter" has already been construed to be equivalent to a laser, the "laser piloting means" functions by being connected to the laser for the purpose of controlling the laser. Only direct modulation works in this fashion; i.e., by having the modulator directly attached to a laser. On the other hand, external modulation operates by having a constant laser beam being acted upon by an external modulator, not connected to the laser.

This reading of the claim is supported by both the language of the specification and the prosecution history. Both parties agree that the corresponding structure found in the specification that performs the function of the laser piloting means is the "laser piloting circuit 20". "Laser piloting circuit 20" is described in the specification as "a known circuit of the digital type in which direct current modulation is carried out . . . ." Col. 4, lines 63-65 (emphasis added), and as "entirely digital and having a circuit portion carrying out direct current modulation." Col. 5, lines 1-6 (emphasis added). Although this language from the specification may not be properly imported into the claim, it does properly assist in giving a context to the disputed claim language. See Wright Medical, 122 F.3d at 1443. Moreover, the prosecution history illustrates that when Pirelli was forced to more clearly define the "laser piloting circuit," Pirelli replied that the circuit was, "merely a laser modulating circuit well known in the art . . . . " Prosecution History, at 167. All five examples that Pirelli provided to the patent examiner were laser driver circuits that directly modulate the laser. For all the foregoing reasons then, the Court holds, pursuant to the means-plus-function analysis of 35 U.S.C. § 112, P6, that the "laser piloting means," found in claims 1, 3, 8, 13, 14, 15, and 17 of the '073 Patent, functions by variably controlling the input of the laser in the adapter through the use of direct modulation in order to produce a directly corresponding output. The corresponding structure, as a matter of law, is found to be "laser piloting circuit," which is a laser driver circuit that directly modulates the input of the laser in the adapter in order to produce a directly corresponding output.
In claim seven, the phrase "a laser source of subpicosecond laser light pulses, . . . producing in the region of said focal point a two photon excitation energy level." Plaintiffs argue this phrase, also taken from two paragraphs (7[c] and [d]), must be construed together as a means-plus-function element. According to the Plaintiffs, there is no recited structure for performing the function of producing a two photon excitation energy level in the focal point. Again, Plaintiffs argue the structure should be read from the specification and should be construed as a colliding pulse mode-locked dye laser. Defendants respond that the term "means" does not appear in this element. Further, definite structure and material is recited, thus making § 112, P 6 inapplicable. For example, the term "laser source" by itself recites a structure, that is, a laser.

For the same reasons the Court refused to interpret the previous phrase as a means-plus-function element, it again declines to do so here.

2416

I. Last Synchronization Signature

Visto argues that the term "last synchronization signature," as used in the '708 patent, means "information regarding synchronization actions carried out with respect to a workspace element." Seven proposes that the term means "a record computed by the general synchronization module which indicates the last date and time of synchronization." In support of its proposed definition, Seven argues that the specification implicitly defines the term in this manner. In particular, Seven argues that the specification requires the last synchronization signature to indicate the last date and time of synchronization. However, the portion of the specification relied on actually states that the general synchronization module includes routines "for examining the version information 255 or 150 against a last synchronization signature (such as a last synchronization date and time) to determine which versions have been modified." '708 Patent, Col. 7, ll. 23-27 (emphasis added). It is clear from the specification that the requirement of a last synchronization date and time is exemplary only and not intended to limit the definition of last synchronization signature. At the same time, despite the shortcomings of Seven's proposal, Visto's definition is too broad. Visto's definition would literally include all information about synchronization actions, when it appears that the term is more limited to the most recent synchronization action. The court therefore construes this term to mean "a record computed by the general synchronization module from which the most recent synchronization may be determined."

2417

8. "latching level shifter"

Having agreed to the meaning of "level shifter," the parties dispute what the word "latching" means in this claim term. A "level shifter" has been defined as "a circuit that accepts digital input signals at one pair of voltage levels and delivers output signals at a different pair of voltage levels, where at least one of those voltage levels changes." (1/27/04 Chart entitled "Agreed and Partially Agree Claim Terms" at p. 4). Defendants contend that a "latching level shifter" is a level shifter that will retain at least one state, i.e., will continue to provide an output signal, in the absence of input signals. MOSAID on the other hand contends that a "latching level shifter" holds the output signals only while the input signals are present. If MOSAID's construction is adopted, a "latching level shifter" without input signals would not provide any output signals.

The Court begins by trying to determine the ordinary meaning of the claim language. Claim 15 of the '253 patent states in relevant part: "a latching level shifter which receives word line selection signals at V[dd] logic levels to drive and latch first and second word line control signals at V[pp] logic levels." '253 patent, claim 15 (emphasis added). Thus, it appears that the terms "latching" and "latch" are being used in a technical sense.

Defendants proffer the Radio Shack dictionary definition of "latch," which is "[a] feedback loop used in a symmetrical digital circuit (such as a flip-flop) to retain a state." Radio Shack Dict. of Electronics (5th ed. 1977). MOSAID criticizes this definition, arguing that the definition does not support Defendants' proposed construction because the definition requires a "symmetrical circuit," whereas Defendants' construction would define "latching" as an asymmetrical circuit since it only
needs to retain one state. However, MOSAID does not dispute that the ordinary meaning of the technical word "latch" includes the ability to retain at least one state. In fact, MOSAID's own expert submitted an expert report in support of its claim construction that states: "Generally, a 'latch' is understood to refer to a circuit that retains its output state in the absence of inputs." (Greene Expert Report at P 18). Consequently, the ordinary meaning of "latching" means "retaining an output state in the absence of inputs."

MOSAID maintains that this definition cannot be correct because it is inconsistent with, and in fact would exclude, the "latching level shifter" set forth in Figure 1 of the patents. The level shifter in Figure 1 is not a symmetrical "latching level shifter." It can only retain one output state in the absence of input signals, an output of V[pp] from transistor 7A to the gate of pass transistor 14A, which would not allow any voltage to pass to the word line. In order for it to be a symmetrical "latching level shifter," it would need an additional pull-down transistor, like transistor 12, to be connected to the gate of transistor gate 7A. Since it lacks that additional pull-down transistor, MOSAID argues that it cannot be a "latching level shifter" as defined by the Radio Shack dictionary. Thus, MOSAID offers an alternative definition of "to . . . latch" which is "to hold the output signals while the input signals are present."

There are several problems with MOSAID's analysis and proffered claim construction. First, as explained above, the ordinary meaning of "latch" only requires that an output state be retained, not that the circuit be symmetrical and be able to retain multiple outputs. Thus, the ordinary meaning would include the level shifter embodied in Figure 1. Second, even if the ordinary meaning of "latch" required a symmetrical circuit, the Court would conclude that the patentee acted as her own lexicographer and broadened the meaning so that it only required one output state to be retained based on Figure 1.

Finally, MOSAID's proffered claim construction cannot be correct because it would strip the terms "latching" and "latch" of any meaning. There is nothing to suggest, and MOSAID offers no evidence, that NAND gate 5 will provide constant input signals to the level shifter so that it becomes "latched." As a result, there is no evidence that the "latching level shifter" would ever "latch" any signals if MOSAID's definition were adopted.

The patentee purposefully used the terms "latching" and "latch" in a technical manner and it is the Court's responsibility to give effect to those words. Since Defendants' proposed construction would give meaning to the disputed terms and would include the preferred embodiment Figure 1, the Court finds that a "latching level shifter" is "a level shifter including a feedback loop that will indefinitely retain at least one data state in the absence of any new control signal to change the state."

20 Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) ("The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction.").

2418

a. "layer" and "conductive layer"

LGD contends that one of ordinary skill in the art would construe the term "layer" to mean "thickness of material," and the term "conductive layer" to mean "thickness of electrically conductive material." D.I. 376 at Exh. C-2. Although the specification of the '449 patent refers to the conductive layer that forms the gate pads, gate electrode and source pad as being of the same material, LGD contends that this limitation should not be imported into the claims. According to LGD more than one material may constitute the conductive layer, and these materials are inseparable. Therefore, LGD maintains that the claims should not be limited to a single material.
AUO and CMO do not appear to dispute the construction of the term "layer," but instead focus on the term "conductive layer." AUO contends that "conductive layer" should be construed in accordance with its plain meaning. Id. CMO contends that a "conductive layer" means "[a] thickness of electrically conductive material that may include one or more patterned features, all of a single material." Id. The Court has reviewed the parties' positions in light of the claim language and the specification of the '449 patent, and concludes that a single material limitation is not required. '449 patent, col. 3, ll. 44-49, col. 4, ll. 46-61. In discussing Fig. 2a, the patent explains that the "conductive layer is formed on a transparent glass substrate 1 and patterned to form a gate electrode 2, a storage capacitor electrode 2D, and a gate pad 2C, all of the same material." Id. at col. 3, ll. 44-46. However, the Court is not persuaded that the limitation of one embodiment should be imported into the claims. Accordingly, the Court concludes that a "layer" means "thickness of material," and a "conductive layer" means "thickness of electrically conductive material."

1. "layer" (all asserted claims)

ATI has proposed plain meaning for the term "layer." Dkt. No. 113, Ex. at 2. Sharp and DNP have proposed that the term "layer" means "a separate and distinct layer of material." Id. The Order construed the term "layer" to mean a "separate layer." Dkt. No. 117 at 17.

a. Objections

ATI objects to the Order's construction of the term "layer" as "separate layer." In particular, ATI argues that "separate" "does not appear in the claims, the specification, or the prosecution history and is not required to give any meaning to the disputed phrase." Dkt. No. 124 at 1. During oral argument on the objections, ATI argued that "some of the claims talk about a layer upon or atop a surface . . . but the words upon and atop merely describe the location of the layer and the addition of the term separate is unnecessary." 5/19/2009 Objections Hr'g Tr., Dkt. No. 170 ("Objections Tr.") at 5:21-25. ATI submits that "[t]he addition of the term 'separate' is superfluous and will confuse the jury." Dkt. No. 124 at 2.

Sharp responds that "the specification, the drawings, and the claim language always show[] separate layers." Objections Tr. at 6:9-10. Sharp emphasizes that in the specification, the word layer is used "always in the context of upon, atop, or between." Id. at 6:17-19. Sharp submits that "you can't be atop something or upon something or between something if you are a part of that other thing." Id. at 7:2-3. Sharp cites Figure 3B as "show[ing] separate layers" and argues that "[t]hese respective layers (14, 26 and 30) clearly sit 'upon' or 'atop' one another, and they are not intermixed." Dkt. No. 129 at 2.

DNP also responds to ATI's objection. Dkt. No. 132. DNP argues that "the drawings, specification, and prosecution history of the asserted patents all unequivocally describe each layer as being separately disposed by a separate process step. Id. at 1. DNP also argues that ATI's previous proposal of "distinguishable" layer, as well as "layer" by itself, "are too vague to provide guidance to the jury." Id. at 2. DNP further cites prosecution history of a grandparent application wherein the applicant purportedly amended to overcome a rejection based on U.S. Patent No. 4,846,556 ("Haneda"). Id. at 4.

b. Discussion

Sharp's comment that layers "are not intermixed" (Dkt. No. 129 at 2) indicates that the parties genuinely dispute the scope of the term "layer." The Court must accordingly resolve whether the word "separate" is appropriately part of the Order's construction. O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., Ltd., 521 F.3d 1351, 1360 (Fed. Cir. 2008) ("When the parties raise an actual dispute regarding the proper scope of these claims, the court, not the jury, must resolve that dispute.")

The specification does not indicate that "intermixing" between layers is impermissible. For example, the Order finds that intermixed boundary regions could exist where one layer contacts another layer but notes that "the drawings include solid lines indicating separate layers, and the language in the claims and the specification use terms such as 'upon' and 'atop' which define a separateness between the layers." See Dkt. No. 117 at 17-18 and 20. Although the word "separate" might be
read to require that layers are separated by some distance (i.e., are not in contact with one another), a better reading of "separate" in light of the specification is that layers are somehow divided from one another by a boundary, however imperfect the boundary may be. See Oxford English Dictionary (Second Edition 1989) (definition of "separate" can include "[p]arted, divided, or withdrawn from others; disjoined, disconnected, detached, set or kept apart"); Phillips, 415. F.3d. at 1316 (noting that "the specification necessarily informs the proper construction of the claims"). DNP's proposal of the word "distinct" more clearly captures the concept that the layers are distinguishable from one another, but the word "distinct" may be read to connote absolute distinction. Because some "intermixing" may be possible, as noted above, the layers are distinctive but not necessarily completely "distinct." 1 The teaching in the specification that a layer is something that can be "disposed" on something or on another layer also indicates that layers are separate from one another, as also reflected in the figures. See, e.g., '711 Patent at 3:26-27. In sum, the Order's construction of "layer" to mean "separate layer" should be affirmed.

--- Footnotes ---

1 For an analogy, see Sharp's Claim Construction Sur-Reply Brief: "ATI relies upon the analogy that 'icing may be atop a cake, even though the icing will blend into the porous cake at the surface.' (Reply at 8.) However, the icing and the cake remain two separate and distinct items. Although the icing may superficially 'blend into the [holes in the] porous cake at the surface,' they remain different elements and layers." Dkt. No. 91 at 4. Although baking a cake surely differs greatly from fabricating a liquid crystal display, the analogy is nonetheless of some persuasive value.

--- End Footnotes ---

4. "layer" Claim 1, 3, and 5.

An exemplar use of the term layer is in Claim 1, stating in part, with the disputed term in bold: "A structure having plural layers in semiconductor material..." Seoul argues that "layer" be construed to mean "a layer of material but does not refer to a substrate in a device." Nichia does not think that the term needs to be construed, but if it is, Nichia proposes "a thickness of material" and does not exclude the substrate.

Specifically, the parties dispute whether a layer includes the substrate. Seoul argues that the specification contrasts a layer with the substrate and that a person of ordinary skill in the art would understand the two terms to mean different things and would not think that a substrate is a layer.

Nichia points to dictionaries for the proposition that a layer can include a substrate and criticizes Seoul's proposed claim construction because it indicates what a layer is not, rather than what it is. The latter argument is unavailing as it may be necessary to construe a claim term to exclude sub-portions of the claim term, as here where the court has been asked to interpret both "layer" and "sub-layer." AFG Industries, Inc. v. Cardinal IG Co., Inc., 239 F.3d 1239, 1250 (Fed. Cir. 2001) (defining layer to exclude inter-layers which are too thin to be optically significant).

Generally, the specification distinguishes between the substrate and a layer. See e.g. col. 3, l. 61-64 ("semiconductor substrate 1 and a stacking of three or four layers in semiconductor material 2, 3, 4 and 5 placed on a major side of the substrate 1."); Col 4, l. 11-13 ("According to a preferred embodiment, the stacking of layers 2 to 5 constitutes a double heterostructure GaAs/GaAlAs formed on a substrate in silicon Si."). Nichia's technical expert, Dr. Schubert, and Seoul's expert, Dr. Streetman both admit that a substrate must be present to deposit semiconductors. Tr. at p. 106, l. 19 to p. 107, l. 19; Tr. p. 109 at 9-10.

However, in certain instances, the substrate should be included as a layer. At times the specification includes the substrate as a layer. In discussing the state of the prior art and dislocation formation in deposited semiconductors, the specification references a silicon substrate and the 4% lattice mismatch between GaAs and Si which results in a large number of dislocations. Col. 1, l. 39-42. The specification continues to explain that "when the crystalline lattice parameter of a layer is lower than that of a second layer, the first layer is subjected to tension and dislocations occur in the layer interface." Col. 1, l. 29-51. The Si substrate is the first layer and the GaAs is the second. Dislocations result from the lattice mismatch. The
'742 patent specifically relies upon lattice mismatch and the three-dimensional growth mode to produce the inclusions. If the properties of the substrate are vitally important to the design and operation of the structure, the substrate is a layer.

Further, the substrate could be an electronically active portion of the structure. If it is, it would be logical to include it in the definition of layer. Both GaAs and InP have been used as substrates. Col. 1, l. 64-66. When the substrate functions as an electronically active portion of the structure, such as the n-type or p-type layer, it would be incorrect to exclude it from the definition of a "layer." If the substrate only acts as a mechanical support, it is not a layer.

The court will therefore construe "layer" as follows:

"layer" means "a thickness of material, which may be made up of sub-layers, but does not refer to a substrate in a device unless the substrate is an electronically active portion of the device.

A. "layer"

The parties dispute the meaning of "layer" as that term appears in the '710 and '322 patents. The claim language of the '322 patent specifies that the invention stores identifiers "at a layer lower than layer 3." The district court construed layer as one of the layers in the Open Systems Interconnection ("OSI") protocol layer stack, finding reference to that standard in the specification.

Reference to "layer 3" in the claims of the '322 patent requires some background to provide meaning for the specific layer number. Toshiba's nebulous definition would leave that layer number without any meaning. See Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1374-75 (Fed. Cir. 2003). With such a broad and potentially ambiguous term, we consult the specification for guidance.

As the district court recognized, the specification consistently uses "layer" in conjunction with the OSI model. E.g., '322 patent, col. 1, ll. 38-42. Accordingly, we hold that the district court correctly construed "layer" as a layer in the OSI protocol layer stack, and thus affirm the judgment of noninfringement as to the '322 patent.

Guardian's Position
Guardian argues that there are seven relevant claim terms in dispute. Guardian's interpretations are listed below.
Heated Treated Coated Article: a coated article that has been heated to a temperature for a sufficient period of time to enable thermal tempering, bending or heat strengthening of the articles.
Layer: a region of material having a thickness and the composition of which is chosen to provide desired properties.
Oxidation Graded: having a change in the relative oxygen content in a region such that one portion contain more oxygen than another portion.
Progressively More Oxidized: having a trend of increased relative oxygen content.
More Oxidized at a Location Further From the Layer Comprising Ag Than at a Location Closer to the Layer Comprising Ag: these precise words do not appear in the asserted claims of the patents-in-suit, and therefore, they do not require interpretation.
Metal or Metal Nitride Contact Layer: metal or metal alloy, contact lawyer means a layer contacting another layer, metal nitride is a material including both metal and nitrogen.
More Metallic: having more relative metal content in a region compared to reactive non-metals such as oxygen or nitrogen.
AFG's Claim Interpretations
AFG groups the terms in dispute into four categories: (1) coated article claim elements; 2) layer claim elements; (3) oxidation graded claim elements; and (4) nitride claim elements.
Coated Article: all of the coated article definitions ("heat treated coated article," "coated article," and "after being heat treated (HT) said coated article") should be interpreted as: "an article which has been coated" with either: a) "and has been
heated to a temperature sufficient to enable thermal tempering, bending, or heat strengthening; or b) "with a heat treatable coating."

Layer: "a thickness of material having a function and chemical composition bounded on each side by an interface with another thickness of material having a different function and/or chemical composition."

Oxidation Graded: all of the oxidation graded claims ("oxidation graded," "is more oxidized at a location further from the [first] layer comprising Ag than at a location closer to the [first] layer comprising Ag," "is more metallic at a location closer to the silver inclusive layer than at another location further from the silver inclusive layer," and "is more metallic at a location closer to the metal or metal nitride contact layer than at another location further from the metal or metal nitride contact layer") should be interpreted as, "a layer that is progressively more or less oxidized through its thickness" with the appropriate variations in language used in the different claims.

Nitride layer: all of the nitride layer ("nitride layer," "comprises silicon nitride," "layers which comprises a nitride," and "layer comprises Si-rich Si[x]N[y] where x/y is from .76 to 1.5") is "a layer containing a silicon nitride compound, and not containing oxygen."

Layer

The two parties proposed interpretations of the term "layer" contain a number of differences. The first difference lies in whether the court should adopt Guardian's "the region of material having a thickness" interpretation or AFG's proposed "thickness of material" interpretation. Both sides agree that a layer has a "thickness" and is made with a certain "material," the difference lies in whether the word "region" should be incorporated into the interpretation.

This court was unable to find any mention of the term "region" in the patents' claims or specifications. Instead, when describing "layers" the patents' claims, tables, and specifications all refer to the type of material used in the specific "layer" and its "thickness." For example, the '349 specifications discuss "exemplary preferred thickness and example materials for the respective layers on the glass substrate." '349, Col. 7, lines 65-66. The patent also provides a chart that outlines the "preferred range," the "more preferred range" and "example" of thickness for each material. '349, Col. 8, lines 1-18.

In a case involving patents related to the same type of glass, the Federal District Court defined "layer" as a "thickness of material of substantially uniform chemical composition…." AFG v. Cardinal, 239 F.3d 1239, 1250 (Fed Cir. 2001). Although these are different patents at issues, this court believes that the Federal Appeals Court's decision is instructive on how a person skilled in the art of these types of inventions would interpret the term "layer."

As a result of the claims' terms, the specifications, and the guidance of the Federal Court's decision in the 2001 AFG case, this court refuses to adopt the "region of material" interpretation proposed by Guardian. Instead, the court will adopt the "thickness of material" interpretation.

Another point of contention, is whether the "layer" interpretation should include AFG's proposed "bounded on each side by an interface with another thickness of material having a different function and/or chemical composition." Guardian's proposed interpretation says nothing about a layer's spatial relationship to other layers.

Guardian argues that AFG's interpretation is faulty for a numerous reasons, including that AFG's interpretation would cause an absurd situation. In a Southern District of New York case, the patent interpretation principle of construing claim language in a manner that causes the claim to make sense in the context of the patent. Leighton Techs. LLC v. Oberthur Card Sys, S.A.,, 358 F.Supp.2d 361, 366. Guardian argues that the "bounded on each side" language would cause just such an absurd situation, i.e. the coating would continue ad infinitum since each layer is bounded by another layer on the other side.

Guardian also points out that AFG's position on the interpretation of the term "layer" has changed since the Federal Circuit opinion in 2001. AFG v. Cardinal, 239 F.3d 1239 (Fed Cir. 2001). In that particular case, AFG argued against defendant Cardinal's proposed definition of "a thickness of material of uniform chemical composition bounded by a material of different chemical composition" and instead advocated for the proposed definition of "a thickness of material of uniform composition." Id. at 1250. The Federal Circuit noted that the patent in question did not limit the term "layer" to a deposit bounded by a material of a different chemical composition, thus declining to include such a limitation in the construction of the term "layer." Id.
Similarly, the specification of the patents in this case do not limit the term "layer" to a deposit bounded on each side by an interface with another thickness of material having a different function and/or chemical composition. At times in the patents' claims and specifications, the term layer is mentioned in connection with its physical relationship to other layers. For example, the silver and NiCrOx layers are said to contact each other in certain patent specifications. In patent '349 claims, the infrared reflecting layer is said to be "contacting and sandwiched between first and second layers, said second layer comprising an oxide of NiCr." '349, Col. 23, lines 52-54. However, the vast majority of both the claims and specifications do not place physical limitations on the term "layer." Thus, the Court refuses to adopt this aspect of AFG's proposed interpretation.

Another difference between the parties proposed "layer" interpretation is Guardian's "the composition of which" versus AFG's "chemical composition." The Federal Circuit in the 2001 AFG case included within its "layer" interpretation "of material of substantially uniform chemical composition." Id. at 1250. The court came to this conclusion discussing whether the term "layer" should include in its interpretation the word "uniform":

[F]ocusing on the chemical uniformity of a deposit, rather than its optical properties, constitutes a departure from the disclosures and teachings of the patent. Nowhere does the patent refer to chemical "uniformity" as a characteristic of a layer… we do not think that the incorporation of trace amounts of silver or zinc oxide into titanium deposit would disqualify that deposit from constituting a layer. Accordingly, we hold that the chemical composition of a layer must only be "substantially uniform," rather than uniform.

Id. The court concluded that consistent with the specification that the term layer should be interpreted as: "a thickness of material of substantially uniform chemical composition, but excluding interlayers having a thickness not to substantially affect the optical properties of the coating." Id.

Even though the 2001 opinion left open the question of whether sequential applications of a single material produce a layer or multiple layers, that question was later answered in the same case in a 2004 decision by the Federal Circuit. AFG, Industries, Inc. v. Cardinal IG Company, Inc., 375 F.3d 1367 (Fed. Cir. 2004). The court determined that the term "layer" was not affected by the method of creation, i.e. whether it was deposited in a single sputtering operation or in multiple operations. Id. at 1373. The court stated that the only way the multiple depositions would only be relevant was if the multiple depositions affected the structure and optical properties. Id. Thus, the court concluded that the "unitary structure of the same material that constitutes a 'layer' does not become multiple layers because the manufacturer decided to deposit it in multiple passes rather than in a single pass." Id.

Guardian's interpretation of "the composition of which is chosen to provide desired properties" comes closer to what this court believes is the proper interpretation. AFG's interpretation separates "function" and "chemical composition," whereas Guardian's interpretation meaningfully connects the two in the spirit of the patents' intent. The patent makes clear that each chemical composition is chosen for certain functions that it gives the glass and coating. AFG's interpretation simply acknowledges that each layer is comprised of a certain chemical composition and each layer also has a function without saying that one is the reason for the other.

Similar to the AFG (2004) case, this court also believes the when determining what constitutes a layer the focus should be on the layer's function as opposed to its method of production. Thus, the sputtering of multiple depositionstions would not be cause to categorize something as more than a layer unless the sputterings affected a different function. This court is not using the prior cases definitions to define the term "layer" in these patents, but the court does believe that the opinions do give this court a better idea of how a person skilled in the art may interpret the patents' claims.

LaserDynamics next contends that the term "layer" as used in the claims means "a plane on a DVD disk where information is recorded." For this definition, LaserDynamics resorted to a dictionary of computer terms. See DVD Demystified, [2nd Ed., McGraw-Hill]. Mediatics challenges this definition arguing that "because a 'plane' is a mathematical concept which has no thickness" the use of the term does not describe a product. Therefore, it argues, the Court should adopt its definition.
To adopt this definition would appear to have the effect of limiting or restricting "layer" to mean a "thin planar disk," thereby suggesting that an optical disk is composed of multi-disks. While this may appear to be a correct manner of defining "layer," the basis for inserting "planar disk" in the definition is not justified. Admittedly, a "plane," as used in mathematics, is a concept. However, its definition also embodies a product. As a product, it means "a smooth or perfectly level surface; or a part of something [a disk] having a level surface." See Webster's Twentieth-Century Dictionary, Publishers Guild, Inc (1939). It is not itself a disk but a location on a surface, or a surface itself. Id. Therefore, the Court rejects Mediamedics' definition of "layer" because it suggests a limitation that is inconsistent with the ordinary meaning of the term and its use in the claims. Texas Digital Systems, Inc., 308 F.3d at 1205.

a. '074 Patent Infringement

 Plaintiff asserts that all of Defendants' EDLC ultracapacitors infringe on the '074 Patent. Doc. No. 13 at 2. Plaintiff relies on its expert report and numerous declarations by John Miller, which contains scanning electron micrograph (SEM)/Auger experiments allegedly supporting that the accused infringing products have a primary coating of a conductive carbon, and a secondary coating of activated carbon, as recited by claim 1 of the '074 Patent. Id.

In response, Defendants dispute that its EDLC ultracapacitors meet the limitations claimed in the '074 Patent, arguing that "layers and coatings" are not synonymous. Doc. No. 47 at 8. Defendants also contend that Plaintiff's experiments are deficient because the particular technique used by Miller "is not well-suited for an examination of the structure of the ultracapacitor electrodes, as viewed in cross section." Id. at 8-9.

Determining the likelihood of patent infringement on a preliminary injunction motion requires two steps: 1) construction of the relevant claims; and 2) comparison of the construed claims to the accused product(s). Pfizer, 429 F.3d at 1372. Because of the nature of a preliminary injunction proceeding, claim construction at this stage is itself preliminary because of the incomplete record provided to a reviewing court. 1 The Federal Circuit recognizes the difficulty of claim construction at the preliminary injunction stage because of the incomplete record. See Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1374-75 (Fed. Cir. 2005), citing to CVI/Beta Ventures, Inc. v. Tura, LP, 112 F.3d 1146, 1160 n.7 (Fed. Cir. 1997); Bayer AG v. Biovail Corp., 279 F.3d 1340, 1349 (Fed. Cir. 2002); Metaullics Sys. Co. v. Cooper, 100 F.3d 938 (Fed. Cir. 1996). Because of this, a district court may issue a "tentative" or "rolling" claim construction when faced with the task of claim construction on an expedited basis. Oakley, Inc. v. Sunglass Hut Intern., 316 F.3d 1331, 1344 n.3 (Fed. Cir. 2003), citing to Jack Guttman, Inc. v. Kopykake Enters., Inc., 302 F.3d 1352, 1361 (Fed. Cir. 2002). As in any patent infringement suit, the burden lies with the patentee in establishing infringement by the accused product in a preliminary injunction motion by a preponderance of the evidence. Id. at 1340. However, if Defendants "raise[] a substantial question concerning … infringement … i.e. asserts an infringement … defense that the patentee cannot prove "lacks substantial merit," the preliminary injunction should not issue." National Steel Car, Ltd. v. Canadian Pacific Ry., 357 F.3d 1319, 1325 (Fed. Cir. 2004), quoting Amazon.com, Inc. v. Barnesandnoble.com, Inc., 239 F.3d 1343, 1350-51 (Fed. Cir. 2001).

--- Footnotes ---

1 On July 21, 2007, Defendants filed the prosecution file history for the '074 Patent as an exhibit to Michael Cima's declaration. See Doc. No. 119-3, Exh. C. The prosecution file wrapper for the '074 Patent was not submitted in conjunction with Defendants' opposition to the motion for preliminary injunction. See Doc. No. 47, filed February 1, 2007. At the evidentiary hearing, this Court permitted the parties to submit supplemental declaration regarding new evidence presented by Defendants, and for Plaintiff to submit additional evidence on this limited scope. See Rough Transcript at 95-96. The Court did not permit the parties to submit additional evidence or declarations on claim construction, especially in light of this filing occurring almost six months after Defendants' initial opposition was filed. Defendants provide no excuse for the late filing of this evidence, nor do they explain how this evidence relates to the limited scope of the evidentiary hearing regarding scanning electron micrograph technology. Accordingly, this Court will not take into consideration the prosecution file history of the '074 patent to tentatively construe the claims of the '074 Patent.
i. Claim Construction - First and Second Coatings

Defendants argue that the accused products do not infringe Claim 1 of the '074 Patent because coating and layers are not synonymous. Doc. No. 47 at 7. Defendants conclude that because it uses only one coating of a mixture of activated and conducting carbon, it does not meet the limitations of the '074 Patent. Id. In response, Plaintiff states that claim 1 of the '074 Patent is not a process claim, but a device claim. Accordingly, even if Defendants only apply its carbon slurry in one mixture, it will infringe the '074 Patent if the mixture nonetheless forms two layers, or coatings, on the aluminum current conductor. Doc. No. 66 at 3.

A review of the patent specification supports Plaintiff's construction of "coating" as including both layers and coatings.

First, Plaintiff is correct that Claim 1 is a device or product claim, and not a process or method claim. The claim, for example, describes physical properties and characteristics of the device, and not a method or process of making the device. As such, Defendants' method of applying a mixture of activated and conductive carbons, instead of as layers as taught in the '074 Patent, is irrelevant if it possesses the structural limitations of Claim 1. See AFG Industries, Inc. v. Cardinal IG Co., Inc., 375 F.3d 1367, 1370 (Fed. Cir. 2004) (A product claim covers any infringing structure "however it is made or however it is used.").

In addition, Defendants' contention that layers are not synonymous with coatings lacks merit in light of the patent specification. Claim construction requires that a reviewing court read the claims "in view of the specification, of which they are a part." Nystrom, 424 F.3d at 1142 (Fed. Cir. 2005). "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Phillips, 415 F.3d at 1316. Here, the specification repeatedly uses the terms "layers" and "coatings" interchangeably:

The first layer … is of a "conducting carbon …" '074 Patent at 7:19-20

The second layer is of an "activated carbon …" Id. at 7:32

The first layer is formed onto the surface of the current collector. Id. at 7:48

The second layer is formed onto the first layer … Id. at 7:60

The first step involves applying a first layer (or primary coating) … Id. at 9:8-9

The primary coating reduces the interfacial resistance and serves as a seed coat for a secondary coating. Id. at 9:25-26

The second layer (or secondary coating) is applied over the primary coating. Id. at 9:58-59.

As can be seen, the first layer and the second layer are coated onto the foil, with the three lanes having been cleared of the first layer and the second layer by the set of wipers. Id. at 11:37-40.

Thus, Defendants' argument that "layers" and "coatings" are not synonymous lack merit in light of the specification's interchangeable use of the terms. Accordingly, this Court construes Claim 1 as a product claim, and the disputed term "coating" to include "coatings or layers." However, as discussed, because the record is not complete, this Court is mindful that any claim construction at this stage is preliminary and tentative.

2425

"Layer 2 Forwarding Protocol Header"

"Forwarding Protocol Header"
The parties agree that these two terms should have the same construction. Cisco's proposed construction for the above terms is "initial information fields in a layer 2 forwarding protocol packet." Alcatel's proposed construction is "the header format defined in RFC 2341, entitled 'Layer Two Forwarding Protocol 'L2F',' which is illustrated in Figure 9." Both parties seem to agree that these terms relate to the parties' respective definitions for "layer 2 forwarding protocol" discussed above.

In similar fashion as the above arguments, Cisco claims that the term "layer 2 forwarding protocol header" does not require a specific header format, while Alcatel seeks to construe the term to require the header format in RFC 2341, which is identical to Figure 9. Again, both parties have taken extreme positions that are not supported by a plain reading of the patent.

The word "header" has a customary meaning in this context. As stated in The Computer Desktop Encyclopedia, "header: … In communications, the first part of the message, which contains controlling data, such as originating and destination stations, message type and priority level." Lumish Decl., Ex. M (Alan Freedman, The Computer Desktop Encyclopedia (2d ed. 1999)), at 395. 65 The particular formulation of the L2F header set forth in Figure 9 is necessary to an L2F only insofar as it satisfies the necessary features set forth above. Nothing in the patent requires that the L2F header be exactly as described in Figure 9, to the extent that another header formulation could be used to comport with the definition of "layer 2 forwarding protocol" identified above.

Therefore, the Court construes the terms "layer 2 forwarding protocol header" and "forwarding protocol header" as "initial information fields of a packet operating according to a layer 2 forwarding protocol."

Alcatel claims that the term "layer 2 forwarding protocol" 56 has no ordinary meaning, and so the Court should look to the intrinsic evidence in the patent for the meaning ascribed to the term. Alcatel argues that the "layer 2 forwarding protocol" is used in the patent to describe a specific protocol, known as "L2F." Around the same time as the filing of the '019 patent, "L2F" was presented to the Internet Engineering Task Force ("IETF") 57 by the named-inventor of the '019 patent, in a document now identified as RFC 2341. 58 Alcatel argues that RFC 2341 is substantially identical to the '019 patent, and in fact describes the identical data structure identified in Figure 9 of the '019 patent. According to Alcatel, the '019 patent was written specifically to cover the "L2F" protocol, and thus when the term "layer 2 forwarding protocol" is used in the claims, it is referring specifically to the "L2F" protocol. However, RFC 2341 is extrinsic evidence, 59 and thus while the Court will accept the reference as illustrative, the Court will not rely on this document to define the claim term unless the intrinsic
evidence fails to resolve the ambiguity as to what is meant by "layer 2 forwarding protocol."

56 Although the Court will refer to the term "layer 2 forwarding protocol," the analysis applies with equal force to the terms "the forwarding protocol" and "virtual dial-up protocol."

57 The IETF is a "large open international community of network designers, operators, vendors, and researchers concerned with the evolution of the Internet architecture and the smooth operation of the Internet. It is open to any interested individual." See http://www.ietf.org/overview.html

58 An RFC, or "Request for comment," is a proposal made to the IETF to adopt a particular approach to certain methods or systems as a standard that can be applied by engineers in the industry.

59 The patent never mentions RFC 2341. Although it is unclear whether the title "RFC 2341" existed at the time the patent was filed, there is no indication that the inventor had disclosed the existence of RFC 2341 to the Patent Office, and thus the patent and prosecution history are devoid of any specific reference to that document.

Alcatel points to several points in the specification where the patent refers to using "L2F" protocol and "L2F" related features. See, e.g., Valencia Supp., col. 2, ll. 32-34; col. 2, l. 65 - col. 3, l. 1 ("L2F header"); col. 4, ll. 9-11; col. 4, ll. 23-27 ("L2F packet") (hereinafter Valencia, at 2:32-34, 2:65-3:1, 4:9-11, 4:23-27). Furthermore, with regard to Figure 9, Alcatel argues that this is the only data structure associated with the L2F packet, and that no other data structure for implementing the L2F protocol is described in the '019 patent.

In response, Cisco argues that "layer 2 forwarding protocol" is not limited to the L2F protocol described in RFC 2341. Cisco contends that, according to its expert, one of ordinary skill in the art would be familiar with forwarding protocols generally, and that the repeated references in the claims to "layer 2 forwarding protocol" in the context of forwarding information at level 2 (i.e. the link level) "informs one of ordinary skill in the art that the forwarding protocol is forwarding information at the point to point link level which is understood to be layer 2 of the network model." Lumish Decl., Ex. J, at 4-5 ("Leifer '019 Report"). 60 Cisco admits that the term "layer 2 forwarding protocol" requires some rules for forwarding information, but argues that the patent is not limited to any specific set of rules beyond those set forth in the claim, which does not include the rules discussed in RFC 2341.

60 In contrast, Alcatel's expert disagrees with Cisco's expert that one of ordinary skill in the art would be familiar with forwarding protocols in general. See Lazar '019 Decl., at P 25. A disagreement between the experts essentially exists with regard to almost all of their pertinent conclusions. Additionally, as noted previously throughout this Order, the Court will not simply rely on expert testimony as a substitute for the Court's role in determining the meaning of the disputed claim terms, which the Court accomplishes primarily by looking to the intrinsic evidence in the patent.

Moreover, Cisco argues that the specification itself discusses "layer 2 forwarding protocol" often in a general sense. According to Cisco, when the patent uses the term "L2F," that is simply an acronym for "layer 2 forwarding protocol," and not a reference to a specific type of protocol named "L2F." See Valencia, at 1:62. Furthermore, both the summary of the invention and the claims refer to a "layer 2 forwarding protocol" instead of the "layer 2 forwarding protocol," which provides some support for Cisco's argument that "layer 2 forwarding protocol" is not limited to one particular set of rules.

61 However, the Court finds this reference to be of limited evidentiary value, since claim drafting rules would require an
inventor to refer to "layer 2 forwarding protocol" as a "layer 2 forwarding protocol" the first time it is used in the claims.

Essentially, the parties' dispute is centered over whether "layer 2 forwarding protocol" is referring to a general protocol with loosely defined rules, or a specific protocol with specific rules. Cisco contends that Alcatel is improperly seeking to limit the claim to a particular embodiment of that claim. See Electro Medical Systems, 34 F.3d at 1054. While it is certainly true that the limitations of one embodiment should not be imported into the claim term, it is also true that the claim term must be read in light of the specification. See SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340-41 (Fed. Cir. 2001). Courts have recognized that there is "a fine line between reading a claim in light of the specification and reading a limitation into the claim from the specification." Comark, 156 F.3d at 1186. Nevertheless, if a claim term is used throughout a patent in a manner which is consistent with only a single meaning for that term, then, by implication, the patent has defined the term in that manner. See Bell Atlantic Network Svcs., 262 F.3d at 1271. Thus, if the patentee has used the term "layer 2 forwarding protocol" in a manner that can only be consistent with the meaning of the term "L2F" as described in RFC 2341, then that is the definition that the patentee intended, even though it encompasses a preferred embodiment.

In light of these guidelines, the Court finds that the patent is not written in a manner where "layer 2 forwarding protocol" must be limited to only the "L2F" that was described in RFC 2341. Although the patent only describes the embodiment of a protocol almost identical to the description of the "L2F" in RFC 2341, the language of the claims and the specification do not discuss "layer 2 forwarding protocol" and "L2F" as if it were attempting to limit the term to that specific type of protocol. While the parties' experts disagree on whether a person of ordinary skill in the art could infer that "layer 2 forwarding protocol" was referring to any forwarding protocol operating from the data link layer, a plain reading of the patent does not support a conclusion that the claim language was intended to be limited to the specific type of protocol described in RFC 2341. Nevertheless, when read in light of the specification, the claim language also does not support a conclusion that "layer 2 forwarding protocol" was meant to encompass all protocols for forwarding information at the point to point link level.

Alcatel argues that "layer 2 forwarding protocol" could not have been intended to cover all protocols for tunneling 62 at the data link layer. The prosecution history demonstrates that Cisco had disclosed to the Patent Office the existence of an article that describes another type of forwarding protocol at the data link layer, known as the "Point-to-Point Tunneling Protocol" or "PPTP." See Valencia, at CLA 0240205, 0240370 (disclosing the existence of the article "Microsoft tunnels through the 'Net with new protocol" authored by Kevin Fogarty and Tim Greene). The article describes a protocol that would allow a user from a remote cite to access a private network via an internet service provider, in a manner similar to that described in claim 1 of the '019 patent, were the Court to construe the term "layer 2 forwarding protocol" as Cisco has proposed. 63 See Alcatel's Opening Markman Brief on Claim Construction Regarding United States Patent No. 5,918,019 (Valencia) ("Alcatel's '019 Opening Brief"), Ex. B; Valencia, at 15:2-12.

62 Although the Court provides an official construction of the term "tunnel" below, for the purposes of the immediate discussion, "tunneling" is understood to mean creating a path from the remote client to the home network.

63 The Court regards the contents of the article as intrinsic evidence, since the article was mentioned in the patent and disclosed to the Patent Office as part of the prosecution history. See, e.g., Zodiac Pool Care, Inc. v. Hoffinger Indus., Inc., 206 F.3d 1408, 1414 (Fed. Cir. 2000).
However, the principle that claims should be read to avoid ensnaring the prior art is simply a guideline, and not an impenetrable rule. In fact, in Apple Computer, the court acknowledged the above principle but actually construed the claim term in a manner which did encompass the prior art, since that was the only construction consistent with the claim's language and the written description. See Apple Computer v. Articulate Sys., 234 F.3d at 24 (citing Rhine v. Casio, Inc., 183 F.3d at 1345). Furthermore, unlike in Apple Computer, where the patent history indicated that the inventor had disclosed a prior art patent to the Patent Office that clearly would be covered by the broad claim construction, all that is present in the '019 file wrapper is a reference to a brief article loosely summarizing the invention in claim 1. Mere disclosure of prior art in the '019 application does not serve as an admission by Cisco that claim 1 is covered by the article under the broader definition of L2F. As Cisco points out, the disclosure of the article to the Patent Office could be viewed as an indication that the PPTP article is actually not anticipatory or obvious prior art. Moreover, an article discussing an invention is not conclusive evidence that article's invention was developed prior to the invention in the '019 patent (and, hence, is not prior art), and Cisco apparently intends to argue that the PPTP actually does post-date the inventions of the '019 patent. See Cisco's Responsive Claim Construction Brief Concerning U.S. Patent No. 5,918,019 (Valencia) ("Cisco's '019 Responsive Brief"), at 6 n.4. Therefore, the disclosure of the PPTP article to the Patent Office does not preclude a construction of the claim that would encompass at least a portion of the potential prior art, since the claims and the specification do not allow for a construction limiting a "layer 2 forwarding protocol" the specific set of rules in RFC 2341.

Therefore, neither Cisco nor Alcatel's proposed construction is correct, as both parties attempt to construe this term to an extreme position not supported by the language of the patent. In light of this lack of guidance provided to the Court by the parties, the Court has carefully reviewed the language of the '019 patent, and has determined the necessary features of a "layer 2 forwarding protocol" described in the corresponding structure set forth in the specification.

Thus, the Court construes the terms "layer 2 forwarding protocol," "the forwarding protocol," and "virtual dial-up protocol" as "rules for enabling a remote client to communicate information with a home network through an intermediary, containing the following features: packaging data at the link level frames of higher protocols; enabling multiplexing (and demultiplexing) multiple remote clients within a single tunnel; encapsulating and packaging data configured in a particular protocol (such as PPP) without regard to the information content of the encapsulated data; structuring packets of data by a layer 2 forwarding protocol header (containing information relating to the layer 2 forwarding protocol operation) and a payload containing the encapsulated data; changing none of the encapsulated data during transmission; obviating the need for authentication or address assignment from the internet service provider; containing no requirement that the remote client be queried a second time; and supporting an arbitrary request/response exchange, in that the network access server can detect the apparent identity of the user and establish a tunnel connection to the home gateway, where the arbitrary exchange can occur." 64

2778

9. an LCD display device for displaying data indicative of the picture image data of the flash memory modules n5

--- Footnotes ---

n5 The corresponding phrases are "an LCD display device for displaying data indicative of [at least part of] the contents of said [digital] flash memory module;" "a [LCD] display device embodied in said [hand-held] housing for displaying;" "said display is operable to display moving image picture data;" "displaying [moving] picture image data on an LCD display embodied within said repository device;" and "for displaying a user's digital photographs."

--- End Footnotes ---
The plaintiff argues that this phrase needs no construction. In the alternative, the plaintiff proposes "an LCD display screen for displaying data indicative of the picture image data of the flash memory module." The defendants propose "an LCD display configured to display image data that is stored on a flash memory module but is not configured to display image data that is stored on the hard disk drive." The defendants' construction includes an additional limitation not supported by the intrinsic evidence. The court concludes that this phrase requires no construction.

2428

9. LCD panel.

The court construes this term to mean "a panel of material whose reflectance or transmittance changes when an electrical field is applied to it."

2429

2. "lead frame," "external mounting frame," "paddle," "paddle support arms," and "fingers"

These five terms shall be construed together because their constructions are, to a significant extent, interrelated. The parties have jointly offered the following three proposed constructions: "lead frame" means "a frame upon which a semiconductor integrated circuit chip can be mounted that includes a paddle, a plurality of fingers, and a plurality of paddle support arms"; "paddle support arms" means "arms that support a paddle"; and "fingers" means "projecting pieces of a lead frame that are initially connected to the external mounting frame and that extend inward toward the center of the lead frame to facilitate electrical connections with a semiconductor integrated circuit chip." The constructions of the terms "external mounting frame" and "paddle" are disputed. Agere argues that the term "paddle" as used in the '269 patent should be construed as "a surface for mounting a semiconductor integrated circuit chip." Atmel argues that the term "paddle" as used in the '672 patent should be construed as "a flat surface at the center of the lead frame on which the semiconductor integrated circuit chip is mounted." The essential difference between the parties' proposed constructions is that Atmel wishes to construe "paddle" to include some reference to its relationship to a lead frame, while Agere argues that no such reference in the construction is necessary. Finally, Agere argues that the term "external mounting frame" should be construed as "that portion of the lead frame that has a plurality of fingers and which is connected to the paddle by paddle support arms," while Atmel argues that the term should be construed as "the exterior portion of the lead frame to which the paddle support arms and fingers are attached before they are severed."

Looking only at the claim language itself for an understanding of these five terms, it would initially appear: (1) that a lead frame comprises (a) a paddle, and (b) paddle support arms; (2) that the lead frame is a separate conceptual entity from, and is connected to, the external mounting frame; and (3) that the external mounting frame comprises (a) fingers, and (b) electrical connections between the chip and the fingers. See '269 Patent at col. 3:29-36 ("A semiconductor integrated circuit package comprising: a semiconductor integrated circuit chip; a lead frame, said lead frame having a paddle on which said chip is mounted and paddle support arms; and an external mounting frame having a plurality of fingers, electrical connections from said chip to said fingers, said paddle being connected to said external mounting frame by said paddle support arms …."). However, a careful reading of the specification reveals that the patentee implicitly, if not expressly, defined these terms in the following specific fashion. See Vitronics Corp., 90 F.3d at 1582 (citing Markman, 52 F.3d at 979).

According to the specification, a "lead frame" comprises not only the paddle and the support arms, but also the fingers and the external mounting frame as well. In other words, the "lead frame" comprises the entire single flat metal piece to which a chip is initially mounted. See '269 Patent at col. 1:24-25 ("The chip itself is mounted on a lead frame which has a plurality of fingers for electrical connections and a paddle for physical support."); '269 Patent at col. 1:41-44 ("the depressed positioning [of the paddle] will necessarily lead to a physical deformation of the paddle support arms during the forming process because the lead frame is initially a flat metal piece"); '269 Patent at col. 2:56-60 ("FIG. 2 is a top view of the single site … of a typical lead frame. Depicted are a lead frame site comprising an external mounting frame [labeled] 13, a paddle [labeled] 3, a plurality of fingers [labeled] 7, and a plurality of paddle support arms [labeled] 9 extending from the paddle. "). Moreover, the Court's conclusion that the patentee intended to define the term "lead frame" as comprising not only the
paddle, the support arms, and the fingers, but also the external mounting frame, is supported by the fact that both parties have proposed that the term "external mounting frame" should be defined as constituting a "portion of the lead frame." See Pl.'s Post-Hearing Brief at 38; Def.'s Post-Hearing Brief at 29.

As to the term "paddle," the Court finds that a construction which includes a reference to the paddle's relationship to a lead frame is unsupported by either the claim language or the specification. Atmel contends that such a reference is appropriate because, in practice, a paddle always exists, at least initially, within the context of a lead frame. See Def.'s Post-Hearing Brief at 28-29. Even if this contention is accurate as a practical matter, the claim language itself compels the conclusion that a person of ordinary skill in the art would understand the term "paddle" as it is used in the '269 patent to refer to the surface to which the chip is mounted regardless of whether the paddle exists within the context of a lead frame or not. A comparison of the language in claim 1 and the language in claim 6 reveals that the patentee intended to cover "paddle support arms comprising a deformation absorbing member" not only (a) within the context of a paddle that is connected to an external mounting frame and that is part of a lead frame (as described in claim 1), but also (b) within the context of a paddle that is not connected to an external mounting frame and that is not part of a lead frame (as described in claim 6). In fact, the only apparent difference between claim 1 and claim 6 is precisely this absence in claim 6 of a reference to either a lead frame or an external mounting frame. Thus, it appears that the patentee in claim 6 specifically intended to cover deformation absorbing members even in the absence of an external mounting frame, in which case, even according to Atmel's own expert witness, it would be inaccurate to say that the paddle existed within the context of a "lead frame" (since a lead frame by definition includes an external mounting frame as discussed above). See Transcript of Hearing on December 6, 2002 ("Tr. 12/6/02") at 126.

The parties also dispute the proper construction of the term "external mounting frame." Atmel contends that the construction should include a reference to the fact that the external mounting frame is typically removed at a point in time subsequent to the depression of the paddle and the mounting of the chip. Again, although it may be true as a practical matter that the external mounting frame is typically removed at some point in time during the packaging process, the Court finds no basis in the intrinsic evidence for including this fact within the definition of the term itself.

The Court finds that the jointly-proposed construction of the term "paddle support arms" as "arms that support a paddle" is consistent with the intrinsic evidence of the '269 patent. However, the jointly-proposed construction of the term "fingers" requires a slight modification in accordance with the notion, discussed above, that in the absence of an external mounting frame, the structure comprising the paddle (upon which the chip is mounted), the paddle support arms, and the fingers is not accurately referred to as a "lead frame." Thus, rather than construing "fingers" as "projecting pieces of a lead frame that are initially connected to the external mounting frame and that extend inward toward the center of the lead frame to facilitate electrical connections with a semiconductor integrated circuit chip," the Court will construe the term "fingers" as meaning "projecting pieces that are initially connected to the external mounting frame and that extend inward toward the center of what is initially the lead frame to facilitate electrical connections with a semiconductor integrated circuit chip."

In summary: (1) the term "lead frame" is construed as "the metal piece, initially flat, to which a semiconductor integrated circuit chip is mounted, and which comprises the external mounting frame, the paddle, the paddle support arms, and the fingers"; (2) the term "paddle" is construed as "the surface upon which a semiconductor integrated circuit chip is mounted"; and (3) the term "external mounting frame" is construed as "the exterior portion of the lead frame to which the paddle support arms and fingers are initially attached."

7. "lead wire extending from the package"

Claim 1 of the '919 Patent describes a "first lead wire extending from the package to enable the second end to be interconnected to a defibrillator prior to the opening of the package and use of the first electrode." Claims 12 and 17 contain similar language. Philips asserts that the "lead wire extending from" language means that the insulated wire starts inside the package, and continues through and beyond the package periphery. Cardiac Science contends that "lead wire extending from" language should be construed as "the wire is configured to enable electrical connection to a defibrillator through an unopened electrode package."
Consistent with the Court's construction of the "electrode connection means" of the '884 Patent, supra, the Court finds that the term "lead wire extending from the package" is properly construed as "the insulated wires or leads start inside the envelope and extend from the inside to the outside of the envelope."

11. "lead wires with connectors extending from the package"

Claims 1, 3, 4, and 10 of the '571 Patent describe "lead wires with connectors extending from the package." Philips asserts that this term should be construed as "a round wire covered by an electrically insulating material, such as polyvinyl chloride, and having two ends used to connect two points in a circuit, the lead wires having connectors on the end that are outside the package." Cardiac Science contends that this term should be construed as "lead wires and connectors extend from electrode package."

The electrodes are sealed in packages that must remain sealed so that the gel on the electrodes (which ultimately forms the contact with the rescue patient) does not dry out. Yet, the self-test requires electrical contact between the AED and the packaged electrodes, so that the self-test can reach the electrodes inside and determine whether electrical conductivity still exists. The lead wires and the connectors extending from the package provide this contact.

The patent specification describes the preferred embodiment as follows:

Insulated lead wires 56 extend from each electrode 50, and have a first end connected to the conductive sheet and a second end connected to connector 58. Connector 58 is configured to releasably mate with the electrode connector 32 in electrode compartment 26. Electrodes 50 are sealed within a polymer or polymer-metal laminate package 60 such as that shown in FIG. 2. Lead wires 56 and connector 58 extend from package 60.

(Id. at c. 2, ll: 50-58.) Based on this language, Philips argues that the wires extend from the package, with the connectors completely outside the package. Cardiac Science, on the other hand, asserts that the connectors may merely reach outside the package with the lead wires contained completely within the package.

The Court finds that the claim language contemplates that the connectors extend outside the package. However, the connectors do not have to "completely" extend outside the package, as Philips contends. The Court need not limit the claim construction to the preferred embodiment. Consistent with the plain language of the claim, the Court construes this term as "the lead wires and the connectors extend, at least partially, from the electrode package."

III. "plurality of Lempel-Ziv encoders"

6 The term "plurality of Lempel-Ziv encoders" is contained in claim 20 of the '937 patent.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

Plaintiff's Proposed Construction
more than one encoder, each employing a method from the Lempel-Ziv family of compression methods

Defendants' Proposed Construction
indefinite

Plaintiff contends that the term "Lempel-Ziv encoders" refers to a family of compression methods that are well-known to those skilled in the art. RESPONSE at 14--15. Plaintiff further argues that this is consistent with writings published by
Defendants' expert, Dr. Storer. Id. at 15. Defendants argue that the intrinsic records fail to describe or mention the Lempel-Ziv family of compression methods—as Plaintiff asserts this term encompasses—and that numerous encoders bear the "LZ" moniker even though they fail to relate to the original Lempel-Ziv encoders. REPLY at 7.

Claim 20 of the '937 patent depends from claim 17, which discloses:

17. A method comprising:

receiving a data stream over an input having a first bandwidth;

compressing, in at least real-time, said received data stream using a plurality of encoders to provide a compressed data stream;

transmitting said compressed data stream over an output having a second bandwidth, wherein said first bandwidth is substantially greater than said second bandwidth and said transmitting said compressed data stream effectively increases said second bandwidth; and

wherein said compressing and said transmitting of said compressed data stream over said output occurs faster than a transmission of said data stream in uncompressed form over said output.

'937 patent at 20:9-26 (claim 17). Claim 20 discloses:

20. The method of claim 17, wherein said compressing said received data stream comprises compressing said received data stream using a plurality of Lempel-Ziv encoders.

'937 patent at 20:35-38 (claim 20). Unasserted claim 4 of the '937 patent also claims compression using Lempel-Ziv encoders. '937 patent at 19:1-3 (claim 4). The specification of the '937 patent refers to "Lempel-Ziv Dictionary Compression" as a "lossless encoding technique[] currently well known within the art." '937 patent at 11:59-61; id. at 14:40-42. Otherwise, the patent is silent as to what comprises Lempel-Ziv compression. Thus, having reviewed all the intrinsic evidence, the Court finds that the term "plurality of Lempel-Ziv encoders" is ambiguous and now will address the pertinent extrinsic evidence.

It is not disputed that the term "a plurality of Lempel-Ziv encoders" includes, at least, the LZ77 and LZ78 algorithms. See RESPONSE at 14-15; REPLY at 7. The LZ77 and LZ78 algorithms are adaptive lossless compression techniques. MOTION, STORERDEC, at 6. Further, these algorithms are dictionary-based algorithms, meaning the algorithm uses a dictionary that stores a constantly changing set of strings of data represented by 8-bit characters. RESPONSE, VON HERZEN DEC., EXH. O at 330-33. 7 Further, the dictionary is essentially an associative memory for strings of data that can "learn" new strings based on the text already processed. Id. at 329. Thus, in dynamic dictionary algorithms—like LZ78—strings of data are input into the algorithm and a sequence of pointers—indices to the dictionary—are output. Id. at 331. In "sliding window" compression—like LZ77—a string of data is represented by a address of dictionary contents and sequence length. RESPONSE, VON HERZEN DEC., EXH. M. One skilled in the art would understand the term "plurality of Lempel-Ziv encoders" to refer to encoders which implement a compression methodology for dictionary-based lossless data compression, where the dictionary contains any data sequence that has already been used to build the dictionary contents; a pointer to an earlier entry in the dictionary contents indicates a data sequence; and either a combination of address to already coded dictionary contents and sequence length is stored or only an index to the dictionary is stored. Given this information, the term "plurality of Lempel-Ziv encoders" is not insolubly ambiguous.

--- Footnotes ---

7 The Court notes that Defendant Citrix Systems, Inc. filed two motions directed, at least, at excluding the opinions of Dr. Von Herzen because 1) Citrix argued that he applied the wrong legal standard in his analysis; 2) Citrix argued that Dr. Von Herzen's declaration fails to meet the requirements of Patent Rule 4-3; and 3) Citrix argued that Dr. Von Herzen's third and final declaration was disclosed late. (Doc. Nos. 258, 280). While the Court did not consider the opinions of Dr. Von Herzen in reaching its conclusions on either claim construction or the instant Motion and therefore denied these motions, (Doc. No. 371), the Court here considers Exhibits O and M attached to Dr. Von Herzen's declaration—two articles written by Dr. Storer,
Defendants' technical expert.

Further, Plaintiff has failed to show that there is a definable "family" of Lempel-Ziv encoders. Therefore, given the foregoing discussion, the Court finds that the term "a plurality of Lempel-Ziv encoders" is not indefinite and is properly construed as "a plurality of encoders which implement a compression methodology for dictionary-based lossless data compression, wherein a dictionary contains any data sequence that has already been used to build the dictionary contents, wherein a pointer to an earlier entry in the dictionary contents indicates a data sequence, and wherein either a combination of address to already coded dictionary contents and sequence length is stored or only an index to the dictionary is stored." 8

8 9 Defendants did not offer a proposed construction for this term, relying solely on the instant Motion. BLUE COAT RESP. at 14. Having resolved the dispute regarding whether this claim term is indefinite, the Court finds that it is can adequately and appropriately adopt a construction for this term based on both the parties' arguments in the briefing and at the Markman hearing.

K. "Lens" (Claims 3 - 4)

Plaintiff's Proposed Construction: A device for altering the path of electromagnetic radiation. For the apparatus of claim 3, it includes a device that has the capacity for internal reflection so that when a certain type of material (for example a fingerprint) touches the outside of the lens, at the point of touch the internal reflection is destroyed and an image of where the internal reflection is destroyed is transmitted.

Defendants' Proposed Construction: A body that has two opposite regular surfaces, at least one of which is curved, that is structured and positioned to form an image by focusing a beam of electromagnetic radiation.

The issue here is whether a lens has at least one curved surface. As with all other construction disputes, Plaintiff argues broadly that a lens includes any device used for altering the path of electromagnetic radiation. Plaintiff finds support for this construction in the specification. When referring to a lens, the specification states that a fingerprint reader "has a lens . . . which must have the capability to cause a proper refraction of the fingerprint . . . . While there are several lens that will cause such an effect, such as, magnifying lens placed in the proper location and angles, it is believed the best device for the refraction lens is a half circle." '474 Patent at 9:25-32. Plaintiff argues, therefore, that the specification contemplates the use of several suitable lenses and should not be limited to a lens with a curved surface.

As has been repeatedly stated, a claim term should be given the ordinary and customary meaning "that the term would have to a person of ordinary skill in the art in question at the time of the invention." Phillips, 415 F.3d at 1313 (emphasis added). In 1995, when the '474 Patent was filed, one skilled in the art would have understood that a lens would have at least one curved surface. Furthermore, although the specification states that "several lens" may be used, '474 Patent at 9:29-30, the preferred lens disclosed in the specification of the Patent is described as being a "half circle." Id. at 9:34-40; Fig. 1. The only other type of lens disclosed in the specification is a "magnifying lens," id. at 9:30, which would also include at least one curved surface. Therefore, one skilled in the art at the time of the invention would interpret the plain language of the claim and specification to determine that "lens," as used in Claims Three and Four, refers to "a body that has two opposite regular surfaces, at least one of which is curved, that is structured and positioned to form an image by focusing a beam of electromagnetic radiation."
8. "pricing information that is less restrictive for the same pricing type": "the pricing information that is less restrictive"

<table>
<thead>
<tr>
<th>Disputed Claim Term or Phrase</th>
<th>Versata's Proposed Construction</th>
<th>SAP's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;pricing information that is less restrictive for the same pricing type&quot;</td>
<td>Pricing information specifically applicable to an organizational group or a product group for a given pricing type.</td>
<td>For a given pricing type, the pricing information applicable to all of the same products or purchasing organizations, plus one or more other products or purchasing organizations.</td>
</tr>
<tr>
<td>&quot;the pricing information that is less restrictive&quot;</td>
<td>The pricing information applicable to a product, a purchasing organization, an organizational group or a product group.</td>
<td>The pricing information applicable to all of the same products or purchasing organizations, plus one or more other products or purchasing organizations.</td>
</tr>
</tbody>
</table>

These two disputed phrases are used in claims 1 and 17, respectively, of the '350 patent. The issue with respect to these terms is the correct interpretation of "less restrictive." Versata would read "less restrictive" to mean "less specifically applicable," while SAP would read "less restrictive" to mean "pricing information applicable to all of the same products or purchasing organizations, plus one or more other products or purchasing organizations."

As shown in Figures 4A and 4B, and as discussed in the specification, price adjustments may arise from a number of categories, both at a lower or higher level in the hierarchy and in combination with one another. A plain reading of the claims in light of the specification indicates that the patent discloses eliminating "less restrictive" pricing information, i.e., pricing information that is less specific to the purchaser or product. SAP's proposed construction is overly narrow; there is no implicit requirement that a comparison be made as to numbers of products or purchasing organizations to determine the "less restrictive" pricing information. As suggested by Versata, SAP's proposed construction does not account for time specific restrictions.

Accordingly, the court adopts Versata's construction.

16. "[L]evel of significance:" 16 "Adding an indicator to the file note for the purpose of specifying the importance of the file note, in addition to the text and topic of the file note itself." The indication of the level of significance must be separate from the content of the file note itself. Regarding plaintiffs' contention that "topic" is the same as the "level of significance," such a construction would violate the presumption in favor of claim differentiation and would effectively read the "level of significance" limitation out of the claim. This result would be especially improper insofar as the prosecution history demonstrates that the "level of significance" limitation was part of the basis for allowance. (D.I. 302 at JA000619-20)
The technology in this case relates to robotic tape storage systems. These systems consist of a pivoting mechanism, such as a robotic arm, located in the center of a roughly cylindrical housing. Shelves on the inside of the housing surround the pivoting mechanism and hold videotapes or computer data tapes. A gripper on the robotic arm can selectively remove a tape from a shelf and place it on another shelf or in a tape player/recorder. The tape storage systems are highly automated and are used in commercial settings, e.g., for playing television commercials automatically or for computer tape archiving.

The '151 patent discloses a tape handling system that uses a rotating carriage to load tapes into—and unload tapes from—a tape storage system. The rotating carriage is mounted in an opening in the wall of a tape storage library. The carriage provides access to the tapes from one side of the opening (exterior of the library) and then rotates to provide access to the tapes from the other side of the opening (interior of the library). Odetics asserts claims 8, 9, and 14 in this litigation. Claim 9 recites (emphasis added to disputed elements):

A tape cassette handling system comprising:

a plurality of tape transports;

a housing including a cassette storage library having a plurality of storage bins and at least one cassette access opening for receiving cassettes to be moved to the storage bins or to the tape transports, or for receiving cassettes to be removed from the library or from the tape transports;

a rotary means rotatably mounted within the library adjacent the access opening for providing access to the storage library, the rotary means having one or more holding bins each having an opening for receiving a cassette, wherein the rotary means is rotatable from a first position in which the opening of at least one holding bin is accessible from outside of the housing to a second position in which the opening of at least one holding bin is accessible from inside the housing; and
cassette manipulator means located within the housing for selectively moving cassettes between the rotary means, said storage bins and said tape transports.

Claims 8 and 14 are similar in all relevant respects. In particular, claim 14 recites "a housing including a storage library," and claim 8 recites "a library housing containing a storage library." In addition, claim 14, like claim 9, recites a "rotary means rotatably mounted within the library," while claim 8 recites a "loading housing rotatably carried within the library housing."

STK manufactures large tape storage systems that consist of multiple "library storage modules" linked together in a matrix-like formation. Each module is generally cylindrical and contains a pivoting robot arm, several columns of tape shelves, and tape players/recorders. Where two modules touch, they are interconnected by a Pass-Thru Port. A Pass-Thru Port is a device that has several shelves on which tapes may be placed by a central rotating gripper. A Pass-Thru Port moves from a position in which its contents can be reached by the gripper of one module to a position in which its contents can be reached by a gripper in the adjoining module. This movement is accomplished through rotation and linear translation through the wall separating the two modules. Through computerized coordination of the Pass-Thru Ports, STK's systems can track tape locations and optimize system performance, for instance, by passing a requested tape from a busy module to a module that has an available player. The infringement issue in this case concerns whether STK's Pass-Thru Ports are the same as, or equivalent structures of, the "rotary means" recited in the asserted claims.

In 1995, Odetics sued STK for direct and contributory infringement and for inducing infringement of claims 8, 9, and 14 of the '151 patent. On cross-motions for summary judgment of infringement, the district court ruled that the claims were not literally infringed, based on the court's interpretation of the term "library," which is common to all the asserted claims. The issues of validity and of infringement under the doctrine of equivalents were tried to a jury. When instructing the jury, the court defined the claim terms "library" and "rotary means rotatably mounted." The jury found the claims not invalid, but
also not infringed under the doctrine of equivalents.

Before trial, STK also moved for summary judgment of laches based on the delay between Odetics's discovery of STK's allegedly infringing products in 1987 and Odetics's filing suit in 1995. The court concluded that laches applied, but limited the defense to cover only sales and use by STK and its customers before Odetics gave STK notice of its alleged infringement, and not to post-notice use by STK's customers of machines purchased before the notice. Odetics appeals the infringement rulings and STK cross-appeals the laches ruling.

II

Determining whether a patent claim has been infringed involves a two-step examination: "First, the claim must be properly construed to determine its scope and meaning. Second, the claim as properly construed must be compared to the accused device or process." Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1576, 27 U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 1993). Odetics argues that the district court misconstrued the "library" and "rotary means rotatably mounted" claim limitations, thus affecting the findings of noninfringement. We consider each limitation in turn.

A

The district court defined "library" as a "collection . . . of places that store information, and you can have a single control or common handling system." The court apparently accepted STK's argument that the meaning of "library" is informed by U.S. Patent No. 4,654,727 (the '727 patent), a parent of the '151 patent that was incorporated by reference into the '151 patent as a description of the operation of the sequencing system and manipulator. STK had argued, in support of its motion for summary judgment of noninfringement, that the '727 patent describes a library which includes all the cassettes under common computer and robotic control in the automated system. From that description, STK concluded that the library and the control system had to be equal in their reach.

The court ruled that the library consists of whatever is covered by a common control system. The court's construction of "library" is significant because, under that construction, STK's many library storage modules would make up a single library and the Pass-Thru Ports, which merely pass tapes back and forth between individual modules, would not provide "access to the storage library," which is an express requirement of the "rotary means" in the claims. After carefully analyzing the claims, specification, and prosecution history of the patent, we conclude that the district court erred.

We begin our analysis, as we must, with the words of the claims. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620, 34 U.S.P.Q.2D (BNA) 1816, 1819 (Fed. Cir. 1995). Although the library and control system are coextensive in the embodiment disclosed in the '151 patent, the claims do not require such a relationship. Indeed, the claims do not mention the control system at all. Instead, the claims describe the tape handling system in terms of the structural relationships among its component parts. Claim 9 recites a housing that includes a library, which in turn has tape transports, storage bins, a cassette access opening, and a rotary means adjacent the access opening. Each of these objects must be arranged in the library so as to be accessible by a cassette manipulator means located within the housing. The access opening and rotary means provide access to the library from areas outside the library, and must therefore be mounted in the periphery of the library. The claims place no other limitations on the structure of the library. The claims thus indicate that a library is a distinct, enclosed space containing at least one cassette manipulator means and a plurality of storage bins accessible by the manipulator means.

We next consider the effect of the specification on the claim construction. See Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1566, 24 U.S.P.Q.2D (BNA) 1321, 1327 (Fed. Cir. 1992) ("In defining the meaning of key terms in a claim, reference may be had to the specification, the prosecution history, prior art, and other
The term "library" is found in claims 1, 6-7, 9-15 of the '057 patent and claims 1, 3-4, 6-8, and 10-13 of the '362 patent. Typhoon suggests that the term means "a collection of customizable content used by the data collection application." Defendants urge the definition is "a collection of possible responses, messages, or images used by the data collection application." The parties agree that a "library" is a collection of content that is used by the data collection application. Thus, the principal controversies surround whether the "content" is limited to "responses, messages, or images" and whether the content is "customizable."

The patents' specification describes five types of libraries: sequential, consequential, help syntax, and pictogram libraries. See '362 Patent at [57] ("Abstract"); 3:7-9 ("[D]ata collection is facilitated by using displayed help fields for each question or subject, sequential and consequential libraries, and cross-referencing of entered responses."); '057 Patent at 3:15-18 (same). "Sequential libraries are libraries of possible responses in text or pictogram form . . . ." '057 Patent at 3:20-21. Consequential libraries are similar to sequential libraries . . . ." Id. at 3:32. With respect to consequential libraries, the specification teaches that the user is able to "select[] from the displayed possible responses as described with respect to sequential libraries." Id. at 3:37-38 (emphasis added). Thus, consequential and sequential "libraries" are described in the
patent as "responses," and the "responses" are, in turn, described as having the form of a "text or pictogram."

Similarly, pictogram libraries are described as "storing graphical images of objects," and syntax libraries are collections of "standard messages that are displayed on the screen to interact with the user." Id. at 15:25-26, 34-35. Finally, the patent refers to "help libraries" with reference to a "help function" described as "messages or text relating to each one of the questions on the data collection screen." '057 Patent at 14:49-51 (emphasis added). These libraries exist so that when a user initiates the help feature "text will pop up on a window and explain, for example, the nature of [what] the answer should be." Id. at 14:54-55.

Thus, Defendants are correct that the specification defines libraries specifically as either responses, messages, or images. Importantly, Typhoon concedes that the patents specifically describe libraries as "responses, messages, or images." See Typhoon's Opening Brief, Docket No. 340 at 22. Typhoon does not suggest, or point to any intrinsic or extrinsic evidence concerning what kind of "content" the term "libraries" would encompass besides the definitions specifically given in the specification and recited above.

Finally, the claims themselves use the word "content" to describe all outputs displayed on the screen of the disclosed devices. See id. at 31:19-22 ("an application generator for generating said data collection applications and for creating different functional libraries relating to said contents and formats displayed on said screen"). If content is the visible result of the interaction between data collection applications and libraries, then the definition of "libraries" must be something less broad: i.e., responses, messages, or images.

Typhoon also argues that libraries should be defined as "customizable." For the same reasons discussed for the term "application generator," the word "customizable" is inappropriate for describing "library." The patents' claims specify that a user can "create" libraries and introducing "customize" into the definition of "library" would only add ambiguity to the definition without clarifying anything about the scope of the term. Accordingly, "library" is defined as "a collection of possible responses, messages, or images used by the data collection application."

E. "virtual media asset library"

Claim 7 of the '704 patent states in part: "a virtual media asset library for storing a reference to a plurality of media assets" and "a media asset portability application that enables the user to access the plurality of media assets referenced in the virtual media asset library." Apple argues that "virtual media asset library" should be defined as "the functionality at the portal that allows for synchronization and replication of a user's licensed assets with each of the user's media player devices." In support of its construction, Apple points to the following passage from the specification: "The portal [] allows for synchronization and replication of a user's licensed assets with each of the user's media player devices." In support of its construction, Apple points to the following passage from the specification: "The portal [] allows for synchronization and replication of a user's licensed assets with each of the user's media player devices." This functionality is hereinafter referred to as the virtual media asset library." (704 patent; 3:22-25) (emphasis added). According to Apple, the specification explicitly defines "virtual media asset library," and as such, that definition controls. See Martek Biosciences Corp. v. Nutrinova, Inc., 579 F.3d 1363, 1380 (Fed. Cir. 2009); Phillips, 415 F.3d at 1321.

Zapmedia contends that this term means "a collection of 'media assets' as data files." According to Zapmedia, the ordinary meaning of asset library relates to storage, not synchronization and replication. The plaintiff also contends that the specification provides an alternative definition of "virtual media asset library": "The user's virtual media asset library represents an intersection of the media assets in the master media library database [] and those assets that the user has licensed rights to." (704 patent; 10:53-56) (emphasis added). Finally, Zapmedia argues that in the context of the claim language, i.e., "a virtual media access library for storing," this term refers to a repository, not software functionality.

Based upon the specification and claims, "virtual media asset library" is described as having two distinct characteristics. Therefore, the court defines this term as "a repository of media assets to which the user is licensed and functionality that allows synchronization and replication of the user's licensed assets with each of the user's media player devices."
5. LICENSE

Again, Plaintiff and Defendants split along the lines of common meaning versus how the word is used in the specification of the '297 Patent. As with "computer" and "association," nothing in the specification convinces the Court that the word "license" was used by the inventors in an idiosyncratic fashion requiring deviation from common usage. Here, common usage is not determined by reference to the field of computer science because "license" is a legal term rather than a computer term. Nor however shall the Court turn to any specialized legal reference source; "license" is commonly used in ordinary parlance, and the constitutional purpose of placing Patents in the public domain is not to communicate with lawyers, but to teach a new invention to the world. Consequently, reference to Webster's Ninth New Collegiate Dictionary is once again appropriate.

Relevant entries for "license" include "a permission granted by competent authority to engage in . . . an activity otherwise unlawful," and also "a document, plate, or tag evidencing a license granted." The salient distinction between the definitions is that the first refers to the abstract concept of permission while the second refers to the physical representation which evidences that permission. Here, there appears to be no dispute that the license at issue must exist in some physical form (e.g., a certain configuration of binary options in digital memory), which could be called "information," and the Court agrees with the parties on that score. The dispute arises over how narrowly the Court should define the type of information which constitutes a license. Plaintiff’s position, essentially consistent with the dictionary definition, is that the word means "information representing authorization from a computer application program vendor permitting use of an application program." Defendants argue that the term should be more narrowly limited to mean "license-specific information, including at least the expiration date," claiming that this more limited construction is required by the Patent specification.

Once again, Defendants’ importation of limitations from the specification is not justified. The particular embodiment of the license within the specification does not amount to peculiar usage indicating that the drafter of the Patent was acting as his own lexicographer. The license referred to in Fig. 2B of the specification appears to consist of an expiration date, and "in use" indicator and a unique identification number (UID). However, it is apparent that these items of data are utilized in the described embodiment to represent authorization to do that which would otherwise be unauthorized, in other words, the word "license" is used in the specification in its ordinary sense, notwithstanding that usage in the context of a particular embodiment is necessarily limiting.

Further, even Plaintiff’s contextual limitation that a license must be "from a computer application vendor for the use of an application program," is unnecessary. This added meaning attempts to pack into the definition of "license," information which is already present in each relevant claim by virtue of other language. For example, Claim 1 refers to "an available license for that program."

A LICENSE is information representing authorization.
A LICENSE POOL is one or more LICENSE(s) collected together, as in a LICENSE FILE.

2. LICENSE STORAGE KEY

The term "license storage key" is not used in the '297 Patent specification, nor is it used other than in the first two claims. Instead, the '297 Patent specification describes "license files, and the other claims of the Patent refer to "license file means . . . for storing." The jarring presence in the '297 Patent of the "license storage key" phrase is the result of the wholesale assimilation of the first two claims of the '297 Patent from a competing patent in an interference proceeding. The first two claims in the '297 Patent began their existence as claims 19 and 23 in U.S. Patent Number 4,924,378 (the '378 Patent).

There is no plain meaning in the art for the term "license storage key," and this term does not appear in the '297 Patent except in Claims 1 and 2. Potentially permissible interpretive aids include, in regressing order of immediacy, the claims themselves, the specification of the '297 Patent, the interference proceeding between the application which underlies the '297 Patent and '378 Patent, the claims of the '378 Patent, the specification of the '378 Patent and the prosecution history of the '378 Patent. Plaintiff prefers an interpretation of "license storage key" which it believes is supported by documentation from the interference proceeding, and also certain language quoted from the specification of the '378 Patent.

Plaintiff first cites to the record from the interference proceeding, and in particular to the declaration of Erwin L. Rehme, one of the inventors listed on the '297 Patent. Rehme defines "license storage key" as a "keyfile which keeps number [sic] of licenses, and temporary files at nodes where program [sic] is run." Plaintiff also cites to a portion of the '378 Patent where "license storage key" explicitly is referred to as "a computer device which essentially contains memory space for storing an indication of how many licenses are available for any given application program and for storing assignments of licenses." ( '378 Patent Col.3 lns. 22-26).

However, a useful interpretation of the disputed term (which is not inconsistent with the portions of the prosecution history just described) can be gleaned from its context within the language of the claims, therefore the Court need not look further. 7 Specifically, in Claim 1 licenses are alluded to as being transferrable from one license storage key to another. Thus, context indicates that a license storage key must be capable of holding at least one license. We therefore know that a minimum definition of license storage key will include that it must be capable of storing at least one license.

--- Footnotes ---

7 Indeed, construction which relies upon the language withing the '297 Patent is inherently preferable. Ultimately, Claims 1 and 2 must constitute some sort of meaningful disclosure in the context of the '297 Patent itself if they are to live up to the constitutional justification for their existence i.e., if they are "to promote the progress of science," (U.S. Constitution Article I § 8 Clause 8).

--- End Footnotes ---

Further, in Claim 1, computers are said each to be associated with one license storage key (although the reverse relationship is not necessarily implied). Defendants point out that this limitation narrows the potential corresponding structures in the specification to one which is described as a "license file." Defendants argue that the limitations inherent to the "license file" in the specification, including the necessity that it exist in a permanent peripheral storage device (such as a hard disk) and that its contents be limited to specific fields (e.g., expiration dates of licenses) also should be attributed to the definition of "license storage key." In the Court's opinion, the wholesale transfer of limitations from the specification is not warranted where, as here, means-plus-function drafting is not at issue. The Court further declines to define "license storage key" in greater detail than is supported. Consequently, term will be defined as follows:

A LICENSE STORAGE KEY is memory in a device or alternatively a device containing memory, capable of storing at least one LICENSE.
Claims 1, 7, 12, and 15 refer to a "licensing component." The analysis of this phrase is analogous to that of "download component," and its interpretation must be consistent. A "component" is a constituent part or element. To "license" is to permit or authorize especially by formal license. Together, these terms imply a part that licenses. While the Court finds that there is no "ordinary meaning" to the phrase as is known by one of skill in the art, the combination of these two words in such a fashion produces an ordinary result. A "licensing component" is a part that coordinates or requests the licensing of information or products. The phrase implies action or the presence of an active constituent part. In computer programming, such an active part is an executable file or program. Thus, based on the claim language, the Court finds that the "licensing component" must include an executable file or program. This interpretation is consistent with the claim language and the patent specification. '124 Patent, 4:27-32, 5:15-20, 7:62-67, 9:50-54, 9:60-10:2, 10:14-18, 10:33-36, 10:51-55, 17:38-18:22.

On the other hand, nothing in the claim language, specification, or prosecution history mandates an interpretation that the "licensing component" be merchandise-specific. Although the specification discloses an embodiment that appears to be merchandise-specific, the claims are not limited to the specified embodiment. To add a limitation of merchandise-specificity would be to improperly import limitations from the specification.

Plaintiff argues that the phrase "in lieu of," as used in claim 1 of the 948 patent, should be read to mean "instead of." Defendants maintain that "in lieu of" means "completely replacing." Defendants' reading would require that no element of the originally provided program remain after the transfer of the preprogrammed memory from the adapter module to the ECM. Mr. Lundell takes a less restrictive approach, agreeing with Plaintiff and advocating the following interpretation: "in place of or instead of control provided by all or part of said originally provided program." As noted above, the Court prefers a claim construction that does not exclude the specified embodiments. Because Mr. Lundell's reading permits all of the embodiments set forth in the patent, the Court adopts his construction.

The next two disputed terms appear together in various claims of the '289, '618 and '120 Patents. For example, Claim 22 of the '289 Patent claims a business office device that includes "a memory which stores static state data including data which does not change over a life of the business office device." '289 Patent, Claim 22. The parties primarily dispute the meaning of the "life of the business office device."

Relying on the expert opinion of Adams, Ricoh asserts that the claim term refers to "the period of time the manufacturer intends the device to be deployed." (Chart at 25). Ricoh argues that from the perspective of an engineer, and based on the context of the patent, "the design objective of the static state data is met so long as other modules of a device or other devices can rely on the fact that the data will not change during a particular deployment of the device." (Ricoh Reply at 21). In contrast, Pitney argues that in the context of a consumer product, "life of the device" typically refers to the "time the business office device is created to the time it is scrapped." (Chart at 25; Tr. of Markman Hr'g at 57:6-20). Pitney further argues that there is no nothing in the intrinsic evidence that would support importing a temporal limitation in the definition.

The Court is again being asked to construe a claim term which the patentee fails to reference in the specification. Thus, the Court is left to make its determination based on the information provided by the parties -- namely, a general dictionary.
definition of "life," i.e. "the period from birth to death," (Pitney Br. at 37) (citing MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 672), or the expert declaration of Adams. Both sources fall into the less reliable category of claim construction tools -- i.e., extrinsic evidence. Mindful that the Court must construe the term in the manner a person of ordinary skill in the art would understand the term after reading the patent, in this case the Court will attribute greater weight to the expert declaration, rather than the general dictionary definition of "life" since the dictionary definition is one that is detached from the context of the specification.

Adams explains that a person of ordinary skill in the art would understand the "life of the device" to mean "the time the manufacturer intends the device to be deployed" since the design objectives are met every time a device is "remanufactured and given a new identification or model number, and [] then redeployed as a new device." (Declaration of Adams PP54-55). The Court finds nothing in the intrinsic evidence to contradict this proposition. Thus, the Court is persuaded by Adams' opinion and therefore adopts Ricoh's proposed construction. Accordingly, "life of the device" means "the period of time the manufacturer intends the device to be deployed."

2. Claim Construction of "Light"

1. Claim Language

The first place to start the claim construction is with the language of the claim itself. The term "light" is used throughout the '454 Patent but the primary claim language can be found in Claim 1. Specifically, limitation (c1) of Claim 1 states "a stationary light source capable of generating a light beam directed towards the wafer from a side of the wafer contacting the polishing pad." ('454 Patent, Col. 16, lines 32-34).

Plaintiff argues that there is no ambiguity as to the meaning of the terms "light," "light source," and "light beam" and that the term "light" encompasses both laser light and broadband light. Defendants argue that the term "light" in the patent refers only to light from a laser. Defendants do not address the issues of claim language but instead rely heavily on imputing the restriction from the specification into the claim language.

In analyzing the language of the claim, the Court must determine what a person of ordinary skill in the art would understand the term "light" to mean. The ordinary and plain meaning of the term "light" is broader than, and not limited to, a laser. A lay person would also understand that a light source is not restricted to only a laser. Defendants have completely ignored that "light" has a "widely accepted meaning" that is readily apparent even to lay judges which would not require the court to look at the written description in the specification. Phillips, 415 F.3d at 1314. ("In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood terms.").

3 While the Court determined that there was not a need for expert testimony, it is telling that Defendants' expert witness, Dr. Gutmann, conceded that no ordinary person of skill in the art would ever have understood the ordinary meaning of "light" to be limited to "laser." (Gutmann Tr. 36:2-7).

In addition to the plain language of the claims themselves, it is also important to note key differences between related claims. Claim differentiation can be a "useful guide in understanding the meaning of particular claim terms." Id. at 1314-15.
The terms "light" and "laser" are used in the '454 Patent in different claims to mean two different things. Independent Claim 1 defines the apparatus to be used with a light source. Dependent Claim 8 specifically delineates the type of light to be used for Claim 1 as a laser source: "[t]he apparatus of claim 1, wherein the light source comprises a laser and the light beam is a laser beam." ('454 Patent, Col. 16, lines 62-63). This particular limitation "gives rise to the presumption that the limitation in question is not present in the independent claim." Id. Additionally, independent Claim 9 describes "generating a light beam." ('454 Patent, Col. 17, line 4). However, dependent Claim 11 describes "the method of claim 9, wherein the step of generating a light beam comprises generating a laser beam." ('454 Patent, Col. 17, lines 17-18).

By construing the term "light" in Claims 1 and 9 to constitute a "laser," the Court would render Claims 8 and 11 superfluous and redundant. Comark Commun. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) (quoting Tandon Corp. v. U.S. International Trade Com., 831 F.2d 1017, 1023 (Fed.Cir.1987)) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant.")

2. Specification

The Court must also look at the specification to determine the proper construction of the claim language. The '454 Patent specification clearly expresses that the embodiments shown and described in the figures were "preferred embodiments":

"Preferred embodiments of the invention will now be described with reference to the drawings." ('454 Patent, Col. 6, lines 25-29).

"Figure 2 depicts a portion of a CMP apparatus modified in accordance with one embodiment of the present invention." ('454 Patent, Col. 6, lines 29-30).

Summary section states that "the present invention is directed to a novel apparatus and method for endpoint detection which can provide this improved accuracy. The apparatus and method of the present invention employ interferometric techniques for the in-situ determination of the thickness of material removed or planarity of a wafer surface, during the CMP process." ('454 Patent, Col. 2, lines 46-51).

(emphasis added).

In Liebel-Flarsheim, the court stressed the inherent tension between determining whether a statement is a clear lexicographic definition or a description of a preferred embodiment. 358 F.3d at 905. "The problem is to interpret claims 'in view of the specification' without unnecessarily importing limitations from the specification into the claims." Id. The court in Liebel-Flarsheim found that even though the written description of the invention was narrow, the claim language was sufficient to maintain a general interpretation. "Even when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Id. at 906 (internal quotations and citations omitted).

Defendants are seeking to do expressly what Phillips cautioned against: using the specification to import limitations into the claims. The Phillips court recognized that sometimes there is a "fine line between reading a claim in light of the specification and reading a limitation into the claim from the specification." Id. at 1323 (citing Comark Commun. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed.Cir. 1998). However, the court focused on several examples that go directly to the matters in this case:

For instance, although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments. In particular, we have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment. That is not just because section 112 of the Patent Act requires that the claims themselves set forth the limits of the patent grant, but also because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments.

Id. at 1323 (internal citations omitted).
The specification only deals with the "preferred embodiment" and nothing in the written description uses the term "light" in a manner inconsistent with its ordinary meaning.

3. Prosecution History

Next, the Court must look to the prosecution history "to determine whether it contains statements that narrow the scope of the claims." Phillips, 415 F.3d at 1317. During the prosecution of the patent, parties may make statements that clearly restrict the scope of the patent. "This may occur, for example, when the patentee explicitly characterizes an aspect of his invention in a specific manner to overcome prior art." Id. (internal citations omitted). During the prosecution of the '454 Patent, there is no evidence that Plaintiff made any explicit disavowal of scope during prosecution. The prosecution history actually shows that Plaintiff sought to increase the scope of the '454 Patent by changing several instances of the term "laser" to "light." These changes are clearly delineated. For example:

. On March 26, 1997, in an Amendment, the term "laser beam" was replaced with "light beam" in Claim 1. Remarks section points out that the patentees have "amended the claims to more particularly point out and distinctly claim the invention." Patent Office reviewed the Amendment and allowed the relevant new claims.

. The original Claim 1 was cancelled and added a new proposed Claim 45 that dropped requirement of laser and instead used an "interferometer which generates a light beam…"

. Dependent Claim 47 further required that it be a "laser interferometer" and that the light beam "is a laser light beam"

. In a Preliminary Amendment - in 22 different claims, "laser" terms were crossed out and replaced with the word "light."

Plaintiff argues that these changes show that the Patent Office examiners and inventors understood that the terms "light," "light source" and "light beam" were not being restricted to lasers. Defendants argue that the examiners did not understand the nature of the changes in the claim language because there is no affirmative showing by the Patent Office to suggest a broader claim scope for the word "light." Essentially, Defendants argue that the examiner "simply reiterated the claim language without commenting on its meaning" and that the examiner was, in essence, silent as to the broader meaning of the word "light." (Def. Claim Construction Mem. at 16). While the Court does not find that the prosecution history clearly explains that the examiners were in agreement with the inventors as to the effect of the changes, the Court must presume that the Patent Office examiners have done their job. There is no basis to conclude that examiner failed to understand and agree to proposed changes. Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1327 (Fed. Cir. 2003) ("We must presume the examiner did his job, and if he truly thought that the specification taught or enabled only the use of exogenous DNA, the asserted claims would not have issued."). Therefore, the changes that were accepted by the office must have been considered and found to be sufficient.

4. Extrinsic Evidence

Because the Court finds that the claim language is clear and supported by the specification and prosecution history, there is no need to consider extrinsic evidence. However, in keeping with Vitronics and Phillips, the Court finds it appropriate to use the dictionary to define the term "light." Phillips, 415 F.3d at 1324 ("Nor is the court barred from considering any particular sources or required to analyze sources in any specific sequences, as long as those sources are not used to contradict claim meaning that is unambiguous in light of the intrinsic evidence."). Merriam-Webster dictionary defines light as "electromagnetic radiation of any wavelength and traveling in a vacuum with a speed of about 186,281 miles (300,000 kilometers) per second; specifically: such radiation that is visible to the human eye." (emphasis in original). Defendants argue that it is inappropriate to use dictionaries. However, the Court is not attempting to use a dictionary definition in place of analysis of the intrinsic evidence. The dictionary definition is to be used to provide a working definition of a commonly understood word. This definition does not "contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584.

The Court finds it problematic that Defendants wish to restrict the term "light" to "laser" based only on the specification. Defendants interpret Phillips too narrowly and ignores the plain meaning of the claim language. The court in Phillips emphasized the importance of the specification but not at the expense of the ordinary and plain meaning of the claim language. The plain and ordinary meaning of the word "light" is clear to a lay person and is not restricted to only light from
a laser source. The specification and prosecution history also provide support that Plaintiff had no intention of restricting the term to only include laser light. "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Id. at 1316. Accordingly, the Court FINDS that the term "light" as defined in the '454 Patent is the spectrum of electromagnetic radiation which can be seen by the human eye and is not limited to lasers.

The plaintiff proposes "an elongated device attached to a motorized vehicle for producing warning light signals that identify the vehicle as an emergency or utility vehicle." Defendants propose "an elongated base, two or more warning signal lights, a cover protecting the warning lights and associated structure for mounting to a vehicle." The parties agree that the construction should include "elongated" to distinguish from hemispherical warning signal lights.

The plaintiff argues that the specification discusses light bars as emergency lights seen on police cars, fire trucks, and ambulances. '269 patent, 1:11-14; '865 patent, 1:13-16. In addition, the plaintiff argues that Defendants' construction narrows the phrase to a specific embodiment by requiring a cover.

Defendants argue that every depiction of a light bar includes a cover and that a light bar is clearly an assembly of components with a cover to protect the warning signal lights and other internal components. See '269 patent, Fig. 1 and Fig. 2, 7:12; '865 patent, Fig. 1 and Fig. 2, 13:2. Defendants also argue that there is no reason to limit "light bar" to a particular function. Finally, Defendants point to the prior art referred to in the Background of the Invention section of the patents-in-suit, specifically the Jincks patent, which discloses light bars with a cover.

The Court agrees with the plaintiff that nothing in the claims or specification requires the limitation of a cover. The Court will not import limitations from a preferred embodiment into the construction of claims. Accordingly, "light bar" means "an elongated device attached to a motorized vehicle for producing warning light signals." The Court incorporates by reference its definition of "warning light signals."

The Court agrees with the plaintiff that nothing in the claims or specification requires the limitation of a cover. The Court will not import limitations from a preferred embodiment into the construction of claims. Accordingly, "light bar" means "an elongated device attached to a motorized vehicle for producing warning light signals." The Court incorporates by reference its definition of "warning light signals."

The Court agrees with the plaintiff that nothing in the claims or specification requires the limitation of a cover. The Court will not import limitations from a preferred embodiment into the construction of claims. Accordingly, "light bar" means "an elongated device attached to a motorized vehicle for producing warning light signals." The Court incorporates by reference its definition of "warning light signals."

Claim 18 of the '714 Patent contains the term "light pipe." Cheetah contends that the term means "an optical fiber or waveguide," while Mitsubishi contends that it means "fiber-optic line." The parties disagree whether the term "light pipe" is limited to a fiber-optic line.

Cheetah asserts that the Patent Office construed the term in a broad manner not limited to fiber optics when applying the prior art and that the term "waveguide" encompasses this broader interpretation. Cheetah also asserts that those skilled in the art consider the term to include both fiber and optical waveguides. Mitsubishi counters with its own extrinsic evidence arguing that "light piping" is commonly understood to mean the use of optical fibers.

Although portions of the specification describe the use of optical fiber, the specification does not provide further emphasis on the importance of fiber versus other alternatives, nor does it provide clear guidance that the invention should be limited to fiber. See '714 Patent, col. 20:31-39, col. 21:6-10. Also, the less significant extrinsic evidence cited by the parties appears
conflicting at best. See Phillips, 415 F.3d at 1317 (stating that "while extrinsic evidence can shed useful light on the relevant art, . . . it is less significant than the intrinsic record in determining the legally operative meaning of claim language" (internal citations omitted)). Finally, as Mitsubishi argues, the term "waveguide" is wholly absent from the intrinsic record. Accordingly, when looking at the intrinsic record as a whole, the Court construes the term "light pipe" to mean "conduit for transmitting light, for example, a fiber-optic line."

A. "light signal"

This term appears in all of the independent claims. The plaintiff proposes "signal produced by selectively activating one or more light sources according to a timing pattern." Defendants propose "a light emission that conveys information." The main disputes revolve around two areas - 1) whether a timing pattern is required, and 2) whether "light signal" conveys information.

The plaintiff contends that the specification and claims repeatedly describe light signals in terms of timing patterns, such as flashing, oscillating, revolving, etc., and sequences or intervals. See '269 patent, 3:36-39, 2:10-12, 4:61-62; '578 patent, claims 24-32, 36-44. The plaintiff also contends that the specification and claims explain that light signals are produced by selectively activating light sources. See '269 patent, 4:23-24, 5:2-65 (light signals created by "selectively activating" light sources or LEDs). The plaintiff argues that Defendants' proposed construction is too narrow because it would not cover a warning signal that does not convey information. The plaintiff also argues that Defendants' proposed construction is too broad because it would cover message boards that convey information but do not produce warning light signals (e.g., "Congestion ahead"). According to the plaintiff, the specifications make it clear that "message" or "images" are not "signals." See '269 patent, 4:36-41 (listing types of signals, but not referring to "message" or "images" as signals). In addition, the plaintiff contends that, according to the inventor's deposition, the invention only covers warning signals that flash, oscillate, revolve, etc., and not panels carrying messages or images. Finally, the plaintiff argues that "messages" were clearly disclaimed in the prosecution history when the patentee stated that there would be no motivation to combine the prior art of vehicle warning lights and modular message boards. '189 application, Sept. 5, 2001 Amendment, at 11-12.

Defendants contend that the phrase is used broadly in the patents and, therefore, should be given a broad construction according to its ordinary meaning. Defendants argue that the specification does not refer to a timing pattern, but explicitly states that "light signals" provide information. '269 patent, 6:4-18. In addition, Defendants point out that the specification refers to some light signals as a "constant light signal" or a "stationary light signal," which do not require a timing pattern at all. Defendants argue that the plaintiff erroneously assumed that warning light signals do not convey "information," and that the patents include message boards within their scope. Furthermore, Defendants argue that the patentee, in distinguishing prior art, stated that "light signals . . . could be that of a stationary loght, a strobe light, a revolving light, or warning signals which could appear as symbols, characters, or arrows." '871 application, Dec. 16, 1999 Amendment, at 15. Finally, Defendants argue that the dictionary definition of "signal" (e.g., "an object placed to convey notice or warning") also supports their proposed construction. See Webster's International Dictionary (2d ed. 1956).

The Court agrees with Defendants that "light signal" should not be limited to "timing patterns" because some signals do not require timing patterns (e.g., constant light signal). The Court also agrees with the plaintiff that "light signal" should not be expanded to "conveying information." In the prosecution history, the patentee disclaimed modular message boards. See '189 application, Sept. 5, 2001 Amendment, at 11-12. Defendants' proposed construction that a light signal "conveys information" would encompass the disclaimed message boards. Accordingly, "light signal" means "light sources activated to notify or warn."

B. Light Sources

The Court, in reviewing all of the evidence submitted, finds that the term light sources in the context of the claims and
specification is limited to light-emitting diodes and their equivalents.

2450

B. "A light transmission element attached to the light device"

According to Yanova, pursuant to the prosecution history and the ordinary meaning of the phrase, "a light transmission element attached to the light device" should be construed as:

An element that transmits the light from the light device outside the periphery of a confection to a point interior to the periphery of the confection, that element being attached to the light device at one end and the edible confection at the other end.

Yanova Memo at 15. Conversely, Defendants contend that Yanova's definition impermissibly limits the ordinary meaning of the phrase and should be construed as:

[A] part of a composite entity that allows light to pass or be conveyed to the "light device."

Def's Memo at 13.

The term "a light transmission element attached to the light device," consists of three additional terms, (i) "transmission," (ii) "element," and (iii) "attached."

First, "transmission" means "an act process or instance of transmitting," "to cause or allow to be spread" and "to cause to pass or be conveyed through space or a medium [or] to send out (a signal) either by radio waves or over a wire." Webster's II New Riverside University Dictionary (1994). The root of the word transmission is "transmit." Transmit, as defined by American Heritage Dictionary, Fourth Edition (2000), means "to cause to spread; pass on."

Accordingly, it would be inapposite to limit the terms to include only the transmission of light from a point outside the confection to inside the confection. Consistent with the plain meaning of "light device," see supra at 3, "a light transmission element attached to the light device" in the asserted claims of the patents-at-issue is construed to mean:

[A] part of a composite entity that allows light to pass or be conveyed to the light device.

2451

1. "limit circuit"

Claim 20 of the '054 Patent describes "a limit circuit." Cardiac Science asserts that this term should be construed as "a circuit, disposed between the storage circuit and the steering circuit, to limit delivery of therapeutic electrical energy from the storage circuit to the steering circuit." Philips, on the other hand, proposes that "limit circuit" should be construed as "a circuit, disposed between the storage circuit and the steering circuit, that enables the protection circuit to limit delivery of the therapeutic electrical energy from the storage circuit to the steering circuit." Thus, the only dispute is whether the limit circuit enables the protection circuit, as Philips contends.

The Court disagrees with Philips' construction. Claim 20, the only asserted claim that uses the term "limit circuit," does not include a protection circuit. Figure 3 depicts one embodiment of the limit circuit as separate from the protection circuit. ('054 Patent at sheet 3, Fig. 3; c. 6, ll: 20-22, 29-47.) The Court finds that "limit circuit" is properly construed as "a circuit,
The parties have presented the terms "consumable participation key" and "limits on use" to the Court for construction. "Consumable participation key" appears in Claim 51 of the '309 patent and reads in context "qualification structure controlled by said record structure for testing caller data signals provided by a respective one of said individual callers to specify a consumable participation key for restricting the extent of access to said system to limit data stored from said respective one of said individual callers on the basis of entitlement." The term also appears in Claim 65 of the '863 patent and reads in context "qualification structure for testing caller data signals provided by at least one of said individual callers to specify a consumable participation key, said consumable participation key for use during a single predetermined period of time for restricting the extent of access to at least a portion of said system by said one of said individual callers on the basis of entitlement."

The term "limit on use" or "limits on use" appears in Claims 33, 44, and 93 of the '707 patent and Claims 79 and 190 of the '863 patent. Claim 33 of the '707 patent recites in part a "qualification structure controlled by said record structure for testing said calling number identification data to specify a basis for entitlement defining a limit on use, for restricting the extent of access to said system for a respective one of said certain of said individual callers. . . . An analysis control system according to claim 26, wherein said limit on use relates to a dollar amount." The other claims in which "limits on use" appears are substantively the same; Claim 44 of the '707 is representative and reads "providing products carrying participation numbers specifying limits on use to entitle individual callers to access said operations of the interface with said telephonic communication system."

The parties agree that "consumable participation key" should be defined as a number or word that allows a caller access to a service or part of a service a predefined limited number of times and which cannot be refreshed or recharged. While the ordinary meaning of the claim language gives some indication of the meaning of "consumable participation key," the specification makes it clear. In Column 9, lines 31 through 35 of the '707 patent, the specification provides that "for example, a list may be preserved by a use-rate calculator to implement a consumable key operation. That is, a user is qualified to a specific limited number of uses during a defined interval." The parties disagree, however, on the meaning of "limits on use." The plaintiffs argue that "limit on use" means "a control imposed on the degree or extent to which callers may avail or utilize a service or one or more operations of a service." (Pls.' App. at 74). The plaintiffs contend that a limit on use can be any one of a range of restrictions including "limits based on the total number of permitted accesses, the time of day for permitted accesses, limits on use based on a dollar value, [and] limits on use based on a predetermined period of time." (Pls.' App. '75-76). The defendants argue that this term has the same meaning as consumable participation key in that it is a control on the number of times a caller may enter a format in the Katz system. The defendants agree that a limit on use can be fixed by a set number of uses or a set dollar amount. However, the defendants argue that a limit on use does not perform a metering function in that it does not effect the duration of access to a format; consequently, it cannot disconnect a caller during a format for exceeding a set period of use.

The place to begin is the claim language. Claim 33 of the '707 patent provides for a limit on use that relates to a dollar amount. The plaintiffs argue that this Claim clearly shows that limit on use is not restricted to only the number of calls or accesses into the system. Although this claim does not explicitly recite that the limit on use would be a duration of time linked to the set dollar amount, e.g. $ 10.00 limit at $ 2.00 per minute, it does not explicitly recite that the dollar amount could only be linked to a set number of accesses, e.g. $ 10.00 limit at $ 2.00 per access.

The defendants argue that the limits on use are used to qualify callers for access to the operations of the interface, which necessarily has to occur before the caller enters into the Katz system. However, claim 44 of the '707 patent provides for a further step of "invalidating on-line said participation numbers after said limits on use specified by said participation numbers are reached." This claim calls out a step of utilizing the limit on use at a later point in the process after the qualification step.
The specification confirms that "limit on use" should not be restricted to set number of accesses to the Katz system. In Column 12, lines 52-57 of the '707 patent, Katz describes how a calling number may be "checked by the use-rate calculator to determine the number of times it has been used in excess of a predetermined number of calls or dollar value to participate in the lottery during a current interval of monitoring." (emphasis added). Similarly, in Column 12, lines 22 through 26 of the '707 patent, Katz describes how a lottery format may use a limit on use and states that "for example, a person might be entitled to play the lottery a limited number of times or to the extent of a limited dollar value during a predetermined interval." (emphasis added).

Contrary to the defendants' assertion, the Court concludes that Katz does not equate all limits on use to consumable participation keys. In Column 9, lines 32 through 35 of the '707 patent, the specification provides that "a list may be preserved by a use-rate calculator to implement a consumable key operation. That is, a user is qualified to a specific limited number of uses during a defined interval." The use of the phrase "limited number of uses," which accurately describes a consumable participation key, does not indicate that all "limits on use" are consumable participation keys. Thus, it is clear from the claims and specifications that a consumable participation key is only one kind of a limit on use.

There is no indication in the Katz patents of a method of measuring a limit on use based on a dollar value. That is, neither the claims nor the specifications require that the limit on use based on a dollar value be decremented by the number of accesses to the system, ie. $2.00 for each access. The claims and the specifications leave open the possibility that the dollar amount could be decremented by some other method of measurement, such as time spent in the Katz system; ie. $2.00 for 10 minutes, such that the limit on use served a metering function.

The statements made by Katz in the prosecution history cited by the defendants do not require a different construction than what is clear from the plain language of the claims and specifications. During the prosecution history of the '707 patent, certain of Katz's pending claims, including pending claim 47, were rejected by the examiner in an office action as unpatentable over two patents and an article of Turbat. (Ex. 51). In an Amendment dated August 31, 1995, Katz amended pending claim 47 by substituting the phrase "one time use" with "limit on use." Katz also argued against the examiner's rejection of his pending claim 47 in a section entitled "Discussion of the Rejections of Claims 32, 37, 40, 41 and 47 under 35 U.S.C. § 103." In that section, Katz distinguishes the rejected claim 47 on the basis that "applicant's system, as claimed, is independent of both time (Barger and DeBruyn) and value (Turbat)." However, this discussion was clearly directed toward the rejection of the claim as originally written, which called for "a basis of entitlement defining a one time use," as evidenced by Katz's statement at the end of the discussion section that "the rejected claims are urged to be distinct for the reasons presented above." Based on this review of the prosecution history, the Court concludes that Katz's statements about a claim that read "one time use" do not limit the claims that were eventually accepted, which read "limit on use."

Based on the foregoing the Court concludes that "consumable participation key" means: a number or word that allows a caller access to a service or part of a service a predefined limited number of times and which cannot be refreshed or recharged. The Court concludes that "limit on use" means: a control that limits a caller's access to a service based on some predetermined method of measuring the level of use. The term "limit on use" is not restricted to a specific method of measuring use, such as a limited number of accesses into the Katz system.

8. "Limiting the Voltage Applied to Said Transformer and to Said Components."

These terms shall be construed consistent with their ordinary meaning; no further construction is necessary.

3. "Limits" The next set of terms in dispute are "maximum and minimum limits of rotation" ('053 patent, claim 2), "maximum angle of rotation excursion, a minimum angle of rotation excursion" ('053 patent, claim 6), "limits of rotation excursion" ('053 patent, claim 20), "upper limit vector and a lower limit vector" ('132 patent, claim 1), and "upper limit of
The parties have agreed that a single construction of "limit[s]" covers all of these phrases. See Tr. at 71, 184. Plaintiff's proposed construction is "end point values delineating the range of angular motion for a particular joint." Defendant's proposed construction is "end point values delineating the range of angular motion for a particular joint for a particular gesture action (as defined above)."

Defendant's addition of the phrase "for a particular gesture action" -- which is the only language the parties disagree on -- is supported by the abstract of the '053 patent, which states:

A number of gesture actions are displayed and defined as a series of frames generated by specifying rotational ranges and speeds of rotation on a number of rotational axes of each joint for each gesture action.

'053 patent abstract (emphasis added); see Tr. at 125. Further, defendant's construction is supported by the prosecution history of the '053 patent, which shows that plaintiff stated, in order to overcome a rejection based on prior art, that "the present invention requires specification of 'upper limit' and 'lower limit' vectors, which vectors delineate the range of motion for a particular joint for a particular gesture action." '053 prosecution history at NYU003964 (emphasis added); see Tr. at 126.

Plaintiff offers two arguments in response. First, plaintiff argues that the language defendant wishes to incorporate--"for a particular gesture action" -- would make claim 5 of the '132 patent redundant, see Tr. at 127, where that claim states that "the upper limit vector, the lower limit vector and the time vector for each of the joints are specified in accordance with the selected gesture action," '132 patent at 10:16-18. But claim 5 lacks redundancy with claim 1 for other reasons, see Tr. at 127, and the specific prosecution history does not accord with plaintiff's definition.

Second, plaintiff argues that its statement in the prosecution history addressed only certain claims at issue there, so that "[t]o the extent there would be a prosecution history argument, the parties would have to step back from their initial position that a common definition applies to all the disputed terms and then parse out to which extent this limitation would be appropriate." See Tr. at 25-26. However, the Court finds it appropriate to rely on the prosecution history in the construction of each disputed claim term here, given that plaintiff has maintained throughout this litigation that "a single definition . . . covers all" of the disputed claim terms, and given that plaintiff's expert based his entire report on that premise. See Tr. at 71.

Accordingly, the Court hereby adopts defendant's proposed construction of "limits."

In Octel III, the district court construed the limitation "a line activity monitor coupled to the telephone line to record information indicative of usage of the telephone line" in claims 1 and 19 to mean:

an apparatus for monitoring activity or information indicative of how the telephone line is being used. All types of line activity or modes of line use need not be monitored and recorded, so long as at least some information indicative of usage is recorded.

Id., slip op. at 12.

The court determined the key issue to be "whether the claimed line activity monitor must be capable of monitoring all five basic line states, identified in the '416 patent preferred embodiment description as IDLE, RING, INTER-RING, SERVICED and ON HOLD." Octel III, slip op. at 8-9. The court concluded, "in light of the limitation of dependent claims 5, 7 and 21 requiring only at least two states, . . . that the line activity monitor in [independent claims 1 and 19] need not be capable of monitoring all five basic line states." Id. at 11. The court also noted that the language of claims 2 and 20 supported its construction of claims 1 and 19. We agree. Independent claims 1 and 19 cannot be construed to require the monitoring of more line states than is required by the various dependent claims.

- 2800 -
SercoNet contends that the term PSICs should be construed to mean "SICs wherein one SIC receives power directly from power source and other SICs are fed power from network wiring and/or may feed power to other connected SICs." NetGear construes it as "an SIC capable of receiving and transmitting power on the data line."

This term is used in claims 1-6 and 21 of the '360 patent. Turning to the language of the claims, claim 1 of the '360 patent describes: "A network topology allowing distributed sensing, control and communication, comprising: a power source, a plurality of line-Powered, Serially connected Intelligent Cells (PSICs) coupled to the power source and to each other via respective communication channels each allowing mutually independent communication in either or both directions and comprising at least two electrical conductors, . . .".

The claim language itself clearly states that the invention comprises a power source and multiple PSICs (which by definition are line-powered) connected to that power source and to each other. According to the plain claim language, it seems that the PSICs are powered, and that this is not an optional feature.

Turning to the specification for further clarification, Figure 2 of the '360 patent shows multiple PSICs that are all connected to one single power source. As SercoNet argues, this intrinsic evidence shows that line-powered in the context of this claim means that the PSICs are powered directly from a power source that is directly connected to a first PSIC, and that all other PSICs are powered from the preceding PSIC to which it is connected. See also '360 patent, Figure 4. In fact, the description of Figure 2 explicitly states that the network comprises a single power source for feeding power via a twisted wire pair to a line powered, serially connected intelligent cell, which is in turn serially connected to other PSICs. See '360 patent at 3:24-30, 3:56-60. Furthermore, NetGear concedes that the first PSIC in the network is not capable of receiving power on the network wiring. See also '360 patent at 4:47-60 (first PSIC is different from other PSICs in that it receives power from the power source, but does not receive data from it). This intrinsic evidence, therefore, supports SercoNet's construction describing one SIC that is directly powered from a power source and other SICs that are fed power from network wiring.

In discussing the PSICs' role in feeding power, the specification notes that the invention provides "an intelligent, distributed network wherein a plurality of intelligent cells are serially connected via bi-directional communication channels permitting data (and optionally power) to be fed serially along the network from one PSIC to the other, in either direction. See '360 patent at 8:40-45. The specification therefore makes clear that the PSICs need not feed power, as the feeding of power is optional. There is nothing in the specification that requires it to do so.

Additionally, the specification also describes the last PSIC in any given string of PSICs as being somewhat different from other PSICs, in that the endpoint PSICs do not both receive and feed power and data, although the endpoint PSICs may be provided with an interface to connect to another PSIC. See '360 patent at 4:47-56. In other words, those PSICs may feed power to other connected SICs if given the capability. SercoNet uses "and/or" in its proposed construction to recognize that the starting and final PSICs do not both feed power to and receive power from any other device. As SercoNet conceded at the hearing, this "and/or" construction is somewhat confusing. However, NetGear's construction that each PSIC is capable of transmitting power does not accurately reflect that the last PSIC in the network would only become capable of feeding power to another PSIC if it is modified with an interface.

Finally, while Netgear's construction requires that power be transmitted on the "data line", it defines such wiring as "network wiring" in its briefing. See NetGear Opp. at 14:4-5. SercoNet also uses the term "network wiring" to describe the wires, so the court adopts this undisputed aspect of the proposed construction.

In sum, and for all the reasons set forth above, the court adopts SercoNet's proposed construction of "PSICs" with slight modifications and construes the term "PSICs" as: "SICs wherein one SIC receives power directly from the power source and other SICs are fed power from network wiring and may feed power to other connected SICs if capable."
I. Claim Construction of "linear combination"

The term "linear combination" appears in Claims 1, 2, and 5 of the '072 Patent, but the primary claim language can be found in Claim 1, which states that "the specified combination of each scatter pixel and the transmission pixel corresponding to the scatter pixel is a linear combination of a function of the value associated with the scatter pixel and a function of the value associated with the transmission pixel."

Plaintiff argues that "linear combination" means the sum or difference in values, or a combination of things added together, and that a linear combination of functions is itself a function that can be expressed as the sum or difference of functions. Defendants argue that the term refers to a combination of two functions that each depend on a different single variable, not two functions that depend on multiple variables.

It is clear from the language of the patent that "linear combination" refers to the sum or difference of two functions, the first a function of the scatter value and the second a function of the transmission value. As the Court has already determined that "function" as defined in the '072 Patent is limited to functions involving a single variable, "linear combination" must be similarly construed. Accordingly, the Court FINDS that "linear combination" as defined in the '072 Patent means the sum or difference of a transmission function and a scatter function, with each function depending on a single input variable.

6. "[L]ine level:" 6 "Structured set of information about applicable coverage." This construction is consistent with col. 84:37-63 of the specification.

A. "Lines"

The Magistrate Judge first construed the claim term "lines" as that term is used in Claim 26 of the 653 Patent. Framing the issue in dispute, the Magistrate Judge observed, "[Quickview] insists that this term, as used in the patent, covers both horizontal and vertical lines . . . [Belo] maintains that the term lines' should be limited to a horizontal line of pixels or characters." (F & R at 5) Next, relying on the specification and accompanying figures, the Magistrate Judge noted that both the specification, when read in its entirety, and the attending figures "clearly" distinguish between horizontal "lines" and vertical "columns." (Id. at 6) Because the specification consistently refers to the term "line" as "a horizontal line of pixels or characters," the Magistrate Judge deduced, "the term should be construed accordingly." (Id.)

Quickview filed objections to this construction of "lines," maintaining that it improperly limits the 653 Patent's scope to its preferred embodiments. Upon de novo review, this Court finds no merit in Quickview's objection to the Magistrate Judge's claim construction, instead finding that his interpretation of the claim language is correct and based upon sound principles of patent law.

The Court does not take issue with Quickview's statement of the settled patent principle that the written description of a preferred embodiment should not be used to improperly read a limitation from the preferred embodiment into a claim. But the Court recognizes that it is oftentimes difficult to "draw a line between construing a claim in light of the specification and
improperly reading a limitation from a preferred embodiment . . . into a claim." The Interpretation of Patent Claims, 32 AIPLA Q.J. 1, at 35 (Winter 2004) (citing Bell Atlantic Network Servs., Inc., v. Covad Communications Group, Inc., 262 F.3d 1258, 1270 (Fed. Cir. 2001) (other citations omitted)). As the Federal Circuit stated in Bell, "the written description can provide guidance as to the meaning of claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format'. . . thus, when a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term by implication." Bell, 262 F.3d at 1271 (emphasis in original) (internal citations omitted).

Here, relying upon the specification which is "the single best guide to the meaning of a disputed term," n3 the Magistrate Judge found that the consistent use of the term "lines" in conjunction with the term "horizontal" essentially defined the term by implication as "horizontal lines of pixels or characters." Based on the unambiguous language contained in the specification, explicitly referred to and relied upon by the Magistrate Judge in reaching his construction of the claim language at issue, this Court finds his construction correct and based upon sound principles of claim construction. He correctly looked to the specification which used the term "lines" in a manner consistent only with the qualifier "horizontal." For these reasons, the Court OVERRULES Quickview's objections to the Magistrate Judge's recommended claim construction of "lines."

10. "link"

The final term is "link," which appears in claims one and seven of the '374 patent. Informatica proposes that the term be construed to mean "connection." BODI proposes the construction "A link is a connection between a reference in a data mart and specific metadata in a shared folder in a global repository. The linking enables those data marts the ability to gain access to the objects stored in the global repository." Informatics argues that the term link has a plain and ordinary meaning, i.e., a connection, that would be understood by one skilled in the art. BODI agrees that generally speaking a link is a connection, but in the context of the '374 patent, connection is too generic and overly simplistic.

BODI's proposed construction, requiring a link to connect a reference in a data mart and specific metadata in a global repository, fails to acknowledge the use of the term link in a broader sense in claim seven and throughout the specification. Claim seven discloses a method for sharing metadata between a plurality of databases, comprising, intra alia, a link between the second database and the first database. The Abstract and the Summary of the Invention discuss that "[a]ny number of data marts can be linked to the global repository." Figure 2 depicts a global data mart repository "connected to a number of linked data marts" (as represented by the arrows pointing from the global data mart repository to the data marts). The description of Figure 2 explains that "[b]y registering a repository with a [global data mart repository], the necessary link between the two repositories is established, and thereafter, the linked repository is able to share metadata with other repositories linked to the same [global data mart repository]." Finally, the detailed description states that the present invention provides for a sharing feature, which is "accomplished by linking certain designated data marts" with the global data mart repository.

When engaging in claim construction, the Court is bound by the presumption that "the same terms appearing in different portions of the claims should be given the same meaning unless it is clear from the specification and prosecution history that the terms have different meanings at different portions of the claims." Fin Control Sys. Pty, Ltd. v. OAM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). BODI's narrow construction of the term link is unworkable in light of the obvious broader use of the term throughout the patent.

There is no need to go beyond the plain and ordinary meaning here. The Court adopts Informatica's proposed construction and construes the term "link" to mean: Connection.
3. Link and linking ('321 patent, claim 83)

Claim 83 of the '321 patent provides that:

A method for use with a system capable of recognizing specifying references (SRs) in a record which reference another record and forming links between the SRs and the referenced records, the method for eliminating ambiguity when SRs overlap and comprising the steps of . . . linking the selected SRs to corresponding records.

Plaintiffs argue that "link" and "linking" mean "to couple or connect" and that in the context of the '321 patent, "linking" can be accomplished by "creating a hypertext link, address association or other logical link." In contrast, defendant argues that the term "link" is synonymous with the term "hyperlink." However, there are two problems with defendant's posture. First, as discussed earlier, hyperlink is made up of three components, a keyword phrase, an address and information stored at that address. Examining the use of the terms "link" and "linking" in the disputed claim, one can see that a link is formed between two components, that is, between the specifying reference and corresponding record. Thus, a link (a connection between two component parts) and a hyperlink (three component parts that include a link or address) could not be interpreted as synonymous. Although I agree with most of plaintiffs' proposed construction, I will not include any "other logical link" as part of the definition because this part of the definition is too nebulous. Accordingly, "link" and "linking" in claim 83 of the '321 patent means creating a hypertext link or address association.

XI. "[B]i-directional communications link coupled between the futures and options computers”; "a bi-directional communications link coupled between the options computer and principal market maker computer”; and "communications link"

Plaintiffs argue that the claim terms "bi-directional communications link coupled between the futures and options computers,” "a bi-directional communications link coupled between the options computer and principal market maker computer,” and "communications link" should be construed to mean "an electronic link that provides two-way, direct communication between computers." (R. 82, Pls.' Mem., Ex. 1 at 7.) Of specific importance, Plaintiffs contend that the term "coupled" should be interpreted to mean "a direct connection." (R. 82, Pls.' Mem. at 24-25.)

Plaintiffs maintain that the specification, along with the figures and their written descriptions, require a "construction in which the communication link directly connects the computers without routing the communications through any intervening components." (R. 82, Pls.' Mem. at 24.) Again, as with their prior attempt to insert a modifier into the construction of a claim term, this effort is unfruitful as it seeks to impermissibly import the claim limitation "direct" from the specification and patent figures. Specifically, Plaintiffs' argument fails as the figures and their accompanying text--which disclose preferred embodiments--cannot limit claim terms. See Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.") Further, as previously noted, the Federal Circuit has consistently warned against importing claim limitations from the specification. E.g. Teleflex, 299 F.3d at 1326 ("[T]he claims must be read in view of the specification, but limitations from the specification are not to be read into the claims."). The Court therefore rejects Plaintiffs' proposed constructions.

TRG, on the other hand, only asks the Court to construe the terms "link" and "coupled." (R. 85, Def.'s Mem. at 19.) They contend that these terms can be construed using a general purpose dictionary. (Id.) Because the ordinary meaning of these terms is readily apparent, the Court agrees that reliance on a general purpose dictionary is appropriate. See Phillips, 415 F.3d at 1314 (Where the "ordinary meaning of claim language as understood by a person of skill in the art may be readily
apparent even to lay judges," claim construction involves little more than the application of the widely accepted meaning of commonly understood words). Accordingly, these terms are construed as follows: (1) "link" means "a unit in a communication system"; and (2) "coupled" means "to join for combined effect." See Merriam-Webster's Collegiate Dictionary 286, 724 (11th ed. 2003) (defining "coupled" as "to join for combined effect" and "link" as "a unit in a communication system").

3. "Link data" (Claims 1 and 18)

HTC asks that this term be construed and suggests that it means "the data required for a link that both the first base station and the mobile station are capable of sending to a second base station to achieve a handover." Chart at 6. IPCom offers "data describing the identity and features of the mobile station and the call in which the mobile station is engaged." Id.

Dr. Rose, HTC's expert, testified that link data is a "generic term" that would "describe a number of different types of information, including . . . a session link, a fixed link, a data rate or information regarding channelization, timing, timing offset, frequencies, etc." IPCom's Resp. [Dkt. # 150] at 52-53 (citing Rose Decl. ¶ 23). It is critical to transfer "connection information" as part of a handover. Id. (Rose Decl. ¶ 14). HTC errs by proffering a construction that defines the term by using the same term — "data required for a link" — and then focusing on its use, not its meaning. As a "generic term," "link data" covers many kinds of data necessary to maintain a call and necessary to a successful handover. "Link data" is construed to mean "data describing the identity and features of the mobile station and the call in which the mobile station is engaged."

3. "Link layer"

As expressed at oral argument, it appears that the parties are in substantial agreement on the construction of this term. They agree that the link layer is the second lowest layer of the OSI seven layer model and that it performs error checking functions. The main issues appear to be whether error correction is limited to frame transmission and/or whether the plaintiff's construction includes error correction at the physical layer. The defendants also argue that one of ordinary skill in the art would understand that retransmission of messages is the way to correct transmission errors.

The court has considered the briefs and the arguments of the parties in light of the intrinsic record. The court construes the term "link layer" to mean "the second lowest layer of the Open Systems Interconnect (OSI) seven layer model, providing the functional and procedural means to transfer data between modems, and to detect and correct errors."

C. "link said memory to a remote home base"

Claim 1 of the '490 patent contains the term "link said memory to a remote home base": "a modem electrically coupleable to said memory, said modem adapted to link said memory to a remote home base to establish a communication link." The exact term "link said memory to a remote home base" is not found in the specification. The specification does describe the modem transferring data from memory, however: "Monitor 48 converts signal 94 to a digital value, stores it in a memory 96, associates it with a real time stamp, and eventually communicates the data to a remote home base 100 by way of a modem 98." (490 patent, 3:52-55). The plaintiff contends that no construction of this term is necessary. Forbes and Petron assert the following construction: "to connect the unit of a computer that preserves data for retrieval with the location where the operator of the mobile repair unit receives datarelated to the repair unit, and such location is removed from the work site at which the repair unit is operating."
The parties' first dispute centers around the meaning of "said memory." "Memory" is described in the preceding limitation of claim 1: "a memory electrically coupleable to said first transducer, said memory storing a first plurality of digital values." Key argues that "memory" does not require definition, or alternatively, it should be defined as "a device for storing data." The defendants contend that the "memory" must be computer memory. Key responds, however, that the patent does not use the word "computer." Furthermore, the specification discloses a "Pocket Logger" that has a memory, ('490 patent, 4:17-20). Key urges that the limitation "computer" may exclude this preferred embodiment. Based upon the use of "memory" in the preceding limitation, quoted above, the court will define "memory" as a "a device that stores digital data."

Next, Forbes and Petron wish to define "link" as "connect." The meaning of "link" is illuminated by the way it is used in the remainder of the claim limitation: "said modem adapted to link said memory to a remote home base to establish a communication link between said remote home base and said plurality of various job sites." This language indicates that the "link" action refers to "establishing a communications link." Thus, thus court will define "link" as "establish a communication connection."

The defendants also propose language regarding "remote home base." As this term has already been construed, it does not need to be addressed again. In all, the court construes "link said memory to a remote home base" to mean "establish a communication connection between a device that stores digital data and a remote home base."

B. Linked (Claims 1, 8, 9, 10)

HP asserts that the ordinary meaning of "linked" is "associated with, related to, or connected to." See e.g., Ex. 5, Webster's Third at 1317 (1986) (defining "link" as "to form a connection or association"). Intergraph argues that "linked" should be defined as "connected for execution by a chain of pointers."

To support its proposed construction, Defendant cites the specification and an IEEE dictionary. The 1992 IEEE dictionary describes a [data management] link as "(A) See: pointer, (B) To establish a pointer; for example, to link two items in a hierarchy." See Gloré Decl., Ex. C4, at 726-27; see also '208 Patent, col. 5:7-10 ("This allows the pointer to be fetched once and used with each data record . . ."). The Court recognizes that "a general dictionary definition is secondary to the specific meaning of a technical term as it is used and understood in a particular technical field." Hoechst Celanese Corp. v. BP Chemicals Ltd., 78 F.3d 1575, 1580 (Fed. Cir. 1996).

However, the IEEE dictionary definition urged upon the Court by Intergraph is not at odds with the dictionary definition proposed by HP. While the IEEE dictionary reference is indicative of the ordinary meaning of a claim term, the reference to pointer in the definition provided by Intergraph, when read in context, is not at odds with the definition proposed by HP. Moreover, the word "pointer" or the phrase "chain of pointers" is found nowhere in the patent claims, which instead use the broader term "link." HP does not deny that the preferred embodiment sometimes uses the term "pointer" to refer to "links." However, the Federal Circuit's teaching on this issue is clear, "particular limitations or embodiments appearing in the specification will not be read into the claims." Loctite Corp., 781 F.2d at 867. The Court finds that the more accurate construction of the term "linked" as used in the '208 Patent is that offered by HP. As such, the Court construes the term "linked" as associated with, related to, or connected to.

C) "Providing access to a personal computer . . . from a remote computer"

The parties disagree about the definition of this phrase. First, 01 Communique contends that this phrase requires no construction at all. In the alternative, 01 Communique proposes that it means "Providing access to (i.e., permission, liberty, or ability to enter, approach, or pass to and from a place or to approach or communicate with a person or thing) the claimed personal computer . . . from a remote computer." Citrix, meanwhile, suggests a more literal translation, to wit, "Providing a connection (i.e., a physical link via wire, radio, fiber-optic cable or other medium) between the claimed personal computer
When evaluating a claim term, "[i]n those cases where the ordinary meaning of a claim term as understood by a person of ordinary skill in the art is readily apparent even to lay persons, the ordinary meaning becomes the acquired meaning of the term." Herbert F. Schwartz, Patent Law and Practice § 5.1.A.2. (5th ed. 2006) (citing Phillips, 415 F.3d at 1314). This phrase falls within that category; the court finds that it requires no construction.

2. "linking the address of such unusable blocks with addresses of other blocks that are useable" ('842 pat., cl. 1)

The parties' principal dispute is whether "linking" must be done in the form of a map or table listing both the unusable and corresponding usable blocks, as defendants contend. A secondary dispute is whether, assuming "linking" does not require a map or table, it is broad enough to include storing a pointer in the unusable block that points to a usable block. (Plaintiff's proposed construction defines linking to include any sort of "substitution," but this term is too vague to be helpful.)

The language itself suggests nothing about the required format for linking addresses, saying only that the claimed method involves "linking the addresses of . . . unusable blocks with addresses of other blocks that are useable." Defendants contend that their construction is "the only construction" consistent with the claim language in light of the order of the following claimed steps: (1) detecting a predefined condition; (2) linking the address of the nonusable block to the address of a usable one; (3) causing the controller to generate an address; and (4) accessing a usable block by referring to the linked address "if the block with the generated address is unusable." '842 pat., cl. 1. As defendants point out, step four anticipates that the "block with the generated address" may be unusable, which means the controller must be able to generate an unusable address after the "linking" occurs.

However, defendants do not explain why the controller would do this only if a map or table is used. Instead, they argue only that the "linking" could not involve plaintiff's proposed "substitution" because then the controller would not generate the unusable address after the "substitution" occurred. For defendants to be correct, "substitution" must mean "replacement" and they must be arguing that the claimed "replacement" would be carried out in a way that affects what the controller generates. This is not plaintiff's understanding of "substitution," but it is irrelevant. As explained above, the term "substitution" does not precisely capture plaintiff's concern and will not be adopted, so it is unnecessary to consider defendants' attacks on that term.

Defendants add that the specification supports the map or table requirement because the examples of linking that it provides involve a map or table. '842 pat., col. 8, lns. 49-51 ("The addresses of the defective cell and the backup cell are stored as defectpointers in the defect map 409."); id., col. 11, lns. 48-52 ("When the number [of bad memory cells] in a sector exceeds a predetermined value, the controller marks that sector as defective and maps it to another sector. The defect pointer for the linked sectors may be stored in a sector defect map."). However, as the Court of Appeals for the Federal Circuit has "repeatedly warned," the scope of a claim should not be limited simply because a specific embodiment shows the requested limitation. Phillips, 415 F.3d at 1323. Even if an embodiment is the only one disclosed, it may serve to limit a claim only if it is clear that the patentee intended to limit the scope of the claims to the disclosed embodiment. Id.; see also On Demand Machine Corp. v. Ingram Industries, Inc., 442 F.3d 1331, 1339-40 (Fed. Cir. 2006) (limitation warranted because specification used the term "customer" repeatedly in specialized context); Nystrom v. TREX Co., Inc., 424 F.3d 1136, 1144-45 (Fed. Cir. 2005) (limitation warranted because written description and prosecution history used term "board" consistently to refer to wood decking materials cut from log). Defendants' cited evidence falls short of showing an intent to limit "linking" to using a map or table.

In addition, the limitation defendants seek to import into claim 1 is already found in claim 7 of the '842 patent, which depends from claim 1. Claim 7 discloses a form of "linking" that includes maintaining a list within the card that links such unusable blocks with addresses of corresponding ones of the other blocks that are usable, and wherein accessing a usable block includes referring to the list to translate the address of the unusable block into an address of a usable block.
Defendants point out that dependent claim 7 involves more than just using a map or table, but they do not deny that using a map or table is one of the features disclosed in this claim. The fact that the "map or table" requirement is spelled out explicitly in a dependent claim is strong evidence that the patentee did not intend the requirement to be a part of claim 1. If the requirement were already present in the independent claim, there would be no reason to repeat the limitation in the dependent claim. In short, defendants fail to support their contention that the claimed "linking" must be by map or table.

The fact that defendants' proposed limitation is unsupported does not mean that plaintiff is right when it says that the usable and unusable addresses can be "linked" by storing a single pointer in the unusable block that points to a usable block. A natural reading of "linking" does not suggest such an indirect relationship. The claim does not call simply for linking a defective block to a good block, but rather for linking the addresses of the defective and good blocks. According to plaintiff, a "linking" occurs when a defect pointer containing the address of a good block is placed somewhere in a defective block. Once the defect pointer is in place, if the controller generates an address in the defective block, it will find the defect pointer in that block and move on to the good block referred to by the defect pointer. In this setting, the blocks are linked, but the addresses are linked only in the sense that the good block address stored in the defect pointer is stored in the defective block (located in an address in the defective block). Plaintiff's proposed construction would stretch the claim language beyond what is acceptable. The claim language says explicitly that the "addresses" of the blocks must be linked but plaintiff's proposed construction does not include that requirement.

In conclusion, "linking the address of such unusable blocks with addresses of other blocks that are useable" need not take the form of a map or table, but must be something more than simply storing a pointer in the unusable block that points to a usable block.

5. Flat-Panel Display Device/ LCD Device

a. The Parties' Constructions

LPL argues that the "flat panel display device" is simply an apparatus with at least a flat display panel and supporting frames. Defendants assert that in the context of the invention, a "flat panel display device" includes a sandwich of layers or stack of components, including the flat display panel, held together or assembled by the first and second frames. ViewSonic further asserts that the stack of components are assembled along the edges. Defendants argue that the intrinsic record mandates such a construction and specifically point to the description in the common specification of an LCD device for support. n19 ViewSonic also submits that under LPL's construction, a portable computer would be a flat-panel display device, thereby rendering superfluous the non-asserted claims' term "portable computer."

n19 For example, Defendants cite to the '641 patent, 1:42-45: "The LCD device 130 has an LCD panel 132, a backlight device 134 fixed to the back of the LCD panel 132, and a supporting frame 136 for assembling the LCD panel 132 and the backlight device 134 along the edge."

b. The Special Master's Constructions

Based on the express language of the claims, the Special Master does not adopt that portion of Defendants' constructions requiring multiple layers assembled or held together, along the edge or otherwise. The Special Master does agree with the Defendants, however, that the flat-panel display device includes the first and second frames.

The language of claims 55 and 56 provides a definition of flat-panel display device. '641 patent, 12:1-18. Tellingly, both claims recite that the flat-panel display device includes only three main elements, namely a first frame, a second frame, and a flat display panel disposed there between. Thus, to limit the flat-panel display device to one that includes multiple layers would be contrary to the claim language and would, in the Special Master's view, improperly read in the preferred
embodiment of an LCD device. Mindful that other claims recite multiple layers, such as the backlight unit of claim 35 of the ‘641 patent, the Special Master adopts a construction that includes at least a flat display panel.

Additionally, the claim language further specifies that the flat display panel of the device is located between, or sandwiched by, the first and second frames. Claim 35 of the ‘641 patent recites, for example, that the "flat display panel is between the first and second frames." The claim term "between" does not require, however, that the panel and frames be assembled as Defendants argue. Instead the claim merely defines the location of the flat-display panel relative to the frames. The Special Master therefore concludes that requiring the frames and panel to be assembled, whether along the edges or not, improperly reads in the preferred embodiment from the common specification.

The term "LCD device," on the other hand, is specifically called out in claim 40 of the ‘718 patent. Because the language of claim 40 itself does not expressly define an LCD device, the common specification provides the best definition for that term. Phillips v. AWH Corp., 415 F.3d at 1315 ("The specification 'is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.") (internal citation omitted). Referring to Figures 4A-4C, the common specification defines the LCD device as an LCD panel, a backlight unit, and a supporting frame. ‘718 patent, 4:17-21. Also, Figure 4C shows that the backlight unit 14 and the panel 12 are disposed between the frames 14g and 16.

Accordingly, the Special Master's constructions are as follows:

<table>
<thead>
<tr>
<th>CLAIM TERM</th>

2. a liquid crystal layer which can have a homeotropic structure (‘028 patent)

CEA's proposed construction is: "the liquid crystal layer having molecules substantially oriented in a homeotropic direction."

Samsung's proposed construction is: "a liquid crystal layer which can have an alignment of liquid crystal molecules parallel to the same direction and perpendicular to the plane of the liquid crystal layer."

At oral argument, Samsung stated that the differences between the parties' proposed constructions were not meaningful and that Samsung would agree to CEA's proposed construction with the caveat that "homeotropic structure," and "homeotropic direction," recited in other disputed claim terms, would be construed as having the same meaning for both the ‘028 and ‘412 patents. 11

11 D.I. 1053 at 34-37; Id. at 85-87.

Consequently, the court adopts CEA's proposed construction: "the liquid crystal layer having molecules substantially oriented in a homeotropic direction."
The term "list" appears in claim 27 of the '226 Patent. It does not appear in the contested claims of the '136 Patent or the '244 Patent. Claim 27 of the '226 Patent states in material part that "each . . . data structure including a list of all computers on said network that permit caching to the I/O device . . ." ('226 Patent, at 28:20-23) (emphasis added). Claim 27 further claims "communicating over the network individually with each computer in the list of computers in the data structure." (Id. at 28:26-27) (emphasis added).

The Court must first look at the claim language and ascribe the plain and ordinary meaning to the phrase. Hockerson-Halberstadt, 222 F.3d at 955. The '226 Patent claims do not provide an explicit definition or attach a special meaning to the term "list." There is also no indication that the '226 Patent specifications use the term "list" in any other way than the term's ordinary and common meaning. The '226 Patent specifications provide that "the cache driver (10) uses its remote message communication channels (18) to send a message to each of the remote cache drivers in the list contained in the TCB (16) disk control structure." ('226 Patent, at 3:33-42) (emphasis added). The specifications further provide that "[t]he list of remote computers that can access the disk (12) is obtained from the TCB (16) disk control structure and a message is sent to all these remote computers using the remote message communication channels (18)." (Id. at 5:37-40) (emphasis added).

Given this use of "list" in the claim and specifications, there is no reason to define that term for the jury. See Generation II Orthotics Inc. v. Medical Tech. Inc., 263 F.3d 1356, 1367 (Fed. Cir. 2001) ("We can discern no sound basis on which to conclude that the word 'controlled,' as used in the claims, is in need of defining. . . .").

Oracle argues that "[t]he plain meaning of the term 'list' as that term is used in the specification and claims of the patents-in-suit, is an item-by-item series of numbers, words, or characters." (Instrument No. 77, at 23). Oracle provides no specific basis in the specifications or the claims to support its argument that the term "list" is restricted to an item-by-item series, or that the '226 Patent in any way implies such a construction. Oracle wholly relies on the testimony of its expert witness and its preferred definition in the IEEE Standard Dictionary of Electrical and Electronics Terms to support its argument. IEEE (INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS) STANDARD DICTIONARY OF ELECTRICAL AND ELECTRONICS TERMS (Kim Breitfelder & Stephen Huffman eds.) (IEEE STANDARDS BOARD, 6th ed. 1996) [hereinafter "IEEE DICTIONARY"]). The Federal Circuit recently warned, however, that "extrinsic evidence consisting of expert reports and testimony is generated at the time of and for the purpose of litigation and thus can suffer from bias that is not present in intrinsic evidence," and that "undue reliance on extrinsic evidence poses the risk that it will be used to change the meaning of claims in derogation of the indisputable public records consisting of the claims, the specification and the prosecution history." Phillips, 415 F.3d at 1318 (citations omitted). Because the term "list," as it is used in the specification and claims, may be understood by both a person of ordinary skill in the art and a layman, there is no need to provide an additional definition. Accordingly, the Court finds that the term "list" means "list."
which may or may not be related to prompts used in automated formats. The term "operator station" appears to have a commonly understood and clear meaning and requires no further construction by the Court. Furthermore, the Court's interpretation is consistent with the plain meaning of the claims and the specification. See 285 patent, Col. 6:11-14 ("the block 29 represents the operations of coupling a caller to an operator station and transferring the appropriate format data to the station for prompting the operator."); Col. 8:12-15 ("Also, in certain situations, a connection to a live operator is to be terminated in favor of an interface to the processor. In either event, an existing format is terminated in favor of a fresh format."); Col. 12:20-23 ("calls are either interfaced to an operator who receives a format prompt, or interfaced to the processor according to a specified format."); see also AT&T Order at 634-35.

</tbody>
</table>

As discussed supra, Term 6, the specification uses the term "load balancing" to describe a two-step process to allocate requests to various servers in order to distribute the load, a preprocessing step on embedded object alphanumeric strings to randomly distribute object requests across a set of virtual servers, followed by an active step which translates virtual server hostnames into real server IP addresses to avoid overloading any single server. (See id. col.3 1.66 - col.4 1.4, col.11 11.6-10, 35-39.) This second step includes active instrumentation and adjustment of server loads. (Id.) Limelight seeks to have this limitation included in the claim construction. (See Docket # 71, 29.) Akamai concedes that load balancing "requires something more than load sharing." (Docket # 81 Ex. A, 31.) Given the construction of load sharing adopted by the court in Term 6, the court construes the "something more" in load balancing to be the additional limitation of actively monitoring the loading on the content servers.

5. Term 6 ('645 Patent, Claim 1)

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>… being selected according to a load sharing algorithm enforced across the subset of the set of content servers associated with the given name server</td>
<td>… being selected by a procedure that distributes requests for objects among a group of content servers in a content delivery network associated with the particular name server to avoid overloading any single content server …</td>
</tr>
</tbody>
</table>

The conflict between the parties arises over the meaning of the words "load sharing." Limelight seeks to limit this term to an active, real-time algorithm which allocates server requests in order to "even out transient load peaks." (See Docket # 71, 29.) Akamai attempts to distinguish between load sharing and load balancing, arguing the former is broader and encompasses both the latter, which they argue is active, as well as "other load distribution methods." (Docket # 68, 24.)
The specification uses the term "load balancing" to describe a two-step process to allocate requests for objects to various content servers in order to distribute the load; a pre-processing step that allocates objects randomly across potentially available servers, followed by the active instrumentation and adjustment of actual server loads:

According to the present invention, load balancing across the set of hosting servers is achieved in part through a novel technique for distributing the embedded object requests. In particular, each embedded object URL is preferably modified by prepending a virtual server hostname into the URL. . . . This function serves to randomly distribute the embedded objects over a given set of virtual server hostnames. . . .

According to the invention, the virtual ghost names may be hashed into real ghost addresses using a table lookup, where the table is continually updated based on network conditions and traffic in such a way to insure load balancing and fault tolerance. . . . The low-level DNS servers monitor the various ghost servers to take into account their loads while translating virtual ghost names into real addresses. This is handled by a software routine that runs on the ghosts and on the low level DNS servers.

(‘645 Patent, col.4 ll.13-24, col.11 ll.23-27, 53-57 (emphasis added) (describing the preprocessing of embedded object alphanumeric strings to randomly distribute object requests across a set of virtual servers, followed by an active step which translates virtual server hostnames into real server IP addresses to avoid overloading any single server.).) The specification describes the goal of load sharing not as evening out transient load peaks, but as distributing object requests among a set of servers so that "no server becomes overloaded." (Id. col.11 I.67; accord id. col.11 ll.7-10 ("The local DNS server is responsible for returning the IP address of one of the ghost servers on the network that is close to the user, not overloaded, and most likely to already have the required data.").) Given the lack of clarity in the prior art and the lack of an explicit definition of load sharing in the specification, a limitation requiring that the load sharing algorithm avoid overloading the content servers comports with the understanding of a person of ordinary skill in the art's reading of the patent. Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005) ("[T]he person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification.").

2475
3. Having a Loadable Font Memory for Storing a Library of up to a Predetermined Maximum Number of Font Patterns

The phrase "having a loadable font memory for storing a library of up to a predetermined maximum number of font patterns" means that the character-based output device must contain a dynamically changeable storage area for storing a limited number of monochromatic characters. A character is an alphanumeric character or symbol or a graphic symbol or element or a combination thereof.

2476
1. IMX's Motion for Summary Judgment of Infringement

IMX begins its argument for summary judgment of infringement by asserting that the LendingTree Exchange literally infringes the '947 patent. IMX premises this contention primarily upon the alleged infringement by the LendingTree Exchange of independent claims 1 and 19. Pursuant to this argument, IMX contends that the LendingTree Exchange is a system for processing loan applications. The court has construed the term "loan application" to mean "a request for an extension of credit in a format that contains sufficiently detailed information to enable a lender to grant or deny the request." IMX asserts that the LendingTree Exchange allows borrowers to fill out a form (which LendingTree refers to as a "qualification form") that "collects significant personal information, financial information, and information about the loan
and property - everything that is required for a lender . . . to make a decision on whether to extend an offer (i.e., make a bid) on a loan to a prospective borrower." (D.I. 156 at 11) For ease of reference, the court will refer to the LendingTree Exchange qualification form as the "Qualification Form." LendingTree maintains that the Qualification Form "does not require or permit a prospective borrower to submit enough information to enable a lender to make a decision to extend credit." (D.I. 167 at 12) Thus, the scope of information contained in the Qualification Form is a central issue in the infringement analysis.

17. Local area network

Again, Seven argues that this term needs no construction. Visto urges that it means "a network that connects several computers that are located nearby to one another, allowing them to share devices and files." Although Seven does not dispute that a LAN requires several computers to be located in close proximity, Seven disputes that the computers on the LAN must necessarily share devices and files. The court has previously construed the term "network" to mean a plurality of computers that are interconnected so they can exchange information. A "local area network" is therefore defined as "a plurality of computers located nearby to one another that are interconnected so they can exchange information."

(ii) Local Area Network

The parties further dispute the construction of the term "local area network." The court construes the term "local area network" to be a network involving switching hardware or software. The language of element (c) provides for "preview station interface means, said preview station interface means separate from and directly connected to said data control means and said at least two preview stations by non-switched connections not involving a local area network." (Helget Aff., Ex. A, Col. 8, Lns. 26-30.) From this language, it is clear that the 908 patent does not include a LAN and that claim 1 defines a LAN to be switched connections. The prosecution history further makes clear that "any local area network, by definition, is switched, not non-switched." (Tolliver Dec., Ex. K at 3.) It emphasizes that a local area network includes "switching hardware and software." (Tolliver Dec., Ex. K at 3.) The fact that Premier does not favor a broad definition of LAN does not mean that Premier can construe the term more narrowly to its own advantage. The language of the patent and the prosecution history are binding. The court therefore construes the term "local area network" to involve a network that switches hardware and software, a construction that is consistent with both the patent language and the prosecution history.

4. "Local area network" ("LAN")

This term appears in claim 1 of the '510 patent, claims 1, 12, 14, 72, 84, 86 of the '368 patent, and claim 18 of the '280 patent. SercoNet contends that LAN means "a short distance communications network (typically within a building or campus) used to link computers and peripheral devices (such as printers, CD-ROMS, modems) under some form of standard control." NetGear's proposed construction for the term is "a configuration of devices, arranged in a serial (i.e., daisy-chained) fashion, but not a bus or star topology." SercoNet also maintains that the term need not be construed where it appears in the claim preamble.

Turning to the language of the claims, claim 1 of the '368 patent reads: "An electrical outlet for configuring a local area network in a building, the network including a powerline wiring carrying frequency multiplexed power and data signals. . . ." Claim 72 describes: "A service outlet for configuring a local area network in a building, the network including a service wiring carrying frequency multiplexed service and data signals . . . ." The remaining claims of the '368 patent (claims 12, 14, 84, and 86) are dependent on claim 72. Claim 18 of the '280 patent describes: "A device for configuring a local area network in a building for the transport of power and data signals across a wiring . . . ." Claim 1 of the '510 patent
sets forth: "A local area network for data communication, sensing, and control comprising a plurality of serial intelligent cells interconnected exclusively by electrically-conducing media into at least one communicating pair. . . ."

The term LAN is used generally in these claims, as the subsequent language in the claim terms supply more detail as to what the LAN comprises. For example, in claim 1 of the '510 patent, what is claimed is a "LAN for data communication, sensing and control comprising a plurality of serial intelligent cells . . ." If the court were to read the term "serial cells" or "serial" into the meaning of the LAN term itself, as urged by NetGear, it would create a redundancy in the claim language. In addition, the claim term contains the word "local." As the parties have explained to the court, a local area network is different from wide area networks and metropolitan area networks, in that it is on a much more localized scale. NetGear's construction does not include any limiting language addressing what it means for a network to be a "local area" network, whereas SercoNet's proposed construction explains what a local or "short distance" network means.

Turning to the specification, NetGear's proposed construction is at odds with intrinsic evidence, as the figures of the '510 patent and '360 patent show that not all devices configured within a LAN are SICs. The figures show that both SICs and personal computers are inter-networked. For example, the '510 patent notes that an example of a LAN of devices is illustrated in Figure 7, which in turn shows both SICs and personal computers connected to the network. See also '510 patent abstract (describing SIC network, noting that each SIC can be connected to data terminals, computers, telephones, sensors, etc.). It appears that NetGear is trying to use the term LAN to define the term "serial" as a daisy-chained network that does not include bus or star topologies. However, this construction fails for the same reasons set forth in the court's analysis of the first disputed claim term. And, while the '510 patent specification does emphasize the SIC topology as a fundamental feature of the invention and describes the invention as a network of SICs, this does not mean that the inventor meant to redefine the term LAN, especially as the figures and descriptions in the specification show that computers and modems may be part of the network as well.

SercoNet's proposed instruction comes from Newton's telecommunications dictionary, and is the ordinary plain meaning as one skilled in the art of electrical engineering would interpret it. This meaning controls here, as there is no contrary definition or disavowal in the specification.

As for whether the term LAN need be construed in the claim preambles, in considering whether a preamble limits a claim, "the preamble is analyzed to ascertain whether it states a necessary and defining aspect of the invention, or is simply an introduction to the general field of the claim." The inquiry is whether the preamble is "necessary to give life, meaning and vitality to the claims or counts." On Demand Mach. Corp. v. Ingram Indus., 442 F.3d 1331, 1343 (Fed. Cir. 2006) (quotations omitted). "If, however, the body of the claim fully and intrinsically sets forth the complete invention, including all of its limitations, and the preamble offers no distinct definition of any of the claimed invention's limitations, but rather merely states, for example, the purpose or intended use of the invention, then the preamble is of no significance to claim construction because it cannot be said to constitute or explain a claim limitation." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999).

SercoNet claims that the term LAN need not be construed in claims 1, 12, 13, 72, 84, and 86 of the '368 patent and claim 18 of the '280 patent. In claim 1 of the '368 patent, the preamble describes an electrical outlet for configuring a local area network, and the claim then notes what comprises that outlet. The claim preamble, therefore, sets forth the framework of the invention and is "intimately meshed with the ensuing language in the claim." Pitney Bowes, 182 F.3d at 1306. Claims 12 and 13 merely build upon claim 1. The preamble language of claims 72 of the '368 patent and claim 18 of the '280 patent are very similar, both setting forth the frameworks of devices for configuring local area networks. All of these terms, therefore, must be construed.

In sum, and for all the reasons set forth above, the court adopts SercoNet's proposed construction of "LAN" and construes the term "LAN" as: "a short distance communications network (typically within a building or campus) used to link computers and peripheral devices (such as printers, CD-ROMS, modems) under some form of standard control." This term shall be so construed in the both the claim preambles and the body of the claims.

GO BACK

2480

33. The method in accordance with Claim 1 further comprising communicatively linking said contributions accepting
devices in a local area network.

A "local area network" is a group of computers and other devices over a relatively limited area connected by a communications link that enables any device to interact with any other on the network.

17. Local area network

Again, Seven argues that this term needs no construction. Visto urges that it means "a network that connects several computers that are located nearby to one another, allowing them to share devices and files." Although Seven does not dispute that a LAN requires several computers to be located in close proximity, Seven disputes that the computers on the LAN must necessarily share devices and files. The court has previously construed the term "network" to mean a plurality of computers that are interconnected so they can exchange information. A "local area network" is therefore defined as "a plurality of computers located nearby to one another that are interconnected so they can exchange information."

18. Local area network that is further connected to the server

This term needs no construction.

H. "a local calling area of the caller"

Stanacard argues that this term should be given its plain and ordinary meaning or, in the alternative, be defined as "a calling area where a caller does not incur long distance or toll charges when making a call." Rebtel asserts that this claim term is insolubly ambiguous and therefore indefinite.

The specification explains that the "local calling area of the caller" is one in which "the caller does not incur long distance or toll charges." '156 Patent, col. 7:50-51. Thus, the "local calling area of the caller" is tied to whether additional charges are incurred by the caller in dialing into the claimed system. This is consistent with the goal of the claimed invention to capture one of the benefits of calling cards -- namely, placing calls without incurring toll charges. See '156 Patent, col. 1:29-32.

Rebtel notes that depending on a caller's calling plan, the local calling area may include the entire nation, or even the entire world. While those circumstances may render Stanacard's claimed invention useless insofar as it may not provide any monetary or convenience benefits, it does not render the disputed claim term meaningless or indefinite.

For the foregoing reasons, the term "a local calling area of the caller" is defined as "a calling area where a caller does not incur long distance or toll charges when making a call."

1. "local computer"

<table>

<td>Local computer</td>
<td>A computer and software system for human user interaction that is physically close to the human user or his principal place of business and includes an information system that stores databases of information used to process jobs, and that is physically remote from the central computer.</td>
</tr>
</tbody>
</table>

This term appears in asserted claim 1 of the '998 patent. The defendants argue that the Court should limit the term in two ways--first, to add a geographic proximity limitation and, second, to add a systems limitation.

Regarding the system limitation issue, the controversy is whether the "local computer" includes the HOME computer, the DAD computer, the HIS computer, or all three. Both parties agree that the "local computer" is at least the HOME computer. The defendants assert that the "local computer" is a HOME computer and software system that actually also includes both the DAD computer and the HIS computer. Their construction requires that the "local computer" (HOME component) include both (1) the computer and software system that intakes dictation (DAD component) and (2) database of information needed to process a job (HIS component). Anthurium argues that the "local computer" does not require both the DAD and the HIS.

The claim language supports the defendants' construction. Claim 1 requires the "local computer" to perform three functions: (1) receive an originating job; (2) generate a job packet; and (3) interpret the job instructions. '998 Patent, cl. 1. The specification describes the system at issue in terms of DAD, HIS, and HOME. The DAD component accepts user dictation, and the HIS component contains the data necessary to process the jobs. See '998 Patent, col. 1 ll. 42-56, col. 2 ll. 55-62. To perform the recited functions in the claims, the "local computer" contemplates both a HIS component and a DAD component.

In addition to the claims, the specification also supports the defendants' construction. In every instance disclosed in the '998 patent, the HOME is specifically identified as consisting of two computer systems, DAD (initiate jobs) and HIS (databases to process jobs). '998 Patent, col. 1 l. 44-col. 5 l. 19. The patentee repeatedly and consistently defines "local computer" to be HOME and to have the ability to both initiate jobs and process them, necessarily involving both the HIS and DAD components as stated in the specification. In support of its argument to the contrary, Anthurium cites a portion of the specification that purportedly contemplates an instance where the HIS is separate from the DAD--"HIS can be either a part of the physical components of DAD or connected to DAD through a MIS connection." '998 Patent, col. 5 ll. 62-63. This argument is not persuasive. Although the DAD may or may not be physically a part of the HIS, the "local computer," at a minimum, embraces a system that includes both components, the HIS and the DAD. This is true even though they are separated via a MIS connection. Anthurium also points to a citation in which the patent purports not to require a "local computer" with a database. The cited portion states as follows:

Users of the system interact with the system through POT lines calls to DAD for voice or fax interaction . . . . Jobs are initiated by voice calls to DAD. If a job entails transcription the system may prompt for template to be used. . . . '998 Patent, col. 6 ll. 19-33.

The immediate sentence following the above cited passage, however, supports the defendants. "When a job is ready for Transcription, DAD passes the VOX File along with a skeleton Job record Transaction and the appropriate Template from its storage on HIS to MOM via an FTP." Id. at col. 6 ll. 34-37 (emphasis added). As such, the cited specification implies that the "local computer" must have the ability to process the jobs (HIS component), whether or not they are physically a part of the same computer.

The Court now turns to the geographical proximity limitation. The defendants assert that both the claims and specification supports the inclusion of a "physically close" and "physically remote." Looking to the claims, the defendants rely on a claims differentiation argument; claim 1 specifically refers to "local computer," a "central computer," and a "remote computer." '998 Patent, cl. 1. The defendants argue that without a geographic aspect to the construction, such differentiation would be meaningless. The defendants further argue that, if the inventor intended "local computer" to refer to a computer that can be situated anywhere without a geographical limitation, the inventor should have used the term "first computer," as
she did in the related '124 patent. Anthurium argues that "local computer" merely describes a user's computer or a "first" computer and nothing more.

The Court agrees with Anthurium as to the geographical proximity issue. The specification does not require "local computer" to be defined using either "physically close" or "physically remote." In fact, unlike the system argument, it is clearer in this instance that a physical proximity limitation would read a preferred embodiment out of the patent. One cited portion of the specification states, "[i]t is a great advantage of the present invention that an Author can create a multi-content file while working from a standard push-button telephone, anywhere in the world." '998 Patent, col. 4 ll. 17-19. Another cited portion states, "[t]he system of the present invention consists of (A) one or more 'HOME's, connected to an Internet provider not more than two 'hops' away from the Internet backbone . . . ." Id. at col. 4 ll. 52-56. This passage suggests that the user does not have to be "physically near" the "local computer." Furthermore, the use of "physically near" does not provide any guidance, as such limitations are too relative. Accordingly, the specification contemplates an indirect initiation of job to the "local computer," in addition to a direct initiation.

As such, the Court defines "local computer" as follows: "a computer system from which an authorized user can initiate a job, either directly or indirectly, that includes an information system that stores databases of information used to process jobs."

3. "local control system"

This term is used in claims 1, 2, 4, 5, 7, and 15 of the '967 Patent. WG seeks to construe this term as "a control system located on or near the streamer positions devices (e.g. birds)," while Ion seeks to construe the term as "system located within each streamer positioning device that uses the desired forces or desired position information from the global control system to control the movement of the wing(s)."

The arguments of the parties with regard to this term largely mirror those advanced with respect to the term "global control system." WG points out that the specification describes the local control system as being located "within or near the birds," and thus this term need not be restricted to "within each streamer positioning device." (017 Patent, col 3 ll. 39-40); Verizon, 503 F.3d at 1305 ("We normally do not interpret claim terms in a way that excludes disclosed examples in the specification.") WG further points out that the specification describes how the local control system interacts with the global control system using terms such as "embodiment," and "preferably." In other words, WG asserts that Ion's construction attempts to improperly limit how the local control system inputs and outputs data according to the embodiments provided in the specification. Ion once again invokes the "magic words" theory from Honeywell and argues that its own construction simply tracks the patentee's own description of the inventive control system's local control system.

This Court once again chooses to adopt WG's more general construction of the term local control system. As with the previous term, Ion's "magic words" theory ignores the specification language indicating the provided descriptions of the local control system and how it interacts with the global control system are only preferred embodiments. This specification language, therefore, does not constitute the type of "disavowal" of claim scope present in Honeywell, and will not be used to place strict limitation upon the scope of the patent claims.

Furthermore, both WG and Ion's arguments find some support in the specification, the Court once again notes that the manner in which the local control system is to function, and the inputs and outputs that it receives from the global control system, is often referred to within the patent claims themselves. As such, it is unnecessary to construe the term according to this description, as this would render the claims' description of the way in which the local control system is used redundant. Again, at this stage the Court is tasked only with construing one particular term, not with attempting to describe the functionality of the entire invention. Moreover, the Court notes that Ion's attempt to describe the functionality of the local control system within the construction of the term itself is unsurprisingly incomplete. For example, claims 4 and 5 of the '967 Patent teach a local control system that "calculates magnitude and direction of the deviation between" the desired position and the actual position. ('967 Patent, col. 11 ll. 37-47.) Such functionality is found nowhere in Ion's construction. Accordingly, the Court will once again apply the more general construction of "a control system located on or near the streamer positions devices (e.g. birds)."
1. "local digital data processing system"

EMC asks the Court to construe this term as: "A digital processing system (i.e., a computer system) restricted to a particular area." HP proposes (in its opposition brief): "A computer system comprising a processor that is directly connected to a main memory and an input/output system."

The claim language indicates that the local digital data processing system is part of a digital data processing system and that it includes a processor for processing data. Although the term does not appear in the written description, the specification does discuss a "local system," see, e.g., 184: abstract, which appears to be synonymous with the term. "The digital computer system in which the present invention is employed includes at least one local system including a processor and a universal memory accessible to the local system for storing data including instructions." 184:2/67-3/3. Thus, as described in the specification, the digital computer system is comprised of a universal memory and local digital computer systems that can access that universal memory. The claims acknowledge this view with additional limitations ("universal logical memory means accessible to each said at least one local system" and "local digital data processing system having access to said universal logical memory means"). The claims also include a limitation requiring the local digital processing system to include a "processor means." These limitations would be redundant if they formed part of the construction of the term.

The claim language requires "at least one" local system. However, it is instructive to refer to the 602 patent, which is incorporated by reference, to understand the purpose of including "local systems." That patent describes an advantage of the invention as

   providing a flexible internal system structure capable of performing multiple, concurrent operations, comprising a plurality of separate, independent processors, each having a separate microinstruction control and at least one separation and independent port of a central, independent communications and memory processor comprised of a plurality of independent processors capable of performing multiple, concurrent memory and communications operations.

602:4/3-11. Thus, the purpose of having "local" systems is that there could be multiple "local" systems. While claims 1 and 13 specifically include the possibility of having a single such system, it is the nature of a "local system" that there is the possibility of more than one distinct system. Accordingly, the word "local" signifies that the invention may include multiple, discretely located, and distinct systems.

Finally, nothing in the specification or claims of this patent or the 602 patent requires a processor to be "directly connected to a main memory and an input/output system." These proposed limitations are part of a described embodiment. Moreover, it is unclear what "directly" connected to would mean in the context of the claim.

Accordingly, the Court construes this term as "a digital data processing system restricted to a particular area and physically and logically distinct from any other local digital data processing system if one exists."

4. "local distribution system"

Claim 14 claims the following steps:

   receiving the transmitted compressed, digitized data representing a complete copy of the at least one item of audio/video information, at a local distribution system remote from the central processing location

The parties dispute the proper construction of the phrase "local distribution system" as that phrase is used in Claim 14 of the '863 patent. The '863 Patent is the first patent in the Yurt Family of Patents to use the phrase "local distribution system."
Under the principles of claim construction, there is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. Tandon Corp. v. U.S. Intern. Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987). In addition, "[T]he terms and phrases used in the claims must find clear support or antecedent basis in the description so that the meaning of the terms in the claims may be ascertainable by reference to the description. Tandon Corp. at 831 F.2d at 1023, citing 37 C.F.R. 1.75(d)(1).

The '863 Patent shares the same written description with the other Yurt Patents. The phrase "local distribution system" is not used in the written description or prosecution history. In Section IA2, above, the Court construed "central processing location" to be the location of the transmission system. Under the written description and drawings, the transmission system transmits only to "reception systems." Therefore, the Court construes "local distribution system" to have the same meaning as "reception system."

In Claim 14, the distribution system is limited to a "local" system. The Court construes this limitation to have its commonly understood meaning to skilled artisans in this field, namely, a geographic location in close proximity to the user or subscriber.

3 In the communications field, "local" is commonly understood as something in close proximity to a user's device. For example, "local access and transport area (LATA): (1) In the United States, a local geographic area in which a local telephone company is allowed to offer communications services;" "local area network (LAN);. . . (3) A communication network to interconnect a variety of intelligent devices (e.g., personal computers, workstations, printers, file storage devices) that can transmit data over a limited area, typically within a facility." IEEE 100: The Authoritative Dictionary of IEEE Standards Terms, 633 (7th ed. 2000).

The Court construes the phrase "local distribution system" as follows:

a reception system, as previously defined, located geographically close to subscriber receiving stations which are coupled to the reception system.

I. Local Memory

The Plaintiff argues that "local memory' requires no more detailed a definition than memory of a local computer,"" quoting the Microsoft Computer Dictionary. Defendants proffered construction is consistent with a more narrow definition of local memory: "a memory that is part of the local computer that is performing the steps of the recited method." But, during the hearing, the parties agreed to the construction "memory easily accessible to the client computer, either because it is physically part of the processor or is attached directly thereto -- as distinct from the memory of the remote server from which data must be downloaded." This definition addresses the Plaintiff's concern that local memory need not actually be physically part of the computer, for example, if located in a thumbdrive, and the Defendants' concern that it be clear that the local memory is distinct from the processor that may be running on the remote server. (Transcript, pp. 68-69)

The language in the disputed claims and the specification highlights that the "local memory", or "cache memory", n7 is the memory directly tied, although not necessarily physically, to the processor and not memory local to any other computing device or remote server. The data in the local memory must be available to the processor in a direct, rapid way that memory found elsewhere -- such as in the remote server -- is not. See, e.g., col. 11, 11. 58-61 ("The term cache memory is used herein generally to refer to any relatively small memory which can be accessed rapidly by processor and is used to save data which is most likely to be used by the processor."); col. 14, 11. 31-45 ("When a request for block, identified as "x," and having resolution level N, is received from renderer, cache manager determines, as indicated in block (FIG. 8), the level j of the highest resolution-level ancestor of block x stored in cache memory. If the block itself is stored in cache memory (i.e., j=N), the block is provided to renderer. Otherwise, the highest resolution level ancestor of block x which is stored in cache
memory is provided to renderer, as indicated in block. As described hereinbelow, cache manager downloads the rest of the
even the ancestors of block x from server in order of increasing resolution levels, as indicated by an arrow in FIG. 9. As the blocks
are received from the server, they are supplied to renderer so that the user sees an image whose resolution increases with
time.

The distinction between the local cache memory and the larger memory stores that are accessible through a
"communication link" is at the heart of the invention. Unlike prior art, this patent purports to display three-dimensional
images on a user's computer without requiring an unusually large "local memory" by streaming data from a remote source,
preferably over the Internet. (col. 2, 11. 7-20, 26-33.)

--- Footnotes ---
n7 The figures included in the patent refer to the "cache memory 32", and it seems clear that this is what is referenced when
the patent speaks of the "local memory." See col. 3, 11. 24-27 (referring to a "local cache memory"); col. 13, 1. 40 ("local
 cache memory").

--- End Footnotes ---

Construction: (local memory) memory easily accessible to the user's processor, either because it is physically part of the
processor or is attached directly thereto, and distinct from the memory of the remote server from which data must be
downloaded.

"Local Memory Device"

The parties disagree as to whether a local memory device must be "attached" to only a single computer (Oracle's view), or
whether it need only be "accessible" by a computer without having to go through another node or computer controlling
access to that device (Mangosoft's view). Neither party has, however, explained precisely how this dispute is, for purposes
of Mangosoft's infringement claims, a meaningful one. Nevertheless, because the parties seek an interpretation of that term,
the court will provide one.

The court concludes that, at the time the '377 patent issued, one of ordinary skill in the relevant art would understand that
the word "local" is used to describe computer devices that are directly attached to a single computer's processor (by, for
example, the computer's bus), without the need for an intervening communication channel. Thus, "local" devices are distinct
from "shared" or "networked" or "remote" devices which, by virtue of some intervening communication channel, might be
accessed by more than one computer (though a "local" device might also be "shared" with other nodes, through such an
 intervening communication channel).

Nevertheless, Mangosoft asserts that the use of the word "coupled" in the claim language (i.e., "local . . . memory device
coupled to said computer") suggests that the device need not be "directly attached" to the computer but may, instead,
communicate with the computer's processor in a more "indirect" manner. See '377 patent at 16:1-4. See also '229 patent at
28:29-32. The court is not persuaded. The use of the word "coupled" simply makes clear that the local memory device in
question must be "local" to the particular computer being described. It does not serve to modify or redefine the commonly
understood meaning of the word "local," as used at the time the patents issued.

The court to construe the disputed claim language as Mangosoft suggests, that construction would ignore the word
"local." In other words, by simply requiring a computer memory device that is somehow "linked" to a computer (whether
directly or indirectly), Mangosoft's construction would recast the claim so that it merely requires "a memory device coupled
to a computer." Importantly, however, the claim language requires a local memory device that is coupled to a computer. To
avoid rendering the word "local" entirely superfluous (or, at best, redundant), it must be given a meaning other than
"coupled."

Accordingly, as used in the '377 patent (as well as the '229 patent), the word "local" when used to modify a computer device
means a computer device (e.g., a hard drive) that is directly attached to a single computer's processor by, for example, the
computer's bus (though it may, of course, be accessed by other computers through any number of the interconnection

--- End ---
technologies discussed in the exhibits to the declaration of David Klausner (submitted with Mangosoft's Opposition Brief (document no. 43)). That is to say, a computer memory device that is "local" to one computer may also be shared with, or accessed by, other computers on the network (or, of course, other computers participating in the shared memory system).
language, Citrix contends that the whole point of the system claimed in Claim 1 is to store auxiliary site data on the local processor assembly so that the user can view it without downloading it over an on-line connection. As for the ordinary meaning of the term "local," Citrix points to definitions provided in various computer dictionaries in support of its construction:

local: adj. 1. In general, close at hand or restricted to a particular area. 2. In communications, a device that can be accessed directly rather than by means of a communications line. 3. In information processing, an operation performed by the computer at hand, rather than a remote computer. (Microsoft Computer Dictionary, 4th Ed. 2000)

local: located at the user's computer or site. Contrast "remote." (Barron's Dictionary of Computer and Internet Terms, 9th Edition 2006)

In support of its position that "local" in the term "local processor assembly" has no relation to a "user" or a "user's location," Rothschild turns to Claims 1-4 and 6 of the '534 Patent as well as the '534 Patent specification. Yet, Rothschild fails to explain how this intrinsic evidence supports its construction. In fact, Rothschild's proposed construction improperly ignores entirely the claim limitation "local." Rothschild's construction does not require that the "local processor assembly" be at the user's location or be accessible without an on-line connection. Accordingly, Rothschild's construction does not define a local processor assembly, but any processor assembly, even one that is remote from and not directly accessible by the user.

Accordingly, consistent with the '534 Patent's use of "local" and its ordinary meaning to one of skill in the art, the Court construes "local processor assembly" to mean "a computer at the user's location; in contrast to a 'remote' server assembly, the user can access data on the claimed 'local' processor assembly without an on-line connection."

2491

a) "Local Server Computers"

One critical element in claim 1 is the teaching of "one or more local server computers." Patent, at col. 14, ln. 3. Netword contends that a "local server computer" is nothing more than an "intermediate network node to which clients may be connected to and which provide immediate service for clients." Pl. Mem. at 8 (citing Patent, at col. 5, Ins. 60-63). According to Netword, this clause encompasses any server that "is linked to a central registry computer." Pl. Opp. Mem. at 8. Netword argues that any one of three computers in the RealNames system can be considered a "local server" -- 1) the RealNames Resolvers; 2) the Ternary Responder-Resolvers; 4 or 3) the customer web servers (e.g. IBM's web server) Netword states that all three of these computers have communications links to the central registry, and that therefore, all three can be considered "within the scope of" the "local servers" element. Pl. Opp. Mem. at 9.

4 Ternary Responders are the Resolvers that are attached to Alta Vista's web server; they are dedicated to that purpose. They are updated every few days with alias information. They are not, in any other way, connected to subscribers or users. See Decl. of Nicholas E. Popp, at PP3-7.
Centraal argues for a more limited construction of "local server computers." According to Centraal, "local server computers" refers only to "intermediary computers that cache certain frequently accessed alias records, transmit cached alias records to client[s] and requests updates of alias records from the central registry." Def. Rep. Mem. at 6 (citing Patent, at col. 6, Ins. 21-31.) Specifically, Centraal contends that its Resolver computers do not cache frequently accessed alias records, and that therefore, the accused system does not infringe the '906 patent's "local server computers" element.

The plain language of the patent makes clear that caching is critical to the function of a local server, and that unless there is caching, the device cannot be considered a local server for purpose of this patent. As the patent teaches: "The Local Servers . . . shall 'cache' Resource Alias-related information . . . ." Patent, at col. 6, Ins. 24-25. Because the patent requires caching by the local server computers of the alias information, we reject Netword's contention that a customer's web server (e.g. IBM's own web server) is the type of local server taught by the patent. A customer's web server does not receive requests from users, and therefore, the web server would never have to search its memory to match the alias with the address of the desired resource.

5 The parties do not dispute the basic definition of caching. Caching is when a computer stores information in its memory, and at the direction of a software command, searches or polls that information to find the desired result.

2492

The '906 patent, entitled "Universal Electronic Resource Denotation, Request and Delivery System," describes and claims a system for locating and retrieving information on a distributed computer system or network, such as the Internet, using so-called "aliases" (informal or incomplete designations) to denote resources whose retrieval is sought. The accused Centraal system, having the brand name RealNames, also locates and retrieves Internet information using aliases. In both systems, when a user enters an informal designation (e.g. "IBM") the systems direct the user's computer to the corresponding resource (e.g. the web site of "International Business Machines, Inc.") The dispute concerns how these systems are structured and operate.

The '906 patent system is directed to a computer network as set forth in claim 1:

1. An electronic resource denotation, request and delivery system within a network which shares information resources among its user community, comprising:

   a central registry computer whose action is directed by software components,

   one or more local server computers whose actions are directed by software components and linked to the central registry computer;

   one or more client computers whose actions are directed by software components, and linked to a local server computer;

   wherein the software components in these computers operate in concert as a distributed entity to allow client computers to denote resources with aliases that are unique across said server computers and said client computers, and further allow client computers to retrieve information corresponding to said aliases; and

   wherein said aliases are maintained in at least said central registry computer and one or more of said local server computers.

As described in the '906 patent, the central registry computer and local server computer maintain aliases and associated
The '906 specification states that the local server computer functions to "cache" or locally store frequently accessed alias records, to obtain updates from the central registry computer, and to transmit records from the cache to the client computer. The specification states that the client computer first searches its own limited database and, if the alias is not stored therein, then requests the information from the local server computer, which in turn has a limited database that may be updated by request to the central registry database. In the '906 system the local server computer only queries the central registry computer when the resource alias can not be found in the local server's database. The specification explains caching as encompassing the storage of Resource Alias-related information for a period of time or while this information continues to be accessed at a reasonable rate. That such storage is inherently limited is shown in the '906 specification's statement that "the aggregate of Resource Alias-related information at such a site directly reflects the level of use or access of a particular subset of the totality of Resource Aliases maintained in the central registry.

Netword argues that the local server computer is a site containing a limited database of aliases reflecting the level of use or access of the total of aliases maintained in the central registry. Thus the local server computer is a site containing a limited database of aliases, for claim 1 does not state this limitation. Netword argues that the functions of "caching" and "pulling" information by the local server are not required by claim 1, and that the district court impermissibly imported limitations into claim 1 from the specification and from claims 6 and 7. Centraal responds that the specification and the prosecution history stress the role of the local server as an intermediary computer with a limited database that stores frequently accessed alias records; the central registry computer updates this limited database on request from the local server. Centraal states that the district court correctly construed claim 1 as requiring that software components in the local server computer perform these functions.

Netword's argument that the district court improperly limited the scope of claim 1 by importing the caching and pulling functions from the specification misperceives the role of "claim construction" in infringement analysis. The role is neither to limit nor to broaden the claims, but to define, as a matter of law, the invention that has been patented. The claims are always construed in light of the specification, of which they are a part. See Slimfold Mfg. Co. v. Kinkhead Indus., Inc., 810 F.2d 1113, 1118, 1 U.S.P.Q.2d (BNA) 1563, 1566 (Fed. Cir. 1987). The role of the specification includes presenting a description of the technologic subject matter of the invention, while the role of claims is to point out with particularity the subject matter that is patented. See 35 U.S.C. § 112 PP 1, 2. The claims are directed to the invention that is described in the specification; they do not have meaning removed from the context from which they arose. Thus the claims are construed to state the legal scope of each patented invention, on examination of the language of the claims, the description in the specification, and the prosecution history. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250, 48 U.S.P.Q.2d (BNA) 1117, 1122 (Fed. Cir. 1998) ("The interpretation to be given a term can only be determined and confirmed with a full understanding of what the inventors actually invented and intended to envelop with the claim.").

Although the specification need not present every embodiment or permutation of the invention and the claims are not limited to the preferred embodiment of the invention, see Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186, 48 U.S.P.Q.2d (BNA) 1001, 1005 (Fed. Cir. 1998), neither do the claims enlarge what is patented beyond what the inventor has described as the invention. "Claim construction" is the judicial statement of what is and is not covered by the technical terms and other words of the claims. See United States Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568, 41 U.S.P.Q.2d (BNA) 1225, 1236 (Fed. Cir. 1997).
database of aliases separate from that of the central registry computer, and that claim 1 was incorrectly construed.

Centraal responds that the '906 specification defines the local server computer as an intermediary computer that caches frequently accessed alias records, transmits cached alias records to the client computer, and requests updates from the central registry. Centraal points to various statements to this effect during prosecution of the '906 claims. Although the specification indeed shows the alternative system which simultaneously performs both central registry and local server functions, we agree with the district court that even in that system the distinct local server functions must be present and be performed as described in the specification.

We conclude that the district court correctly construed claim 1 as requiring a local server computer that has a limited database of aliases and that may request updates from a central registry computer. The district court's construction of the claimed element "local server computer" as requiring performance of these functions is affirmed.

CLEVENGER, Circuit Judge, dissenting.

The majority holds that the district court correctly interpreted claim 1 to require a local server computer that has a limited database of aliases and that requests updates from a central registry computer. The majority also agrees with the district court's decision that the accused RealNames system lacks those functions.

I respectfully disagree with the majority. It certainly is true that dependent claims of the '906 patent, such as claim 6, define a local server computer that has a limited database of aliases and that requests updates from a central registry computer. Netword does not assert those claims against the RealNames system. The question before us is whether the admitted limitations found in the dependent claims are also present in claim 1, quoted in the majority opinion, which on its face does not restrict a local server computer to a limited database of aliases, and which does not specify the manner in which a local server receives the database of aliases that it maintains.

According to claim 1, the claimed system must include a central registry computer and at least one local server computer "wherein said aliases are maintained." Nothing in the claim language specifies that a local server computer cannot maintain the same database as is maintained by central registry computer, and nothing in the claim language precludes a local server computer from receiving its database of aliases by periodic communication from the central registry computer. In short, the mandatory limitations imposed on a local server computer in claim 1 by the district court and by the majority--a limited database of aliases and maintenance of aliases by the local server computer as a result of requests made by it to the central registry computer--are not present in the claim.

Those two mandatory limitations are also not present in the written description, which only states that the mechanisms for keeping the local server up to date "may include" (not must include) requests made by the local server to the central registry computer. The file history of the patent clearly indicates that the update function can also be provided without such "bottom up" requests, by using "top-down" communication: the applicant describes the claimed system as "a centralized, top-down hierarchy of maintaining the alias database." And the specification describes the same manner of updating the database, i.e., "push down" of information by periodic updating from the central registry to other computers in the system that meet the definition of a local server computer. See column 6, lines 15-20; column 8, lines 1-6.

At another point in the file history, the same point is made, as well as the point that the local server computer may maintain the entire database that is maintained by the central registry computer. That part of the file history, included by the applicant as a "General Comment," reads:

The system is maintained and operated using a single master database, and various distributed copies of all or part of that database which can be accessed by clients. The databases at various levels are interactively updated by obtaining changes from the master database. These changes can be obtained both on a periodic basis, and whenever the requested alias name is not located in a client's local database.

(Emphasis supplied.)
These features of the specification and of the file history are not credited by either the district court or the majority. I have no quibble with the fact that the file history and the specification disclose a local server computer that has a limited database of aliases and that achieves its updating function by making requests of the central registry computer. Unlike the majority and the district court, I would treat those disclosures as explanations of the dependent claims to which they clearly relate. In short, I detect nothing in the specification or the file history that requires a local server computer in claim 1 to have a limited database of aliases that is updated only by requests made to the central registry computer. Indeed, the file history and the specification, as demonstrated above, actually teach that claim 1 does not carry the limitations imposed on it by the district court and the majority.

Because the correct interpretation of local server computer in claim 1 includes a local server that maintains a database equal to that of the central registry computer and that achieves its updating by periodic updates pushed down to the local server by the central registry computer, the summary judgment of noninfringement must be reversed, insofar as it relates to the question of whether the accused system meets the local server computer limitation of claim 1.

B. A "Local Unit" is "an Element of the Network Separate from the Central Information Bank."

The term "local unit" appears in asserted claims 1, 3, 11, 15, 17, 19, and 23. In each of the claims, the "local unit" is the unit that is "communicatively coupled" to the central information bank. The central information bank is presumptively at a distance from the end user, whereas the "local unit" is close to the user, because it is the device from which he or she can download content from the system. In this context, the ordinary meaning of the term "local unit" is a unit that is a member of a network that includes a central information bank, but is more "local" to the user than the central information bank. Again, Digeo's proposed construction reflects the ordinary meaning. Again, Audible proposes a construction divorced from the ordinary meaning: "a self-service user interactive information vending device, such as a kiosk or book bank." Audible Br. at 15.

Although the specification does not use the term "local unit," it uses the words "unit" and "local" in a manner consistent with the ordinary meaning noted above. A "unit" is simply an element in the network. Sometimes it is an element contained within a larger element. E.g., id. at 2:52-53 (disclosing a "central processing unit contained within the Book Bank"); 7:43-45 (disclosing a central processing unit in a fileserver). In other instances, a "unit" may be a stand-alone element. E.g., id. at 14:9-10 (disclosing a separate "memory storage unit"); id. at 14:35-41 (disclosing promotional units).

The adjective "local" usually refers to a capability or feature contained within something, as opposed to a capability or feature that it must get from another unit or system. In this vein, the patent discusses a "customer service terminal" with "local processing capability," id. at 7:33-34, and a "Book Bank" that contains "local memory storage," id. at 2:44-45. In other disclosures, the specification uses "local" to refer to areas away from the central hub of a system. E.g., id. at 7:65-67 (discussing how external "network systems such as institutional or corporate network systems with local merchants terminals" can be coupled to the network).

The "local unit" of the asserted claims is a unit with particular capabilities that the surrounding claim language describes explicitly. In Claim 1, for example, the local unit must be communicatively coupled to the central computer, and it must include memory for storing information from the central computer, as well as a processor for transferring the stored information to a user's storage media. The local unit must also be configured to dynamically encrypt information.

Despite these explicit limitations, Audible insists that the term "local unit" contains implicit limitations as well. Audible focuses on the "Book Bank," which the specification describes as the "interface between the network and the user," id. at 2:37-38, and explains that it is a "self-service, user interactive information vending device."

Id. at 2:43-44. In "one embodiment," the Book Bank is housed in a kiosk that permits an in-store user to select and purchase media content. Id. at 8:14-38 & Fig. 5. The in-store kiosk is merely an embodiment of a local unit, and the court declines Audible's invitation to treat it as a limitation on the term. See Dow Chem., 257 F.3d at 1378. The specification's description of the Book Bank as a "self-service, user interactive information vending device" is not meant to limit the term "local unit,"
but rather to illustrate a local unit in accordance with the claims. Even if the court agreed that the Book Bank is the only embodiment of a local unit in the specification, the Federal Circuit has "expressly rejected" the notion that the court must construe the term in accordance with a single embodiment. Phillips, 415 F.3d at 1323. Patentees are encouraged to use examples to illuminate their claims. See id. ("[I]t is important to keep in mind that the purposes of the specification are to teach and enable those of skill in the art to make and use the invention and to provide a best mode for doing so."). Absent a clear disavowal of full scope of "local unit," the court declines to penalize the inventors of the 823 Patent for providing an example of their invention that is not as broad as the scope of the patent.

For these reasons, the court construes the term "local unit" as "an element of a network separate from the central information bank."

II

We now consider whether the district court's failure to require the "localized wireless gateway system" of asserted claims 1 and 6-8 of the '880 patent to operate with a range of a "few feet" (discussed above) was error. Again we need not decide whether raising this claim construction issue at the Markman stage excuses compliance with the requirements of Rule 51. This is so because the trial record establishes that it indeed would have been futile for Vonage to object at the jury charge conference to the district court's construction of the claim term "localized wireless gateway system," on the ground that the district court failed to limit the range of such a system to a "few feet." 5

--- Footnotes ---
5 During the trial Vonage sought to present expert testimony that the claims required that the patented system was limited to a range of a "few feet" and that the Vonage system was not so limited. Verizon's counsel objected, arguing that "[t]he Court has already construed the claim and there is no need for anything with respect to the prosecution history. The Court has already looked at it and, frankly, rejected this proposed limitation which Vonage offers." J.A. at 6046 (1144:10-14). In response the district court sustained Verizon's objection. Verizon itself clearly understood the district court to have announced that the construction of this term was finally determined: later in the trial Verizon again argued that the claim construction of this term was finally determined and not open to being reargued at trial, and that Vonage testimony regarding the operating range of one of its devices should be excluded. See J.A. at 6061. Under these circumstances a further objection would have been futile, and the claim of error was preserved.

--- End Footnotes ---

Vonage proposed construing the term "localized wireless gateway system" to mean "a plurality of base station transceivers with a limited range of a few feet and a packet service gateway that compresses/decompresses and packetizes voice signals." Appellants' Br. at 26 n.7 (emphasis added). Vonage argues that the gateway is limited to a transmission range of only a few feet because of statements made by the patentee during prosecution of a related patent of the same family as the '880 patent that so limited the term. The district court instructed the jury to interpret the term "localized wireless gateway system" as: "a system which is fixed to a limited or local area and which provides wireless service coverage within that local area," and did not include a "few feet" limitation. J.A. at 6623.

We have held that a statement made by the patentee during prosecution history of a patent in the same family as the patent-in-suit can operate as a disclaimer. Microsoft Corp. v. Multi-tech Sys., Inc., 357 F.3d 1340, 1350 (Fed. Cir. 2004) (statement made during prosecution of related patent operated as a disclaimer with respect to a later-issued patent). To operate as a disclaimer, the statement in the prosecution history must be clear and unambiguous, and constitute a clear disavowal of scope. Id., at 1356-57.

--- Footnotes ---
6 See Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1371-72 (Fed. Cir. 2003) (statements made during prosecution of parent patent surrendering subject matter binding on later interpretation of the claims); Augustine Med., Inc. v. Gaymar Indus., Inc., 181 F.3d 1291, 1300 (Fed. Cir. 1999) ("[T]he prosecution history of a parent application may limit the scope of a later application using the same claim term."); see also Phillips, 415 F.3d at 1317 ("[T]he prosecution history can often
inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be.

Chimie v. PPG Indus. Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005) ("The purpose of consulting the prosecution history in construing a claim is to exclude any interpretation that was disclaimed during prosecution.") (internal quotation marks omitted).

Such a clear disavowal has occurred here. The claims of the '880 patent originated in U.S. patent application No. 08/814,291 ("291 application"). During prosecution the examiner issued a restriction requirement on the ground that the '291 application covered two independent and distinct inventions. The applicants then filed divisional application No. 09/363,750 ("750 application"), pursuing some of the claims of the original '291 application, which was allowed as the '880 patent. The remainder of the claims of the original '291 application in turn matured into U.S. Patent No. 6,542,497 ("497 patent"). The claims of both applications require a "localized wireless gateway system." During prosecution of the '291 application the applicants' claims were rejected based on prior art wireless gateway systems.

The applicants gained allowance of the claims of the '291 application after stating that the prior art systems "all appear to be directed to non-localized systems," and that the "present invention," by contrast, was "restricted to operate within a few feet from a base station (i.e. wireless handsets)." J.A. at 7191. Thus the applicants stated:

Even further, [the prior art references] all appear to be directed to non-localized systems. More specifically, Applicant respectfully submits that although the term "wireless" is used in [the prior art references], "wireless" does not mean "local wireless," as claimed by the present invention, in the sense of a cordless phone that is restricted to operate within a few feet from a base station (i.e. wireless handsets). The term "wireless" in [the prior art references] is directed to systems having wide-ranging networks of switching machines.

Id. (emphasis added). The applicants also stated:

[A prior art reference] arguably appears to disclose a local cellular or local wireless system, such as, for example, a cordless phone that is restricted to operate within a few feet from a base station. However, [the reference] does not disclose anything related to voice-over-internet or voice-over-internet protocol.

Id. at 7189 (emphasis added). We think that this language clearly disclaimed coverage of systems operating with a range greater than a "few feet," and that the district court erred in failing to construe the localized system as requiring a range of a few feet.

Verizon nonetheless argues that the disclaimer in the '291 application process (leading to the '497 patent) should not apply to the '880 patent because it occurred after the '880 patent issued. We reject this argument. As we held in Microsoft, where we faced the same situation (disclaimer occurred after patent-in-suit had issued), "we think that it is not unsound to apply the same interpretation to th[e] patent[-in-suit]," "even though [that] patent had already issued." 357 F.3d at 1350.

Showing that the district court erred in instructing the jury is not sufficient to warrant a new trial, however. Vonage also must show it was prejudiced by the district court's error. 7 Vonage argues that it was prejudiced by the district court's error because several of its devices operate with a range greater than "a few feet" and, therefore, had the district court adopted Vonage's proposed instruction, those devices would not have been shown to infringe. As discussed above, because of the district court's claim construction Vonage was not able to introduce evidence that its telephones did not operate beyond a range of a "few feet." The record also clearly shows that it was prepared to offer such evidence. Under such circumstances we believe that Vonage has satisfied the requirement of prejudice. The district court's error in failing to limit the localized system to one with a range of a few feet therefore requires a new trial under the correct construction.

Cir. 2002) ("[T]o warrant a new trial, Ecolab must show that the erroneous jury instruction was in fact prejudicial. When the error in a jury instruction could not have changed the result, the erroneous instruction is harmless.") (internal quotation marks omitted); Advanced Display Sys., 212 F.3d at 1281 ("A party seeking to alter a judgment based on
erroneous jury instructions must establish that . . . the errors had prejudicial effect.); Biodex, 946 F.2d at 854 (holding that a party challenging jury instructions "has a two-fold task [and] must both prove the jury instructions read in their entirety were incorrect or incomplete as given and then demonstrate that the suggested instruction could have cured the error"); 11 Charles A. Wright et al., Federal Practice and Procedure § 2886 (2d ed. 1995).

Since a new trial is necessary on the issue of infringement with respect to the '880 patent, we believe it appropriate to interpret other claim terms that are disputed by the parties on appeal and are likely to be at issue in the new trial. Vonage challenges the district court's construction of the term "localized wireless gateway system" of asserted claims 1 and 6-8 of the '880 patent (the same term pertinent to the "few feet" limitation) on the ground that the district court erred in failing to require that the patented gateway system "compress[/decompress[/ and packetiz[е] voice signals." Appellants' Bf. at 26, n. 7. We agree. The "Disclosure of the Invention" section of the '880 patent begins with a description of the gateway system of the "present invention." '880 patent col.4 ll.1-6. In the course of describing the "present invention," the specification then states that "]the gateway compresses and decompresses voice frequency communication signals and sends and receives the compressed signals in packet form via the network." Id. ll.12-15. When a patent thus describes the features of the "present invention" as a whole, this description limits the scope of the invention. Honeywell Int'l, Inc. v. ITT Indus., 452 F.3d 1312, 1318-19 (Fed. Cir. 2006); Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343 (Fed. Cir. 2001) ("[T]he characterization of the coaxial configuration as part of the 'present invention' is strong evidence that the claims should not be read to encompass the opposite structure."); see also Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1368 (Fed. Cir. 2007) (specification's description of a "critical element" found limiting). Thus the term "localized wireless gateway system" must be limited to one performing compression and packetization functions at the gateway.

8 Verizon argues that the "present invention" language is not significant in this case because the specification merely refers to "one aspect" of "the present invention." But that "aspect" is the "localized wireless gateway system," the very claim term that is at issue here. See '880 patent col.4 ll.6-7 ("Thus, in one aspect, the present invention relates to a localized wireless gateway system.").

Vonage also argues that the district court erred in failing to require that the "localized wireless gateway system" have multiple base station transceivers, because the specification states that "]the inventive system includes a plurality of base station transceivers." '880 patent col.4 ll.7-8. However, we have held that a limitation requiring a "plurality" may be satisfied by a single object. Interactive Gift Express, Inc. v. Compuserve Inc., 256 F.3d 1323, 1335 (Fed. Cir. 2001) ("[T]he reference to a plurality . . . can consist of one material object."). Therefore, Vonage has failed to show error in the district court's interpretation.

Finally, Vonage challenges the district court's construction of the claim term "wireless telephone terminal" of asserted claims 1 and 6-8 of the '880 patent. The district court instructed the jury to construe the term as "a telephone that communicates through radio signals to provide two-way voice communication." J.A. at 6623. Vonage alleges that the district court improperly failed to require that the "Wireless Telephone Terminal" roam among a plurality of base stations. Vonage's argument is meritless. Although the specification on occasion makes reference to "roaming" telephones, Vonage fails to identify language that would require roaming in every case. Vonage argues that because the patent requires multiple base stations, telephones must then roam between base stations. But we have rejected the contention that there must be multiple base stations, and the claims do not require roaming.

We conclude that the district court erred in construing the term "localized wireless gateway system" by failing to require that the system be limited to an operating range of a few feet and perform compression and packetization functions, but hold that in other respects there was no error.
8. locally generated video signal (‘825 Patent only)

The plain and ordinary meaning of "locally generated video signal" is a video signal that is generated at the headend, i.e., locally to the switching system. To fully understand the nature of this signal, it is necessary to look to the specification. According to the specification, the "locally generated video signal ..." corresponds to one of a plurality of digitally formatted video signals stored locally at or near the switch." ‘825 Patent, col.2, 11.40-42. In contrast to the "local video signal" of the ‘883 Patent, the "locally generated video signal" is not restricted to gap filler. Rather, the preferred embodiment of the ‘825 Patent discloses an insertion system in which some of the commercials from the stream comprising the commercial insert video signal can be replaced by commercials from an alternate stream compiled from digitally formatted signals that are stored at the headend. A gap filler, such as a still frame video, is also disclosed. See id. col.6, 1.22 to col.7, 1.64.

Additionally, the "locally generated video signal," also referred to in the patent as "local video signal" or "third video signal," is the subject of two means-plus-function elements, and its meaning must be consistent with the meaning of these elements. First, the claim recites a "means for storing" the "digitally formatted" local video signals. Id. col.11, 1.11. Second, the claim recites a "means for obtaining from said means for storing, and outputting" the local video signals. Id. col.11, 11.13-14.

The specification describes the structure corresponding to the functions of storing, and obtaining from storage, the local video signals: A computer located at the headend contains a microprocessor that "obtains digitally formatted video signals from the memory, and applies those signals to the third video inputs ... via digital video interface ("DVI") boards. Id. col.4, 11.59-66. The computer includes both digital commercial insert ("DCI") memory and a mass storage digital video source. See id. col.4, 1.66 to col.5, 1.14. The DCI memory can be used to store "significant amounts of digitally formatted video signals such that these digitally formatted signals can be quickly manipulated and loaded into various DVI boards." Id. col.4, 1.68 to col.5, 1.3. The mass storage source is slower, and may consist of RAM, a hard disk, a digital network, a CD-ROM, or a digital tape player. See id. col.5, 11.8-13, 15-23 (Table 1).

Defendants assert that the local video signal is used as an alternative output to the commercial insert signal during a local avail and that the same advertisement must be inserted into all local time avails offered concurrently on all programmed channels. It is clear from the claim that the local video signal is provided as an alternative to the commercial insert signal, either of which can be selected for insertion into a local avail. However, the claim does not state the additional limitation that the same advertisement from the local video signal must be inserted on all channels. Indeed, an illustration is provided in the preferred embodiment in which different digital segments are concurrently shown on different channels. In fact, the specification expressly provides that

the video switch system of the present invention provides greater flexibility than the video switch system disclosed in the [‘883 Patent] ... In the present system, multiple DCI sequences can be played through one or more of the video switches and, hence, channels broadcast by the cable system. In contrast, all the switches in the second input state must play the same ACI [commercial insert signal] segment.

Id. col.8, 1.64 to col.9, 1.3. Thus, while the same commercial insert signal is sent to all switches, different locally generated video signals can be inserted by different switches.
inconsistent with the claims' requirement that the PRN generator device be in a sealed casing, with the specification's teaching that the PRN generator device is installable by the user on-site, and with the depiction in Figure 1 of the PRN generator device 22 as being separate from the CPU 12 and the main memory 14. Secondly, he argues that the court's construction of the phrase "located in the computer" is inconsistent with the court's construction of the term "computer" because the latter does not include the CPU circuit board. Thirdly, he urges that he did not distinguish his invention over Thomas during prosecution on the basis of the location of the PRN generator device.

Rainbow responds that the court's construction is the unambiguous result of the intrinsic evidence. Rainbow draws attention to the fact that the patent claims refer to a "computer," whereas the specification describes a "computer system" with reference to Figure 1. Thus, according to Rainbow, a "computer" is something less than a "computer system." Rainbow also defends the court's construction of the phrase "located in the computer" by arguing that it is consistent in part with the court's definition of the term "computer," that Pickholtz's broader construction would render the phrase superfluous, and that the prosecution history compels the court's construction.

In interpreting claims, a court "should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conceptions, Inc., 90 F.3d 1576, 1582, 39 USPQ2d 1573, 1577 (Fed. Cir. 1996). Only if a disputed claim term remains ambiguous after analysis of the intrinsic evidence should the court rely on extrinsic evidence. 90 F.3d at 1583, 39 USPQ2d at 1577.

We agree with Rainbow that the proper construction of the term "computer" follows without ambiguity from the intrinsic evidence; however, that construction is not as Rainbow contends. Instead, we agree with Pickholtz that the '353 patent uses the terms "computer" and "computer system" as synonyms. Although we would typically be inclined to give meaning to the word "system," rather than regard it as surplusage, see Elekta Instrument, 214 F.3d at 1307, 54 USPQ2d at 1913, the patent in this case provides no indication that the two terms mean different things. Instead, the patent uses the term "computer system" in the specification and the term "computer" in the claims; nothing in the patent itself explicates their relationship or indicates any difference in meaning.

The remaining intrinsic evidence, the prosecution history, does not compel a different result. Pickholtz originally submitted the claims in vastly different form, referring to the invention as part of a "data processing system" and reciting "a pseudorandom number generator at the data processing system." Pickholtz changed the claims into their allowed form after the PTO rejected the claims as being obvious in light of the Thomas patent. Although Thomas clearly uses the terms "computer" and "computer system" in a part-whole relationship, '519 patent at fig. 2, col. 5, ll. 18-25, Pickholtz did not distinguish his invention over Thomas on the basis of any difference between a "computer" and a "computer system." Despite Pickholtz's argument to the PTO that Thomas lacks a "[PRN] generator device located in the computer," Thomas clearly discloses PRN generating software, and that software is located in the core "computer" part of Thomas's "computer system." '353 patent at col. 4, ll. 37-48 (disclosing that the PRN generator is software loaded into the working memory and executed by the CPU). Pickholtz's argument, although inaptly stated, can only be understood to mean that he considered Thomas's software to not contain a PRN generator at all. Thus, although Pickholtz may have been casual and gratuitous in amending his claims and making arguments to distinguish over the Thomas patent, nothing in the prosecution history convinces us that the terms "computer" and "computer system" in the '353 patent have different meanings, even if they might have in the Thomas patent.

Accordingly, the district court erred when it concluded that the intrinsic evidence unambiguously imparted different meanings to the terms "computer" and "computer system." On the contrary, they are used interchangeably in the '353 patent. Because the meaning of the term "computer" can be resolved from the intrinsic evidence alone, we need not rely on any extrinsic evidence, see Vitronics, 90 F.3d at 1582, 39 USPQ2d at 1577, which in any event is not conclusive. While Pickholtz advanced a number of technical dictionaries defining "computer" as inclusive of peripherals, as well as expert testimony to the same effect, Rainbow disputed the meaning of those technical dictionaries and offered contrary expert testimony.

Furthermore, as the patent's specification includes one peripheral, a disc "reading means," as part of the "computer system," '353 patent at col. 6, ll. 11-12; fig. 1 (disc 18), the synonymous term "computer" in the claims must include at least some peripherals. However, the term "computer" cannot be so unbounded as to include all devices connected in any way to the CPU, or else the phrase "located in the computer," and particularly the word "in," would become meaningless. A peripheral distantly connected reasonably cannot be "in the computer." Therefore, not everything somehow connected to a CPU can be
a peripheral in the sense of being part of the "computer." At the very least, however, the term "computer" encompasses peripherals that are within a reasonable proximity to the CPU and its main memory and directly connected to the CPU or the CPU circuit board. We need not, and indeed cannot, attempt to precisely define which peripherals may be part of the "computer" as used in the '353 patent for all cases. See EMI Group N. Am. v. Intel Corp., 157 F.3d 887, 895, 48 USPQ2d 1181, 1187 (Fed. Cir. 1998) ("It is irrelevant whether the district court achieved a technologically perfect definition, because there is no dispute that the corresponding step of the Intel process is within the literal scope of [the claim limitation]. Thus we do not attempt to decide, de novo, the correct meaning of [the claim limitation]."). The accused device in this case is certainly such a peripheral, as it indisputably connects substantially directly to the CPU circuit board and is in close proximity to the CPU.

In summary, we construe the phrase "located in the computer" to mean "located in the CPU, main memory, the CPU or main memory circuit boards, or qualifying peripherals" as indicated above. In view of that construction, it necessarily follows that the Rainbow dongle, when attached to a computer port, is such a peripheral and is therefore "located in the computer." No reasonable juror could conclude otherwise.

Claim 38 describes "[a] vending machine as claimed in claim 1, wherein said control unit is located remote from said vending machine." ('400 Patent 18:17-19). In disputing the proper interpretation of the phrase "located remote from said vending machine," the parties raise essentially the same points made with respect to claim construction of the term "vending machine" and whether it must be construed as a single unit. The reasoning set forth in the construction of "vending machine" as well as the construction of "customer interface" dictate a similar finding in this case, namely, that the control unit is not simply remote from other components but -- as plainly stated in the claim -- from the vending machine itself.

Thus, the following construction:

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Located remote from said vending machine</td>
<td>Having a different physical location than the vending machine</td>
</tr>
</tbody>
</table>

TERM # 6: "located remotely" - Again, this not a highly technical term, and no special meaning is assigned to it by the intrinsic evidence. In the context of the patent, the bidder's computer and the issuer's computer need only be located in different places. There is nothing in the patent to preclude them from being in the next room, across town, or in different countries. Certainly, defendants have provided no support from the intrinsic record to support their position that the computers must be "far away" from each other. This phrase means: "not in the same location."

F. "Locating"

Next, the Court interprets the ubiquitous claim term number 7, "locating." The parties dispute whether this claim term dictates that methods of "locating" must involve locating the boring tool in either two or three dimensions or only in three dimensions. The Court's short answer is, it depends. This claim term arises throughout the claims of many of the patents. For example, Claim 1 of the '589 Patent contains the following language:

1. A method of locating a generally horizontally extending dipole magnetic field transmitter which is disposed underground within a particular vertical transmitter plane defined by its dipole axis and which generates a magnetic dipole filed containing magnetic flux lines, each one of which extends from one end of the transmitter around to its opposite end and all of which are spaced from one another about the dipole axis of said transmitter, said method comprising the steps of:
(a) providing a locating receiver including an antenna arrangement and means for producing

(i) a first signal . . .;

(ii) a second signal . . .;

(iii) a third signal . . .;

(b) moving said locating receiver above the ground at a predetermined orientation and . . .;

(c) thereafter, again moving said locating receiver above the ground at said predetermined orientation and within a second vertical receiver plane transverse to the vertical transmitter plane . . .;

(d) thereafter, still again moving said locating receiver above the ground within a third vertical receiver plane transverse to the vertical transmitter plane containing the axis of said transmitter either ahead of or behind the transmitter with respect either ahead of or behind the transmitter with respect to its general direction of movement so as to cause said receiver to produce successively first, second and third signals in a predetermined way which will establish a point above ground directly over the transmitter.

(emphasis added). In this case, it is clear that what is being achieved is the location on the surface directly above the boring tool, which is underground. Location "on the surface" is two dimensional. This is true for the term in the context of many other claims. See '678 Patent, Claim 1; '780 Patent, Claim 1; '025 Patent, Claim 1 ("method of finding a point on the ground" over the boring tool); '538 Patent, Claim 1. However, in Claim 8 of the '539 Patent, it is clear that the method of locating also involves a depth calculation once the place on the ground above the boring tool has been located. Therefore, whether this claim term refers to a three dimensional locating method or a two dimensional locating method will depend on the context in which the term is used. This is supported by appropriate references in the specification as well. See '589 Patent, Col. 14:9-19.

The Court will therefore in part adopt the plaintiff's construction, defining "locating" as the act of determining the location of the boring tool relative to a known position or reference.

2501

h. "locating said predetermined position"

The next term is "locating said predetermined position." The plaintiffs argue that this term means "establishing operand or instruction supply within the instruction group that includes the operand or instruction being accessed at the predetermined position." The defendants argue that the term means "using the results of the decoding step to ascertain the address of the accessed operand or instruction by referencing the current instruction group address rather than the current executing instruction address without adding or subtracting an operand with the current Program Counter." The parties make similar arguments with regards to "predetermined position" as discussed in the previous section.

The plaintiffs oppose the additional limitation in the defendants' proposed construction of "without adding or subtracting an operand with the current Program Counter." According to the plaintiffs, this would exclude a preferred embodiment from the specification stating that the processor "treats the three operands similarly by adding or subtracting them to the current program counter." '584 patent, 11:13-15. In support of this additional limitation, the defendants argue that additions and subtractions are done only at assembly/linking and not at run time. See '584 patent, 20:43-50.

The defendants' construction improperly incorporates a limitation from the preferred embodiment. The Court construes the term to mean "locating the operand or instruction within the instruction group that includes the operand or instruction being accessed at the predetermined position."
The parties dispute centers on the word “location.” Plaintiffs contend that “location” means the place in the memory where information is stored. In other words, information is stored in a directory of folders or subfolders designated for particular types of data. Reply Brief, Ex. 21 at ¶¶ 22-24. Defendants contend that the claim requires song and advertising data to be stored at “separate structural location,” i.e., a different physical location. Resp. Brief at 25. They base their contention on language in the specification stating that “[t]he advertisement data is stored at a separate location on the storage unit 93 so that they can be easily located and tracked.” Opening Brief, Ex. 6 at 9:11-12. Defendants do not offer any evidence to support their contention that a person of ordinary skill in the field would understand that a separate “location,” as described in the specification, means a separate physical location.

The Court concludes that a person of ordinary skill in the field would understand that items stored in separate locations within a computer's memory are divided into folders and subfolders. The Court therefore adopts plaintiffs' proposed construction.

E. "location-based service"

The term "location-based service" appears three times in claim 23 of the '763 patent: "A method of providing a location-based service comprising the steps of . . . receiving a request for a location-based service from the mobile unit; . . . responding to the request for a location-based service based on the comparison." "Location-based service" is not found in the specification. The plaintiffs' proposed construction is "a service providing information based, at least in part, on the location of the mobile unit," and the defendant's proposed construction is "wireless communications service provided based, at least in part, on the location of the mobile unit."

The parties reiterate their dispute, discussed in "service provider," over whether "service" should be limited to "wireless service." For the reasons discussed above, the court concludes that "service" is not limited to only wireless service. Thus, "location-based service" is construed to mean "a service providing information based, at least in part, on the location of the mobile unit."

B. Methods of Routing Customer Calls

Before construing the claims of the '267 Patent that are at issue in this case, it is worthwhile, first, to describe the two types of call-routing systems at issue in this case. The first method, which the Court will refer to as the "Real-Time Computation Method," is a means by which incoming calls are routed to the dealer located the shortest geographic distance to the caller by using a mathematical calculation, or algorithm. The first six digits of the caller's telephone number, or NPA-NXX, 5 are compared to a V-H File, which yields the vertical (latitude) and horizontal (longitude) coordinates ("V-H coordinates" or "V-H Coordinate System") of the LCO that services the caller's line. 6 The system employing this method then compares the V-
H coordinates of the caller to the V-H coordinates of all prospective dealers using a "Nearest Neighbor" algorithm to identify the one dealer closest to the caller. This entire process takes place while the caller is on the line. See ATI's Brief at 4; Sprint's Mot. at 10.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 "NPA" is the designation given to the first three numbers, or area code, of a telephone number. The next three numbers, designated "NXX," serve as the code for the local central telephone office ("LCO") that services the line. Each LCO is located approximately 1.5 miles from the telephone that the office serves.

Although the '267 Patent refers to the LCO code as "NNX," the parties consistently refer to this code as "NXX" throughout their filings. Accordingly, except when quoting directly from the '267 Patent, the Court will adopt the parties' position and will refer to this code as "NXX" throughout this Memorandum and accompanying Order.

6 ATI obtains the V-H coordinates of the LCOs on electronic media from Bell Communications Research Company. The system is set up so that given the NPA-NXX of a full telephone number, the system will yield the V-H coordinates for the local central office that services that telephone number. Sprint's Ex. B, col. 8, lns. 30-36.

Therefore, by using the V-H Coordinate System, one could determine the geographic location of a potential customer or dealer within a radius of 1.5 miles if the NPA-NXX of the customer or dealer is ascertained. See supra note 5.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

An alternative method, which the Court will refer to as the "NPA-NXX Table Look-Up Method," routes incoming calls to a preassigned destination, based upon the caller's NPA-NXX. In essence, the system utilizing this method determines the NPA-NXX of the caller, scans a database for the caller's NPA-NXX, and locates the dealer that has been assigned to the caller's NPA-NXX. See ATI's Brief at 4-5.

The parties agree that the '267 Patent discloses use of the Real-Time Computation Method to route customer calls to the nearest dealer. The essence of the claim construction dispute in this case, however, is whether the '267 Patent discloses use of the NPA-NXX Table Look-Up Method, as an alternative embodiment of the invention, to achieve the same goal.

C. Claims 1, 11, and 14

Of the three elements that comprise Claims 1, 11, and 14, paragraph (b) of these claims is the most significant in this case. This paragraph discloses a "location determining means," by which "information associating each second party [dealer] with a geographic location" is used to identify the dealer located "the shortest geographic distance" from the caller. In addition, Claims 3, 12, and 16, each dependent on Claims 1, 11, and 14 respectively, elaborate that the location determining means referred to in Claims 1, 11, and 14 includes a comparison means for comparing the caller's NPA-NXX against a dealer database to find the one dealer located the shortest geographic distance from the caller. Sprint's Ex. C, col. 1, lns. 64-68, col. 2, lns. 32-37 and 65-67, col. 3, lns. 1-2.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

7 Claims 1 and 14 use the phrase "location determining means," while Claim 11 uses the phrase "determining the location." The Court sees no material distinction between these phrases in the context of the claims and, accordingly, will attribute the same meaning to both.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

1. Claim Language

Looking solely at the claim language, the first source a court should consider in interpreting a patent claim, the Court cannot say, with any degree of certainty, that these claims exclude the NPA-NXX Table Look-Up Method of routing a caller to the nearest dealer. Indeed, as ATI argues, the plain language of these claims "is broad enough to read on both the real time calculation and table look-up methods." ATI's Reply at 4. However, the Court may not merely consider the possible
interpretations of the claims, but must, instead, interpret the claims as a matter of law. The claim language is simply not
dispositive of whether Claims 1, 11, and 14 teach the use of the NPA-NXX Table Look-Up Method to route incoming calls
to the nearest dealer. Indeed, there is no language in these claims that explicitly refers to either method as a "location
determining means." Accordingly, the Court will look to the specification and prosecution history of the '267 Patent for
further guidance on this issue.

2. Patent Specification

The Court finds nothing in the specification that describes, discloses, or suggests an embodiment of the invention that would
utilize the NPA-NXX Table Look-Up Method to route calls to the geographically nearest dealer. Indeed, the specification is
rife with references that convince the Court that the location determining means identified in Claims 1, 11, and 14 is
comprised of a comparison means, which employs the Real-Time Computation Method, using the V-H Coordinate System
and a "Nearest Neighbor" algorithm, to route calls to the geographically nearest dealer.

The '267 Patent specifies as follows:

This invention improves upon all present methods of dealer referral by embodying the following features:

1. The telephone is answered automatically by a computer . . . . The computer interacts with the caller to acquire . . . the
callers [sic] TELEPHONE NUMBER. Given the first six digits (termed the NPA-NXX) of the caller's telephone number,
the system can determine the caller's location by reference to a telephone company computerized document called the "V-H"
file. . . .

The V-H is a complex transformation of latitude and longitude which is used by long distance telephone companies to
compute the distance between a caller and a called party and thereby to assess the charge for the call. The invention uses the
V-H coordinate system to refer a caller to a dealer.

Sprint's Ex. B., col. 2, lns. 59-end & col. 3, lns. 1-13 (emphasis added). The specification elaborates further:

In essence, the invention provides an improvement over present systems for dealer referral. It answers telephone calls
automatically by computer, it employs telephone company Custom Call Routing to distribute the calls to Routing Centers
in an economical manner, it provides further routing according to the V-H coordinate system based on NPA-NXX, and
actually connects the caller to his nearest dealer instead of merely giving the dealer's identification to the caller.

Id. at col. 5, lns. 57-65 (emphasis added). In other words, the '267 Patent specification makes it clear that use of the V-H
Coordinate System is the sine quo non of the invention. It is the V-H Coordinate System that associates each dealer with a
particular geographic location. 8 Therefore, it is the use of the V-H Coordinate System that distinguishes the '267 Patent
from all previous methods of dealer referral. By using the V-H coordinates of the callers and dealers, the ATI system
guarantees that every caller will be routed to the geographically nearest dealer, a function that was not necessarily
guaranteed by the AT&T system. 9

Additional language in the specification makes it equally clear that the invention utilizes the Real-Time Computation
Method, with little or no indication in the specification that the NPA-NXX Table Look-Up Method is an alternative means

- 2836 -
to achieve the desired result. In the portion of the specification entitled "Summary of the Invention," it is taught that "the computer proceeds to search the product/services -- dealers database based upon the V-H coordinates. It calculates the distance between several potential dealers and the caller and chooses the closest one to the caller." Id. col. 3, Ins. 61-65 (emphasis added). The specification, under the subheading "Detailed Description of the Preferred Embodiment," provides further: "The caller's NPA-NNX is searched in the V-H file and the search yields that caller's V-H coordinate. Then, using a 'Nearest Neighbor' algorithm . . . , the system chooses a dealer nearby or nearest to the caller." Id. col. 8, Ins. 37-41 (emphasis added).

The only reference in the '267 Patent specification that arguably refers to the NPA-NXX Table Look-Up Method is at column 6, lines 13 through 59, which recites how the system can be used for "territorial routing." This portion of the '267 Patent provides, in pertinent part: "The system enters the file with the caller's NPA-NNX as the argument and retrieves the distributor's telephone number as the function." Sprint's Ex. B, col. 6, Ins. 57-59. Sprint argues, however, that ATI's reliance on this portion of the specification is inappropriate, because ATI abandoned the claim in the '267 Patent that related to territorial routing on reexamination. See Sprint's Ex. J. at 8.

Reading the specification as a whole, the Court is unpersuaded by ATI's argument that the three-line reference to the NPA-NXX Table Look-Up Method noted above, in the context of a claim abandoned by ATI on reexamination, supports the position that the '267 Patent discloses the NPA-NXX Table Look-Up Method as an alternative location determining means. Moreover, in the portion of the specification that is captioned "Alternative Embodiment of the Invention," Sprint's Ex. B, col. 27-28, there is nothing that would support such a position. Indeed, if ATI contemplated using the NPA-NXX Table Look-Up Method as an alternative location determining means, this portion of the specification would have been the logical place to make its intentions known.

The above references, and others, convince this Court that the location determining means in Claims 1, 11, and 14 does more than merely match the NPA-NXX of a caller with a preassigned dealer. The invention actually determines, from a list of dealers, the one dealer located the shortest geographic distance from the caller. The invention accomplishes this task by employing the Real-Time Computation Method, using a "Nearest Neighbor" algorithm to compare the V-H coordinates of the caller to the V-H coordinates of the dealers. Id. at col. 8, Ins. 37-42; Sprint's Ex. C, ABSTRACT.

3. Prosecution History

The prosecution history of the '267 Patent, detailed above, supports the Court's interpretation of Claims 1, 11, and 14. On reexamination, ATI needed to overcome the challenges raised by its competitors. Specifically, ATI's system was challenged as being unpatentable in light of an already existing call-routing system employed by AT&T. As noted above, the AT&T system employs the NPA-NXX Table Look-Up Method to route calls to preassigned locations. The AT&T system, however, does not include a means for assigning specific geographic locations to the dealers, so as to route calls to the dealer located the shortest geographic distance from the caller. This was the reason for patentability of the claims in the '267 Patent noted by the Examiner. ATI's Ex. O; Sprint's Ex. Y; see Sprint's Ex. CC.

ATI relies on a portion of the Amendment in which it argued that "the use of the first six digits for the purpose of routing a call was clearly not contemplated at the time of the [AT&T] invention." Sprint's Ex. J at 29. Although ATI acknowledged that the AT&T system contemplates using a "caller's number or a part of a caller's number such as the area code" in routing customer calls, see Sprint's Ex. P, col. 2, Ins. 46-46; Sprint's Ex. J at 28, ATI insisted that, at the time the AT&T system was invented, routing a call based on the area code and another portion of the caller's number was impracticable -- that "one of ordinary skill in the art would not modify the AT&T system to further include a table look-up based on area code and another portion of the caller's number since the system would be too cumbersome and not economically feasible." Sprint's Ex. J. at 30. ATI contends that this portion of the prosecution history supports its argument that the '267 Patent discloses the NPA-NXX Table Look-Up Method as an alternative means of routing customer calls to the nearest dealer. After reading this passage of the prosecution history in context, however, the Court finds ATI's suggestion unpersuasive.

The portion of the Amendment relied upon by ATI was an apparent attempt by ATI to contradict the Examiner's conclusion that, at the time the AT&T system was invented, it was obvious that the system could be modified to route a call to the nearest dealer, which is the primary function of AT&T's system. Sprint's Ex. DD at 2. 10 If this were the case, as the Examiner concluded, AT&T's system would be unpatentable under 35 U.S.C. § 103. However, nowhere in the portion of the Amendment relied upon by ATI, or in any other part of the prosecution history of the '267 Patent is there any indication by ATI, Riskin,
or the Examiner that the '267 Patent teaches the use of the NPA-NXX Table Look-Up Method as a means to route calls to
the geographically nearest dealer. On the contrary, on reexamination, ATI consistently maintained that its system "uses
a nearest neighbor algorithm in combination with the V-H Coordinates System." Sprint's Ex. J. at 13-15, 29. Accordingly, the
Court finds ATI's reliance on this fragment of the prosecution history unpersuasive.

10 In summarizing its arguments, ATI stated: "The AT&T system does not include any means whatsoever for determining
the geographic position of the second parties with sufficient accuracy to locate the one second party which is located the
shortest geographic distance from the location of the first party." Sprint Ex. J. at 30 (emphasis in original).

4. Conclusion

In short, the Court is satisfied that there is nothing in the specification or the prosecution history of the '267 Patent that
would support the broad interpretation of Claims 1, 11, and 14 advocated by ATI. Therefore, it is unnecessary for the Court
to look to the many conflicting expert opinions offered by the parties for further guidance in interpreting these claims. See
construed to recite a "location determining means" that employs the Real-Time Computation Method, using a "Nearest
Neighbor" algorithm to compare the V-H coordinates of a caller to the V-H coordinates of the dealers to find the one dealer
located the shortest geographic distance from the caller. 12

11 There is uncontradicted extrinsic evidence, however, that clearly supports the Court's legal construction of these claims.
ATI's sales literature, referring to its call-routing system as "InstaLink," provides:

Conventional search processes require that a table be created which assigns each of 48,000 telephone exchanges to
specific dealers. The information on these tables is static and any changes require revising the table itself. In contrast,
InstaLink uses a proprietary nearest neighbor algorithm to search the caller's area for "nearest dealer candidates" and to
calculate the geographic distance between the caller and each dealer that was identified to determine the closest appropriate
location.

Sprint's Ex. M (emphasis added). Clearly, at least in its sales literature, ATI attempted to distinguish its call-routing system
from its competitors' systems by disavowing use of the NPA-NXX Table Look-Up Method.

12 In reaching this conclusion, the Court rejects ATI's argument that the doctrine of claim differentiation precludes a legal
construction of Claims 1 and 14 that would limit these claims to the Real-Time Computation Method. To adopt ATI's
argument would be to ignore the clear language in the specification and the prosecution history of the '267 Patent.
Accordingly, the Court finds ATI's argument unpersuasive. See California Medical Prods., Inc. v. Tecnol Medical Prods.,
Inc., 921 F. Supp. 1219, 1232 (D. Del. 1995) ("The true test must be that claims are defined and construed as they were
drafted by the patent holder in light of the claim language, specification, and the prosecution history. Where the
specification or prosecution history provide a basis for reading a limitation into a claim, the presumption provided by the
doctrine of claim differentiation may be overcome."); Total Containment, Inc., 921 F. Supp. at 1385 (noting that "claim
differentiation is a guide to construction, not an absolute rule).

D. Claims 43 and 44

The language at issue in Claims 43 and 44 of the '267
Patent, which were added on reexamination, is virtually identical to that in Claims 1, 11, and 14, and ATI has not persuaded
the Court that it should interpret the terms in these claims differently. 13 The claim language in Claims 43 and 44, like that
in Claims 1, 11, and 14, could reasonably be construed as broad enough to read on both the real-time calculation and table

- 2838 -
look-up methods. However, as the Court noted above, the specification and prosecution history of the ’267 Patent do not disclose, describe, or suggest an embodiment of the invention in which the NPA-NXX Table Look-Up Method would be used as a location determining means to route a call to the geographically nearest dealer. The Court is equally satisfied that, on reexamination of the ’267 Patent, the Examiner found the added claims patentable because, consistent with the other claims in the ’267 Patent, the location determining means in the claims "includes information that gives each second party a geographic location," ATI's Ex. O., which the Court has already determined is the dealers' V-H coordinates, not merely each dealer's NPA-NXX. 14

--- Footnotes ---

13 Paragraph (c) of Claim 44, like paragraph (b) of Claims 1, 11, and 14, discloses a "location determining means" substantially similar to Claims 1, 11, and 14. Paragraph (c) of Claim 43 discloses a "means including information associating each second party with a geographic location for determining a second party . . . who is located geographically nearest to said first party." The Court sees no material distinction between these phrases in the context of the added claims and the phrase "location determining means," as interpreted by the Court above with respect to Claims 1, 11, and 14.

14 See supra note and accompanying text.

--- End Footnotes ---

ATI maintains that added Claim 44 "more narrowly defines the location determining means as an NPA-NXX table look-up, as compared to claims 1, 11, and 14." ATI's Reply at 6. In fact, ATI argues that Claim 44 "expressly recites the use of an NPA-NXX table look-up to route calls to the nearest dealer. ATI could not have been any clearer in communicating its intent to the Examiner." Id. at 7 (emphasis in original). The portion of Claim 44 upon which ATI apparently relies is paragraph (c) (2), which teaches that the "location determining means" includes a "comparing means for comparing the area code (NPA) and the local central office code (NNX) of said first party against said second party database to identify the second party located the shortest geographic distance from said first party." A similar comparison means is set forth in dependant Claims 3, 12, and 16 of the ’267 Patent.

The Court, however, is no more persuaded that the plain language of added Claim 44 teaches the NPA-NXX Table Look-Up Method as a location determining means than it was with regard to original Claims 1, 11, and 14. As the Court has already observed, neither the specification nor the prosecution history support such an interpretation. Moreover, because this Court has already determined that the location determining means referenced in the original claims of the ’267 Patent is limited to use of the Real-Time Computation System, interpreting the same language in the added claims to include the NPA-NXX Table Look-Up Method as a location determining means would, in effect, enlarge the scope of the ’267 Patent to include an embodiment that would not have infringed the original claims. See Total Containment, Inc., 921 F. Supp. at 1385-86. Such a result would be contrary to the reasons that a patent owner may add new claims on reexamination, which are "to distinguish the invention as claimed from the prior art . . . or [to respond] to a decision adverse to the patentability of a claim of the patent." 35 U.S.C. § 305.

Accordingly, the Court will not interpret the added claims in the manner advanced by ATI and will construe added Claims 43 and 44 to recite a "location determining means" that employs the Real-Time Computation Method, using a "Nearest Neighbor" algorithm to compare the V-H coordinates of a caller to the V-H coordinates of the dealers to find that one dealer located the shortest geographic distance from the caller.
construed in accordance with Section 112, paragraph 6. However, this presumption may be rebutted when the claim element does not recite sufficiently definite structure or material to perform the claimed function. In determining whether these presumptions have been rebutted by a preponderance of the evidence, the court may examine the intrinsic evidence and any relevant extrinsic evidence.

Schwartz, supra, § 5.III.C.

There are four permutations of "communication facility" at issue here, and Citrix asserts that all of them are subject to Section 112, paragraph 6. The court disagrees. The four permutations are as follows: 1) "Data Communication Facility"; 2) "Location Facility"; 3) Communication Facility"; 4) "Data Generating Facilities."

None of these four permutations use the word "means" and Citrix fails to rebut the presumption that this is not a means-plus function by a preponderance of the evidence. The court agrees that the specification provides a clear description of the "facilities" and particularly the "data communication facility" as a computer software product. Indeed, the specification provides that "a number of computer program facilities are described in this invention as separate facilities for the sake of describing the invention." '479 Patent, col. 10, lines 11-13. Therefore, the court concludes that 01 Communique's proposed construction is correct, which is "Computer software associated with the personal computer."

I) "location facility"

As explained in section E) above, the court agrees with 01 Communique that the appropriate construction is "Computer software associated with the locator server."

2506

4. "location information"

This phrase is used in claims 1, 8, and 15 of the '967 Patent. WG seeks to construe this term as "information regarding location." Ion largely agrees with this construction but argues that it should be made clear that this term does not include anything regarding force information; accordingly, Ion proposes the construction of "information regarding location (not including force information)." According to Ion, the specification plainly distinguishes between location information and force information because it teaches that the global control system transmits either "location information" or "force information." ('967 Patent, col. 6 ll. 45-47.)

Importing negative limitations into a claim absent an explicit disavowal is generally disfavored. See Omega Eng'g. Inc. v. Raytek Corp., 334 F.3d 1314, 1332-33 (Fed. Cir. 2003) (noting that a negative limitation imposed by the district found no anchor in the claim language, the plain and ordinary meaning of the phrase, or in any express disclaimer within the specification). Although the specification for the Bittleston Patents appears to draw a distinction between location and force information when stating that "the global control system can transmit location information to the local control system instead of force information," there is nothing in the claim language or the specification that says that location information can never consist of force information or that the two kinds of information can never overlap. ('967 Patent, col. 6 ll. 45-47.) The single statement within the specification that distinguishes between location and force information does not constitute the type of "disavowal" that would render appropriate a negative limitation. As such, the Court declines to construe this term using the negative limitation suggested by Ion. Instead, the Court adopts WG's proposed construction, and holds that "location information" should be construed as "information regarding location." This construction applies the "widely accepted meaning of commonly understood words." Phillips, 415 F.3d at 1314.

GO BACK

2507 - 2840 -
the claimed locator server computer's "location on the internet being defined by a static IP address"

01 Communique argues that no construction of this phrase is required, whereas Citrix maintains that the appropriate construction of this phrase is "The claimed locator server computer has an IP address that is fixed." In the alternative, 01 Communique argues that the appropriate proposed construction is "The Internet Protocol (IP) address of a locator sever is fixed or predetermined, as distinguished from dynamic IP addresses."

The court agrees with 01 Communique that this phrase requires no construction.

**2508**

5. "Predetermined location." Used in '114 patent, Claim 1.

The first term appears in Claim 1 of the '114 patent as follows:

A pre-paid calling card system to enable customers to purchase calling cards at predetermined locations and to use such calling cards to access . . . .

The second term appears in Claims 1 and 2 of the '768 Reexamination Certificate as follows:

Claim 1: A method to enable customers to obtain pre-paid calling card accounts from a plurality of point-of-sale locations and to . . . .

Claim 1 & 2: maintaining in the database information sufficient to identify: . . . a particular point-of-sale location at which the particular pre-paid calling card account is activated (["recharged" in Claim 2].

Defendants propose for both terms, "a retail or other establishment where a customer obtains a calling card." TGIP argues that neither of these terms need to be construed. If "predetermined location" is construed, TGIP proposes "a location determined beforehand." If "point-of-sale location" is construed, TGIP suggests "location at which the sale takes place."

At the hearing Defendants agreed with the court's proposal of "a business establishment or kiosk, which may be automated or staffed by one or more persons." TGIP objected, asking why a "point-of-sale location" could not include on line purchasing. Tr. p. 96. TGIP's counsel envisions customers activating cards from their personal computers by visiting a website. Tr. p. 97. But the court must construe the terms as understood by one skilled in the art, reading those terms in the context of the specification and file history.

Web sites were known when the first application was filed on June 6, 1994, and were well known by the time the reexamination certificate was issued in 2005. See http://www.matterform.com/macintosh software company/old sites.html (showing a Matterform Media website online in 1994). Nothing in the claims, nor in the prosecution history, nor even in the extrinsic evidence, including articles written by the inventor and announcements concerning his calling card systems hints at sales from a website. To the contrary the specification describes physical locations. See '114 Patent, col. 5, 11. 42-44.

In normal usage a "predetermined location" and a "point of sale location" refer to a place, such as the establishment of the retailer. If it was a disembodied electronic construct, such as a website, there would be no reason for Claims 1 and 2 to put such emphasis on the database maintaining "a particular point-of-sale location at which the particular pre-paid calling card account is activated [or recharged]." '114 patent, col. 1, 11. 41-43; '114 patent, col. 2, 11. 12-14. There would actually be no "point of sale" or "predetermined location. Rather the sale would be made wherever the user had a laptop.

The patentee had the opportunity to pick his language. He did not attempt to include incorporeal constructs like websites as possible locations. The court is not going to broaden the scope of the patents in such a way at this time. **These terms will be defined as follows:**

- 2841 -
"Predetermined locations" and "Point-of-sale locations mean "a business establishment or kiosk which may be automated or staffed by one or more persons."

The court agrees with Citrix that 01 Communique's construction seeks to define the claimed function of the "locator server computer" while failing to provide a construction for the "locator server computer" itself. Therefore, the court finds that Citrix's proposed construction is correct.

The parties agreed at the hearing that a log entry is information concerning transactions or activities that take place on a computer, which is placed in a log file. The real question is whether, in the context of this patent, a log entry must, at a minimum, include a physical address. The "physical address" is the actual location of a unit of data on the disk or other storage device. This is contrasted with the "logical address" which is the address the computer program uses to access memory. It is an identifier for the unit of data, which is independent of the data's physical location.

Microsoft argues that the claim language mandates that every log entry include a physical address, pointing to the fact that the words "logical address" are not used in either claim. The inclusion of "physical memory address(es)" in the log entry is described in the '630 patent, col. 5, ll. 24-26. But the sentence starts with "Alternatively." The specification also describes another embodiment in which the "log entry includes a file identifier, the logical address(es) specified in the call and the time of access (e.g., system time; index value). '630 patent, col. 5, ll. 22-24.

It is true that in one embodiment, "all the log entries are sorted according to physical address to optimize access time . . . ." '630 patent, col. 7, ll. 62-63. Again, that sentence begins with "Alternatively." The same paragraph also states: "Each access resulting in a log entry specifies a file and an address." '630 patent, col. 7, ll. 56-57. The indefinite article "an," without more, does not connote a single embodiment. See Scanner Technologies Corp. v. ICOS Vision Systems Corp., N.V., 365 F.3d 1299, 1304-1305 (Fed. Cir.2004)(construing "an" in a claim).

Under the patent, there will be log entries made, altered, and reordered. There is no basis for the court to decide, as a matter of claim construction, that the definition of "log entry" must include a physical address. The experts may testify that, for technical reasons, based upon the remaining language of the claim describing "logging accesses to the secondary storage device" at '630 patent, col. 8, ll. 48-54, including a physical address in every log entry is the only practical application of the invention. That is a matter for trial, not claim construction.

Disclosure-Dedication Argument

Relying upon Toro Co. v. White Consol. Indus., Inc., 383 F.3d 1326, 1331 (Fed. Cir. 2004), and Johnston &Johnston Assoc.
Inc. v. R.E. Serv. Co., Inc., 285 F.3d 1046, 1054 (Fed. Cir. 2002), Microsoft argues that the disclosure of logical addresses in the specification, combined with the failure to state them in a claim, results in a donation of that embodiment to the public.

The specification must give a full and exact description of claimed invention. Phillips, 415 F.3d at 1316. The purpose of the specification is to teach and enable those of skill in the art to make and use the invention and provide the best mode for doing so. Id. at 1323. Therefore, it is not unusual that the specification contains more detail than the claim, or describes alternative embodiments. Microsoft admits that this is not a disclaimer or disavowal situation, where, in order to overcome a rejection from the patent office, the patentee changed a claim or expressly stated in a response to the PTO that the claims do not include a piece of prior art. However, like prosecution estoppel, the disclosure-dedication rule limits the application of the doctrine of equivalents. Toro, 383 F.3d at 1331. Claim construction is not the time for the court to decide infringement issues.

Neither the language of the claim nor the specification indicates any special use in this claim term of any of the common technical terms set out above. There is no basis to import a limitation from the specification to this claim term. Whether CAC can show how the patented method can work with log entries that do not have a physical address, or whether Microsoft can show that an infringement by equivalents argument is barred, are questions left to a later time. The court defines this term as follows:

"Log Entry" means: A set of data items, treated as a unit, which concern transactions or activities that take place on a computer and which is placed into a set of related records concerning such transactions or activities.

CAC at first argued that the log file did not have to be created during the initial launch. However, the flow chart at Figure 3...
shows that when the launch of a program is directed, the first question asked is whether a log file exists. If not, the log file is created. Fig. 3, Blocks 72, 74, & 76. CAC tried to argue that this was just an embodiment. But, neither its attorneys nor its experts could give an example of a single embodiment described in the patent, or logically derived from the claims, in which the log file was not created sometime during the initial launch.

It seems that CAC's argument is really an attempt to anticipate a non-infringement argument concerning a method in which something is done to the log file between the time of its creation (Claim 1, Step 2) and its alteration (Claim 1, Step 4). That issue will have to be reserved for a later time. At this point, the court is merely defining what a log file is in this patent, not what may be done to it after it is created.

Microsoft urged a construction by which the log file would contain all log entries in the order created. But nothing in either Claim 1 or 2 indicates that when the log entries are first placed in the file (the "logging" of Step 2), they will be kept in any order. Likewise the specification has no such provision. n4 It is true that at Step 5, a "final log file" is generated from the "altered log file," by reordering log entries to speed up a subsequent launch. '630 patent, col. 8, ll. 58-61. But that is described in the claim language, and is not part of a proper definition of "log file."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n4 In describing the construction and operation of computers, it could be misleading in the context of this patent, especially to those not skilled in the art, such as jurors, to talk of information being "stored in order." The data structure into which bits and bytes of information are placed may be accessed in a particular order, but that is not the same as physically storing them in order, like packages stacked in a box.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

One issue was not addressed in the briefs, but is apparent from the flow chart at Figure 3. The first question asked in the flow chart is: does the log file exist? Figure 3, item 74. There is no reason to limit the creation of the log file to the very first time the program is ever used, as might be implied from the term "initial launch," which was proposed by Microsoft. The log file could have been deleted accidentally, or because of a cleanup of material that had not been used for a long period of time. In such a case, the log file would be created even though it was not the "initial" launch of the program. It is more accurate to describe a log file as one which is created if it does not already exist.

Based upon the foregoing, the representations of the parties at the claim construction hearing, the agreed definitions of "launch" and "launch sequence," and the way one of ordinary skill would generically understand "log entry" and "log file," the court defines this term as follows:

"Log file" means: the set of log entries, which, if the log file for a program does not already exist on the computer system, are, upon launch of that program, generated in sequence for each access during the launch sequence to a physical address block at which a portion of the computer program is stored.

3. "second logic coupled with the buffer, and responsive to the packet filter to read and process data in the identified packets from the buffer, and to produce a data value dependent on contents of the packet prior to transfer of the identified packets to the second port by the first logic"

The dispute turns on the applicability of 35 USC § 112(6) to this limitation. D-Link contends that the term "logic" fails to recite sufficient structure such that § 112(6) should apply notwithstanding the presumption against its applicability due to the absence of the words "means for." Doc # 78 (05-0098) at 23-24.

"A claim limitation that actually uses the word 'means' invokes a rebuttable presumption that § 112(6) applies. By contrast, a claim term that does not use 'means' will trigger the rebuttable presumption that § 112(6) does not apply." CCS Fitness, 288 F.3d at 1369 (internal citations omitted). This presumption is "a strong one that is not readily overcome." Lighting World, Inc v Birchwood Lighting, Inc, 382 F.3d 1354, 1358 (Fed Cir 2004).
D-Link can overcome this presumption by showing that the claim limitation "fails to recite sufficiently definite structure." Apex Inc v Raritan Computer, Inc, 325 F.3d 1364, 1372 (Fed Cir 2003) (quotations omitted). This structure need not be "a single well-defined structure." Greenberg v Ethicon Endo-Surgery, Inc, 91 F.3d 1580, 1583 (Fed Cir 1996).

It is appropriate to consult dictionaries in connection with this inquiry. Linear Technology Corp v Impala Linear Corp, 379 F.3d 1311, 1320 (Fed Cir 2004); see also Apex, 325 F.3d at 1373. Technical dictionary definitions suggest that the term "logic" itself connotes some structure. See McGraw-Hill Dictionary of Scientific and Technical Terms, 1231 (6th ed 2003) (defining "logic" as a "[g]eneral term for various types of gates, flip-flops and other on/off circuits used to perform problem-solving functions in a digital computer"); IBM Dictionary of Computing, 396 (10th ed 1994) (defining "logic" as "[t]he systematized interconnection of digital switching functions, circuits, or devices").

The Federal Circuit addressed the similar issue of whether "circuit" conveys sufficient structure in Linear Technology, 379 F.3d 1311. The limitation at issue was "a first circuit for monitoring a signal from the output terminal to generate a first feedback signal." Id at 1320. The Linear court found this limitation to recite "the respective circuit's operation in sufficient detail to suggest structure to persons of ordinary skill in the art." Id at 1320-21. The Linear court further stated that when "structure-connoting term 'circuit' is coupled with a description of the circuit's operation, sufficient structural meaning generally will be conveyed to persons of ordinary skill in the art." Id at 1320. Because of both the similarity between "logic" and "circuit" and the similarity of the subsequent functional language, the analysis in Linear is highly relevant to the construction of claim one.

The difference between the Linear term "circuitry" and the "logic" term in this case is not significant. As previously noted, several technical dictionary define "logic" in terms of circuits. See McGraw-Hill Dictionary of Scientific and Technical Terms, 1231 (6th ed 2003) (defining "logic" as a "[g]eneral term for various types of gates, flip-flops, and other on/off circuits used to perform problem-solving functions in a digital computer"); IBM Dictionary of Computing, 396 (10th ed 1994) (defining "logic" as "[t]he systematized interconnection of digital switching functions, circuits, or devices").

In addition, there is no significant difference between the additional functional language. In the Linear claim, the circuitry is "for monitoring a signal from the output terminal to generate a first feedback signal." Claim one states that the logic is "to read and process data in the identified packets from the buffer, and to produce a data value dependent on contents of the packet prior to transfer of the identified packets to the second port by the first logic." Both claims include specific functional language.

Because of the similarities between the claim addressed in Linear and claim one, the court can see no reason to diverge from the Linear analysis. The term "logic" defines some structure and additional functional language. This functional language is sufficiently detailed "to suggest structure to persons of ordinary skill in the art." Id at 1320-21; see also PCTEL, Inc v Agere Systems, Inc, 2005 U.S. Dist. LEXIS 34288, 2005 WL 2206683 (ND Cal 2005) ("[S]election logic" did not fall under paragraph six.). Accordingly, the court finds that "logic" does not fall within 35 USC § 112(6).

Having found that § 112(6) does not apply, the court turns next to construing the term "logic." 3Com proposes "circuitry and/or programming." Doc # 81 (05-0098) at 48. D-Link proposes "processing resources configured to perform binary tasks where the processing resources operate at speeds slower than the stream of the incoming packet stream." Id at 48-49. Realtek has not submitted a specific proposal.

The specification discloses a network interface:

with limited intelligence, implemented using a relatively slower, and lower cost embedded processor, supported by dedicated hardware logic for the purposes of intercepting certain packets being received via the network. In particular, the present invention provides an interface that comprises the first port on which incoming data is received at the data transfer rate of the network, a buffer coupled to the port that stores received packets, and a second port coupled with the buffer through which transfer of packets to the host is executed.

884 patent 1:63-2:5. This language suggests that the first port and buffer are "dedicated hardware." Claim one discloses that the buffer is "coupled to the first port," suggesting that "coupled" is a hardware-to-hardware connection. Id at 1:13. Claim one also states that the second logic is "coupled with the buffer." Id at 1:22. Use of the word "coupled" with the second logic
suggests the second logic is also a hardware component.

Although the invention relates to a "lower cost embedded processor," no such processor is explicitly recited by claim one. The second logic is described in claim one as being used "to process data," suggesting that the second logic is indeed a low-cost processor. Claim two supports this view by stating that the second logic comprises "a general purpose processor module." In viewing all of the intrinsic evidence, 3Com's proposal is impermissibly broad.

While 3Com's proposal is too broad, D-Link's proposal is too narrow. The specification discusses a low-cost processor but does not disclose that such a processor is required. Even if a processor were required, there is no support for a specific performance limitation such as "speeds slower than the stream of the incoming packet stream" as D-Link's proposal imposes.

Although the evidence weighs heavily against a construction of "programming," a construction of "circuitry" was perfectly consistent. Accordingly, the court adopts the modified proposal, "circuitry."

2513

1. "logic circuit"

"Logic circuit" is used in claims 1 and 22 of the 148 patent. UniRAM contends that "logic circuit" means "a high performance circuit, distinct from the circuits found in a stand-alone memory device, whose primary design goal is the efficient performance of logic functions, such as a microprocessor or ASIC." Jt Cl Const, Ex B at 12. MoSys construes logic circuit as "[a] circuit outside of the memory array that performs some processing or controlling function." Id. TSMC adopts the even broader definition, "[a] circuit that performs processing or controlling functions." Id.

The court first observes that, consistent with UniRAM's proposed construction, a "logic circuit" is different from a "peripheral circuit." When discussing peripheral circuits, the 148 patent consistently refers to circuitry such as sense amplifiers and decoders, which are outside the memory cells but within the memory device. See, e.g., 148 patent at 2:19-21 ("Peripheral circuits such as sense amplifiers, decoders, and precharge circuits are depend[ent] upon memory cell pitch"), 7:12-14 ("Each memory bank needs to have a full set of peripheral circuits"). When discussing logic circuits, the 148 patent consistently refers to logic components outside of the memory device. See, e.g., 148 patent at 2:62-64 ("high density memory device placed on the same chip as high performance logic circuits"), 3:6-7 ("contradicting requirements between logic circuits and memory devices"). Although peripheral circuits contain "logic" components, that does not make them "logic circuits." Instead, the 148 patent consistently treats logic circuits and peripheral circuits as separate and non-overlapping entities. See, e.g., 21:48-49 ("the transistors used for peripheral circuits and logic circuits").

Nonetheless, UniRAM's proposed construction is problematic because it defines logic circuit at a level of detail that is unsupported by the specification. UniRAM imports limitations that the specification never discusses -- for example, the specification never mentions a microprocessor or ASIC. Moreover, the specification implicitly concedes that "logic circuits" are not necessarily high performance by using the phrase "high performance logic circuits." 148 patent at 2:63-64; see also Phillips, 415 F3d at 1314 (use of term "steel baffles" strongly implies that not all baffles are made of steel).

Accordingly, the court adopts a blend of the parties' constructions -- a "logic circuit" is "a circuit outside of the memory device that performs some processing or controlling function." This construction distinguishes "logic circuits," which are outside of memory devices, with "peripheral circuits," which are within memory devices.

As a final matter, the court notes that the parties apparently want "logic circuit" and "logic-circuit" to share the same construction. Jt Cl Const, Ex B at 12. Because the term "logic-circuit" is only used on a few occasions and always as "peripheral logic-circuit," the court declines to construe separately the term "logic-circuit."
7. Logic Circuit

The phrase "a logic circuit connected with the test signal generator and the processor" appears in claim 6 of the '681 Patent. Diagnostic initially asserted that "logic circuit" should be construed as "hardware and/or software for alternatively enabling either the sound wave generator or the test signal generator to output discernible signals." Benson proposes that the entire phrase be construed as a "a logic circuit to run the hearing test in the conventional audiometer connected with the test signal generator and processor." In its rebuttal, Diagnostic modified its proposed construction of "logic circuit" to "the software and/or hardware that provides pre-programmed, or preset, responses dictated by the test subject's inputs."

The Court begins by ascertaining the ordinary meaning of "logic circuit" to one skilled in the art. The relevant definition of "logic" in the field of computer science is "a. The nonarithmetic operations performed by a computer, such as sorting, comparing, and matching, that involve yes-no decisions, b. Computer circuitry, c. Graphic representation of computer circuitry." American Heritage Dictionary 1057. Moreover, the definition of "circuit" in the field of electronics is "(a) a closed path followed or capable of being followed by an electric current; (b) a configuration of electrically or electromagnetically connected components or devices." Id. at 346. Using these definitions, the ordinary meaning of "logic circuit" is "the software and/or hardware used for performing a specified function."

The Court next turns to the intrinsic evidence to determine whether the ordinary meaning has been rebutted or altered. Diagnostic argues that its proposed construction is supported by the intrinsic record, specifically the Amendment, wherein the patentees argued that the "logic circuit" added intelligence to the test signal generator, such that they could provide certain preprogrammed responses dictated by the test subject's inputs. Benson, on the other hand, reiterates its prosecution history estoppel argument, asserting that the logic circuit for the hearing test must be located in the conventional audiometer. In particular, Benson argues that the patentees argued that the logic circuitry was located in the conventional audiometer and that a second computer with multimedia functions added other multimedia operations.

As discussed previously, the Court rejects Benson's argument that the claimed invention covers only a specific physical configuration. Benson has not pointed to any specific language in the intrinsic record indicating that the "logic circuit" is for running a hearing test or that the "logic circuit" must reside in the conventional audiometer. In addition, the Court finds that remarks made by the patentees in the Amendment clarify the meaning of "logic circuit" in the context of the invention. Specifically, the Amendment added the "logic circuit" and indicated that logic circuit functions to "provide certain pre-programmed responses dictated by the test subject's inputs" that did not exist in the prior art. (Amend, at 9.) These remarks demonstrate that "providing preset responses dictated by the test subject's inputs" is the specified function of the software or hardware of the circuit. Therefore, the Court concludes that the proper construction of "logic circuit" is "the software and/or hardware that provides pre-programmed, or preset, responses dictated by the test subject's inputs."

3. "second logic coupled with the buffer, and responsive to the packet filter to read and process data in the identified packets from the buffer, and to produce a data value dependent on contents of the packet prior to transfer of the identified packets to the second port by the first logic"

The dispute turns on the applicability of 35 USC § 112(6) to this limitation. D-Link contends that the term "logic" fails to recite sufficient structure such that § 112(6) should apply notwithstanding the presumption against its applicability due to the absence of the words "means for." Doc # 78 (05-0098) at 23-24.

"A claim limitation that actually uses the word 'means' invokes a rebuttable presumption that § 112(6) applies. By contrast, a claim term that does not use 'means' will trigger the rebuttable presumption that § 112(6) does not apply." CCS Fitness, 288 F.3d at 1369 (internal citations omitted). This presumption is "a strong one that is not readily overcome." Lighting World, Inc v Birchwood Lighting, Inc, 382 F.3d 1354, 1358 (Fed Cir 2004).

D-Link can overcome this presumption by showing that the claim limitation "fails to recite sufficiently definite structure." Apex Inc v Raritan Computer, Inc, 325 F.3d 1364, 1372 (Fed Cir 2003) (quotations omitted). This structure need not be "a single well-defined structure." Greenberg v Ethicon Endo-Surgery, Inc, 91 F.3d 1580, 1583 (Fed Cir 1996).
It is appropriate to consult dictionaries in connection with this inquiry. Linear Technology Corp v Impala Linear Corp, 379 F.3d 1311, 1320 (Fed Cir 2004); see also Apex, 325 F.3d at 1373. Technical dictionary definitions suggest that the term "logic" itself connotes some structure. See McGraw-Hill Dictionary of Scientific and Technical Terms, 1231 (6th ed 2003) (defining "logic" as a "[g]eneral term for various types of gates, flip-flops and other on/off circuits used to perform problem-solving functions in a digital computer"); IBM Dictionary of Computing, 396 (10th ed 1994) (defining "logic" as "[t]he systematized interconnection of digital switching functions, circuits or devices").

The Federal Circuit addressed the similar issue of whether "circuit" conveys sufficient structure in Linear Technology. 379 F.3d 1311. The limitation at issue was "a first circuit for monitoring a signal from the output terminal to generate a first feedback signal." Id at 1320. The Linear court found this limitation to recite "the respective circuit's operation in sufficient detail to suggest structure to persons of ordinary skill in the art." Id at 1320-21. The Linear court further stated that when "structure-connoting term 'circuit' is coupled with a description of the circuit's operation, sufficient structural meaning generally will be conveyed to persons of ordinary skill in the art." Id at 1320. Because of both the similarity between "logic" and "circuit" and the similarity of the subsequent functional language, the analysis in Linear is highly relevant to the construction of claim one.

The difference between the Linear term "circuitry" and the "logic" term in this case is not significant. As previously noted, several technical dictionary define "logic" in terms of circuits. See McGraw-Hill Dictionary of Scientific and Technical Terms, 1231 (6th ed 2003) (defining "logic" as a "[g]eneral term for various types of gates, flip-flops and other on/off circuits used to perform problem-solving functions in a digital computer"); IBM Dictionary of Computing, 396 (10th ed 1994) (defining "logic" as "[t]he systematized interconnection of digital switching functions, circuits or devices").

In addition, there is no significant difference between the additional functional language. In the Linear claim, the circuitry is "for monitoring a signal from the output terminal to generate a first feedback signal." Claim one states that the logic is "to read and process data in the identified packets from the buffer, and to produce a data value dependent on contents of the packet prior to transfer of the identified packets to the second port by the first logic." Both claims include specific functional language.

Because of the similarities between the claim addressed in Linear and claim one, the court can see no reason to diverge from the Linear analysis. The term "logic" defines some structure and additional functional language. This functional language is sufficiently detailed "to suggest structure to persons of ordinary skill in the art." Id at 1320-21; see also PCTEL, Inc v Agere Systems, Inc, 2005 U.S. Dist. LEXIS 34288, 2005 WL 2206683 (ND Cal 2005) ("[S]election logic" did not fall under paragraph six.). Accordingly, the court finds that "logic" does not fall within 35 USC § 112(6).

Having found that § 112(6) does not apply, the court turns next to construing the term "logic." 3Com proposes "circuitry and/or programming." Doc # 81 (05-0098) at 48. D-Link proposes "processing resources configured to perform binary tasks where the processing resources operate at speeds slower than the stream of the incoming packet stream." Id at 48-49. Realtek has not submitted a specific proposal.

The specification discloses a network interface:

with limited intelligence, implemented using a relatively slower, and lower cost embedded processor, supported by dedicated hardware logic for the purposes of intercepting certain packets being received via the network. In particular, the present invention provides an interface that comprises the first port on which incoming data is received at the data transfer rate of the network, a buffer coupled to the port that stores received packets, and a second port coupled with the buffer through which transfer of packets to the host is executed.

'884 patent 1:63-2:5. This language suggests that the first port and buffer are "dedicated hardware." Claim one discloses that the buffer is "coupled to the first port," suggesting that "coupled" is a hardware-to-hardware connection. Id at 1:13. Claim one also states that the second logic is "coupled with the buffer." Id at 1:22. Use of the word "coupled" with the second logic suggests the second logic is also a hardware component.

Although the invention relates to a "lower cost embedded processor," no such processor is explicitly recited by claim one. The second logic is described in claim one as being used "to process data," suggesting that the second logic is indeed a low-cost processor. Claim two supports this view by stating that the second logic comprises "a general purpose processor
module." In viewing all of the intrinsic evidence, 3Com's proposal is impermissibly broad.

While 3Com's proposal is too broad, D-Link's proposal is too narrow. The specification discusses a low-cost processor but does not disclose that such a processor is required. Even if a processor were required, there is no support for a specific performance limitation such as "speeds slower than the stream of the incoming packet stream" as D-Link's proposal imposes.

Although the evidence weighs heavily against a construction of "programming," a construction of "circuitry" was perfectly consistent. Accordingly, the court adopts the modified proposal, "circuitry."

2516

A. The '049 and '554 Patents

Plaintiff argues that the numerous "logic for" claim elements in the '049 and '554 patents are means-plus-function clauses. The court begins with the rebuttable presumption that "logic for" is not a means-plus-function clause. See Watts v. XL Systems, Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000). The presumption that § 112, paragraph 6 does not apply can be rebutted by showing that the claim limitation recites a function without reciting sufficient structure for performing that function. See id. at 880. Plaintiff asserts that "logic" does not recite specific structure. The court agrees. The court finds that "logic" does not recite sufficient structure to avoid means-plus-function analysis.

Each of the "logic for" claim limitations of the '049 and '554 patents relate to a processor programmed to perform a specific function. These claim limitations will be construed pursuant to the Federal Circuit's guidance in WMS Gaming Inc. v. International Game Technology, 184 F.3d 1339, 1349 (Fed. Cir. 1999).

GO BACK

2517

b. "logic gates"

The term "logic gates" appears in four of the asserted claims of the '806 patent. Claims 7, 13, 18 and 24 of the '806 patent refer to a "logic portion" having at least "30K logic gates" or "40K logic gates." NeoMagic argues that "logic gates" refers to the logic circuitry that makes up the graphics engine and manipulates the video data on a computer screen. Trident counters that the term "logic gates" refers to any kind of logic gate and is not limited to those found in a graphics accelerator.

In order to acquire the proper context to understand claim terms, the court may consult the specification and the prosecution history. See Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 2000 U.S. App. LEXIS 6921, 2000 WL 387159, at *3 (Fed. Cir. 2000); Pitney Bowes, 182 F.3d at 1308-09. In this case, the claims of the '955 and '806 patents are directed to a graphics controller that integrates logic and memory components on a single semiconductor chip. The inventors use the term "logic gates" consistently throughout the specification to refer to the logic circuitry of the graphics engine. For example, the specification states that "with the ability to incorporate large amounts of logic and memory in a single integrated circuit, the present invention provides for video memory and logic for graphics control operations in one integrated circuit." Therefore, the court finds, as advocated by NeoMagic, that the term "logic gates" refers to the logic circuitry that makes up the graphics engine and manipulates video data on a computer screen.

GO BACK

2518

a. The '219 patent, claim 1: "logic means"

Claim 1 of the '219 patent describes "logic means responsive to said output data control means for determining an output data format for each digitized captured image in accordance with the assigned output data format code." The parties dispute whether this term is in means-plus-function form.
St. Clair contends that "logic means" describes a structure of circuitry or a set of instructions. St. Clair contends that, at the filing of the patents-in-suit, a "logic circuit" had a known structural definition, rebutting the presumption that 35 U.S.C. § 112, P 6 applies.

Defendants contend that the use of the word "means" in the disputed term creates a presumption that the term is in means-plus-function form. Defendants contend that the disputed term is not "logic circuit," and does not reference the structure of a logic circuit.

After reviewing and considering the claim language and specification of the '219 patent in light of the parties' respective arguments, the Court concludes that "logic means," as used in claim 1 of the '219 patent, is not in means-plus-function form. Claim 1 describes a responsive "logic means" for determining an output data format data code in a digital camera. In this context, "logic means" clearly refers to a logic circuit, a structure sufficient to perform the described function. See Ex. 27, Van Nostrand Reinhold Dictionary of Information Technology 307 (3d ed. 1989) (defining "logic circuit" as "in electronics, a circuit comprising one or more gates or flip flops that performs a particular logic function"). Because a sufficient structure is recited, the presumption that Section 112, P 6 applies as a result of the use of the term "means" is rebutted. Accordingly, the Court concludes that the term "logic means" must be interpreted according to its ordinary meaning as "circuitry and/or a set of instructions."

Claim 1 of the '219 patent claims, in pertinent part, an electronic camera comprising:

output data control means for selecting for each digitized captured image . . . one of a plurality of different output data format codes . . . , and

logic means responsive to said output data control means for determining an output data format for each digitized captured image in accordance with the assigned output data format code.

'219 patent, col. 12 lines 45-59 (emphasis added).

Defendants contend that the term "logic means" is in means-plus-function format. According to Defendants, the function of the "logic means" is to "determin[e] an output data format for each digitized captured image in accordance with the assigned output data format code." (D.I. 259 at 47) Defendants contend that the corresponding structure is a microprocessor which includes the disclosed algorithm corresponding to the recited function, specifically "the CPU 20 configured to perform the portions of the algorithm illustrated in the flow chart of Fig. 14B and described at '219 Patent col. 12 lines 11-39 that correspond to the function of this element." (JCCC at 34)

St. Clair contends that "logic means" is not in means-plus-function format and should be construed as "circuitry and/or a set of instructions." (JCCC at 34) Judge Farnan agreed with St. Clair on both points in his Canon Construction. 2004 U.S. Dist. LEXIS 17489, 2004 WL 1941340, at *20-21. On this dispute, I agree with Defendants.

St. Clair asserts: "To one of ordinary skill in the art, the term 'logic' is a circuitry or set of instructions. Indeed, by the time the original patent application was filed, 'logic circuit' was defined as 'a circuit comprising one or more gates or flip flops that performs a particular logic function.'" (D.I. 258 at 37) (emphasis added) (quoting JCCC Ex. 48: Van Nostrand Reinhold Dictionary of Information Technology 307 (3d ed. 1989)) But, as Defendants point out, "'logic circuit' is not the claim term at issue. The term 'logic means' does not include the word 'circuit' . . . ." (D.I. 282 at 39) St. Clair's references to portions of the specification it insists are "consistent with" this dictionary definition are also unpersuasive. (D.I. 258 at 37) As Defendants explain, none of these specification excerpts relate to the function involved in the claim (i.e., "determining an output data format." 14 In other words, each of the portions of the specification on which St. Clair relies deal with different "particular logic functions," making reliance on them somewhat inconsistent with St. Clair's own definition.
I have concluded that the term "logic means" does not recite sufficient structure to overcome the presumption that it is in a means-plus-function format. Accordingly, I recommend that the Court construe "logic means" as used in claim 1 of the '219 patent as a means-plus-function element, with the function being "to determin[e] an output data format for each digitized captured image in accordance with the assigned output data format code," and with the associated structure being "the CPU 20 configured to perform the portions of the algorithm illustrated in the flow chart of Fig. 14B and described at '219 Patent col. 12 lines 11-39 that correspond to the function of this element." 15

15 For the same reasons, I recommend that the Court adopt Defendants' proposed means-plus-function constructions of claims 10 and 16 of the '219 patent, both of which also include "logic means." The specific recommended constructions are provided below. See infra Part IV.

<tbody>
<tr>
<td>Logical Address</td>
<td>a fixed, unique, and unchanging identifier assigned</td>
</tr>
</tbody>
</table>
within a network of interconnected computers for source to destination packet delivery; provided that this construction does not imply that a logical address is fixed, unique, and unchanging for all time.

In the alternative:
a fixed code assigned within a network to uniquely identify a host independent of its hardware connection.

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Defendants' Proposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical Address</td>
<td>a fixed, unique, and unchanging identifier assigned within a communications system comprising a plurality of data networks.</td>
</tr>
<tr>
<td></td>
<td>In the alternative: a fixed, unique, and unchanging identifier assigned within a communication system comprising a plurality of data networks, whereby the identifier does not change when a host moves from one network to another in the communication system.</td>
</tr>
</tbody>
</table>

The Court previously construed this term in the '061 opinion as "a fixed, unique, and unchanging identifier assigned within a network of interconnected computers for source to destination packet deliver." In that case, the Court considered whether a logical address is "unchanging." The parties in the present case raise this issue again. Defendants oppose Plaintiff's proposed inclusion of a clause in the claim construction that the logical address is not unchanging for all time. In its alternative construction, Defendants propose a clause stating that the logical address may not change when a host moves between two networks. Plaintiff argues that Defendants' language would improperly introduce a new limitation to the claim and limit the scope of the claimed invention to a routing method involving mobile hosts. Plaintiff offers a modified version of the construction provided by the Court in its '061 opinion. The Court agrees with Plaintiff with respect to Defendants' proposal, but declines to adopt Plaintiff's proposed construction.

The Court finds no reason to deviate from its previous construction of this term. Defendants' language unnecessarily incorporates mobility. Claim 3 is directed simply at source filtering at a node. In contrast to the '670 patent, claim 3 recites a "sender" and does not make a mobile-stationary distinction. Whether a particular embodiment of the routing method involves static or mobile hosts is irrelevant to the scope of the claimed invention. Restricting claim 3 to mobile hosts would unnecessarily limit the scope of the claim.

Plaintiff's proposed language tracks the Court's construction from the '061 opinion, but includes an additional clause regarding the duration of time that a logical address is fixed. In the '061 opinion, the Court construed the term such that the logical address was "fixed" but described in its rationale that the address was not unchanging for all time. Given the instruction that the parties not interpret the term contrary to the Court's explained rationale, the Court found it unnecessary to incorporate its reasoning into the text of the construction. Plaintiff has not persuaded the Court an alternate construction is necessary here, particularly in light of an identical instruction. Therefore, the Court construes the term "logical address" as
"a fixed, unique, and unchanging identifier assigned within a network of interconnected computers for source to destination packet deliver." The parties may not interpret this term in a manner that is inconsistent with this opinion.

<td>A fixed, unique, and unchanging identifier that has no internal structure to suggest network connection location and that is assigned to the host receiving the data packet.</td>
</tr>
</tbody>
</table>

During the hearing, the parties essentially agreed on the scope of these terms, but disagreed as to the best way to explain that scope to the jury. The parties agree that a logical address is a fixed, unique identifier that is assigned by a computer.
network. See '224 patent at 10:52-11:9. The parties also agree that, although a logical address may have some sort of structure, it is processed by the claimed invention without regard for that structure. Markman Hr'g Tr. 70:20-71:8, Apr. 23, 2009; see '224 patent 11:4-9. For example, a phone number has a hierarchical structure based on geographic location. The area code identifies a general geographic area, the first three digits identifies a subset of that area, and the final four numbers identify the particular phone within that subset. However, a phone number may be used simply as an identifier without regard to that structure. When a store such as Home Depot uses that phone number to keep track of a customer's buying habits, it does so without regard to the hierarchical structure of the phone number. The parties disagree as to the best way to explain this concept to the jury.

In light of the parties' substantive agreement, the Court tried to reach an agreed construction between the parties at the hearing, but no agreement was reached. Plaintiff proposes that a logical address "is processed without regard for the physical location of the connection," and Defendants propose that a logical address "has no internal structure to suggest network connection location." However, because of the parties' agreement that a logical address may contain structure even though the claimed invention processes the logical address without regard for that structure, there is no claim scope dispute for the Court to resolve. See O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1362 (Fed. Cir. 2008). Although both parties try to capture the agreement in their proposals, both proposals would needlessly confuse the jury by describing how a logical address is used, rather than what it is. There is no need to include this concept in the Court's construction because the parties may not interpret this term in a manner that is inconsistent with their agreement, as embodied in this opinion. Thus, the Court rejects both parties' proposals.

Next, the parties dispute whether a logical address is "unchanging." Defendants propose that a logical address must be "fixed, unique, and unchanging," even though this limitation is not present in the claim language. Defendants point to the specification to support their position. The patent identifies certain problems in the prior art associated with mobile users in interconnected communication networks. In a system of interconnected networks, each network may have a different protocol for routing packets between physical devices. '224 patent at 10:58-62. When one device (the source) attempts to send a packet to another (the destination), it sends a packet to a physical address associated with the particular physical device with which it is trying to communicate. '224 patent at 10:35-51. If that destination device moves to a different network, its physical address may need to be changed to comply with the protocols of the new network. See '224 patent at 10:52-67. This may lead to frequent switching of network addresses, thus making it difficult to efficiently route data packets. '224 patent at 2:22-36. The claimed invention solves this problem by assigning a logical address to each device, which is "fixed, unique, and unchanging." '224 patent at 2:38-40. This logical address refers to a connection to the communication system, not a particular physical device. Thus, by relying on logical addresses rather than physical addresses, data packets can be efficiently routed even to a device whose physical address frequently changes. See '224 patent at 10:52-11:9. (explaining the distinction between physical and logical addresses).

Plaintiff agrees that a logical address must be fixed, unique, and unchanging during a connection, but argues that it need not be unchanging "for all time." Markman Hr'g Tr. 77:3-7, Apr. 23, 2009. That is, the phrase "fixed, unique, and unchanging" is used to distinguish physical addresses which must change every time a device moves between networks. This phrase should not be read more broadly to imply that, once assigned, a logical address must always refer to one and only one particular physical device. Such an interpretation would conflate the difference between a logical address and a physical address. In other words, Plaintiff argues that, if a device is disconnected from the network, and later re-connected, it may be assigned a different logical address that is fixed, unique, and unchanging, for the duration of the connection. Plaintiff's argument is well taken.

Because the specification distinguishes physical addresses by describing logical addresses as "fixed, unique, and unchanging," '224 patent at 2:38-40, the Court will construe the term "logical address" as "fixed, unique, and unchanging." Nonetheless, this construction does not imply that a logical address is fixed, unique, and unchanging for all time. Such an interpretation would conflate the difference between a physical address and a logical address, and would be inconsistent with the requirement that a logical address be assigned within a network to represent a connection to the network rather than a particular physical device. See '224 patent at 10:52-11:9. Therefore, the Court will construe the term "logical address" as "a fixed, unique, and unchanging identifier assigned within a network of interconnected computers for source to destination packet delivery." 4 The parties may not interpret this term in a manner that is inconsistent with this opinion. See Aloft Media, LLC, 2009 U.S. Dist. LEXIS 24124, 2009 WL 803133 at *5 n. 2.
4 The Court rejects the parties' proposals insofar as they require a logical address to identify "a connection to the internet" or be "represented by a series of numbers." These two limitations are not present in the claim language or the specification. Rather, a logical address may identify a connection to a network of interconnected computers not necessarily connected to the internet. '224 patent at 2:37-45. In addition, the specification mentions at least one embodiment which does not require a logical address to be represented by a series of numbers. '224 patent at 16:55-57.

With regard to the remaining address terms, Defendants attempt to inject their proposed construction of "logical address" into the constructions of these terms. Having rejected Defendants' proposed construction of "logical address," the Court will not adopt Defendants' proposed constructions of these terms. At the hearing, both parties agreed that destination addresses and source addresses are logical addresses. Markman Hr'g Tr. 82:20-83:3, Apr. 23, 2009. The claim language itself clearly expresses that these addresses are logical addresses. See '224 patent claim 8 ("a source address for logically identifying a sender of the data packet independent of the sender's physical media address"). In light of this claim language, the Court finds that the remaining address terms would be readily understood by a lay jury. Therefore, the Court will not construe these terms. See O2 Micro Int'l Ltd., 521 F.3d at 1362; Fenner Inv. Ltd. v. Microsoft Corp., No. 6:07-cv-8, 2008 U.S. Dist. LEXIS 65686, 2008 WL 3981838 at *3 (E.D. Tex. Aug. 22, 2008) (finding that a court need not construe a disputed term as long as it has resolved the claim scope dispute between the parties).

2523

B. Construction of "logical block address" in the '051 patent

Lexar's proposed construction: A value provided by the host for addressing a sector

Toshiba's proposed construction: Logical address provided by the host to the controller for identifying information blocks

Pretec's proposed construction: none

The parties' dispute over "logical block address" in the '051 patent, like "controller," focuses more on that with which the LBA interfaces rather than the LBA itself. Lexar contends that the LBA identifies sectors while Toshiba argues that the LBA identifies blocks. In its Opening Brief, Lexar cites claim language from the '314 patent to support its construction. As explained above, '314 patent claim language is inapposite in construing a common term in the '051 patent. Although the two patents share, at least in part, the same parent application and each patent's prosecution history may be relevant for the construction of common terms, common terms are not necessarily construed consistently. Toshiba contends that the LBA identifies information blocks and directs the Court to the language of claims 1 and 18 of the '051 which expressly says that a group of LBAs "identif[ies] one or more information blocks." ('051 patent, 18:42-43; 20:29-30.) In its Reply Brief and at oral argument, Lexar suggested two reasons that Toshiba's proffered construction is incorrect. First, the claim language referenced by Toshiba is incomplete in that follows the cited language clarifies that what an LBA really identifies is a sector. And second, the host, from which the LBA issues, communicates only in terms of sectors, not blocks. The Court agrees in part.

Indeed, the language that follows that cited by Toshiba reflects that what an LBA identifies is more complex than the initial phrase suggests. LBAs "identify[] one or more information blocks to be accessed in the nonvolatile memory, each of the information blocks including a plurality of N sectors." Additionally, the Court agrees that the host, which provides the LBA, speaks in terms of sectors, not blocks. Lexar's contextual argument in this regard is useful, but not dispositive because it would be improper to ignore the claim language itself which does say that the LBA identifies information blocks. Therefore, the Court construes "logical block address" in the '051 as: address provided by the host to the controller for identifying blocks which contain a plurality of N sectors.
C. "logical network"

While we have affirmed the judgment of noninfringement as to the '322 and '710 patents based on the construction of "layer" and "available for receiving [transmitting] a packet," the '080 patent does not contain those terms. It does, however, contain the "logical network" limitation.

The parties take disparate approaches to the "logical network" term, which the district court construed as "a subnetwork in a network." Specifically, Juniper argues that the district court properly construed the term, and that Toshiba's construction would unduly limit the correct meaning. Toshiba, on the other hand, asserts that the district court's construction limits the claims in support of Juniper's noninfringement position. Toshiba urges us to adopt "a subnet in the network layer" as the correct meaning. Whatever the motivations behind the parties' arguments, Toshiba has appealed the construction of "logical network" after a judgment of noninfringement, without providing any further context for our analysis. We will therefore treat the term as critical to Toshiba's case.

The district court correctly construed "logical network." The specification of the '710 patent states, "a logical network here refers to a network that can be handled logically as a single entity, regardless of a physical configuration." '710 patent, col. 8, ll. 24-26. This passage does not introduce the requirement that a logical network exist in the network layer of a communication protocol. Toshiba does not point to anything specific in the patents indicating the network layer plays a critical role in understanding the "logical networks" term. The parties agree that a logical network is a subnetwork. Accordingly, we affirm the district court's construction of that term and the judgment of noninfringement of the '080 patent.

2. "Logical page address" ('424 pat., cls. 20 and 24)

The parties disagree about whether the claimed "logical page address" is limited to a "logical block number plus logical page offset." (The parties seek construction of two different claim terms referring to the "logical page address": (a) "programming individual ones of a first plurality of said given number of pages and a logical page address associated with the original data"; and (b) "programming individual ones of a second plurality of a total number of pages less than said given number in a second block with updated data and a logical page address associated with the updated data." There are no other disputes related to the first term and only one other dispute related to the second, which is discussed in the section below.)

Defendants contend that the embodiments specify only a "logical block number plus logical page offset" and therefore that the claims should be so limited. Plaintiff's attempt to show that the embodiments involved other types of "logical page addresses" is unpersuasive, but ultimately this does not matter. Once again, embodiments alone do not create limitations. Defendants identify no evidence that the claims were intended to be limited to the embodiments listed. The term "logical page address" is not limited to a "logical block number plus logical page offset."

7. Logical Processor Number

The TOLL software adds a second type of intelligence to the instruction stream. This intelligence is the logical processor number, or "LPN." The "logical processor number" limitation appears in claims 11, 12, and 20-22 of the '755 patent as well as in claims 1, 3, 6, 11, 13, 15, 21, 23, 28, 36, and 37 of the '945 patent.

The plaintiff asks the court to construe the term to mean "information that is used to indicate which processor will execute the instruction." The defendants construe it to mean "the number added to an instruction, identifying the particular processor
assigned to execute the instruction." Once again, the court concludes that the ITC court correctly construed this term. The plaintiff’s definition does not account for the fact that the term in dispute specifically uses the word "number." As such, this court defines "logical processor number" to mean "a number correlated by the hardware to an actual physical processor element."

2527

16. Logical Resource Driver

The next term in dispute is the "logical resource driver" or LRD. This term appears in claims 11, 12, 13, and 37 of the ‘755 patent. Biax argues that the various claims define the LRD by describing the functions the LRD performs. According to Biax, the LRD is a unit that stores received instructions and delivers the instructions to processor elements. Intel and ADI define the term to mean "a hardware device assigned to a single user having a data cache, instruction selection support including an instruction cache, a plurality of instruction queues for delivering instructions to the processor element assigned to each logical processor number, a branch execution unit and an instruction cache address translation unit, and a data cache address translation unit."

Neither side's construction is entirely appropriate. The term "logical resource driver" does not have a specific meaning in this art. Resort to the specification is necessary. The specification states:

The logical resource drivers 620 are unique to the system architecture 600 of the present invention. Each illustrated LRD provides the data cache and instruction selection support for a single user (who is assigned a context file) on a timeshared basis. The LRDs receive execution sets from the various users wherein one or more execution sets for a context are stored on an LRD. The instructions within the basic blocks of the stored execution sets are stored in queues based on the previously assigned logical processor number. For example, if the system has 64 users and 8 LRDs, 8 users would share an individual LRD on a timeshared basis. The operating system determines which user is assigned to which LRD and for how long.

‘755 patent, col. 15, 11. 45-59. A more detailed depiction of the LRD is found in Fig. 15 and the accompanying description of the preferred embodiment.

The patent states that the LRDs are "unique to the system architecture 600 of the present invention." As a result, the court construes the term "logical resource driver" as "a hardware device which provides a data cache and instruction selection support system for a given user. The LRDs receive execution sets, store the instructions, and deliver the instructions to the processor elements."

2528

D. Meaning of "Logical Unit"

Lastly, Veritas argues that the term "logical unit" refers to a disk partition, rather than a disk volume. To recap pertinent vocabulary, as the Court understands it, a disk drive is the physical mass storage device itself. The operating system or storage system presents physical mass storage to the file system as a logical (i.e., not physical) entity consisting of a series of blocks of data storage that can be read from and written to. This separation of the logical from the physical, or abstraction, is useful because it permits different logical organizations of the physical disks in ways that are advantageous. Individual physical disks may be formatted or subdivided into one or more logical partitions. One or more partitions, spanning one or more physical disk drives, are aggregated by the operating system (or storage system) and presented to the file system or application software as a single, addressable series of data storage blocks, i.e., a volume or virtual disk.

The Court finds that this thumbnail description is generally accepted as a common mode of mass storage, using terms generally understood as indicated. (Although this is certainly not the only method or vocabulary of mass storage.) The Court is also of the impression that both parties agree that the term "logical unit" is not a term of general usage in the mass storage
world. Nor is it expressly defined in the patent. The most explanatory discussion in the specification follows:

Finally, and as generally indicated in FIG. 7A, the storage space available in Disk Drives 16Da through 16Dc is organized into one or more logical partitions, referred to as Logical Units (LUNs) 100, wherein the mass storage system, as described herein above, operates such that each Logical Unit (LUN) 100 operates as a logical storage device regardless of the number or physical configuration of the actual physical devices, that is, Disk Drives 16, comprising each Logical Unit (LUN) 100.

Veritas App. at 15 (col. 14, l. 4-12). The Court holds that this description of Logical Unit is synonymous with the term "volume" or "virtual disk" as described above. Veritas' suggested construction of logical unit as synonymous with partition is excluded by the quoted language above indicating that a logical unit can consist of more than one disk drive.

Veritas also argues that a logical unit must be designated for mirroring before any data is written to it. The Court finds no support for that limitation in the claims and declines to impose it.

3. "Logging accesses to" the secondary storage device . . . (Second step of Claim 1 and second means element of Claim 2).

Although the parties initially asked the court to construe "logging access," the parties agreed at the Markman hearing that the phrase, in context, is actually "logging accesses to" the secondary storage device. The parties further agreed that "logging accesses to . . ." can be replaced with the phrase, "placing in a log file, information about the obtaining of data from . . ." This comports with the specification and the meaning of the words commonly understood by those of ordinary skill in the art. The court defines this term as follows:

"Logging accesses to . . ." means: Placing in a log file, information about the obtaining of data from . . .

B. "Logon Command"/"Valid Logon Command"

The term "logon command" appears in claim 16 of the '253 patent, claims 1 and 2 of the '943 patent, and claims 3, 4, and 5 of the '945 patent. The term "logon command" is preceded by the word "valid" where it appears in claims 1 and 2 of the '943 patent, and in claims 3, 4, and 5 of the '945 patent.

102 The term "logon command" literally appears only in claim 1 of the originally issued version of the '945 patent. Claims 3, 4, and 5, however, are written in dependent form and all depend on claim 1. As explained above, ABC canceled claim 1 during reexamination, but claims 3, 4, and 5 survived reexamination without amendment. Therefore, the text of claim 1, including the term "logon command," remains part of the '945 patent because it is incorporated by dependent claims 3, 4, and 5.

ABC asserts that "logon command" means "identifying information, such as a name or data, associated with, and enabling access to, one or more remote computers where the validation is performed by a website, remote system controller, or network control computer." WebEx contends that "logon command" means "a command that, if valid, establishes a connection with the remote computer unit, thereby enabling operation of the remote computer unit by the local portion." WebEx also asserts that the term "valid logon command" should be separately construed, and means "a 'logon command' that has been confirmed by the [remote system controller (Claim 1 of the '943 Patent)])/[network control computer (Claim 2 of the '943 Patent)]/[website (Claim 1 of '945 Patent)] to be valid for establishing a connection to enable remote operation." ABC argues that it is not necessary to separately define "valid logon command."
The parties' proposed definitions do not consistently define what constitutes a logon command. ABC contends that a logon command consists of "identifying information, such as a name or data, associated with . . . one or more remote computers . . . ." WebEx, on the other hand, begins its definition with the phrase "a command that . . . ." WebEx therefore seeks to define a logon command based only on its function or purpose -- i.e., "establish[ing] a connection with the remote computer unit, thereby enabling operation of the remote computer unit by the local portion" -- without reference to what constitutes the command.

Since ABC's proposed definition explains what a logon command is, instead of only what a logon command does, it is more helpful and informative. WebEx's definition is circular, defining "logon command" using the term "command." Moreover, ABC's proposed definition is, for the most part, supported by the specifications and the claim language of the asserted patents. Therefore, the court is inclined to adopt this portion of ABC's proposed definition, with one significant modification.

The description of the preferred embodiment in the '253 and '943 patents explains that a "logon command" could "either be a set of keyboard strokes or a special function key provided on the input unit for this purpose." 107 The specification of the '945 patent describes other possible examples of logon commands, referring to the use of "authorization code[s]," 108 "personal Identification Number[s] (PIN)," 109 and "password code[s] . . . such as data, finger and voice prints . . . ." 110 This indicates that a logon command consists of identifying information, such as a name or other data.

The language of the asserted claims indicates that this identifying information is associated with a particular remote computer unit, but not more than one remote computer unit as ABC's proposed definition suggests. Claim 16 of the '253 patent states that "each of the remote computer units [is] associated with a unique individual," that "each individual is associated with . . . one of the remote computer units," and that the remote system controller, after checking the validity of the logon command, "interface[s] each individual's local portion with the individual's remote computer unit . . . ." 111 Similarly, claims 1 and 2 of the '943 patent describe the process of connecting a local unit to a single remote computer unit after confirming the validity of a logon command. 112 Finally, the asserted claims of the '945 patent state that the website
"associates a valid logon command with the remote computer unit." 113

ABC contends that the specifications of the asserted patents describe preferred embodiments in which a logon command could be associated with more than one remote computer unit and, therefore, that the term logon command should be interpreted to account for that possibility. 114 But even if ABC correctly characterizes the specification, the claim language itself for each of the asserted claims speaks in terms of only a single remote computer unit. Therefore, the court's definition of logon command will reflect association with a single remote computer unit. See Phillips, 415 F.3d at 1312 (explaining that the language of the claim itself is "of primary importance[] in the effort to ascertain precisely what it is that is patented" (quoting Merrill v. Yeomans, 94 U.S. 568, 570, 24 L. Ed. 235, 1877 Dec. Comm'r Pat. 279 (1876))). See also TIP Sys., LLC v. Phillips & Brooks/Gladwin, Inc., 529 F.3d 1364, 1373 (Fed. Cir. 2008) ("[T]he mere fact that there is an alternative embodiment disclosed in the . . . patent that is not encompassed by [a] district court's claim construction does not outweigh the language of the claim, especially when the court's construction is supported by the intrinsic evidence.").

An extrinsic evidence reference cited by ABC is also informative. A technical dictionary defines the term "logon" as "the process of identifying oneself to a computer after connecting to it over a communication line. During a logon procedure, the computer usually requests the user's name and a password." 115 This definition suggests that a logon command consists of the information or data necessary to identify a particular user to a particular computer. Accordingly, the court concludes that the definition of logon command should include the phrase "identifying information, such as a name or data, associated with . . . a remote computer unit . . . ."

2. The Function of a Logon Command

WebEx contends that the logon command "establishes a connection with the remote computer unit, thereby enabling operation of the remote computer unit by the local portion." ABC asserts that the logon command "enabl[es] access to one or more remote computers . . . ." 116

114 WebEx's Response, Docket Entry No. 166, at 18-19.

2. The Function of a Logon Command

WebEx contends that the logon command "establishes a connection with the remote computer unit, thereby enabling operation of the remote computer unit by the local portion." ABC asserts that the logon command "enabl[es] access to one or more remote computers . . . ." 116

116 ABC's proposed definition suggests that a logon command may be associated with and enable access to more than one remote computer unit. As noted above, the language of each of the asserted claims speaks in terms of only a single remote computer unit; therefore, the court concludes a logon command enables a connection to only a single remote computer unit.

- 2860 -
The parties agree that the logon command "enables" something. They disagree, however, as to precisely what the logon command enables. Under ABC's definition, the logon command "enables" access to a remote computer unit. Under WebEx's definition, the logon command "enables" operation of a remote computer unit.

The parties also disagree as to whether the logon command, in addition to enabling access to or control of a remote computer unit, "establishes a connection with" the remote computer unit. ABC argues that the remote system controller, network control computer, or website -- depending on which claim is involved -- establishes a connection, not the logon command.

These disagreements can be resolved by a careful reading of the relevant claim language. Claim 16 of the '253 patent describes

...adapted to receive remote logon commands, check the remote logon commands for validity, and interface each individual's local portion with the individual's remote computer unit . . . thereby permitting valid data signals received from each individual's local portion to be transmitted to each individual's remote computer unit . . . , the data signals being process able by the individual's remote computer unit . . . to generate output signals . . . transmittable from the individual's remote computer unit . . . to the individual's local portion.

In this claim the remote system controller must be adapted to perform three functions, one of which is to "interface," i.e., establish a connection between, the local portion and the remote computer unit. This function is not performed by the logon command. As for what is enabled by the logon command, this claim does not use either the term "operation" or "access." However, the process of sending data signals to the remote computer unit, processing the signals, and then sending output data back to the local portion, evinces the concept of operation of the remote computer unit, not mere access.

117 '253 patent, claim 16 (as amended) (emphasis added).

Claim 1 of the '943 patent describes a method, two steps of which are "[1] receiving and checking the validity, by the remote system controller, a valid logon command; and [2] interfacing, through the remote system controller, the local computer unit with the remote computer unit to permit the local computer unit to operate the remote computer unit . . . ." 118 Again, in this claim it is the remote system controller, as opposed to the logon command, that performs the task of "interfacing" or, in other words, establishing a connection between the local computer unit and the remote computer unit. The claim also explicitly uses the verb "operate" to describe how the local computer unit acts in relation to the remote computer unit. It is therefore operation, not access, that is enabled by the logon command.

118 '943 patent, claim 1 (as amended) (emphasis added).

Claim 2 of the '943 patent similarly describes a method, one step of which is "operating a network control computer . . . to connect the remote computer unit to the local computer unit permitting the local computer unit to operate the remote computer unit upon receipt and checking the validity of a valid logon command . . . ." 119 In this claim the network control computer, not the logon command, performs the function of connecting the local computer unit to the remote computer unit. Additionally, this claim, like claim 1 of the '943 patent, states that the local computer unit "operate[s]" the remote computer unit. There is no mention of accessing the remote computer unit.

119 '943 patent, claim 2 (as amended).
The three asserted claims of the '945 patent all provide for a "website capable of allowing and facilitating communication between a remote computer unit and a [local] unit . . . ." 120 The claims further describe "receiving, by the website, a valid logon command . . . whereby the website associates the valid logon command with the remote computer unit . . . ." 121 In light of this language, it is clear that the website establishes a connection between the local unit and the appropriate remote computer unit. The logon command does not perform that task.

Elsewhere, the '945 patent claims describe the steps of "receiving, by the website, data signal instructions from the interface unit; and sending the data signal instructions from the website to the remote computer unit whereby the data signal instructions act to remotely operate the remote computer unit . . . ." 122 Again, the term operate is used, as opposed to access.

In light of the plain language of the asserted patent claims, the court concludes that the logon command enables the operation of, not access to, a remote computer unit by the local portion. The court also concludes that the logon command does not establish a connection with the remote computer unit. That function is performed by the remote system controller, network control computer, or website, depending on which claim is involved.

3. Validation of a Logon Command

As the parties' proposed definitions reflect, the parties agree as to which device or element validates a logon command in each of the asserted patent claims. 123 In claim 16 of the '253 patent and claim 1 of the '943 patent the remote system controller validates the logon command. 124 In claim 2 of the '943 patent the network control computer validates the logon command. 125 And in the three asserted claims of the '945 patent the website validates the logon command. 126 The parties disagree, however, as to how this information should be incorporated into the definition(s) of particular terms.

123 See ABC's Brief, Docket Entry No. 154, at 14; WebEx's Response, Docket Entry No. 166, at 15-16.
124 See '253 patent, claim 16 (as amended) ("a remote system controller . . . adapted to . . . check the remote logon commands for validity"); '943 patent, claim 1 (as amended) ("receiving and checking the validity, by the remote system controller, a valid logon command").
125 See '943 patent, claim 2 ("a network control computer . . . to connect the remote computer unit to the local computer unit . . . upon receipt and checking the validity of a valid logon command").
126 See '945 patent, claim 1 ("receiving, by the website, a valid logon command from the interface unit whereby the website associates the valid logon command with the remote computer unit").
ABC proposes including the following phrase at the end of the definition of logon command: "where the validation is performed by a website, remote system controller, or network control computer." WebEx proposes a different method. WebEx suggests that the court should define the term "valid logon command" separately from the term "logon command," and that "valid logon command" should be defined as "a 'logon command' that has been confirmed by the [remote system controller (Claim 1 of the '943 Patent)]/[network control computer (Claim 2 of the '943 Patent)]/[website (Claim 1 of '945 Patent)] to be valid for establishing a connection to enable remote operation."

The court concludes that WebEx's proposed definition of "valid logon command" is circular, confusing, and unnecessary. It is not helpful to define "valid logon command" as "a 'logon command' that has been confirmed . . . to be valid . . . ." The proposed definition conveys no information about how the term "valid" modifies the term "logon command." That is, however, evidently not WebEx's intent. Apparently, WebEx intends to use this definition as a means to explain which device or element performs the task of validating the logon command for each particular asserted claim. To the extent such information needs to be explained in a definition, it can be explained in the definition of "logon command." There is no need to arbitrarily select the phrase "valid logon command" as an additional term to define simply to achieve the goal of identifying which element performs the task of validation. Accordingly, the court will not define the term "valid logon command." See U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997) ("Claim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary to explain what the patentee covered by the claims . . . . It is not an obligatory exercise in redundancy.").

The court, however, agrees with WebEx on a different point. WebEx points out that ABC's proposed definition fails to specifically link the element that performs the logon command validation with the corresponding asserted claim. This lack of specificity may cause confusion because the asserted claims use different terminology to refer to the intermediate element that performs the validation function. To avoid any confusion, the definition of "logon command" should be customized for each asserted patent claim to clearly identify the element that performs the logon command validation for that particular claim. Accordingly, the court concludes that the definition of logon command should conclude with the phrase "and which is checked for validity by the [remote system controller (claim 16 of the '253 patent, claim 1 of the '943 patent)]/[network control computer (claim 2 of the '943 patent)]/[website (claim 1 of '945 patent)]."

4. Conclusion

The court concludes that a "logon command" is "identifying information, such as a name or data, associated with and enabling operation of a remote computer unit, and which is checked for validity by the [remote system controller (claim 16 of the '253 patent, claim 1 of the '943 patent)]/[network control computer (claim 2 of the '943 patent)]/[website (claim 1 of '945 patent)]."

127 The court does not include the phrase "if valid" in the definition of "logon command," as WebEx suggests, because the context in which the term appears in each of the asserted claims makes clear that only a valid logon command will enable operation of the associated remote computer unit. In fact, in all but one of the asserted claims, the term "logon command" is immediately preceded by the word "valid."

2531

B. "Logon Command" and "Associates the Valid Logon Command with the Remote Computer Unit"

The term "logon command" appears in claim 16 of the '253 patent, claims 1 and 2 of the '943 patent, and claims 3, 4, and 5 of the '945 patent. ABC asserted in its opening claim construction brief that the term should be interpreted as "identifying information, such as a name or data, associated with, and enabling access to, one or more remote computers where the validation is performed by a website, remote system controller, or network control computer." 14 The court concluded that
"logon command," as used in the asserted patents, means identifying information, such as a name or data, associated with and enabling operation of a remote computer unit, and which is checked for validity by the [remote system controller (claim 16 of the '253 patent, claim 1 of the '943 patent)] / [network control computer (claim 2 of the '943 patent)] / [website (claim 1 of '945 patent)]. 15

14 ABC's Opening Claim Construction Submission, Docket Entry No. 154, at 14 (emphasis added).

15 Memorandum Opinion on Claim Construction, Docket Entry No. 190, at 54 (emphasis added).

In reaching this conclusion the court rejected ABC's argument that the logon command enabled operation of "one or more remote computers" because "the claim language itself for each of the asserted claims speaks in terms of only a single remote computer unit." 16 Accordingly, the "court's definition of logon command . . . reflect[s] association with a single remote computer unit." 17

16 Id. at 46.

17 Id.

The term "associates the valid logon command with the remote computer unit" appears in claims 3, 4, and 5 of the '945 patent. In its opening Markman brief ABC offered the following definition: "to connect or bring into relation a valid logon command with one or more computers that are to be remotely controlled from a remote location using a local computer / interface unit." 18 The court adopted a different definition: "to connect or bring into relation a valid logon command with a particular computer unit that is to be remotely controlled from a remote location using an interface unit." 19 As it did with regard to the definition of the term "logon command," the court rejected ABC's position that the definition should refer to "one or more computers" because "the asserted claims unanimously and unambiguously speak in terms of a single remote computer unit . . ." 20

18 Plaintiff ABC's Opening Claim Construction Submission, Docket Entry No. 154, at 15 (emphasis added).

19 Memorandum Opinion on Claim Construction, Docket Entry No. 190, at 59 (emphasis added).

20 Id.

ABC now asks the court to reconsider its rulings to the extent they limit a logon command to being associated with only one particular remote computer unit or suggest that a separate logon command must be entered in order to operate each remote computer unit. 21 In other words, ABC asks the court to modify its definition of "logon command" by replacing the phrase "a remote computer unit" with the phrase "one or more remote computer units," and to modify its definition of "associates the valid logon command with the remote computer unit" by replacing the phrase "a particular computer unit" with the phrase "one or more computer units." 22 ABC asserts that its interpretation is correct because, as a matter of law, the articles "a" or "the" that proceed the term "remote computer unit" in the asserted claims must be understood to mean "one or more." See Baldwin Graphic Sys., 512 F.3d at 1342 (explaining that "an indefinite article 'a' or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase 'comprising,'" and that "'[t]he subsequent
use of definite articles 'the' or 'said' in a claim to refer back to the same claim term does not change the general plural rule”).

23, 24 The court evaluates ABC's argument with respect to each of the asserted patent claims.

21 ABC's Motion, Docket Entry No. 191, at 5-14.

22 See id.

23 ABC did not raise this argument or invoke this claim construction rule in its opening claim construction brief or in response to WebEx's initial claim construction brief. See ABC's Opening Claim Construction Submission, Docket Entry No. 154, at 14-17; ABC's Response to WebEx's Claim Construction Submission, Docket Entry No. 165, at 7-11.

24 WebEx does not dispute, and the court agrees, that each of the asserted claims is an "open-ended claim[] containing the transitional phrase 'comprising.'" Baldwin Graphic Sys., 512 F.3d at 1342.

1. '253 Patent

Claim 16 of the '253 patent, as amended, reads:

A remote portion of a split personal computer system for selectively processing video portions, input/output portions, computational portions and storage portions of personal computer tasks wherein the split personal computer has a plurality of remote computer units selectively performing the computational portions and the storage portions of the personal computer tasks, each of the remote computer units being associated with a unique individual and having application programs and data associated with previous usage by the individual stored thereon, and a plurality of local portions located remotely from the remote computer units and adapted to selectively perform the video portions and the input/output portions of the personal computer tasks, each of the local portions being associated with an individual such that each individual is associated with one of the local portions and one of the remote computer units, the remote portion comprising:

a remote system controller established on the World Wide Web and communicating with the local portions via the Internet, adapted to receive remote logon commands, check the remote logon commands for validity, and interface each individual's local portion with the individual's remote computer unit of the split personal computer system thereby permitting valid data signals received from each individual's local portion to be transmitted to each individual's remote computer unit of the split personal computer system, the data signals being processable by the individual's remote computer unit of the split personal computer system to generate output signals, the output signals including video signals and being transmittable from the individual's remote computer unit of the split personal computer system to the individual's local portion. 25

25 '253 patent, claim 16 (as amended).

The singular term "remote computer unit" is never immediately preceded by the articles "a," "an," or "the." Instead, the term is always proceeded by the term "the individual's" or "each individual's." Therefore, it is questionable whether the general rule cited by ABC is even potentially applicable in this situation. Even if the general rule is potentially applicable, however, the court concludes that an exception applies.

When the claim language itself clearly limits the article "a" or "an" to "one" or some other specific number of elements, the general rule cited by ABC does not apply. Baldwin Graphic Sys., 512 F.3d at 1342; KCJ Corp., 223 F.3d at 1356. See also Abtox, Inc., 122 F.3d at 1024 (holding that, despite the general rule, the claim language "clarifies that only one chamber is in question"). Claim 16 of the '253 patent clearly limits the number of remote computer units that may be associated with a
particular logon command.

The claim states that "each of the remote computer units [in the personal computer system] [is] associated with a unique individual." 26 Moreover, "each individual is associated with . . . one of the remote computer units." 27 The claim then explains that after the remote system controller receives logon commands and checks them for validity, it "interfaces each individual's local portion with the individual's remote computer unit . . . ." 28 The remote system controller cannot interface the individual's local portion with more than one remote computer unit upon receipt of a particular valid logon command because the claim specifically states that each individual is associated with only "one of the remote computer units." 29 Accordingly, claim 16 of the '253 patent makes abundantly clear that a logon command is associated with and enables the operation of only one remote computer unit. The court will not modify its construction of the term "logon command" for claim 16 of the '253 patent.

2. '945 Patent

Claims 3, 4, and 5 of the '945 patent were originally dependent claims. Claims 4 and 5 depended on the now-withdrawn claim 1, and claim 3 depended on the now-withdrawn claim 2, which itself also depended on claim 1. The full text of claims 3, 4, and 5 are provided below, written in independent form.

Claim 3 of the '945 patent provides:

A method for providing a service for remotely controlling a remote computer unit using an interface unit, the remote computer unit comprising a personal computer, the method comprising the steps of:

operating a website capable of allowing and facilitating communication between a remote computer unit and an interface unit via an internet;

receiving, by the website, a valid logon command from the interface unit whereby the website associates the valid logon command with the remote computer unit;

receiving, by the website, data signal instructions from the interface unit;

sending the data signal instructions from the website to the remote computer unit whereby the data signal instructions act to remotely operate the remote computer unit as if the operator of the interface unit were sitting in front of the remote computer unit and actually operating the remote computer unit;

installing a program onto the remote computer unit to permit the data signal instructions sent by the website originating from the interface unit to further facilitate the ability of the interface unit to remotely operate the remote computer unit through the website as if the operator of the interface unit were sitting in front of the remote computer unit and actually operating the remote computer unit; and

billing for access to the service and monitoring payments made by the customer to maintain the customer's access to the service. 30
Claim 4 of the '945 patent provides:

A method for providing a service for remotely controlling a remote computer unit using an interface unit, the remote computer unit comprising a personal computer, the method comprising the steps of:

operating a website capable of allowing and facilitating communication between a remote computer unit and an interface unit via an internet;

receiving, by the website, a valid logon command from the interface unit whereby the website associates the valid logon command with the remote computer unit;

receiving, by the website, data signal instructions from the interface unit;

sending the data signal instructions from the website to the remote computer unit whereby the data signal instructions act to remotely operate the remote computer unit as if the operator of the interface unit were sitting in front of the remote computer unit and actually operating the remote computer unit; and

billing for access to the service and monitoring payments made by the customer to maintain the customer's access to the service. 31

Claim 5 of the '945 patent provides:

A method for providing a service for remotely controlling a remote computer unit using an interface unit, the remote computer unit comprising a personal computer, the method comprising the steps of:

operating a website capable of allowing and facilitating communication between a remote computer unit and an interface unit via an internet;

receiving, by the website, a valid logon command from the interface unit whereby the website associates the valid logon command with the remote computer unit;

receiving, by the website, data signal instructions from the interface unit; sending the data signal instructions from the website to the remote computer unit whereby the data signal instructions act to remotely operate the remote computer unit as if the operator of the interface unit were sitting in front of the remote computer unit and actually operating the remote computer unit; and

downloading a program from the website to the remote computer unit prior to the step of sending the data signal instructions from the website to the remote computer unit, the program downloaded onto the remote computer unit establishing the remote computer unit to be controlled by the data signal instructions. 32
Claims 3, 4, and 5 of the '945 patent are "open-ended claims containing the transitional phrase 'comprising.'" Baldwin Graphic Sys., 512 F.3d at 1342, and the term "remote computer unit" is immediately preceded by the article "a" in the first instance, and then the article "the" in subsequent instances. Therefore, unless an exception applies, the court must construe the articles "a" and "the" preceding the term "remote computer unit" to mean "one or more." Id.

WebEx first contends that the claim language of the '945 patent specifically limits the number of remote computer units associated with a particular logon command to one. WebEx points out that all three claims provide that the "website associates the valid logon command with the remote computer unit," and that a valid logon command enables the user to "operate the remote computer unit as if [he] were sitting in front of the remote computer unit and actually operating the remote computer unit." 33 WebEx asserts that this claim language, in combination with the fact that ABC has admitted that "a user would connect only to a particular remote computer unit at a time, . . . and not multiple computers simultaneously," 34 mandates a one-to-one correspondence of logon commands to remote computer units. WebEx reasons that a single valid logon command must be associated with the single remote computer unit that the user will operate at a given time.

The court disagrees. The quoted excerpt from the asserted claims does not use a word such as "one" or "particular" before the phrase "remote computer unit" that would necessitate a one-to-one correspondence or a singular interpretation. The quoted excerpt of the claim uses only the articles "a" and "the" -- the very articles to which the general rule applies -- before the pertinent nouns. Therefore, the claim language itself does not require that a single logon command be associated with only one particular remote computer unit. Nor does the fact that a user can operate only one of his remote computer units at any given time mean that a logon command could not be associated with and enable operation of more than one remote computer unit. Nothing in the claim language of the '945 patent excludes from the scope of the invention an embodiment in which a user first enters a single logon command, which will identify his remote computer unit(s), and then selects the particular one of his remote computer units he seeks to control. Based solely on the claim language, a single logon command could identify or be associated with a group or subset of multiple remote computer units belonging to a particular user, any one of which the user could then choose to operate. Cf. Invitrogen Corp. v. Biocrest Mfg., L.P., 327 F.3d 1364, 1368 (Fed. Cir. 2003) ("The transition 'comprising' in a method claim indicates that the claim is open-ended and allows for additional steps.").

WebEx also asserts that the specification of the '945 patent evinces a clear intent on the part of the patentee to limit the articles "a" or "an" preceding the term "remote computer unit" to a singular meaning. WebEx admits that the specification describes a preferred embodiment that enables a user to remotely control two different types of remote computer units: (1) a multiple computer system ("MCS") unit or (2) any other computer such as a home or office computer. 35 WebEx points out, however, that the specification uses two different terms to describe the logon command required to access and operate each of the two different types of remote computer units. The specification explains that a user seeking to connect to and control a non-MCS computer unit, i.e., a home or office computer, would enter an "authorization code." 36 On the other hand, a user seeking to connect to and control an MCS unit must enter a "personal identification number (PIN)." 37 WebEx also points out that in the preferred embodiment of the invention described in the specification, a user first selects whether he would like to connect to his MCS unit or his "other computer" and then, after he selects MCS unit, enters his PIN. 38 WebEx contends that "these passages confirm that the user needs a separate logon for each remote computer unit it wants to operate . . . ." 39

35 See '945 patent col.4 ll.37-44 (explaining that a user can use the invention to connect with and remotely control either a
MCS unit or another computer, such as the user's home computer).

36 Id. col.5 l.26.
37 Id. col.4 l.48, col.6 l.27.
38 Id. col.6 ll.5-11, col.6 ll.25-29 (explaining that the customer would have three options, "a) new customer, b) service computer and c) other computers," and that "[i]f the service computer (b) option is selected the menu which appears, asks for the customer's [PIN]," and that "[u]pon providing the PIN a connection by the CSCU 20 unit is made to the MCS 30 via line 35").
39 WebEx's Response, Docket Entry No. 196, at 11.

The court agrees with WebEx, based on the specification excerpts cited above, that there is a one-to-one correspondence between logon commands and remote computer units in the preferred embodiment of the invention described in the '945 patent. This, however, does not demonstrate that the patentee clearly intended to so limit the scope of the invention. "[S]tanding alone, a disclosure of a preferred or exemplary embodiment encompassing a singular element does not disclaim a plural embodiment." KCJ Corp., 223 F.3d at 1356. See also Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) ("[A]lthough the specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments.").

WebEx also points out that the specification explains that each time the user uses the invention to connect to his remote computer unit, the screen he will see on his local interface unit will "appear just as it was, the last time the individual signed off on that particular type of machine. In addition all of the individual's database[s] and files are decoded and made available just as if they were stored on a PC located at the individual's current log in location." 40 WebEx contends that "[t]he logon command must be associated with a particular remote computer unit to be able to obtain the specific collection of information 'dedicated' to this particular individual's use of this particular remote computer unit." 41

40 '945 patent, col.1 ll.63-67.
41 WebEx's Response, Docket Entry No. 196, at 12.

The court is again not persuaded. The claim language is broad enough to encompass an embodiment where a single logon command is associated with and enables a user to connect to and operate multiple remote computer units, albeit only one at a time. There is no reason that a different logon command is required for each separate remote computer unit in order for each particular remote computer unit to appear just as it was the last time the user disconnected with that particular unit.

The court concludes that no exception to the general rule applies. Because the general rule cited by ABC applies, the court must, as a matter of law, interpret the articles "a" and "the" to mean "one or more." See Baldwin Graphic Sys., 512 F.3d at 1342-43; KCJ Corp., 223 F.3d at 1356. Therefore, contrary to the court's prior claim construction rulings with regard to the terms "logon command" and "associates the valid logon command with the remote computer unit," with respect to the '945 patent, the court concludes that a logon command is not limited to being associated with or enabling the operation of only one particular remote computer unit.

3. '943 Patent
Claim 1 of the '943 patent, as amended, reads:
A method for providing a service for connecting a local computer unit to a remote computer unit to permit the local computer unit to operate the remote computer unit, the remote computer unit comprising a personal computer, the method comprising the steps of:

establishing a remote system controller on an internet such that the remote system controller is remote from the local computer unit and the remote computer unit;

receiving and checking the validity, by the remote system controller, a valid logon command; and interfacing, through the remote system controller, the local computer unit with the remote computer unit to permit the local computer unit to operate the remote computer unit wherein an input unit of the local computer unit functions as an input unit of the remote computer unit and a display device of the local computer unit displays output signals from the remote computer unit; and

generating a bill for the service. 42

Claim 2 of the '943 patent, as amended, reads:

A method for providing a service for connecting a local computer unit to a remote computer unit to permit the local computer unit to operate the remote computer unit, the remote computer unit comprising a personal computer, the method comprising the steps of:

operating a network control computer that is remote from the local computer unit and the remote computer unit to connect the remote computer unit to the local computer unit permitting the local computer unit to operate the remote computer unit upon receipt and checking the validity of a valid logon command identifying the remote computer unit; and

generating a bill for the service. 43

Claims 1 and 2 of the '943 patent are "open-ended claims containing the transitional phrase 'comprising,'" Baldwin Graphic Sys., 512 F.3d at 1342, and the term "remote computer unit" is immediately preceded by the article "a" in the first instance, and then the article "the" in subsequent instances. Therefore, unless an exception applies, the court must construe the articles "a" and "the" preceding the term "remote computer unit" to mean "one or more." Id.

WebEx first contends that the claim language of the '943 patent specifically limits the number of remote computer units associated with a particular logon command to one. WebEx points to a particular phrase in claim 2: "to connect the remote computer unit to the local computer unit permitting the local computer unit to operate the remote computer unit upon receipt and checking the validity of a valid logon command identifying the remote computer unit." 44 WebEx argues that this phrase, in combination with the fact that ABC has admitted that "a user would connect only to a particular remote computer unit at a time, . . . and not multiple computers simultaneously," 45 mandates a one-to-one correspondence of logon commands to remote computer units. WebEx contends that the logon command must identify the single remote computer unit that is to be operated by the user at a given time.

44 '943 patent, claim 2 (as amended).
This is virtually the same argument that WebEx made with regard to the claim language of the '945 patent. For the same reasons explained above, the court is not persuaded. The claim language of the '943 patent does not require that a single logon command be associated with only one particular remote computer unit. The claim language does not foreclose the possibility that a single logon command could identify "one or more" remote computer units, any one of which the user could then choose to connect to and control. Cf. Invitrogen Corp., 327 F.3d at 1368 ("The transition 'comprising' in a method claim indicates that the claim is open-ended and allows for additional steps.").

WebEx also asserts that the specification of the '943 patent evinces a clear intent on the part of the patentee to limit the articles "a" or "an" preceding the term "remote computer unit" to a singular meaning. WebEx cites only a single sentence from the specification of the '943 patent. The sentence cited by WebEx states:

"Application programs are typically stored on the remote computer units 24 and the data associated with the previous usage by the individual are stored on the remote computer units 24 so that such application programs and data are accessible by the local portion 12a and 12b of the split personal computer system 10, as will be discussed below." 46

This sentence does not even mention logon commands and does not suggest that a logon command may be associated with only one remote computer unit. This sentence suggests that an individual user may have or be associated with multiple remote computer units. The sentence is silent, however, as to the relevant question, i.e., whether the individual must have a distinct logon command for each of his remote computer units, or whether he can access all of his remote computer units using a single logon command.

Another sentence in the specification of the '943 patent, however, answers this question. As ABC points out, the specification explains that

"[t]he remote system controller 26 receives the remote logon command, and in response thereto, the remote system controller 26 checks the remote logon command for validity and allows connection to at least one of the remote computer units 24 if the remote logon command is valid and prohibits connection of the remote portion 22 to the local portion 12 of the split personal computer system 10 if the particular remote logon command is not valid." 47

This sentence shows that claims 1 and 2 of the '943 patent would encompass an embodiment in which a single logon command is associated with and enables operation of more than one remote computer unit. See Vitronics Corp., 90 F.3d at 1582 (explaining that the specification is "highly relevant to the claim construction analysis" and can be the "single best guide to the meaning of a disputed term"). Contrary to the court's prior claim construction ruling with regard to the term "logon command," with respect to the '943 patent, the court concludes that a logon command is not limited to being associated with or enabling the operation of only one particular remote computer unit.

46 '943 patent, col.5 ll.2-8.

47 Id., col.7 ll.50-58.
(3) In claims one, two, four, six and eight, the term "long wavelength spectral range." 7 According to Defendants, the term means light of such a wavelength that the fluorophore in the target material will not fluoresce in response to the absorption of one photon, but will fluoresce when the energies of two photons of that wavelength are absorbed and combine. 613 Patent at 5:68; 6:10, 47-53. Defendants contend that it is unnecessary and perhaps misleading to fix a numerical range for the term. Again, according to Defendants, the term is relative, it is longer than the "short wavelength spectral range" and depends on the fluorophore in the target material. Plaintiffs argue that the specification supports a meaning of 630 nanometers or at least the red spectral region. 613 Patent, 6:31, 47; 7:33-50.

7 Defendants state that the terms "long wavelength," "long wavelength spectral range," "long wavelength light," and "long wavelength impinging light pulses" are used as synonyms throughout the 613 Patent. Tr. 186.

On behalf of the Defendants, Dr. Walmsley explained that the long wavelength is used to illuminate the fluorophore and it has a specific relationship to the short wavelength and to the particular target material as demonstrated by the patent in the equation at the bottom of column six as well as equation two. Tr. 187. For instance, the abstract explains that "the relationship between the long and short wavelength range indicates they are both variable, that they depend on the particular fluorophore, and that the long wavelength range could lie in the red or the infrared spectral range." Tr. 193. Dr. Walmsley testified that to a person of ordinary skill in the art the term would mean "light of a particular wavelength that will cause two photon excitation in the sample." Tr. 188; 613 Patent at 5:16 ("The light emitted by the fluorescent material in the specimen is at a wavelength that is specific to the fluorophore contained in the specimen and thus is a different wavelength than the incident light."); 5:64 ("The present invention utilizes two-photon excitation of a fluorophore which has a one-photon absorption peak at a wavelength which overlaps one-half that of the exciting light.").

The prosecution history provides the same support for Defendants' interpretation of long wavelength range as it did for their interpretation of short wavelength range. See supra; Prosecution History at 107-08. Finally, Defendants' second expert testified that the term cannot be limited to 630 nanometers or the red range. Dr. Svoboda explained that fluorophores appear in many different colors and, as a result, the corresponding long wavelength spectral ranges will appear in many colors, red to infrared. Tr. 338.

Plaintiffs' expert, Dr. Fraser testified that a person of ordinary skill in the art would find long wavelength range means 630 nanometers because the patent equates the term with the red spectral range in several instances. Tr. 460. Additionally, Dr. Fraser stated that at the time of the patent, two-photon laser microscopy could only be accomplished with a colliding pulse mode locked laser, which delivers 630 nm light. Tr. 462. However, on cross examination, Dr. Fraser stated that 700 nm, 750 nm and 800 nm could be perceived as the color red. Tr. 501-02.

Again, the patent language is clear. The long wavelength is relative and can be in the red or infrared range. 613 Patent at Abstract ("relatively long (red or infrared)"); 4:68 ("a relatively long wavelength, preferably in the visible red or near infrared spectral range"); 6:1 ("relatively long wavelength, for example in the visible red or the infrared range"). The prosecution history is also clear. The term is relative and depends on the target material. Prosecution History at 107. The Court will not limit the definition to the embodiment in the patent where there is no indication that the applicants so intended. Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d at 973 (Fed. Cir. 1999); cf. Scimed Life Systems v. Advanced Cardiovascular, 242 F.3d 1337, 1343-44 (Fed. Cir. 2001) (limiting definition to preferred embodiment where patent language expressly disclaimed any other embodiment). The terms "long wavelength spectral range," "long wavelength," "said long wavelength light" and "said long wavelength impinging light pulses" therefore mean: "The light produced by the laser is of such a wavelength that the fluorophore in the target material will not fluoresce in response to the absorption of one photon, but will fluoresce when the energies of two photons of that wavelength are absorbed and combined. Long wavelength means longer than the short wavelength spectral range light of claim element 1[a] or the predetermined wavelength of claim element 7[a]. The specific wavelengths depend on the particular fluorophore used in the target material."
A. "Look ahead distance"

Claim 1 of the '080 patent requires a signaling device for "defining a look ahead distance as a function of the speed of the aircraft." The district court construed the term "look ahead distance" to mean "a distance along the ground track of the aircraft that marks the outer limit of each alert envelope that is a function of aircraft speed and time to complete an evasive maneuver." Claim Construction Decision, 264 F. Supp. 2d at 146.

Honeywell argues that the correct construction of this term would define the distance the system looks ahead of the aircraft as a function of speed of the aircraft, according to the language of the claim. While the specification describes in detail the manner in which Honeywell calculates the time component of the look ahead distance in its preferred embodiment, the claim itself includes no limitation regarding the time component, asserts Honeywell. Thus, Honeywell argues the district court improperly read a limitation into the claim from a preferred embodiment.

The district court correctly construed "look ahead distance." "Look ahead distance" is not a term of art. As the record shows, time is inherent in the calculation of "look ahead distance." Usage within the patent makes clear that the purpose of the "look ahead distance" limitation is to allow time to make an evasive maneuver. The specification states that "look ahead distance" is a function of airplane speed and "look ahead time." '080 patent col.9 ll.14-15. "Look ahead time" is thus the time necessary to make an evasive maneuver. In the preferred embodiment, the patent describes "look ahead distance" as the sum of time for "a single turning radium," time for "terrain clearance at the top of the turn," and "a predetermined reaction" time. '080 patent col.9 ll.16-19; see also '080 patent FIGURE 5. Given the clear purpose of the "look ahead distance" limitation, this court concludes that the district court correctly construed it to mean "[a] distance along the ground track of the aircraft that marks the outer limit of each alert envelope and that is a function of aircraft speed and time to complete an evasive maneuver."

2. "lottery game and an amusement game"

a. The Parties' Proposed Constructions

The parties have two disputes regarding this claim term. First, they dispute whether a lottery game requires payment. The parties agree that a lottery game requires participation in a chance to win, a result based on chance, and a prize awarded to the winner. (D.I. 113 at 16-17; D.I. 117 at 18.) Ingenio argues, however, that payment must also be associated with participation in a chance to win. (D.I. 113 at 16.) Ingenio argues that payment is part of the ordinary meaning of "lottery game," and that the specification supports its definition. (Id. at 16-17.) GameLogic asserts, on the other hand, that nothing in the claims or the specifications of either the '082 or '603 patents requires payment, and that thus, payment should not be a part of the definition of "lottery game." (D.I. 117 at 18-19.)

The parties' second dispute revolves around the definition of "amusement game," and specifically whether the amusement game must be separate from the lottery game. Ingenio argues that "amusement game" should be construed to mean "a game that amuses the player." (D.I. 113 at 17-18.) Ingenio relies both on the plain language of the claim, and on the preferred embodiments of the patent to support its construction. (Id.) It asserts that some embodiments provide for two games, one which is purely for fun, i.e. the "amusement game", and one "actualization game" which displays the result of the lottery. (Id.) Other embodiments, however, allow for the amusement and actualization games to be combined into a single game, according to Ingenio. (Id.) GameLogic argues, however, that Ingenio's proposed construction "provides no real definition at all, relying on subjective assessments, leaving the term ambiguous and vain." (D.I. 117 at 19.) According to Gamelogic, the amusement game and the actualization game must always be separate. (Id. at 19-23.) GameLogic bases its argument on the preferred embodiments in the '082 patent, and on that patent's prosecution history. (Id.) GameLogic asserts that during prosecution, when the words "lottery game and amusement game" were added to the patent, Ingenio gave up a reading of
the patent in which there was only a single game. (Id.)

b. The Court's Construction

The plain meaning of the term "lottery game" involves payment. See Merriam-Webster's Collegiate Dictionary 688 (10th ed. 2002) ("a drawing of lots in which prizes are distributed to the winners among persons buying a chance"). n5 The specification of the patent also supports a definition of "lottery game" which includes payment. (See '082 patent, 2:39-41 ("FIG. 4 illustrates a sales device used to purchase game media for the self-contained embodiment of the present game"); id. at 4:40-44 ("player wishing to purchase . . . [m]oney Is put into the bill validater").) GameLogic's arguments to the contrary are unavailing, as the plain meaning of the term "lottery game," supported by the specification of the '082 patent, controls. I will therefore construe the term "lottery game" to mean "a game based on three basic principles: payment associated with participation in a chance to win; a result based on chance; and a prize awarded to the winner(s)."

--- Footnotes ---

n5 No one contends that the meaning of "lottery" has changed between the time the patents issued and today.

--- End Footnotes ---

As to whether the amusement game and the actualization game must be separate games, rather than a single game, the preferred embodiments of the patent shed considerable light on the question. The '082 patent contains a number of preferred embodiments, several of which have two separate games, namely a game that "is purely for player enjoyment, and is used to give the feel of a completely random game of chance," and another game which "display[s], in a pleasing fashion, the actual prize that is stored in the Destiny Code and . . . display[s] the game results." ('082 patent at 3:25-46.) In another embodiment, the two games "can be run as one system, such as a poker game." (Id. at 4:6-21.) Thus, the preferred embodiments of the patent indicate that the amusement and actualization games can be run separately, or as one system.

GameLogic argues, however, that Ingenio gave up the latter preferred embodiment during prosecution when it changed the claim language from "the game" to "the lottery game and an amusement game." (D.I. 117 at 19-23.) That argument is unpersuasive. Construction of a disputed term such that "a preferred . . . embodiment in the specification would not fall within the scope of the patent claim. . . is rarely, if ever, correct and would require highly persuasive evidentiary support[.]") Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). Indeed, the Federal Circuit has found that such a construction is proper only in "the rare case in which such an interpretation is compelled" by the prosecution history. Elekta Instrument S.A. v. O.U.R. Scientific Int'l, Inc., 214 F.3d 1302, 1308 (Fed. Cir. 2000).

The prosecution history here does not provide compelling evidence that Ingenio intended to disclaim a preferred embodiment by adding to the patent the phrase, "the lottery game and an amusement game." After the examiner issued an office action rejecting the claims of the '082 patent application as anticipated, indefinite, and obvious, (D.I. 114, Ex. C at IN1409-12), the applicant amended claims 1 and 10 of the patent (id. at IN1401-03). However, claims 1 and 10 of that patent still included the language "the game," and did not contain the language "the lottery game and an amusement game." (Id. at IN1401.) After three interviews with the examiner, the examiner issued an examiner's amendment which changed "the game" to "the lottery game and an amusement game." (Id. at 1393-94.) The only reasoning offered for that amendment was documented by the examiner as follows:

Proposed and discussed claim language to overcome 112(2) issues and prior art and to further clarify/define novel and non-obvious features of instant invention. Agreement was reached to amend claims 1, 5-6, 10-17 and to cancel claims 18-21.

(Id. at IN1398.) This statement offers no explanation for why the phrase "lottery game and an amusement game" was added to the patent. In the absence of clear evidence, I will not construe this term to exclude a preferred embodiment set out in the patent. An amendment that adds something more to the claim than simply a reference to "the game" does not, without more, require that a lottery game cannot be amusing. Therefore, I will construe the term "amusement game" in the context of the phrase "the lottery game and an amusement game" to mean "a game which amuses the player, which can be combined with or be separate from the 'actualization' game which reveals the result of the lottery game."
A. "Lottery-type wagering game"

<table>
<thead>
<tr>
<th>Plaintiff FortuNet's Proposed Construction</th>
<th>Defendant Planet Bingo's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>A game whose outcome is determined by a random selection of only some of a plurality of discrete lottery elements of that game.</td>
<td>A game in which a fixed number of lottery elements are randomly selected. A player having a lottery ticket that matches the lottery elements selected wins, without any requirement that the lottery elements be in a particular pattern on the player's ticket or card.</td>
</tr>
</tbody>
</table>

Planet Bingo argues that during prosecution history the patentee restricted this patent to the lottery game depicted in Figures 9-12 of the specification in an effort to distinguish prior art. Among the features of the game in Figures 9-12 is (a) a prescribed set number of balls is always drawn (as opposed to bingo where the number of balls drawn is not fixed); and (b) a lottery player who matches all the balls drawn wins (as opposed to bingo, where a player conceivably could match all balls drawn but not make out the pattern for the game). Planet Bingo argues FortuNet is attempting to recapture through litigation what it expressly abandoned during patent prosecution by expanding the patent beyond the invention described in Figures 9-12. Planet Bingo thus argues claim 1 of the '784 is restricted to the game depicted in Figures 9-12, including its features of a fixed number of balls being drawn and the drawing of an additional element affecting the player's odds of winning. Planet Bingo also seeks to impose the requirement that the player purchase a lottery ticket, as described in the specification.

FortuNet argues its proposed construction reflects the claim language's usual and ordinary meaning. FortuNet denies the patentee limited the claim to the game depicted in Figures 9-12 because claim 1 was a generic claim which includes embodiments beyond Figures 9-12. Additionally, FortuNet notes the specification identifies bingo as a possible game under this patent. FortuNet contends the claim language does not require calling a fixed number of balls or purchasing a lottery ticket.

1. Ticket

Planet Bingo argues the patent requires the lottery player to purchase a lottery "ticket." Planet Bingo asserts this is how lottery games usually are played. Additionally, Planet Bingo notes the specification states the lottery game involves the purchase of "the usual ticket." (JA206, Col. 19 at 43-45.) FortuNet argues the claim language does not require purchasing a ticket.

Nothing in claim 1's plain language requires the player to purchase a ticket. The patent's only reference to purchasing a ticket is done so in the discussion of the preferred embodiment in the specification. The Court will not impose a limitation from the preferred embodiment not supported by the claim language or surrendered during prosecution. Nothing in the prosecution history suggests the patentee narrowed the claim to involve purchase of a ticket. Claim 1 does not require the purchase of a "ticket."

2. Restriction During Prosecution

Planet Bingo argues that during prosecution, the patentee restricted his claims only to the embodiment reflected in Figures 9-12 of the patent. This embodiment involves the drawing of a fixed number of lottery elements. For instance, in the actual
embodiment in Figures 9-12, nine balls are drawn. The player must match six out of nine balls to win. In addition to the numbered balls, additional no value "chance" balls are added to the mix. If the no-value additional elements are selected, the odds of the player achieving a match with six numbers is reduced. For example, if one chance ball is selected, the player must match six of the remaining eight numbers, so his odds of winning are reduced. If two or three chance balls are selected, the odds of matching six numbers are reduced even further.

FortuNet admits that during patent prosecution the patentee restricted his claims. However, FortuNet argues claim 1 remained generic and covers any embodiments falling within the claim's terms, including Figures 6 and 8 in the specification. Additionally, FortuNet notes the specification states the game method could be adapted to bingo.

If an applicant claims two or more independent and distinct inventions in one application, the PTO may require the patentee to restrict the application to one of the inventions. 35 U.S.C. § 121; 37 C.F.R. § 1.142. The applicant must reply to the restriction and either oppose the restriction, or elect an invention to which the claims will be restricted. 37 C.F.R. § 1.142; § 1.143. The unelected claims are either canceled or withdrawn from further consideration by the patent examiner, subject to reinstatement if the restriction is withdrawn or overruled. 37 C.F.R. § 1.142. However, an applicant may claim more than one species of an invention in one application so long as the application also includes "an allowable claim generic to all the claimed species and all the claims to species . . . are written in dependent form . . . or otherwise include all the limitations of the generic claim." 37 C.F.R. § 1.141(a).

With respect to the '784 patent, the PTO issued a restriction office action, identifying three distinct species in the claimed invention: (1) Figures 9-12 associated with claims 2-4; (2) Figures 3-7 associated with claims 5-10 and 20; and (3) Figure 8 associated with claims 11-19 and 21-33. (JA0274.) The patent examiner noted that at that point, claim 1 was generic. (Id.) The patent examiner directed the patentee to elect a single species for prosecution. (Id.)

In a telephone conversation, the patentee elected not to oppose the restriction, and elected "to prosecute the invention of Figures 9-12, claims 1-4." (Id.) The patent examiner withdrew claims 5-23 from further consideration as non-elected. (JA0275.) By amendment, the patentee confirmed in writing the election to the species in Figures 9-12, and added new claims 24-31 directed to this species. (JA0288.)

In addition to the restriction, the patentee amended claim 1 several times in response to the patent examiner's rejections. First, the patent examiner rejected claims 1-4 as anticipated by the Grossman patent. (JA0275-76.) Grossman discloses a craps game that adds colors to the die faces. (JA0275.) The player can place a wager on the usual game, and an additional wager on the colors. (Id.) In response to this rejection, the patentee added the words "single" and "discrete" to describe the additional elements and clarified the distinction between his invention and Grossman as follows:

[Under the Grossman disclosure,] each roll of a dice produces a combination of a number and a color.

. . . In the present invention, the selection of the additional symbol is made independently (not in combination with another symbol), or as the Examiner noted there is a separate "game piece" for each of the usual symbols and the (or each) additional symbol.

. . . [The] elements have been further described as being "discrete" and "single" to help differentiate the individual game "pieces" of the present invention from the combination number/color faces of the dice of the Grossman patent.

(JA0289-90 (emphasis in original).)

The patent examiner again rejected the claims, but this time as unpatentable over the Thanet patent. (JA0297.) Thanet discloses a roulette game which adds to the usual roulette wheel a spot for the "players pool." (Id.) Players can wager on the usual roulette game and the additional element of the players pool. (Id.)

Following this rejection, the patentee and examiner conducted an interview on April 22, 1993. (JA0330; JA0281.) At the interview, the patentee proposed changes to claim 1. (JA0330; JA0281.) Among other changes, the patentee proposed that claim 1 be modified to disclose a game in which a "set number" of lottery elements are selected, and in which "the selection of the additional element [does] not affect[] the chance occurrence of the first-mentioned wagering step." (JA0281.)
The patentee subsequently filed a formal amendment in response to the examiner's rejection based on Thanet. (JA0303.) In this amendment, the patentee did not include the language from the proposed amendment offered during the April 22, 1993 interview. Instead, the patentee made two relevant changes. First, he deleted the word "single" from the prior amendment distinguishing Grossman, but added the word "separate" to describe the "at least one separate and discrete additional element." (Id.) Second, he added the words "lottery-type" wagering game to differentiate from Thanet, which was a roulette game selecting only one spot on the wheel, as opposed to a lottery game in which several elements would be selected. (Id.; JA0308.) In the remarks of this amendment, the patentee stated the following:

Initially, it is noted that an interview with the Examiner was conducted on April 22. This interview was very helpful - but unfortunately the undersigned did misstate a feature of the invention, at least insofar as one embodiment thereof is, a certain number must be corrected. In one embodiment, a certain number of lottery balls are selected, and if an additional ball is selected then another lottery ball will be selected. In this embodiment, the odds of the lottery bet are not affected by the presence or selection of the additional ball(s). This was indicated at the interview, and proposed in language added to the claim presented at that time. However, in the other embodiment which is particularly described with respect to Figures 9-12, the additional ball will take the place of a lottery ball when selected (with a plurality of other lottery elements), which does affect the odds. In view of this, it will be appreciated that the language about not affecting the odds is not present in the independent claims presented in this Amendment.

(JA0307-08.) Additionally, the patentee noted that dependent claims 24 (now claim 5) and 30 (now claim 11) "have been amended for consistency with the amendments made to the independent claims from which they depend and in particular that the 'single' and 'individual' nature of the game pieces is now part of the independent claims." (JA0309.) The patent examiner subsequently concluded that claims 1-4 and 24-33 were allowable, and noted the applicant approved the cancellation of claims 5-23. (JA0310-12.)

The parties dispute the meaning of this prosecution history. Planet Bingo argues the patentee restricted himself to the specific embodiment in Figures 9-12, and that claim I did not remain generic. Planet Bingo argues that because the '784 is restricted to the embodiment in Figures 9-12, the number of elements drawn to determine the winner must be "fixed," that is, a certain number must be drawn each time. Planet Bingo also notes this is a standard feature of lottery-type games, where a certain number of elements are drawn which players try to match. FortuNet responds that although the patentee restricted his application to the embodiment in Figures 9-12, claim 1 remained generic throughout prosecution and allowance. FortuNet therefore argues there is no basis for limiting claim 1 to an embodiment in which only a "fixed" number of balls are drawn. Further, FortuNet notes that dependent claim 2 has a "set number" of drawn elements, so presumptively that limitation is not in claim 1.

The Court begins with the claim language, which does not require a fixed number of balls be drawn or that the player's odds of winning are affected when an additional element is drawn. However, during prosecution, the patentee restricted his application to the embodiment in Figures 9-12. The embodiment in Figures 9-12 depicts a game in which a fixed number of balls are drawn. In the particular illustration in Figures 9-12, nine balls are drawn. Because the number of elements are fixed, the odds of a player matching six of the nine balls is affected if one or more no-value additional elements are drawn. If claim 1 is limited to the specific embodiment in Figures 9-12, then drawing a "fixed" number of elements would be a limitation of claim 1.

However, the patentee pursued claim 1 as generic. The patentee's intent to keep claim 1 generic is illustrated by the proposed changes in the April 22, 1993 interview and the patentee's subsequent explanation about why he did not include the proposed language in his formal amendment. At the 1993 interview, the patentee proposed altering claim 1 to include language about drawing a "set number" of elements, as well as language about how this would affect the odds of drawing other elements. In the subsequent formal amendment, the patentee explained he did not include this language in claim 1 because in one embodiment of the claimed invention, the odds would not be affected by drawing an additional element. It is only in the embodiment reflected in Figures 9-12 that the odds-affecting feature occurs. Accordingly, the patentee did not include the "set number" limitation in the independent claims because that would limit the otherwise generic claim 1 to only the fixed element/odds affecting embodiment in Figures 9-12. The patentee's removal of that language therefore reflects the patentee's intention to keep claim 1 generic and not limited to the embodiment in Figures 9-12.

This understanding of the prosecution history is bolstered by a review of dependent claim 2. Dependent claim 2 discloses the wagering game in claim 1 "wherein said wagering a lottery wager step includes the step of choosing of a set number of
the discrete lottery elements; and wherein the selecting step includes the selecting of the set number plus the number of
additional elements available to be selected." (JA0206.) Claim 2 describes the embodiment in Figures 9-12. It includes the
limitation of selecting a "set number" of the lottery elements. Additionally, because the number of drawn elements will be
the "set number plus the number of additional elements available to be selected," the drawing of an additional element will
affect the player's ability to match the remaining elements drawn. A limitation in a dependent claim presumptively is not a
limitation in the independent claim. Further, the patentee's use of the words "set number" of lottery elements drawn in both
claims 2 and 7 demonstrates the patentee knew how to express this feature when he meant to include it as a claim limitation.

Based on the claim language, prosecution history, and claim differentiation principles, the Court finds claim 1 is generic,
and is not restricted to the embodiment in Figures 9-12. Claim 1 does not require either a "fixed" number of elements be
drawn, or that the drawing of an additional element affect the odds of a player achieving a match with the discrete lottery
elements. The Court therefore holds "lottery-type wagering game" means "a game whose outcome is determined by a
random selection of only some of a plurality of discrete lottery elements of that game." (See JA0206, Col. 20 at 24-28.)

2536

Low Level Current

The Court modifies D-Link's proposed construction and construes the term as "a current sufficient to cause the access
device to start up, but not sufficient to sustain the start up." n1 Network-1 argues the term should be construed as "a
detection current too small to sustain operation of the access device." During the Markman hearing, D-Link described the
current as sufficient to "tickle" the access device, but insufficient to sustain start up. In its arguments, Network-1 focused on
the sustaining language in its proposed construction. However, in the Markman hearing, Network-1 pointed to D-Link's own
claim construction expert's testimony in support of Network-1's position that the low level current is not limited to one
value. n2 While the Court agrees that the low level current can have more than one value, in relying on this testimony
Network-1 bolstered D-Link's argument that the current must both be too small to sustain start up and strong enough to
cause the access device to start up. See Col. 3:14-16.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
n1 D-Link's proposed construction states "a current, of approximately 20 ma, sufficient to cause a dc-dc switching supply in
the access device to start up, but not sufficient to sustain the start up."

n2 The testimony reads:

Question: "But would an electrical engineer--a person of ordinary skill in this art, an electrical engineer with several years
of experience, read the patent such that the low level current could have only one value?"

Answer: No. You could make implementations of devices according to the teachings of the patent that used different
values of the low level current as long as that low level current was sufficient to stimulate a response from the device, yet
insufficient to sustain its operation.

Dep. of Rich Seifert, P.155 L:2-12 (emphasis added)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

D-Link's proposed construction has been modified because the references to a specific voltage of 20 ma and the dc-dc
switching supply are attempts to adopt the preferred embodiment's limitations into the claim construction. The 20 ma value
is merely the illustrative value in the preferred embodiment. n3 The 20 ma value is disclosed with regard to the "network
interface," whereas the claim more generally specifies a low level current delivery to the access device. See Cols. 3:12-16,
4:23-25. In addition, the dc-dc switching supply is also illustrative. See Col. 3:12-16. The claim language itself does not
recite an access device power supply; it merely states "for delivering a low level current from said main power source to the
access device." Col. 4:23-24. For these reasons, the Court declines to include "of approximately 20 ma" and "dc-dc
switching supply" in its construction.
n3 The Court notes that D-Link's own claim construction expert testified that a person skilled in the art would not read the patent such that the low level current could have only one value.
energy detection means for detecting a specific electrical energy pulse having been filtered by said filter means and having a predetermined minimum magnitude;

timer means for cooperating with said detection means so that said timer means begins running for a first predetermined period of time when the specific pulse is detected;

sound detection means for detecting sound during the telecommunication and for cooperating with said timer means so that said sound detection means is activated at the end of the first predetermined period for a second predetermined maximum period of time; and

conference calling handling means for implementing a predetermined response if sound is undetected by said sound detecting means during the second predetermined period.

T-Netix's Proposed Construction

A "low pass filter means" means an analog or digital filter, including a digital signal processor, capable of passing frequencies below about 500 Hz, and equivalents thereof.

Global's Proposed Construction

A "low pass filter means" performs:

1. Filtering energy received by the local telephone equipment to pass energy having frequencies below about 500 Hz; and

2. The filtering must be carried out by analog components that significantly attenuate electrical energy having frequencies above 300 Hz.

b) Discussion

The relevant text from the '702 patent is found in column 9, beginning with line 23:

"Block 400 is a Low Pass Filter (LPF). LPF block 400 passes frequencies below 280 Hz while significantly attenuating signals above 300 Hz. LPF block 400 filters the signal received on line 256 and drives the absolute value detector on line 451. LPF block 400 normally has a gain of 0 Db (Gv=1). The LPF block 400 may optionally be implemented as a 100-300 Hz Band Pass Filter (BPF) or as a discrete or monolithic component analog/digital filter or with a Digital Signal Processor (DSP) with appropriate software to implement the filter." Emphasis added.

It is clear from this passage of the patent specification that the low pass filter was envisioned as including an analog or a digital filter or even a Digital Signal Processor controlled by software. In the specification, however, this quote refers to the low pass filter passing "frequencies below" a certain amount and not to passing "energy received. . . having frequencies below" a certain amount.

Figure 1b is directed specifically to a digital embodiment. The description of that embodiment in the specification is found in column 10, beginning with line 3:

"FIG. 1b is a block diagram showing the general organization of the pulse-dial and hook-switch flash supervision architecture for implementing the system wherein echo cancellation, call progress tone detection, DTMF tone detection, broadband energy detection, low pass filtering and energy threshold detection are implemented with an emphasis on digital techniques." Emphasis added.

The references here to "energy detection" and "energy threshold" are all implemented in block 880 after any such energy
has been converted from analog to digital by analog-to-digital converters 872 and 874. Although it can be logically argued that such "energy" terms should be reserved for analog implementation, the drafter of the patent chose to use the analogous terms for a digital implementation. In this case, the patent drafter should be allowed to be his or her own lexicographer since the terms are used consistently throughout the patent. The obvious misspellings in block 880 of Figure 1b are made clear in the portion of the specification quoted above.

The analog low pass filter is shown in Figure 13, which is not described in detail in the specification and is not claimed in detail, but it shows several amplifier stages. In such an arrangement, even in an analog embodiment, we could object to the use of the description "passing energy received" from somewhere else, since the energy received is amplified several times, thus retaining the essential shape and frequency characteristics of the energy received, but being an enhanced version of the energy received and no longer being that energy. In addition there is a rectifier/amplifier prior to the threshold level detection. The amplified and filtered energy then even loses its shape, being rectified and further amplified.

c) Construction

In view of the foregoing, the Court concludes that:

The term "low pass filter means" means an analog or digital filter, including a digital signal processor, capable of passing frequencies below about 500 Hz, and equivalents thereof.

The Court construes "low-power state" as the "state of operation brought about by shutting off or reducing power to the unnecessary sections of circuitry."

A. Parties' Construction Arguments

Plaintiff seeks the Court to construe "low-power state" as a "state where power is reduced or unnecessary sections of the circuitry are inactive." The most disputed portion of Plaintiff's construction is the inclusion of the word "or," which has the obvious consequence of making "lower-power state" either a state where "power is reduced" or a state where "unnecessary sections of the circuitry are inactive." For support, Plaintiff cites to the specification. See, e.g., '323 patent, 5:6-8 ("To reduce power requirements, the ADSL units 232 and 242 may enter low power mode when user data transmission is complete."); 7:23-26 ("Upon detecting a shut-down signal, the COT unit may save loop characteristics (step 310) and enter low power mode by reducing power to now unnecessary circuitry (step 311).").

Defendants' primary construction is that "low-power state" means a "state where [first, demodulation, or demodulator] circuitry is no longer operational after shutting off or reducing power supplied to that circuitry." The disputed language here is "no longer operational." Defendants imply the "no longer operational" language from specification language that states, at least in some embodiments, that the wire loop or circuitry be "inactive." '323 patent, 3:3-5.

However, in their briefing, Defendants proposed a new and alternative construction that is closer to Plaintiff's construction that reads a "state where unnecessary [first, demodulation, or demodulator] circuitry is inactive when shutting off or reducing power supplied to that circuitry." Defendants argue that the "low-power state" involves deactivating unnecessary circuitry to conserve power. Additionally, Defendants argue the unnecessary circuitry is deactivated when power to that circuitry is shut off or reduced. Defendants cite to the specification for support. See, e.g., '323 patent, 5:25-27 ("Each unit . . . may . . . enter low-power mode by shutting off the now unnecessary sections of signal processing [], transmitting [], and receiving [], circuitry.").

B. Analysis

The Court believes that both Plaintiff's and Defendants' proposed constructions are flawed. The most obvious flaw in Plaintiff's construction, which reads a "state where power is reduced or unnecessary sections of the circuitry are inactive," is that Plaintiff's construction includes the disjunctive word "or." By using the word "or" in Plaintiff's proposed construction, there could be a low-power state if either there is a state where "power is reduced" or a state where "unnecessary sections of
the circuitry are inactive." So in some situations there could be a low-power state when only unnecessary sections of the circuitry are inactive. In this case, there would not even be a requirement that any power be reduced to be in a low-power state. That is problematic for two reasons. First, the ordinary meaning of the words "low-power state" implies that the power is reduced or lowered. Second, the patentee's entire invention relates to power conservation, which means power is reduced or lowered in some aspect of the invention. See '323 patent, 1:4-5 ("The present invention is directed to a power conservation system . . . ."). '323 patent, 2:10-11 ("the invention features a method of conserving power"). As a result, the Court refuses to adopt Plaintiff's proposed construction.

The Court also refuses to adopt Defendants' proposed constructions. For Defendants' original construction that reads a "state where [first, demodulation, or demodulator] circuitry is no longer operational after shutting off or reducing power supplied to that circuitry," the Court concludes that the "no longer operational" limitation is flawed. Defendants are improperly importing a limitation into the claims with the "no longer operational" limitation. Except in situations where the specification requires it, it is improper for the Court to import limitations from the specification that do not appear in the claims. N. Am. Container, Inc., 415 F.3d at 1348. The specification never states that certain circuitry must be non-operational during the low-power state. Further, at one point, the specification states that "the receiving ADSL unit returns the signal processing 111, transmitting 112, and receiving 113 circuitry to full power mode." Presumably, that is when the circuits are exiting the low-power state. But the specification uses the language of returning to "full" power mode, which implies there could be a state of operation in a lower power mode.

The Court finds instructive that the inventor describes the "low-power state" in the specification. Column 5 of the patent describes the method of the invention "[t]o reduce power requirements." See generally '323 patent, 5:6-47. In that section where the specification is describing how to enter low power mode, it specifically states "[e]ach unit 232 and 242 may then enter low-power mode by shutting off the now unnecessary sections of signal processing 111, transmitting 112, and receiving 113 circuitry." '323 patent, 5:25-28. While the specification says "low-power mode" instead of "low-power state," the Court concludes that "low-power state" is merely a state of operation in low-power mode. See '323 patent, 5:28-30 (describing "low-power mode" as "low power operation") (emphasis added). Further, in addition to "shutting off" the unnecessary circuitry, the specification also describes that the unit may enter low power mode by "reducing power" to the unnecessary circuitry. '323 patent, 7:23-25 ("Upon detecting a shut-down signal, the COT unit may save loop characteristics (step 310) and enter low power mode by reducing power to now unnecessary circuitry (step 311)."). Therefore, the Court's construction of a "state of operation brought about by shutting off or reducing power to the unnecessary sections of circuitry" is supported by the specification. While Defendants' alternative construction of a "state where unnecessary [first, demodulation, or demodulator] circuitry is inactive when shutting off or reducing power supplied to that circuitry" is close to the Court's adopted construction, the Court concludes that the proposed construction adds language that is redundant and not necessary given the inventor's specific description of the "low-power mode" above. See, e.g., '323 patent, 5:25-28 ("Each unit 232 and 242 may then enter low-power mode by shutting off the now unnecessary sections of signal processing 111, transmitting 112, and receiving 113 circuitry.").

K. "Low Temperature Oxide" ('715 patent, claims 4 and 26; '419 patent, claims 5 and 15)

The parties disagree regarding the appropriate level of specificity this court should adopt in construing the claim term "low temperature oxide." Ixys argues that a low temperature oxide may be any type of oxide, while APT contends that only silicon oxide (SiO\(_2\)) deposited by a particular chemical reaction is appropriate. Both parties cite to the same portion of the specifications for support: "... a low temperature oxide, gas dielectric, polyimide, or any other insulator requiring deposition, densification, or curing, at temperatures less than about 450 [degrees] C is deposited over the first metallization layer." '715 patent, 5:50-52. Neither party has mentioned any other text in the specifications that bears on the question at hand.

Although this would seem to provide an adequately clear definition of "low temperature," and although the language of the specifications does not provide any indication that the "oxide" must be a particular type, APT nevertheless directs this court towards a silicon processing treatise and argues for a definition based on the descriptions in those pages. APT notes correctly that such a reference is not precisely the type of extrinsic evidence traditionally disfavored in claim construction. See Vitronics, 90 F.3d at 1583. On the contrary, "the ordinary meaning of a claim term may be determined by reviewing a
variety of sources, including… dictionaries and treatises…." Teleflex, 299 F.3d at 1325 (internal citations omitted). Of course, this does not alter the fact that "intrinsic evidence is the most significant source of the legally operative meaning of disputed claim language." Vitronics, 90 F.3d at 1582.

Although this court is willing to consider APT's submission in interpreting this term, the materials APT provides do not shed further light upon, nor meaningfully confine, the claim language. In particular, none of the pages to which APT cites this court state that SiO[2] is the only low temperature oxide in use within the industry, or even attempt to limit the range of oxides that may qualify as "low temperature oxides" for the purposes of an invention such as this one. Because SiO[2] is not the only conceivable oxide to which the patent might refer, any specification of the chemical process by which that oxide may be deposited is unnecessary. The court construes the claim language at issue as follows: "An oxide in which deposition, densification, or curing occurs at temperatures less than approximately 450 [degrees] C."

6. "Lower layers" (Claim 1)

The portable terminal described in Claim 1 of the '705 patent utilizes a "communication protocol stack having higher and lower layers specified by industry standards." ('705 patent, col. 38, ll. 6-8.) As background, a "protocol stack" is an abstract method of dividing the various communications functions of a data network into hierarchical layers. (Acampora Rep. at 42.) Both parties agree that, at the time of this patent's invention, there were multiple industry-standard protocol stacks in existence, any of which could have been utilized by the portable terminal described in the '705 patent. (R. at 270 (May 6, 2004).)

The dispute over this claim term concerns the content of the "lower layers" of the protocol stack in the '705 patent. According to Agere's proposed construction, the term "lower layers" is specifically limited to the two bottom-most layers in the seven-layer OSI model," 22 namely, the "data link layer" and the "physical layer." In contrast, Broadcom's proposal describes the term "lower layers" more broadly as "the layers below a dividing line in a layered protocol model."

The court's analysis of this term begins with the claim language. The term "lower layers" is clearly a relative concept that must derive its content in relation to "higher layers" in the protocol stack. (R. at 271 (May 6, 2004) ("Obviously, lower is a relative term. I don't know about a dividing line, but they're lower than something.") (Goodman).) The language of claim 1 itself does not provide much further content or limitation to this term, except that the lower and higher layers of the protocol stack are "specified by industry standards." ('705 patent, col. 38, ll. 7-8.) As there were multiple industry standards in existence at the time of this invention, a person of skill in the art would not understand the claim language to be limited to the two bottom-most layers of the OSI-model. (Acampora Rep. at 43.) Accordingly, the claim language supports Broadcom's construction.

A review of additional evidence in the intrinsic record similarly provides no basis to limit the broad claim text. The patent specifications teach that the dividing line between lower and higher layers of the protocol stack may vary. (R. at 277 (May 6, 2004); '705 patent, col. 10, ll. 39-40 ("Alternatively, the dividing line might also be drawn at a higher level, for example, at the network layer . . . or at somewhere in between.").) In addition, dependant claim 9 and Figure 1C each demonstrate that the "lower layers" are not limited to the data link and physical layers, but can also include portions of the network layer. ('705 patent, col. 38, ll. 63-65 ("The portable terminal of claim 1 wherein the lower layers of the communication protocol stack includes at least a portion of a network layer"); see also R. at 277 (May 6, 2004) (acknowledging that Figure 1C depicts lower layer as including portion of network layer).) In fact, Agere's expert, Dr. Goodman, conceded this point at the Markman hearing, admitting that the term "lower layers" may include layers beyond the physical and data link layer. (R. at
Despite Dr. Goodman's concessions at the Markman hearing, Agere nonetheless makes the additional argument that its construction is dictated by an explicit definition of the term "lower layers" in the specification. Renishaw, 158 F.3d at 1249 (noting that, when patent applicant acts as own lexicographer, the provided definition controls). In one portion of the specification, the patentee describes the embodiment illustrated by Figure 1B and states: "the functionality of the lower layers (i.e. data link layer and physical layer[)] is performed by the microprocessor of the data and communication module." ('705 patent, col. 10, ll. 1-4.) Agere argues that this constitutes an explicit definition of the term "lower layers" that limits the term's meaning in the remainder of the patent. Agere's argument is unsuccessful, however, as this specification clearly does not define the term "lower layers" generally, but rather describes which layers are "lower" for the purposes of this one particular embodiment. (Id., col. 9, l. 60); Electro Med., 34 F.3d at 1054. In conclusion, as Agere has not provided any basis upon which to limit the broad claim language, the Court adopts the plain and ordinary meaning of this claim term, which is: "The layers below a dividing line in a layered protocol model."

12. Lower speed return channel protocol; upstream channel protocol

The term "lower speed return channel protocol" is found in claims 35, 36, 37 (by virtue of its dependence on claim 35), and 38 (by virtue of its dependence on claim 36) of the '774 patent. The term "upstream channel protocol" is found in claims 39 and 52 of the '121 patent and claim 119 of the '845 patent. The plaintiff proposes a construction of "any set of rules for data transmission upstream" and the defendants propose a construction of "set of rules for assigning an upstream channel to a single remote link adapter." Upon consideration of the arguments, the court construes each of the above terms to mean "a set of rules for transmission of lower speed data addressed to a host computer or server."

A. "Lower Substrate" and "Conductive Layer Formed Over Said … Substrate"

The disputes concerning these two terms are closely connected because a determination of the meaning of one term will almost automatically yield a determination of the meaning of the other. Paradigm contends that these terms connote a horizontal, planar surface only, so that the conductive layer is literally over, or on top of, the nonconductive substrate. In Paradigm's view, the conductive layer in its cylindrical array is not formed "over" the nonconductive layer, but inside it. Paradigm asserts that the nonconductive layer in its array is not "lower" than the conductive layer, but rather is an outer ring.

LDAI disagrees. According to LDAI, when the conductive layer is formed onto the surface of the nonconductive layer, it is formed "over" the nonconductive layer, regardless of whether the structure is planar or cylindrical.

After reviewing the evidence, and in particular the claims of the '951 patent itself, as well as the expert testimony concerning how these terms would be understood by a person of ordinary skill in the art, I agree with LDAI's interpretation of these terms. I believe that the words "lower" and "over," as used in the patent, do not mean that one layer is physically above, or higher than the other, but simply that one layer is applied or formed onto the surface of the other.

The word "over" has many different meanings. When used to describe the relative position of two objects, it can mean that one object is physically higher than the other, e.g., "the lamp hangs over the table." It can also be used, however, to connote that a surface is covered with some substance. If one were to say, for example, "the ceiling was stained, so I painted over it," that would not mean that the person painted above the ceiling, but only that he covered its surface with paint. In that example, the paint would, strictly speaking, physically be beneath the ceiling.

In my view, that is a more logical interpretation of the terms at issue here. The patent indicates that one begins with a nonconductive layer, and then forms a conductive layer "over" it. That simply means that one surface of the nonconductive...
layer is covered with a conductive layer. The fact that the nonconductive layer may be cylindrical does not mean that it cannot be covered "over" in this manner.

Likewise, the nonconductive layer can be described as "lower" than the conductive layer for the same reason: the conductive layer has been formed "over" it. Again using the analogy of a painted ceiling, one could speak in terms of what lies "beneath" the surface of the paint, even though the ceiling itself is physically higher off the ground than the paint that covers it.

Paradigm's interpretation of these terms is not persuasive, because according to Paradigm's logic, one could theoretically construct a laser diode array exactly like those made by LDAI, flip it upside down, and claim that it does not infringe the '951 patent because the conductive layer is physically lower than the nonconductive layer. Such a result is obviously absurd. Clearly, then, these terms are not meant so much to describe the physical position of these layers, but rather the order in which they are formed. The nonconductive layer is formed first, and then the conductive layer is formed "over" it, i.e., on the surface of the nonconductive layer. I conclude, therefore, that as used in Claim 1 of the '951 patent, "lower substrate" refers to the base or foundation on which the rest of the structure is built, and "conductive layer formed over" the substrate means that the conductive layer covers the surface of the substrate.

--- Footnotes ---

4 I also note that, as pointed out by LDAI, Paradigm's arrays are actually constructed of two identical pieces, each of which is shaped roughly like a half-cube with a semicylindrical concavity running along one side. Those pieces are made of a nonconductive material, and the concave surface is covered with a conductive layer. The two pieces are then joined together, with the concavities facing each other, to make the final product. See Fig. 3 (taken from the drawing sheets of the '850 patent). Even using Paradigm's own interpretation of these claim terms, then, the two halves, considered individually, could arguably be considered to have a conductive layer "over" the "lower" nonconductive layer.

2543

7. "Lowest layer" (Claim 10)

Agere proposes that the term "lowest layer" should be construed as "the physical layer," while Broadcom suggests that the term should be construed as "the bottom-most layer in a layered protocol model." As the Markman hearing revealed, the parties' core dispute concerns whether Agere's use of the word "physical" is merely descriptive or a specific reference to the lowest layer of the protocol stack in the OSI model. As discussed above, the meaning of this term is determined with reference to "industry standards," of which there are many, each with different names for the lowest layer. ("A portable terminal utilizing a communication protocol stack having a highest layer, at least one middle layer and a lowest layer specified by industry standards.") (emphasis added.) For instance, the lowest layer of the SS7 protocol stack is called the MTP 1 layer. (Broadcom Reply at 53.) Thus, for the same reasons as set forth regarding the previous term, it would be inappropriate and in conflict with the broad claim language to limit this term to the name of the lowest layer in one particular protocol stack. Therefore, the Court accords this term its plain and ordinary meaning: "The bottom-most layer in a layered protocol model." 23

--- Footnotes ---

23 While the Court finds that this claim term is not confined to the lowest layer of the OSI model, the parties agree that the lowest layer of all extant layered protocol stacks includes some physical component. (R. at 319-20 (May 6, 2004); Goodman Rep. P 94 ("As far as I am aware, in every layered protocol model (be it a standard, public or private protocol), the bottom-most layer is the physical layer.").)

--- End Footnotes ---
II. MAC Address

The term "MAC address" appears in claims 9, 10, 19, and 20 of the '906 patent.

Both parties acknowledge that, to one skilled in the art, the term "MAC address" typically refers to a unique serial number assigned by a manufacturer to a type of physical device called a media access controller ("MAC"). Defendants point out that the Fenner patents teach that a logical address—typically identified by a series of numbers—must be assigned to each node. In other words, defendants argue that the term "MAC address," as it appears in the claims of the '906 patent, refers to a logical address which happens to be represented by the same series of numbers as some physical address assigned to a MAC.

Plaintiff argues that the term MAC address should be given the ordinary and accustomed meaning as understood by one of ordinary skill in the art at the time of the invention in the context of the entire patent. Phillips, 415 F.3d at 1312-13.

All of the asserted claims of the '906 patent recite "at least three IEEE 802 media access controller (MAC) communications ports, each communications port having associated with it a MAC address." Because the MAC address is associated with a MAC—a physical device—this address cannot be a logical address, which is an identifier of a connection to a communication system. As explained above, a logical address is not permanently associated with a particular physical device. Thus, the plain language of the claims counsels against Defendants' assertion that a MAC address is a logical address. Because nothing in the specification indicates that the patentee assigned a new meaning to the term "MAC address," the ordinary and accustomed meaning of the term as understood by one of ordinary skill in the art governs. Phillips, 415 F.3d at 1312-13. The Court adopts Plaintiff's proposed construction.

6 At the hearing, Defendants argued that their construction should be adopted because the '906 patent is subject to a terminal disclaimer. However, the Defendants have not attached the PTO's explanation for the double patenting rejection, or the patentee's response. The mere existence of a terminal disclaimer, without further explanation, does not affect the Court's construction. Defendants also argue that unless their construction is adopted, the claims of the '906 patent must be found invalid for lack of written description. While Defendants may rely on this argument to contest validity, it does not affect the construction of this term.

Claims 1-14 describe how the objects are associated by the system with unique authorized information comprised of "machine-readable code elements." Alliance contends that the phrase is limited to directly-encoded binary numbers, while
CIAS argues that it refers to any code that can be separated into parts and automatically obtained from objects.

The specification defines "machine-readable" as "used in a broad sense and [] meant to encompass techniques, methods and apparatus for automatically obtaining from objects information applied thereto or associated therewith." n82 Since the specification here acts explicitly as a dictionary, its definition of "machine-readable" controls. n83

"Code elements" are also defined in the specification, albeit less concretely, as "digits, characters, positions, places, pulses, signals, etc." n84 This list of examples is non-exclusive, which suggests that the phrase is intended to refer broadly to any individual part of a code. Defendants argue that the specification describes only embodiments that use binary code, but again, a patent is not limited to one embodiment if its terms, as defined, include a broader scope. n85 Here, the specification describes numerous kinds of code elements, not just binary forms.

The specification is "the single best guide to the meaning of a disputed term." n86 Where, as here, it provides explicit definitions, the Court must follow its direction. n87 Accordingly, the phrase "machine-readable code elements" is construed as individual parts of a code (1) that can be separated into parts and (2) that can be automatically obtained from objects.

The parties dispute the meaning of the terms "[the needle] is rendered magnetic at [or to] a level that enables detection of the magnetism of the needle," which appears in claims 1 and 13 of the '668 patent, and "the needle is magnetized to a level which enables detection of the magnetism of the needle," which appears in claims 7 and 15 of the '668 patent. The parties competing constructions of these terms are shown in the following chart:

<table>

<td>[The needle] is</td>
<td>The needle or needle</td>
<td>Prior to use of the</td>
</tr>
</tbody>
</table>
The needle is magnetized to a level which enables detection of the magnetism of the needle (In claims 1 and 13) 

rendered magnetic at [or to] a level that enables detection of the magnetism of the needle (In claims 7 and 15) 

piece has been magnetized to be a permanent magnet that produces a magnetic field, or has been magnetized in a magnetic field to maintain a residual magnetism that produces its own magnetic field that persists when the magnetic field is removed, prior to use of a detector. The term does not refer to stainless steel which is merely attractable to a permanent magnet. It is the permanent or residual magnetism that must be detected by the detector in order to determine a needle or piece is present in the meat. The needle or needle piece has been magnetized to be a permanent magnet that produces a magnetic field, or has been magnetized in a magnetic field to maintain a residual magnetism that produces its own magnetic field that persists when the magnetic field is removed, prior to use of a detector. The term does not refer to stainless steel which is merely attractable to a permanent magnet. It is the permanent or residual magnetism that must be detected by the detector in order to determine a needle or piece is present in the meat.

The needle has broken off in the flesh of an animal which has then been killed for slaughter, the needle is magnetized to be a permanent magnet that produces a magnetic field or has been magnetized to produce a magnetic field for a period of time, whereby the magnetism of the magnetic needle facilitates locating a needle or needle fragment in the flesh of a slaughtered animal.

The needle is magnetized, or the magnetism of the needle is enhanced, to a level which facilitates locating a needle or needle fragment in the flesh of a slaughtered animal.
As the chart above reveals, Rivard argues that the same proposed construction applies to the pertinent language in claims 1 and 13 and to the slightly different language in claims 7 and 15 of the '668 patent. Indeed, Rivard contends that the same proposed construction should apply to the term "magnetic or magnetizable" in claim 1 of the '196 patent, and to the term "the needle cannula or piece thereof is magnetized to a level which enables detection of the magnetism of the needle cannula or piece thereof" in claim 8 of the '196 patent. See Chart of Constructions In Dispute, supra beginning on page 23, the '196 patent, disputed claim terms c. and h. Ideal, on the other hand, contends that all four claim terms must be given different constructions. For now, the court will confine its analysis to the "magnetism" terms of the '668 patent.

a. Arguments of the parties

Rivard argues that the claims and specification demonstrate that these claim phrases require (1) that the needle be magnetized so as to act as a magnet prior to the use of a metal detector, and (2) that it is the magnetism that is detected. Rivard argues that, during prosecution of the patents, the patentee argued that the invention did not encompass needles that merely had stainless steel metallurgy with the capacity to be magnetized, and that, instead, the needle had to be made into a magnet, and on that basis, distinguished prior art. Rivard surmises that Ideal is now arguing that no construction of these claims is required, so that Ideal can argue that the claims read on a needle that could be made into a magnet, but is not yet one. Implicit in Rivard's argument is a contention that there is no difference between "rendered magnetic," "is magnetized," "magnetic," and "magnetizable." Rivard points out that the Summary of the Invention repeatedly refers to a needle that "is magnetized" or that is "permanently magnetizable or magnetic." Similarly, Rivard points out that the Detailed Description recites that the invention uses either a permanently magnetic or magnetizable alloy or an alloy that can be magnetized for a period of time, i.e., made a residual magnet, prior to use of a metal detector, and also describes an embodiment in which a magnetizing device is located in the conveyor line ahead of the metal detector in order to magnetize any needle parts located in processed meat. Rivard also cites portions of the prosecution history, including the examiner's rejection of newly added independent claim 30 as incomplete, pursuant to 35 U.S.C. § 112, because it recited that the needle was magnetizable, but omitted the step of magnetizing the needle. Rivard asserts that, in response to this rejection, the patentee amended the patent to add the step requiring that the needle be magnetized, and then distinguished prior art on the basis that the prior art did not teach use of magnetized needles. Rivard contends that the prosecution history reveals that the examiner and patentee understood that the needle must, itself, be made into a magnet. As extrinsic evidence, Rivard points out that Ideal's vice president confirmed that Ideal was initially magnetizing the detectable needles in a separate operation.

Ideal argues that Rivard's construction cannot be correct, precisely because Rivard has offered the same construction for four different claim terms, in violation of well established canons of patent claim differentiation. For its own part, Ideal argues that neither the "rendered magnetic" nor the "is magnetized" term requires any construction, because the ordinary meanings of these terms are unambiguous and well known to one skilled in the art. Ideal acknowledges that, during prosecution of the '668 patent, the examiner rejected application claims 30 through 35 as incomplete, pursuant to 35 U.S.C. § 112, for failure to include the essential step of magnetizing the magnetizable needle, and that Ideal responded by adding the "rendered magnetic" language to what became claims 1 and 13. Ideal asserts, nevertheless, that the addition of this language does not require the court to adopt Rivard's construction. Ideal contends that Rivard's proposed interpretation comprises language that represents an embodiment described in the specification rather than language expressly or implicitly disclaiming or disavowing claim scope. In summary, Ideal contends that Rivard's proposed interpretation of the "rendered magnetic" term is improper for the following reasons: (1) the language of the claim is clear and unambiguous, and thus, requires no interpretation; (2) the language that Rivard uses, which is the same language Rivard uses to interpret "magnetic or magnetizable," would reincorporate language that was amended out of the '668 patent; (3) the language that Rivard uses is the same as the language that Rivard uses for several entirely different claim terms; and (4) the language that Rivard uses would effectively negate the amendment to overcome the § 112 rejection. If some construction of the "rendered magnetic" term is required, Ideal offers an alternative, shown in the chart above, which Ideal contends, without explanation, is well supported by the intrinsic evidence.

Ideal also argues that the "is magnetized" term in claims 7 and 15 requires no construction, because its meaning is clear and unambiguous to one of ordinary skill in the art. Again, Ideal asserts that Rivard's construction of this term is wrong, because Rivard uses the identical construction for the completely different term "magnetic or magnetizable" in the '196 patent. Ideal also contends that the language of the "is magnetized" term in the '668 patent is obviously different from the "rendered magnetic" language in the same patent, as well as the "magnetic or magnetizable" language in the '196 patent, but does not explain the difference in meaning between "rendered magnetic" and "is magnetized." If the court deems some construction
to be necessary, Ideal again offers an alternative construction, shown in the chart above, which Ideal contends, without explanation, is well supported by the intrinsic evidence.

In its rebuttal brief, Rivard again asserts that the constructions of all of the "magnetism" terms in the two patents should be similar, because they have a common import and associated meaning in the patents-in-suit. Rivard contends that Ideal's claim differentiation argument is overcome here by the presence of only minor differences in language and the requirement in both of the patents that the magnetism of the needles must be what is detected, so that the claim terms must be interpreted consistently. Rivard also argues that it is a critical and necessary aspect of the claims that the magnetism be brought to such a level prior to detection that it enables detection of the needle or piece thereof. Rivard argues that Ideal's response to rejections by the examiners demonstrates that Ideal conceded that the needle must be magnetized, so that the claim language cannot be construed to cover a needle that is merely capable of being magnetized, and must, instead, be construed to require that the needle be magnetized prior to the metal detector, not in the metal detector, as Ideal argues. Rivard also argues that the prosecution histories of both patents are relevant to construction of these related claim terms, because they are interwoven, with cancelled claims of the '668 patent application later reasserted in the '196 patent application.

In its rebuttal brief, on the other hand, Ideal argues that Rivard is slyly attempting to narrow construction of this term to require that the needle be rendered magnetic "prior to the detector" or "before the detection process," when the claim term and intrinsic evidence refer to rendering the needle magnetic "prior to detection." Ideal contends that this subtle difference is important, because the detector may itself include a means for magnetizing or enhancing the magnetism of the needle, as such a product and such a practice is commonly used in the industry. Ideal also contends that Rivard's constructions would send the court off on a red-herring attempt to determine when the "detection process" begins. Ideal contends that the prosecution history provides no indication of when the needle is either magnetized or rendered magnetic, other than before detection. Ideal also argues that absolutely nothing in the prosecution history could be construed as a disavowal of needles capable of being magnetized, when the prosecution history specifically states that the patentee identified needles that either are or are capable of being magnetized.

The time at which the needle is rendered magnetic or is magnetized was one of only four issues that Rivard addressed in the Markman hearing in light of the court's tentative ruling. The Court will summarize Rivard's Markman argument on this issue below, in the pertinent part of the court's analysis.

b. Analysis

i. Difference in words or difference in meaning? Starting with the words of the two claim terms in the '668 patent presently at issue, see Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), the court agrees that there are obvious differences between the language of the claim term "[the needle] is rendered magnetic at [or to] a level that enables detection of the magnetism of the needle" in claims 1 and 13 and the language of the claim term "the needle is magnetized to a level which enables detection of the magnetism of the needle" in claims 7 and 15 of the '668 patent. The court is considerably less convinced, however, that there is any difference in meaning between "is rendered magnetic" and "is magnetized."

Consultation of an ordinary dictionary, to assist in understanding the commonly understood meaning of words, see Free Motion Fitness, Inc., 423 F.3d at 1348 (recognizing such use of a dictionary as appropriate, citing Phillips, 415 F.3d at 1320); Phillips, 415 F.3d at 1324 ("[A] judge who encounters a claim term while reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term.");), reveals that "rendered," in the sense appropriate here in light of intrinsic evidence, see id., means "to cause to be or become: MAKE." MERRIAM WEBSTER'S COLLEGIATE DICTIONARY 990 (10th ed. 1995); OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("render" means "to make, to cause to be or become, of a certain nature, quality, etc."). Thus "rendered magnetic" would mean "is made magnetic" or "is magnetized." Indeed, as the chart of proposed claim constructions, above, reveals, Ideal's alternative construction actually equates "is rendered magnetic" with "is magnetized," because Ideal construes the term "[the needle] is rendered magnetic . . . " to mean "the needle is magnetized . . . . "

The intrinsic evidence of the Summary of the Invention and the Detailed Description confirm the appropriateness of equating "is rendered magnetic" with "is magnetized." See Phillips, 415 F.3d at 1314 (the specification is "highly relevant" to claim construction, "[u]sually, it is dispositive," and it "is the single best guide to the meaning of a disputed term"). The Summary of the Invention uses only "is magnetized" to describe the process of making the needle magnetic at a level that
enables detection of the magnetism of the needle, see the '668 patent, Col. 2, ll. 28-29, 42-43, 57-58; see also id., Col. 3, ll. 24-25 (needle cannula comprising a stainless steel alloy that is magnetized"), and nothing else in the specification suggests a different meaning. The court finds the obvious equating of "is rendered magnetic" and "is magnetized" in the '668 patent overcomes any presumption that the different words were intended to have different meanings. Compare Andersen Corp., 474 F.3d at 1369 (different words used in separate claims are presumed to indicate that the claims have different meanings and scope).

Ideal is correct, however, that claim terms "rendered magnetic" and "is magnetized" not only use different language but have different meanings from the claim term "magnetic or magnetizable," which appears only in the '196 patent, precisely because the former terms from the '668 patent require that something be done to the needle in question to make it become magnetic, while the latter term from the '196 patent does not. Compare OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("render" means "to make, to cause to be or become, of a certain nature, quality, etc.,,", so that "rendered magnetic" means "to be made magnetic"), with OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("magnetic" means, inter alia, "having the properties of a magnet," and "magnetizable" means "capable of being magnetized."). The court will return to the meaning of "magnetic or magnetizable" in the '196 patent, below, but for now, concentrates on the meaning of the "is rendered magnetic" and "is magnetized" terms in the '668 patent.

ii. Permanent and residual magnetism. The court turns to the question of what "is made magnetic" or "is magnetized" means in the context of the '668 patent. It is clear from both parties' constructions, and more importantly, clear from the intrinsic evidence, that "is made magnetic" or "is magnetized" would be understood by one of ordinary skill in the art, reading the patent, to mean that the needle must be made into or become a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time. For example, the Detailed Description identifies a preferred embodiment as one in which the "stainless steel alloy is an alloy that is permanently magnetic or magnetizable before detection," but also notes that, "[a]lternatively, the needle cannula of the present invention can comprise a stainless steel alloy that is not a permanent magnetic [sic] but is capable of being magnetized in a magnetic field to maintain a residual magnetism." See the '668 patent, Col. 5, ll. 46-59. Rivard contends that the construction of this phrase must state that it "does not refer to stainless steel which is merely attractable to a permanent magnet." The court finds, however, that such a construction, while accurate, is superfluous, where the claim term unambiguously requires that the needle be or be made magnetic, not merely that it be attracted or attractable to a magnet.

At the Markman hearing, Rivard contended that the court's tentative construction of "residual magnet" should be modified to add that a residual magnet is a magnet that retains its magnetic field for a period of time "when the magnetizing field is removed." Ideal contended that this construction improperly requires the magnetization of the needle and withdrawal of the magnetizing field before the needle enters the metal detector, a matter of timing of the magnetization of the needle addressed below. The court finds it unnecessary to add the language that Rivard proposes and potentially improper to do so, because the court has found nothing in the record that disavows a construction that permits the needle to be rendered a residual magnet as it is detected, i.e., a circumstance in which the residual magnetism of the needle is detected before the magnetizing field is removed.

iii. Capacity to be magnetized. The parties' arguments concerning the "is rendered magnetic" and "is magnetized" language in the '668 patent, and indeed, their arguments concerning "magnetic or magnetizable" in the '196 patent, also suggest concerns about the "capacity" or "capability" of the needle to be so magnetized. Rivard contends that, based on the specification and prosecution history, the "magnetism" terms of both patents do not apply to a stainless steel needle that merely has the capacity to be magnetized, but only to a needle that has been made into a magnet. Ideal argues that the claims, specification, and prosecution history make clear that the invention applies to a needle that merely has the capacity to be magnetized until it is rendered magnetic, as well as to a needle that is magnetic.

The words of the claims, see Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), suggest that the needle must be magnetized either prior to injecting the animal or after slaughter. Specifically, claim 1(a) claims an injection means wherein the needle, not otherwise identified as already magnetic or made from a magnetic alloy, "is rendered magnetic to a level that enables detection of the magnetism of the needle," and claim 1(b) claims injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter." The '668 patent, Claim 1. Because the claim permits rendering the needle magnetic as late as after slaughter, it clearly contemplates that the needle was, until that time, only capable of being magnetized. Indeed, logic dictates that something that "is rendered magnetic" is capable of being magnetized until it is
"rendered magnetic."

The intrinsic evidence from the specification also supports this construction. See Phillips, 415 F.3d at 1314 (the specification is "highly relevant" to claim construction, "[u]sually, it is dispositive," and it "is the single best guide to the meaning of a disputed term"). While there are numerous references in the specification to the needle being made from a magnetized or magnetic stainless steel alloy, there are also references to a needle or alloy that is "capable of being magnetized" or "magnetizable." For example, one alternative embodiment describes a needle cannula that is comprised of "a stainless steel alloy that is not a permanent magnetic [sic] but is capable of being magnetized in a magnetic field to maintain a residual magnetism." The '668 patent, Col. 5, ll. 56-59. Similarly, the Detailed Description includes a description of a particular embodiment in which the detection apparatus "can further comprise a means for producing a high magnetic field (not shown) to magnetize or enhance the magnetism of the stainless steel comprising needle cannula 12 or piece thereof in animal flesh or meat product after slaughter 200 before it enters metal detector 104." Id., Col. 6, ll. 42-48. Thus, the patent contemplates a needle that is capable of being magnetized, but is not actually rendered magnetic until after slaughter of the animal in which it has broken off, as well as a needle that is a permanent magnet or that is rendered magnetic at some time prior to use to inject a live animal.

Rivard, nevertheless, argues that the prosecution history reveals that the patentee disavowed a needle that was only capable of being magnetized or only had the capacity to be magnetized, citing a portion of the June 2, 2002, amendment to the application for what became the '668 patent. See Joint Appendix at 47-53. Rivard characterizes the patentee's argument therein as (1) asserting that the invention requires the needle to be magnetized, not just to have the capability to be magnetized, and (2) distinguishing prior art that was merely capable of being magnetized but not actually magnetized, because such non-magnetized prior art needles did not provide increased detectability. Although prosecution history certainly can be relevant to the construction of claim terms, see Nystrom, 424 F.3d at 1142 ("In addition to the written description, the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be.") (quoting Phillips, 415 F.3d at 1317), the court finds Rivard's characterization of this portion of the prosecution history to be strained at best.

Specifically, the cited portions of the amendment distinguish two prior art references, one for reusable stainless steel needles and one for Martensitic stainless steel, explaining,

[N]either suggests that the stainless steel be rendered magnetic and neither suggests that a magnetic stainless steel needle be used to inoculate animals because the magnetism of the magnetic needle would facilitate locating the a broken needle fragment in the flesh of a slaughtered animal in the event the needle should break during inoculation of the animal prior to slaughter. Thus, neither prior art reference on its own teaches or suggests the applicant's claimed method for detecting broken needles in the flesh of slaughtered animals, which is using a needle comprised of a stainless steel that is magnetic.

Joint Appendix at 48-49. The amendment then argues that the combination of the two prior art references also would not render the claimed invention obvious, because there was no reason why one of ordinary skill in the art would have combined them. Id. at 49. At most, the patentee asserted that the two prior art references would have suggested making reusable needles from Martensitic steel, but would not have suggested rendering Martensitic steel needles permanently or temporarily magnetic to improve detectability. Id. at 49-52. The patentee certainly did not expressly or even implicitly disavow needles only capable of being magnetized by observing that nothing taught magnetizing needles made of an alloy capable of being magnetized.

In its rebuttal brief, Rivard again argues that, in response to a prior art rejection of application claims 16 and 23, Ideal argued "that the claim language itself already required that the needle be magnetized and did not cover a needle that merely had the capability of being magnetized." Rivard's Rebuttal Brief at 18 (citing Joint Appendix at 51-52). Rivard also argues that the patentee's contention that Martensitic stainless steel in the Hultin-Stigenberg prior art must be made permanently or temporarily magnetic in order for it to have a magnetic field that would render it more detectable means that the patentee disavowed needles that were only capable of being magnetized, because the Martensitic stainless steel of Hultin-Stigenberg would be capable of being magnetized. Rivard's Rebuttal Brief at 24-25. Such an argument completely mischaracterizes the patentee's argument, which was precisely that the prior art did not teach magnetizing needles made of alloys capable of being magnetized to improve detectability. See Joint Appendix at 51-52 ("There is nothing in the prior art that would have suggested that it would have been desirable to make Martensitic stainless steel permanently or temporarily magnetic for the
purpose of making needles, the fragments of which would be more readily detected in the flesh of a slaughtered animal by a metal detector than would be nonmagnetic fragments."). Moreover, the patentee argued, "The applicant discovered that the ability of the detector to detect stainless steel needle fragments is enhanced by using needles which are magnetic or capable of being rendered magnetic in an electric field." Joint Appendix at 52 (emphasis added). Thus, the patentee expressly asserted that the invention was magnetizing needles capable of being rendered magnetic, as well as using magnetic needles, and an attempt to construe these statements as conveying exactly the opposite meaning, as express or implicit disavowals of needles capable of being rendered magnetic, is wholly unpersuasive.

Thus, the court finds no comments in the cited prosecution history expressly or implicitly disavowing needles made of stainless steel that had the capacity to be magnetized, even in the express assertions that what made the invention patentable was rendering the claimed needle magnetic. The proper construction does not require exclusion of needles capable of being magnetized, because the patent clearly contemplates needles with the capacity to be magnetized until they are rendered magnetic, as well as needles that are magnetic.

iv. Time at which the needle is rendered magnetic. The parties' arguments concerning the "is rendered magnetic" and "is magnetized" language in the '668 patent, and indeed, their arguments concerning "magnetic or magnetizable" in the '196 patent, also suggest concerns about the time at which the needle must be, become, or be made a permanent or residual magnet. Rivard argues that the needle must be rendered magnetic "prior to use of a [metal] detector." Indeed, this contention was one of only four arguments that Rivard asserted during the Markman hearing. Ideal argues that the claims, specification, and prosecution history make clear that the needle must be made magnetic prior to use to inject animals or after it has broken off in the flesh of an animal which has then been killed for slaughter, i.e., before detection, not before the detector.

Rivard may be on better ground when it asserts that the needle must be magnetized "prior to use of a detector." Logic suggests that, in order for the magnetism of the needle to be detectable, the needle must be rendered magnetic or magnetized before whatever does the detecting is used. Any uncertainty about what does the detecting is rapidly dissipated by copious intrinsic evidence that what does the detecting is a metal detector or a magnetic detector. See, e.g., the '668 patent, Summary of the Invention, Col. 1, l. 67, to Col. 2, l. 1 ("which enables the needle cannula to be detected in a metal detector"); Detailed Description, Col. 5, l. 46, to Col. 6, l. 19 (describing detection of magnetized needles by metal detectors or magnetic detectors, but suggesting that a drawback of a magnetic detector is that it cannot detect non-magnetizable metals). Indeed, no other method of detection is described anywhere in the patent. Furthermore, as noted above, the Detailed Description includes a description of a particular embodiment in which the detection "apparatus can further comprise a means for producing a high magnetic field (not shown) to magnetize or enhance the magnetism of the stainless steel comprising needle cannula 12 or piece thereof in animal flesh or meat product after slaughter 200 before it enters metal detector 104." id., Col. 6, ll. 42-48 (emphasis added), which appears to support Rivard's argument, at least by describing the time at which the needle could be rendered magnetic as "before it enters metal detector 104."

On the other hand, the court cannot simply import what is clearly a particular embodiment in the specification, see id., Col. 6, ll. 41-42 (stating that the apparatus described in ll. 42-48 is "[i]n particular embodiments"), into the construction of the claim term. See Playtex Prods., Inc., 400 F.3d at 906 ("The court must take care in its analysis, when locating in the written description the context for a disputed term, not to import a limitation from that written description. It must use the written description for enlightenment and not to read a limitation from the specification [into the construction of the term]," and "'[i]t is axiomatic that claims, not the specification embodiments, define the scope of protection." (internal citations and quotation marks omitted)). Therefore, it is inappropriate to use the description of an embodiment in which the needle is magnetized by a high magnetic field before it enters the metal detector to limit the time at which the needle must be magnetized. See the '668 patent, Col. 6, ll. 41-48.

More importantly, the words of the claim, see Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), suggest that the needle must be magnetized more generally either prior to injecting the animal or after slaughter. Specifically, claim 1(a) claims an injection means wherein the needle (albeit not otherwise identified as already magnetic or magnetizable or made from a magnetic or magnetizable alloy) "is rendered magnetic to a level that enables detection of the magnetism of the needle," and claim 1(b) claims injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter." The '668 patent, Claim 1 (emphasis added). None of the other claims in which either of the two claim terms at issue is used specifies precisely when the needle is magnetized, although each suggests that the detection of the magnetism
of the needle occurs "when the animal is slaughtered and processed." See id., claim 7, Col. 9, ll. 39-42; claim 13, Col. 10, ll. 22-24; claim 15, Col. 10, ll. 47-49.

In the tentative draft, the court concluded that the specification sheds no particular light on this question, either, despite its usual importance. See Phillips, 415 F.3d at 1314 (the specification is "highly relevant" to claim construction, "[u]sually, it is dispositive," and it "is the single best guide to the meaning of a disputed term"). The court found that this was so, because the specification refers once to a preferred stainless steel alloy "that is permanently magnetic or magnetizable before detection," see id., Col. 5, ll. 46-57 (emphasis added), and once, as noted above, to a preferred embodiment of the detection apparatus in which the stainless steel of the needle is magnetized "before it enters metal detector 104." Id., Col. 6, ll. 42-48 (emphasis added). The court found in the tentative draft that the specification does not otherwise specify when magnetism must be imparted to the needle or steel of which the needle is comprised.

Therefore, in light of the words used in the claim, the court concluded in the tentative draft that a proper construction of the "timing" aspect of these terms requires that the needle is magnetic or is made magnetic "either prior to injecting the living animal or while in the flesh of the animal after slaughter," as this language "stays true to the claim language and most naturally aligns with the patent's description of the invention." Nystrom, 424 F.3d at 1142 (quoting Phillips, 415 F.3d at 1316, in turn quoting Renishaw PLC, 158 F.3d at 1250); see also the '668 patent, claim 1(a) (claiming an injection means wherein the needle "is rendered magnetic to a level that enables detection of the magnetism of the needle"); id., claim 1(b) (claiming injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter").

At the Markman hearing, however, Rivard argued that the patents-in-suit and their prosecution histories make clear that the needle must be magnetized before the metal detector, not just before detection. First, Rivard takes issue with this court's observation, in a footnote in the tentative draft, that one portion of the Detailed Description--which describes a particular embodiment in which the detection "apparatus 100 can further comprise a means for producing a high magnetic field (not shown) to magnetize or enhance the magnetism of the stainless steel comprising needle cannula 12 or piece thereof in animal flesh or meat product after slaughter 200 before it enters metal detector 104," id., Col. 6, ll. 42-48 (emphasis added)--demonstrates that, contrary to Rivard's contention, the specification does describe an embodiment in which the needle is magnetized using the metal detector, or at least, is magnetized in an "apparatus for detecting metal" comprising a means for magnetizing the needle as well as the metal detector. See id. Col. 6, ll. 20-21 (describing the "apparatus 100" as "an apparatus for detecting metal in the flesh of an animal after slaughter"). Rivard argues that "apparatus 100" does not disclose an embodiment in which the needle is magnetized in the same device used for detecting metal, because "apparatus 100" is not a single component, but an assembly of multiple components. See the '668 patent, Col. 6, ll. 20-27 ("apparatus 100 comprises conveyors and detection units") and Col. 6, ll. 20-21 ("apparatus 100 comprises belt conveyors for transporting animal flesh or meat products after slaughter through metal detector 104 for detecting whether animal flesh contains a broken piece of needle cannula 12 of the present invention").

Indeed, Rivard argues that "apparatus 100" does not include any device for magnetizing a needle, although other embodiments of the assembly may include such a device for magnetizing the needle before it enters the metal detector 104. See id., Col. 6, ll. 41-47. As a matter of specificity, Rivard is correct: The description does not describe a single component that both magnetizes and detects the magnetized needle. Nevertheless, Ideal argues that a metal detector itself may generate sufficient magnetic field to magnetize a needle as the detector detects the needle. While Ideal's contention may be true, the court does not find evidence either supporting it or disproving it in the record. Ultimately, however, whether or not the patent discloses a method for magnetizing the needle with a metal detector is beside the point. The pertinent question is what the patent discloses about when the needle must be magnetized.

Rivard argued at the Markman hearing that, because the needle can be magnetized to retain residual magnetism, and residual magnetism is magnetism that persists after a magnetic field is removed, and because the magnetized needle is described as detectable by a metal detector or a magnetic detector, it must be magnetized before the metal detector or magnetic detector, and if it is not, it will not be detectable by both kinds of detectors. 8 Finally, Rivard argued that, because the patentee argued that the prior art does not disclose that the detectability of Martensitic needles would be improved by magnetizing the needles, and indeed, the patentee argued that Martensitic needles that had not been magnetized would not have improved the detectability of fragments from the needles, the claimed needles must be magnetized prior to the metal detector.

--- Footnotes ---

8 A large portion of Rivard's argument concerning the time at which the needle is magnetized was illustrated using the
vi. The court's construction. In light of the foregoing, Rivard attempted to add the Horita patent to the record, but Ideal resisted its inclusion. The court finds it unnecessary to address Rivard's arguments based specifically on the Horita patent, as they are only illustrations of arguments otherwise summarized above in reference to the description and prosecution history of the '668 patent.

These arguments are unpersuasive, however, because they fall well short of demonstrating that, in either the specification or the prosecution history, the patentee disavowed magnetizing the needles at any time other than "prior to the metal detector." See, e.g., Research Plastics, 421 F.3d at 1296 ("The purpose of consulting the prosecution history in construing a claim is to "exclude any interpretation that was disclaimed during prosecution,"" quoting Rhodia Chimie, 402 F.3d at 1384, in turn quoting ZMI Corp., 844 F.2d at 1580, and noting that "the prosecution history can reveal instances where the inventor limited the invention in the course of prosecution and thus narrowed the scope of the claim."). To put it another way, the court cannot find that language of the claims themselves--that is, language of claim 1(a) which claims an injection means wherein the needle (albeit not otherwise identified as already magnetic or magnetizable or made from a magnetic or magnetizable alloy) "is rendered magnetic to a level that enables detection of the magnetism of the needle," and language of claim 1(b), which claims injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter," the '668 patent, Claim 1 (emphasis added)--is contrary to the portions of the specification or prosecution history on which Rivard relies. Thus, the court reiterates its conclusion that a proper construction of the "timing" aspect of these terms requires that the needle is magnetic or is made magnetic "either prior to injecting the living animal or while in the flesh of the animal after slaughter," as this language "'stays true to the claim language and most naturally aligns with the patent's description of the invention.'" Nystrom, 424 F.3d at 1142 (quoting Phillips, 415 F.3d at 1316, in turn quoting Renishaw PLC, 158 F.3d at 1250); see also the '668 patent, claim 1.

v. Magnetized to a level that enables detection. The remaining question for these claim terms is the appropriate construction, if any is required, for the phrase requiring that the needle be magnetized "at [or to] a level that enables detection of the magnetism of the needle." Rivard contends that the construction of this phrase must state that "it is the permanent or residual magnetism that must be detected by the detector in order to determine a needle or piece is present in the meat." Again, the court finds this part of Rivard's construction to be superfluous, because the claim term itself clearly and unambiguously states that what must be detected is "the magnetism of the needle."

Ideal, on the other hand, contends that, if any construction is required, the phrase "at [or to] a level that enables detection of the magnetism of the needle" should be construed to mean "whereby the magnetism of the magnetic needle facilitates locating a needle or needle fragment in the flesh of a slaughtered animal" or "to a level which facilitates locating a needle or needle fragment in the flesh of a slaughtered animal." The problem with Ideal's construction of this phrase, in the court's view, is that "enables" and "facilitates" do not have the same ordinary meaning, and nothing in the patent suggests that a specialized meaning of "enables" to mean "facilitates" is appropriate. See Free Motion Fitness, Inc., 423 F.3d at 1348 (recognizing such use of a dictionary as appropriate, citing Phillips, 415 F.3d at 1320); Phillips, 415 F.3d at 1324 ("[A] judge who encounters a claim term while reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term."). As to ordinary meaning, in the sense appropriate here from the intrinsic evidence of the patent, "enable" means "to make possible, practical, or easy," or "to cause to operate." See MERRIAM WEBSTER'S COLLEGIATE DICTIONARY 380 (10th ed. 1995). "Facilitate," on the other hand, means "to make easier" or "help bring about." Id. at 415; see also Free Motion Fitness, Inc., 423 F.3d at 1348 ("The court must ensure that any reliance on dictionaries accords with the intrinsic evidence."). While the definitions of "enable" and "facilitate" overlap at the broadest definition of "enable," the one defining "enable" as "to make easy," it is inappropriate to select the broadest of the dictionary meanings as a matter of course. See id., 423 F.3d at 1348-49 (noting that use of the fullest range of a terms ordinary meaning does not mean that the term will presumptively receive its broadest dictionary definition or the aggregate of multiple dictionary definitions). The court also believes that "enable" in the context of the patent means "to make possible," not merely "to make easy." See, e.g., the '668 patent, Detailed Description, Col. 5, ll. 63-66 ("Thus, a needle cannula or piece thereof comprising a residual magnetism, which is embedded in the flesh of an animal or meat product, can be detected in a metal detector or magnetic detector . . . .") (emphasis added).

vi. The court's construction. In light of the foregoing, the court concludes that the proper construction of both "[the needle] is rendered magnetic at [or to] a level that enables detection of the magnetism of the needle," which appears in claims 1 and
13 of the '668 patent, and "the needle is magnetized to a level which enables detection of the magnetism of the needle," which appears in claims 7 and 15 of the '668 patent, is the following: "Either prior to injecting the living animal or while in the flesh of the animal after slaughter, the needle is magnetized to become a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time, to a level that makes it possible for the magnetism of the needle to be detected by a metal detector or magnetic detector."

6. "magnetic disk operation format" (claims 1 and 6)

The plaintiff asks the court to define "magnetic disk operation format" to mean "a format applicable to conventional magnetic disk drives" and the defendant asks the court to construe the term to mean "commands capable of being provided to conventional magnetic disk drives." The defendant states in its response brief that "operation requests issued by users in magnetic disk operation format must be usable by magnetic disk drives." This statement is consistent with the ordinary and plain meaning of this claim term.

The plaintiff argues that its proposed construction is also consistent with the plain meaning of the claim term. But the specification does not support the plaintiff's proposed broad construction. Consider two examples from the specification:

- upper layer operating system receives the read command from the user, wherein the command format is the familiar format used by the legacy magnetic disk.
  
  Col. 5, ll. 47-49.

- Under the management of the operating system, users can operate the external storage device the same way operating [sic] a classical disk.
  
  Col. 3, ll. 23-26.

Both of these passages describe a format that is usable by the magnetic disks rather than merely "applicable" to a magnetic disk drive. At col. 10, ll. 14-16, the specification states "[b]ecause the format of the write command is the standard magnetic disk operation format, which is different from the operation format of USB and flash memory. . ." Throughout the patent, the specification discloses converting user requests in magnetic disk operation format to special instructions for the flash memory. The specification requires "magnetic disk format" to be more narrowly defined than "applicable to conventional magnetic disk drives."

The court defines "magnetic disk operation format" to mean "a format capable of being provided to conventional magnetic disk drives."

2548

c. "Magnetic or magnetizable"

The parties next dispute the construction of the term "magnetic or magnetizable" in claim 1 of the '196 patent. Ideal asserts that no construction of this unambiguous term is required, even as an alternative to Rivard's proposed construction. Therefore, the chart that follows shows only the claim term and Rivard's proposed construction.

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Rivard's Proposed Definition</th>

<td>c. Magnetic or magnetizable</td>
<td>The needle or needle piece has been magnetized to be a permanent magnet that produces a magnetic field, or has been magnetized in a magnetic field to maintain a</td>
</tr>
</tbody>
</table>
residual magnetism that produces its own
magnetic field that persists when the magnetic
field is removed, prior to use of a detector.
The term does not refer to stainless steel which
is merely attractable to a permanent magnet.

i. Arguments of the parties. Rivard argues that claim 1 refers to stainless steel that is "magnetic or magnetizable," then thereafter refers to the "magnetism" of the needle. Rivard argues that, to be grammatically and substantively consistent, the term "magnetism" must relate back to and be produced by the stated "magnetic or magnetizable" feature of the needle cannula, and that the term "magnetism" does not refer to the mere capacity to be magnetized, but to something that actually operates as a magnet. Rivard also argues that the specification repeatedly refers to a magnetic needle or one that is magnetized before detection and to "magnetic stainless steel." From this language, Rivard apparently infers that "magnetic or magnetizable" means already made a magnet, not merely capable of becoming a magnet. Similarly, Rivard argues that the prosecution history shows (1) that the invention requires the needle to be magnetized not just to have the capability to be magnetized, and (2) that the patentee distinguished prior art that was merely capable of being magnetized and not actually magnetized because non-magnetized prior art needles did not provide increased detectability. Rivard's arguments in its rebuttal brief concerning the "magnetism" terms of the two patents, which were discussed in reference to construction of the "magnetism" terms of the '668 patent, are also asserted as to the "magnetic or magnetizable" terms of the '196 patent. Ideal, however, argues that "magnetic or magnetizable" is unambiguous and that the prosecution history reveals no intent to disavow any scope to the term.

ii. Analysis. Beginning with the words of the claim, Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), it is apparent that "magnetic or magnetizable" refers to two possible, and different, conditions. See Merck & Co., 395 F.3d at 1372 (the court must construe claims so that no term becomes "superfluous," and "[a] claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."). The first problem with Rivard's construction, in the court's view, is that it improperly conflates the two stated conditions into a single condition, "magnetic."

The second problem with Rivard's construction of this phrase, in the court's view, is that "magnetic" and "magnetizable" do not have the same ordinary meaning, and nothing in the patent suggests that a specialized meaning conflating the latter term into the former one is appropriate. See Free Motion Fitness, Inc., 423 F.3d at 1348 (recognizing such use of a dictionary as appropriate, citing Phillips, 415 F.3d at 1320); Phillips, 415 F.3d at 1324 ("[A] judge who encounters a claim term while reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term."). More specifically, as to ordinary meaning, in the sense appropriate here from the intrinsic evidence of the patent, see Free Motion Fitness, Inc., 423 F.3d at 1348 ("The court must ensure that any reliance on dictionaries accords with the intrinsic evidence."). "magnetic" means "magnetized or capable of being magnetized," and "magnetize" means "to induce magnetic properties in." See MERRIAM WEBSTER'S COLLEGIATE DICTIONARY 700 (10th ed. 1995). Thus, "magnetic" means having been induced with magnetic properties, see OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("magnetic" means, inter alia, "having the properties of a magnet"); "magnetizable" means "capable of being magnetized." See OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com). While the definitions of "magnetic" and "magnetizable" overlap at the broadest definition of "magnetic" as "capable of being magnetized," Rivard argues that the appropriate meaning for both "magnetic" and "magnetizable" is the narrowest meaning of "magnetic" as "magnetized," which is a meaning that the term "magnetizable" simply will not bear. Moreover, in a context where both terms are used in succession, it is appropriate to read them to have different meanings. See Merck & Co., 395 F.3d at 1372 (the court must construe claims so that no term becomes "superfluous," and "[a] claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."). Thus, applying ordinary meanings, "magnetic" means "magnetized" or "induced with magnetic properties," and "magnetizable" means "capable of being magnetized" or "capable of being induced with magnetic properties."

Returning to intrinsic evidence, the court is unpersuaded by Rivard's argument that the subsequent references to "magnetism" in claim 1 mean that "magnetic or magnetizable" must refer to something that actually operates as a magnet, not to something that merely has the capacity to be magnetized. It is true that claim 1 does not include any limitation requiring that the "magnetic or magnetizable" needle actually be magnetized, even though it later refers to the "magnetism" of the needle. See the '196 patent, claim 1. 16 The subsequent references to "magnetism" in claim 1 are in an extended "so
that" clause, which "simply expresses the intended result of a process step positively recited"; consequently, that clause is not given weight and does not state a material limitation in the method claim. Cf. Hoffer v. Microsoft Corp., 405 F.3d 1326, 1329 (Fed. Cir. 2005) (explaining that a "whereby" clause is given "no weight" when it "simply expresses the intended result of a process step positively recited" in a method claim, but "when the 'whereby' clause states a condition that is material to patentability, it cannot be ignored in order to change the substance of the invention"). Here, the method claim is "a method of injecting an animal health product into flesh of a living food animal." The '196 patent, claim 1, Col. 8, ll. 58-60. The "process" step is "providing an injection means comprising a needle assembly . . . wherein the needle cannula is made of stainless steel which is magnetic or magnetizable . . . ." Id., Col. 8, ll. 61-67. The intended result is "so that . . . the magnetism . . . enables detection of the magnetism of the needle cannula or piece thereof in the flesh of the animal upon slaughter and processing into a food if the needle cannula or piece thereof were to break off in the flesh of the living animal during the injection." Id., Col. 9, ll. 4-12. The fact that this intended result may not actually follow if a "magnetizable" needle is not also claimed to be "rendered magnetic" is beside the point; the references to "magnetism" in the "so that" clause cannot alter the meaning of the limitation actually claimed, that "the needle cannula is made of stainless steel which is magnetic or magnetizable." Id., Col. 8, ll. 66-67 (emphasis added). Moreover, the Summary of the Invention repeatedly refers to a "magnetic or magnetizable" needle, not merely one that "is magnetic" or "is magnetized." Consequently, it cannot be said that a "magnetic" needle is the fundamental invention to the exclusion of a "magnetizable" needle, such that the references to "magnetism" in the "so that" clause limit the claimed method in claim 1. Compare Hoffer, 405 F.3d at 1330 (the condition stated in the "whereby" clause was part of the "fundamental invention," based on the specification, and did limit the method claimed).

The specification also supports distinguishing between the meanings of the two words "magnetic" and "magnetizable." See Aquatex, 419 F.3d at 1380 ("Where . . . the disputed claim term is technical or a term of art, [t]he best source for understanding [it] is the specification from which it arose, informed, as needed, by the prosecution history.") (quoting Phillips, 415 F.3d at 1315); Phillips, 415 F.3d at 1314 (the specification is not only "highly relevant" to claim construction, "[u]sually, it is dispositive," and "is the single best guide to the meaning of a disputed term"). The Summary of the Invention repeatedly refers to a needle that is "magnetizable or magnetic," see the '196 patent, Col. 11, 29, 43, and Col. 4, 1, 2, thereby reinforcing the notion that the two terms have different meanings and that both conditions that the terms describe are intended to be fundamental to the invention.

The court turns, next, to the question of what is meant by "magnetic or magnetizable," in the context of the patent. Again, as with other "magnetism" terms in the '668 patent, it is clear from the intrinsic evidence that "magnetic" or "magnetizable" would be understood by one of ordinary skill in the art reading the patent to mean that the needle is or is capable of becoming a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time. For example, the Detailed Description identifies a preferred embodiment as one in which the "stainless steel alloy is an alloy that is permanently magnetic or magnetizable before detection," but also notes that, "[a]lternatively, the needle cannula of the present invention can comprise a stainless steel alloy that is not a permanent magnetic [sic] but is capable of being magnetized in a magnetic field to maintain a residual magnetism." See the '196 patent, Col. 5, ll. 50-63.

Rivard contends, as it did with other "magnetism" terms of the '668 patent, that the construction of this phrase must state that it "does not refer to stainless steel which is merely attractable to a permanent magnet." The court finds, however, that such a construction, while accurate, is superfluous, where the claim term unambiguously requires that the needle be or be capable of being made magnetic, not merely that it be attracted or attractable to a magnet.

Also as with the "magnetism" terms of the '668 patent, Rivard argued at the Markman hearing that the court's tentative construction of "residual magnet" in the '196 patent should be modified to add that a residual magnet is a magnet that retains

- 2898 -
its magnetic field for a period of time "when removed from the magnetizing field" and that the court should add to its tentative construction "that [the magnetism] makes it possible for the magnetism to be detected in a metal detector and magnetic detector." Ideal contended that the first proposed addition improperly requires the magnetization of the needle and withdrawal of the magnetizing field before the needle enters the metal detector, a matter of timing of the magnetization of the needle addressed above. Again, the court finds it unnecessary to add that a "residual magnet" is one that retains its magnetism for a period of time "when removed from a magnetic field," as Rivard proposes, and potentially improper to do so, because the court has found nothing in the record that disavows a construction that permits the needle to be rendered a residual magnet as it is detected, i.e., a circumstance in which the residual magnetism of the needle is detected before the needle is removed from the magnetizing field. The court finds it improper to add to the construction of "magnetic or magnetizable" that "[the magnetism] makes it possible for the magnetism to be detected in a metal detector and magnetic detector," because enabling detection is not a limitation in claim 1, but only language appearing in a "such that" clause, as explained more fully below, beginning on page 132.

iii. The court's construction. In summary, the court concludes that "magnetic or magnetizable" in claim 1 of the '196 patent must be construed as follows: "is or is capable of becoming a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time."

10. "magnetic reed relay switch"

Dependent Claim 23 of the '571 Patent discloses a "magnetic reed relay switch." Cardiac Science asserts that this term should be construed as "a magnetically operated switch." Philips contends that the term should be construed as "a reed switch combined with a coil to create a relay."

Both parties rely upon the same dictionary definition to support their constructions. The IEEE 100 defines "reed relay" as a "relay using glass-enclosed magnetically closed reeds as the contact members. Some forms are mercury wetted." IEEE 100 Authoritative Dictionary of IEEE Standards Terms at 941 (7th ed. 2000). Philips also asserts that magnetic reed relay switches are known in the art to be a particular type of magnetic switch that has reeds and a coil. However, aside from one unsubstantiated Internet reference and another company's data sheet that cites a coil requirement, Philips offers no support from the patent itself. Neither the IEEE definition nor the patent makes reference to a coil or, more specifically, a copper coil. On the other hand, Cardiac Science's definition adds nothing to the meaning of the term. The Court construes the term "magnetic reed relay switch" as "a relay switch that uses magnetically closed reeds as the contact members."

5. "main board"

This term appears in the '408 patent claims 1 and 9.

Rackable asserts that "main board" means "main circuit board inside the computer that makes it possible for the other parts of a computer to communicate with each other, into which additional boards may be plugged if present." Supermicro asserts that "main board" means "a circuit board that contains the primary components of a computer."

The essence of this dispute is whether this term constitutes the principal board in the computer through which other parts of the computer communicate, as Rackable contends, as opposed to any printed circuit board having a processor, according to Supermicro.

Rackable explains that a computer may contain several printed circuit boards, but that the "main board" is "the largest printed circuit board in the computer" into which other circuit boards would plug. It asserts that many electronic devices contain circuit boards, but do not contain "main boards" as found in general purpose computers such as servers. In support, Rackable cites to extrinsic evidence, including several different print and online dictionaries. In addition to the dictionary
definitions, in support of its construction, Rackable also argues that one of ordinary skill in the art "would expect a main board of the basic type that permits the level of functionality required of a general purpose computer, . . . also known as a 'motherboard'" and "would also know that the main board in a general purpose computer makes it possible for the other parts of the computer to communicate with each other."

Supermicro, in response, argues that specification language supports its construction, in addition to extrinsic evidence, including several computer and/or electronic dictionary definitions.

At the hearing, the parties agreed that "main board" is synonymous with "motherboard." Based on the admissions at the hearing, it is clear to the court that the parties agree that the "main board" includes "the primary components of a computer," and is distinguishable from a daughter board. In fact, Supermicro made a judicial admission that a "main board" is not the same thing as a daughter board. Thus, the real issue concerns the amount of detail that should be provided regarding the function of the motherboard or "main board" and its relation to other boards. As noted, per Rackable's construction, the "main board" should be construed to include language regarding communication, specifically that it is a circuit board that enables "other parts of a computer to communicate with each other," and should also be construed to note that additional boards, if present, may be plugged into it.

The only guidance in the specification itself appears to be several examples of "[p]referred main boards," which include "models N44BX, L44GX, 810, 810E and C440GX by Intel." However, the court cannot read limitations from the embodiment or the examples in the specification into the definition. Because analysis of the intrinsic evidence fails to resolve the ambiguity, the court will consider the extrinsic evidence -- most significantly, the dictionary definitions provided by the parties.

Rackable cites to five dictionary definitions in support of its construction, including: (1) a CNET.com definition (Ostapuk Decl., Exh. X); (2) Merriam-Webster's Online Dictionary (Exh. Y); (3) Free Online Dictionary of Computing (Exh. Z); (4) Microsoft Press Computer Dictionary (Exh. AA); and (5) an Answers.com definition (Exh. EE).

Supermicro cites to three different dictionary definitions in support of its construction, including: (1) Microsoft Computer Dictionary definitions of "main board" and "mother board;" (Yamashita Decl., Exh. D) (3) Dictionary of Computer and Internet Terms (Exh. F); and (4) the IEEE Standard Dictionary of Electrical and Electronic Terms (Exh. E).

Technical treatises and dictionaries are generally preferred over a definition in an ordinary dictionary based on "the principle that patents are to be construed by the hypothetical person skilled in the art." Kahrl, Patent Claim Construction, § 7.03[B], Technical Treatises (Aspen 2005 Suppl.); see also, e.g., Rambus, Inc. v. Infineon Technologies AG, 318 F.3d 1081, 1091 (Fed. Cir. 2003). "A technical treatise is more likely to provide a definition used by persons skilled in the art than an ordinary dictionary definition." Id. In defining electrical and computer terms, the Federal Circuit has employed computing dictionaries and the IEEE Standard Dictionary of Electrical and Electronic terms, as offered by Supermicro in this case. See Rambus, 318 F.3d at 1091; see also NeoMagic Corp. v. Trident Microsystems, Inc., 287 F.3d 1062, 1071 (Fed. Cir. 2002).

Here, the technical dictionaries overwhelmingly support Supermicro's construction of the term "main board," with one modification -- that the "main board" be "main" or "primary." Rackable's definition is unnecessarily complex and contains limitations on the definition of "main board" that are not universally present in the dictionary definitions.

For these reasons, the court adopts, with one addition, Supermicro's construction, and construes the term "main board" as a main circuit board that contains the primary components of a computer.

2551

1 "main case"

The parties dispute whether the scanner's main case necessarily contains the interface engine.

The mobile scanner disclosed by independent claim 13 comprises "a main case including an image sensing module and a motion mechanism," "an interface engine coupled to the image sensing module and the motion mechanism" and "a universal
The parties originally agreed that "main case" means "a compact case that houses the image sensing module and the motion mechanism." Doc # 36, Ex 1 at 16. Plaintiff now rejects that construction and contends that "main case" means "a compact case that houses the image sensing module, the motion mechanism and the interface engine." Doc # 58-2 at 2 (emphasis original). Plaintiff argues that the previously agreed upon construction is inconsistent with dependent claim 14, which claims "the mobile scanner of claim 13, wherein the interface engine is enclosed in the main case and communicate[s] with the computing device through the universal serial bus." '506 patent, col 12, 11 12-14.

It is true that "the usage of a term in one claim can often illuminate the meaning of the same term in other claims." Phillips, 415 F3d at 1314; see also Fonar Corp v Johnson & Johnson, 821 F2d 627, 631 (Fed Cir 1987) ("[C]onstruction of disputed claims requires reference to the specification, the prosecution history, and the other claims."). But in this context, plaintiff's argument proves too much. The fact that claim 14 specifies that the main case houses the interface engine actually militates against implying such a spatial limitation into claim 13, for it suggests that the patentee contemplated that the interface engine would not necessarily be enclosed within the main case. See Phillips, 415 F3d at 1325 ("The inclusion of such a specific limitation on the term 'baffles' in claim 2 makes it likely that the patentee did not contemplate that the term 'baffles' already contained that limitation.").

This is confirmed by dependent claim 15, which specifies that interface engine is housed in "a separate case integrated with the universal serial bus." '506 patent, col 12, 11 12-17 (emphasis added). The additional and mutually exclusive limitations of claims 14 and 15 show that the location of the interface engine was not a limitation inherent to the "main case" language of claim 13. Hence, "main case" should not be construed so as to specify the interface engine location.

Plaintiff lastly contends that its construction is appropriate because this court found in the previous claim construction order that the "interface engine is enclosed in the main case." Id at 2-3. But the court merely observed that the claim language of the '506 patent "makes clear that the interface engine is contained within the main case in some embodiments." Doc # 57 at 17 (emphasis added). This observation is entirely consistent with the conclusion that the interface engine may be housed outside the main case, a possibility that should not be foreclosed in the manner plaintiff proposes.

In sum, the court declines to construe "main case" so as to import a limitation concerning the location of the interface engine into claim 13. Because (1) the location of the interface engine vis-a-vis the main case was the sole subject of dispute and (2) the parties agree that the main case is a compact case that houses the image sensing module and the motion mechanism, the court adopts the parties' previously agreed upon construction, which is amply supported by the claims and the specification. See '506 patent, col 2, 11 13-14 (proclaiming that the disclosed scanner fulfills the need for a "compact, energy-efficient and lightweight" scanner); col 2, 11 57-61 ("The main case houses the image sensing module and the motion mechanism"); col 5, 11 41-42 (same); col 11, 11 31-40 (same).

The court construes "main case" as "a compact case that houses the image sensing module and the motion mechanism."

2552

1. "Main Computer" & "Remote Computer"

As was the case when the parties first briefed the construction of the '490 patent claims, many of the terms in the system claims are largely undisputed. However, the parties disagree over the construction for the first two elements of Claim 30. The first claim element reads: "a main computer including a main memory for storing variable data, constant data and a main revision status related to at least one product, the main revision status indicating the revision level of the constant data stored in the main memory …." '490 Patent, col. 25, II. 16-20. The Court will refer to the first element of Claim 30 as the "main computer" element. The second claim element reads:

- a remote computer including a remote memory for storing constant data and a remote revision status related to the at least one product, the constant data being a subset of information data related to the at least one product, the remote revision status indicating the revision level of the constant data stored in the remote computer ….
Id. col. 25, ll. 21-26. The Court will refer to the second element of Claim 30 as the "remote computer" element.

Hill asserts that both elements mean, in their entirety: "A computer that has a memory for storing data as required by subsequent limitations within the claim." Pl.'s Exh. H, Chart, Proposed Claim Construction of Pl. Charles E. Hill & Assoc., Inc., at 1 ("Pl.'s Claim Constr. Chart"). In contrast, CompuServe asserts that the "main computer" element means, in its entirety: "A computer that has a memory in which variable data, constant data, and a main revision status indicating the revision level of the constant data is stored as required by subsequent limitations within the claim." Id. Abstract, at 1. In other patent, whether system or method, "perform[] the steps of storing and maintaining variable data and constant data … in a memory of a remote computer.

Therefore, the major difference between the two proposed constructions is whether or not the main and remote computer elements require that the computer memory actually store the data referred to in the claim. The Court finds that the language of Claim 30 requires that specific types of data be stored on the main and remote computers. Therefore, the "main computer" phrase means: "a computer that has a memory in which variable data, constant data, and a main revision status indicating the revision level of the constant data is stored;" and the "remote computer" phrase means: "a computer that has a memory in which constant data and a remote revision status indicating the revision level of the constant data is stored."

Starting with the plain language of the claims, the Court notes that the elements themselves use permissive rather than compulsory language to describe the memory required of the two computers. Claim 30 states, in relevant part: "a main computer including a main memory for storing …", "490 Patent, col. 25, l. 16, "a remote computer including a remote memory for storing …" Id. col. 25, l. 21. The use of the word "for" in these phrases is permissive. In other words, the word "for" implies that the memory needs to "be capable of" the function described, rather than requiring that the memory actually perform the function described. See, e.g., Ecolab Inc. v. Envirochem Inc., 264 F.3d 1358, 1366 (Fed. Cir. 2001) (finding that the functional phrase "for ware and hard surface washing" required only that the "substantially uniform" detergent referred to "contain components capable of "ware and hard surface washing"")); Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 516, 546 (D. Del. 2001) (finding that "the functional phrase 'for coupling' … indicates only that the I/O port must be capable of being connected to an off-chip memory means and not that it is actually connected to such memory means").

But, the main and remote computer phrases in Claim 30 of the '490 patent do not exist in a vacuum. Accord Laitram Corp. v. Cambridge Wire Cloth Co. 863 F.2d 855, 858 (Fed. Cir. 1988) (finding that a claim term, "slightly greater," was not without definitional parameters found within the remainder of the claim). The remainder of the claim requires that certain types of data or information be stored in a certain computer. For example, the third element of Claim 30 requires that the system have a " means for transmitting the remote revision status from the remote computer to the main computer." 490 Patent, col. 25, ll. 28-29. This element assumes that the remote revision status is found at the remote computer. It specifically states that the structure referred to is used to transmit the revision status "from" the remote computer to the main computer. This can only happen if the remote computer stores the remote revision status. Five other claim elements, elements five through nine of Claim 30, specifically state that the data or status it references is found in a particular computer's memory. See, e.g., id. col. 25, ll. 32 - 34 ("means for selecting portions of the constant data stored in the main memory that are different from the constant data stored in the remote memory"); id. ("means for transmitting updated portions of the constant data stored in the main memory from the main computer to the remote computer"); id. col. 25, ll. 38-40 ("means for replacing portions of the constant data stored in the remote memory with the updated portions of constant data received from the main computer"), id. col. 25, ll. 41-43 ("means for transmitting variable data related to a selected product stored in the main memory from the main computer to the remote computer"); id. col. 25, ll. 45-50 ("means for integrating constant data related to the selected product stored in the remote memory with the variable data related to the selected product received from the main computer"). Therefore, the language of Claim 30, in its entirety, requires that the types of data identified be stored in the memory of either the main or remote computer, or both.

A construction for the first two elements of Claim 30 that requires that the main and remote computers store certain types of data also comports with the teachings in the specification. The Abstract delineates that the electronic catalog defined by the patent, whether system or method, "perform[] the steps of storing and maintaining variable data and constant data … in a memory of a main computer and storing constant data … in a memory of a remote computer." Id. Abstract, at 1. In other words, certain data is stored on particular computers. In addition, the abstract teaches that "[a] constant data revision status
in the memory of the main computer is then compared with a constant data revision status in the memory of the remote computer. "Id. Again, certain information is stored on certain computers.

The specification also teaches that "catalog data is stored on both the vendor's computer and the customer's computer." Id. col. 1, ll. 51-52. The specification here teaches that the vendor's computer contains variable data and the customer's computer contains all constant data. Id. col. 1, ll. 52-58. Similarly, in the Detailed Description of the Drawings section of the specification, the '490 patent teaches:

"Hard disk drive 30 of vendor's computer 12 is used to store variable data [and] constant data ...." Id, col. 8, ll. 48-49.

"Constant data … [is] stored on hard disk drive 36 of customer's computer 18." Id. col. 8, ll. 65-67.

"Variable data is stored in vendor's computer 12." Id. col. 9, ll. 40-41.

"Constant data is stored in customer's computer 18." Id. col. 9, ll. 45-46.

And, the specification, like Claim 30 itself, teaches that certain data is stored in certain computers because such data or its status is either transmitted to the other computer or is compared by the computer that stores the data or status. See, e.g., id. col. 18, ll. 31-34 (the vendor's computer compares the constant data revision status received from customer's computer with the constant data revision status on the vendor's computer); id. col. 19, ll. 49-51 (customer's computer replaces stored constant data files with updated files received from vendor's computer); id. col. 20, ll. 5-11 (vendor's computer builds a data file of variable data to transmit to customer's computer based on customer's request for certain variable data).

Hill argues that a construction that requires the main and remote computers to actually store certain kinds of data improperly imports a limitation from the specification into the claim. The Court disagrees because it is the claim language itself that provides the definitional parameters for the main and remote computer elements. The requirements that certain data be stored in the memory of either the main or remote computer is delineated in the other elements of Claim 30. Apparently, Hill recognizes this fact at some level because its proposed definitions end with "as required by subsequent limitations within the claim." Pl.'s Claim Constr. Chart, at 1. Clearly, as Hill suggests, the remaining elements of Claim 30 require that the main and remote computer memories actually store certain data. The Court finds no improper importation of a limitation from the specification. Accord Laitram, 863 F.2d at 858.

For the foregoing reasons, the Court concludes that the "main computer" phrase means: "a computer that has a memory in which variable data, constant data, and a main revision status indicating the revision level of the constant data is stored." The "remote computer" phrase means: "a computer that has a memory in which constant data and a remote revision status indicating the revision level of the constant data is stored."

2553

Main power source

Claims 1 and 6 of the '930 Patent contain the term "main power source." Network-1 contends that the term needs no construction or, in the alternative, means "source of main power," while Defendants contend that it means "a DC power source that provides the specified power for the data node and the low level current delivered to the access device." The parties disagree whether or not the term "main power source" is limited to DC power.

Network-1 asserts that Defendants' construction is vague as to "specified power" and limits "main power source" to be a DC power source without support in the specification for making that limitation. If the term is construed, Network-1 also asserts that its construction should be adopted because "main" and "secondary" refer to supplying power for two different operating modes. Defendants counter that, in the context of the claim as a whole, the term is restricted to a DC power source. Further, Defendants argue that Network-1's assertion that "main" and "secondary" refer to a single power-providing device with two operating modes is inconsistent with both the claims and the specification.

The claim language specifies that the main power source is "connected to supply power to the data node." '930 Patent, col.
4:17-18. Figure 3 below shows that the main power source is a source of DC power.

[SEE Figure 3 of the '930 Patent IN ORIGINAL]

In Figure 3, main power supply 70 is energized from an AC electrical outlet connection to deliver "main" power to the 8-Port Ethernet switches 68, which have secondary power sources. The words "source" and "supply" are used interchangeably in the '930 Patent as seen in Claim 4, which refers to the "source" from Claim 1 as "said . . . supply." See '930 Patent, col. 4:19, 4:44-45. Figure 1 showing Power Source 16 is not a separate embodiment of the invention, as the specification states that "Figure 3 illustrates the physical layout of components corresponding to" Figure 1, where Figure 1 is merely a "simplified schematic diagram." '930 Patent, col. 3:59-60, 2:21-25.

Network-1 attempts to construe the term broadly to include an AC electrical outlet as a "main power source," but a construction of such a breadth is inconsistent with the specification. See Wang Lab., Inc. v. Am. Online, Inc., 197 F.3d 1377, 1383 (Fed. Cir. 1999) (stating that "[t]he usage 'preferred' does not of itself broaden the claims beyond their support in the specification" and finding that "the claims were correctly interpreted as limited" to "[t]he only embodiment described in the . . . specification"). Further, the construction of "main power source" cannot be broader than what the inventors actually invented, as determined from the scope of the disclosure in the specification. See Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001) (stating that "[a]lthough the specification need not present every embodiment or permutation of the invention and the claims are not limited to the preferred embodiment of the invention, . . . neither do the claims enlarge what is patented beyond what the inventor has described as the invention").

The remainder of Defendants' construction, "that provides the specified power for the data node and that the low level current delivered to the access device," is superfluous, as the information is contained in the claim itself, which specifies that power is supplied by the main power source to the data node and the low level current is delivered from the main power source. See, e.g., '930 Patent, col. 4:17-18, 4:22-23. Accordingly, the Court construes the term "main power source" to mean "a DC power source."

VI. "[M]aintain a . . . market"

Plaintiffs ask the Court to construe the term "maintain a . . . market" to mean "to continuously provide a two-sided bid and offer market for a designated product." (R. 82, Pls.' Mem. at 21.) In contrast, TRG appears to propose that the Court interpret the claim term as meaning "to make a market." (See R. 85, Def.'s Mem. at 18 ("'Maintain a currency futures bid and offer market' means to make a market for currency futures.").) The Court rejects TRG's proposed construction as it fails to shed light upon what it means to "maintain a . . . market." Merely exchanging the verbs "maintain" and "make" does not help explain what it means to "maintain a . . . market." 19

19 Further, the terms are not interchangeable as a financial dictionary draws a distinction between the two. See Barron's Dictionary of Finance and Investment Terms 316 (4th ed. 1995) (in defining "make a market," stating that a dealer who "makes a market over a long period is said to maintain a market.").
markets for certain products." (R. 85, Def.'s Mem. at 19.) Given this support, the Court finds that a person of ordinary skill in the art would conclude that Plaintiffs' proposed definition reflects the ordinary meaning of the claim term "maintain a . . . market." Accordingly, the Court construes the term "maintain a . . . market" as follows: "to continuously provide a two-sided bid and offer market for a designated product."

2. "maintain an index"

EMC argues that this term should be given its plain and ordinary meaning. Alternatively it asks the Court to construe it as: "Keep or store an index." HP proposes: "To keep an index in an existing, up-to-date state (as of repair, efficiency or validity)." HP thus seeks to include a limitation requiring the index to be kept in an "up-to-date state."

It is unclear what "up-to-date-state" would mean in the context of the claim. It is true that the claim indicates that the index is modified with use. For example, the claim language suggests that the index is updated as the storage systems store new data: the

storage systems maintain an index, said index including at least a first indicator providing an indication of whether a predetermined data element stored on said first data storage system is valid, and at least a second indicator providing an indication of whether said predetermined data element stored on said second data storage system is valid.

However, the claim language does not specify when the index is updated.

Similarly, although several portions of the written description suggest that the index is updated, the specification provides no basis for the "up-to-date-state" limitation, nor does it provide guidance as to what such language would mean. For example, the storage system controller "maintaining a list of primary data to be copied updates this list to reflect that the given primary data has been received by and/or copied to the secondary data storage system." 347:3/20-23.

[S]ince data will not be immediately synchronized between the primary and secondary data storage systems, data integrity must be maintained by maintaining an index or list of various criteria including a list of data which has not been mirrored or copied, data storage locations for which a reformat operation is pending, a list of invalid data storage device locations or tracks, whether a given device is ready, or whether a device is write -- disabled. Information must also be included as to the time of the last operation so that the data may later by synchronized should an error be detected.

347:7/22-32. Moreover, "[w]hen the primary data storage system controller disk adapter writes the data to the primary data storage device, it will reset bit 104 of the write pending indicator (JFLCI) bits." 347:7/59-62. Thus, although the specification describes a system in which indices are updated as part of the data storage on both systems, it does not include a requirement as to when such updating must or should occur. Under these circumstances, importation of a limitation requiring the index to be kept in an "up-to-date-state" could exclude the claimed invention itself if the invention's indices were not updated instantaneously.

In the absence of contrary language in the specification, a person having ordinary skill in the art would understand this term to have its plain meaning. A dictionary definition-consistent with the description of the claimed invention -- of "maintain" is "to keep in an existing state (as of repair, efficiency, or validity)." Webster's Ninth New Collegiate Dictionary. According to the plain meaning of the term, the index must be kept in a state of proper use as defined by the claim. The claim indicates that the index contains information concerning the validity of predetermined data elements. Thus, because the index generally must represent the existing states of the storage systems, it must be updated at some point after the validity of predetermined storage elements is altered.

Accordingly, the Court construes this term as "keeping -- although not necessarily instantaneously -- an index in a state of validity."

GO BACK
Lumileds argues that the phrase "maintain the luminous output of said LED (12) at a predetermined level" requires claim 1's switching power supply to adjust the current supplied to the LEDs so that their luminous output is essentially constant. Focusing solely on the meaning of the word "predetermined," Relume argues that the disputed phrase requires only that the switching power supply maintain LED light intensity at amounts that are known or modeled in advance.

The drafter's use of the word "maintain" exposes the error of Relume's construction. The idea of uniform or constant output inheres in the word's ordinary meaning. Webster's defines "maintain" as "to keep in a state of repair, efficiency, or validity: preserve from failure or decline." And it defines "predetermine" as "to settle beforehand: settle in advance." Taken together, these definitions establish that the phrase, "maintain the luminous output of said LED (12) at a predetermined level," simply means to keep the LEDs' luminous output at a level chosen beforehand.

19 Here is what this construction means in practice. Suppose the desired level of LED output chosen beforehand is two units of light. The invention of claim 1 will seek to keep luminous output at this predetermined level of two units despite fluctuations in operating temperature.

The specification does not alter this construction. It states that "the present invention relates to a new method of maintaining an essentially constant luminous output from an LED array, irrespective of operating temperature." '909, 4:42-44. It later observes that either of its contemplated sensors -- the light sensor or the temperature sensor -- "can be used to modulate the average current through the LED array to maintain essentially constant luminous output, irrespective of operating temperature." '909, 5:17-20. It also describes how the invention's preferred embodiment uses a temperature behavior model "in order to keep the luminous output of the LED array essentially constant at a predetermined level." '909, 3:66-67.

Nowhere does the specification indicate that the invention of the '909 patent has the ability to produce anything other than essentially constant LED output.

In the end, the clear language of claim 1 and the equally clear specification of the '909 patent demonstrate that Relume's construction of "maintain the luminous output of said LED (12) at a predetermined level" is incomplete and at odds with the ordinary meaning of "maintain." It is not enough, as Relume did in its response brief, to offer a definition for "predetermined" and then ignore the more important and relevant meaning of "maintain." The disputed phrase must be examined in its entirety in order to comprehend its full scope.

Accordingly, I hold that a person of ordinary skill in the art would understand the claim language "maintain the luminous output of the said LED (12) at a predetermined level" to charge the invention of claim 1 with the task of keeping, or preserving from decline, the luminous output of its LEDs at an amount chosen beforehand.

10 Dow Jones further argues that "maintaining" means "storing, in a table." Because claim 1 is a method claim, rather than an apparatus claim, a construction that limits the claim to a particular structure is only appropriate if other structures were disavowed by the applicants. Dow Jones points to language in the specification and file history which indicates that formatting data, at least in the preferred embodiment, would be maintained in "string list store 1103," a table within a database. '530 Patent, Col. 15, ll. 9-12; Decl. of Brian Rosenbloom, Ex. R., Amendment, Aug 20, 1999, at 5. Although the applicants did not disclose any other possible method for maintaining this data, none of the references cited by Dow Jones indicate that the applicants "ma[de] clear the invention does not include a particular feature," SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001) or limited the scope of their claim by disclaiming...
2558

7. The term "maintaining" should be interpreted as follows: "preserving or keeping in a given existing condition."

2559

I now turn to the next disputed elements of this limitation, which are "establishing" and "maintaining" the path for the message to travel. There is really no dispute about the term "establishing." When the switch establishes a path for the message to travel, it "decides" where the message has to go. IBM puts it quite plainly: the switch sets up a path for the message to travel from the input circuit that received the message to the output circuit that was identified during the decoding process. When it does that, the switch "establishes" the path. It is fixed and will not be changed.

The word "maintains" generates considerably more controversy. As IBM notes, the parties are in agreement to a certain extent. They agree that, once the output circuit has been identified and the path established, that path may not change during the time the message is transiting (going through) the switch. By the end of oral argument, it became clear that the parties also agreed that the notion of a second message's cutting across (or interleaving) that path was inconsistent with the concept of "maintaining" the path. No other message can cut in, or ditch, the message whose path has been established once that path is established.

The parties do not agree, however, about whether two or more messages can occupy the same path at the same time. TM contends that its claim is broad enough to encompass such a situation, although I infer that a technology that would permit two messages to travel the same path at the same time has not yet been invented. IBM contends that simultaneous transmission of messages is not disclosed in the patent and that lack of exclusivity is inconsistent with the concept of "maintaining" a path for the use of our message until the entire message has passed over the wire.

The dictionary definition of the word "maintain" is "to preserve or keep in a given existing condition." Webster's II New Riverside University Dictionary 717 (1994). As no one disputes that the path in question must be kept in a state of readiness to transmit the message from the time it is established until the entire message has passed through, I find that this definition is not particularly helpful concerning the precise issue confronting me. Neither are any of the other dictionary definitions proffered by IBM in its Glossary of Terms.

I turn then to the specifications, which, as IBM observed repeatedly during the Markman hearing, are the single best guide to interpreting claim language. (Tr. of Markman Hearing at 96-97, 112, 300). The specification clearly and unmistakably states that the path established is for the exclusive use of the message. (See '773 Patent, column 2, lines 49-56, attached as Exh. C to Cmplt.) Such an interpretation is logically consistent with the notion of the path's being "maintained" for the particular message we are analyzing. It is also consistent with the notion, contained in Claim 2, that messages must be buffered (put in a waiting area, so to speak) if a path to their destination output circuit is occupied. If two or more messages could occupy the same path at the same time, there would be no need for a buffer in which to store one message while another occupies the path.

I am not persuaded by TM's argument that Claim 1 does not require exclusivity because the dependent claim, Claim 2, does not require exclusivity. Claim 2, to my reading, clearly does require exclusivity. Similarly, after reading the parties' supplemental submissions, I am not persuaded that the doctrine of claim differentiation applies here, since both Claim 1 and Claim 2 recite the words "establish" and "maintain." As IBM points out, claim differentiation presumes a difference in meaning and scope when different words or phrases are used in separate claims; it does not permit the same words to be construed differently in different limitations. See Tandon v. International Trade Commission, 831 F.2d 1017, 1023 (Fed. Cir. 1987); Slater Electric, Inc. v. Thyssen-Bornemisza Inc., 650 F. Supp. 444, 463-64 (S.D.N.Y. 1986).

I therefore accept IBM's argument and construe the word "maintaining" to require the path to be kept free for the exclusive use of a particular message.
I defer putting this construction in the precise language I will use with the jury until such time as I have come to a final decision on the one issue that still troubles me, which is the proper meaning of the word "one." The parties will have ample opportunity to critique my opening charge before it is delivered (though they should keep their comments to the clarity of the language and its consistency with this opinion, and not use that opportunity to reargue positions I reject here).

S. Maintaining

Given the definition just construed for the term "storing," it is obvious that the Court cannot accept the definition for "maintaining" offered by Hill, which is simply "preserving" or "keeping." Hill's Brf. at 22. As with the proposed definition for storing, Hill encourages the Court to drop the qualifying language from the ordinary dictionary meanings of the word "maintain." The dictionary meanings include "keeping in a state of repair, efficiency, or validity: preserving from failure or decline." Hill's Brf. at 21 (citing Webster's Unabridged Dictionary). In support of its suggestion of abbreviating the dictionary meaning, the plaintiff points to the testimony of its expert witness at the hearing, Dr. Dunsmore, who used the term "maintain" interchangeably with "keep available." Tr., Vol. I at 48-50. Dr. Dunsmore also said that the definition of "keeping in existing state of repair, efficiency, or validity" works in the context of the patent. Id. at 49-50. His testimony clearly focused on the notion of keeping all of the catalog data available on the main computer, without any reference to the process for keeping it valid.

In the context of the patent, however, the idea of keeping the catalog data in a state of validity is equally important to keeping it available. The difference is in what is done to the data once it is stored in a memory. According to Dr. Dunsmore, the main computer "has the responsibility of always having the electronic catalog information available" so that remote computers may access it as needed. Tr. Vol. I, at 48. Yet, for the system to work that task is only one-half the responsibility. The main computer is also responsible for having all of the most up-to-date information for all catalog items. This idea is communicated in the claims by the description of a main revision status "indicating the revision level of the constant data stored in the main computer." '490 Patent, Col. 21, ll. 58-61. It is also conveyed by the step of updating the remote computer data "with constant data maintained in the memory of the main computer that is different from the constant data stored in the memory of the remote computer." Id. Col. 22, ll. 5-8.

With the latter claim limitation, the Court construes a different meaning for maintain than Hill's proposed definition of merely "preserving." This meaning is further supported by language from Claim 10, in which the "constant data updating step" involves "determining updated portions of the constant data stored in the main computer that are different than the constant data stored in the remote computer." '490 Patent, Col. 22, ll. 48-53. In fact, that step clarifies the difference between the claim term "maintaining" and the term "updating" in the context of this patent. "Maintaining" necessarily involves adding, modifying or deleting electronic catalog information stored in the main computer memory so that it reflects any changes the vendor wants to communicate to its customers. Otherwise, how would the data in the main computer memory be different from that in the remote? There is no step in the patent that provides for "updating" the catalog information held in the main computer memory. Nor is there any step that specifically provides for incrementing the revision level in the main revision status. Instead, these notions are expressed in the claim term "maintain."

This finding is reinforced in the claim covering the program aspects of the invention, in which one of the five steps involves "maintaining the latest revisions of the program and a main program revision status in the memory of the main computer." '490 patent, Claim 12, Col. 23, ll. 3-5. Claim 13, which depends from Claim 12, describes the step of "determining updated portions of the program stored in the main computer that are different from the program stored in the remote computer." Id. Col. 23, ll. 18-20. These two claims echo the relationship between Claim 1, in which variable and constant data are stored and maintained in the main computer memory, and Claim 10, in which the constant data updating step involves determining updated portions of the constant data "stored" in the main computer that is different than that stored in the remote computer. The difference is that with the program claims, there is a step that suggests what is meant by the concept of "maintaining." In Claim 12, "maintaining" encompasses the act of storing the latest revisions of the program and keeping them available.

Just because the Court finds Hill's proposed definition too limited to work in the context of the patent, does not mean that Compuserve's proposed definition should be adopted. It is the court's responsibility to independently construe the claim
terms, in the context of the claim language, the specification and the prosecution history -- not merely adopt one proposed definition or the other. See Markman I, 52 F.3d at 979 ("the court has the power and obligation to construe as a matter of law the meaning of language used in the patent claim."). CompuServe suggests that "maintaining means that when constant data changes, the main computer is updated to reflect these changes, including incrementing the main constant data revision level." Def's Brf. at 23. That definition includes more detail than is necessary to accurately express the meaning of the word "maintain" in this patent.

In fact, CompuServe's proposed definition narrows the meaning of "maintain" to include only action taken in connection with constant data. Such a definition would contradict the first step listed in Claim 1, which describes "storing and maintaining variable data and constant data" in the main computer. '490 Patent, Col. 21, ll. 57-58 (emphasis added). It would also be inconsistent with usage of "maintaining" in Claim 12 in reference to "the latest revisions of the program," Id., Col. 23, ll. 3-5 (emphasis added). CompuServe is correct in identifying that the word "maintain" refers only to action taken with respect to data or programs on the main computer, yet this recognition does not dictate that maintaining means only updating constant data when it changes and incrementing the main constant data revision level. See Def's Brf. at 23. Instead, what is clear is that the act of "maintaining" is only taken with respect to data or programs contained in the main computer.

The specification provides that when changes in the variable data occur, those changes are entered into the main computer, '490 Patent, Col. 1, ll. 65-66, but it does not specifically describe the act of changing constant data and incrementing the main revision status to reflect such changes. Instead, it uses the word "maintain." Without a doubt, the act of changing constant data in the main computer must have occurred for there to be differences between the constant data and revision status stored in the main computer and the constant data and revision status stored in the remote computer. Consequently, the claim term "maintaining" provides the "hook" for linking this concept to the claims. It must be defined so that it contemplates the act of revising constant data and incrementing the revision status, as well as keeping the results available. Because Claim 1 includes the step of "maintaining variable data and constant data," the term maintaining must also be defined to cover the act of revising variable data to reflect the latest information. This conclusion is further supported by the prosecution history, which described the vendor updating both constant and variable data on the main computer "immediately after change is made to a catalog item." Plf's Ex. 93, Prosecution History, Tab 6 at 4, Tab 9 at 6. Thus, the Court finds that the better definition for "maintaining" is "keeping the most current information available" for whatever item is designated.

Each time the word "maintain" is used in the patent, substituting the phrase "keep the most current information available" works without changing the idea being expressed in the sentence. For example, in Claim 1, substituting the phrase in the first step results in: "storing and [keeping the most current information available for] constant and variable data." The phrase adequately captures the notions about what happens to the data in the main computer. Changing the constant data to make it current is a necessary condition for there to be a revision status at the main computer reflecting the revision level of the data stored in the main computer, and for constant data in the memory of the main computer to be different from and useful for updating the constant data in the remote computer.

Claims 12, 27 and 33 refer to a step or means for "maintaining [keeping the most current information available for] the latest revisions of the program." The specified step or means facilitates the language in the remainder of the claim referring to the program revision status and the step of updating the program stored in the remote with the program stored and maintained in the main computer. In either case, the meaning provided for this term by the Court works to convey the idea necessary to be consistent with the patentee's intention and the objectives of the invention: access to up-to-date information or reduction of computer on-line time. In sum, the appropriate definition for the claim term "maintaining" is "keeping the most current information available."

1. Maintaining a Currently Displayed Frame (Claim 1)/Maintain A Currently Displayed Frame (Claim 8)

Matsushita argues "maintaining a currently displayed frame"/"maintain a currently displayed frame" should be construed as "continuing to display a frame being displayed as this step starts," or, alternatively, "continuing to display a frame displayed after receipt of the manually inputted signal." Mediatek argues "maintaining a currently displayed frame"/"maintain a currently displayed frame" should be construed as "continuing to display the same picture frame that is being displayed at
the time the manually inputted signal is detected."

The Court finds, for the reasons stated by Mediatek, that "maintaining a currently displayed frame"/"maintain a currently displayed frame" is properly construed as "continuing to display the same picture frame that is being displayed when the manually inputted signal is detected." 3

3 At the claim construction hearing, Mediatek suggested the substitution of "when" for "at the time" to alleviate Matsushita's concerns that Mediatek's initial proposed construction would require simultaneity. This modification is supported by the specification. See, e.g., '475 Patent, col. 10, II. 60-66 ("[I]n the first embodiment, passing data through to the input buffer memory 102 is inhibited when change of program is detected, and simultaneously all the data in the input buffer memory 102 is erased while the display picture deciding means 106 is controlled to maintain the display picture at this time.") (emphasis added).

1. Maintaining data succession (claim 2)

Plaintiff's construction: "When recording after the pause, writing to the disc in a manner such that the user's information is readable when the disc is subsequently played back."

Defendants' construction: "maintaining logical continuity of data (i.e., no dummy data) and physical continuity of data, within a tolerance of 2 clock bits, across said first point."

The specification defines "data succession" as "continuity of data." '755 Patent, col. 1, ln. 44. It is not restricted to a particular type of continuity and continuity is not defined further. This suggests that continuity is meant in a general sense in that the data picks up where it left off, in all relevant respects.

This makes sense when reading the claim as a whole. According to claim 2, when the buffer becomes low on information, the recording is stopped "at a first point on said optical disk." '755 Patent, col. 9, Ins. 5-9. Once the buffer is sufficiently refilled, recording is restarted "while maintaining data succession across said first point on said optical disc." '755 Patent, col. 10, Ins. 1-4 (emphasis added). Thus, the context of "data succession" indicates that it means there is no break in the data at the point the recording is paused; again, the data resumes where it left off.

I decline to read into the claim defendants' distinction between "logical continuity" and "physical continuity." Neither of these terms is found in the patent. As is demonstrated by the parties' stark differences in understanding those terms, they do nothing to clarify the meaning of the claim; if anything, they make it more complicated. It is sufficient to say that "data succession" is the "the continuity of data."

Also, defendants' suggestion to incorporate the concept of "dummy data" is misplaced. "Dummy data" is mentioned multiple times in the patent, but not as a part of a definition of "data succession." Rather, the patent explains that if dummy data is written, data succession cannot be maintained. '755 Patent, abstract ("a write operation may be paused without writing data dummy data, thereby maintaining data succession"); id. at col. 1, Ins. 44-46 ("Continuity of data, or data succession, is lost by inserting and writing dummy data."). In other words, an absence of dummy data is a cause of data
succession, but the two concepts are not interchangeable.

The second dispute relates to the meaning of "maintaining." Plaintiff proposes a functional definition, which is that data succession is preserved enough to allow the disk to be read when it is played back. Defendants say that it requires a tolerance of no more than "2 clock bits." In support, defendants point to the following passage in the patent: "It is necessary, as shown in FIG. 6, to write succeeding data within a +/-2 bit clock error." ’755 Patent '755, col 6, Ins. 17-18.

In its briefs, plaintiff said that defendants were attempting to improperly import a description of a preferred embodiment into a claim, but the passage is written as more than a description of an embodiment. First, the passage says that the +/-2 clock bit level of tolerance is "necessary," indicating that it is a requirement rather than a preference or illustration. Further, it does not say that this level of accuracy is required in FIG. 6 only. Rather it says the requirement is "shown in FIG. 6," suggesting that it is a general requirement of which FIG. 6 provides one demonstration. Thus, this passage from the specification is like the one in Andersen Corp. 474 F.3d at 1367, in which the court held that it was proper to read in a limitation from the specification because the specification stated that the limitation was "require[d]."

At the hearing, plaintiff focused almost exclusively on another argument: the cited passage does not relate to data succession, but to data synchronization, which plaintiff says is not an issue to which the invention is directed. The problem with this argument is that it appears to be directly contrary to the passage, which addresses the tolerance for errors "to write succeeding data." Further, the description of Fig. 6 (the figure that shows the 2 bit clock tolerance level) states that the figure demonstrates how data is written "according to the present invention," ’755 Patent, col. 3, ln. 65, so plaintiff is incorrect that the required 2 clock bit tolerance level is not related to the invention.

Accordingly, I will adopt defendants' proposal with respect to the tolerance level, but I will not adopt their suggestion to include "physical" and "logical" continuity in the construction.

Court's construction: "maintaining continuity of data within a tolerance of 2 clock bits"

3. Maintaining said encoded information (claim 1)

Plaintiff's construction: "When a recording operation on a recordable or rewritable optical disc is paused, preserving information that was encoded before the pause but not yet written to the disc"

Defendants' construction: "keeping the encoded data in the encoder and the recording circuit so that all encoded data at the time of pausing of the transfer is not lost, replaced or substituted"

The focus of the dispute for this term is what it means to "maintain." Plaintiff objects to two aspects of defendants' proposed construction: (1) it requires that encoded data be kept in the encoder; and (2) it prohibits any data from being lost, replaced or substituted.

With respect to the first part of defendants' construction, the claim itself is silent as to whether data must be "maintain[ed]" with respect to location or whether it is only the form of the data that is kept the same. At the hearing, plaintiff said that specification makes it clear that the claim does not require the data to remain in the encoder and recording circuit, pointing to a figure that shows that the information is kept in the random access memory. Vitronics Corp., 90 F.3d at 1583-84 (claim should be construed to include embodiments). Defendants' only response to this was the following statement: "I would, I guess to some extent, perhaps agree with them, although I would suggest that the [random access memory] that was pointed out as where the data was maintained would probably be considered part of the encoder and the recording circuit." Dkt. # 186, at 79. However, defendant offered no argument why the random access memory should be considered part of the encoder or the recording circuit. In fact, defendants offered no argument in their briefs or at the hearing defending their view on this issue. Accordingly, I reject defendants' suggestion to import a location restriction into the claim.

I may quickly reject the second aspect of defendants' proposed construction because it requires that the data be kept in the exact same form. As is acknowledged by defendants in the context of their proposed construction on "maintaining data
succession," the meaning of "maintaining" in the '755 patent allows some room for errors. Thus, any construction requiring perfection is inconsistent with the patent. Further, the patent does not place a specific tolerance level on encoded information, making a functional definition appropriate.

Curiously, plaintiff does not propose such a definition, as it did with respect to "maintaining data succession." Instead, it simply replaces "maintaining" with "preserving," which adds nothing to the understanding of the claim. However, at the hearing, plaintiff agreed that it is seeking a functional definition. Therefore, I will adopt plaintiff's proposed construction for "maintaining data succession" and adopt it for "maintaining encoded information."

Court's construction: "keeping the encoded information such that it is readable when the disc is subsequently played back"

BACKGROUND

The '511 patent discloses a brown-out detection scheme that resets the microcontroller when the power supply voltage drops below the brown-out detection threshold to avoid malfunction. See '511 patent, col. 3, ll. 1-6. Asserted claim 12 of the '511 patent recites:

In a microcontroller device fabricated in a semiconductor integrated circuit (IC) chip for controlling an external system with which the device is to be installed in circuit, and having a central processing unit (CPU), a program memory for storing program instructions to be implemented by the CPU, a data memory for storing data including data pertaining to parameters of the external system to be controlled by operation of the CPU according to said instructions, means for providing a supply voltage to operate the IC chip, said supply voltage being defined by a voltage level relative to a ground reference level; a device-implemented method of brown-out protection comprising the steps of monitoring the supply voltage level relative to the ground reference level to reset said device as protection against malfunction thereof in response to reduction of an arithmetic difference between the supply voltage level and the ground reference level to a value less than a predetermined threshold operating voltage level, wherein reset defines a cessation of operation of the device while maintaining status quo of implementation of program instructions by the CPU and data stored in the data memory; discriminating between a reduction representative of a brown-out event warranting invoking a reset of said device and a reduction representative of mere transitory voltage swings commonly occurring in the device operation not warranting invoking a reset of said device, and suppressing a reset of said device when the reduction of the difference between the supply voltage level and the ground reference level represents a transitory voltage swing not warranting invoking a reset, whereby to avoid both malfunctions and unnecessary resetting of the device in control of the external system.

Microchip develops 8-bit microcontrollers, which serve as the "brains" of a broad range of consumer and industrial applications. Microchip is the assignee of the '511 and '557 patents, which relate to such microcontrollers.

In August 1997, SSI introduced its SX microcontroller, which is "socket and object code compatible" with Microchip's PIC16C5x series microcontroller. Parallax is a third-party development tool provider for the SX microcontroller.

On October 27, 1997, Microchip filed suit against Scenix, alleging that SSI's SX microcontroller infringed its '511 and '557 patents, among others. On March 27, 1998, Microchip filed a motion for an order preliminarily enjoining Scenix from making, using, selling, or offering for sale certain SX-series microcontrollers that allegedly infringed claims 1 and 12 of the '511 patent and claim 2 of the '557 patent. On April 13, 1998, the district court issued an order deferring its decision on Microchip's motion until it conducted a Markman hearing, which the court subsequently held on May 27, 1998.

On August 7, 1998, the district court issued its claim construction ruling with respect to claims 1 and 12 of the '511 patent and claim 2 of the '557 patent, and sua sponte certified this ruling for immediate interlocutory review. See Microchip Tech., Inc. v. Scenix Semiconductor, Inc., No. C-97-3923 (N. D. Cal. Aug. 7, 1998) ("Microchip I"). On August 17, 1998, both Microchip and Scenix petitioned for interlocutory review by this court of the district court's claim construction ruling. On September 8, 1998, we denied these petitions, stating:

The matter of Microchip's entitlement to a preliminary injunction has not been decided by the district court. After the
district court issues its decision granting or denying an injunction, the losing party can appeal under 28 U.S.C. § 1292(a)(1). We deem the appropriate course is to review the district court's pretrial claim construction decision in the context of any appeal of a preliminary injunction.

On December 14, 1998, Microchip filed a new motion for a preliminary injunction based solely upon claim 12 of the ‘511 patent. On February 12, 1999, the district court denied Microchip's motion, relying upon its earlier claim construction ruling. Microchip Tech., Inc. v. Scenix Semiconductor, Inc., No. C-97-3923 (N.D. Cal. Feb. 12, 1999) ("Microchip III"). The district court determined that, because the SX microcontroller did not preserve data when the power drops below two volts, it was unlikely to satisfy the "reset" element of claim 12. See id., slip op. at 11. Consequently, the district court concluded that Microchip was unlikely to prevail on its contention that the SX microcontroller infringed claim 12. See id. The district court further found that Scenix had raised a substantial question as to whether claim 12 was invalid as anticipated by U.S. Patent No. 5,237,699 ("the Little patent"). See id., slip op. at 16-17. The district court determined that Scenix had failed to raise a substantial question as to whether claim 12 was invalid either as obvious in view of the National Semiconductor COP820CJ microcontroller and the knowledge of one of ordinary skill in the art or for failure to disclose the best mode of practicing the claimed invention. See id., slip op. at 17-27.

Microchip appeals the district court's February 12, 1999 denial of its motion for a preliminary injunction. Microchip also contests the district court's August 7, 1998 claim construction of claims 1 and 12 of the ‘511 patent and claim 2 of the ‘557 patent. Scenix cross-appeals, challenging the district court's claim construction of claim 12 of the ‘511 patent and its determination that Scenix had failed to raise a substantial question regarding its obviousness and best mode defenses. The parties submitted this appeal and cross-appeal for our decision following oral argument on April 3, 2000. We have jurisdiction pursuant to 28 U.S.C. § 1292(a)(1) (1994).

DISCUSSION

To obtain the extraordinary relief of a preliminary injunction, the moving party must establish that: (1) it has a reasonable likelihood of succeeding on the merits; (2) it will suffer irreparable harm if the injunction is not granted; (3) the balance of hardships tips in its favor; and (4) an injunction would be consistent with the public interest. See Nutrition 21 v. United States, 930 F.2d 867, 869, 18 U.S.P.Q.2D (BNA) 1347, 1348-49 (Fed. Cir. 1991). To overturn the denial of a preliminary injunction, the patentee must show that the district court "abused its discretion, committed an error of law, or seriously misjudged the evidence." Smith Int'l, Inc. v. Hughes Tool Co., 718 F.2d 1573, 1579, 219 U.S.P.Q. (BNA) 686, 691 (Fed. Cir. 1983). We review de novo the district court's claim construction underlying its denial of a preliminary injunction. See Bell & Howell Doc. Management Prods. Co. v. Altek Sys., 132 F.3d 701, 705, 45 U.S.P.Q.2D (BNA) 1033, 1037 (Fed. Cir. 1997).

I. Claim 12 of the ‘511 Patent

In its August 7, 1998 claim construction ruling, the district court construed the claim limitation that the "reset . . . maintain the status quo of implementation of program instructions by the CPU and data stored in the data memory" to require that:

When the device is reset, the CPU stops executing instructions and is placed into a known initial state so that when the device comes out of reset, the CPU can begin executing the program instructions from a known point in the program memory without risk of malfunction. When the device is reset the existing data in the data memory is preserved, and is not modified or altered.

Microchip I, slip op. at 40, 42. In light of this interpretation, the district court determined that Microchip was unlikely to prove that Scenix infringed claim 12 either literally or under the doctrine of equivalents, since the SRAM that the SX microcontroller used for data memory did not retain data if the power dropped below two volts during a brown-out condition. See Microchip III, slip op. at 11.

Microchip contends that the district court erroneously interpreted "reset" as requiring that the microcontroller actively "preserve" the data in the data memory. According to Microchip, the district court should have construed "reset" according
to the understanding of one of ordinary skill in the art, who, Microchip maintains, would view the reset circuitry of the claimed microcontroller as passively leaving the data memory unmodified.

Microchip argues that the written description of the '511 patent fails to support the district court's "preservation" requirement. Because claim 12 begins with the phrase "in a microcontroller device fabricated in a semiconductor integrated circuit (IC) chip," Microchip contends that such active preservation circuitry would need to be found on the microcontroller itself. Yet the '511 patent discloses no method for backing up the data to non-volatile memory or for using a battery to prevent the loss of the power supply voltage, and in fact fails to even mention the word "preserve." Microchip further argues that the district court's "preservation" requirement violates a basic tenet of claim construction law by rendering claim 12 invalid for failure to satisfy the written description requirement of 35 U.S.C. § 112, P 1. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1557, 37 U.S.P.Q.2D (BNA) 1609, 1617 (Fed. Cir. 1996). Because the allegedly infringing SX microcontroller maintains the data in data memory if the supply voltage exceeds two volts, Microchip contends that Scenix must infringe.

We hold that the district court correctly construed "reset" as preserving the data in the data memory, and thus appropriately denied Microchip's motion for a preliminary injunction. First, claim 12 expressly recites "maintaining . . . data stored in the data memory." The plain language of claim 12 does not limit such data maintenance only to brown-out conditions in which the supply voltage remains above the minimum operating voltage of the data memory. See National Recovery Techs., Inc. v. Magnetic Separation Sys., Inc., 166 F.3d 1190, 1195, 49 U.S.P.Q.2D (BNA) 1671, 1675 (Fed. Cir. 1999) (refusing to adopt construction of claim limitation that would apply "only some of the time"). Additionally, had the inventor intended "reset" only to passively retain the data in the data memory (and thus essentially do nothing to the data memory), the claim language "maintaining . . . data stored in the data memory" would hardly have been necessary.

Second, the written description clearly supports this preservation requirement. The written description states:

Reset causes operation of the device to be halted while the status quo of implementation of program instructions by the CPU and data stored in the data memory is maintained as it was at the time of occurrence of the reset.

A power-up timer responds to a supply voltage fluctuation at a second point in time, at which the other sample value establishes when a reset should be terminated, to maintain the device in reset condition for a predetermined time interval, and thereafter restores device operation at a point corresponding to the status quo at which the reset was initially invoked.

'511 patent, col. 3, ll. 6-10, 34-40 (emphasis added). Were the data in the data memory not actively preserved during a reset, a user of the claimed microcontroller would not be able to rely upon the data in the data memory when the operation of the device was restored "at a point corresponding to the status quo at which the reset was initially invoked," since a temporary drop in the supply voltage below the minimum retention voltage of the data memory could cause the corruption (if not the deletion) of data in the data memory.

Finally, although Microchip argues that we should construe claim 12 to preserve its validity, we may not judicially rewrite the claim to do so. See Rhine v. Casio, Inc., 183 F.3d 1342, 1345, 51 U.S.P.Q.2D (BNA) 1377, 1378-79 (Fed. Cir. 1999). In view of the plain meaning of "maintain" and the brown-out detection feature's overall purpose of avoiding microcontroller malfunction, the "reset" element of claim 12 must actively preserve the data in the data memory. We render no opinion on whether the '511 patent actually complies with the written description requirement of 35 U.S.C. § 112, P 1.

Because the district court correctly construed the term "reset" as preserving the contents of data memory, it did not abuse its discretion, commit legal error, or seriously misjudge the evidence in determining that Microchip was unlikely to succeed on its infringement claims regarding claim 12 and thus in denying Microchip's requested preliminary injunctive relief. Both parties agree that the SX microcontrollers use volatile SRAM for data memory, which retains data during a brown-out condition only if the power remains above two volts. Consequently, the district court correctly found that the SX microcontroller does not effect a "reset [that] maintains data in the data memory."

Given that our interpretation of the "reset" element of claim 12 as preserving the data in data memory provides a sufficient basis for affirming the district court's denial of Microchip's motion for a preliminary injunction, we expressly decline to
reach the parties' other arguments regarding the proper construction or possible invalidity of claim 12, and dismiss Scenix's cross-appeal as moot.

**2565**

The district court's noninfringement ruling with respect to claims 1 and 13 was predicated on its interpretation of the "maintaining updated sums" limitation in the two claims, which addresses how a seamless DWT of the image is formed. The district court construed that limitation to mean "summing the DWT coefficients of one tile together with overlapping DWT coefficients from one or more adjacent tiles." Both parties agreed with that construction.

As explained by the district court, the ER Mapper fails to meet the "maintaining updated sums" limitation when it forms a seamless DWT of an image because overlapping DWT coefficients are never added together. Instead, the ER Mapper uses the fact that wavelet transforms are linear. The ER Mapper forms a seamless transform of the image by first calculating the DWT coefficients in the row direction for all the pixels in that row. That process is then repeated for all the rows in the image. After the DWT coefficients are calculated for the rows, the ER Mapper proceeds to take the DWT of those coefficients for the columns. The result is the full set of two-dimensional DWT coefficients for the entire image. The ER Mapper solves the memory problem faced by the prior art because it only needs to load one row or column of the image into memory at once. Furthermore, the method used by the ER Mapper creates no edge artifacts because it uses no artificial internal boundary conditions in creating the DWT coefficients.

LizardTech maintains that after it agreed to the district court's claim construction, the court materially altered that construction by changing the meaning of the word "overlapping." According to LizardTech, the court's "new" construction does not comport with the '835 patent's specification and is incorrect. Specifically, LizardTech argues that the only place the term "overlapping" is used in the district court's claim construction order is where the court agreed with the special master that "in the context of the '835 patent [maintaining updated sums] includes summing overlapping DWT coefficients from two adjacent tiles [where] the adjacent tiles would be abutting, or side by side, but their respective DWT coefficients overlap because of the expansive nature of the transform explained earlier." LizardTech contends that the district court changed that definition of overlapping in its order granting summary judgment of noninfringement when it adopted the position that overlapping meant "that certain tile coefficients overlap those of a neighboring tile; in other words, image data from both tiles (or at least some data near the border) contribute to the DWT coefficients."

Contrary to LizardTech's assertions, we discern no change in the district court's claim interpretation. In the context of the '835 patent, "maintaining updated sums" means "summing the DWT coefficients of one tile together with overlapping DWT coefficients from one or more adjacent tiles." Overlapping in that context can only mean that the DWT coefficient at a given position, obtained from the data in one tile, is added to the DWT coefficient at the same position, obtained from the data in an adjacent tile. As explained above, that process is the basis for forming a seamless DWT in the '835 patent, see '835 patent, col. 6, ll. 6-13, and that process was clearly encompassed by the court's claim construction from the start. LizardTech agreed to the district court's construction at the time, and it cannot now argue against that claim construction simply because it resulted in an adverse ruling on summary judgment. See ArthroCare Corp. v. Smith & Nephew, Inc., 406 F.3d 1365, 1376 (Fed. Cir. 2005).

Furthermore, the district court's construction of the "maintaining updated sums" limitation comports with the claim language and the specification. Claim 1 specifically provides that "DWT coefficients from said discrete tile image $T_i(x,y)$" are added together to "form a seamless DWT of said image." '835 patent, col. 11, ll. 54-56. Claim 13 similarly provides that "DWT coefficients from said discrete tile image $T_i(x,y)$" are added together to "form a seamless DWT of said $I(x,y)$." That is the equivalent of saying that DWT coefficients derived from one tile are added together with overlapping DWT coefficients from one or more adjacent tiles or, as the district court put it, "image data from both tiles (or at least some data near the border) contribute to the DWT coefficients." Claims 5-8, which depend on claim 1, further support the district court's claim construction. Those dependent claims specify exactly which tiles are the source of the DWT coefficients that are added together. For instance, claim 5 requires "retrieving updated sums of DWT coefficients from $T_i-1(x,y)$ and $T_i-1(x,y)$ and adding to coefficients for $T_i(x,y)$." The specification also supports the court's construction of the "maintaining updated sums" limitation. In the summary of the invention, the patent states:

A seamless wavelet-based compression process is effected on $I(x,y)$ that is comprised of successively inputting the tiles
T\(ij(x,y)\) in a selected sequence to a DWT routine, adding corrections that are passed from previous invocations of the DWT routine on other \(Tij(x,y), \ldots\) [which] can be viewed as an "overlap-add" realization of the DWT.

Id., col. 2, ll. 51-63. In other words, the DWT coefficients from one tile are added to the DWT coefficients calculated from another tile to create the seamless DWT.

In response, LizardTech argues that the special master's original construction contemplated that if DWT coefficients were generated from adjacent tiles, the DWT coefficients necessarily "overlapped." According to LizardTech, that meant that when ER Mapper calculates DWT coefficients in the row-wise direction, the resulting coefficients "necessarily" overlap with the DWT coefficients of the adjacent row. That argument, however, fails as a matter of logic. In the '835 patent, the reason that the DWT coefficients derived from two tiles overlap is because the patented method calculates DWT coefficients beyond the boundary of the tile, creating an "expansive transform."'835 patent, col. 7, ll. 42-44. That does not necessarily have to be the case. In fact, the ER Mapper calculates DWT coefficients only for locations within the tile, which in the case of the ER Mapper happens to be a single row or column. See LizardTech, 35 Fed. Appx. at 926. As one expert noted, in most cases DWT coefficients are calculated only for positions within the image, and it is readily apparent how to do so: in calculating DWT coefficients, the center of the filter is always placed within the boundary of the image. While the algorithm described in the '835 patent corrects boundary effects by calculating DWT coefficients outside the tile based on information inside the tile, that does not imply that DWT coefficients are always calculated outside the tile in every algorithm. In sum, merely because the coefficients between tiles in the '835 patent "necessarily" overlap does not mean that coefficients calculated by ER Mapper necessarily overlap.

Alternatively, LizardTech contends that ERM infringes even under what it considers the district court's erroneous claim construction. LizardTech's argument is based on the fact that after the ER Mapper calculates the DWT of the image rows, it then calculates the DWT of the resulting coefficients of the image columns. As explained above, what that means is that the DWT coefficients derived from the rows are multiplied against the low-pass and high-pass filters and are then summed together. According to LizardTech, that process falls within the district court's construction of "summing the DWT coefficients of one tile together with overlapping DWT coefficients from one or more adjacent tiles," while "image data from both tiles (or at least some data near the border) contribute to the DWT coefficients." In other words, the summation that is inherent in taking a DWT satisfies the "maintain updated sums" limitation of the '835 patent.

The problem with LizardTech's argument is that "the ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the art." Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005). In this case, there is no evidence that a person of skill in the art would consider the limitation of maintaining updated sums of DWT coefficients to include the altogether distinct process of taking a DWT; the two are entirely different concepts and procedures. As ERM's expert explained, "the adding required by the 'maintain updated sums' step claimed in the '835 patent should not be confused with the mathematics inherent in the prior art DWT process."

The claim language bears out that distinction. Claim 1 states that part of the claimed process is "performing one or more discrete wavelet transformation (DWT)-based compression processes on each said tile image." The claim then sets forth the entirely separate process of "maintaining updated sums of said DWT coefficients." Claim 13 contains similar language. Other portions of the patent also delineate the difference between taking a DWT and maintaining updated sums of DWT coefficients. For example, in Figure 5, which depicts a flow chart for the patented algorithm, the DWT is placed in one block while the procedure for maintaining updated sums is assigned a separate block. See also '835 patent, col. 7, ll. 31-53. The distinction between adding coefficients and performing a DWT is maintained throughout the specification as well. See, e.g., id., col. 2, ll. 54-57. In conclusion, the patent clearly uses the terms "DWT" and "maintaining updated sums of said DWT coefficients" differently. Simply because the DWT procedure entails the process of addition does not mean that a person of skill in the art would refer to the two processes interchangeably. Because the ER Mapper does not add overlapping DWT coefficients from one or more adjacent tiles together to form a seamless DWT, we affirm the district court's grant of summary judgment of noninfringement with respect to claims 1 and 13.

We also reject ERM's second alternative ground for affirmance. ERM submits that the ER Mapper does not meet the claim limitation of "maintaining updated sums of said coefficients." Simply put, ERM argues that this limitation describes a
function (maintaining updated sums) "without the recital of structure, material, or acts in support thereof," thus restricting the scope of the limitation to the specific structure disclosed in the specification pursuant to 35 U.S.C. § 112, P6. See Serrano v. Telular, Corp., 111 F.3d 1578, 1583, 42 U.S.P.Q.2D (BNA) 1538, 1542 (Fed. Cir. 1999). ERM argues that the only example of "maintaining updated sums" provided in the specification involves processing tiles using DWT coefficients from previously processed tiles, and it asserts that its process neither breaks the image into "tiles" (since it utilizes single rows of pixels) nor uses coefficients from subparts in which the DWT process is complete. Instead, the ER Mapper maintains coefficients obtained from part of the DWT process.

ERM's argument is flawed. First, the claim limitation "maintaining updated sums of said coefficients," far from reciting a function without specific acts, appears to delineate an act ("maintaining updated sums of said coefficients") that helps achieve the desired purpose of "forming a seamless DWT." ’835 patent at col. 11, ll. 54-56. We therefore hold that the claim limitation at issue does not, as a matter of law, implicate section 112, paragraph 6, and it is not limited accordingly. See Personalized Media Communications, Inc. v. Int’l. Trade Comm’n, 161 F.3d 696, 702, 48 U.S.P.Q.2D (BNA) 1880, 1886 (Fed. Cir. 1998) ("Whether certain claim language invokes 35 U.S.C. § 112, P6 is an exercise in claim construction and is therefore a question of law . . . .").

9. "include the majority of the unscrambling circuit" and "include the essential portion of the unscrambling circuit"

Claim 10 states that "the key elements of the unscrambling circuit are on a card and include the majority of the unscrambling circuit. . . ." Claim 11 states that "the key elements of the unscrambling circuit are on a card and include the essential portion of the unscrambling circuit. . . ." The plaintiff contends that "majority" in claim 10 needs no construction and that "essential portion" in claim 11 means important parts. The defendants argue that the terms are indefinite under 35 U.S.C. § 112, P 2.

The specification describes in detail the invention claimed, and I have summarized the relevant description in Part 3.B.10 above, where I construe "substantially replaceable" and "differing unscrambling circuits." The nub of the defendants' argument merely rehashes what has come before.

As for "majority," EchoStar argues:

This lack of clarity is compounded by no disclosure of whether the "majority" of the unscrambling circuit refers to a measure of the physical amount of circuitry (e.g., 51%), or to that portion of the unscrambling circuit that performs the majority or most important aspects of the unscrambling function.

One of ordinary skill in the art would understand the term "the majority of the unscrambling circuit," when read in light of the rest of the specification, to include either the amount of circuitry or the portion of the circuitry that performs the majority or most important part of the unscrambling function. The point is that only by inserting the presently activated user card, with its circuitry in combination with either the contacts of the decoding box or the contacts and the circuitry of the decoding box, is the unscrambling means able to unscramble the signal.

"Majority" as used in claim 10 is not indefinite and requires no further construction.

"Essential" has an ordinary meaning of "indispensable." The American Heritage Dictionary of the English Language, at p. 448. I construe the term "essential portion of the unscrambling circuit" to mean the indispensable portion of the entire circuit that restores a modified signal to its unmodified condition.
9. Claim 10: Step (a)

Text:

making a first image of the organ with respect to a first coordinate system using a first imaging device;

ZMED's Proposed Construction:

Making an image or rendering of the organ of interest. This could be done by use of a CT scan or an MRI. The image is taken with respect to a first coordinate system, for example, the coordinate system of the first imaging device, a point in the room contain the first imaging device or the radiation therapy plan.

ZMED Opening Brief at 12.

NOMOS's Proposed Construction:

The specification describes the step of making a first image as "making at least one 3D image of the organ and of its surface or of the surface of the skin region with the first imaging device." The "first imaging device" should be construed to mean a CT or MRI device that makes three-dimensional images of an organ in a patient's body.

NOMOS Opening Brief at 22 (citations omitted).

NOMOS agreed at oral argument with the ZMED construction up to the point at which ZMED describes the second coordinate system, "for example, the coordinate system of the first imaging device, a point in the room contain the first imaging device or the radiation therapy plan." Oral Argument at 86-87.

Construction:

Step (a) of claim 10 means "making a three-dimensional rendering of the organ of interest. This may be done by use of a CT or a MRI device. The rendering is taken with respect to a first coordinate system."

Commentary:

As with claim 1 of the '154 patent, the additional detail that ZMED seeks, "for example, the coordinate system of the first imaging device, a point in the room contain the first imaging device or the radiation therapy plan," is unnecessary and not within the claim language, and therefore is omitted.

As to whether the "first image" is two-dimensional or three-dimensional, the parties have not focused their arguments on this issue in claim 10 in step (a). I find that the "first image" should be a three-dimensional rendering, as explained in detail in claim 10, step (e), of the '154 patent below.

2569

5. Claim 1: Step (d)

Text:

making a second image with said second imaging device, the second image corresponding to a cloud of points of the surface of the organ or skin region;

ZMED's Proposed Construction:

Using the second imaging device (e.g., the ultrasound probe) to make an image showing the organ.

ZMED Opening Brief at 9.

NOMOS's Proposed Construction:

While the vague and ambiguous term "cloud of points" is not defined at all in the '154 patent, the "second image corresponding to a cloud of points" of step (d) must be construed to be a "3D image." Moreover the specification of the '154 patent supports the interpretation of the "second image corresponding to a cloud of points" as being a "3D image."

Particularly, the specification describes the second image as a 3D image generated by either (1) an echography probe where the 3D image sought is that of a cloud of surface points of an organ, or (2) a non-contact 3D surface imaging device where the image sought is of a skin region. Therefore, when construed in light of the specification, the second image that is specified in step (d) of claim 1 is a 3D image.

NOMOS Opening Brief at 20-21 (citations omitted).

Construction:

Step (d) means "using the second imaging device (e.g., the ultrasound probe that takes two-dimensional images) to make a three-dimensional rendering showing the organ."

Commentary:

Analysis begins with the claim language. As the parties acknowledge, "the second image corresponding to a cloud of points of the surface of the organ or skin region," is ambiguous. Therefore, reference to the specification must be made.

The specification, unfortunately, is jumbled. On the one hand, it indicates that the ultrasound probe takes images in a "plane" and "a viewing plane." '154 Patent, col. 3, l. 60; col. 5, ll. 22-23. By definition, images of planes or viewing planes are two-dimensional. But on the other hand, the specification repeatedly refers to the second image as a "3D morphologic image." '154 Patent, col. 3, ll. 21, 24, and 35.

However, some clarification may be derived from the specification:

One of the originalities of the invention lies in the use of a device that does not provide functional information but only images of surface points to serve as an intermediate device operable for matching different coordinate systems. In particular, the idea of using an echography [ultrasound] probe to carry out this coordinate alignment is one of the aspects of the invention since, a priori, an echography image provides less valuable information than a MRI or scanner-type apparatus. Indeed, echography usually provides a series of plane and independent cross-sectional images of an organ instead of a volume image structured in series of parallel image slices.

'154 Patent, col. 3, ll. 51-62. The paragraph explains that an ultrasound device usually makes two-dimensional images, but impliedly is not used to do so in the '154 patent. Instead, the ultrasound probe here is used not to create its usual two-dimensional images, but rather to create "images of surface points." I find that the "surface points" are the same as "a cloud of points of the surface" in the claim itself (although neither party so argues). This meaning of "a cloud of points" is buttressed by the statement in the specification that "in an embodiment, the present invention aims at providing a method in which the on-site image results from a cloud of points obtained by echography examination of the region of interest, which permits visualizing objects that have been previously segmented." '154 Patent, col. 7, ll. 10-14.

Consequently, "the second image corresponding to a cloud of points of the surface of the organ or skin region" must be a three-dimensional rendering, as the surface of an organ or skin region, even if mostly flat, is still a three-dimensional surface. The direct output of the ultrasound probe, a two-dimensional image, is not the "second image" being discussed in the claim.

- 2919 -
This conclusion is reinforced by a discussion in the specification of the drawbacks in matching three-dimensional and two-dimensional images. '154 Patent, col. 2., l. 34 - col. 3., l. 5. The discussion implies that this invention is a remedy to those problems.

2570

1. "Making a Wager" Step

The parties agree that the meaning of "making a wager" is the same in both the '215 Patent and the '603 Patent. IGT essentially contends that "making a wager" means betting, which is performed by the player. Aristocrat argues that "making a wager" means processing a bet, which is performed by the gaming machine when it transfers credits from the credit meter to the bet meter.

"It is well-settled, that in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics, 90 F.3d at 1582. "Such intrinsic evidence is the most significant source of the legally operative meaning of disputed claim language." Id.

The court thus begins by examining the words of the claims themselves. The claim language in both patents provide support for IGT's proposed construction. The claims describes a network of gaming machines, "each of said gaming machines being capable of accepting different wager amounts made by a player." 4 '603 Patent 8:9-10 (emphasis added); see also '215 Patent 8:48-49, 9:29-30. This claim language indicates that gaming machines accept wagers, while players make wagers. Aristocrat makes much ado about the fact that the preamble refers to the player making different "wager amounts" as opposed to simply making "wagers." Viewed in context, the word "amounts" is necessary in the preamble to make clear that the gaming machines are able to accept wagers of differing amounts. This characteristic is important because the claimed invention improved upon the prior art (which gave players the same likelihood of achieving a jackpot regardless of whether they were betting a single token per line or multiple tokens per line) by making the probability of winning proportional to the amount of the wager made. See '603 Patent 1:46-52, 8:29-32. The court fails to see how this changes the clear implication that it is the player making the wager, whatever the amount, and the gaming machine accepting the wager.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

4 Though this language is in the preamble, it is essential to consider the preamble when construing terms used in both the preamble and the rest of the claim to ensure "one unified and internally consistent recitation of the claimed invention." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1306 (Fed. Cir. 1999).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

The '215 Patent also contains the following dependent claim: "The method of claim 2 wherein said step of making a wager includes betting a plurality of credits, and wherein said step of allotting includes allotting one number for each credit bet." 5 '215 Patent 10:33-36. This claim language, which makes clear that "making a wager" is satisfied by "betting a plurality of credits," strongly supports IGT's contention that "making a wager" refers to the player's act of betting, not to the gaming machine's act of processing a bet.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

5 The '603 Patent contains similar language in a dependent claim as well: "The method of claim 1, wherein said step of making a wager includes boning a plurality of credits, and wherein said step of allotting includes allotting one number for each credit bet." '603 Patent 8:51-54.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

Aristocrat asserts that the prosecution history of the '215 Patent supports its proposed construction. Aristocrat originally drafted the first step in the claimed method using the following language: "allowing the player to bet a plurality of credits
for a single play at a gaming machine in the bank of gaming machines." Dkt. No. 463-10 at 2. After its claims were rejected by the patent examiner, Aristocrat made various amendments to the claim language. One of these amendments was replacing the earlier language describing the first step with: "making a wager at a particular gaming machine in the network of gaming machines." Id. According to Aristocrat, having the player perform the step of making a wager (as opposed to having the gaming machine perform the step of allowing the player to bet) would not have helped to distinguish the claimed method from the prior art, and therefore, the court should interpret the new "making a wager" language as having the same meaning as the original "allowing the player to bet" language. In the absence of any information in the public record suggesting the purpose for this amendment, the court finds this prosecution history ambiguous and unhelpful. If anything, the fact that Aristocrat chose to amend the claim language in the face of earlier rejections suggests that it sought to change the scope of what it claimed rather than to keep it the same. See Warner-Jenkinson Co. v. Hilton Davis Chem. Co., 520 U.S. 17, 33, 117 S. Ct. 1040, 137 L. Ed. 2d 146 (1997) (holding that where there is no established reason for amendment, courts are to presume amendment was for the purpose of patentability). Moreover, the original claim language demonstrates that Aristocrat knew how to draft its claims in a way that clearly indicated to the public that the actor performing the first step was the gaming machine rather than the player, yet it chose not to draft its final claims in this way.

Though courts are to look first to intrinsic evidence, they may also consider expert testimony in construing claims. "However, conclusory, unsupported assertions by experts as to the definition of a claim term are not useful to a court." Phillips v. AWH Corp., 415 F.3d 1303, 1318 (Fed. Cir. 2005). In addition, because extrinsic evidence, including expert testimony, is generally less reliable than intrinsic evidence, courts should discount any expert testimony that clearly contradicts the claim construction mandated by intrinsic evidence. Id.

Aristocrat offers a declaration by Dwight Crevelt, an expert in the gaming industry, that "making a wager," as understood by a person of skill in the art, means "the transfer of credits from the credit meter to the bet meter by the game software." Dkt. No. 520 ("Crevelt Decl.") P 6. Because conclusory statements regarding how a claim term should be construed are not helpful to the court, Phillips, 415 F.3d at 1318, the court examines the basis for Crevelt's assertion. Crevelt explains that microprocessors have been used to control gaming machines since the early 1980s, and whenever a bet is placed, microprocessors must carry out a sequence of programming steps, in particular, the step of transferring credits from the credit meter to the bet meter. Crevelt Decl. PP 6, 11. Since microprocessor involvement is required to process a bet, Crevelt concludes that "making a wager" necessarily refers to the procedure by which microprocessors transfer credits from the credit meter to the bet meter. See id. at P 6 ("IGT's proposed construction, in effect, would divest the gaming machine of any function related to processing a wager amount."). 6 This reasoning, however, begs the question since it assumes that "making a wager" means processing a bet. If "making a wager" refers to processing a bet, one may infer that "making a wager" describes this microprocessor step. On the other hand, if "making a wager" refers to the act of betting, then it would describe an act by the player rather than the microprocessor.

6 Aristocrat makes the same argument in its briefs. See Dkt. No. 524 at 7 ("Because IGT's proposed construction of 'making a wager' has no role for the computer, it cannot be correct.").

Both the '215 Patent and the '603 Patent use the transition "comprising," which is "well understood in patent law to mean 'including but not limited to.'" Exergen Corp. v. Wal-Mart Stores, Inc., 575 F.3d 1312, 1319 (Fed. Cir. 2009) (quoting CIAS, Inc. v. Alliance Gaming Corp., 504 F.3d 1356, 1360 (Fed. Cir. 2007)). When a patent uses the term "comprising," the method claim "is open-ended and allows for additional steps." Invitrogen Corp. v. Biocrest Mfg., L.P., 327 F.3d 1364, 1368 (Fed. Cir. 2003). In other words, the method claimed in the patents-in-suit covers all processes that include all of the enumerated steps, regardless of whether they involve additional steps not described in the claim. Consequently, even if a microprocessor must transfer credits from the credit meter to the bet meter as a required step of the betting process, the enumerated steps in the claim need not encompass this processing act.

The court notes that, up until IGT brought its motion for summary judgment based on Muniauction, Aristocrat also interpreted "making a wager" as an act performed by the player, rather than the processing performed by the gaming machine. In its preliminary infringement contentions, Aristocrat contended that the "making a wager" limitation was met because "[i]n all of the accused IGT games, a player can make a wager at a particular gaming machine." Dkt. No. 445-5 at
5; see also Dkt. No. 445-4 at 4, 7. While not dispositive, this at least suggests that "making a wager," under its ordinary and customary meaning, refers to an act performed by the player.

Having considered both the intrinsic evidence and the extrinsic evidence offered by the parties, the court construes "making a wager" to mean betting, which is an act performed by the player. Because the parties agree that at least some of the remaining steps in the method claim are performed by the gaming machine, the standard for joint infringement by multiple parties of a single claim articulated in Muniauction and BMC Resources comes into play. IGT cannot be liable for infringement of the '603 Patent unless it exercises control or direction over the player's performance of the "making a wager" step, such that the law would hold IGT vicariously liable for the player's action. See Muniauction, 532 F.3d at 1330. As discussed above, the court rejects Aristocrat's argument that IGT controls or directs the behavior of players by providing free credits to induce gambling at IGT's machines. In addition, because the "awarding prize" step is not performed when IGT employees test gaming machines, IGT does not perform all of the steps of the claimed method during testing, as required for a finding of infringement. 7 Consequently, the court grants IGT's motion for summary judgment of non-infringement with respect to the '603 Patent.

--- Footnotes ---

7 The inventors could have structured their claims to capture infringement by a single party, but they did not. See BMC Resources, 498 F.3d at 1381; Mark A. Lemley et al., Divided Infringement Claims, 33 AIPLA Q.J. 255, 272-75 (2005).

--- End Footnotes ---

2. Claim 1: Step (a) 2

--- Footnotes ---

2 The '154 patent does not use letters such as "(a)" to mark each subpart in its claims. The parties, however, have referred to each subpart as a "step" and designated them with letters. In the interest of clarity, I adopt this nomenclature for both claim 1 and claim 10 of the '154 patent.

--- End Footnotes ---

Text:

making at least one 3D first image of an organ of a patient having a first coordinate system and of a surface of the organ or skin region with a first imaging device while the patient is in a pre-operation site without fixing any mark to the patient;

'154 Patent, col. 11, ll. 12-16.

ZMED's Proposed Construction:

Making a 3D image or rendering of the organ of interest. This could be done by use of a CT scan or an MRI. The image is taken with respect to a first coordinate system, for example, the coordinate system of the first imaging device, a point in the room containing the first imaging device or the radiation therapy plan.

NOMOS's Proposed Construction:

The specification of the '154 patent describes the step of making a first image as "making at least one 3D image of the organ and of its surface or of the surface of the skin region with the first imaging device." Particularly, the specification of
the '154 patent describes the first image as a 3D image generated by X-ray scanner or MRI device.

NOMOS Opening Brief at 20 (citations omitted).

NOMOS agreed at oral argument with ZMED's construction up to the point at which ZMED suggests that the image would be taken with respect to a first coordinate system, "of the first imaging device, a point in the room containing the first imaging device or the radiation therapy plan." Oral Argument at 66.

Construction:

Step (a) means "making a three-dimensional rendering of the organ of interest. This may be done by use of a CT or a MRI device. The image is taken with respect to a first coordinate system while the patient is in a pre-operation site and without fixing any mark to the patient."

Commentary:

The additional detail that ZMED seeks, "for example, the coordinate system of the first imaging device, a point in the room containing the first imaging device or the radiation therapy plan," is unnecessary and not within the claim language, and therefore is omitted.

1. "A unique method for making telephone calls from any available telephone"

The phrase "making telephone calls from any available telephone" appears in the preamble to claim 1. The parties raise two issues concerning the phrase: (1) whether it requires that a "standard telephone" be used to call the special exchange (an issue raised by Telco); and (2) whether it says anything about the location of the telephone (an issue raised by Aerotel).

Aerotel proposes that "the telephone is not location-specific (i.e., a prepaid caller is not limited to a dedicated telephone fixed at a particular location) and that the telephone can communicate signals with the special exchange." (Joint Claim Chart, at 1.) Telco contends that "making telephone calls from any available telephone" means "[m]aking telephone calls from any standard telephone without requiring a special interface to communicate with the special exchange." (Id.)

"In general, a preamble is construed as a limitation [only] if it recites essential structure or steps, or if it is necessary to give life, meaning, and vitality to the claim. A preamble is not limiting, however, where a patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use for the invention." Symantec Corp. v. Computer Assocs. Int'l, Inc., 522 F.3d 1279, 1288 (Fed. Cir. 2008) (citations and internal quotation marks omitted). Because the lettered paragraphs of claim 1 do not expressly indicate that the prepaid calling center or special exchange is called from a phone, and since that aspect of the claim is essential to its meaning, the Court finds that "making telephone calls from any available telephone" states a limitation on claim 1, namely that the call be made from a telephone.

The scope of that limitation is determined by generally applicable claim construction principles. Bell Communications Research v. Vitalink Communications Corp., 55 F.3d 615, 621 (Fed. Cir. 1995). Applying those principles, the Court finds that "making telephone calls from any available telephone" generally means what it says. While the ability to access the prepaid system from any available telephone allegedly distinguishes the '275 patent from the prior art, the patent is conspicuously silent on the characteristics of the telephone used to call the special exchange. The only features that are clearly required by the specification and claims are that the telephone (1) be capable of dialing the special exchange (see step (c); see, e.g., col.3 ll.20-21 (using "nearest available telephone," calling party "dials a special central office"); (2) be capable of transmitting a "special code" to the special exchange (see step (d); see, e.g., col.3 ll.26-29 ("When the calling party hears the special dial tone[,] indicating that the computer at the exchange is ready for him[,] he dials the identifying code and the called number he wants as indicated at block 17."); and (3) be capable of transmitting a phone number to the exchange (see id.). The preferred embodiment described at col.6 ll.22-26 further requires that the phone be capable of transmitting special codes to the special exchange while a call is in progress (e.g., "999" to signal the end of a call). But claims 1 and 23 contain no corresponding limitation, thus the claims are not limited by the preferred embodiment disclosed in the specification.
Telco's suggestion that a "standard telephone" must be used to call the special exchange cannot be squared with the language of the claim or the specification. As for the claim's language, the word "any" speaks for itself. Turning to the specification, one of the two embodiments described in the patent uses "dedicated public telephone[s]" to access the special exchange. The specification further contemplates that the exchange can be reached from "hotel room telephones" (col.1 l.36), "public payphones," (col.1 l.40), and phones that belong to salesmen's customers (col.1 l.50.) Undoubtedly, some of these are not "standard" telephones, either because they connect to the regular telephone system through a special interface (as with a phone connected to an office PBX), or because they use nonstandard hardware (as with a payphone). Thus, the Court rejects Telco's proposed limitation that calls must be made from a standard telephone without requiring a special interface to communicate with the special exchange.

The fact that Aerotel distinguished the invention of the '275 patent from earlier systems which required a special interface does not alter this conclusion. Telco maintains that "if you need a special interface to access the exchange to make a phone call, then that's not within the scope of the invention" because prior art systems required a special interface to make a prepaid call. (See Def.'s Opening Br. 8-10; Tr. of Oral Arg. 32-34.) But this mistakes a distinguishing feature of the invention disclosed in the '275 patent (accessibility from any phone) for a limitation (accessibility from standard phones). Consider a less technologically exotic example. Unlike motorcycles designed for highway use, the Ducati Multistrada excels on every kind of road with amazing sports performance. (See generally Jim McCraw, All Roads Become a Holiday, N.Y. Times, Nov. 9, 2003, at L12.) We would not say, however, that because the Multistrada can be used on roads other than highways, it must be; the Multistrada's genius lies in its versatility. So it is with the system disclosed by the '275 invention: "if a party wants to make a call, be it a local call or a long distance national or international call, he should be able to accomplish the call from the nearest available telephone," (col.1 ll.57-60), whether or not it uses a special interface. 5

5 In a variation on this argument, Telco contends that a no-special-interface limitation must be read into claim 1 to save the claim's validity, since otherwise the claim would be anticipated by a British patent. (Def.'s Opening Br. 9.) Without expressing any view as to the claim's validity, the Court notes that the interpretative issue is not nearly so close as to require the application of the doctrine that a claim should be construed, if possible, so as sustain its validity. Cf. MBO Labs., Inc. v. Beeton, Dickinson & Co., 474 F.3d 1323, 1332 (Fed. Cir. 2007) ("[w]e have limited the maxim [that claims are to be construed to preserve validity] to cases in which the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous."); Phillips, 415 F.3d at 1327 (same).

Aerotel's contention that "a prepaid caller is not limited to a dedicated telephone fixed at a particular location" finds more support in the patent's specification. In light of the disclosed embodiments, claim 1 clearly is not limited to a "dedicated" phone system. And the specification nowhere describes the calling phone as being "fixed" or "unfixed." The language proposed by Aerotel, however, is largely redundant in view of the limitations already identified by the Court. Thus while the Court agrees with Aerotel's understanding of what "any available telephone" denotes, it declines to adopt Aerotel's proposed language.

"Making telephone calls from any available telephone" means that the calling telephone must be capable of (1) dialing the special exchange; (2) transmitting a special code to the exchange; and (3) transmitting a phone number to be called to the exchange. Beyond those requirements, the phrase does not limit the characteristics of the initiating telephone.
XIII. "[T]o manage risk"

Finally, Plaintiffs present the claim term "to manage risk" for construction and propose that the term be construed to mean "to control and direct the possibility of loss." Since its definition is readily apparent, the Court will adopt Plaintiffs' general purpose dictionary-derived construction of the term "manage" as meaning "to control and direct." The Court, however, rejects the proposed definition of the term "risk" as it uses a general purpose dictionary to define a term that has a more precise meaning in the relevant art. Relying upon Barron's Dictionary of Finance and Investment Terms, the Court will construe the term "risk" as meaning the "measurable possibility of losing or not gaining value." Accordingly, the Court construes "to manage risk" as follows: "to control and direct the measurable possibility of losing or not gaining value."

25 TRG fails to provide a proposed construction of the term. (See R. 85, Def.'s Mem., Ex. 2.)

26 Plaintiffs rely upon the most relevant definition of the word "manage" located in Webster's Third New International Dictionary. See Webster's Third New International Dictionary 1372 (1981) (defining "manage" as "to control and direct").

27 See Barron's Dictionary of Finance and Investment Terms 491 (4th ed. 1995) (defining "risk" as "measurable possibility of losing or not gaining value").

"Managing the efficient routing of transit traffic between said plurality of tandem access points and said switch"

NT proposes the following construction for the above term: "managing transit traffic into, out of and throughout the claimed network by reducing the customer carriers' reliance on the RBOC/ILEC network." Peerless does not propose its own construction of this term but raises two objections to NT's proposed construction. First, Peerless raises the same objection it did to NT's proposed construction of "tandem access points," arguing that by including the phrase "throughout the claimed network" in the construction, the interpretation becomes an endless loop of analysis. That argument was rejected with respect to tandem access points and is rejected here as well for the same reasons.

Second, Peerless argues that the '708 Patent and the prosecution history show that the term is intended to describe the efficient routing of transit traffic within the Neutral Tandem Network, not into or out of it. Peerless's objection is not convincing. The term "throughout" is sufficiently broad to include transit traffic coming into or going out of the claimed network. Indeed, as decided above, the tandem access points are the points at which a carrier's network is connected to the claimed network. Thus, transit traffic being routed to or from one of these points would be moving into or out of the network. Therefore, the Court construes the term as "managing transit traffic into, out of and throughout the claimed network by reducing the customer carriers' reliance on the RBOC/ILEC network."

5. The term "MANIPULATING" (claims 1 and 13) requires no construction.
15. Manipulating component fields

The court construes "manipulating component fields" to mean "rearranging the data fields received from the data path in different ways."

8. Manipulating the client database by commands received from the gateway computer

This term appears in claim 11 of the '201 patent. Seven asks the court to incorporate its construction of "directly manipulating" into this phrase, the terms of which would require the commands to be received from the gateway computer. Visto proposes that the term means "the session module on the gateway computer directly manipulates the client database through the use of Remote Database APIs." Visto's proposed construction incorporates limitations not found in the claims. It is therefore rejected. The only phrase that needs construction is "manipulating the client database by commands," and the court incorporates by reference its previous construction of "directly manipulating the client database" as the definition for that term.

9. Manipulating the client database with the session module

This limitation appears in claim 28 of the '542 patent. The court concludes that "manipulating the client database" means "causing tasks to occur on the client database, such as querying, adding, or removing data, by commands sent to the client database." The balance of the phrase requires no construction. The court rejects Visto's proposed construction because it requires the use of Remote APIs and the retrieval from, and insertion of data into, the client database. The patents use the term "manipulation" more broadly than Visto proposes. In particular, manipulation is not limited to retrieving and inserting data into the client database. Moreover, requiring the use of Remote APIs would unnecessarily limit the scope of the claims to the preferred embodiment.

5. "The adjustment being performed in a manner which causes the actual ion output current value to become equal to the ion output current reference value"

The dispositive word in this element of the claim is "manner." ITW wants it to mean "varying or changing the actual ion output current so that the measure of the ion output current continuously moves toward the value of the current reference value." Pl.'s Revised Proposed Order Regarding Claim Construction at 3. Ion proposes that "manner" means "the increase or decrease by the predetermined amount being such that an increase is used if by increasing by the predetermined amount the actual ion output current becomes closer to the ion output current reference value" and the opposite for purposes of decreasing the actual ion output current. Def.’s Proposed Order re Claim Construction for the '756 patent at 4.

The dictionary definition for "manner" is: "a way of doing something or the way in which a thing is done or happens." American Heritage Dictionary of the English Language (4th 2000). ITW offers no explanation for why the word "continuously" should limit this claim term, other than that it is mentioned within the specification. Nothing in the claim language suggests why the "way" of bringing the actual ion output current value to equal the ion output current reference value should be limited to a specific method like "continuously." Nor does a broad definition like the dictionary's conflict with the specification. Accordingly, there is no need to incorporate such a limitation.
Ion's proposed construction clarifies the "manner" in which the two values are brought equal, so long as it does not restrict the "manner" to either a continual or periodic change in value. Ion's use of the word "predetermined" to limit the word's ordinary meaning threatens to import such a limitation. A construction containing the word "predetermined" would therefore be confusing and unsupported by either the claim language or the specification.

For the reasons stated above, the proper construction for the "manner" in which the disputed adjustment is performed shall be: "the actual ion output current value is either increased or decreased until it equals the ion output current reference value."

2. Claim 2

Claim 2 requires construction. It states that:

The method of claim 1 wherein said manual reset is accomplished by cycling the power off and then on.

Agrizap argues that Claim 2 should be construed as: "reset signal produced by any manner of cycling the power off and then on, including a mechanical on/ off switch, or reset button/ actuator, or cycling under control of electronics hardware, software/ firmware or a combination thereof." (Agrizap's Claim Construction Statement, at 3). Woodstream argues that Claim 2 is indefinite and invalid under 35 U.S.C. § 112 because it refers to "said manual reset" and there is no such "manual reset" phrase in claim 1.

This Court will construe "manual reset" to be the same "power on reset signal" present in Claim 1(d) and (e). Agrizap's broad construction is inappropriate. On the other hand, Woodstream's claim of indefiniteness is also incorrect. "[T]he context of the surrounding words of the claim also must be considered in determining the ordinary and customary meaning of those terms." ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082, 1088 (Fed. Cir. 2003). Here, the "manual reset" can be construed based on the surrounding language of Claim 2 and on the previous constructions of "reset signal" in Claim 1(d) and 1(e). Claim 2 is a dependent claim of Claim 1. While there is no preceding "manual reset" term in Claim 1 for the "said manual reset" in Claim 2 to refer to, it will be construed to refer to the "reset signal" in Claim 1(d) and (e). By using the word "said," the claim must be construed to referring to a reset that was already mentioned. Black's Law Dictionary, at 1363. The only "reset" mentioned in the previous Claim 1 was the "reset signal" in Claim 1(d) and 1(e). That reset signal is the power on reset signal. Furthermore, the "manual reset" in Claim 2 is described as being "accomplished by cycling the power off and then on." Cycling the power off and then on is the same functionality as the power on reset signal. Therefore, the "manual reset" in Claim 2 is the power on reset signal.

Q. "manually modified"

<table>
<thead>
<tr>

</table>

<table>
<thead>
<tr>
<th>Term</th>
<th>Defendants' Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>manually modified</td>
<td>to change by the hands of the user</td>
</tr>
</tbody>
</table>

The disputed term is located in claim 1 of the '733 patent: "wherein the second menu is manually modified after generation." The specification gives the following description of "manually modified": "Manual modifications to the generated menus include handwritten screen captures and/or voice recorded message captures coupled with the standard menus and modifiers.
generated according to standard choices." (‘733 patent, 3:48-51).

For example a restaurant server taking a drink order could select from a menu of her hand-held device's screen 'Iced Tea,' and then manually write in the literal screen of her hand-held 'with lemon' as shown in FIG. 8. The manually-written information could, for example, be printed or displayed in front of a bartender preparing the drink order."

("733 patent, 4:6-11). "Similarly, a server taking a drink order could select from a menu of her hand-held device's screen 'Iced Tea,' and then record the voice message 'with lemon' using her hand-held device integral microphone." (‘733 patent, 4:18-22).

Based on the specification's disclosure of voice recording as a form of manual modification, the court rejects the defendants' proposed construction "to change by the hands of the user." (See also ‘733 patent, claim 4 ("said second menu is manually modified by handwriting or voice recording after generation")). Although the specification discusses handwriting and voice recording, there is no indication that "manually modified" must be limited to the preferred embodiments. Therefore, "manually modified" is construed to mean "effecting a change as a result of a user's input or request."
in an Orders folder for the associated the product [sic].

'761 patent, col. 2:36-44. Thus, the phrases "one-to-many" and "many-to-one" describe the relationship between the number of users and the number of data files- in both instances, multiple users and a single data file. See also '761 patent, col. 2:45-46 ("Conventional systems are designed to allow multiple users to access the same file for collaboration purposes.") That the term "many-to-many functionality" refers to multiple users and multiple data files is further supported at numerous points throughout the specification. See '761 patent, col. 3:25-27 ("The data management tool includes a novel architecture where the highest contextual assumption is that there exists an entity that consists of one or more users."); col. 3:37-43 ("Any user operating within a board has access to the suite of applications associated with that board, and can obtain access to any data in any form . . . created by the applications . . . [T]hereafter, the user can then move to shared workspaces (or boards), and access the same data or other data."); col. 3:63 ("the tool supports multiple users"); col. 4:5-7 ("All files and groups of files can be associated with any other file in the system, allowing a system user the flexibility in determining dynamic associations.").

In the Court's view, Leader's proposed construction of "many-to-many functionality" comports with the specification, from which the meaning of Claim 32 is made sufficiently clear to avoid invalidity on indefiniteness grounds. Accordingly, the Court concludes that "many-to-many functionality" is not indefinite, and means "two or more users able to access two or more data files.*

2584

I. "map" 35

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

35 The word "map" is used in claims 18, 25, 26, 27, 28, 34, 35, 36, and 37 of the '259 patent.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

1. ADE's Position

ADE suggest that the Court construe "map" to mean "a visual representation of the location of pit and particle defects, or the electronically stored image file (e.g., bit map) directly used to generate the visual display." (JCCS at 14.)

2. KLA's Position

KLA argues that the word should mean "'electronic information indicating a location of an anomaly.'" (Id.)

3. Analysis

The inventors in the '259 written description refer to data being stored in memory to define a "map" of the particles and pits and they stated that Figures 20, 21, and 22, one of which is reproduced below, represent "maps" of a wafer surface. (D.I. 627, '259 Patent Prosecution File History, '259 Patent at col. 11 I. 50 to col. 12 I. 7.)

GET DRAWING SHEET 19 OF 20

Consistent with this description, the Court construes "map" to mean a visual representation of the location of pit and particle defects on the surface of a scanned workpiece that includes the underlying electronically stored data corresponding to said visual representation.

2585

2. Displaying a map image with image coordinates corresponding to the geographic coordinates

The parties dispute nearly every term in this limitation. Specifically, they disagree on the meaning of "map image," "image
coordinates, and "corresponding," as well as the meaning of the limitation as a whole. The court will address each of the parties' disputes.

Beginning with the term "map image," the plaintiff contends that the term means "a representation of a flood map, such as a FEMA flood map, stored as a grid of pixels." Based on the prosecution history, the defendants contend the phrase "map image with image coordinates" is limited to "a georeferenced raster map image."

With respect to the prosecution history, the plaintiff concedes that it surrendered vector maps during prosecution, yet asserts that the scope of the surrender is limited to vector maps. The court agrees. The court observes that dependent claim 5 requires a map image that is "a digital raster image." 326 patent, claim 5. Claim differentiation counsels a broader construction for independent claim 1 than for claim 5. The court therefore construes the term "map image" to mean "a representation of a flood map, such as a FEMA flood map, stored as a grid of pixels."

The next dispute involves the term "image coordinates." The plaintiff suggests that the term means "locations that define the position of a point on an image." The defendants, building on their argument that the claim is limited to raster maps, contend that term "image coordinates" means "X, Y pixel locations (row, column intersections) that make up a raster image." The court has rejected that argument and therefore adopts the plaintiff's proposed construction of "image coordinates."

Next, the defendants contend that claim 1 of the 326 patent implicitly requires that the map image be a "georeferenced" raster map image and that the patentee acted as his own lexicographer in defining the term "georeferenced" and urge that the term "georeferenced" means georeferencing all of the X, Y pixel locations of the georeferenced raster map images. With respect to the first point, other claims explicitly require that certain map images be "georeferenced." As a result, the court rejects the defendants' attempt to limit the claims to the preferred embodiment. With respect to the second argument, although some portions of the specification describe georeferencing in a specific manner, other portions of the specification provide a broader meaning of the term. The 326 patent states explicitly that "georeferencing is the process of relating source coordinates to referenced geographic coordinates, which are typically in standard latitude and longitude." 326 patent, col. 2, II. 16-19. Although the preferred embodiment contains some of the details sought by the defendants, the plaintiff's construction is correct for the "georeferenced" term, and the court adopts it for use in those claims in which it appears.

Finally, the defendants contend that this limitation, read as a whole, requires "marking" the location of the property on the map image. The claim language does not require this. Rather, the language of the claim requires "displaying a map image with image coordinates corresponding to the geographic coordinates." It is true, as the defendants urge, that the description of the preferred embodiment describes a method which "marks on each map the location of the property (step 415)." 326 patent, col. 4, 11. 48-50. The claim language, however, requires only that the map image be displayed. Accordingly, the court rejects the defendants' proposed limitation.

--- Footnotes ---
n1 The term "corresponding" needs no construction.

--- End Footnotes ---
Defendants face an uphill battle to show that "mapping" should not be construed in an analogous fashion to "mapped" because "claim terms are normally used consistently throughout the patent." 4 Phillips, 415 F.3d at 1314. The prosecution history of U.S. Patent No. 5,088,028, to which defendants cite, is of questionable relevance when construing the terms of the '369 patent because the two patents, although having similar specifications, were not formally related. 5 See Goldenberg v. Cytogen, Inc., 373 F.3d 1158, 1167-68 (Fed. Cir. 2004). While "mapping" and "translating" both appear in the patent, they are not, as defendants assert, used as synonyms. The description of the preferred embodiment contains the following language:

When a device on VMEbus 10 seeks to read or write access an address mapped to Futurebus address space, a VMEbus-to-Futurebus (V-F) translation circuit 18, coupled to VMEbus 10 by a buffer 20, translates the upper portion A(12:31) to a corresponding upper portion of the Futurebus bus address, and a buffer 22 selectively places this portion of the Futurebus address on local address bus 16.

'369 patent at 4:11-18. In the context this passage, it appears that VMEbus addresses have already been mapped to Futurebus addresses ("When a device on VMEbus seeks to read or write access an address mapped to Futurebus address space"), but that the translating must be done each time a device on the VMEbus wishes to access a mapped address ("a [V-F] translation circuit . . . translates the upper portion . . . to a corresponding upper portion of the Futurebus address"). The patent thus makes clear that mapping and translating in some instances take place at different times and therefore cannot be synonyms. The court adopts CCCC's proposed construction of "mapping" because it is consistent with both the parties' agreed-upon definition of "mapped" and the language of the patent. "Mapping" is "establishing a correspondence between the elements of one set and elements of another set."

--- Footnotes ---

4 Intel's citation to Comark Communications v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims.")., does not support Intel's argument that "the patent uses the terms 'mapping' and 'translating' synonymously." See Intel Opp'n (dkt. # 71) at 16. In Comark, the Federal Circuit held that a term in an independent claim should presumptively not be defined in such a way as to render a dependent claim "completely superfluous and redundant." Id.5 The court understands defendants' argument that as a matter of policy, a patentee should not be able to benefit from improperly failing to alert the PTO to the fact that on the same day, the same inventors filed two separate patent applications containing substantially overlapping specifications and claim language. (The application for the '369 patent and the parent application of the '028 patent were both filed on April 7, 1989.) Even assuming the defendants are correct that the '369 and '028 patents should have been related during prosecution and that the prosecution history of the '028 could therefore in theory be used to narrow the scope of the '369 patent, the argument of the patentee they quote,

Applicants' claimed invention is an interface circuit 8 for communicating between two computer systems having respective bus masters (2;4) and system buses (10;12), the two systems having different protocols, such as VMEbus and Futurebus. An address on the first bus intended for a device on the second bus is detected and translated into an address on the second bus by V-F translator 18 and address generator 47 while a first local bus request signal V-LREQ is generated,

Ochs Decl. (dkt. # 54), Ex. 4 at 5, is consistent with mapping taking place once initially and translating taking place each time cross-bus access is sought. The court therefore need not try to predict whether the Federal Circuit would, upon consideration of the facts of this case, expand the rule of Goldenberg to cover the instant situation.

2587

D. "Shared Memory Subsystem"

Both the '377 and '229 patents describe the use of a "shared memory subsystem for mapping a portion of said shared addressable memory space to a portion or the whole of said persistent storage and said volatile storage . . . ." 377 patent at 16:6-9. See also '229 patent at 28:31-34 ("a shared memory subsystem for mapping a portion of the shared addressable memory space to at least a portion of the persistent and volatile storage . . . ."). Oracle asserts that the "shared memory
subsystem" described in the patents is a means-plus-function claim. The court disagrees.

First, the absence of the word "means" undermines Oracle's claim. See, e.g., Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318 (Fed. Cir. 1999) ("When an element of a claim does not use the term 'means,' treatment as a means-plus-function claim element is generally not appropriate."). Second, the claim element "shared memory subsystem" recites sufficiently definite structure to dispel the argument that it is a means-plus-function claim. Third, the phrase "shared memory subsystem" appeared in both patents and technical literature at the time the '377 patent issued. See, e.g., Exhibit J to Mangosoft's Opposition Brief, United States Patent no. 5,341,475 (describing a communication system for exchanging data, which employs a shared memory subsystem). See also Mangosoft's Opposition Brief at 15-16 (representing that the phrase "shared memory subsystem" appeared in at least nine U.S. Patents filed before the '377 patent, as well as in academic literature).

With regard to the word "mapping" -- a function performed by the shared memory subsystem -- Oracle asserts that it means "assigning a correspondence between the addresses of portions of virtual memory to the addresses of portions of physical memory." Oracle's Claim Construction Brief (document no. 36) at 23. Mangosoft, on the other hand, says that Oracle's construction of the word is too narrow in two respects. First, it says the word "mapping" means simply "defining or establishing a relationship," rather than assigning a direct correspondence. Mangosoft's Claim Construction Brief at 16. Next, it says that the plain language of the claim provides only that a portion of the shared addressable memory space must be mapped to a portion or the whole of the system's persistent and/or volatile storage. It does not, says Mangosoft, require the mapping of portions of the system's virtual memory to portions of the system's physical memory.

The word "mapping," as used in the patents at issue, would be understood by one of ordinary skill in the art to mean "creating an association between." See, e.g., Oracle's Claim Construction Brief at 23 (citing IEEE Standard Dict. of Elec. and Electronics Terms (6th ed. 1996) at 627 for the proposition that to "map a range of addresses" means "to create an association between a range of a process's address space and a range of physical memory or some memory object, such that a reference to an address in that range of the address space results in a reference to the associated physical memory or memory object."). Accordingly, the memory subsystem described in the '377 patent and the '229 patent creates an association or relationship between the shared addressable memory space and some or all of the local persistent and local volatile memory space of the participating nodes.

"determining whether or not the data packet is marked as being transmitted at an excessive rate" is construed to mean determining whether the packet is marked in a network environment where marking is being performed to designate those packets that are transmitted at excessive rates. According to Newbridge, this phrase should be construed to require the claimed dropping method to be able to conclude from the marking information why the packet was marked. After reviewing the specification of the 811 Patent, the Court concludes that Newbridge's construction would exclude the preferred embodiment, which merely checks to see if the packet is marked without engaging in additional processes to determine the reason for the marking. The Court's construction is also supported by the specification which explains that marking can occur as a result of a special service where all of a customer's packets are marked. These special service packets are treated like other marked packets, which indicates that the dropping function described in the specification does not determine the reason for marking. (811 Patent, col. 10, ll. 62-64). Accordingly, the Court's construction of this phrase embraces the Patent's preferred embodiment and is consistent with the specification.

6. Marker: Echometer argues that a "marker" as used in its '399 Patent is a symbol or indicator of a specific location on a display, but the particular marker's use depends upon the type of marker described in the individual claim being construed. Lufkin argues that the term "marker" is limited to a line identifying a specific depth or time, and the determination of the depth or time is dependent upon the calculation of acoustic velocity and collar frequency. The Court finds, consistent with its previous rationale, no reason to read into the term marker additional limitations pertaining to the calculation of the marker's exact position in the well bore. Therefore, the Court concurs with Echometer and defines the term marker as a symbol or indicator of a specific location on a display.
The term "marker," however, is limited depending upon the context in which it is used in the '399 Patent claims, e.g., claim 1 describes a marker "for each of known reflectors," claim 2 describes "incremental depth markers," and claim 7 describes a "moveable marker." The Court does not find it necessary to impose any additional limitations on the term marker beyond the contextual limitations of the claims, i.e. the markers of claim 7 are found at various increments and are used for measuring depth.

Numerous claims of the '952 patent contain the phrase "marker value." Claim 8, for example, associates a "marker value" with a channel tuning designation as follows:

  tuner means for receiving a processor signal and a multi-channel input signal, and in response to said processor signal, tuning out all but one channel corresponding to a selected one of said preassigned channel tuning designations;

  memory means for storing a marker value for at least one of said channel tuning designations, and means of retaining said channel tuning designations in a plurality of ordered cues ….

(Doc. # 1, Exh. A at col. 16)(emphasis added). Claim 10 associates a "marker value" with a channel select designation as part of its memory means as follows:

  wherein said memory means includes means for storing a marker value for each of said channel select designations, and means of retaining said channel select designations in a plurality of ordered cues ….

Id. at col. 17 (emphasis added). In addition, both claims 8 and 10 describe a "marker value" as being stored or retained for each channel tuning designation or channel select designation in a plurality of ordered cues. Other claims associate the phrase "marker value" with a plurality of scroll sequences. For instance, claim 37 describes its memory means as follows:

  memory means for storing a marker value for at least one of said channel tuning designations, and means for retaining said channel tuning designations in a plurality of scroll sequences.

Id. at col. 30.

Despite claim language associating "marker values" with either cues or scroll sequences, Thomson construes the phrase "marker value" as a single binary value or multiple binary values used to mark scroll sequences in cues. Thomson contends that the specification requires "marker bits" and "multiple bit markers" to mark entries in a cue to create a scroll sequence. As a result, according to Thomson, a "marker value" marks a listing not only of channel tuning designations but also a listing of a display code, channel code, and select code. A "marker value" is thus a flag for a cue to be included in a scroll sequence. These contentions, however, improperly seek to remove the alternative provided in the claim language whereby a marker value is stored in either plurality of ordered cues or scroll sequences.

The specification does not explicitly define "marker value." The preferred embodiment, however, explains that when an operator chooses a channel to place into a scroll, a "marker bit" is used to flag the particular channel the operator wants to place into a scroll. (Doc. # 1, Exh. A at col. 9, ll. 16-21). The specification also states that a marker bit may be a single marker bit "whereby a single scroll is provided …" or multiple marker bits to create more than one scroll sequence to permit subject matter scrolls or favorite channels, for example. Id. at col. 12, ll. 53-63. Thus, a "marker value" may include one or more bits in a memory. Yet, this does not lead to the conclusion that a marker value must be used to mark scroll sequences in cues because the claim language indicates that a "marker value" is used to indicate that its associated channel tuning
placemark the claim term "principal market maker." (R. 82, Pls.’ Mem. at 11-14; R. 85, Def.’s Mem. at 10-17.) Plaintiffs propose construing "principal market maker" as "an entity that is assigned to: (i) continuously maintain a two-sided bid/offer market of specified size and spread for its designated products, (ii) maintain a public order book with respect to these assigned products, and (iii) give priority to customer order execution over personal trading." (Id., Ex. 1 at 1.) In contrast, TRG defines the claim term as "an organization designated by an exchange to maintain a two-sided bid/offer market in return for priority volume benefits." (R. 85, Def.’s Mem. at 11.) For the following reasons, the Court rejects both proposed constructions.

Because the meaning of "principal market maker" as understood by a person of skill in the art is not readily apparent, its construction involves more than the "application of the widely accepted meaning of commonly understood words." Phillips, 415 F.3d at 1314. Thus, the Court must look to those "sources available to the public that show what a person of skill in the art would have understood disputed claim language to mean." Id. The Court therefore turns to an examination of the intrinsic record.

Plaintiffs first argue that Garber acted as his own lexicographer and explicitly defined the claim term "principal market maker" in the specification. (R. 82, Pls.’ Mem. at 11-12.) Plaintiffs point to the following language contained in the specification in support of this argument:

The [Principal Market Makers] functions are similar to that of a market making foreign exchange bank and broker specialist. A PMM specialist should continuously maintain a sized two-sided bid/offer market for its designated products. This market should be of a designated minimum quantity and maximum spread, i.e., the difference between bid and offer. Also, the PMM should maintain the "public order book" (collection of public customer orders to purchase or sell) with respect to the assigned products. Finally, the PMM should give priority to customer order execution over personal trading. '923 patent, col. 1, ll. 35-45.

When a patentee acts as his own lexicographer and gives a claim term a special definition that differs from the meaning it would otherwise possess, it is the patentee's definition that governs. Phillips, 415 F.3d at 1316. If a "patentee acts as his own lexicographer in redefining the meaning of particular claim terms away from their ordinary meaning, he must clearly express that intent in the written description." Merck & Co., Inc. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1370 (Fed. Cir. 2005). Such a redefinition "must have sufficient clarity to put one reasonably skilled in the art on notice that the inventor intended to redefine the claim term." Id.

The Court finds Plaintiffs' first argument unpersuasive as the quoted specification language does not reveal an express intent to define "principal market maker." Rather, this language, taken in its context, merely provides background information regarding CME's proposed rules for its Principal Market Maker. See '923 patent, col. 1, ll. 23-45. Thus, it falls well short of the "reasonable clarity, deliberateness, and precision," Renishaw PLC v. Marposs Societa’ per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998), needed to redefine a claim term.

Next, Plaintiffs contend that parts of the prosecution history support their proposed construction. (R. 82, Pls.’ Mem. at 12-13.) Specifically, they point to the '584 provisional application. 11 (Id.) In the '584 provisional application, Garber provides an overview of his proposed invention, which he describes as "the opportunity of linking the Chicago Mercantile Exchange's Rolling Spot Currency contracts with the Principal Market Maker program (PMM)." 12 (R. 82, Pls.’ App., Ex. 6 at 5.) After describing these synergies generated by a combined PMM/Rolling Spot Currency program, Garber goes on to define a PMM's functions:
The PMM's functions are similar to that of a market making foreign exchange bank and broker specialist. In return for specified considerations, a PMM specialist will be required to provide the following functions: (1) A PMM must continuously maintain a two-sided bid/offer market for their designated products. This market must be of a designated minimum quantity and maximum spread—the difference between bid and offer; (2) the PMM must maintain the "public order book" with respect to the assigned products; and (3) the PMM must give priority to customer order execution over personal trading.

As compensation for the above named functions, the PMM is entitled to the following considerations; (1) guaranteed participatory volume . . . (2) The retention of floor executed brokerage transactions commissions, except where principal-agency conflicts of interest apply.

(Id. at 7.)

The Court finds that this portion of the intrinsic record provides support for Plaintiffs' position that, contrary to TRG's proposed construction, a "principal market maker" must do more than merely "maintain a two-sided bid/offer market in return for priority volume benefits."

--- Footnotes ---

11 The prosecution history consists of the complete record of the proceedings before the USPTO. Phillips, 415 F.3d at 1317. The '584 provisional application is part of the complete record of the proceedings before the USPTO leading to the issuance of the '923 patent, and is thus properly considered part of its prosecution history. See, e.g., Juniper Networks, Inc. v. Bahattab, No. 07-1771, 2009 U.S. Dist. LEXIS 39499, 2009 WL 1285916, at *6 (D.D.C. May 8, 2009) (considering a provisional application as part of the prosecution history).

12 This description is virtually identical to the general description provided in the Summary section of the '923 patent. See '923 patent, col. 3, ll.41-50 ("The present invention provides a method and system for linking Rolling Spot Currency contracts with a PMM specialist program.").

--- End Footnotes ---

In support of its proposed construction, TRG argues that several pieces of extrinsic evidence indicate that those skilled in the art understood the term "principal market maker" to "mean an organization designated by an exchange to maintain a two-sided bid/offer market in return for priority volume benefits." (R. 85, Def.'s Mem. at 11.) The Court finds TRG's argument unpersuasive as it decontextualizes the portions of the extrinsic record upon which it relies. For example, it points to a CME Memorandum which states: "A PMM will be required to make two-sided markets in both products for a minimum number of contracts and at a maximum bid/ask spread. . . . In return, a PMM is guaranteed a percentage of trading activity based on average daily volume." (R. 85, Def.'s App., Ex. 4 at 1.) While this excerpt does provide support for TRG's position, it fails to note that CME also stated that the official rules for the PMM Program were attached to the document. (Id. ("The official rules for the PMM Program follow this memorandum.")) In these rules, it is clearly stated that a PMM must not only continuously maintain a two-sided market, but must also maintain an order book and give priority to customer order execution. (See id. at 2-3.) In exchange for the fulfillment of these responsibilities, the rules also state that the PMM is entitled to certain priority volume benefits. (Id. at 3.)

Similarly, TRG's reliance on CME's application to receive a prohibited transaction exemption under ERISA Section 408(a) is unconvincing. Again, TRG points to language stating that the overall incentive for a PMM to satisfy its responsibilities is its priority volume benefits. (R. 85, Def.'s App., Ex. 4 at 1.) What it conveniently fails to draw to the Court's attention is the preceding language describing a PMM's responsibilities, such as making a two-sided market, maintaining an order book, and prioritizing customer orders. 13 (Id. at 3.)

--- Footnotes ---

13 TRG also relies upon a footnote in a Commodity Futures Trading Commission ("CFTC") advisory opinion and a 1995 news article to support its proposed construction. (See R. 85, Def.'s App., Ex. 8 at 6 n.9; Ex. 10.) These pieces of extrinsic
The evidence are unpersuasive as they merely indicate the use of priority volume benefits as incentives for a PMM, and do not define its responsibilities in maintaining the market.

The Court finds that a person of ordinary skill in the art at the effective filing date of the '923 patent application would have understood the term "principal market maker" to mean more than "an organization designated by an exchange to maintain a two-sided bid/offer market in return for priority volume benefits." Based on evidence presented by the parties, the Court construes the claim term "principal market maker" as "an entity required to provide the following functions: (1) continuously maintain a two-sided bid/offer market of specified size and spread for its designated product(s); (2) maintain a public order book with respect to these assigned products; and (3) give priority to customer order execution over personal trading. As compensation for the fulfillment of these responsibilities, this entity is to receive priority volume benefits."

The parties dispute the meaning of the term "market reports routine" as that term appears in claim 4. AMS and Bidsoft argue that the term should mean "a user application residing on the user's workstation which provides information about prior sales, including the sale prices for different vehicle types that have been sold at an auction in the system." Manheim contends that the term should mean "a section of code that can be invoked or executed within a program that performs the particular task of allowing the user to search and view auction data such as recent vehicle sale prices for a specific motor vehicle auction location[] or geographic region." In the Court's view, neither proposed construction is appropriate.

Claim 4, which is dependent of claim 1, specifically claims: "The system of claim 1 wherein the auction data includes historical sales information." As set forth above, the parties agree that the term "historical sales information" means "information about prior sales including the sale prices for different vehicle types that have been sold at an auction in the system." Thus, as AMS and Bidsoft correctly explain, the plain language of claim 4 requires that the "market reports routine" allow the user to search the auction data and display at the workstation the "historical auction data." As such, the market reports routine, at a minimum, must allow the user to search the auction data and display at the workstation "information about prior sales including the sale prices for different vehicle types that have been sold at an auction in the system."

That issue resolved, the primary remaining dispute appears to be whether the "market reports routine" must be "a user application residing on the user's workstation" as AMS and Bidsoft contend. The Court concludes that it does not. As Manheim correctly points out, claim 4 makes clear that the market reports routine is included within the set of user application modules. While the patent clearly discloses that the user application modules are resident on the user workstations, the Court finds no basis for requiring that they be so located. Notably, the term "user application module" appearing in claim 1 is also in dispute. Neither party proposed a construction of that term which required that the modules be resident on the user workstation; rather, the parties agreed that the term means only "portions of a program that perform[] a particular task or implement[] a particular abstract data type." Because "the same terms appearing in different claims in the same patent . . . should have the same meaning 'unless it is clear from the specification and prosecution history that the terms have different meanings at different portions of the claims,'" see Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322, 1328 (Fed. Cir. 2006) (quoting Fin Control Sys. Pty, Ltd. v. OAM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001)); Phillips, 415 F.3d at 1314 ("[C]laim terms are normally used consistently throughout the patent."); and because the Court perceives nothing in the specification or file history which clearly indicates that this claim term should be construed differently, the Court declines to require that the market reports routine consist of a stand-alone application resident on the user workstation.

In view of the foregoing, the Court concludes that the term "market reports routine" in claim 4 shall mean a "portion of a program that performs the particular task of allowing the user to search the auction data and display on the user workstation information about prior sales including the sale prices for different vehicle types that have been sold at an auction in the system."
2. "market-specific segments" (claims 1, 9, 38, 39)

STV Asia proposes that the term "market-specific segment" be construed as "targeted material." Defendants argue that this term means "individual video segments, each encoded with a destination address (or addresses)." Defendants assert that STV Asia's proposed construction is incorrect because: 1) it fails to include the limitation that the segments must be encoded with the destination addresses; 2) it is overly broad in that it could include formats other than audiovisual media; and 3) it loses the sense of the word "segment," which indicates that the market-specific segment is part of a broader video program. With respect to the last point, STV Asia argues that its use of the word "targeted" captures the sense that the market-specific segment is the "counterpart" of the network-wide program. STV Asia Opening Brief at 7.

With respect to the first issue, the Court concludes that its construction of this term should not include the limitation that each segment is "encoded with a destination address." That limitation is included elsewhere in the disputed claims. See claim 1 ("said market specific segments including a destination address"); claim 9 ("means in the distribution center for encoding the market-specific segments with a destination address and a set of control data"); claim 38 ("encoding each of a plurality of market-specific segments with a destination address"). Where a limitation is contained elsewhere in a claim, it is generally inappropriate to read that limitation into a claim term. See Phillips, 415 F.3d at 1314. Here, as in Phillips, it would be redundant to include the limitation that the term "market-specific segments" must be encoded with a destination address because that limitation is found elsewhere in the claims.

On the other hand, the Court concludes that the word "material" in STV Asia's proposed construction is overly broad. Rather, the Court agrees with STV Asia's statement in its Reply that market-specific segments are "all audiovisual material and are not limited to just video." Reply at 8 (citing '416 patent, col. 5, ll. 10-20). This construction is consistent with Defendants' position on this issue. Further, it is consistent with the Court's construction of "network-wide video program."

Finally, the Court declines to use the word "targeted," as requested by STV Asia, but instead concludes that a "market-specific segment" is better described as a segment that is "designed for a specific market."

The Court construes this term as follows: "individual audiovisual segments designed for specific markets within the network."

"marking" is construed to mean "marking." The Court declines to further construe this term.

Lucent contends that this term should be given its ordinary meaning. (D.I. 396 at 5.) Extreme contends that the term "marking" means "setting a bit in the packet header that indicates that a packet is being transmitted at an excessive transmission rate along/in the virtual circuit to which the packet belongs." (D.I. 395 at 18.) Foundry contends that the preamble of claim 12 limits claim 12 and that "marking" means marking of excessive bandwidth packets in prior art virtual circuits employed in a packet switching network. (D.I. 385 at 9.)

In view of the Court's conclusion that the claims of the '810 and '811 patents are not limited to packet-switching network comprised of virtual circuits, the Court rejects those parts of Defendants' proposed constructions that rely on the presence of a virtual circuit. With regard Extreme's contention that marking means "setting a bit in the packet header," the Court concludes that Extreme impossibly tries to restrict the claim to the particular type of marking used in the preferred embodiment. Accordingly, in the Court's view, the Court's construction is consistent with the plain language of the claim and the specification.
"marking that one customer's data packets as being transmitted into the network at an excessive rate" is construed to mean monitoring the transmission of a customer's data packets and marking those packets that are being transmitted at an excessive rate. Newbridge contends that this phrase should be construed to require the switching node to mark "all packets received by the switching node as if they were being transmitted at an excessive rate." (D.I. 547 at 30). In other words, "the marking is done regardless of whether the received packet is actually being transmitted at an excessive rate." (D.I. 547 at 30). After reviewing the express language of the claim and the specification, the Court disagrees with Newbridge's proposed construction. Newbridge's construction corresponds to the "special service" marking described in the specification of the 811 Patent, in which all of a customer's packets are marked prior to transmission. However, this section of the specification does not refer to marking packets transmitted at an excessive rate, a requirement expressed in the plain language of the claim. In addition, the Court's construction is supported by the specification which discloses a congestion control scheme directed toward monitoring and marking selected customer data packets and eliminating or dropping from further transmission through the network marked data packets whenever and wherever they encounter a congestion condition. (811 Patent, col. 5, ll. 37-41) (emphasis added). Further, the specification explains that the packets are selected for marking by "monitoring the bandwidth of a customer and . . . marking that customer's packets when the customer's subscribed bandwidth is exceeded. (811 Patent, col. 5, ll. 54-57). This "monitoring is accomplished by an algorithm which determines whether or not the individual customer . . . is transmitting at an excessive rate. (811 Patent, col. 6, ll. 21-24) (emphasis added). Accordingly, the Court's construction is consistent with the plain language of Claim 12 and the 811 Patent's specification.

2. "mask"

Construction of the term "mask" follows similar lines. As with "pattern," the parties agree that the word "mask" has an established meaning in both common and scientific idioms. Read as a part of claim 1, in fact, "mask" carries a specific and well-established meaning: It denotes an item containing a circuit pattern in a semiconductor integrated circuit. See, e.g., '041 Patent at 1:19-24. Both the context of the claim, see Pitney Bowes, 182 F.3d at 1311, and the specification language buttress this construction. See '041 Patent at 3:15-37 (discussing the manufacture of semiconductor and liquid crystal devices). By comparison to the parties' over- and under-generalized definitions, the court's construction better captures the meaning of "mask" while leaving related—but distinct—claim terms, purposes, and connotations outside the definition of this oft-used term. The court construes "mask" to mean "an item, in a semiconductor integrated circuit, on which a circuit pattern is placed." Id.

1. "Mass information" is construed to mean "the computation of all mass features. Masses are lesions within the breast characterized by density, margin definition, shape, texture, or asymmetry."

1. "Mass Storage Means" Limitation

The "mass storage means" is a means for storing fax data. ('926 patent, claim 55 & '302 patent, claim 24.) This claim structure tracks the format for invoking the means-plus-function framework, and thus § 112, P 6, presumptively applies. Micro Chem. Inc. v. Great Plains Chem. Co., 194 F.3d 1250 1257 (Fed. Cir. 1999).

Here, the Court finds that "mass storage means" is a proper mean-plus-function limitation because, while there, are endless
ways to store information, the claim language, itself provides none of that structure. Notably, other courts have treated the term "storage" means" as a means-plus-function limitation. E.g., General Creation LLC v. LeapFrog Enters., 232 F.Supp.2d 661, 674-78 (W.D. Va. 2002). The corresponding structure disclosed in the specification is as file on a magnetic disk. (926 patent.) Thus, the Court finds that is the proper construction.

VII. "master controller" 14

14 The term "master controller" is in claim 12.

Plaintiff's Proposed Construction
Defendants' Proposed Construction

a device or subsystem that has overall control of other devices or systems
centralized server

Plaintiff argues that a "master controller" is not limited to only a centralized server. OPENING at 28. Defendants contend that a "master controller" must be centralized. RESPONSE at 30.

Claim 12 depends from claim 1 and discloses:

12. The method of claim 1, wherein the steps of accepting the first request from the buyer, accepting the second request from the buyer, and receiving the performance data from the buyer, are performed by a master controller.

'253 patent at 10:17-20. In other words, the master controller accepts the first and second requests and receives the performance data from the buyer.

The specification adds that the buyer selects a desired product or service "via a website managed by the seller or the seller's agent (e.g., a master controller)." 253 patent at 4:30-31. The master controller may be a computer server which provides content to and manages a website and handles operations for efficient processing and marketability. Id. at 6:19-26. The specification refers to the master controller as a "centralized server," "controller," "master operation controller," "operation controller," and "content server." Id. at 4:17, 6:20-22, 33, 64-67, 7:1. The parties' main dispute centers on whether the "master controller" must be centralized or may be distributed. The aforementioned sections of the specification indicate that a "master controller" may be a centralized server, as Defendants propose. However, the language of the claims and the specification do no limit the master controller to only a centralized server. Therefore, the Court rejects Defendants' proposed construction.

Plaintiff proposes a broad construction that indicates that the "master controller" has "overall control of other devices or systems." There are significant problems with this construction. Not only is this construction overly broad, but it has no support in the specification. Plaintiff contends that the construction is proper because it has support from a myriad of different dictionaries. OPENING at 28 (citing Oxford Dictionary of Computing, Microsoft Computer Dictionary, WordNet 3.0, and Am. Heritage Dictionary of the English Language). While dictionaries are "often useful to assist in understanding the commonly understood meaning of words . . . in claim interpretation," Phillips, 415 F.3d at 1322, the "ordinary meaning" of a claim term "is its meaning to the ordinary artisan after reading the entire patent" id. at 1321. Thus, reliance placed on intrinsic evidence--the claims, specification, and prosecution history--should be greater than that placed on extrinsic sources--dictionaries, treatises, and encyclopedias, among other sources. Id. at 1320. Furthermore, extrinsic sources may be considered, but may not be "used to contradict claim meaning that is unambiguous in light of the intrinsic evidence." Id. at 1324.

Despite the Federal Circuit's statement that dictionaries may be useful in determining the ordinary meaning of a term, the Court explicitly noted three main problems with this approach. First, dictionaries focus on the abstract meaning of words
rather than the meaning of claim terms within the context of the patent. Phillips, 415 F.3d at 1321. Second, dictionaries collect all uses of particular words, and the use of such dictionaries may extend patent protection beyond what should properly be afforded by the inventor's patent. Id. at 1321-22. Finally, the scope of a claim term should not be determined based on "the preferences of a particular dictionary editor, or the court's independent decision, uninformed by the specification to solely rely on one dictionary rather than another." 15 Id. at 1322.

--- Footnotes ---

15 While the parties were able to agree to a construction of the term "auction," the Court notes that Plaintiff also attached a copy of a Wikipedia page in support of its proposed construction for this term. OPENING, EXH. 15. This exhibit suffers from not only the deficiencies that are discussed above, but other problems as well. The content on this website is provided by volunteers from around the world--anyone with internet access can provide or modify content. See Ivovate Health Sciences, Inc. v. Bio-Engineered Supplements & Nutrition, Inc., No. 9:07-cv-46, 2008 U.S. Dist. LEXIS 24989, 2008 WL 859162, *8 n.4 (E.D. Tex. Mar. 28, 2008) (Clark, J.). Thus, not only is the information unreliable, Techradium, Inc. v. Blackboard Connect Inc., No. 2:08-cv-214 (Ward, J.), 2009 U.S. Dist. LEXIS 36083, 2009 WL 1152985, *4 n.5 (E.D. Tex. April 29, 2009), but it can potentially change on a day-to-day basis.

--- End Footnotes ---

Plaintiff explicitly invites this Court to adopt an overly broad construction of the term "master controller" that has no support in the claims, specification, or prosecution history and that is based on a myriad of different dictionary definitions. Yet, the specification sets forth specific functionality, as well as particular embodiments of a "master controller." Therefore, based on the intrinsic evidence, the Court finds that the proper construction of the term "master controller" is "a computer server, centralized server, operation controller, or content server for managing transactions."

2600

Claim Element 1b

master data base of a first plurality of options that may be implemented on a computer system

The parties disagree on the meaning of the above-stated language.

Dell proposed that a "computer system" should be construed as follows: "an information handling system which can be designed to give independent computing power to one user or a plurality of users." Dell further proposed that the remaining terms should be construed according to their ordinary meanings.

Lucent proposed that a "master data base" should be construed as follows: "a central, up-to-date file containing a collection of entries for every option offered that may be implemented on a computer system and at least one tag indicating compatibility with other entries."

The court concludes that a "master data base" should be construed as follows:

"a file containing a collection of entries for every option offered that may be implemented on a computer system."

<tbody>
<tr>
<td>&quot;master processor&quot;</td>
<td>general purpose processor not under control of a signal</td>
</tr>
</tbody>
</table>
Claim 1

Claim Term | Defendants' Proposal | Construed Meaning
---|---|---
"master processor" | a general purpose microprocessor, not under the control of a signal processor | The parties agree that a master processor is not under the control of a signal processor, but Defendants propose that a master processor must also control the apparatus. Defendants argue that Saxon's proposal disregards the word "master" in the claim term. Saxon argues that the term "master" refers only to the fact that the processor is not under the control of a signal processor.

Defendants' proposed additional limitation is not present in the claim language. While, the specification does describe an embodiment wherein a master processor controls the apparatus, '394 Pat. at 2:15-16, the Court sees no reason to import this limitation into the claim at issue. The Court's conclusion is bolstered by the prosecution history, in which the patentee explained that a "master" processor "does not allow a slave processor to take over control of the master processor at any time." '394 Pat. Amendment at 5 (Aug. 26, 1997). This explanation is consistent with Saxon's proposal and makes no mention of Defendant's proposed additional limitation.

The Court finds that Saxon's proposal adequately explains the plain and ordinary meaning of "master processor," and thus it does not read the word "master" out of the term. The Court adopts Saxon's proposed construction.

A. Claim Construction

On February 16, 2006, the Court held a claims-construction hearing in this matter. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The Court considered the '136 Patent and prosecution history, the parties' Markman briefs, the applicable law regarding, inter alia, claim construction, indefiniteness, and means-plus-function claims, and the argument of counsel. On May 25, 2006, this Court rendered a claims-construction order (Doc. # 292), which construed the terms as following:

Claim Term | Construed Meaning
---|---
"Debit Card" | "a prepaid card for exchange of value"
"ID information [stored on the debit card]" | "encrypted data, excluding the card number, stored on the debit card in the form of merchant ID, store ID, or terminal ID"
"Terminal" | "a point-of-sale apparatus, which includes a central processing unit, a card reader, a keypad, and a communications interface"
"ID information [stored on the terminal]" | "data stored on the terminal in the form of merchant ID, store ID, or terminal ID"
"Stored thereon prior to the transaction" | "stored on the terminal prior to the consumer presenting the debit card to the merchant"
"Relates . . . in a predetermined manner"  "prior to a transaction, ID information stored on the debit card and ID information stored on a terminal are capable of being matched"

"Matching" and "Matched"  "determining whether ID information stored on the debit card and corresponding ID information stored on the terminal are equal or identical"

"Retrieving via the terminal"  "locating and returning, by means of the terminal, ID information and a card number stored on the debit card"

"Computer" and "Computer means"  "a data processing device"

"Transmitting to a computer"  "sending by means of a signal path to a computer"

"Validation" and "Valid"  "indication of whether the ID information stored on the debit card matches the corresponding ID information stored on the terminal"

"Computer means disposed remotely"  "a computer that is located apart from a terminal and connected to the terminal by a signal path"

"Card reader means"  "a device, included as part of a terminal, used for retrieving ID information from a debit card"

"Communication means function"  "transmitting the ID information stored on the debit card and the ID information stored on the terminal to the computer means"

"Communication means structure"  "a modem or a signal path"

"Selected from a group of ID information" (Claim 2)  "chosen from one of the following ID information"

--- Footnotes ---

n2 "ID," as used throughout this opinion, in whatever context, is shorthand for "identification."
ePlus argues that this terra needs no construction but that, if it is construed, it means: items in search results that satisfy search criteria. Lawson proposes that the term mean: the results of a search of items matching a user-entered search criteria (i.e. Hit List).

a. Words of the Claims

Claim 3 of the '683 Patent claims an electronic sourcing system comprising:

- at least two product catalogs containing data relating to items associated with the respective sources;
- means for selecting the product catalogs to search;
- means for searching for matching items among the selected product catalogs…

- a database containing data relating to items associated with at least two sources;
- means for searching for matching items in the database;
- means for building a requisition using data relating to matching items and their associated source(s);
- means for processing the requisition to generate one or more purchase orders for the selected matching items; and
- means for converting data relating to a selected matching item and an associated source to data relating to an item and a different source.

'683 Patent at 25: 31-42. Claims 26, 28 and 29 of the '683 Patent claim a method comprising the steps of:

- maintaining at least two product catalogs on a database containing data relating to items associated with the respective sources;
- selecting the product catalogs to search;
- searching for matching items among the selected product catalogs…

Claim 1 of the '172 Patent claims an electronic sourcing system comprising:

- a database containing data relating to items associated with at least two vendors maintained so that selected portions of the database may be searched separately;
- means for entering product information that at least partially describes at least one desired item;
- means for searching for matching items that match the entered product information in the selected portions of the database;
- means for generating an order list that includes at least one matching item selected by said means for searching;
- means for building a requisition that uses data obtained from said database relating to selected matching items on said...
order list;

means for processing said requisition to generate purchase orders for said selected matching items.

'172 Patent at 23:56-24:42 (emphasis added). The claims themselves demonstrate that matching items are the results of a database search.

b. Specification

The specification provides:

When a search is performed in Shell 52 and search program 50, a Hit List 47 is produced. . . The user would see on Monitor 22 of local computer 20 a Hit List 47 screen representing limited data about all matching catalog items that were located in catalog database 36 as a result of the search.

'683 Patent at 9:37-42 (emphasis added). Thus, the specification also demonstrates that the matching items are located as a result of a search.

c. Prosecution History

During prosecution of the '683 Patent, the inventors, in amending the claims, noted that, "[a]pplicants have amended the claims using the following terminology: 'matching items' are the search results. . ." (Pl. Ex. 22 at 11 (emphasis added).) This statement is unequivocal and shows precisely how the inventors interpreted the claim term.

d. Proper Construction

The term "matching items" means: the search results. This construction is consistent with the words of the claim, the specification and the prosecution history. It is also consistent with the construction in ePlus, Inc. v. Ariba, Inc., Civil Action No. 1:04cv612 (E.D. Va.). (Pl. Ex. 10 at 27.)

Matching Relationship

Konami proposes that "matching relationship" should be construed as "having a correspondence when one overlaps another," whereas Defendants argue that the construction should be "a corresponding relationship." The main dispute between the parties involves Konami's inclusion of "overlap" in its construction, which Defendants characterize as an impermissible attempt to import a limitation from the specification. Although the Court agrees with Defendants that Konami's construction is inappropriate, in the end, the Court also declines to adopt Defendants' proposed construction, finding instead that no construction is needed. First, the Court will address Konami's proposed construction. n7

n7 The Court declines to consider "a corresponding relationship" because it is both unhelpful and impermissible. It is unhelpful in the sense that it merely restates "relationship," and impermissible in the sense that it seeks to substitute "corresponding" for "matching," which would unjustifiably broaden the meaning of "matching."

Whereas the essence of "recognizable relationship" was in describing the relationship between "first display parts" and "second display parts" as well as between "first display parts" and "corresponding actuable display parts," the essence of "matching relationship" rests in describing how a player is prompted to "actuate said actuable parts" such that the player is directed to "dance." Claim 11 offers a fair representation of this term's use throughout the patent, and provides in relevant part: n8
said guidance unit including a control section for controlling said relative movement to display a matching relationship between said first and second display parts in timed relationship with said rhythmic piece to thereby direct the player to actuate said actuateable parts with the player's feet in timed relationship with the displayed matching relationship between the first and second display parts and thereby in timed relationship with said rhythmic piece such that the player is thereby directed to dance in rhythm with said rhythmic piece (emphasis added).

The "matching relationship between said first and second display parts" prompts the player to "actuate" the "actuatable parts." Further, the "matching relationship" and the "rhythmic piece" are in a "timed relationship." Thus, a player properly actuating the actuatable parts will "dance," in time with the "rhythmic piece," which seems to be at the heart of the game, and certainly of claim 11. A plain reading of the claims would lead to that understanding of "matching relationship," which is properly focused on the interplay between the "first and second display parts," the "rhythmic piece," and the player actuating the "actuatable parts," that provide cues in such a way that the player is "directed to dance."

--- Footnotes ---

n8 This language was taken from claim 11, but "matching relationship" takes on the same meaning and is used in similar contexts in claims 22, 28, 36, 42, and 45. Therefore, the Court may fairly use claim 11 as an exemplar.

--- End Footnotes ---

Konami seeks to further limit this term, arguing that the specification teaches that this "matching relationship" specifically occurs when "the scrolled mark M completely overlaps (matches) the still mark S [which] guides a stepping operation timing (emphasis added)." 8:55-57. However, this excerpt comes from the preferred embodiment and the Court is reluctant to import such a limitation, especially where the claims adequately describe "matching relationship" in the broader sense set forth above. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001) ("Unless compelled to do otherwise, a court will give a claim term the full range of its ordinary meaning as understood by an artisan of ordinary skill.). Further, even if it were appropriate to look beyond the claims to the specification, the Court would still elect not to adopt Konami's construction because "overlaps" is not well supported by the specification.

Konami offers the specification excerpt including "completely overlaps (matches)" to support its construction which includes the significantly more ambiguous "overlaps." n9 The next sentence emphasizes that "completely overlaps," not merely "overlaps," was contemplated, as it reads "[a]t the timing at which the mark M completely overlaps the still mark S, the display luminance or the display color of the still mark S is temporarily changed, showing the matching of timing (emphasis added)." 8:57-60. To the extent that the specification supports the notion that a "matching relationship" necessarily implies "overlap," it would seem to support a "complete overlap" rather than the more general "overlaps" that appears in Konami's proposed construction. Therefore, the Court cannot find that the specification supports Konami's proposed construction.

--- Footnotes ---

n9 Inserting "overlaps" into the construction could also create confusion as the question will certainly arise, "what does 'overlap' mean?" The Court is not inclined to adopt a construction that runs the risk of creating such confusion by, in essence, using a term that begs its own construction.

--- End Footnotes ---

As stated before, however, the Court finds that no construction is necessary because a proper understanding of "matching relationship" may be reached from a plain reading of the term in context of the surrounding claim language.

2605

6. Claim 1: Step (e)
matching the at least one 3D first image and the second image where the at least one 3D first image is located with respect to the first coordinate system of the patient;

ZMED's Proposed Construction:

Matching the image of the organ taken in the pre-operation site (by the CT scan or MRI device) with the appropriate ultrasound image taken in the operation site by localizing the first and second coordinate systems to allow a comparison of the position of the organ in the two images.

ZMED Opening Brief at 9 (citation omitted).

NOMOS's Proposed Construction:

Step (e) of claim 1 can only properly be construed as providing the step of merging or combining the 3D first image and the 3D second image, or, more particularly, as providing the step of aligning the coordinate system of the 3D first image generated by the MRI device with the coordinate system of the 3D second image generated by the echography probe.

NOMOS Opening Brief at 21 (citation omitted).

Construction:

Step (e) means "aligning the at least one three-dimensional first rendering, which is located with respect to the first coordinate system, with the three-dimensional second rendering."

Commentary:

Step (d) determined that the second image should be construed to be a three-dimensional rendering. The remaining dispute in step (e) centers around the term "matching."

If the meaning of "matching" were not clear, then it would be appropriate to turn to the specification to find meaning for the term. In the specification, the word "matching" is defined by inference twice, once to mean "combining" and once to mean "merging." '154 Patent, col. 3., ll. 17-18; col. 9, l. 23. It is also referred to as "localizing." '154 Patent, col. 5., l. 62.

However, the common-sense understanding of "matching" in this context is "aligning," and therefore I adopt that definition based on the plain language of the claim. As a note, it is the three-dimensional renderings that are aligned, not necessarily their coordinate systems.

2606

II. Material Object

As with the term point of sale location, the district court made several findings with regard to the construction of the term "material object." We address these findings below, agreeing with some and disagreeing with others.

1.

The district court held that a material object is "a tangible medium or device in which information can be embodied, fixed, or stored, other than temporarily, and from which the information embodied therein can be perceived, reproduced, used or otherwise communicated, either directly or with the aid of another machine or device." Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. Although IGE admits in its brief to this court that a material object is a tangible medium, counsel for IGE argued to this court at the oral hearing that a material object is defined as the information itself and need not
be a tangible medium. The appellees respond that the district court's construction is supported by the specification.

Although the appellees do not argue that IGE has waived this argument, we note that it is being presented for the first time on appeal. However, given that the proper resolution is beyond any doubt, we exercise our discretion and consider it for the purpose of elucidating our further comments on the proper construction of the term "material object." L.E.A. Dynatech v. Allina, 49 F.3d 1527, 1531, 33 U.S.P.Q.2D (BNA) 1839, 1843 (allowing an appellate court to consider an issue not presented below if "the proper resolution is beyond any doubt").

A material object cannot be the information itself, as IGE now argues. Examining first the claim language, claim 1, for example, requires that the information be reproduced in a material object. See Freeny patent, col. 28, ll. 22-23 (preamble to claim 1) and 44-45 (step four of claim 1). If the information itself is the material object, as IGE argues, then claim 1 would require the information to be reproduced in itself. Such a construction is illogical and does not accord with the plain import of the claim language. See White v. Dunbar, 119 U.S. 47, 52, 30 L. Ed. 303, 7 S. Ct. 72 (1886) ("It is unjust to the public, as well as an evasion of the law, to construe [a claim] in a manner different from the plain import of its terms. This has been so often expressed in the opinions of this court that it is unnecessary to pursue the subject further."); Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1579, 40 U.S.P.Q.2D (BNA) 1019, 1024 (Fed. Cir. 1996) (rejecting a proffered construction because "the plain meaning of the claim [would] not bear [such] a reading"); cf. Conopco, Inc. v. May Dep't Stores Co., 46 F.3d 1556, 1562, 32 U.S.P.Q.2D (BNA) 1225, 1228 (Fed. Cir. 1994) (noting that "a finding that the accused process literally infringed did not . . . eviscerate the plain meaning of the [relevant] term").

Despite the plain language of the claims, we turn to the specification to discern whether IGE attributed a different meaning to the term material object. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577 ("It is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning."). Examining the specification, it is clear that even the broadest definition of material object in the specification requires that a material object be a "medium or device in which information can be embodied or fixed." Freeny patent, col. 4, ll. 36-38. Thus, IGE's argument that the reproduced information itself constitutes the material object is not only illogical, but unsupported in the specification as well.

2.

The district court further held that a material object must be: (a) separate and distinct from the IMM, (b) removed from the IMM after purchase, and (c) intended for use away from the point of sale location. See Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. IGE argues that neither the claims nor the specification requires that a material object be separate and distinct from the IMM or intended for use at a location other than the point of sale location, and that these limitations were improperly read into the claims from the specification. The appellees respond that the district court's construction is supported by the specification. We agree with the district court on these three limitations, with one variation regarding point (c) above. On that point, we find that the material object could be intended for use at the point of sale location as long as it is on a device separate from the IMM.

Beginning with the claim language, we note that the preamble of claim 1, for example, describes a method in which IMMs are located at point of sale locations and in which information is reproduced in material objects utilizing the IMMs. See Freeny patent, col. 28, ll. 22-24. This language could be read to suggest that the material objects, which receive the reproduced information, are not part of the IMM and are intended to be purchased and removed from both the IMM and the point of sale location, but that reading is not clear from the claim itself. The claim later describes reproducing the information in a material object, but again there is no clear indication that the material object is or is not a separate and distinct item that is to be removed from the IMM after purchase and used on another device. See id. at col. 28, ll. 42-45. Thus, we look to the specification for further guidance.

The Freeny patent envisions and discloses only material objects that are separate from the IMM and that can be purchased by the consumer and taken away from the IMM. See, e.g., Freeny patent, col. 13, ll. 25-48 (retail store embodiment), cols. 26-27 (vending machine embodiment). The emphasis of the specification on distribution and sale consistently reveals that the material objects are intended to be separate from the IMM, removed from the IMM, and used apart from the IMM. See, e.g., Freeny patent, col. 4, ll. 13-18 ("The system of the present invention solves the problems associated with manufacturing, inventory, configuration distribution and collection . . . and permits sale of material objects embodying information in a more efficient, economical and profitable manner."). These three conditions, namely, that a material object
be separate and distinct from the IMM, removed from the IMM after purchase, and used apart from the IMM, are
fundamental to the meaning of a material object as clearly and consistently specified in the patent description. See, e.g.,
Freeny patent, col. 4, ll. 36-59; col. 5, ll. 47-50; col. 13, ll. 36-44; col. 26, ll. 28-34.

IGE contends that "material object" should be construed so broadly as to include a hard disk that is internal to a personal
computer. Although the specification describes numerous material objects, a hard disk, internal or otherwise, is never
mentioned as a possibility. In fact, where a hard disk is discussed, it is in relation to the implementation of particular aspects
of the IMM or the ICM and not as an example of a material object. See id. at col. 22, ll. 6-34. Any construction of the
expression "material object" which encompasses a hard disk is not only not envisioned anywhere in the specification but is
also inconsistent with the definition of a point of sale location asserted by IGE before the district court. Specifically, a
consumer would not go to a point of sale location to purchase an internal hard disk embodying predetermined or preselected
information. See id. at col. 5, ll. 47-50.

3.

The district court also held that a material object "must be offered for sale independently from the information that may be
reproduced onto the material object." Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. The district court applied this
same limitation to a point of sale location. For the reasons discussed earlier with respect to a point of sale location, we again
disagree with the district court's reading of this condition into the claims.

4.

Accordingly, we construe a material object to be a tangible medium or device in which information can be embodied, fixed,
or stored, other than temporarily, and from which the information embodied therein can be perceived, reproduced, used or
otherwise communicated, either directly or with the aid of another machine or device. A material object must be offered for
sale, and be purchasable, at point of sale locations where at least one IMM is located. Further, a material object must be
separate and distinct from the IMM, removed from the IMM after purchase, and intended for use on a device separate from
the IMM either at the point of sale location or elsewhere. "Material object" does not encompass the hard disk component of
a home personal computer. Finally, a material object need not be offered for sale independently from the information that
may be reproduced onto the material object, that is, as a blank.

3. Maximizing throughput of said memory requests to the synchronous DRAM so that use of the data slots by the
synchronous DRAM is maximized

The court adopts the plaintiff's construction of "maximizing throughput of said memory requests . . . " and construes this
phrase to mean "scheduling memory requests to the synchronous DRAM to maximize throughput so that the use of data
slots is maximized."

A. "A maximum dose of the selected transition metal that can be fully dissolved into the substrate at a temperature in a
range between a eutectic temperature of the substrate and an annealing temperature of the substrate" (claims 1 and 2)

The parties place at issue several facets of the interpretation of this extended claim phrase. First, Ixys contends that the
"dose" in question here must be determined empirically, or that it must in some manner be "measured." As a matter of pure
ontology, Ixys is almost surely correct: the maximum possible dosage of a transition metal that may be dissolved is not the
type of engineering question that can be determined theoretically with any meaningful precision, and so at some level
experimentation is essential. However, neither party disputes that such experimentation has already been undertaken by
others, and Ixys provides no support for its contention that such experiments need be repeated in the course of performing
the claim steps at issue here. A person skilled in the art could simply consult one of the many treatises employed by the
parties. Ixys' proposed "measurement" limitation is rejected.

Second, Ixys argues that this court should assign a numerical value to the maximum upper dose in the instance where platinum is the transition metal employed. APT responds that there is nothing in the claim language that ordains platinum as the only usable metal, and this point Ixys does not appear to dispute. APT argues further that it is inappropriate to attach numerical limitations gleaned from the specifications to non-numerical claims, citing E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430 (Fed. Cir. 1988), for this proposition. However, that case simply cautions against importing "a limitation read into a claim from the specification wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim." Id. at 1433. This is a well-known axiom of patent law, one which holds no proscriptive force when, as in the present case, the ambiguity of the claim language ("a maximum dose") has itself begged the numerical question. Both parties agree that since Ixys' allegedly infringing device uses only platinum that is the metal at issue here, and thus if the patent does disclose a numerical limitation on the maximum dose of platinum it would be both appropriate and expedient for this court to construe that limitation here.

The specifications for this patent state that "the substrate is doped with a transition metal in a predetermined dose less than a predetermined maximum, which is about 2 x 10<16> atom/cm<2> for platinum." '202 patent, 9:5-8; see also '202 patent, 22:61-62 ("For Pt, this dose is less than 2 x 10<16> atom/cm<2>.") Seeking to raise this maximum threshold, APT points to the specification language that indicates that "the amount of Pt that can be dissolved into silicon is substantial (2 x 10<21> atom/cm<3>) which is the cause for the higher leakage current using conventional evaporation and diffusion." '202 patent, 23:2-6.

The differences between "dose" and "concentration" is one upon which the parties spend a great deal of time, and that difference seems particularly relevant and worthy of elaboration here. The "concentration" of transition metal in the silicon wafer is the number of atoms per unit volume that have been dissolved into the substrate, and is therefore expressed in units of atoms/length<3>. The 2 x 10<21> atom/cm<3> figure quoted by APT is thus an expression of concentration. The "dose" of transition metal applied in order to dope the substrate is the number of atoms per unit area that have been deposited on the surface of the substrate (in order that they later be dissolved into the substrate), and hence is expressed in units of atoms/length <2>. As it has self-identified, the 2 x 10<16> atom/cm<2> figure is a "dose."

"Doses" and "concentrations" have both a practical and a mathematical relationship. As a straightforward general rule, higher applied doses will cause higher concentrations of the transition metals to occur within the substrate. Further, the number of particles that are eventually dissolved within the substrate must equal the number of particles initially deposited upon the surface of the substrate (assuming that few transition metal atoms are created or destroyed in the process of dissolution). In other words,

\[(\text{average concentration throughout substrate} \times \text{volume of substrate}) = (\text{dose applied to substrate} \times \text{surface area of substrate}).\]

Since the volume of the substrate is essentially equal to its surface area multiplied by its "thickness" or depth (assuming no cross-sectional variation in the substrate geometry), Ixys has simplified the above equation into the form

\[(\text{average concentration throughout substrate} \times \text{thickness of substrate}) = (\text{dose applied to substrate}).\]

While this formula is essentially correct, it is not sufficiently precise to be entirely useful here. The entire purpose of this invention is to create a substrate with a heterogeneous transition metal concentration that varies with depth. By consequence, this relationship is more usefully expressed as

[See formula in printed version]

The significant fact here is that maximum concentrations at any given point can well exceed the "average concentrations" within a substrate. Without knowing whether a listed concentration is a "maximum concentration" or "average concentration," it is impossible to simply approximate dosage by multiplying concentration by thickness.

This analysis is made relevant through application to the quarrel between APT and Ixys over the maximum dosage described above. Ixys' argument is buttressed by quite explicit and categorical specification language (found within the
"Summary of Invention" section) that teaches that the maximum dose for Pt is 2 x 10^{-16} atoms/cm^2. APT argues in response that the dosage level must be higher than Ixys alleges because a 1 mm thick substrate with a concentration of 2 x 10^{-21} atoms/cm^3 must have had an incident dosage of 2 x 10^{-20} atoms/cm^2. However, this calculation relies on portraying 2 x 10^{-21} atoms/cm^3 as an average dosage throughout the substrate, not a maximum dosage at any given point. This portrayal does not withstand an examination of the specification, which describes the number in question as "the amount of Pt that can be dissolved into silicon," denoting a maximum possible concentration at any location. '202 patent, 23:3-4. In addition, the specification section that gives this figure references the "solid solubility of Pt in silicon" at a particular temperature range, namely the "Pt-Si eutectic temperature." '202 patent, 23:2-3. The 2 x 10^{-16} atoms/cm^2 figure, referenced explicitly in the specifications as the maximum dosage, is not controverted, and is therefore controlling.

The court construes this claim as follows: "The upper limit to the dose of selected metal that can be fully dissolved within the semiconductor material at subsequent processing temperatures. When the selected metal is platinum, this maximum dose is about 2 x 10^{-16} atoms/cm^2."

2609

B. "The maximum dose sufficient to effect lifetime control without substantially increasing leakage current of the device" (claims 1 and 2)

As a logical antecedent to interpreting the longer claim language phrase designated by the parties for construction, it is first necessary to affix a meaning to the amorphous term "substantially increasing" when used in this context. The need for contextual understanding, while always present in claim construction, is distinctly heightened in the case of language such as this which invokes an implicit comparison between a baseline level of leakage current and a quantity "substantially" above that baseline.

The specifications describe such a comparison in two places. First, they teach that "[a] dose in the range of 10^{-11} to 10^{-16} atoms/cm^2 of Pt is sufficient to effect lifetime control without an appreciable increase in leakage current. Higher doses can be used but will cause a higher leakage current." '202 patent, 23:9-13. This description may or may not be rephrasing "substantial" as "appreciable;" in either case, by itself it is unhelpful. However, it appears to state that a dose as large as 10^{-16} atoms/cm^2 will not cause substantial leakage current.

In a second location slightly farther along, the specifications state that "Conventional evaporative deposition of e.g. 100 [angstrom] of platinum will produce an equivalent surface dose of 6.5 x 10^{-16} atoms/cm^2, diffusion of which would give a leakage current of three to four orders of magnitude greater than no lifetime control. ... In contrast, implanted platinum doses in the range of 1 x 10^{-13} to 1 x 10^{-16}/cm^2 gave leakage currents in power MOSFET and IGBT-type devices that were no more than two orders of magnitude greater compared to devices with no lifetime control." '202 patent, 23:50-61. Since the specification language referenced in the previous paragraph has already described the leakage current caused by doses up to 10^{-16} atoms/cm^2 as not an "appreciable increase," the second segment of language described at the top of this paragraph indicates that leakage currents "that were no more than two orders of magnitude greater compared to devices with no lifetime control" do not constitute "substantial" increases.

This "Conventional evaporation" language described above sets forth another comparison between the quantities described in its first and second sentences. The "two orders of magnitude" (and thus not "substantial") greater leakage current caused by doses up to 10^{-16} atoms/cm^2 is described "in contrast" to doses of 10^{-16} atoms/cm^2 "which would give a leakage current of three to four orders of magnitude" above the baseline (set by a device without lifetime control). Putting these pieces of specification language together, the court thus finds that the specifications imply that a leakage current three to four orders of magnitude above the baseline constitutes a "substantial increase."

Having resolved the prior question regarding "substantially increasing," the remaining aspects of the construction of this claim fall into place in a relatively straightforward manner. While the claim language again does not limit the transition metal to any particular type, this case will focus around Ixys' use of platinum, and thus the court will be as specific regarding Pt as possible. The specifications analyzed above indicate that a Pt dose of 6.5 x 10^{-16} atoms/cm^2 will cause a "substantial increase" in leakage current, but no portion of the specifications appears to further limit that upper threshold. The specifications contain numerous references to a dose of 10^{-16} atoms/cm^2, and in particular they teach that "A dose
in the range of $10^{10}$ to $10^{16}$ atoms/cm$^2$ of Pt is sufficient to effect lifetime control without an appreciable increase in leakage current. Higher doses can be used by will cause a higher leakage current."

The specification does not indicate that for doses above $10^{16}$ atoms/cm$^2$ the leakage will be "substantially increased;" it states only that leakage current will be "higher." Absent a more explicit limitation within the specifications, Ixys cannot demonstrate that the claims are limited to the range it has described. However, as described in section (A) above, the specifications indicate (and the claims have been construed so to reflect) that the maximum dose of Pt that can be dissolved within the substrate is $2 \times 10^{16}$ atoms/cm$^2$, and so the range of doses between $2 \times 10^{16}$ atoms/cm$^2$ and $6.5 \times 10^{16}$ atoms/cm$^2$ will likely be rendered functionally irrelevant for the purposes of this adjudication.

For the reasons described in part (A) above, Ixys' proposed limitation regarding the need for "measurement" is similarly rejected. Also, neither party has presented any argument to the court regarding the construction of the phrase "effect lifetime control" that is found within this claim language, and in fact APT employs that same phrase in its proposed construction. The meaning of that three-word term is apparently sufficiently well-established among those skilled in the art that this court need not clarify it further or resolve any related lingering dispute among the parties.

The court construes the claim language at issue to mean: "The upper limit to the dose of transition metal that can be applied to the device that will be sufficient to effect lifetime control but will not cause the leakage current to increase by three orders of magnitude or more when compared with a similar device that has not had transition metal added. For Pt, this upper dose limit is between $10^{10}$ and $6.5 \times 10^{16}$ atoms/cm$^2$.

1. Principles of claim construction

Claim construction of a patent, including terms of art within claims, is exclusively within the province of the court, not the jury. Markman v. Westview Instruments, Inc., 517 U.S. 370, 388-89, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996).

It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history. See Markman, 52 F.3d at 979, 34 U.S.P.Q. 2d at 1329. Such intrinsic evidence is the most significant source of the legally operative meaning of disputed claim language.

The first step is to look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention. Id. Second, it is necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. Id.

The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication. Id. "Claims must be read in view of the specification, of which they are a part." Id. (citing Markman, 52 F.3d at 979). The specification is always highly relevant to the claim construction analysis, and usually, it is dispositive; it is the single best guide to the meaning of a disputed term. Id. The drawings or figures of the patent are considered with the specification in interpreting claim language. Wright Medical Tech., Inc. v. Osteonics Corp., 122 F.3d 1440, 1443 (Fed. Cir. 1997).

Third, the court may also consider the prosecution history of the patent, if in evidence. Vitronics Corp., 90 F.3d at 1582.

In addition, the Court should not read into a patent limitations that do not exist in the claims. As the Federal Circuit recently held, "[t]he danger of improperly importing a limitation is even greater when the purported limitation is based upon a term not appearing in the claim." Amgen, Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1325 (Fed Cir. 2003) (internal citations omitted).

Moreover, like contract interpretation, the Court should first give claim terms their ordinary and accustomed meanings.
Claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic evidence using words or expressions of manifest exclusion or restriction, representing clear, disavowal of claim scope.

Apex, Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1377 (Fed. Cir. 2003) (emphasis added) (citation omitted).

In fact, the Federal Circuit has issued a ruling instructive on this issue. In Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1343-44 (Fed. Cir. 2001) the Federal Circuit overruled the district court's holding that the claim term "portion" was to be accorded a meaning narrower than its customary meaning, by finding that the district court had improperly relied on the preferred embodiment, the drawings, and one passage in the prosecution history to "overcome the presumption.

Finally, if an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term, it is improper to rely on extrinsic evidence. Id. at 1583. Extrinsic evidence is that evidence which is external to the patent and file history, such as expert testimony, inventor testimony, dictionaries, and technical treatises and articles. Id. at 1584. Extrinsic evidence in general, and expert testimony in particular, may be used only to help the court come to the proper understanding of the claims; it may not be used to vary or contradict the claim language. Id.

This approach was affirmed in the Federal Circuit's most en banc decision, Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005). In that case, the Court reiterated that "[w]e have viewed extrinsic evidence in general as less reliable than the patent and its prosecution history in determining how to read claim terms." Id.

Following this guidance and framework, this Court finds that the '252 Patent's Claim and the specification establish that the "error correcting means" refers to a circuit or portion of the computer chip geared towards error correction. Reading the Claim 1 and the patent language as a whole it is clear that the terms using the "means" language are used in their ordinary and customary meaning throughout the patent to mean "circuit" or "portion" of the chip. As such Claim 1 provides sufficient structure and section 112, paragraph 6 does not apply to the analysis.

This Court rejects Mediatek's argument that Claim 1 requires a specific sequential order. Nothing in the claim language, the specification, or the patent prosecution gives rise to the limitation that the "error correction means" must happen in a specific sequential order. Rather, the circuit or portion must simply be able to "read, detect, correct, and write." While Claim 1's language demonstrates the processes that will take place, it does not require a specific order. Most importantly, it does not specify when detection of errors must take place or when correction must take place - arguably either could come first. Claim 1's specifications simply provide an example of how this could work. Defendant Mediatek's argument impermissibly would limit Claim 1's "error correcting means" to a sequential order requirement not included in the patent's claim. This is just the type of limitation the Federal Circuit has warned against.

The district court held that the "battery means" and "lamp means" limitations of claim 1 are "means" limitations that are subject to 35 U.S.C. § 112, para. 6 (1994). That was error. Paragraph six states:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Here, the limitations in issue recite structure - battery and lamp - and not functions. A battery and a lamp are not functions, and the addition of the word "means" does not convert the structure to a means or a step for performing a specific function. Consequently, the limitations fail the test of § 112, para. 6, and must be construed as ordinary limitations. The district court thus erred in thinking the limitations to be governed by § 112, para. 6.
That error, however, is harmless. The "battery means" and "lamp means" limitations, when construed in light of the specification, refer to a light bulb powered by a battery (’229 patent, col. 1, lines 20-24, 61-62). As the district court properly found, the accused products use a chemiluminescent light instead. A chemiluminescent light does not require a battery to operate. The chemiluminescent light in the accused products results from a chemical reaction between chemical materials (chemiluminescent glow sticks and glow buttons) that generates light for a limited time. No electrical current is generated. On the other hand, the patent claims a lamp that is powered by an electrical current generated by the battery. Thus, the battery means and lamp means limitations are not met, and the accused products do not infringe the patent literally.

Neither is there infringement under the doctrine of equivalents. To prove infringement under the doctrine of equivalents, the patentee must show that the accused devices perform (1) substantially the same function, (2) in substantially the same way, and (3) to achieve substantially the same result, as the claimed invention. London v. Carson Pirie Scott & Co., 946 F.2d 1534, 1538, 20 U.S.P.Q.2d (BNA) 1456, 1458 (Fed. Cir. 1991).

Here, the claimed invention and the accused products generate the light in very different ways with different results. Generating light through chemiluminescence generally makes the saucer lighter because the battery is not needed. Also, no mechanical connections between the lamp and the battery are necessary, making it a sturdier construction. However, once the chemical reaction starts, chemiluminescence cannot be stopped. In a battery-operated lamp, on the other hand, a simple switch may be employed to turn off the lamp light (see ’229 patent, col. 2, lines 6-11). Accordingly, the district court did not err in holding noninfringement under the doctrine of equivalents with respect to the battery means and lamp means limitations.

### 2612

**A. Claim Construction**

On February 16, 2006, the Court held a claims-construction hearing in this matter. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The Court considered the ’136 Patent and prosecution history, the parties’ Markman briefs, the applicable law regarding, inter alia, claim construction, indefiniteness, and means-plus-function claims, and the argument of counsel. On May 25, 2006, this Court rendered a claims-construction order (Doc. # 292), which construed the terms as following:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Construed Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Debit Card&quot;</td>
<td>&quot;a prepaid card for exchange of value&quot;</td>
</tr>
<tr>
<td>n2&quot;ID information [stored on the debit card]&quot;</td>
<td>&quot;encrypted data, excluding the card number, stored on the debit card in the form of merchant ID, store ID, or terminal ID&quot;</td>
</tr>
<tr>
<td>&quot;Terminal&quot;</td>
<td>&quot;a point-of-sale apparatus, which includes a central processing unit, a card reader, a keypad, and a communications interface&quot;</td>
</tr>
<tr>

4. "master network timing means"

Claim 1 requires a master unit with a master network timing "means." In relevant part, claim 1 states "said master unit including a master network timing means with a period which is divided into a plurality of subframes, wherein each subframe is divided into said time slots, and each of said time slots is used as an interval in which one of said application programs . . . ." '819 patent, claim 1. The parties debate whether this limitation is a means-plus-function limitation.

Use of the word "means" invokes a presumption that the claim is governed by 35 U.S.C. § 112 P 6. The plaintiff, however, correctly observes that the limitation does not recite any function performed by the means and, as such, is outside the scope of § 112 P 6. Sage Products, Inc. v. Devon Industries, Inc., 126 F.3d 1420, 1427 (Fed. Cir. 1997).

Although the phrase is not a means-plus-function limitation, the plaintiff suggests that the court should construe the "timing means" limitation. The plaintiff proposes a construction of "a clock for determining network timing or for delineating time into time slots." Although the defendants do not propose an alternative construction, they disagree that a clock determines what the period shall be and how the period should divide into subframes and time slots. The defendants instead argue that the period, subframes, and time slots are determined by the network timing and control processor. See '819 patent, 3:1-3. The plaintiff, on the other hand, argues that the description of "master network clock" in the specification matches the language of the claim. See ’819 patent, 6:37-39, 7:38-39.

Because the term is not governed by § 112 P 6, it is improper to limit the term to the structures described in the specification. The language of this claim limitation needs no further construction, and the court rejects the plaintiff's attempt to limit the term to the master network clock recited in the patent.

2615

Means (at a merchant) for accepting a customer identifier as payment from the customer and means for electronically
forwarding information related to the payment to a computerized merchant processor

The parties have addressed this single "means-plus-function" claim limitation as two separate limitations, one being "means for accepting" and the other being "means for forwarding." However, the claim, as written, clearly sets forth dual functions and requires the corresponding structure to perform both. See Cardiac Pacemakers Inc. v. St. Jude Med. Inc., 296 F.3d 1106 (Fed. Cir. 2002).

Also, both parties advance a construction that includes a telephone and a World Wide Web page as alternative corresponding structures. Initially, it is to be noted that the claim clearly specifies that the structure is "at a merchant." The '281 patent specification only identifies that a modality for a customer to provide a customer identifier as payment to a merchant can be use of a telephone or use of the World Wide Web. These modalities are alternatives to a customer being "at a merchant location," such as a retail establishment. See Col. 2, lines 7-11 and Col. 3, lines 20-27. Therefore, a telephone and a World Wide Web page are not linked as structure "at a merchant" that performs the customer identifier accepting function specified in the claim, nor is such structure linked to performing the "forwarding" function.

The Plaintiff identifies corresponding structure as being consumer data input device 316 and input/output device 322 as the "accepting means" and "forwarding means," respectively. Defendants contend that the "accepting means" is a keyboard or magnetic card reader but no structure is disclosed for the "forwarding means." According to Defendants, the absence of structure is because a computer, properly configured software, and a communications device are required to perform the forwarding function but the '281 patent specification fails to provide an algorithm according to which software performs the forwarding function. SeeDefs.' Br. at 23-28.

In support of their position, Defendants rely upon WMS Gaming, Inc. v. Int'l Game Tech., 184 F.3d 1339 (Fed. Cir. 1999) and Harris Corp. v. Ericsson Inc., 417 F.3d 1241, 1253 (Fed. Cir. 2005). According to Defendants, the corresponding structure cannot be a general purpose computer alone but must also include the algorithm being executed in realization of the specified function. Plaintiff sidesteps WMS Gaming and Harris by contending that the function is not computer-implemented. Rather, according to Plaintiff's view, the "forwarding" function simply requires a transmission of the payment-related information, which function is adequately accomplished by just the modem. Although the parties purport to have "agreed" as to the function, they have staked out positions as to the corresponding structure based on differing views of the "forwarding" function. Plaintiff contends it is simply a transfer of data between the merchant location and the merchant processor, whereas Defendants consider it to involve a complex, algorithmic processing operation.

The parties, however, do agree that any corresponding structure must be clearly linked to the claimed function by the '281 patent specification. See Pl.'s Br. at 9; Defs.' Br. at 30. The parties also agree that the diagram of Fig. 3B illustrates the structure that is disclosed as being "at a merchant." The structure of Fig. 3B is further identified as being in accordance with Verifone merchant-location equipment. See Col. 6, lines 57-59. Moreover, the '281 patent specification reiterates the linking of Verifone equipment to the accepting and forwarding functions in the Summary of the Invention. See Col. 2, lines 31-43.

Neither of the parties disputed at oral argument that Verifone merchant-location equipment includes a keypad, magnetic card reader, processor, memory and modem. All of these components are shown in Fig. 3B. Also, such equipment would be understood by one skilled in the art to include the necessary software algorithms for execution by a processor in conducting the necessary point-of-sale operations attendant accepting a customer identifier and forwarding payment information.

The "forwarding" function is with respect to "information related to the payment" from the customer. The '281 patent specification describes the equipment of Fig. 3B as including a cash register device 318, which permits a sales clerk to enter the amount of the customer purchase and "possibly other related information." See Col. 6, lines 34-39. The description continues with an explanation that the transaction data entered through the keypad/card reader and the cash register may be stored in memory along with merchant data including information identifying, for example, the time or location of the sale. See Col. 6, lines 43-49. Throughout the description of Fig. 3B in relation to the "information related to the payment," the '281 patent specification does not mention the I/O modem 322 and instead focuses on the processor and memory elements of Fig. 3B. Thus, the '281 patent specification does not link the modem 322 standing alone to "information related to the payment."

Because the processor 312 is part of the corresponding structure linked to forwarding information related to the payment, in accordance with WMS Gaming and Harris, any disclosed algorithm is necessarily part of the corresponding structure. Defendants contend that there is no algorithm disclosed. However, the '281 patent specification identifies Verifone
merchant-location equipment, which was generally available and is identified in the '281 patent as including all the structure, including software to be executed by the processor, for implementing the accepting and forwarding functions. This is a description of sufficient disclosure to one skilled in the art. See Atmel Corp. v. Information Storage Devices, Inc., 198 F.3d 1374 (Fed. Cir. 1999).

The Court concludes therefore that the corresponding structure "at a merchant" linked by the '281 patent specification to the accepting and forwarding functions is a combination of processor 312, memory 320, modem 322, and a keypad or magnetic card reader 316, together with software executing an algorithm as implemented by Verifone merchant-location equipment available as of the July 9, 1997, filing date of the parent application, serial no. 08/890,398. Consequently, the limitation of "at a merchant, means for accepting a customer identifier as payment from the customer and for electronically forwarding information related to the payment to a computerized merchant processor" covers a combination of processor 312, memory 320, modem 322, and a keypad or magnetic card reader 316 together with software executing an algorithm as implemented by Verifone merchant-location equipment available as of the July 9, 1997 filing date of the parent application, serial no. 08/890,398, and equivalents thereof.

K. The Means Limitations

In asserting that the means limitations of the '156 Patent are indefinite for failing to disclose a structure as required by § 112, P 6, Rebelt relies on WMS Gaming, Inc. v. International Game Technology, 184 F.3d 1339 (Fed. Cir. 1999) and the related line of Federal Circuit precedent. See Net MoneyIn v. VeriSign, Inc., 545 F.3d 1359 (Fed. Cir. 2008); Finisar Corp. v. DirecTV Group, Inc., 523 F.3d 1323 (Fed. Cir. 2008); Aristocrat Techs. Austl. Pty Ltd. v. Int'l Game Tech., 521 F.3d 1328 (Fed. Cir. 2008); Harris Corp. v. Ericsson, Inc., 417 F.3d 1241 (Fed. Cir. 2005).

In WMS Gaming, the patent at issue covered an electronic slot machine designed to manipulate the odds of winning by using a mathematical formula, rather than the natural stop positions of the slot machine reels, to control the outcome of the game. The means limitation for assigning numbers to the stop positions on the reel disclosed, as the corresponding structure, a microprocessor or computer to control the slot machine along with an algorithm for assigning numbers to the various stop positions. WMS Gaming, 184 F.3d at 1347-48. The Federal Circuit held that the corresponding structure was the algorithm to be run on the general purpose microprocessor since the computer, once programmed with the algorithm, "in effect becomes a special purpose computer once it is programmed to perform particular functions pursuant to instructions from program software." Id. at 1348 (quoting In re Alappat, 33 F.3d 1526, 1545 (Fed. Cir. 1994) (en banc)).

Rebelt's indefiniteness argument with respect to the means limitations of the '156 Patent is premised on its assertion that the WMS Gaming line of cases applies to these limitations. WMS Gaming, however, dealt with the situation in which the disclosed structure for a means plus function claim was a general purposes computer or microprocessor programmed to carry out a mathematical algorithm. See id. at 1349. Subsequent cases applying WMS Gaming to require disclosure of an "algorithm" share the common characteristic of dealing with systems in which algorithms were used to perform various functions on a general purpose computer or microprocessor. See Net MoneyIn, 545 F.3d at 1365 (system for processing credit card transactions over the Internet and to address security issues utilizing computer "means for generating an authorization indicia in response to queries"); Finisar, 523 F.3d at 1340 (information broadcasting system with computer-based "database editing means . . . for generating a hierarchically arranged set of indices . . . and for embedding said indices."); Aristocrat Techs., 521 F.3d at 1331-33 (electronic slot machine with "game controls means" "defining a set of predetermined arrangements for a current came" where the structure was simply "any standard microprocessor base [sic] gaming machine [with] appropriate programming."); Harris Corp., 417 F.3d at 1253-54 (system implemented by a microprocessor programmed to handle distortion of wireless signals using a "time domain processing means for simulating the time domain effect of said dispersive medium on signals . . . and for producing estimates of said information signals").

Those cases establish that disclosing a computer or a computer with "appropriate programming" as the structure designated to perform a function does not satisfy the requirements of § 112, P 6. The specifications of the patents at issue in those cases identified only general purpose computers or microprocessors as the relevant structure without providing specifics as to the type of software running on the devices. Because general purpose computers and microprocessors can be programmed to perform any number of functions, a person skilled in the art reading the claims in view of the specification would not
understand the metes and bounds of the claims. WMS Gaming and the cases citing to it sought to prevent this type of indefinite claiming that relied on the disclosure of an undefined computer algorithm.

Here, however, the specification of the '156 Patent does not point to some undefined software implemented on a general purpose computer as the corresponding structure for its functional claim limitations. Rather, the specification describes various types of modules and their equivalents as the corresponding structure for the means limitations. Numerous courts have previously found that in the telecommunications field, a "module" is not a general purpose computer. Rather, it is a special purpose hardware device or software component, readily identifiable to a person of skill in the art, and which can serve as the corresponding structure for a means plus function limitation. See Foundry Networks, 2005 U.S. Dist. LEXIS 46840, at *21, 22, 24, 25 ("voice communication module"); Alcatel USA, 2008 U.S. Dist. LEXIS 64351, at *52, 56, 60 ("locator module" and "device module"); Roche Diagnostics, 455 F. Supp. 2d at 857 ("removable and/or read-only-memory . . . module"); Visto Corp., 2008 U.S. Dist. LEXIS 3244, at *32-34, 37 ("general synchronization module," "synchronization start module," and "communications module"); Autobytel, 2006 U.S. Dist. LEXIS 3381, at *24-26 ("process purchase request module," "database access module," "buyer-dealer association module," and "network access module").

Moreover, not every patent that utilizes computer processing power must disclose all the algorithms utilized. Courts have held that a specific algorithm need not be disclosed to avoid indefiniteness where the function in question would be readily apparent to a person of skill in the art. See Aristocrat Techs. Austl. Pty Ltd., v. Multimedia Games, Inc., No. 2007-1375, 266 Fed. Appx. 942, 2008 U.S. App. LEXIS 3774, at *16 (Fed. Cir. Feb. 22, 2008) ("WMS Gaming, however does not require that a particular algorithm be identified if the selection of the algorithm or group of algorithms needed to perform the function in question would be readily apparent to a person of skill in the art."); Med. Instrumentation, 344 F.3d at 1214 ("[T]here would be no need for a disclosure of the specific program code if software were linked to the converting function and one skilled in the art would know the kind of program to use."); S3 Inc. v. nVIDIA Corp., 259 F.3d 1364, 1371 (Fed. Cir. 2001) ("[T]he law is clear that patent documents need not include subject matter that is known in the field of the invention and is in the prior art, for patents are written for persons experienced in the field of the invention."); SPX Corp. v. Bartec USA, LLC, 557 F. Supp. 2d 810, 819-20 (E.D. Mich. 2008) (extent of algorithm requirement determined by knowledge of ordinary skilled artisan).

Here, a caller ID detection module (or originating telephone number module) performs the well-known function of identifying the calling telephone number. Likewise, a telephone number detection module performs the function of detecting the dialed telephone number, an interface module performs the function of receiving an incoming telephone call, and a call connection module performs the function of connecting telephone calls. These functions practiced by every telephone service provider and are well known in the art.

The '156 Patent's module references would convey to a person skilled in the art the structure required for performing the claimed functions and therefore the metes and bounds of the claim. As a result, the WMS Gaming line of cases is inapplicable, and the means limitations of the '156 Patent are not indefinite.

5. "means, coupled with the buffer memory and including a host system alterable threshold store for storing a threshold value, for monitoring the transferring of data of a frame to the buffer memory to make a threshold determination of an amount of data of the frame transferred to the buffer memory"

This term appears only in claim ten of the of the '872 patent. '872 patent at 31:16-22. The parties dispute whether "coupled with the buffer memory and including a host system alterable threshold store for storing a threshold value" should be interpreted according to 35 USC § 112(6). 3Com again argues that § 112(6) should not apply to this portion of the limitation. Doc # 81 (05-0098) at 53-54. Realtek again argues that § 112(6) should apply to the entire limitation.

Paragraph six of § 112 applies to functional language "without the recital of structure, material, or acts in support thereof." 35 USC § 112. While the claim is somewhat unusual in form, it does appear that the language set off by commas does define structure. The terms "coupled," "buffer memory" and "alterable threshold store" are all structural rather than functional elements. Accordingly, the court holds that "coupled with the buffer memory and including a host system
alterable threshold store for storing a threshold value” should not be interpreted according to § 112(6).

6. "Means for ascertaining whether the at least one claim contains a plurality of medical service codes.” 15 This is a means-plus-function limitation. 16 The function is ascertaining whether the at least one claim contains a plurality of medical service codes. 17 The structure is hardware and software capable of ascertaining whether the at least one claim contains a plurality of medical service codes. 18

15 The ’164 patent, claims 3, 10, 12, 14 and 15. 16 35 U.S.C. § 112, P6. 17 The structure of a computer system is adequately linked to the function of ascertaining whether a claim contains a plurality of medical service codes, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 (“The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a computer system for receiving a claim].”). See ’164 patent, col. 4, ll. 51-54 (“Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both.”); Fig. 1. The computer system is adequately disclosed as being known to a person of skill in the art. Budde, 250 F.3d at 1381. See ’164 patent, col. 4, ll. 33-40.

--- End Footnotes ---

Claim 7 of the ’114 patent states, with the disputed terms in bold:

A calling card system comprising:

. . . a plurality of data terminals connectable to the host computer, each data terminal identified by a data terminal identification code and including means for authorizing calling card security numbers in selectable call authorization amounts . . .

The parties agree, and the court finds, that this is a means-plus-function term governed by 35 U.S.C. § 112 (6). TGIP states that the function is "authorizing calling card security numbers in call authorization amounts selectable by the customer.” Defendants neither suggested any alternative function, nor stated that there is no function.

The specification, and the prosecution history, do not indicate that the words in this means-plus-function clause have a special meaning.

The data terminal allows for variable authorization and recharging of a calling card. When the cardreader cannot detect the security number stored in the memory . . . the data terminal operator may enter the security number using the keypad to enable point-of-sale activation or recharging of the card. By keeping track of the security number and the identification of the authorizing data terminal, the system can generate accounting and/or billing information so that [the] system operator can determine which data terminal operator authorized and/or recharged a particular calling card.

'114 patent, col. 2, l. 60 - col. 3, l. 4; see also ’114 patent, col. 4, ll. 44-50. Based upon the specification, the definitions set out in the Claim Construction Order, and the ordinary meaning of the terms to one skilled in the art, the court concludes that the function is: "authorizing calling card security numbers in call authorization amounts selectable by the customer."

- 2960 -
TGIP argues that the corresponding structure is "a keypad, cardreader, optical scanner, voice recognition card connected to a microphone for providing limited speaker-independent or speaker-dependent discrete or continuous voice recognition, or equivalents for entering and/or reading the security number and/or call authorization amount; and a data terminal, on-site activation terminal, Verifone Model XL 300, modem, or equivalents for transferring the security number and/or call authorization amount to the host computer, or any equivalents of the above."

Claim 7 is the only independent claim in the '114 patent which does not refer to "associating." The parties agree that the "means for authorizing" structure must be included in the data terminal. TGIP's argument is based on fact that the data terminal is described as including "a number of functional components." '114 patent, col. 3, l. 67-col. 4, l. 1. Among these are the means for reading a calling card (such as a cardreader), means for entering any monetary amount corresponding to an amount of call authorization associated with a particular calling card (such as a keypad), means for dialing the host computer to transfer the security number (such as a modem), and means for receiving and displaying a verification message from the host computer authorizing the receipt of the monetary amount (such as a display). '114 patent, col. 2, ll. 49-59; '114 patent, col. 4, ll. 17-29. These are the same structural components which TGIP states correspond to the "means for associating" clause, discussed above. Neither the specification nor the claims discuss "means for authorizing" in context with these structural components.

TGIP has argued that Claim 7 is different because it does not include the function of "associating, at the host computer, an amount of call authorization to a security number," n3 as found in Claims 1 and 6. See TGIP's Supp. Br., pp. 2-3[Doc. # 229-1, pp. 3-4 of 12]; Markman Tr. pp. 75-78. In contrast, before the PTO, the patentee argued that there was no difference between Claims 1 and 7. See Amendment to First Office Action, 5/18/1995, p. 9 (Bates No. TGIP 006429), Ex. 7 to Defendants' Responsive Brief [Doc. # 207, Attachment # 7, p. 10 of 11](emphasis added); Claim Construction Order, p. 12 [Doc. # 238].

n3 The arguments concerning, and the meaning of, this term are set out in the Claim Construction Order, pp. 7-12 [Doc. # 238].

TGIP cannot "have its cake and eat it, too." If Claim 7 is so different from Claim 1, then what is the corresponding structure? TGIP proposes only the same structure as the "means for associating" clause in Claim 1. The associating function and the authorizing function, however, are not mentioned or discussed as being similar in the patent. Absent some connection, or at least some similarity, between the two, there is no basis for one skilled in the art to conclude that the corresponding structure is the same.

There is also no basis to assume that a skilled artisan would be able to tell how the authorizing function is accomplished, or what the limitations of the claim are, from TGIP's proposed structure. As noted above, TGIP's proposed structure relates to means for reading a calling card, means for entering any monetary amount, means for dialing the host computer, and means for receiving and displaying. There is nothing in the specification or the claims which clearly links the authorizing function to these proposed structures. This is consistent with TGIP's position that the clauses in Claims 1 and 7 are very different, and that they perform different functions. Because it is not possible to clearly identify the corresponding structure, there is no way for one skilled in the art to meaningfully determine the limitations of the "means for authorization" clause.

Additionally, if Claim 7 is the same as Claim 1, then "means for authorizing" would simply be synonymous with "means for associating." This would effectively collapse the two claims and would violate the principal of claim differentiation. See Free Motion Fitness, Inc. v. Cybex Intern., Inc., 423 F.3d 1343, 1351 (Fed. Cir. 2005)("the difference in meaning and scope between claims is presumed to be significant."). Notably, TGIP does not suggest this argument in its response.

While TGIP insists that Claim 7 and Claim 1 are different because Claim 7 does not refer to "associating," TGIP proposes the exact same structure for both of these claims without reconciling, or accounting for, how the same structure would perform these different functions. There is no evidence that one skilled in the art would be able to determine that the structure suggested by TGIP corresponds to the authorizing function. The court concludes that this claim is indefinite and so
Construing the Disputed Limitations of Claim 1

As far as claim construction is concerned, our task is to identify the claimed function and the corresponding structure of each of the three disputed limitations of claim 1. We begin with the first of the three disputed limitations: "means for assigning a plurality of numbers representing said angular positions of said reel, said plurality of numbers exceeding said predetermined number of radial positions such that some rotational positions are represented by a plurality of numbers." This limitation contains the terms "angular positions," "radial positions," and "rotational positions." The district court construed each of these terms to refer to stop positions of the reel. Neither party challenges that construction.

The claimed function of the "means for assigning" limitation is "assigning a plurality of numbers representing said angular positions of said reel, said plurality of numbers exceeding said predetermined number of radial positions such that some rotational positions are represented by a plurality of numbers." In other words, the claimed function is assigning a plurality of numbers to stop positions, where the plurality of numbers exceeds the number of stop positions and some stop positions are represented by more than one number.

In regard to the disclosed corresponding structure of the "means for assigning" limitation, WMS and IGT stipulated--and the district court accepted the stipulation--that the Telnaes patent discloses a microprocessor, or computer, to control the operation of the slot machine, including the operation of the machine in the assignment of numbers to reel stop positions. The algorithm that controls the assignment of numbers to stop positions is disclosed in Figure 6 of the Telnaes patent. Figure 6 illustrates an algorithm in which a plurality of single numbers are assigned to stop positions such that: 1) the range of single numbers exceeds the number of stop positions; 2) each single number is assigned to only one stop position; 3) each stop position is assigned at least one single number; and 4) at least one stop position is assigned more than one single number. The prosecution history reinforces the teachings of Figure 6. The prosecution history indicates that each number must correspond to a stop position, but that several numbers may correspond to the same stop position. In response to an Office Action, Telnaes stated, "the applicant has disclosed a machine which utilizes a standard mechanism but on which the odds can be changed substantially infinitely. The only guidelines are that there must be a symbol for each symbol indicator in virtual memory but there can be many positions in the virtual memory for each symbol on the reel."

Although we fail to find anything in the Telnaes patent that limits the "means for assigning" limitation to a microprocessor or computer, where, as here, the parties agree to a claim construction that is adopted by the district court, and neither party disputes that construction on appeal, we decline to raise an issue sua sponte that the parties have not presented. See Seal-Flex, Inc. v. Athletic Track & Court Constr., 172 F.3d 836, 842, 50 U.S.P.Q.2D (BNA) 1225, 1228 (Fed. Cir. 1999).

The district court construed the "means for assigning" limitation of claim 1 to cover "any table, formula, or algorithm for determining correspondence between the [randomly selected] numbers and rotational positions of the reel." WMS argues that this construction was overly broad. It contends that the "means for assigning" limitation should have been defined by the corresponding structure, material, or acts described in the patent specification, or their equivalents, and should have been further limited by the prosecution history. IGT responds that the court properly construed the claim.

We agree with WMS that the district court's construction of the "means for assigning" limitation was overly broad. The written description of the Telnaes patent is almost completely devoid of any structure to support this limitation of the claim. The district court apparently took this lack of disclosure to indicate that the limitation reads on any means for performing the recited function. However, this construction is at odds with the requirements of 35 U.S.C. § 112. See Valmont Indus., 983 F.2d at 1042, 25 U.S.P.Q.2D (BNA) at 1454 (holding that section 112, P 6, permits the use of means-plus-function language in claims, but with the proviso that the claims are limited to the structure, material, or acts disclosed in the
specification and their equivalents).

The district court determined that the structure disclosed in the specification to perform the claimed function was "an algorithm executed by a computer." While this finding accurately reflected the parties' stipulation, the court erred by failing to limit the claim to the algorithm disclosed in the specification. The structure of a microprocessor programmed to carry out an algorithm is limited by the disclosed algorithm. A general purpose computer, or microprocessor, programmed to carry out an algorithm creates "a new machine, because a general purpose computer in effect becomes a special purpose computer once it is programmed to perform particular functions pursuant to instructions from program software." In re Alappat, 33 F.3d 1526, 1545, 31 U.S.P.Q.2D (BNA) 1545, 1558 (Fed. Cir. 1994) (en banc); see In re Bernhart, 57 C.C.P.A. 737, 417 F.2d 1395, 1399-1400, 163 U.S.P.Q. (BNA) 611, 615-16 (CCPA 1969) ("If a machine is programmed in a certain new and unobvious way, it is physically different from the machine without that program; its memory elements are differently arranged."). The instructions of the software program that carry out the algorithm electrically change the general purpose computer by creating electrical paths within the device. These electrical paths create a special purpose machine for carrying out the particular algorithm. n3

n3 A microprocessor contains a myriad of interconnected transistors that operate as electronic switches. See Neil Randall, Dissecting the Heart of Your Computer, PC Magazine, June 9, 1998, at 254-55. The instructions of the software program cause the switches to either open or close. See id. The opening and closing of the interconnected switches creates electrical paths in the microprocessor that cause it to perform the desired function of the instructions that carry out the algorithm. See id.

In a means-plus-function claim in which the disclosed structure is a computer, or microprocessor, programmed to carry out an algorithm, the disclosed structure is not the general purpose computer, but rather the special purpose computer programmed to perform the disclosed algorithm. See Alappat, 33 F.3d at 1545, 31 U.S.P.Q.2D (BNA) at 1558. n4 Accordingly, the structure disclosed for the "means for assigning" limitation of claim 1 of the Telnaes patent is a microprocessor programmed to perform the algorithm illustrated in Figure 6. In other words, the disclosed structure is a microprocessor programmed to assign a plurality of single numbers to stop positions such that: 1) the number of single numbers exceeds the number of stop positions; 2) each single number is assigned to only one stop position; 3) each stop position is assigned at least one single number; and 4) at least one stop position is assigned more than one single number.

n4 In State Street Bank & Trust Co. v. Signature Financial Group, Inc., 149 F.3d 1368, 47 U.S.P.Q.2D (BNA) 1596 (Fed. Cir. 1998), cert. denied, 525 U.S. 1093, 124 L. Ed. 2d 704, 119 S. Ct. 851 (1999), the patented invention related generally to a system that allowed an administrator to monitor and record financial information flow and make all calculations necessary for maintaining "a partner fund financial services configuration." 149 F.3d at 1371, 47 U.S.P.Q.2D (BNA) at 1598. We pointed out that claim 1 of the patent, which was drafted in section 112, P 6 format claimed "a machine, namely, a data processing system for managing a financial services configuration of a portfolio established as a partnership, which machine is made up of, at the very least, the specific structures disclosed in the written description and corresponding to the means-plus-function elements (a)-(g) recited in the claim." Id. at 1372, 47 U.S.P.Q.2D (BNA) at 1600. The structures corresponding to the means-plus-function elements recited in claim 1 in State Street were "a personal computer including a CPU" (element (a)), "a data disk" (element (b)), and "arithmetic logic circuits" configured to perform various functions (elements (c)-(g)). Id. at 1371-72, 47 U.S.P.Q.2D (BNA) at 1599.
means for determining. 27 The structure is hardware and software capable of authorizing medical service codes which are valid in response to the means for determining. 28

The computer system is adequately disclosed as being known to a person of skill in the art. Budde v. Harley-Davidson, Inc., 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

13. "Means for requesting further information from a user regarding the at least one claim." 41 This is a means-plus-function limitation. 42 The function is requesting further information from a user regarding the at least one claim. 43 The structure is hardware and software capable of requesting further information from a user regarding the at least one claim. 44 The '164 patent, claim 8.42 35 U.S.C. § 112, P6.43 '164 patent, col. 118, ll. 10-12.44 The structure of a computer system is adequately linked to the function of requesting further information from a user regarding the at least one claim, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 ("The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a computer system for receiving a claim]."). See '164 patent, col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both."); Fig. 1. The computer system is adequately disclosed as being known to a person of skill in the art. Budde, 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

14. "Means for determining whether one of the medical service codes in the at least one claim is included in any other medical service code in the at least one claim." 45 This is a means-plus-function limitation. 46 The function is determining whether one of the medical service codes in the at least one claim is included in any other medical service code in the at least one claim. 47 The structure is limited to the disclosed algorithm in the patent specification. 48 The '164 patent, claim 10.46 35 U.S.C. § 112, P6.47 '164 patent, col. 118, ll. 31-34.48 The specification links the claimed function to software. ('164 patent, Fig. 2, 24; Fig. 4, 24) However, according to the patentee, at the time of the patent application there was no software to carry out this function. ('164 patent, col. 3, ll. 6-14) Therefore, as a result of using means-plus-function language and software as the structure, the structure is limited to the algorithms disclosed in the patent specification and their equivalents. WMS Gaming Inc., 184 F.3d 1339.

15. "Means for authorizing medical service codes which are not contained in any other medical service code." 49 This is a means-plus-function limitation. 50 The function is authorizing medical service codes which are not contained in any other medical service code. 51 The structure is hardware and software capable of authorizing medical service codes which are not contained in any other medical service code. 52 The '164 patent, claim 10.50 35 U.S.C. § 112, P6.51 '164 patent, col. 118, ll. 35-37.52 The structure of a computer system is adequately linked to the function of authorizing medical service codes which are not contained in any other medical service code, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 ("The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a
computer system for receiving a claim]."). See '164 patent, col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both."); Fig. 1. The computer system is adequately disclosed as being known to a person of skill in the art. Budde, 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

23. "Means for determining whether one of the medical service codes in the at least one claim is mutually exclusive due to non-medical criteria with any other medical service code in the at least one claim." 81 This is a means-plus-function limitation. 82 The function is determining whether one of the medical service codes in the at least one claim is mutually exclusive due to non-medical criteria with any other medical service code in the at least one claim. 83 The structure is limited to the disclosed algorithm in the patent specification. 84

81 The '164 patent, claim 14. 82 35 U.S.C. § 112, P6. 83 '164 patent, col. 119, ll. 37-41. 84 The specification links the claimed function to software. ('164 patent, Fig. 2, 24; Fig. 4, 24) However, according to the patentee, at the time of the patent application there was no software to carry out this function. ('164 patent, col. 3, ll. 6-14) Therefore, as a result of using means-plus-function language and software as the structure, the structure is limited to the algorithms disclosed in the patent specification and their equivalents. WMS Gaming Inc., 184 F.3d 1339.

24. "Means for authorizing medical service codes which are not mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining." 85 This is a means-plus-function limitation. 86 The function is authorizing medical service codes which are not mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining. 87 The structure is hardware and software capable of authorizing medical service codes which are not mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining. 88

85 The '164 patent, claim 14. 86 35 U.S.C. § 112, P6. 87 '164 patent, col. 119, ll. 37-41. 88 The structure of a computer system is adequately linked to the function of authorizing medical service codes which are not mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 ("The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a computer system for receiving a claim]."). See '164 patent, col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both."); Fig. 1. The computer system is adequately disclosed as being known to a person of
skill in the art. Budde, 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

25. "Means for rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining." 89 This is a means-plus-function limitation. 90 The function is rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining. 91 The structure is hardware and software capable of rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining. 92

89 The '164 patent, claim 14.90 35 U.S.C. § 112, P6.91 '164 patent, col. 119, ll. 42-46.92 The structure of a computer system is adequately linked to the function of rejecting medical service codes which are mutually exclusive due to non-medical criteria with any other medical service codes contained in the at least one claim in response to the means for determining, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 ("The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a computer system for receiving a claim]."). See '164 patent, col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both."); Fig. 1. The computer system is adequately disclosed as being known to a person of skill in the art. Budde, 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

26. "Means for authorizing the at least one claim in response to the means for determining." 93 This is a means-plus-function limitation. 94 The function is authorizing the at least one claim in response to the means for determining. 95 The structure is hardware and software capable of authorizing the at least one claim in response to the means for determining. 96

93 The '164 patent, claim 15.94 35 U.S.C. § 112, P6.95 '164 patent, col. 120, ll. 20-23.96 The structure of a computer system is adequately linked to the function of authorizing the at least one claim in response to the means for determining, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 ("The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a computer system for receiving a claim]."). See '164 patent, col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both."); Fig. 1. The computer system is adequately disclosed as being known to a person of skill in the art. Budde, 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

27. "Means for rejecting the at least one claim in response to the means for determining." 97 This is a means-plus-function limitation. 98 The function is rejecting the at least one claim in response to the means for determining. 99 The structure is hardware and software capable of rejecting the at least one claim in response to the means for determining. 100

97 The '164 patent, claim 15.98 35 U.S.C. § 112, P6.99 '164 patent, col. 120, ll. 22-23.100 The structure of a computer system is adequately linked to the function of rejecting the at least one claim in response to the means for determining, which a person of skill in the art would understand is one of the functions a computer system operating on a database performs. Medical Instrumentation & Diag. Corp., 344 F.3d at 1212 ("The correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass [a computer system for receiving a claim]."). See '164 patent, col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims
or both."); Fig. 1. The computer system is adequately disclosed as being known to a person of skill in the art. Budde, 250 F.3d at 1381. See '164 patent, col. 4, ll. 33-40.

4. "means for comparing the counter to the threshold value in the alterable storage location and generating an indication signal to the host processor responsive to a comparison of the counter and the alterable storage location"

The parties dispute whether "generating an indication signal to the host processor responsive to a comparison of the counter and the alterable storage location" should be construed as a "means-plus-function" limitation under 35 USC § 112(6). 3Com contends that "generating an indication signal to the host processor responsive to a comparison of the counter and the alterable storage location" should not be governed by § 112(6). Doc # 81 (05-0098) at 53. Realtek contends that § 112(6) should apply to the entire limitation. Id.

The court finds that § 112(6) applies to "generating" for two reasons. First, "generating" is a function, not a structure. Paragraph six of § 112 applies to functional language "without the recital of structure, material, or acts in support thereof." In the absence of defined structure, "generating" must fall under § 112(6). Second, the grammatical structure of the claim suggests generating is to be considered part of single element. Patents, including the '459 patent, are structured with a series of elements separated by semicolons. The patentee could have inserted a semicolon before "generating" to indicate the start of a new element. While not dispositive, the absence of a semicolon suggests that a single limitation prefaced by "means" was intended. "A claim limitation that actually uses the word 'means' invokes a rebuttable presumption that § 112(6) applies." CCS, 288 F3d at 1369. Accordingly, the court finds that § 112(6) applies to the entire term identified above.

a. "means for decompressing"

The parties agree that claim 1 is a means-plus-function claim. Plaintiff contends that the function should be construed as “decompressing compressed song digital data,” which is the exact term used in the claim. Defendants contend that the function should be construed as “converting a compressed audio file back to its original size.” These are similar constructions, though defendants' proposed construction includes a proposed limitation (the file is converted back to its original size) that plaintiffs contend is technically incorrect. See Reply Brief, Ex. 21 at ¶ 26. Plaintiffs' expert opines that files can lose certain information during compression. Upon decompression, the lost information is not restored. Id.

The specification offers no guidance regarding the parties' competing constructions. Defendants offer no reason why this particular claim term requires any further definition beyond the language used in the claim. After all, the claim language itself is the first place to look to construe a claim. See Hockerson-Halberstadt, 222 F.3d at 955. The Court therefore construes the term as “decompressing compressed song digital data.”
Plaintiffs contends that the structure corresponding to this function is “a software algorithm or decompression circuit, and equivalents thereof.” Opening Brief at 12. Defendants contend that the structure is an adaptive delta pulse code modulation (ADPCM) algorithm corresponding to the particular ADPCM algorithm used for compression. Resp. Brief, Ex. E at 2. They point to language in the specification that describes an ADPCM compression circuit. Because no other decompression means is specifically identified, defendants contend that the only possible decompression means is an ADPCM algorithm. Defendants ignore, however, the next two sentences in the specification, which state that “[o]ther compression schemes may also be used. The compression circuit might also be fully replaced by a software algorithm which is executed by the host computer.” Opening Brief, Ex. 2 at 4:9-12. In short, the specification quite clearly does not limit decompression to an ADPCM algorithm as defendants contend. Because other compression schemes may be used, a person of average skill in the relevant field would understand that a corresponding decompression scheme must also be available. The Court therefore construes the term as “a software algorithm or decompression circuit.”

IV. “means for executing programs which make calls to a general purpose operating system”/ "means for executing programs which make calls to a UNIX operating system"

The final two disputed means-plus-function claim elements appear in claims 6 and 7 of the ’366 Patent and in claim 2 of the ’918 Patent. These dependent claims recite, inter alia, a "means for executing programs which make calls to a general purpose [or a Unix] operating system." ’366 Patent, 52:56-64; ’918 Patent, 127:15-19. The parties agree that the recited function is "executing programs which make calls to a general purpose [or a Unix] operating system." How-ever, while the parties also agree that the corresponding structure must include host processor 118, defendant urges the court to limit the scope of the claim to a Sun Microsystems Central processor. The specifications expressly state that "[t]he host processor 118 is a conventional OEM Sun central processor card, Model 3E/120." See, e.g., ’366 Patent, 11:49-50. Elsewhere in the specifications, host 118 is described as "essentially a standard SunOS Unix processor." See, e.g., id. at 8:18-19. Although the inventors also observed that other processors such as a SPARC-based processor were possible alternatives to the Sun Microsystems computer, see id. at 11:52-53, the only disclosed embodiment describes the host as Sun Microsystems processor. The court therefore adopts defendant's view that the structure corresponding to the "executing programs" function must include a SunOS Unix processor.

Defendant also proposes numerous other structural limitations on the scope of the "executing programs" term. The first group of these asserted limitations is essentially a list of services that would typically be provided by a general purpose operation system (e.g., a server manager). See id. at 11:7-48. Relying on WMS Gaming, defendant argues that these functional attributes are "algorithms" and thus must be included as corresponding structure. However, nothing in WMS Gaming requires this result. The rule that the Federal Circuit announced in that case is worth repeating: "In a means-plus-function claim in which the disclosed structure is a computer, or microprocessor, programmed to carry out an algorithm, the disclosed structure is not the general purpose computer, but rather the special purpose computer programmed to perform the disclosed algorithm." 184 F.3d at 1349 (citing Alappat, 33 F.3d at 1545). The court has already observed that in applying this rule, WMS Gaming appeared to define "algorithm" broadly, concluding that a description of the steps necessary to carry out the claimed function was sufficient to constitute "structure" for the pur-pose of section 112 P 6. Id.
It is true that the manner in which the court defined the structure of disclosed microprocessor was indirect and inferential in that it described the electronic configuration of the microprocessor by reference to a series of functional steps that the structure performs. See id. at 1348-49. Nonetheless, despite the indirect fashion in which the court described the disclosed structure, nothing in WMS Gaming suggests that the Federal Circuit intended to abandon the requirement that a structure corresponding to a means-plus-function element must be clearly linked to the claimed function and necessary to perform that function. See Asyst Techs., 268 F.3d at 1370. In contrast, defendant's proposed claim limitations are little more than a laundry list of applications that run on the host processor. Rather than describing a "means for executing programs" in functional terms or otherwise, this list of programs merely describes the functional attributes of the programs that are executed by those means. This is not sufficient to disclose "structure" for purposes of applying section 112 P 6.

Finally, defendant argues that the structure corresponding to the "executing programs" function must include algorithms for reading "message descriptors" sent to the local host by the network controller and for copying messages from either the network controller's local memory or from system memory. In other words, defendant seeks to include algorithms for communicating with other components of the file server as limitations of the "executing programs" term. However, the Federal Circuit "has repeatedly held that it is improper to restrict a means-plus-function limitation by adopting a function different from that explicitly recited in the claim." Creo Prods., Inc. v. Presstek, Inc., 305 F.3d 1337, 1346 (Fed. Cir. 2002) (collecting cases). Simply put, "executing programs" is a different function than "communicating." Thus, because defendant's proposed "reading" and "copying" algorithms in defendant's proposed claim construction do not perform the "executing programs" function, they cannot limit the meaning of that term as it is used in the patents' means-plus-function claim elements. The court therefore holds that the structure corresponding to the "means for executing programs which make calls to a general purpose [or a Unix] operating system" is "a SunOS Unix processor."

After holding a Markman hearing, the Court issued its Memorandum Opinion and Order on Claim Construction in which it construed six terms integral to the determination of this case and the instant motions. (doc. 270) The claims were construed as follows:

(1) "connected and connectable" -- These terms mean "directly joined to one another within the same unitary piece of equipment without any intervening equipment."

(2) "unified structure" -- Although not a claim term, the Court defines the term "unified structure" to mean "a consolidated structure with all components directly connected to one another."

(3) "bypass" -- "Bypass" means "a structure and path by which data channels completely go around and in no respect go through the TST switch."

(4) "control store" -- 'A control store' is included within a single unified DRTST switching unit that includes a memory, processor, and operating software that determines (1) which data circulating on the network loop is to be selected and diverted to the TST switch of a given switching node; (2) how that data passes through the TST switch; (3) which data is output from the TST switch back onto the network loop; and (4) which data is to bypass the TST switch of that node."

(5) "means for measuring" -- The Court finds that this term is not capable of construction.

(6) "direction of the timing adjustment interval" -- This term means "[t] he timing adjustment control command signal is fed in a reverse direction from the data signal; that is, from a downstream digital switching unit to an upstream digital switching unit, in a direction opposite the data flow."

(Mem. Op. and Order on Claim Constr. at 30-31)
claim is operating on a predetermined database. The structure corresponding to this function comprises data processing capabilities, memory and software capable of managing a database.

5. "Means for receiving at least one claim." This is a means-plus-function limitation. The function is receiving at least one claim. The structure is hardware and software capable of receiving the at least one claim.

Claims 1 and 15 are representative of the claims in issue and are reproduced below.

1. A method for determining the approximate distance of a golf ball to a golf cup using a global positioning satellite system comprising the steps of:

   locating the position of the cup;
   storing the position of the cup;
   positioning a remote global positioning satellite receiver near the golf ball;
determining a position of the remote receiver using the global positioning satellite system; and

determining the distance from the remote receiver to the cup using the stored cup position and the position of the remote receiver.

15. An apparatus for determining the approximate distance to a golf cup using a global positioning satellite system comprising:

a global positioning receiver means for receiving signals indicative of the apparent position of the receiver means using the global positioning satellite system;

memory means for storing the position of the golf cup;

means linked to said global positioning receiver means and said memory means for calculating the distance between the position of the receiver means and the position of the golf cup; and

display means for displaying the distance.

'093 patent, col. 8, l. 60 - col. 9, l. 3 (claim 1), col.10, ll. 1-14 (claim 15).

The terms "position" and "location," used in the asserted claims, are central to the appeal. The district court construed these terms as, respectively, "position on the face of the earth in terms of latitude and longitude" and "location on the face of the earth in terms of latitude and longitude." Optimal Recreation Solutions, LLP v. Leading Edge Techs., Inc., No. CIV 96-2560-PHX-SMM, slip op. at 4 (Ariz. Sept. 29, 1999). The district court also determined that the terms "global positioning receiver means," "memory means," and "display means," in claim 15, were means-plus-function limitations subject to 35 U.S.C. § 112, paragraph 6. Id. at 6.

The district court precluded Optimal from using, at trial, any evidence of infringement under the DOE. The court made this ruling, in response to a motion in limine from LET, because of: (1) Optimal's failure to comply with Rule 26(a)(2)(B) of the Federal Rules of Civil Procedure regarding expert reports; (2) Optimal's failure to comply with the district court's discovery orders; and (3) Optimal's failure to update clearly posed interrogatories.

Optimal appeals the district court's judgment, challenging the claim construction and the DOE evidentiary ruling. We have exclusive appellate jurisdiction. 28 U.S.C. § 1295(a)(1) (1994).

* * *

3. The "means" Limitations

"If a claim element contains the word 'means' and recites a function, this court presumes that element is a means-plus-function element under § 112, P 6. That presumption falls, however, if the claim itself recites sufficient structure to perform the claimed function." Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1364, 54 U.S.P.Q.2D (BNA) 1449, 1452 (Fed. Cir. 2000) (citation omitted). As an aid in determining whether sufficient structure is recited by a term used in a limitation, this court has inquired into whether the "term, as the name for structure, has a reasonably well understood meaning in the art." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583, 39 U.S.P.Q.2D (BNA) 1783, 1786 (Fed. Cir. 1996). Contrary to the position of the dissent, resort to the specification is appropriate in making this determination. See Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1303-05, 50 U.S.P.Q.2D (BNA) 1429, 1435-37 (Fed. Cir. 1999) (looking to the written description to buttress both the determination that the claim recites sufficient structure and the identification of the claimed function); Unidynamics Corp. v. Automatic Prods. Intl', Ltd., 157 F.3d 1311, 1319, 48 U.S.P.Q.2D (BNA) 1099, 1104 (Fed. Cir. 1998) (looking to the written description to determine whether the word "spring" recited sufficient structure to rebut the presumption that § 112, paragraph 6 applied).

This court, in Greenberg, also pointed out that "many devices take their names from the functions they perform . . ., such as 'filter,' 'brake,' 'clamp,' 'screwdriver,' or 'lock.'" Id. at 1583, 39 U.S.P.Q.2D (BNA) at 1786. This court faced a similar
situation in Envirco when we construed the limitation "second baffle means having inner surfaces for directing the airflow . . . inwardly." Envirco, 209 F.3d at 1363, 54 U.S.P.Q.2D (BNA) at 1450 (quoting claim). In Envirco, this court held that the second baffle means limitation was not subject to § 112, paragraph 6 because "the term 'baffle' itself imparts structure" sufficient to rebut the presumption that § 112, paragraph 6 applies. Id. at 1365, 54 U.S.P.Q.2D (BNA) at 1452. Additionally, this court held in Cole v. Kimberly-Clark, Corp., 102 F.3d 524, 41 U.S.P.Q.2D (BNA) 1001 (Fed. Cir. 1996), that "perforation means . . . for tearing" was not subject to § 112, paragraph 6 because "it describes the structure supporting the tearing function (i.e., perforations)." Id. at 531, 41 U.S.P.Q.2D (BNA) at 1006.

Applying this precedent, we must determine whether, to one skilled in the art: (1) a "global positioning receiver" describes, or imparts, sufficient structure "for receiving signals indicative of the apparent position of the receiver means using the [GPS] system"; (2) a "memory" describes sufficient structure "for storing the position of the golf cup"; and (3) a "display" describes sufficient structure "for displaying the distance."

It is important to bear in mind the context of the invention and the relevant arts involved. The context of the claim is a GPS receiver. '093 patent, col. 8, l. 68. The specification points out that a GPS receiver essentially comprises a hand-held computer, communicating with multiple orbiting satellites. Id. at col. 3, l. 35 - col. 4, l. 14. The specification describes that a standard GPS receiver can be reprogrammed to carry out the claimed invention. Id. at col. 4, l. 16 - col. 5, l. 27. The reprogramming entails modifying display routines and storing a variety of formulas and data in memory. Id. at col. 6, l. 50 - col. 8, l. 58.

The specification repeatedly refers to GPS receivers, memories, and displays. E.g., id. at col. 3, l. 53 - col. 4, l. 28 (GPS receivers), col. 5, ll. 23, 46, 57 (memories), col. 4, ll. 32-42 (displays). The specification discusses global positioning receivers, memories, and displays as structural terms. Id. at col. 4, ll. 24-28 ("The GPS receiver 22 is preferably the 3 channel receiver such as used in the TransPak Model made by Trimble navigation of Sunnyvale, Calif. Other commercially available substitutes are acceptable such as . . . ."), col. 4, ll. 52-59 ("The storage 25 preferably includes nonvolatile memory . . . . Battery backed-up RAM is preferred, but other alternatives are operable and offer some advantages, such as a WORM optical disc coupled to RAM or EEPROM. Volatile memory stores the current error correction."). col. 4, ll. 32-35 ("The display 26 is illustrated in FIGS. 1 and 2. The display 26 is preferably a 640x480 pixel LCD supertwist, ISA bus compatible display, but other conventional types of displays are operable."). From the passages cited above, it is clear that, to one skilled in the arts of GPS receivers and computer programming, a "global positioning receiver," a "memory," and a "display," as the names for structure, have reasonably well understood meanings in those arts and are sufficient structure for accomplishing the functions recited in the pertinent claim limitations. The fact that these particular terms may be broad does not detract from their well understood meanings as the names for structure. Thus, none of these three limitations is subject to § 112, paragraph 6.

The ordinary meaning of these terms, to one of skill in the art, is clear and the specification does not redefine them. Accordingly, we construe a "global positioning receiver" as a GPS receiver, a "memory" as a device capable of storing data, and a "display" as a device capable of visually representing information.

2629

DISSENT

GAJARSA, Circuit Judge, dissenting in part.

I write separately to dissent from the majority's conclusion that "memory means" and "display means" are not means plus function limitations. In the course of finding that the terms "memory" and "display" impart sufficient structure to take the limitations out of the realm of § 112 P6, the majority misconstrues this court's precedents.

As recognized by the majority, use of the word "means" creates a presumption that a claim limitation falls within the bounds of § 112 P6. Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1364, 54 U.S.P.Q.2D (BNA) 1449, 1452 (Fed. Cir. 2000). This presumption is rebuttable if a "means" limitation recites not only a function, but also specific, definite structure that performs the entire function from the view of a person of ordinary skill in the art. Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997) ("Where a claim recites a function, but
then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format.); Data Line Corp. v. Micro Techs., Inc., 813 F.2d 1196, 1201, 1 U.S.P.Q.2D (BNA) 2052, 2055 (Fed. Cir. 1987) ("Where a claim sets forth a means for performing a specific function, without reciting any specific structure for performing that function, § 112 P6 applies."); Serrano v. Telular Corp., 111 F.3d 1578, 1582, 42 U.S.P.Q.2D (BNA) 1538, 1541 (Fed. Cir. 1997) ("The 'determination means' limitation . . . recites a means for determining the last digit without reciting definite structure in support of that function and that limitation therefore is a 'means plus function' limitation. . . ."); Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 U.S.P.Q.2D (BNA) 1001, 1006 (Fed. Cir. 1997) ("An element with such a detailed recitation of its structure, as opposed to its function, cannot meet the requirements of § 112 P6."); Micro Chem., Inc. v. Great Plains Chem. Co., 194 F.3d 1250, 1257, 52 U.S.P.Q.2D (BNA) 1258, 1263 (Fed. Cir. 1999) ("This presumption remains unrebutted because neither claim recites structure sufficient to perform the recited function."). Cf. Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1536, 19 U.S.P.Q.2D (BNA) 1367, 1369 (Fed. Cir. 1991) ("The recitation of some structure in a means plus function element does not preclude the applicability of section 112(6).").

In this case, there is no specific, definite structure that is well understood in the art corresponding to the claim terms "memory" or "display." The majority's citation of language from Greenberg indicating that devices such as "brakes" and "screwdrivers" take their names from the functions they perform is inapposite. The terms "memory" and "display" do not describe devices; these terms simply describe functions. One of ordinary skill in the GPS field would not equate "display" to any specific, definite structure. Likewise, one of ordinary skill in the GPS field would not associate the term "memory" with any specific, definite structure. Therefore, the presumption that "memory means" and "display means" fall within the ambit of § 112 P6 is not rebutted by the claim language itself because these limitations do not recite sufficient structure to perform the "memory" and "display" functions. The majority's references to the use of the terms "memory" and "display" in the specification of the '093 patent is inappropriate. Whenever claim terms, such as "memory" and "display," have generally accepted meanings in the art, it is unnecessary to consider the specification to assess those meanings.

For the reasons stated hereinabove, I dissent in part.

The parties agree that the structure for this means-plus-function limitation is a computer. The only dispute is whether the structure is a computer and structural equivalents thereof, or a "computer structure/steps." The Court agrees with PolyVision that the claim term is properly defined solely as a computer, and structural equivalents, because the patent discloses a computer as the means for performing the identified function, without mentioning "structure/steps." (Col. 15, ll. 32-36.)

The parties disputed six terms used in the claims of the '843 patent. The Court has construed those terms as follows:

a) "Waveguiding structure" is used interchangeably with "waveguide" and is defined as: "A structure formed by a waveguiding film and a substrate and containing a diffraction grating";

b) "Waveguide film" means: "A film which, in combination with a sample having a lower index of refraction and a substrate can guide light along a path";

c) "Diffraction grating" means: "Any arrangement in the waveguiding structure that imposes a periodic variation of

- 2976 -
amplitude and/or phase on an incident wave;"

d) "Wavelength" means: "A wavelength of light at which the optical sensor, including the waveguiding structure, waveguiding film, and diffraction grating, detects chemical, biochemical or biological substances in the sample";

e) "Effective index" means: "A number that relates the propagation velocity of light guided in a waveguide to the speed of light in a vacuum";

f) "Measuring the effective index and effective index change" means: "determining the effective index" and "determining the effective index change."

(D.I. 156).

2632

D

Hamilton next argues that the district court should have construed claim 16 to require that the accused device automatically measure the patient's levels of carbon dioxide and oxygen, in effect excluding a system in which an operator measures the gas levels and inputs those values into the device. The district court concluded that "the patented method need not 'automatically measure' the concentration of carbon dioxide and oxygen in the exhaust of a patient, as Defendant contends."

In support of its argument, Hamilton points to the specification, the preamble language, and the prosecution history. Although we regard the question as close, we agree with Dr. Tehrani that the method of claim 16 does not require that the respirator itself measure the carbon dioxide and oxygen levels of the patient. While the specification describes an apparatus and method for automatically measuring the concentration of carbon dioxide and oxygen in the exhaust of a patient, that disclosure is not a sufficient basis on which to read the limitation of automatic measurement into the claim. See N. Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1290 (Fed. Cir. 2000); Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998) ("While . . . claims are to be interpreted in light of the specification and with a view to ascertaining the invention, it does not follow that limitations from the specification may be read into the claims."). The claim requires simply "measuring levels of carbon dioxide and oxygen of the patient," and it neither includes the word "automatically" in describing that function, nor specifies that the respirator must do the measuring.

Nor does the preamble language "in a respirator" require that the measurement step be performed by the respirator itself. We interpret the preamble language as requiring that the various steps of the method be performed in the context of a "respirator for varying tidal volume and frequency of breaths of a patient," but not requiring that the data inputs to the respirator all be obtained automatically. The claim language indicates that what is automatic is the control function, not the input of data. Thus, the claim recites "a method of automatically controlling the respirator."

Hamilton points out that Dr. Tehrani amended claim 16 to replace "A method of controlling a respirator" in the preamble with "In a respirator for varying tidal volume and frequency of breaths of a patient, a method of automatically controlling the respirator." Hamilton argues that Dr. Tehrani amended the claim in that manner to distinguish her invention from the prior art. The applicant explained that the amendment to claim 16 was made because the prior art reference on which the examiner had relied was not a respirator, but a gas mixer, and that it did not provide for automatic control of the respirator in the claimed manner. That prosecution history is simply not sufficiently specific to persuade us that the language of the claim must be read restrictively, to limit the claim to a method in which the respirator automatically measures the patient's oxygen and carbon dioxide levels rather than having that data provided from a different source. In any event, this issue may be of limited practical importance to the ultimate disposition of this case, as Hamilton does not argue that claim 1 is limited in this fashion, and indeed the language of claim 1 clearly is not limited to a device that automatically measures the patient's oxygen and carbon dioxide levels.

GO BACK
Measuring variable parameters and similar phrases

ConnecTel argues "measuring variable parameters" and similar phrases should be construed as "observing and quantifying a parameter whose value can vary over relatively short periods of time at or about the time of transfer." Cisco contends the term should be construed to mean "in connection with the data file to be transferred, ascertaining the measurements of said variable parameters for each of said paths at or about the time of transfer of the data file." Thus, ConnecTel and Cisco agree that the measuring is done at or about the time of transfer, but disagree as to whether it is done connection with a particular data file to be transferred or whether it occurs in the background unrelated to the transfer of a data file.

The Court modifies Cisco's proposed construction and construes "measuring variable parameters" to mean "ascertaining the measurements of said variable parameters for each of said paths at or about the time of transfer." ConnecTel's construction incorporates its construction of "variable parameters." As that term has already been construed, it is unnecessary to reconstrue that term here. Neither the claims, the specification, nor the prosecution history require that the measurement of the variable parameters be done in connection with a data file to be transferred. The claims themselves do not require a certain order of the steps. See Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1369-72 (Fed. Cir. 2003) (discussing proper application of the rule from Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1342-43 (Fed. Cir. 2003): "Unless the steps of a method actually recite an order, the steps are not ordinarily construed to require one. However, such a result can ensue when the method steps implicitly require that they be performed in the order written."). Cisco argues that the sequence of steps is implied by the nature of the invention itself. Specifically, Cisco argues that because the measurements are done in real-time at or about the time the data file is transferred, see col. 4:17-23, the measurements must be done in connection with a particular file to be transferred. Such a cause and effect relationship is not required for the measurements to be done if real-time. If the variable parameters were constantly measured, their values would be in real-time as to any file to be transferred. Further, one of the variable parameters, $ avgstate(i)$, is the "average of $ presentstate(i)$ over prior five minute window." Col. 4:57-58. Thus, unless there is a five-minute delay between selecting the file for transfer and the actual transfer, the specification contemplates that the measurements of at least $ avgstate(i)$ will be done without a connection to any particular data file to be transferred. Accordingly, the Court rejects Cisco's limitation that the measurements must be performed "in connection with the data file to be transferred."

MIT and EFI argue that the district court erroneously held the phrase "colorant selection mechanism" was a means-plus-function limitation under section 112 P6. That phrase appears in the patent together with a description of its functions, "receiving said modified appearance signals" and "selecting corresponding reproduction signals representing values of said reproducing colorants to produce in said medium a colorimetrically-matched reproduction."

The phrase "colorant selection mechanism" is presumptively not subject to 112 P6 because it does not contain the term "means." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002). However, a limitation lacking the term "means" may overcome the presumption against means-plus-function treatment if it is shown that "the claim term fails to 'recite sufficiently definite structure' or else recites 'function without reciting sufficient structure for performing that function.'" Id. (quoting Watts v. XL Sys., Inc., 232 F.3d 877, 880 (Fed. Cir. 2000)).

We agree with the district court's conclusion that the presumption here is overcome and that the phrase "colorant selection mechanism" should be construed as a means-plus-function limitation. The generic terms "mechanism," "means," "element," and "device," typically do not connote sufficiently definite structure. In Personalized Media Commun's., LLC v. Int'l Trade Com'n, 161 F.3d 696 (Fed. Cir. 1998), we addressed the claim term "digital detector." We contrasted the term "detector," which recited sufficient structure to avoid 112 P6, with "generic structural term[s]such as 'means,' 'element,' or 'device,'" which do not. Id. at 704. Similarly, in Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354 (Fed. Cir. 2004), we recognized that Section 112 P6 does not apply to "a term that is simply a nonce word or a verbal construct that is not
recognized as the name of structure and is simply a substitute for the term 'means for.'" Id. at 1360.

Here the patentee used "mechanism" and "means" as synonyms. See '919 patent, claim 3, col. 15 I. 51 (referring to "colorant selection means") (emphasis added); id., claim 14, col. 17 II. 1-2 (same). At least one dictionary definition equates mechanism with means. See The Random House Webster's Unabridged Dictionary 1193 def. 2 (2d ed. 1998) (defining "mechanism" as "the agency or means by which an effect is produced or a purpose is accomplished"); see also The Random House Dictionary of the English Language - The Unabridged Edition 889 (1973) (same). The term "mechanism" standing alone connotes no more structure than the term "means."

Claim language that further defines a generic term like "mechanism" can sometimes add sufficient structure to avoid 112 P6. For example, in Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580 (Fed. Cir. 1996), which involved a mechanical device, we held that 112 P6 did not apply to the term "detent mechanism," because "the noun '[d]etent' denotes a type of device with a generally understood meaning in the mechanical arts, even though the definitions are expressed in functional terms." Id. at 1583. The court recited several dictionary definitions for "detent," including "a mechanism that temporarily keeps one part in a certain position relative to that of another, and can be released by applying force to one of the parts." Id. (internal quotation marks and citations omitted). These definitions connoted sufficient structure to avoid 112 P6. We also concluded that "[t]he fact that a particular mechanism--here 'detent mechanism'--is defined in functional terms is not sufficient to convert a claim element containing that term into a 'means for performing a specified function' within the meaning of [112 P6]" because "[m]any devices take their names from the functions they perform." Id. n4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n4 Of course, a claim term defined solely in functional terms, without more, would fall within Section 112(6). See Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318 (Fed. Cir. 1999); see also Micro Chem., Inc. v. Great Plains Chem. Co., Inc., 194 F.3d 1250, 1258 (Fed. Cir. 1999).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In contrast, the term "colorant selection," which modifies "mechanism" here, is not defined in the specification and has no dictionary definition, and there is no suggestion that it has a generally understood meaning in the art. We therefore agree with the district court that "colorant selection mechanism" does not connote sufficient structure to a person of ordinary skill in the art to avoid 112 P6 treatment. n5

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n5 In Lighting World, we held that it was appropriate to look to dictionaries "to determine if a disputed term has achieved recognition as a noun denoting structure," and determined that "connector" had a reasonably well-understood meaning as a name for a structure. 382 F.3d at 1360-61. That structure was defined in terms of the function it performed, "connecting." Id. Here, the term "mechanism" is not defined by a function that particularizes its structure.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The district court found that the functions of the "colorant selection mechanism," as recited in claim 1, are "receiving said modified appearance signals" and "selecting corresponding reproduction signals representing values of said reproduction colorants to produce in said medium a colorimetrically-matched reproduction." The court further held that the corresponding structures are the components of the "ink correction module (ICM)." MIT does not argue that if means-plus-function treatment was appropriate, the district court erred in its conclusions regarding the function and corresponding structure of the term. Therefore, the district court's construction will govern further proceedings.

GO BACK

2635

Claim 15 teaches "[a] vending machine as claimed in claim 1, wherein said customer interface comprises a mechanism that interfaces with software supplied by the customer." ('400 Patent 16:65-67). According to plaintiffs, "mechanism that
interfaces with software supplied by the customer" means "machinery or process that involves interacting with software that is loaded on the customer's computer." (Pls.’ Mem. On Claim Construction 18). To the contrary, defendant proposes "a mechanism (as construed above) that interacts with software made available to the vending machine by the customer."

Plaintiffs offer no support for their assertion that this language describes a process, and the earlier claim construction of "customer interface" resolves any issue regarding location of the customer interface.

The proper construction is as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanism that interfaces with software supplied by the customer</td>
<td>A mechanism (as construed above) that interacts with software made available to the vending machine by the customer</td>
</tr>
</tbody>
</table>

2636

(3) media access controller

Claim 1 of the '261 patent states "media access controller which outputs first data in a packet form." N-Data proposes replacing "media access controller" in the above claim language with "circuitry." Dell seeks to import "transmit," "receive," and "physical media." The court finds no support for inclusion of "transmit" and "physical media"; however, the patent specification expressly discusses the ability of a media access controller to "receive" data. See '261 Patent, col. 3, ll. 10-15 (stating, "[i]n another embodiment, a new media access controller can be provided which receives data . . . ").

As such, the court defines the term as follows: "circuitry that outputs and receives data in packet form."

2637

A. "media asset"

The preamble of each of the asserted claims contains the term "media asset." For example, the preamble of the '704 patent, claim 7 states, "A media asset management system comprising," and the preamble of the '414 patent, claim 1 states, "A method of managing access to a plurality of media assets comprising the steps of." The term "media asset" is used throughout the specification. (E.g., '704 patent, 3:35-45 ("The digital media assets distributed by the system [] may be audio such as music, video such as movies, television programs or other video productions, interactive software games, or any media that is digitized and suitable for electronic distribution. The digital media assets may be in any known or hereinafter developed formats . . . .") (emphasis added)). The plaintiff contends that the term "media asset" means "any media that is digitized and suitable for electronic distribution." The defendant contends that the term means "an item, such as a digital file or a computer disk, that contains digital or analog media."

Zapmedia argues that "media assets" are limited to digital media and do not include analog formats. According to the plaintiff, the phrase "digital media assets" appears in the specification twenty-five times, but "analog" is never used with the term "media asset." Additionally, both the Abstract and Summary of the Invention describe the invention as "a system and method for distributing digital media assets." ('704 patent, 1:33-34) (emphasis added). In response, Apple argues that the ordinary meaning of "media asset" is not limited to digital assets. Furthermore, the specification uses both "digital media asset" and "media asset," so the patentee wishes to distinguish between the terms. Finally, according to Apple, the specification refers to "physical media assets," which are not necessarily digital.

Based upon the use of "media asset" in the specification and claims, this invention is limited to digital formats only. Therefore, the court construes "media asset" to mean "any media that is digitized and suitable for electronic distribution."
A. Claim 6
1. Media Attachment Unit

Level One argues that the MAU should be construed precisely as it reads in the language of Claim 6, subject to no additional limitations. Seeq contends that the court must define the relationship of the MAU to other parts of the circuit and then determine all of its elements. In order to do so, Seeq proposes that the court incorporate into the definition of MAU language from the claim's preamble and from the specification. Defendant argues that the preamble defines the relationship of the MAU to the attachment unit interface ("AUI") and the twisted pair link, namely, that the MAU provides an interface between the two, which further limits the MAU in Claim 6 to a twisted pair MAU. In support of this interpretation, defendant relies on Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995), in which the court found that a preamble gave meaning to the invention and could properly be considered in defining claim terms. In addition, Seeq maintains that the definition of MAU should include a long list of elements recited in the summary of the invention, including means for detecting and correcting reverse polarity, means for internally predistorting data to fit a 10Base-T jitter template of the twisted pair link and jabber control means. Seeq offers no apparent rationale for incorporating this detailed description.

--- Footnotes ---

1 The parties agreed during the mediation session that "'interfacing' refers to a shared boundary between two systems, or between parts of systems, through which information is conveyed." Plaintiff Mem., App. F at 4. However, that agreement appears to have given rise to another dispute: whether the MAU must share a boundary with the AUI and twisted pair link. The claim preamble uses the word "interface" but the claim speaks only of "coupling." The parties have agreed that interface refers to a shared boundary. "Couple" should be given its ordinary meaning of to link or join. Random House College Dictionary. It also seems as if that linkage could be either direct or indirect. In any event, the court finds no reason to read the preamble as a further limitation in this instance. Even if the two terms have significant differences in meanings, the claim language consistently uses "coupling" and appears to do so with relative clarity.

--- End Footnotes ---

In Bell, the Federal Circuit found that preamble construction "presents no deeper mystery than the broader task of claim construction, of which it is but a part." Id. at 621. 2 In other words, the preamble has the meaning and importance that the claims suggest for it. A patent claim can completely define the subject matter of the invention or it can expressly or implicitly use the preamble as a limitation. As Bell itself makes plain, nothing in its holding contradicts the imperative of courts to look first to claim language and then to construe it in light of the specification. Id. at 620.

--- Footnotes ---

2 Given that the mystery of claim construction is rather deep indeed, this is faint encouragement.

--- End Footnotes ---

The MAU recited in Claim 6 is not specifically defined as a twisted pair (or 10Base-T) MAU. However, the preamble to Claim 6 states its purpose as "interfacing an attachment unit interface to a twisted pair link". '183 Patent at 7:29-30. Of greater significance, the MAU of Claim 6 includes a twisted pair port. Moreover, the rest of the specification indicates that the disclosed invention concerns a 10Base-T MAU. The abstract begins, "A local area network (LAN) having a 10Base-T media Attachment unit (MAU) is disclosed . . . ." '183 Patent, Abstract. Likewise, the first line of the summary reads, "A 10Base-T (twisted pair) media attachment unit is disclosed . . . ." '183 Patent at 2:6-7. Read in the context of the specification as well as the rest of Claim 6, the MAU in Claim 6 is a 10Base-T MAU. Nor does the court have to read the preamble to Claim 6 as a limitation on the claim in order to reach this conclusion. Beyond this construction of MAU, the court declines Seeq's invitation to further elaborate the relationship of the MAU to other elements of the claim.

Finally, Seeq's effort to incorporate wholesale a large portion of the specification into the construction of MAU seems to be
a rather bald attempt to impermissibly broaden the scope of the claim, particularly when many of the elements enumerated in the specification which Seeq believes expressly define the MAU in Claim 6 are already contained in dependent Claims 9 and 11. Narrow claims should not be read to limit broader ones. D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed. Cir. 1985); see also Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995).

Accordingly, the court construes the MAU of Claim 6 to be a 10Base-T MAU comprising an AUI port, a twisted pair port and an auto-engage means, each of these as defined in Claim 6 and as further construed below.

1. A plurality of media data streams

The first group of disputed claim terms involves the media data streams processed by the processor. The plaintiff contends that "a plurality of media data streams" means "two or more different types of media data streams such as audio, video, radio, graphics, encryption, authentication, and/or network information." The defendants urge that "a plurality of media data streams" means "two or more concurrent streams of audio, video, radio, graphics, encryption, authentication, and/or network media data information from two or more sources." At issue is the defendants' use of the word "concurrent" in their proposed construction. After considering the submissions of counsel and the intrinsic record, the court is persuaded that the plaintiff's position is correct. Accordingly, the court construes "a plurality of media data streams" to mean "two or more different types of media data streams."

B. "output media format"

• Plaintiff's proposed construction: "standard video format for optical disk"

• Defendants' proposed construction: "standard playback format for optical disk (e.g. DVD, VCD, SVCD)"

The term "output media format" is found in claims 1, 5, 6, and 10 of the '655 patent and claims 1, 5, 6, 10, 16, and 19 of the '172 patent. For example, in claim 1 of the '655 patent the claimed system receives from an input the desired output media format (e.g. a DVD, VCD or SVCD format) and then the invention resizes the video to that format before processing the video together with audio compatible with that output media format into an appropriate presentation format. The parties essentially agree that this term should describe the target format for the disk mastering program, but disagree as to how to describe that. Plaintiff wishes to construe this term as "standard video format for optical disk" while Defendants wish to construe this term as "standard playback format for optical disk (e.g. DVD, VCD, SVCD)."

In support of its "video" construction, Plaintiff points to the specification that lists only standard video media formats, such as DVD, VCD, and SVCD. The standards for each media type specify the acceptable video resolutions and codecs as well as acceptable audio bit rates and codecs.

Defendants wish to use "playback," as they believe "playback format" is a more precise definition of the formats contemplated by the patent. They argue that "playback format" would not create the confusion in the jury that "video format" would create when the claims contemplate the audio information that is associated with the video. At the claim construction hearing, Defendants expressed concern that "standard video format for optical disk" would confuse jurors because there are standards for optical disk that do not require video, such as DVD-R and DVD-RW. Defendants also
expressed concern in their briefing that a jury may be confused by the lack of "audio" in this definition. Defendant has not provided any evidence that there exists a "standard video format for optical disk" that does not include audio, so the Court finds Defendants' concern overstated.

The "standard video format[s] for optical disk" include the DVD, VCD, and SVCD video playback standards. Because the parties agree that the patent is directed to standard video formats for optical disks and the specification supports that position, the Court adopts "standard video format for optical disk" as the definition for "output media format."

--- End Footnotes ---

2642

(a) Media Header Information

StorageTek contends that "media header information" should be construed as "information contained in the header of a PDU that provides details about the PDU. The information can be ISO Layer 2 or Layer 3 information." Cisco's proposed construction is "the information contained in the header of a packet that specifies the media information (also referred to as ISO Layer 2 or data link layer information)." As the patent explains, the International Organization for Standardization (ISO) developed the Open Systems Interconnection (OSI) model to describe communication networks and their operations. See 170 Patent, Col. 6, In. 33-44. The OSI model contains seven layers, wherein each layer performs a specific data communications task, a service to and for the layer that precedes it. Id., In. 33-47. ISO Layer 2 information is the data link layer and includes flow control of data. ISO Layer 3 information is the network layer and provides routing and relaying of data through the network. Id., Col. 7, In. 43-51.

Cisco argues that the "media header information" is limited to ISO Layer 2 data link information. Cisco relies on the declaration of its expert, Dr. Smith, which states that one of ordinary skill in the art would know that the term "media header information" refers to media information which is Layer 2 information, also known as the data link layer information, and which provides for transit of data across a physical network link. See Declaration of Jonathan M. Smith in Support of Cisco's Claim Construction of the 170 and 040 Patents ("Smith Decl.") PP 14-20. Cisco contends that a person of ordinary skill in the art would understand the term "network header" or "network layer" to refer to the header containing Layer 3 network information, and the term "media header" or "data link layer" to refer to the header containing Layer 2 information. See Smith Decl. P 17.

Cisco asserts that its definition of "media header information" is supported by the patent claims which regularly distinguish between "network" and "media" information. See Claims 8, 11, 19, and 28. Cisco also relies on the specification, where "media header information" is defined to typically include "the encapsulation type, protocol type, frame type, media destination, and source route information." Cisco argues that a person of ordinary skill in the art would recognize that each of these attributes describes Layer 2 information that is contained in the Layer 2, or data link layer, header. See 170 Patent, Col. 5, In. 27-29; Col. 10, In. 17-19; Smith Decl. PP 16-18. Finally, Cisco relies on instances in the specification where the information in the media header specifies a "media source address" and "media destination address." See 170 Patent Col. 10, In. 50-59; Col. 12, In. 50-65. Cisco asserts that these addresses are Layer 2 data link information and refer to the specific physical device, e.g., a particular router or a particular switch, that a packet just came from or the specific physical device to which a packet will next travel, e.g., the next "hop" address.

StorageTek does not dispute that the term "media information" generally refers to Layer 2 data link information, but argues that the specification of the 170 patent makes it clear that the header information gathered by the identification means can be either Layer 2 data link or Layer 3 network information. For example, StorageTek notes that in the 170 patent the media header information is determined by the identification step, and that this identification step includes determining network destination addresses, Layer 3 information. See 170 Patent, Col. 12, In. 50-59 (the information determined by the identification means, 302, may include comparing network destination addresses or media destination addresses).
StorageTek disputes the claim by Cisco's expert Dr. Smith, that the fact that the "address means" considers network addresses "does not transform such addresses into media header information, nor does it transform media header information into Layer 3 information." Smith Decl. PP 18-19. StorageTek argues that the teaching of the 170 patent is that the address lookup mechanism, or the "address means," is part of the identifying step performed on the media header information, not separate from it. See, e.g., 170 Patent Fig. 2; Fig. 6. Finally, StorageTek notes that the specification indicates only that the media header information "typically includes at a minimum" the types of Layer 2 information described, but that the specification does not limit the media header information to Layer 2 information. See 170 Patent, Col. 5, In. 27-29; Col. 10, In. 17-19.

The Court concludes, based on examination of the specification, that media header information in the 170 patent can include Layer 3 network information in addition to Layer 2 data link information. While recognizing that the term "media information" typically signifies Layer 2 information, the Court finds that the specification demonstrates that "media header information" can include Layer 3 information. Specifically, the specification shows that network addresses, in addition to media addresses, can be determined and used as part of the "media header information." See, e.g., Col. 12, In. 50-60; Fig. 6, element 302. Additionally, even where the patent specifies types of Layer 2 information contained with the "media header," these types are only examples and not an exhaustive list. See Col.5, In. 27-29; Col. 10, In. 17-19 ("the media header information typically includes at a minimum . . . "). Therefore, the Court construes "media header information" as:

"media header information" means information contained in the header of a PDU that provides details about the PDU. The information can be ISO Layer 2 (data link) information or ISO Layer 3 (network) information.

TiVo argues "Media Switch" means "hardware and/or code that connects with CPU and memory." TiVo's Opening Br. at 8-9; TiVo's Op. Br. at 19-21; '389 patent at col. 3:62-64 ("The Media Switch 102 mediates between a microprocessor CPU 106, hard disk or storage device 105, and memory 104."); id. at cols. 2:22-25, 6:59-63, 7:5-23, 14:21-22; TiVo's Markman Slides at 85-97.

EchoStar argues "Media Switch" is specially defined by the '389 patent as "a hardware module that is separate from the computer's CPU, is connected to temporary memory, receives MPEG data representing a television program from one or more Input Sections, parses data into separate video and audio components, using a parser that detects the start of all important events in a video or audio stream and the start of all frames, sends the data to a storage device, retrieves the data from the storage device, and sends it to one or more Output Sections." See '389 patent at cols. 3:62-4:2, 5:31-64, 6:16-46, 6:59-65; 7:19-26; 8:44, & Figs. 1, 2, 7 & 13; EchoStar's Response Br. at 4-7; EchoStar's Slide Presentation at 99-112.

The Court finds that the specification is the best guide to the meaning of the term "Media Switch." As used in the '389 patent, "Media Switch" is hardware and/or code that mediates between a microprocessor CPU, hard-disk or storage device, and memory. This definition is consistent with the use of the term in the patent claims and specification. See '389 patent at col. 3:62-4:2, 4:34-36, 4:55-58, 5:34-36, 6:16-27, 6:59-65, 7:5-11. Neither the claims nor specification limit the Media Switch to a physical device.

Regarding the term "parse", TiVo construes "parse" as "analyze" arguing that "parses said MPEG stream, said MPEG stream is separated into its video and audio components" means "analyzes an MPEG stream, the MPEG stream having distinguished video and audio components." TiVo's Opening Br. at 9-11; TiVo's Op. Br. at 11-13; '389 patent at cols. 4:26-30, 5:3-6, 5:33-36, 6:36-58, & Figs. 6 & 13; TiVo's Markman Slides at 98-112.

EchoStar argues "parses" means "separates," and "said Media Switch parses said MPEG stream, said MPEG stream is separated into its video and audio components" means "the Media Switch must analyze the content of an MPEG Systems stream carrying one television program and from it output two distinct streams: one video MPEG stream and one audio MPEG stream." See '389 patent at Fig. 3 & col. 4:23-29; EchoStar's Opening Br. at 11-12; EchoStar's Response Br. at 7-10; EchoStar's Slide Presentation at 76-98; 6-7-05 Joint Claims Construction Chart at 3.
Although the court finds persons of ordinary skill in the art understand the meaning of the term "parses," for clarification purposes, it defines the term as "analyses." The claim language and the specification are instructive in this regard as both "parse" and "separate" are at times used in the same sentences and claims indicating that the terms are not interchangeable. '389 patent at col. 2:15-16; claims 1 and 32; Abstract; see Innova, 381 F.3d at 1119 (noting that each term used in a claim is presumed to have meaning and that it is permissible to infer, where different terms are used in a claim, that the patentee intended a differentiation in the meaning of those terms). As further evidence that the terms are not interchangeable, "parse" is often used without the term "separate" several times in the specification. '389 patent at cols. 2:22-24, 4:52-54, 5:3-6, 6:36-39, 7:12-16; '389 patent Abstract; see Innova, 381 F.3d at 1119; see Phillips, 415 F.3d 1303, 2005 WL 1620331 at *7.

Therefore, the Court construes "providing a Media Switch, wherein said Media Switch parses said MPEG stream, said MPEG stream is separated into its video and audio components" as "providing hardware and/or code that mediates between a microprocessor CPU, hard-disk or storage device, and memory, wherein said device, portion of a device, or code analyzes said MPEG stream, said MPEG stream is separated into its video and audio components."

8. "media unit"

The parties dispute the construction of the term, "media unit." The term at issue appears in Claim 5 of the '025 Patent as follows:

5. A system of tracking real estate and real estate related demographic information using a computer network system comprising:

   a media unit, said media unit having:

   a multimedia computer;

   a digitizer, said digitizer receiving information from outside said network system and within said multimedia computer;

   i/o means, . . .

(Herbst Decl. P 5, Ex. 3 at col. 15, ll. 57-66.)

Plaintiffs' proposed construction of the term is "a computer system capable of producing real estate related information." Defendants first contend that "media unit" declared invalid for indefiniteness. However, in the event the term is not indefinite, Defendants alternatively propose the term's construction to be a "system that receives analog property information and transmits digital property information via modem to the server's unit." In support of their respective constructions, the parties primarily rely on the '025 Patent specification. However, before turning to the specification, the Court first addresses the words of the claims. See Vitronics Corp., 90 F.3d at 1582.

Turning to the claim language, the Court notes again that is must ascribe the words of a claim their ordinary and customary meaning. Id. "[T]he ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention, i.e., as of the effective filing date of the patent application." Phillips, 415 F.3d at 1313. Here, the Court finds that the claim language is not helpful in ascertaining the ordinary meaning of "media unit." Consequently, the Court will turn to the specification.

The '025 Patent specification provides slightly more insight into the meaning of "media unit." Although the specification does not directly refer to "media unit," it contains several references to "media" and "media multimedia device." Both parties cite to these portions of the specification in support of their respective constructions.

In referring to the term, "media," the specification provides, "[t]he system further includes media terminals for production of
files, including digitized property descriptions. The media terminal has digitizing capabilities to digitize analog input and i/o for receiving and transmitting the digitized information." (Herbst Decl. P 5, Ex. 3 at col. 3, ll. 39-43.) The specification also refers to "media multimedia device," reading "[t]he media's multimedia device 100 would preferably consist of a digitizer 108, compress/decompress unit 106, modem 104, and multimedia PC 102." (Id. at col. 5, ll. 58-60.) Next, the specification also refers generally to "media" in describing Figures 2 and 3. There, the specification provides,

FIG. 2 illustrates the information flow to and from the Media's multimedia device 100 to the Server's Processor 400. The raw data is either gathered from outside sources, generally in the form of analog information 110, or entered directly at the Media's multimedia PC 102. Any analog information 110, albeit audio, video, photos, text, or graphics, must be digitized by Media's digitizer 108, to be read by the PCs used herein. The digitized information is sent directly to the Media's multimedia PC 102. Information from Real Estate Agents and other sources is received via the Media's modem 104, or by any other means, for entry into the Media's multimedia device 100. Data produced by the Media's personnel is directly entered onto the multimedia PC 102. Once entered, the information is edited at the media's multimedia PC 102, as illustrated in FIG. 3.

In construing the term, "media unit," the Court recognizes that the specification identifies a list of parties, entities, systems, and devices associated with the invention. (Herbst Decl. P 5, Ex. 3 at col. 5.) The specification identifies "media" as the primary party responsible for production of property files and possibly all other advertising displayed on the system. The Media has access to all files on the Server and, alternatively, may be part of the Server's system. The Media can include multimedia communications, conglomerates, or local media entities. (Id. at col. 5, ll. 16-22.) In light of the specification, the Court now turns to the parties' proposed constructions.

At the outset, the Court finds that "media unit" is not an indefinite term as Defendants contend. According to the Supreme Court, "[t]he statutory requirement of particularity and distinctness in claims is met only when [the claims] clearly distinguish what is claimed from what went before in the art and clearly circumscribe what is foreclosed from future enterprise." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005) (citing United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 236, 63 S. Ct. 165, 87 L. Ed. 232, 1943 Dec. Comm'r Pat. 758 (1942)). The definiteness requirement, however, does not compel absolute clarity. Id. Only claims "not amenable to construction" or "insolubly ambiguous" are indefinite. See Novo Indus., L.P. v. Micro Molds Corp., 350 F.3d 1348, 1353 (Fed. Cir. 2003); Honeywell Int'l, Inc. v. ITC, 341 F.3d 1332, 1338 (Fed. Cir. 2003); Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001). Thus, the definiteness of claim terms depends on whether those terms can be given any reasonable meaning. Datamize, 417 F.3d at 1347. Here, as discussed more fully below, because "media unit" has a reasonable meaning in light of the intrinsic evidence, the Court finds it is not an indefinite term.

In construing the term, "media unit," the Court recognizes that the specification identifies a list of parties, entities, systems, and devices associated with the invention. (Herbst Decl. P 5, Ex. 3 at col. 5.) The specification identifies "media" as the primary party responsible for production of property files and possibly all other advertising displayed on the system. (Id. at col 5, ll. 17-23.) The device associated with the "media" is a "multimedia device" described as "[a] device and/or system which includes, but is not limited to, video and audio-graphic conferencing and multimedia messaging . . . capable of storing, transmitting, receiving, compressing, decompressing and error correcting, digital information for displaying text, graphics, audio and video." (Id. at col. 5, ll. 26-34.) From there, the patent describes the "media unit" as comprised of a multimedia computer, digitizer, and input/output means. (Id. at col. 15, ll. 61-66, Claim 5.) Taken together, the specification and claim language contemplate that the "media unit" is "computer system capable of receiving analog or digital real estate and real estate related information, and transmitting said real estate and real estate related information."
The Court now turns to the parties' proposed limitations in their respective constructions. Defendants' proposed construction imports three limitations into "media unit": (1) requiring receipt of "analog" property information; (2) requiring transmission of "digital" property information; and (3) requiring that the transmission be "via modem to the server's unit." As to Defendants' first proposed limitation, the Court finds no basis to conclude that the media unit receives only "analog property information." To the contrary, the specification clearly contemplates that the "media unit" is capable of receiving both analog and digital information. Similarly, the claim itself does not contain any indication of such a limitation. The Court finds Defendants' second and third proposed limitations also to be problematic. Defendants' second and third proposed limitations both attempt to import limitations from the '025 Patent's embodiment. Because claims should not be limited to the preferred embodiment, the Court also finds no basis to conclude that the transmissions from the "media unit" are required to be either "digital" or "via modem to the server's unit." See Northern Telecom Ltd. v. Samsung Electronics Co., Ltd., 215 F.3d 1281, 1292 (Fed. Cir. 2000); see also Kemco, 208 F.3d at 1362 (stating "particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments").

Plaintiffs' proposed limitation limits the information associated with "media unit" to be "real estate related information." The Court finds this limitation to be appropriate because the claim itself specifically teaches "[a] system of tracking real estate and real estate related demographic information using a computer network system comprising . . . a media unit." (Herbst Decl. P 5, Ex. 3 at col. 15, ll. 58-60) (emphasis added.)

Thus, having considered the claim terms and the specification, the Court construes "media unit" as "computer system capable of receiving analog or digital real estate and real estate related information, and transmitting said real estate and real estate related information."
3. medical identification number (Claim 33)

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>Alexsam's Proposed Construction</th>
<th>Humana's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>medical identification number</td>
<td>a number used for identification purposes associated with a record in a database containing medical-related data</td>
<td>a number on a patient's card that corresponds to a record containing the patient's medical history information</td>
</tr>
</tbody>
</table>

On this term, the parties disagree as to what a medical database record entails. Because Humana seeks to limit the database to one containing only medical history information, it argues that the record being retrieved using a "medical identification number" has to be a patient's record containing medical history information. Here too, Humana argues that phrase "medical-related data" as proposed by Alexsam is too broad.

The specification does not recite the term "medical identification number." The only related disclosure is of an "identification number encoded on the patient's card" that is used to pull a record containing a patient's medical information stored in a medical information database. See '608 patent, 10:7-12. The Court has, however, construed the term "medical card" to include databases that contain "medical information." Furthermore, the claims allow for the use of single identification number that can be used to access different types of databases. See, e.g., '608 patent, cl. 13. Therefore, it is inappropriate to limit the scope of this term to patient medical history information alone.

The Court construes this term consistent with the preceding one as "a number used for identification purposes associated with a record in a database containing medical information."

2647

2. "Medical service code": 5 A code representing a particular medical service or procedure, e.g., CPT-4 codes, CVS codes, and similar medical service or procedure codes. 6

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
5 The '164 patent claims 1, 2, 3, 6, 12, 13, 14, 15 and 16. "Standard industry practice allows medical claims processors to enter the codes submitted on surgeon claims into a computer system. . . . Two coding methods most frequently used are the American Medical Association's 'Current Procedural Terminology, Fourth Edition (CPT-4),' and the 'California Relative Value Studies (CRVS)." (164 patent, col. 2, ll. 17-24) "The present invention utilizes the CPT-4 codes in the knowledge base of the expert system, although other coding methods for classification of medical procedures such as the CRVS discussed above may be utilized as well." (164 patent, col. 3, ll. 38-42) Code and description are used separately in the '164 patent specification. See '164 patent, col. 10, ll. 17-50 (describing correlating a description to a code before it can be processed); col. 4, ll. 51-54 ("Generally, the user 3 will enter into the computer system 2 a description of the medical claims for which reimbursement or payment is requested or the codes associated with such claims or both.").

2648

C. "Meet"

Lastly, we turn to the disputed claim term "meet." The relevant part of the third limitation of claim 1 of the '211 patent with the disputed term underlined reads as follows:

second storing means . . . for storing selected portions of received television program schedule information which meet at least one of the desired program start time, the desired program end time, the desired program service, and the desired
Acknowledging the variety of dictionary definitions for the term "meet," SuperGuide advocates "satisfies" as the one definition that makes most sense as used in claim 1. It further maintains that it preserved its right to assert this construction. According to SuperGuide, this definition subsumes, but is not limited to, the district court's construction. It further contends that the court's construction precludes certain embodiments disclosed in the specification that describe a viewer entering a start and end time and receiving a range of program listings falling within that period. SuperGuide argues that construing "meet" as "satisfies," however, allows a selection of a range of times, services, and types. Additionally, SuperGuide maintains that by citing a specification passage describing the operation of the "group format transmission" embodiment, the court erroneously imported an unclaimed comparison function into the "second storage means" limitation of claims 1 and 5. Lastly, SuperGuide contends that the passage cited does not support the court's construction.

DirecTV responds by first making a procedural argument that SuperGuide conceded before the district court that "meet" means "equal to or matching" and thus waived its right to assert a different construction on appeal. On the merits, DirecTV argues that the term "satisfies" is more indefinite than "meet" and also that the specification, particularly Figure 4a, is consistent with the district court's construction. In this regard, DirecTV explains that in Figure 4a, "meet" defines the comparative test that compares the received program schedule listings with the user chosen criteria.

We agree with DirecTV that SuperGuide waived its right to assert a construction other than "matches or equals" for the term "meet." Before the district court, DirecTV and EchoStar agreed that the term "meet" means "equal to or matching" and they presented this construction in their consolidated brief. In its reply brief, SuperGuide agreed that the term "meet" should be interpreted as "matches or corresponds." The parties filed a stipulation before the Markman hearing listing all the disputed terms that required construction and the term "meet" was not listed. Nevertheless the term came up at the hearing and SuperGuide made the following comments: 15

The next term that [defendants] go to is meet. There are two interesting things about the meet term. First of all, they say it's got to be exactly and you've got to have identity of what you're talking about. And I don't think there's any disagreement that meet means that it's equal to. Where there's disagreement is that in their comments concerning that claim, they are trying to say that the only thing that it can be is exactly or the identity. And what that leaves out is the analysis under the comprising claim that it can do more than just meet. It can meet it, and it can also do other things along the way because the claim reads comprising. And, so, it has a certain number of things that are within the claim, and if a defendant is out there doing those things plus something else, they can still be found to infringe the claim. And that's exactly the type of thing they're trying to prevent in this case because there may be other things that they're doing in addition to that.

(Emphasis added). SuperGuide argues that these comments demonstrate its efforts to broaden the scope of the term "meet" as used in the claim at issue. We disagree and conclude that this discussion by SuperGuide shows that it agreed that "meet" means "equal to." Rather, it was arguing about the meaning of the term "comprising" in the preamble of the asserted claims. It was making the point that an accused product infringes a claim if it "exactly" meets every limitation and thus has "identity" with the claim. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1328 (Fed. Cir. 2003); Catalina Mktg. Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 812 (Fed. Cir. 2002) (stating that whether an accused system literally infringes an asserted claim depends on whether it "meets every limitation" recited in the properly construed claim).

SuperGuide was further noting that an accused product infringes a "comprising" claim if it meets every limitation and also has additional components. See Vivid Techs., Inc. v. Am. Sci. & Eng'g, Inc., 200 F.3d 795, 811 (Fed. Cir. 1999) (stating that "comprising" is "generally understood to signify that the claims do not exclude the presence in the accused apparatus or method of factors in addition to those explicitly recited"). Because we conclude that SuperGuide is now proffering a broader definition of "meet" than it advocated before the district court, we decline on appeal to address SuperGuide's new construction. See Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1346 (Fed. Cir. 2001) (discussing cases in which the appellate court applied the doctrine of waiver to preclude a party from adopting a new claim construction on appeal because the new construction proffered on appeal changed the scope of the claim construction asserted before the trial court).
In conclusion, we affirm the district court's construction of the claim language "at least one of" and "meet."

2. "membership signatures"

EMC asks the Court to construe this term as: "Information which identifies a mass storage device as a member of a logical set and substantially matching the global identifier." HP proposes (in its opposition brief and at the claim construction hearing, see Transcript of April 6, 2004 Hearing, 161:3-10): "A value or data structure stored either in the array controller or on the mass storage device, reflecting the device's status as an active member of a logical set of mass storage devices by substantially matching the global identifier."

The claim language indicates that membership signatures comprise information substantially matching the global identifier. The specification indicates that a membership signature is assigned "to each of the physical mass storage devices in the set [and it] identifies the physical mass storage device as a member of the set." 497:2/41-44. The set may be a logical set comprised of portions of the physical disk drives. See 497:3/12-16. Additionally, "[t]he signatures for all members are identical, or at least substantially identical (e.g., the signature may include a member number that differs from drive to drive.)." 497:3/16-19.

HP's proposed additional limitations are not supported by the intrinsic evidence. The patentee expressly claimed a location limitation in dependent claim 8, strongly suggesting in light of the doctrine of claim differentiation that there is no location limitation in the independent claim. Moreover, nothing in the claim supports the importation of a limitation requiring the comparison of the global identifier to the membership signature in order to determine whether its status is "active." Instead, the members of a set are assigned membership signatures and the set is given a substantially matching global identifier.

Accordingly, the Court construes "membership signatures" as "information that identifies physical mass storage devices or portions of physical mass storage devices as members of a set and which substantially matches the global identifier of the set."

B. Ref. No. 3 "Memory"

This term is recited in Claim 1 of the Patent. Plaintiff proposes the following construction of the term: "A commonly used internal computer component (here within the voting machine or system) which is capable of storing information (e.g. the voting record of each voter) and interacts with the processor." Defendants propose the following construction: "A commonly used internal computer component (here, within the voting machine or system) which is capable of storing the voting record and the [unique randomly assigned identifying number or unique identifier] and interacts with the processor."

Claim 1 provides, in relevant part, that the method for voting claimed includes a step of "[s]toring the voting record including the voting selections made during the voting session in the unique randomly assigned identifying number in a memory." (Defs. Ex. 3, Col. 27, ll. 48-50.) The language in the Claim itself supports Defendants' construction of the term "memory." Moreover, the specifications cited by Plaintiff support the position that the voting session identifier is stored in the "memory." (Id. Col. 8, ll. 53-62.) There is no difference between the cited language in the '787 Patent and the '730 Patent; therefore, the Court adopts its prior construction of the term "memory."
"Memory" is construed as:

A commonly used internal computer component (here, within the voting machine or system) which is capable of storing the voting record and the [unique randomly assigned identifying number or unique identifier] and interacts with the processor.

Claims 1 and 8 of the '521 patent contain the term "memory." IPI contends that the term is entitled to its ordinary meaning. Defendants contend that the term should be restricted to "primary memory in a computer." The parties agree that the neither the specification nor the claims provide any guidance regarding the specific type of memory required by the claims. To support its limitation of "memory" to primary memory, Defendants urge that the technical definition of "memory" refers only to "primary memory" as distinguished from "secondary" storage. See Prentice Hall's Illustrated Dictionary of Computing (1992) at 280. On the other hand, IPI suggests that the technical meaning of "memory" does not limit it solely to primary memory. See Oxford Dictionary of Computing (4th ed. 1996) at 299 (defining "memory" as "a device or medium that can retain information for subsequent retrieval").

Considering that the type of memory used to practice the claims is neither central to their scope or the context of the invention, importing an additional limitation of "primary" memory from discordant dictionary definitions is improperly limiting and unhelpful to the jury. See Home Diagnostics, 381 F.3d at 1358 (Fed. Cir. 2004) ("Absent a clear disavowal or contrary definition in the specification or the prosecution history, the patentee is entitled to the full scope of its claim language."). Defendants' proposed definition is rejected. The term "memory" is entitled to its ordinary meaning, and no further definition is necessary.

Papst asserts that the term "memory" as used in Claim One of both the '399 and the '449 Patents should be construed by the Court and that the term means "any type of semiconductor memory such as EPROM, EEPROM, and RAM," 23 Papst's App. at 2, as these are examples given in the Patents. See, e.g., '399 Patent, col. 7:23-25 ("In addition to the digital signal processor memory, which comprises the operating system of the digital signal processor and can be implemented as an EPROM or EEPROM"); '449 Patent, col. 6:23-26 (same); '399 Patent, col. 10:14-15 ("In FIG. 2, the memory means 14 of FIG. 1 is implemented by an EPROM"); '449 Patent, col. 9:14-15 (same); '399 Patent, col. 9:18-20 ("[T]he DSP can be any DSP but preferably has a 20- MB on-chip random access memory (RAM)"); '449 Patent, col. 8:18-21 (same). The Camera Manufacturers contend that the term need not be construed but if the Court decides to do so, the term should be interpreted broadly to mean "any type of memory," which could include a hard drive. CMs' Slides at 245.

23 RAM is volatile memory; EPROM and EEPROM are non-volatile memory. Tr. 3:138 (Papst). ROM in EPROM and EEPROM is read only memory. Tr. 3:142 (CMs). The specification explains that the non-volatile memory in the interface device is used for storing instructions like the operating system. See '399 Patent, col. 7:23-26 ("In addition to the digital signal processor instruction memory, which comprises the operating system of the digital signal processor and can be implemented as an EPROM or EEPROM, the memory means can have an additional buffer . . . ."). '449 Patent, col. 6:23-27 (same).

The key difference between the parties' proposed definitions is whether the term "memory" can include a hard drive. The
Camera Manufacturers agree with Papst that the inventor did not disclose an actual hard drive as part of the interface device, Tr. 3:141 (CMs), but they insist that the term "memory" is broad and could include a hard drive. Papst's proposed definition necessarily excludes a hard drive because a hard drive is electro-mechanical (and not semiconductor) and Papst's proposed definition is "any type of semiconductor memory." Papst's App. at 2.

Papst further argues that "memory" is not used in the Patents to mean a storage device, which could include a hard disk drive, and thus memory should be construed to exclude hard drives. The Patent refers to storage devices "such as hard disk drives, tape drives, and floppy drives." Tr. 3:136 (Papst); accord '399 Patent, col. 4:36-39 ("Drivers for other storage devices such as floppy disk drives, CD-ROM drives or tape drives could also be utilized."); '449 Patent, col. 3:39-42 (same); see also '399 Patent, col. 11:66-67 & col. 12:1-3 ("Using the ASPI manager . . . the present invention can now obtain active access to a[] SCSI hard disk . . . which . . . cannot be a virtual but a real SCSI mass storage device . . . .") (emphasis added); '449 Patent, col. 11:1-5 (same).

Papst's construction is strained. Just because the specification refers to storage devices such as hard drives does not mean that the "memory" cannot include a hard drive. And just because the specification referred to three types of semiconductor memory does not mean that "memory" can only include semiconductor memory. The IEEE dictionary definition at the time of the invention defines "memory" as "Memory (electronic computation). See: storage; storage medium."

New IEEE Dictionary at 797. The IEEE dictionary defines "storage" broadly as:

Storage (1) (electronic computation).

. . .

(B) Any device in which information can be stored, sometimes called a memory device.

(C) In a computer, a section used primarily of [sic] storing information. Such a section is sometimes called a memory or store (British).

Notes: (1) the physical means of storing information may be electrostatic, ferroelectric, magnetic, acoustic, optical, chemical, electronic, electric, mechanical, etc., in nature. (2) pertaining to a device in which data can be entered, in which it can be held and from which it can be retrieved at a later date. See store.

(2) (data management). In a computer, one or more bytes that are used to store data.

Id. at 1294-95. Papst's distinction between memory and storage is not reflected in the New IEEE Dictionary, nor is its distinction between semiconductor memory and other physical means of storing memory. "Memory" means "any type of memory."

b. "memory" and "a memory"

The plaintiffs propose "all of the storage elements on the substrate and the control circuitry configured to access the storage elements." The defendants claim that this term is indefinite, but if construction is possible, they propose "an information storing array that does not include registers, cache or column latches." n3 The main dispute appears to be whether or not memory can include registers, cache, or column latches.
The defendants contend that "memory" and "column latches" must have different meanings because when two claim terms are used, they are presumed to mean different things. See '148 patent, claim 1. The defendants, therefore, argue that "memory" cannot include "column latches." The defendants also point out that the specification recognizes that latches, registers and cache can exist within the CPU which is separate from the memory. See '148 patent, 4:5-10, 4:14-19, 5:58-60.

The plaintiffs contend that the specification describes DRAM to include registers and column latches. '148 patent, 8:65-9:4. The defendants, moreover, agree that registers, cache, and column latches may be considered part of the memory when they are included in the storage array. Defendants'Responsive Claim Construction Brief, at 34.

In the Court's view, the plaintiffs' proposal is too broad because it would include storage elements that are within the CPU. On the other hand, the defendants' proposed construction is too limiting because it would exclude registers and cache that one of ordinary skill in the art would consider to be types of memory. The claim language, however, does indicate that "memory" does not include "column latches." "Memory" and "column latches" are two distinct elements in Claim 1 of the '148 patent. The claim also states, in relevant part, that "a plurality of column latches [is] coupled to . . . the memory . . . ." '148 patent, 31:11-12. If "memory" included "column latches," then the claim would not need to specify that "column latches" are coupled to the "memory." Accordingly, the Court construes "memory" to mean "storage elements other than column latches."

2. "memory"

Plaintiffs' construction: a chip dedicated to the nonvolatile storage of data for subsequent retrieval

Defendant's construction: a device in which information may be stored and from which the same information may be subsequently retrieved

The parties' primary dispute with respect to this term is whether memory must be nonvolatile in nature. They also disagree whether it is stored on a "chip" or a more general "device." Both parties rely on similar dictionary definitions for the "ordinary" meaning of the term. Apparently the dictionaries disagree about whether memory is something stored on a "chip" or a "device." The parties have offered no reason to believe that one set of dictionaries is more persuasive than the other and I will not speculate independently.

Next, nothing in the claim terms or the specification of the '839 patent provides a definitive answer regarding the volatile or nonvolatile nature of memory used in the patented device. Therefore, the parties rely on dueling expert opinions to support their arguments. The Court of Appeals for the Federal Circuit has held that expert testimony "can be useful to a court" but has cautioned also that it is generally "less reliable" than intrinsic evidence. Phillips, 415 F.3d at 1318.

This case presents a clear example of why expert evidence may be of limited value in claim construction. Plaintiffs' expert states that memory "must be non-volatile in order to obviate a manual field upgrade or system swap when a new function, application or transducer scanhead is introduced." Schafer Decl., dkt. # 41, at 16. Defendant's expert takes the opposite position. He asserts that the memory can be volatile, nonvolatile or a collection of both kinds. Waag Decl., dkt. # 46, at 15.

In their claim construction briefs, the parties attempt to discredit each other's expert witnesses but neither has pointed to anything that demonstrates that the experts are correct or incorrect as a matter of law. This is a problem. A court construing patent claims may resolve legal disputes, Markman, 52 F.3d at 970-71, but it may not resolve genuine issues of fact.

Therefore, I will decline to adopt either proposed construction of "memory."

These terms appear in the claim language as follows:

1. A method of displaying stored intra-oral radiographs, comprising:

   . . .

   displaying a stored intra-oral radiograph corresponding to said selected target intra-oral radiological site.

2. A method for storing and displaying intra-oral radiographs, comprising: generating and displaying intra-oral radiographs of dentition;

   . . .

   storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation along with indicia of respective selected intra-oral radiological sites; and

   subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation.

3. A program storage device readable by a machine and tangibly embodying a representation of a program of instructions adaptable to be executed by said machine to perform the method of any one of claims 1 or 2.

4. A device for storing and displaying intra-oral radiographs, comprising:

   . . .

   a memory in which said x-ray images are stored;

   . . .

   means, responsive to selection of said selectable sites, for displaying corresponding stored x-ray images.

5. The device of claim 4, further comprising:

   an image digitizer for digitizing x-ray images produced by said sensor before storage in said memory.

The parties originally submitted an agreed construction of "stored, storage, and memory" as referring to "any form of volatile or non-volatile data storage, including but not limited to hard disk drives, random access memory ["RAM"], floppy disks, and optical media, in addition to any other data storage devices or means." However, Plaintiffs later withdrew their agreement to this construction.

Defendants argue that the Court should order that these terms include any means or device for data storage, including but not limited to random access memory ("RAM"). Otherwise, Defendants assert, jurors might incorrectly draw a distinction between easily recognizable and dedicated devices for data storage, such as floppy disks and hard drives, and RAM. However, Defendants argue, the specification clearly includes RAM as a means for storing information in conjunction with the claimed invention, and thus the jury should have clear guidance that RAM is one possible form of memory and carries out the function of storage.

Plaintiffs agree that "memory," "storage," and "stored," encompass all types of computer memory, but take issue with Defendants' request for clear guidance that RAM carries out the function of storing because it would conflate the media on which the action of storing may be done with the action of storing. Plaintiffs assert that whether the RAM in an accused device or an alleged prior art device is being used to perform the function of recording, retaining, or preserving radiographic images and whether that function is being done "responsive to selection" is a fact issue that should be reserved to the jury. Thus, whether the RVG performed the function of "storing" is a fact issue for the jury. Plaintiffs contend that the terms are plain and ordinary on their face and need no construction. Plaintiffs argue that construing these terms could be confusing to the jury. Plaintiffs are also opposed to a jury instruction stating or suggesting that the mere existence of data in volatile...
"Storage" is used in claim 3 in the context of a "program storage device." Program storage devices are defined in claim 3 as being readable by a machine and tangibly embodying a representation of instructions adaptable to be executed by said machine, and thus program storage device refers to a device for storing the software that performs the methods of claims 1 and 2, which is loaded onto a computer. The specification states that "program storage medium can be any machine readable storage medium such as, for example, a floppy or hard magnetic or optical disk, or a programmable read-only memory." Column 3, lines 4-7. Contrary to Defendants' argument, see Joint Claim Construction Statement (docket no. 75) at 11, this portion of the specification does not describe the memory onto which x-ray images are stored, but describes only the program storage medium, i.e., the media on which the software to be loaded onto the computer memory can be stored. The program storage medium (item 23 on Figure 1) and the memory (item 22) are clearly distinct, and thus the listing of program storage media does not apply to the memory.

Claims 4 and 5 refer to a memory in which x-ray images are stored and to x-ray images being digitized before storage in said memory. The summary of the invention also states that, "the images are then stored, preferably after digitization, in a computer memory." Column 2, lines 18-20. Figure 1 depicts the memory, and the specification also states that the CPU loads software embodying the present invention into memory. However, neither Figure 1 nor the specification describe the memory. The only possible description can be in the preferred embodiment, which describes a computer with 8 megabytes of system RAM and 40 megabytes of hard disk drive. The claim language also makes clear that stored x-ray images correspond to selectable sites and are stored in response to selection of those sites. Further, the images are "subsequently" retrieved and displayed in response to selection of the sites, indicating that they are stored for subsequent retrieval. Thus, "storing" means "placing in memory for subsequent retrieval," and "stored" means "placed in memory for subsequent retrieval." "Storage" as used in claim 5 means "placement in memory for subsequent retrieval." The real dispute centers on what is meant by the term "memory" and whether it includes random-access memory ("RAM").

As noted, Plaintiffs originally stipulated that "memory" could include RAM, but now oppose a construction stating that placement of the x-rays in RAM would constitute the act of storing. Plaintiffs argue that placement of the x-rays in RAM or volatile memory "does not necessarily establish that the action of storing' has occurred -- at least not in the sense of saving the information long-term for later retrieval, as described on columns, 5-6 of the 579 specification." Further, Plaintiffs argue, though the specification describes a preferred embodiment of a computer system that includes RAM, it never describes RAM as a storage device, and the specification indicates that a radiographic image can reside on display memory (RAM) before it is stored.

Defendants argue that Plaintiffs should be held to their prior agreed construction, which is consistent with the specification's description of the preferred embodiment and is consistent with the extrinsic evidence. Defendants point to Dr. Dove's deposition testimony in a related case over the same patent, in which he testified that "stored" means "it resides somewhere . . . it can be in computer RAM memory, on memory. It could be stored on the hard drive, CD-ROM. It could be stored somewhere. There are more storage devices in computers." He also agreed that "both volatile [RAM] and nonvolatile memory is what the patent was referring to in terms of retrieving images that were stored." Defendants further point to Plaintiffs' argued construction in the recently filed and settled patent infringement suit (involving this same patent) against Planmeca U.S.A., in which they stated that "the 579 specification supports a broad construction of these computer memory and storage terms. The 579 specification describes both volatile and non-volatile types of computer memory. The preferred computer at that time included 8 megabytes of RAM,' which is a type of volatile memory, and 40 megabytes of hard disk drive,' which is a type of non-volatile memory."

The Court agrees with Defendants that "memory" is not limited by the specification to any particular type of memory, but could include RAM or hard disk space as described in the specification. Plaintiffs argue that placement in RAM is not storage "in the sense of saving the information long-term for later retrieval, as described on columns 5-6 of the 579
specification." However, while the specification indicates that various exams corresponding to different dates and times can be stored, see Column 3, line 59-60, Column 4, lines 3-5, and Figure 2 (displaying four intra-oral examinations conducted over sixteen months), tending to indicate a long-term storage, a close reading of the specification reveals that there is no indication that the invention relates only to such long-term storage. It does not even state that the x-rays will continue to be stored after the computer or program is shut down. Thus, the Court construes the term "memory" as "any form of volatile or non-volatile computer memory, including random-access memory (RAM) and hard disk drive space."

## 2656

# 8

# 8 -- "memory" -- (appears in claims 44 and 45) Luma's Construction (Luma May 4, 2005, p. 4).

**MASTER'S CONSTRUCTION**

# 8 -- "memory" -- means a device for storing information or data.

**REASONS**

**INTRINSIC EVIDENCE**

The Patent Specification has numerous references to "memory". For example, the Specification refers to "image database" can reside in any suitable memory device in system 10 (e.g. disk storage". Col. 29, Ls. 5-9).

**EXTRINSIC EVIDENCE**

The Markman Hearing provides a definition of "memory". Nutter, when asked what "memory" is, he responded, "memory is where information is stored", "data or information". (Nutter, Markman Hearing Tr. 117: Ls. 11-15). This is consistent with the Master's Construction.

**LUMA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION**

Luma's construction is set forth in (Luma May 4, 2005, p. 4).

Luma is asking that "memory" be constructed but Luma limits it to long-term storage of an image from an input device of the imaging system. Claim 44 has further limiting language of a memory that is configured to store images from an input device. The Master agrees that the language in the claim limits the term "memory". Luma has not requested that the entire phrase be constructed. Luma has only asked that "memory" be construed. That is what the Master did.

**STRAKER'S POSITION AND MASTER'S COMMENTS ON THAT POSITION**

Stryker's position is set forth in Stryker May 23, 2005, p. 11.

Stryker argues that Luma's proposed construction is incorrect for the same reasons that Stryker asserted with respect to Luma's construction of "still frame buffer". Other than the objection to "piecemeal" construction, the Master is not certain how to apply those reasons to the term "memory". Therefore, one is directed the Master's comments to Stryker's position for the "still frame buffer".

**KSEA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION**

KSEA's position is set forth in (KSEA May 23, 2005, Sheet 9).

KSEA argues that "memory" should be given its plain ordinary meaning. The Master has done this as guided by the intrinsic evidence and extrinsic evidence. KSEA points to the fact that Luma has "cut out" certain language in the claim following
"memory". The Master acknowledges this. However, Luma has requested that only the term "memory" be construed. The other language will further limit the "memory" as construed when the scope of the entire claim is determined.

J. First Memory/Second Memory

Various claims of the '131 patent include the term memory, first memory and second memory. Visto proposes that the court define "memory" to mean "a medium where information can be stored and retrieved." Seven contends that the court should define "first memory" to mean "a medium where information can be stored or retrieved, which is located within a firewall-protected corporate LAN and stores workspace elements." Also, Seven contends that the court should define "second memory" to mean "a medium where information can be stored or retrieved, which is located on a global server and stores independently modifiable copies of workspace elements." The court defines memory pursuant to Visto's proposal to mean "a medium where information can be stored and retrieved." The court is not persuaded that the patents incorporated the various locational limitations included in Seven's proposed definitions. The terms "first" and "second" need no construction.

2. Element [B] - "Memory"

The parties dispute the proper construction of the term "memory" in element [B]. WeddingChannel argues that "memory" entails any device where information can be stored and retrieved. The Knot argues that the term is more restrictive, encompassing only the volatile main storage in a computer --i.e., the RAM.

WeddingChannel argues that its proposed construction is supported by the plain meaning of the term "memory" (as understood by one of ordinary skill in the art of the '753 patent). The Microsoft Computer Dictionary (4th ed. 1999)(5th ed. 2002), which WeddingChannel cites in its brief, defines "memory" as follows:

A device where information can be stored and retrieved. In the most general sense, memory can refer to external storage such as disk drives or tape drives; in common usage, it refers only to a computer's main memory, the fast semiconductor storage (RAM) directly connected to the processor.

WeddingChannel acknowledges that pursuant to the Microsoft Dictionary definition, the term "memory" is used to refer narrowly to "RAM," and the term is also used to refer more generally to a computer system's external storage capacity (e.g., disk drive memory). WeddingChannel argues that where, as here, "more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim term may be construed to encompass all such consistent meanings." Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002).

Moreover, WeddingChannel argues that the intrinsic evidence compels a construction of the term "memory" that encompasses both volatile system memory and also disk drive memory. See id. (stating that "the objective and contemporaneous record provided by the intrinsic evidence is the most reliable guide to help the court determine which of the possible meanings of the terms in question was intended by the inventor"). WeddingChannel points out that the specification uses the term "system memory" to refer exclusively to RAM. However, the claims do not use the term "system memory." Rather, they refer generally to "memory" thereby evidencing, in WeddingChannel's view, an intent to encompass both RAM and disk-drive memory.

WeddingChannel argues that the text of the specification and Figure 1 demonstrate that the term "memory" must encompass both RAM and disk-drive memory. The description of the general architecture of system 100 states:

System 100 has a standard computer configuration including at least one central processing unit (CPU) 102, at least one hard disc 104, an optional user interface 106, a network interface 112, and a system memory 114 that are connected by bus 138. Disc 104 is used to store various components of system memory 114. Optional user interface 106 can perform tasks
such as monitoring traffic on system 100, controlling disc 104 data upload or download, and/or optimizing a component of system memory 114.

'753 Pat. at col. 4, ll. 25-33. The above-excerpted text provides that disc drive 104 is "used to store various components of system memory 114." Id. at ll. 29-30. Elsewhere in the specification, Figure 1 shows system memory 114 storing various system 100 software modules and data components. WeddingChannel argues that, taken together, the specification's text and graphics provide that the burden of storing system 100's software and data is shared by disc drive 104 and system memory 114 (i.e., the RAM). Based on the fact that the specification appears to provide that the storage burden is shared between the two different types of memory, WeddingChannel concludes that the claimed memory must be construed to entail more than just RAM.

WeddingChannel argues that its construction of the term "memory" is further supported by the statement in the specification that "optional user interface 106 can perform tasks such as . . . controlling disc 104 data upload or download . . . ." Id. at ll. 30-32. WeddingChannel explains that as used in this passage, a "data upload" is a data update received from a registry database provider using software called an "upload module." Claim 39 states that the "first registry" referenced in Claim 35 is (1) stored in said memory, and it is (2) a copy of a registry stored in a master registry database stored in a remote server. Id. at col. 15, ll. 23-25. Claim 40 states that the memory referenced in claims 35 and 39 includes an upload module that facilitates the receipt of updates by the first registry from the master registry. Finally, WeddingChannel points out that claim 43 states that the upload module described in claim 40 uses a file transfer protocol to send the updates referenced in claim 40 to the memory referenced in claims 35 and 39. Id. at col. 15, ll. 36-37.

According to WeddingChannel, claims 39, 40 and 43 establish that the "memory" of claim 35 must encompass a disk-drive memory: Claim 43 says that the update is sent by the upload module to the memory referenced in claims 39 and 35, and the specification says that update data are uploaded to disc drive 104. Therefore, for claim 43 to encompass the disclosed embodiment (as it must), the "memory" of claim 35 must be construed to include disk-drive memory. See, e.g., Dow Chemical Co. v. Sumitomo Chemical Co., Ltd., 257 F.3d 1364, 1378 (Fed. Cir. 2001) (stating that it is "well established that a claim construction that excludes a preferred embodiment is 'rarely, if ever, correct'") (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996)).

The Knot argues that the WeddingChannel has misinterpreted the specification. First, the Knot argues that no significance should be attached to the fact that the specification refers to "system memory" while the claim uses the seemingly more general term "memory." Rather, the Knot argues that the specification refers to the "memory" as "system memory" merely because it is the memory of what is labeled "system 100."

The Knot also disputes WeddingChannel's interpretation of the specification as providing that disc 104 and system memory 114 are complementary components of the memory which share the burden of storing the system's software and data. The Knot argues that the specification merely provides that disc 104 stores some of the non-physical elements of system 100. Furthermore, the Knot points out that Figure 1 shows all of the system's non-physical components stored in system memory 114. The Knot argues that this interpretation of the specification is consistent with its interpretation of claim 35 as requiring that the memory (i.e., system memory 114) contain all listed non-physical elements of the claim. The Knot points out that the claim does not state that such RAM memory is the only place where such information can be stored.

The Knot also disputes WeddingChannel's argument that the "upload module" of claim 40 can only upload data to disc 104. The Knot points out that the specification shows the "upload module" stored in the system memory.

Reading the claim and the specification together, the Knot concludes that the claim provides: (1) that the RAM necessarily stores all claimed non-physical elements of system 100; (2) that the disk drive serves as a back-up to the RAM; and (3) that the disk drive stores duplicate versions of at least some of the information stored in the RAM.

WeddingChannel has correctly observed that the term "memory," as used by one of ordinary skill in the art, is broad enough to encompass both RAM and disc memory. Furthermore, WeddingChannel has demonstrated that the specification teaches storage of certain software components of system 100 in disk drive 104. Therefore, WeddingChannel's construction of the term "memory" is adopted.
IV. CLAIM CONSTRUCTION

At issue in this controversy is the meaning of "without utilizing any memory buffer."

As noted above, claim construction begins with the words of the claim. Teleflex, 299 F.3d at 1324. The words of the claim generally are given their "ordinary and customary meaning." Phillips, 415 F.3d at 1312 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). This "ordinary and customary meaning" is the meaning that the term would have to a person of ordinary skill in the relevant art at the effective filing date of the patent application. Id. at 1313. If this meaning is readily apparent to the court, then claim construction may involve "little more than the application of the widely accepted meaning of commonly understood words." Id. at 1314.

The term "without utilizing any memory buffer" is used in each independent claim of the '141 Patent. (UF 1.) Defendant maintains that "any memory buffer" should be interpreted to mean "a memory buffer of any type whatsoever," i.e., computer hardware or software that allows information to be stored temporarily or permanently. It is not readily apparent to the Court, however, that this is the meaning the term would have to a person of ordinary skill in the art reviewing the patent. The language of the term itself is ambiguous and does not clearly delineate the scope of what it purports to describe. The Court must therefore look to "intrinsic evidence," that is, "those sources available to the public that show what a person of skill in the art would have understood disputed claim language to mean." Phillips, 415 F.3d at 1312.

A. Intrinsic Evidence

1. Language of the Claims

First, within the category of intrinsic evidence, the language of the claims themselves "provide[s] substantial guidance as to the meanings of particular claim terms." Id. at 1314. The context in which a term is used may be highly probative, as may its usage in other claims in the disputed patent. Id. Differences among claims may also help guide a district court in ascribing meaning to particular terms. Id.

Here, claim language is not helpful in defining the scope of the term "memory buffer." Claims 1, 5, 15, 18, 34, 37, 45, and 48 contain the phrase: ". . . such that the copied data directly flows from said source HDD to said multiplicity of target HDDs without utilizing any memory buffer." (McCloskey Decl., Ex. A, ICS00085, ICS00086, ICS00087, ICS00089, ICS00090.) Claims 7, 12, 23, 29, 38, 42, 53, and 57 contain the nearly identical phrase: ". . . such that the copied data directly flows from said source HDD to said at least one target HDD without utilizing any memory buffer." (McCloskey Decl., Ex. A, ICS00086, ICS00087, ICS00088, ICS00090, ICS00091.) It is evident, therefore, that context does not provide much assistance, as the disputed term is used identically in each instance in which it appears in the various claims. Specifically, in each claim, a particular device or function is described, and the disputed phrase follows as language of limitation. For instance, the relevant portion of Claim 18 reads:

   g. said data bus switches and said control signal switches controlled by said internal means to operate said direct data path between said source HDD and said at least one target HDD such that the copied data directly flows from said source HDD to said at least one target HDD without utilizing any memory buffer.

(McCloskey Decl., Ex. A, ICS00090.) All of the other disputed claims contain nearly identical language, and none use the term "memory buffer" in a way that sheds light on the term's meaning.

2. The Specification

The Court next turns to the patent specification for guidance.

Because the claims are but one component of the patent instrument, "they must be read in view of the specification, of which they are a part." Phillips, 415 F.3d at 1315 (quoting Markman, 52 F.3d at 979). The specification is always relevant to claim construction analysis, and is generally dispositive. Id. In particular, the patent specification may reveal a special
definition given to a claim term by the patentee, one that differs from the meaning it would otherwise possess. Id. at 1316. In such a case, the patentee's lexicography governs. Id. The specification may also reveal a disclaimer or disavowal of claim scope by the patentee. Here too, the patentee's intention governs. Id. Though a court may rely on the specification to determine the meaning of a claim, it should not import limitations from the specification into the claim. Id. at 1323. The line between construing terms and importing limitations can be difficult to apply in practice, but "can be discerned with reasonable certainty and predictability if the court's focus remains on understanding how a person of ordinary skill in the art would understand the claim terms." Id.

Plaintiff points the Court to two relevant sections of the specification. The first states:

The primary novel features of the present invention include: (1) the PC can read and write to the source HDD, or any of the target HDDs; (2) multiple target HDDs can be created at the same time; (3) data flows from the source HDD to the multiple target HDDs directly without having the data saved in the PC memory; and (4) the speed of duplicating multiple HDDs simultaneously is significantly increased.

(McCloskey Decl., Ex. A, ICS00081.) Identical language appears in the original patent application. (McCloskey Decl., Ex. A, ICS00105.) The third listed novel feature ("data flows from the source HDD to the multiple target HDDs directly without having the data saved in the PC memory") is relevant to defining "memory buffer." This language is very similar to the phrase repeated in each of the disputed claims ("...such that the copied data directly flows from said source HDD to said multiplicity of target HDDs without utilizing any memory buffer.") Both describe data flows from the source HDD to target HDDs without the use of "PC memory" (specification language) or a "memory buffer" (claims language). Naturally, this indicates that "PC memory" and "memory buffer" mean the same thing. Plaintiff also points to a portion of the specification explaining that:

Typically, the present invention HDD duplicator is at least five times faster than conventional HDD duplicators which do not provide direct data transfer between the source HDD and the target HDD but rather pass the data through the PC's data buffer.

(McCloskey Decl., Ex. A, ICS00083.) This language is also helpful in defining the meaning of "memory buffer." It describes "direct data transfer" as occurring without passing data through a PC's data buffer. It follows that claims language referring to direct data transfer without a "memory buffer" means transfer without a PC's data buffer.

In sum, language in the specification closely parallels language found in the various disputed claims. This suggests that within the lexicography of the patentee, "memory buffer" is synonymous with "PC memory buffer." Defendant responds that the patentee has not sufficiently defined the term at issue to qualify as his own lexicographer. On the contrary, although "any special definition given to a word must be clearly defined in the specification," Markman, 52 F.3d at 980, a specification may define terms by implication, and rigid formal definitions are not required. Astrazeneca AB v. Mutual Pharm. Co., 384 F.3d 1333, 1339-40 (Fed. Cir. 2004). Here, Plaintiff has successfully established the meaning of "memory buffer" by implication.

Although the specification by itself suggests the proper claim construction, the Court will turn to the prosecution history to verify this finding. See id. at 1341 (finding that consideration of prosecution history is proper even when patent specification is unambiguous).

3. Prosecution History

Prosecution history is the third form of intrinsic evidence useful to a district court in construing claims. See Phillips, 415 F.3d at 1317. As with the specification, the prosecution history assists the court in determining how the PTO and the inventor understood the patent. Id. However, "because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes." Id. Nevertheless, examining the prosecution history in construing a claim allows a court to exclude any interpretation that was disclaimed by the patentee during prosecution. Id. Use of prosecution history to construe a claim should not be confused with its use in assessing prosecution history estoppel to determine the scope of a claim. See Markman, 52 F.3d at 980 ("Although the prosecution history can and should be used to understand the language used in the claims, it too cannot 'enlarge, diminish, or vary' the limitations in the claims.").

- 3000 -
The prosecution history in this case is not straightforward. Nevertheless, it supports the conclusion that "memory buffer" means "PC memory buffer."

As part of the First Office Action, PTO Examiner King allowed many of Plaintiff's claims, finding that prior art did not reveal an HDD duplicator that enabled direct duplication of data between source and target HDDs without "processing and storage elements (i.e. CPUs, buffers, memories) between the source HDD and the multiplicity of target HDDs." (UF 11.) At this stage, none of the claims in Plaintiff's patent application contained the phrase "without utilizing any memory buffer." (UF 5.)

The PTO then issued a Second Office Action reversing claims allowed in the First Office Action. (UF 12.) PTO Examiner Peikari rejected the earlier claims based on prior art, namely the Bodo patent. (UF 13.) After this Office Action, Examiner Peikari wrote in an Interview Summary, "Applicant will amend the claims to include the central feature of direct transfer to storage devices without the use of the PC's buffer (note pg. 17 of spec. & fig. 2). Bodo, in Col. 4, lines 22-26, teaches away from this feature." (UF 15.) Plaintiff and the PTO thus contemplated adding language to the claims that described direct transfer without use of a PC's buffer. In response to this Office Action, Plaintiff's second set of amendments added claims language containing the words "without utilizing any memory buffer." (UF 17.) This strongly suggests that "memory buffer" and "PC buffer" were considered synonymous by Plaintiff and the PTO.

The Notice of Allowability subsequently issued to Plaintiff also indicates that "memory buffer" means "PC buffer." Examiner Peikari stated that Plaintiff's second set of amendments put the remaining pending claims "in condition for allowance by further including control means operable to determine and utilize system parameters such that the data transfer may occur with synchronized timing between the sender and receiver, as opposed to intermediate storage in a buffer memory." (McCloskey Decl., Ex. A, ICS00211.) This language by itself is not dispositive, but Examiner Peikari also stated that "[t]he use of a portable hard disk drive duplicator was taught by Bodo, 5,777,811, cited in the previous Office action, however, the Bodo system required the use of the buffer of the PC system to which the duplicator was connected. The amendment of 4/15/99 specifically limited each of the independent claims to data transfer 'without utilizing any memory buffer', thus overcoming the prior art rejection." (McCloskey Decl., Ex. A, ICS00211-212.) This statement clearly explains that prior art required the use of a PC buffer system, and that Plaintiff overcame the prior art objection by including the language "without utilizing any memory buffer" in its claims. Again this suggests that "memory buffer" refers to a PC buffer system.

On June 25, 1999, Plaintiff filed a request for continuation of the original application. (UF 30.) In response to Plaintiff's request, Examiner Peikari issued an Office Action on September 22, 1999 rejecting many of Plaintiff's claims as obvious under § 103(a). He stated that the feature of transfer between systems without the use of a storage buffer was known in the art at the time of invention, and that such a feature was found in Read and Korth. (McCloskey Decl., Ex. A, ICS00245.) Because of this prior art, Examiner Peikari determined that it would have been obvious to a person of ordinary skill in the art at the time of invention "to directly transfer data in the Bodo system between target and source memories without the use of an intermediate buffer . . . ." (McCloskey Decl., Ex. A, ICS00245.)

Two months after this, Plaintiff submitted an amendment responding to this Office Action. Plaintiff acknowledged Bodo's teaching that RAM receives data from one device and supplies it for writing to the other device. (McCloskey Decl., Ex. A, ICS00265.) Plaintiff distinguished Bodo on the basis that Plaintiff's invention uses data switches and control signal switches that enable the copied data to directly flow "from the source HDD to target HDDs without utilizing any memory buffer." (McCloskey Decl., Ex. A, ICS00265.) Plaintiff emphasized that a PC was not a necessary component of the invention, and thus deleted all references to a PC or parallel port in the amended claims. (McCloskey Decl., Ex. A, ICS00267-268.) Defendant contends that the RAM referred to in Bodo is internal to the device itself, and is not part of a PC. (Def's. Mot. Summ. J. 17.) Defendant maintains that "direct data path" means a data path without PC memory and notes that the claims already contained the phrase "direct data path" prior to amendment. (Def's. Mot. Summ. J. 18.) From this, Defendant reasons that the addition of the term "without utilizing any memory buffer" narrowed the scope of the claims to exclude a non-PC memory buffer. 5 (Def's. Mot. Summ. J. 18.)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

5 The Court rejects Defendant's contention that the portions of the specification cited above are only relevant to two of the claims as granted, those that refer to PC control of data. Rather, the specification is also relevant to defining the term
"memory buffer" contained in Plaintiff's final amendments.

The Court disagrees with Defendant's reading of the prosecution history. Plaintiff emphasized in its response to the final Office Action that what distinguished its invention from Bodo was that no PC was necessary to operate the device. (McCloskey Decl., Ex. A, ICS00267-268.) Defendant added the language "without utilizing any memory buffer" for the purpose of distinguishing its invention from Bodo.

In sum, the prosecution history indicates that the term "memory buffer" refers to PC memory, and not merely to a buffer within the duplication device itself.

B. Extrinsic Evidence

Both Plaintiff and Defendant have advanced expert testimony.

Expert testimony may be useful to the court for a number of purposes, such as (1) to provide background on the relevant technology; (2) to explain how an invention works; (3) to ensure that the court's understanding of the technical aspects of the patent is consistent with that of a person of skill in the art; or (4) to establish that a term in the patent or the prior art has a particular meaning in the pertinent field. Phillips, 415 F.3d at 1318. But extrinsic expert testimony is not helpful if it consists merely of conclusory, unsupported assertions as to the definition of a claim term. Id. Likewise, a court must not rely on expert testimony that is contradicted by the intrinsic evidence. Id. Further, though a district court may "in its sound discretion" admit and use extrinsic evidence, consideration of such evidence is likely to be reliable only if considered in the context of the intrinsic evidence. Id. at 1319 ("In exercising that discretion, and in weighing all the evidence bearing on claim construction, the court should keep in mind the flaws inherent in each type of evidence and assess that evidence accordingly.").

1. The Ravid Declaration

Plaintiff filed a declaration of Gonen Ravid, inventor of the device described in the '141 Patent. Defendant objects to consideration of this evidence on the basis that it constitutes an impermissible hindsight explanation by the patentee.

The Federal Circuit has explained that "[a]n inventor is a competent witness to explain the invention and what was intended to be conveyed by the specification and covered by the claims." Voice Tech. Group, Inc. v. VMC Sys., Inc., 164 F.3d 605, 615 (Fed. Cir. 1999). The inventor may not, however, "by later testimony change the invention and the claims from their meaning at the time the patent was drafted and granted." Id. In light of this precedent, Plaintiff's objection is overruled.

Ravid states that the term "without utilizing any memory buffer" means that data does not pass through the main memory of a PC. (Ravid Decl. P 4.) On the data path from the source HDD to the destination HDD, however, there may be "dedicated buffers or queues," such as "components of switches implemented in field programmable gate arrays." (Ravid Decl. P 4.) The presence of these buffers or queues, according to Ravid, does not change the essence of the invention claimed in the '141 Patent. (Ravid Decl. P 4.) Rather, data still flows "directly" between the source and target drives, and does not run through a PC's memory. (Ravid Decl. P 4.) According to Ravid, this is one of the key innovations in the '141 Patent. (Ravid Decl. P 5.) The Bodo device does not operate in this manner. (Ravid Decl. P 5.) Rather, it operates like a standard PC in that data is temporarily stored in the PC memory during transfer between source and target HDDs. (Ravid Decl. P 5.) In his invention, Ravid added switches to enable a data path between the two HDDs and a control mechanism to allow the data to flow from one HDD to the other without the use of the PC memory. (Ravid Decl. P 5.) Switches may in some contexts contain buffer memories, but "if the switch has a little buffer of some bytes of data," in Ravid's opinion, "it doesn't make any difference." (Ravid Decl. P 7.)

Ravid's assertions are entirely consistent with the intrinsic evidence discussed above. Both suggest that a main innovation of the device is that the data path between the source and target HDDs does not include a PC memory buffer. Ravid also contends that buffer memories within switches are not technically significant. This further emphasizes that the relevant claims of the '141 Patent seek not to describe a lack of buffer memories within the device's switches, but rather to describe a data path that does not run through a PC's buffer.
Nonetheless, Ravid merely states his opinion of the proper claim construction without relying on independent sources or analysis of industry publications. See Network Commerce, Inc. v. Microsoft Corp., 422 F.3d 1353, 1361 (Fed. Cir. 2005) (discounting expert testimony for lack of reference to industry publications or independent sources). The Court therefore accords little weight to his assertions.

2. Technical Expert Yuval Tamir

To aid the Court in claim construction, Plaintiff advances a technical report prepared by Yuval Tamir ("Dr. Tamir").

In his report, Dr. Tamir notes that Claims 42 and 57 of the '141 Patent describe a data path that includes "switches." (Second Rozsa Decl., Ex. 5, P 5a.) In Dr. Tamir's knowledge and experience, "in some contexts a 'switch' may include buffer memory." (Second Rozsa Decl., Ex. 5, P 5a.) Dr. Tamir also examines the prosecution history, concluding that the use of non-PC buffers on the data path is "not precluded." (Second Rozsa Decl., Ex. 5, P 5b.)

Gralnik asserts that based on his "training and experience during the mid-1990's," he would understand the '141 Patent's references to direct data duplication without utilizing any memory buffer to mean transfer of data without the data being stored in any kind of temporary memory. (Second Rozsa Decl., Ex. 6.) Gralnik states that, as of 1996, he would understand "direct data path" to mean "a finite, point-to-point conduit for the transfer of information between devices or locations."
Therefore, for the reasons stated above, the Court construes "memory buffer" to mean "PC memory buffer."
C. "memory cell"

The parties dispute the scope of the term "memory cell." Defendant argues that the term refers only to a cell that has a single select device and a single memory device. Plaintiff argues that as used in the patent, a "memory cell" can also encompass a cell with repeating elements that share the use of common regions, and which may contain multiple select and memory devices. Plaintiff refers to such a cell as a "mirror cell," although as discussed below, the Court believes that the term "mirror cell" is used in the specification with a different meaning.

The specification contemplates the creation of mirror cells: "As will be readily understood by those skilled in the art, 'mirror' cells may be formed in order to facilitate the integration of many memory cells into an array." '776 patent, 5:16-19. The Court believes that the specification uses the term "mirror cell" not with plaintiff's meaning, but rather to refer to an individual memory cell containing only a single select and memory device that lacks channel end field stop regions on both ends and that shares a region with at least one other such cell. That definition of "mirror cell" is consistent with the specification's statement that if mirror cells are formed, "channel end field oxide regions 13 [sic] 4 will separate groups of mirror cells as is known in the art, rather than separating individual cells at the channel ends as shown in Fig. 1." '776 patent, 5:21. The description of the entire mirrored assemblage as a "group of mirror cells" rather than as a single "mirror cell" suggests that a mirror cell is an atomic unit, not a collection of cells.

4 In the rest of the specification, the channel end field oxide region is labeled as region 12, and the channel side field oxide region is labeled as region 13. See '776 patent, 5:15-16, 6:11, 5:14-15. The Court concludes that in the quoted passage, the drafter meant to refer to the channel end field oxide region, but erroneously labeled the region as 13 instead of 12.

The terms "individual cells" and "mirror cells" in the specification thus each appear to denote cells with only a single memory and select device, distinguished only by the presence or absence of channel end field stop regions. Moreover, the specification later states that the "the memory cell of the present invention . . . includes a single gate select device . . . [and] a floating gate memory device." '776 patent, 2:64-68. The Court therefore holds that the term "memory cell" in the '776 patent refers to a cell with a single select and memory device.

5 The patent specification also states that "for purposes of this disclosure, a memory cell . . . includes at least a memory device and a select device." '776 patent, 1:61-65. Although this might be read to mean that a memory cell could contain multiple memory and select devices, it does not conclusively establish that, as the term "at least" might also refer to the presence of devices other than memory and select devices.

GO BACK

Memory cell array

The Court adopts the construction of "memory cell array" that the parties agreed to at the claim construction hearing: "a coordinated group or matrix of memory cells." Although MEI argued that the construction of the terms should specify that "bit lines" are included, MEI essentially conceded at the hearing that memory cells are understood to have bit lines and that a jury would understand this fact from testimony. See Claim Const. Hr'g Tr. at 62. It is therefore unnecessary to include "bit lines" in the construction.
G. "Sales random access memory chip," "Incoming Random Access Memory Chip," and "Playback Random Access Memory Chip"

Sightsound sees no reason to further define these terms. Defendants assert that "sales random access memory chip," and "sales random access memory," should be interpreted as "a semiconductor storage element within the first memory at the first party location." "Incoming playback memory chip" should be "a semiconductor storage element within the second memory at the second party location," and "playback random access memory chip" should be "a semiconductor storage element within the second memory at the second party location that is separate and distinct from the incoming random access memory chip."

These terms appear in the '734 and '440 patents. Claim 1 of the '734 patent discloses a "first memory" which has a "hard disk having a plurality of digital . . . signals . . . and a sales random access memory chip which temporarily stores a replica of the . . . desired . . . signals" (Docket # 69, Exhibit I, Column 8, lines 42-50). Claim 3, which builds upon claims 1 and 2, then discloses that "the second memory includes an incoming random access memory chip which temporarily stores the coded desired . . . signals . . . and a playback random access memory chip for temporarily storing the . . . signals . . . for sequential playback." (Id., Column 9, lines 17-26). Other claims are similar, except that the term "chip" is not included in all iterations.

The specification of the '734 patent also provides a detailed description of the preferred embodiment:

In FIG. 1 and FIG. 2, the following components are already commercially available: the agent's Hard Disk 10, the Telephone Lines 30, the Compact Disc Player 40, the user's Hard Disk 60, the Video Display Unit 70, and the Stereo Speakers 80. The Control Units 20 and 50, however, would be designed specifically to meet the teachings of this invention. The design of the control units would incorporate the following functional features:

* * *

3) the Sales Random Access Memory Chip 20c would be designed to temporarily store user purchased Digital Audio Music for subsequent electronic transfer via telephone lines to user's Control Unit 50.

4) the Incoming Random Access Memory Chip 50c would be designed to temporarily store Digital Audio Music for subsequent electronic storage to the user's Hard Disk 60.

5) the Play Back Random Access Memory Chip 50d would be designed to temporarily store Digital Audio Music for sequential playback.

The foregoing description of the Control Units 20 and 50 is intended as an example only and thereby is not restrictive with respect to the exact number of components and/or its actual design.

(Id., Column 4, lines 32-65).

The focus of the dispute in this case is whether the claims may be read to include configurations where the RAM of a computer is used interchangeably as the "Sales Random Access Memory" and for other functions as part of the first party's control unit, and as the "Incoming Random Access Memory" or "Playback Random Access Memory" as well as other functions in the second party's control unit. Defendants would read each of these phrases as requiring a separate storage element in the respective computers, apparently without the ability to be used for other purposes for which RAM is typically used on personal computers.

Reading the language of the claims in light of the specification, and particularly the language following the description of the preferred embodiment regarding the intended breadth with respect to the number of components and design of the control units, there is no indication that the inventor limited himself to situations in which particular RAM chips are
designated for a specific purpose only. In the court's view, the language cited covers any RAM in a system which is configured to perform the function described, whether or not that is the only function it is configured to perform.

2663

E. Ref. No. 10 "A memory coupled to said processor for storing the voting record and the unique voting session identifier for each voting session; and" or "memory for storing a voting record of each one of a number of voting sessions."

These phrases are recited in Claims 1, 21, 23, 76, 80, and 82.

Claims 1, 21, and 80 provide for the storage of the voting record and the voting session identifier. Claims 21, 76, and 82 provide for the storage of the voting record. It is Plaintiff's position, therefore, that this difference requires two separate definitions. Defendants disagree.

Plaintiff cites Application of Koller, 613 F.2d 819 (C.C.P.A. 1980), in support of its position that Claim 21's language for storing just the voting record is the language of an originally filed claim, and "original claims constitute their own description." Id. at 823. When an applicant adds a claim or amends the specification after the original filing date, "the new claims or other added material must find support in the original specification." TurboCare Div. of Demag Delaval Turbomachinery Corp. v. General Elec. Co., 264 F.3d 1111, 1118 (Fed. Cir. 2001) (citing Schering Corp. v. Amgen Inc., 222 F.3d 1347, 1352 (Fed. Cir. 2000)). When construing a claim, the Court should consider the prosecution history which often informs the meaning of claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in its prosecution narrowing its scope. Aero Products Int'l, Inc., 466 F.3d at 1010. "In the course of prosecuting a patent application, a patentee may redefine a claim term." Arlington Indus., Inc., 345 F.3d at 1328. "An amendment or argument made in the course of prosecution may also serve as a disclaimer of a particular interpretation of a claim term." Id. (citing Eckhian, 104 F.3d at 1304).

Here, in the response to the final official action filed August 24, 2004, Plaintiff argued that "[b]ecause the voting session identifier is stored with or as part of the voting record in both the voting machine memory and in the tangible medium . . ." a vote by vote audit is available. (Defs. Ex. 4d at 24.) This description of the invention is evidence that the inventor intended the memory device to store the voting record, including the voting session identifier.

For the reasons set forth herein, the Court construes the terms contained in Ref. No. 10 as follows:

A commonly used internal computer component (here, within the voting machine or system) which is capable of storing the voting record and the voting session identifier and interacts with the processor.

2664

H. "MOS Memory Device"

Although the claim language of the '750 patent does not refer to a "memory cell," it uses the term "MOS memory device." The parties raise the same arguments as in the '776 patent about whether the device so claimed must include only a single select and memory device, or can include multiple select and memory devices. The '750 patent is different because the requirement that there be four opposed field oxide regions makes impossible mirror cells, which as defined in the '776 patent contain field oxides only at the two channel sides. The unavailability of mirror cells, however, does not require a new definition of memory cell. For the other reasons that supported its construction of "memory cell" in the '776 patent, the Court holds that "MOS memory device" refers to a cell with only a single select and memory device.

2665

15. a memory input port sized to receive a digital camera flash memory module
The plaintiff argues that no construction is needed other than the term "port" as discussed above. The defendants propose "a memory input port, located within the housing, sized to directly receive a digital flash memory module." The defendants' proposed construction includes limitations that reiterate claim language or is not supported by the intrinsic record. Accordingly, the court incorporates by reference its construction of "port", and concludes that the balance of the phrase requires no construction.

16. **a memory insertion section for receiving a first digital flash memory module, and for receiving a second flash memory module**

The plaintiff argues that no construction is needed. The defendants propose "at least two flash memory module slots located in the housing that directly receive first and second flash memory modules." As in the previous section, the defendants' proposed construction includes limitations that reiterate claim language or is not supported by the intrinsic record. Accordingly, the court concludes that this phrase requires no construction.

A. **memory means** (Claims 1, 2, 5, 10)

A "means-plus-function" claim is a special type of claim provided for in 35 U.S.C. § 112, paragraph 6, which provides:

An element in a claim for a combination may be expressed as a means or a step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6. Under this provision, an inventor can describe an element of the invention by the result accomplished or the function served, rather than by describing the item or element to be used. Warner-Jenkinson Co., Inc. v. Hilton Davis Chemical Co., 520 U.S. 17, 27, 117 S. Ct. 1040, 137 L. Ed. 2d 146 (1997). When using means-plus-function language, "[t]he applicant must describe in the patent specification some structure which performs the specified function." Valmont Industries, Inc. v. Reinke Manufacturing Co., Inc., 983 F.2d 1039, 1042 (Fed. Cir. 1993). A structure disclosed in the specification is only deemed to be "the corresponding structure" if the specification clearly links or associates that structure to the function recited in the claim. Kahn v. GMC, 135 F.3d 1472, 1476 (Fed. Cir. 1998). The duty to link or associate structure in the specification with the function is the quid pro quo for the convenience of employing the means-plus-function format. Id.

An accused device with a structure that is not identical to the structure described in the patent will literally infringe the patent if the accused device performs the identical function required by the means-plus-function claim with a structure identical or equivalent to that described in the patent. Cybor Corp. v. FAS Technologies, Inc., 138 F.3d 1448, 1457 (Fed. Cir. 1998) (en banc); Kahn, 135 F.3d at 1476. "Thus, the statutory provision prevents an overly broad construction by requiring reference to the specification, and at the same time precludes an overly narrow construction that would restrict coverage solely to those means expressly disclosed in the specification." Symbol Technologies, Inc. v. Opticon, Inc., 935 F.2d 1569, 1575 (Fed. Cir. 1991) (citations omitted).
The parties disagree whether "memory means" is governed by 35 U.S.C. § 112 P 6. PCTEL contends that this claim is not governed by § 112, P 6. n1 However, if the claim is subject to § 112, P 6, PCTEL contends that the corresponding structure is "memory and equivalents thereof." Agere contends that this claim is a means-plus-function limitation that is governed by § 112, P 6. Agere asserts that the corresponding structure is "external memory ROM/RAM 50 of modem 10." USR contends that this claim is governed by § 112, P 6, and that the corresponding structure is "a memory and equivalents thereof."

--- Footnotes ---

n1 Interestingly, PCTEL accepted that "memory means" was a means-plus-function term in the ITC investigation.

--- End Footnotes ---

PCTEL relies upon Environ Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360 (Fed. Cir. 2000), to support its proposition that the term is not governed by § 112, P 6. n2 In Environ, the Federal Circuit held that the word "baffle" alone constituted sufficient structure, and trumped the use of the word "means." Id. at 1364-65. "Because the term "baffle" itself imparts structure, meaning a surface which deflects air, its use in the claims rebuts the presumption that § 112, P 6 applies." Id. at 1365.

--- Footnotes ---

n2 Despite PCTEL's assertions to the contrary, the Court does not consider Dr. Wicker's Declaration because it is extrinsic evidence. See Vitronics, 90 F.3d at 1583.

--- End Footnotes ---

PCTEL also relies upon Katz v. AT&T Corp., 63 F. Supp. 2d 583, 640 (E.D. Pa. 1999), where the court held that "memory means" is not subject to analysis under § 112 P 6 because the word "memory" connotes sufficient structure to rebut the presumption that the term is written in means-plus-function format. The Katz court construed "the term 'memory' according to its plain meaning as: computer hardware that stores information, such as disks, RAM, or tapes." Id. at 602 n.14.

--- Footnotes ---

As in Lutron and Lucent, the Court finds that PCTEL has not overcome the presumption that "memory means" is a means-plus-function limitation. The function of this element is to store values for storing operating parameters. The structure associated with this element is memory associated with "External Memory ROM/RAM 50."

However, the parties' disagree regarding the precise scope of the structures to be included in the claim. PCTEL and USR assert that the structure of "memory means" is "memory and equivalents thereof." PCTEL contends that the '561 patent discloses a discrete class of structures that perform the claimed function and admits that a specific, preferred type of memory is disclosed in embodiment of the patent (i.e., ROM and RAM). PCTEL argues that it should not be penalized for having disclosed a preferred type of memory by having the scope of the claims narrowed so as to only cover a certain type of memory. Along the same lines, PCTEL asserts that the location of its memory should not be limited to only "external" memory.

Agere responds that the only disclosed embodiment of the invention of the '561 patent expressly discloses that the structure corresponding to the "memory means" is "External Memory ROM/RAM 50 of modem 10." Agere also notes that Fig. 1 of the '561 patent discloses that External Memory ROM/RAM 50 of modem 10 is separate and "external" to the data terminal equipment, which can contain a separate ROM and/or RAM of its own.
At this stage of the litigation, the Court need only identify all corresponding structures disclosed in the specification of the '561 patent. "[T]he scope of such a claim is not limitless, but is confined to structures expressly disclosed in the specification and corresponding equivalents." Symbol Technologies, 935 F.2d at 1575. The Court notes that the specification reveals "memory means" such as "RAM," "ROM," "EPROM," and "EEPROM." Therefore, the Court finds that the structure corresponding to "memory means" is memory 50, including "RAM," "ROM," "EPROM," or "EEPROM." The Court declines to limit the location of the memory to only "external memory."

2668

2. Memory Means

The second element of claim 6 reads "memory means for storing information received through the I/O means indicating the groups of individual controls linked and their present settings." Lutron contends that "memory means" is a means plus function phrase, with the specified function being "storing information received through the I/O means indicating the groups of individual controls linked and their present settings," and the structure recited in the specification being "the EEPROM 35, the microcontroller's internal memory, and the FIFOs 53, and their collective equivalents." Genlyte argues that "memory means" is "a device in which data can be input and stored for retrieval at a later time."

The phrase "memory means" in claim 6 is written in means plus function language, and the claim does not recite structure definite enough to rebut the presumption that it is a means plus function situation. The function performed by the memory means is "storing information received through the I/O means indicating the groups of individual controls linked and their present settings," and the specification recites the structures which carry out the function. As addressed above, the specification states that "the button assignment table 37 and active button map 36 [which] are used by the central processing unit 42 of a microcontroller 44 to construct a room connection table 38 within the microcontroller's internal memory." Additionally, the specification states that "read/write memory is provided by a RAM 52 that is organized into ten 256 byte output FIFOs 53 (first in, first out). The data codes received from the ten light controls 10 are read by the microcontroller 44 and then stored in and transmitted from these FIFOs 53 by the microcontroller 44 in the order in which the codes arrive." Specification at col. 7, ll. 22-28.

Lutron correctly argues, therefore, that the EEPROM 35, the internal memory of the microcontroller 44, and the FIFOs 53 each take part in performing the function of storing information received through the I/O means indicating the groups of individual controls linked and their present settings. Therefore, the phrase "memory means" in claim 6 is construed to mean "the EEPROM 35, the microcontroller's internal memory, and the FIFOs 53 of RAM 52, and equivalent structures."

2669

2. "Memory Means"

As an initial matter, it is necessary to determine whether § 112(6) applies to the term "memory means", thereby restricting claim limitations to those structures, materials or acts disclosed in the specification that perform the claimed function.

The use of the word "means" creates a presumption that § 112(6) applies. However, "where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format." Sage Prods. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997). Data General argues that "memory" describes, to one skilled in the art, the memory and processor of any general purpose computer system, a sufficiently definite structure to remove the term from the strictures of § 112(6).

The Court must determine whether the claim elaborates sufficient structure to perform the recited function, not simply whether the claim contains a term that has a commonly accepted meaning to those of ordinary skill in the art. In Claim 10, the memory means performs the function of:
storing and providing data in response to memory commands, each said memory command including an address specifying a location in said memory means, and … said data items include ordinary unresolved pointers.…

'603 Patent, col. 7, ll. 5-8, 14.

Although the memory of a general purpose computer system is a sufficiently described structure to perform the function of "storing and providing data," the '603 Patent language is not sufficiently descriptive where the data includes logical addresses. It becomes necessary to examine whether physical or logical memory is used when discussing the use of logical addresses. A physical memory system, in the absence of a mechanism to convert logical addresses into physical addresses, could not perform the function stated in Claim 10. Thus, § 112(6) applies and it becomes necessary to look to the Common Specification to determine the construction of "memory means."

The Court must first identify the function performed by the means and then identify the structure described in the specification which performs that function, the "corresponding structure." Data General contends that the corresponding structure is the physical main memory of a general purpose computer system, i.e., Main Store Bank 1810, whereas IBM argues that it is the logical memory system described in the Common Specification. 4

--- Footnotes ---

4 Main Store Bank 1810 is one of five major units of the main memory (MEM 10112). According to IBM, the logical memory system consists of the structures referred to as MEM 10112, IOS 10116, ED 10124, Memory Reference Unit 27017 and Protection Unit 27019.

--- End Footnotes ---

Again, the function performed by the memory means is:

…storing and providing data items in response to memory commands, each said memory command including an address specifying a location in said memory means.

'603 Patent, col. 7, ll. 5-8.

Data General maintains that the term "memory" is commonly used in computer engineering to refer to the physical main memory of a computer system. Accordingly, it argues, Main Store Bank is the structure that stores and provides data, using DRAM (Dynamic Random Access Memory). Data General contends that the four other devices in MEM 10112 do not "store and provide data" but rather, are part of the interface between the processor and memory means. 5

--- Footnotes ---

5 The four other devices in MEM 10112 are Bank Controller, Field Interface Unit, Memory Cache, and Memory Interface Controller.

--- End Footnotes ---

Data General's construction does not, however, encompass the use of logical addresses, as described in the Common Specification and discussed in the preceding section of this Memorandum. Although physical memory generally stores and provides data, if that data includes logical addresses, physical memory alone does not store and provide data. Rather, a mechanism is required to convert the logical addresses into physical addresses, compatible with physical memory. The use of logical addresses in the Common Specification indicates a logical, as opposed to a physical, memory system.

Data General's assertion that "memory means" does not refer to logical memory because logical memory is a scheme for organizing the memory system, rather than a physical device that "stores" data is unpersuasive. Although logical memory is not a physical device, it is composed of an implemented by physical devices, microcode and software.

This Court concludes that the term "memory means" refers to the logical memory system of a general purpose computer.
system and the corresponding structures that perform the function of storing and providing data which contain logical addresses are MEM 10112, IOS 10116, ED 10124, MRU 27017 and PU 27019.

2670

a. "Memory Means for Storing Caller Cues and Use Indications"

The plaintiffs agree that all of the limitations of Claim 15 are subject to means-plus-function analysis except for the limitation that reads "memory means for storing caller cues and use indications for said caller cues in relation to said callers as identified by said identification signals." Consistent with the Court's conclusion above in footnote 14, the Court concludes that "memory means" would have connoted sufficient structure to one of ordinary skill in the art at the time of the Katz patents such that it is not subject to analysis under 35 U.S.C. § 112, ¶ 6. The Court defines "memory means" as computer hardware that stores information, such as disks, RAM, or tapes.

The defendants also contend that the "caller cues" recited in this limitation must be quiz or lottery questions, as disclosed in the specification. Similar to the defendants' argument that the term "format" should be restricted to the seven disclosed formats, the Court concludes that there is no support in the claim language or specification for limiting the ordinary and common meaning of "cues" to only questions posed in a quiz or lottery. Thus, the Court construes the term "caller cues" to mean: questions or prompts which are given to a caller.

2671

a. The '219 patent, claim 10: "removably mounted memory means for storing digitized image data"

The parties disagree on whether "removably mounted memory means for storing digitized image data," as used in claim 10 of the '219 patent, is in means-plus-function form. St. Clair contends that the term "memory" is a definite, known structure, and therefore, the claim is not in means-plus-function format. Defendants contend that this claim element is phrased using the word "means" such that 35 U.S.C. § 112, ¶ 6 is implicated, and that this element does not recite a structure sufficient to rebut the presumption created by the use of the word "means." In their contentions and proposed constructions, Defendants focus on determining the structure of the "memory" and not the structure required to removably mount this memory.

After reviewing the claim language and the specification in light of the parties' respective positions, the Court concludes that "removably mounted memory means," as used in claim 10 of the '219 patent, is not in means-plus-function form. As the surrounding claim language indicates, the "memory means" is removably mounted in a camera body and must store digitized image data. In this context, "memory means," or "memory," would be understood by one skilled in the art as a definite structure. This recited structure is capable of performing the described function, and therefore "memory means" is not a means-plus-function term.

6 This understanding of "memory" is further evidenced by the Microsoft Press Computer Dictionary, which, as early as 1991, defined "memory" in terms of a structure as "circuitry that allows information to be stored and retrieved." (D.I. 486, Ex. 28.)

End Footnotes
without structure. In attempting to overcome this rejection, the inventors stated that the term should be properly construed to "cover the structure and function as fully described in the specification, and drawing and any equivalents thereof, as required by the statute and relevant case law precedents." (D.I. 498, Ex. 30, tab E at 10-11.) The Court does not understand that the inventors referenced the specification in their response to the PTO in order to disclose the structure for the term "memory." Rather, the Court finds the inventors were referencing the specification to disclose the structure of the mounting of the memory means. The inventors clarified that "removable mounted memory means' … accurately describes that memory means of the applicants' improved electronic video camera in which the video or picture data is selectively formatted and recorded in the camera to facilitate removal of such memory means for insertion into the predetermined type of information handling apparatus for which the output data format code data was selected." (Id.) Further demonstrating that their discussion was directed to the "mounting means," the inventors indicated that they had amended the claim language to add "means for removably mounting" "to more particularly point out and claim that element of their improved camera." (Id.) Thus, the Court finds that when the inventors proposed a means-plus-function construction for this phrase, they were discussing the mounting means, rather than the memory means, and therefore, the Court cannot agree with Defendants' argument that the inventors intended a means-plus-function construction of the term "memory means." 7

7 Although the amendment proposed by the applicants was never incorporated into the final claim language, it is relevant to demonstrate that, taken in the proper context, the remarks relied upon by Defendants do not support the proposition that the applicants sought a means-plus-function construction for the memory means.

Defendants also direct the Court to two cases which they contend support their argument that "memory means" is a means-plus-function element. In the first, Intel Corp. v. Broadcom Corp., 172 F. Supp. 2d 478, 515 (D. Del. 2001), the court examined "memory means" as part of the larger phrase "an I/O port for coupling said integrated circuit to memory means." Id. at 544. In Intel, the court did not analyze or state whether the claimed "memory means" was a means-plus-function term. Id. at 544-555. Further, it is not entirely clear to the Court that the Intel court defined "memory means" as a means-plus-function term. Rather, the Court finds the Intel court distinguished the term "memory means" from the structure of the preferred embodiment in the patent specification and concluded that the term should not be defined by reference to the specification or limited in the manner proposed by the defendant. Id. (stating that "memory means' cannot be limited to the specific dual-mode VRAM that was used to describe the preferred embodiment, because the patentees did not claim 'a dual mode VRAM[;]' and noting that "the patentee claimed a generic 'memory means' "). Instead, the Intel court concluded that the term "memory means" should be afforded its ordinary meaning in the art as "memory or device where information can be stored and retrieved." Id. (citing Microsoft Computer Dictionary 285 (4th ed. 1999)).

In the second case, Genlyte Thomas Group v. Lutron Elecs. Co., 2004 U.S. Dist. LEXIS 5311, 2004 WL 690847 (N.D. Tex. Mar. 31, 2004), the court did conclude that "memory means," as it appeared in a patent for lighting control, was in means-plus-function form. However, the circumstances involved in the Genlyte case are distinguishable from the instant case. Id.

In Genlyte, the Court found that "memory means" was in means-plus-function form because the specification gave "a detailed description of the structure used to carry out the function." 2004 U.S. Dist. LEXIS 5311 [WL] at *11. In contrast, the specification in the instant patent does not provide a detailed structure of memory such that "memory means" should be considered to be a means-plus-function phrase requiring construction by reference to the specification. Rather, in the Court's view, the plain language of the claim and the lack of detail in the specification support the Court's conclusion that the term "memory" is a sufficient structure such that the presumption of means-plus-function format is overcome and the term "memory means" should be afforded its ordinary meaning as a non-means-plus-function element.

Having concluded that "removably mounted memory means" is not in means-plus-function form and its structure is not determined by reference to the patent specification, the Court must construe the term. Defendants contend that, if the term is not construed as a means-plus-function claim, that the interpretation of the term should still be limited to only certain types of memory. Fuji contends that these include "a memory diskette (i.e. a floppy disk) such as a double density or high density diskette." (D.I. 496, exhibit 8, tab 1 at 42.) Canon contends that the memory must be a removable magnetic diskette, not to include "(a) solid state memory devices such as removable memory cards or bubble memory, (b) memory devices that work with a playback device, reproducing unit or interface (such as an interface board or memory card interface), (c) memory
devices that work with a tether such as a cable, or (d) memory devices that require use of driver software (except for floppy
diskette driver software)." (Id.)

St. Clair contends that the ordinary meaning of memory should be used in defining the disputed term. St. Clair contends that
"removably mounted memory means" is "removably mounted memory: removable memory, e.g. floppy disks, optical disks,
magnetic disks, magnetic media, memory storage disk drive, semiconductor memory, and solid state memory." (D.I. 486,
Ex. 21 at 42.)

After reviewing the claim language, specification, and prosecution history of the '219 patent, the Court concludes that
"removably mounted memory means" should be construed according to its ordinary and customary meaning as "removable
memory, e.g. floppy disks, optical disks, magnetic disks, magnetic media, memory storage disk drive, semiconductor
memory, and solid state memory." The Court concludes that this meaning is supported by the claim language and is not
contradicted by the specification or prosecution history. The language of claim 10 does not restrict or limit itself to a
specific type of memory and uses the broad term "removably mounted memory means." Thus, the Court finds the language
of claim 10 does not support Defendants' construction which would improperly limit the claimed term to a 3.5 inch diskette.

Defendants contend that the specification of the '219 patent discloses that the inventors attempted to "make direct use of
data files in computers without any readers or adapters," and that this solution required a certain kind of memory. (D.I. 495
at 25.) Canon cites a section of the invention's background which describes the invention's possible use of a digital diskette
that can be directly inserted into a personal computer. Canon also cites a section of the specification detailing that the object
of the invention is to provide for recording on standard removable magnetic diskettes and that the invention also provides
for the direct and immediate incorporation of digital image files into various software programs.

Although the specification clearly discloses the use of magnetic diskettes, the Court is not persuaded the specification limits
the patent to such devices. The descriptions of magnetic diskettes in the specification are offered as examples and do not
imply exclusivity or limit the scope of the patent. Further, the specification describes the option to use, in the patented
cameras, "a diskette such as a standard three and a half inch or similar storage medium." '219 patent, col. 6, 1. 24-26
(emphasis added). The specification goes on to provide a variety of examples of memory for use with the invention,
including but not limited to RAM, ROM, semiconductor memory, and optical disk. '219 patent, col. 9, 1. 22; col. 6, 1. 10,
25; col. 9, 1. 8; col. 1, 11. 43-46. Therefore, read in full, the specification does not indicate an intent to deviate from the
ordinary meaning of "memory" or to limit that term to only three and a half inch diskettes. See Teleflex, Inc. v. Ficosa N.
Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002) (stating that a "patentee may demonstrate an intent to deviate from the
ordinary and accustomed meaning of a claim term by including in the specification expressions of manifest exclusion or
restriction, representing a clear disavowal of claim scope").

Defendants also direct the Court to the prosecution history of the '219 patent, during which the inventors made several
statements distinguishing their cameras from prior art devices. For example, the inventors stated that "Kawahara et al.
teaches a digital camera for use with a dedicated, single purpose playback device" and that "the only reasonable
combination of the teachings of Kawahara et al. and Eikonix, if any, is the use of a removable memory card for playback on
a PC via an interface." (D.I. 498, Ex. 30 at 3.) It is clear that, when prosecuting the '219 and related patents, the inventors
attempted to distinguish their technology from the prior art; however, in the Court's view, they did not disavow various
types of memory devices by distinguishing the prior art. Instead, the prosecution history reveals that the inventors
distinguished their invention based on the prior art's failure to take advantage of removable memory and the prior art's use
of computers and dedicated playback devices to format image data. (D.I. 49, Ex. 30 at 3; D.I. 521, Ex. 83.) For example, in
discussing the "teachings of Kawahara et al. and Eikonix," the inventors do not disavow or distinguish all memory cards.
Instead they distinguish "the use of a removable memory card for playback on a PC via an interface." (D.I. 498, exhibit 30
at 3.) The other statements in the prosecution history are likewise distinguishable. Thus, the Court finds the sections of the
prosecution history cited by Defendants do not evidence a disavowal of various types of memory. Indeed, in the prosecution
history of another, related patent, the inventors make it clear that they did not intend to limit the "memory means" to a
certain type of diskette, but intended the term to embrace other examples of memory. Specifically, the inventors explained:

While diskette 50 is disclosed in applicants' specification as a 3.5 inch floppy disk, applicant' independent claims are not
limited to the format checking and/or formatting of any particular type of digital memory. Applicants' claims as written
would thus cover format checking and/or formatting of any memory device in a camera, including but not limited to 3.5
inch floppy disks, hard disks, optical disks, minidisks, semiconductor memory cards, etc. Although as discussed below the
Examiner's position relied in part on the asserted use of a 3.5 inch floppy disk in a camera, applicants' claims should not be deemed so limited.

(D.I. 498, Ex. 30, tab F at 3 (08/712, 493 Appeal Brief, 1/7/99) (emphasis added).

In sum, "removably mounted memory means" is not in means-plus-function form and is construed according to its ordinary and customary meaning. Therefore, the Court concludes "removably mounted memory means" means "removable memory, e.g. floppy disks, optical disks, magnetic disks, magnetic media, memory storage disk drive, semiconductor memory, and solid state memory."

2672

H. Local Memory Means and Further Memory Means

The remote terminal also contains something called the local memory means. According to claim 3, when a block of information is selected by the operator via her keyed input, and called up to the remote terminal, the block of data splits apart and the two portions go to separate parts of the local memory means. These portions of data are simultaneously transferred -- that is, they go to their respective places at the same time. The second portion of the block of information is received by and stored in the further memory means when the first portion is transmitted to the remote terminal for display.

The first portion of the block of information that is received from the central computer goes to what we will call "Memory A" of the local memory means and the second part goes to what we will call "Memory B." Memory B has a special name -- it is called the further memory means -- and in this claim, it is a part of what it is called the local memory means. The purpose of the further memory means (or Memory B) is to receive and store the second portion of the block of data that the remote terminal user has selected from the central computer -- the portion containing the complete addresses that are referenced in the data that is displayed on the remote terminal.

In addition to storing the first and second portions of the block of information, the local memory means figures out the complete address for the block of information that is associated with an abbreviated address. According to the claim, the operator enters keyed digital data of "less extent" than any one of the complete addresses for other blocks of information that are contained in the second portion, but which is nevertheless uniquely indicative of one of those complete addresses. The keyed digital data is sort of like an abbreviation for the complete address. By inputting this abbreviated form of the complete address for the next block of data that the operator wishes to access, the operator accesses the further memory means -- where, as you will recall, the second portion containing the complete addresses is stored -- and retrieves the complete address represented by the abbreviation. That complete address is then transmitted, via the modem, to the central computer, where the new block of information desired by the terminal operator is retrieved and sent to the remote terminal, so that he or she can view the first portion of this new block of data.

The abbreviated address is indicated by keyed digital data. Remember, we already described keyed digital data as operator input that is generated by manually pressing one or more keys of a keypad or keyboard or their structural equivalents. For example, if a user at the remote terminal punches in 9, then that information is transmitted by the modem to the local memory means, and the local memory means determines what the complete address is that corresponds to the number 9 -- let us say that complete address is 987.654.321. The local memory means then gives that complete address to the modem means. The modem means transmits that information to the central computer, and the new block of information is retrieved and sent to the remote terminal.

The structure of the local memory means in claim 3 is memory, a memory control unit, or a memory logic unit, and their structural equivalents. The structure of the further memory means is memory and its structural equivalents.

1. Local Memory Means

Everyone agrees that this phrase is written in means-plus-function format. The term "means" is in the claim, followed by functional language and insufficient structural information to describe precisely the device that performs the function.

Everyone also agrees that the recited function in the claim language is "locally storing digital data representing at least the
first portion of the selected block of information received via said modem means from the central computer and processing
digital data." 662 patent, col. 6, 11. 29-33.

The storing function of the local memory means is locally storing at least the first portion of the selected block of
information received via the modem means from the central computer. In claim 3, the local memory means may store data
other than the first portion of the block of information -- but it stores "at least" that first portion.

The local memory means in Claim 3 also performs an additional function -- processing digital data. The parties part ways
over the construction of this function. BT asserts that this function is "determining the address associated with keyed digital
data" and then supplying that address to the modem means, while Prodigy urges that the function should be "selecting for
another block of information its complete address associated with keyed digital data" and then supplying that address to the
modem means.

The difference between the parties' contending definitions are not great, but Prodigy's definition more accurately describes
what the local memory means really does when "processing digital data." Prodigy takes its language from claim 3. This
passage describing the local memory means states:

said local memory means utilizing keyed digital data of less extent than any one of said complete addresses for another
block of information but nevertheless uniquely indicative of one of the complete addresses contained in said second portion
of the block of information which contains the first portion then being displayed for selectively accessing said further
memory means and for supplying data to be transmitted by said modem means and indicative of the complete address of the
next block of information which is to be retrieved and utilized for display purposes.

662 patent, col. 6, 11. 44-56. Once the reader parses this convoluted passage, the function is relatively clear: the local
memory means takes the abbreviated address that is given to it in the form of keyed digital data and associates with that
abbreviated address the complete address for another block of information. I construe the processing digital data function to
mean determining the complete address for another block of information that is associated with the abbreviated address
received in the form of keyed digital data.

The remaining issue is the structure associated with these functions. Both parties agree that the structure corresponding to
the claimed function of the local memory means is described as Memory A in the specification, "when a block of
information is received from the computer 1, the first part is stored in memory A 7 and the second part in memory B 14
under the control of memory control unit 8." Id., col. 4, 1. 68 - col. 5, 1. 4. Prodigy argues that the memory device is
therefore separate from the further memory means since the parts of the block of information go to different places. BT
points out, however, that claim 3 requires "further memory means being provided as part of said local memory means." Id.,
col. 6, 11. 39-40 (emphasis added). BT therefore argues that the structure associated with the local memory means in this
claim does not necessarily have to be separate from the further memory means. I agree. Indeed, under claim 3, the local
memory means cannot be structurally separate from the further memory means. The language of claim 3 clearly states that
the further memory means is a part of the local memory means.

BT argues that the structures disclosed in the specification are memory, a memory controller, and memory logic, while
Prodigy asserts that the disclosed structures are a memory device, a memory control unit and a memory logic unit. The
specification discloses "memory," Id., col. 3, 1. 29, 1. 60 - col. 4, 1. 4, a "memory control unit 8," Id., col. 3, 11. 30, 34-35,
61, 68; col. 4, 11. 3, 58, 66; col 5, 11. 3-4, "memory B LOGIC unit 16," Id., col. 4, 11. 59-60, and "logic unit 16," Id., col. 5,
11. 8, 14. I find no reason to limit the structure of memory A in this claim to a memory "device," nor will I read out the word
"unit" in the disclosed structures. Hence, I find that the structures associated with the local memory means are memory, a
memory control unit, a memory logic unit, and structural equivalents.

2. Further Memory Means

Further memory means is recited in means-plus-function format. The parties disagree about the recited function of the
"further memory means," the proper construction of that functional language, and the identification of the structures in the
specification that correspond to the claimed function.

Prodigy argues that the recited function in this claim is "receiving and storing said second portion of the selected block of
information." BT urges the Court to add on to the end of this language, "selected by a particular terminal means." I find that
the recited function is "receiving and storing said second portion of the selected block of information in response to the
selection of the block and when its first portion is transmitted thereto." 662 patent, col. 6, 11. 42-44.

As for the construction of this function, I find that the purpose of the further memory is to receive and store the second
portion of the block of data that the remote terminal user has selected from the central computer -- the portion containing the
complete addresses that are referenced in the data that is displayed on the remote terminal. This is a straight-forward reading
of the functional language. It is consistent with Prodigy's construction, although with slightly different wording. BT's
construction does not include the idea that the block of information is selected by the user, which is odd, since BT urged that
the recited function should include the idea that the block of information is selected by a particular terminal means.

BT argues that the structure corresponding to this function is memory and equivalents. Prodigy asserts that the structure
disclosed in the specification corresponding to the function of the "further memory means" is a memory device of the
terminal means separate from the memory device of the local memory means and structural equivalents. Because of the
reasons stated in the discussion of "local memory means," see infra, page 28, I disagree with Prodigy that the further
memory means in claim 3 is a memory device separate from the local memory means. I also find no support in the
specification that the disclosed structure of the further memory means is a "memory device" rather than simply "memory."

2673

- "memory means for storing predetermined operating parameters defining one of said plurality of features to be performed
  at each type of said port circuits connected to said system" is a means-plus-function element. The function of this element is
  storing predetermined operating parameters. The structure associated with this element is memory associated either
  internally or externally with central call processor unit 101.

The parties agree with the Court's construction of the function of this element. However, the parties' disagreement centers on
the structures identified with this function. Newbridge contends that the structures are not clearly identified in the patent,
rendering the claim indefinite. Lucent contends that the structure associated with this function is the memory associated
with central processor unit 101. After reviewing the specification, the Court finds that the specification explains that the
central call processing unit 101 stores the operating parameters that correspond to the features to be performed at the port
circuits. When the system is configured, the controller accesses this information in order to retrieve the operating
parameters, which are then sent to the appropriate port circuits. (136 Patent, col. 2, ll. 18-22, 48-52). Accordingly, the Court
concludes that its construction is consistent with the Patent's specification.

2674

C. "memory portion"

The term "memory portion" appears in four of the asserted claims of the '806 patent. Claims 7 and 18 of the '806 patent
require "a memory portion having a capacity of at least 2 megabits" and Claims 13 and 24 state that "said memory portion
has a capacity of at least 7.3 megabits." The parties apparently agree, as does the court, that "memory portion" refers to the
circuitry required for a working memory, including the memory cells that store data and the circuitry associated with
reading, writing, addressing and refreshing data in the memory cells.

2675

4. Memory requests

The term "memory requests" appears in all of the asserted claims of the 096 patent. The plaintiff proposes that "memory
requests" are "requests from an external device, such as a processor, to a memory device." The defendants assert that
"memory requests" are "requests from an external device such as a processor, to load data from or store data to the
The parties dispute whether "memory requests" must be directed to the synchronous DRAM. According to the defendants, "memory requests" are addressed only to the synchronous DRAM and not any other memory device. After considering the submissions of counsel, the court adopts the plaintiff's construction of "memory requests."

"Memory Selection Second Switch Means" - Claim 5

Claim 5 recites a "memory selection second switch means being adapted to select a first position . . . and . . . a second position." Because this claim element utilizes the term "means" and the claim does not specify any structure or material for performing the recited function, the district court properly held "memory selection second switch means" is a means-plus-function element under 35 U.S.C. § 112, ¶ 6 (1994). See Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318, 50 U.S.P.Q.2d (BNA) 1161, 1166 (Fed. Cir. 1999) ("if the word 'means' appears in a claim element in combination with a function, it is presumed to be a means-plus-function element"). Thus, "memory selection second switch means" covers the "corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112, ¶ 6 (1994). The district court's determination of corresponding structure is a matter of claim construction, see Chiuminatta, 145 F.3d at 1306, which this court reviews de novo. See Cybor, 138 F.3d at 1456. Determining whether Figure 3 is a "corresponding structure" for the "switch means" of claim 5 requires the court to consult again the language of the claim and the other factors that inform claim meaning. Of course, the central focus remains on the claim language. The written description, the prosecution history, and admissible extrinsic evidence may supply context to understand the claim language. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2d (BNA) 1573, 1576-77 (Fed. Cir. 1996); Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1309, 51 U.S.P.Q.2d (BNA) 1161, 1169 (Fed. Cir. 1999).

In construing claim 5, the district court determined the term "memory selection second switch means" encompasses the same scope as the "memory selection switch" of claim 1. Specifically, the district court determined that "memory selection second switch means" covers only the mechanical switch of Figure 2, not the software embodiment of Figure 3. The written description of the '364 patent and the prosecution history, however, reveal a broader meaning of "memory selection switch means."

As previously explained in this court's analysis of claim 1, Figure 3 illustrates a flow diagram "describing both the operate and program modes of the invention." '364 patent, col. 4, ll. 23-24. The two lower-right corner dialog boxes of Figure 3 describe steps to "store code at location pointed to by the code location pointer" and "increment code location pointer[;] if pointer increments over five then load code location pointer with one." See id. at Fig. 3 (emphasis added). Dr. Rhyne’s expert testimony shows that one of ordinary skill in the computer science art would understand the underlined terms to describe software operations.

Although software operations do not fall within the literal scope of the "memory selection switch" in claim 1, the reissue prosecution history also discloses a broader reading for the "switch means" of claim 5. First, the patentees’ representation to the Patent and Trademark Office in its November 29, 1989 sworn declaration indicated their intent to include the algorithm of Figure 3 as a "corresponding structure" for the switch means. The patentees stated:

We believe the aforesaid Letters Patent to be wholly or partly inoperative or invalid by reason of our claiming less than we had a right to claim in the patent. More specifically, we believe the sole independent original claim [i.e., claim 1 of the '118 and now claim 1 of the '364 patent] is too narrow in three respects:

. . .

(c) The claim requires a "switch moveable" and a "memory selection switch" but should have required a --first switch means-- and a --memory selection switch means--, respectively, because switch means includes electronic switches as well as mechanical switches.

J.A. at 5388 (emphasis added). While this statement weighs against construing claim 1 to include software operations, it gives a broader reading to claim 5. This statement evidences the patentees' use of the term "switch means" to include microprocessor operations driven by software, i.e., "electronic" switches, as opposed to a mechanical switch of Figure 2.
The patentees' use in claim 5 of the term "switch means" rather than "switch" and "being adapted to select" rather than "setable" and "set," to describe software operations, further support a broader construction.

Later in the reissue proceedings, the patentees argued in response to an anticipation rejection:

Applicants' method and apparatus is intended to simplify the remote control of equipment by code transmitters. . . . Such simplifications are provided by including multiple storage locations in the receiver and including a programming routine which receives and stores codes transmitted from the code transmitters of the system.

J.A. at 5822 (emphasis added). This statement further supports reading "switch means" to include structure corresponding to Figure 3.

The differences in claim language, bolstered by the patentees' statements during the reissue proceedings, cause this court to reach a broader construction for claim 5 than for claim 1. See Vitronics, 90 F.3d at 1582. The district court erred in ruling that only the mechanical switch in Figure 2 is "corresponding structure" for the claimed "switch means." "Switch means," when properly construed, also covers the software-based embodiment described in Figure 3.

Chamberlain asserts that, should this court construe claim 5 to cover the software embodiment of Figure 3, then it is entitled to summary judgment of literal infringement. An accused device satisfies a means-plus-function element literally if it performs the identical function required by the limitation, and incorporates the structure disclosed in the specification or an equivalent thereof. See Cybor, 138 F.3d at 1456. The language of claim 5 and the written description establish that the function of "switch means" is to select different memory locations, thereby enabling the microprocessor to store transmitter identifiers in the memory locations. The parties do not dispute that the Intellicode's memory selection software program performs this function.

The Intellicode, however, constitutes a different "structure" than the software disclosed in the '364 patent because it uses a different algorithm to perform the recited function. Figure 3 and the corresponding description indicate that the code location pointer increments through a series of memory locations, automatically erasing the previous contents of a memory location when it stores a new transmitter code in that location. When the pointer can no longer increment, i.e., when it is pointing to the last memory location in the series, the microprocessor "loads code location pointer with one," causing the pointer to loop back and select the first memory location in the series. The Intellicode, on the other hand, randomly chooses an unused memory location. Thus, the Intellicode's memory selection scheme is not identical to the structure disclosed in Figure 3 of the '364 patent.

Moreover, Overhead Door presented evidence that its memory selection scheme is not structurally equivalent to that of Figure 3. A structure in an accused device is equivalent to the disclosed structure corresponding to a means-plus-function element if it is insubstantially different from the disclosed structure. See Chiuminatta, 145 F.3d at 1309. Overhead Door urged that the Intellicode software is substantially different from the claim element because its software uses memory more efficiently and minimizes the chances of overwriting previously-stored codes. Viewing the evidence in a light most favorable to the non-movant Overhead Door, this court finds that Overhead Door has raised a genuine issue of material fact precluding summary judgment of literal infringement of claim 5. Accordingly, this court remands for the fact-finder to determine whether the Intellicode uses a structure equivalent to the mechanical switch in Figure 2 or to the software-implemented algorithm in Figure 3, for selecting different memory locations.

Moreover, Overhead Door presented evidence that its memory selection scheme is not structurally equivalent to that of Figure 3. A structure in an accused device is equivalent to the disclosed structure corresponding to a means-plus-function element if it is insubstantially different from the disclosed structure. See Chiuminatta, 145 F.3d at 1309. Overhead Door urged that the Intellicode software is substantially different from the claim element because its software uses memory more efficiently and minimizes the chances of overwriting previously-stored codes. Viewing the evidence in a light most favorable to the non-movant Overhead Door, this court finds that Overhead Door has raised a genuine issue of material fact precluding summary judgment of literal infringement of claim 5. Accordingly, this court remands for the fact-finder to determine whether the Intellicode uses a structure equivalent to the mechanical switch in Figure 2 or to the software-implemented algorithm in Figure 3, for selecting different memory locations.

2677

"Memory Selection Switch" - Claim 1

The district court construed the "memory selection switch" element of claim 1 to mean "a switch separate from the microprocessor which is user operated to select different positions of the switch." The claim uses the term "switch," a word connoting a mechanical device with different settings, such as "on" or "off." Claim 1 further defines the memory selection switch as "connected to" the microprocessor, "setable in" a first position, and "set in" a second position. This claim language is more consistent with a mechanical switch attached to the microprocessor, rather than software programmed into the microprocessor.
In the '364 patent's "Brief Description of the Drawings," the patentee states that "Fig. 2 illustrates in block form the invention." Col. 2, l. 43 (emphasis added). Figure 2 complements the definition supplied by the claim language:

[SEE FIGURE 2 IN ORIGINAL] Figure 2 shows the program/operate switch 22 as a mechanical switch, which alternates between "program" and "operate." Moreover, the drawing depicts the memory selection switch 23 as a mechanical switch with five separate numbered positions. The associated written description identifies the memory selection switch with 23, see '364 patent, col. 3, ll. 9-11, and describes it as a five-position, moveable switch separate from and "connected to" the microprocessor 44. See id. at col. 3, ll. 9-19 (emphasis added); see also Fig. 2. Again this part of the patent suggests a mechanical switch.

Finally, Chamberlain does not contest the special master's interpretation of the program mode "switch" as a mechanical toggle switch. To interpret the term "switch" consistently in the claim and to harmonize the drawing depiction with the claim language, this court confirms the district court's reading of the term "switch." Thus, the term "memory selection switch" means a mechanical device separate from the microprocessor. This interpretation is also most in harmony with the prosecution history of the reissue application, as explained later.

In reaching this claim interpretation, this court considered but rejected the contention that Figure 3 discloses as part of the claim a software embodiment for the switch of claim 1. Figure 3 of the '364 patent, shown below, illustrates how the invention receives and validates codes:

[SEE FIGURE 3 IN ORIGINAL] In Figure 3, the two dialog boxes in the lower-right corner refer to storing the code at the location "pointed to" by the "code location pointer," "incrementing" the code location pointer, and "loading" the code location pointer with a value of one. The '364 patent, however, does not indicate whether the "code location pointer" is a particular embodiment of the "switch" of claim 1, or some other (unclaimed) component. "Code location pointer" appears nowhere in the claims. Moreover, the only reference to a code location pointer in the written description is a single sentence that does not illuminate Figure 3: "If the switch 22 is in the 'program' mode as shown in FIG. 3 when the incoming signal from a transmitter is received, the flow diagram is followed so as to store the new incoming program in the code location pointed to by the code location pointer 23," Col. 4, ll. 57-61. The vague terms in Figure 3 do not override the claim language and written description that closely identify the "memory selection switch" as a mechanical device. This court interprets "memory selection switch" to mean a mechanical switch with different positions, each position corresponding to a different location in memory, thus enabling the garage door operator to store codes in different memory locations. Thus, this court affirms on review the district court's interpretation of "memory selection switch."

Applying this claim construction to the accused device, this court affirms the district court's summary judgment of no literal infringement of claim 1. "Literal infringement of a claim requires that every limitation recited in the claim appear in the accused device, i.e., that the properly construed claim reads on the accused device exactly." Amhil Enters., Ltd. v. Wawa, Inc., 81 F.3d 1554, 1562, 38 U.S.P.Q.2D (BNA) 1471, 1476 (Fed. Cir. 1996). Claim 1 covers a mechanical "memory selection switch." The accused Intellicode system, in contrast, selects memory locations with a software program, not with a mechanical switch. Thus, the "memory selection switch," as correctly construed, is literally absent from the Intellicode. Therefore, the Intellicode does not literally infringe claim 1.

The district court erred, however, in also deciding on summary judgment that the Intellicode did not infringe under the doctrine of equivalents. The doctrine of equivalents requires that the accused product contain each limitation of the claim or its equivalent. See Warner-Jenkinson Co. v. Hilton Davis Chem. Co., 520 U.S. 17, 40, 41 U.S.P.Q.2D (BNA) 1865, 1875, 137 L. Ed. 2d 146, 117 S. Ct. 1040 (1997). An element in the accused product is equivalent to a claim element if the differences between the two are "insubstantial" to one of ordinary skill in the art. Warner-Jenkinson, 520 U.S. at 39-40; Hilton Davis Chem. Co. v. Warner-Jenkinson Co., 62 F.3d 1512, 1517, 35 U.S.P.Q.2D (BNA) 1,641 (Fed. Cir. 1995) (en banc), rev'd on other grounds, 520 U.S. 17, 137 L. Ed. 2d 146, 117 S. Ct. 1040 (1997). The district court found as a matter of law that the Intellicode had no equivalent of the memory selection switch claim element.

"Although equivalence is a factual matter normally reserved for a fact-finder, the trial court should grant summary judgment in any case where no reasonable fact-finder could find equivalence." Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1423, 44 U.S.P.Q.2D (BNA) 1103, 1106 (Fed. Cir. 1997). This case does not satisfy this lofty standard. The record contains considerable evidence, including several reports and declarations by Chamberlain's expert, Dr. Rhyne, that one of ordinary
skill in the art would find the Intellicode's software-driven memory selection system insubstantially different from the hardware switch of claim 1. Dr. Rhyne averred in his June 2, 1997 report: "[i]t is a fundamental and well understood tenet of the computing art [that] . . . 'any software process can be transformed into an equivalent hardware process, and any hardware process can be transformed into an equivalent software process.'" See ED KLINGLER, MICROPROCESSOR SYSTEMS DESIGN 5 (1977). Dr. Rhyne stated that this "dualistic transformation," known as the "hardware/software" trade-off, effectively means that the selection of a software pointer for a microprocessor versus a hardware switch to control a microprocessor-based system is simply a matter of design choice. This record evidence shows that one of skill in the art would recognize these alternative systems as interchangeable substitutes. Drawing all reasonable inferences in favor of Chamberlain, as this court must in reviewing the summary judgment of non-infringement, this court concludes that Dr. Rhyne's statements and supporting citations to computer science literature show a genuine issue of material fact precluding summary judgment.

In discerning this genuine factual issue, this court also considered the district court's interpretation that a mechanical switch would necessarily require a human operator. In operation of a mechanical switch, a human operator would indeed set the memory selection switch to one of five positions. This "user operated" characteristic of a mechanical switch, however, would not necessarily preclude a finding that software performs equivalently without human operation. Indeed in other contexts, this court has noted the interchangeability of hardware and software. See, e.g., Pennwalt Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 935, 4 U.S.P.Q.2D (BNA) 1737, 1740 (Fed. Cir. 1987) (en banc) ("If . . . the accused devices differ only in substituting a computer for hard-wired circuitry, [the patentee] might have a stronger position for arguing that the accused devices infringe the claims."). Moreover the Supreme Court has acknowledged that interchangeability can be one of the hallmarks of an equivalent. See Warner-Jenkinson, 520 U.S. at 37 ("known interchangeability . . . for an element of a patent is one of the express objective factors . . . bearing upon whether the accused device is substantially the same as the patented invention"); Graver Tank & Mfg. Co., Inc. v. Linde Air Prods. Co., 339 U.S. 605, 609, 85 U.S.P.Q. (BNA) 328, 331, 94 L. Ed. 1097, 70 S. Ct. 854 (1950) ("An important factor [in determining equivalency] is whether persons reasonably skilled in the art would have known of the interchangeability . . . ").

This court has explained that the "function-way-result" test may help detect an equivalent, particularly for mechanical elements. See Dawn Equip. Co. v. Kentucky Farms Inc., 140 F.3d 1009, 1016, 46 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1998). The function-way-result test dictates that an element in the accused device is equivalent to the claim element if it "performs substantially the same function in substantially the same way to obtain the same result." Graver Tank, 339 U.S. at 608. Applying the function-way-result test to claim 1, the district court found that "the function of the memory selection switch [is] . . . to permit selection of a particular memory location at the receiver for subsequent storage of a transmitted code, by use of a switch connected to the microprocessor." Overhead Door Corp, No. 95-CV-1648-D, at 24 (N.D. Tex. Jan. 13, 1999) (emphasis added). The district court then found that this function was "totally missing" from the accused device because "the user is unable to predetermine selection of specific, desired memory locations." This application of the function-way-result test erroneously incorporates the claim element's "way" into the definition of the function, effectively limiting the claim element to its literal terms.

The claim language and the specification explain that the "memory selection switch" functions to select memory locations. This claim element accomplishes its function by way of a mechanical switch. This particular switch constitutes the claim element's "way" of accomplishing the memory selection function, not the function itself. The result of this element is storage of codes in different memory locations. The record at this stage, preliminary to a trial, creates a genuine issue of material fact whether the Intellicode accomplished substantially the same function, in substantially the same way, to achieve substantially the same result.

Moreover, contrary to the district court's determination, this court's ruling in Sage Products does not limit the range of equivalents to the memory selection switch in this case. In Sage Products, this court noted that the claim limitations "top of the container" and "over said slot" constituted "a precise arrangement of structural elements" and a "clear structural limitation" in a "relatively simple structural device." Sage Prods., 126 F.3d at 1425. Finding that Sage's theory of equivalence - i.e., a container having two constrictions below its top was equivalent to the claimed container having a constriction above and a constriction below -- would "remove entirely the 'top of the container' and 'over said slot' limitations from the claim," this court affirmed the district court's grant of summary judgment of non-infringement. Id. at 1423-24. Thus, the proposed application of the doctrine in Sage Products would have utterly written out of the claim not one, but at least two (maybe more) express limitations of the claim. Indeed under Sage Products' equivalents theory, a finding of equivalents for one limitation ("at the top") would necessarily require writing out of the claim another limitation.
("over said slot"). No matter how the patentee purported to apply the claim to the accused device under the doctrine, the device was always missing at least one limitation. Thus, the claim language specifically negated the patentee's equivalence theory. Moreover, this court in Sage Products noted that "any subsequent change in the state of the art, such as later developed technology" would have been eligible for coverage under the doctrine of equivalents, thus clearly defining at least one type of expanded claim coverage under the doctrine. Id. at 1425.

In contrast to the facts in Sage Products, claim 1 of the '364 patent does not contain any clear structural limitations that preclude a reasonable jury from finding a software system equivalent to the claimed system. By definition, an equivalent does not fall literally within the claim language. Although the literal meaning of the "memory selection switch" does not cover the software-implemented Intellicode, this case does not preclude application of the doctrine under Sage Products because any application of the doctrine would not leave some aspect of the claim missing from the accused device. Applying the doctrine of equivalents to cover Intellicode's software does not vitiate the "memory selection switch" element. See id., at 1423-24.

As properly construed, the "memory selection switch" means a mechanical switch for selecting memory locations. The question remains whether the Intellicode's software-driven memory selection scheme is equivalent to a mechanical switch. This issue remains for the fact-finder to determine at trial in view of the considerable evidence in the record.

1. "memory signals"

The parties dispute whether the term should be limited to the "main memory." The plaintiff argues that it is important to specify the type of memory because there are many different types of memory used by computers (e.g., external storage). According to the plaintiff, the specification initially refers to "main memory" and then subsequently uses "memory" as shorthand to refer to the "main memory." 924 patent, 1:12-13. The plaintiff also points to the deposition of the defendant's expert who concedes that the memory in the patent refers to the "main memory." Plaintiff's Opening Claim Construction Brief, Exhibit 3, 186:7-15.

The defendant, on the other hand, argues that the point of the invention was to allow the memory controller to interface with various speeds of memory and there is no indication that the inventor excluded certain types of memory.

The Court acknowledges that the patentee does not provide a specific definition of "memory." The patent, however, describes the prior art memory controller being used in connection with the "main memory." 924 patent, 1:12-25. The preferred embodiment also shows the memory controller connected to a dynamic random access memory (DRAM), which is typically understood as the "main memory." 924 patent, 2:63-65. Although the Court does not read limitations from the preferred embodiments into the claims, in this case, one of ordinary skill in the art at the time of the invention would understand that the memory controller is used to access the "main memory." Accordingly, "memory signals" means "main memory signals."

v. Memory stack

The parties appear to agree that a memory stack is a term of art that describes a specific type of storage arrangement. According to Gobeli, "memory stack" is a "group of storage locations, within said computer, structured to store data on a last-in first-out basis." Apple contends that "memory stack" is "a linear list, where accesses, insertions, and removals are made at one end of the list." Sun generally agreed with Gobeli's construction as long as the construction was limited to computer memory.

The Court agrees with Gobeli and Sun. Accordingly, "memory stack" is "a group of storage locations located in the computer's memory that is structured to store data on a last-in first-out basis."
8. Memory store

With respect to the term "memory store," Foundry contends that it should be construed in accordance with its ordinary meaning. Lucent, on the other hand, argues that "memory store" should be construed to mean "a predetermined location in the internal memory of a computer." After considering the claims and the submissions of counsel, the court concludes that "memory store" is not limited to "a predetermined location" of a computer's internal memory. The court therefore construes "memory store" consistent with the ordinary meanings of "memory" and "storage": "a section used primarily for storing information. It includes all of the addressable storage in a processing unit and other internal storage that is used to execute instructions." See IEEE Standard Dictionary of Electrical and Electronics Terms (6th ed. 1997).

G. "Memory Subsystem"

1. Proposed Constructions

The parties do not contest that the claimed "memory subsystem" of the '736 patent includes related elements, such as (1) a "buffer" in the context of "a read first-in-first-out (FIFO) buffer" and "a write first-in-first-out (FIFO) buffer" in claims 1 and 7, (2) a "register" in the context of "a memory data input register" and "a memory data output register" in claim 1, and (3) "a single memory cell" in claims 1 and 7. Plaintiffs' '736 Br. at 16; Defendants' '736 Br. at 15.

Plaintiffs, however, assert that "a memory subsystem" should be construed as "a data storage subsystem." Plaintiffs' '736 Br. at 16. Plaintiffs further assert that the memory subsystem claim limitation requires sharing between CD and DVD processing systems, not sharing between all systems for all possible memory tasks. Id. at 17. By contrast, defendants construe "a memory subsystem" to mean "one subsystem that provides all of the memory resources for the subsystems of the controller, including the signal processor and the error code correction and detection subsystem." Defendants' '736 Br. at 15. Defendants further construe the memory subsystem to be contained within the controller. Id. at 16.

2. Claim Language

Claims 1 and 7 each state "a memory subsystem" once. Based on Crystal Semiconductor, plaintiffs argue that the preamble claim language of the indefinite article "a" combined with the transitional phrase "comprising" mean that the claims cover a system with one or more memory subsystems. Plaintiffs' '736 Br. at 16.

On the other hand, defendants contend that the article "a" can mean "exactly one" in a "comprising" claim where the written description or prosecution history invites or requires an interpretation of "a" as meaning "exactly one." Defendants' '736 Br. at 15-16. In support of this contention, defendants cite to Insituform Techs., Inc. v. CAT Contracting, Inc., 99 F.3d 1098, 1105-06 (Fed. Cir. 1996) and Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023 (Fed. Cir. 1997). Defendants also assert that the plain meaning of the claims requires the memory subsystem to be contained within the controller. Id. at 16.

In addition, defendants contend that the memory subsystem of claim 7 requires one memory subsystem coupled to the signal processor that includes the following: a single memory cell that receives data via a write FIFO buffer and provides data via a read FIFO buffer; the write FIFO buffer; the read FIFO buffer; and a MPEG FIFO interface. Defendants' '736 Br. at 25.

3. Ordinary Meaning

Defendants contend that the "memory subsystem" of claims 1 and 7 would not be understood by a person skilled in the art without reference to the '736 patent specification. Defendants' Br. at 15. However, to support their proposed construction of the "memory subsystem" as being contained within the controller, defendants argue that a person skilled in the art of the
'736 patent as of December 1998 would have been familiar with the use of embedded memory. Id. at 17.

4. Specification

Plaintiffs assert that the key feature of the invention in patent '736 is the sharing of memory resources by different subsystems, not the sheer number of memory resources. Plaintiffs' '736 Br. at 17. On the other hand, defendants assert that the specification sets forth that a memory subsystem "provides a common memory resource for the subsystems of the DVD/CD controller such as CD-DSP, DVD-DSP, and error code correction and detection subsystem." Defendants' '736 Br. at 15; see '736 patent at 4:31-34, 7:56-8:2. In addition, defendants argue that the '736 patent describes the memory as being located within the controller. Defendants' '736 Br. at 16; '736 patent at 4:31-35, 6:40-51, Fig. 4. According to defendants, the use of a common memory for the controller functions decreases the number of memory chips needed, which is cited as an important benefit of the '736 invention. Defendants' '736 Br. at 17; '736 patent 4:35-39, 7:64-8:2.

5. Prosecution History

To rebut defendants' proposed construction of "a memory subsystem," plaintiffs argue that the prosecution history demonstrates that the inventors did not intend to limit the claims to require defendants' proposed construction of "a memory subsystem" as "one subsystem that provides all of the memory resources for the subsystems of the controller." Plaintiffs' '736 Br. at 17.

However, based on plaintiffs' assertion that admitted prior art Fig. 1 shows four memories and only two of these memories are replaced by the memory subsystem of the claims, defendants contend that plaintiffs selectively cite to the '736 patent as calling for a "shared memory" or a "common memory used by the various subsystems of the controller." Defendants' '736 Br. at 16. Defendants assert that the other two memories are not used by the controller under the invention. Id.;'736 patent at 1:43-44, 47-49 & Fig. 1; 5: 8-65 & Figs. 2, 4, 5; 2:32-34 & Fig. 1.

In addition, defendants argue that the memory subsystem was added as a narrowing amendment during the '736 prosecution to distinguish over the prior art for the following reasons: 1) neither claim 1 or 7 required a memory subsystem as originally filed, and 2) neither claim 1 or 7 was allowed until the memory system with all of its limitations was added to these claims in the final amendment before the patent issued. Id. at 17.

The court finds that the memory subsystem must provide shared memory for all controller subsystems. The specification repeatedly states this limitation as an advantage of the invention. Further, plaintiffs have acknowledged that the sharing of memory resources permits a reduction in number of subsystems. Plaintiffs' '736 Reply Br. at 6. However, defendants' argument that the memory subsystem must be contained entirely on the controller is not supported by the claims, which do not explicitly specify the location for the memory subsystem. Defendants acknowledge that other coupled subsystems such as the MPEG decoder are not required to be resident on the controller. Additionally, the specification teaches that alternate embodiments would replace the entire on-controller memory subsystem from the preferred embodiment with an external SDRAM and memory controller. '527 patent at 8:37-39. Thus, the court construes the term "memory subsystem" to provide a shared memory for all controller subsystems, but the memory subsystem need not be at the same location as all controller circuitry.

2682

C. The Allen Patent

The parties ask the Court to construe the phrase "whereby the meniscus provides a constant flow of said chemical onto said substrate surface" in Claim 5 of the Allen Patent. Joint Statement at 1. The parties agree that meniscus refers to the "curved surface of the solvent." Oki's Response to AMD's Opening Markman Brief at 1; AMD's Markman Reply Brief at 9. The parties also agree that a meniscus forms as a result of surface tension. AMD's Markman Reply Brief at 9; see Oki's Response to AMD's Opening Markman Brief at 4.

Beyond that, the parties are at odds. Oki argues that the meniscus must extend "continuously from the nozzle tip to the substrate." Oki's Response to AMD's Opening Markman Brief at 1. AMD's definition only require the meniscus to form at

- 3024 -
the substrate. AMD's Markman Reply Brief at 9. Oki argues that prosecution history estoppel places limits on the definition. Oki's Response to AMD's Opening Markman Brief at 1-3. The dispute again boils down to two issues. (1) Does Oki's proposed requirement that the that the meniscus extend from the nozzle tip to the substrate have any support in the intrinsic evidence? (2) Does AMD's decision to amend the claims to overcome a rejection place any limits on the scope of the claims? The answers to those questions are no and yes, respectively.

1. The Claims of the Allen Patent

Nothing in the claims supports the requirement that the meniscus be continuous and unbroken. The Allen patent describes a method for removing coating from the edges of a silicon wafer. 678 Patent, at [57]. Claim 5 describes a process that involves "contacting one surface adjacent to the periphery of [the] substrate with a chemical capable of dissolving the coating material." Id. at col.6 ls.48-50. This is accomplished "by forming a meniscus between [the] surface [of the substrate] and a nozzle positioned adjacent to the periphery of [that] surface." Id. at ls.50-52. The claim then introduces the limitation in dispute: "whereby the meniscus provides a constant flow of said chemical onto said substrate surface." Id. at ls.52-54. Thus, the claims impose three limitations on the meniscus. First, the formation of the meniscus must lead to the contact between the edge of the spinning wafer and the solvent. Second, the meniscus must form between the spinning wafer and the nozzle. Finally, the meniscus must provide a constant flow of the solvent onto the spinning wafer.

None of these requirements support Oki's contention that the meniscus must extend continuously and unbroken from the nozzle tip to the substrate. In fact, the claims hint that such a requirement is unlikely. Oki's requirement that the meniscus extend continuously and unbroken springs from a dictionary definition. That definition defines meniscus as "[t]he curved upper surface of a nonturbulent liquid in a container that is concave if the liquid wets the container walls and convex if it does not." Oki's Response to AMD's Opening Markman Brief at 3 (quoting the American Heritage Dictionary (4th ed. 2000)) (internal quotations omitted). Oki then derives the continuous and unbroken requirement from the word nonturbulent. Id. at 3. However, in the Allen Patent, the meniscus does not exist in a stationary container. Instead, it exists between a nozzle out of which the solvent flows and a rotating wafer that is covered with a coating material.

678 Patent col.6 ls.44-45, 56, 64-66. Given that the substrate is rotating, one would not expect the meniscus in the patent to replicate the behavior of a "nonturbulent liquid in a container." The Court rejects Oki's attempt to force the invention to behave in accordance with a dictionary definition that describes the behavior of a liquid in a context contrary to the plain language of the claims.

The claims also do not impose Oki's requirement that the meniscus extend from the nozzle to the substrate. Oki's logic proceeds as follows: (i) the definition refers to a single convex or concave surface between two stationary walls of a container; (ii) in the Allen patent, the liquid exists between the nozzle and the substrate; (iii) therefore, the meniscus here must be one concave or convex surface between the nozzle and the substrate. Again, this logic suffers from the same fallacy: the claims indicate that the solvent does not lie stationary in a container but flows from a nozzle to the substrate. Furthermore, the word "between" in the claims only requires that the meniscus exist between the nozzle and the substrate, not extend like a bridge from one to the other. The Court finds no support in the claims for Oki's requirement that the meniscus extend continuously and unbroken from the nozzle to the substrate.

2. The Specification of the Allen Patent

The specification also casts doubt on Oki's attempt to impose its dictionary-based limitation on the claims. The specification refers to the meniscus twice. Referring to an illustration of the preferred embodiment, the specification describes how the meniscus forms. First, a valve is opened and the solvent flows under pressure from a reservoir through a series of tubes into the nozzle. Id. at col.3 ls.46-50. "As the chemical exits [the] nozzle . . . at [the] nozzle tip . . ., a meniscus is formed by the exiting liquid between [the] nozzle tip . . . and the underside of [the] substrate. . . . Forming of this meniscus is expedited by closely spacing [the] nozzle tip . . . to [the] substrate. . . ." Id. at col.3 ls.50-54. The specification reveals two important features of the meniscus. First, it may be formed by a liquid that is flowing under pressure. Second, moving the nozzle tip closer to the substrate expedites formation of the meniscus. The first limitation runs counter to Oki's argument that the meniscus behave like a stationary liquid in a glass vessel. The second limitation is one that the parties conceded at oral argument when they both agreed that in order for the meniscus to form, the nozzle tip must be very close to the wafer.

3. The Prosecution History of the Allen Patent
The prosecution history sheds light on what the patent claims mean when they require that "the meniscus provide [] a constant flow of [the] chemical onto [the] substrate surface." Id. at col.6 ls.52-54. During prosecution, the Examiner rejected all the claims of the Allen Patent as obvious or anticipated in light of the Sato patent. Oki's Response to AMD's Opening Markman Brief, Ex. 2 ("Allen Rejection") at 1, 3. The Sato Patent teaches a process similar to that of the Allen Patent. The Sato Patent describes a device that ejects liquid from a nozzle towards the edge of a spinning substrate to remove coating at the edge of the substrate. U.S. Patent No. 4,113,492 col.3 ls.28-47. However, nowhere does the Sato Patent mention a meniscus. Thus, AMD responded to the rejection by adding a new claim which eventually issued as Claim 5 of the Allen Patent. Oki's Response to AMD's Opening Markman Brief, Ex. 3 ("Response to Allen Rejection") at 5, 7. AMD distinguished the Allen Patent from the Sato Patent by pointing to the meniscus language at issue here. AMD stated that "[w]hile the applicant . . . does use a nozzle as does Sato, applicant's removal process comprises positioning the nozzle sufficiently close to the spinning coated wafer to establish a meniscus formed between the nozzle and the spinning wafer." Id. at 9. According to AMD, formation of this meniscus allows the invention to control . . . the amount of surface contacted by the solvent solely by control of the rotational speed of the coated substrate." Id. at 12. AMD claimed that the Sato Patent neither anticipated nor made obvious this feature. See id. at 11-12. This exchange during the prosecution of the Allen Patent explains what the disputed claim terms mean. Because the meniscus provides a constant flow of the solvent onto the spinning wafer, the invention can control how much of surface area of the wafer the solvent contacts solely by varying the speed of rotation of the wafer. Thus, the claim limitation requiring the meniscus to provide a constant flow of the solvent onto the substrate distinguishes Claim 5 of the Allen patent over the Sato reference.

4. Construction of Disputed Terms in the Allen Patent

The intrinsic evidence directs the Court to construe the phrase "whereby the meniscus provides a constant flow of said chemical onto said substrate surface" of Claim 5 of the Allen Patent as follows. The meniscus, i.e., the curved surface of the chemical created by the surface tension of the chemical when the chemical contacts a solid, supplies a constant flow of the chemical onto the substrate. The meniscus exists between the nozzle and the substrate. The meniscus cannot form unless the nozzle is positioned sufficiently close to the spinning coated wafer to establish a meniscus formed between the nozzle and the spinning wafer.

The disputed term is located in each of the asserted independent claims: "a first menu consisting of menu categories." Claim 1 of the '850 patent describes the term "menu categories": "a first menu consisting of menu categories, said menu categories consisting of menu items." "Menu categories" is also disclosed in the specification: "A hierarchical tree structure [] is used to show the different relationships between the menu categories [] (e.g., soups, salads, appetizers, entrees, deserts, etc.)." ('850 patent, 6:14-17).

The parties dispute the need for menu categories to be at the top level, or in other words, "stemming from the root of a menu tree." Ameranth argues that categories can be nested within categories. To support its position, Ameranth cites the following passage from the specification: "In the above example, Menu is the root. Entrees is a menu category. Red Meat is an Entree category." (850 patent, 6:66-67) (emphasis added). Thus, according to the plaintiff, "Red Meat" is a category located within the "Entrees" category. However, "Red Meat" is not explicitly described as a "menu category." Next, in support of Ameranth's construction, one skilled in the art would consider "Red Meat" to be a category within a category, not a menu item. But, as discussed below, the patents use the terms "menu category" and "menu item" in a way that is inconsistent with their ordinary meanings.

- 3026 -
In response to the plaintiff's argument, the defendants assert that the patent consistently uses "menu categories" as the top level class of items only--categories are not located within other categories. Figure 1 of the '850 patent depicts the hierarchical menu tree. The first level of items, e.g., appetizers, desserts, drinks, entrees, salads, sandwiches, and soups, are defined as "menu categories." ('850 patent, 6:17-18). The figure shows the very next level of items, e.g., chicken, red meat, and seafood, as well as sub-items, are "menu items" not "menu categories." ('850 patent, 6:17). The specification and claims also discuss the addition of menu items to menu categories, but they do not disclose the creation of categories within categories. (E.g. '850 patent, 7:8 ("4. Add menu items to the categories"); 8:1 ("To add menu items to categories . . . ."); claim 1 ("a first menu consisting of menu categories, said menu categories consisting of menu items"). Finally, the specification explicitly states that "[m]enu categories are created from the root." ('850 patent, 7:60).

Although it is a close call, "menu categories" are restricted to the top level items. Therefore, the term "menu categories" is defined as "the class of items stemming from the root of a menu tree."

"menu choice selection display"

JVL construes "menu choice selection display" as "a list of video game menu choices that is displayed simultaneously with the separate list of video game menu options in the programming mode." Merit's construction is a "display of the chosen game menu items." Pl's Suppl. Markman Br. at 23. As discussed above, "chosen game menu items" is Merit's proffered construction of "video game menu choices." Thus, plaintiff and defendant agree that "menu choice selection display" involves video game menu choices.

As with the interpretation of many other terms in this patent, Merit challenges JVL's inclusion of language concerning the when and where of the display's appearance. The issue is whether the words "that is displayed simultaneously with the separate list of video game menu options in the programming mode," as JVL proposes, are necessary.

Beginning with the language of the claim itself, claim 13(f) counsels against a construction that includes "in the programming mode." Claim 13(f) recites "exiting the programming mode and entering the menu choice selection mode wherein one of the video game menu choices may be selected for activation from the video game menu choice selection display." Claim 13(f) specifically indicates that selections may be made from the menu choice selection display upon "exiting the programming mode and entering the menu choice selection mode." '717 patent, claim 13(f). When the claim language explicitly describes "menu choice selection display" in the menu choice selection mode, its proper construction cannot limit it to the programming mode.

JVL's reliance on a description of the preferred embodiment does not dictate a different result. JVL cites the description of the preferred embodiment in Figure 2 which states "[i]n the programming mode, menu options 36-62 are selected by the operator from the second region 20 and placed in locations 64-78 in the third region 22 as designated by the operator." '717 patent at 4:8-11. This limitation should not be read into the construction because a claim is not limited to its preferred embodiments. Phillips, 415 F.3d at 1323. Therefore, JVL's inclusion of "in the programming mode" in its construction is not adopted.

Nor should "menu choice selection display" be construed to mean, as JVL suggests, that the video game menu choices are "displayed simultaneously with the separate list of video game menu options." The language in the specification describing that video game menu options and choices are displayed simultaneously when the mode selector is in the programming mode does not lead to the conclusion that "menu choice selection display" always requires separate and simultaneous display of options and choices. '717 patent at 2:28-31. Having rejected the limitations JVL seeks to introduce, "menu choice selection display" is construed as "a display of video game menu choices selected from the video game menu options."
"video game menu choices"

JVL's proposed construction of "video game menu choices" is "the subset of video game menu options that are currently available for a user to play on a video game machine." Def.'s Presentation, '717 patent at 16. Merit offers a more succinct construction - "chosen game menu items."

The "video game menu choices" are the games selected by the operator that players may play. The claim language itself repeatedly refers to "selecting" video game menu options and video game menu choices. '717 patent, claim 1. Yet, Merit's proposed construction employs "chosen" instead of "selected." Here, the meaning of "selecting," a term found in the claim language surrounding the disputed term, is unambiguous. Therefore, Merit's use of "chosen" instead of "selected" is not adopted.

Merit challenges JVL's inclusion of "currently available for a user to play on a video game machine." At the Markman hearing, JVL argued the specification supports inclusion of this language, pointing to the description of Figure 2, one of the preferred embodiments of the invention, which states "[i]n the menu choice selection mode, the programmed menu choices are selectable for game activation either by touching the location of the desired game …" '717 patent at 4:29-31 (emphasis added).

The portion of the specification upon which JVL relies does not justify its construction. The description, by its express terms, is limited to the "menu choice selection mode." It does not encompass the other mode, the programming mode. Indeed, the patent does not contemplate game play by players when the apparatus is in the programming mode. In other words, in the programming mode, the video game menu choices are not "currently available for a user to play."

The claim language is clear that a video game menu option can be selected to be a video game menu choice. '717 patent, claim 3. Merit's construction, "chosen game menu items," does not explain from where the games are chosen. Video game menu options are selected to be video game menu choices by the game operator while the apparatus is in the programming mode. See '717 patent, claim 1. When the machine is in the menu choice selection mode, a player can select a "video game menu choice," a particular game, to play. Therefore, "video game menu choices" is construed as "video games, selected from among the video game menu options, made available for play in the menu choice selection mode."

**G. "menu items"

<table>
<thead>
<tr>
<th>Term</th>
<th>Ameranth's Definition</th>
<th>Defendants' Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>menu items</td>
<td>data which enables or reflects menu choices or options within a menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the set of items stemming from each menu category</td>
</tr>
</tbody>
</table>

The disputed term is located in each of the asserted independent claims: "said menu categories consisting of menu items." Ameranth argues for a broad construction of "menu items," such that it encompasses modifiers and sub-modifiers. In support of this contention, the plaintiff notes that the specification allows the user to "add the item as a modifier" ('850 patent, 7:29-30) and "add the item as a sub-modifier." ('850 patent, 7:55-56). But these phrases use the generic word "item," as opposed to the term "menu item." The specification, however, does not equate "items" with "menu items." (See '850 patent, 8:36-37 ("Once the modifiers have been entered, it may be desired to assign sub-modifiers to the modifiers items."); '850 patent 13:30-31 ("a database that includes every item of merchandise").

Several statements in the specification, as well as the patent claims, indicate that "menu items" are separate and distinct from "modifiers" and "sub-modifiers": "5. Assign Modifiers to the menu items" ('850 patent, 7:9); "[o]nce the menu items have been entered, it may be desired to assign some modifiers to the menu items" ('850 patent, 8:21-22); "assignment of parameters to items in the second menu . . ., said parameters being selected from the modifier and sub-modifier menus" ('850 patent, Claim 1).

Based on the statements in the specifications, "menu items" does not encompass "modifiers" or "sub-modifiers." It appears,
however, that a menu item may contain other menu items. Therefore, "menu items" is construed as "the set of data stemming from menu categories or other menu items."

2687

Menu key

The Court rejects the parties' proposed constructions and construes "menu key" to mean "a user-actuated input device, which allows the user to choose one of two options, e.g., select or deselect, such as a keyboard key, for displaying on the screen a set of selectable colors." AVG proposes that the term means "a user-activated input device . . . ." "Input device" is too broad and could refer to any device from which data is imported. Microsoft's construction, "key that when pressed discretely changes the color value associated with the input key," is too narrow.

2688

"video game menu options"

Merit's posited construction of "video game menu options" is "all of the selectable game menu items." Plaintiff Merit Industries, Inc.'s Supplemental Markman Brief at 9 ("Pl.'s Suppl. Br."). JVL's suggested construction is "all of the video games that can be selected to be made available for a user to play on a video game machine." JVL's Markman Hrg. Presentation, '717 patent at 13 ("Def.'s '717 Presentation").

The parties appear to agree that "video game menu options" are selectable video games and that the word "options" includes "all" of the selectable games. See Merit's Markman Hrg. Presentation, '717 patent, Ex. 3 at 1 ("Pl.'s '717 Presentation") ("video game menu options are 'selectable games'"). They disagree on the additional detail needed to properly construe this term. Specifically, Merit does not ascribe to JVL's inclusion of "to be made available for a user to play on a video game machine." JVL recognizes that "video game menu options" presented in the programming mode can become "video game menu choices" available for a user to play. Merit construes "video game menu options" as selectable video games but does not explain for what they can be selected.

Merit does not offer any basis for its use of the word "items" in its proposed construction. There is no reason to refer to the options as anything other than games.

The term "video game menu options" is construed as "video games that can be selected in the programming mode to be video game menu choices playable in the menu choice selection mode."

2689

C. "menus"

<table>
<thead>
<tr>
<th>Term</th>
<th>Ameranth's Definition</th>
<th>Defendants' Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>menus</td>
<td>computer hospitality data representing collections of linked levels of choices or options intended for display in a graphical user interface</td>
<td>a database and structured set of displays for the data</td>
</tr>
</tbody>
</table>

The disputed term is located in the preamble of each of the asserted independent claims: "An information management and synchronous communications system for generating and transmitting menus comprising . . . ." The specification defines "menu" as
Menus are typically utilized to provide end users of applications with available choices or processing options. . . . [Menu] [o]ptions can have additional subordinate or child options associated with them. . . . Thus, such a menu system comprises cascading sets of menus which are displayable in context to show the parent/child relationships between options of the context menu.

('850 patent, 5:18-31). Based in part on their requirement of local databases on the client devices, the defendants contend that "menus" must include a database. In support of their database requirement, the defendants cite the following language from the specification: "The steps taken in building a menu are as follows: . . . 7. Download the menu database to the handheld device." ('850 patent, 7:4-12). But, as discussed above in "information management and synchronous communications system," the patent's use of "database" appears to define that term as "data." Furthermore, the written description indicates that the menus' purpose is to be displayed, not to act as storage, e.g., "facilitates user-friendly and efficient generation of computerized menus for . . . non-PC standard graphical formats, display sizes and/or applications" ('850 patent, 2:49-55), "displays menus in a readily comprehensible format" ('850 patent, 2:63-67), and "converting paper-based menus . . . to small PDA-sized displays and Web pages." ('850 patent, 3:32-35). Thus, the court rejects the requirement that there is a storage limitation included in the construction of menus.

Ameranth's proposed construction limits the menus to "computer hospitality data." There is no support for this limitation. The court construes the term "menus" as "computer data representing collections of linked levels of choices or options intended for display in a graphical user interface."
credit rate and the purchase amount." Claim 15, which depends from claim 14, requires that the credit value be "determined by multiplying a merchant-selected credit rate by the purchase amount of the transaction." The parties' principal dispute concerns the meaning of these terms.

The defendant proposes that "merchant-selected credit rate" means "a credit rate selected by a merchant, irrespective of any other merchant and independent of a central authority." The defendant further argues that "merchant-specific credit rate" should have the same construction as "merchant-selected credit rate." If, however, the court determines that "merchant-specific credit rate" means something different, then the defendant proposes "a credit rate selected or otherwise indicated by a merchant, irrespective of any other merchant and independent of a central authority." With respect to the term "merchant-specific credit value," the defendant proposes that it means "a credit value selected or otherwise indicated by a merchant, irrespective of any other merchant and independent of a central authority." The defendant also contends that the terms "credit rate" and "credit value" refer to the antecedent terms "merchant-selected credit rate" and "merchant-specific credit value," respectively. Therefore, according to the defendant, "credit rate" and "credit value" must have the same meaning as "merchant-selected credit rate" and "merchant-specific credit value," respectively. If the court determines otherwise, however, the defendant proposes that "credit value" means "a portion of a purchase amount that is to be credited to a consumer's account, regardless of how the transaction is paid for. The credit value is determined at the point of sale by applying a credit rate selected by that merchant irrespective of any other merchant and independent of a central authority, to the purchase amount of the transaction and is then transmitted to a central system." The defendant appears to agree with the plaintiff that "credit rate" means "a rate used along with a purchase amount to determine a credit value."

The plaintiff, on the other hand, proposes that "merchant-selected credit rate" means "a credit rate selected by a particular merchant," "merchant-specific credit rate" means "a credit rate determined for a particular merchant," and "merchant-specific credit value" means "a credit value determined using either a merchant-specific credit rate or a merchant-selected credit rate." According to the plaintiff, "credit rate" means "a rate used along with a purchase amount to determine a credit value," and "credit value" means "a value determined in connection with point-of-sale transactions." The principal disputes are 1) whether a third party may set the credit value and/or credit rate, and 2) whether there are any limitations on how the credit value is determined.

a. Third Party Determination

In support of its proposed constructions that a third party may not set the credit value and/or credit rate, the defendant argues that the patentee defined "merchant-specific credit value" in the prosecution history by stating that "the salient point [is] that the merchant may select or otherwise indicate the desired credit value (in some claims, by reference to a 'credit rate')." Combined Reissue Declaration and Power of Attorney, February 15, 1996, at 2. In addition, the defendant argues that the patentee distinguished his invention over prior art by stating that the prior art "fails to disclose or suggest . . . the concept of permitting each of several merchants to select a merchant-specific rate . . . ." Response to Office Action, February 26, 1997, at 10. The defendant points to this statement and also contends that the Examiner used the terms "merchant-selected credit rate" and "merchant-specific credit rate" interchangeably when it issued an Interview Summary referring to "the limitation of 'merchant-specific credit rate' from Claim 15, . . . " even though Claim 15 actually used the phrase "merchant-selected credit rate." Interview Summary, March 12, 1998 (emphasis added). Finally, the defendant argues that the Examiner, in his Notice of Allowance, stated that "the prior art of record, neither singularly nor in combination, discloses a rebate system whereby a consumer receives a cash rebate, based on the amount of purchases made and a credit rate that is determined by the merchant." Notice of Allowability, May 22, 1998, at 2. Because the patentee did not respond to this notice, the defendant argues that the patentee acquiesced in the examiner's statement.

The plaintiff argues that, under the doctrine of claim differentiation, "merchant-specific credit rate" and "merchant-selected credit rate" cannot mean the same thing. The plaintiff also argues that the specification does not require that the merchant actually assign the rate in all circumstances. The plaintiff points to passages in the specification which state that the rate "may be selected" by the merchant and "the credit rate for one merchant is preferably selected by that merchant and not by any other merchant or the central system." '116 patent, 1:39-42, 3:38-40 (emphasis added). In addition, the plaintiff points to the prosecution history and urges that the applicant distinguished between "merchant-specific" and "merchant-selected." See Response to Office Action, February 26, 1997, at 10-11. Finally, the plaintiff argues the failure to respond to the notice of allowability does not represent a clear disavowal of claim scope. See 37 C.F.R. § 1.104(e) (1998); Salazar v. Proctor & Gamble Co., 414 F.3d 1342, 1345 (Fed. Cir. 2005).
Although it is a close issue, application of the rules governing claim construction supports the plaintiff's proposed constructions. It is a general principle of claim construction that different words in a claim have different meanings. Innova/Pure Water, Inc., 381 F.3d at 1119 ("[W]hen an applicant uses different terms in a claim it is permissible to infer that he intended his choice of different terms to reflect a differentiation in the meaning of those terms."). Without question, the two phrases "merchant-selected" and "merchant-specific" are different. The former connotes that it is the merchant who selects the applicable rates; the latter implies that, although the applicable rate is keyed to a particular merchant, a third party (or the merchant) may specify the rate. Under Phillips, the language of the claims supports the plaintiff's argument.

The court has also considered the claims in light of the specification. As the plaintiff correctly notes, the written description does not equate the term "merchant-selected" with the term "merchant-specific." Moreover, the specification explicitly states that the merchant "may" select the applicable rate. The cited passages in the specification, although not conclusive, further support the plaintiff's proposed construction.

Finally, the court has examined the prosecution history. There is no clear statement in the prosecution history in which the applicant explicitly defined "merchant-specific" to mean "merchant-selected." To the contrary, the applicant stated that "[i]ndependent claim 14 includes the slightly different limitation of 'determining a merchant-specific credit value for the transaction' . . . ." Response to Office Action, February 26, 1997, at 11 (emphasis added). It does not appear that the applicant made a clear disavowal of claim scope and, therefore, the credit rate of claim 14 may be assigned by a third party.

b. Credit Value

Next, the court examines the term "credit value." The defendant contends that the credit value must be 1) determined at the merchant location, 2) determined by multiplying the credit rate by the purchase amount, and 3) can be determined regardless of how the consumer pays for it.

i. Merchant Location

The defendant contends that the patentee disclaimed any system and method for determining credit value other than at the merchant's location in his appeal brief. In that brief, the patentee stated that claims 1, 14, 22, and 35 "clearly recite electronic capture of . . . credit value at the merchant location and its electronic transmission to the central system . . . ." Appeal Brief, June 12, 2006, at 13.

In reply, the plaintiff points out that the appeal brief also states that "[t]he prior art fails to disclose the electronic delivery of credit values and/or account numbers to a central system . . . ." Appeal Brief, June 12, 2006, at 18 (emphasis added). According to the plaintiff, this does not require that the credit value be determined at the merchant location.

There is no clear disclaimer of claim scope. The patentee chose to include this limitation in some claims, but not others. For example, claims 1, 8, and 35 specifically require the credit value to be calculated at the merchant location while claims 22 and 31 do not require the credit value to be calculated at the merchant location. Accordingly, this limitation should not be included in the construction of these terms because imposing this limitation would be redundant in some claims and, without a clear disclaimer, would be improper in the other claims.

ii. Multiplying Credit Rate by Purchase Amount

Next, the defendant contends that the only method for determining a credit value in the '090 specification is multiplying the credit rate by the purchase amount. The defendant attempts to limit the intrinsic evidence to the specification of a different patent and to import a limitation from a preferred embodiment into the construction of a claim term. Furthermore, dependent claim 15 states that "the credit value is determined by multiplying a merchant-selected credit rate by the purchase amount of the transaction." Therefore, the court concludes that the term "credit value" is broader, standing alone, than the limitation in the dependent claim. The proposed limitation is rejected.

iii. Determination Regardless of How a Product is Paid For

Finally, the defendant contends that the inventor's notes disclaimed any system which is dependent on the form of payment. Defendant's Responsive Claim Construction Brief, Ex. B., at PS 11339. The defendant also cites to the specification which

- 3032 -
states "consumers build up cash value by buying products from participating merchants independent of how that product is paid for ...." '116 patent, 2:22-24. Again, the defendant attempts to import a limitation from a preferred embodiment. The court rejects this limitation.

c. Constructions

Based on the foregoing discussion, the court issues the following constructions:

"Merchant-selected credit rate" means "a credit rate selected by a particular merchant."

"Merchant-specific credit rate" means "a credit rate associated with a particular merchant."

"Merchant-specific credit value" means "a credit value associated with a particular merchant."

"Credit rate" means "a rate used along with a purchase amount to determine a credit value."

The term "credit value" has been defined in the prosecution history as proposed by the plaintiff. See Response to Office Action, February 26, 1997, at 3. "Credit value" means "a value determined in connection with point-of-sale transactions."

1. "Merchant-Specific Credit Value," "Merchant-Specific Credit Rate," "Merchant-Selected Credit Rate," "Credit Rate," and "Credit Value"

Independent claim 14 requires "determining a merchant-specific credit value for the transactions from a merchant-specific credit rate and the purchase amount." Claim 15, which depends from claim 14, requires that the credit value be "determined by multiplying a merchant-selected credit rate by the purchase amount of the transaction." The parties' principal dispute concerns the meaning of these terms.

The defendant proposes that "merchant-selected credit rate" means "a credit rate selected by a merchant, irrespective of any other merchant and independent of a central authority." The defendant further argues that "merchant-specific credit rate" should have the same construction as "merchant-selected credit rate." If, however, the court determines that "merchant-specific credit rate" means something different, then the defendant proposes "a credit rate selected or otherwise indicated by a merchant, irrespective of any other merchant and independent of a central authority." With respect to the term "merchant-specific credit value," the defendant proposes that it means "a credit value selected or otherwise indicated by a merchant, irrespective of any other merchant and independent of a central authority." The defendant also contends that the terms "credit rate" and "credit value" refer to the antecedent terms "merchant-selected credit rate" and "merchant-specific credit value," respectively. Therefore, according to the defendant, "credit rate" and "credit value" must have the same meaning as "merchant-selected credit rate" and "merchant-specific credit value," respectively. If the court determines otherwise, however, the defendant proposes that "credit value" means "a portion of a purchase amount that is to be credited to a consumer's account, regardless of how the transaction is paid for. The credit value is determined at the point of sale by applying a credit rate selected by that merchant irrespective of any other merchant and independent of a central authority, to the purchase amount of the transaction and is then transmitted to a central system." The defendant appears to agree with the plaintiff that "credit rate" means "a rate used along with a purchase amount to determine a credit value."

The plaintiff, on the other hand, proposes that "merchant-selected credit rate" means "a credit rate selected by a particular merchant," "merchant-specific credit rate" means "a credit rate determined for a particular merchant," and "merchant-specific credit value" means "a credit value determined using either a merchant-specific credit rate or a merchant-selected credit rate." According to the plaintiff, "credit rate" means "a rate used along with a purchase amount to determine a credit value," and "credit value" means "a value determined in connection with point-of-sale transactions." The principal disputes are 1) whether a third party may set the credit value and/or credit rate, and 2) whether there are any limitations on how the credit value is determined.

a. Third Party Determination
In support of its proposed constructions that a third party may not set the credit value and/or credit rate, the defendant argues that the patentee defined "merchant-specific credit value" in the prosecution history by stating that "the salient point [is] that the merchant may select or otherwise indicate the desired credit value (in some claims, by reference to a 'credit rate')." Combined Reissue Declaration and Power of Attorney, February 15, 1996, at 2. In addition, the defendant argues that the patentee distinguished his invention over prior art by stating that the prior art "fails to disclose or suggest . . . the concept of permitting each of several merchants to select a merchant-specific rate . . . ." Response to Office Action, February 26, 1997, at 10. The defendant points to this statement and also contends that the Examiner used the terms "merchant-selected credit rate" and "merchant-specific credit rate" interchangeably when it issued an Interview Summary referring to "the limitation of 'merchant-specific credit rate' from Claim 15 . . . ." even though Claim 15 actually used the phrase "merchant-selected credit rate." Interview Summary, March 12, 1998 (emphasis added). Finally, the defendant argues that the Examiner, in his Notice of Allowance, stated that "the prior art of record, neither singularly nor in combination, discloses a rebate system whereby a consumer receives a cash rebate, based on the amount of purchases made and a credit rate that is determined by the merchant." Notice of Allowance, May 22, 1998, at 2. Because the patentee did not respond to this notice, the defendant argues that the patentee acquiesced in the examiner's statement.

The plaintiff argues that, under the doctrine of claim differentiation, "merchant-specific credit rate" and "merchant-selected credit rate" cannot mean the same thing. The plaintiff also argues that the specification does not require that the merchant actually assign the rate in all circumstances. The plaintiff points to passages in the specification which state that the rate "may be selected" by the merchant and "the credit rate for one merchant is preferably selected by that merchant and not by any other merchant or the central system." '116 patent, 1:39-42, 3:38-40 (emphasis added). In addition, the plaintiff points to the prosecution history and urges that the applicant distinguished between "merchant-specific" and "merchant-selected." See Response to Office Action, February 26, 1997, at 10-11. Finally, the plaintiff argues the failure to respond to the notice of allowability does not represent a clear disavowal of claim scope. See 37 C.F.R. § 1.104(e) (1998); Salazar v. Proctor & Gamble Co., 414 F.3d 1342, 1345 (Fed. Cir. 2005).

Although it is a close issue, application of the rules governing claim construction supports the plaintiff's proposed constructions. It is a general principle of claim construction that different words in a claim have different meanings. Innova/Pure Water, Inc., 381 F.3d at 1119 ("[W]hen an applicant uses different terms in a claim it is permissible to infer that he intended his choice of different terms to reflect a differentiation in the meaning of those terms."). Without question, the two phrases "merchant-selected" and "merchant-specific" are different. The former connotes that it is the merchant who selects the applicable rates; the latter implies that, although the applicable rate is keyed to a particular merchant, a third party (or the merchant) may specify the rate. Under Phillips, the language of the claims supports the plaintiff's argument.

The court has also considered the claims in light of the specification. As the plaintiff correctly notes, the written description does not equate the term "merchant-selected" with the term "merchant-specific." Moreover, the specification explicitly states that the merchant "may" select the applicable rate. The cited passages in the specification, although not conclusive, further support the plaintiff's proposed construction.

Finally, the court has examined the prosecution history. There is no clear statement in the prosecution history in which the applicant explicitly defined "merchant-specific" to mean "merchant-selected." To the contrary, the applicant stated that "[i]ndependent claim 14 includes the slightly different limitation of 'determining a merchant-specific credit value for the transaction' . . . ." Response to Office Action, February 26, 1997, at 11 (emphasis added). It does not appear that the applicant made a clear disavowal of claim scope and, therefore, the credit rate of claim 14 may be assigned by a third party.

b. Credit Value

Next, the court examines the term "credit value." The defendant contends that the credit value must be 1) determined at the merchant location, 2) determined by multiplying the credit rate by the purchase amount, and 3) can be determined regardless of how the consumer pays for it.

i. Merchant Location

The defendant contends that the patentee disclaimed any system and method for determining credit value other than at the merchant's location in his appeal brief. In that brief, the patentee stated that claims 1, 14, 22, and 35 "clearly recite
electronic capture of . . . credit value at the merchant location and its electronic transmission to the central system . . . ." Appeal Brief, June 12, 2006, at 13.

In reply, the plaintiff points out that the appeal brief also states that "[t]he prior art fails to disclose the electronic delivery of credit values and/or account numbers to a central system . . . ." Appeal Brief, June 12, 2006, at 18 (emphasis added). According to the plaintiff, this does not require that the credit value be determined at the merchant location.

There is no clear disclaimer of claim scope. The patentee chose to include this limitation in some claims, but not others. For example, claims 1, 8, and 35 specifically require the credit value to be calculated at the merchant location while claims 22 and 31 do not require the credit value to be calculated at the merchant location. Accordingly, this limitation should not be included in the construction of these terms because imposing this limitation would be redundant in some claims and, without a clear disclaimer, would be improper in the other claims.

ii. Multiplying Credit Rate by Purchase Amount

Next, the defendant contends that the only method for determining a credit value in the '090 specification is multiplying the credit rate by the purchase amount. The defendant attempts to limit the intrinsic evidence to the specification of a different patent and to import a limitation from a preferred embodiment into the construction of a claim term. Furthermore, dependent claim 15 states that "the credit value is determined by multiplying a merchant-selected credit rate by the purchase amount of the transaction." Therefore, the court concludes that the term "credit value" is broader, standing alone, than the limitation in the dependent claim. The proposed limitation is rejected.

iii. Determination Regardless of How a Product isPaid For

Finally, the defendant contends that the inventor's notes disclaimed any system which is dependent on the form of payment. Defendant's Responsive Claim Construction Brief, Ex. B., at PS 11339. The defendant also cites to the specification which states "consumers build up cash value by buying products from participating merchants independent of how that product is paid for . . . ." '116 patent, 2:22-24. Again, the defendant attempts to import a limitation from a preferred embodiment. The court rejects this limitation.

c. Constructions

Based on the foregoing discussion, the court issues the following constructions:

"Merchant-selected credit rate" means "a credit rate selected by a particular merchant."

"Merchant-specific credit rate" means "a credit rate associated with a particular merchant."

"Merchant-specific credit value" means "a credit value associated with a particular merchant."

"Credit rate" means "a rate used along with a purchase amount to determine a credit value."

The term "credit value" has been defined in the prosecution history as proposed by the plaintiff. See Response to Office Action, February 26, 1997, at 3. "Credit value" means "a value determined in connection with point-of-sale transactions."
The defendant proposes that "merchant-selected credit rate" means "a credit rate selected by a merchant, irrespective of any other merchant and independent of a central authority." The defendant further argues that "merchant-specific credit rate" should have the same construction as "merchant-selected credit rate." If, however, the court determines that "merchant-specific credit rate" means something different, then the defendant proposes "a credit rate selected or otherwise indicated by a merchant, irrespective of any other merchant and independent of a central authority." With respect to the term "merchant-specific credit value," the defendant proposes that it means "a credit value selected or otherwise indicated by a merchant, irrespective of any other merchant and independent of a central authority." The defendant also contends that the terms "credit rate" and "credit value" refer to the antecedent terms "merchant-selected credit rate" and "merchant-specific credit value," respectively. Therefore, according to the defendant, "credit rate" and "credit value" must have the same meaning as "merchant-selected credit rate" and "merchant-specific credit value," respectively. If the court determines otherwise, however, the defendant proposes that "credit value" means "a portion of a purchase amount that is to be credited to a consumer's account, regardless of how the transaction is paid for. The credit value is determined at the point of sale by applying a credit rate selected by that merchant irrespective of any other merchant and independent of a central authority, to the purchase amount of the transaction and is then transmitted to a central system." The defendant appears to agree with the plaintiff that "credit rate" means "a rate used along with a purchase amount to determine a credit value."

The plaintiff, on the other hand, proposes that "merchant-selected credit rate" means "a credit rate selected by a particular merchant." "merchant-specific credit rate" means "a credit rate determined for a particular merchant," and "merchant-specific credit value" means "a credit value determined using either a merchant-specific credit rate or a merchant-selected credit rate." According to the plaintiff, "credit rate" means "a rate used along with a purchase amount to determine a credit value," and "credit value" means "a value determined in connection with point-of-sale transactions." The principal disputes are 1) whether a third party may set the credit value and/or credit rate, and 2) whether there are any limitations on how the credit value is determined.

a. Third Party Determination

In support of its proposed constructions that a third party may not set the credit value and/or credit rate, the defendant argues that the patentee defined "merchant-specific credit value" in the prosecution history by stating that "the salient point is that the merchant may select or otherwise indicate the desired credit value (in some claims, by reference to a 'credit rate')." Combined Reissue Declaration and Power of Attorney, February 15, 1996, at 2. In addition, the defendant argues that the patentee distinguished his invention over prior art by stating that the prior art "fails to disclose or suggest . . . the concept of permitting each of several merchants to select a merchant-specific rate . . . ." Response to Office Action, February 26, 1997, at 10. The defendant points to this statement and also contends that the Examiner used the terms "merchant-selected credit rate" and "merchant-specific credit rate" interchangeably when it issued an Interview Summary referring to "the limitation of 'merchant-specific credit rate' from Claim 15, . . . " even though Claim 15 actually used the phrase "merchant-selected credit rate." Interview Summary, March 12, 1998 (emphasis added). Finally, the defendant argues that the Examiner, in his Notice of Allowance, stated that "the prior art of record, neither singularly nor in combination, discloses a rebate system whereby a consumer receives a cash rebate, based on the amount of purchases made and a credit rate that is determined by the merchant." Notice of Allowability, May 22, 1998, at 2. Because the patentee did not respond to this notice, the defendant argues that the patentee acquiesced in the examiner's statement.

The plaintiff argues that, under the doctrine of claim differentiation, "merchant-specific credit rate" and "merchant-selected credit rate" cannot mean the same thing. The plaintiff also argues that the specification does not require that the merchant actually assign the rate in all circumstances. The plaintiff points to passages in the specification which state that the rate "may be selected" by the merchant and "the credit rate for one merchant is preferably selected by that merchant and not by any other merchant or the central system." '116 patent, 1:39-42, 3:38-40 (emphasis added). In addition, the plaintiff points to the prosecution history and urges that the applicant distinguished between "merchant-specific" and "merchant-selected." See Response to Office Action, February 26, 1997, at 10-11. Finally, the plaintiff argues that the failure to respond to the notice of allowability does not represent a clear disavowal of claim scope. See 37 C.F.R. § 1.104(e) (1998); Salazar v. Proctor & Gamble Co., 414 F.3d 1342, 1345 (Fed. Cir. 2005).

Although it is a close issue, application of the rules governing claim construction supports the plaintiff's proposed constructions. It is a general principle of claim construction that different words in a claim have different meanings. Innova/Pure Water, Inc., 381 F.3d at 1119 ("[W]hen an applicant uses different terms in a claim it is permissible to infer that
he intended his choice of different terms to reflect a differentiation in the meaning of those terms."). Without question, the two phrases "merchant-selected" and "merchant-specific" are different. The former connotes that it is the merchant who selects the applicable rates; the latter implies that, although the applicable rate is keyed to a particular merchant, a third party (or the merchant) may specify the rate. Under Phillips, the language of the claims supports the plaintiff's argument.

The court has also considered the claims in light of the specification. As the plaintiff correctly notes, the written description does not equate the term "merchant-selected" with the term "merchant-specific." Moreover, the specification explicitly states that the merchant "may" select the applicable rate. The cited passages in the specification, although not conclusive, further support the plaintiff's proposed construction.

Finally, the court has examined the prosecution history. There is no clear statement in the prosecution history in which the applicant explicitly defined "merchant-specific" to mean "merchant-selected." To the contrary, the applicant stated that "[i]ndependent claim 14 includes the slightly different limitation of 'determining a merchant-specific credit value for the transaction' . . . ." Response to Office Action, February 26, 1997, at 11 (emphasis added). It does not appear that the applicant made a clear disavowal of claim scope and, therefore, the credit rate of claim 14 may be assigned by a third party.

b. Credit Value

Next, the court examines the term "credit value." The defendant contends that the credit value must be 1) determined at the merchant location, 2) determined by multiplying the credit rate by the purchase amount, and 3) can be determined regardless of how the consumer pays for it.

i. Merchant Location

The defendant contends that the patentee disclaimed any system and method for determining credit value other than at the merchant's location in his appeal brief. In that brief, the patentee stated that claims 1, 14, 22, and 35 "clearly recite electronic capture of . . . credit value at the merchant location and its electronic transmission to the central system . . . ." Appeal Brief, June 12, 2006, at 13.

In reply, the plaintiff points out that the appeal brief also states that "[t]he prior art fails to disclose the electronic delivery of credit values and/or account numbers to a central system . . . ." Appeal Brief, June 12, 2006, at 18 (emphasis added). According to the plaintiff, this does not require that the credit value be determined at the merchant location.

There is no clear disclaimer of claim scope. The patentee chose to include this limitation in some claims, but not others. For example, claims 1, 8, and 35 specifically require the credit value to be calculated at the merchant location while claims 22 and 31 do not require the credit value to be calculated at the merchant location. Accordingly, this limitation should not be included in the construction of these terms because imposing this limitation would be redundant in some claims and, without a clear disclaimer, would be improper in the other claims.

ii. Multiplying Credit Rate by Purchase Amount

Next, the defendant contends that the only method for determining a credit value in the '090 specification is multiplying the credit rate by the purchase amount. The defendant attempts to limit the intrinsic evidence to the specification of a different patent and to import a limitation from a preferred embodiment into the construction of a claim term. Furthermore, dependent claim 15 states that "the credit value is determined by multiplying a merchant-selected credit rate by the purchase amount of the transaction." Therefore, the court concludes that the term "credit value" is broader, standing alone, than the limitation in the dependent claim. The proposed limitation is rejected.

iii. Determination Regardless of How a Product is Paid For

Finally, the defendant contends that the inventor's notes disclaimed any system which is dependent on the form of payment. Defendant's Responsive Claim Construction Brief, Ex. B., at PS 11339. The defendant also cites to the specification which states "consumers build up cash value by buying products from participating merchants independent of how that product is paid for . . . ." '116 patent, 2:22-24. Again, the defendant attempts to import a limitation from a preferred embodiment. The court rejects this limitation.
Based on the foregoing discussion, the court issues the following constructions:

"Merchant-selected credit rate" means "a credit rate selected by a particular merchant."

"Merchant-specific credit rate" means "a credit rate associated with a particular merchant."

"Merchant-specific credit value" means "a credit value associated with a particular merchant."

"Credit rate" means "a rate used along with a purchase amount to determine a credit value."

The term "credit value" has been defined in the prosecution history as proposed by the plaintiff. See Response to Office Action, February 26, 1997, at 3. "Credit value" means "a value determined in connection with point-of-sale transactions."

13. "message" and "message address"

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>FotoMedia's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;message&quot;</td>
<td>A notice that can be sent or received electronically</td>
<td>Email address</td>
</tr>
<tr>
<td>&quot;message address&quot;</td>
<td>Information used to send or receive a message</td>
<td>Email address</td>
</tr>
</tbody>
</table>

The Cell Phone defendants separately seek to limit a "message" to an "email." They argue that the patentees told the Examiner during prosecution of the '936 continuation patent that "message" meant "email message." 7 They urge the Court to apply this definition to claims of the earlier '774 patent as well. See Kothmann Enters., Inc. v. Trinity Indus., Inc., 394 F. Supp. 2d 923, 958 n. 25 (S.D. Tex. 2005) ("the prosecution history of a subsequently issued patent may be relevant for purposes of a related, previously granted patent"). Further, the defendants argue that throughout the specification, when the inventors refer to sending a "message," they always and only refer to sending email messages. See, e.g., '774 patent, col. 12, ll. 36-55. Similarly, the defendants argue that the specification discusses "address" only in the context of an "email address." Id. at col. 5, ll. 31-35.

7 During prosecution of the '936 patent, the patentee amended claim 8, changing:

"create a message including the identifier"

to:

"create an email message including the identifier that includes the URL associated with the display notifying the recipient that the display is available for viewing."

Fotomedia argues that prosecution amendments made to claims in the '936 patent do not affect the scope of the issued claims and are irrelevant. Fotomedia contends that the patentees intended claim 17 of the '936 patent to be different from claim 1 of the '774 patent by including the phrase "email message." Fotomedia further argues that email is not the only contemplated messaging system disclosed in the patent. The Court agrees. The term "message" need not be limited to an email message.
"Message" is construed to mean an "electronic notice," and "message address" is "an electronic address used to send a message."

2. "Message" (Claims 1 & 5)

a. The Parties' Proposed Constructions

Motorola's Proposal
Plain and ordinary meaning.

Should the Court require a construction, "message" means "a communication." In the alternative, Motorola would be amenable to a construction of "information received by the selective call receiver."

VTech's Proposal
Requires construction.

"Information received by the pager and entered by the sender of the page."

b. Discussion

According to Motorola, the term "message" is not a term that this Court needs to construe. A person of ordinary skill, reading the patent as a whole, (as well as a lay jury) would have a clear understanding of what this term means. Should the Court find that this term should not be given its plain and ordinary meaning, the present dispute is essentially whether that message must be "received by the pager and entered by the sender of the page," as VTech claims.

The Court finds the term should be construed and agrees with Motorola that VTech's construction of the term "message" is improperly limited to a specific way of creating a message, consistent with VTech's attempts to limit the "user-interface" patents to pagers. VTech provides no support for requiring this "message" be "entered by the sender of the page." Claims 1 and 5 of the '391 patent are directed to a method and apparatus for displaying messages within the selective call receiver. The Court declines to limit the language to a particular way of creating a message.

c. The Court's construction

The Court is of the opinion the term "message" should be construed as: "information received by the selective call receiver."

4. "Message" shall be construed as a reconfiguration message that includes a reconfiguration command.

1. Message (claims 1-2 and 6-8)

Plaintiff's Construction: a data packet

Defendant's Construction: a unit of transmission

Plaintiff relies on the specification for its construction of "message"; defendant offers no support for its construction other than its belief that plaintiff's construction is wrong. But even defendant agrees that the patent specification uses "message" and "data packet" interchangeably throughout. Although defendant may be correct that "message" normally has a broader
meaning than "data packet," an inventor "may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001). Accordingly, I will adopt plaintiff's construction: "a data packet."

II. "Message"

Plaintiff submits that the term message should be given its ordinary and accustomed meaning, viz., "an intended communication." Defendant argues that the term, understood in context, means "one or more packets of data for transmission from a source to a destination."

The problem with defendant's construction is that it blurs the distinction between "message" and "packet." Properly understood, packets are the mechanism by which messages are sent; as the patent specification explains, "message packets . . . generally include 'source' and 'destination' fields" that assist in routing messages to their intended destinations. Col. 7:52-58. Defining a message as a packet ignores the fact that a packet includes not only message data but also information about where the data originates and where it is supposed to go.

Defendant's proposed construction flows from the fact that the patent is directed to a packet-switched network. Since a packet-switched network transmits packets of data, reasons defendant, the term "message" in the phrase "transmitting a message . . . within a packet-switched network" must refer to a packet. In essence, therefore, defendant asks the Court to find that "message" and "packet" are interchangeable. They are not. Accordingly, the Court will adopt plaintiff's proposed construction of this phrase.

The parties agree that these terms did not have ordinary and customary meanings to one skilled in the art when the patent issued. The parties' primary disagreement is over Amazon's attempt to include a cryptographic key in the construction of each of these terms. Amazon argues that the patentee so limited the terms in the specification. Soverain argues that such a construction improperly imports limitations from the specification. Soverain also points out there are specific instances where a dependent claim includes cryptography but the independent claim does not, making it improper to impute the cryptography limitation into each of these claim terms when it is not expressly included in the claim language.

Amazon's argument is not supported by the claim language. Words used in multiple claims should be given consistent meanings. Fin Control Sys. Pty, Ltd. v. OAM Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). When a dependent claim includes
a limitation that the independent claim does not include, a presumption is raised that the independent claim does not include the limitation. Liebel-Flarsheim Co., 358 F.3d at 910. Amazon's argument fails because the claims recite instances where each of the terms is used without a cryptographic key.

Claim 1 of the '314 patent states, "A network based sales system, comprising: . . . a payment message to be sent to said payment computer that comprises a product identifier identifying said product." As described here, the payment message is not required to contain a cryptographic key. Claim 33 of the '314 patent also does not require a cryptographic key as part of the payment message. In claims 12, 14, 17, 18, 19, 23, 26, and 30 of the '492 patent, the payment message comprises: "a product identifier identifying the product that the user desires to buy," "a universal resource locator," "a merchant computer identifier," or a "payment amount." In claims 27 and 28, which are dependent on claims 19 and 27 respectively, the payment message includes a payment message authenticator based on a cryptographic key.

Claim 34 of the '314 patent does not require shopping cart messages to include cryptographic keys: "respective shopping cart messages to said shopping cart computer each of which comprises a product identifier identifying one of said plurality of products." "Shopping cart messages" is used in claims 17, 18, 35, and 36 of the '492 patent, none of which state it includes a cryptographic key.

In the '492 patent, independent claims 1, 5, 11, 13, 31, and 33 do not state that the access message includes a cryptographic key, but independent claims 19 and 30 do require the cryptography. Claim 32, which is dependent on claim 31 (not requiring cryptography), does require "the access message to be created using a cryptographic key." Claim 34, which is dependent on claim 33 (not requiring cryptography), describes "the access message in a cryptographic process to ensure that the user has paid for the product."

In the '492 patent, claims 7, 15, and 16 describe hypertext statement systems involving a transaction detail hypertext link, but none include a cryptographic key. Similarly, claims 1, 5, 37, and 38 of the '492 patent utilize a product request message, but none describe it as containing a cryptographic key.

For these reasons, including a cryptographic key in these terms' constructions is contradicted by the claim language.

2. "message center"

The disputed claim term "message center" appears in claims 1, 2, 4, 7, 25, 35, 36, 43, and 44 of the '416 Patent and claims 1, 2, 4, 5, 8, 10, 13, 14, 17, 34, and 35 of the '186 Patent. According to Kyocera the "message center" is

a conventional telephone answering device, a personal computer with voice/fax mail or modem communications, or a conventional facsimile device, or some other device suitable for receiving incoming calls automatically and initiating automatic outgoing calls automatically to a paging center or transmissions by an integrated paging transmitter in response to calls received.

(Kyocera Br. 17.) Intellect Wireless, however, argues that "a computer, server, or other device suitable for receiving and transmitting messages" is the proper construction of the claim term "message center." (Intellect Wireless Resp. 12.) Again, the parties' primary dispute centers around whether the "message center" includes similar "paging" limitations like those previously discussed in connection with the "receiver" claim term. Related to this dispute, the parties also disagree as to whether the term "message center" was ambiguous to one of ordinary skill in the art at the time of the invention in the mid-1990s. Arguing that the term was ambiguous, Kyocera bases its construction on a description of a message center from the specifications which refers to paging. Lastly, the parties contest whether the court's construction of "message center" should explicitly acknowledge that the message center may be a server. For the reasons explained below, the court adopt's Intellect Wireless's proposed construction of "message center."

a. "Message Center" Was Not Ambiguous to One of Ordinary Skill in the Art

Relying on Dr. Poor's testimony, Kyocera argues that "[a]t the time of the invention, the claim term 'message center' did not
have a clear meaning to persons of skill in the art of wireless communication systems that include paging devices." (Kyocera Br. 18.) Based on this testimony, Kyocera argues that the court should adopt the following description of a "message center device" from the specifications, which, according to Kyocera, "approaches an express definitional statement" of "message center" (id.):

Message center device (301) may be a conventional telephone answering device, a personal computer with voice/fax mail or modem communications, or a conventional facsimile device, or some other device suitable for receiving incoming calls automatically and initiating automatic outgoing calls automatically to a paging center in response to calls received.

'186 Patent, col.5 l.65-col.6 l.4. Kyocera further argues that the additional inclusion of the "transmissions by an integrated paging transmitter" limitation in its proposed construction is supported by the specifications' recognition that the "message center" alternatively may integrate a paging transmitter. (See Kyocera Br. 19 (citing '186 Patent, col.9 ll.49-52; col.12 ll.32-37; col.16 ll.10-12, 47-51).)

Having reviewed the patents and a number of the cited references, the court is not persuaded that "message center" did not have a plain and ordinary meaning to one of ordinary skill in the art at the time of the invention. First, as discussed above in connection with the court's construction of "receiver," the court disagrees with Kyocera that the claimed invention is limited to "wireless communication devices that include paging devices." The appropriate inquiry, therefore, is whether the term "message center" was ambiguous to one of ordinary skill in the art of wireless communication devices.

Second, the intrinsic evidence suggests that "message center" would not have been ambiguous to one of ordinary skill in the art in the mid-1990s. The References Cited section in the specifications lists several telecommunications patents which consistently discuss "message centers" as receiving and transmitting messages. For example, U.S. Patent No. 5,007,076 ("076 patent"), titled "Call Announcement Arrangement," was filed on November 3, 1989, and discusses "transmitting call information . . . to a message center." '076 Patent, col.16 ll.53-58. Similarly, U.S. Patent No. 5,588,037 ("037 patent"), titled "Remote Access Telephone Control System," was filed on July 8, 1994, and addresses leaving a message at the call receiver's "message center." '037 Patent, col.7 ll.13-47. Finally, U.S. Patent No. 5,950,123 ("123 Patent"), titled "Cellular Telephone Network Support of Audible Information Delivery to Visually Impaired Subscribers," was filed on August 26, 1996, and describes a "message center" which is "connected to the fixed telephone network 20 and to the cellular telephone network" and "functions as a store and forward center for receiving and delivering short message service messages." '123 Patent, col.3 ll.1-6.

This understanding of "message center" also comports with the claims' and the specifications' repeated references to the message center as receiving and transmitting messages. As described in the specifications, the invention relates to "[t]he automatic transmission of caller id or ANI data from the PSTN to a message center, for storage and retransmission." '186 Patent, col.4 l.66-col.5 l.1. 4 Similarly, the asserted claims describe a message being sent to the "message center" which then transmits that message to the claimed "receiver." Thus, the court finds that the intrinsic record indicates that "message center" would have had a plain and customary meaning to one of ordinary skill in the art at the time of the invention and that the plain and customary meaning is consistent with Intellect Wireless's proposed construction.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 "ANI" refers to "automatic number identification," and "PSTN" refers to "public switched telephone network." (See Kyocera Br. 20 nn.16-17 (citing Nat'l Commc'n's Sys., Telecommunications: Glossary of Telecommunications Terms (1996), available at http://www.its.bldrdoc.gov/fs-1037/).)

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

b. "Message Center" Is Not Limited to Paging Communications

Kyocera's arguments for a narrower construction of "message center" are not persuasive. Kyocera contends that the "message center," like the "receiver," has a "paging" limitation which requires the "message center" to "initiate automatic outgoing calls automatically to a paging center" or "transmissions by an integrated paging transmitter." However, as discussed more thoroughly above with respect to the claim term "receiver," the intrinsic evidence supports Intellect Wireless's position that the "receiver" need not be operably coupled to a paging network. Because the "receiver" "is
operably coupled to receive a message from the message center," the "message center" similarly is not constrained by Kyocera's proposed "paging" limitation. Moreover, the plain language of the asserted claims simply requires that the "receiver" be capable of receiving a message from a "message center"; the claims do not mandate that the "message center" further be able to "initialize automatic outgoing calls automatically to a paging center" or "transmissions by an integrated paging transmitter," as necessitated by Kyocera's proposed construction.5

--- Footnotes ---

5 To the extent that Kyocera relies upon the prosecution history to support its "paging" limitation in its proposed construction of "message center," the court rejects those arguments for the same reasons it declined to rely on the prosecution history to impose the "paging" limitation in its construction of the disputed claim term "receiver."

--- End Footnotes ---

Kyocera's reliance on the specifications for the '186 and '416 Patents as support for its construction also is misplaced. According to Kyocera, the excerpt from the specifications which is the primary basis for its construction "approaches an express definitional statement" of "message center." (Kyocera Br. 18.) The court disagrees. Although "[a] patentee may act as its own lexicographer and assign to a term a unique definition that is different from its ordinary and customary meaning," Helmsderfer v. Bobrick Washroom Equipment, Inc., 527 F.3d 1379, 1381 (Fed. Cir. 2008), the Federal Circuit has repeatedly cautioned that "a patentee must clearly express that intent in the written description," id. In this case, the excerpt from the specifications cited by Kyocera is not an explicit definition but rather uses permissive language: "Message center device (301) may be a . . . device suitable for receiving incoming calls automatically and initiating automatic outgoing calls to a paging center in response to calls received." '186 Patent, col.5 l.65-col.6 l.4 (emphasis added). "May" is a permissive term suggesting that the claimed "message center" is not constrained by this description. See i4i Ltd. P'ship v. Microsoft Corp., 598 F.3d 831, 844 (Fed. Cir. 2010) (finding that "permissive language" in specification did not limit the disputed claim term).

Furthermore, contrary to Kyocera's proposed construction which includes the "paging" limitation, Figures 9A and 9B in the specifications disclose message centers which are not connected to paging networks. In Figure 9A, the message center is directly connected to two personal communicators, and in Figure 9B, the message center is coupled to a telephone office and a personal communicator; neither of these figures identifies a "paging center" or a "paging network." The court, therefore, finds that the specifications do not require the "message center" to initiate either outgoing calls to a paging center or transmissions by an integrated paging transmitter.

c. "Message Center" Can Be a Server or Other Similar Device

Regarding Kyocera's contention that the "message center" is a "conventional telephone answering device, a personal computer, or a conventional facsimile device, or some other device," the court agrees with Intellect Wireless that this proposed language improperly imports limitations from the specifications into the claims and implies that the "message center" is confined to an embodiment where it is located at the called party's location. As depicted in Figure 2b, however, the specifications disclose "an alternative embodiment in which a personal message center is located at the telephone office (102) rather than at the called party office (300)." '186 Patent, col.5 ll.36-38. Based on this embodiment, the court believes that one of ordinary skill in the art would have understood that the "message center" was not limited to devices typically used at an individual's home or office, such as a fax machine or personal computer, but also could have been a more high-powered device with greater storage capacity, such as a server.

Accordingly, the court adopts Intellect Wireless's proposed construction of "message center": "a computer, server, or other device suitable for receiving and transmitting messages," which is consistent with both the term's plain and ordinary meaning and the intrinsic evidence.
Leader's Construction
plain and ordinary meaning

Facebook's Construction
A stored item of information associated with the user's data that identifies at least the context, user workspace or user environment in which the user and the data currently reside

The term "metadata" appears in numerous claims throughout the '761 patent. Facebook contends that its proposed construction is consistent with the specification and prosecution history of the '761 patent. (D.I. 191, at 15.) Facebook generally contends that "metadata" cannot be understood without reference to the system in which it is stored and utilized. (Id. at 17.) According to Facebook, the system disclosed by the '761 patent is about linking data to a user and keeping track of the user's location in the system, and therefore, "[t]he purpose of the 'metadata' [in the system] is to store information related to the (a) user to whom the data is tied, and (b) the user's location (since that is where the data will be)." (Id. at 15.) Leader contends that Facebook's proposed construction suffers from three main faults: 1) it incorporates limitations that are inconsistent with the intrinsic record; 2) it creates ambiguity in a commonly understood term; and 3) needlessly attempts to deconstruct the term. (D.I. 179, at 30-31.) Leader contends that "metadata" is universally understood by one of ordinary skill in the art to mean data about data. (Id. at 30.) Thus, Leader contends that this term should be given its plain and ordinary meaning. (Id. at 32.)

The Court concludes that Facebook's proposed construction imports unnecessary and unwarranted limitations into the term "metadata." The claim language demonstrates that the patentee intended "metadata" to have a broad meaning. For example, Claim 1 states that context information is stored in metadata. '761 patent, col. 21:2-3. Claim 9 states that "the metadata includes information related to the user, the data, the application, and the user environment." '761 patent, col. 21: 46-48. Claim 17 states that metadata stores "the association of the data and the second user environment." '761 patent, col. 22:26-27. Claim 21 states that metadata "includes information related to the user of the user workspace, to the data, to the application and to the user workspace. '761 patent, col. 22:54-56. Facebook's contention that the words "at least" in its proposed construction make it "abundantly clear" that "metadata could theoretically contain information beyond" the information identified in its construction, (D.I. 191, at 7 (emphasis added)), is not persuasive. As defined by the literal claim language, "metadata" actually includes types of information beyond that included in Facebook's proposed construction, such as information related to the application.

Facebook's contention that its proposed construction is supported by the specification is similarly unavailing. The specification does state, inter alia, that "[d]ata created while the user is in the board is immediately associated with the user, the current workspace, any other desired workspace that the user designates, and the application. This association is captured in the form of metadata . . . The metadata automatically captures the context in which the data was created . . ." '761 patent col. 9:50-56. In the Court's view, this portion of the specification is consistent with the claim language, and was not meant to restrict the term "metadata." The specification describes association and context as being captured in the form of "metadata," but there is no necessary corollary that "metadata" is exclusively comprised of that information.

The Court further concludes that the prosecution history does not support Facebook's proposed construction. Facebook contends that the following excerpt from the May 2006 Amendments and Remarks submitted by the patentee to the Patent and Trademark Office demonstrates that the intended meaning of "metadata" is "a stored item of information associated with the user's data that identifies at least the context, user workspace or user environment in which the user and the data currently reside":

When a user logs in to a system that employs the tool, the user enters into a personal or user workspace environment . . . Context information associated with the workspace is automatically stored in the database as metadata, and the metadata is further associated with data that is created in the workspace. Accordingly, any data created by the user in the workspace can be searched via the metadata.

Moreover, thereafter, the user can then move (or login) to a different workspace, such as a shared workspace (or shared board) that accommodates multiple users, for example, and the user can then access the same data created by the user in the first workspace and/or new data that was created in the shared workspace. The fact that the user is now in the shared
workspace, and that s/he accessed the same data created in the personal (or first) workspace, is recorded as additional information stored in the metadata of the same data created in the personal workspace.

***

Again, this context information of the single workspace and/or shared workspaces and any movement of a user or users between the workspaces is automatically captured and stored in the metadata, and the metadata is further associated with data that is created in the workspaces.

(D.I. 180, Andre Decl., Ex. 4 at LTI 000610-11). The Court disagrees with Facebook's contention. Nothing in this lengthy excerpt amounts to an unambiguous disavowal of the scope of the term "metadata," and accordingly, no disclaimer has taken place. See Purdue Pharma L.P. v. Endo Pharms. Inc., 438 F.3d 1123, 1136 (Fed. Cir. 2006)("Under the doctrine of prosecution disclaimer, a patentee may limit the meaning of a claim term by making clear and unmistakable disavowal of scope during prosecution.").

Accordingly, the Court declines to adopt Facebook's proposed construction for the term "metadata."

* * *

IT IS HEREBY ORDERED that the following terms in United States Patent No. 7,139,761 (the "'761 patent") are assigned the following meanings:

* * *

7. The term "metadata" shall be given its plain and ordinary meaning.

1. "image metadata"

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>FotoMedia's Proposed Construction</th>
<th>Defendants' Proposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;image metadata&quot;</td>
<td>Information associated with image data, other than that particular image data itself</td>
<td>data about or describing an image, other than the image itself</td>
</tr>
<tr>
<td>&quot;metadata elements for an image&quot;</td>
<td>At least a portion of metadata</td>
<td>a plurality of data elements relating to an image, other than the image itself</td>
</tr>
</tbody>
</table>

The defendants contend that FotoMedia's proposed construction of "metadata" expands the scope of this term beyond what was disclaimed during prosecution. The patentees differentiated prior art, stating that the prior art was not "concerned with metadata, which is commonly defined as 'data that describes other data' or 'data about data.'" Therefore, the defendants contend that the scope of metadata should be limited to it being about data rather than being anything "associated with the image."

Fotomedia argues that because the specification recites the phrase "metadata associated with an image" multiple times, it is entitled to its proposed construction. See, e.g., '231 patent, at col. 3 ll. 53-55 ("The present invention provides an improved method for allowing users to access metadata associated with a digital image file.").

The Court finds that the general understanding of the term "metadata" in the art is consistent with what the applicants stated to the examiner - it is data about data. The fact that it is also associated with an image file does not necessarily make this definition improper. The Court, therefore, construes "metadata" as "data associated with and about the image, other than the image itself."
The related dispute over "metadata elements" is whether the construction of these elements needs to incorporate the reference to the image, and whether a plurality is required. The claim language reads "defining metadata elements for an image." Therefore, the defendants argue that metadata elements must be variables for an image that can store the data. See, e.g., '231 patent, col. 3, ll. 56-67 (discussing how metadata elements are defined for an image file and how metadata elements are populated with data). The defendants argue that construing these elements as just some random portion of the metadata would fail to acknowledge the discrete nature of the metadata - whereby each of these elements can be accessed individually. 8 The Court agrees.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

8 Defendants contend that FotoMedia's own infringement contentions - that allege that defendant Yahoo's websites meet this limitation by "defining metadata elements such as variables and/or data structures, that references and/or store image metadata," - demonstrate FotoMedia's understanding of this term.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

"Metadata elements for an image" means "a plurality of data elements relating to an image, other than the image itself."

2705

b. "metal interconnect layer"

The scope of an independent claim incorporates the embodiments recited in dependent claims. See Transmatic, Inc. v. Gulton Industries, Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995). Claim 1 of the '785 patent claims the method of "forming a metal interconnect layer above the substrate surface." Claim 3 recites the method of claim 1 "wherein said metal interconnect layer comprises an aluminum alloy." The court agrees with EMI that the term "metal interconnect layer" includes interconnects made of metal alloys. The specification lends further support for this construction, as it states that the most common metal interconnects are made "of aluminum or aluminum alloys." The term "metal interconnect layer" thus refers either to pure elemental metals or to alloys.

2706

C. The District Court Proceedings

Sextant sued Analog for infringement, inter alia, of claim 2 of Marcillat and claim 1 of Boura. Analog's accused devices are fabricated using semiconductor processing techniques and use a deposited doped polysilicon layer for those structures corresponding to the test body and blades of the claims. Analog moved for summary judgment of noninfringement and for construction of certain disputed limitations of the claims. See Sextant Avionique, S.A. v. Analog Devices, Inc., No. C-95-2838 SI (N.D. Cal. Feb. 6, 1997) (order granting summary judgment). The court construed six limitations, four of them in favor of Analog's interpretation, n2 and thereafter granted summary judgment of no literal infringement to Analog. Particularly relevant here, the court construed the term "metallization" to mean a deposited metallic material, and in so doing noted the relevance of the prosecution history in which Marcillat distinguished his claims over Rudolf's use of doping to achieve suitable conductivity. See id. at 14-15. Because Analog did not use a deposited metallic layer, but instead used a doped polycrystalline silicon layer, the court held that Analog's device did not literally infringe any claim of the Marcillat patent.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

n2 The court construed the claim limitations "pendular structure," "in a same plane," "metallization," "one and the same crystalline wafer," "flat fixed part," and "two parallel blades." The court construed all but the first two of these limitations in Analog's favor.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -
Analog later successfully moved for judgment as a matter of law, arguing that prosecution history estoppel barred Sextant from asserting that Analog's devices infringed either patent under the doctrine of equivalents. Concerning the Marcillat patent, the court concluded that

Marcillat added the "metallization" limitations to his patent to distinguish Rudolf and by so doing, he surrendered an accelerometer in which the test body and attachment means are conductive without the addition of an additional deposited metal layer. The Court furthermore finds that Analog's accused devices are conductive without the addition of a deposited metal layer and therefore fall within the scope of the "metallization" estoppel. Accordingly, Sextant is estopped from claiming infringement under the doctrine of equivalents as to the "metallization" element of the Marcillat patent claims.

The court next addressed the impact of prosecution history estoppel on the Boura patent and concluded that the estoppels present in the Marcillat file history were applicable to limit the scope of equivalence of the same claim terms in the Boura patent. The court explained that

Analog argues that Boura's amendments to his claim language in response to the section 112 [rejection] should create an estoppel. The Court agrees with Analog that under the unusual facts of this case, prosecution history estoppel applies. See Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1220 (Fed. Cir. 1995) ("[change made in order to more particularly point out the applicant's invention are] not presumed to raise an estoppel, but is reviewed on its facts, with the guidance of precedent.")

On having his claims rejected as indefinite by the Examiner, Boura incorporated the claim terms of the Marcillat patent which had recently been allowed and then argued that these claim terms addressed the Examiner's concerns. Of particular importance is the timing of Boura's amendments. The claims of the Marcillat patent had been allowed on October 22, 1986 after Marcillat had narrowed and redrafted his claims to the satisfaction of the Examiner. Boura incorporated the terms from the Marcillat patent (i.e. metallization, made from one and the same crystalline wafer, and flat fixed part) into his own patent application on May 15, 1987. It appears that Boura's intent in adding these terms was to secure quick allowance of the Boura application and to avoid the objections raised during Marcillat's prosecution of his patent. Under these circumstances, the Court finds that Boura should be estopped from asserting infringement under the doctrine of equivalents against Analog as to these claim elements[,] Because Sextant is estopped from asserting infringement under the doctrine of equivalents as to the individual metallization, made from one and the same wafer, and flat fixed part limitations of the Boura claims, the court GRANTS judgment in favor of Analog on Sextant's doctrine of equivalents claim as regards the Boura patent.

Id. at 14-15 (brackets in quote from Pall in original).

Sextant appealed the noninfringement rulings to this court. We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1) (1994).

II. DISCUSSION

A. Standard of Review

Judgment as a matter of law (JMOL) is appropriate when "a party has been fully heard on an issue and there is no legally sufficient evidentiary basis for a reasonable jury to find for that party on that issue." Fed. R. Civ. P. 50(a)(1). We review a district court's decision on a motion for JMOL de novo, reapplying the JMOL standard. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 975, 34 U.S.P.Q.2d (BNA) 1321, 1326 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 38 U.S.P.Q.2d (BNA) 1461, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). Summary judgment is appropriate when there are no genuine issues of material fact and the moving party is entitled to judgment as a matter of law. Fed. R. Civ. P. 56(c). We similarly review a district court's grant of summary judgment de novo, reapplying the summary judgment standard. See Conroy v. Reebok Int'l, Ltd., 14 F.3d 1570, 1575, 29 U.S.P.Q.2d (BNA) 1373, 1377 (Fed. Cir. 1994).
B. Claim Construction and Literal Infringement

"An infringement analysis entails two steps. The first step is determining the meaning and scope of the patent claims asserted to be infringed. The second step is comparing the properly construed claims to the device accused of infringing. Markman, 52 F.3d at 976, 34 U.S.P.Q.2D (BNA) at 1326. The first step, claim construction, is a question of law, which we review de novo. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed. Cir. 1998) (en banc). The second step is factual. See North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1574, 28 U.S.P.Q.2D (BNA) 1333, 1335 (Fed. Cir. 1993). When construing a claim, a court principally consults the evidence intrinsic to the patent, viz., the claims themselves, the written description portion of the specification, and the prosecution history. See VTRONICS Corp. v. Conceptor, Inc., 90 F.3d 1576, 1582-83, 39 U.S.P.Q.2D (BNA) 1573, 1576-77 (Fed. Cir. 1996).

Sextant argues that the court erred in its construction of the four claim limitations that were construed against it, viz., metallization, one and the same crystalline wafer, flat fixed part, and two parallel blades. Because we conclude that the district court did not err in its construction of the term metallization, and therefore that summary judgment of no literal infringement was properly granted to Analog, we need not address Sextant's arguments with respect to the latter three limitations.

Sextant's claim construction arguments hinge on an ironic contention: that the evidence intrinsic to its own patent is ambiguous and insufficient to construe the claims, thus requiring resort to extrinsic evidence such as expert testimony. We disagree that the intrinsic evidence is insufficient to construe the term metallization. We start first with the claim language. See VTRONICS, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1576. The term metallization certainly connotes the use of a metallic material. While Sextant was free to act as its own lexicographer and to define this term in a manner different from its plain meaning, see id. (Although words in a claim are generally given their ordinary and customary meaning, a patentee may choose to be his own lexicographer and use terms in a manner different from their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history.), it has not done so here. The Marcillat specification discloses only the deposition of metallic materials, see Marcillat patent, col. 8, ll. 1-8 (he metal deposited on the pendular structure may be gold or a gold alloy such as a chromium-gold alloy for example. However, these circuits are preferably made from silver or aluminum) (emphasis added), and does not otherwise suggest that the term metallization can include conductive materials generally or materials made conductive by doping. In fact, the specifications of both Marcillat and Boura use the concepts of metallization and conductors in related, but somewhat different, contexts, suggesting that they do not have identical meanings. See, e.g., Marcillat patent, col. 7, ll. 3-5 (this conductin strip being connected to a metallized one of the thin faces of the flexible blade); Boura patent, col. 3, ll. 20-22 (The edges of the mobile teeth are covered by metallizations which extend the conducting layer at right angles.).

The prosecution history of the Marcillat patent, in which the applicant distinguished his metallized structure over the doped silicon structure of Rudolf, strengthens our conclusion that the term metallization denotes only metallic materials, not doped silicon materials. The extrinsic evidence proffered by Sextant cannot alter the construction indicated by the intrinsic evidence, thereby injecting an ambiguity where none exists. See Bell & Howell Document Management Prods. Co. v. Altek Sys., 132 F.3d 701, 706, 45 U.S.P.Q.2D (BNA) 1033, 1038 (Fed. Cir. 1997) (holding that extrinsic evidence may not be relied upon during claim construction when the intrinsic evidence is sufficient to construe the claim). Accordingly, the district court did not err in its construction of the term metallization, and it therefore did not err in granting summary judgment that Analog's device, which uses doped polysilicon, did not literally infringe any of the claims of the Marcillat or Boura patents.

(1) "Plurality of Integral Metering Cycles"

Square D argues that the term "plurality of integral metering cycles" should be construed consistent with its ordinary meaning to mean "two or more metering cycles where a 'metering cycle' is a 'series of recurring events that occur on a meter.'" El contends that the term should be defined as "two or more consecutive cyclic firmware 1 loops, executing during each loop, calculations, metering logic, and secondary functions, all using coincident data."

- 3048 -
As EI correctly notes, the specification does seem to define what is meant by a "metering cycle." The patent states:

"The metering logic is executed by the processor 130 in each metering cycle of the metering unit 104. Without the metering logic, each metering cycle generally includes the step sequence of obtaining data, performing metering calculations, and performing secondary functions. These three steps are repeated for each metering cycle. In the preferred embodiment, application-specific metering logic is programmed in the metering unit 104 to be performed as part of the metering cycle. Thus, the metering cycle includes the step sequence of obtaining data, performing metering calculations, performing metering logic, and performing secondary functions." U.S Patent No. 5,831,428, col. 6, lines 53-64.

Although EI's proposed construction is certainly appropriate with respect to the preferred embodiment, it need not be true for all embodiments, and it would be inappropriate for the Court to read the additional limitations urged by EI into claim 1. Having said that though, the Court is persuaded that Square D's construction is too broad: a metering cycle is more than just a series of recurring events; it's a series of readily defined categories of recurring events that happen in a particular order - namely, first data is obtained; then metering updates/calculations are performed; then use programmed metering logic is completed; then secondary functions are performed. Thus, the Court construes "plurality of integral metering cycles" to mean "two or more metering cycles" where a "metering cycle" is "a series of recurring events that occur on a meter, including, in this order, the collection of data, the performance of updates/calculations, the execution of user programmed metering logic, and the performance of secondary functions."
60 ("the foregoing process in FIG. 5 is programmed into the main functionality firmware located in the flash EEPROM 124, 126 of the metering unit 104, and is executed by the processor 130 during each metering cycle."). Reading the patent as a whole makes clear that execution during each metering cycle is an important feature of the invention. Accordingly, the Court is persuaded that this aspect is appropriately incorporated into the construction of this language.

In its presentation at the Markman hearing, Square D did not really say much about the "executed every metering cycle" aspect of EI's proposed construction; instead, Square D focused on EI's use of the word "code" (as opposed to "program or procedure"). The Court agrees with Square D that "metering logic programmed by a user" need not require "code" but is more appropriately construed to mean a program or procedure. The Court accepts Square D's proposed alternative construction, and construes "metering logic programmed by a user" to mean "program or procedure written by a user to perform functions other than those included by the meter manufacturer."

Disputed Claim Language

"A method for adjusting a noise threshold of said laser light receiver to a level at which said laser light receiver produces a noise light pulse output having a constant pulse firing rate."

Analysis

Defendants argue that I should read the structural limitation of diode 316 into this claim as I did in Claim 18. Defendants' Reply Memo, 27. Again, I agree. Defendants argue: "just as the adjustment circuit in Claim 18 is a means-plus-function element, the adjusting step in Claim 25 is a step-plus-function element, and a reader must turn to the specification to learn how one does [the method]."

Section 112 P 6 applies when a claim element recites a step plus a function, without reciting actions to enact the function. O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1582-83 (Fed. Cir. 1997). Here, "adjusting a noise threshold of said laser light receiver to a level at which said laser light receiver produces a noise light pulse output having a constant pulse firing rate" is a method, or step, for doing something. This claim language does not recite a "function." The purpose for which the adjusting ultimately is done--the why and what for--is noticeably absent from the disputed language. Therefore, this is a step without a function, and § 112 P 6 does not apply.

Nonetheless, there are three other circumstances in which I may refer to intrinsic evidence outside the claim language to construe a claim. First, "the claim term will not receive its ordinary meaning if the patentee acted as his own lexicographer and clearly set forth a definition of the disputed claim term in either the specification or prosecution history." CCS Fitness, Inc., 288 F.3d at 1366. Second, "a claim term will not carry its ordinary meaning if the intrinsic evidence shows that the patentee distinguished that term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention." Id. at 1366-67. Third, "a claim term also will not have its ordinary meaning if the term chosen by the patentee so deprive[s] the claim of clarity as to require resort to the other intrinsic evidence for a definite meaning." Id. at 1367.

All three apply here. First, Jeremy Dunne, the '779 patent inventor, clearly defined the "method for adjusting a noise threshold of said laser light receiver to a level at which said laser light receiver produces a noise light pulse output having a constant pulse firing rate" in the prosecution history. He described, detail-by-detail, the automatic noise threshold section, which is the embodiment of the method described in Claim 25, for two-and-half pages. Amendment, 16-18. He began by stating, "an important feature of the present invention is the detailed construction and arrangement of … [the] automatic noise threshold section. The essence of [the] automatic noise threshold section … is a feedback loop that comprises the detected (see detector 314, 316, 322, 324) average noise firing rate …." Id. at 16. Second, by describing his automatic noise thresholding mechanism which includes diode 316, Dunne distinguished patent '779 from patent no. 4,259,592 by highlighting the "essence" of a particular embodiment, i.e., the feedback loop including diode 316. Id. Third, the phrase "a method for adjusting the noise threshold" is so deprived of clarity that it is not sufficiently understandable without reference to other intrinsic evidence. Claim 18 gives meaning to the method. Based on my construction of that claim, I look to the feedback loop that includes diode 316.
All three circumstances require me to look to the feedback loop composed in part of diode 316 that is at the "essence" of the automatic noise thresholding mechanism for understanding. Therefore, I construe Claim 25 to incorporate the feedback loop and diode 316.

CONSTRUCTION: A method including a feedback loop composed in part of diode 316 for adjusting a noise threshold of a laser light receiver to obtain a constant pulse firing rate from the laser light receiver to a level at which said laser light receiver produces a noise light pulse output having a constant pulse firing rate.

I. "A Method of Preventing the Spread of Computer Viruses to a Computer Having a Storage Medium"

Claim 18, the patent's second independent claim, claims "[a] method of preventing the spread of computer viruses to a computer having a storage medium, comprising" three steps. '776 Patent, col. 18, Ins. 44-46. The parties dispute both whether this phrase, appearing in the preamble of Claim 18, requires construction at all and, if so, the meaning of the terms.

1. Whether the Phrase Needs to Be Construed

As noted above in connection with the language of the preamble to Claim 1, see supra part IV.A.1, the language of a preamble generally does not have a limiting effect upon the claims. Preamble language is, as a general matter, limiting only in three situations: (1) "[w]hen limitations in the body of the claim rely upon and derive antecedent basis from the preamble, then the preamble may act as a necessary component of the claimed invention," Eaton Corp., 323 F.3d at 1339; (2) if the preamble "recites essential structure or steps, or if it is necessary to give life, meaning, and vitality to the claim." NTP Inc., 392 F.3d at 1358 (quoting Catalina Mktg., 289 F.3d at 808); and (3) if there is "clear reliance on the preamble during prosecution to distinguish the prior art." Intirtool Ltd., 369 F.3d at 1295 (quoting Catalina Mktg., 289 F.3d at 808).

Unlike with the preamble language of Claim 1, there is no indication that the preamble language of Claim 18 was relied upon by the patentee to distinguish the prior art. Nevertheless, defendant contends that the term "said computer" used in the body of Claim 18 (and necessarily in dependent Claims 19 and 20) finds its antecedent basis in the preamble's use of "computer." The Court agrees. The term "said computer" is meaningless without reference to the computer that has already been "said." "Given the fact that the body of the asserted claim refers to 'said [computer]' . . . , it is clear that the phrase ['computer'] can take no other meaning than that explicitly stated in the preamble[.]" Derman v. PC Guardian, No. 95-1263, 1995 U.S. App. LEXIS 36873, 1995 WL 746237, at *2 (Fed. Cir. Dec. 15, 1995); see also, Goldenberg v. Cytogen, Inc., 373 F.3d 1158, 1164 n.2 (Fed. Cir. 2004); Eaton Corp., 323 F.3d at 1339 ("When the body of the claim refers to 'said vehicle master clutch (8),' and 'said drive train,' it is referring back to the particular clutch and the particular drive train previously described in the preamble."). Accordingly, it is necessary to construe this preamble language. 11

11 Because the language of the patent itself resolves this issue, the Court need not consider the effect of defendant's supplemental brief and the testimony of Mr. Schallop discussed therein.

2. Construction of the Phrase

The parties agree that the meaning of "computer virus" as used in Claim 18 is "malicious computer code, including but not limited to self-replicating code." JCCS, Appx. A, at 16 (term 59). The parties do dispute, however, the meaning of the terms "computer" and "storage medium," and thus the meaning of the phrase as a whole. Specifically, the parties treat "computer" as the equivalent of "computer system," and propose a construction of "computer" that is identical to each of their proposed constructions of "computer system." Compare id. (term 58), with id. at 4 (term 17). Likewise, both parties adopt a definition of "storage medium" as used in Claim 18 that is identical to the definition of that term as used in Claim 1. Compare id. at 16 (term 60), with id. at 1 (term 4).
It is generally understood that "if a claim term appears in more than one claim it should be construed the same in each." Dayco Prods., Inc. v. Total Containment, Inc., 329 F.3d 1358, 1371 (Fed. Cir. 2003); see also, CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1159 (Fed. Cir. 1997). Accordingly, the Court adopts the constructions of "computer" and "storage medium" previously adopted in connection with the use of those terms in Claim 1. Thus, "computer" means "a personal computer or workstation, and "storage medium" means "any storage medium of the computer system, if the data, when stored on the medium, are accessible to the operating system or other programs, such that viruses in the data can spread and infect the computer system." This leads to the further conclusion that the phrase as a whole means "a method of preventing the spread of malicious computer code, including but not limited to self-replication code, to a personal computer or workstation having a 'storage medium', i.e., having any storage medium such that the data, when stored on the medium, are accessible to the operating system or other programs such that viruses in the data can spread and infect the computer system."

2711

A. "Microcircuit Device"

The first disputed term is "microcircuit device." The Preamble and method of Claim 1, for example, uses the term as follows:

A method of imaging a large microcircuit device in a resolution range of 0.1-0.50 micrometers, said method comprising:

a. using an axially centered photolithographic reduction lens having a circular image field with a diameter that is less than a diagonal of said microcircuit device;

b. arranging a stage for a mask for said microcircuit device to be movable relative to said lens;

c. arranging a stage for a wafer on which said microcircuit device is imaged to be moveable relative to said lens …

e. using said movement of said stages to correlate different regions of said mask moved into a field of view of said lens with correspondingly different regions of said wafer moved into said image field of said lens in a pattern that successively images the entire area of said microcircuit device.
'996 Patent, col. 6, In. 60 - col. 7, In. 12 (emphasis added).

Ultratech proposes the following definition:

A 'microcircuit device' consists of one or more die made by superimposing one or more photolithographic patterns onto a wafer, where each photolithographic pattern corresponds to a single mask or reticle.

Jt. Cl. Constr. Br. at 4. ASML, on the other hand, contends that a microcircuit device

is an integrated circuit. An integrated circuit is a circuit formed from a single die whose components are formed on a single semiconductor substrate. Thus, a large microcircuit device is an integrated circuit comprising a single die having a diagonal longer than a diameter of the image field of the reduction lens.

Id. at 6.

The proffered definitions appear to hinge on a single distinction. Ultratech contends that "microcircuit device" refers to a "series of patterns" which are contained on a single mask, regardless of whether the mask contains a pattern for one circuit which will be imaged onto a single die, or multiple copies of circuit patterns which may be imaged onto multiple die. ASML argues that "microcircuit device" refers to the resulting image which is placed onto the wafer, and that referring to a single microcircuit device necessarily refers to a circuit pattern which will only exist on a single die.

1. Ultratech's Argument

Ultratech argues that the meaning of this term is apparent from the claim language, making the consideration of extrinsic evidence unnecessary. It contends that the '996 patent relates to a specific method of increasing the field size of a photolithographic system without increasing the image field size of the lens. Furthermore, Ultratech argues that anyone skilled in the art would know that the enlarged field size could serve two purposes: (1) to permit the mask to contain a larger field with multiple copies of an image, such that imaging the mask will create multiple die, and (2) to permit the system to project an image onto the wafer of a larger single die contained in the pattern of a single mask or reticle. Ultratech argues that at the time of filing the patent, it was common practice to place patterns for multiple individual die onto a single mask.

Ultratech notes that the term "microcircuit device" is first used in the preamble language to the patent claims, in reference to the "suggested use" of imaging as described by the method. Citing Bell, it argues that use of the term in the preamble does not constitute a claim limitation, and thus the Court should apply a generic definition. See Bell, 55 F.3d at 620 (preamble language denied the effect of a claim limitation when it "merely stated a purpose or intended use").

Ultratech also argues that when "microcircuit device" appears in Claim 1, the claim refers to various regions of the mask, and that the "microcircuit device" pattern imaged onto the wafer corresponds with the pattern contained on the mask. Similarly, Claims 8 and 13 also use the term when referring to the imaging of an entire mask onto the wafer. Accordingly, Ultratech argues that a single "microcircuit device" must consist of all of the patterns which appear on a single mask, not just an image which relates to a single die.

In addition to the claim language, Ultratech points to the patent specification to support this interpretation. First, Ultratech argues that the title of the '996 patent, "Photolithographic Reduction Imaging of Extended Field," makes clear that the purpose of the patent, and the benefits derived therefrom, relate to exposing a larger image field onto a wafer. This advantage does not depend on whether the field contains one or multiple die. Further, the advantage is not dependent on the contents of the mask, so any image or images which are projected by a single mask in an extended field (i.e. a field larger than that available prior to the '996 patent) are uses of the patent. Thus, according to Ultratech, any corresponding images which are produced on a wafer from a single mask constitute a microcircuit device. Since the term refers to any patterns projected by a single mask, Ultratech argues that microcircuit device cannot be limited to a single die.

As further support for the argument that the "microcircuit device" refers to any series of patterns on a single mask, Ultratech notes that when discussing the imaging of an entire microcircuit device, the patent refers to imaging "a mask or reticle for the circuit." '996 Patent, col. 1, Ins. 63-65. Similarly, when the patent describes methods for joining portions of masks to
image an entire microcircuit device, it refers to a single "mask or reticle for the entire microcircuit device." Id., col. 3, Ins. 25-29.

Finally, Ultratech argues that the patent never refers to the microcircuit device as an "integrated circuit," or that the term is limited to a single "die." Since "integrated circuit" and "die" were well known to those skilled in the art, the absence of these terms in describing a microcircuit device should weigh against ASML's interpretation.

Ultratech also provided extrinsic evidence in the form of expert testimony which suggests that the term "microcircuit device" is broader than the phrase "integrated circuit." The expert's declaration also supports Ultratech's theory that one skilled in the art would recognize that the patent would enable projection of either larger circuit patterns, or a larger number of individual images corresponding to the individual die. Because the patent claims must be construed according to the understanding of one skilled in the art, and one skilled in the art would recognize this benefit, Ultratech argues that the term must be construed to include both these uses.

2. ASML's Argument

ASML argues that the plain meaning of "microcircuit device" supports its proposed interpretation, that a single microcircuit device refers to an image which will be contained on a single die. ASML's analysis deconstructs the term: "micro" meaning small, and "circuit" being a closed path for an electric current. Thus, a microcircuit is a circuit defined by small electrically connected elements through which current travels to form a functioning device. Further, ASML cites technical dictionaries to argue that "microcircuit" is synonymous with "integrated circuit," and that a "device" is an "electronic element that cannot be divided without destroying its stated function." Accordingly, a microcircuit device must be an integrated circuit which cannot be divided. This means that a single microcircuit device, being indivisible, may only exist on a single die.

ASML further argues that Ultratech misconstrues the meaning of the Bell holding. While Ultratech interprets Bell to mean that the preamble may never become a limitation, ASML argues that if a claim preamble discloses a structural limitation, then it can indeed be construed as a limitation.

Additionally, ASML contends that Ultratech's preamble analysis is based on the incorrect assertion that the patent claims an apparatus that has various possible uses. To the contrary, ASML argues that Claim 1 is a method claim, and that the product being imaged is an intrinsic element of the specific method claimed. Thus, when the preamble refers to "a large microcircuit device," '996 Patent, col. 1, Ins. 38-40, it refers to the product being produced by the method, which is an intrinsic element of the specific method claimed. Further, the claim language necessarily includes the use of the term in the preamble, by referring to "said microcircuit device." '996 Patent, col. 6, Ins. 65-66. In short, ASML argues that the term is a positively defined structural limitation that is necessary to give the claim meaning. Accordingly, under Bell, this term should be construed as a claim limitation within the preamble.

ASML also points to the specification to support its proposed construction, arguing that the specification repeatedly refers to imaging a single unitary microcircuit device. ASML argues that the patent describes the problem of imaging larger microcircuit devices, not that there was a problem producing a large number of die or patterns to cover the wafer. In other words, the stated purpose of the patent is to allow the imaging of "larger devices having bigger overall dimensions." '996 Patent, col. 1, Ins. 13-14.

ASML notes that the description provided in the patent describes the creation of a single large circuit. The patent refers to joining images on the wafer both "to form a complete microcircuit device," id., col. 2, Ins. 22-28, and "to form one complete and intact image of the circuitry" of the microcircuit device. Id., col. 5, Ins. 57-58. ASML argues that this language leads one to conclude that the patent describes a method for imaging a single large integrated circuit, not multiple copies of disconnected circuits on a field.

ASML also provides its own extrinsic evidence, arguing that the patent's lead inventor, John Bruning, has testified that "microcircuit device" is synonymous with "integrated circuit." Further, many technical dictionaries refer to a microcircuit as an integrated circuit or other very small electrical circuit.

ASML also produced its own expert who countered Ultratech's definition. ASML argues that the definition provided by Ultratech is unsupported by persons skilled in the art, and that Ultratech's expert incorrectly applies the term
"microelectronic device" to support his interpretation of the term "microcircuit device."

ASML concludes that Ultratech's definition of the term is incorrect for three reasons: (1) such a construction would deprive the patent of utility; (2) the construction is illogical in that it attempts to impart a plural meaning to a singular term; and (3) the definition attempts to read into the claim an element which is not present.

3. Discussion

This Court must first address Ultratech's allusions to acting as its own lexicographer. In order to assign a unique definition to the term "microcircuit device," the definition must be clearly stated in the patent's specification or prosecution history. See Vitronics Corp., 90 F.3d at 1582. No such definition has been presented, thus the term must be given its ordinary meaning to one experienced in the art. Id. However, the Court notes that in drafting the '996 patent, the inventor clearly recognized a distinction between the singular "microcircuit device" and plural "microcircuit devices." Compare '996 Patent, col. 5, lns. 40-41, with '966 Patent, col. 5, lns. 43-44. The Court considers this intentional distinction relevant to the patentee's intent.

To determine the ordinary meaning of the term "microcircuit device" to one experienced in the art, the court must first consider the claims of the patent. See Vitronics Corp., 90 F.3d at 1582. The initial use of the term "microcircuit device" is found in the preamble to Claim 1: "A method of imaging a large microcircuit device in a resolution range of 0.1-0.50 micrometers, said method comprising …." '996 Patent, col. 6, lns. 60-62.

Contrary to Ultratech's assertions, the patentee may use the preamble of the claim to help define the subject matter of the invention. Bell, 55 F.3d at 620. Bell does not preclude a preamble term from being a claim limitation, see 55 F.3d at 621-22, and Ultratech has offered no support for the proposition that simply placing the term in the preamble precludes that term from being a claim limitation. Moreover, it appears that the use of the term in Claim 1 provides a necessary description of what the patented method will produce. Thus, Ultratech has not established that "microcircuit device," as used in the preamble, cannot create a claim limitation.

The use of "microcircuit device" within the patent's claims does not clearly favor either party's proffered definition. As used in Claim 1, "microcircuit device" could be defined as either "a series of patterns contained on a single mask," as suggested by Ultratech, or "the circuit pattern for a single electrical circuit" as suggested by ASML. The other Claims use of the term "microcircuit device" is similarly ambiguous.

While the use of "microcircuit device" within the claims is ambiguous, the specification lends support for ASML's proposed construction. First, in referring to the prior art, the specification uses the term "microcircuit device" when discussing the imaging of a single circuit. '996 Patent, col. 1, lns. 61-64. That imaging process "is then repeated for successive regions of a wafer, until many copies of the circuit have been imaged on a single wafer." '996 Patent, col. 1, lns. 61-64. If a "microcircuit device" refers to a single mask or reticle capable of transcribing circuits on multiple die, as Ultratech contends that it may, a single imaging of the entire microcircuit device would create a number of copies of the circuit. However, the patent's discussion of prior art, where copies of a single microcircuit device are created by repeated exposure of successive regions of the wafer, reveals that a microcircuit device refers to a single die. See Id.
Similarly, Ultratech's proposed definition is called into question in the "Detailed Description" section of the patent. There, the patent states that "[a] single pattern for a microcircuit device can be divided between two or more separate reticles that are imaged in juxtaposed registry on a wafer." Id., col. 4, Ins. 14-17. This language is in direct conflict with Ultratech's proposed definition, which states that "each photolithographic pattern corresponds to a single mask or reticle." Here, the patent refers to a pattern for a single microcircuit device created by the use of two or more separate reticles. Accordingly, Ultratech's proposed definition cannot be applied consistently throughout the patent.

Further, the patent's descriptions of Figures 6 and 7 inferentially support ASML's assertion that the patent intended "microcircuit device" to refer to the imaging of a pattern for a single die. When describing Figure 6, discussing the imaging of portions of a microcircuit device, the patent notes that

the joining of image portions 26a and 26b along the broken line connects all the elements of microcircuit device 26 that extend across the broken line, to form one complete and intact image of the circuitry of the device 26. Copies of the complete images 26 can then be repeated in different regions of wafer 16 as illustrated in Fig. 6.

996 Patent, col. 5, Ins. 54-63. As noted by ASML, the ordinary meaning of this language supports the inference that a microcircuit device is the circuit pattern for a single die, which is imaged onto the wafer. Multiple die are created through repeated imaging of the single microcircuit device. While Ultratech's definition is not directly refuted by this language, applying that definition requires a much more strained reading of the patent.

In addition, when describing the "scanning" form of the invention depicted in Figure 7, the patent notes that the process "can be repeated as illustrated to form a number of complete images of microcircuit devices 26 on a single wafer 16." Id., col. 6, Ins. 13-15. Again, while not conclusive, this use of the term "microcircuit device" appears to refer to a single circuit on a single die. Imaging of multiple die is performed through repeated imaging.

Based on the use of the term "microcircuit device" within the patent claims and specification, the Court is satisfied that the appropriate definition is one which considers a "microcircuit device" as a circuit pattern on a single die. However, it is not clear that the remainder of ASML's proposed definition is entirely accurate. For example, ASML proposes that "microcircuit device" is an "integrated circuit," yet its papers note that the patent refers to the imaging of a single layer of a circuit pattern, and that "an integrated circuit is made by adding subsequent layers of materials ...." ASML's Cl. Constr. Resp. Br. at 5 n.2. Since there is no question that the imaging of a microcircuit device, as used in the patent, does not create a functioning integrated circuit, this Court must develop a more precise definition.

To create a definition, the Court considers the meaning of the words "microcircuit" and "device" to a person skilled in the art. The parties agree that the patent relates to the production of integrated circuits. See Ultratech's Cl. Constr. Opening Br. at 4 ("Photolithography is used in the manufacture of semiconductor integrated circuits."); ASML's Cl. Constr. Resp. Br. at 5 ("A microcircuit is also known as an integrated circuit.").

To assist in construing the term "microcircuit device" the Court may consider dictionary definitions and technical treatises. See Markman I, 52 F.3d at 986; Bell Atl. Network Services, Inc. v. Covad Comm. Group, Inc., 262 F.3d 1258, 1267 (Fed. Cir. 2001) ("Dictionaries and Technical treatises hold a 'special place' and may be considered along with intrinsic evidence."); Vitronics, 90 F.3d at 1584 n.6. (the court may use technical treatises and dictionaries at any time to form a better understanding of the claim terms).

These dictionary definitions support ASML's argument that a "microcircuit" is synonymous with "integrated circuit." While Ultratech has provided an expert witness who opines that the meaning of the term is much broader than a simple integrated circuit, see Declaration of Richard B. Fair, P 21, this extrinsic evidence should not be considered when the intrinsic evidence is clear. Further, Mr. Fair reaches his conclusion, not by analyzing the term "microcircuit device," but by considering the definition of the term "microelectronic device," which he then construes as meaning a device which comprises inseparable parts and other circuits or structures. This analysis, based on the definition of a related term, is not as
compelling as the dictionary definition of the exact word, as provided by ASML.

Both parties agree that the imaging of a single mask onto a wafer does not form a complete integrated circuit. See Ultratech's C1 Constr. Opening Br. at 4; ASML’s C1 Constr. Resp. Br., at 5 n.2. Moreover, ASML has provided a dictionary definition of the term "device" as "an electronic element which cannot be divided without destroying the stated function." McGraw-Hill Dictionary of Science and Engineering at 261.

While Ultratech argues that the term "device" is defined as "a mechanism designed for a specific use," the definition provided by ASML is more appropriate in light of the source of the proffered definitions and the context of the patent language. First, the technical dictionary which supplies both of the proposed definitions specifically notes that ASML's definition is generally applicable to the field of electronics while Ultratech's definition is applicable to the field of engineering. Ultratech argues that since the patent deals with photolithographic reduction, an engineering task, the engineering-related definition should apply. However, in the patent, the term "device" refers to a "microcircuit device," a circuit pattern for electric current. While the imaging process may be an engineering task, electrical circuitry is within the field of electronics. Thus, ASML's proposed definition, relating to the field of electronics, would appear to be controlling.

Also, from both party's descriptions of the photolithographic process, it is clear that the patent refers to placing a single image onto a wafer. This image is one layer of an integrated circuit; an electronic element which cannot be further divided. Thus, "device" modifies the term microcircuit, so that "microcircuit device" refers to a single imaged layer of a microcircuit.

However, as noted above, this is where ASML's definition goes astray. ASML states that a microcircuit device is an integrated circuit, which it is not. "Microcircuit" is synonymous with "integrated circuit." Both terms are defined as an "electronic circuit in which all the active and passive elements and the connections are made in or on a single semiconductor substrate." See Electronics Dictionary, 4th Ed., McGraw-Hill Book Company, 1960. Since "device" modifies "microcircuit" to refer to a single imaged layer which cannot be further divided, a "microcircuit device" is a single imaged layer on a single die. This definition is supported by relevant dictionary definitions, as well as the language used in the patent claims and specification.

Lastly, the patent refers to imaging "a large microcircuit device" using a "reduction lens having a circular image field with a diameter that is less than the diagonal of said [large] microcircuit device." 996 Patent, col. 6, lns. 63-66. Stated Conversely, a "large microcircuit device" has a diameter which is longer than the diameter of the image field of the reduction lens.

For the foregoing reasons, the Court construes the term "microcircuit device" as follows: "A microcircuit device is a single imaged layer on a single die. A large microcircuit device is a single imaged layer on a single die which has a diagonal longer than the diameter of the image field of the reduction lens."

Turning to the claim language, the preamble of claim 1 refers to "[a] method of imaging a large microcircuit device." Preliminarily, since the mask pattern and the image on the wafer are identical, it is potentially unclear which copy of the pattern is considered the "microcircuit device." We see two possibilities. First, "microcircuit device" could refer to the underlying pattern, whether on the mask or on the wafer. Alternatively, "microcircuit device" could refer just to the image located on the wafer. In this second understanding, the design on the mask would be a pattern for the "microcircuit device," but not the "microcircuit device" itself.

For several reasons, we conclude that the second characterization is correct. We reach this result from the first limitation of claim 1, which requires that the diagonal of the "microcircuit device" exceed the diameter of the image field of the lens. The image field of the lens is positioned relative to the wafer. In both the traditional "step and repeat" and the '996 patented processes, the diagonal of the mask pattern for the microcircuit device would always exceed the diameter of the image field of the lens, depriving limitation (a) of any meaning. See ’996 patent, col. 3, ll. 55-63 (illustrating that when mask size ranges in the inches, both the diameter of the lens image field and the diagonal of the resulting image on the wafer will remain only millimeters in length).

The purpose of the '996 patent further persuades us that the second characterization is correct. Although a mask pattern is
required to carry out the patented method, the goal and end result of the claims is the exposure, or imaging, of a pattern on the wafer. It is this copy of the pattern, not the copy on the mask, which will be used to eventually create functioning circuitry. Thus, it is appropriate to draw a distinction between the mask pattern and the pattern projected onto the wafer. The specification supports this distinction, contrasting the "square image" exposed onto the wafer, with the "image pattern" contained on the reticle or mask. Id. col. 3, ll. 2-4. We conclude that the image on the wafer is the "microcircuit device," whereas the mask contains the pattern for the "microcircuit device."

Continuing with the claim language, the "mask for said microcircuit device," id. col. 6, l. 67, is to be movable in stages "into a field of view of said lens with correspondingly different regions of said wafer moved into said image field of said lens in a pattern that successively images the entire area of said microcircuit device." Id. col. 7, ll. 6-11. If performed exactly as claimed, the '996 patent's method creates a pattern on the wafer that exactly mirrors the pattern on the mask. 4 Thus, each reference in the claim to "microcircuit device" is to the pattern that will be found in the photo-resist on the wafer after the patented method has been performed. The claims do not provide a reason for us to inquire further into the particular contents of the mask pattern, and thereby limit the meaning of "microcircuit device" accordingly. In our view, a "microcircuit device" is simply the entirety of the exposed pattern on the wafer that results from the practice of the claimed invention. This will necessarily replicate what is on the mask. An alternative phrasing of our construction for "microcircuit device," would therefore be, as suggested by Ultratech, "the mask patterns B whatever they contain B that are projected or exposed onto the wafer."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 Although we employ the singular form of "mask" throughout this opinion, we do not intend to exclude the possibility that more than one movable mask might be used to image a large pattern onto the wafer. See id. col. 6, ll. 18-27 (presenting example in which "double reticles or masks" are used to image a single "microcircuit device"). In other words, by "mask," we refer to the entirety of the pattern to be imaged on the wafer through one iteration of the claimed process.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Since the meaning of "microcircuit device" in the context of the claims of the '996 patent is clear, we do not rely on dictionary definitions offered by the parties. The meaning of "microcircuit" is relatively undisputed: "an integrated circuit or other very small electrical circuit." Oxford Reference Dictionary 520 (Oxford University Press 1989); see also McGraw-Hill Electronics Dictionary 336 (5th ed. 1994) ("integrated circuit or hybrid circuit"). As far as the word "device" is concerned, Ultratech offers, "[a] mechanism, tool or other piece of equipment designed for specific uses"; ASML describes a "device" as a "thing made or adapted for a particular purpose," but also suggests a more technical definition that was adopted by the district court: "an electric element that cannot be divided without destroying its stated function."

We reject these definitions insofar as they are inconsistent with the meaning of "microcircuit device" we have gleaned from the language of the claims. Both of the parties' definitions would impose upon "device" a requirement of functionality that is unhelpful in the context of the method claimed in the '996 patent, where the resulting image is only a precursor of a functioning circuit. As just seen, as used in claim 1, the term "microcircuit device" simply refers to the pattern on the mask to be transferred to the wafer. Other claims of the '996 patent are similarly limited to a single imaging step within the much more complicated (and unclaimed) process of circuit construction. The pattern on the mask that is imaged onto the wafer using the '996 patented process serves as a design or map for what may become a functioning "device," but that resulting image on the wafer cannot itself be said to have an immediate "specific use," "stated function," or "particular purpose." It was in this respect, we think, that the district court erred. Its claim construction was framed in terms of the ultimate product. However, that ultimate product, a die, could never be created solely by the exercise of the '996 patented process. For purposes of claim construction, we must begin and end our analysis with the process claimed; what happens to the wafer after the '996 patented process is performed is irrelevant and should not limit the scope of the claimed method.

The specification of the '996 patent supports this conclusion. It highlights, as the critical feature of the invention, the projection and joining of several "image portions" on a wafer to form a single large image or "microcircuit device." See, e.g., '996 patent, col. 1, ll. 51-58 ("reduced images of the mask on the wafer" are formed by movement of the mask and wafer in tandem to "successively image[] the entire area of the microcircuit device"); col. 3, ll. 16-33 (discussing how the claimed process solves the "larger image problem" of "enlarging the size of an image formed on a wafer" by forming 15 mm square images in "juxtaposed registry with each other to produce a single large microcircuit device 30 mm square"); col. 6,
ll. 6-17 (discussing how the scanning embodiment of the invention is used to "form[] a reduced image 26" of the mask pattern "on a single wafer 16"); col. 6, ll. 20-28 ("Relatively large and square imaging patterns are shuttled reciprocally into the viewing field of [the] lens; and [the] mask is moved in the image field of [the] lens so that extended field rectangular images are formed on successive regions of wafer. Each of the images is formed by juxtaposing and registering a pair of images carried on double masks." (diagram designations omitted)). The emphasis on the methodology of imaging the "microcircuit device" compels the conclusion that, in using the term "microcircuit device," the inventors were referring to the entire pattern exposed or imaged onto the wafer.

Notwithstanding the language of the claims and portions of the specification that suggest "microcircuit device" is synonymous with the photo-resist image, ASML contends that the purpose of the invention—namely, "to image larger devices having bigger overall dimensions and containing ever-increasing numbers of finely resolved elements," id. col. 1, ll. 13-16—requires a construction that limits "microcircuit device" to a single circuit or die. In making this argument, ASML points to portions of the specification in which the inventors use "microcircuit device" and circuit interchangeably to describe how the process might be used to image layers of large circuits. See, e.g., id. col. 1, ll. 59-66 (indicating equivalence between "microcircuit device" and "circuit being imaged"); col. 5, l. 50, 64 (referring to the "mask circuit").

It is certainly the case that the inventors had certain expectations as to how the art would evolve, and framed their specification with those predictions in mind. These statements, however, do not speak to the operation of the invention. Whether the image being transferred will later form a component of one die or multiple dies does not affect the manner of "imaging," or its result. The inventors claimed solely a method of image transfer; they did not claim any aspect of the resulting circuitry. Because the "content" of a mask pattern in no way alters the ability of one skilled in the art to perform the claimed method, we should not formulate our construction in those terms. As a matter of law, these statements of use within the '996 patent specification may not alter or undermine the very clear language of the claims. Our construction should be based on what actually was claimed a method of transferring a pattern from the mask onto the wafer.

In sum, as used in the asserted claims of the '996 patent, the term "microcircuit device" refers to the pattern exposed in the photo-resist on the wafer, as the result of the practice of the method claimed by the '996 patent. The pattern exposed on the wafer will necessarily mirror the pattern on the mask. A "large microcircuit device," then, refers to a pattern on the wafer which, when measured in the diagonal, exceeds the diameter of the image field of the reduction lens.

As we have explained, the parties' focus in the trial court on the creation of a single die or multiple dies was misplaced. It was this misplaced focus, we think, that led the district court to incorrectly conclude that a "microcircuit device" is "a single imaged layer on a single die." We mention this point because the district court's claim construction decision reflects a great deal of thought and care which we are confident would have led the court to the construction set forth above had either of the parties pointed it in that direction.

For the foregoing reasons, we reverse the district court's grant of summary judgment of non-infringement in favor of ASML. The case is remanded to the district court for determination of infringement under the correct construction of the term "microcircuit device." See, e.g., NeoMagic Corp. v. Trident Microsys., Inc., 287 F.3d 1062, 1075-76 (Fed. Cir. 2002).

1. "microcode"

EMC asks the Court to construe this term as: "One or more programs for a peripheral device that can be stored in the non-volatile memory of the peripheral device." HP initially proposed: "Program instructions embedded in the internal circuitry of a microprocessor." Thus, the parties initially disputed where the microcode is stored. However, HP changed its proposal in its opposition brief to: "Program instructions that directly control a microprocessor, stored in internal circuitry that is non-volatile memory directly connected to that microprocessor." HP thus concedes that the microcode need not be stored in the microprocessor. Plaintiffs' and Counterclaim Defendants' Opposition Claim Construction Brief on Key Terms, p. 11.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

6 EMC has filed a "Motion to Preclude HP from Asserting New Claim Construction Positions in its Opposition Brief." The
The claims do not define microcode; they merely indicate that microcode resides in non-volatile memory and may be replaced. The specification, however, provides useful insight. Peripheral devices have "special processors installed in them, called resident processors." 801:1/14-15. "These resident processors execute programs, called microcode in the remainder of this application, which are generally stored in a non-volatile memory in the peripheral device." 801:1/16-19. Thus, in its most general sense, "microcode" is a program executed by a peripheral device's resident processor. The remainder of the specification is consistent with this interpretation. See, e.g., 801:2/33-35 ("resident processor . . . is responsive to the resident microcode"), 2/50-57, 5/47-51, 6/35-37, & 7/46-48.

Although the disputed claims do not include the limitation of "control," HP proposes that microcode "controls" the peripheral device. HP is correct in implying that "microcode" does not include all possible types of computer code or programs. Indeed, the patent itself is entitled "Method and Apparatus for Replacing Resident Peripheral Device Control Microcode . . .," and the written description nearly always modifies "microcode" with the word "control." EMC does not necessarily dispute that microcode is a limited subset of all possible computer programs or code: it concedes that microcode is a program "for a peripheral device," that is, code used to assist a peripheral device in functioning. The specification uses the word "microcode" in a manner consistent with this interpretation. See, e.g., 801:1/25-29 ("In order to upgrade performance of, or provide new features for, such peripheral devices, the control microcode may be updated via a download of new control microcode."), 5/47-50 ("The resident processor 106 operates in a known manner, according to a control program stored in the control microcode in the non-volatile memory 108, to execute the disk control command."). Similarly, a dictionary definition provided by both parties defines microcode in part as the "lowest-level instructions that directly control a microprocessor." Declaration of Mark R. Weinstein in Support of EMC's Opening Claim Construction Brief, Ex. 3 (Random House Webster's Computer & Internet Dictionary). While the Court will not import the word "control" into the claim, it notes that a person of ordinary skill in the art would understand "microcode" to mean a limited set of programs that are used specifically for a peripheral device.

With respect to the parties' contentions regarding the location of the microcode, it is true that microcode generally is stored in non-volatile memory in a peripheral device. However, "microcode" need not be defined according to its location, and nothing in the claim indicates that such a limitation must be added. Moreover, the importation of such a limitation would be inconsistent with the written description. For example, microcode sometimes is transferred from a central computer system for replacement purposes. See 801:1/26-29.

Similarly, nothing in the claim language or specification requires the microcode to control a microprocessor "directly" or that the non-volatile memory be "directly" connected to a resident microprocessor. Although microcode sometimes may "control" a resident processor, see 801:4/21-23, it is unclear what is meant by "direct" connection or control. The purpose of claim construction is to clarify the claim language, not to add ambiguous terms. Moreover, the invention appears to teach away from "direct connection" of the resident microprocessor and the non-volatile memory. See 801: Figure 1. Accordingly, the Court construes this term as "one or more programs for a peripheral device that can be stored in the non-volatile memory of the peripheral device and executed by a peripheral device's resident processor."
precise process control in data handling and communication." Lantronix adapted this definition from the definition given by the McGraw-Hill Dictionary of Scientific and Technical Terms.

Digi proposed the Court construe "microcontroller" as "a type of programmable and/or configurable electronic device such as the Intel 8031 or the Hitachi HM 2-62256." See 407 patent, 2:57-59 ("A further example of such programmable and/or configurable electronic device is a microcontroller with downloadable code storage e.g. the Intel 8031 . . . and the Hitachi HM 2-62256."). Digi criticized Lantronix's proposed construction as being unrelated to the 407 patent.

During the hearing, the parties agreed "microcontroller" does not require construction. The Court agrees.

2716

The first disputed term is "microcontroller." SuperGuide and Gemstar argue that while the microcontroller must contain input/output interfaces, a microprocessor and an up-dateable memory, the microcontroller need not contain these elements within a single integrated circuit. Defendants 11 contend the invention claims a single integrated circuit containing each of these elements.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 The Defendants have filed a joint proposed claim construction and therefore are not considered separately with the exception of Third-Party Defendant Gemstar.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The plain language of the claim does not specify that the microcontroller be contained within a single integrated circuit. The Court therefore looks to the specification because "claims must be read in view of the specification, of which they are a part." Advanced Cardiovascular Sys., Inc. v. Scimed Life Sys., Inc., 261 F.3d 1329, 1338 (Fed. Cir. 2001) (citations omitted).

The specification contains the following:

Microcontroller 60 comprises an eight-bit microprocessor, input/output interfaces and an updateable memory which is preferably a 32K random access memory (RAM). Those skilled in the art will of course appreciate that each element of microcontroller 60 may be separately provided, and that the microprocessor could be other than eight-bit, while the updateable memory could comprise a RAM, a hard disk, a floppy disk, bubble memory, tape, etc. and could be other than 32K in dimension.

Reiter '578, at Col. 4, ll. 9-18 (emphasis added).

Additional changes to the system may be made by including one or more of the elements in a single piece of hardware, or by dividing a single element into many individual pieces. Thus, for example, the microcontroller, mixer and RF section could be combined into a single hardware chip. Conversely, the microcontroller could be divided into a microprocessor, a RAM and the various I/O interfaces. Indeed, various combinations of all the elements could be made to suit various needs.

Reiter '578, at Col. 7, ll. 61-68; Col. 8, ll. 1-2 (emphasis added). The language of the specification clearly anticipates that each element of the microcontroller, i.e., the microprocessor, RAM and I/O interfaces, could be "divided" "into many individual pieces." Moreover, while both the claim language ("including") and the specification language ("comprises") require the microcontroller to have at least these three elements, there is no requirement that the elements be contained within a single integrated circuit. "The claim word 'including' is not construed in a lexicographic vacuum, but in the context of the specification and drawings." Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999). "The claim term 'including' is synonymous with 'comprising,' thereby permitting the inclusion of unnamed components." Hewlett-Packard Co. v. Repeat-O-Type Stencil Mfg. Corp., Inc., 123 F.3d 1445, 1451 (Fed. Cir. 1997). "Comprising is a term of art used in claim language which means that the named elements are essential, but other elements may be added and still form a construct within the scope of the claim." Dow Chem. Co. v. Sumitomo Chem. Co., Ltd., 257 F.3d 1364, 1381 (Fed. Cir. 2001).
2001) (quoting Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997)). And, where "including" or "comprising" is used in conjunction with the indefinite article "a," the article "in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase '[including]." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). "The written description supplies additional context for understanding whether the claim language limits the patent scope to a single [integrated circuit] or extends to encompass a device with multiple [circuits]." Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1024 (Fed. Cir. 1997). Here, neither the language of the claim nor that of the specification requires the elements of the microcontroller to be integrated into a single circuit. Advanced Cardiovascular Sys., Inc., supra. Therefore, the undersigned will not read such a limitation into the claim.

"Microcontroller" is thus construed as the electronics including input/output interfaces, a microprocessor, and an updateable memory comprising at least a random access memory which is capable of being updated via an electronic medium and which is capable of storing updated information including at least television programming information. The microcontroller is not limited to a single integrated circuit.

GO BACK

2717

b. "microprocessor"

The plaintiffs propose "an electronic circuit that executes programmed instructions and is capable of interfacing with input/output circuitry and/or memory circuitry." The defendants propose "an electronic circuit that uses a central processing unit to interpret and execute programmed instructions." The main disputes are whether the microprocessor must be capable of interfacing with input/output circuitry and/or memory circuitry, and whether the microprocessor needs to use a central processing unit.

The plaintiffs argue that the patent discloses a microprocessor that communicates with memory circuitry. '336 patent, 8:56-58, 11:49-54. The plaintiffs also argue that the claim language does not support the fact that a microprocessor is required to use a central processing unit because claim 3 does not recite the use of a central processing unit whereas all other independent claims require the use of a central processing unit.

The defendants argue that one of ordinary skill in the art would understand that microprocessors include a central processing unit. In addition, the defendants contend that not all microprocessors need to interface with input/output circuitry because some microprocessors communicate solely with external memory. The defendants also contend that microprocessors do not need to connect to external memory because some microprocessors rely solely on on-chip memory.

The Court is not persuaded that the additional limitations proposed by the plaintiffs or the defendants are appropriate. The input/output interface and the central processing unit limitations are included in other portions of the claims and, therefore, adding those limitations to the construction would be superfluous. See, e.g., '336 patent, 32:12-13, 25-26. The Court construes "microprocessor" to mean "an electronic circuit that interprets and executes programmed instructions."

GO BACK

2718

b. "microprocessor means"

Claim 1 discloses as an element: "microprocessor means in the housing for receiving the signal from the electrical means and for converting the signal into an altitude value." The parties dispute the proper construction of the "microprocessor means."

This element is written in a mean-plus-function format: "microprocessor means . . . for receiving . . . and for converting." As discussed above, § 112 P 6 permits an inventor to express an element in a claim as a means for performing a specified function without the recital of structure. 6 The element under consideration arguably includes disclosure of a structure, i.e., "microprocessor means." A "microprocessor" is a structure. Thus, the Court considers whether § 112 P 6 applies.
The normal convention is to use the indefinite noun "means" followed by a description of its function: "Ordinarily, the question whether a claim element triggers section 112(6) is not difficult. Claim drafters conventionally use the preface 'means for' (or 'step for') when they intend to invoke section 112(6), and there is therefore seldom any confusion about whether section 112(6) applies to a particular element." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996).

This consideration was not raised with respect to "electrical means" because the word "electrical" is not a structure.

If a claim recites a "means for" performing a specified function, it may nevertheless falls outside the ambit of § 112 P 6 if it recites a definite structure that performs the described function. Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996). In deciding whether a claim that recites a structure should be construed under § 112 P 6, the Court should consider the degree of detail with which the structure is described. Id.

The Court concludes that the recital of a "microprocessor" in the Claim is not a recital of a definite structure. A skilled artisan would understand the phrase "microprocessor means" to be indefinite as to structure because the word "microprocessor" refers to a wide range of silicon microchips that contain electronic circuits. See e.g., WEBSTER'S NEW WORLD COMPUTER DICTIONARY 232 (10th ed. 2003.) Thus, the Court construes "microprocessor means" pursuant to § 112 P 6.

i. the recited functions

The recited functions of the "microprocessor means" are "receiving" and "converting." The specification does not contain any specialized definition of "receiving." Thus, the Court construes the word "receiving" as having its ordinary meaning.

The element recites a limitation on what is received: "the signal from the electrical means." As discussed above, the electrical means conducts an analog signal from the semiconductor strain gauge to other components in a circuit. A skilled artisan would understand that the "microprocessor means" receives the analog signal from the "electrical means."

The element discloses that a further function of the "microprocessor means" is to convert "the [analog] signal" into an "altitude value." 8 the conversion for "calibration," 9 programmed to display absolute altitude constantly, through circuitry and programming logic. (Id.) The conversion is performed by a "microprocessor means." In the written description, the inventors use "microprocessor" interchangeably with "silicon chip," "microchip," "chip," and "microprocessor chip." (See '694 Patent, Col. 4:7-9, 41-51.) A person of skill in the art would understand "microprocessor" to be a solid state integrated circuit diffused onto a silicon substrate that performs computing functions on digital data. See INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERING (IEEE) DICTIONARY OF STANDARDS TERMS 306, 570, 693 (7th ed. 2000). Thus, the Court concludes that the function of "conversion" to an altitude value necessarily requires conversion from an analog signal to a digital signal capable of being processed by a microprocessor.

8 In the written description, the inventors describe the converting process as being from an analog signal to "an appropriate altitude figure."

The resistance signal is an analog variable signal which is converted by the microprocessor chip 25 into an appropriate altitude figure. ('694 Patent, Col. 4:48-51.) The Court concludes that the inventors used "altitude value" and "altitude figure" interchangeably.9 ('694 Patent, Col. 4:52.)

Footnotes:

6 The normal convention is to use the indefinite noun "means" followed by a description of its function: "Ordinarily, the question whether a claim element triggers section 112(6) is not difficult. Claim drafters conventionally use the preface 'means for' (or 'step for') when they intend to invoke section 112(6), and there is therefore seldom any confusion about whether section 112(6) applies to a particular element." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996).

7 This consideration was not raised with respect to "electrical means" because the word "electrical" is not a structure.

End Footnotes.
ii. corresponding structure

The Court considers whether the inventors recite a corresponding structure capable of performing the functions of the "microprocessor means." In the written description, the inventor described a "microprocessor:"

Electronics included in the device 10 preferably are embodied in specially designed silicon chip 25 . . . . The microchip 25 is a microprocessor for accomplishing the functions of the invention. The chip 25 is connected in a circuit with the strain resistance element 18 and receives a resistance signal from the strain resistance element 18 and a battery or batteries 29. The resistance signal represents the degree of strain in the element 18, representative of the differential pressure on the two sides of the transducer diaphragm 17. The resistance signal is an analog variable signal which is converted by the microprocessor chip 25 into an appropriate altitude figure.

('694 Patent, Col. 4:7-9, 41-51.)

Thus, microchip 25 appears to qualify as a corresponding structure for the "microprocessor means." The issue becomes whether such a structure is capable of performing all of the functions of the "microprocessor means." A person of skill in the art would understand that in order to perform the function of receiving an analog signal and converting it to a digital altitude value necessarily requires the presence of an analog-to-digital converter on the microchip. Although the written description does not recite the presence of an analog-to-digital converter on the microchip, such converters were commonly known in the art at the time of the invention. For example, in Claim 10, the inventors expressly recite an invention where an analog-to-digital converter is in the "microprocessor means:"

The altimeter device of claim 1, further including an analog to digital converter in the microprocessor means, and means included in the display means for displaying the altitude as converted.

('694 Patent, Col. 8:20-23.)

Thus, the Court concludes that since Claim 1 is a means-plus-function claim, its scope includes microchip 25 and its equivalents. Accordingly, as used in Claim 1 of the '694 Patent, the Court construes "microprocessor means" to mean:

An apparatus in the housing for receiving an analog signal from the electrical means and for converting it to a digital altitude value, as illustrated by the item labeled 25 in Figures 3 and 4, and its equivalents.

Footnotes

10 An invention disclosed in a claim depending from a means-plus-function claim is an equivalent to the broader independent claim. See IMS Tech., Inc. v. Haas Automation, Inc., 206 F.3d 1422, 1431-32 (Fed. Cir. 2000). The doctrine of claim differentiation is not violated because the dependent claim is narrower, and because it does not include the means-plus-function "equivalents." (Id.)

2. The term "A microprocessor responsive to a program resident therein" should be interpreted as follows: "An integrated circuit that contains a central processing unit (CPU) on a single chip, that responds to a software program resident in memory."

GO BACK

2720

1. "Microscope station" (claims 16, 17, 21)
Cytyc argues that the term "microscope station" should be construed as "equipment, not including a cell analysis instrument, at which a human operator performs microscope analyses." Tripath objects to the exclusion of cell analysis instruments and the requirement of a human operator. It proposes a broader definition: "a place equipped with a microscope." The claims and the specification support the narrower definition.

Claim 16(b) describes three elements that each microscope within a "microscope station" must include: a movable slide stage, a means for computing that stores and shares information about the slide being examined, and a means for automatically recording location information of interest of the slide stage during slide examination. Claim 16 by itself appears to define "microscope station" broadly as any location equipped with a microscope that satisfies the three requirements. However, four dependent claims suggest a narrower meaning.

Claim 17 adds to the microscope station a terminal for a database having information relevant to the appropriate examination of the slide specimen. Claim 22 adds a means for recording time information, such as how long a previous user spent viewing a particular location of interest on the slide. These claims indicate that a "microscope station" is a place where a user can store and retrieve information about slides for use in diagnosis.

Claims 21 and 24 further narrow the definition of "microscope station" by distinguishing a "cell analysis instrument". Claim 21 states that the network "includes at least one cell analysis instrument and that at least one microscope station "comprises a terminal for receipt of analysis from the cell analysis instrument." Claim 24 states that separate microscope stations are "linked to a cell analysis instrument" and "analysis data from the cell analysis instrument and results of the microscope examination are simultaneously available at the separate microscope stations for review thereof." These two claims make clear that the cell analysis instrument is a specialized machine for producing analytical data. In contrast, the "microscope station" receives the data from the cell analysis instrument and other sources. Its purpose is to allow users to access the data.

The specification supports this distinction between a "microscope station" and a "cell analysis instrument." The specification repeatedly refers to "microscope stations" as places where end users access data. For example, the Detailed Description of the Invention states:

The network reviewing method comprises the step of causing the computer storage means to be independently accessible by at least two separate microscope stations in a network, each of the stations comprising a microscope and computer means, with each of the microscope stations being separately individually linked to at least one computer means capable of recalling the stored movements and location information from the . . . microscope used in the original examination.

Id. at col. 3, 11. 13-23. Another passage reads:

recalling, at one or more of said microscope stations from said computer storage means, a computer generated image of a slide . . . , onto the viewing means of the respective microscope station for review.

Id. at col. 3, 1.65 -- col. 4, 1. 1.

Beginning at column 8, line 10, the specification describes in detail how a pathologist uses the "microscope station" in practice. Id. at col. 8, 1. 10 -- col 9, 1. 24. The pathologist interacts with the "microscope station" by placing the slide on the stage, finding locations of interest, viewing data on a screen, and printing reports. Id. These examples show that a "microscope station" is a place where different types of information is gathered, stored, and viewed. It follows that the "microscope stations" must have some means for data storage, sharing, and access by a human.

The description of "cell analysis instrument" is quite different. The specification provides examples of four types of instruments: hemotology analyzers, PAP smear analyzers, image analyzers, and laser scanning cytometers. Id. at col. 9, 11. 25-27. These instruments scan slides and process the data from these slides. Id. at col. 9, 11. 27-30. They then isolate, locate, and characterize cells based on the scan data. Id. Importantly for purposes of claim construction, the specification states that "one or more of the instruments can be interfaced with at least one of the microscope stations on the network in accordance with the present invention." Id. at col. 9, 11. 30-33. This last sentence makes clear that a cell analysis instrument is not part of a "microscope station." It can be linked to a "microscope station" so that its data can be accessed there, but it is a separate apparatus.
n13 Claims 25-28 specifically claim each of these four types of instruments.

Figure 1 illustrates these differences between "microscope station" and "cell analysis instrument" in a preferred embodiment. The Cytology Lab Pathfinders and Anatomic Pathology Pathfinders, represented by the number one, consist of a microscope equipped with stage position encoders, a microprocessor, a display screen and a keyboard. Id. at col. 6, 11. 54-58. These are "microscope stations." Id. The Pathfinder DS System, numbers four and eight, has similar components, and is also a "microscope station." The Laser Scanning Cytometer, which is a type of cell analysis instrument, is shown as number five. Id. at col. 9, 11. 36-37. It is depicted as a separate entity, with different components than the "microscope stations." Id. at col. 9, 11. 37-39.

TriPath contends that Figure 1 depicts four types of "microscope stations": Cytology Lab Pathfinders (number one), Anatomic Pathology Pathfinder (number one), Pathfinder DS System (numbers four and eight) and the Laser Scanning Cytometer (number five). It contends that these "stations" meet the requirements of claim 16 because each includes a microscope, some sort of microprocessor or personal computer, and a microscope staged encoder.

However, TriPath fails to recognize that the requirements of claim 16(b) refer only to the microscope component of a "microscope station." Claim 16(b) leaves open the possibility that a "microscope station" has other features." n14 As I explained above, the specification and the other claims define these other features in such a way that a "microscope station" is a place, separate from a cell analysis instrument, where a human conducts cell analysis and review.

n14 The preamble of claim 16 (b) provides: "A network of interconnected microscope stations comprising . . ." From this language, it is not clear whether "comprising" refers to the "network" or the "microscope stations." However, claims 16(a) and (b) refer to the connections between microscope stations, suggesting that claim 16 read as a whole describes the elements comprising the network, not the microscope stations.

TriPath also argues for a broader construction on the grounds that independent claims must be construed independently of and irrespective of dependent claims which specify a specific structure. It relies on Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991), for this proposition. However, Laitram does not apply to the present situation.

In Laitram, independent claim 21 contained a means-plus-function claim relating to a "means for joining" ends of a conveyer belt. Id. at 1534-35. Dependent claim 24 specifically required a cross-member as a means for joining the ends of the belt. Id. at 1538. Laitram argued that claim 21 could not also require a cross-member because that interpretation would violate the prohibition against reading limitations from a dependent claim into the independent claim and would frustrate the doctrine of claim differentiation. Id. The Federal Circuit rejected both of these arguments. Id. It held that the interpretation of "means for joining" as requiring a cross-member was proper because it derived from the specification, not the dependent claims. Id. It also found that claim differentiation was a judicially developed presumption that did not override § 112, P 6, the statute authorizing means-plus-function claims. Id.

In this case, unlike Laitram, the term "microscope station" itself is not a means-plus-function claim governed by § 112, P 6. Claim 16(b)(ii) and (iii) are means-plus-function claims describing two elements of the microscopes in a "microscope station." I do not read claims 17, 21, 22 and 24 as enumerating the means required to complete the functions in claims 16(b)(ii) and (iii) or as limiting claim 16 to the structures in the dependent claims. Rather, I look at the dependent claims to shed light on the meaning of a term that appears in the independent claim and three of the four dependent claims. See Phillips, 415 F.3d 1314 ("Other claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment as to the meaning of a claim term.").

Finally, TriPath claims that Cytyc's proposed construction is incorrect because it would invalidate the preferred
embodiment. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, (Fed. Cir. 1996) (holding that an interpretation that invalidates the preferred embodiment is "rarely, if ever, correct and would require highly persuasive evidentiary support"). This is simply not the case. Figure 1 represents the preferred embodiment. 969 patent at col. 6, 11. 54-55. As discussed earlier, the Cytology Lab Pathfinders and the Anatomic Pathology Pathfinders are "microscope stations" that contain the movable slide stage, means for computing, and means for automatically recording required by claim 16. Id. at col. 6, 56-58. The Pathfinder DS System, depicted as numbers four and eight, is also a "microscope station" according to claim 16. Id. col. 7, 11. 50-55; col 8, 11. 28-29, 59-61. The Laser Scanning Cytometer is a "cell analysis instrument" that meets the requirements of claims 21, 24 and 28. Therefore, the preferred embodiment falls within the claims and is presumably valid.

In sum, the specification and claims support a narrow reading of "microscope station." Thus, I construe "microscope station" to be equipment, not including a cell analysis instrument, at which a human operator performs analysis.

3. To Mimic the Setting of the Other Individual Light Controls

The parties dispute the meaning of the term "mimic" in claim 14. Genlyte argues that "mimic" means "to imitate closely the adjusting (i.e. raising or lowering) of the other controls, which are functionally separate from one or more other light controls." Lutron asks the Court to interpret "mimic" to mean "to send its setting to other individual light controls and to receive and respond to settings from other individual light controls."

At col. 4, ll. 26-33, the specification states that "in a mimic mode, each of the controls 10 will mimic any other control activated within the group. For example, if a first individual control 10 in the linked group is activated to raise light intensity, all controls 10 will respond by raising the intensity of the respective lights in their rooms. If a second control in a group lowers light intensity, all individual controls correspondingly lower the intensity of their respective lights."

However, Lutron attempts to add into the meaning of mimic "to send its setting to other individual light controls," while the claim and the specification both speak only to the ability of the individual light control to respond to settings sent from other individual light controls. Therefore, the individual controls 10 "mimic" the light settings of other individual controls 10 by receiving and responding to the settings of the other individual controls 10.

Accordingly, "mimic" is construed to mean "receive and respond to."

5. Minimize

The term "minimize" appears in both the preamble and the fourth element of claim 1: "finding a solution which is used to generate the input which minimizes the value of the expressions while satisfying the first and second constraints ..." (635 patent Col. 10 lines 50-51) (emphasis added).

Plaintiffs argue that the term "minimize" should be understood to mean "reduce to a minimum." Defendants argue that "minimize" should be "reduce to zero." Neither party has indicated that this term is used in any way other than it's ordinary meaning. The dictionary definition of "minimize" is "to reduce to the smallest possible number, degree, or extent." Merriam-Webster's Third New International Dictionary Unabridged, Merriam-Webster, Inc., 1993. Plaintiffs assert that within the context of the claim, "minimize" does not require reduction to zero. In support of their argument, plaintiffs recite the claim language that expressions are "minimized" subject to the constraints in the other elements of the claim. The constraints, as constructed supra, impose strict requirements on the input generated. Physical systems have a range of inputs which they are designed to receive. The input must be within this range (635 patent Col. 7, lines 36-39) ("If at any time during the convolution, the actuator limit is exceeded, the sequence is unacceptable."). and within the range of tolerances the system permits (635 patent Cols. 5-7). Within these constraints, and subject to real world conditions, the claimed method cannot necessarily eliminate all vibrations. (Decl. of Dr. Bell P20-21). See also '635 patent Col. 6, lines 8-11
"Acceptable response is defined as less than 5% of total move size residual vibration."

Defendants correctly indicate that the abstract of the patent states an objective "to eliminate unwanted dynamics", and a disclosed method in the specification which describes amplitudes of undesired vibrations as being reduced to zero. ('635 patent abstract; Col. 5, lines 44-61). Reducing unwanted dynamics to zero is only one step of the method taught by the invention. The abstract provides "A sequence of impulses is determined which eliminates unwanted dynamics of a dynamic system." (635 patent abstract). This "sequence of impulses" is not the "input which minimizes the value of the expressions." In the preferred embodiment, the method taught determines how to translate an arbitrary input into another input. If the model is perfect with respect to the real-world operating environment, the patent contemplates eliminating all residual vibration. The imposition of the first and second constraints, above, are specifically imposed because of the difficulty of formulating a model which can capture every variation of the system's environment. See '635 patent Col. 5 lines 67-68 ("The two-impulse input, however, cancels vibration only if the system natural frequency and damping ratio are known exactly.") Interpreting "unwanted dynamics" to incorporate a threshold for acceptable residual vibration is consistent with the specification and the awareness of this difficulty. The disclosed method establishes a model which, in an idealized and abstracted world, eliminates a dynamic, such as vibration, from the system. ('635 patent Col. 5-6, lines 67-3) (noting that "vibrations [are canceled] only if the system natural frequency and damping ratio are known exactly.") The preferred embodiment specifically accommodates for uncertainty in the natural frequency of the system, and to variations in the damping ratio. This is exactly what is contemplated by the "first constraints" and "second constraints" in the '635 patent claims. Defendants concede that they have no support for the assertion that reducing resulting vibrations to zero is possible.

8

Mr. Akerley, attorney for defendant Seagate, adduced at the Markman hearing:

MR. AKERLEY: . . . I'm not going to stand here and tell you that we can ever reduce those vibrations to an absolute zero.

THE COURT: . . . what you're arguing that the plaintiff got a patent for, you're saying to me is impossible?

MR. AKERLEY: No.

THE COURT: Any of your experts opine that they know of such a system that reduces vibration to zero?

MR. AKERLEY: No.

Transcript of Markman Hearing at 131.

Accordingly, the term "minimize" as used in independent claims 1 and 11 is interpreted to mean: "reduce to a minimum."

C. Minimum Bandwidth (claims 10, 13, 26 and 28 of the '700 patent; claim 5 of the '438 patent)

Plaintiff's Construction: Smallest amount of transmission capacity
Defendant's Construction: A minimum number of bits sent in a defined time period

The parties disagree about three issues: (1) whether bandwidth measures the capacity of data to be sent or the data actually sent; (2) whether the data must be measured in bits; and (3) whether a particular time period is at issue.

I agree with plaintiff that bandwidth measures what can be sent, not what has been sent. Even the dictionary definitions defendant cited at the claim construction hearing support this view. Each of those dictionaries defines "bandwidth" as "data transfer capacity" or data "that can be transmitted." Defendant cites no other intrinsic or extrinsic evidence suggesting that bandwidth is a backward looking measurement of data that already has been sent.

Defendant relies on the same dictionary definitions to support its contention that bandwidth must be measured in "bits per second." Although those definitions suggest that bandwidth is "usually" so measured, the patent is not so constrained. Rather, the patent specification says that bandwidth may be measured in bits per second "or any other convenient representation." '700 pat., col. 8, lns. 5-8.

However, I agree with defendant to the extent it argues that bandwidth is measuring something. Plaintiff's proposed construction says only that bandwidth is transmission capacity without identifying what is being transmitted. Because plaintiff admitted at the claim construction hearing that bandwidth is about data transfer, Cl. Const. Tr, dkt. # 48, at 18, I will add that to the construction.

The specification provides support for defendant's third suggested limitation: "Minimum bandwidth indicates the minimum amount of bandwidth a particular traffic group needs to be provided over a defined time period." '700 pat., col. 8, lns. 9-11. Because plaintiff failed to advance any argument either in its briefs or at the claim construction hearing that "minimum bandwidth" is not measured over a defined time period, I will adopt that part of defendant's proposed construction.

Accordingly, I construe "minimum bandwidth" to mean "smallest amount of data transmission capacity over a predefined period of time."

The parties dispute the constructions of "minimum queue bandwidth" and "minimum bandwidth allocation" as well, but these disputes mirror those with respect to "minimum bandwidth," so it is unnecessary to define these separately.

7. "Mining the image data stored in the sensor memory." Used in Claim 22.
Claim 22, with the disputed term in bold, states:

The system of claim 18, the server is adapted for mining the image data stored in the sensor memory.

March Networks suggests that the term is indefinite and impossible to construe. If the term is construed, March Networks states that the term means "performing an analysis of the image data to determine historical patterns of behavior."

Data mining is described at col. 13, ll. 55-66, referring to Figs. 46a-46h and 47a-47i (which are described at col. 33, ll.24-67 and at col. 34, ll. 1-67) which describe "mining" a database. Both parties agreed that "mining" means "searching." Tr. p. 75, ll. 19-25; p. 76, ll. 1-7. March Network argues that the claim must be limited to data stored in the sensor memory, and is therefore indefinite because no sensors are disclosed - only sensor appliances.

35 U.S.C. § 112 P 2 requires that the claims of a patent particularly point out and distinctly claim the subject matter which the applicant regards as his invention. "In ruling on a claim of patent indefiniteness, a court must determine whether those skilled in the art would understand what is claimed when the claim is read in light of the specification." Bancorp Servs., LLC v. Hartford Life Ins. Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004). "The claims as filed are part of the specification, and may provide or contribute to compliance with Section 112." Hyatt v. Boone, 146 F.3d 1348, 1352 (Fed. Cir. 1998)." "If the claim is subject to interpretation, i.e., it is not insolubly ambiguous, it is not invalid for indefiniteness." Bancorp Servs., 359 F.3d at 1371.

Here, the specification refers to the server and sensor appliances as having memory. See' 183 patent, col. 7, ll. 38-40. Claim 18, on which Claim 22 depends, refers to sensor appliances. In light of the specification, including the claims, the court concludes that the claim term is not indefinite, even though it refers to sensor memory, and the rest of the claim uses "sensor appliance." n7

--- Footnotes ---

n7 The court notes that since the original claims included "sensor memory," there is disclosure of sensor memory in the ' 183 patent and the patentee could have amended the written description in the body of the specification to include it.

--- End Footnotes ---

The court construes this claim term as follows:

"Mining the image data stored in the sensor memory" means: "searching the still frame images and the motion video images stored in those sensor appliances which retain such images."

The parties have agreed to the definition of some claim terms in Claim 25. For convenience Claim 25 is set out below, with the agreed terms in italics and the disputed terms in bold. n8

A comprehensive, IP network compatible, multimedia surveillance and security system comprising a plurality of sensor appliances adapted to connected to a network based server for monitoring, logging, and transmitting data to the server in order to permit comprehensive surveillance of a predetermined area, the system comprising:

a. a plurality of surveillance sensor appliance controlled by the server for monitoring an area and generating a data signal indicating a condition in the monitored area controlled by the server, whereby the server receives and logs signal data. . .

--- Footnotes ---

n8 The terms in the preamble are the same as those in the preamble of Claim 1, and have already been construed.

--- End Footnotes ---
13. Mobile Processor: A processor which can be carried by a person outside of a home or office and which executes electronic mail programming to function as a destination and/or source of electronic mail.

3. "mode control data" ('326 patent, claim 56)

AVID contends that "mode control data" should be construed as "data describing one or more parameters associated with a mode of operation." In opposition, the Defendants cite the '326 patent at 17:30-37 n2 as support for their argument that "mode control data" should be construed as "data consisting of driving frequency, type of modulation (i.e., FSK, OOK, CPSK, and DCPSK), mark and space frequencies, bit rate, data encoding if any, start message code, error detection process, tag type, encryption and all constants incorporated within firmware for controlling the operations of the reader." According to the Defendants, during prosecution the inventors distinguished their claimed "modes" from "modes" in prior patents and therefore relinquished all "mode control data" that relates to modes other than those required to extract information from different types of tags employing different protocols. In reply, A VID states that the inventors during prosecution consistently referred to operating modes and operating capabilities of a reader and did not limit claims to "modes" for extracting information.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n2 The '326 patent at 17:30-37 states:

Mode data include driving frequency, type of modulation (i.e., FSK, OOK, CPSK, and DCPSK), "mark" and "space" frequencies, bit rate, data encoding if any (e.g., Manchester or related coding techniques), "start message" code, error detection process (e.g., cyclic redundancy checks, parity checks), tag type, and all of the constants that are incorporated into the firmware that controls the operations of the reader.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

After carefully considering the parties' proposed constructions, the '326 patent, and the prosecution history, the Court adopts AVID's proposed construction. To invoke prosecution history argument-based estoppel, the prosecution history "must evince a clear and unmistakable surrender of subject matter." Aquatex Indus., Inc. v. Techniche Solutions, 419 F.3d 1374, 1382 (Fed. Cir. 2005) (quoting Pharmacia & Upjohn Co. v. Mylan Pharm., Inc., 170 F.3d 1373, 1377 (Fed. Cir. 1999)). "To determine if subject matter has been relinquished, an objective test is applied, inquiring 'whether a competitor would reasonably believe that the applicant had surrendered the relevant subject matter.'" Id. (quoting Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1457 (Fed. Cir.1998)). Based upon the Court's examination of the prosecution history, the inventors did not make an unmistakable surrender of the subject matter.

2. "mode of operation"

Plaintiffs' construction: a manner of operating an instrument for its intended purpose, including acquiring and/or displaying ultrasonic images

Defendant's construction: manner of operation characterized by a particular range of power conservation or power consumption, for example, full operation or active scanning modes, freeze mode, or power-off mode

Plaintiffs contend that "mode of operation" means the same thing as "method of operation" and that the proper construction
for both terms can be gleaned from the patent specification. As discussed above, I do not find plaintiffs' argument persuasive and have not adopted this construction. Defendant's construction is better, to some degree. The patent specification explains unambiguously that "modes" of operation relate to power consumption levels. '651 pat., col. 5, lns. 57-67 (describing modes of operation including "full operation mode," "freeze mode," "sleep mode," and "power-off" modes in relation to power use). Therefore, I will adopt that portion of defendant's construction. However, the list of examples of modes is unnecessary and will not be adopted.

**Court's construction:** manner of operation characterized by a particular range of power conservation or power consumption

---

1 **Claim 3 reads as follows:**

An audio recording and tape measuring system for enabling the measurement of distance using a measuring tape and enabling the measurements to be orally enunciated and recorded for later use, said system comprising

A. a housing

B. a measuring tape securely mounted in the housing for being removed therefrom, whenever desired, to any desired length to enable measurements of distances to be made; and

C. an audio signal recording circuit mounted in the housing and construction for receiving and recording audible information and replaying the recorded information upon demand, said circuit comprising

a. circuit controlling and processing means,

b. an information storage address

1. controllably interconnected to the controlling and processing means for receiving signals corresponding to orally enunciated information,

2. storing said signals therein, and

3. transmitting, upon demand, stored signals to the circuit controlling and processing means,

c. a microphone connected to the circuit controlling and processing means and constructed for

1. receiving an orally enunciated signal corresponding to the desired information to be recorded, and

2. transmitting the signal to the controlling and processing means for transmission to and retention in the storage address,

d. output means connected to the circuit controlling and processing means for receiving signals retrieved from the storage address and presenting the stored information as an audible signal corresponding to the stored information, and

e. a mode selector switch connected to the circuit controlling and processing means and movable between a RECORD and a PLAY mode, enabling the circuit controlling and processing means to establish the desired operation of the recording circuit.

---

* * *

- 3072 -
The Activation Switch

I find that the plain language of Claim 3(c)(e) does not require an activation switch that initiates the operation of the recording circuit in the selected mode and is distinct from the mode selector switch. Zircon argues that Claim 3's mode selector switch's primary purpose is to define the operation performed by an activation button. In its preferred embodiment, this dual mode selector and activation switch combination allows one button to perform either record or play function from multiple address locations; a distinct mode selector/activation switch combination requires only one activation button per location. Zircon argues that this differs from the Repeater's design. The Repeater requires both a record and a play button. From a distinct activation switch and mode selector switch requirement, Zircon maintains, it is a short step to find that the Repeater does not infringe on Claim 3(c)(e) because it does not have modes as Claim 3 requires. Unfortunately for Zircon, I find that while the preferred embodiment does have dual mode selector switch/activation switches, the patent is not necessarily so limited. Transmatic, Inc. v. Gulton Industries Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995). For Zircon's argument to be persuasive, I must read distinct activation and mode selector switch requirements into Claim 3.

After careful reading I hold that Claim 3 does not require separate activation and mode selector switches; Claim 5 2 does. Where some claims are broad and others narrow, the narrow claim limitations cannot be read into the broader claim. Transmatic, 53 F.3d at 1277 (Fed. Cir. 1995); D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed. Cir. 1985). Given this legal rule and Claim 3's language, I hold that the Claim 3(c)(e) does not require an activation switch distinct from its mode selector.

--- Footnotes ---

2 Claim 5 reads as follows:

D. at least one activation switch mounted to the housing for ease of access by the user and constructed for transmitting an activation signal to the circuit controlling and processing means for initiating the operation of the audio signal recording circuit in the selected mode.

--- End Footnotes ---

2730
e. “modem”

Claim 3 discloses a “computer jukebox as recited in claim 1 wherein said communication interface includes a modem.” Opening Brief, Ex. 1 at 9:16-17 (emphasis added). Plaintiffs contend that “modem” means “a connection between components that allows communication from one component to the other that includes a device that modulates and demodulates signals.” Id. at 11. Defendants contend that modem is limited to “a telephone modem connected to a modem on the central management system through a leased or dial-up telephone line.” Resp. Brief, Ex. E at 2. Nothing in the claim or specification supports defendants' proposed construction. The claim refers only to a “modem,” and the language in the specification upon which defendants rely states that the transmission link “may be a cable system such as public or private telephone lines or the like.” Id.,
Ex. 1 at 3:30-32. In addition, defendants' proposed construction would render the words “such as” and “or the like” superfluous. Id. If the patentees wanted to include the limitation proposed by defendants, they easily could have written that the transmission link “was a public or private telephone line.” Moreover, skilled artisans would understand that a “modem” could include a telephone dial-up modem, cable modem, ADSL modem, etc. See Dictionary of Computer and Internet Terms, supra, at 326 (“a device that encodes data for transmission over a particular medium, such as telephone lines, coaxial cables, fiber optics, or microwaves.”). See also Reply Brief, Ex. 21 at ¶ 33 (modems can be “dial-up modems, cable modems, or any modem suitable for the transmission link.”).

For these reasons, the Court construes “modem” as used in the claim as “a connection between components that allows communication from one component to the other that includes a device that modulates and demodulates signals.” This construction also applies to the term “modem” in the 189, 398, and 834 patents.

For the same reason, I have also concluded that "modem means" is not means-plus-function terms. There is no structure disclosed in the specification for this claim term other than a "modem."

AVID contends that the term should be construed as "the reader operating in at least one of two or more modes, each mode being characterized by data describing one or more parameters associated with the mode of operation." The Defendants argue that the terms should be construed as "the reader operating in at least one of two or more modes, each of which permits the reader to extract information from a particular type of tag, the modes being characterized by mode control data." According to the Defendants, the term "modes" as used in the '326 patent does not encompass any and all operating modes, but rather includes only those modes that permit the reader to distinguish between different types of tags employing different communication protocols. The Defendants also renew their contention that the inventors in the prosecution history disclaimed a meaning of modes that would have encompassed all types of modes. The court rejects this argument and adopts AVID's proposed construction.

AVID contends that the term should be construed as "the reader operating in at least one of two or more modes, each mode being characterized by data describing one or more parameters associated with the mode of operation." The Defendants argue that the terms should be construed as "the reader operating in at least one of two or more modes, each of which permits the reader to extract information from a particular type of tag, the modes being characterized by mode control data." According to the Defendants, the term "modes" as used in the '326 patent does not encompass any and all operating modes, but rather includes only those modes that permit the reader to distinguish between different types of tags employing different communication protocols. The Defendants also renew their contention that the inventors in the prosecution history disclaimed a meaning of modes that would have encompassed all types of modes. The court rejects this argument and adopts AVID's proposed construction. The court rejects this argument and adopts AVID's proposed construction.

3. "Modifiable Tree Structure Including Elements in A Fixed Hierarchical Relationship"/"Modifiable Static Tree Structure"
The parties' dispute regarding this proposed claim term has been somewhat of a moving target. Originally, the parties' dispute centered around the terms "tree structure" and "modifiable." NetApp took issue with Sun's attempt to replace the term "tree structure" with the broader term "hierarchy." Because "tree structure" is another disputed term not ripe for construction at this point in time, Sun amended its proposed constructions to include the words "tree structure" (as does NetApp) in its construction instead of embedding a definition of that term in the construction. The sole remaining dispute concerns the term "modifiable" and whether that term requires that modifications be made by a user, as NetApp maintains, or whether the modifications also may be implemented through other means, as Sun maintains.

NetApp also contends that Sun's proposed construction, which states that the tree structure "can be modified but does not change," appears contradictory and will confuse the jury. At the hearing, Sun noted that NetApp's construction would be acceptable so long as the Court struck the phrase "edited by a user" and replaced it with "changed" or "can be changed." The Court agrees with NetApp that Sun's proposed construction is likely to confuse a jury, because the claim language "can be modified but does not change" is unclear as to how a structure can be both modifiable and static at the same time. The Court therefore focuses on whether or not to adopt NetApp's proposed construction with or without the user-editing requirement.

As noted above, Claim 1 of the '249 patent provides:

A method comprising:

- providing a host state representing a state of a computer system, the host state being represented as a modifiable tree structure including elements in a fixed hierarchical relationship, the elements being given value by associated tokens, the elements and associated tokens representing hardware and software components of the computer system and wherein the tokens are extracted from diagnostic data from the computer system;

- determining if predetermined conditions exist in the computer system by comparing respective definitions of the predetermined conditions to the host state; and

- generating an alert if one of the predetermined conditions is determined to exist.

'249 patent at 39:1-17. The reference to a modifiable tree structure also appears in claims 7 and 10 of the '249 patent. These claims make no reference to a "user," and the term "modifiable" seems to be used in a general sense, which supports Sun's construction, but the claim language does not define the term, and is not particularly instructive here.

Turning to the specification, Sun relies on the following excerpt to show that the specification discloses that a tree structure comprising elements, a tree structure that can be modified and that does not vary according to the system being monitored, and which can be edited by a user to add or delete elements representing hardware or software components on a computer system.

NetApp's construction
A tree structure comprising elements, which does not vary according to the system being monitored, and which can be edited by a user to add or delete elements representing hardware or software components on a computer system.

Sun's construction
A tree structure that can be modified and that contains elements that are linked together in a hierarchical relationship, where the relationship does not change based on the systems being monitored. (Claims 1, 10)

A tree structure that can be modified, but does not change based on the systems being monitored. (Claim 7)

The parties' dispute regarding this proposed claim term has been somewhat of a moving target. Originally, the parties' dispute centered around the terms "tree structure" and "modifiable." NetApp took issue with Sun's attempt to replace the term "tree structure" with the broader term "hierarchy." Because "tree structure" is another disputed term not ripe for construction at this point in time, Sun amended its proposed constructions to include the words "tree structure" (as does NetApp) in its construction instead of embedding a definition of that term in the construction. The sole remaining dispute concerns the term "modifiable" and whether that term requires that modifications be made by a user, as NetApp maintains, or whether the modifications also may be implemented through other means, as Sun maintains.

NetApp also contends that Sun's proposed construction, which states that the tree structure "can be modified but does not change," appears contradictory and will confuse the jury. At the hearing, Sun noted that NetApp's construction would be acceptable so long as the Court struck the phrase "edited by a user" and replaced it with "changed" or "can be changed." The Court agrees with NetApp that Sun's proposed construction is likely to confuse a jury, because the claim language "can be modified but does not change" is unclear as to how a structure can be both modifiable and static at the same time. The Court therefore focuses on whether or not to adopt NetApp's proposed construction with or without the user-editing requirement.

As noted above, Claim 1 of the '249 patent provides:

A method comprising:

- providing a host state representing a state of a computer system, the host state being represented as a modifiable tree structure including elements in a fixed hierarchical relationship, the elements being given value by associated tokens, the elements and associated tokens representing hardware and software components of the computer system and wherein the tokens are extracted from diagnostic data from the computer system;

- determining if predetermined conditions exist in the computer system by comparing respective definitions of the predetermined conditions to the host state; and

- generating an alert if one of the predetermined conditions is determined to exist.

'249 patent at 39:1-17. The reference to a modifiable tree structure also appears in claims 7 and 10 of the '249 patent. These claims make no reference to a "user," and the term "modifiable" seems to be used in a general sense, which supports Sun's construction, but the claim language does not define the term, and is not particularly instructive here.

Turning to the specification, Sun relies on the following excerpt to show that the specification discloses that a tree structure comprising elements, a tree structure that can be modified and that does not vary according to the system being monitored, and which can be edited by a user to add or delete elements representing hardware or software components on a computer system.

NetApp's construction
A tree structure comprising elements, which does not vary according to the system being monitored, and which can be edited by a user to add or delete elements representing hardware or software components on a computer system.

Sun's construction
A tree structure that can be modified and that contains elements that are linked together in a hierarchical relationship, where the relationship does not change based on the systems being monitored. (Claims 1, 10)

A tree structure that can be modified, but does not change based on the systems being monitored. (Claim 7)

The parties' dispute regarding this proposed claim term has been somewhat of a moving target. Originally, the parties' dispute centered around the terms "tree structure" and "modifiable." NetApp took issue with Sun's attempt to replace the term "tree structure" with the broader term "hierarchy." Because "tree structure" is another disputed term not ripe for construction at this point in time, Sun amended its proposed constructions to include the words "tree structure" (as does NetApp) in its construction instead of embedding a definition of that term in the construction. The sole remaining dispute concerns the term "modifiable" and whether that term requires that modifications be made by a user, as NetApp maintains, or whether the modifications also may be implemented through other means, as Sun maintains.

NetApp also contends that Sun's proposed construction, which states that the tree structure "can be modified but does not change," appears contradictory and will confuse the jury. At the hearing, Sun noted that NetApp's construction would be acceptable so long as the Court struck the phrase "edited by a user" and replaced it with "changed" or "can be changed." The Court agrees with NetApp that Sun's proposed construction is likely to confuse a jury, because the claim language "can be modified but does not change" is unclear as to how a structure can be both modifiable and static at the same time. The Court therefore focuses on whether or not to adopt NetApp's proposed construction with or without the user-editing requirement.

As noted above, Claim 1 of the '249 patent provides:

A method comprising:

- providing a host state representing a state of a computer system, the host state being represented as a modifiable tree structure including elements in a fixed hierarchical relationship, the elements being given value by associated tokens, the elements and associated tokens representing hardware and software components of the computer system and wherein the tokens are extracted from diagnostic data from the computer system;

- determining if predetermined conditions exist in the computer system by comparing respective definitions of the predetermined conditions to the host state; and

- generating an alert if one of the predetermined conditions is determined to exist.

'249 patent at 39:1-17. The reference to a modifiable tree structure also appears in claims 7 and 10 of the '249 patent. These claims make no reference to a "user," and the term "modifiable" seems to be used in a general sense, which supports Sun's construction, but the claim language does not define the term, and is not particularly instructive here.

Turning to the specification, Sun relies on the following excerpt to show that the specification discloses that a tree structure comprising elements, a tree structure that can be modified and that does not vary according to the system being monitored, and which can be edited by a user to add or delete elements representing hardware or software components on a computer system.

NetApp's construction
A tree structure comprising elements, which does not vary according to the system being monitored, and which can be edited by a user to add or delete elements representing hardware or software components on a computer system.

Sun's construction
A tree structure that can be modified and that contains elements that are linked together in a hierarchical relationship, where the relationship does not change based on the systems being monitored. (Claims 1, 10)

A tree structure that can be modified, but does not change based on the systems being monitored. (Claim 7)
may be modified to add or remove elements corresponding to hardware and software components in the computer system being monitored, but does not place any restriction on who or what makes the modification:

The description of the static tree is exemplary. Another tree may be chosen according to the system being monitored. Additionally, the static tree may be modified to reflect hardware and software enhancements to computer systems. The hierarchy tree definition is static in that it does not vary according to the system being monitored. However, the hierarchy tree can be edited in element hierarchy editor 215 to accommodate additions and/or deletions from the hierarchy tree when for instance, a new technology begins to be utilized in the monitored computer systems.

'T249 patent at 6:54-63 (emphasis added). Sun is correct that there is nothing in the specification or claims requiring that such modifications be performed only by a user. This portion of the specification makes clear that the "element hierarchy editor" is simply an embodiment, because it is described as "exemplary." 5 In addition, this "editor" requirement is not in the abstract, or the summary of the invention, and is not described as a necessary part of the invention. Therefore, the Court will not read this requirement into the claim term. Cf. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) ("Even when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using 'words or expressions of manifest exclusion or restriction.'") (internal citation omitted).

--- Footnotes ---

5 Both parties' experts conceded that an "element hierarchy editor" requires that a user make those edits. Therefore, as to this particular embodiment, a human user is required. At the hearing, NetApp noted that the inventor Mr. Chu stated during his deposition that the editor needs to involve a human user. However, the inventor was asked about the element hierarchy editor, which Sun concedes requires a human user. This inventor testimony is irrelevant on the point of whether the term "modifiable" always requires a human user.

--- End Footnotes ---

Turning to the extrinsic evidence, Sun's expert maintains that it is just as likely that the supplier of the monitoring system would provide modifications to the static tree structure through software or firmware updates, rather than only through user edits. Smith Decl. P 57. If a new hardware device is introduced into the marketplace -- a CD-ROM, for example -- and the static tree needs to be modified to allow a representation of that new device to be a part of it, the system could conceivably be programmed in such a way to allow such modifications through automatic updates.

NetApp's expert argues that "modifiable" must mean something more than automatic updates, because all systems have automatic updates. Dr. Smith contested this point at the hearing, noting that certain computer software components need to be sent to a vendor for modification, for example. Professor Long countered that such unmodifiable "software" is actually called firmware, which is no longer classified as software and is not implicated in the patent at issue. Hearing Tr. at 90. The experts' arguments are tangential. The patent makes clear that the static tree, while static, can be modified to reflect hardware and software enhancements. The use of the word "modifiable" in the claims focuses on the effect of the modification, rather than the process of the modification. Because the term "modifiable" is not used to describe the process, NetApp's argument that the term "modifiable" is redundant is not persuasive.

In sum, the Court adopts a hybrid of the parties' constructions of the term "modifiable tree structure including elements in a fixed hierarchical relationship/modifiable static tree" and construes the terms as: "A tree structure comprising elements, which does not vary according to the system being monitored, and which can be changed to add or delete elements representing hardware or software components on a computer system."

GO BACK

2734

Modification of the connection

Lantronix contends this term does not require construction because the concept is simple and construing the term would merely use more words to essentially say the same thing. Alternatively, if the Court believes the term needs construction,
Lantronix proposes the Court construe it as "altering the characteristics of the connector such that information can move through the connector."

Digi contends the term should be construed to mean "the connector to change its protocol, parameters, and pin-outs." Digi argues that the connector adapts itself to a desired configuration by changing its protocol, parameters, and pin-outs. Lantronix objects to Digi's construction for the same reasons already given above. Digi criticizes Lantronix's proposed construction as "impermissibly expand[ing] the patent language by avoiding a description of the specific modification of the patented invention."

The Court modifies Lantronix's proposed construction and construes "modification of the connection" to mean "altering the connection such that information can move through the connector." Again, Digi's "protocol, parameters, and pin-outs" limitation impermissibly limits the claim scope to a single embodiment. The Court modifies Lantronix's proposed construction to make it more straightforward to the jury.

**K. Modifications**

Visto contends that the term "modifications" as used in the '131 patent means "any changes related to a workspace element or an independently modifiable copy of the workspace element." Seven argues that the term means "changes in content made to a workspace element or changes in content made to an independently modifiable copy of the workspace element."

With respect to this term, Seven seeks to incorporate a content limitation into its definition. The court has previously rejected this position and does so again with respect to this term. Visto's definition, however, is also too broad. Visto sponsors a definition of any changes "related to" a workspace element. This is simply broader than the language of the claims will support. Claim 1, limitation (a) is exemplary. That limitation states: "providing first memory storing a first workspace element and first version information for identifying any modifications made to the first workspace element since a previous examination." Visto's definition seeks to define modification to include any changes "related to" a workspace element. That definition, if adopted, would eviscerate the more narrow claim language of claim 1(a) which requires modifications to be "made to the first workspace element." (emphasis added). The court therefore rejects Visto's proposal and defines the term to mean "changes to a workspace element or an independently modifiable copy of the workspace element."
The disputed terms are located in each of the asserted independent claims: "a modifier menu stored on said data storage device and displayable in a window of said graphical user interface" and "a sub-modifier menu stored on said data storage device and displayable in a window of said graphical user interface." Although the specification does not contain the exact terms "modifier menu" and "sub-modifier menu," Figure 1 depicts a "modifiers window" and a "sub-modifiers window." The specification states, "The Sub-Modifiers window lists the sub-modifiers that correspond to the modifier that is selected." (‘850 patent, 6:32-34). The modifiers window appears to list the modifiers that correspond to the menu item that is selected.

The defendants, consistent with their arguments regarding "menu," contend that the "modifier menu" and "sub-modifier menu" must contain a database. For essentially the reasons set forth above, the court is not persuaded that modifier menu and sub-modifier menu must contain databases. Therefore, "modifier menu" means "a list of choices or options that may modify menu items." Likewise, "sub-modifier menu" means "a list of choices or options that may further modify a modifier."

GO BACK
2. "monitoring said at least one defining element for changes thereto" ('443 Patent, Claim 25)

3. "maintaining an internal reference between said derived elements and said at least one defining element" ('443 Patent, Claims 39-42)

4. "editing at least one of said defining element in one operation without the regeneration of said derived elements until all of said at least one defining element has been modified" ('443 Patent, Claim 39)

5. "using said internal reference to identify and discard all derived elements associated with a modified defining element" ('443 Patent, Claim 41)

Because the dispute with respect to these phrases centers on the same issue, the Court will combine its interpretation of these phrases.

--- Footnotes ---

3 In its revised opening claim construction brief, Macromedia set forth proposed constructions for the following five other phrases contained throughout the method claims of the '443 Patent:

1. "accepting at least one new parameter while said derived elements are still displayed" ('443 Patent, Claim 25)

3. "making a plurality of changes in one or more of said defining elements" ('443 Patent, Claim 40)

4. "using said internal reference to rederive any derived elements without manually reestablishing any unchanged parameters" ('443 Patent, Claim 42)

5. "wherein the derived elements are modified in accordance with established parameters" ('443 Patent, Claim 42)

(See D.I. 470 at 9-11). Because these phrases were not addressed in either Adobe's opposition brief or Macromedia's reply brief, the Court will assume that these phrases are no longer in dispute. (See D.I. 479; D.I. 491).

--- End Footnotes ---

Adobe construes each of these five phrases in accordance with 35 U.S.C. § 112 P6, contending that they are drafted in means-plus-function form. Specifically, Adobe contends that each of these phrases defines a function without defining a structure, material, or act sufficient to produce that function. According to Adobe, the structure corresponding to the function recited in these phrases is the algorithm of Figure 9 of the '443 Patent. Adobe thus construes each of these phrases to be limited to the algorithm of Figure 9 and equivalents thereof.

Macromedia contends that 35 U.S.C. § 112 P6 should not apply because they are not drafted in means-plus-function form. According to Macromedia, these phrases should be construed in accordance with their ordinary and accustomed meaning without regard to any particular structure.

The Court has reviewed each of these five phrases in the context of their respective claims and concludes that they are not drafted in means-plus-function form. Accordingly, 35 U.S.C. § 112 P6 does not apply, and the Court will construe these phrases in accordance with the standard principles of claim construction.

In construing these phrases, the Court has reviewed the specification and prosecution history. ('443 Patent; D.I. 250, Ex. 3). Based on a review of these sources, the Court concludes that there is no reason to construe these phrases in a manner inconsistent with their ordinary and accustomed meaning. Therefore, the Court will adopt the constructions proposed by Macromedia. The phrase "modifying a characteristic of said display of said derived elements in accordance with said accepted at least one new parameter without respecification of all said parameters, said characteristic selected from a group..."
consisting of display shape and display color of said derived elements" means "regenerating the derived elements with new colors or with new shapes, based on the one or more new parameters, without all of the parameters having been edited." The phrase "monitoring said at least one defining element for changes thereto" means "monitoring the defining elements for changes entered by a user." The phrase "maintaining an internal reference between said derived elements and said at least one defining element" means "using an internal reference to associate the derived elements with the parent defining element(s)." The phrase "editing at least one of said defining element in one operation without the regeneration of said derived elements until all of said at least one defining element has been modified" means "automatically updating the derived elements only after all of the defining element or elements that a user intends to edit have been edited." The phrase "using said internal reference to identify and discard all derived elements associated with a modified defining element" means "an internal reference is utilized to automatically delete the existing derived elements when a defining element is updated, clearing the way for the subsequent generation of new derived elements."

2740

(6) In Claim 1 of the '132 patent, "modifying a phase of a selected portion or portions of said duration of the color stripe burst in chosen lines of the selected lines to be the phase of the normal color burst" means "modifying the phase of the abnormal color stripe bursts to match normal color bursts."

2741

2. Term 11 ('703 Patent, Claim 15)

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>… modifying a URL for the page object …</td>
<td>… modifying a Uniform Resource Locator for an object embedded in a page …</td>
</tr>
</tbody>
</table>

Limelight similarly seeks to limit this term to "a computer program that modifies an existing Uniform Resource Locator of an embedded object of a web page." (Docket # 71, 36.) This construction fails not only for the reasons discussed supra, Term 10, but also because claim 15 is a method claim and Limelight's proposed construction describes a product claim limitation.

3. Term 12 ('703 Patent, Claims 5, 15) 15

3. "modifying said sequence"

The dispute over the phrase "modifying said sequence" is whether it is limited to randomization.

The plain and ordinary meaning of "modification" is not restricted to randomization. Reading the claim language in light of the written description suggests that limiting modification to randomization would be improper. The '661 patent discusses the use of random information to "select between parallel code processes, such that the same cryptographic result will be produced regardless of which code process is selected but where the parallel processes perform different operations toward producing the result." Col. 10, 11, 32-36. Each of the two parallel processes has a fixed, or non-random, sequence. While the data may be processed in random order, the sequence of operations itself is not completely random. Also, the patent
states: "Although the embodiments differ in the details of their implementations, those skilled in the art will appreciate the fundamental commonality in their essential operation--using randomness or other sources of unpredictability." Col. 2, l. 66 - Col. 3, l. 7 (emphasis added). The intrinsic evidence indicates that a modification may render the data unpredictable in a manner which does not require randomness. There is no indication that a person of ordinary skill in the art would limit "modify" to "randomize."

The Court construes "modifying said sequence" to mean: "changing the order of the sequence."

2743

2. Claim 6

Claim 6 of the '281 patent states in its entirety (with disputed terms highlighted):

A method according to claim 1 including storing each of said second plurality of frames as a series of video pixels in digital form and as part of said altering modifying the digital values of selected pixels in accordance with the sets of said data.

The parties do not dispute the following interpretations, and the court construes these terms accordingly. "Second plurality of frames" refers to the frames of the existing cinematic work. "Pixel" or "picture element" means a finite-sized rectangular region on a video screen, the location of which can be represented by X and Y coordinates. A digital image on a video screen is formed by an array of PIXELS. The numerical values that characterize a PIXEL define its color and intensity.

Joint Memorandum at 5:20-23.

As to the interpretation of the "modifying the digital values" step of claim 6, the parties reprise their arguments regarding the "altering" step of claim 1. Consistent with the court's construction of claim 1, claim 6 requires that the digital values representing the colors and intensities of selected pixels of the first facial display be modified in accordance with the lip position data of both the first and second facial displays and the control point data of the first facial display.

2744

1. Modulate

The Defendants propose that "modulate" be construed as follows:

"Modulation" requires that a characteristic of the carrier wave has been changed to represent the 1 and 0 values of the digital signal so that the voltage levels of the modulated signal in and of themselves do not represent the 1 and 0 values of the digital signal. Modulation involves more than simply encoding digital data in serial formats such as non-return to zero, return to zero, Manchester, or bi-phase. Demodulation involves more than simply decoding of digital data.

Lectrolarm argues that this definition improperly restricts the scope of the patent claim and is unnecessary. The issue revolves around the question of whether the coding of digital data into electrical pulses constitutes "modulation."

Technical dictionaries and treatises may help "a court to better understand the underlying technology and the way in which one of skill in the art might use the claim terms." Phillips, 415 F.3d at 1318 (internal quotes omitted). "Such evidence ... may be considered if the court deems it helpful in determining the true meaning of language used in the patent claims." Id. (internal quotes omitted). The Defendants have directed the court to the textbook Digital Communications for help in deciding the meaning of "modulation" to a person of skill in the art. Digital Communications was published in 1988, one year before the '088 patent was filed. The author of the textbook is Bernard Sklar, who is also an expert for Lectrolarm.
At its most basic, a digital communication system operates as follows: 1) data enters the system; 2) if the data is not digital, it is represented by digital data through the process of formatting; 3) the digital data is encoded onto a waveform for transmission through the process of modulation; 4) the modulated data is transmitted along some channel; 5) the transmitted data is removed from the waveform by the process of demodulation; 6) if the desired output of the process is not digital data then the digital data is formatted into whatever final form of data is desired. Bernard Sklar, Digital Communications: Fundamentals and Applications 54 (1988). Defendants argue that the process of encoding digital data into formats such as non-return to zero, return to zero, Manchester, or bi-phase is part of the process of formatting, not part of the process of modulation.

Formatting makes a "source signal compatible with digital processing." Id. at 52. These source signals are textual or analog data. Id. at 54. Digital data is already compatible with digital processing and does not need to be formatted. Id. The end result of formatting is a stream of binary digits known as pulse code modulation (PCM). Id. at 54, 73.

Modulation transforms digital data represented as PCM into waveforms that are compatible with transmission along a channel. Id. at 54, 118. For transmission along a cable or wire, called baseband transmission, the appropriate waveform is an electrical pulse. Id. at 54, 78. The most common types of pulse waveforms used in baseband transmission are non-return to zero, return to zero, and multilevel binary. Id. at 78. The phase encoded group consists of bi-phase and Manchester coding. Id. at 81.

The process of transmission over a channel that is not a cable or wire (such as radio transmission) is called bandpass transmission. Id. at 52. The appropriate waveform for bandpass modulation is a sinusoid. Id. at 118.

Sklar's textbook clearly states that modulation is encoding digital information onto a waveform, and one type of wave form is an electric pulse which includes non-return to zero, return to zero, Manchester, and bi-phase formats. Further, because modulation can result in a waveform that is simply a series of electrical pulses, modulation necessarily includes the process of encoding digital information into a format where the voltage level of the signal indicates whether the data being transmitted is a one or a zero.

The description of "modulation" in Sklar's textbook is consistent with the IEEE Standard Dictionary of Electrical and Electronics Terms' (hereinafter the "IEEE Dictionary") definition of "modulation:"

(1)(A)(data transmission). (i) The process by which some characteristic of a carrier is varied in accordance with a modulating wave. (ii) The variation of some characteristic of a carrier. See also: angle modulation; modulation index. (B) (data transmission) (Signal transmission system). (i) A process whereby certain characteristics of a wave, often called the carrier, are varied or selected in accordance with a modulating function. (ii) The result of such a process. See also: angle modulation; modulation index.

A leading non-litigation induced treatise from 1988, Digital Communications by Bernard Sklar, coupled with the definition of modulation in the IEEE Dictionary make clear that the plain meaning of the term "modulate," to one skilled in the art in 1989, included representing digital data as electrical pulses coded into serial formats such as non-return to zero, return to zero, Manchester, or bi-phase. n8 Neither the prosecution history nor the specification lead the court to conclude that the term "modulation" should be given a definition different from its plain and ordinary meaning. Therefore, the court will not use the Defendants' proposed definition.

n8 The Defendants support their position with excerpts of testimony from expert witnesses for both sides. The court need not consider this extrinsic evidence. The meaning of "modulation" to one of skill in the art in 1989 can be construed from non-litigation induced treatises and technical dictionary definitions.
Arbitron argues that "modulating the energy" simply means "varying the energy of at least one of the frequency components." The point of contention here is the construction of the term "modulating" as it relates to adding the encoded message onto the audio signal. Ipsos uses the McGraw-Hill dictionary to define "modulation" as "[t]he process or result of the process by which some parameter of one wave is varied in accordance with some parameter of another wave." Ipsos argues that Arbitron's proposed construction ignores the fact that there is a second signal that determines the modulation of the first signal. In this case, it contends, the second signal is the message containing identifying information that is being added to the audio signal. Ipsos therefore proposes the following construction: "Varying the energy of at least one of the frequency components in accordance with the message to be encoded."

Arbitron argues that the meaning of the word "modulation" is well-known in the art. It refers to the IEEE standard dictionary's definition for modulation: "A process whereby certain characteristics of a wave, often called the carrier, are varied or selected in accordance with a modulating function." Here, it contends that it has not ignored the second signal; the fact that there is a second modulating signal is captured by the phrase "adding the encoded message" in the claim language. However, neither the claim language nor Arbitron's proposed construction makes clear how the encoded message is added. The Court therefore finds that the term "modulating the energy" means "varying the energy of at least one of the frequency components in accordance with the message to be encoded."

The Defendants again argue that the patent claims do not include "encoding digital data in serial formats such as non-return to zero, return to zero, Manchester, or bi-phase" by stating that "modulation with a carrier wave" (discussed in Claim 1, P 4) does not include these types of waveforms. (Df.'s Post-Hearing Mem. Concerning Claim Interpretation Issues at 11-12.) The Defendants refer to the following language from the textbook Digital Communications:

in the case of baseband modulation, [the] waveforms are pulses, but in the case of bandpass modulation the desired information signal modulates a sinusoid called a carrier wave, or simply a carrier.

Digital Communications at 118.

As already discussed, encoding digital data onto a pulse waveform in a format such as non-return to zero, return to zero, Manchester, or bi-phase is a form of modulation called baseband modulation. Id. at 78. Bandpass modulation, as the cited text discusses, involves formatting digital data onto a sinusoid. The cited passage from Digital Communications treats "sinusoid" and "carrier wave" as synonyms. The definition of carrier wave that the court has adopted, however, explicitly acknowledges that "carrier wave" and "sinusoid" are not synonyms. The Digital Communications text uses the term "carrier wave" inconsistently with the definitions of "carrier wave" proposed by both the Defendants and Lectrolarm.

The court has determined that modulation includes encoding digital data onto waveforms that are both electrical pulses and sinusoids. The court has also adopted a definition of carrier wave that includes both sinusoidal and non-sinusoidal
waveforms. Consequently, "modulation onto a carrier wave" includes encoding digital data onto a pulse waveform in a format such as non-return-to-zero, return to zero, Manchester, or bi-phase.

A. Parties' Construction Arguments

Plaintiff's proposed construction construes "modulation scheme" as "a technique by which a modulator converts digital data into a modulated analog signal and a demodulator converts the modulated analog signal back to digital data." Defendants argue first that the specification uses the words "scheme" and "technique" interchangeably, so this supports Plaintiff's construction of "modulation scheme" as "a technique." See, e.g., '759 patent, Abstract, 2:65-66. Plaintiff also argues the inclusion of "modulator" and "demodulator" in the construction identifies structures that implement the "modulation scheme" and therefore provide context to the construction. Plaintiff argues the specification provides support for the "modulator" and "demodulator" language in the discussion of Figure 2 which shows a "modem . . . used to modulate/demodulate data in the wireless communications systems . . . described above. Modems . . . are used by the base station . . . and CPEs . . . to modulate and demodulate data." '759 patent, 6:27-31 & Fig. 2.

Defendants' proposed construction construes "modulation scheme" as "a method of converting digital data to an analog signal and converting it back to its original form." Defendants point out that the parties basically agree that the modulation scheme is used to convert digital data into modulated analog signal; however, Defendants argue Plaintiff is improperly adding additional structural requirements (i.e., "modulator" and "demodulator") that are unnecessary and do not appear in the '759 patent. Defendants argue Plaintiff's additional language is flawed because if any structure is used to convert the data then it must be a "transmitter module" or a "receiver module" according to the specification. '759 patent, 6:37-43; 6:43-45. Therefore, Plaintiff's references to "modulator" and "demodulator" are inaccurate according to the specification.

B. Analysis

The parties basically agree that the modulation scheme is used to convert digital data into modulated analog signal and vice versa. But the parties disagree whether to include the "modulator" and "demodulator" language or define the phrase more broadly as Defendants' construction. The Court agrees with Defendants that Plaintiff is improperly adding the additional structural requirements of "modulator" and "demodulator." The specification never mentions any structures specifically called a "modulator" or "demodulator." The Court agrees with Defendants that even if the Court were to add structures to define the "modulation scheme," Plaintiff uses the incorrect structures. The specification specifically discloses a "transmitter module" and a "receiver module" to convert the digital and analog data. '759 patent, 6:37-43 ("the transmitter module 204 converts digital data to an appropriately modulated analog signal"); 6:43-45 ("[t]he receiver module . . . converts it back to its original digital form"). Nonetheless, the Court agrees that it is not necessary to define "modulation scheme" in the context of structures that perform the modulation.

The Court also disagrees with Defendants' proposed construction because it is overbroad. Defendants' proposed construction does not clarify that the "modulation scheme" actually involves some form of modulation; instead, Defendants' proposed construction would cover any "method of converting" the digital data. The term "modulation scheme," under its ordinary and customary meaning, implies that there is some form of modulation occurring. Further, the specification clarifies that the method of converting the data is modulation. See, e.g., 1:9-11 ("The present invention relates to a wireless communication system and to a system and method for implementing asymmetric modulation in such systems."). Therefore, to alleviate this issue in Defendants' proposed construction while not including unnecessary structures as in Plaintiff's proposed construction, the Court uses the language "modulated analog signal" and "demodulated digital data." The "modulated" and "demodulated" language has foundation in the specification. See, e.g., 6:37-39 ("the transmitter module 204 converts digital data to an appropriately modulated analog signal"). Finally, the Court agrees with Plaintiff in calling the scheme a "technique" instead of Defendants calling it a "method" because there is support in the specification. See, e.g., 7:57-58.
("[t]he downlink data 310 is transmitted in a pre-defined modulation or a sequence of modulation techniques"). So the Court construes the phrase "modulation scheme" as "a technique by which digital data is converted into modulated analog signal and the modulated analog signal is converted back to demodulated digital data."

GO BACK

2748

2. "a modulator arranged to modulate bits of the encoded data signals onto multiple carriers of the transmission system, different numbers of bits in each transmission symbol period being allocated to different carriers"

The next disputed term of the '604 Patent appears in Claims 1 to 14, and 22. There are two issues with respect to the parties' proposed constructions. First, the parties dispute the meaning of "arranged to." Second, the parties dispute whether "concurrently" should be incorporated in the term's construction to describe the modulation. Since the Court previously concluded that the ordinary meaning of "arranged" should be adopted in the term's construction to describe the modulation. Since the Court previously concluded that the ordinary meaning of "arranged" should be adopted in the previous term, the Court will adopt the ordinary meaning for "arranged" in this term. The Court will now address the issue regarding "concurrently." 19

19 It should be noted that the Court's reasoning and conclusion regarding this issue will be applied to subsequent disputed terms which raise the same issue, namely disputed terms [32] and [34].

Plaintiff proposes that the term should be construed as: "a modulator actually arranged so that, in each transmission symbol period, the modulator concurrently modulates bits of the plurality of encoded data signals that have different delays." (Chart at 8 (emphasis added)). Relying on the claim language and specification, Plaintiff injects the word "concurrently" to describe the manner in which the encoded data signals are modulated onto the multiple carriers. Plaintiff explains that the allocation of bits onto the carriers must occur simultaneously during a symbol period. Plaintiff bases its contention, in part, on the patentees' use of the phrase "in each transmission symbol period."

Plaintiff also refers to other claims in the patent to support its construction. Plaintiff focuses on Claim 15 which recites "applying FECC . . . coding and codeword interleaving differently to signals of different data channels to produce encoded data signals having different delays." '604 Patent, col. 13, ll. 43-46. From this language, Plaintiff contends that on its face, the claim "refers to at least two data channels, and specifies that one of these data channels will be coded and codeword-interleaved in a first way, while at the same time another of these data channels will be coded and codeword-interleaved in a different way." (Pl.'s Opening Br. at 35-36 (emphasis added)). Moreover, Plaintiff relies on various portions of the specification as evidence that "the patent throughout contemplates simultaneous data signals, each with different degrees of delay, different . . . coding [and] different interleaving." (Tr. at 125:23-25).

The Court disagrees with Plaintiff, finding that its construction unjustifiably attempts to import an additional limitation into the claim by adding the word "concurrently." Upon reviewing the patent's claims and specification, the Court concludes that there is nothing in the patent's disclosure requiring "concurrent" or "simultaneous" transmission of data signals. One glaring fact belying Plaintiff's arguments is the absence of the word "concurrently" in the patent. Indeed, Plaintiff admitted at the Markman hearing that the word "concurrently" does not appear in the patent at all. (Tr. at 124:18-19). Thus, the crux of Plaintiff's argument is that "concurrent" modulation is implicitly required.

The intrinsic evidence demonstrates there is no such requirement. The patent's disclosure describes a symbol period as a finite period of time. See '604 Patent, col. 5, l. 63. For example, a symbol period may last 250 [mu] s. See id. Importantly, however, there is no mention that modulation amongst the multiple carriers, or anything for that matter, must simultaneously occur within that finite period. This leaves open the possibility that modulation may occur at any time, for example, during smaller time frames, within the symbol period itself. Plaintiff's reasoning would require that the modulation occurring in the multiple carriers begin and end at the same time. Clearly, this is not the case. Thus, Plaintiff's argument that modulation must be simultaneous within a symbol period is needlessly limiting and contrary to the specification.

Accordingly, the Court concludes that disputed term [25] "a modulator arranged to modulate bits of the encoded data signals
onto multiple carriers of the transmission system, different numbers of bits in each transmission symbol period being allocated to different carriers" means "a modulator configured to modulate bits of encoded data signals such that different numbers of bits are allocated to different carriers in each symbol period."

7. "modular type adaptor design"

The '347 patent, claim 9, refers to "an alarm filter circuit as claimed in claim 1…housed in a modular type adaptor design." Pulse contends this term is clear on its face according to its common meaning and therefore does not require specific construction by the court. Mascon counters the term is indefinite and cannot be construed, relying on the somewhat conclusory allegation that the term can "mean anything or nothing." (Doc. No. 33 at 22.) Pulse, on the other hand, demonstrates the specification fleshes out the scope of this term. For example, the claim language defines the design as "having plug means on its one end for connection to the incoming telephone lines and having jack means on its other end for connection to said alarm unit." ('347 patent, claim 9.) The specification elaborates, describing the design as one which "facilitate[s] quick and easy connections between incoming telephone lines and an alarm unit." ('347 patent, Col. 1, l. 42-45.) Further, one end "has a RJ31X jack…formed integrally therewith for connection to the alarm unit," and the other end "has a RJ-45 plug…formed integrally therewith which is connectible to both the incoming telephone line wiring...and the house wiring." ('347 patent, Col. 4, ll. 40-47.) The adaptor is depicted in Figure 2 (labeled 60) as encompassing the entire filter unit. ('347 patent, Fig. 2.) With this information, the term "modular type adaptor design" would have a particular meaning to one skilled in the art.

For the reasons above, the court gives the term "modular type adaptor design" its plain and ordinary meaning and finds no specific construction of this term is required.

2750

"computing module" / "computer module"

Various asserted claims of the patents-in-suit contain the terms "computing module" and "computer module." The parties agree that the terms should be given the same construction. ACQIS originally contended the terms meant "an assembly with a main circuit board having at least a processing unit, memory, I/O circuitry and a connector component distinct from the main circuit board that couples to a corresponding connector component in the console for power and data communication." However, at the claim construction hearing, ACQIS recognized that its original proposal both included some elements that were already affirmatively recited in all claims, rendering those elements superfluous, and included other elements that were not affirmatively recited in all claims, inserting additional limitations into those claims. Thus, ACQIS now proposes that the terms mean "an assembly for providing a computing function within a computer system, wherein the assembly has a circuit board, a connector for engaging a corresponding connector of a console, and other elements as recited in a particular claim." Defendants contend that the terms mean "a structure comparable in size to a videocassette that provides the core computing power and environment for the computer system." The parties' dispute centers around two issues: (1) whether a size limitation should be imported into the claims, and (2) whether the inclusion of "core computing power and environment" is necessary given the computing elements present in each claim.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
Regarding the first dispute, ACQIS argues that Defendants' inclusion of a size limitation unnecessarily injects ambiguity into the terms and would improperly read limitations from a single preferred embodiment into the claims. ACQIS further contends that had the patentee intended to include size limitations in the claims, he would have done so. Defendants contend that the inventor disclaimed computer modules larger than a notebook computer. Although the '185 Patent specification does emphasize the module's size and portability, the same emphasis is missing in the specifications and prosecution histories of the '8,415 Patent family. In further support of their position, Defendants point to figures of the computer module in the '8,415 Patent family which illustrate its portable size, as well as the incorporation by reference of the '185 Patent specification into the '8,415 Patent family's specifications. Defendants' arguments are unpersuasive. The specifications in '8,415 Patent family specifically state that "some details of the ACM" can be found in the '185 Patent's application. See e.g., '8,415 Patent, col. 4:50. There is no reason to confute the invention described in the '185 Patent with the inventions described in '8,415 Patent family. Furthermore, the fact that the patent examiner did not require the patentee to include any size limitations in the claims demonstrates that the '185 Patent invention focused more on the separability of and interconnection between the ACM and PCON units, rather than the portability and size of the ACM.

As for the parties' second dispute, ACQIS contends that Defendants' inclusion of "core computing power and environment" also injects ambiguity into the terms by repeating what is already expressly recited in all asserted claims. Defendants contend that the inventor disclaimed modules without a "core computer power and environment." This argument fails for the same reason discussed above—there is no reason to confute the invention described in the '185 Patent with the inventions described in '8,415 Patent family. Moreover, the '185 Patent specification provides that "[t]he core computing power in the ACM comprises the central processing unit (CPU), system memory, any auxiliary processors, and primary mass storage (e.g., a hard disk drive) which serves as the boot device for the computer system." '185 Patent, col. 2:48-57. Thus, Defendants' inclusion of "core computing power and environment" is superfluous and confusing when cast against the specific claim limitations that recite a CPU, memory, mass storage, etc. See, e.g., '185 Patent, 18:32-46.

There is no express disavowal of claim scope with regard to Defendants' size limitation or the "core computer power and environment" limitation. Thus, Defendants' proposed construction is improper in all respects. ACQIS's revised proposed construction, although consistent with the specification, may create unnecessary ambiguity for the fact finder. Accordingly, the Court adopts a modified version of ACQIS's proposed construction and construes the terms "computing module" and "computermodule" to mean "an assembly for providing a computing function within a computer system as recited in a particular claim."
Numerous cases demonstrate that the term "module," in the context of the telecommunications field, denotes sufficient structure such that § 112, P 6 is not invoked. See, e.g., PalmTop Prods., Inc. v. Lo-Q PLC, 450 F. Supp. 2d 1344, 1364-65 (N.D. Ga. 2006) (holding that "communicate module' and even 'module,' represents more than a mere verbal construct serving as a 'means for substitute' and concluding 'module' connotes definite structure, and when combined with 'communications,' which describes the module's operation, sufficient structural meaning will likely be conveyed to a person of ordinary skill in the art"). Similarly, the court in C2 Commc'ns Techs., Inc. v. AT&T, Inc. also found, in the context of a telephone calling system patent, that section § 112, P 6 is not "invoked by the use of the term 'module.'" No. 2:06-CV-241, 2008 U.S. Dist. LEXIS 46942, at *34-35 (E.D. Tex. June 13, 2008) (holding that "first protocol conversion module" does not invoke § 112, P 6).

Moreover, in many communications and computer arts cases, courts have found that a "module" is the actual structure described in the specification which corresponds to the function claimed by means language. See On Demand Mach. Corp. v. Ingram Indus., Inc., 442 F.3d 1331, 1340-41 (Fed. Cir. 2006) (affirming claim construction that found "computer module" to be the structure for "means for a customer to visually review said sales information"); Foundry Networks v. Lucent Techs., Inc., No. 2:04-CV-40, 2005 U.S. Dist. LEXIS 46840, at *21, 22, 24, 25 (E.D. Tex. May 24, 2005) (finding "voice communication module" to be the structure for "means for forwarding an incoming call" limitations); Roche Diagnostics Corp. v. Apex Biotechnology Corp., 455 F. Supp. 2d 840, 868 (S.D. Ind. 2005) (finding "a removable and/or reinsertable read-only-memory ('ROM') chip and/or module" to be the structure for "pluggable memory key means" limitation); Alcatel USA, 2008 U.S. Dist. LEXIS 64351, at *52, 56, 60 (finding a processor using a "locator module" to be structure for "means for determining" and "means for identifying" and "device module" and the software executing it to be structure for "means for manipulating each received data or message"); Visto Corp. v. Good Tech, Inc., No. 2:06-CV-039, 2008 U.S. Dist. LEXIS 3244, at *32-34, 37 (E.D. Tex. Jan. 16, 2008) (finding "general synchronization module" to be the structure for "first/second] means for generating first/second] examination results from first/second] version information" and "means for generating;" "synchronization start module" to be the structure for "means for initiating;" and communications module" to be the structure for "means for downloading data"), constructions adopted by Visto Corp. v. Research in Motion, Ltd., No. 2:06-CV-181, 623 F. Supp. 2d 756, 2008 U.S. Dist. LEXIS 35580 (E.D. Tex. Apr. 30, 2008); Autobytel, Inc. v. Dealix Corp., No. 2:04-CV-338, 2006 U.S. Dist. LEXIS 3381, at *24-26 (E.D. Tex. Jan. 18, 2006) (finding "process purchase request module," "database access module," "buyer-dealer association module," and "network access module" to be structures for "means for identifying," "means for creating," and "means for communicating").

The terms "originating telephone number module," "telephone number detection module," and "call connection module" would be readily understood by a person of skill in the art based on the functions to be performed. For example, with respect to the "originating telephone number module," the specification states that "[i]n one embodiment, the caller's telephone number is detected by the call identification module 320 through caller ID service. In this embodiment, the caller's telephone number is automatically detected through a caller identification service that supplies the telephone number from which the telephone call is placed." '156 Patent, col. 3:45-61, 6:45-48; Fig. 3. The specification also provides that "[t]he telephone number detection module 310 detects the telephone number dialed by the caller. In one embodiment, the telephone number dialed by the caller is an assigned incoming telephone number that corresponds with a recipient." '156 Patent, col. 3:44-48; Fig. 3. The specification also discloses that "the call connection module 360 connects the caller with a particular recipient based on the identity of the caller, the caller's profile, and the assigned incoming telephone number dialed by the caller." '156 Patent, col. 4:33-36. Thus, "originating telephone number module," "telephone number detection module," and "call connection module" would be understood by a person skilled in the art to refer to any of that class of hardware and/or software components that, respectively, (1) identifies an originating telephone number; (2) detects a dialed telephone number; and (3) connects a telephone call. As a result, § 112, P 6 is not invoked.

In asserting that the module limitations should be treated as means plus function limitations subject to § 112, P 6, Rebtel cites to the Federal Circuit's holding in Ranpak Corp. v. Storopack, Inc., No. 98-1009, 1998 U.S. App. LEXIS 16348, 1998 WL 513598 (Fed. Cir. July 15, 1998). There, the patents-in-suit were directed towards technology for converting multi-ply paper into pad-like products to be used as cushioning in boxes. The patents contained claims reciting both a "settable control means" as well as a "settable control module." The court concluded that "settable control module" invoked § 112, P 6. Rebtel has also cited to Kozam v. Phase Forward, Inc., No. MJG-04-1787, 2005 U.S. Dist. LEXIS 46850, 2005 WL 6218037, at *6-7 (D. Md. Aug. 29, 2005), in which the court concluded that the terms "first data verification module" and "second data verification module" should be construed the same as "first data verification means" and "second data verification means."
Both cases, however, are distinguishable on their facts. In Ranpak, there was no indication that the term "module" identified a structure as understood by a person of skill in the art. Consequently, the "module" containing claims simply recited the same function described in the "means" containing claims without offering any additional structural description. 2005 U.S. Dist. LEXIS 46850, 2005 WL 6218037, at *6-7 ("[T]he use of the term 'settable control module' invokes § 112, P 6, because it merely sets forth the same black box without recitation of structure for providing the same specified function."). In Kozam, the court found that the term "module" referred to a software component of a much larger software program, but failed to describe any meaningful structure. Kozam, 2005 U.S. Dist. LEXIS 46850, 2005 WL 6218037, at *6. Because "module" failed to convey any structural meaning beyond the recitation of its function, the court concluded that the limitations containing "module" should be treated as means plus function limitations subject to § 112, P 6. 2005 U.S. Dist. LEXIS 46850, [WL] at *6-7.

In contrast, numerous cases have demonstrated that in the telecommunications context, there exists a well-understood structure associated with the term "module" by those skilled in the art. 1 See, e.g., C2 Commc'ns Techs., 2008 U.S. Dist. LEXIS 46942, at *34-35; Foundry Networks, 2005 U.S. Dist. LEXIS 46840, at *21, 22, 24, 25; Alcatel USA, 2008 U.S. Dist. LEXIS 64351, at *52, 56, 60. As a result, neither Ranpak nor Kozam requires the application of § 112, P 6 to the module limitations of the '156 Patent.

--- Footnotes ---

1 Rebtel also argues that the court in Alcatel USA Res. Inc. v. Microsoft Corp., No. 6:06 CV 500, 2008 U.S. Dist. LEXIS 49615 (E.D. Tex. June 27, 2008) found the term "module" to be indefinite. However, the term at issue was "recognition means," which the court identified as being located within a "set-up module." 2008 U.S. Dist. LEXIS 49615 at *38. The court did not find that the "set-up module" term was subject to § 112, P 6 or that it was indefinite.

--- End Footnotes ---

Consequently, the presumption against subjecting claims lacking the "means" language to the requirements of § 112, P 6 applies, and the module limitations of the '156 Patent should not be treated as means plus function limitations. See CCS Fitness, 288 F.3d at 1369.

GO BACK

2752

4. "module"

The next disputed terms that the parties identify is "module," which occurs throughout the 366 and 918 Patents. For example, claim 10 of the 366 Patent and claim 7 of the 918 Patent describe "a network control module, including a network interface coupled to receive NFS [or file system] requests from [a data] network," and "a file system control module, including a mass storage device interface coupled to [a] mass storage device." 366 Patent, 53:15-18; 918 Patent, 127:42-46. Adopting its now familiar posture, plaintiff argues that no construction of the term "module" is required. Defendant, on the other hand, proposes that the term be construed to mean "a distinct, plug-hardware unit."

The primary point of contention is whether "module" should be construed to encompass both software and hardware modules, or whether it should be limited to hardware modules alone. The parties cite numerous dictionary definitions for the term, some of which support the view that the module is a hardware unit and others that are consistent with a broader definition of that would include both hardware and software. See, e.g., AP Dictionary at 1399 (defining module as software in the context of "computer programming" and hardware in the context of "computer technology"). Indeed, the IEEE Dictionary provides no fewer that twenty definitions of the word, and refers to both hardware and software modules. Plaintiff argues that this welter of inconsistent definitions supports its view that no construction of the term "module" is needed. This is illogical, for where there are a myriad of definitions it is unlikely that all of them fit. Once again, we are reminded by the case law that where "words . . . have multiple dictionary definitions, some having no relation to the claimed invention, the intrinsic record must always be consulted to identify which of the possible dictionary meanings of a claim terms in issue is most consistent with use of the words by the inventor." Texas Digital, 308 F.3d at 1203. Thus, the court must construe the term module in light of the claim language, the specification and the prosecution history of the 366 and
As noted above, the claims of the 366 and 918 Patents identify two types of modules, network control modules and file system modules. The language used to describe these modules implies that they are hardware devices. For example, claim 7 of the 918 Patent claims a network control module "coupled to receive file system requests from [a data] network." 918 Patent, 127:42-45. Another element of claim 7, the file system module, "include[s] a mass storage device interface coupled to [a] mass storage device." Id. at 127:45-46. The fact that the inventors claimed modules that "couple" and "interface" with other hardware devices suggests that the modules are themselves physical devices -- i.e., hardware. In contrast, a software module is typically defined as "[a] program unit that is discrete and identifiable with respect to compiling, combining with other units, or loading," or as "[a] logically separable part of a program." IEEE Dictionary at 703-04. Simply put, it makes no sense to refer to a part of a software program as "coupled" to a hardware device such as a mass storage device. Thus, the ordinary meaning of the word module, as used in the claims of the patents in suit, refers to a hardware module.

This construction is also supported by the prosecution history of U.S. Patent No. 5,163,131 (Nov. 10, 1992) ('131 Patent), a parent application of the 366 and 918 Patents. In the course of prosecuting the parent application, the examiner rejected four claims as anticipated by a prior art multiprocessor data processing system. Grewal Decl., Exh. I at 339. Like the 131 Patent and the patents in suit, the prior art processor disclosed a file server architecture in which a file manager, a storage processor, and a "requesting unit capable of issuing calls" (i.e., a network controller) were controlled by separate and independent elements the file server. Id. at 339-40. Auspex sought to distinguish the prior art server, arguing that the various "levels" of that server (e.g., a file controller represented by a "file management level") "are merely software processes." Id. at 340 (emphasis added). Auspex contrasted these software processes with the claimed invention, noting that "one of the primary features of the Applicants' invention is that these processes [i.e., the network control, file control, and storage processing] do run on different hardware." Id. Auspex continued: "[T]he separation of these processes onto different hardware which yields the performance advantages of the Applicants' invention, not the separation of these tasks into different software processes." Id. at 341.

Plaintiff contends that the referenced passage of prosecution history is irrelevant to the patents in suit. Admittedly, the term "module" does not appear as a limitation in the 131 Patent's claims. As the Federal Circuit observed in Advanced Cardiovascular Systems, Inc. v. Medtronic, 265 F.3d 1294 (Fed. Cir. 2001), the prosecution history of a parent application is most apposite to the construction of claims in a successor patent "if . . . it addresses a limitation in common with the parent in suit." Id. at 1305. In that case, the court declined to read a claim limitation culled from the prosecution history of two parent applications into a subsequently issued patent, citing the absence of the disputed claim term in the parent application's prosecution history. Id. at 1305-06. However, unlike Medtronic, the record in the instant case does not indicate that Auspex applied for the patents in suit with the intent of securing broader claims than the parent application. See id. at 1306. Moreover, despite the absence of the term "module" in the claims of the 131 Patent, Auspex emphasized the separation of network and file control processes onto different hardware as one of the "primary features" that "yields the performance advantages of Applicants' invention" when compared to the prior art file server. Grewal Decl., Exh. I at 340-41. Although these statements do not expressly limit the claim term "module" -- the term did not appear in the rejected claims of the 131 Patent -- they are nonetheless relevant to determining the meaning of the term as it is used in the patents in suit. Accord Microsoft Corp. v. Multi-Tech Sys., Inc. 357 F.3d 1240, 1250 (Fed. Cir. 2004) (observing that "[a]ny statement of the patentee in the prosecution of a related application as to the scope of the invention would be relevant to claim construction"), cert. denied, 543 U.S. 821, 160 L. Ed. 2d 31, 125 S. Ct. 61 (2004). Furthermore, the term "unit" is used in the 131 Patent similarly to the use of the term "module" in the 366. Thus, considering the prosecution history of the 131 Patent together with the context in which the disputed term appears in the claims of the 366 and 918 Patents, the court concludes that the term "module" must refer to a hardware device.

Defendant also argues that the modules disclosed in the 366 and 918 Patents must be "distinct . . . plug -- in unit[s]." In support of this construction, defendant cites the AP Dictionary, which defines module as "a distinct unit or component," or alternatively, as "an interchangeable plug-in item containing electronic components that complete, enhance, or expand processing capability or memory capacity." AP Dictionary at 1399 (defining "module" in the art of computer technology). The court agrees that the essence of modularity requires that a modular component be discrete, distinct, and separable from the whole. On the other hand, it is unclear what purpose would be served by adopting the "plug-in" limitation that defendant proposes. Defendant appears to extract the term from a single dictionary definition of the term "module." See AP Dictionary at 1399. However, "[i]f more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claims may be construe to encompass all such ordinary meanings." Texas Digital, 308 F.3d at 1203. Of the twenty
definitions of module that appear in the IEEE Dictionary (the majority of them pertaining to hardware), only two contain the "plug-in" limitation. Id. at 703-04. While the intrinsic record in this case requires that the court limit the meaning of the disputed term to exclude software modules, defendant fails to convince the court that it should include the phrase "plug-in" as a limitation in the claims at issue. Accordingly, for the reasons stated above, the court construes the term module to mean "a distinct hardware unit."

3. "Module processor" and "Module memory" (Claims 1, 10, 11, 12)

As the parties' arguments regarding these two claim terms are related, the Court addresses them in tandem. Agere proposes that these terms should be construed as requiring physical attachment to the communication module, while Broadcom suggests that they do not need construction at all. Looking to the claim language for primary support, Agere asserts that "as a matter of simple grammar, the modifier 'module' signifies that the processor belongs to the 'communication module.'" (Agere's Resp. at 12; Goodman Rep. P 78 ("Because the word 'module' is used to modify the word 'processor' in the claims, the 'processor' is clearly contained within the 'communication module.'").) The claim language itself and its grammatical construction, however, do not require that the module processor and module memory be physically attached to the communication module. The claim language only requires that the communication module be "comprised" of, inter alia, a module processor and a module memory. (‘705 patent, col. 38, ll. 14-15 ("each communication module comprising a module processor [and] a module memory"), col. 39, ll. 8-9 (same).) A person of skill in the art would understand that this relationship could be accomplished either by physical attachment, or, alternatively, by an electrical association. (Acampora Rep. at 35, 37 (testifying that person of ordinary skill would understand from claim language that module processor and module memory are "associated" with communication module, not necessarily physically attached).) Accordingly, the Court finds that the claim language itself does not support Agere's proposed limitation.

Similarly, the patent specifications do not require that the "module memory" and "module processor" be physically attached to the "communication module." While Figures 1A and 2 in the '705 patent suggest that, in various embodiments, the "module memory" and "module processor" may be physically attached to the "communication module," these figures are explicitly referred to as "a schematic diagram of functional blocks" (‘705 patent, col. 5, l. 21 (emphasis added)), and "a schematic diagram of functional interfaces" (id., col. 5, l. 28 (emphasis added)), respectively. Accordingly, a skilled artisan would understand that these representations describe functional rather than physical relationships. (Acampora Rep. at 35.) Furthermore, even if these figures were to demonstrate a physical connection, they would only represent particular embodiments of the invention and could not be used to limit the broader claim language. Electro Med. Sys., S.A. v. Cooper Life Sci., Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) ("Particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments."). In conclusion, the claim language and specification do not support the limitation Agere proposes. Accordingly, the Court agrees with Dr. Acampora and finds that these terms need no construction. (Acampora Rep. at 35 ("The plain meaning of the phrase is understood by a skilled artisan."), 37 (same).)

B. Dispute Respecting Whether A Term Is A Means-Plus-Function Term

Before turning to the disputed means-plus-function claim terms, it is appropriate to decide the dispute respecting whether one of the putative means-plus function claim terms is such a claim at all. That term is:

"A multiple purchase order generation module, said purchase order generation module creating multiple purchase orders from a single requisition created with said user-generated criteria and said search-module criteria"

‘516 Patent, Claim 21

The parties disagree over whether this claim element should be construed as a means-plus-function element. Because the
element does not contain the word "means" there is a rebuttable presumption that it should not be construed as a means-
plus-function element. Depuy Spine, Inc., 469 F.3d at 1023. To overcome the presumption, the proponent, here Lawson,
must demonstrate that the claim term "fails to recite sufficiently-definite structure or else recites a function without reciting
sufficient structure for performing that function." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir.
2002).

Lawson argues that "module" fails to connote sufficient structure. (Def. Br. at 20.) It asserts that "module" is akin to the
terms "mechanism," "means," "element," and "device," which the Federal Circuit has found do not constitute sufficient
structure. See Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1360 (Fed. Cir. 2004). And, Lawson argues,
the Federal Circuit has found that both a "settable control means" and "settable control module" required construction under

ePlus argues that "module" is a "well-known term in computer software technology that constitutes structure. (Pl. Br. at 16-
17.) Neither part suggest that the term "module" is definable by references to the intrinsic evidence. However, it is not
disputed that the term is defined in extrinsic evidence. Thus, for example, Webster's New World Computer Dictionary
defines "module" as "a unit or section that can function on its own. In an integrated program, for instance, one can use the
word processing module as though it were a separate, standalone program." (Pl. Br. at Ex. 18.) Similarly, the Microsoft
Computer Dictionary defines "module" as "a collection of routines and data structures that perform a particular task or
implement a particular abstract data type." (Pl. Br. at Ex. 15.) The Court may properly consider those definitions so long as
the ultimate construction is grounded in intrinsic evidence. Mangosoft v. Oracle Corp., 525 F.3d 1327, 1330 (Fed. Cir.
2008). And, here, the definitions offered by ePlus are consistent with the claim language. Significantly, in addition to the
term at issue, Claim 21 of the '516 Patent is also comprised of "a requisition module" and "a catalog collection searching
module." The use of the word "module" in those parts of Claim 21, together with the reference in the specification ('516
Patent at 10:50-65; 15:25-50; 18:23-26) support the assertion that the term module carries the meaning argued by ePlus.

Thus, when the entire claim is examined, it is clear that the term is used consistently to connote a structure.

Thusly understood, the term "module" connotes sufficient structure. Because the patents deal with computer software, and
module carries a special meaning in that field, the term "module" as used in the patent defines a structure. Therefore,
Lawson has not overcome its burden, and "module" will not be construed as a means-plus-function term.

Although the parties disagreed over whether this term is a means-plus-function term, neither party offered a proposed
construction of the term. And, no construction seems necessary if the term "module" is given its usual meaning.

2755

1. "Modular Jack"

The term "modular jack" is used in the claims of the '641 patent as follows:

1. A modular jack to be mounted on a circuit board, said modular jack comprising:

a printed board containing an electronic element for suppressing noise;

a contactor for contacting with a plug, said contactor being electrically connected with the electronic element by a wire on
the printed board;

a terminal for contacting with the circuit board, said terminal being electrically connected with the electronic element by a
wire on the printed board; and

an insulating housing for encasing the printed board.

2. A modular jack as claimed in claim 1, wherein the noise suppressing electronic element is an array of common mode
choke coils.
4. A modular jack as claimed in claim 1, wherein the noise suppressing electronic element is a chip capacitor.

6. A modular jack as claimed in claim 1, wherein the interior of the housing is divided into a first chamber in which the printed board is set and a second chamber to which the contactor is extended, and the terminal is protruded outside the housing from the first chamber.

The parties agree that "modular" refers to "the geometric configuration of jacks and their corresponding plugs, such as the RJ-11 series, RJ-45 series and the like, which are now commonly seen on telephony apparatus, computer modems, switches, and routers, and similar equipment." Murata's Opening Brief, at 12; Bel Fuse's Responsive Brief, at 25. Murata argues that "jack" should be construed as "a socket to which wires of a circuit are connected at one end and into which a plug is inserted at the other end." Murata's Opening Brief, at 12. Bel Fuse argues that a "jack" should be construed as "a female connector to which wires of a circuit are connected at one end and into which a plug is inserted at the other end." Bel Fuse's Responsive Brief, at 25. Thus, the parties dispute whether a "jack" is more properly characterized as a "socket" or a "female connector." The parties have not explained to the court why construing some thing as a "socket" as opposed to a "female connector" is a distinction with a difference; indeed, their briefs indicate that both parties understand the meaning of "jack" as it is used in the '641 Patent. Nevertheless, the court will consider which is the more appropriate term.

Murata argues that "female connector" is too general a term because the '641 Patent does not claim female connectors generally; it claims a modular jack. Instead, Murata argues that "socket" is a more specific term that is consistent with the intrinsic record of the '641 Patent. Dr. David Hughes ("Dr. Hughes"), Murata's expert, opined that the word "jack" means "a socket to which wires of a circuit are connected at one end and into which a plug is inserted at the other end." Hughes' Expert Report at 4, Ex. 2 to Murata's Opening Brief. He based his construction on a definition from Rudolf F. Graf, The Modern Dictionary of Electronics 529 (6th ed. 1984) ("The Modern Dictionary of Electronics") ("1. A socket to which the wires of a circuit are connected at one end, and into which a plug is inserted at the other end."). Id. Dr. Hughes also opined that the "plug" is usually thought of as the "male portion of the assembly," and the "jack" is usually thought of as the "female portion." Id.

Murata argues that "female connector" is too general a term because the '641 Patent does not claim female connectors generally; it claims a modular jack. Instead, Murata argues that "socket" is a more specific term that is consistent with the intrinsic record of the '641 Patent. Dr. David Hughes ("Dr. Hughes"), Murata's expert, opined that the word "jack" means "a socket to which wires of a circuit are connected at one end and into which a plug is inserted at the other end." Hughes' Expert Report at 4, Ex. 2 to Murata's Opening Brief. He based his construction on a definition from Rudolf F. Graf, The Modern Dictionary of Electronics 529 (6th ed. 1984) ("The Modern Dictionary of Electronics") ("1. A socket to which the wires of a circuit are connected at one end, and into which a plug is inserted at the other end."). Id. Dr. Hughes also opined that the "plug" is usually thought of as the "male portion of the assembly," and the "jack" is usually thought of as the "female portion." Id.

In evaluating the intrinsic evidence, the court notes that while the parties have provided the prosecution history of the '641 Patent, that history provides no assistance in the task of claim construction. See Ex. 11 to Bel Fuse's Responsive Brief. The patent application was filed on January 30, 1991. On May 30, 1991, the examiner held an interview with the applicant by telephone. According to the examiner's summary, in that interview, the examiner and applicant reached an agreement to amend claim 5. Subsequently, the examiner issued a notice of allowability along with an examiner's amendment. That amendment changed "the pitch among the terminals" in claim 5 to "the pitch among a plurality of terminals" and also deleted "the" from "among the contactors on the printed board."

Thus, the patentee made no representations during the prosecution of the '641 Patent about the constructions of the terms at issue here. Indeed, the claims at issue in this case (1, 2, 4, and 6) were issued without amendment.

In support of its position that "female connector" is too broad a term, Murata cites the deposition testimony of Albert Willette ("Willette"), who is apparently Bel Fuse's expert. Willette testified that there are other kinds of female connectors that are not jacks. Willette Dep., 81:5-15, Ex. 19 to Murata's Opening Brief. Willette also testified that a jack and plug
together form a connector. Id. at 78:7-12. Murata also cites the specification of the ‘641 Patent which states: "The present invention relates to a modular jack in a modular connector. . . ." ‘641 Patent, col. 1, ll. 6-7. According to Murata, adopting Bel Fuse's construction would cause this sentence to be nonsensical, reading "a modular connector in a modular connector." The court notes that Murata is incorrect; Bel Fuse's construction would cause the specification to read, "a female modular connector in a modular connector." Given the fact that Willette testified that the jack and plug together form a connector, testimony that Murata cites, the court finds that this substitution makes sense.

Additionally, it appears that Bel Fuse's proposed construction would not cause the claims of the ‘641 Patent to read on all types of modular connectors. Instead, it would describe only the female portion of a connector into which a plug is inserted. This appears to be an appropriately narrow construction of a "jack." Other references in the same art area show that jacks are often described as "connectors." See U.S. Patent No. 4,772,224 (titled "Modular Electrical Connector" and describing a "modular jack"), Ex. 8 to Bel Fuse's Responsive Brief; U.S. Patent No. 4,799,901 (referring to jacks as "connector subassemblies" and stating "U.S. Patent No. 4,726,638 discloses a transient suppression assembly for retrofitting existing electrical connectors, such as telephone jacks") (emphasis added), Ex. 10 to Bel Fuse's Responsive Brief; U.S. Patent No. 4,878,848, col. 2, ll. 40-42 ("The adapter system comprises a modular connection means, such as a modular jack, and a housing structure connected to the modular jack."). Ex. 12 to Bel Fuse's Responsive Brief.

Thus, the court finds that a jack and plug together form a modular connector. Indeed, Murata cites Willette's deposition testimony in which he testified that a jack and plug together form a modular connector. Willette Dep., 78:9-10. Murata bases its proposed construction of a "jack" as a "socket" on only a single dictionary definition in the Modern Dictionary of Electronics n6 and Dr. Hughes' expert report which refers only to that same definition without further explanation. The Federal Circuit has stated that "conclusory, unsupported assertions by experts as to the definition of a claim term are not useful to a court." Phillips, 415 F.3d at 1318. While Dr. Hughes' assertion is not wholly unsupported (it refers to a dictionary definition), it is only marginally useful to the court because it provides no explanation as to why the particular definition was chosen or why it is consistent with the view of a person of ordinary skill in the art.

After reviewing all of the evidence, both intrinsic and extrinsic, the court finds that adopting a construction which characterizes a "modular jack" as "the female portion of a modular connector" is consistent with the intrinsic evidence, and reflects the view of a person of ordinary skill in the art. Adding the restriction "in which wires of a circuit are connected at one end and into which a plug is inserted at the other end" appropriately narrows the definition such that it is clear that a "jack" does not encompass all female connectors. Additionally, the parties have agreed that the additional modifier "modular" restricts the construction of the claim "modular jack" to certain configurations. Thus, the court construes the term "modular jack" as "the female portion of a modular connector in which wires of a circuit are connected at one end and into which a plug is inserted at the other end."

11. "modulator"

Wi-LAN's Proposed Construction

"a device that varies one or more of the amplitude, frequency, or phase of each data symbol from each set of data symbols in accordance with a code from the up to M direct sequence spread spectrum codes"

 Defendants' Proposed Construction

invalid for failure to meet 35 U.S.C. § 112
Claim 2 requires a "modulator to modulate." The specification provides that "[t]he computing means shown in FIG. 1 includes a source 16 of N direct sequence spread spectrum code symbols and a modulator 18 to modulate each ith data symbol from each set of N data symbols with the I code symbol from the N code symbol to generate N modulated data symbols, and thereby spread each I data symbol over a separate code symbol." '802 patent, 4:7-12. While Wi-LAN proposes a construction for the term, the Defendants do not provide a proposed construction and rather argue that it is invalid. Defendants argue that the "modulator" term in claim 2 is indefinite and thus renders claim 2 invalid. Defendants argue that the structure corresponding to the computing means function in claim 1 requires that each data symbol in the set of N data symbols be spread over a separate code. By amending claim 2 to require spreading each set of data symbols over a separate code in the reissue application, Defendants argue that the applicants broadened claim 2 beyond the scope of independent claim 1, rendering it invalid.

The Court rejects Defendants' arguments. The Court is not convinced that during reissue the applicants impermissibly broadened the claim language. Further, it is well settled law that claim terms are not necessarily limited to a preferred embodiment. The Court finds that the term "modulator" is not indefinite. A claim is indefinite only if the "claim is insubstantial in ambiguity, and no narrowing construction can properly be adopted." Exxon, 265 F.3d at 1375; Honeywell, 341 F.3d at 1338-39. This term is not "insubstantial in ambiguity" so as to prevent construction. See Young, 492 F.3d at 1346 (claims are considered indefinite when they are "not amenable to construction or are insubstantially ambiguous"). The specification contains examples from which one of ordinary skill in the art could determine the scope of the claim. See '802 patent, 4:7-12; Figure 1 (item 18). The Court finds that there is sufficient guidance in the specification as to the meaning of "modulator" to one of ordinary skill in the art. See Exxon, 265 F.3d at 1375 ("If the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds."). The Court finds that various dictionary definitions provide a consistent meaning for the term modulator as, generally, a device that modulates an electronic wave, e.g., a device that varies one or more properties of a carrier wave or signal, such as the amplitude, phase, or frequency of the wave. Wi-LAN's proposal is partially consistent with the ordinary meaning of the term modulator, but adds language that is mostly superfluous based on the claim language following the term to be construed. The Court finds that in other claims the parties have not construed the terms modulate, modulating, or modulated, and thus the Court will not construe modulating, as opposed to modulator, in the claim at issue. The Court construes the term "modulator" to mean "a device that varies one or more of the amplitude, frequency, or phase of each data symbol."

4. Module Identifier/Text String

Isogon and Amdahl do not dispute that "module identifier" and "text string" are synonymous claim terms that describe a recognizable "string of characters" embedded in the software programs. Markman Tr. at pp. 12, 101-02. This string of characters is used by the invention to identify those software programs for which the invention lacks pre-stored identifying information in the knowledge base. See id. at pp. 101-02. The only dispute concerns in what part of the invention the "module identifier" must be stored. Amdahl contends that the module identifier must be stored in either the knowledge base or the surveying program; Isogon contends that it may be stored "anywhere in the apparatus." Markman Tr. at p. 13.

The '340 claims describe the invention as having a means "for storing said module identifier in said secondary memory means" and a means for relating the module identifier with a module name which is also stored in the "secondary memory." '340 Pat. at col. 13, l. 65-col. 14, l. 3. The "secondary memory" referred to in the '340 patent is defined in the claims as part of the "plurality of storage devices" comprising part of the invention apparatus. '340 Pat. at col. 12, ll. 48-53. While the '340 "secondary memory" is described in the claims as storing "module names" that are retrieved by the "surveying means," id. at col. 12, ll. 55-60, the claims do not require that the secondary memory be part of the "surveying means" or the knowledge base.

In addition, "Figure 4" of the drawings, which describes the operation of the surveying program, states that the module identifier is stored in the "system configuration log." '340 Pat. at Figure 4, Sheet 4. This system configuration log is then identified in the specification as component "66" of the drawings. Id. at col. 11, ll. 47-49. Amdahl admits that the module identifiers for which the invention searches are "dumped" into file "number 66." Markman Tr. at p. 27. In "Figure 1" of the
'340 patent drawings, the component numbered "66," the "system configuration log," is shown in relation to the surveying program. Component "66," however, is clearly embodied outside of the boundary lines indicating the surveying program labeled as component "12" in "Figure 1". '340 Pat. at Figure 1, Sheet 1. Because certain components are represented within the boundaries of the surveying program, namely the "directory," labeled "12A," and the "module reader," labeled "12B," the drawing indicates a demarcation between components contained within the surveying program and those that are not. Therefore, the preferred embodiment of the '340 patent teaches that module identifiers may be stored in a peripheral device used by the surveying program, but need not be part of that surveying program.

Further, the specification refers to the knowledge base as component "20" in the drawings. '340 Pat., at col. 5, l. 20. The system configuration log, component "66," is clearly indicated in Figure 1 as a separate entity from the knowledge base, component "20," and likewise as separate from, and outside of, the surveying program, component "12." Id. It follows that if, as described by the specification and shown in "Figure 4," a module identifier can be stored in the system configuration log, which is embodied here as an entirely separate entity from both the surveying program and the knowledge base, then the '340 patent teaches that the invention does not require storage of a module identifier in either the surveying program or the knowledge base.

Nowhere in the claims or the specification does the patent require storage of a module identifier in a given location. Markman Tr. at p. 102. The specification language describing module identifier storage, using the terms "may" and "can," permits optional locations for storage, describing how "the knowledge base can also be used to store information, such as the strings...." '056 Pat. at col. 5, ll. 63-66, and that module identifiers "may be stored in the knowledge base or hard coded into the file reader 12B." Id. at col. 6, ll. 18-20. While Dr. Kaliski testified that this language permitted only these two possible storage locations, he also acknowledged that this specification language should not be taken out of context. See Markman Tr. at p. 181. The patents as described in the drawings and specification reveal that these two locations are not the only locations where module identifiers may be stored, because module identifiers can also be stored in the system configuration log, which is not part of the knowledge base or the surveying program's "module reader 12B." '340 Pat. at Figure 1, Sheet 1. The storage of module identifiers is not limited to the surveying program or knowledge base locations.

3. monitors

Again, plaintiff provides a dictionary definition for the term monitor because the claims and specification do not provide a definition. Plaintiff suggests that monitor means: "to watch, keep track of, or check, usually for a special purpose." (Plaintiff's Supplemental Brief, at 1 (quoting the Merriam-Webster Collegiate Dictionary)). Defendants look to the brief summary of disclosure within the text of the patent for guidance:

During each monitor of the phone line, the external microphone is temporarily disabled so that any signal on the line cannot be the result of external noise or someone talking on the external microphone....The voice communication system comprises a microprocessor circuit....and which operates in combination with a timing circuit to enable a monitor of the link at periodic intervals. If there is a sound on the line, it is presumed to be generated at the microphone in the interior environment....and the microprocessor will dedicate transmit control to the microphone at the interior environment.

U.S. Patent No. 4,604,501 at col. 4:6-22. However, the brief summary of the disclosure does not define the term. The Court concludes that the dictionary meaning provided by plaintiff comports with the language set forth in the patent. Thus, for purposes of the 501 patent, monitor means "to watch, keep track of or check." This definition applies to all claims of the 501 patent.
2759
2. "monitor and accumulate"

Tidel proposes the term means "ongoing observation and keeping." FKI proposes the term means "keep track of and gather." "Monitor" generally means "to observe, supervise, or keep under review; to keep under observation; to measure or test at intervals" Oxford English Dictionary. "Accumulate" generally means "to amass or collect." Oxford English Dictionary.

Tidel argues that "ongoing" must be included in the definition because the transactions are automatically communicated to the central control unit. This is unpersuasive. There is no support for requiring this limitation in the definition. The court, therefore, construes "monitor and accumulate" to mean "to keep under observation and collect."

2760
4. Monitor Means

In Claim 1, the term "monitor means" refers to any computer monitor (Tr. 46). The term is not limited to the precise type of monitor (one built into a desk or table top) shown in the '520 Patent.

2761

The first disputed term is contained in the beginning of claim 1. This section is set out below with the disputed terms in bold and the agreed terms in italics.

A comprehensive multi-media security and surveillance system for monitoring a commercial transport utilizing IP protocol and transmitting secure data to both a ground monitoring station and to the commercial transport in digitized, multi-media format comprising textual, visual and audio information . . .

E-Watch argues that the term "monitoring" is plain and ordinary on its face and does not need to be construed. In the alternative, E-Watch proposes "watching, observing, recording, or detecting." March Networks suggests "observing and gathering current data which indicates the specific near real time status of the transport's condition or its operational systems."

March Networks argues strenuously that "monitoring" cannot involve the storage of any data for later review. Its position is that a camera which sweeps a room is "monitoring" the room even though it covers only a part of the room at a time. On the other hand, March Networks argues, the "black box" in a plane is not "monitoring" because the F.A.A. doesn't get the box until the plane has crashed. At the hearing, March Networks stated that its proposal of "near real time" would allow for the delay between observations of a guard going around a building or "a system that polls every 20 minutes. Tr. p. 103, ll. 16-25.

March Network's construction is somewhat strained, and does not take into account col. 3, ll. 33-41, which describe monitoring of water, waste water, etc., so that an aircraft can be re-supplied when it reaches the terminal. There is no need for such data from the sensor appliances to be continuously transmitted, as there might be for other information such as fuel and oil levels or temperature. The data can be accessed when the plane approaches an airport, and the proper arrangements made. See' 692 patent, col. 6, ll. 42-43 ("Any signal which is capable of being captured and stored may be monitored in this manner.").

There is no limitation in the claim language, nor in the specification, that the monitoring must be in or close to "real time." March Networks' examples of "real time" involved delays of up to twenty minutes. If that expansion is accepted, there is no
basis in the specification for determining what would be "real time" and what would be "delayed" or "stored." Therefore the court construes this term as follows:

"Monitoring" means: "observing characteristics of, or events concerning."

--- Footnotes ---

n2 Philips asserts that "monitoring" means "checking or measuring," but never explains what the term "checking" adds to its definition. The court finds "checking" to be redundant of "measuring."

--- End Footnotes ---

Defibtech's argument finds some support in the claim language. Each time the patents use "monitoring," the accompanying language suggests that monitoring takes place over an interval of time. Claim 1 of the 612 Patent refers to "monitoring a patient-dependent electrical parameter during the discharging step," and several other claims use substantially identical language. 879 Patent Claim 13; 454 Patent Claims 1, 15, 53; 905 Patent Claims 1, 4, 9; 927 Patent Claims 1, 9, 11. Claim 16 of the 454 Patent discloses "an electrical parameter monitored during the discharge step." The language of the claims leaves no doubt that the "steps" they refer to are not single points in time, but rather intervals of time. The most compelling evidence for this proposition is that "monitoring" inevitably takes place "during" a step, suggesting that a step takes place over a period of time, whereas "monitoring" that took place "at" a step would suggest a step that is a single point in time. Moreover, the claimed steps "begin" and "end" according to the language of the claims. E.g., 454 Patent Claims 53, 54. This suggests that monitoring cannot be an instantaneous event, because intervals begin and end, whereas instants do not.

Moreover, as Defibtech noted during oral argument, Philips used the term "measuring" in other portions of the shock delivery specifications, including other claims. For example, Claim 13 of the 879 Patent covers "monitoring a patient-dependent electrical parameter during the discharging step," whereas Claim 1 discloses "measuring a patient impedance during the discharge step." Defibtech argues that if "monitoring" and "measuring" had the same meaning, Philips would have used the same term consistently in the patents.

The court finds the claim language insufficient to carry Defibtech's argument. Although the use of "monitoring" in one claim and "measuring" in another raises an inference that the terms have different meaning, that inference is not determinative. Desper Prods., Inc. v. Qsound Lab, Inc., 157 F.3d 1325, 1337 n.3 (Fed. Cir. 1998). In addition, comparing the "measuring" and "monitoring" claims reveals that both take place "during the discharging step." If both "measuring" and "monitoring" occur "during" periods of time, there is little reason to assume that one term excludes single measurements and one does not.

Fortunately, the written descriptions provide answers that the claim language does not. Each description of the six shock delivery patents discloses an invention whose preferred embodiment has three "aspects." 879 Patent at 2:39-52. n3 The first is a defibrillator that delivers a shock with a biphasic waveform that has predetermined values for the length of its two shock pulses. E.g., 879 Patent at 4:29-53. In this aspect, no "measuring" or "monitoring" takes place. In the second aspect, the initial phase of shock lasts for a minimum predetermined threshold time, but that time is extended if the voltage has not dropped below a threshold voltage at the end of the threshold time. 879 Patent at 5:13-20. In the third aspect, the initial phase of shock ends at a predetermined threshold time or at the time that the voltage drops below a threshold value, whichever comes first. 879 Patent at 5:47-60.
n3 The 454 Patent and the 927 Patent disclose the three aspects by incorporating the written description of the 879 Patent.

The disclosure of the second and third aspects of the preferred embodiments illuminates the meaning of "monitoring." In the second aspect, there is no need to measure a voltage until the end of the threshold time. If, however, the voltage has dropped below a threshold at the end of the threshold time, the first phase of the shock terminates, and no further measurements are necessary. In the third aspect, the defibrillator necessarily measures voltage at least once before the threshold time, so that it can determine whether to terminate the initial shock phase before the threshold time expires. In either aspect, it is possible for a single measurement to suffice. Indeed, a single measurement will suffice in every instance in which the first measurement reveals a voltage below the threshold level.

The court ultimately adopts "measuring" as the definition of "monitoring" because only this definition allows the patents to cover the invention's preferred embodiment. The court recognizes that it is not necessary that every claim cover the preferred embodiment. In this case, however, unless Philips' construction is correct, four of the six shock delivery patents would contain no claims covering the preferred embodiment. The asserted claims of the 612, 454, and 905 Patents use only the term "monitoring," and never the term "measuring." If "monitoring" excludes single measurements, then none of the claims would cover the second and third aspects of the preferred embodiment, both of which admit the possibility that a single measurement would suffice. There is a heavy presumption against construing claims to read out a preferred embodiment. Vitronics, 90 F.3d at 1583 (noting that such a construction is "rarely, if ever, correct").

In addition, because each of the possibilities requiring a single measurement corresponds to a patient characteristic, Defibtech's construction would not merely read out the preferred embodiment, it would exclude an entire class of patients from an invention whose purpose is to adjust shock delivery to fit any patient's impedance parameters. In the second aspect of the invention, the single measurement scenario corresponds to a patient with low impedance. 879 Patent at 5:23-26. The single measurement scenario in the third aspect also corresponds to a patient with low impedance. 879 Patent at 5:57-60. The Patents thus teach that only a single measurement in the first phase of the shock waveform is necessary for patients with sufficiently low impedance. The court therefore cannot exclude single measurements from the definition of "monitoring" without implicitly holding that the shock delivery patents exclude low impedance patients. The court thus construes "monitoring" to mean "measuring," and to include single measurements.

4.1 "monitoring"

The parties dispute, however, what it means to "monitor" a call path. Rockwell contends that the claim term "monitoring" means observing or viewing information and putting the information on a display, thus illustrating the information. According to Rockwell, monitoring a "prospective call path" addresses re-routing types of calls to be received in the future so that an off-line program for prospective calls is within the claims. Apropos contends that the term "monitoring," as used in the 059 patent, means observing events as they occur in order to ensure that they are proceeding as expected or desired. Therefore, Apropos posits, "monitoring" does not cover off-line programming tools.

Rockwell first relies on dictionaries to support its view: "monitor: to watch, keep track of, or check usually for a special purpose; display: to put or spread before the view." MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 752 and 335 (ed. not cited); "monitor: to observe, record, or detect (an operation or condition) with instruments that have no effect upon the operation or condition"; "display: to show or exhibit; make visible." RANDOM HOUSE WEBSTER'S COLLEGE DICTIONARY 847 and 378 (ed. not cited). Rockwell also points to the preamble of claim 1, which, it contends, literally speaks to a system for monitoring "information regarding a prospective call..." and argues that there is no requirement in the claims or the specification that the patent only apply to on-line monitoring, that a certain time when the information that is monitored must occur, or that the information that is monitored must be current calls in a queue. Rockwell also points to Fig. 3, which describes three call "types," DNIS, ANI, and Default, suggesting that a current call is excluded, and to the
A monitoring doesn't require that activity be occurring.

Q: If there is no activity occurring . . . what would be monitored?

A: The absence of activity [is] the narrowest sense of monitoring.

The court finds this unpersuasive because the context indicates watching something as it occurs or, in this instance, does not occur. Rockwell also cites to the inventor, Van Berkum who testified, "'Monitoring' is a word that's used in two different ways." He continues that in col. 1, the patent uses the term "in a very broad way . . . it indicates that you're looking at almost every type of activity that can occur within a call-a call center or-yeah, pretty much everything that goes on within the call center . . . " (Van Beckum Dep. at 50, l. 12-24; 52, l. 2-24; 53, l. 1-10). This testimony is inconclusive at best.

In support of its view, Apropos relies on the same dictionary citation as Rockwell, but argues that "monitor" means "to watch, keep track of, or check" something as it occurs. Apropos also refers to text within the patent to support its view that "monitoring" is used in the sense of the contemporaneous watching of calls as they come in. It cites col. 1, l. 31-34 ("Management personnel continually monitor activities of the call center to assure that callers, or customers, are being promptly assisted by agents having the desired skills."). Further, Apropos points to the prosecution history, at R000142, in which Rockwell represents that whereas the Kline prior art is only able to trace calls retrospectively, because of the multitude of paths a call may take, "a computer of an automatic call distributor is able to monitor a prospective call path" and "the computer … selects the agent to receive the call based upon many factors including skills, availability and the like . . . " (Emphasis in original). This means, Apropos argues, observing events as they occur in order to ensure that they are proceeding as expected or desired. As further support, Apropos points to the specification, detailed in the margin, to indicate that in the context of call centers "monitoring" means observing activities of the call center for the purpose of ensuring proper business performance. 18 Finally, Apropos points out that one of the inventors, Paul E. Van Berkum, conceded that "monitoring" does not cover off-line programming tools, such as Rockwell's Telescript Editor or Bellcore's SCE. 19
context of this patent"); (id. at 84-85) (comparing the 059 patent to Rockwell's Telescript Editor is "mixing apples and oranges"); (id. at 85) ("The telescript editor was a product that was used to create and control call flow by creating these scripts, call flow scripts. How that refers . . . to this patent, I have no idea."). and at 86 (Rockwell's Telescript Editor has "no implications to this patent whatsoever."); see also (Markman Tr. at 370) (Forys) (describing a similar prior art offline programming tool called the Service Creation Environment (SCE) that was used at Bellcore in 1988): (Apropos Br. at 16) (explaining that claim cannot be validly construed such that "monitoring" encompasses off-line programming, because if it does, the claim is anticipated by the prior art, including the Rockwell Telescript Editor prior art admitted to by inventor; the claim would be anticipated and unenforceable because the inventor and Rockwell would have committed serious inequitable conduct in failing to disclose such prior art); (MacCrisken Dep. at 262-63 (MacCrisken unable to differentiate prior art-type telescript editors from 059 patent as he construes it).

As stated above, when there is no express intent to impart a novel meaning to a term in a claim anywhere in the patent or its prosecution history, the term must be given its ordinary meaning. Kegel Co. v. AMF Bowling, Inc., 127 F.3d 1420 at 1429, 1427 (Fed. Cir. 1997). Monitor, however, is a word whose ordinary meaning is malleable. One can monitor water quality by testing it three times a year for ten years, and one can monitor a telephone call by listening to it as it occurs. Thus, monitor in the context of the 059 patent must be grounded in the particular technology and the specification. See Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1248 (Fed. Cir.1998) (While it is improper to read limitations from the written description into a claim, claims must be read in light of the specification of which they are a part.) Rockwell is correct that neither the preamble, the claims nor the specification explicitly state that the patent only applies to on-line monitoring, or that a certain time when monitoring must occur, or that the information that is monitored must be current calls in a queue. Nevertheless, where the specification refers to the administrator, who may select a type of call, modify the route that type of call will take, and display which agents will receive which types of calls, the message conveyed is that the administrator is viewing activity as it occurs so that the administrator can see which agents ("Sally, Nancy, and Bruce") will receive a particular type of call and modify that path according to the needs at the time. For example, col. 4, l. 14-33, can only be understood in the context of monitoring activity "on line" as it happens. With respect to Rockwell's argument that on-line monitoring would be impossible because current calls are switched in a fraction of a second, this may or may not be accurate, 20 but if the prospective call path is programmed, as stated, e.g., col. 3, l. 16-27, one must assume that all calls will proceed according to that programmed path until modified by the administrator, and that is what this invention does for the user.

20 This is puzzling because the court does not understand Rockwell to be taking the position that on-line monitoring is not covered by the 059 patent. Van Berkum states, "So--as one example, if you were [dealing with] a VIP customer . . . you [i.e., an administrator] could use that information to move them to the first available agent in the whole call center. Or maybe [the customer] dealt with a specific person. You could move that information to page that person or have that call drop in next on that person" (Van Berkum Dep. at 88).

If it is assumed that the invention applies to an on-line situation, the issue is whether it also applies to an off line monitoring of "what is there in the program." The answer is no. The primary difficulty with Rockwell's position is that it does not distinguish the invention from the prior art. Van Berkum tellingly described an offline programming tool, Telescript Editor, used by Rockwell "to create and control call flow by creating these . . . call flow scripts," which seems to be what Rockwell is arguing, as not, to the best of his knowledge, a part of this patent, (Van Berkum Dep. at 85), as having "no implications to this patent whatsoever[,]" (id. at 86). This is confirmed by the prosecution history in which the examiner initially rejected the application in light of Thompson, "which monitors the prospective call path of an incoming call, . . . [the call path] is displayed in the form of a graphical display on the screen of an operator who then can transfer the call. . . . [It also] teaches . . . that a prospective call path . . . can be displayed . . . and modified by an operator . . . ." R000148. After the applicant amended claim 1 to include a feature of acquiring information relating to the identity of the caller to influence the prospective call path at a point between the switch and the agent, the claim was allowed. R000171. The initial context of the file relates to "live" or incoming calls, not a programming tool.
For these reasons, the court concludes that "monitoring" in the 059 patent means observing events as they occur.

Step 3

Step 3 provides for "monitoring which data sources are actually accessed by each recipient." Def. Mem. at Ex. 1, Col. 55, Claim 17. Amazon asserts "monitoring" means "keeping track of and recording." Id. at 22. The first part of Amazon's proposed construction is taken from Webster's Dictionary, defining "monitoring" as "keep track of, regulate or control (as a process or the operation of a machine)". Id. The second part of Amazon's proposed construction is taken from the specification: "preferably, the monitoring function is accomplished by storing, at each customer's set top multimedia terminal, a record of the video programs actually watched by the customer." Id. Ex. 1, Col. 6. Pinpoint does not directly respond, but suggests in the claim chart attached to its memorandum that claim construction of this term is unnecessary. See Pl. Opp. Mem. Ex. 4 at 2 ("Pinpoint Construction. . . Monitoring which data sources are actually accessed by each recipient"). In the absence of any explanation supporting Pinpoint's position, the court construes "monitoring" to mean "keeping track of and recording."

The Court construes "monitoring circuit" and "monitoring circuitry" as "circuitry that is capable of signal detection." The Court construes "second circuitry . . . to detect a resume signal" as "circuitry that is capable of signal detection during low power operation."

Plaintiff seeks no construction of the phrase "second circuitry . . . to detect a resume signal." For the "monitoring circuit" phrase, Plaintiff seeks a construction of "circuitry that monitors." Defendants seek to add the limitation that it "remains operative" by construing "monitoring circuitry" as "circuitry that remains operative to monitor the loop" and "second circuitry . . . to detect a resume signal" as "circuitry that remains operative to detect a resume signal." Defendants argue the specification supports the "remains operative" limitation when it states "[c]ircuitry to detect the resume signal must remain capable of signal detection during low power operation." '323 patent, 5:28-30. However, Plaintiff responds by arguing that this would be importing a limitation that is not supported by the specification. Plaintiff argues this construction would require the "monitoring circuit" to remain operative to monitor the loop at all times, whereas the specification language Defendants cite only requires it remain operable "during low power operation." Id.

For the claim phrases "monitoring circuit" and "monitoring circuitry," Plaintiff's construction of "circuitry that monitors" merely rephrases the claim language and adds no meaning, so the Court refuses this construction because it would not be helpful to the jury. The Court also disagrees with Defendants' construction that adds the "remains operative" limitation. There is some support for this limitation in the specification where it states that "[t]his detector 115 remains operative when the unit 232 is in low-power mode." '323 patent, 5:55-56. But this specification quotation is only referring to the monitoring circuit that detects the resume signal. See '323 patent, 5:47-59 (making clear that the "detector 115" detects the resume signal). The "monitoring circuitry" in claim 24 is also "configured to detect a shut-down condition on the loop," and according to this Court's construction of shut-down condition, the shut-down condition may also be a signal. There is no requirement in the specification that the "monitoring circuitry" configured to detect the shut-down condition remain operative to monitor the loop. The only characteristic of the "monitoring circuitry" that is repeatedly mentioned in the specification is that it is capable of signal detection. See, e.g., '323 patent, 5:28-30. ("Circuitry 115 to detect the resume signal must remain capable of signal detection during low power operation."); '323 patent, 2:16-18 ("monitoring the loop with a monitoring circuit to detect a resume signal outside the voiceband frequency range on the loop"); '323 patent, 6:28-30 ("The resume signal is subsequently detected by loop monitoring circuitry in the COT unit (step 304).")); '323 patent: 7:21-23 ("The shut-down signal is subsequently detected by monitoring circuitry in the COT ADSL unit (step 309)."). Therefore, the Court construes "monitoring circuit" and "monitoring circuitry" as "circuitry that is capable of signal detection."

For the phrase "second circuitry . . . to detect a resume signal," the Court agrees with Plaintiff that Defendants' "remains operative" limitation is incorrect because this construction would require the circuitry to remain operative to monitor the
loop for a resume signal at all times. The specification only requires "[t]his detector 115 remain[] operative when the unit 232 is in low-power mode." '323 patent, 5:55-56. As discussed above, the Court's construction reflects the specification's characterization of this circuitry being capable of signal detection. Further, in this instance, since the "second circuitry" in claim 7 specifically refers to the circuitry capable of detecting a resume signal, the Court's construction clarifies that the circuitry be capable of signal detection specifically during low power operation. See '323 patent, 5:28-30 ("Circuitry 115 to detect the resume signal must remain capable of signal detection during low power operation."). Thus, the Court construes "second circuitry . . . to detect a resume signal" as "circuitry that is capable of signal detection during low power operation."

5. "monitoring information," "monitoring data"

The Court finds Power-One's proposal to be correct and, therefore, construes this term as "data concerning the status of the one or more POL regulators in the power system." See '125 patent, col.6:44-55

2. "monitoring patient data elements of patients in a plurality of geographically dispersed ICUs"

Plaintiff proposes: "monitoring at the remote command center data elements of patients who are located in a plurality of geographically dispersed ICUs." Defendants propose the same construction but add, "in an automated fashion 24 hours a day 7 days a week." Thus, the only difference in the proposed construction is defendants' addition of "in an automated fashion 24 hours a day 7 days a week." Defendants argue that by adding this language, it will keep all of the information in one place for the jury and reduce confusion.

As with the 24/7 language, the phrase "in an automated fashion" is already set forth in the concluding "wherein" paragraph. Adding this phrase yet again is repetitive, not within the ordinary meaning of the claim when read in its entirety, and will be more, not less, confusing to the jury. Additionally, the Court has previously addressed and rejected defendants' suggestion of adding the 24/7 language throughout the construction. The term is construed as "monitoring at the remote command center data elements of patients who are located in a plurality of geographically dispersed ICUs."

E. "Monitoring Payments"/"Monitoring Payments Made by the Customer to Maintain the Customer's Access to the Service"

The phrase "monitoring payments made by the customer to maintain the customer's access to the service" appears in claims 3 and 4 of the '945 patent. WebEx contends that the court should define the phrase as "automatically determining whether a payment has been received for services used, and automatically terminating access if the payment has not been received." 156 ABC asserts that only the term "monitoring payments" needs to be defined and proposes the following definition: "any process of various persons or devices for checking on whether payment has been made." 157 The court will first define "monitoring payments."

--- Footnotes ---

156 WebEx's Brief, Docket Entry No. 156, at 32.
157 ABC's Brief, Docket Entry No. 154, at 18.

--- End Footnotes ---
The parties essentially agree that monitoring payments involves "checking on whether payment has been made." Although WebEx uses slightly different terminology -- "determining whether payment has been received" -- the court perceives no real difference in this aspect of the parties' proposed definitions. The parties, however, disagree as to whether the step of monitoring payments must be automated and performed by a machine or apparatus, as opposed to a human, and as to whether the payments monitored are only for "services used," i.e., services rendered and received in the past.

a. Automation

The court rejects WebEx's contention that monitoring payments must be automated. WebEx points out that the preferred embodiment of the invention described in the patent specification is capable of automatically monitoring payments. But, as explained above in the court's discussion of the terms "billing for access to the service" and "generating a bill for the service," the claimed invention should not be limited to the preferred embodiment. See Dow Chem. Co., 226 F.3d at 1341-42. Nothing in the claim language, specification, or prosecution history of the '945 patent indicates that the step of monitoring payments must be performed automatically.

b. Various Persons or Devices

ABC asserts that the relevant claim language is broad and open-ended, and does not limit who or what must monitor payments. Indeed, the patented methods of claims 3 and 4 include the same final step, which simply recites "monitoring payments made by the customer to maintain the customer's access to the service." No other intrinsic evidence limits who or what must perform this step. Therefore, as ABC's definition correctly explains, this step in the patented processes could be performed by "various persons or devices."

WebEx argues that construing the disputed term this broadly, particularly by allowing for the step of monitoring payments to be conducted by a person, renders the claims unpatentable because "systems that depend for their operation on human intelligence alone" are not patentable subject matter under 35 U.S.C. § 101. In re Comiskey, 554 F.3d 967, 980 (Fed. Cir. 2009). The court is not persuaded by WebEx's argument. Although it is true that "mental processes -- or processes of human thinking -- standing alone are not patentable," Comiskey, 554 F.3d at 979, "it is inappropriate to determine the patent-eligibility of a claim as a whole based on whether selected limitations constitute patent-eligible subject matter." In re Bilski, 545 F.3d 943, 958 (Fed. Cir. 2008). Process claims such as claims 3 and 4 must be evaluated as a whole, and "it is irrelevant that any individual step or limitation of such process by itself would be unpatentable under § 101." Id.

There is no question that claims 3 and 4, viewed as a whole, constitute patentable subject matter under § 101. "A claimed process is surely patent-eligible under § 101 if: (1) it is tied to a particular machine or apparatus, or (2) it transforms a
particular article into a different state or thing." Bilski, 545 F.3d at 954. Claims 3 and 4 are tied to at least three machines or apparatuses: an interface unit, a website, and a remote computer unit. 161 Therefore, these claims are not rendered unpatentable merely because the final step in each does not necessarily utilize any of these three devices.

161 See '945 patent, claims 3, 4 (claiming a method "for remotely controlling a remote computer unit using an interface unit, the remote computer unit comprising a personal computer," the first step of which is "operating a website . . ." (emphasis added)).

c. Past Services

WebEx again asserts, as it did with regard to the definition of "billing for access to the service" and "generating a bill for the service," that the bills generated and, therefore, the payments received and monitored, are only for "services used" or received in the past. WebEx contends that because payments are monitored to "maintain the customer's access to the service," 162 the payments must be for services rendered in the past. As explained above in the court's discussion of the billing terms, merely because a payment is made to "maintain" a service does not necessarily mean it is for services rendered in the past. The payment could just as easily be an up-front payment made so that the user may, in the future, continue to receive a service he has, up until that time, received. Accordingly, the court is not persuaded that the payments monitored are necessarily associated with past services. The court concludes that "monitoring payments" means "any process of various persons or devices for checking on whether payment has been made."

162 '945 patent, claims 3, 4.

2. "Monitoring Payments Made by the Customer to Maintain the Customer's Access to the Service"

WebEx contends that the clear implication of the phrase "to maintain the customer's access to the service" is that service is automatically terminated if payment is not received. In response, ABC does not contest WebEx's assertion that service is terminated if payment is not received. 163 ABC argues only that the process of terminating service need not be automated. 164

164 See id. ("While monitoring and termination of access could occur automatically, the claim does not require it." (emphasis added)).

The court agrees that the word "maintain" clearly suggests that the service will terminate unless payment is received. The court, however, does not agree with WebEx that termination must be automated. Again, WebEx improperly relies only on the description of the preferred embodiment for its position that the termination step must be carried out automatically. 165 See Dow Chem. Co., 226 F.3d at 1341-42. The court will not so limit the invention. The court concludes that "monitoring payments made by the customer to maintain the customer's access to the service" means "any process of various persons or devices for checking on whether payment has been made, and terminating access to the service if payment has not been received."

- 3105 -
independent review of the patent document reveals . . . there is no basis in the patent specification for adding the negative construing this limitation. See, e.g., Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003) (“Our patent specification for adding the negative limitation—excluding monitoring voltage—we hold that the Commission erred in appropriate for the court to construe a claim solely to exclude the accused devices.”) Thus, because there is no basis in the accused devices. See, e.g., Cohesive Techs., Inc. v. Waters Corp., 543 F.3d 1351, 1367-68 (Fed. Cir. 2008) (“[I]t is not limiting this limitation as it did, we think the Commission interpreted this limitation incorrectly when it excluded the "monitoring current" limitation under its claim construction section, it effectively construed the limitation. We thus address the parties' dispute regarding this limitation as a claim construction issue. See, e.g., Board of Regents of Univ. of Tex. Sys. v. BenQ Am. Corp., 533 F.3d 1362, 1367 (Fed. Cir. 2008) (treating the parties' dispute over a limitation as a claim construction issue because the district court "effectively construed the claim phrase" in its summary judgment order). Linear argues that the exclusion of indirectly monitoring current is incorrect, arguing that the '258 patent's specification and Ohm's Law support the proposition that "monitoring the current to the load" in claim 35 can be accomplished either directly or indirectly. In response, AATI contends that the Commission properly rejected Linear's reliance on Ohm's Law and, thus, correctly found that monitoring current could not include monitoring a voltage.

Lastly, we address the Commission's ruling regarding the "monitoring the current to the load" limitation in claim 35. See '258 patent col. 20 ll.9-14 ("a third circuit for monitoring the current to the load to generate a second control signal during a second state of circuit operation to cause one of said switching transistors to be maintained OFF"). During its infringement analysis, the Commission excluded "monitoring voltage" from meeting this limitation. Final Determination, 2007 ITC LEXIS 1108 at *16-17. In effect, because a device can indirectly monitor current by monitoring voltage, the Commission limited the "monitoring current" limitation to instances of directly monitoring current. Thus, although the Commission did not explicitly address the "monitoring current" limitation under its claim construction section, it effectively construed the limitation. We thus address the parties' dispute regarding this limitation as a claim construction issue. See, e.g., Board of Regents of Univ. of Tex. Sys. v. BenQ Am. Corp., 533 F.3d 1362, 1367 (Fed. Cir. 2008) (treating the parties' dispute over a limitation as a claim construction issue because the district court "effectively construed the claim phrase" in its summary judgment order). Linear argues that the exclusion of indirectly monitoring current is incorrect, arguing that the '258 patent's specification and Ohm's Law support the proposition that "monitoring the current to the load" in claim 35 can be accomplished either directly or indirectly. In response, AATI contends that the Commission properly rejected Linear's reliance on Ohm's Law and, thus, correctly found that monitoring current could not include monitoring a voltage.

We agree with Linear that the Commission improperly narrowed this claim limitation to exclude indirectly monitoring current through the measurement of voltage. The claim limitation does not state directly monitoring current. Rather, it simply reads "monitoring the current to the load." "258 patent col. 20 ll.9-10. As such, this limitation should be accorded a scope commensurate with the '258 patent's specification. See, e.g., Tegal Corp. v. Tokyo Electron Am., Inc., 257 F.3d 1331, 1342 (Fed. Cir. 2001) (construing a limitation broadly based on the specification). In this case, '258 patent not only discloses monitoring current directly by using a current comparator, see, e.g., id. col.14 ll.43-61, but also indirectly by some other means. Explicitly, the specification states that "other means of detecting current reversals in the inductor current could be used as well," id. col.15 ll.1-4, including "generating a feedback signal indicative of current reversal in inductor current . . . (see, e.g., resistor R[SENSE] in Fig. 7)," id. col.15 ll.8-10 (emphases added). Generating a feedback signal based on resistor R[SENSE] measures the voltage across resistor R[SENSE], therefore indirectly "indicating[] . . . current reversal in inductor current" by measuring voltage. Thus, the '258 patent expressly contemplates indirectly monitoring current by using a voltage measurement as a proxy. Moreover, once voltage is known, one skilled in the art would recognize that Ohm's Law easily allows current to be calculated, therefore monitoring current indirectly by monitoring voltage. Without support for limiting this limitation as it did, we think the Commission interpreted this limitation incorrectly when it excluded the accused devices. See, e.g., Cohesive Techs., Inc. v. Waters Corp., 543 F.3d 1351, 1367-68 (Fed. Cir. 2008) ("[I]t is not appropriate for the court to construe a claim solely to exclude the accused device."). Thus, because there is no basis in the patent specification for adding the negative limitation—excluding monitoring voltage—we hold that the Commission erred in construing this limitation. See, e.g., Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003) ("Our independent review of the patent document reveals . . . there is no basis in the patent specification for adding the negative
limitation." (citations omitted)). In contrast to the Commission's ruling, this limitation can encompass monitoring voltage to indirectly monitor current.

9. "MONITORING THE RECEPTION OF THE PACKETS BY THE USERS AND ACCUMULATING RECORDS THAT INDICATE WHICH STREAMS WERE RECEIVED BY WHICH USERS"

   AOL: "Recording data about packets actually received by the users and collecting data regarding which streams of packets were actually received by which users, all independent of data about packets transmitted to users."

   TWM: No construction required.

   In the alternative, "Checking or observing whether the users are receiving the packets" "and gathering information that indicates which streams of packets were received by which users."

AOL focuses its entire argument on what TWM "told the PTO" during the patent prosecution. (D.E. 68, pg. 9). Again, the Court begins its analysis with the other aspects of intrinsic evidence. The preferred embodiment monitors a user's reception of a stream using a PING message. (D.E. 1, Exh. A, col. 14). The Media Server generates a PING message and sends it to the user's computer. Upon receipt, the user's computer sends a return message, indicating to the server that it is still receiving and processing the transmitted information. (Id. at col. 9). This description is stated in the preferred embodiment. AOL simply sidesteps the specification. Based on the specification, there is no justification for AOL's proposal. For example, the specification does not even intimate that the monitoring be "independent" of transmission, as AOL suggests. Indeed, TWM asserts the preferred embodiment states that the monitoring is not independent of transmission because the monitoring occurs on the transmission-side of the network. AOL does not support its contention with reference to the claims or specification. Because an ordinary skilled person would understand the monitoring process clearly based on TWM's specification, no construction is necessary.

   AOL: "Recording data about the streams of information actually received by the users and collecting data relating to the reception of the stream of information by the users, all independent of data about the stream of information transmitted to the user"

   TWM: No construction required.

   In the alternative, "Checking or observing whether the users are receiving the stream of information and gathering information relating to the reception of the stream of information by the users."

The parties agree that this term should be constructed in alignment with the previous term's construction. (D.E. 68, pg. 12). As such, no construction is necessary.

4. The term "MOTION" (claims 1 and 5) means movement of body tissue which causes erratic noise, that, in the absence of a filter, would cause the ratio of red to infrared signals to not accurately reflect the arterial oxygen saturation.
6. "motion control commands" (claims 9 and 23)

Omax proposes this construction: "Instructions to a machine tool that cause it to move." Flow argues for the following: "Time delay and incremental instruction consisting of a series of step and direction commands consisting of either a 1 or 0 with a sign of + or - that effect movement." Flow's proposed construction mirrors its proposed construction of the claim terms in claims 1 and 14, which refers to "a series of incremental motor commands for the motor, each increment for the motor being one of: zero, positive increment, or negative increment." The Court agrees with Omax's argument that this approach violates the principle of claim differentiation. Comark Commc'ns. Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims."). The patent consistently refers to the incremental motion control commands in claims 1 and 14, and consistently refers only to motion control commands in claims 9 and 23. Moreover, Flow's proposed construction contradicts the intrinsic evidence available in the prosecution history of the '596 patent: "Claim 12 [which later became claim 9] is similar to Claim 1, except that the limitation that the segments are incremental motor commands is eliminated." FLO 002008-13. Accordingly, the Court adopts Omax's proposed construction.

n2 The parties' slightly divergent constructions of this claim, addressed in the joint claim chart, are not addressed in their Markman briefs.

Motion detector camera

The Court construes "motion detector camera" to mean "a digital or mechanical film-based camera that takes pictures when it detects motion." Defendants' proposed construction limits a "motion detector camera" to a camera that records images on a film medium, expressly excluding a digital camera. Defendants argue that only a film-based camera is disclosed in the specification. Defendants also argue that during prosecution of the '868 Patent, the Examiner found that the '387 Patent did not disclose digital cameras. See '868 Patent, Office Action February 2, 2004 at 15, 16, 19, 22, and 23. Defendants contend that Plaintiffs admitted in their Initial Disclosures that the '868 Patent claims asserting "digital camera electronics" are not entitled to the '387 Patent priority date, which is further proof that digital cameras are not disclosed in the '387 Patent.

Defendants are correct that the '387 Patent does not specifically disclose digital cameras. While all of the preferred embodiments described in the '387 Patent are film-based cameras, no where in the '387 Patent or its claims does the inventor disavow coverage of digital cameras, which were known in the art when the application was filed. Additionally, the patentee clearly stated in the specification:

The above description is intended to be illustrative, and not restrictive. Many other embodiments will be apparent to those of skill in the art upon reviewing the above description. The scope of the invention should, therefore, be determined with reference to the appended claims, along with the full scope of equivalents to which such claims are entitled.

Col. 6:29-34. Thus, one skilled in the art would have understood that the patent was not limited to film-based cameras.

Defendants' prosecution history arguments are equally unavailing. While the examiner did find that certain '387 Patent claims did not disclose "digital camera electronics," the examiner did not find that digital cameras were not covered by the '387 Patent. Rather, the examiner rejected the proposed claims on double-patenting grounds. Finally, although Plaintiffs are not claiming the '387 Patent's priority date for certain claims in the '868 Patent, Plaintiffs did not admit that this is because the '868 Patent's digital camera claims are new matter and thus not entitled to the earlier date.

The Court rejects Defendants' limitation that would exclude digital cameras from the meaning of "motion detector cameras." Defendants are unable to point to any place in the specification or prosecution history where the patentee clearly disavowed such coverage. Accordingly, the Court will not import the limitations of the preferred embodiments into the claims.
Moveable

As with "terminal," the parties agree on the first portion of the construction, n4 but in this case, it is Defendants who advocate a second sentence containing a negative limitation. n5 Their limitation tracks several disclaimers Tessera made during patent prosecution and the TI and Samsung cases to distinguish its invention from prior art that relied on CTE matching or deformable solder balls. Although Tessera seems to acknowledge that its invention does not claim CTE matching or deformable solder balls, Defendants maintain that this limitation is necessary to prevent Tessera from disavowing its disclaimers at trial and contending that the movement covered by its patent is that addressed by CTE matching and deformable solder balls. For reasons similar to those described above, the Court is not convinced that a negative limitation has a place in a proper construction of "moveable."

--- Footnotes ---

n4 The first sentence reads, "In the operation of the assembly, the terminals are capable of being displaced relative to the chip by external loads applied to the terminals, to the extent that the displacement appreciably relieves mechanical stresses, such as those caused by differential thermal expansion which would be present in electrical connections absent such displacement."

n5 Defendants' second sentence reads, "The relief of mechanical stress due to CTE matching and/or deformable solder balls is not the claimed movement."

--- End Footnotes ---

The plain language of both the claims and specifications describe the type of movement encompassed by the term "moveable." For example, the 977 patent at claims 17-18 describe that, "said terminals . . . being movable with respect to the chip to compensate for differential thermal expansion of the chip and substrate," and the 627 patent at claim 1 describes, "said terminals being movable with respect to said central contacts so as to compensate for thermal expansion of said chip."

During prosecution of the 419 and 893 patents, Tessera assured the patent office that its technology solved the problem of strain due to thermal cycling in a different way than the Lin patent which relied upon CTE matching and deformable solder balls. CTE matching between the substrate and the circuit board aims to reduce the relative movement between the terminals and the contacts on the circuit board during thermal cycling by ensuring that the package substrate and the PCB expand to the same or similar degree when heated, thereby lessening the strain on the solder balls disposed between the two components. Deformable solder balls are designed to weather the remaining relative movement better than a more brittle component, and in that way, work in conjunction with the CTE matched PCB and package substrate to reduce wear due to thermal cycling. The key point being that the movement targeted by the Lin patent was between the terminals and the circuit board, but the movement described in Tessera's patents is the relative movement between the terminals and the chip contacts.

Defendants request the additional language to ensure that Tessera does not change its position at trial and disavow the disclaimers it made before the PTO in an attempt to muddle the distinction between the claimed movement in these patents and the claimed movement in the Lin patent. However, Defendants' limitation would inject unnecessary confusion into an otherwise helpful and legally appropriate construction. n6 First, the sentence is technically incorrect because it implies that "relief of mechanical stress due to CTE matching and/or deformable solder balls" is a type of movement, but a person skilled in the art would understand that relieving mechanical stress and movement are separate concepts. Second, the sentence aims to resolve an issue that came up in the Samsung and TI cases, but that may or may not arise at this trial. If the issue does not arise, the construction would create confusion by inviting the jury to divert its attention away from the claimed movement and toward a red herring. The Court is not inclined to risk that confusion especially where Defendants appear to be attempting to use claim construction as a plank in its trial strategy without any concomitant benefit to the jury. See Sulzer Textil A.G. v. Picanol N.V., 358 F.3d 1356, 1366 (Fed. Cir. 2004)(explaining that a clear claim construction is
necessary for a jury to "intelligently determine the questions presented"). Even assuming Defendants' construction was not confusing and offered for an improper purpose, the Court would likely adopt the agreed portion of the construction because it is amply supported by the intrinsic evidence.

n6 Both the ITC and TI Courts adopted constructions similar to Tessera's proposed construction, which lacks Defendants' proposed additional language.

Thus, the Court construes the term "movable" to mean "in the operation of the assembly, the terminals are capable of being displaced relative to the chip by external loads applied to the terminals, to the extent that the displacement appreciably relieves mechanical stresses, such as those caused by differential thermal expansion which would be present in electrical connections absent such displacement."

1. Moving said electronic record via EMF communications links from point to point

The first disputed term is found in Claim 2 of the '364 Patent, which discloses: "The process of claim 1, further comprising the process of: (f) moving said electronic record via EMF communications links from point to point along a route of passage to said destination for said selected products." '364 Patent, col. 16, ll. 3-7.

DE contends that this phrase should be construed as "transmitting the electronic record electronically where feasible between or among two or more points along a route of passage to said destination for said selected products." Dell proposes the construction, "transmitting the electronic record electronically to a each of a plurality of points."

The primary conflict between the parties' constructions concerns whether an electronic transmission is necessary. DE claims that there are certain instances, such as where a government system is incapable of using electronic records, when hard copies will have to be used and electronic transmission could not be required. See '364 Patent, col. 12, ll. 10-14; col. 14, ll. 7-9. Dell refers to the plain meaning of the term and the specification, arguing that "point to point" requires that transmission occur from at least one point to another point. As the specification describes the invention, it "provides a comprehensive point-to-point cost analysis for any international transaction." Id. at col. 14, ll. 55-56.

The court generally agrees with Dell that this term should be given its plain and ordinary meaning, and that "point to point" would require transmission from at least one point to another point. As DE has recognized, however, the specification refers to situations in which a particular destination could not accept the electronic record, and provides that "paper copies of the title or commercial invoice can also be generated from the electronic original for archival purposes or for presentation to entities requiring hard copies to further process the title or commercial invoice." Id. at col. 12, ll. 10-14.

Accordingly, the court finds that the phrase "moving said electronic record via EMF communications links from point to point" means "transmitting the electronic record electronically to at least one point and, where necessary and where feasible, between or among other points along the route of passage for the selected product."

The relevant limitation of claim 31 of the '204 patent is:

moving said visual identification in the first dimension and in the second dimension between first and second ones of said
irregular movement in the time dimension.

Thus, written description, the claim encompasses both regular and irregular movement in the time dimension of the television schedule. See, e.g., Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867 (Fed. Cir. 1986). The ITC's reliance on the description of the preferred embodiment in the written description to conclude that only regular movement by the "visual identification"--regular or irregular steps--in the time dimension.

Scientific-Atlanta states that the ITC's construction that the cursor must move relative to both dimensions of the television screen is not required by the claim language, and it was error for the ITC to import limitations from the written description and drawings. Scientific-Atlanta responds that since the "visual identification" is the innovative cursor, the "visual identification" must move like the innovative cursor in regular, half-hour increments. Scientific-Atlanta argues that because the written description disclaimed the irregular movement of the conventional cursor as an undesirable aspect of the prior art, the claim should not encompass such irregular movement. Further, Scientific-Atlanta states that the ITC's requirement that the "visual identification" must move in both dimensions on the grid and relative to the television screen is supported by the plain language of the claims, which requires the movement of the "visual identification," not the grid of cells.

a. Regular Movement

The parties dispute whether the claim requires that the "visual identification" must move in regular intervals of a fixed time duration (e.g., 30 minutes) in the time dimension, often within the same program cell in the grid guide; or whether the "visual identification" may move in irregular intervals of varying time durations (e.g., 30 minutes, 60 minutes, etc.) between adjoining program cells in the grid guide, depending on the length of the cells. The ITC required that the "visual identification" move in regular, half-hour increments, "which may result in cell to cell movement or movement within a cell." FID Opinion 2002 ITC LEXIS 812 at *195. The ITC found that irregular, cell-to-cell movement was disclaimed when the written description of the '204 patent disclaimed the regular movement of a conventional cursor. 2002 ITC LEXIS 812 at *193. In finding a disclaimer, the ITC placed special emphasis on the following passage from the '204 patent:

If this array is navigated by a cursor that goes from cell to cell, a single cursor command can produce violent screen changes. For example, a cursor right command may cause an abrupt jump to a cell situated several hours from the current page. Not only is this unsettling, but may take considerable effort to recover. Clearly, a gentler cursor motion is needed for the irregular cells found in a grid TV guide.

Id. (quoting '204 patent, col. 2, ll. 8-15 (emphasis added)).

The ITC erred in its construction of "moving . . . between . . . cells." The claim language only requires "moving said visual identification in the first dimension and in the second dimension between first and second ones of said irregular cells." 204 patent, col. 20, ll. 8-10. The ordinary meaning of "moving" is: "that is marked by or capable of movement: that is not fixed or stationary." Webster's Third New International Dictionary 1480 (1993). This claim language encompasses any type of movement by the "visual identification"--regular or irregular steps--in the time dimension.

The ITC's reliance on the description of the preferred embodiment in the written description to conclude that only regular movement in the time dimension was encompassed by the claims was error. See Liebel-Flarsheim, 358 F.3d at 906. Consistent with our earlier construction of "visual identification," the discussion of the preferred embodiment in the written description concerning the drawbacks of the irregular movement of the conventional cursor does not provide a basis for importing a limitation of regular movement into the claim. See, e.g., Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867 (Fed. Cir. 1985) ("Particular limitations or embodiments appearing in the specification will not be read into the claims."). Because there was no regular movement limitation in the claim language and no express disavowal of irregular movement in the written description, the claim encompasses both regular and irregular movement in the time dimension of the television schedule. Thus, it was error for the ITC to limit the broad "moving . . . between . . . cells" claim language to encompass only irregular movement in the time dimension.
b. Movement of the "Visual Identification" or Grid Guide

In construing the "moving . . . between . . . cells" limitation, the ITC further required that the "visual identification" move relative to the television screen along both dimensions of the grid guide. In other words, the ITC's construction precluded the grid guide from moving relative to the television screen while the "visual identification" remains stationary to reflect the relative movement of the "visual identification" through the cells of the grid guide. FID Opinion 2002 ITC LEXIS 812 at *192. In support of its construction, the ITC relied on statements in the abstract and written description that describe the "movement of the cursor." 2002 ITC LEXIS 812 at *194. The ITC further relied on Figures 1-3 of the '204 patent, which depict the cursor moving within the schedule grid and relative to the television screen, with the grid remaining static relative to the television screen. Id.

This construction was also incorrect. The claim language does not specify a frame of reference for moving the "visual identification" such as to require that the "visual identification" move or not move relative to the television screen. The claim language only requires that the "visual identification" move between the cells themselves. See '204 patent, col. 20, ll. 8-10 ("moving said visual identification in the first dimension and in the second dimension between first and second ones of said irregular cells" (emphasis added)). Thus, this limitation can be met either by the grid or the "visual identification" moving relative to the television screen, as long as the "visual identification" is capable of navigating along both dimensions of the schedule grid.

The ITC's reliance on isolated language in the written description that the cursor must "move . . . in the array" does not limit the claim. FID Opinion 2002 ITC LEXIS 812 at *194 (quoting '204 patent, col. 2, ll. 64-66). This language is consistent with our construction that the movement within a particular frame of reference is immaterial, so long as the "visual identification" is able to move in both dimensions of the grid guide array. There is no express requirement in the claim language that the "visual identification" must move both within the grid and further relative to the television screen. Moreover, the ITC's reliance on the depiction of the cursor in the preferred embodiment moving relative to the television screen in Figures 1-3 is misplaced. See Gart v. Logitech, Inc., 254 F.3d 1334, 1342 (Fed. Cir. 2001) (noting that "drawings [depicting the preferred embodiment] are not meant to represent 'the' invention or to limit the scope of coverage defined by the words used in the claims themselves").

In light of the foregoing, we conclude that the ITC erred in its construction of "moving . . . between . . . cells." "Moving said visual identification . . . between . . . cells" includes both regular and irregular movement of the "visual identification," and requires only that the visual identification be capable of moving relative to the cells in the grid guide in either dimension. There is no requirement that the "visual identification" must move relative to the television screen.

---

B. MPEG Decoder 5

5 MPEG is a set of audio and video data compression formats and ancillary standards. (MPEG is an acronym for the Moving Picture Experts Group', officially ISO/IEC JTC1/SC29 WG11.)

1. Proposed Constructions

Plaintiffs assert that "MPEG decoder" should be construed as "hardware and/or software that can decode compressed data in accordance with any of the standards established by the Moving Picture Experts Group." Plaintiffs' '736 Br. at 8. According to plaintiffs, an MPEG decoder can be used, if desired, to process audio or video data independently. Id. at 9. Plaintiffs contend that there is no reason to impose any additional limitations on their proposed construction of "MPEG decoder." Id. at 8.

Defendants, by contrast contend that an "MPEG decoder" must be capable of separating and decoding both audio and video
MPEG data according to MPEG standards. Defendants' '736 Br. at 6. 6 Defendants assert that the MPEG decoder has three primary functional blocks: a demultiplexer, a MPEG audio decoder, and a MPEG video decoder. Id. Defendants propose that "MPEG decoder" should be construed as "an integrated circuit that decompresses, separates, and further processes the corrected audio and video data that is received from an external controller according to the MPEG specifications." Id. Defendants contend this is how "MPEG decoder" would have been understood by a person skilled in the art at the time of the '736 patent application. Id.

6 Defendants assert their proposed construction of "MPEG decoder" with the following background interpretation: 1) claims 1 and 7 claim a controller with discrete subsystems that perform front-end operations on MPEG-encoded data of two formats, and 2) the controller transfers that data to a separate MPEG decoder.

The parties additionally dispute whether the MPEG decoder must be separate from and external to the controller. Defendants argue that the plain language of the claims requires the controller to be separate and distinct from the MPEG decoder. In support of this argument, defendants note that the "controller [is] coupled with a MPEG decoder" (emphasis added) and that the parallel interface, which is part of the controller, transfers data to the MPEG decoder. Id.; see '736 patent at Claims 1, 7. Defendants reason that the terms "coupled with" and "transfers data to" are used only between subsystems -- in this case, the controller and MPEG decoder -- that are separate and distinct. Defendants' '736 Br. at 7. Plaintiffs object to defendants' interpretation of the claim language, contending that there is no textual hook in the claims, as required by plaintiffs' reading of NTP, Inc. v. Research in Motion, Ltd., 418 F.3d 1282, 2005 WL 180612 (Fed. Cir. 2005), that would justify construing the MPEG decoder to be separate and distinct from the controller. Reply at 2-3.

2. Claim Language

"MPEG decoder" appears in claims 1 and 7 in two contexts: 1) "a controller coupled with a MPEG decoder" in the preamble and 2) "the parallel interface configured to transfer the corrected data to the MPEG decoder." '527 patent at 10:42-43, 11:12-14; see also id. at 13:3-4, 13:24-26 ("a parallel interface coupled to the MPEG FIFO interface compromising a plurality of parallel data lines for transferring the corrected data to the MPEG decoder").

Plaintiffs assert that the claim language requires only that the MPEG decoder and the controller be coupled and that they be connected through a "parallel interface . . . [that] comprises a plurality of parallel data lines. . . " Plaintiffs' '736 Br. at 9-10. Consequently, plaintiffs conclude that even if the blocks for the controller functions are connected within either a single system or a circuit integrated to the blocks performing the MPEG decoding, those blocks are still "coupled." Id. at 10. Plaintiffs argue that defendants' construction requiring that the MPEG decoder be external to the controller and that the MPEG decoder be separate is not found in the claims. Plaintiffs also contend that the defendants' requirement that the MPEG decoder process both audio and video information is likewise not found in the claims. Id. at 9.

3. Specification

In support of their proposed construction that the controller is separate and distinct from the MPEG decoder, defendants contend that the specification identifies the MPEG decoder as an "external subsystem" from the controller. Defendants' '736 Br. at 7; see '736 patent at 3:24-35. Defendants assert that the '736 patent shows that the controller is separate and distinct from the MPEG decoder. Defendants' '736 Br. at 7; see '736 patent at Figs. 1, 2, 4-6. According to defendants, the specification repeatedly refers to a transfer of data from the controller to the MPEG decoder. Defendants' '736 Br. at 7; see '736 patent at 4:2-6, 5:1-4, & Fig. 6. Lastly, defendants argue that the '736 patent specification does not enable a MPEG decoder that is integrated into a controller in part because the specification contains no disclosure as to how to integrate the controller and a MPEG decoder. Defendants' '736 Br. at 8.

Plaintiffs, on the other hand, argue that defendants' construction directly contradicts the teaching of the patent specification that the invention permits the MPEG decoder and the controller to be integrated and combined. Plaintiffs argue that the specification supports their construction that the MPEG decoder need not necessarily be external to the controller. Plaintiffs point out that the specification repeatedly sets forth that "[d]ue to the simplified MPEG interface, DVD/CD controller 62
may also be easily integrated into MPEG decoder 40." Plaintiffs' '736 Br. at 9; Reply at 2; see also '736 patent at 4:21-23, 5:58-60, 9:7-9.

Defendants, like plaintiffs, point to the specification to support their construction of "MPEG decoder." Defendants essentially argue that, in conformance with the understanding of one of skill in the art when the patent application was filed, the MPEG decoder must be capable of decoding both audio and video data and thus that the specification supports the construction that the MPEG decoder be implemented in the three functional blocks set forth above: a demultiplexing function, audio decompression function, and video decompression function. In the Background of the Invention, the '736 patent specification states that the MPEG decoder decompresses and separates compressed audio and video data. '736 patent at 2:44-51; see also id. at 3:25-35. Defendants contend that this statement, combined with the MPEG specification available at the time the patent was filed, discussed below, confirms their proposed construction. Plaintiffs, however, assert that those passages of the patent description refer to a particular MPEG decoder in the preferred embodiment and do not expressly or implicitly identify its configuration as a limitation of the claims. Reply at 1.

4. Extrinsic Evidence: MPEG Industry Specifications

Defendants' contention that the MPEG decoder must be implemented in three functional blocks relies upon consideration of two industry specifications: one for MPEG-1, International Standard, ISO/IEC 11172-1, MTK-ITC 396579-638, dated August 1, 1993; and another for MPEG-2, International Standard, ISO/IEC 13818-1, MTK-ITC-396244-377, dated April 15, 1996. Those industry specifications describe a prototypical MPEG decoder design. That prototypical decoder design includes functional blocks for demultiplexing a bitstream containing both audio and video information and functional blocks for decompressing both audio and video information. However, both specifications make it clear that "[t]he prototypical decoder design does not imply any normative requirement for the design of an [MPEG-1 or MPEG-2] decoder."

An MPEG decoder in the abstract, in light of the MPEG specifications, does not require support for a specific encoding nor specify the type of data represented by the encoded bitstream. Defendants' argument that the construction of MPEG decoder must imply a particular construction in three distinct modules is unpersuasive, as the claims do not require a specific MPEG decoder implementation and the MPEG industry specifications do not mandate the construction advanced by the defendants. The presence in the specification of a reference to a preferred embodiment of an MPEG decoder that decodes both audio and video data does not itself limit the construction of an MPEG decoder to require both data types. However, when viewed in light of the purpose of the invention, the court concludes that the MPEG decoder must at least decode both compressed audio and video data. The Federal Circuit has held that the purpose of the invention may guide claim construction since "the problem the inventor was attempting to solve, as discerned from the specification and prosecution history, is a relevant consideration" in construing claims. CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1160 (Fed. Cir. 1997). The specification states that "[a]ccording to one aspect of the present invention, the DVD/CD controller includes a unique MPEG interface which facilitates transfer of CD data and DVD data from the DVD/CD controller to a MPEG decoder. . . ." '736 patent at 4:2-5. The undisputed purpose of the invention is to provide streamlined processing of both CD and DVD data. Thus, the court construes MPEG decoder to mean "hardware and/or software that can decode compressed audio and video data in accordance with any of the standards established by the Moving Picture Experts Group." The court also concludes that the MPEG decoder need not necessarily be external to the controller.

7 There are presently multiple MPEG encoding formats: MPEG-1, MPEG-2, MPEG-4, MPEG-7, MPEG-21, etc.

2778

1. "a transmission system using multicarrier modulation"

The first issue presented with respect to the '322 Patent is whether the term "a transmission system using multicarrier modulation," which appears in the preamble of Claim 1, is a claim limitation. Claim 1 reads as follows:
1. A method of changing a parameter of a transmission system using multicarrier modulation, comprising the steps of:

identifying symbols transmitted by the system by a symbol count;

communicating between a transmitter and a receiver of the system information identifying a change in said parameter and a symbol count value for implementing said change;

implementing said change at the transmitter in response to a transmitted symbol having a symbol count matching said value; and

implementing said change at the receiver in response to a received symbol having a symbol count matching said value.

'322 Patent, col 11, 1. 64 -- col. 12, 1. 11 (emphases added).

Plaintiff argues that the phrase "using multicarrier modulation" merely states one intended use, and therefore is not meant to limit the claim's scope. (Pl.'s Opening Br. at 25-27). Plaintiff further asserts that the body of Claim 1 does not make any reference to multicarrier modulation, which indicates that the four steps of Claim 1 may be applied to a single-carrier system. Lastly, Plaintiff directed the Court's attention to Claim 20, where the patentees made a specific reference to "multicarrier modulation." Plaintiff asserts that if the patentees meant to limit the reference to "multicarrier modulation" in Claim 1, they would have specifically referred to "multicarrier modulation" as they did in Claim 20. (Tr. at 76:4-9 ("If there's a specific reference to multi-carrier modulation in Claim 20, the patentees knew how to say it when they meant it, and they do not make such a statement in Claim 1.").)

Defendants argue that the term must be read as a claim limitation. Citing Storage Technology Corp. v. Cisco Systems, Inc., 329 F.3d 823 (Fed. Cir. 2002), Defendants assert that a term is "unquestionably" a limitation "when the body of a claim refers back to a portion of the preamble." (Defs.' Reply at 19). Defendants note that the terms "the system" and "said parameter," which appear in the body of the claim, refer to both the "system" and the "parameter" in the preamble, providing an antecedent basis for those terms. Id. Defendants also refer to Claim 7, a dependent claim of Claim 1, which refers to at least "one subchannel of the system." Id. Such reference to "one subchannel," Defendants contend, implicitly requires a multicarrier system.

The Court concludes that the term "a transmission system using multicarrier modulation" is a claim limitation. Terms appearing in the body of claim 1 and in subsequent dependent claims, such as Claim 7, depend on this disputed phrase for antecedent basis. Such dependence on a preamble phrase, as the Federal Circuit articulated, "indicates a reliance on both the preamble and claim body to define the claimed invention" and therefore may limit the claim's scope. Catalina Mkts. Int'l v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002). Moreover, the Federal Circuit stated that the preamble may operate as a limitation of the claim when additional structure or steps are recited in the preamble and are underscored as important in the specification. Id. In the present case, the written description clearly supports the conclusion that the use of "multicarrier modulation" is a key aspect of the invention, and necessary to perform the claimed method.

Having concluded that the term is a claim limitation, the Court must now construe it. Because Plaintiff has not proffered a claim construction that treats this term as a claim limitation, and Defendants' proposed construction is persuasive, the Court will adopt Defendants' construction. Accordingly, the Court concludes that disputed term [13] "a transmission system using multicarrier modulation" serves as a claim limitation and means a "transmission system using modulation of more than one carrier."

G. "Component Tasks"/"Multi-Component Tasks" ('451 Patent)

The '451 patent describes a system and method that allows for multiple tasks to be performed upon one command from the client, such as a broad user command to "plan a trip" which causes the system to make airline, hotel, and car reservations on its own and return the results of these completed tasks to the user.
The patent uses the term "component tasks" in both its independent claims (claims 1 and 8). Yodlee construes "component tasks" to mean "individual tasks that make up a multi-component task," while CashEdge construes it to mean "the distinct sub-tasks of the multi-component task." The dispute thus centers around the word "distinct." It is not clear to the Court how the addition of the word "distinct" clarifies the meaning of the term "component tasks." The prosecution history cited by CashEdge does not support the addition of the word "distinct." Accordingly, the Court adopts Yodlee's definition.

"Multi-component task" also appears in both independent claims of the '451 patent. Yodlee defines "multi-component task" as "an overall task that is made up multiple individual tasks." CashEdge defines it as meaning "a task that is accomplished by performing two or more distinct sub-tasks in unrelated areas that is more than simply gathering information and presenting the information to the end user." Again, CashEdge cites to prosecution history that does not support its addition of the words "unrelated areas that is more than simply gathering information and presenting the information the end user." There is nothing in the intrinsic evidence to support the limiting language proposed by CashEdge. The Court adopts Yodlee's definition.

6. "a unique predetermined multi-digit jump code" is construed to mean "a unique predetermined code consisting of more than one number." There is nothing in the specification, however, to warrant the defendants' proposed narrower construction, limiting the code to just numbers, so long as the code has more than one number.

Claim 18(a), with the disputed term in bold, and agreed terms in italics, states:

a multi-function image sensor appliance adapted for generating an image signal representing the visual condition of a monitored zone of operation, the image signal comprising both still frame image data and motion video image data. . . .

The court has previously defined the term "sensor appliance." The claim language simply provides a further limitation that the appliance must be able to generate more than one kind of image. n6 Accordingly, the court provided the following construction of the language in question, to which the parties agreed. See Tr. p. 70, ll. 23-25, p. 71, ll. 1-14.

"Multi-function image sensor appliance" means "a sensor appliance, as defined above, that can generate more than one type of image signal."

n6 Other language at the end of the claim specifies both static frame image data and motion video image data, which the parties agree are produced by different algorithms. Tr. p. 68, 11. 11-19.
The parties disagree on the meaning of "multi-level information."

Dell argued that the ordinary meaning should suffice. Lucent proposed: "the information inputted to the web site from the first user intranet point (i.e., any terminal on a private network used by a site provider), which is organized or grouped by the first user intranet point into more than one level of user access."

The court construes "multi-level information" as follows:

"the information inputted to the web site from the first user intranet point which is organized or grouped into more than one level of user access."

Claim Element 1d

multi-level managed information

The parties disagree on the meaning of "multi-level managed information."

Dell argued that the ordinary meaning should suffice. Lucent proposed: "the information inputted to the web site from the first user intranet point (i.e., any terminal on a private network used by a site provider), which is organized or grouped by the first user intranet point into more than one level of user access."

The court construes "multi-level managed information" as follows:

"the information inputted to the web site from the first user intranet point which is organized or grouped into more than one level of user access."

Claim Element 1f

multi-level user access

Initially, the parties disagreed on the meaning of "multi-level user access." Dell argued that the ordinary meaning should suffice. Lucent proposed: "the multiple levels of user access correlate to the multiple levels of the multi-level managed information." The parties subsequently agreed, and the court concurs, that no construction of this claim term is required.

Claim 3

3. Multi mega bit per second

The term "multi mega bit per second" appears in claims 11, 24 (by its dependence from claim 20), 35, and 36 of the '774 patent. The parties dispute whether the term refers to the data rate addressed to a specific RLA, e.g. the transfer rate (the defendants' position), or the aggregate data rate for the entire downstream channel. In dispositive form, the specification of the '774 patent states that high speed digital signals (containing information) can be broadcast from Data Communications Equipment ("DCE") to a Hybrid Transmission Facility ("HTF"), such as through a piece of coaxial cable. The HTF can thereafter combine multiple incoming high speed digital signals (from various DCEs) and broadcast that information through a downstream channel, such as a cable channel. An RLA at a user location will monitor (receive) the high speed signal and forward the appropriate information contained in that signal to the DTE. See '774 patent at 2:59-17; 4:57-50 (stating "the RLA modem automatically synchronizes to the incoming high-speed data being broadcast and starts
monitoring (receiving) the incoming signal"). These passages indicate that the high speed rate is associated with the aggregate transmission rate.

Because the '774 patent specification fails to support the defendants' restrictive construction, the court adopts the plaintiff's proposed construction of the term "multi mega bit per second" as "an aggregate data transmission rate of 10 or more megabits per second."

A. '288 Claim 1 & '288 Claim 10: "single or multi-mode operation"

Claim 1 of the '288 patent refers to an implantable heart stimulator "capable of being programmed to undergo a single or multi-mode operation to treat a detected arrhythmia." CPI proposes that the term "multi-mode operation to treat a detected arrhythmia" be construed to mean: "two or more different modes of therapy (e.g., antitachy pacing and cardioversion) capable of being used in sequence to treat a single arrhythmia (e.g., tachycardia)." Pl. Amd. Prop. Conc. of Law at 1. St. Jude objects to CPI's definition because it includes unnecessary examples and because the phrase "capable of being used in sequence" is claimed to be inaccurate, or at least imprecise. St. Jude offers the following as the proper construction:

The phrase "multi-mode operation to treat a detected arrhythmia" as used in claims 1 and 10 of the '288 patent means two or more different modes of therapy capable of being used individually to treat a single arrhythmia.

Def. Prop. Conc. of Law at 8.

To begin by defining the term "mode" as used in Claim 1, the patent specification reveals that the operating modes of the device include various treatment modes, or therapies, that can be applied to the heart in the event of an arrhythmia. Each type of therapy, or mode, involves some form of electrical stimulation of the heart. The specification identifies the following treatment modes: ventricular fixed-rate pacing, atrial fixed-rate pacing, ventricular demand pacing, atrial demand pacing, automatic defibrillation, cardioversion, and various automatic ventricular tachycardia control operations. '288 Patent, col. 4, ll. 21-27; col. 4, l. 65 to col. 5, l. 3.

--- Footnotes ---

12 Besides the various treatment modes, other operating modes include the "automatic patient warning" feature and the "direct memory access" mode. '288 Patent, col. 4, ll. 67-68; col. 5, ll. 5-8.

--- End Footnotes ---

Referring again to the claim language itself, the device is said to be "capable of being programmed to undergo a single or multi-mode operation to treat a detected arrhythmia." The plain meaning of this language is that the device can be programmed to treat any particular arrhythmia using either one mode of operation, or more than one mode of operation. If the device is programmed to treat an arrhythmia using one mode of operation, it will "undergo a single . . . mode operation." If the device is programmed to treat an arrhythmia using more than one mode of operation, it will "undergo a . . . multi-mode operation."

The specification provides a clear example of "multi-mode operation" in explaining the automatic ventricular tachycardia control operations:

In this mode, any combination and/or sequence of the following sub-modes can non-invasively be selected (programmed) by the attending physician: ventricular overdrive pacing, ventricular coupled pacing, automatic cardioversion, and rapid atrial pacing. Any or all of these can be selected, so that, if the first response is not effective in controlling ventricular tachycardia, the next response is activated. That is, initially, a list associated with the various modes can be developed; then, the doctor can revise the list depending on the patient's reaction to treatment.

'288 Patent, col. 5, ll. 33-43. 13 The specification further explains that in executing such automatic ventricular tachycardia
control operations, the device automatically proceeds from one response mode to the next. '288 Patent, col. 5, ll. 50-52. This specific example is consistent with the more general description of the invention that appears in the patent document. See '288 Patent, col. 7, ll. 7-12 ("The implantable heart stimulator and method involve . . . the choosing of at least one mode of treatment for treating the condition.") (emphasis added). Together, the claim language and the specification provide strong support for CPI's proposed construction of "multi-mode operation to treat a detected arrhythmia."

--- Footnotes ---

13 Another example of "multi-mode operation," closely associated with dependent Claim 8, involves a method for treating the heart when the device detects the absence of a natural R-wave. '288 Patent, col. 21, l. 55 to col. 22, l. 6. The absence of an R-wave could indicate either an asystole (treatable by pacing), or life-threatening ventricular fibrillation. Under such conditions, the device first executes a pacing treatment. If the pacing therapy does not restore a forced R-wave, the device then attempts defibrillation. '288 Patent, col. 2, l. 66 to col. 3, l. 5.

--- End Footnotes ---

St. Jude's characterization of CPI's proposed construction as an improper "limitation" on the claim has no merit. According to St. Jude, the specification and the prosecution history provide no support for claiming that "multiple modes" could be used only in sequence. Def. Br. at 44. Under this view, which is reflected in St. Jude's preferred construction, the device has more than one treatment mode that could be used to treat each specific heart condition (thus, multiple modes), but a single mode is selected from among the multiple possibilities and programmed as the individual mode that will treat a given arrhythmia. Such individually selected modes, defendants argue, would not be executed in sequence and, thus, an "in sequence" limitation would be improper. Id. at 44-45 & n.22.

St. Jude may well be correct that a single mode of treatment can be programmed to treat a given arrhythmia even though the device is capable of executing different modes to treat that same arrhythmia. However, this possibility is already accounted for in the claim language that refers to programming a device to undergo a "single" mode operation. Multi-mode operation, as taught by both the claim language and the specification, is different. It involves programming the device to undertake more than one treatment mode to treat a single arrhythmia, especially if the first mode is not successful. St. Jude's preferred construction would effectively re-write the language of the claim to read "a heart stimulator providing at least one treatment mode for each specific heart condition and capable of being programmed to undergo the single available mode, or, if applicable, one of the multiple available modes to treat the detected arrhythmia." That interpretation is contrary to the claim language and the written description.

St. Jude offers a proposed alternate construction in an attempt to save at least part of its preferred construction:

   The phrase "multi-mode operation to treat a detected arrhythmia" as used in claim 1 of the '288 patent means two or more different modes of therapy capable of being used individually or together in sequence to treat a single arrhythmia.

Def. Br. at 41. The court rejects this construction because it is unnecessarily complex and confusing. The possibility that a device may offer more than one treatment mode for a single arrhythmia but may be programmed to undertake only one of those modes is accounted for by the fact that the claim language already allows a device to be programmed for single mode operation. Thus, St. Jude's construction of "multi-mode operation" to encompass two or more modes "capable of being used individually" repeats what is already stated in the claim.

St. Jude's final argument on this language is that it would be improper for the court to include the examples of treatment modes and heart conditions that plaintiffs have selected and included in their claim construction. The court agrees that using examples is unlikely to be necessary. By the end of the trial, the jurors should be able to identify for themselves (at least with the help of counsel) appropriate examples of treatment modes and different types of arrhythmia. The court, therefore, intends to adopt plaintiffs' proposed construction of "multi-mode operation" with the exception of the parenthetical examples. This interpretation of the language in the preamble of Claim 1 of the '288 patent will also apply to the disputed parallel language in the preamble of Claim 10 of the '288 patent.

GO BACK
11. Multi-precision arithmetic unit

The parties largely agree on the construction of "multi-precision arithmetic unit" with one exception. The plaintiffs contend that the "multi-precision arithmetic unit" is "a unit that can perform addition, subtraction, multiplication, division, and other integer and floating point arithmetic operations on data streams of varying sizes." The defendants object to the plaintiff's proposed construction on two grounds. First, the defendants contend that the term "unit" refers to a defined circuit block, and not circuitry distributed across the media processor, as the plaintiff argues. Second, the defendants further contend that the language "other integer and floating point arithmetic operations" should not be included in the construction. Thus, the defendants propose the following construction of "multi-precision arithmetic unit" -- "a unit that can perform addition, subtraction, multiplication, division, and other arithmetic operations on data streams of varying sizes." The 840 patent provides as follows:

Many of the logic blocks themselves can also replaced [sic] with a single multi-precision arithmetic unit, which can be internally partitioned under software control to perform addition, multiplication, division, and other integer and floating point arithmetic operations on symbol streams of varying widths while sustaining the full data throughput of the memory hierarchy.

'840 patent, col. 2, 11. 58-65. Based on the cited portion of the specification, the court is persuaded that the plaintiff's construction is correct and adopts it. The court declines to further define "unit" to require a single circuit block.

12. Multi-precision execution unit

The court construes "multi-precision execution unit" to mean "a unit that receives instructions and executes the instructions to perform simultaneous parallel operations on the plurality of media data streams, each of a width up to the width of the data path."

2. A multi-pulse portion (claim 1)

Plaintiff's construction: "a portion of the waveform with multiple pulses"

Defendants' construction: "the entire region between the front-end portion and the tail-end portion"

The dispute is whether the "multi-pulse" portion of the waveform includes everything between the front-end portion and tail-end portion or whether there may be other (unidentified) portions in the wave. The relevant portion of the claim provides: "a multi-pulse waveform of each mark portion of the driving power that includes a front-end portion, a multi-pulse portion and a tail-end portion." According to defendants, the multi-pulse waveform has three parts and only three parts: front-end portion, a multi-pulse portion and a tail-end portion. Thus, the multi-pulse portion must encompass everything between the front and tail-end portions.

According to plaintiff, the multi-pulse waveform is not limited to the three portions named in the claim. Plaintiff points out that, under the claim language, a multi-pulse waveform "includes" those three portions. In the context of patent claims (and in ordinary English), use of the word "includes" does not restrict the claim to the named elements. Rather, it means that "the named elements are essential, but other elements may be added and still form a construct within the scope of the claim." Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1345 (Fed. Cir. 2003)(quoting Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997)).
Defendants have not explained why this general rule would not apply in this case. They say that in all the embodiments discussed in the patent, there are no portions mentioned other than the front-end portion, the tail-end portion and the multi-pulse portion, but they point to no language suggesting that those embodiments limit the claim. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004)(rejecting argument that claim is limited to embodiments, even when all described embodiments include same limitation); Home Diagnostics, Inc. v. LifeScan, Inc., 381 F.3d 1352, 1357 (Fed. Cir. 2004)(even patent that describes single embodiment is not necessarily limited by that embodiment). They say also that because the patent does not discuss other portions, the invention must be limited to those or the public is left without sufficient notice regarding what infringes and what does not. The answer to this is that anything that includes those three portions (and the other elements of the claim) infringes, regardless what else is included. Accordingly, I reject defendants' argument that the multi-pulse portion must encompass everything between the front-end portion and the tail-end portion.

In looking at plaintiff's proposed construction, it is clear that it is just another restatement of the term that adds no additional insight into the meaning. Accordingly, I conclude that this term requires no additional construction.

**Court's construction: No construction needed**

---

**2790**

E. "multi-purpose interface"

The Camera Manufacturers propose that "multi-purpose interface" be construed to mean "a communication interface designed for use with multiple devices having different functions from each other." CMs' Slides at 62. Papst proposes that it means "a computer interface which supports more than one type of device." Papst's App. at 2. Papst conceded at the Markman hearing that the definition proposed by the Camera Manufacturers is satisfactory, as long as it provides that multiple devices are connected one at a time. Tr. 1:156-57 (Papst) ("COURT: Your problem is temporal, not otherwise. You don't have any problem with multiple devices having different functions from each other as long as they're plugged in one at a time? PAPST: Right, Your Honor."). The Patents do not answer this point, 13 and the Court declines to add an unspoken limitation. With the parties' essential agreement, the Court thus construes "multi-purpose interface" to mean "a communication interface designed for use with multiple devices that can have different functions from each other."

---

13 See '399 Patent, col. 4:48 (ambiguously stating, "[c]ommunication between the host device and the devices attached to the multi-purpose interface then essentially takes place by means of the specific driver software for the multi-purpose interface . . . " without indicating whether such devices are connected to the multi-purpose interface one at a time).

---

**2791**

2. "in a multi-tasking environment" n4

---

n4 According to Smart, PolyVision belatedly identified this and several other claim terms as requiring construction and, therefore, Smart did not have an opportunity to address these terms in its brief on claim construction. Smart asserts that these terms do not require construction but that if the Court concludes otherwise, they should be given their plain and ordinary meanings, which Smart has identified for the Court.

---
PolyVision's proposed definition
Computer is capable of performing more than one task at the same time.

Smart's proposed definition
A computer performs or appears to perform more than one task at a time.

This term is part of the phrase "a computer for executing one or more applications program in a multi-tasking environment." (Col. 15, ll. 32-33.) The Court concludes that the term requires no construction because, as Polyvision concedes, the term would be clear to a person of ordinary skill in the art. If construction were required, however, the Court would adopt Smart's construction using "performs or appears to perform more than one task at a time," because Smart has demonstrated that in the context of computers, "multitasking" includes the "appearance" of performing several tasks at once, even though only one program is being executed. For example, Smart notes that Windows does not perform more than one task at a time but operates at such a speed that it appears to perform more than one task at a time. It also cites the definition of multitasking from http://www.webopedia.com/TERM/m/multitasking.html, which states that "[i]n multitasking, only one CPU is involved, but it switches from one program to another so quickly that it gives the appearance of executing all of the programs at the same time."

2792

5. "multi-tasking interface function"/"multi-tasking interface"/"multi-tasking interface sub-component"

The related terms "multi-tasking interface," "multi-tasking interface function," and "multi-tasking interface subcomponent" appear in independent claims 1, 7, and 11 of the 037 Patent, respectively. Claim 1 recites a "multi-tasking interface function" implemented by one of the peer-level facilities and

responsive to control messages for selecting for execution [the] peer-level facility related functions of [] one of said predetermined operating system peer-level facilities and responsive to said one of said predetermined peer-level facilities for providing control messages to request or in response to the performance of said predetermined peer-level facility related functions of another operating system peer-level facility. . . ."

037 Patent, 55:41-58. Claim 7 recites a "multi-tasking interface," also implemented by one of the peer-level facilities, and "coupleable between said communications bus and a respective and unique peer-level control function set to permit message transfer between each of said plurality of facilities." Id. at 56:42-47. Similarly, claim 11 recites a "facility sub-component" of a component facility "coupled to a multi-tasking interface sub-component." Id. at 57:13-15. Consistent with parties treatment of these terms, the court construes "multi-tasking interface function" and "multi-tasking interface sub-component" as synonyms with "multi-tasking interface."

The parties broadly agree that the multi-tasking interface performs the function of facilitating communication between the various operating system peer-level facilities of the claimed invention. That is the extent of their agreement, however. While plaintiff argues that "multi-tasking interface function" need not be construed, defendant proposes the following definition: "in each peer-level facility, software tailored to that peer-level facility for managing multiple concurrent processes and supporting direct communication with other peer-level facilities so as to allow multiple, independent instances of the peer-level facilities."

In support of its "ordinary meaning" construction of the multi-tasking interface term, plaintiff contends that the claim language itself provides sufficient context to define multi-tasking interface, and that therefore no further elaboration by the court is required. Specifically, plaintiff argues that the language of claims 1 and 7 defines the disputed term. However, while the language of the claims is sufficient to describe what the multi-tasking interface does in the context of a particular claim -- for example, providing control messages -- the claim language standing alone is insufficient to define what a multi-tasking interface is. Recognizing that multi-tasking interface is a noun, the court must attempt to define it as such. Moreover, the claimed function of the multi-tasking interface differs among the various claims in which the term appears. Consequently, even assuming that court could replace the noun "multi-tasking interface" with a verb, plaintiff's argument would imply that the term should be defined differently in each claim. To do so would violate the canon of construction stating that a claim term should be construed consistently throughout a patent. See, e.g., Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001). The court therefore rejects plaintiff's argument that the claim language alone is
sufficient to define the term "multi-tasking interface."

Arguing in the alternative, plaintiff also relies on dictionary definitions, citing definitions of "multi-tasking" and "interface" from both technical and general-purpose dictionaries. See IEEE Dictionary at 574, 718; Webster's Collegiate Dictionary at 610, 765. The court focuses on the definitions in the IEEE Dictionary. Accord Transclean Corp. v. Bridgewood Servs., Inc., 290 F.3d 1364, 1375 (Fed. Cir. 2002) (observing that when comparing technical and non-technical dictionary definitions of a claim term used in a technical context, a technical dictionary is "a better source to inform the meaning of the term to a skilled artisan"). In the IEEE Dictionary, "multitasking" is defined as "[a] mode of operation in which two or more tasks are executed in an interleaved [i.e., alternating] manner . . . [or] that provides for concurrent performance or interleaved execution of two or more tasks." Id. at 718. The IEEE Dictionary also recites four definitions of interface apposite to the art of computer software. Id. at 574-75. Like the multi-tasking interface claimed in the 037 Patent, several of these definitions refer to facilities that allow for communication between different components of a computer system. See, e.g., id. at 574 (Definition 9(B)). However, these definitions also suggest that the term "interface" may be used to describe either hardware, software, or a conceptual relationship among hardware or software components that is neither hardware nor software.

Compare id. at 574 (defining "interface" as "[a] hardware or software component that connects two or more components for the purpose of passing information from one to the other") with id. at 575 (defining "interface: in the field of "software development" as a relationship between two or more entities [e.g., hardware and/or software components] . . . in which the entities share, provide, or exchange data"). Thus, because the ordinary meaning of the term "interface" includes hardware, software, and conceptual interfaces, the court must look to the intrinsic record to determine which of these possible meanings was intended by the inventor. Texas Digital, 308 F.3d at 1203.

The court begins with the language of the claims. At a minimum, the plain meaning of the claims is sufficient to support defendant's view that the multi-tasking interface must refer to a software interface. Taking claim 1 as an example, the multi-tasking interface function recited in claim 1 "executes . . . peer-level facility related functions" and "provide[s] control messages" for the purpose of communicating with other peer-level facilities. 037 Patent, 55:44-52. Consistent with defendant's proposed construction, these are tasks that one would expect software to perform. Defendant also relies on the specification's description of the preferred embodiment of the invention, which discloses, as a component of each peer-level facility, "an interface that supports direct communication with [the other peer-level facilities]." Id. at 8:24-26. This interface is further defined as "a messaging kernel layer" that "includes a message passing multi-tasking kernel . . . tailored to each type of peer-level facility in order to support the specific facility's function." Id. at 8:28-30. Defendant argues that this definition of "interface" should limit the "multi-tasking interface" term at issue here.

Ordinarily, it is improper to read limitations from the preferred embodiment into the scope of the claims. See, e.g., Liebel-Flarsheim, 358 F.3d at 906. However, in the instant case, the prosecution history of the 885 Application lends additional support to the view that the claimed multi-tasking interface must include the aforementioned limitations. As noted above, the examiner initially rejected claim 1 of the 885 Application for indefiniteness, observing that "[s]tripped of the characterization of the stored instruction as a predetermined peer-level facility and a multi-tasking interface function,' the claim is seen simply to recite a multiprocessor system." Grewal Decl., Exh. K at 422. Auspex responded to this rejection by expressly defining these terms. Specifically, it defined the multi-tasking interface function as "a messaging kernel layer tailored to each type of peer-level facility as appropriate for the specific facility function provided." Id. at 439.

"It is well established that the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Springs Window Fashions LP v. Novo Indus., L.P., 323 F.3d 989, 994 (Fed. Cir. 2003) (internal quotation marks omitted) (collecting cases). In this case, the Auspex expressly defined "multi-tasking interface function" to overcome the examiner's objections to the patentability of the invention claimed in claim 1 of the 885 Application. Thus, at a minimum, the court must construe the term "multi-tasking interface" to include the limitations that Auspex expressly included in its response to the examiner's rejection.

Although the 885 Application describes the multi-tasking interface as a "messaging kernel layer," it does not define the messaging kernel layer term itself. However, "messaging kernel" is defined in the specification of the 037 Patent as "an interface that supports direct communication between one [operating system peer-level facility and] another." 037 Patent, 8:24-8:27. 7 The court adopts this definition. Accord Vitronics, 90 F.3d at 1582 ("The specification acts as a dictionary when it expressly defines terms used in the claims or defines terms by implication."). Accordingly, the court agrees with defendant that the term "multi-tasking interface" should include the limitations "software tailored to each operating system peer-level facility that supports direct communication with other peer-level facilities."
In addition, defendant contends that the specification gives rise to two other claim limitations. First, defendant argues that the court should restrict the meaning of multi-tasking interface to an interface that "manage[s] multiples concurrent processes." In essence, this argument urges the court to limit the definition of "multitasking" to "managing concurrent processes." In doing so, however, defendant fails to account for the fact that the IEEE Dictionary defines "multitasking" to include both "concurrent" and "interleaved" processes. Id. at 718. Thus, the ordinary meaning of "multitasking" includes both of these types of processes.

To rebut the presumption that this ordinary meaning should apply, defendant relies on the specification's description of the preferred embodiment of the multi-tasking interface, which states that "[t]he provision for multi-tasking operation allows the peer-level facilities to manage multiple, concurrent processes." 037 Patent, 8:30-32. However, the specification merely states that the multi-tasking interface "allows" for such a concurrent processing to take place; it does not suggest that the multi-tasking interface is charged with managing these processes. Indeed, the quoted passage appears to assign the "management" task to the peer-level facilities rather than the multi-tasking interface. In short, the reference to "multiple, concurrent processes" in the specification falls short of the clear disclaimer of ordinary meaning required to construe the multi-tasking interface according to a "special meaning" disclosed in the specification. Accord Teleflex, 299 F.3d at 1325 (requiring that intent to deviate from the ordinary meaning of a claim term must be demonstrated by the patentee's "clear disavowal of claim scope"). Thus, the court adopts the ordinary meaning of the word multi-tasking, which in this context is defined as "capable of managing two or more concurrent or interleaved (i.e., alternating) tasks."

Defendant's contention that the multi-tasking interface term should include the limitation "allowing multiple, independent instances of the peer-level facilities" is similarly flawed. It is true that the specification discloses this function as one of the "primary benefits" of the invention. 037 Patent, 16:1-4. However, the specification again states only that the operating system "allows" for multiple instances of each peer-level facility. Id. There is no requirement that the claimed invention must contain this limitation. Indeed, some of the claims read on an operating system that comprises only a "plurality" -- i.e., at least two -- processors, each corresponding to a single instantiation of one type of peer-level facility. See, e.g., id. at 55:59-62. In view of the plain meaning of the claim language, the court refuses to read defendant's proposed limitation into the claims.

Accordingly, for the reasons stated above, the court construes the term "multi-tasking interface" to mean "software that is tailored to each operating system peer-level facility that supports direct communication with other peer-level facilities and capable of managing at least two concurrent or interleaved tasks."

18. "multiple non-regulating isolating step down converters providing plural nonregulated, isolated DC outputs, plural of the non-isolating down-converter switching regulators receiving power from one of the non-regulated, isolated DC outputs" ('702 patent)

SynQor's Proposed Construction
"two or more non-regulating isolating step down converters through which power from the DC input flows first before flowing through any regulation stage, each providing a non-regulated, isolated DC output, wherein at least one of..."
those non-regulated, isolated DC outputs is provided
to two or more non-isolating down-converter switching
regulators"

This term is also subject to a motion for summary judgment of indefiniteness filed by some of the Defendants. See Dkt. No. 432. Claim 1 of the '702 patent recites, among other things, "a non-regulating isolating step-down converter through which power from the DC input flows first before flowing through any regulation stage." Claim 26, dependent upon claim 1, includes the disputed limitation of "multiple non-regulating isolating step-down converters." Thus, claim 26 essentially states that one must add at least one more "non-regulating isolating step-down converter" to the system of claim 1.

Defendants argue that the claim limitation is indefinite because it claims multiple isolation stages in a void, with no disclosure of how these multiple stages are to be connected to each other or otherwise incorporated into the claimed power converter system. Defendants theorize four different options for a configuration of the system with the additional "non-regulating isolating step-down converter." Defendants argue that technically they are all possible configurations, and without any disclosure of which configuration is appropriate, that the claim is indefinite because one cannot choose between equally plausible possibilities. SynQor argues that the fact that the claim is broad and allows the "non-regulating isolating step-down converters" to be connected in multiple ways or configurations does not make itself indefinite. SynQor argues that the claim is understandable to a person of ordinary skill in the art.

The Court finds that the mere fact that the claim is broad and can potentially cover multiple configurations of the "non-regulating isolating step-down converter" does not make it indefinite. SeeUltimax Cement Mfg. Corp. v. CTS Cement Mfg. Corp., 587 F.3d 1339, 1352 (Fed. Cir. 2009) ("Merely claiming broadly does not render a claim insolubly ambiguous, nor does it prevent the public from understanding the scope of the patent."). "The test for indefiniteness does not depend on a potential infringer's ability to ascertain the nature of its own accused product to determine infringement." SmithKline Beecham Corp. v. Apotex Corp., 403 F.3d 1331, 1340-41 (Fed. Cir. 2005) ("Even if a claim is broad enough to embrace undetectable trace amounts of the claimed invention, breadth is not indefiniteness.") (internal citations omitted). The parties clearly contemplate multiple configurations of the claim that indicate its breadth, not its indefiniteness. Thus, the Court need not rewrite the claims, as in the previous term where there was an admitted antecedent basis problem, but must only interpret the claim as written. In this situation, the mere fact that the claim does not specify every aspect of how the additional "non-regulating isolating step-down converter" is connected does not make the claim indefinite. The Court finds that the term is not indefinite. A claim is indefinite only if the "claim is insubordinately ambiguous, and no narrowing construction can properly be adopted." Exxon, 265 F.3d at 1375; Honeywell, 341 F.3d at 1338-39. This term is not "insubordinately ambiguous" so as to prevent construction. See Young, 492 F.3d at 1346 (claims are considered indefinite when they are "not amenable to construction or are insubordinately ambiguous"); Exxon, 265 F.3d at 1375 ("If the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds.").

Whereas claim 1 requires only one non-regulating isolating step down converter, claim 26 requires multiple non-regulating isolating step-down converters wherein plural of the non-isolating down-converter switching regulators receive power from one of the non-regulated, isolated DC outputs. The Court finds that SynQor's proposed construction makes various changes to the recited limitations without any clear justification or support in the specification, and thus rejects those changes to the express claim language. Defendants do not provide a construction for the term and only argue that it is indefinite. The Court construes the phrase "multiple non-regulating isolating step down converters providing plural non-regulated, isolated DC outputs, plural of the non-isolating down-converter switching regulators receiving power from one of the non-regulated, isolated DC outputs" to mean "two or more non-regulating isolating step down converters, each providing a non-regulated, isolated DC output, wherein two or more of the non-isolating down-converter switching regulators receives power from one of the non-regulated, isolated DC outputs."

22. Multiple operands in partitioned fields of operand registers

The court construes "multiple operands in partitioned fields of operand registers" to mean "more than one object upon which operations are performed, each object being stored in a separate and distinct field of a register."
5. multiplexed/multiplexed manner

Each party's construction for multiplexed is long and contains numerous limitations. OPTi's construction for "multiplexed" is "individual signal lines carry more than one type of specific information in a time interleaved manner (i.e., one specified type of information is carried at a first time and a second specified type is carried at a second time). In addition, each specified information type must be carried on a signal line that also carries at least one other specified type of information." nVidia's construction for "multiplexed" is "carrying more than one type of information in a time-interleaved manner using phase techniques, such that address information is carried on the bus during an address phase, data information is carried on the bus during a data phase, and other information, such as cycle definition information, command information, or DMA information, is also carried on the bus during either the data or address phase."

While the parties' constructions appear vastly different, the true "rub" in the alternative constructions is whether "multiplexed" is limited to using phase techniques as proposed by nVidia. Phasing is the method of multiplexing used in the preferred embodiment. However, there are numerous methods of multiplexing -- a fact which nVidia does not contest. For the reasons set forth above in Section III.2 regarding the construction of address-data bus, the Court rejects nVidia's attempt to limit multiplexing to phasing techniques. Accordingly, the Court adopts OPTi's proposed construction.

"Multiplexed Output Data Stream"

Alcatel's proposed construction is "a data transmission sent out from the data processing system including data from selected multiple data transmissions received by the data processing system." Cisco's proposed construction is "data stream which exits a port of a data processing system and is made up of data from the input data streams transmitting through the port."

This claim element is found in claim 6, which reads in pertinent part: "Data processing system including multiplexing means wherein input data streams are multiplexed so as to form a multiplexed output data stream applied to at least one output of the system . . . " 24 DePrycker, at 15:8-11.

24 The parties have already agreed that the term "output of the system" is properly construed as "hardware through which data exits the data processing system." See Northern Telecom Ltd. v. Samsung Elecs. Co., Ltd., 215 F.3d 1281, 1290 (Fed. Cir. 2000) (noting that unstated limitations should not be read into the claim language).
In looking at the language of claim 6, the word "port" is certainly not included, nor does the language appear to limit the multiplexed data output stream to a single output, as the language clearly states, "applied to at least one output of the system." Id. at 15:10-11 (emphasis added). Moreover, as evidenced from a reading of claim 9, which is dependant on claim 6, the inventors were capable of using the term "port" when they intended to limit their claim in such a way. See id. at 15:34-38.

Regardless, in combining the language of the patent and the parties' agreed upon construction of the term "output of the system," the claim language is clear that the "multiplexed output data stream" is applied to hardware through which data exits the data processing system. Thus, there is no reason for the Court to further define "multiplexed output data stream" to incorporate the location through which the data stream exits, since that limitation is already included elsewhere in the claim.

26 Cisco relies heavily on extrinsic evidence to support its proposed construction. While the Court agrees with Cisco as to a portion of its proposed construction, the Court finds no need to analyze Cisco's extrinsic evidence in this instance because the meaning of the disputed term is clear from an analysis of the intrinsic evidence. See, e.g., Vitronics, 90 F.3d at 1583 ("In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances, it is improper to rely on extrinsic evidence.").
