On appeal, Gemstar challenges the court's construction of this claim limitation. According to Gemstar, the claim phrase does not require a search of all television programming information stored in memory. Gemstar specifically argues that the district court's analysis of this phrase did not address the absence of claim language requiring any particular method of searching, the specification's teaching that listings may be coded for searching, or the specification's discussion of searching less than all the information contained in the RAM.

EchoStar responds that the limitation at issue requires an examination of all the records in memory. In support, EchoStar notes that during prosecution the '578 patentees distinguished their invention over a prior art reference by arguing that in their system a "search of all the coded information is carried out by the microcontroller." EchoStar further explains that a search is not complete until all the items in memory that meet the search criteria have been located.

We begin with the claim language. Although claim 1 requires "a search on at least said updated television programming information contained in RAM," that requirement is not commensurate with examining all of the programming information in RAM. One of the dictionary definitions of "search" is "to look into or over carefully or thoroughly in an effort to find something." Webster's Third New International Dictionary 2048 (1993). This definition, however, says nothing about how the search is to be conducted. Thus, the ordinary dictionary meaning of the disputed language covers any method of searching the program listings stored in RAM to retrieve those that satisfy a user's search criteria. It does not require that all the records in memory be searched as urged by EchoStar.

An examination of the specification does not overcome the presumption that the patentees intended to adopt the ordinary meaning. The two specification excerpts relied upon by the district court in construing this language state that a search is conducted on the information in the RAM, without specifying what portion of the RAM, and emphasizes that only the requested information is retrieved. '578 patent, cols. 5-6. These excerpts do not expressly or implicitly limit the search to "all" the program listing information in memory or otherwise limit the covered method of searching.

EchoStar's main argument in support of the district court's construction is that the '578 patentees disclaimed all searches other than a search that touches all records. EchoStar maintains that during prosecution of the '578 patent, the Examiner rejected the asserted claims in view of the Skerlos reference. Skerlos discloses an invention that allows the user to assign a
location in memory where a desired telephone number is stored. To retrieve a stored telephone number, the Skerlos user enters the specific address location to recall the number from memory. In response to the Examiner's rejection, the patentees explained that in Skerlos "no search of the information in RAM takes place." The patentees further stated that the '578 patent involves "a search of all of the coded information." EchoStar focuses on this statement to argue that it mandates a claim construction that requires examination of all the records in memory.

We are not persuaded by EchoStar's reliance on the prosecution history to support the district court's construction for two reasons. First, the '578 patentees were merely distinguishing their invention from one that requires no searching at all by pointing out that their invention provides for searches of coded information stored in memory. They did not clearly disavow the scope of searches covered by claim 1 because Skerlos did not conduct any type of search. See Amgen, 314 F.3d at 1327. Moreover, a statement that a search is conducted on "all of the coded information" is not commensurate with an examination of every piece of data stored in memory. If the memory is ordered in such a way that a search of only part of the memory can retrieve all the records that meet the user's criteria, the search has been conducted on all the coded information without having examined every record in memory. EchoStar does not argue that such a search is not possible or that the '578 specification does not enable such a search. Indeed, the specification contemplates that the "microcontroller 60 must be logically arranged . . . in order to accomplish the quick display of the requested information." '578 patent, col. 5, ll. 55-57. Accordingly, we conclude that the claim phrase "to perform a search" means any examination of the program listings stored in RAM to find those that meet a user's search criteria.

AMS and BidSoft contend that the term "search the auction data" appearing in claim 6 should be construed to mean "query a relational database for vehicle detail information relating to vehicles being auctioned at a user- selected auction event and displaying on the video monitors vehicle detail information corresponding to the user selected auction event." Manheim argues that the term should mean "a query is made of the auction data."

The primary basis for AMS and BidSoft's construction derives from their construction of the term "database server," which they argued should be construed to mean a relational database server. Having rejected this proposed construction, supra, the Court finds no basis for requiring the "search" to be "a query of a relational database." Accordingly, the term "search the auction data" in claim 6 shall mean "a query is made of the auction data."

--- Footnotes ---

3 The Court notes that the same term appears in claim 1. AMS and BidSoft did not propose a construction for that term which required a query of a relational database. Rather, they proposed that the term "search the auction data" in claim 1 should mean "to query a motor vehicle auction database matching a user-selected parameter. . . ." AMS and BidSoft point to nothing in the claims, specification, or file history which would indicate that the same term appearing in both claim 1 and claim 6 should be construed differently, and the Court therefore adopts a construction of the term "search the auction data" which is consistent throughout the '873 patent.

--- End Footnotes ---
Rather, the "second" and "third" circuits must only perform their stated functions. For example, what is required is that the narrowly construing the terms to require a specific structural requirement or entirely distinct "second" and "third" circuits. 

We agree with the Commission's construction of "second circuit" and "third circuit," defining the terms broadly to not allow the second and third circuits to differ by merely including an additional component, but instead contends that the proper construction requires that the additional component must "participate[ ] in performing the claimed function." More specifically according to AATI, the additional component in the "third circuit" must at least help perform the function of that circuit and cannot be an arbitrary component, which is unrelated to the function of the "third circuit." In contrast, both Linear and the Commission advocate that the Commission's construction is correct.

We now turn to the "second circuit" and "third circuit" limitations, which appear in apparatus claims 2, 3, and 35, but not method claim 34. The Commission modified the ALJ's initial construction because the ALJ "too narrowly construed the asserted claims as requiring that the 'second' and 'third' circuits be entirely distinct without common circuit elements, that every element in the second circuit be completely distinct from every element in the third circuit, and as precluding shared use of the same circuitry by the 'second' and 'third' circuits of the asserted sleep mode claims." 2007 ITC LEXIS 1108 at *69. Accordingly, the Commission found that "even a difference such as having an additional [component] can cause the circuits to be different and distinct in their topology and their operation." Id. AATI does not appear to take issue with allowing the second and third circuits to differ by merely including an additional component, but instead contends that the proper construction requires that the additional component must "participate[ ] in performing the claimed function."
"second circuit" "generates a first control signal ... to vary the duty cycle," not that any particular components make up this circuit. 258 patent col.16 ll.48-52. In fact, the '258 patent's specification expressly discloses that the "second circuit" and "third circuit" can share common components. For example, figure 2 shows that components of the "second circuit"—such as the reference circuit 37—can also be part of the "third circuit." See id. fig.2 (disclosing that the reference circuit 37 sends a signal to the hysteretic comparator 74, which can be a part of the "third circuit for generating a second control signal"). Accordingly, we think the terms "second circuit" and "third circuit" should be accorded their full scope. See, e.g., Home Diagnostics, Inc. v. LifeScan, Inc., 381 F.3d 1352, 1358 (Fed. Cir. 2004) ("Absent a clear disavowal or contrary definition in the specification or the prosecution history, the patentee is entitled to the full scope of its claim language."); Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d 1311, 1320 (Fed. Cir. 2004) (construing the term "circuit" in the parent '178 patent of this case and acknowledging that the term is normally recognized broadly as "the combination of a number of electrical devices and conductors that, when interconnected to form a conducting path, fulfill some desired function"); cf. In re Translogic Tech., Inc., 504 F.3d 1249, 1257-58 (Fed. Cir. 2007) (construing "input terminals coupled to receive" without a specific structural requirement because "the claim terms [did] not specify any structural connection for the input terminals . . . and the . . . figures show[ed] no structural connection for the input terminals . . . or the control input terminals").

Moreover, AATI does not contest that the "second circuit" and "third circuit" can contain overlapping components. Rather, it advocates that the distinct component must aid in the function of the claimed circuit. 3 As pointed out by the Commission, however, the claim language itself mandates that the components comprising the claimed second and third "circuits" must aid in the claimed function—e.g., the "third circuit" must "cause both switching transistors to be OFF." 258 patent col.16 ll.53-57. Thus, because the claim language already requires the components to aid in the circuit's function, AATI's proposed additional language is unnecessary. See, e.g., Linear Tech., 379 F.3d at 1320 (construing the nearly identical claim limitations "second circuit" and "third circuit" of the '178 patent, although under § 112 P 6 analysis, to not require additional structural clarification because the "limitations . . . are accompanied by . . . language [in the claims] reciting their respective objectives or operations"). The Commission did not err in its construction of the "second circuit" and "third circuit" limitations.

3 In particular, AATI argues that the Commission's construction is erroneous because it allowed "a difference such as having an additional ZC comparator" to distinguish the second and third "circuits." Final Determination, 2007 ITC LEXIS 1108 at *1323 (a comparator is an electronic device that can compare two voltages or currents and subsequently output a signal to indicate which is larger). Accordingly, AATI apparently does not contest that the second and third circuits can generally be distinguished by an additional component, if that component aids in the function of the claimed circuit. In contrast, AATI takes specific issue with identifying the "ZC comparator" as the distinguishing component because, according to AATI, it does not aid in the function of the "third circuit"—namely, causing both switching transistors to be OFF. This argument—whether the ZC comparator aids in the function of the third circuit—however, is one of AATI's noninfringement positions and does not impact our claim construction analysis. See Int'l Rectifier Corp. v. IXYS Corp., 361 F.3d 1363, 1369 (Fed. Cir. 2004) ("Although IXYS's arguments on claim construction often conflate with its arguments on infringement, we address these issues separately, turning first to claim construction.").
construction, contending that the language, and in particular "cause," was correctly given its broad ordinary meaning--to make happen, to result in, requiring neither a "direct" nor immediate cause.

We hold that the Commission properly construed the limitation "a second control signal . . . to cause both transistors to be OFF" as requiring the second control signal to neither directly cause both transistors to be OFF nor be entirely distinct from the first control signal. The '258 patent's specification does not indicate that the "second control signal" must directly cause both transistors to be OFF. Indeed, a direct causation requirement--without the intervention of other signals or components--would be nearly unworkable to articulate or ascertain. Also, such a requirement would allow an accused infringer to evade infringement by merely identifying an intermediary signal or component that allegedly breaks the "chain of causation." Cf. Resonate Inc. v. Alteon Websys., Inc., 338 F.3d 1360, 1365 (Fed. Cir. 2005) ("The patentee's . . . choice not to specify a transmission path from the server to the client" did not require direct transmission to the client because "such a rule likely would prove unworkable."). In addition, such a requirement would be contrary to the specification, which in fact discloses components that are located between the generation of the second control signal and the switching transistors. See, e.g., '258 patent fig.2. Tellingly, in construing the nearly identical, but more restrictive, claim limitations of the parent '178 patent, we held that "to cause both switching transistors to be simultaneously OFF for a period of time" should not be construed to include a narrow causation requirement. See Linear Tech., 379 F.3d at 1324 (holding that the district court construed the limitations too narrowly "because simultaneously merely requires a condition to exist at the same time or concurrently," "encompasses the simultaneous state of both switching transistors being disabled or held off," and "does not require the switching transistors to be turned off or disabled at the same instant").

Nor does the specification indicate that the "second control signal" must be entirely distinct from the claimed "first control signal." In fact, the specification discloses the contrary--that a portion of the "first control signal" impacts whether the "second control signal" turns both transistors OFF. Indeed, figure 2 discloses that the signal from hysteretic comparator 74 in combination with the signal 25A from constant off time one-shot circuit 25--part of the disclosed "first control signal" that "var[ies] the duty cycle of the switching transistors"--"cause[s] both switching transistors to be OFF." See, e.g., '258 patent fig.2; id. col.6 ll.38-55. Thus, the patent shows that the first control signal can be a part of the second control signal, precluding a requirement that the two control signals must be entirely distinct. The Commission's construction of "a second control signal . . . to cause both transistors to be OFF" is correct.

"Second Information Indicative of Said Total Traffic Load Constituted By Communication Packets Belonging to Communications Handled By the Switching Module"

Alcatel's proposed construction for this term is "information indicative of the total traffic load." Cisco's proposed construction is "values reflecting the accumulated traffic load for all of the communications that flow through a port." 32

32 In its briefs, Cisco represents that its proposed construction is "the value or values reflecting the accumulated traffic load for all of the communications that flow through all of the ports of a switching module." Cisco's Opening Claim Construction Brief Concerning U.S. Patent No. 5,020,052 (DePrycker) ("Cisco's '052 Opening Brief"), at 15; Cisco's '052 Responsive Brief, at 14. This proposed construction differs from the proposed construction indicated in the Revised Joint Statement, which is quoted above. In order to avoid confusion, the Court will consider both of Cisco's proposals in determining the proper construction of the disputed term.

Alcatel does not identify any support for its proposed construction, which the Court finds to be overly broad. According to the language in the claim, the term is referring to information describing the total traffic load for all communications flowing through the switching module. Cisco acknowledges this in its opening brief. See Cisco's '052 Opening Brief, at 15 ("The claim language is also self-explanatory in describing the second information as indicating the total traffic load for all of the communications that flow through a switching module.").
However, as described in the specification, the "second information" consists of "the average and maximum values of the accumulated traffic loads constituted by all the communications flowing through [a] transmit port TX1/TX8." DePrycker, at 4:34-37. According to the patent, that information is necessary to determine whether that transmit port can accept the communication seeking to be transmitted by comparing the traffic load of the communication (identified in the path setup packet) with the total traffic load flowing through that transmit port, and determining whether the additional traffic load of the communication would exceed the maximum allowed traffic on that communication line. See id. at 4:31-5:14.

Thus, while the claim language containing the disputed term does not expressly limit the "second information" to information indicative of the total traffic load for only one output source, and in fact seems to imply that the information is indicative of the total traffic load for the entire switching module, the preferred embodiment does limit the information to describing the accumulated traffic load on only one given output port among many output ports on the switching module. In this regard, the term cannot be construed, as Cisco suggests, as referring to the "second information" as the combined accumulated traffic loads for every output port on a switching module, as that construction would read out the preferred embodiment, identified in Figure 2, which shows that the information is for a single transmit port, in order to allow a decision to be made as to whether the communication path would be able to flow through that transmit port.

Therefore, the Court construes the term "second information indicative of said total traffic load constituted by communication packets belonging to communications handled by the switching module" as "information indicative of the accumulated traffic load for all of the communications flowing through at least one output of the switching module."

3841

1. "a second memory associated with the scanhead and outside of the console and communicating with the console through a second connector, the second memory storing software and data necessary for use of the transducer scanhead in the ultrasound diagnostic instrument" or "the second memory storing software and data necessary for the use of the transducer scanhead in the ultrasound diagnostic instrument"

Plaintiffs' construction: memory that stores system executable code and transducer specific data required for system setup, drive, imaging and optimization, and that obviates manual field upgrade or system swap when a new function, application, or transducer scanhead is introduced

Defendant's construction: No construction of the full phrase. Instead, construction of the phrase "the second memory storing software and data necessary for use of the transducer scanhead in the ultrasound diagnostic instrument" as "the second memory stores portions of software and data that the transducer scanhead in the ultrasound diagnostic instrument needs to function properly"

The parties disagree about several aspects of claim construction with respect to claim 1 of the '839 patent. The most fundamental dispute relates to which terms require construction. Plaintiffs contend that it is necessary to construe the full phrase that appears in part d of claim 1; defendant argues that the phrase need not be construed in its entirety and that if any construction is needed, shorter phrases and terms should be construed instead.

Neither party has persuaded me that its proposed construction is correct. I will start with defendant's proposed construction of the phrase "the second memory storing software and data necessary for use of the transducer scanhead in the ultrasound diagnostic instrument." Defendant's construction of the phrase is "the second memory stores portions of software and data that the transducer scanhead in the ultrasound diagnostic instrument needs to function properly." However, no intrinsic evidence supports the addition of the terms "portions of software and data" or "function properly." These terms broaden the reach of the claim language impermissibly.

On the other hand, plaintiffs' proposed construction narrows the scope of the claim language impermissibly by importing a requirement that the second memory obviate the need for manual field upgrade or system swap. It is true that the patent specification, in the Summary of the Invention, touts the advantage of using a second memory because it obviates the need to perform "manual field upgrade[s]" or "system swap[s]" when a new "function, application, or transducer scanhead is introduced." '839 pat., col. 2, lns. 9-12. However, it does not follow that this stated advantage must be read into the language of individual claims. Ventana Medical Systems v. Biogenex Laboratories, Inc., 473 F.3d 1173, 1181 (Fed. Cir. 2006);
Golight, Inc. v. Wal-Mart Stores, Inc., 355 F.3d 1327, 1331 (Fed. Cir. 2004) ("[P]atentees [are] not required to include within each of their claims all of [the] advantages or features described as significant or important in the written description.").

Plaintiffs' argument that the prosecution history requires the importation of this limitation into the claim language is equally unavailing. As noted above, a patentee may limit the meaning of a claim term by making a "clear and unmistakable disavowal of scope during prosecution." Purdue Pharma L.P. v. Endo Pharmaceuticals, Inc., 438 F.3d 1123, 1136 (Fed. Cir. 2006). Claim 1 of the '839 patent was rejected initially because of U.S. Pat. No. 5,690,114. '839 file history, dkt. # 64, First Office Action, SONO-GE0059874-78. After the rejection, claim 1 was amended to clarify that the second memory was associated with the scanhead and outside the console. '839 file history, dkt. # 64, Response to First Office Action, SONO-GE0059889-92. In their effort to overcome the rejection, the inventors pointed out that the memory described in U.S. Pat. No. 5,690,114 was not included in the scanhead itself and was instead included in the console. Id. at SONO-GE0059891. They noted also that this obviated the need for manual field upgrade and system swap. Id. Again, this is a statement of the advantage of including a second memory within the scanhead; it is not an "unambiguous disavowal" of scanheads that include a second memory but do not obviate the need for manual field upgrades and system swaps. E.g., Omega Engineering, Inc. v. Raytek Corp., 334 F.3d 1314, 1324 (Fed. Cir. 2003) (declining to apply doctrine of prosecution disclaimer when alleged disavowal is ambiguous).

Because I conclude that both parties have failed to propose an appropriate construction, I will decline to construe "a second memory associated with the scanhead and outside of the console and communicating with the console through a second connector, the second memory storing software and data necessary for use of the transducer scanhead in the ultrasound diagnostic instrument" or "the second memory storing software and data necessary for the use of the transducer scanhead in the ultrasound diagnostic instrument."

D. "First portion of the dose" (claim 1)

Per the agreement of the parties, the court construes this claim language to mean: "That portion of the dose which is diffused first."

E. "Second portion of the dose" (claim 1)

The parties' disagreement over this term has coalesced around the question of whether the "second portion of the dose" must be applied after the first portion, in addition to being diffused after it, or if they may be applied together. Ixys contends that the plain language of the claim itself demands that the second portion be applied after the first portion. In evaluating this claim, it is worth quoting a larger section of the claim than the parties have here put at issue in order to establish context:

… an improved minority carrier lifetime control process comprising… determining and depositing a dose of the transition metal not exceeding the maximum dose sufficient to effect lifetime control without substantially increasing leakage current of the device; and diffusing the metal atoms throughout the substrate at a temperature within said range, including; diffusing a first portion of the dose throughout the substrate; and diffusing a second portion of the dose….

'202 patent, 28:56-29:5 (emphasis added). Not only does this language fail to support Ixys' position, it actually undermines it. The diffusion of the dose is explicitly described as taking place in two steps and involving a first and a second portion. But the initial deposition is mentioned only once; the process requires "determining and depositing a dose of the transition metal," not two doses in sequence.

The specifications trace a similar pattern. The relevant portion of the specifications, cited by both parties, teaches:

"First, the substrate is lightly dosed with, e.g., 10<11> Pt atoms/cm<2>, and diffusing the Pt atoms throughout the device at first elevated temperature, e.g., 850 [degrees] -865 [degrees] C. for one hour for a PIN. Second, an additional dose of Pt atoms is applied to a selected surface of the device and is diffused at a higher temperature, e.g., 950 [degrees] -1100 [degrees] C. for 5-20 seconds (rapid thermal anneal) such that the additional dose is retained in a gradient band near the..."
selected surface. Preferably, the doses can be applied in a single implant or silicide formation step.

'202 patent, 24:13-22 (emphasis added). The disclaimer in the last sentence effectively negates the full thrust of support that this section might have provided for Ixys' position, and thus the specifications do not provide sufficient justification for amending the clearer claim language.

The court construes this claim term to mean: "That portion of the dose which is diffused after the first portion."

3. second telecommunications network(s)

The term "second telecommunications network" would be understood by a person of ordinary skill in the art to be a telecommunications network over which the switch system at the local cable headend receives from a remote control center the commercial insert video signal and the switch commands, and, in the '825 Patent, the insert locator data. Additionally, it would be understood that the second telecommunications network is distinct from the "first telecommunications network," over which is sent the programmed channel signal. Finally, the second telecommunications network must be connected to the switch at a video input and at an Input/Output ("I/O") port, since its function is to allow the commercial insert signal and the channel switch commands to be sent from the remote control center to the switch. See infra § II.A.4 (construing "first, second and third (channel) switch commands").

Nothing in the claims themselves supports the additional limitation advanced by Defendants that the second telecommunications network connects a source that is located "at a significant distance" from the headend to the switch system. 10 SeaChange and the Cox Companies' Markman Br. on the Interpretation of Disputed Claim Language, at 16. Defendants also argue that the commercial insert signal and the switch commands must be continuously received 11 over the second telecommunications network. This limitation does not properly belong in the definition of second telecommunications network.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 Defendants rely on the preferred embodiments, which describe the second telecommunications network as being a satellite or fiber optic cable link, to argue that there is a significant distance between the remote control center and the switch system. The court will not import this limitation from the specifications into the claims. See infra note 12.

11 The court understands "continuous receipt" to mean that the switch commands and commercial insert signal are sent from the remote control center to the switching system when the cue tones are detected (the detector being located at the remote control center), as opposed to being sent and stored at the headend well in advance of the local avail.

3844

Secondary Power Source

The parties agree to part of the construction of secondary power source. The agreed portion states: secondary power source "means a source of power connected to provide power between the data node and the access device using the data signaling pair." The parties disagree on the relationship between the recited main and secondary power sources. The Court modifies D-Link's proposed construction and further construes the term as "the secondary power source is physically separate from the main power source." Network-1 argues the secondary power source may be derived from the main power source, or separate.

The claim language describes a main power source and a separate power source. Col. 4: 17-20. The parties do not dispute
that two sources exist; however Network-1 argues that these two sources do not have to be separate, but they can both be derived from the main power source. Network-1 points to Claims 1 and 6 in support of its argument that there is no language in the patent that restricts the configuration, placement or construction of the main or secondary power sources, nor do the independent claims specify any relationship between the two power sources. See Col 4:10-30, 50-65. However, Network-1 was unable to demonstrate in the Markman hearing or in its briefing how these two power sources, which perform two separate functions according to the claim language, could be the same, or "not separate."

Claim 1 specifies that the main power source provides a driving point for the load established by the data node and specifies that the secondary power source provides an additional driving point for the load established by the access device. See Col. 4:18-22. Claim 1 does not specify whether or not the additional driving point derives the power that it delivers to the access device from the main power source. The additional driving point, however, would necessarily be physically separate from the main power source driving point because each "drives" separate loads. Looking at the plain language of the claim, the Court construes the claim as requiring the secondary source to be physically separate.

Network-1 asserts that since the D-Link case, Federal Circuit cases have demonstrated that the "secondary power source" need not be physically separate from the "main power source." See, e.g., Linear Tech. Corp. v. ITC, 566 F.3d 1049, 1055 (Fed. Cir. 2009) (holding that the terms "second circuit" and "third circuit" do "not require entirely separate and distinct circuits" with each "requir[ing] a specific structural requirement"); Oatey Co. v. IPS Corp., 514 F.3d 1271, 1275 (Fed. Cir. 2008) (holding that the term "first and second juxtaposed drain ports" does not require "two separate identifiable physical elements"). Network-1 also asserts that the claim language does not specify that the sources are physically separate, and inclusion of this limitation in the construction excludes a preferred embodiment from the scope of the claim. Finally, Network-1 asserts that the claim refers to a secondary mode of operation, not to a separate connection.

Defendants counter that the claims recite two distinct power sources that must be physically separate, where the main power source supplies power to the data node and the secondary power source supplies power from the data node. Defendants also argue that the Federal Circuit cases cited by Network-1 do not support its position because they involve embodiments where components are shared. Finally, Defendants argue that there is no support for Network-1's contention that two modes of operation of a single power source are being described in the '930 Patent.

The Federal Circuit cases cited by Network-1 are inapposite. Unlike in Linear, the terms at issue in this case are not "second" and "third" as mere identifiers; rather, the terms "main" and "secondary" set forth an operational hierarchy. Furthermore, the Court's construction in the D-Link case does not impose a requirement of "entirely separate and distinct." Linear, 566 F.3d at 1055 (emphasis added). Unlike in Oatey, the Court's construction in the D-Link case does not require "separate identifiable physical elements" for each of the power sources. Oatey, 514 F.3d at 1275 (emphasis added). The Court's construction in the D-Link case requires only that there be physically separate "driving points" because each power source "drives" a separate load. Network-1 Sec. Solutions, Inc. v. D-Link Corp. & D-Link Sys., Inc., Case No. 6:05cv291, 2006 U.S. Dist. LEXIS 84510, Memorandum Opinion and Order (Docket No. 137) (E.D. Tex. Nov. 20, 2006). The hierarchy of "main" and "secondary" also indicates a physical separateness, particularly because two different loads (the data node and the access device) are being driven. This is true even though the electrical energy applied to the access device via the data node originates from the main power source.

Network-1 is incorrect that an embodiment is excluded with the requirement of physical separateness. The argument is based on Power Source 16 in Figure 1, which Network-1 asserts shows that the main and secondary power sources are the
same. Although Power Source 16 is depicted as a single power source in Figure 1, it must provide the electrical energy that goes to both the data node and the access device. See '930 Patent, fig. 1. Thus, the functional block diagram of Figure 1 does not identify where the main and secondary power sources are located, nor how they are physically arranged.

The functional block diagram of Figure 1 is shown in detail in Figure 3 where main power supply 70 supplies power to Ethernet switches 68. '930 Patent, col. 3:66-4:1. Ethernet switches 68 include the power detector 22 of Figure 1 and the power supply 34 of Figure 2. Id. at 4:1-4. In Figure 2, the feed and return lines of the remote power supply are identified as lines 39 and 45, respectively. Id. at 3:37-38. The RJ45 connector 43 of Figure 2 is specified for a network cable connection using the CAT-5 Ethernet Premises Wiring of Figure 3. See id. at figs. 2-3. The feed line corresponds to line 18 in Figure 1, and the return line corresponds to return path 20 in Figure 1. Id. at 2:52-59. Thus, Figure 1, when read in conjunction with Figures 2 and 3 by one of ordinary skill in the art, does not show an embodiment without separate power sources. Instead, the figures show a clear hierarchy of the main power source, then the secondary power source to the data node, and finally the access device from the data node.

Figure 2 below identifies terminals 6 and 3 as an active pair and, similarly, terminals 1 and 2 as an active pair. '930 Patent, col. 3:31-37. Ethernet networks utilize at least two signaling pairs. See id. at 1:56-58. Delivering supply power from the data node via the data signaling pairs to the access device, which is the operative arrangement of the secondary power source, finds support in the specification discussing Figure 2. See id. at 3:28-42. The disclosure of transformers between the feed and return lines and the data signaling pairs also implies physical separateness. See id. The arrangement of transformers electrically isolates the electrical load of the access device from the electrical load of the data node. Thus, electrically separate power sources are established for the data node (from the main power source) and the access device (from the secondary power source).

Thus, the main power source in the disclosed embodiment is main power supply 70 of Figure 3, and the secondary power source is power supply 34 of Figure 2. See '930 Patent, figs. 2-3. The primary power to drive the data node established by the Ethernet switches 68 is provided by the connection of the Main Power Distribution Bus in Figure 3. See id. at fig. 3. The secondary power to drive the access device is provided by the RJ45 connector in Figure 2 at the end of the CAT-5 Ethernet Premises Wiring in Figure 3. See id. at figs. 2-3.

Finally, the claim language specifies that a low level current is supplied from the main power source to the access device over the data signaling pair. '930 Patent, col. 4:22-25. This indicates that, in view of the other claim elements as to the secondary power source, the secondary power source is physically separate from the main power source. See id. at 4:10-29. The element that supplies power to the access device is the secondary power source. Id. at 4:19-21. In light of the specification, the claim language indicates that the secondary power source is used between the main power source and the access device as a type of controlled valve for electrical energy applied from the main power source to the access device. Claim 4 is more specific than Claim 1 in placing the secondary power source in the data node. See id. at 4:43-45. Claim 4 further confirms the indication in Figure 3 that power supply 34 of Figure 2 is the secondary power source. See id. at fig. 2.

Accordingly, the Court adopts its previous construction in the D-Link case and Defendants' construction and construes the term "secondary power source" to mean "a source of power connected to provide power between the data node and the access device using the data signaling pair. The secondary power source is physically separate from the main power source."

b. secondary voltage

Fairchild contends that a "secondary voltage" means "a voltage generated by the secondary voltage source." (D.I. 156 at 36). In advancing this claim construction, Fairchild specifically argues that the "secondary voltage sources are additional voltage sources which are distinct from the primary voltage source."

In response, Power Integrations contends that a "secondary voltage" means "a subsequent or additional voltage." In advancing this construction, Power Integrations also refers to the definition of secondary voltage source. Power Integrations contends that, in accordance with its plain meaning, a "voltage source" means a "source of voltage," and the term...
"secondary" means something that comes second or subsequent. Thus, Power Integrations maintains that a "secondary voltage source" means "one or more voltage sources used to generate the secondary voltage," and therefore, secondary voltage means "subsequent or additional voltage." (D.I. 152 at 12-13).

Reviewing the claim language and the specification, the Court concludes that the term secondary voltage means "subsequent or additional voltage." While the claim language does require the secondary voltage to be generated by the secondary voltage source, there is no requirement that the secondary voltage source be distinct from the source of the primary voltage as discussed previously. Further, in the Court's view, identification of the voltage source for the secondary voltage is not a necessary part of defining the claim, because the source of the secondary voltage is clearly recited in the claim language. Accordingly, the Court construes "secondary voltage" to mean "a subsequent or additional voltage."

### J. "Secret Key of the Credential Issuing Entity"

The court shall apply the ordinary definition of the word "secret"-"kept from the knowledge of any but the initiated or privileged." 6 The phrase contemplates the initiated being the credential issuing entity. Thus, the term "secret key of the credential issuing entity" shall be construed to mean "a key that is known only to the credential issuing entity and those intended to know it and that exists beyond the duration of a particular transaction."

### B. "Secret Key of the First Party"

The court shall apply the ordinary definition of the word "secret"-"kept from the knowledge of any but the initiated or privileged." 1 The disputed phrase contemplates the initiated being the first party. Thus, the term "secret key of the first party" shall be construed to mean "a key that is known only to the first party and those intended to know it and that exists beyond the duration of a particular transaction."

### C. "secret key of the first party/payor/originator"

<table>
<thead>
<tr>
<th>Term</th>
<th>Plaintiff's Definition</th>
<th>Defendants' Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;the payer creating a variable authentication number (VAN) on a computer using at least a portion of the document&quot;</td>
<td>A private key that is created by the payor, or an entity originating an instrument on the document</td>
<td>A key that is known only to the payor and those intended to know it and that exists beyond the duration of the document</td>
</tr>
</tbody>
</table>
information, and a secret key of the payor" '148 patent, Claim 28.
"creating the VAN on a computer by coding the EDC1 using a secret key of the originator"
'148 patent, Claim 35.

This term, found in claims 28, 34, and 35 of the '148 patent, does not appear in the specification. The parties dispute whether the disputed term refers to the "PIN" or the "joint key" of the specification. The Delaware court construed this claim term, adopting plaintiff's proposal in the previous litigation. Defendants propose the Delaware Court's construction.

Plaintiff argues that the "secret key" refers to the "joint key" because Claim 34 recites, "[a] VAN being created using at least a secret key of the first party." According the Plaintiff, only the joint key (or joint code) is used to create the VAN. See '302 patent, 5:13-15. Plaintiff argues that the secret key cannot be the PIN because the authenticating party must recreate or uncover the secret key, which cannot be done with a PIN.

Concluding that the secret key is the joint key, Plaintiff goes on to define "joint key." Plaintiff determines that a joint key is "created by coding 'information associated with at least one of the parties involved in the transaction (in this case, the originator and recipient).'" Pl. Brief at 15. Plaintiff further explains that the key is secret because "only the first party/payor/originator can provide the secret PIN that is used to create a joint key." Pl. Brief at 16.

Defendants argue that the "secret key" is the PIN because, of all the pieces of data used to create a VAN, "[t]he only thing in that process that the patent describes as 'secret' and 'of a party' is the originator's PIN." Def. Brief at 24. Defendants argue that the secret key cannot be a joint key because "the joint key can be created by someone other than the party to whom it belongs and is not a 'secret key of a party.'" See Def. Brief at 24.

Defendants also argue that the secret key must exist beyond the duration of a transaction. According to Defendant, "[t]he PIN exists before a transaction, during enrollment, and after a transaction, so that the PIN remains associated with the first party and can be used to authenticate that party." Def. Brief at 25. The bank, so it follows, must have a relatively static reference point in order to perform a meaningful authentication.

Contrary to Plaintiff's interpretation, the Court is of the opinion that the PIN is indeed used to create a VAN, as described in the '302 patent, Column 5, Lines 3-18. Notably, "the originator's PIN is converted to a coded PIN (CPNO), which is applied as the key input to coder 28." '302 patent, 5:5-6. The coded PIN is then used to code the payment recipient's information into the joint key. Furthermore, it is the coded PIN that is used to authenticate the originator of an instrument, which means it is known by those intended to know. Finally, Plaintiff's argument that the VAN cannot be created without the joint key applies equally as well to the coded PIN. The Court finds no error and adopts the Delaware Court's construction. This term means "a key that is known only to the payor and those intended to know it."

F. "Secret Key of the Originator"

The court shall apply the ordinary definition of the word "secret"-"kept from the knowledge of any but the initiated or privileged." 3 The phrase contemplates the initiated being the originator. Thus, the term "secret key of the originator" shall be construed to mean "a key that is known only to the originator and those intended to know it and that exists beyond the duration of a particular transaction."
3 The Random House College Dictionary, 1189 (revised ed. 1980)

D. "Secret Key of the Payor"

The court shall apply the ordinary definition of the word "secret"—"kept from the knowledge of any but the initiated or privileged." The phrase contemplates the initiated being the payor. Thus, the term "secret key of the payor" shall be construed to mean "a key that is known only to the payor and those intended to know it and that exists beyond the duration of a particular transaction."

2 The Random House College Dictionary, 1189 (revised ed. 1980)

2. "secret state"

A limitation on the "first device" is that it includes a computer-readable memory having an internal "secret state." The parties dispute the meaning of the phrase "secret state."

The plain and ordinary meaning of the word "state" is the condition of a device at a given instance. See Institute of Electrical and Electronics Engineering (IEEE) Dictionary of Standards Terms, 1102 (7th ed. 2000). A person of ordinary skill in the art reading the patent documents at the time of the invention would understand that the phrase "secret state" refers to a collection of parameters which are stored in a memory. The "base secret cryptographic value" and the "updated secret cryptographic value" are examples of such parameters. The written description provides:

In one embodiment, a cryptographic client device (e.g., a smartcard) maintains a secret key value as part of its state . . . [a] state's secret key value typically, but not necessarily, includes a secret session key.

In addition, "secret state" also refers to the condition of the memory when it is holding a secret value:

In an exemplary embodiment, the client is initialized with a secret key K[0] for a symmetric cryptosystem, where K[0] is also known to (or derivable by) the server. The key K[0] is usually (but not necessarily) specific to a particular client device or party.

* * *

FIG. 1 shows an exemplary sequence of client device secret state values usable to perform a series of transactions, typically (but not necessarily) using one state per transaction. (The client process used to produce the sequence will be described with respect to FIG. 2 and the corresponding server process will be described with respect to FIG. 3.) A state's secret value typically, but not necessarily, includes a secret session key; therefore, as a matter of convenience, the secret value will be denoted by K and the term "secret value" may be used somewhat interchangeably with "key."
Accordingly, the Court construes the phrase "secret state" to mean: one or more parameters, the attributes, conditions or values of which are secret, which are stored in computer-readable memory of the device.

Disputed Claim Language

"a precision timing section coupled to said laser transmit section and said laser receive section for determining a flight time of said laser pulses to said target and said reflected laser pulses from said target"; "based upon a flight time of a pulse"

Analysis

Plaintiff argues that this claim should be construed in accordance with its plain language and that there is no basis for construing the claim subject to § 112 P 6. I agree.

As discussed above, means-plus-function formatting applies to claim limitations that portray a function to be executed, but provide no instruction as to the structure or materials for executing that function. See CCS Fitness, Inc., 288 F.3d at 1369, 1370. Claim 8 does not fit this format. First, the Claim 8 language is not written in means-plus-function format, typified by the use of the word "means." See id. at 1369. Therefore, the rebuttable presumption applies that the element should not be construed according to means-plus-function format. Personalized Media Communns., 161 F.3d at 702. Second, a claim term can avoid application of 112 P 6 even if it does not espouse a precise physical structure. CCS Fitness, 288 F.3d at 1370.

Once again, Defendants may rebut the presumption that § 112 P 6 does not apply by "demonstrating that the claim term fails to recite sufficiently definite structure or else recites a function without reciting sufficient structure for performing that function." 288 F.3d at 1369. "In deciding whether [the] presumption has been rebutted, the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112 P 6." Personalized Media Communns. 161 F.3d at 704. To determine whether the claim term recites such sufficient structure, I may examine whether the claim term has an understood meaning in the art. See CCS Fitness, Inc., 288 F.3d at 1370. Defendants fail to rebut the presumption as to this claim language.

The disputed language in Claim 8 describes definite structure. The precision timing section is "coupled" to the laser transmit and laser receive sections. The verb "couple" means "to fasten together" (2), or "to bring (electric circuits) into such close proximity as to permit mutual influence" (2d-2), or "to join (electric circuits or devices) into a single circuit." (2d-3). WEBSTER'S 3RD NEW INTERNATIONAL DICTIONARY 521 (3rd ed. 1986). This joining or increase in proximity connotes the relationship of two or more parts. Structure itself is defined as "something made up of more or less interdependent elements or parts" (2b), "the interrelation of parts dominated by the general character of the whole" (5), and "the elements or parts of an entity or the position of such elements or parts in their external relationship to each other" (6). Id. at 2267.

While the claim language here might not describe a "known specific structure," it need not do so. See CCS Fitness, 288 F.3d at 1370. I conclude that the claim language recites sufficiently definite structure to resist application of 112 P 6.

I also conclude that Claim 8 does not require more than one separate precision timing section or clock, and does not require a capacitor. See Defendants' Memo, 29-30. Both of these interpretations would have me look beyond the plain claim language. Markman construction of a claim requires me to look first to the plain text of the claim language. See CCS Fitness, 288 F.3d at 1366. While Defendants suggest I look beyond the plain language, it is not apparent from the specification that Plaintiff intended the claim language to embody anything but its ordinary meaning. And, "references to a preferred embodiment, such as those often present in a specification, are not claim limitations." Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988), cert. denied, 490 U.S. 1068, 104 L. Ed. 2d 634, 109 S. Ct. 2069 (1989).

Defendants refer to extrinsic evidence to support their conclusion that Claim 8 requires a separate clock. See Defendants' Memo, 29 (citing Creusere Decl. P 35). They argue that "[since] the precision timing section is not defined by components
specified in Claim 8, construing the claim element requires reference to the '910 patent specification." Id. I conclude there is no basis to import the limitation of a separate clock into the claim from the specification sections-parts of the preferred embodiment--that Defendants cite (’910, col. 8, lines 1-25 and 52-55; col. 12, lines 26-31 and 34-38).

As Plaintiff argues, the precision timing section includes a transistor that charges a capacitor, but the capacitor itself is not the precision timing section. See Plaintiff's Reply Memo, 28 (citing '910 patent, col. 8, lines 31-35). The capacitor effectively "stretches" the time-of-flight of received laser pulses. That information then goes to a system clock. The preferred embodiment clearly depicts a capacitor that expands the flight time "so that the slower clock in the CPU section can then count it accurately." ’910 patent, col. 8, lines 29-34.

While the capacitor is part of the preferred embodiment of Claim 8, there is no reason to construe the claim to require the capacitor. There is no mention of a capacitor in the claim itself, and the capacitor is not the precision timing section. Although the capacitor assists the laser range finder's ability to clock laser-pulse flight times by "stretching" the times-of-flight, it does not determine the times-of-flight. Therefore, I conclude that Claim 18 requires "a precision timer coupled to the transmitter and receiver that determines a flight time of laser pulses reflected from a target." Plaintiff's Reply Memo, 26.

CONSTRUCTION: A precision timer coupled to the transmitter and receiver that determines a flight time of laser pulses reflected from a target. A separate clock or timer is not required.

3854

C

"[S]ectors" (claims 1 & 10)

As a starting point, both SanDisk and Ritek agree that a "sector" is the "basic unit of erase." The Federal Circuit endorsed this interpretation. SanDisk Corp v Memorex Prods, Inc, 415 F3d at 1281. Judge Breyer also adopted this construction in the Lexar litigation. In full, Judge Breyer's construction was:

A "non-volatile memory sector" is the basic unit of erase for the non-volatile memory. It is not limited to 512 bytes of user data and 64 bytes of overhead data.

SanDisk Corp v Lexar Media, Inc, 1999 U.S. Dist. LEXIS 2682, 1999 WL 129512, 3 (ND Cal 1999). The parties agree with this construction as far as it goes, but this does not end their dispute.

The dispute is whether the construction of "sector" should include some reference to size or number of memory cells. JCC (Doc # 371), Ex A at 6. SanDisk proposes that the court adopt Judge Breyer's construction and add that a sector is "further understood to refer to a substantial number of memory cells." Id. Ritek contends that SanDisk is playing "fast and loose with the courts" since they previously argued that "sector" was not limited to the size recited above. Ritek Br (Doc # 148) at 15.

SanDisk's position in Lexar (that size was not limited to a specified value) was essentially arguing that the example provided in the specification should not be read into the claim. See Lexar, 1999 U.S. Dist. LEXIS 2682, 1999 WL 129512, 3; Berta Reply Decl (Doc # 397-2), Ex A at 8-12. This is consistent with arguing that size must be a certain minimum number of cells, i.e., more than an insubstantial number. Ritek's judicial estoppel argument lacks merit.

Ritek also argues that inserting SanDisk's proposed language is incorrect because the specification refers to "Flash EEprom" and traditional (non-flash) "EEprom." Ritek argues that since the invention did not exclude EEprom, and in fact refers to EEprom, that the invention relates to both flash EEprom and traditional EEprom. This distinction is significant, Ritek argues, because traditional EEprom memories would only allow sectors to contain small units of memory.

The court need not visit the issue whether the invention relates to flash EEprom only or both flash and traditional EEprom because it is unnecessary to insert SanDisk's proposed addition ("further understood to refer to a substantial number of memory cells") in the court's construction. Nothing in the construction which the parties agree to ("the basic unit of erase")
precludes the size of the "basic unit of erase" from being a "substantial," according to one having ordinary skill in the art, "basic unit of erase." The court reaches this conclusion without deciding whether Ritek's argument, that the invention is not limited to flash EEprom memories, has merit. The court also reaches this conclusion without deciding whether SanDisk's arguments that one having ordinary skill in the art would understand the invention to relate only to flash EEprom memories.

Since Ritek does not argue, as Lexar did, that a sector was limited to a described embodiment in the specification (512 bytes of user data and 64 bytes of overhead data), it is unnecessary to include that clarification here.

Accordingly, the court adopts the following construction for "sector" means:

The basic unit of erase.

The parties' dispute over sector" in the '051 patent centers around the amount of data a "sector" can contain. Lexar contends that a sector must contain at least 512 bytes while Pretec and Toshiba suggest that a sector can be much smaller. Toshiba and Pretec contend that Lexar's proposed construction is not supported by the '051 claim language. Indeed, the actual language of the claims at issue in the '051 patent do not provide a numeric limitation on the size of a sector. Toshiba argues that the '051 specification confirms that no numeric limitation was intended. In support of its argument, Toshiba points to that part of the specification describing the preferred embodiment which states that "a preferred sector size of 512 bytes is used in these examples whereas other sector sizes may be employed without departing from the scope and spirit of the present invention." ('051 patent, 12:54-57 (emphasis added).) There is no indication that by "other sector sizes," the patentee only meant "larger sector sizes." Nothing in the patent indicates that the patented technology can only be used with an operating system in which the sector size is 512 bytes. Therefore, a sector, as recited in the '051 patent, can contain 512 bytes, fewer than 512 bytes, or more than 512 bytes and, accordingly, the Court rejects this aspect of Lexar's proposed construction.

Having resolved the question of the size of a "sector" in the '051, the Court must now address the remaining portions of the parties' proposed constructions. Lexar's proposed construction does not actually articulate a definition of the term "sector." Lexar does not explain whether a "sector" is a unit of memory or of data or some other type of "unit." Toshiba and Pretec do each provide an actual construction of "sector," but neither party provides the Court with any support for the language it chose. Toshiba contends that a "sector" is a "subdivision of the nonvolatile memory or the data stored therein;" Pretec argues that a "sector" is the "smallest unit of memory that can be read or written to at one time in a system." Toshiba's proposed construction is overly broad. Pretec's proposed construction does not appear to match how a person of ordinary skill in the art would understand "sector" here. As Lexar argued at the claim construction hearing, the smallest unit of memory that can be read or written at one time here is a byte and no one skilled in the relevant art would ever equate a "sector" with a byte. At oral argument, Pretec did not rebut Lexar's argument, instead focusing on the number of bytes in a sector. The Court therefore rejects Pretec's proposed construction and construes "sector" in the '051 as follows: a unit of memory containing user data and overhead.

ii. "sector" in the '918 patent

The parties' dispute over sector" in the '918 patent centers around the amount of data a "sector" can contain. Lexar contends that a sector must contain at least 512 bytes while Pretec and Toshiba suggest that a sector can be much smaller. Toshiba and Pretec contend that Lexar's proposed construction is not supported by the '918 claim language. Indeed, the actual language of the claims at issue in the '918 patent do not provide a numeric limitation on the size of a sector. Toshiba argues that the '918 specification confirms that no numeric limitation was intended. In support of its argument, Toshiba points to that part of the specification describing the preferred embodiment which states that "a preferred sector size of 512 bytes is used in these examples whereas other sector sizes may be employed without departing from the scope and spirit of the present invention." ('918 patent, 12:54-57 (emphasis added).) There is no indication that by "other sector sizes," the patentee only meant "larger sector sizes." Nothing in the patent indicates that the patented technology can only be used with an operating system in which the sector size is 512 bytes. Therefore, a sector, as recited in the '918 patent, can contain 512 bytes, fewer than 512 bytes, or more than 512 bytes and, accordingly, the Court rejects this aspect of Lexar's proposed construction.
The Court instead construes "sector" as it did in the '051 patent: a unit of memory containing user data and overhead.

iii. "sector" in the '314/138 patent
Lexar's proposed construction: a unit of 512 bytes or more, including user data and/or overhead.
Toshiba's proposed construction: a subdivision of the nonvolatile memory or the data stored therein.

Again, the parties disagree about how much data a sector can contain. And again, Lexar proposes to improperly limit a "sector" in the '314/138 patent to a unit of 512 bytes or more when the claim language does not so limit sector size and when the specification does not reflect an intent on the part of the patentee to act as his own lexicographer. The '314/138 specification notes that "[i]t is common in the industry for each sector to include 512 bytes of user data plus overhead information." ('314 patent, 7:42-44; '138 patent, 7:34-36.) However, as in the '051 and '918 patents, the '314/138 specification explains that although the preferred embodiment employs sectors of 512 bytes of user data and 16 bytes of overhead, "a sector may include other numbers of bytes of information." ('314 patent, 7:44-47; '138 patent, 7:36-40.) That the Preferred Embodiment section permits sectors sizes other than the 512 bytes counsels against limiting a sector's size to 512 bytes plus overhead. Therefore, the Court construes "sector" in the '314/138 as a unit of memory containing user data and overhead.

1. Claim Construction
The parties agree on all matters of claim construction except one -- the meaning of the term "sector", which appears in independent claim 13 and the dependent claims that incorporate claim 13 (claims 14 through 23). Claim 13 requires that securities be separated into a "sector" that "comprises a subset of the group of securities" and "satisfies a specific criteria."

9 Pretec offers no proposed construction here. Pretec only proposes constructions for disputed terms in the '638 and '051 patents.

10 Pretec offers no proposed construction here. Pretec only proposes constructions for disputed terms in the '638 and '051 patents.

The intrinsic evidence in this case makes clear that the term "sector" is used in the '685 Patent to mean a subdivision or subsection, which may or may not relate to a particular industry. Because the patent specification does not give the term "sector" any special meaning, it must be given its ordinary meaning, which is, in this context, the meaning that persons experienced in ETFs would give the term. The best place to look for that meaning are financial or investment dictionaries. See Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002) (acknowledging that dictionaries "may be the most meaningful sources of information to aid judges in better understanding . . . the terminology used by those skilled in the art to describe the technology."). Although financial dictionaries provide varied definitions of the word "sector", they all agree that the core meaning of the term is the idea of a subdivision, which may (but not must) relate to a particular industry. See, e.g., investorwords.com, at http://www.investorwords.com/cgi-bin/getword.cgi?4430&sector (defining sector as "a distinct subset of a market, society, industry, or economy, whose components share similar characteristics"); Money Words Empowerment Venue, at http://www.mone ywords.com/glossary/detail.CFM?ID=3726&SearchTerm=Sector (defining sector as a "distinct part of a market, society, industry, or nation's economy"); Campbell R. Harvey's Hypertextual Finance Glossary, at http://www.duke.edu/charvey/Classes/wpg/bfgloss.html (defining sector as "a group of securities that are similar with respect to maturity, type, rating, industry, and/or coupon); Yahoo! Financial Glossary, at http://biz.yahoo.com/f/g/bfgloss.html (same); Bloomberg Financial Glossary, at http://www.bloomberg.com/money/tools/bfgloss.html (same). 16

15 Mopex relies primarily on the deposition testimony of experts and witnesses for its definition of "sector". See Mopex Mem. at 18 (citing the definitions provided by Weber, Gastineau, and Nathan Most, a former senior vice president of the AMEX). Such reliance on extrinsic evidence is unnecessary and improper here.

16 A court must consider an array of dictionaries in determining the "plain meaning" of a term. See Geoffrey Nunberg, High
Moreover, the patent specification uses the term "sector" interchangeably with "subgroup", thereby suggesting that the two words are synonymous. See Patent '685 at column 7, lines 36-46 ("The index of mutual funds described herein provides a means for identifying superior historical performance within each subgroup . . . . The hope is that by identifying and investing within an index of funds that have demonstrated superior risk/return ratios within a particular sector, these funds will continue to produce superior returns with low risk.") (emphasis added).

3857

E. "secure access"

Plaintiff contends that one need only consider the specification to construct "secure access."

(Dkt 64, p. 10). Additionally, Plaintiff relies on the Dictionary of Computer and Internet Words at pages 1 and 247 for definitions of "security" and "access," arguing that "secure access" should be construed as "the prevention of unauthorized entry or use of a directory, file, program, or device on a computer system or over a network." (Dkt. 86 at Ex. 1, p. 1). Plaintiff does not, however, include a construction of 'access' in its ordinary meaning.

Defendants on the other hand contend that the entire phrase "said home page providing only secure access by each browser-based subscriber to one of a plurality of subscriber areas within said system" must be construed. The Court disagrees. Those additional substantive terms are being construed separately. Further, Defendants' suggested construction of "[a] home page of a web site, as construed above, that provides only for the entry of a unique subscriber log-in and password..." (emphasis added), would improperly import a limitation from the specification into the claim. See Burke, Inc., 183 F.3d at 1340. The specification explains that a "unique subscriber log-in and password" provides a "secure access" to a subscriber area. The claim merely references the home page as "providing only secure access by each browser-based subscriber to one of a plurality of subscriber areas" and says nothing about a "unique subscriber log in and password."

The term "secure access" can be construed in accordance with its ordinary meaning, considered in the context of the entire claim. Its meaning is readily apparent and does not require elaborate interpretation. General purpose dictionaries are helpful in this circumstance, however. Phillips, 415 F.3d at 1314. A person skilled in the art would understand the term "secure access" to mean "the ability to gain entry to and make authorized use of, such that unauthorized entry and use is prevented."

The plain language of Claim 1 states that the home page provides only secure access to one of a plurality of subscriber areas. (229 patent, col. 5, ll. 60-63). The Court interprets this plain language to mean that the only type of access provided is "secure." The specification supports this conclusion. "Each of the subscribers 12 and 20 enter the system 11 via a home page 18 of the system 11. A unique subscriber log-in and password provides a secure access to a subscriber area 28 which then provides access to data forms (not shown) of a software application which are transferred to, and appear on the screen of each remote subscribers PC." (Id., col. 3, ll. 50-57).

The Dictionary of Computer and Internet Words defines "security" as the "prevention of unauthorized use of a program and device" and "access" as "the ability to locate, gain entry to, and use a directory, file, or device on a computer system or over a network." (Dkt. 64 at Ex. 6, pp. 1, 247). These definitions are consistent with the patent claim and specification. Accordingly, the Court construes the term "secure access" to mean "the ability to gain entry to and make authorized use of, such that unauthorized entry and use is prevented."

3858

"secure computer network address"
The '180 patent, claims 1, 17, and 33 contain the term "secure computer network address." VirnetX contends that "secure computer network address" means "a network address associated with a computer capable of virtual private network communications." Microsoft contends that "secure computer network address" means "a network address that requires authorization for access." The parties dispute whether the network address "requires authorization for access."

The Court construes "secure computer network address" as "a network address that requires authorization for access and is associated with a computer capable of virtual private network communications." First, the claim language supports that the network address requires authorization for access. Claim 1 of the '180 patent states "[a] method for accessing a secure computer network address, comprising the steps of." Col. 56:48-50. The claim then goes on to list the method steps including "receiving from the secure domain name service a response message containing the secure computer network address corresponding to the secure domain name" and "sending an access request message to the secure computer network address." Col. 56:55-57; 56:58-59. This supports that the "secure computer network address" requires authorization because there must be a request made to the "secure computer network address" in order to access the "secure computer network address." Accordingly, the Court uses "requires authorization for access" in construing "secure computer network address."

Second, the claim language supports that a "secure computer network address" is associated with a computer capable of virtual private network communications. Claim 1 states "A method for accessing a secure computer network address, comprising steps of." Col. 56:48-50. The claim later states the step "sending an access request message to the secure computer network address using a virtual private network communication link." Col. 56:59-61. Thus, the secure computer network address receives an access request message via a virtual private network communication link. This shows that the secure computer network address is associated with the computer at the secure computer network address that is using the virtual private network communication link. Accordingly, the Court construes "secure computer network address" as "a network address that requires authorization for access and is associated with a computer capable of virtual private network communications."

GO BACK

3859

"secure domain name"

The '180 patent, claims 1, 17, and 33 contain the term "secure domain name." VirnetX contends that "secure domain name" means "a domain name which indicates that it is to be translated into a secure computer network address by a secure domain name service." Microsoft contends that "secure domain name" means "a non-standard top-level domain name (such as .scom, .sgov. or .sorg) that corresponds to a secure computer network address." The parties dispute whether the claimed invention is limited to "non-standard top-level domain name."

The Court construes "secure domain name" as "a domain name that corresponds to a secure computer network address." "Secure domain name" ordinarily includes "non-standard top-level" domain names or equivalents as suggested by the specification, but "non-standard top-level" is not a limitation. Claim differentiation shows that "secure domain name" is not limited to "non-standard top-level" domain names. Differences among the claim terms can assist in understanding a term's meaning. Phillips, 415 F.3d at 1314. For example, when a dependent claim adds a limitation to an independent claim, it is presumed that the independent claim does not include the limitation. Id. at 1314-15. Dependent claims 11, 27, and 41 contain the "top-level" limitation whereas their corresponding independent claims 1, 17, and 33 do not. Thus, it is presumed that independent claims 1, 17, and 33 do not contain the "top-level" limitation. As a result, "secure domain name," without further express limitations provided in the claims, presumably does not contain the "top-level" limitation.

Microsoft argues that there is clear disavowal in the specification. The specification states:

The present invention provides a domain name service that provides secure computer network addresses for secure, non-standard top-level domain names. The advantages of the present invention are provided by a secure domain name service for a computer network that includes a portal connected to a computer network, such as the Internet, and a domain name database connected to the computer network through the portal. According to the invention, the portal authenticates a query for a secure computer network address, and the domain name database stores secure computer network address for the computer network. Each secure computer network address is based on a non-standard top-level domain name, such as .scom, .sorg, .snet, .snet, .sedu, .smil and .sint.
Col. 7:36-42 (emphasis added). Thus, the specification asserts that the invention provides the secure domain names that are "non-standard top-level," using the "present invention" language. However, such language is not necessarily limiting. "Use of the phrase 'the present invention' does not 'automatically' limit the meaning of claim terms in all circumstances, and . . . such language must be read in the context of the entire specification and prosecution history." Netcraft Corp. v. eBay, Inc., 549 F.3d 1394, 1398 (citing Rambus Inc. v. Infineon Techs. AG, 318 F.3d 1081, 1094 (Fed. Cir. 2003)). The claims show that "non-standard top-level" should not be imported as a limitation into the claims. Accordingly, the Court does not use "non-standard top-level" in construing "secure domain name."

There is no dispute as to whether "secure domain name" "corresponds to a secure computer network address." In any case, the claim language itself states that a secure domain name corresponds to a secure computer network address. Claim 1 states "sending a query message to a secure domain name service, the query message requesting from the secure domain name service a secure computer network address corresponding to the secure domain name." Col. 56:51-55 (emphasis added). Thus, the claim language clearly establishes that a secure domain name corresponds to a secure computer network address. Accordingly, the Court construes "secure domain name" as "a domain name that corresponds to a secure computer network address."

The '180 patent, claims 1, 17, and 33 contain the term "secure domain name service." VirnetX contends that "secure domain name service" means "a service that receives requests for secure computer network addresses corresponding to secure domain names, and is capable of providing trustworthy responses." Microsoft contends "secure domain name service" means "a domain name service that provides secure computer network addresses for secure, non-standard top-level domain names."

The Court construes "secure domain name service" as "a lookup service that returns a secure network address for a requested secure domain name." This construction is consistent with the claim itself. Claim 1 states

sending a query message to a secure domain name service, the query message requesting from the secure domain name service a secure computer network address corresponding to the secure domain name; receiving from the secure domain name service a response message containing the secure computer network address corresponding to the secure domain name.

Col. 56:51-61. This language shows that the secure domain name service receives a query message requesting a secure computer network address that corresponds to a secure domain name. Then, the secure domain name service sends a response message containing the secure computer network address that corresponds to the requested secure domain name. As such, the secure domain name service looks up a secure domain name network address in response to a requested secure domain name. Accordingly, the Court construes "secure domain name service" as "a lookup service that returns a secure network address for a requested secure domain name."

IV. "secure hash operation" and its relevant permutations

</tbody>
</table>
14 The term "secure hash operation" is contained in claim 1 of the '646 patent and claim 1 of the '612 patent.

15 The term "secure hash algorithm" is contained in claim 12 of the '646 patent.

16 The term "secure hash computer program" is contained in claim 12 of the '646 patent.

The patents-in-suit both contain permutations of claim terms that will be collectively referred to as the "secure hash terms" or "secure hash function." The secure hash terms include "secure hash operation," "secure hash algorithm," and "secure hash computer program."

PACid argues for a construction of the secure hash terms that includes two important properties of secure hash operations: (1) that the output is deterministic (i.e., repeatable in that the same inputs always produce the same outputs), and (2) that the output has no known relationship with the input that may be used to recover the input from the output. REPLY at 6. PACid's proposed construction is premised on language in the specifications reciting, "There is no known relationship between the input and output of a hash algorithm which may be used to recover the input from the output." OPENING at 7 (citing '646 patent at 2:8-10; '612 patent at 2:15-17).

Defendants argue that the specifications and extrinsic evidence known to a person of skill in the art require a secure hash function to include the four key properties of a secure hash, a "well-known tool used in cryptography": (1) that the output is always the same binary length regardless of the size of the input, (2) that it is computationally infeasible to determine the input from the output, (3) that it is computationally infeasible to determine two inputs that produce the same output, and (4) that on average, approximately 50 percent of the secure hash output bits are changed when only one single bit is changed. RESPONSE at 6-10; see also id. at 5, n.2 (citing cryptography handbooks and other technical resources)). Defendants present specific arguments contending that these four requirements of a secure hash were embraced by the patentee at the time of the invention and are further supported through intrinsic evidence and technical standards established in the prior art. Id. at 5-6. Given the disagreement surrounding the four criteria in Defendants' proposal for "secure has operation," each requirement will be evaluated in turn.

1. Accepting the proposal that the output is always the same binary length regardless of the size of the input

The first requirement proposed by Defendants is well-supported by the intrinsic language of the '646 and '612 patent specifications. Both patents clearly state that a "characteristic of a hash algorithm is that the output is always the same binary length regardless of the size of the input." '646 patent at 2:2-4; '612 patent at 5:5-11. This is further clarified in the '612 patent in describing "the present invention" by stating that a secure hash function produces a message digest of constant binary length, regardless of the length of the input. '612 patent at 2:54-65. Importantly, while this specification language appears to describe the properties of secure hash functions generally, the Court notes that the use of "present invention" does not automatically trigger a narrowing of the claim language. See Fenner Investments, Inc. v. 3Com Corp., No. 6:08-cv-61, 2009 U.S. Dist. LEXIS 44842, 2009 WL 1505407, at *11-12 (E.D. Tex. May 26, 2009) (stating that the Court will not read a specification discussing "present invention" to be magic words that automatically triggers a narrowing of the claim language) (citing Verizon Services Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1308 (Fed. Cir. 2007)).

Instead, as the language is used here, the description of "the present invention" in the '612 patent offers additional insight as to the patentee's understanding of the secure hash terms in a manner that comports with relevant teachings cited in the prior art. 17 Defendants have put forward a comprehensive showing that the definition of "secure hash" was known at the time of the invention through a consistent collection of prior art representing that when there was a variable length input, there was always a fixed length output. See RESPONSE at 7 (citing technical resources). In particular, the patentee's knowledge of this property was characterized through the disclosure of the SHA-1 reference, as well as through the of the Schneier Book instructing one of ordinary skill in the art as to "general information related to file encryption techniques." '612 patent at 2:49-51. Recognizing that cited prior art "can have particular value as a guide to the proper construction of the term," the body of prior art identified by Defendants effectively demonstrates the basic requirements of a "secure hash" known at the time of the invention. Arthur A. Collins, Inc. v. N. Telecom Ltd., 216 F.3d 1042, 1045 (Fed. Cir. 2000). Therefore, based on the consistent representation of this property in the intrinsic record, the Court accepts as a key requirement of a secure hash
function that an input of variable bit length will always produce an output having a fixed length.

17 For example, both patents-in-suit disclose the Secure Hash Standard, FIPS PUB 180-1 ("SHA-1") as an example of "secure hash." '646 patent at 2:26-28; 5:27-28; '612 patent at 2:2-5; and 5:2-4. SHA-1 demonstrates that an input can be of variable length, but always produces an output having the same bit length.

2. Rejecting proposals (a) that it is computationally infeasible to determine the input from the output and (b) that it is computationally infeasible to determine two inputs that produce the same output

It was clarified at the hearing that the "computationally infeasible" language in Defendants' proposal is not present in the PACid patents, but Defendants suggest that it is nonetheless intrinsic because it derives from the SHA-1 reference disclosed in the '646 and '612 patent specifications. See '646 patent at 2:26-28; 5:27-28; '612 patent at 2:2-5 and 5:2-4. While it has previously been noted that cited prior art can guide the construction of a claim term because it may indicate the meaning of the term to a person of skill in the art at the time of the invention, Defendants' incorporation of "computationally infeasible" improperly imports an unclaimed limitation into the proposed construction.

18 Defendants seek to include these requirements based on language in the SHA-1 standard reciting that "[t]he SHA-1 is called secure because it is computationally infeasible to find a message [i.e., input] which corresponds to a given message digest [i.e, output] . . . ." RESPONSE at 8, n.7 (citing SHA-1 standard).

Even with the support of the SHA-1 or Schneier Book prior art references, the Federal Circuit's claim construction teachings strongly weigh against interjecting limitations that are not present in the claims, the specification, or the prosecution history of the patents. Dayco Products, Inc. v. Total Containment, Inc., 258 F.3d 1317, 1325 (Fed. Cir. 2001) (declining to read an unclaimed and potentially undisclosed limitation into the claims). It is a basic canon of claim construction that one may not read a limitation into a claim from the written description, Simmons, Inc. v. Bombardier, Inc., 73 Fed. Appx. 421, 423 (Fed. Cir. 2003) (citing Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1248 (Fed. Cir. 1998)), and the same holds true for limitations imported from intrinsically cited prior art. In evaluating the prosecution history and cited prior art, a court should consider how the evidence demonstrates the inventor understood the invention and whether the inventor intended to limit the scope of the invention. Trading Technologies Intern., Inc. v. eSpeed, Inc., 595 F.3d 1340, 1352 (Fed. Cir. 2010) (internal citations omitted). Here, there is no indication that the inventor was seeking to include the meanings presented in the SHA-1 reference, and in the absence of clear intent, the proposed limitation unnecessarily restricts the scope of the claim terms. See Saunders Group, Inc. v. ComforTrac, Inc., 492 F.3d 1326, 1332 (Fed. Cir. 2007) (holding that claim scope is not limited to the disclosed embodiments "unless the patentee has demonstrated a clear intention to [do so]").

Despite related language cited from the written description that purportedly confirms the "computational infeasibility" of the secure has function, the Court finds that the patentee failed to identify Defendants' proposed requirement when defining the invention or otherwise negotiating with the PTO during the prosecution history. Accordingly, the definition provided for these claim terms will not include the "computationally infeasible" restriction, but will encompass the underlying substantive teachings as presented in the patents.

3. Altering the proposal that on average, approximately 50 percent of the secure hash output bits are changed when only one single bit is changed

Lastly, Defendants propose the written description requires that if a single bit of the input is changed, on average approximately 50% of the output bits are changed. RESPONSE at 11. PACid, however, maintains that this improperly imports a limitation from the specification in to the claims and unnecessarily complicates the construction of the "secure hash" terms. REPLY at 5. As a preliminary matter, this limitation, unlike the "computationally infeasible" language, finds
support in the intrinsic record. At the hearing both parties cited to the Background of the Invention section, stating: "if only one bit in a message or file is changed, approximately 50% of the bits in the output change." '646 patent at 2:2-8; '612 patent at 2:13-15. Similarly, the '646 specification states that, "[t]he irreversibility of the encryption key was made even more difficult by using a secure hash algorithm, which has the property of changing on average approximately 50 percent of its output bits when only a single bit in the input is changed." '646 patent at 6:5-9. In general, the effect of Defendants' argument and proposal regarding these specification passages could confuse the jury into applying an approximate floor and ceiling to the bits that may change as a result of the claimed hash operations. The Court finds that the application of such a floor or ceiling is at odds with the specification and the statistical underpinning of a secure hash operation.

Looking first at the cited passages, it is determined that, in context, neither passage imposes a strict floor or ceiling to the percentage of bit changes that may occur in a secure hash operation. Rather, both passages were reciting a desirable characteristic of secure hash function and an apparently true characteristic of the preferred embodiment SHA algorithm. For example, in both instances, the SHA algorithm is identified within just a few lines of the passage. Furthermore, even referring to the SHA algorithm or strict avalanche criteria cited by Defendants, there may only be a 1/2 probability that each bit will change. See RESPONSE at 10 (citing ALFRED J. MENEZES, PAUL C. VAN OORSCHOT & SCOTT A. VANSTONE, HANDBOOK OF APPLIED CRYPTOGRAPHY 277 (1997) (defining "strict avalanche criterion" as "whenever one input bit is changed, every output bit must change with probability of 1/2")). Since there is simply a statistical 1/2 chance of each bit changing, on rare occasions, far greater than 50% of the bits will change. Thus, if the jury misunderstood that any strict ceiling or floor applied, then the preferred embodiment would fall outside the claims in certain instances.

Of course, while the fact finder may be confused into applying a floor or ceiling, Defendants do not technically argue for literal bit-change limits, but rather propose a statistical average limit of approximately 50%. A general notion of an average 50% change is indeed supported in the intrinsic evidence quoted above. Defendants further cite extrinsic references to bolster and enforce the necessity of its proposed 50% average limit. In particular, Defendants point to extrinsic definition for the term "strict avalanche theory." However, Defendants do not sufficiently support that strict avalanche theory applies to all secure hash algorithms such as the non-SHA algorithms listed in the specifications. See '646 patent at 5:30-43; '612 patent at 5:5-16. Nevertheless, the Court is persuaded that the specifications reference to a 50% average bears on the definition of the secure hash terms at least to require the "dramatic change" to the input, as referenced in the specifications. See '646 patent at 5:21-24; '612 patent at 4:64-67. Further, the specifications' repetitive recitation of "dramatic change" supports Defendants' proposal with respect to the notion that a high percentage of bits must change on average. Thus, the 50% language should not be completely ignored, but should be applied in a way that respects the specifications' teachings regarding dramatic change and does not set a strict ceiling.

Finally, at the hearing, Plaintiff suggested that, if the Court were to adopt the 50% principle, then there would be agreement in applying the words "at least," thus implying a floor on average, but not a ceiling. Defendants agreed that they had proposed that language. See TRANSCRIPT at 60-61. Accordingly, the Court provides the following constructions:

- The term "secure hash operation" means "a deterministic operation that produces a fixed output bit length regardless of input bit length such that it is practically impossible to determine (a) the input from the output, and (b) two inputs that produce the same output and where if a single bit of the input is changed, on average at least approximately 50% of the output bits are changed."

- The term "secure hash algorithm" means "an algorithm that implements a secure hash operation."

- The term "secure hash computer program" means "a computer program that implements a secure hash operation."

"secure web site"

The '135 patent, claims 1 and 10 contain the term "secure web site." VirnetX contends that "secure web site" means "a computer associated with a domain name and that can communicate in a virtual private network." Microsoft contends that "secure web site" means "web site that requires authorization for access." The parties dispute whether a "secure web site"
requires authorization for access and whether a "secure web site" can communicate in a virtual private network.

The Court has construed "web site." See supra. The Court construes "secure web site" as "a web site that requires authorization for access and that can communicate in a VPN." First, the specification supports that a "secure web site" "requires authorization for access." The specification states

According to certain aspects of the invention, a specialized DNS server traps DNS requests and, if the request is from a special type of user (e.g., one for which secure communication services are defined), the server does not return the true IP address of the target node, but instead automatically sets up a virtual private network between the target node and the user. The VPN is preferably implemented using the IP address "hopping" features of the basic invention described above, such that the true identity of the two nodes cannot be determined even if packets during the communication are intercepted. For DNS requests that are determined to not require secure services (e.g., an unregistered user), the DNS server transparently "passes through" the request to provide a normal look-up function and return the IP address of the target web server, provided that the requesting host has permissions to resolve unsecured sites. Different users who make an identical DNS request could be provided with different results.

Col. 37:63-38:13 (emphasis added). These italicized portions explain that "secure" relates to registered users who have the ability to set up a virtual private network with a target node. This supports that "secure" means "requiring authorization for access." 6

Second, the claims themselves support that a "secure web site" "can communicate in a VPN." Claims 1 and 10 state "transparently creating [create] a virtual private network (VPN) between a client computer and a target computer." Col. 47:20-22; Col. 48:3-5. The "client computer" may seek access to a "secure target web site," which is on the target computer. See Col. 47:20-22; Col. 48:3-5. Because a VPN may be established between the client computer and target computer, the "secure target web site" can communicate in the VPN so that the client computer can access the "secure target web site" at the target computer. See Col. 47:29-32; see Col. 48:16-19. Accordingly, a "secure web site" "can communicate in a VPN," and the Court construes "secure web site" as "a web site that requires authorization for access and that can communicate in a VPN."

3863

Claim 36 of the '179 patent is representative of the claims at issue on appeal: 1

36. A method for establishing the validity of a display created by a non-secure printer, said method comprising the steps of:

placing in said printer paper upon which information may be created, said paper containing preestablished data which is unique to said paper;

communicating at least a portion of said preestablished data to a location independent from said printer, said independent location operable to send to said printer a security indicia, as part of a human readable display, said security indicia created in part by information contained in said preestablished media data and whereby said security indicia is validatable at a subsequent time partially under control of data contained in said preestablished paper data, said unique data being created on said paper defining one or more from the group consisting of:

postage stamps, money orders, bank drafts, letters of credit, legal documents, legal certificates, diplomas, passports, birth certificates, visas, drivers licenses, social security cards, medical insurance cards, vacation packages, travel vouchers,
car rental vouchers, hotel vouchers, meal vouchers, drink vouchers, food stamps, tickets, baggage tags, prescriptions (Rx), vehicle licenses, vehicle titles;

wherein said paper is divided into sections each section adapted for printing thereon information pertaining to a different display, each such display having associated therewith a security indicia.

The central dispute concerns the meaning of the underlined language describing the creation and validation of the security indicia. The claim construction dispute pertains to three separate terms or phrases:

1) "security indicia"

2) "said independent location operable to send to said printer a security indicia, as part of a human readable display, said security indicia created in part by information contained in said preestablished media data" (the creation limitation)

3) "and whereby said security indicia is validatable at a subsequent time partially under control of data contained in said preestablished paper data" (the validation limitation)

The construction of all three terms, however, turns on the same issue: whether the security indicia must be created and validated under control of a key contained in the preestablished data. In its Markman Order, the district court construed "security indicia" by stating that the indicia must "be created under control of a key" and stated that the "information contained in" the preestablished data must be a "key." Kara Tech. Inc. v. Stamps.com, Inc., No. 05-1890, 2007 U.S. Dist. LEXIS 98764, *28 (C.D. Cal. Sept. 10, 2007) (Claim Construction Order). The district court further construed the creation limitation as "said independent location having a computer programmed to create a security indicia under control of a key contained in the preestablished data that is capable of sending to the printer a security indicia, and that the security indicia is part of a human readable display." 2007 U.S. Dist. LEXIS 98764 at *31. Finally, the court construed the validation limitation as "and by which it may be established at a subsequent time, under control of the key contained in the preestablished [media or] paper data, that the security indicia is authentic." 2007 U.S. Dist. LEXIS 98764 at *32. In doing so, the district court explained that "the history of secure systems design supports that this invention requires a key." 2007 U.S. Dist. LEXIS 98764 at *28. It also referred to the detailed embodiment in the specification describing the use of a key in the preprinted data to support its construction. Id.

Kara argues that the term security indicia should be construed as "any distinctive mark that can be used to establish the validity of a document or display." It further argues that these claims do not require that the security indicia be created or validated by a key contained in the preestablished data. In response, Stamps.com argues that only a cryptographic key embedded in the preestablished data allows for the creation, control, and validation of the security indicia, as required by the patent claims. We agree with Kara that the preestablished data does not have to contain a key, and, as logically follows, that the security indicia does not have to be created or validated by a key in that data.

The claims at issue do not state that the preestablished data contain a key; they state that the data contain "information." Specifically, the plain language of the claims requires that the security indicia be "created in part by information contained in preestablished media data." See, e.g., ‘179 patent col.12 ll.14-15. This language does not require that the preprinted data contain a key, and certainly not a cryptographic key (as argued by Stamps.com), from which the security indicia would be generated. The preestablished data must, as the claim requires, simply contain information that will be used to create the security indicia--the information will be part of what creates the security indicia. Similarly, the claim requires that "security indicia is validatable at a subsequent time partially under control of data contained in said preestablished paper data." This merely requires that the data in the preestablished paper data (in this case the serial number on the preprinted label) is part of what must be used to validate the security indicia. It in no way requires a key in the preestablished paper data.

- 4126 -
Moreover, when all of the claims of the '179 and '575 patents are viewed together, it is clear that the claims at issue on appeal do not require a key in the preprinted data. "Differences among claims can . . . be a useful guide in understanding the meaning of particular claim terms." Phillips, 415 F.3d at 1314. Here, when the inventor wanted to restrict the claims to require the use of a key, he did so explicitly. None of the claims at issue on appeal recite the term "key." By contrast, all of the other independent claims require either an "encryption key" or "key data." '179 patent claims 1, 14, 47, 54, 59, 66; '575 patent claims 52, 60. In addition, dependent claim 2 of the '575 patent explicitly adds the limitation to claim 1 of the '575 patent that the security indicia "is validated by key information contained in at least a portion of said preestablished data." This further indicates that the claims at issue on appeal do not require the use of a key in the preprinted paper. See Phillips, 415 F.3d at 1314-15 ("[T]he presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim.").

To be sure, the specification repeatedly discusses a key embedded in the preestablished data. See, e.g., '179 patent col.2 ll.11-15, col.4 ll.52-59, col.5 ll.57-60, 65-67. In the only detailed embodiments in the patent, the key is embedded in the preestablished data. Id. This is not enough, however, to limit the patentee's clear, broader claims. The claim language read in the context of the specification does not require that a key be contained in the preestablished data, the patentee did not act as his own lexicographer or disavow claim scope. It is the claims that define the metes and bounds of the patentee's invention. See Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989). The claims, not specification embodiments, define the scope of patent protection. The patentee is entitled to the full scope of his claims, and we will not limit him to his preferred embodiment or import a limitation from the specification into the claims. See Phillips, 415 F.3d at 1323.

Thus, in the context of these patents, a security indicia is "a mark printed on a document that can be used to verify the authenticity of the document." The disputed terms and phrases require that the information or data contained in the preestablished data be used to create and validate the security indicia, but contrary to the district court's determination and Stamps.com's arguments, they do not require a key or cryptographic key in the preestablished data.

The expert testimony presented below does not compel a different result. The claims recite "security indicia created in part by information . . . and . . . validatable at a subsequent time partially under control of data." See, e.g., '179 patent col.12 ll.14-17. Stamps.com's expert, Professor McDaniels, testified that the terms "by" and "under control of" are terms of art that would indicate to one skilled in the art of secure systems design that the preprinted information must contain a cryptographic key, which he defined as "a very large number (e.g., 500 to 1,000 digits long)." Kara presented competing testimony by Professor Keromytis, who opined that the terms would indicate to one skilled in the art that while the preprinted information must be used for both creation and validation, it "need not 'contain' a 'key.'" It is not uncommon in patent cases to have such dueling experts. When construing claims, however, the intrinsic evidence and particularly the claim language are the primary resources. We have held that extrinsic evidence such as expert testimony is "less significant than the intrinsic record in determining the legally operative meaning of claim language." Phillips, 415 F.3d at 1317 (internal quotation marks omitted). While helpful, extrinsic sources like expert testimony cannot overcome more persuasive intrinsic evidence. A "court should discount any expert testimony that is clearly at odds with the claim construction mandated by the claims themselves, the written description, and the prosecution history, in other words, with the written record of the patent." Id. at 1318 (internal quotation marks omitted).

Here, the testimony of Stamps.com's expert cannot overcome the plain language of the claims, which requires only that the security indicia be created "in part" by and validatable "partially" under control of the preprinted information and which does not require a key in the preestablished data. See, e.g., '179 patent col.12 ll.14-17. The asserted claims, in contrast to other claims in these patents, do not contain a limitation to a key embedded in the preestablished data, and we decline to read such a limitation into them.

Although the parties acknowledged for the first time at the Markman hearing that "security measures" and "coded embedding" are not identical, they did not offer the Court any proposed construction for the term "security measures." Consequently, it falls to the Court to determine the meaning of "security measures."
The claimed invention seeks to prevent dishonest persons from misusing the invention by issuing drafts payable to someone other than an authorized payee. The system uses "security measures" to "reduce the likelihood of production of unauthorized drafts." '677 patent, col. 4, lines 31-34. Every time the term "security measures" is referred to in the identified claims, it includes, but is not limited to, "coded embedding." See, e.g., '677 patent, claim 2 ("security measures comprising the coded imbedding of said identification of said payee in said software"); claim 22 (same); claim 37 (same); claim 39 (same). Other security measures that are available in addition to "coded embedding," include password protection and encryption. See, e.g., '249 patent, claim 12 (claiming hard coding and password protection as security measures). Thus, "security measures" is broader than "coded embedding" and shall be construed as "measures taken to preclude the generation of drafts payable to someone other than the payee, including at least coded embedding of the payee identification information." (1) Security Module

Square D argues that "security module," should be construed to mean "a module that performs the task of preventing access to data, such as by authenticating users through passwords, data encryption, or firewalls." EL contends that the term should be construed to mean "a module including encryption and authentication components." At the Markman hearing, Square D offered an alternative construction: "module including encryption, authentication or firewall components." The emphasis on "or" is Square D's. The dispute, therefore, is whether the term security module" necessarily includes both encryption and authentication components. The Court finds that it does not.

First, the plain language of the claim does not require authentication and encryption; it merely requires that the module be "operative to prevent unauthorized access to said power management data." col. 33, lines 49-50. Second, the specification uses "or" - not "and" when discussing these measures. See, e.g., U.S. Patent No., 6,751,562 B1, col. 15, lines 65-67 ("[i]n an alternate embodiment the Security Sub-layer 321a includes authentication or encryption . . ."). The Court construes the term "security module" to mean "a module that performs the task of preventing unauthorized access to data, including encryption, authentication or firewall components." 2. Claim Construction

NRT argues that the district court erred in incorporating its claim construction in its discussion of enablement and in interpreting claim 1 to require perfect isolation between those signals that pass through irregularities and those that do not. NRT argues that the term "select" means that only those signals that do not pass through irregularities are to be preferred to those signals that do. According to NRT, the term "select" does not require absolute perfection in separating signals that pass through an irregularity from those that do not. Because claim construction is a matter of law that we review de novo, we independently construe claim 1 of the '576 patent.

Claim interpretation begins with the language of the claim itself. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619, 34 U.S.P.Q.2D (BNA) 1816, 1819 (Fed. Cir. 1995). The claim terms are to be given their ordinary meaning unless it is apparent that the inventor intended to use them differently. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D (BNA) 1619, 1622 (Fed. Cir. 1996); Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2D (BNA) 1162, 1165 (Fed. Cir. 1995). At issue on appeal is the construction of part (d) of claim 1, more specifically, the limitation that requires the claimed invention to "select[] for processing those of said process signals which do not pass through irregularities in the bodies of said material items." The parties agree that the ordinary meaning of the term "select" means "chosen in preference to another or others; picked out, especially for excellence or some special quality; picked." Webster's New World Dictionary (3rd College Ed.) (emphasis added).

The plain meaning of the term "select," including the dictionary meaning agreed upon by the parties, implies that some signals are to be picked or chosen and others are to be excluded based upon some special, unique or discrete quality. A
specific choice is being made. Both claim 1 and the specification of the '576 patent make clear that those signals that do not pass through irregularities are to be chosen for processing to the exclusion of those signals that do pass through irregularities. Nothing in the plain and ordinary meaning of the term "select" indicates that only a preference for signals that do not pass through irregularities is required. Furthermore, nothing in claim 1 indicates that signals are to be picked based on any other characteristic than penetrating a "normal" or regular portion of a container. Claim 1 clearly indicates that the "special quality" for which a signal is selected is whether or not that signal has passed through an irregularity. There is no indication in the plain meaning of the limitation, or from the claim as a whole, that this selection criterion is to apply only some of the time.

Nothing in the specification indicates that the inventor intended to deviate from the plain and ordinary meaning of the word "select." Thus, the plain language of the claim when read in light of the specification is clear that the term "select" does not merely require a "preference" for certain signals. Signals are to be specifically chosen based on whether or not they pass through irregularities in the container.

f. "To Select Voids"

The parties next dispute the meaning of the term "to select voids" that first appears in claim 15. They agree that the construction should include the phrase "to identify particular voids to be altered," but Lexmark and Dell seek to add "as distinguished from the coincidental filling of all voids in a row between existing scan lines which results from deinterlacing" n8 to the end of the definition.

During prosecution, Cooper sought to distinguish his invention from a prior art patent, which disclosed deinterlacing a video signal. He referred to the prior art process as "coincidental" and specified that his invention, by contrast, selectively detected voids before filling them. Lexmark and Dell contend that this amounts to a disclaimer of coincidental filling caused by deinterlacing during prosecution.

As we read IP's proffered definition, the distinction Lexmark and Dell seek to make explicit is already contained within it. The phrase "identify particular voids" makes it clear that voids are not coincidentally or accidentally filled. Rather, the term "identify," much as the term "select," implies some purposeful or deliberate action that is neither coincidental nor accidental. Therefore, the court adopts IP's proposed construction: to identify particular voids to be altered.

This construction applies equally to the related terms "indicating voids" in claim 146 of the 780 patent and "to determine the presence of a void" in claims 1 and 107 of the 637 patent.

B. "selectable categorical information"

The second disputed phrase from the '730 patent is "selectable categorical information." At the claim construction hearing, the parties informed the Court that they had come to a partial agreement on this phrase, and offered two revised constructions for consideration. The revised constructions are shown below.

<table>
<thead>
<tr>
<th>LSI'S PROPOSED CONSTRUCTION</th>
<th>SANDISK'S PROPOSED CONSTRUCTION</th>
</tr>
</thead>
</table>
As seen above, the parties differ only on whether the selectable categorical information must be selectable by a user. In claim 1, "selectable categorical information" is defined as information "related to . . . individual tracks of audio." The dependent claims explain that this may include the category of music for the track and artist information (cols. 6:14-27, 6:34-44). Importantly, there is no limitation that this information must be selectable by any particular person or thing.

At oral argument, SanDisk pointed to various portions of the specification that described user selection. For example, the specification stated that it was "an object of the present invention[] to provide a storage format for pre-recorded music that is easily selectable by a user in regard to general content" (col. 1:40-43) (emphasis added). Elsewhere, the specification described the invention as one that "allows a user to make selections by type of music, mist, etc. which is to be played over a period of time" (col. 1:67-2:3) (emphasis added). 2 This idea of user interaction was reiterated by the specification in other places as well (see, e.g., col. 3:49-53).

Even so, this order declines to read SanDisk's proposed limitation into the claim. A person having ordinary skill in the relevant art at the time the patent application was filed would have understood that individual music tracks could be categorized in ways that would be useful to (and therefore selectable by) a computer program, but not necessarily a user. For example, music files might be categorized by whether or not they are "copy-protected." If a user attempts to copy ten music files to a personal music player, a software program might "select" only those files that are not "copy-protected" and limit the copying to just those music files. In such a scenario, the copy-protection information would be "selectable categorical information" pertaining to individual tracks of audio, but it would not be selectable by the user. As such, "selectable categorical information" is construed by this order to mean "information related to a type of music that can be used to select individual tracks of music."

Even so, this order declines to read SanDisk's proposed limitation into the claim. A person having ordinary skill in the relevant art at the time the patent application was filed would have understood that individual music tracks could be categorized in ways that would be useful to (and therefore selectable by) a computer program, but not necessarily a user. For example, music files might be categorized by whether or not they are "copy-protected." If a user attempts to copy ten music files to a personal music player, a software program might "select" only those files that are not "copy-protected" and limit the copying to just those music files. In such a scenario, the copy-protection information would be "selectable categorical information" pertaining to individual tracks of audio, but it would not be selectable by the user. As such, "selectable categorical information" is construed by this order to mean "information related to a type of music that can be used to select individual tracks of music."

1. The word "SELECTED" (claim 29 4) requires no construction.

5. "Selected" (Claims 1, 10, 11)

The term "selected" has a plain and ordinary meaning that is obvious to both skilled artisans and laypersons alike. (Broadcom Reply at 46 (citing Webster's definition of "chosen"); Acampora Rep. at 40.) A claim term assumes its ordinary and customary meaning "unless the patentee . . . redefines the term or . . . characterizes the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex,
299 F.3d at 1327. Agere proposes that the Court adopt the construction that "selected" means "inserted" because, according to Agere, the patentee explicitly redefined the term as such. Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998) (noting that patentee's explicit definition of term controls).

A review of the claim language reveals no basis for the Court to deviate from the plain and ordinary meaning of this term. Agere derives its limiting construction from the final preferred embodiment described in the specification in which the patentee writes: "In addition, the base module may interrogate the selected ('inserted') communication module(s) to determine which antennas to interconnect." (‘705 patent, col. 37, ll. 58-60.) This parenthetical does not indicate a clear intention on the part of the patentee to redefine the term "selected," but rather as an acknowledgment that the base module cannot "interrogate" the chosen communication module until it has been inserted into the base module. (Acampora Rep. at 41.) This conclusion is consistent with the claim language, which suggests a two-step process comprised of "selecting" a communication module and "inserting" the module into the base module. (‘705 patent, col. 38, ll. 26-27 ("The base module receiving the selected one of the plurality of communication modules in an assembled position") (emphasis added).)

For the foregoing reasons, the Court cannot conclude that one parenthetical, located in one preferred embodiment, exhibits the patentee's "clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Brookhill-Wilk 1, 334 F.3d at 1299. Thus, the Court finds that the term "selected" is used in accordance with its plain and ordinary meaning and requires no construction.

3871

C. First Server Computer and the "Selected Computer Resources of at least a [or said] first server computer . . ."

Plaintiff contends that the first server computer, or "subscription access server," does not need to actually store all of the selected computer resources it makes available to subscribers. Rather, Plaintiff contends, the first server computer can act as a gatekeeper, controlling access to those resources by instructing a "Service Function" to make those services, applications or content available. (D.I. 266 at 27; D.I. 305 at 17-18).

Defendants contend that the claim language and specification of the '416 Patent require that the first server computer physically store all of the protected content it communicates to subscribers, pointing to language in the specification stating that the invention "control[s] access to selected computer resources of at least a first server computer." (D.I. 306 at 20, citing ‘416 Patent, col. 35, ll. 26, 29-31)(emphasis added). Defendants contend that the use of the word "of" implies possession of resources by the first server. (Id. at 20). However, reading the claim in the context of the entire patent, the Court concludes that Defendants' contentions rely on an overly restrictive concept of possession, and that, given a broader reading, the language cited by Defendants is consistent with the specification.

The specification discusses a system whereby various web sites are hosted through web servers operating in conjunction with first server computers that protect the contents of the sites. (See e.g. col. 5, ll. 14-16, col. 27, ll. 3-4). Figure 3 shows the protected contents residing outside of the first server computer, with the path over which protected contents can be sent crossing through the "Service Function" block rather than the server. (Id., Fig. 3). Likewise, in Figure 4, the protected content resides outside the first server, and is accessed by the server through the "Service Function," which also resides outside the first server computer. (Id., Fig. 4). Thus, the Court concludes that the system disclosed in the specification and corresponding figures does not require the first server computer to store the resources it communicates to subscribers. Rather, it allows the server to act as a gatekeeper, accessing selected computer resources protected by the invention either itself or through a "Service Function" block, and communicating those resources to subscribers.

Accordingly, the Court construes "First Server Computer" to mean "a computer that makes available information or other resources." The Court also construes "selected computer resources of at least a [or said] first server computer" to mean "computer services, applications, or content that can be accessed by (either directly or indirectly) said first server computer."
II. Selected Content and Selected Displayed Content

Defendants propose that the terms "selected content" and "selected displayed content" be construed as "a distinct item clicked, marked or highlighted on a screen to perform an operation on the item. The distinct item, or content, does not include a URL." Aloft argues that no construction is necessary. At the hearing, the parties had difficulty articulating the basis for the disagreement regarding these terms. Nonetheless, a number of discrete agreements were reached. Both sides agree that: (1) "selected content" and "selected displayed content" do not include a URL, "Hr'g Tr. 45:9-10; (2) "selected content" and "selected displayed content" may include an entire web page, Hr'g Tr. 44:8-14, 50:18-19; (3) a product which stores metadata or un-displayed content along with selected content satisfies the claim limitation at issue, Hr'g Tr. 63:6-9, 64:11-21; and (4) "selected content" must be selected with affirmative user action. DEF'S RESP. at 13; PL.'S REPLY at 1-2.

In light of these agreements, the Court finds Defendants' proposed construction to be inappropriate for a number of reasons. First, because the parties have agreed that selected content does not include a URL, there is no need to restate this agreement in a construction of this term. Second, Defendants' proposed construction limits the term "selected" to "clicked, marked, or highlighted on a screen." However, Defendants concede that these "are merely examples of ways the user can specify the selected item." Def.'s Resp. at 15. Because the parties agree that selection requires affirmative user interaction, the Court sees no reason to limit this term to the examples listed by Defendants. Finally, Defendants' reference to a "distinct item" injects unnecessary ambiguity into the claim language. Because this phrase does not appear in the specification of the patents, it is unclear if it would include multimedia files, highlighted text, or portions of a web page. Such a result would be inconsistent with the patent's description of "documentation related to the selected URLs" as "web pages, articles, spread sheets, slide shows, compressed documents such as files in Portable Document Format (.pdf), etc. and can even include multimedia files and streaming multimedia." '443 Patent 9:3-6; Aloft I, 570 F. Supp. 2d at 893-894. The Court has no reason to conclude that the "content" of the asserted claims is narrower than this exemplary list described in the specification.

--- Footnotes ---

1 In Aloft I this Court stated: "Defendants also expressed concern that "content" could potentially encompass non-displayable information that "documentation" could not. However, Defendants do not explain how the word "documentation" will resolve this concern. A URL can just as easily reference a hidden document as it can hidden content." 570 F.Supp. 2d at 894 n. 3.

--- End Footnotes ---

Defendants' primary argument appears to be that the claims require that "selected content" be visually depicted on a computer screen, selected by a user, and stored. For example, consider a web page with an image of a box labeled "audio" that contains a link to an audio file stored on a server. When a user views the web page and clicks on the box, the user's computer retrieves the audio file and plays it. A software product may allow a user to select the box labeled "audio." Defendants argue that if that product stores only the link to the audio file or the audio file itself, but not the box displayed on the web page, that product would not satisfy the claims at issue because it does not store the displayed, i.e. visually depicted, content. Hr'g Tr. 67:14-25. Plaintiff argues that the product would satisfy the claim limitation because it stores content that has been selected, i.e. the link to the audio file. Hr'g Tr. 64:11-21.

--- Footnotes ---

2 The parties presented this example at the Markman hearing, and the Court has relied on it to explain the parties' positions. However, the Court does not offer any infringement analysis or express any opinion as to the functionality of any of the accused products.

--- End Footnotes ---

The Court sees no reason to limit the "selected content" of claims 36 and 37 to the exactly visually depicted content selected by a user. Rather, as explained by the Court in Aloft I, content may include spread sheets, slide shows, pdfs, multimedia, and...
streaming multimedia files, which need not be visually depicted on a screen. The Court must begin its construction by
consulting the claim language at issue. Phillips, 415 F.3d at 1314. Claims 36 and 37 recite "selected content associated with
at least one of the URLs displayed during use of the network browser is . . . stored." This "selected content" may include a
link or an audio file, among other things, as those items may be associated with a "URL[] displayed during use of the
network browser." This is true even though the link or audio file is not visually depicted on the screen. Because Defendants
do not point to any evidence other than the language of the claims at issue, the Court sees no reason to inject Defendants'
limitation into the claims. Having rejected Defendants' argument, the Court finds that this term can be easily understood by
a jury and that no construction is necessary.

For the reasons stated above, Defendants' proposed construction for the term "selected displayed content" is inappropriate. The Court finds that a jury could easily understand this term and that no construction is necessary.

A. Claim Construction

On February 16, 2006, the Court held a claims-construction hearing in this matter. See Markman v. Westview Instruments,
Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The Court considered the '136 Patent and prosecution history,
the parties' Markman briefs, the applicable law regarding, inter alia, claim construction, indefiniteness, and means-plus-
function claims, and the argument of counsel. On May 25, 2006, this Court rendered a claims-construction order (Doc. #
292), which construed the terms as following:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Construed Meaning</th>

</tbody>
</table>
1. At Selected Higher and Lower Pressure Magnitudes

This phrase is found in Claims 3 and 24 of the '802 Patent and Claims 9, 44, and 53 of the '193 Patent.

Phrase: At selected higher and lower pressure magnitudes

Construction: at a higher pressure magnitude and a lower pressure magnitude that have been chosen prior to operation of the computer circuitry that is used to determine whether the patient is inhaling or exhaling.

Reasoning: The dispute between the parties focuses on when, and how, the two pressures must be selected. Plaintiffs contend that they can be selected in any manner and at any time prior to their being applied. In fact, at the hearing, plaintiffs contended that the lower pressure could fluctuate breath by breath while the device is in operation. Defendant
contends that the pressures must be selected manually prior to operation.

In construing the term "selected" it is of primary importance to understand the overall context of the patents themselves. These patents disclose bi-level treatment devices. The claims disclose a treatment method that senses the occurrence of the exhalation or inhalation phase of the breathing cycle, even in the presence of system leakage, based on the spontaneous breathing of the patient, so that the system knows when to apply a higher pressure magnitude (i.e., during inhalation), or a lower pressure magnitude (i.e., during exhalation).

With that said, in arriving at the proper construction of the term "selected", we must look at the entirety of the claims. By way of example, the word "select" appears in Claim 3 of the '802 Patent twice. It is the first occurrence of the term that we are being asked to construe. The first time, "select" is used it appears in the past tense as part of the first step of the claim (i.e., "... for delivery to the airway of such a patient at selected higher and lower pressure magnitudes... "). The second time, "select" appears it is used in the present tense as part of the final "utilizing" step of the claim (i.e., "utilizing said instantaneous flow rate and said reference indicia to select one of said higher and said lower pressure magnitudes"). When the claim is read in its entirety, it is clear that the "selected" higher and lower pressure magnitudes of the first step are pre-selected, before the computer circuitry does its detecting, processing, and utilizing, so that once the circuitry has completed these tasks, it can pick which of the two pressures to apply. Apart from the structure of the claim itself, this is supported by the fact that in the final "utilizing" step, the higher and lower pressures are referred back to as "said", or previously mentioned/referenced, pressures (i.e., "utilizing said instantaneous flow rate and said reference indicia to select one of said higher and said lower pressure magnitudes").

This reading of the claim language is consistent with the remaining intrinsic evidence. The specifications, figures, and prosecution history all presuppose that the two pressures are chosen before the device starts detecting, processing, and utilizing. See e.g., Prosecution History, '802 Patent, Amendment and Remarks (June 11, 1990) at 19-20; '802 Patent, Fig. 4; cl. 2, Ins. 59-63; cl. 3, Ins. 24-28; cl. 6, Ins. 43-46, 55-59, 61-66; cl. 8, Ins. 53-55; cl. 11-12, Ins. 62-62; cl. 13, Ins. 24-32, 40-42. There is no indication in the patents that the lower pressure magnitude can somehow be changed breath by breath, as was asserted at the hearing. While a person of ordinary skill in the art might be able to modify the invention so as to "select" the pressures via computer screen, rather than dial, there is nothing to suggest that the "selected" step is nearly as broad as plaintiffs contend.

4. Selected Matching Items

'683 Patent, Claims 3, 6, 26, 28, 29

'172 Patent, Claim 1

ePlus asserts that this term need not be construed but that, if it is, it should be construed to mean: items returned in search results that are selected for inclusion on an order list or in a requisition. Lawson proposes that the term mean: one or more items selected by a user in the search program from the list of 'matching items' for inclusion in an order list.

a. Words of the Claims

Claim 3 of the '683 Patent claims an electronic sourcing system comprising:

at least two product catalogs containing data relating to items associated with the respective sources;

means for selecting the product catalogs to search;

means for searching for matching items among the selected product catalogs;

means for building a requisition using data relating to selected matching items and their associated source(s);
means for processing the requisition to generate one or more purchase orders for the selected matching items; and
means for converting data relating to a selected matching item and an associated source to data relating to an item and a different source.

'683 Patent at 25:10-23 (emphasis added). Claim 6 of the '683 Patent claims an electronic sourcing system comprising:

a database containing data relating to items associated with at least two sources;
means for searching for matching items in the database;
means for building a requisition using data relating to matching items and their associated source(s);
means for processing the requisition to generate one or more purchase orders for the selected matching items; and
means for converting data relating to a selected matching item and an associated source to data relating to an item and a different source.

'683 Patent at 25:31-42. Claims 28 and 29 of the '683 Patent claim a method comprising the steps of:
maintaining at least two product catalogs on a database containing data relating to items associated with the respective sources;
selecting the product catalogs to search;
searching for matching items among the selected product catalogs;
building a requisition using data relating to selected matching items and their associated source(s);
processing the requisition to generate one or more purchase orders for the selected matching items; and
converting data relating to a selected matching item and an associated source to data relating to an item and a different source.

'683 Patent at 26:62-67; 27:12-17 (emphasis added). Claim 1 of the '172 Patent claims an electronic sourcing system comprising:

a database containing data relating to items associated with at least two vendors maintained so that selected portions of the database may be searched separately;
means for entering product information that at least partially describes at least one desired item;
means for searching for matching items that match the entered product information in the selected portions of the database;
means for generating an order list that includes at least one matching item selected by said means for searching;
means for building a requisition that uses data obtained from said database relating to selected matching items on said order list;
means for processing said requisition to generate purchase orders for said selected matching items.

'172 Patent at 23:56-24:42 (emphasis added). The words of the claim clearly link the selected matching items to the requisition.
b. Specification

The specification shows that the selected matching items are items that are eventually transferred to a requisition. For example, the '683 Patent provides:

When in search program 50, particular items selected can be added to an Order List 48...The items that are sent to the Order List 48 are collected and shown on the Items Selected screen of Shell 52...Upon clicking on "Order" when the Items Selected screen (Appendix VI) is viewed, many or all of these fields on the items in the Order List are transmitted back to REQU program 44A (via the programs of interface 60 shown in FIG. 2) to be added to the pending Requisition Item Table 46.

'683 Patent at 11:30-55.

c. Prosecution History

During prosecution of the '683 Patent, the inventors, in amending the claims, noted that, "[a]pplicants have amended the claims using the following terminology: 'selected matching items' are requisition items..." (Pl. Ex. 22 at 11 (emphasis added).) This statement demonstrates that meaning given to the claim term by the inventors.

d. Proper Construction

The words of the claim and specification make clear that selecting matching items are used to build a requisition. And, the prosecution history unequivocally states that selected matching items are requisition items. Thus, this term is construed to mean: requisition items. That construction is also consistent with the construction in ePlus, Inc. v. Ariba, Inc., Civil Action No. 1:04cv612 (E.D. Va.). (P1. Ex. 10 at 27.)

First, ERM argues that the method used by the ER Mapper does not process tiles using a DWT in a "selected sequence" as required by the representative Claim 1. ERM contends that the term "selected sequence" is limited by the selected sequence of processing tiles described in the specification, wherein the tiles are processed beginning with the tile in the upper left corner of the image. '835 patent at col. 7, II. 46-64. The processing of the tiles in this selected sequence, according to ERM, is central to the claimed invention, since it permits the storage of DWT coefficients from previous tiles for use in performing a DWT on ensuing tiles. Id. at col. 2, II. 45-60. Since the ER Mapper processes images in subparts (which we have construed to constitute "tiles") of single-row pixels, ERM asserts that it does not utilize a processing sequence beginning in the upper-left corner of the image and that therefore, as a matter of law, it does not infringe claim 1.

We decline to affirm the district court's summary judgment of non-infringement on this basis. To do so would require us to ignore the plain meaning of the term "selected sequence" and improperly import the characteristics of the selected sequence described in the specification to limit the claimed invention. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186, 48 U.S.P.Q.2D (BNA) 1001, 1005 (Fed. Cir. 1998) ("Claims are to be interpreted in light of the specification and with a view to ascertaining the invention, [but] it does not follow that limitations from the specification may be read into the claims."). The "selected sequence" limitation in the claim simply requires that the processing of tiles occur in a predetermined and planned sequence, not that it follow the particular sequence set forth in the specification. Simply put, we are not persuaded that a predetermined sequence of processing tiles beginning with a tile in the upper right of the image or the bottom row of pixels is not "selected." Nor does the specification support such a conclusion, for ERM fails to point to any language indicating that the particular disclosed sequence is the only processing sequence that meets this claim limitation. Accordingly, we interpret the term "selected sequence" in conformance with its plain meaning, instead of imposing an additional requirement that it correspond to the particular sequence disclosed in the specification.
D. Selecting

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>selecting</td>
<td>to specify a block of data, text, or image on a screen by highlighting it or otherwise marking it with the intent of performing some operation on it</td>
<td>user selects</td>
</tr>
</tbody>
</table>

The next disputed term, "selecting," is related to the previous one because both are found in the same sentence and the dispute about both centers on which actor does the selecting. The sentence containing both terms is the fourth step of Claim One: "selecting keys on the keyboard to provide the desired input." Plaintiff again argues that the actor is the computer, and Defendants again argue that it is the user. Plaintiff would construe "selecting" as "to specify a block of data, text, or image on a screen by highlighting it or otherwise marking it with the intent of performing some operation on it." Defendant's would construe "selecting" as "user selects."

Just as they did with respect to "desiring," Defendants argue that "selecting" is linked to the "user input" mentioned in step one of Claim One. (Defs' Br., at 6-7.) As Defendants see things, because the selecting "provides the desired input," and that "desired input" is the "user input," the user must be the one doing the selecting. This argument has some force even though the court has rejected Defendants' proposed construction of "desired input" based on the user's desire. That the selection is done in order "to provide" the information requested by the computer program certainly suggests that the entity doing the selecting is the same entity that provides the information--the user. Moreover, Claim One is a method of "entering data on a touch screen display." ('873 Patent, col. 20, l. 55.) In ordinary usage, the actor that enters data into a computer is the user, not the computer, so it should be no surprise that the user performs one of the steps of the method.

Plaintiff would read the language of the claim differently; it argues that step four of Claim One must be read as being done by the same actor as the other four steps, the computer program. (Pl's Br., at 16.) Context is, of course, important in interpreting a disputed claim term, Netcraft Corp. v. eBay, Inc., 549 F.3d 1394, 1396-97 (Fed. Cir. 2008), but Plaintiff provides no support for its argument that the same actor must be behind every step in a single claim. Cf. Muniauction, Inc. v. Thomson Corp., 532 F.3d 1318, 1328-29 (Fed. Cir. 2008) (all steps in single claim not performed by same actor).

Next, Plaintiff argues that because the patentees used the word "user" in other places in the claim, their failure to use it before "selects" is evidence that the user does not do the selecting. (Pl's Br., at 9-10.) By the same token, though, the inventors' failure to use the word "computer program" before "selects" is evidence that the computer program is not the actor doing the selecting. Using the phrase "steel baffles" suggests that not all baffles are made of steel, Phillips, 415 F.3d at 1314, but using the word "baffles" alone does not suggest that the writer intends to exclude baffles made of steel.

Finally, Plaintiff argues that if the computer program does not do the selecting in step four, it will be impossible for the invention to receive the desired input as required by step five. (Pl's Resp., at 8.) This argument also misses the mark as there are dozens of processes that an implementation of the invention would have to perform that are not explicitly stated in the claim. Rambus Inc. v. Infineon Techs. Ag, 318 F.3d 1081, 1093 (Fed. Cir. 2003) ("[T]he claims need not recite every component necessary to enable operation of a working device.")

Moving beyond the claim terms, Defendants support their construction with references to the specification. (Defs' Br., at 7-8, citing '873 Patent, col. 1, ll. 20-22, col. 2, ll. 50-52, col. 3, ll.16-20, col. 20, ll. 42-45.) Only one of those references actually contains some form of the word "select," but that single reference does support Defendants' construction: "Therefore, a user can input data by selecting keys 22 on the keyboard 20 as necessary." (873 Patent, col. 20, ll. 42-45.) Plaintiff responds that the sentence in question describes only a possible implementation of the invention because it includes the word "can," and Defendants' citation to it is another attempt to limit Claim One to one of the specification's examples. (Pl's Resp., at 8.) The court disagrees that Defendants are attempting to limit Claim One. As the court reads the construction, it is a proper use of the text of the specification to understand the claim terms. Abbott Labs, 566 F.3d at 1288-89.

Both sides also refer to the prosecution history, (Pl's Br., at 17-18;Defs' Br., at 8), but the court finds it to be ambiguous.
Defendants point to the inventors' statement that prior patents failed to disclose "determining that input from a user is no longer needed." (Pl's, Ex. 2, at 222.) This statement shows only that the invention involves user input; it does not show anything about how to interpret the word "selecting." The statement suggests that one step in the method might be taken by the user, but it does not require that. Plaintiff's argument about the prosecution history is that the patent examiner understood the "selecting" step to be equivalent to a certain part of the Buxton patent. (Pl's Br., at 17-18.) In summarizing reasons for rejecting the patent, the patent examiner wrote that, in Buxton, "the processor 5 and application program 50 process the data entry (selecting keys on the keyboard) from the display." (Pl's, Ex. 2, at 145.) Ignoring the last three words quoted, this reference supports Plaintiff's argument that selecting is done by the computer because selecting is equivalent to "process[ing] the data entry." When those last three words are considered, though, they suggest that the examiner equated "selected keys on the keyboard" with "data entry from the display," an interpretation that supports Defendants' argument. Accordingly, the prosecution history does not resolve the dispute.

Finally, Defendants appeal to common sense and argue that reading "selecting" as performed by the computer would be nonsensical. (Defs' Br., at 8.) The court does not agree that Plaintiff's construction is nonsensical. Nevertheless, for all the reasons given, the court finds that Plaintiff's construction is not supported by the intrinsic record. The only support that Plaintiff has for its construction is the definition of "select" found in the Computer User's Dictionary published by Microsoft Press:

select vb. 1. In general computer use, to specify a block of data or text on screen by highlighting it or otherwise marking it, with the intent of performing some operation on it. 2. In database management, to choose records according to a specified set of criteria. See also sort. 3. In information processing, to choose from a number of options or alternatives, such as input/output channels.

MICROSOFT PRESS COMPUTER USER'S DICTIONARY at 312 (1998). Although general purpose dictionaries can be helpful in reading claim language, the Microsoft Computer Dictionary is a technical dictionary within the class of extrinsic evidence, so it is less significant than the intrinsic record. Phillips, 415 F.3d at 1314, 1317-18; see also Paragon Solutions, 566 F.3d at 1092 (treating Microsoft Computer Dictionary as extrinsic evidence). In any event, the court does not understand the Microsoft Dictionary definition to be helpful to Plaintiff's argument because the definition does not require that the selecting be done by the computer.

Plaintiff's proposed construction suffers from two more serious defects. First, despite vehemently arguing that the actor doing the selecting is the computer, Plaintiff has proposed a construction that, like the definition it relies on, does not make that clear. The act of "specify[ing] a block of data, text, or image on a screen by highlighting it or otherwise marking it with the intent of performing some operation on it" could be performed by the computer program, but it could also be performed by the user. Second, Plaintiff's construction is simply not grammatical. The result of replacing the word "selecting" with Plaintiff's proposal is the following: "to specify a block of data, text, or image on a screen by highlighting it or otherwise marking it with the intent of performing some operation on it keys on the keyboard to provide the information requested by the computer program." That result would not help the jury.

Accordingly, the court adopts Defendants' proposed construction, "user selects."

GO BACK
The preamble recites that the method steps are to be performed automatically by the drilling rig. This language suggests that the selecting step is not limited to manual operation of valve selectors and/or manual calibration of regulators as construed by the district court. See Catalina Mktg. Int'l v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002) (quoting Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999)) ("In general, a preamble limits the invention if it recites essential structure or steps, or if it is 'necessary to give life, meaning, and vitality' to the claim."); Innova/Pure Water, 381 F.3d at 1118 ("Language in a preamble limits a claim where it breathes life and meaning into the claim ... but not where it merely recites a purpose or intended use of the invention.") (internal citations omitted). Hence, the language of claim 14 (particularly the preamble) does not support the district court's construction of this step.

In addition, the specification does not limit the selecting step to the manual operation of valve selectors or the manual calibration of regulators. Rather, the specification discloses an initial setup procedure in which an operator, using valve selectors 232-235, manually chooses the regulators 200-203 that will control the drilling operation once underway. See '142 patent, col. 7, l. 49-col. 8, l. 6; col. 23, ll. 6-12. The specification also discloses a manual calibration process, a subset of the initial setup procedure, for those regulators 200-203 selected using valve selectors 232-235. See '142 patent, col. 8, l. 51-col. 10, l. 3; col. 23, ll. 12-23. To clarify this setup procedure, the specification explicitly states that this initial setup occurs "before the [selected] regulator ... will automatically regulate" the release of the drill string. '142 patent, col. 8, ll. 57-61 (emphasis added). The district court relied on this portion of the specification to support its requirement of manual operation. To the contrary, this portion of the specification sets forth an initial setup or calibration step that precedes the claimed selecting step. In effect, the district court erred by reading the initial setup or calibration step into the claimed selecting step.

Notably, the specification also describes a conflict resolution process automatically performed by the drilling rig after the initial setup or calibration; i.e., once the drilling rig is up and running. See '142 patent, col. 24, ll. 4-26. Because the valves 236-239 are connected in series, see '142 patent, Figure 2, the valve 236-239 with the largest signal generally provides the signal conveyed to the air motor 204, which ultimately controls the brake 32. With two or more parameters in use (i.e., when the drill rig operator "selects" two or more parameters, such as bit weight and drilling pressure), conflicts will occur between the controlling parameters (e.g., a first parameter may suggest the drill string should be released whereas a second parameter may suggest the drill string should be held steady).

This conflict resolution process led to the 35 U.S.C. § 112, P1 rejection during prosecution, because the Examiner did not understand the drilling system's method for resolving conflicts between the "primary" and "secondary" controls. The Examiner questioned the conflict resolution method:

\[
\text{It is the examiner's view that at the least, applicant has failed to provide a logical explanation with respect to how such conflicts can be resolved. Because it is well known in the art that among other things, the relationship between rate of penetration and the drilling parameters ... one can not simply isolate one parameter from the others ... Specifically the operational procedures illustrated in [the specification] fail to teach ... how and when the secondary control overrides the primary control. Examiner also could not understand why among the four control parameters, the rpm and the torque regulators can be switched off, since as best understood, all these four parameters need to be taken into consideration and should be properly balanced.}
\]

In response, the applicant explained to the Examiner that an operator, as part of the initial setup procedure, can adjust the level for override of the primary control, thus ensuring that only undesirable conditions will trigger intervention. With this initial adjustment in place, the drilling system then automatically selects between the primary and secondary controls during operation. Thus, the prosecution history confirms that selecting in claim 14 does not encompass the initial setup or calibration of the drilling system, but rather the conflict resolution process between primary and secondary controls during operation.

Finally, one potential reading of dependent claim 15 implicitly suggests "selecting" in the context of the initial setup or calibration of the automatic driller differs from "selecting" in the context of claim 14. See '142 patent, col. 2, ll. 20-24 ("relay selectors which ... permit an operator ... to select which one of or which combination of the regulators are to control the drilling operation."). Specifically, claim 15 provides two signals, a signal representing drill string torque and a signal representing drill string RMP, in addition to the two signals required by claim 14. Compare '142 patent, col. 28, ll. 34-38, with col. 28, ll. 39-57. Because claim 15 adds signals to the control process and the addition/subtraction process is described in the specification as occurring during the initial setup/calibration of the automatic driller, "selecting" in claim
14 must refer to the conflict resolution process that occurs between controlling parameters. Otherwise, the provision of additional signals in claim 15 would be subsumed within the "selecting" step already recited in the claims.

In sum, claim 14 does not suggest that the selecting step requires a two-part manual process as interpreted by the district court. Moreover, the specification and prosecution history confirm that the two-part manual process relied upon by the district court is distinct from the claimed selecting step. Thus, the district court's interpretation of the selecting step was unduly narrow.

2. Meaning of "selecting"

The parties also dispute the meaning of "selecting" a conductive line. Defendant argues that "selecting" means bringing the line from a logical low to a logical high voltage; plaintiff argues that it means floating the line at some voltage. Section 112(6) does not apply to this dispute because it concerns not a structure, but rather a function.

The specification does not resolve the parties' dispute. Consistently with defendant's construction, the specification states that when a line has been selected, "it sits at approximately Vcc [a logical high voltage]." '811 Patent, 5:45. The specification also indicates, however, that the line is floated: "During programming word line 8 is dynamically at Vcc; there is no active voltage source holding it at Vcc since device 22 is turned off." '811 patent, 5:51-53.

The Court therefore turns to the expert testimony presented at the Markman hearing. Plaintiff's expert, Mr. Callahan, testified that "selecting" a line simply means to identify it for future action. According to his view, floating a line could select it if none of the other lines were floated. Mr. Callahan, however, provided no examples of any circuit in which a line was selected merely by being floated; defendant's expert, Dr. Fellman, refused to admit on cross examination that such a device was possible. The Court agrees with defendant that merely floating a line does not select it.

The Court does not believe, however, that in the context of the '811 patent, "selecting" necessarily means driving a line to a logical high voltage, as defendant argues. Dr. Fellman himself testified that one skilled in the art would understand "selecting" a line to mean driving it to a voltage that activates a device to which the line is connected. In the context of the '811 patent, this means driving the line to a voltage high enough to activate the transfer means. Adopting this more general definition of selecting is consistent with the principle that where section 112(6) does not apply, a claim should not be limited to the examples used in the specification. See Electro Med. Sys. v. Cooper Life Sciences, 34 F.3d 1048, 1054 (Fed. Cir. 1994).

The issue remains whether "selecting" also means floating the line once it has been driven to the level that activates the transfer means. The parties agree that the line must be floated to be able to be pumped up to a higher voltage, and that the post-decoder described in the specification is the device that causes the line to float. See '811 patent, 5:51-53. Floating the line is thus an integral part of what the selection means does; no other structure described in the patent performs that function. Accordingly, the Court holds that "selecting" is used in the '811 patent to mean driving a line to a voltage that activates the transfer means and then floating it.

The parties also dispute whether "selecting" means that all lines can be selected at the same time. Plaintiff argues that they can; defendant maintains that some lines must remain unselected. Defendant first cites a dictionary definition of "select" as "to choose from among several: pick out." That definition, however, does not preclude "selecting" from meaning choosing every item from a set. The claim, moreover, explicitly states that the invention selects "one or more" lines. The applicant was plainly aware of the issue of multiple selection; having specified that more than one line could be selected, his failure to specify that less than all had to be selected appears to have been a conscious decision. Defendant also argues that the patent refers to action on both selected and unselected lines. The Court agrees with plaintiff, however, that nothing in the patent requires that there must simultaneously be some lines that are selected and others that are unselected. The Court therefore holds that in the '811 patent, the meaning of "selecting" includes selecting all lines simultaneously.
B. Claims 40 and 67

Here, I must construe the following elements of the following claims: 19

Claim 40--"the "means . . . for selecting a set of parameters to be compounded."

Claim 67--"means for . . . selecting a set to be compounded based on the particular base solution and amount required by a set to minimize the quantity of containers of base solution required."

19 See supra note 12.

The issue is the meaning of the function "selecting." See 35 U.S.C. § 112, P 6 (claim element expressed in means-plus-function terms). Baxa contends that "selecting" is synonymous with "sorting" appearing in claims 1, 19, 87, and 93, i.e., sorting a set of parameters to be compounded such as to minimize the quantity of containers of base solutions. Clintec counters that "selecting" "means [merely] to pick or choose a set of parameters (i.e. formula) out of a sequence of formulas entered into the system by preference, such as for an emergency." 21 (Pl.'s 12(M) Statement P 37.)

20 The parties agree that Clintec has expressed these elements in the means-plus-function terms, subject to § 112, P 6. 21 The record does not support Clintec's argument that Baxa should not be allowed to offer its definition of "selecting" because it refused to do so throughout discovery.

1. Patent/Claims

The terms of the claims are given "their ordinary and accustomed meaning, unless it appears that the inventor used them differently." Jonsson v. Stanley Works, 903 F.2d 812, 820 (Fed. Cir. 1990) (quoting Envirotech Corp. V. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984)). To sort is to choose, allot, classify. See WEBSTER'S THIRD NEW INT'L DICTIONARY at 2175 (1981). To select is to choose. Id. at 2058. Thus, the two words are synonyms.

Additionally, the terms of a claim must be interpreted in light of the other claims. Jonsson, 903 F.2d at 819. Claim 67 includes the "means for . . . selecting a set to be compounded based on the particular base solution and amount required by a set to minimize the quantity of containers of base solution required." Claims 1, 19, 87, and 93 all include a step or a means of sorting a set of parameters to be compounded, in accordance with the particular base solutions and their amounts to be included in each set of parameters, such as to minimize the quantity of containers of base solutions. Since the context in which the term "sorting" appears in claims 1, 19, 87, and 93 is identical to that in which "selecting" appears in claim 67, the two terms have identical meanings.

2. Specification

The specification can act as a dictionary when it defines terms by implication. Markman, 52 F.3d at 979. The specification provides that

- 4142 -
in accordance with the present invention a system and a method are provided for compounding a plurality of selected mixtures from one or more base solutions. The system includes a storage device for storing sets of parameters for a group of mixtures which are to be compounded from the base solutions. A compounder is electrically connected to the storage device, and in combination with the storage device, compounds a selected mixture on receiving a set of parameters which define the base solutions to be used and the amounts thereof.

('010 patent, col. 3, lines 3-13) (emphasis added). The above is the first paragraph of the Summary of the Invention. Nowhere else in the specification do the words "select," "selecting," or "selected" appear. Given the importance and the prominence of the sorting feature to the Clintec's invention, it is unlikely that the first paragraph of the Summary of the Invention would refer merely to "picking or choosing a set of parameters" out of sequence in which they were entered into the computer, (Pl.'s 12(M) Statement P 37), without sorting. A more logical interpretation is that the mixtures (or sets of parameters) are "selected" for compounding (or transmitted to the compounder) in the order in which the host computer has previously sorted them to minimize the quantity of containers of base solutions out of which the mixtures will be compounded.

3. Prosecution History

22 Neither party explores the prosecution history of claim 67 in any detail and I do not find it necessary to do so. Vitronics, 90 F.3d at 1582 ("The court may also consider the prosecution history of the patent, if in evidence.") (emphasis added).

"The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. . . . Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers." Southwall Techs., 54 F.3d at 1576.

Claim 40 (numbered 37 in the patent applications) originally read as follows:

A system for compounding a plurality of selected mixtures comprising:

means for storing sets of parameters for a plurality of mixtures to be compounded from a group of base solutions;

means for compounding a selected mixture corresponding to a selected set of parameters; and

means for coupling said storing means to said compounding means.

(Ex. D at 2-3. 24) The Patent Office Examiner ("Examiner") rejected claim 37(40) for two reasons. First, she said that the claim was indefinite, 35 U.S.C. § 112, P 2:

In claim 37, line 3, again it is unclear what the "sets of parameters" are and how they are inputted into the system. It is also unclear what the "base solutions" are. In lines 5-6, how is the "selected set of parameters" selected

Axelson et al disclose an apparatus for compounding substances which includes a programmable controller for receiving the ratio, and or volume parameters to be used in the compounding apparatus. Axelson et al also teach a control means for selecting which of the substances is to be compounded. These substances have been presorted and placed in a container to facilitate ease when compounding the final mixture. Instead of presorting the substances as disclosed in Axelson et al. it would be obvious to one of ordinary skill in the art to use a programmable sorting routine, as in the instant invention, within the programmable controller of Axelson et al.
23 In discussing prosecution history, I will refer to claim 40 as claim 37(40) and amended claim 37(40).

24 The exhibits cited in the following subsection are attached to Baxa's Statement of Undisputed Facts filed as a response to Clintec's partial summary judgment motion and in support of its own cross-summary judgment motion viz-a-viz claim 40.

25 The statute states, in relevant part, that

[a] patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains.

Clintec responded to the Examiner's two objections. In an Amendment letter dated May 12, 1986, Clintec first amended claim 37(40) to address the vagueness concern:

(Amended) A system for compounding a plurality of selected mixtures to produce individual doses of mixture comprising:

means for receiving sets of parameters for a plurality of mixtures to be compounded from a group of base solutions, one set for each dose:

means for storing said sets and for selecting a set of parameters to be compounded [of parameters for a plurality of mixtures to be compounded from a group of base solutions];

means for compounding a selected mixture corresponding to a selected set of parameters to produce individual doses; and

means for coupling said storing means to said compounding means.

(Ex. D at 2-3) (new text underlined and old text bracketed in the original).

Second, Clintec did not dispute that Axelson was prior art. Rather, implicitly acknowledging that it was prior art, Clintec stated that

all of the claims have been rejected under 35 U.S.C. § 103 as being unpatentable over Axelson, Jr. et al. in view of Hawes, Jr. et al. The scope and content of the Axelson, Jr. et al. reference includes the teaching that a plurality of commodities such as various types of feed grains can be blended together to produce a final product which consists of a selected percentage of each of the commodities used to make the blend. The percentage of commodity used to make the blend is controlled by a computer which selectively opens various gates a desired amount to allow a selected amount of each commodity to flow through a chute into a grain bin.

(Id. at 6.) 26

26 Axelson includes "means for selecting the containers whose commodities are to be blended together" and "means for selecting the relative percentages of the commodities to be blended." (Ex. B, col. 1, lines 58-62.)
Clintec next distinguished the amended claim 37(40) from Axelson in the following manner:

the claimed invention, as claimed in Claims 1, 19, 37[, which issued as claim 40], 67, 87, and 93, requires that a plurality of sets of parameters of mixtures be provided and that these parameters are sorted in accordance with the particular base solutions used to make each mixture and the amount of each base solution included in each set of parameters in order to minimize the number of containers of base solution required to make a plurality of individual doses[.]

(Id.) (emphasis added). This was the only fashion in which claim 37(40) was distinguished from Axelson. Clintec also stated that other groups of claims were different from Axelson because they required time intervals, or queuing, or printing labels, or other features not found in Axelson. (Id. at 6-7.) Clintec concluded that since "none of the differences discussed above are either taught or even suggested by the Axelson, Jr. et al. reference, even given the claims their broadest interpretation suggested by the Examiner," the '010 patent claims "contain allowable subject matter over the Axelson . . . reference." (Id. at 7.)

The Examiner allowed the '010 patent after Clintec amended claim 37(40) and distinguished it, among others, from Axelson. The Notice of Allowability was "responsive to the Amendment filed May 12, 1986." (Ex. E.) The record shows that the May 12, 1986 Amendment was the only occurrence between the rejection and the allowability. The distinction drawn between Axelson and claims 1, 19, 37(40), 67, 87, and 93 in the Amendment is consistent with the repeated description of the invention in the specification as sorting mixtures to be compounded so as to minimize the number of source solution containers. (See '010 patent, col. 2, lines 64-68; col. 3, lines 44-51; col. 8, lines 45-49; col. 8, lines 64-68.)

The prosecution history is part of the "public record of the patentee's claim . . . on which the public is entitled to rely . . . [in order to] ascertain the scope of the patentee's claimed invention and [to] design around" it. Vitronics, 90 F.3d at 1583. In this case, based on the prosecution history, a reasonable competitor would be entitled to conclude the following: (1) the Examiner rejected claim 37(40) as unpatentable over prior art because the Axelson patent taught use of a computer to select which substances to compound; 27 (2) Clintec acknowledged that Axelson was prior art; 28 (3) Clintec distinguished Axelson from the amended claim 37(40) on the basis that the latter required sorting to minimize the number of containers of base solutions; (4) the Examiner allowed the amended claim 37(40) based on Clintec's amendment and explanation; and (5) the term "selecting" in claim 37(40), therefore, means the same as the term "sorting" in claims 1, 19, 87, and 93.

27 Clintec points out that the Examiner also found other differences between Clintec's various claims and Axelson. This is correct. However, this fact is irrelevant.

28 Clintec argues that Axelson is not prior art because it pertains to grains, not pharmaceuticals. Clintec cannot make this argument now. First, he did not make it in response to the Examiner's rejection. Second, in a Preliminary Amendment, dated February 14, 1985, Clintec cited numerous references to the Examiner in its Preliminary Amendment and Information Disclosure Statement ("IDS"), (Ex. C), that did not involve pharmaceutical compounding. In the IDS, Clintec said that "each of the above-identified systems is believed to be pertinent to the pending application in that each discloses a form of multicomponent mixing system." See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1304 (Fed. Cir. 1997) ("holding that statements made in an IDS can be the basis for a court to interpret the scope of the claims").
appear suggests the meaning attributed to it by Baxa, i.e., sorting to minimize the number of source solution containers. See supra; ('010 patent, col. 3, lines 3-13.)

Relying on Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017 (Fed. Cir. 1987), Clintec says that different words in claims are presumed to have different meanings. Although Tandon does make this statement, id. at 1023, it immediately follows with another: "practice has long recognized that claims may be multiplied . . . to define the metes and bounds of the invention in a variety of different ways. (cites omitted) Thus two claims which read differently can cover the same subject matter." Id.

Clintec also relies on the doctrine of claim differentiation. Under this doctrine, "interpretation of a claim should be avoided if it would make the claim read like another one." Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 404 (Fed. Cir. 1967). Clintec points out that claim 62, which depends upon claim 40, includes "means for sorting authorized parameter sets." Thus, the plaintiff says that claim 40 cannot likewise include a "sorting" limitation. However, "although the doctrine of claim differentiation may at times be controlling," it is trumped if

the "definition [at issue] . . . is otherwise clear from the claim language [the specification], and [the] prosecution

O.I. Corp. v. Tekmar Co. Inc., 115 F.3d 1576, 1582 (Fed. Cir. 1997); see also Autogiro Co. of Am., 384 F.2d at 404 ("Claim differentiation is a guide, not a rigid rule. If a claim will bear only one interpretation, similarity will have to be tolerated."). Such is the case here.

Clintec attempts to invoke the testimony of its expert, Mr. Uhen. However, in cases such as this one, "where the public record unambiguously describes the scope of the patented invention, reliance on any extrinsic evidence[ such as expert testimony[,] is improper" because the public is entitled to rely on the public record. Vitronics, 90 F.3d at 1583.

Clintec insists that what Baxa is doing is improperly injecting into claim 40 a "sorting" element appearing in the prosecution history. Clintec says that Kay Hannafan, the attorney prosecuting the patent application, simply made a mistake when she stated that claim 37(40) required sorting. Clintec relies on Intervet Am., Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050 (Fed. Cir. 1989), this court's opinion in Viskase Corp. v. American Nat'l Can Co., 947 F. Supp. 1200 (N.D. Ill. 1996), and International Rectifier Corp. v. SGS-Thomson Microelecs. Inc., 38 U.S.P.Q.2d (BNA) 1083 (C.D. Cal. 1994).

In Intervet the prosecution history was as follows: responding to the second Patent Office action, the attorney prosecuting the patent application sought to distinguish his invention from the prior art on the basis that, unlike the prior art which required two vaccinations, his invention required only one. In the third Patent Office action, the Examiner pointed out that the claims were not expressly limited to a single vaccination which would patentably distinguish them from the prior art. In response, the attorney amended only three of the claims to refer to a single vaccination. In the "Remarks" accompanying the amendment, however, the attorney said that all claims were restricted to a single vaccination. The attorney subsequently admitted that the "Remarks" statement was incorrect. 887 F.2d at 1053-54.

The court held that

when it comes to the question of which should control, an erroneous remark by an attorney in the course of prosecution of an application or the claims of the patent as finally worded and issued by the Patent and Trademark Office as an official grant, we think the law allows for no choice. The claims themselves control.

Id. at 1054.

The court acknowledged that

there are . . . situations in which what an attorney says or does during prosecution may be held against a patentee . . . . For example, when a patentee attempts to expand the literal meaning of a claim . . . and the prosecution history shows that the expanded scope would be inclusive of subject matter the attorney had represented to the examiner was not intended to be included in order to get the claim allowed, the patentee may be estopped to contend otherwise.

Id. (emphasis in the original). The court concluded that the instant case was different because "the patentee was granted broad claims in spite of the statement by the attorney that he was amending them, though he never did so." Id. (emphasis added). The court pointed out that "the examiner was not misled or deceived[because] the erroneous remark was not the end
of the prosecution." Id. There were two telephone interviews between the attorney and the examiner, the examiner made two "examiner's amendments," and the absence of the "single vaccination" limitation in all but three claims "may very well have been discussed." Id.

The present case is different. In Intervet three claims were expressly limited to one vaccination, while the others were not. The Intervet court did not have to interpret an existing term. The Intervet court itself acknowledged the difference between "interpreting what is meant by a word in a claim[, which is proper via reliance on the prosecution history,] . . . [and] adding an extraneous limitation appearing in the [prosecution history], which is improper." Id. at 1053 (emphasis in the original); Vitronics, 90 F.3d at 1582 (in interpreting claim, "the court may also consider the prosecution history of the patent, if in evidence"). In addition, unlike the Intervet attorney, Ms. Hannafan amended claim 37(40) in response to the Examiner's vagueness, not patentability, concern. Then, in response to the Examiner's patentability objection, she explained how the amended claim 37(40) differed from the prior art, thereby defining "selecting." Unlike in Intervet there is no evidence of further contact between the Examiner and Ms. Hannafan, during which the Examiner could have acquired a different understanding than that conveyed by the May 12, 1986 Amendment. Unlike Intervet, the only logical conclusion is that the Examiner allowed claim 37(40) because of Ms. Hannafan's explanation, not in spite of it. See Intervet, 887 F.2d at 1054.

Clintec insists that the Examiner knew that "selecting" and "sorting" had different meanings, see id. ("The examiner was fully aware of what claims he was allowing."); and that Ms. Hannafan's error would be obvious to anyone perusing the prosecution history, see Southwall Techs., 54 F.3d at 1578 (competitors "must be able to rely on the patent documents[, including prosecution history,] . . . in ascertaining the scope of a patentee's right to exclude"), because (1) neither the original nor the amended claim 37(40) contained the term "sorting;" (2) prior to the May 12, 1986 Amendment, the Examiner demonstrated that she knew the difference between "selecting" and "sorting;" (3) Clintec amended the original claim 37(40) to add a "selecting," not a "sorting," function; and (4) the Examiner did not require Clintec to further amend claim 37(40) to include a "sorting" limitation. However, these statements are unresponsive to Baxa's argument, i.e., that in the one and only response by Clintec to the rejection of its patent, Clintec (through Ms. Hannafan) effectively defined "selecting" as "sorting," thereby shaping the Examiner's and the public's understanding of the meaning of that word. 29

29 Clintec relies on the fact that, prior to the May 12, 1986 Amendment, regarding claim 37(40), the Examiner asked "how is the selected set of parameters' selected?" while with respect to claim 87, she asked "how is the sorting accomplished?" (Ex. A at PP 12, 13.) However, the unamended claim 37(40) recited "means for compounding a selected mixture corresponding to a selected set of parameters," while the unamended claim 87 recited "sorting the sets of parameters in accordance with the types of base solutions included in each said set." (Ex. D at 2-3, 4) (emphasis added). The Examiner rejected the above claims, among others, for vagueness. Obviously, in seeking clarification of vague terms, she would have posed the question using the words whose meaning was unclear. One cannot surmise from this that the Examiner knew that "selecting" and "sorting" meant different functions.

In Viskase v. American Nat'l Can Co., also relied upon by Clintec, the issue was the meaning of the term "about" as used in the phrase "a density below about 0.91 g/cm<3>." The plaintiff argued that it meant a number between 0.905 and 0.914. The defendant argued that it meant 0.910. 947 F. Supp. at 1202. One of the defendant's reasons was that in a letter sent to the Patent Office after the plaintiff's patent had been allowed, the plaintiff's attorney stated that the patent "does not have a density below about 0.910 g/cm<3>." Id. (emphasis added). Following Intervet, this court disregarded the attorney's statement because "in no other place in the prosecution history did Viskase use a third decimal point," id., the attorney used the word "about," suggesting numbers "slightly above and slightly below," id. at 1201, "the Examiner certainly knew that the claims themselves included broader language than the limitation of 0.910," 30 and " the Examiner "did not require an amendment." Id. at 1202.

30 This statement was based on the court's earlier observation that the Examiner said that the plaintiff "clearly . . . intended to claim below 0.91," and that the plaintiff's claims included "density of from about 0.86 to about 0.91." Viskase, 947 F. Supp. at 1201.
The present case is different. By limiting "about 0.91" to "0.910," the defendant was advocating a construction contrary to the term's "ordinary dictionary definition" and to its understanding by "persons skilled in the art." Id. The Examiner in the present case did not indicate that she differentiated between "sorting" and "selecting." See supra. The term "sorting" appears more than once in the prosecution history because Clintec's Ms. Hannafan used it to distinguish claims 1, 19, 37(40), 67, 87, and 93 from Axelson. See supra. In addition, the specification abounds with the term "sorting," in contrast to "selecting." See supra. Finally, it is not surprising that the Examiner in this case did not require a further amendment of claim 37(40) since she had been provided with the definition of "selecting" by the May 12, 1986 Amendment.

In the third case relied on by Clintec, International Rectifier, the attorney "plainly wrongly" distinguished prior art. The court concluded that the Patent Office must have "found other grounds on which to distinguish [prior art] and did not rely on the erroneous statement made by counsel." 38 U.S.P.Q. at 1091. Clintec cites this case in support of its contention that the Examiner must have distinguished claim 37(40) from Axelson on grounds other than those represented by Ms. Hannafan. However, Ms. Hannafan's explanation that "selecting" in claim 37(40) required sorting to minimize the number of source solution containers would not have appeared "plainly wrong," see id., to the Examiner who herself rejected claim 37(40) as unpatentable over Axelson.

I conclude, therefore, that the meaning of "selecting" in claims 40 and 67 is identical to that of "sorting" in claims 1, 19, 87, and 93. Since there is no genuine issue of material fact that Baxa's compounders employ the identical or equivalent structure for "sorting" as that disclosed in the '010 patent, see supra, there can be no literal infringement of claims 40 and 67. Carroll Touch, 15 F.3d at 1578 (literal infringement of means-plus-function element requires that accused device (1) perform identical function and (2) do so with identical or equivalent structure). Accordingly, Baxa's summary judgment motion on literal infringement and cross-summary judgment motion viz-a-viz claim 40 are granted. Clintec's summary judgment viz-a-viz claim 40 is denied.

6. The Selecting Step

For the purposes of claim construction, the "selecting step" is defined as: "selecting a floor broker to whom a further instruction is to be transmitted." 877 Patent col.32 ll.46-47. Papyrus suggests that the selecting step means "choosing a floor broker to whom another instruction will be sent." Pl. PCCO 2. Papyrus argues that the selecting step does not require that the choice of floor broker be based on current-status information or on the number of unfilled orders, and thus, no such limitation should be read into the claim. Pl. Br. 19. Rather, the booth clerk's selection could be based on either the calculating step, the displaying step, or both. Pl. MHSP vol. 1 at 69. Because the invention provides that the programmed computer display the broker status and that the booth clerk "can monitor the progress of one or more of the floor brokers," the clerk's review of the status information may occur as a result of the displaying step, but not necessarily so. 877 Patent col.10 ll.2-5; see id. col.9 ll.24-27. In addition, Papyrus also cites dictionary definitions to support its construction, noting that "select" means "to take preference from a number or group: to pick out: choose." Pl. Br. 19; see Pl. App. Ex. 48 at 473; Pl. App. 49 at 497.

On the other hand, NYSE proposes the following definition for the step: "the operator selects, based on the displayed current status information and number of unfilled orders calculated above using current status information, the identity of a floor broker to whom a further instruction is to be transmitted." Def. PCCO 2. NYSE relies on the patent specification to argue that broker selection depends on the current-status information and the quantity of pending instructions. For example, the Abstract explains that "the method uses a programmed computer to compare a relative number of instructions having a pending status . . . and find the floor broker having comparatively few pending instructions." 877 Patent Abstract (emphasis added). Similarly, the body of the specification explains that

[t]he determination of who among several floor brokers is best able to handle a further instruction may be made, for example, by comparing the relative number of instructions having a pending status that have been delegated to the floor brokers, and finding the floor broker with a comparatively few number of such instructions.

- 4148 -
Id. col.9 ll.55-60 (emphasis added). In addition to the patent language, NYSE also relies on the prosecution history to buttress its argument. Specifically, NYSE argues that Papyrus overcame the prior art by emphasizing a selection process in which brokers with a comparatively smaller number of pending instructions were selected based on status information received at the programmed computer. Def. Br. 23; Def. MHSP 117. The April 23, 1997 amendment states that "[t]he operator's selection is informed by current-status information concerning any delegated instructions which is transmitted to the programmed computer by virtue of the 'transmitting' step and automatically displayed by virtue of the 'displaying' step." Pl. App. Ex. 8 at 183. Further, the September 8, 1997 amendment emphasized that "[t]he real time nature of the claimed invention was stressed [by Papyrus] in the record in connection with the claimed 'current-status' information, as informing the operator's selection of a floor broker to whom a further instruction is to be transmitted." Pl. App. Ex. 12 at 207. Finally, NYSE notes that inventor Mr. L. Thomas Patterson answered affirmatively when asked during his deposition whether "[the person] managing the floor brokers, [is] making the selection based on the display that is recited in the previous step [i.e., the displaying step]." L. Thomas Patterson Dep., Murray Decl. Ex. 18 at 155; Def. MHSP 118.

In light of this evidence, the court disagrees with Papyrus's contention that the selecting step need not be based on current-status information. The intrinsic evidence stands in sharp contrast to Papyrus's proposed construction, and clearly explains that operator's selection is informed by the current-status information. The court therefore construes the selecting step as "the operator selects, based on the displayed current status information and number of unfilled orders calculated above using current status information, the identity of a floor broker to whom a further instruction is to be transmitted."

1. Term 7 (‘413 Patent, Claims 8, 18, 20)

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>… responsive to a DNS query, selecting a given one of the name servers in the content delivery network … [claims 8, 18]</td>
<td>… in response to a DNS query, the content delivery network's domain name system selects a particular name server …</td>
</tr>
<tr>
<td>… responsive to a DNS query received from a client local name server, selecting a given one of the name servers in the content delivery network … [claim 20]</td>
<td>… in response to a DNS query received from a client local name server, the content delivery network's domain name system selects a particular name server …</td>
</tr>
</tbody>
</table>

The crux of the disagreement between the parties here is whether the selection of the particular name server is a result of a DNS lookup, or whether the claim covers any method which results in the selection of a particular name server in response to a DNS query. Limelight argues that there is no support in the specification for any method of choosing a particular name server other than by a DNS lookup. The Brief Summary of the Invention describes the "hosting framework" as including two sets of DNS servers. (‘413 Patent, col. 3 ll.27-32.) "To locate the appropriate hosting servers to use, the top-level DNS server determines the user's location in the network to identify a given low-level DNS server to respond to the request for the embedded object." (Id. col.3 ll.37-41.) In Limelight's view, this requires the invention's domain name system to choose the second-level name server.

Akamai counters that, under Limelight's proposed construction, if the particular name server is selected by a first DNS lookup, the particular name server chosen must therefore be a member of a second DNS level. This, they assert, is in conflict with language earlier in each of the three claims describing the content provider's domain name system as "having one or more DNS levels." (‘413 Patent, Claim 1 emphasis added.) In addition, they point to other claims that explicitly require a two-level DNS system as evidence that the patent differentiates between claims that require a two-level DNS implementation and claims that do not. Therefore, Akamai argues for a broad, dictionary definition of "selecting" as "making a choice." (Docket # 68, 28.)
The error in Akamai's argument is that limiting the selection of a particular name server to the DNS lookup does not necessitate two DNS levels from the client's perspective. While the embodiment describes a global hosting system containing a two-level DNS system, it notes that "the functionality of the top and low-level servers" may be combined in "a single DNS level." (413 Patent, col.5 ll.59-65 (emphasis added).) Thus, the specification supports language claiming a single-level DNS system, but with the requirement that it accomplish the same steps as the described embodiment. For example, in the described embodiment, the top-level DNS server selects a low-level name server and "[re]direct[s] the user to a... low-level DNS[] server that is close-by [the user]." (Id. col.9 ll.49-50.) The user's local name server then makes a second DNS request to this second level of DNS to obtain the object's IP address. 10

Footnotes

10 (See '413 Patent, col.10 ll.26-27 ("[T]he ability to redirect [DNS] requests is a standard feature in the DNS system."); see also Akamai Technologies, Inc. Tutorial -- Corrected Version (Docket # 84) Figure 7 (showing the end user's local domain name server making two separate DNS lookups, steps 2 and 3, to determine the IP address of the Akamai content server.).) In a single-level DNS embodiment, as suggested by the specification, the user's local name server would still contact a content delivery provider's top-level name server to resolve the IP address of a server to serve an object. This name server, however, would then directly communicate with a particular local name server, based on the user's location, to resolve the server's IP address and return it to the user, rather than require the user to conduct a second lookup. Thus, the user would obtain the IP address of the appropriate ghost server with only a single DNS request, however the selection of a particular name server would still be the result of a DNS lookup by the service provider's DNS system. Such an embodiment would satisfy the claimed "one" level of DNS, yet not be in conflict with Limelight's proposed claim construction.

However, Limelight's proposed requirement that "the content delivery network service provider conducts a DNS lookup to select a single specific name server" is excessively limiting. (Docket # 71, 23.) Each of the three claims containing the term to be construed requires a "content delivery network service provider" to establish a "domain name system (DNS) having authority to resolve the alphanumeric strings in the URLs of the objects identified by the participating content providers" having "one or more DNS levels." (413 Patent, Claims 8, 18, 20.) As discussed supra, Term 2, the service provider's domain name system includes "special function[s] that [are] different from regular DNS servers like those of the .com domain" and "appropriate control routines" to select a particular name server. (Id. col.9 ll.44-50.) Read in this light, the selection of a particular name server is made by these special functions in the DNS system in response to a DNS query, but not necessarily by a DNS lookup. 11 The construction adopted by the court reflects this broader understanding of the term in dispute.

Footnotes

11 While a subtle distinction, the court interprets a "DNS lookup" to be the name resolution function provided by normal DNS servers like those of the .com domain.

End Footnotes

3883

2. Selecting a language from a menu and selecting a currency from a menu

Claim terms should be construed consistently throughout a claim and claims of the same patent. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001). The court therefore finds that these phrases should be construed in the same manner. The proper constructions of these terms are "choosing a language after presentation of a language menu and consideration of user input," and "choosing a currency after presentation of a currency menu and consideration of user input." n3

Footnotes
For the purposes of this discussion, the proper construction of the currency term will be described. As noted above, however, the resulting construction is applicable to the language term.

DE contends that the phrase should be construed as "direct selection of a currency by a customer from a list of currency options, or default selection of a currency by a customer and/or by a computer system from a list of information other than currency options." Dell contends that the construction should be "choosing a currency from a list of currency options displayed to the user."

In attempting to limit the construction to a direct user selection, Dell relies upon the specification. For example, the Summary of the Invention provides that "the customer also selects the currency in which to pay for the products to be bought." '020 Patent, col. 3, ll. 44-46. The preferred embodiments section describes that, "this second database provides a 'real time' conversion from the currency of the country in which the catalogue originates to that selected by the customer." Id. at col. 5, ll. 65-67. Although the summary of invention and preferred embodiments refer to customer selection of a currency, that method of selecting a currency is not necessarily exclusive. As Dell notes in its brief, a default currency can be chosen based upon the customer's selection of a language or a country. See Dell's Supplemental Claim Construction Brief and Proposed Conclusions of Law, at 13 (citing '020 Patent, col. 4, ll. 43-45 ("the selection of language operates a default to select the most likely currency of the customer unless the customer indicates otherwise"); id. at col. 5, ll. 16-21 ("the downloading of the country of origin of the selected catalogue also triggers an automatic access of the translation database ... to provide the specific currency conversion between that of the original catalogue country and that of the customer as selected by the automatic defaults")).

The default selection of a currency can be overridden by the user. As the preferred embodiments provide, "the selection of language operates a default to select the most likely currency of the customer unless the customer indicates otherwise." '020 Patent, col. 4, ll. 43-45 (emphasis added). Similarly, the preferred embodiments section states that "normally currency is chosen by default ... however, the customer has the option of selecting a particular currency (step 112) in which he wants the catalogue price of the selected products." Id. at col. 5, ll. 60-63. This override step requires a list of currencies to be presented to the user.

DE contends that default override step 112 is merely an optional feature of the invention, demonstrated by the dotted line used in Figure 1A, and the description of the override step as "optional step 112." See '020 Patent, col. 6, l. 38. The plain language of the preferred embodiments clearly indicate, however, that the description of step 112 as "optional" refers to the fact that the customer does not need to override the default selection if the currency chosen by default is satisfactory. The preferred embodiments section describes that "normally currency is chosen by default ... however the customer has the option of selecting a particular currency (step 112) in which he wants the catalogue price of the selected products." Id. at col. 5, ll. 60-63. This step, in which the customer is given an option to override the default currency selection, requires that the customer be presented with a currency menu.

The plaintiff is attempting to broaden the construction and the defendant is seeking to limit the construction. The court therefore construes the phrase in accordance with the claim language and specification. The court's construction is broad enough to allow for the default possibilities suggested by DE, but requires that a list of currencies always be presented to the user, so that the user can override such a default selection if the user so chooses.

The court adopts the following construction of the phrase, which uses the plain meaning of the claim terms and specification. The term "selecting a language from a menu" means "choosing a language after presentation of a language menu and consideration of user input." The term "selecting a currency from a menu" means "choosing a currency after presentation of a currency menu and consideration of user input."
Claim 56 of the 553 patent provides:

A method of adding a graphic indication of a first down to a video of a football game during a broadcast of said football game, comprising the steps of:

selecting a position in a first video frame corresponding to a location on a football field representing said first down . . .

Sportvision contends that phrase "selecting a position in a first video frame" need not be construed.

SportsMEDIA seeks to construe the phrase as "manually identifying a position in a first video frame using a pointing device, such as a mouse or light pen." (SportsMEDIA's Memo at 11.)

In response, Sportvision proposes as an alternative, "choosing a position in a first video frame" as a counter-point to SportsMEDIA's proposed construction. (Sportvision's Memo at 8.)

It appears to the Court that both parties are merely proposing substitute terms for the operative term "selecting." SportsMEDIA wishes the Court to substitute "manually identifying" for the term "selecting." Sportvision asks the Court to substitute "choosing" for the term "selecting." The ordinary meaning of the term "selecting" is "identifying or designating." In the context of the patent, "selecting a position in a first video frame" is to identifying or designating a location in a video frame which corresponds to a location on the physical football field.

The plain language of Claim 56 is not limited to "manually identifying" a position or location. In contrast, Claim 49 discloses a method for adding a graphic indication of a first down to a video of a football game by, in relevant part, storing an indication of "a location" corresponding to the first down and by then finding "said location's" position in the video. Claim 51, which depends from Claim 49, adds the following limitation to the method in Claim 49: "manually selecting said location." Thus, in Claim 51, the patentee claims a particular method for designating a location for adding a graphic line, i.e, "manually selecting." However, no limitation on "selecting" is present in Claim 56. Therefore, the Court declines to limit "selecting" in Claim 56 to "manually identifying."

The Court gives the phrase "selecting a position in a first video frame" its ordinary and customary meaning, "identifying or designating a position in a first video frame."

1. The phrase "SELECTING A RESULTING ARTERIAL OXYGEN SATURATION" (claim 1) requires no construction.

5. "selecting a timing parameter from a plurality of predetermined timing parameters in response to said timing control bit"

The plaintiff proposes that no construction is needed because this phrase may be understood through its plain and ordinary meaning. The defendant proposes "using a bit from the register to control the selection of one of a plurality of predetermined selectable values which are used to control the timing characteristic of the memory signals." The defendant points to the prosecution history where the patentee, in response to a rejection, stated that "timing parameters are input to selectors which are controlled by bits from a control register . . . ." Response to Office Action, Oct. 14, 1994, at 3.

In reply, the plaintiff argues that the statement in the prosecution history described a preferred embodiment because the response to the office action referenced pages in the application discussing the preferred embodiment. The plaintiff also argues that the defendant adds words, e.g., "using a bit" and "control the selection," without support from intrinsic or extrinsic evidence. For example, the plaintiff points out that the patent teaches that more than a single control bit is used
when selecting more than two timing parameters. n1 '924 patent, 9:2-4.

n1 The defendant conceded during the Markman hearing that one or more control bits could be used.

The Court agrees with the plaintiff and concludes that no further construction is required because the phrase may be understood according to its plain and ordinary meaning. The Court incorporates by reference its previous definition of "timing parameter."

7. "Selecting an item from the table." Used in '691 patent, claim 1. [Parties' Joint Claim Construction Chart, term # 13].

In their briefs, the parties initially disputed the meaning of this term. Once it became clear at the hearing that a human makes a choice of an item and enters the choice into a computer, the parties realized that any conflict was illusory. See Tr. at p. 79, l. 7 - p. 80 l. 24. The claim language is not complicated, and the specification makes clear that the customer, or perhaps the sales agent with input from a customer, chooses an item from the computer-generated table and enters the choice in the computer. See '691 patent, col. 3, ll. 27-40, col. 14, ll. 15-24. The court will define this term as follows:

"Selecting an item from the table" means: "a choice made by the customer and then input into the computer by the salesperson, or possibly by the customer in the case of an on-line purchase."

E. '288 Claim 1: "selecting at least one mode of operation of the implantable heart stimulator which operation includes a unique sequence of events corresponding to said determined condition"

The second step recited in Claim 1 is the step of "selecting at least one mode of operation of the implantable heart stimulator which operation includes a unique sequence of events corresponding to said determined condition." St. Jude contends that the claim language dictates the following limitation:

The step of "selecting at least one mode . . .[corresponding] to said determined condition" of claim 1 of the '288 patent requires that the selection of a mode of operation be based on the currently determined condition of the heart without regard to any previously determined condition of the heart.

Def. Prop. Conc. of Law at 9. CPI contends that the "selecting step" is an act, not a function, and that St. Jude's proposed narrowing limitation is not warranted by the language of the claim.

St. Jude's proposed construction of the claim language is derived from the decision criteria involved in "selecting at least one mode of operation." According to St. Jude, the '288 patent "discloses a system in which the treatment mode is totally independent of history and is a function only of the current detected condition." Def. Br. at 52. 15 The court agrees with St. Jude's contention that the currently determined condition of the heart is the only variable that affects the step of "selecting."

15 St. Jude bases its construction of the "selecting" element primarily on an amendment to the claim language made during the prosecution of the patent that added the phrase "unique sequence of events." See Def. Br. at 51-52, citing Ex. 123, '288 Pros. Hist., at 2, 8-9. The court does not fully agree with St. Jude's analysis of the prosecution history. Had the claim language or the written description suggested that the step of "selecting at least one mode" was a function of a variable in
addition to the determined condition of the heart, the phrase "unique sequence of events" would not limit the claim as suggested by St. Jude.

The language of the "selecting" step states that the device selects an operation (consisting of at least one mode) corresponding to said determined condition of the heart. The phrase "corresponding to" does not by itself foreclose the possibility that the device considers variables in addition to the currently determined condition of the heart. However, the remainder of the claim language and the written description indicate that "corresponding to" should be interpreted to indicate that the selection of an operation is based solely on the currently determined condition of the heart.

First, the claim language states that the selected operation corresponds to "said determined condition." The determined condition, as defined through the determining step in Claim 1, is the result of an evaluation of the current condition of the heart. The evaluation process involves using rate and PDF circuitry to detect the presence of various arrhythmias and to differentiate those arrhythmias from one another. Nothing other than assessing the current condition of the heart is involved in the determining step.

Second, the written description explains how the selecting step is accomplished without ever suggesting that any additional variable affects the selection process. The "at least one mode of operation" is selected by matching the output of the "determining" step (i.e., a current heart condition in need of treatment) to the corresponding treatment. In greater detail, the matching process involves programming the device so that a particular treatment, consisting of one or more modes, is associated with each detected heart condition. A section of program memory contains the instructions for carrying out the sequence of events necessary to execute each treatment operation. Then, when a particular heart condition is detected, the device selects the proper set of instructions (i.e., the unique sequence of events of the treatment operation) by matching the determined heart condition to the area of the program memory that contains the program for treating that heart condition. '288 Patent, col. 12, ll. 11-65; Fig. 3B. At the step of selecting the treatment mode, the only relevant variable is the currently determined heart condition.

In summary, if the patentee intended to claim a method of selection involving criteria other than the currently determined condition of the heart, the claim language and the patent specification fail to provide adequate notice of this intent. See Athletic Alternatives, Inc. v. Prince Manufacturing, Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996) ("Where there is an equal choice between a broader and narrower meaning of a claim, . . . we consider the notice function of the claim to be best served by adopting the narrower meaning."). The court intends to define the "selecting" step in method Claim 1 as follows:

The step of "selecting at least one mode of operation of the implantable heart stimulator which operation includes a unique sequence of events corresponding to said determined condition" involves matching the currently determined heart condition to the unique set of instructions that have been programmed to treat the detected condition. The treatment operation selected by the device is determined exclusively by the currently determined condition of the heart.

16 The court acknowledges that the physician may consider factors other than the currently determined condition of the heart when programming a device. However, at the point where a device itself detects an arrhythmia and selects a treatment mode to execute, no other variables are at work.

G. selecting from said stored data for each of the specified definitions a corresponding integrated circuit hardware cell

Ricoh contends that the term means "selecting from the plurality of hardware cells in the hardware cell library a hardware cell for performing the desired function of the desired ASIC." Aeroflex contends that the term means "mapping the specified stored definitions for each logical step and decision represented in the flowchart to a corresponding stored hardware cell.
Ricoh's argues that this term simply refers to the process of selecting hardware cells from those stored in the hardware cell library that can be used to implement the desired functions of the ASIC to be produced. In support of its argument, Ricoh cites the specification language stating that "[t]he Cell Selector 32 is a knowledge based system for selecting a set of optimum cells from the cell library to implement a VLSI system." '432 patent, col. 8:21-23.

Aeroflex argues that its proposed construction is supported by the language in claim 13, which according to Acroflex, "dictates that mapping the specified definitions to the stored hardware cell descriptions must be performed by a rule-based expert system and not conventional software." Aeroflex Responsive Brief at 41:3-6. Aeroflex relies upon the following specification language to support its argument: "To design a VLSI system from a flowchart description of a user application, it is necessary to match the functions in a flowchart with cells from a cell library. This mapping needs the use of artificial techniques because the cell selection process is complicated and is done on the basis of a number of design parameters and constraints." '432 patent, col. 8:31-37.

Although it is a close question, Aeroflex's argument is ultimately more compelling. As discussed above, the patent file history demonstrates that the patentee distinguished the present invention based on the rule-based expert system's ability "to accomplish a task of selection of cells from the cell library." April 1989 Amendment at 10. This amendment strongly suggests that the mapping of the specified definitions to the stored hardware cells must be performed by a rule-based system. See Aeroflex Responsive Brief at 42. Ricoh's proposed language does not include a reference to a "rule-based system." Aeroflex's use of the word "mapping" is supported by the specification language '432 patent, col. 8:34; col. 9:53. Furthermore, at the claims construction hearing, Ricoh's counsel stated that he had no objection to the use of the term "mapping" in this context. However, Aeroflex's inclusion of the phrase "for each logical step and decision represented in the flowchart" is improper because it attempts to limit the claim to the preferred embodiment of the flowchart input specification, as discussed supra. Therefore, the Court construes "selecting from said stored data for each of the specified definitions a corresponding integrated circuit hardware cell" as mapping the specified stored function to a corresponding stored hardware cell.

"showing … a number of game credits associated with a deposit of one coin of a particular type"

JVL’s construction of "showing … a number of game credits associated with a deposit of one coin of a particular type" is "showing a specific number of game credits associated with a deposit of one coin of a particular type." Def.’s '799 Presentation at 35. Merit's construction simply substitutes the word "insertion" for "deposit." Pl.'s '799 Presentation, Ex. 3 at 13. Thus, the only two issues are whether to adopt JVL's insertion of the word "specific" and Merit's inclusion of "insertion" into the claim construction.

The plain and ordinary meaning of this term is best expressed in the language of the claim itself. The proffered constructions do not add value to the understanding. The specification does not require that "specific" be included in the construction. Nor is it necessary to construe "deposit" to mean "insertion." The only support that Merit offers for this construction is in the specification’s description of Figure 3, which states "[t]he ratio of 'coins inserted to game credits granted per coin can be individually adjusted for each coin type." '799 patent at 6:41-43 (emphasis added). However, construing the claim term to include "inserted" is not necessary because the plain and ordinary meaning of "deposit" is clear. Thus, no construction is required.

"selecting the number of game credits to be associated with a deposit of one coin for each of the different coin types"

According to JVL, "selecting the number of game credits to be associated with a deposit of one coin for each of the different coin types" means "that an operator individually sets the specific number of game credits that are directly associated with the deposit of one coin of each coin type." Def.’s '799 Presentation at 38. Merit construes this term as "choosing the number of game credits associated with the insertion of one coin for each of the types of coins." Pl.'s '799 Presentation, Ex. 3 at 13.

JVL correctly notes that the language of element (a), involving the "deposit of one coin of a particular coin type" is distinct
from element (b), which describes "a deposit of one coin for each of the different coin types." '799 patent at 9:4-7. As depicted in Figure 3 and described in element (b) of claim 7, the operator can adjust the number of credits applicable to a particular type of coin such that a player might receive one game credit if he deposits a nickel and six game credits for depositing a quarter. '799 patent, Fig 3. However, this does not justify JVL's inclusion of the operator's role or the words "specific" or "directly." Nor is such construction necessary to achieve the plain and ordinary meaning as understood by a person skilled in the art. As with other disputed terms in this patent, "selecting the number of game credits to be associated with a deposit of one coin for each of the different coin types" does not require construction.

JVL's interpretation of "selecting the total number of currency units to be associated with each coin type," a term found in element (b) of claim 1, is "an operator individually sets the specific number of meter pulses that are directly associated with each of the distinct symbols representing the different coin types." Merit's construction is "choosing the total number of cents to be associated with each coin type." "Def.'s '799 Presentation at 16. As discussed above, a "currency unit" is neither a "meter pulse" nor a "cent." Therefore, these aspects of the proposed interpretations are not adopted.

Merit and JVL construe the word "selecting" differently. Merit essentially interprets "selecting" as "choosing." JVL is correct in arguing that the '799 patent allows the game operator to set the number of meter pulses associated with each coin type. '799 patent at 2:16-20 ("The present invention . . . [provides] an apparatus and method which allows the game operator to program the meter to advance in accordance with the exact value of the entered currency and to allow such ratios to be individually adjusted.") However, this alone is insufficient reason to read the game operator's role into the claim language. Indeed, the plain and ordinary meaning is clear. Thus, the term "selecting the total number of currency units to be associated with each coin type" does not require additional interpretation.

3892

Selecting a particular product in response to at least one of the customer answers; selecting a particular environment picture in response to at least one of the customer answers; selecting a particular text segment in response to at least one of the customer answers

Defendants urge the Court to construe this term to mean: "Separately selecting one of multiple product pictures; separately selecting one of multiple product environment pictures; and separately selecting one of multiple text segments. These three selections are performed separately such that one of multiple product environment pictures could be selected for the separately selected product picture. Each of the separate selections must be based on a customer answer to at least one of the questions." This term also raises the "separate and distinct issue" already discussed.

Both claims 1 and 11 require selecting at least three separate items, namely (1) a product picture, (2) a product environment picture, and (3) a text segment. Neither claim 1 nor claim 11 requires selecting a product picture, product environment picture, and text segment based on separate answers. The claims allow selecting each of a product picture, a product environment picture, and a text segment based on the same answer. Although that is difficult to visualize in the context of the preferred embodiment, i.e., cars, trucks, and other vehicles, again the claims of the 342 patent are drawn to "products," which goes far beyond "vehicles."

This term does not require construction. As Defendants' construction reflects, the claim language expressly requires making three selections. The Court rejects Defendants' construction because, in addition to including the limitation the Court rejected in the previous paragraph, it does not clarify the term. The sentence "These three selections are performed separately such that one of multiple product environment pictures could be selected for the separately selected product picture" implies the product picture is selected first. Defendants' construction also implies that the product environment picture is selected "for" the product picture. This implication is ambiguous, since the claim requires that the environment picture be selected "in response to at least one of the customer answers" and does not reference the product picture in this
The Staples Defendants urged the Court to construe these terms to mean: "Separately selecting one of multiple product pictures; separately selecting one of multiple product environment pictures; and separately selecting one of multiple text segments. These three selections are performed separately such that one of multiple product environment pictures could be selected for the separately selected product picture. Each of the separate selections must be based on a customer answer to at least one of the questions." The Court resolved that dispute by concluding that "[n]either claim 1 nor claim 11 requires selecting a product picture, product environment picture, and a text segment based on separate answers." Staples Markman opinion at 24. Having resolved that dispute, the Court concluded that no further construction was necessary, noting that "the claim language is sufficiently clear that a particular product picture, a particular product environment picture, and a particular text segment are selected in three separate steps." Id. It is clear, as the Court concluded in the Staples Markman opinion, that both claims 1 and 11 require selecting at least three separate items, namely (1) a product picture, (2) a product environment picture, and (3) a text segment. Hyundai says that it agrees with that construction.

Nevertheless, turning to Hyundai's first argument that the "context" of the specification supports "matching," Hyundai points to the following in the "summary" portion of the specification:

Based upon the customer's answers to the queries, the system links product pictures, environment pictures, and textual descriptions together in a customized proposal. . . . The customized proposal, therefore, contains pictures, textual descriptions, and pricing information that is all of interest to and relevant to a specific customer, since all of the pictures and text were linked together based upon the customer's answers.

'T342 patent, col. 2:20-30, and urges that "[t]his statement is not merely a description of a preferred embodiment or an illustrative example," but "is Johnson's summary of how his invention operates to provide a novel solution to the problem of generating customized brochures." Hyundai Opening Brief at 11. Even if that is taken as true, "match" is not used here or elsewhere in the specification. "Although this description does not literally use the word 'match,'" Hyundai nevertheless contends that "it is apparent that anything less than 'matching' will not allow the system to select 'pictures, textual descriptions, and pricing information that is all of interest to and relevant to a specific customer.'" Id. In its Reply, Hyundai further argues that "[t]he only way that all of the selected information can [be] assured to be relevant to a specific customer is if each of the those selections are matched to at least one of the customer's answers." Hyundai Reply Brief at 3.

Although Hyundai does not explain what it intends to convey by "match," Hyundai is simply wrong in suggesting that "match" is necessary to achieve the result stated in the specification. The specification explains that "[b]ased upon the customer's answers to the queries, the system links product pictures, environment pictures, and textual descriptions together in a customized proposal. 'T342 patent, col. 2:20. Similarly, the claims call for "selecting a particular product picture [etc.] in response to at least one of the customer answers." That is sufficient to achieve the result stated in the specification.

Hyundai secondly relies on the prosecution history of a parent application to the 'T342 patent, namely application Serial No.
In an Office action dated May 22, 1995, the PTO rejected application claim 30 (and other claims) as having been obvious over a UK patent to Donald et al. and U.S. Patent No. 4,775,935 to Yourick. In the rejection, the examiner reasoned that Donald et al. "fails to expressly disclose presenting questions to users and receiving answers in order to associate the answers with stored images or text portions. Instead, Donald's system is drawn to generating images or other information in response to direct user entries on a keyboard or user selections from a menu-driven software program." However, the examiner reasoned, "question and answer query systems for presenting a product for selection are known in the art. Namely, Yourick discloses a multimode video merchandising system with a variable and adoptive product sequence presentation order, comprising two levels of an inductive learning process based upon user preferences and selections. In particular, Yourick's system queries the user for preferences by asking questions and makes suggestions in response to selected answers in order to present a product most suited to the needs and desires of the user. It would have been obvious to one of ordinary skill in the art . . . to apply the teaching of Yourick within the system disclosed by Donald with the motivation of presenting items which most likely appeal to the user." May 22, 1995 Office Action, Application No. 07/878/602, at 4 (citations omitted).

The applicant amended claim 30:

d) output means, coupled to the receive means and the processing means, for receiving the [gathered] customer-specific vehicle information, for formatting the customer-specific vehicle information according to criteria related to a layout of the customized proposal, and for compiling the [gathered] formatted customer-specific vehicle information into the customized proposal.

June 19, 1995 Amendment and Response (underlining indicating additions and brackets indicating deletions). The applicant argued, inter alia:

Yourick, furthermore, does not associate a user's responses with product pictures, environment and text. Yourick uses inductive learning techniques in order to best "guess" about a customer's desired features of a product. The present invention provides advantages over this technique by querying the customer about his or her desired product features and uses in order to "match" the answer with customer-specific information. This can result in a more persuasive proposal, because the present invention is not simply making "best guesses," but, rather, is obtaining information specifying the customer's desired product features and uses.

Id. at 4 (emphasis added). The emphasized portion is what Hyundai relies on urging that the "selecting" steps require "matching." Hyundai argues that "Johnson distinguished his invention by stating it did not need to 'guess,' because it 'matched' a customer's answers with customer-specific information." Hyundai Opening Brief at 13. This was the sole use of "match" in the prosecution history of the parent.

Two interviews later, it appears that the examiner suggested "incorporating the feature of selecting a particular vehicle picture, environment picture, or text segment in response to one of the answers specified by the customer in the input means . . . ." July 24, 1995 Telephone Interview.

The applicant then amended claim 30 (in relevant part) as follows:

c) processing means for gathering [customer specific] vehicle information for use in generating the customized proposal, comprising:

i) means for electronically selecting a particular vehicle picture in response to at least one of the answers [associating at least one of the answers with a particular vehicle picture];

ii) means for electronically selecting a particular vehicle environment picture in response to at least one of the answers [associating at least one of the answers with a particular vehicle environmental picture]; and

iii) means for electronically selecting a particular text segment in response to at least one of the answers [associating at least one of the answers with a particular text segment]; and

d) output means, coupled to the receive means and the processing means, for receiving the gathered [customer-specific] vehicle information [, for formatting the customer-specific vehicle information according to criteria related to a layout of the customized proposal,] and for compiling the gathered [formatted customer-specific] vehicle information into the customized
proposition.

The applicant argued that "[i]n the present invention, the customer's answers are used to determine the vehicle pictures, vehicle environment pictures, and text segments. This feature is not present in the prior art and in particular the Donald et al. and Yourick references." July 24, 1995 Supplemental Amendment & Interview Summary, Application No. 07/878,602, at 3.

All of the foregoing occurred during prosecution of what is now the '490 patent, parent to the '342 patent-in-suit. Hyundai argues that despite no reference to "match" or "matching" during the prosecution of the '342 patent, the statements made during prosecution of the parent application apply as well to the application maturing into the '342 patent.

Accepting Hyundai's argument that the prosecution history of the '490 patent applies equally to the '342 patent, that does not require (or counsel in favor of) Hyundai's proposed construction. First, Hyundai's proposed construction essentially rewrites the asserted claims to substitute "that is matched to the content of in place of "in response to." As the foregoing prosecution history makes clear, though, the applicant (and the examiner) chose to use the words of the present claims--not "matched" or the phrase "that is matched to the content of," as now Hyundai suggests.

Second, the applicant in the portion of the prosecution history that Hyundai relies on, was not distinguishing "guessing" from "matching," but rather was distinguishing Yourick's inductive learning techniques which did not associate a user's responses with product pictures, environment and text. That response provides no rationale or basis for construing "in response to" as "that is matched to the content of in the issued claims, or otherwise construing the issued claims as Hyundai urges.

Using the word "match" in that response provides no sufficient reason, by itself or in the context in which it was made, for concluding that one of ordinary skill in the art would construe "selecting a . . . in response to at least one of the customer answers" as "selecting a . . . that is matched to the content of at least one of the customer answers." That is especially so in light of the subsequent change in claim language, and subsequent arguments in which "match" is never used. Nor has Hyundai shown that the actual claim language somehow fails to define the actual invention disclosed in the '342 patent and that its proposed construction is necessary to do so.

The point is, and the undisputed facts are, the applicant used the term "match" exactly once throughout the entire prosecution of the '490 and '342 patents and presented no claim nor any further argument using "match." That is not to suggest that an applicant must make the same argument more than once in order to be subjected to a form of argument-based estoppel. Nevertheless, the "context" of the prosecution history simply does not support Hyundai's argument.

Rather, at the suggestion of the examiner, the applicant chose to use "means for electronically selecting a particular vehicle picture in response to at least one of the answers," "means for electronically selecting a particular vehicle environment picture in response to at least one of the answers," and "means for electronically selecting a particular text segment in response to at least one of the answers" in the parent application maturing into the '490 patent, and similar language in the application maturing into the '342 patent. The applicant thereafter argued in prosecuting the '490 patent that "[i]n the present invention, the customer's answers are used to determine the vehicle pictures, vehicle environment pictures, and text segments. This feature is not present in the prior art and in particular the Donald et al. and Yourick references." July 24, 1995 Supplemental Amendment & Interview Summary, Application No. 07/878,602, at 3. The applicant similarly argued in prosecuting the '342 patent that "[t]he present application is directed to a computerized system which utilizes a customer's answers to computer-generated questions to select stored pictures of products, product-related environments and text segments for incorporation into a customized proposal . . . The claimed system selects a particular product picture, a particular product environment picture, and a particular text segment in response to at least one of the customer answers." The selected pictures and text segment are used to generate 'a customized proposal for the customer.' September 24, 1996 Amendment & Request for Reconsideration, Application No. 08/596,575, at 3.

Under the circumstances, Hyundai has simply provided no persuasive reason why one of ordinary skill in the art, reviewing the specification and prosecution history of the '342 patent, as well as the parent '490 patent, would conclude that "selecting a particular product picture in response to at least one of the customer answers," "selecting a particular product environment picture in response to at least one of the customer answers," and "selecting a particular text segment in response to at least one of the customer answers" in claim 1, and "automatically selecting, in response to at least one of the customer answers, a product image, a product environment image and a text segment" in claim 11, meant "selecting a product picture that is
matched to the content of at least one of the customer answers; selecting a product environment picture that is matched to the content of at least one of the customer answers; and selecting a text segment that is matched to the content of at least one of the customer answers,” as Hyundai proposes.

Accordingly, the Court rejects Hyundai’s proposed construction. There being no other dispute about the terms’ meanings, no further construction is necessary.

1. "AUDIO AND/OR VISUAL SELECTION"

AOL: "An individual work such as a song or a music video."

TWM: No construction required. In the alternative, "Audio and/or visual content of a stream made available to user(s)."

AOL argues that its definition is "consistent with the ordinary meaning of a 'selection' as a 'work.'" (D.E. 68, pg. 6). TWM counters that "nothing in the claim language limits 'selection' to an individual song." (D.E. 69, pg. 7). As described above, the Court is mandated to first examine the claim language and specification.

AOL's proposal is inconsistent with the claim language. The claim language does not intimate that a "selection" consists of a whole "individual" work, as AOL suggests. Instead, the disputed term is preceded by the following: "wherein at least one stream of [p]ackets comprises an audio and/or visual selection." (emphasis added). The claim itself reveals that merely a packet of information, which as recalled from both parties' DVD tutorials, is a digitized part of an audio selection--not the whole selection--constitutes a selection. A stream of packets is short segments of a song. Because those segments are not the entire "individual" song, AOL's proposal does not comport with the claim language.

The Court believes a construction is necessary because the ordinary skilled person in the art understands "selection" differently than laypersons. Specifically, laypersons would read "selection" as an individual work; skilled persons in the field would read "selection" as either an individual work or a selection of data. To prevent any confusion, the Court adopts TWM's second proposal. So "selection" is construed as "audio and/or visual content of a stream made available to user(s)."

The Court proceeds to consider the other disputes with respect to the selection circuit.

3. Inapplicability of means-plus-function analysis

The second issue is whether the use of a functional limitation "for selecting the transmission power level" invokes means-plus-function analysis. While the language disclosing a selection circuit uses the functional language, i.e., "for selecting the transmission power level," 13 the Court finds the inventors' recital of a "transmission power level selection circuit" is sufficient structure for performing the claimed function. Accordingly, the Court finds that the selection circuit limitation is not a means-plus-function limitation.

13 The Court considers that the prepositional phrase "for selecting the transmission power level" modifies the noun "circuit" and not the noun "command" because "command" has an antecedent basis in the preceding radio receiver limitation that makes no direct reference to a function for selecting the transmission power level.
The third issue is the construction of the phrase "transmission power level selection circuit." The plain and ordinary meaning of "selection circuit" is "a circuit that selects between or among alternatives." In general, the parties do not dispute this interpretation; they agree that the "selection circuit" disclosed in Claim 61 selects the transmission power level. The dispute is over the phrase "transmission power level." 

--- Footnotes ---

14 (Opposition CCB at 24; Plaintiff's Reply Brief Regarding Claim Construction at 16, Docket Item No. 208.)

--- End Footnotes ---

The specification discusses "transmission power level" with respect to an embodiment of the radio transmitter in a remote unit:

The remote unit transmitter 86 is capable of transmitting at a power-conserving lower power level and also at an emergency higher power level.

('770 Patent, Col. 8:62-64.) Thus, the Court finds that one of ordinary skill on the art would have understood the "transmission power level selection circuit" to be a circuit that selects the power level at which the radio transmitter transmits.

5. "responsive to the received command"

The final issue which must be resolved with respect to the selection circuit is the limitation that the selection circuit be "responsive to the received command."

The antecedent of "the received command" is the "command" received by the radio receiver discussed in Section (IV)(B)(1) above. As discussed above, Figure 5 is a diagram of the "preferred" method of transmission to the remote unit. Both the caption of Figure 5 ("Message format: Base to Remote") and the written description indicate that the "command" received by the radio receiver originates in the base station: 15

The command field 182 includes a coded field of bits 184 used to command a specific remote unit to transmit its response message (using the format 150). The command field 182 also includes a single bit 186 used to command a remote unit such as the embodiment illustrated in FIG. 3, to transmit at high power.

('770 Patent, Col. 7:65-8:4.)

--- Footnotes ---

15 In Irdeto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004), the Federal Circuit noted, "Even when guidance is not provided in explicit definitional format, the specification may define claim terms by implication such that the meaning may be found in or ascertained by a reading of the patent documents."

--- End Footnotes ---

Figure 3 and the accompanying written description discloses an embodiment of a remote unit which receives a power selection command from a base station and which contains a power level selection circuit that is "responsive to the received command":

(SEE FIG. IN ORIGINAL)

Notably, the illustration of Figure 3 and the related disclosure in the specification make reference to a "command" being received by the remote unit radio receiver. The "command" is passed to the "power level select circuit," which then commands the radio transmitter to change the power level of its transmission. (‘770 Patent, Col. 8:64-9:2.) The Court finds Figure 3 and the accompanying written description particularly appropriate for construction of Claim 61 because Figure 3, as well as Figure 12, disclose power level selection based on commands received from the base station, rather than power.
level selection calculated on the basis of the strength of the received signal.

In construing Claim 61, the Court relies on the specification's reference to Figure 3 instead of its reference to Figure 1. In the discussion of Figure 3, the inventors specifically refer to receipt of a "command," while in the discussion of Figure 1, the inventors use the general term "signal." In addition, to meet the limitations of Claim 61, the signal must carry an instruction before it is received by the remote unit. The embodiment illustrated in Figure 3 would satisfy that limitation. There is no discussion of how Figure 1 would meet that limitation. Thus, the Court finds that one of ordinary skill in the art would have understood "responsive to the received command" to mean that the selection circuit selects the transmission power level in response to the signal, or set of signals containing an instruction from a base station that requires the remote unit to perform an operation.

Accordingly, the Court construes the phrase, "the transmission power level selection circuit being responsive to the received command for selecting the transmission power level" as used in Claim 61 of the '770 Patent to mean: a circuit in a remote unit that is responsive to an instruction from a base station to select a power level at which the radio transmitter in the remote unit transmits.

H. "Item Selection Criteria," "Movie Selection Criteria," and "Game Selection Criteria."

These terms were used many times throughout the claims of the '450 patent, but not the '381 patent. By way of example, claim 1 recited (14:43-55):

1. A method for renting items to customers, the method comprising the computer-implemented step of:

   receiving one or more item selection criteria that indicates two or more items that a customer desires to rent;

   providing to the customer up to a specified number of the two or more items indicated by the one or more item selection criteria; and

   in response to receiving any of the items provided to the customer, providing to the customer one or more other items indicated by the one or more item selection criteria, wherein a total current number of items provided to the customer does not exceed the specified number.

The usage of the terms "movie selection criteria" and "game selection criteria" was similar. Claim 31 recited (col. 19:6-19):

31. A method for renting movies to customers, the method comprising the computer-implements steps of:

   receiving one or more movie selection criteria from a customer that indicates two or more movies that the customer desires to rent;

   providing to the customer up to a specified number of the two or more movies indicated by the one or more movie selection criteria; and

   in response to a return of any of the movies provided to the customer, providing to the customer one or more other movies indicated by the one or more movie selection criteria, wherein a total current number of movies provided to the customer does not exceed the specified number.

Similarly, claim 50 recited in part (col. 21:56-65):

50. A computer-readable medium as recited in claim 36, wherein: the two or more items are two or more games,

   the one or more item selection criteria are one or more game selection criteria,
the step of receiving one or more item selection criteria that indicates two or more items that a customer desires to rent includes receiving one or more game selection criteria that indicates two or more games that the customer desires to rent.

Netflix proposes that "item/movie/game selection criteria" should mean "characteristics and/or order of items/movies/games desired by the customer." Blockbuster proposes that the term should mean "any information used to choose a thing (or "item"), regardless of what person or device makes the choice." The sum of parties' disagreement is over who or what entity makes choice -- Blockbuster maintains that it could be any person or thing, while Netflix requires that it must be the customer.

As shown above, the claims use the term in the context of "receiving one or more item selection criteria that indicates one or more items that a customer wants to rent." This shows that the criteria is linked to or reflects the customer's preferences.

Netflix argues that the specification defines the term "item selection criteria" as explicitly being selected by the customer. "[T]he presumption in favor of the ordinary meaning of claim language as understood by one of ordinary skill in the art may be overcome where the patentee chooses to be his or her own lexicographer by clearly setting forth a definition for a claim term in the specification." Anchor Wall Sys., Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1306 (Fed. Cir. 2003). In the specification, Netflix points to language such as "[t]he one or more item selection criteria provided by the customer to provider indicate the particular items that customer desires to rent from provider. Thus, the item selection criteria define a customer-specific order queue that is fulfilled by provider" ('450 pat. col. 4:54-58). Additionally, "the item selection criteria indicate items that customer desires to rent from provider" (col. 4:22-23). This seems to make clear that the item selection criteria are chosen by the customer. The specification also distinguishes between the item selection criteria and the actual order in which the items will be sent to the customer. The specification taught that the customer can select categorical criteria, such as movies directed by Wes Andersen, that would select items the customer wanted to rent, but would not put them in the customer's desired, specified order. Thus, the use of the term in the specification indicated that the customer chose the selection criteria.

Blockbuster relies mistakenly on Netflix's use of the word "may" in conjunction with specifying item selection criteria. For example, they cite that customers "may specify what items to rent using one or more item selection criteria . . ." ('450 patent at col. 4:9-11). This language refers to an embodiment that gives customers the option of selecting criteria that would add groups of items to their queues. Customers may still select items to rent for no other reason than personal whim. The specification simply does not show that the criteria could be selected by any entity other than the customer.

Accordingly, "item/movie/game selection criteria" will mean the characteristics used by the customer to select items.

3897

a. "selection keys"

Defendants contend that the term “selection keys” in claims 1 and 7 of the 189 patent means “keys on a keyboard; the keyboard is separate from the display."Resp. Brief, Ex. E at 2. They argue, as they did with regard to the construction of “song selection means” in the 302 patent, that the patent identifies “selection keys” as the keyboard depicted on figure 1. The term “selection keys” in the 189 patent is not, however, expressed in means-plus-function format like the term “song selection means” in the 302 patent. It is therefore unnecessary to look to the specification of the 189 patent for corresponding structure, and it is impermissible to limit the claim term to specific preferred embodiments shown in the specification. Phillips, 415 F.3d at 1323. The term “selection keys” in the 189 patent
should be given its plain and ordinary meaning, as informed by the specification. The specification teaches that the selection keys are used by the user to select a song. Opening Brief, Ex. 3 at 5:32-35 ("[t]he keys 123 provide signals representing user inputs such as displayed song selection."). The Court therefore construes the term "selection keys" as "keys that allow a user to select a song" and declines to limit the claim term to keys on a keyboard separate from the display.

D. "selection keys"

Touchtunes proposes that the term "selection keys" be construed as "mechanical buttons that allow a user to select a song," emphasizing that the keys are separate from the non-mechanical "display" of the jukebox. Arachnid, on the other hand, proposes that the term be construed as "keys that allow a user to select a song."

Because there is no dispute regarding the construction of the term "selection," Touchtunes argues that the proper construction of the term "keys" is essential and that Arachnid's proposed definition fails because it is circular, defining keys as "keys." To support its proposed construction, Touchtunes cites selected dictionary definitions that define keys as mechanical buttons. While these definitions conform to Touchtunes' proposed construction, they do not reflect the ordinary meaning of the word "key." For example, Webster's defines "key" as "a small switch for opening or closing an electric circuit," with no reference to any "mechanical" quality. Merriam Webster's Collegiate Dictionary 640 (10th Ed. 1993).

Touchtunes also relies on the separate recitation of "selection keys" and "display" in the '189 Patent specifications. It argues that merging the display and keys would make both terms redundant. See Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1561-62 (Fed. Cir. 1991). However, nothing about the separate recitation suggests or requires that the keys be mechanical. Moreover, this separation does not preclude the possibility that selection keys can be on a visual screen. Touchtunes' reliance on the preferred embodiments shown in the specification is improper, as it is impermissible to limit the claim term to specific preferred embodiments shown in the specification. See Phillips, 415 F.3d at 1323.

Finally, Touchtunes argues that the Court should consider the accused products: Touchtunes jukeboxes use a "touchscreen" computer display for the selection songs, whereas Arachnid's patents do not disclose a touchscreen. Although consideration of the accused products may provide meaningful context, "[a] court may not use the accused products for the sole purpose of arriving at a construction of the claim terms that would make it impossible for the plaintiff to prove infringement." Every Penny Counts, Inc. v. American Express Co., 563 F.3d 1378, 1383 (Fed. Cir. 2009).

Nothing in the intrinsic record requires that "keys" be "mechanical" or separate from the visual display. The term "selection keys" is therefore given its plain and ordinary meaning and construed as "keys that allow a user to select a song."

F. Selection Logic

Agere contends that this term should be construed in accordance with 35 U.S.C. § 112, P 6. PCTEL asserts that the term does not trigger the applicability of § 112, P 6.

There is no dispute that the term "selection logic" does not include the term "means." The absence of the word "means" in a claim term raises the rebuttable presumption that the claim term is not written in means-plus-function format. Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1371-72 (Fed. Cir. 2003). Agere bears the burden of overcoming the presumption
by a preponderance of the evidence. Id. at 1372. To fulfill that burden, it must prove that the claim element "selection logic" fails to "recite[] sufficiently definite structure" or recites a "function without reciting sufficient structure for performing that function." Watts v. XL Sys., Inc., 232 F.3d 877, 880 (Fed. Cir. 2000).

To determine if a claim term recites sufficient structure, courts generally examine "whether it has an understood meaning in the art." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002). Here, PCTEL asserts that "logic" is synonymous with circuitry, while Agere contends that term connotes function. A review of the technical dictionaries supports PCTEL's view that "logic," by itself, can connote structure. (O'Grady Decl., Ex. 16, McGraw Hill Dictionary of Scientific and Technical Terms (1994) ("General term for the various types of gates, flip-flops, and other on/off circuits. . ."). The Federal Circuit has stated that courts must not only rely on single words of the limitation, but also view the limitation as a whole. See Apex, 325 F.3d at 1372-73. Specifically, the Apex court stated that "[w]hile we do not find it necessary to hold that the term 'circuit' by itself always connotes sufficient structure, the term 'circuit' with an appropriate identifier such as 'interface,' 'programming' and 'logic,' certainly identifies some structural meaning to one of ordinary skill in the art." Id. at 1373. Similarly, in Linear, the court stated that "when the structure-connoting term 'circuit' is coupled with a description of the circuit's operation, sufficient structural meaning generally will be conveyed to persons of ordinary skill in the art. . .." 379 F.3d at 1320.

Claim 1 of the '950 patent claims a host signal processing communication system comprising:

   selection logic coupled between the device and the host processor the selection logic being coupled to select the interrupt signal provided to the host processor wherein the selection logic selects the first signal as the interrupt signal when the device is operating in the first mode and selects a second signal from the communication lines as the interrupt signal when the device is operating in the second mode

'950 patent, col. 6:50-57. The Court finds that this contextual language describes the objective of the "logic" (i.e., selecting the first signal when in first mode and selecting the second signal when in second mode). Additionally, the term "selection" apprises skilled artisans of the function of the claimed "logic."

In response, Agere has only offered a Federal Circuit case construing "selection device" and a district court case construing "logic means." This evidence is not sufficient to overcome the presumption that § 112, P 6 does not apply. Therefore, the Court concludes that Agere has not shown by a preponderance of the evidence that one of ordinary skill in the art believes that "selection logic" does not recite sufficiently definite structure. Because "selection logic" is not governed by § 112, P 6, the Court finds that no further construction of the term is necessary.

12. "SELECTION SIGNALS RECEIVED FROM THE USERS"

AOL: "Signals from users indicating their choice of channel[s]"

TWM: No construction required.

In the alternative, "Signals from users selecting a stream."

TWM contends that the selection signals select a stream. (D.E. 69, pgs. 6-7). Conversely, AOL argues that the selection signals indicate the user's choice of a channel. (D.E., pg. 22).

The pertinent claim language recites "controlling the routing of the stream of packets in response to selection signals received from the users." Obviously, the contested portion is the tail-end of the sentence. Again, an inspection of the claim itself reveals that TWM's interpretation of the contested language is correct. Specifically, the term "channel" does not appear at all in any claim of the '187 patent. In contrast, "stream" appears throughout the claims. Injecting the word "channel" into the claim now would not comport with the claim's language. The Court adopts TWM's alternative proposal.
12. "Selective Access"

The plaintiff argues that this term does not need construction. In the alternative, the plaintiff proposes "access pursuant to some criteria." The defendant proposes "allowing access from or through a central station, to an access account, which is separate from the consumer account, and periodically allowing selected consumers to obtain from the access account, a portion of cash value which has been transferred from the consumer account to the access account."

The defendant argues that the description in the '090 patent specification uses the language in its proposed construction. In addition, the defendant argues that the specification is not broad enough to allow a consumer to have direct access to his account, and, therefore, the plaintiff's construction is too broad.

The court has considered the parties' constructions. The court is not persuaded that the defendant's limitations are proper. The court further concludes that this term needs no additional construction.

Selective Communication Link

"Selective Communication Link" is recited in Claim One, as cited supra. Furnace Brook's proposed construction of "selective communication link" and "switchable communications means" is "a communication link via an online interactive communications network." Overstock's proposed construction of "selective communication link" is "a dial-up connection through a telephone exchange or a private branch exchange ("PBX") to a telephone network such that it is not the Internet."

Furnace Brook argues that Overstock's construction imports embodiments into the claims and ignores intrinsic evidence of other embodiments.

Selective communication link is recited in Claim One as a component of one step of the improved interactive computerized catalog process. The specific step is "establishing a selective communication link initiated by a user between said user's telephone terminal and said computer system." '832 Patent at 10: 62-64. The specification teaches:

In response to a customer initiating a request by dialing a predetermined 800 telephone number, the telephone exchange signals the central data processor that a user has requested service and the processor in response thereto retrieves the digital catalog data selected by the user inquiry for transmission via the telephone exchange and communication link to the user's terminal.

'832 Patent at 3: 20-26. It also teaches in relation to the telephone-associated cable-TV, that

As was described in conjunction with FIG. 1, a user/customer would establish a communication path from a user TV terminal through the communication system[,] for example a PBX telephone exchange network, marketed by AT&T. ... which is functionally and structurally similar to the apparatus described in connection with FIGS. 1 and 4.

'832 Patent at 6: 64 - 7: 5.

It is evident that the selective communications link is the telephone line connection established between the user's terminal and the retailer-end computer. The Court adopts an interpretation similar to Overstock's proposal and concludes that a "selective communication link" is "a dial-up connection through a telephone exchange or a private branch exchange to a telephone network."
5. **selective coupling** / **selectively couple** / **selectively coupling**

2 Rohm asserts that all grammatical forms have the same meaning. See Rohm Response Brief at 24; Microsemi Response Brief at 10 n.3.

Judge Ward has previously construed the term "coupled" to mean "electrically connected, directly or indirectly." O2 Micro v. BiTEK, 2:04-CV-32. Judge Ward also declined to construe the term "selectively coupling" beyond its construction of "coupled." In this regard, however, Judge Ward rejected the argument that the term "selectively" is limited to "alternatingly." In light of this background, Rohm proposes that the term "selectively coupling" means "coupled under some circumstances and not coupled under other circumstances." O2 Micro asserts that no construction of this term is necessary. In view of the parties' arguments, the court adopts the prior construction of the term "coupled," and concludes that "selective coupling" means "coupling under some circumstances and not others."

7. "selective reception of the signals incorporating the differing scrambling techniques"

The plaintiff asserts that this term means reception of a signal modified in accordance with a scrambling technique. Joint Claim Construction Brief, Exh. B. Defendant EchoStar argues that "selective reception" means reception of a signal scrambled according to a particular one of the separate and distinct scrambling methods"; and "the signals incorporating the differing scrambling techniques" means each signal transmitted by the scrambling transmitter has a modification that is unique to one of the separate and distinct scrambling techniques." Id. The DIRECTV defendants argue that the term means each of a plurality of information service signals is scrambled according to a different scrambling technique, and the user must select a matching unscrambling card in order to receive a particular information service signal. Id.

The issue appears to be that the defendants seek to restrict the term "scrambling techniques" to one of separate and distinct scrambling techniques. The plaintiff resists the attempted restriction, arguing that "the specification of the '066 patent discloses that a combination of scrambling techniques may be used to scramble a signal." Broadcast's Opening Claim Construction Brief, at p. 33.

I agree with the plaintiff. The specification states:

A particular technique or combination of techniques can be quickly selected and implemented at will via a programming keyboard 32. The master scrambling circuit 31 therefor is able to put out a wide variety of scrambled signals. . . . In contrast with normal scrambling the number of differing techniques is more important to the invention than the sophistication of any particular on technique.

'066 Patent, col. 2, lines 40-54.

Although I have construed differing scrambling techniques to require something more than merely varying the parameters of a single scrambling technique, the specification clearly contemplates that a distinct combination of coding techniques such as, for example, combining some form of signal emphasis with a voltage spike, would be one scrambling technique; and, for example, combining signal emphasis with a frequency shift, would be a differing scrambling technique.

I construe the term "selective reception of the signals incorporating the differing scrambling techniques" to mean reception of a signal modified in accordance with a scrambling technique.
c. "selective voltage" and related claims

The parties disagree as to whether the claimed voltage refers to a voltage difference between the subject electrodes. Claim 1 of the '007 patent describes the addressing procedure as follows:

in conducting addressing, applies a selective voltage between one electrode of a selected pair of the display electrodes and a selected address electrode, such that said address electrode has a potential which is positive relatively to the one electrode of said selected pair of display electrodes, thereby generating a write discharge in a selected discharge cell.

(emphasis added)

LG's construction seems to require the application of a single voltage to multiple electrodes. The claim limitation, read in light of the specification, however, indicates that the claimed selective voltage contemplates a voltage difference. See '007 Patent, cl. 1; Fig. 18. Furthermore, the "and not applied" limitation proposed by LG is unnecessary and confusing.

For these reasons, the court defines "selective voltage" as "voltage difference used to select a cell to be lit during the display period."

GO BACK

2. "selectively accessing"

The parties disagree about the meaning of the words "selectively accessing" in the phrase "selectively accessing the subscriber location from a remote location to obtain access to each program identification code stored at the subscriber location" of claim 8. Echostar argues that "selectively accessing" requires that the remote location actively connect to the subscriber location, and not vice versa, while IPPV contends that "selectively accessing" simply refers to the process of establishing a communication path, regardless of whether the remote location or the subscriber location initiates the connection.

Having reviewed the claim and the specification, the court finds that the plain meaning of "selectively accessing . . . from a remote location" does not require that the remote location have initiated the connection. The subscriber location could initiate the connection and then allow the remote location computer to access its records from the remote location. This scenario is consistent with the language of the claim. Moreover, this interpretation is consistent with the specification, which explains that "in this connection, the computer [located at the remote location] and access unit [located at the subscriber location] may be connected over the telephone lines through conventional telephone switching equipment as commanded either from the access unit or from the computer." Thus, the court concludes that initiation of the connection can come from either the remote location or the subscriber location, and therefore, "selectively accessing" refers to the process of establishing a communication path, regardless of the origin of the connection.

GO BACK

7. "selectively according to a particular one of a multiple of differing scrambling techniques"

The plaintiff argues that this term means by using one of the different ways of modifying a signal. Joint Claim Construction Brief, Exh. B. EchoStar argues that it means there exist multiple, distinct predesigned scrambling techniques, which are simultaneously available for selection. Id. The DIRECTV defendants argue that it means there exist multiple distinct, pre-programmed scrambling techniques that are available and from which one can be quickly selected for use at any given time. Id. A principal issue as between the plaintiff, on the one hand, and the defendants, on the other hand, is whether "differing scrambling techniques" means a single scrambling technique having a variable parameter, as the plaintiff's construction would allow, or whether it requires separate and distinct scrambling methods which are something more than merely a variation of one technique's parameters.

I am persuaded by the defendants that the prosecution history requires that "differing scrambling techniques" means something more than a single scrambling technique where the technique's parameters are varied. In particular, during the
prosecution of the patent the applicant distinguished "a single scrambling technique having a variable parameter," stating:

In marked contrast, the invention of this present application uses one of a wide variety of totally distinct scrambling techniques.

* * *

This present invention is thus totally distinct from the teachings of the cited art wherein the parameters of a single scrambling technique are selectively altered to produce differing characteristics for the same scrambling technique.

Declarations of Jose L. Patino In Support of Defendant EchoStar . . . Opening Claim Construction Brief for U.S. Patent 4,993,066 (the "Patino Decl."), at Exh. E., p. 265. See Spectrum Int'l, 164 F.3d at 1378 ("Statements made by a patent applicant during prosecution to distinguish a claimed invention over prior art may serve to narrow the scope of a claim").

This construction finds further support in the specification, where the patentee defined "typical coding techniques" to include the distinct techniques of "signal emphasis/deemphasis, voltage spikes, sync removal, or frequency shifts." '066 patent, col. 2, lines 45-47.

I construe the words "differing scrambling techniques" to mean distinct scrambling methods which are something more than merely varying one scrambling technique's parameters.

Within this term, the plaintiff contends that the words "a particular one" need no construction. The defendants contend that those words should be construed to mean one and only one. In my view, there is no meaningful distinction between the positions of the parties. One is in the singular and means one, whether it is "a particular one" or "one and only one."

The parties also disagree about whether the word "multiple" means more than one, as the plaintiff contends, or more than two, as the defendants contend. "Multiple" normally means "having, pertaining to, or consisting of more than one individual, element, part, or other component. . . ." The American Heritage Dictionary of the English Language, at p. 861. In support of their contention that "multiple" as used in claim 9 means more than two, the defendants invoke the doctrine of claim differentiation and point to the fact that claims 10 and 11, depending from claim 1, concern "more than one scrambling technique. . . ." '066 Patent, col. 5, lines 20-21. The defendants argue that "when read in light of claims 10 and 11 (and their use of 'more than one' to mean 'two or more'), the doctrine of claim differentiation indicates that 'multiple' must have a different meaning than 'more than one.'" Defendant EchoStar . . . Opening Claim Construction Brief for the '066 Patent, at p. 20.

It is apparent that syntax, and not an intention to differentiate, led to the use of the differing phrases in claims 10 and 11, on the one hand, and claim 9, on the other hand. The claim language involved in claims 10 and 11 involves "the improvement of means to incorporate more than one scrambling technique. . . ." '066 Patent, col. 5, lines 19-21. The claim language in claim 9, by contrast, involves introducing interference into a signal "according to a particular one of a multiple of differing scrambling techniques. . . ." Id. at col. 6, lines 30-34. It is apparent that the claim drafter used the word "multiple" in claim 9 to avoid the awkward alternative of "one of more than one of differing scrambling techniques. . . ." See Karlin Technology Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 972 (Fed. Cir. 1999)("The canon of claim differentiation is not a rigid rule"); 5A Donald S. Chism, Chism on Patents § 18.03[6][a] (1999 and July 2001 Cum. Supp.)(stating that Federal Circuit decisions "confirm that claim differentiation is not a rigid rule," citing cases).

I construe the word "multiple" in its ordinary and customary manner to mean more than one.

Defendant EchoStar requests a construction of the term to require that the scrambling techniques be simultaneously available. There is no such requirement in the claim or the specification. To the contrary, the specification states that the scrambling technique "can be quickly selected and implemented at will," '066 Patent, col. 2, lines 41-42, not that the differing techniques be simultaneously available. I reject EchoStar's construction requiring that differing scrambling techniques be simultaneously available. In addition, although an embodiment of the invention disclosed in the specification "can be quickly selected and implemented at will," id., that is not a limitation of the claim.

I construe the term "selectively according to a particular one of a multiple of techniques" to mean by selecting a particular
one of more than one distinct scrambling methods, where a scrambling method is something more than merely varying one
scrambling technique's parameters.

I.

When a party appeals from a trial court's post-verdict grant of JMOL, this court reviews the trial court's claim construction,
a matter of law, de novo. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329
(Fed. Cir. 1995) (en banc). The claim limitations at issue in this case are: (1) "means for selectively activating each of said
emitters for predetermined periods of time" in claim 1, (2) "selectively energizing for predetermined periods of time each of
the said emitters" in claim 2, and (3) "synchronously generating a first data signal . . . and a second data signal which
determines the duration of the energization period of said emitters" in claim 2. Both parties agree that the periods of
activation (claim 1) or energization (claim 2) -- the periods during which the printer prints a stripe -- vary with the desired
stripe length. The dispute in this case is whether the claim terms "selectively activating" in claim 1 and "selectively
energizing" in claim 2 cover printing strobed stripes, or whether those claim terms encompass only printing continuous
stripes.

In construing claim language, the court considers the claims at issue, the specification, and the prosecution history.
Markman, 52 F.3d at 979 (quoting Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1561, 19 U.S.P.Q.2D (BNA) 1500, 1503
(Fed. Cir. 1991)). The specification of the '311 patent discloses strobing the LEDs to print an exposed "region" or stripe:

(Emphasis added.) Thus, the specification contemplates strobing during the variable periods of selective activation (as in
claim 1) or selective energization (as in claim 2).

Dependent claims 4 and 27 confirm that "selectively activating" in claim 1 and "selectively energizing" in claim 2 cover
strobing. Although each claim is an independent invention, dependent claims can aid in interpreting the scope of claims
from which they depend. Claim 4 which depends from claim 3, in turn depending from claim 1, recites:

4. An electro-optical printing apparatus as recited in claim 3 further comprising means for flashing said emitters a
number of times along said linear regions.

Claim 4 covers an embodiment of the invention recited in claim 1 where the printer flashes, or strobes, LEDs during the
activation period to print "linear regions" or stripes. Claim 27, which depends from claim 2, recites:

27. A method of electro-optically printing alpha-numeric characters on the recording surface of a photosensitive material
as recited in claim 2 wherein said step in which the emitters are selectively energized includes the step of strobing said
emitters during the duration of the energization period.

Claim 27 makes clear that, in one embodiment of the invention recited in claim 2, strobing occurs during the energization
period.

The prosecution history does not suggest a different result, moreover. During prosecution of the reexamination application,
Laitram distinguished claim 2 from two prior art references. The first reference, United States Patent No. 3,085,132 to Innes
(the Innes patent), discloses a dot matrix printer that forms alpha-numeric characters by marking distinct dots on a recording
medium. For example, an "E" produced by the Innes printer appears below:

Laitram distinguished the Innes patent on the basis of the "fixed timing of the Innes dot matrix" and the Innes' "fixed-time-
duration pulses":

In alleging that Innes in the "plot mode" operates in accordance with claim 2 ignores the claimed mode of operation
which records alpha-numeric character images by means of second data signals that determine the duration of the energization period of the emitters coordinated by the constant speed movement along the Y axis as taught [by the '311 patent]. The character style S of Fig. 1 is unique to [the '311 patent] and goes contrary to the fixed timing of the Innes dot matrix. . . . Innes teaches only a dot [point] mode for both alphanumeric and plot modes . . . . Further, it is clear from Innes . . . that all marking is done with "fixed-time-duration" pulses, as contrasted to the claimed second data signal which determines the variable duration of [the '311 patent] line type marks.

(Emphasis in original.) Unlike the claimed printer, the Innes printer does not print stripes of varying length. Rather, the Innes printer produces distinct dots of fixed length by fixed duration pulses. Thus, this passage from [**12] the prosecution history does not define the relevant claim language of the '311 patent to mean something other than strobing during the activation period.

Laitram also distinguished United States Patent No. 1,201,624 to Baylis (the Baylis patent) from claim 2 of the '311 patent. The Baylis patent discloses an electro-optical printer that uses LEDs to record an image on a recording surface. Laitram explained a difference between the claimed printer and that disclosed in the Baylis patent:

"Nor is there anticipation of the step of "coordinating -- including the step of synchronously generating a second data signal which determines the duration of energization period of said emitters" in view of the absence of Baylis of any teaching of determining the duration or of coordinating [Baylis'] continuously energized emitter 114 synchronously with anything. . . . The Faraday shutter cells [of Baylis] are scanned and arranged to selectively gate light one at a time . . . "to build up from rows of spots images of the cells 111." That passage does not anticipate or teach in any way the second data signal defined in Claim 2 of variable duration to effect energization [**13] of the plurality of emitters to form line images. . . . Thus, Baylis does not in the Fig. 2 embodiment anticipate the variable duration defined by the claimed step of "coordinating -- a second data signal which determines the duration of the energization period of said emitters."

(Emphasis in original.) Again, this passage does not define the relevant claim language to exclude strobed striping. Laitram noted that the Baylis printer builds characters from rows of distinct spots. Laitram then pointed out that the Baylis patent does not teach synchronization of a plurality of emitters with the movement of a recording medium to form vertical line images or stripes. At no time during prosecution did Laitram represent that the relevant claim language could not embrace painting stripes by fixed-time strobing during variable periods of activation.

In sum, claims 1 and 2, as properly construed, cover both printing continuous and strobed stripes.
necessarily the case that a display that might conceivably return a vehicle to an original optimal route would be shown only after a vehicle has deviated from said original optimal route. Adding this phrase clarifies the claim language without inserting inappropriate limitations. However, plaintiff's proposed addition of "obtaining user instruction" is inappropriate because it goes beyond the tasks identified in the claim language. The claim states only that the display sometimes shows route guidance information leading the vehicle back to the optimal route and sometimes does not show route guidance information leading the vehicle back to the optimal route. The claim language is silent as to the process for deciding whether to show the information or where to obtain instructions. I construe the claim as:

said step of displaying, after deviation from the original optimal route, sometimes allowing and sometimes prohibiting the display of said route guidance information that returns said vehicle to an original optimal route.

3910

3. "selectively altering circuitry functions depending on mode of operation of the instrument when a first power limit is reached, thereby reducing power consumption"

Plaintiffs' construction: the instrument monitors its power consumption and, when a first preselected power consumption limit is reached, it changes selected circuitry functions depending on the mode of operation, thereby reducing power consumption.

Defendant's construction: selectively changing the functions of certain circuits based upon mode of operation of the instrument, when a first level of power consumption is reached.

Having reviewed the claim construction briefs and the transcript of the claim construction hearing, it remains unclear whether the parties have a live dispute about this term, other than their disagreement regarding the proper construction of the term "mode of operation," which I have considered above. In their reply brief, plaintiffs indicate that the only real dispute relates to the construction of "mode of operation." Plts.' Br. in Reply, dkt. # 71 at 96. In its reply brief, defendant makes a lengthy argument about how "power consumption" and "power limit" should be understood, but proposes no construction for these terms. Dft.'s Br. in Reply, dkt. # 67 at 22-26. Whether or not this is a contested issue, I do not intend to invent constructions that defendant did not propose, especially when this issue was raised first in defendant's reply brief. Accordingly, I conclude that the phrase "selectively altering circuitry functions depending on mode of operation of the instrument when a first power limit is reached, thereby reducing power consumption" cannot be construed further.

3911

The '674 Patent

A. How is Insulation Selectively Applied?

The parties interpret differently whether claim 1 of the '674 patent requires application of insulation only in certain places and not in other locations over the semiconductor substrate. Claim 1 reads, in relevant part, "selectively applying at least one layer of insulation material to said semiconductor substrate." The claim language does not specify locations or methods for application of insulation.

The term "insulation material" has its common meaning: material that does not conduct electricity. The term "selectively applying" has no common, well-understood meaning. Thus, this court sought expert testimony about its meaning to one of skill in this art at the time of invention.

Dr. Wen testified that one skilled in the art at the time of the invention would have understood this process step to encompass formation of one or more layers of a defined thickness of insulation at different points across the surface of the device. Transcript of September 19, 1995, hearing, at 224 (hereinafter referred to as "Transcript"). According to Dr. Wen, the thickness of insulation varies in different parts of the device. For example, the active part of the circuit, where the light sensing element resides, would have a relatively thin layer of insulation material. A thin layer at this location is necessary to
facilitate sensitivity to light. However, Dr. Wen explained, the periphery of the device or field area would have a relatively thick layer of insulation. Transcript at 224-25.

Dr. Wen explained that at the time of the '674 patent those in the field knew several methods of applying different thicknesses of insulation at various locations on the device. For example, one application process would grow a relatively thick layer of insulation over the whole array. The manufacturer would then use a mask to define the active region of the circuit. After masking, a chemical etch would remove the thick oxide in these areas. Then, the manufacturer would grow a very thin layer of oxide in the active region. Thus, "selectively applying" as understood by those skilled in the art at the time of invention meant application of a thin layer of insulation over the active region leaving a relatively thick layer in the inactive region. Transcript at 225-26.

The specification also suggests the application of insulation material of various thicknesses according to the function of the underlying semiconductor layers. For instance, the specification discusses use of silicon nitride to prevent the formation of additional oxide on the insulation layers:

The second insulating layer 26 is silicon nitride because thermally grown oxides will not form on the nitride. Thus the silicon nitride is very useful in protecting the underlying layer 24 from becoming significantly thicker as would normally occur during the subsequent oxidation steps in the process of this invention.

The '674 patent, column 4, lines 31-37.

The specification further discusses the use of silicon nitride to slow oxide growth: "Moreover, since oxides grow much more slowly on a silicon nitride surface, no substantial oxide grows on the top surface of silicon nitride layer 26." Column 5, lines 16-18. As these passages indicate, insulation material grows in all areas even using the disclosed illustrative method. Thus, the specification does not suggest that the inventor intended to limit this process step to one technique or to a process that insulated certain areas and not others.

Consequently, this court concludes this language describes a process step during which one or more layers of insulation material of a defined thickness form at specific locations on the top surface of the silicon wafer.

C. "Selectively Changing Transmission Rates"

Covad asserts that the Court should construe "selectively changing said first and second transmission rates" as altering both the first and second data rates from one level to another during a communication session. Bell Atlantic argues that the phrase "during a communication session" is a limitation that should not be read into the claims. The patent explains that the transmission rate can "be selected in any one of a number of ways during a transmission session." Col. 13, ll. 63-65; see also col. 15, ll. 4-6 ("The ADSL/AVR service can be changed over a range from conventional ADSL to full AVR functionality at any time during a transmission session."). To implement the recited change, "[a] menu may be displayed at the subscriber end which queries for desired parameters such as the … data rate. The subscriber then selects the desired data rate, or indicates transmission at a variable rate, through software or through selection of buttons on the set top box." Col. 14, ll. 11-16. Alternatively, a selected data rate could be "programmed or controlled so that it is executed upon the performance of some event," such as after a search was completed and a file was ready to be downloaded. See col. 14, ll. 39-43, 55-58.

With regard to the prosecution history, claim 1 initially recited a controller "for selecting the mode in which said first transceiver operates or for controlling said first and second transmission rates." July Amendment, at 3. The PTO rejected the claim over the Arnon patent that disclosed a system that selected either a fault or a normal modes before initiating the communication session. See Arnon, at col. 7, ll. 26-44. Bell Atlantic amended the claim to include the "selectively changing" limitation and argued that "even though Arnon teaches a fault induced substitution mode in col. 7, lines 26-44, the bandwidth or transmission rates in the ADSL loops during the fault mode or during the normal modes remains unchanged. Hence it is submitted that Arnon fails to show, teach, or suggest selectively changing the first and second transmission rates in the subscriber loop." July Amendment, at 15. Covad notes further that one of Bell Atlantic's press releases, issued to announce the grant of the '786 patent refers to the invention's ability to "change the rate of a DSL.
transmission 'on the fly.'" Bell Atlantic Press Release (December 14, 1998).

With regard to this disputed claim construction, Bell Atlantic first looks to the language of the patent itself to support its position that Covad's proposed construction attempts to read language into the claim that was not contemplated by the inventors. The patent states the following:

When a request for a change in modes (e.g., from ADSL to bi-directional) is received during or prior to a communication session, a negotiation is made between the two ADSL/AVR boxes so that they are operating in a compatible mode within a short period of time.

* * *

The changes in the mode and rate for the channel can be accomplished by the ADSL/AVR interface in the subscriber's premises. Any intra-session change should be accomplished within 10 seconds and, preferably, within two seconds so that the subscriber does not experience a long delay between mode or rate changes.

* * *

In addition to direct subscriber selection or control of modes during a communication session mentioned above, the selection of modes may also be made indirectly, programmed or otherwise controlled so that it is executed upon the performance of some event.

Col. 14, ll. 7-11, 22-27, 39-43.

In the alternative, the patent states that "the subscriber could instruct the LAN or file server to utilize a command file to change the mode and download the file or information upon the occurrence of some detectable event or at a designated time." Col. 14, ll. 59-62. In addition, the patent states that:

The use of a common hardware platform and programmable firmware also provides advantages in initial manufacturing and cost, and in product enhancement, upgrade costs, and time to market. For example, a subscriber could receive a fractional T1 service at 384 Kbps using the ADSL/AVR system and then upgrade the capability of the service to higher data rates in the future using a network management system without altering the hardware.

Col. 11, ll. 53-60.

Bell Atlantic states that receiving a 384 Kbps service now, and upgrading the service to higher data rates in the future, is a contemplated advantage of this "common hardware platform."

Covad is attempting to read limitations into the claims that were not contemplated by the inventors. The Court will not limit the claims in such a way, where the meaning of the claim terms are clear. The patent in several instances refers to changing transmission rates at some time in the future, thus no temporal limitation will be read into the claims. Thus, the Court finds that "selectively changing" the first and second transmission rates in claims 1 and 21 means that a change is chosen and occurs, although it need not occur during a communication session.

As an initial matter, Bell Atlantic argues that we lack jurisdiction to decide this issue because Covad did not file a cross-
appeal, and Covad's proposed claim construction would require modification of the judgment on appeal. However, the
general rule is that "without taking a cross-appeal, the prevailing party may present any argument that supports the judgment in its favor" as long as the acceptance of the argument would not lead to "a reversal or modification of the judgment rather than an affirmance." Carnival Cruise Lines, Inc. v. United States, 200 F.3d 1361, 1365 (Fed. Cir. 2000). Thus, where the prevailing party in a motion for summary judgment of noninfringement seeks "a claim construction more favorable to [its] case than the construction adopted by the district court on summary judgment, that would have no different result than affirmance of the [judgment]." Genentech, Inc. v. Wellcome Found. Ltd., 29 F.3d 1555, 1562, 31 U.S.P.Q.2D (BNA) 1161, 1165 (Fed. Cir. 1994). Because Covad's proposed construction of the "selectively changing" limitation would merely lead to an affirmance of the judgment below, there is no requirement for a cross-appeal on this issue.

It is true that the '786 patent specification explains that the transmission rate or mode of the ADSL/AVR may be selectively changed "during a communication session." '786 patent, col. 13, l. 65; col. 15, ll. 4-6. Indeed, the written description describes how a user may selectively change the "mode and/or data rate." '786 patent, col. 14, ll. 11-16. At the same time, however, the specification discusses selectively changing the mode and rate at times other than during a communication session:

In addition to the direct subscriber selection or control of modes during a communication session mentioned above, the selection of modes may also be made indirectly, programmed or otherwise controlled so that it is executed upon the performance of some event.

'786 patent, col. 14, ll. 38-42. Elsewhere, the written description notes that "when a request for a change in modes (e.g. from ADSL to bi-directional) is received during or prior to a communication session, a negotiation is made." '786 patent, col. 14, ll. 7-9 (emphasis added). The specification also recognizes that "the subscriber could . . . change the mode and download the file or information upon the occurrence of some detectable event or at a designated time." '786 patent, col. 14, ll. 59-62 (emphasis added). Thus, the patent clearly contemplates the possibility of selectively changing the transmission mode or rate at times other than during a communication session. Consequently, the specification does not define the limitation, either expressly or by implication, as a change made only during a communication session. The varied use of this limitation throughout the '786 patent specification "demonstrates the breadth of the term rather than providing a limited definition." Johnson Worldwide, 175 F.3d at 991, 50 U.S.P.Q.2D (BNA) at 1611. Covad's proposed construction would improperly import a limitation from the specification into the claim. Comark, 156 F.3d at 1186, 48 U.S.P.Q.2D (BNA) at 1005.

Instead, the significance of the "selectively changing" and "selectively operating" limitations is that the transmission mode or rate may be changed either automatically or manually without altering the transceiver hardware. The specification notes that a subscriber may "upgrade the capability of the service to higher data rates in the future using a network management system without altering the hardware." '786 patent, col. 11, ll. 57-59 (emphasis added). The specification also states:

the structure of the chips in the chip set does not need to be changed to vary the mode of the transceiver or the transmission rates . . . . The use of a single chip set, capable of either transmitting or receiving conventional ADSL, at both ends of the transmission loop in the ADSL/AVR system . . . make it possible to easily and selectively implement the reversible ADSL mode.

'786 patent, col. 13, ll. 46-60. Moreover, in the prosecution history, the patentees distinguished the fixed-bandwidth nature of Arnon:

Even though Arnon teaches a fault induced substitution mode . . . the bandwidth or transmission rates in the ADSL loops during the fault mode or during the normal modes remain unchanged. Hence, it is submitted that Arnon fails to show, teach, or suggest selectively changing the first and second transmission rates in the subscriber loop.

(Emphasis added.)

Thus, the "selectively changing" and "selectively operating" limitations in claims 1 and 21 mean that a change is chosen or occurs without alteration of the transceiver hardware, although the change need not occur during a communication session.
McNulty argues that the district court erred in requiring the current from the power supply to the electronic circuit to flow through the trigger means. The district court also erred, McNulty continues, in its construction of "selectively connecting." Although the electrical discharge sequences of the Taser devices proceed according to a predetermined sequence after the trigger on the Taser devices is released, McNulty explains, continued operation of the trigger causes the discharge sequence to repeat. Therefore, an operator of a Taser device cannot interrupt the discharge sequence, but can control whether that sequence will repeat. Although imprecise, McNulty concludes, it is still a selective disconnection.

Construction of a means-plus-function limitation requires a court to first identify the claimed function, and then to determine what structure disclosed in the specification performs those functions. Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1322 (Fed. Cir. 2003). The district court identified SW1 in FIG. 5 of the '048 patent as the structure corresponding to the "trigger means" referenced in claim 39. McNulty's arguments do not challenge this correspondence, but instead dispute the district court's determination as to the limitations on that structure and the functions that it is to perform.

The function of the trigger means is to "connect[] the power supply to the electronic circuit when in a first position." '048 patent, col. 12, ll. 41-43. The plain language of the claim, therefore, suggests that the power supply and the electronic circuit are connected only when the trigger means is in the first position, which the parties agree is the position when SW1 of Figure 5 is closed. "Selectively" modifies the "connecting . . ." phrase, and reflects the option available to the operator as to whether or not to activate the device. The written description of the '048 patent reinforces the correctness of this interpretation, explaining that "the electrical diagrammatic representation of trigger switch 14 is shown as switch SW1, wherein closure of the switch SW1 connects power source BTI with the inverter transformer TI." '048 patent, col. 4, ll. 32-35; see also id. at col. 1, ll. 61-63 ("The circuit thus operates to produce the high voltage for so long as the trigger switch is operated." (emphasis added)). As the appendices submitted by the parties present no prosecution history suggesting a contrary interpretation, we agree with the district court that "selectively connecting . . ." requires that the connection between the electronic circuit and the power supply occur when the trigger means is in the first position and that the operator of the device be able to use the trigger means to select when the power supply and the electronic circuit are connected.

The parties have briefed a series of these terms and the dispute is whether the terms are drafted in means-plus-function form. To illustrate, claim 20 of the '755 patent requires "selectively connecting" stored instructions to the processor elements. The terms do not use the term "means," but the defendants ask the court to construe them as means-plus-function limitations and to incorporate the full-access, non-blocking networks described in the specification. This argument is rejected. The defendants have not overcome the presumption that the limitations are non-means-plus-function terms. No additional construction is required.
2. "Selectively controlling said engine by means of said first computer through at least one additional programmed mode provided by said adapter module, said additional programmed mode not being originally included in said originally provided memory."

Plaintiff advocates the following construction: "selectively changing the vehicle computer through the user's use of at least one additional program in the adapter module, while preserving the originally provided program mode in some location."

Defendants argue that the proper interpretation is "choosing either the originally provided programmed mode or the additional programmed mode, both of which are part of the automotive computer, such that the operator of the automotive computer can select between the two modes by inserting or removing the adapter module." Defendants' construction would require, inter alia, that mode selection be accomplished by physical attachment or removal of the module.

The Court disagrees with Defendants' proposed limitation, finding Mr. Lundell's recommended construction more appropriate: "making a decision to switch control of the engine from the programmed mode provided in the originally provided memory to the additional programmed mode provided by the adapter module, with the adapter module remaining coupled to the bus such that control of the engine can be switched back and forth between the originally provided programmed mode and the additional programmed mode." This construction -- unlike Defendants' proposed reading -- is consistent with Defendants' contention, and the Court's ruling, that the language of the patent requires that the device be permanently attached to the vehicle. The Court therefore adopts Mr. Lundell's construction.

3917

B.

With respect to the method claim, Mr. Adrain argues that the district court erred in granting summary judgment of invalidity. The "selectively controlling" clause n3 of claim 19 was construed to mean "making a decision to switch control of the engine from the programmed mode provided in the originally provided memory to the additional programmed mode provided by the adapter module, with the adapter module remaining coupled to the bus such that control of the engine can be switched back and forth between the originally provided programmed mode and the additional programmed mode." Adrain, 2006 U.S. Dist. LEXIS 25212 at *20. Yet, the court clarified that this interpretation "does not require that the device permit switching between modes while the vehicle is in operation." Id. at n.2. In finding claim 19 anticipated by Berra, the court rejected Mr. Adrain's argument that Berra did not disclose retaining the vehicle's originally provided memory during and after reprogramming of the ECM. Id. at *26-27.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n3 Claim 19 recites the following limitation: "selectively controlling said engine by means of said first computer through at least one additional programmed mode provided by said adapter module, said additional programmed mode not being originally included in said originally provided memory."

We generally agree with the district court's claim construction. Claim 19 does not recite the "improvement in a vehicle" limitation of the apparatus claims. As such, the claimed method does not require that the adapter module remain attached to the vehicle. Moreover, the language of claim 19 makes no reference to switching back and forth between the originally provided programmed mode and the additional programmed mode during vehicle operation. Nor does claim 19 require the further step of storing the original configuration elsewhere in an additional memory, as Mr. Adrain argues. It merely requires that the adapter module provide at least one additional programmed mode not originally included in the ECM.

3918

PROST, Circuit Judge, dissenting-in-part.
Because, in my view, under the proper construction of claim 19, Berra cannot support the district court's finding of invalidity, I respectfully dissent from part B of the opinion. The majority reads claim 19 as having "no reference to switching back and forth between the originally provided programmed mode and the additional programmed mode during vehicle operation." While lacking a requirement to switch during vehicle operation, the claim does require "selectively controlling" the engine. As the district court properly recognized, "selectively controlling" indicates the ability to switch back and forth between multiple programmed modes.

Giving appropriate meaning to "selectively," Berra fails to anticipate claim 19. As the majority discusses, Berra may allow two programs to exist simultaneously in the on-board controller, and therefore allows the possibility of returning to the original program in the future. To properly anticipate claim 19, however, Berra must disclose the means by which to return to the original program, not just leave open a possibility. Contrary to the majority, I do not believe Berra discloses the ability to return to that program. Accordingly, I would reverse the district court's finding of invalidity based on Berra.

Appellees additionally assert anticipation of claim 19 based on the Microburst device. The district court did not address the Microburst device, and the record on appeal provides insufficient basis to support a grant of summary judgment at this time. I would therefore remand to the district court to evaluate anticipation based on the Microburst device.

**3919**

B. "Selectively controlling said engine by means of said first computer through at least one additional programmed module provided by said adapter module"

This term means that the vehicle's ECM can be selectively changed by the user through the use of at least one of the additional programs in the adapter module. Again, the court declines to add the "in transit" limitation to this term, because it has already read the limitation into claim 19.

**3920**

B. "selectively controlling the durations of the time intervals of activation"

Claims 1 and 3 of both the '481 and '561 patents include the limitation "selectively controlling the durations of time intervals of activation." In its Markman ruling, the district court explicitly refused to provide a distinct definition for this limitation, deeming the phrase "sufficiently defined."

Telegenix contended before the district court, and reiterates on appeal, that this limitation means "specifically controlling the length of time that individual pulses are activated to vary the amount of light emitted from a light source." Telegenix argues that by his disclosure in the specification, the inventor limited the claims to varying color using pulse width modulation ("PWM"), a technique that varies the duration of individual pulses. Telegenix further contends that the inventor limited the asserted claims to PWM by statements and amendments during prosecution of the patents in suit.

TDS responds that the claims are not limited to the particular PWM technique suggested by Telegenix. TDS urges that the claim language uses the plural form of both "durations" and "time intervals" and thus is consistent with an interpretation in which color is controlled with "more than one pulse and includes multiple activations of the same LED within the repetition period." In other words, TDS urges a claim construction that would cover devices which change perceived light intensity by varying either the width of the pulses or the number of pulses.

The words of the claim require "controlling the durations" of the "time intervals of activation." The plain meaning of "controlling the durations" indicates that the claimed invention requires variation of the duration of individual time intervals, or controlling the width of pulses, during which the LEDs are activated, e.g., PWM. This plain meaning is consistent with the specification of the '481 and '561 patents. The structures shown in Figures 9 and 11 of the '481 patent and Figure 1 of the '561 patent depict circuitry for driving the LEDs using PWM. As shown in Figure 9 of the '481 patent, the circuitry includes at least one counter 71f for each color connected to a corresponding memory 76 containing data.
regarding the amount of primary color activation required to produce the desired color. '481 patent, col. 4, ll. 24-59. The counter and corresponding memory are connected to a "flip-flop" 73 which provides the appropriate output to generate the desired color. Id. According to the specification, the "output of the flip flop 73 will be at a high logic level for a period of time proportional to the data" loaded into the counter 71f from the memory 76. Id. at col. 4, ll. 51-52. Thus, the circuitry controls color by setting the output "at a high logic level for a period of time proportional" to the desired color data.

Moreover, the prosecution history is consistent with this interpretation of the claim language. During prosecution of the '481 patent, the inventor distinguished prior art on the basis of PWM. The Patent Office initially rejected all claims in the application as obvious in view of the Kaelin reference, which taught that "LED color display elements can be varied by applying variable timed pulses to the individual diodes." The applicant responded by submitting new claims and arguing that the invention "controls the durations of the pulses that are applied to the primary color light sources in the selected display areas to control the portions of the primary color light signals, to thereby control the color of the exhibited display unit."

On the basis of our review of the ordinary meaning of the words themselves, we conclude that this limitation requires control of pulse width. This is entirely consistent with the intrinsic record. Contrary to TDS's argument, introducing multiple pulses of identical duration during the repetition period does not effect control of pulse duration. Where multiple pulses of identical duration are introduced during a single repetition period, pulse duration remains constant and color is controlled not by varying "the durations of the time intervals of activation" of pulses, as called for in the claims themselves, but by varying the number of constant duration pulses applied. Such a technique does not set the output "at a high logic level for a period of time proportional" to the desired color data nor does it "control the durations of the pulses," and thus is inconsistent with the specification and prosecution history.

We conclude that "selectively controlling the durations of the time intervals of activation" means controlling the width of pulses during repetition periods.

### 3921

(6) Selectively Delay Execution of Said Door Operation Commands

The '628 Patent includes the term "selectively delay execution of said door operation commands." The parties propose the following meanings to the words "selectively delay":

<table>
<thead>
<tr>
<th>Braun's Proposed Construction</th>
<th>VMI's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delaying the execution of door operation commands when movement of the door would cause operational interference between the door and the ramp.</td>
<td>Indefinite. No definition in the specification. Only embodiment disclosed is intercept/transmit/echo.</td>
</tr>
</tbody>
</table>

Braun submits that terms "selectively," "delay," and "execution" have common and ordinary meanings that, when combined, make clear that "whenever the ramp is moving or might otherwise be in the path of a closing door . . . the door control system is prevented from executing door operation commands." (Braun Claims Constr. Br. at 17.)

VMI objects to such an interpretation as overly broad. It argues that "[o]ne skilled in the art would be uncertain as to whether his wheelchair accessible vehicle infringes the patent claims or not as it is absolutely necessary for all wheelchair accessible vehicles to prevent door operation when the ramp is deployed. There is no other way to operate the vehicle. Thus, if the term were defined broadly, the method claims, claim 23 for example, would encompass all methods of preventing operational interference between the door and the ramp." (VMI Resp. at 12-13.) Consequently, VMI submits that the language must be interpreted narrowly to mean "intercept/transmit/echo method of delaying execution of door operation
The Court adopts Braun's interpretation: "selectively delay execution of the said door operation commands" means delaying the execution of door operation commands when movement of the door would cause operational interference between the door and the ramp. This meaning is consistent with the language of the claims themselves which recite that the controller "selectively delay[s] execution of said door operation commands by said door control system while operating said ramp motor to move the ramp" (Claims 1 and 21) and that execution of the door operation commands is selectively delayed "in order to prevent operational interference between the door and the ramp" (Claims 11 and 23).

In challenging the claims as indefinite VMI bears the burden of showing the invalidity of the patent. Its current briefs fail that burden, and the Court is not convinced that the term must be limited to the narrow interpretation of "intercept/transmit/echo method of delaying execution of door operation commands." Claims are indefinite when they are "not amenable to construction or are insolubly ambiguous." Young v. Lumenis, Inc., 492 F.3d 1336, 1346 (Fed. Cir. 2007). That is not the case here.

3922

Selectively Elect to be Included In or to be Excluded From

Furnace Brook asserts that this term should be interpreted to mean "selectively elect, by, for example, depressing the appropriate key on the customer terminal, to be included in, or to be excluded from." Overstock asserts that this term should be interpreted to mean "when placing an order, a customer using a telephone terminal may elect to have his/her name added or deleted by activating a computer code at the customer telephone terminal." Claim One recites, in part:

...enabling a user when placing an order to selectively elect to be included in or to be excluded from said customer profile marketing data file created as part of a completed catalog product or services order transaction.

A customer elects to have his or her name deleted from a computer file after placing an order "by electronically activating a marketing data delete file" and that customer gives his or her approval to having data included in a customer data file by "depressing an appropriate key at the customer terminal." Accordingly, "selectively elect to be included in or to be excluded from" is a "customer's acceptance or denial of an invitation to have his name and address, and, if applicable, his order placed, retained in a customer profile by the retailer."

3923

1. '776 Patent

In the '776 patent, the last element of each of claims 1, 3, and 24 is construed to be a step or means that energizes, or turns on, a compressor in response to an increase capacity signal and deenergizes, or turns off, a compressor in response to a decrease capacity signal. The claims do not allow for energizing a compressor in response to a decrease capacity signal or deenergizing a compressor in response to an increase capacity signal.

The word "respective" in the context of the claim means "in the order given." The order given in the claim is to energize and deenergize in response to increase capacity signals and decrease capacity signals. "Respective" links the energizing steps to the increase capacity signals and links the deenergizing steps to the decrease capacity signals. The Court adopts Dr. Rhyne's testimony that a person of ordinary skill in the art would give this interpretation to the word "respective."

In the specification, where "respective" is used many times, it also means "in the order given." See, e.g., Column 4, line 66 through Column 5, line 4. The prosecution history further supports this interpretation. See JX-776, Response, Bates Nos. 144-45, example showing that a compressor was energized only in response to an increase capacity signal and that a
The compressor was deenergized only in response to a decrease capacity signal.

The language in claim 1 is exemplary and states that the last step comprises "selectively energizing and deenergizing compressors in response to respective increase capacity signals and the decrease capacity signals." To understand why "compressors" and signals" are plural, the Court examined other portions of the claims, the specification, and the prosecution history. The next to last element in each of claims 1, 3, and 24 indicates that a single increase capacity signal is generated when more compressor capacity is needed and that a single decrease capacity signal is generated when lesser compressor capacity is needed. The use of the plural "signals" in the last element of claims 1, 3, and 24 reflects a history of operation, i.e., a result of controller operation over a time interval. The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill at the relevant time would have so understood and interpreted the use of plural "signals" and "compressors" in the claims. Because there is no indication from other portions of claims 1, 3, and 24 whether the use of the plural in "compressors" is also a result of the same time interval or history of operation, the Court looked to the specification and discovered that the specification and disclosure indicate that a single compressor is turned on in response to an increase capacity signal and a single compressor is turned off in response to a decrease capacity signal. See, e.g., Column 4, line 66 to Column 5, line 4 states that "one of the multiple compressors" is energized in response to an increase capacity signal. The prosecution history at pp. 28-29, JX-776, Response, Bates Nos. 144-45, reflects that only one compressor is turned on in response to an increase capacity signal and one compressor is turned off in response to a decrease capacity signal. On page 30 of the same Response, JX-776, Bates No. 146, the applicant argued,

It is the independent control of each compressor of the present invention without regard to the energized or deenergized state of the other compressors in the system which makes the number of combinations of compressors available greater than the number of available compressors.

Thus the last element of claims 1, 3, and 24 of the '776 patent recites a step or means for energizing a single compressor in response to an increase capacity signal and deenergizing a single compressor in response to a decrease capacity signal.

The claim further needs interpretation in light of the collective limitations of the words and phrases, "selectively," "in respective response," and "to provide a greater combination of compressors." In combination with other limitations of "respectively" and "to provide a combination of compressors . . .," "selectively" means energizing or deenergizing compressors according to some particular logic or criteria. Thus the claim element takes on the construction indicated supra. Support is found in the specification, Column 7, line 45-51, DX-119:

As described above, it will be evidence that controller circuit 10 will "cut-in" or "cut-out" the next compressor or compressor stage as above described until the combination of stages has an operating capacity closest to matching the system load, i.e., causing the system suction pressure to return to the previously established . . . range as hereinabove described and shown in FIG. 4 [emphasis added].

Similarly, the prosecution history also supports this construction. On page 30, Response, JX-776, Bates Nos. 146), the applicant was commenting upon the example provided on the prior pages which compared the operation of "the invention"
to the prior art (in which the example clearly cycled through compressors until the correct capacity match was made) and explained

Successive reiterations of the FIFO strategy enables [sic] the present invention to more efficiently match the system load with the expanded set of compressor combinations available than previous systems, such as in Golber, having only a limited number of combinations available [emphasis added].

The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill in the art at the time would have understood and interpreted the use of "selectively" and "respective" in the claims in the '776 patent as limited with respect to choosing the optimal combination without the cycling through individual compressors until the proper combination for the needed capacity was achieved.

As discussed above, the Court finds that the specification at Column 7, line 58 through Column 8, line 10 does not disclose a binary sequence as an alternate logic to the FIFO sequence of operation for controlling compressors. Instead, based upon the prosecution history, the Court interprets the claims as limited to the structure or an act for achieving a FIFO sequence. While the example of the invention given by the applicant was specifically directed at application claims 7, 8, and 10, among others, and did not explicitly limit the sequence to FIFO, the example is clearly a FIFO sequence. See, e.g., the statement at page 29 of the Response, JX-776, Bates No. 145:

By contrast, the second system [in accordance with the present invention] faced with the same five horsepower requirement will energize Compressor Number 3, being the compressor deenergized for the longest period of time, in addition to maintaining Compressor Number 2 in an energized state. This will establish a capacity of six horsepower which, being greater than that required, will initiate a cut-out signal for the compressor which is energized for the longest period of time, i.e., Compressor No. 2. This leaves a total capacity of four horsepower. In the final stage of matching the system capacity to the instantaneous load, the second system will then initial a cut-in signal and increase the capacity of the system by energizing the compressor which has been deenergized the longest period of time (i.e., Compressor Number 1) [emphasis added].

On the following page, the applicant states that "successive reiterations of the FIFO strategy" enabled the present invention to match more efficiently the system load.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

24 The '602 patent makes clear that both the binary and the FIFO sequences cycle through a set sequence of turning compressors on and off until they arrive at the optimal combination to satisfy the load demand.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

On page 2 of a Supplemental Response (JX-776, Bates No. 162) mailed to the PTO on November 10, 1982, moreover, the applicant asserted that

the arrangement claimed by applicant provides an operation that has several subtle advantages over the art which may not be readily apparent, and therefore, the claimed structural and functional operations do not really do justice to the many advantages of applicant's system, except by comparison with operation in accordance with the prior art [emphasis added].

The only comparison of the operation of the present invention against the prior art in the prosecution history is found at pages 28-29, Response (JX-776, Bates No. 144-45). Moreover also on page 2 of the Supplemental Response, the applicant states,

Expressed in shorthand terms, an applicant's claims are directed to a cooling system using a FIFO control strategy applied in tandem to a plurality of commonly piped compressors to enable independent compressor control.

Furthermore, the Court observes that the FIFO sequence is mentioned five more times in the following page and a half. In addition, Dr. Rhyne, whose expertise is greater than one of ordinary skill in the art in 1979, testified that in five readings of the prosecution history, he never construed the "shorthand terms" comment as limited to certain claims.
The statements in the Supplemental Response are not limited to any particular claims, as evidenced by the last quoted statement, which is not restricted to any particular claims. Moreover, the applicant stated in the first paragraph about the description of "THE INVENTION" (JX-776, Bates No. 208),

The claimed invention concerns a novel control system for controlling the capacity of a preselected number of commonly piped compressors, as typically employed in a cooling system. Expressed in shorthand terms, applicant's claims are directed to a FIFO control strategy applied in tandem to a plurality of commonly piped compressors to enable independent compressor control.

In sum, the Court concludes from these arguments and statements made during the prosecution history that all the claims of the '776 patent, regardless of the application of 35 U.S.C. § 112 par. 6, are limited to the structure and acts for achieving a FIFO sequence of operation.

The Court concludes that the last element in each of claims 1, 3, and 24 of the '776 patent invokes application of § 112 par. 6 and satisfies the three requirements indicated supra.

Specifically Claim 1 of the '776 patent is a method claim that recites a series of "steps." The preamble ends with the phrase "steps of," indicating that each of the following elements is a step. (DX-109). Thus the element "selectively energizing" is a step. Moreover the step of "selectively energizing and deenergizing" has a specified function, following the step and linked to the step, "to provide a combination of energized unequal capacity compressors that exceeds in number the preselected number of compressors in the system . . . ." Finally, the step does not recite structure, material or acts for achieving the designated function.

The last elements in claims 3 and 24 are also subject to § 112 par. 6. These claim elements are expressed as "means for," signaling an intention to invoke § 112 par. 6 and raising the presumption that it applies. The elements in claims 3 and 24 have the specified function "to provide . . .," following the recited "means" and linked to that means. There is no recitation of structure, material or acts in those respective elements for achieving the specified function. Dr. Rhyne, testifying that § 122 par. 6 applied, maintained that "selection" or "selection means" had no commonly understood meaning in the art at the time to define a particular structure.

Since claims 1, 3, and 24 are subject to § 112 par. 6, they are limited to the corresponding structure or acts disclosed in the specification for performing the recited function, and their equivalents. As noted supra, the only disclosure for such a means or step to achieve the recited function is a capacity controller circuit that implements a FIFO logic or sequence. Thus the last elements of claims 1, 3, and 24 are limited to a FIFO sequence of operation and structure.

The decision in Altech Controls Corp. v. The Larkin Group, Inc., No. 1:88-CV-499-MHS at *6, 56-61 (N.D. Ga. September 18, 1990), holding that some claims were directed specifically to the FIFO control strategy and others to more combinations, is not binding on this Court. Moreover because E.I.L. was not a party, the doctrine of res judicata does not apply. Substantial questions have been raised about the order, adopted from the plaintiffs' proposed findings of fact and conclusions of law after a settlement was communicated to the court. Furthermore, it was issued prior to Vitronics, which clarified the need to focus on intrinsic evidence, and recent Federal Circuit cases dealing with § 112 par. 6, including Greenberg, York Products, Cole, and Fonar.

3924

e. "Selectively Filling in the Void"

The term "selectively filling in the void" appears in claims 1 and 107 of the 637 patent. This claim term brings up the issues similar to those encountered in the terms "to select voids" and "altering voids" and related terms. For the reasons stated in the discussions pertaining to those terms, we construe this term to mean filling in, replicating, creating, modifying, replacing, substituting, adding to, providing, correcting, or improving the void by varying the input signal without solely modifying the on and off times of the signal carrying the image. Although IP requests that we construe this term differently between these two claims, this construction will apply to both. See Rexnord, 274 F.3d at 1342.

- 4183 -
2. "selectively generating"; "selective transfer"

a. The Parties' Proposed Constructions

Ampex asserts that "selective" means "characterized by selection," and "select" means "chosen in preference to another or others." (D.I. 305 at 14.) Ampex requests that "selectively generating" be construed to mean that "without the operator orchestrating each step, the claimed means automatically determines whether to generate a reduced size version and generates it in those cases." (Id. at 31.) Similarly, Ampex argues that "selective transfer" should be construed to mean that "without the operator orchestrating each step, the claimed means automatically determines whether to generate a reduced size version and generates it in those cases, and transfers the reduced size image so generated to random access memory." (Id.) In support of its position that the selection is made "automatically" by the claimed system, Ampex relies on the prosecution history of the '121 patent, as well as expert testimony. (D.I. 300 at 32.)

Defendants claim that "selective" and "selectively" mean "the ability to choose (i.e., select)." (D.I. 305 at 14.) Accordingly, Defendants ask that "selectively generating" be construed to mean that "there is the ability to choose (i.e., select) whether to generate reduced size images," and that "selective transfer" be construed to mean that "there is the ability to choose (i.e., select) whether to transfer the reduced size images from the size reducer through random access memory to bulk memory." (Id.) The basis for Defendants proposed claim construction is the ordinary meaning of the term "select," the plain language of the claims, and specification. (D.I. 299 at 19-21.) Defendants disagree with Ampex's argument that the claimed system "automatically" makes the selection. (Id. at 21-22.)

b. The Court's Construction

The parties appear to agree that the ordinary meaning of the terms "selective" and "selectively" involves choice. (Id. at 19; D.I. 300 at 32.) The parties also seem to be in agreement that "selectively generating" be construed to mean that "there is the ability to choose (i.e., select) whether to generate" and "selective transfer" means "to choose whether to transfer." (D.I. 299 at 19; D.I. 300 at 32.) The only dispute is as to whether the system or the user performs the selection. Ampex admits that the terms "selective" and "selectively" do not mean that the selection is performed "automatically" by the system. (D.I. 346 at 23.) And, Ampex points to no other language in the claims that can be construed to mean "automatically." Rather, Ampex argues that the purpose of the invention requires that "automatically" be read into the claims. (D.I. 300 at 32; D.I. 346 at 24.) Ampex also provides a statement from the prosecution history, which it claims confirms that the system itself performs the selection. n5 (D.I. 300 at 32.) But, Ampex does not show how these general explanations of the invention relate to any of the specific language in the claims. As discussed above, the specification and prosecution history cannot be used to read limitations into the claims that have no support in the claim language. See Bayer AG, 279 F.3d at 1348. Therefore, I will construe "selectively generating" to mean "to choose whether to generate," and "selective transfer" to mean "to choose whether to transfer."

--- Footnotes ---

n5 "Applicant's invention ... as described and claimed, provides image reduction via his size reducer (26) coupled only to the frame store (22), and which receives the full size image only from the frame store whenever there is no reduced size image, and which then returns the reduced size image directly back to the frame store for storage thereof simultaneously with the corresponding full size image." (D.I. 300 at 32 (emphasis added by Ampex).)

--- End Footnotes ---
Claim 1 of '796 Patent claims, in pertinent part: "(5) forming a masking layer to selectively mask one or more of said second portions from dopants in a subsequent doping step. . . ." (See '796 Patent at 5:33-35.) Micrel proposes that the Court construe "selectively mask one or more of said second portions from dopants in a subsequent doping step" to mean "selectively shield at least a portion of one of said second portions from dopants implanted during a doping process conducted after forming the masking layer (shield)." MPS argues that the Court should construe the disputed term as "select where a third doped region (different that the first and second doped regions) is to be formed, with a boundary defined by the oxide over the first doped regions, by protecting one or more of the second portions from the dopants deposited in step (6)." At the hearing, the Court proposed construing the term to as "selectively shield at least one or more of said second portions from dopants implanted during a doping process conducted after forming the masking layer (shield)."

With the exception of the phrase "a portion of one of said second portion," the Court finds that the construction proposed by Micrel is supported by the intrinsic evidence. Micrel informed the Court at the hearing that it would accept the Court's modification of its proposed construction. The Court concludes that MPS's proposed construction is not supported by the intrinsic evidence. MPS's construction inserts a "third doped region," which would add a limitation that is not supported by the claim language by requiring the formation of a third region and would import into step five conduct which is set out in other steps, i.e. depositing dopants. Therefore, the Court adopts Micrel's proposed construction with the modification regarding "a portion of one of said second portion," and accordingly construes "selectively mask one or more of said second portions from dopants in a subsequent doping step" to mean "selectively shield at least one or more of said second portions from dopants implanted during a doping process conducted after forming the masking layer (shield)."

3927

Selectively placing the motion detector camera into one or more of a burst state, a pause state, and a test state

The Court construes "selectively placing the motion detector camera into one or more of a burst state, a pause state, and a test state" as "the motion detector camera is placed automatically or by the user into at least one of a burst state, a pause state, and a test state." Defendants' construction, "the motion detector camera is purposely put by the user into the burst state, pause state, or test state or the motion detector camera is purposely put by the user into two or more of such states simultaneously," contains two unnecessary limitations. First, Defendants' construction requires the user to select the camera state. For the reasons already discussed, the Court rejects this limitation. Second, Defendants' construction requires that the camera be placed into "two or more" states simultaneously. The claim language is not so restrictive as it only requires that the camera be placed into "one or more" states. Defendants argue that to give "one or more" any meaning, it must be interpreted to mean "two or more." Defendants have no support for this argument, which belies the very meaning of "one or more." The Court's construction accurately reflects the plain meaning of the claim language.

GO BACK

3928

Selectively Providing Access

The Court adopts ST's proposed construction of "selectively providing access" and construes it to mean "determining which of a plurality of devices coupled to a bus is allowed access to the memory based on a priority scheme." Comparison of ST's proposed construction with Motorola's 3 demonstrates agreement that the term should include: multiple devices, a bus, memory access, and a priority scheme. The dispute over this term regards Motorola's attempt to include other limitations in this claim term. For example, Motorola would include the limitation "that the decoder operates in real time" in the definition of "selectively providing access." Although it is true that claim 1 of the Diaz patent concerns real time operation, that limitation is found in the claim language "requires access to the memory sufficient to maintain real time operation." '789 Patent, 12: 31-32. The Court adopts ST's proposed construction as following the ordinary meaning to one skilled in the art and denies Motorola's for incorporating unrelated limitations from the claims and specification.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Motorola's proposed construction is: "providing access using a priority scheme that ensures that the decoder operates in
real time, without denying the other components on the bus access to the memory for an amount of time that would interfere with their operation."

3929

3. "Selectively showing" is construed to mean "choosing whether or not to present something."

3930

14. "advertising selector for…" ('366 patent)

<table>
<thead>
<tr>
<th>Beneficial's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternatively, &quot;advertising selector&quot; means &quot;a device or program that selects or chooses advertisements&quot;</td>
<td>Function: Determining, for each of a plurality of users, a corresponding advertising presentation, from a plurality of advertising presentations.</td>
</tr>
<tr>
<td>Structure: Advertising selection engine 618 (disclosed in Figs. 6A and 8A) including the algorithm for performing the claimed function (disclosed in the '366 patent at col. 23:32-36 and 44-48).</td>
<td>Alternative: To the extent this is not sufficient structure or algorithm, the '366 patent lacks disclosure of all of the structure or algorithm for performing the corresponding function, which renders this term indefinite.</td>
</tr>
</tbody>
</table>

The parties' primary dispute with respect to this term is whether it should be construed as a means-plus-function limitation under § 112, P 6. Beneficial argues that because the claim element does not use the word "means," there is a rebuttable presumption that § 112, P 6 does not apply. Beneficial argues that the presumption cannot be overcome because the phrase "advertising selector" is a claim term that recites a sufficient structure and the term has a well understood meaning in the art. Defendants argue that the "advertising selector…” limitation should be construed under § 112, P 6. Defendants generally argue that a limitation that does not recite the term "means" can still be construed as a means-plus function limitation if it can be shown that the claim term fails to recite sufficiently definite structure or else recites function without reciting sufficient structure for performing that function. Defendants argue that generic or software-related terms do not connote sufficient structure. First, Defendants argue that the phrase "advertising selector" does not recite sufficiently definite structure. Defendants argue that neither the generic word "selector" nor the addition of the word "advertising" conveys sufficient structure to a person of ordinary skill in the art. Second, Defendants argue that the remainder of the limitation, "for determining, for each of a plurality of users, a corresponding advertising presentation," merely recites function and does not convey sufficient structure for performing that function.

The Court finds that, because the claim element "advertising selector" does not use the word "means," there is a rebuttable presumption that § 112, P 6 does not apply. MIT, 462 F.3d at 1353-54. The Court finds that the Defendants have not met their burden to rebut the presumption. The Court finds that one of ordinary skill in the art would understand the term "advertising selector" to recite sufficient structure and to have a reasonably well understood meaning. The Court finds that the term is not "simply a nonce word or a verbal construct that is not recognized as the name of structure." See Lighting World, 382 F.3d at 1359-60. The specification of the '366 patent describes the capabilities and uses of the advertising
selection engine. See '366 patent, 23:43-24:42; see also FIG. 8A and 8B (item 618). Further, Beneficial has provided a dictionary definition for the term "selector" as "one that selects." The Court notes that the Defendants have not provided an alternative construction, and have not argued against Beneficial's proposed construction, if the term is not construed under § 112, P 6. Thus, the Court construes the term "advertising selector" to mean "program that selects advertisement presentations."

3931

E. "song selector"

As with "selection keys," Touchtunes proposes a construction of the term "song selector" -- "a mechanical device, separate from a display, that allows a user to select a song" -- that adds "mechanical" and "separate" requirements. Arachnid proposes a more general construction: "a device that allows a user to select a song."

Touchtunes again contends that the separate recitation of the terms "display" and "song selector" in the '575 Patent supports the limitations it seeks to impose. However, this separate recitation in a specific preferred embodiment does not require physical separation between the "song selector" and the display screen, nor does the fact that the '575 Patent discloses keys and a keyboard as the selection devices in the preferred embodiments limit the claim term to "mechanical" devices. See Phillips, 415 F.3d at 1323.

For these reasons, consistent with its plain and ordinary meaning, the term "song selector" is construed as "a device that allows a user to select a song."

3932

1. "being self-aligned with said conductive gate when forming said first region"

Claim 1 of the '046 Patent claims, in pertinent part, "[a]lateral DMOS transistor structure comprising: . . . a first region formed completely within said semiconductor material of said first conductivity type, said first region being self-aligned with said conductive gate when forming said first region. . . ." (See '046 Patent at 7:20-29.) Micrel proposes that "being self-aligned with said conductive gate when forming said first region" be construed to mean "being formed using the conductive gate as a mask so that the relative position of the first region is controlled by the position of the conductive gate." MPS proposes that this term be construed as: "fabricated by first forming a conductive gate which then blocks the introduction of dopants when forming the first region such that (1) dopants are allowed to be introduced to the surface covered by the conductive gate and (2) the first region extends from the gate to where the second region will be formed."

The crux of the parties's dispute centers around the meaning of "self-aligned with." Both parties agree that the enhanced drift region or "first region" being "self-aligned with" the conductive gate means that the conductive gate controls the position of the enhanced drift region. What the parties dispute is whether the position of the enhanced drift region is fixed or relative with respect to the gate and thus whether the claim language allows for or precludes the use of gate edge spacers attached to the gate before the enhanced drift region is formed. (Opp. at 8; Reply at 1.) In other words, MPS argues that the language of Claim 1 precludes the use of gate edge spacers, and thus, the enhanced drift region or the "first region" forms adjacent to the gate. Micrel argues that the specification describes the use of gate edge spacers and that the location of both the spacers and the enhanced drift region are set off of or relative to the gate.

The specification of the '046 Patent teaches that:

Well known gate edge spacers may be formed, if desired, prior to the P doping process to prevent the P doping from subsequently diffusing too far under the gate. P-type dopants are then implanted to form the body regions and then driven in.

An N dopant is then used to form the N enhanced drift regions 31 . . .
The Court finds that there is nothing inherent in the phrase "self-aligned" which requires that the enhanced drift region be formed in an absolute location, as opposed to being set in relation to the gate. On the other hand, if the Court construes "self-aligned" narrowly to require the enhanced drift region be set in a particular or absolute location, the use of gate edge spacers, which are included in a preferred embodiment, would be excluded. Generally, courts should not construe terms in a manner that would exclude a preferred embodiment. Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001) ("a claim construction that would exclude the preferred embodiment is rarely, if ever, correct and would require highly persuasive evidentiary support . . ."). More importantly, the Court finds that there is no language in the specification or in the claims which specifically disclaims or precludes the use of spacers in the '046 Patent.

At the hearing, for the first time, MPS argued that the preferred embodiment only addresses the use of gate edge spacers on one side of the gate with respect to P-type dopants which form the body regions. Given that the specification discusses implanting N-type dopants after implanting P-type dopants while the gate edge spacers are in place, construing this language to include a gate edge spacer only on one side of the gate would be reading it too narrowly. (See '046 Patent at 5:18-27.)

MPS relies heavily on the prosecution history to support its proposed construction of "self-aligning with," but its reliance is misplaced. To overcome the Patent Office's initial rejection of Claim 1, the inventors amended the claim from "a first region formed in said semiconductor material" to "a first region formed completely within said semiconductor material of said first conductivity type, said first region being self-aligned with said conductive gate when forming said first region." (Declaration of Thomas Rees, Ex. B at MIC000127.) In explaining why these changes made the claim patentable, the inventors explained the claim was amended "to emphasize that the 'first region' (enhanced drift region 31) is self-aligned with the conductive gate 26. Conductive gate 26 is therefore formed before enhanced drift region 31 is formed, and the gate acts as a mask when ions are implanted to form enhanced drift region 31." (Id.) A further examination of the prosecution history reveals that the inventors amended Claim 1 in an effort to distinguish prior art in which the drain region was formed before the gate. (Id., Ex. B at MIC000127-28.) The issue the inventors were addressing by amending the claim language was the timing in which the enhanced drift region is formed, not its location. (Id.) Thus, the prosecution history does not speak to whether using the gate as a mask precludes the use of gate edge spacers attached to the gate, and therefore, does not assist MPS.

Accordingly, the Court concludes that "self-aligned with" does not require the enhanced drift region to be in a fixed location, but rather, merely teaches that the location of the enhanced drift region is controlled by the gate. Whether gate edge spacers are attached to gate would not alter the fact that the gate controls the location of the enhanced drift region. If gate edge spacers are used, then the location of both the gate edge spacers and the enhanced drift region would be set in relation to the gate. Thus, the Court construes the disputed term to mean "being formed using the conductive gate as a mask so that the relative position of the first region is controlled by the position of the conductive gate."

**3933**

3. **"Self-configuring bus"**

Claim 1 discloses a "self-configuring bus and a bus master and a plurality of interfaces interconnecting the instruments to the self-configuring bus." '286 Pat. col.7 ll.10-12. The Parties agree that a "bus" is a "shared communication medium." (Agreed-Upon Constructions Chart 2.) KSEA contends that the "self-configuring bus" is a shared communication medium "in which at least two connected devices automatically communicate with each other." (Proposed Constructions Chart 7.) S&N argues that the "self-configuring bus" is a shared communication medium "connecting multiple stations (e.g., instruments) that has functionality for (i) automatically, based on arbitration provisions or assigned priorities, determining which one of the stations will serve as the bus master, and (ii) automatically detecting the connection or disconnection of stations to or from the bus." (Id.)
The Court rejects KSEA's proposed construction. KSEA's argument rests on the premise that the bus is self-configuring because the bus master configures the bus. (See Pl.'s Opening Claim Construction Br. 28.) This premise is incorrect because the applicant chose to use the phrase "self-configuring," which naturally reads as configuring itself. Counsel for KSEA essentially conceded that KSEA's proposed construction contradicts the words of the claim, (see Hr'g Tr. 175), and KSEA has not shown that the Court should disregard the claim's plain text.

S&N's proposed construction accords with both the text and the assumptions underlying the claim. This proposed construction teaches that the bus configures itself both by selecting a bus master, and by determining at a basic level when an instrument has been plugged in or removed, so that the bus master can then perform its separate configuration function of controlling access to the bus. (See Hr'g Tr. 167-70.)

8 The Court finds that Dr. Ellen Zegura's experience is sufficient with regard to the electrical engineering concepts underlying the relevant aspects of Claim 1.

The Court rejects KSEA's objections to S&N's proposed construction. First, S&N's proposed construction does not require more than one master-capable instrument to be connected to the bus. It simply teaches that the bus is capable of determining, if more than one master-capable instrument is connected, which such instrument will serve as bus master. Second, KSEA's claim differentiation argument fails because Claims 3 and 11 explicitly contain limitations not present in Claim 1: that the bus is a two-wire line, '286 Pat. col.7 l.24, and that the bus master is selected from a defined set of instruments, id. at col.7 ll.49-57. Third, S&N's proposed construction does not, as KSEA contends, suggest that stations are not connected to the bus through the disclosed interface. Fourth, that Dr. Zegura is unaware of other systems where a bus automatically detects the connection or disconnection of stations does not overcome the textual evidence suggesting that Claim 1 discloses such a system.

The Court construes "self-configuring bus" as a "shared communication medium connecting multiple stations (e.g., instruments) that has functionality for (i) automatically, based on arbitration provisions or assigned priorities, determining which one of the stations will serve as the bus master, and (ii) automatically detecting the connection or disconnection of stations to or from the bus."

3934

6. "second doped regions being self-aligned with said first doped regions"

Claim 1 of '796 Patent claims, in pertinent part:

(6) depositing dopants of a second conductivity type into said second regions not masked by said first making layer to form second doped region, said oxide masking said first doped portions from dopants during this step, said second doped regions being self-aligned with said first doped regions, wherein said first doped regions are N-wells and said second doped regions are P-type regions.

(See '796 Patent at 5:36-43.) Micrel proposes that the Court construe "second doped regions being self-aligned with said first doped regions" to mean "first and second doped regions being formed using the same mask to control the relative locations of said regions." MPS argues that the Court should construe the dispute term as "second doped regions are fabricated by using the oxide over the first doped regions, where the boundaries of the oxide are the same as the boundaries of the first doped regions, to define a boundary of the second doped regions."

The Court already construed "self-aligned" in the '046 Patent. In the context of self-aligning with a gate, which acted as a mask to shield dopants, the Court determined that the gate controlled the location of the region being doped. In Claim 1 of the '796 Patent, the oxide mask shields the dopants and thus controls the location of the doped regions. Micrel's proposed construction of the disputed term here is consistent with the Court's construction in the related '046 Patent. MPS's proposed
construction here is similar to the construction urged by MPS of "self-aligned" in the '046 Patent. MPS proposes that the disputed term here be construed to create fixed boundaries of the regions, a construction the Court already rejected as unsupported. Therefore, the Court construes "second doped regions being self-aligned with said first doped regions" to mean "first and second doped regions being formed using the same mask to control the relative locations of said regions."

3935

A. Single Self-Contained and Autonomous

Digi proposes that "self-contained" means "providing all networking hardware, networking software, and device interface elements needed for networked operation of a device." Digi asserts that the term "autonomous" should be construed as follows: "the module operates independently of the device, does not incorporate any of its functionality or require any changes to the device, and can if necessary provide all processing power and the network communication capabilities required to enable networked operation of the device." Further, Digi adds, "No device specific applications run on the module." Lantronix, on the other hand, contends that the term "self-contained autonomous" "should be defined by the elements listed after the word 'comprises,' which define what the 'self-contained autonomous' module is 'comprised of.'" Lantronix asserts that the word "comprises" is "non-limiting and means that a device may be covered by the claim even if it has additional components or functionality." Finally, Lantronix maintains that "autonomous," as used in Claim 1, does not mean that the module is located outside the device.

As a preliminary matter, the Court disagrees with two crucial aspects of Lantronix's proposed construction. First, Lantronix asserts that the claim language to be construed is a single phrase: "self-contained autonomous." Claim 1, however, uses the language "self-contained and autonomous." ('192 Patent C. 18, 1: 41 (emphasis added).) In light of the actual claim language, the Court will construe the terms "self-contained" and "autonomous" separately. To do otherwise would inappropriately render one of the terms meaningless. See Cardiac Pacemakers, Inc. v. St. Jude Medical, Inc., 296 F.3d 1106, 1115 (Fed. Cir. 2002).

In addition, the Court finds no support for Lantronix's position that the phrase "self-contained and autonomous module," followed by the word "comprises," means that the "module" of Claim 1 merely contains the elements that are subsequently listed in Claim 1. The Court agrees with Lantronix that the word "comprises" acts as a transition, meaning that the claim language "is inclusive or open-ended and does not exclude additional, unrecited elements or method steps." Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1327 (Fed. Cir. 1999) (citations omitted). However, this transitional language does not render meaningless the terms that precede the word "comprises." In other words, Lantronix's proposed construction would inappropriately render the terms "self-contained" and "autonomous" as mere surplusage. The Court finds that Claim 1 describes a unit that "comprises" the subsequently listed elements, but is also "self-contained" and "autonomous." ('192 Patent c. 18, 11: 41-44.) With this determination in mind, the Court turns to the construction of the words "self-contained" and "autonomous."

1. Self-Contained

As noted above, Lantronix has not provided the Court with an independent proposed construction for the term "self-contained." Digi asserts that the term "self-contained" should be construed as "providing all networking hardware, networking software, and device interface elements needed for networked operation of a device." The Court finds merit in Digi's construction.

The specification supports Digi's construction. The specification describes a module that provides all of the networking capabilities needed to operate or monitor a device from a remote location. The specification specifically states:

the present invention requires only a single, inexpensive integrated circuit chip. Remarkably, this single network interface chip provides all the networking hardware, networking software and device interface elements necessary for network connectivity and web-based or network-based management of any device.

(192 Patent c.2, 11: 45-50.) Further, it describes the invention as follows:
the network interface chip of the present invention provides complete internet enablement without any expensive web server machine. The chip alone is a fully functional internet node, including a web server, and supporting various protocols and hardware connections.

(Id. at c. 3, 11: 11-16.) Finally, the specification reads:

The network interface chip 36 is a single integrated circuit that connects to the control circuitry 38 of virtually any remote device 34 and implements all networking services required to interface the device with a high performance computer network 32 for remote control and monitoring by one or more clients 30.

(Id. at c. 6, 11: 30-35.) This language supports a construction of "self-contained" as providing all of the hardware and software required to operate a device remotely.

In addition, the prosecution history supports Digi's construction. In their reply to the Office Action dated November 30, 2001, the inventors stated:

The present invention clearly claims and describes in the specification (for example Page 3, lines 23-24; Page 4, lines 22-24; Page 5, lines 1-2) a single module (such as a network interface chip) that provides all the networking hardware, networking software, and device interface elements necessary for network connectivity and web-based or network-based management of any device.

(Reply to Office Action at 5-6 (emphasis in original).) This prosecution history is consistent with the specification and supports Digi's construction.

Thus, the Court construes the term "self-contained" to mean that the module "provides all networking hardware, networking software, and device interface elements needed for the networked operation of the device."

2. "self-contained power supply"

Claims 4, 5, 7, and 20 of the '571 Patent describe a "self-contained power supply." Philips contends that this term should be construed as "circuitry contained within a separate housing, that converts power from a power source (e.g., AC power) to another form (e.g., DC power)." Cardiac Science asserts that the phrase should be defined as "a power supply that is complete within itself."

In support of its construction, Cardiac Science asserts that the self-contained power supply of the '571 Patent is analogous to the batteries described in Claim 1, yet embraces a broader concept than just a battery. Cardiac Science maintains that the self-contained power supply is contained within itself, where all the power comes from a single place or a single package. Cardiac Science's construction is consistent with dictionary definitions of the term "self-contained." Merriam-Webster's Collegiate Dictionary, supra, at 1127. Philips, on the other hand, asserts that the '571 Patent clearly distinguishes between a battery and a power supply. Philips asserts that the claim construction should reflect this difference. Moreover, Philips contends that technical dictionary definitions, and thus people of ordinary skill in the art, define a power supply as something that converts power from one form to another.

Column 3 of the '571 Patent describes the electrical system of the invention. The specification states that "during normal operation, power generation circuit 84 generates regulated * 5 V, 3.3 V and 12 V (actually about 13.3 V) supplies with the power provided by the twelve volt battery 80." ('571 Patent at c. 3, ll: 16-19.) The specification continues to describe how each of these voltage supplies is used to power certain things in the AED. However, the patent does not describe an AC to DC conversion of power -- the patent merely describes a power supply with a battery that provides DC power. Philips' proposed construction goes too far in this regard, and would read out a battery, which only provides DC power, as a possible self-contained power supply. In addition, the patent does not describe a power supply that is "contained within a separate housing," as Phillips proposes. Rather, the patent describes a self-contained power supply that is "disposed within the case" of the AED.
The Court finds that, based on the claim language and the patent specification, a straightforward definition of "self-contained power supply" is appropriate. Thus, the Court construes "self-contained power supply" to be "a power supply that is complete in itself."

GO BACK

3937

- "self initializing" is construed to allow human intervention. Newbridge contends that this phrase should be construed to mean that "the communication system automatically initializes port circuits without human intervention," including working through a keyboard. After reviewing the specification of the 136 Patent, however, the Court disagrees with Newbridge. Indeed, the specification contemplates that type of human intervention which Newbridge seeks to exclude. Specifically, the specification provides: "The CAU also enables a customer to manually input or change the operating parameters of the system ports." (136 Patent, col. 2, ll. 24-26). A CAU is a customer access unit, such as a keyboard.

GO BACK

3938

8. "self-installation by a subscriber or customer"

In claim 12 of the '347 Patent, the modular type adaptor design housing the alarm filter circuit is capable of "self-installation by a subscriber or customer." Pulse suggests this term is clear on its face using its common meaning and therefore does not require specific construction by the court. Mascon argues the term is indefinite and cannot be construed. In support of this term, the specification recites only that such a design would "allow the subscriber or customer to perform his own connection, thereby avoiding the time and cost for a trained technician to be sent to a subscriber=s (sic) premises to perform the installation." ('347 patent, Col. 1, ll. 37-40.) "Self-installation by a subscriber or customer" is further described as a situation that avoids "having a trained technician visit the premises and perform the installation." ('347 patent at Col. 4:32-34.) This term is unbounded by application of its ordinary meaning to one skilled in the art. The specification provides no source of limiting language the court might rely on in adopting a narrowing construction. Thus, the court finds the term "self-installation by a subscriber or customer" is indefinite under 35 U.S.C. § 112, second paragraph.

GO BACK

3939

The first step for the court then is to construe Claim 1 by establishing the scope and boundaries of the subject matter that is patented. 11 Claim 1, in pertinent part, is "an electrical device comprising a device supporting substrate, a semi-conducting material on said substrate, said semi-conducting material having a portion thereof converted to its non-conducting oxide…." 12 The parties' disagreement as to how this claim should be construed centers on the meaning of the term "semi-conducting material".

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 In this case, a finding of non-infringement or infringement as to Claim 1 would dispose of the infringement question as to all the '586 patent-in-suit claims because the other three claims are dependent claims. "Infringement of an independent claim would result in the same damage award as would infringement of all claims dependent thereon and non-infringement of an independent claim carries with it non-infringement of all claims dependent thereon. Wahpeton Canvas Co. v. Frontier, Inc., 870 F.2d 1546, 1552 n.10 (Fed. Cir. 1989).

12 The '586 patent at 12, Exhibit 2 attached to Browner Declaration, Clerk's Docket No. 480 (emphasis added).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

As noted above, in construing a claim, the court starts with the language of the claim itself and follows the general rule that terms are given their ordinary and accustomed meaning to someone skilled in the art at the time the patent application was
filed. There is no dispute of material fact that to someone skilled in the art in 1964, the ordinary and accustomed meaning of "semi-conducting material" would include all materials, whether elements, compounds, or some other material, known to be semi-conducting. As a matter of law, this ordinary meaning controls unless a contrary definition is clearly and deliberately set forth in the specification or the prosecution history. K-2 Corp. v. Saloman S.A., 191 F.3d 1356, 1363 (Fed. Cir. 1999).

Cypress first argues that in the specification for the '586 patent-in-suit, Mr. Lemelson clearly limited the meaning of "semi-conducting material" to compounds only and excluded elements that were known to be semiconductors, in particular silicon, from the scope of the term. Cypress's argument is based on a portion of the specification which reads:

semi-conducting materials such as compounds of germanium, silicon, tantalum and others may be selectively oxidized as described to form tunneling barriers, collector domains, electron sinks and integral electronic devices.[sic][16]

Cypress contends that the only way this passage can be construed is that "semi-conducting material" is limited to compounds, in particular compounds of germanium, compounds of silicon, and compounds of tantalum.

The above-quoted passage from the specification is clear on its face and there is no basis for giving it the very constricted meaning that Cypress suggests. Cypress's interpretation of this portion of the specification asks the court to apply a meaning to the phrase "such as" that is contrary to its ordinary meaning. The phrase "such as" commonly indicates that what is to follow is an example or further explanation of what has previously been stated. In this case, the use of the phrase "such as" after the term "semi-conducting material" simply means that what follows are examples of "semi-conducting material." The use of the phrase "such as" in no way limits the meaning of "semi-conducting material" to include only compounds.

Nor does anything else in the specification indicate that Mr. Lemelson was giving the term "semi-conducting material" a meaning limited to compounds only. The specification contains express references to other semi-conducting materials such as "films of silicon or germanium" and even doped silicon itself: "Selective introduction of certain impurities in the oxidizing atmosphere and/or electron beam may also be used to dope the film as it anodized to provide various electronic devices." 17 In addition, the specification contains twenty-five generic references to "semi-conducting material", which indicates that this term had no special or limited meaning. In fact, even Cypress's expert witness admitted that one had to go to the file wrapper 18 to find any indication of a contrary meaning for "semi-conducting material". When asked whether "in the patent specification, the written document with 16 columns of text, there is nothing, nothing that you can see … that limits semiconducting material to only compounds; isn't that right?", Dr. Bower responded, "not within the patent itself, not
unless you look at the file wrapper in that context." 19

--- Footnotes ---

17 Id. at Column 9, Ins. 58-61.

18 "The file wrapper contains the entire record of the proceedings in the Patent Office from the first application papers to the issued patent." Autoigro Co. of Amer. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 398 (Ct. Cl. 1967).

---

Because there is nothing in the specification that indicates that Mr. Lemelson limited "semi-conducting material" to compounds only, the court next considers whether Mr. Lemelson gave the term any special or limited meaning during the prosecution of the '586 patent-in-suit. Cypress first argues that during the prosecution of the application for the '586 patent-in-suit, Mr. Lemelson limited the scope of "semi-conducting material" to include only compounds. "The prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance." Standard Oil Co. v. American Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985).

As already mentioned, the PTO originally rejected Claim 1 because of obviousness-type double patenting. In an Office Action dated March 24, 1980, the examiner listed two earlier patents that had been issued to Mr. Lemelson that claimed a conductive metal material be used as opposed to Claim 1 in the '586 patent-in-suit which claimed that a "semi-conducting material" be used. The examiner rejected the '586 claims based on this prior art, stating that "it would be obvious to substitute semi-conducting material for the conductive metal." 20 The examiner reiterated this conclusion in Paragraph 4 of the Office Action and explained that:

on page 19, lines 16 and 17, of the specification [Column 9 of the '586 patent specification in evidence] the applicant lists silicon and tantalum as semi-conducting materials. On page 29, lines 26-29, [Column 15 of the patent specification in evidence] the applicant lists tantalum and silicon as conducting metals which may be converted to semi-conducting compounds. [21]

--- Footnotes ---

20 Examiner's Action at 2, P 1, Exhibit 27 attached to Hughes Declaration, Clerk's Docket No. 481.

21 Id. at 3, P 4.

--- End Footnotes ---

The reference to page 19, lines 16 and 17, is the "such as" sentence discussed above, which states that "semi-conducting materials such as compounds of germanium, silicon, tantalum and others may be selectively oxidized as described." 22 At page 29, lines 26-29, the specification states that "in addition to the use of copper and aluminum for the metal films … such other metals as tantalum, silicon, nickel, nickel-chromium and other highly conducting metals and alloys or compounds thereof may also be used…." 23 Based on these portions of the specification, the examiner concluded that Mr. Lemelson was defining silicon and tantalum as both conducting metals and semi-conducting materials, thereby making it obvious to substitute a semi-conducting material for a conductive metal because, according to the specification, they were the same thing.

--- Footnotes ---

22 '586 Patent at Column 9, lines 53-55, Exhibit 2 attached to Browner Declaration, Clerk's Docket No. 480.
In his appeal brief, Mr. Lemelson, acting through his attorney, asserted that the examiner had misread the specification. Mr. Lemelson's attorney stated:

page 19, lines 16 and 17 does not list silicon and tantalum as semi-conductive materials as the examiner claims. The exact language is:

"Semi-conducting materials such as compounds of germanium[,] silicon, tantalum and others may be selectively oxidized as described...." (emphasis added).

The examiner erroneously failed to note that it was COMPOUNDS which were referred to, not the elements themselves. The application then at page 29 consistently states that tantalum and silicon are conducting metals which may be converted to semi-conducting compounds. [24]

While not a model of clarity, the attorney appears to argue--correctly--that the specification did not identify any element as both a conducting metal and a semi-conducting material.

Cypress seizes on the fact that in the appeal brief, Mr. Lemelson's attorney emphasized the word "compounds" and asserts that in doing so Mr. Lemelson was choosing to ignore the words "such as" in the phrase "semi-conducting materials such as compounds of..." By ignoring these words and emphasizing the word "compounds", Cypress contends that Mr. Lemelson made clear he was not listing "compounds" as an example of a type of semi-conducting material, as a plain reading of that sentence would suggest, but that he meant to limit that term to "compounds" only.

This argument is unavailing. Cypress appears to be suggesting that, based on what Mr. Lemelson asserted in the appeal brief, the "such as" portion of the specification should read "semi-conducting materials are compounds, such as compounds of silicon, compounds of tantalum, etc." There is no support for this interpretation of Mr. Lemelson's statements on appeal. Rather, it appears that all Mr. Lemelson and his attorney were doing was correcting the examiner's mistaken reading of the specification and explaining how the '586 patent-in-suit differed from the earlier Lemelson patents, which had to do with conducting metals, not "semi-conducting material."

Cypress also makes much of another statement in the appeal brief, found at page 8, which reads that

the examiner is wrong in his assertion that germanium, silicon, and tantalum are semi-conductive materials as set forth in paragraph 4 at page 4 of this brief. Compounds may be semi-conductive, but not the elements. [25]

Cypress insists that this was a clear, unequivocal statement by Mr. Lemelson that he was defining "semi-conducting material" to include only compounds and that he was excluding elements from the scope of the term.

This argument is also unavailing. All Mr. Lemelson and his attorney were doing was again pointing out that the examiner had read the specification incorrectly, as had already been pointed out in paragraph 4 at page 4 of the appeal brief. The
examiner had read the specification as stating that germanium, silicon, and tantalum are semi-conductive materials. Mr. Lemelson's attorney, although perhaps not as clearly as one would hope, was merely reiterating that what this portion of the specification actually said was that compounds of germanium, silicon, and tantalum are semi-conductive materials.

In sum, nothing in the prosecution history supports Cypress's argument that Mr. Lemelson deliberately and expressly limited "semi-conducting material" to only compounds. Although it is not disputed that in the appeal brief Mr. Lemelson's attorney twice stated that compounds, not the elements, are semi-conducting, in both instances, he was referring to the "such as" sentence in the specification and he was only trying to correct the examiner's erroneous reading of the specification.

Besides arguing that Mr. Lemelson limited "semi-conducting material" to only compounds during the prosecution of the '586 patent-in-suit application, Cypress also argues that Mr. Lemelson specifically disavowed silicon from the scope of "semi-conducting material" during the prosecution of the '586 patent-in-suit. As has been discussed, one of the issues with respect to the '586 claims was obviousness-type double patenting. Cypress argues that to overcome the double patenting rejection, Mr. Lemelson had to put silicon in either the "conducting metal" category or the "semi-conducting material" category and that he chose to put it in the "conducting metal" category, not the "semi-conducting material" category. In making this argument, Cypress relies on the statement in the appeal brief that "the application then at [Col. 15, lines 18-26] consistently states that tantalum and silicon are conducting metals which may be converted to semiconducting compounds." 26 Because silicon could not be both a "conducting metal" and a "semi-conducting material", because of the obviousness double-patenting issue, Cypress argues that Mr. Lemelson clearly disavowed silicon as a "semi-conducting material," instead putting it in the "conducting metal" category. Cypress further argues that Mr. Lemelson brought this point home when the appeal brief stated that "the examiner is wrong in his assertion that … silicon … [is a] semi-conductive material[.]" 27 Cypress argues that if the two statements are read together, it is clear that Mr. Lemelson disavowed silicon from the scope of "semi-conducting material", and that this was not some kind of mistake on the part of Lemelson's attorney.

The court is not convinced by Cypress's argument. As discussed above, the statement that the examiner was wrong in his assertion that silicon was a semi-conductive material refers to the "such as" statement in the specification. All Mr. Lemelson's attorney was doing in making this statement was pointing out that the examiner had read the "such as" sentence incorrectly. Mr. Lemelson's attorney was not expressly taking silicon out of the "semi-conducting material" category. The other statement on which Cypress relies, that silicon was a conducting metal, was nothing more than an obvious misstatement by Mr. Lemelson's attorney.

Mr. Lemelson's attorney stated that the specification "at [Col. 15, lines 18-26] consistently states that tantalum and silicon are conducting metals which may be converted to semi-conducting compounds." 28 This was clearly a mistake. First of all, the specification never identifies silicon as a conducting metal. What this portion of the specification states is that "in addition to the use of copper and aluminum for the metal films … such other metals as tantalum, silicon, nickel, nickel chromium and other highly conducting metals and alloys or compounds thereof may also be used…." 29 The specification states that silicon is a "metal"; it does not state that it is a "conducting metal." Furthermore, the experts all agree that it would be a mistake to classify silicon as a conducting metal. 30 Anyone skilled in the art would recognize that silicon is not a conducting metal. There can be no dispute that Mr. Lemelson's attorney, when he called silicon a conducting metal, made a mistake. A mistaken statement by an attorney during the prosecution of a patent does not control the meaning of a claim. As the court in Intervet America, Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050, 1054 (Fed. Cir. 1989), observed, when it comes to the question of which should control, an erroneous remark by an attorney in the course of prosecution of an application or the claims of the patent as finally worded and issued by the Patent and Trademark Office as an official grant, we think the law allows for no choice. The claims themselves control.
However, the court cannot ignore the fact that Mr. Lemelson identified silicon as a "metal", which it is not, in the specification. This reference cannot be written off as an attorney's mistake during prosecution because it is in the specification itself. On the other hand, Mr. Lemelson also identified silicon as a "semi-conducting" film in the specification. At best, this makes the specification ambiguous. In the end, it is not clear what category the specification put silicon in. Nor is it clear what category Mr. Lemelson would have put silicon in, although it strikes the court as highly improbable that Mr. Lemelson would have deliberately placed silicon, one of the best-known and most common semi-conductors, in the conducting metal or metal category. The court cannot conclude that Mr. Lemelson specifically disavowed silicon as a "semi-conducting material" during the prosecution of the '586 patent-in-suit application, or in the specification itself for that matter.

While there is no doubt that a claim can be amended in the course of an appeal, the court concludes that no amendment was intended or made in this case. Therefore, the language of the claim controls. "Semi-conducting material" is given its ordinary and accustomed meaning, a meaning that, as a matter of law, would include the doped silicon that Cypress uses.

SynQor argues that there is no requirement for a separate "regulation stage" as the Defendants contend. SynQor argues that the specification states that "the output can be said to be semi-regulated" where the drops between the voltage on the primary side and the output "are small and proportional to the current flowing through the isolation stage." See '034 patent, 15:7-13. SynQor argues that the specification never mandates that a particular circuitry is required to provide "semi-regulation," much less a regulation stage preceding an isolation stage. SynQor argues that the specification describes an alternative approach that would allow for the sensing and control to occur anywhere on "the primary side of the isolation stage," including in the isolation stage itself. SynQor also argues that the "during normal operation" language is proper because it clarifies that the claimed operation is not required "all the time" in every conceivable situation. Defendants argue that the specification is clear that "semi-regulation" only exists where the regulation stage precedes the isolation stage. Defendants argue that "semi-regulation" and an output "whose voltage value drops due to impedance of an output path" are two different and distinct concepts and SynQor is blending the two concepts. Defendants argue that the claims require two distinctly recited limitations: (i) semi-regulation, and (ii) an output "whose voltage value drops due to impedance of an output path." Defendants argue that SynQor is attempting to broaden the concept of semi-regulation by extending it to multiple configurations. Defendants argue that there is nothing in the '034 patent that suggests the concept of semi-regulation involves the control of an isolated output.

Claims 1 and 20 of the '034 patent contain the disputed "semi-regulation" terms. Only the '034 patent uses the "semi-regulated" terms, as the "semi-regulation" language was inserted in the specification during prosecution of the '034 patent on the basis that it was shorthand for already-existing disclosures:

In some situations, it may be desirable to place the isolation stage first in the power flow, and to have the regulation stage follow. For example, as shown in FIG. 11, when there are many outputs sharing the total power, the circuit might be configured as one isolation/step-down (or step-up) stage 501 followed by several DC-DC switching on-linear regulators 503.

* * *

When the regulation stage precedes the isolation stage, it is not necessary to sense the isolated output voltage to control the regulation. An alternative approach is to sense the voltage on the primary side of the isolation stage, which may eliminate the need for secondary side circuitry and the need to bridge the feedback control signal across the isolation barrier.

For example, in FIG. 6 the voltage across C[B], the capacitor of the third-order output filter of the down converter, could be used. This voltage nearly represents the isolated output voltage (corrected for the turns-ratio). It differs only due to the resistive (and parasitic inductance commutation) drops between C[B] and the output. Since these drops are small and proportional to the current flowing through the isolation stage, the output can be said to be semi-regulated and the error in output voltage they create can either be tolerated or corrected.

'034 patent, 14:49 - 15:13 (emphasis added). The specification also provides another example of "semi-regulated," where the output voltages from multiple isolation stages are not used to provide feedback to the regulation stage. See '034 patent,13:9-23.

Consistent with previous terms and for the same reasons, the Court rejects SynQor's attempt to add "during normal operation" to this term when there is no basis for it in the claims or the specification. The Court also rejects Defendants' argument that semi-regulation only exists where the regulation stage precedes the isolation stage. First, the claims expressly require the "isolation/semi-regulation circuitry" to come before the "switching regulators." Second, while not referencing semi-regulation in the specification, it does so in the actual figure, Figure 11 is described as illustrating "an isolation stage followed by plural regulation stages." '034 patent, 3:66-67. Figure 11 of the '034 patent depicts a structure similar to the claims, where the "isolation/semi-regulation" stage exists prior to the plural regulation stages. Third, the specification expressly states that in some situations "it may be desirable to place the isolation stage first in the power flow, and to have the regulation stage follow." '034 patent, 14:49-55.

The Court finds that "semi-regulation" is related to "regulation," in that while there is not necessarily a measurement or regulation of the actual isolated output voltage, there is a type of regulation (i.e., "semi-regulation") whereby a voltage can be sensed and regulated that represents the isolated output voltage without actually measuring the isolated output voltage. See '034 patent, 13:9-23, 14:49-15:13, Figure 11. The specification expressly states that "[w]hen the regulation stage precedes the isolation stage, it is not necessary to sense the isolated output voltage to control the regulation." Id. at 14:64-66.
The specification then provides an example of semi-regulation where it senses the voltage on the primary side of the isolation stage that represents the isolated output voltage. Id. at 14:64-15:13. Thus, with "semi-regulation," regulation is provided where it is not necessary to sense the isolated output voltage to control the regulation. As further required by the claims, the semi-regulation circuitry "senses a voltage in the primary transformer winding circuit." The Court rejects SynQor's attempts to negatively define "semi-regulation" by the language "without sensing . . . and passing . . ."

The Court defined "regulation" to mean "the act of controlling an output towards a predefined value." Thus, the Court construes the term "semi-regulation" to mean "the act of controlling an output towards a predefined value by sensing a voltage in the primary transformer winding circuit without sensing the isolated output voltage." The Court defined "regulated output" to mean "an output that is controlled towards a predefined value." Likewise, the Court construes the term "semi-regulated, isolated output" to mean "an isolated output that is controlled towards a predefined value by sensing a voltage in the primary transformer winding circuit without sensing the isolated output voltage."

1. "semiconductor/ semiconductor material" Claims 1 and 5.

Claim 1 of the '742 patent, states in part, with the disputed claim term in bold: "A structure having plural layers in semiconductor material,. . . ."

Claim 5 states in part, with the disputed claim term in bold: "The structure claimed in claim 1, wherein said layer comprising said inclusion comprises one of the following semiconductor materials. . . ."

Nichia suggested defining this term as: "a compound made up of two or more of the following elements: gallium (Ga), arsenic (As), aluminum (Al), indium (In), and phosphorus (P)." Seoul proposed that the court construe semiconductor material to mean "a material whose conductivity properties can be controlled by either adding dopants or by applying an electric field."

The background of the invention and the summary of the invention provide references to semiconductors in general. Col. 1, l. 15-16; col. 4, l. 33-36. Nitride semiconductors were known at the time of the patented invention. See e.g. H. U. Baier and W. Monch, Formation of Aluminum Nitride Films on GaAs(110) at Room-Temperature by Reactive Molecular-Beam Epitaxy: X-Ray and Soft-X-Ray Photoemission Spectroscopy, 68 Journal of Applied Physics 586 (1990); R. F. Davis et al, Critical Evaluation of the Status of the Areas for Future Research Regarding the Wide Band Gap Semiconductors Diamond, Gallium Nitride and Silicon Carbide, 104 Mat. Sci. and Eng. 77 (1988). The specification discusses III-V semiconductors, a list that includes more elements than the five identified by Nichia. It is true that the specification names the semiconductors formed from materials on Nichia's list, but these are descriptions of specific embodiments. Col. 1, l. 20-23; col. 3, l. 11-14; col. 6, l. 20-24. Additionally, while Claim 1 uses the general term "semiconductor material," Claim 5 describes semiconductors made of only the five specific elements included in Nichia's list. Since neither the specification nor prosecution history indicates otherwise, this lends support to the argument that "semiconductor material" includes more than those five elements.

As with many scientific terms there are a number of definitions of "semiconductor" that are partly correct, or that convey one or more properties or concepts associated with the term. A simple example would be to define a semiconductor as a material, the conductivity or resistivity of which, is between an insulator and a conductor. In this case that does not help one of skill in the art, or a juror. In the context of this patent the properties of carriers and forbidden bandgaps in semiconductors are important because the object of the invention is to reduce the influence of dislocations on the functioning of multilayer structures made from semiconductor material. See '742 Patent, Abstract; col. 1, l. 8-10; col. 2, l. 46-53; col. 2, l. 65 - col. 3, l. 2.

Based on these specification references, the following definition focuses on these properties of a semiconductor:

"semiconductor" and "semiconductor material" mean "a solid material that conducts limited electric current by means of a small number of carriers (free electrons or holes) and additional carriers that can be freed from their local bonds by the addition of other elements (doping) or by application of an electrical or magnetic field."

3942

semiconductor substrate

Claims 1 and 12 contain the term "semiconductor substrate." Lonestar argues "semiconductor substrate" means "base material upon which the layers of a capacitor structure are formed, wherein the base material is semiconducting with resistivity being intermediate between a metal and an insulator, and having a conducting medium in which the conduction is by electrons and holes." Nintendo argues "semiconductor substrate" means "base made of a material having a resistivity between a metal and an insulator." The parties do not dispute that "substrate" means a base material having resistivity between a metal and an insulator. They disagree as to whether the construction should include that a semiconductor substrate must have layers of a capacitor formed upon it and whether conduction must be by electrons and holes.

The Court construes "semiconductor substrate" as "a semiconducting base material having resistivity between a metal and an insulator." Lonestar's construction states that "layers of a capacitor structure are formed" on the base material. Although the specification describes that layers of a capacitor structure are formed on a base material, the limitation is already described in the claim. Claim 1 states, "On a semiconductor substrate, a capacitor structure comprising a first layer of conducting strips parallel to each other on said substrate." Col. 6:65-68. Because the limitation is stated in the claim, it is not necessary to repeat the limitation in the Court's construction.

As to conduction by electrons and holes, no part of the intrinsic record limits conduction to electrons and holes. In fact, the patent never makes reference to electrons and holes. Lonestar argues that extrinsic evidence shows that semiconductor conduction occurs by electrons and holes. However, extrinsic evidence also shows that conduction in semiconductors does not exclusively rely on electrons and holes. In particular, Nintendo cites to dictionary definitions that state, only "[c]ertain semiconductors possess two types of carriers, namely, negative electrons and positive holes," THE NEW IEEE STANDARD DICTIONARY OF ELECTRICAL AND ELECTRONICS TERMS 1188 (5th ed. 1993) (emphasis added), and ":[t]he electric current is usually due only to the motion of electrons, although under some conditions, such as very high temperatures, the motion of ions may be important." MCGRAW-HILL ENCYCLOPEDIA OF ELECTRONICS AND COMPUTERS 799 (2nd ed. 1988) (emphasis added). These definitions indicate that conduction can occur in semiconductors in ways other than through electrons and holes. The extrinsic record does not support the limitations sought by Lonestar and is at best contradictory. Thus, the Court rejects Lonestar's construction and does not construe "semiconductor substrate" as limited to "having a conducting medium in which the conduction is by electrons and holes." Accordingly, the Court construes "semiconductor substrate" as "a semiconducting base material having resistivity between a metal and an insulator."

3943

A. The "Sending," "Transmitting," and "Receiving" Limitations

On appeal, Multi-Tech first challenges the district court's construction of the limitations that refer to "sending," "transmitting," and "receiving" data packets in claim 1 of the '649 patent; claims 1, 2, 5, 7, and 13 of the '627 patent; and claim 11 of the '532 patent. Multi-Tech argues that the court erred in restricting those limitations to the transmission of data packets over a direct point-to-point telephone line connection. According to Multi-Tech, the claims are directed only to the "ends" of the disclosed communications system and do not address what happens once the data packets are sent from the local user to the telephone line. Multi-Tech also argues that the specification describes a telephone line connected to a modem, which may be a direct end-to-end connection or may connect to a packet-switched network such as the Internet. Furthermore, Multi-Tech maintains that it did not disclaim transmission through a packet-switched network during prosecution of the '627 patent because it distinguished the Lewen reference by amending claims 1 and 13 to require a
modem. Multi-Tech also argues that the term "point-to-point," which it used in remarks made to the PTO during prosecution, can refer to a connection made over a packet-switched network. In any event, Multi-Tech contends, any disclaimer arising from the statements made during prosecution of the '627 patent should not be applied to the other two patents because the '649 patent issued before those statements were made and because the inventions claimed in the '649 and '532 patents are distinct from the invention claimed in the '627 patent.

Microsoft and Net2Phone respond that the claim language, particularly that of claim 7 of the '627 patent, and the specification require a direct point-to-point connection over a telephone line. They also argue that the prosecution history of the '627 patent mandates such an interpretation because Multi-Tech defined its invention as establishing a direct connection between the local and remote sites over a telephone line and argued that its claims require a "point-to-point" connection "from the communications system through the [telephone] line to a receiving communications system at the other end of the line." Finally, Microsoft and Net2Phone maintain that the prosecution history of the '627 patent is relevant to an understanding of the other two patents, which stem from the same parent application and share a common specification.

Thus, the parties' dispute over the "sending," "transmitting," and "receiving" limitations reduces to a single issue: whether those limitations are restricted to communications over a telephone line or whether they may encompass communications over a packet-switched network such as the Internet. For the reasons enumerated below, we agree with Microsoft and Net2Phone that the district court properly construed the "sending," "transmitting," and "receiving" limitations in the '649, '627, and '532 patents as being limited to communications over a telephone line and excluding the use of a packet-switched network.

Claim interpretation begins with the claims themselves, the written description, and, if in evidence, the prosecution history. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). "Claim language generally carries the ordinary meaning of the words in their normal usage in the field of invention." Invitrogen Corp. v. Biocrest Mfg., L.P., 327 F.3d 1364, 1367 (Fed. Cir. 2003). Although it is improper to read a limitation from the specification into the claims, Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998), "claims must be read in view of the specification, of which they are a part," Markman, 52 F.3d at 979; see also United States v. Adams, 383 U.S. 39, 49, 15 L. Ed. 2d 572, 86 S. Ct. 708, 174 Ct. Cl. 1293 (1966) ("Claims are to be construed in the light of the specifications and both are to be read with a view to ascertaining the invention."); Slimfold Mfg. Co. v. Kinkead Indus., Inc., 810 F.2d 1113, 1116 (Fed. Cir. 1987) ("Claims are not interpreted in a vacuum, but are part of and are read in light of the specification."). Indeed, "one purpose for examining the specification is to determine if the patentee has limited the scope of the claims." Watts v. XL Sys., Inc., 232 F.3d 877, 882 (Fed. Cir. 2000). When the specification "makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question." SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001). A patentee may also limit the scope of the claims by disclaiming a particular interpretation during prosecution. Biodex Corp. v. Loredan Biomed., Inc., 946 F.2d 850, 862 (Fed. Cir. 1991).

We thus begin our analysis with the claim language itself. Claim 1 of the '627 patent recites "a modem connected to a telephone line for receiving incoming packets from a remote site and for sending the outgoing packets to the remote site in full duplex communication mode." '627 patent, col. 46, ll. 50-53. Claim 7 of the '627 patent requires "sending the outgoing packets to a remote site over a telephone line using a modem" and "receiving incoming packets through the modem from the remote site." Id. at col. 47, ll. 15-18. Similarly, claim 13 of the '627 patent recites "transmitting the compressed outgoing digital voice packets on a communication line using a modem" and "receiving the compressed incoming digital voice data packets from the communication line." Id. at col. 48, ll. 44-47. Claim 1 of the '649 patent and claim 11 of the '532 patent recite "transmitting the outgoing packet stream" and "receiving multiplexed incoming data." '649 patent, col. 47, ll. 18-19; '532 patent, col. 49, ll. 7-8.

From the plain language of those claims, only claim 7 of the '627 patent explicitly states that the transmission of data packets between the local site and the remote site must occur "over a telephone line." Claim 1 of the '627 patent similarly refers to a telephone line, but is more ambiguous in that it refers to the modem connection rather than the data transmission. And the language of claim 13 of the '627 patent, claim 1 of the '649 patent, and claim 11 of the '532 patent is even more broad. It makes no reference to a telephone line and standing alone does not exclude data transmission over a packet-switched network. n3
n3 We reject Microsoft's contention that the "full duplex" language of claim 1 of the '627 patent and claim 11 of the '532 patent requires a direct telephone line connection. "Full duplex" operation means that the data packets can be transmitted simultaneously in both directions; it does not require that the data packets travel along the exact same path in both directions. See Microsoft Press Computer Dictionary 119 (1991).

n4 For ease of reference, we cite only the specification of the parent '289 patent, although the same statements are also found in the identical specifications of the '649, '627, and '532 patents.

Those statements, some of which are found in the "Summary of the Invention" portion of the specification, are not limited to describing a preferred embodiment, but more broadly describe the overall inventions of all three patents. Indeed, they characterize the entire "personal communications system" as enabling communications between a local site and a remote site over a telephone line. Moreover, those descriptions of the claimed inventions are by no means limited to just the "ends" of the communications system as Multi-Tech argues. On the contrary, they explain that data packets from a local site are transferred "over" or "through" a telephone line "to a remote site," making clear that the communications link between the local and remote systems is a telephone line. In fact, the specification refers to data transmission "over" or "through" a telephone line roughly two dozen times. Nowhere does it even suggest the use of a packet-switched network. In light of those clear statements in the specification that the invention ("the present system") is directed to communications "over a standard telephone line," we cannot read the claims of the '627 patent, the '649 patent, or the '532 patent to encompass data transmission over a packet-switched network such as the Internet. Instead, the specification shared by all three patents leads to the "inescapable conclusion" that the communications between the local and remote sites of the claimed inventions must occur directly over a telephone line. See SciMed Life Sys., 242 F.3d at 1342 (concluding that the common specification of three patents led to the "inescapable conclusion" that their claims required coaxial lumens, even though the claim language itself was not so limited); see also Alloc, Inc. v. ITC, 342 F.3d 1361, 1370 (Fed. Cir. 2003) (concluding that, read as whole, the common specification of three patents led to the "inescapable conclusion" that the claimed inventions must include "play" in every embodiment, even though the claim language was not so limited). Accordingly, we construe the "sending," "transmitting," and "receiving" limitations of the '627, '649, and '532 patents to require that the claimed data packets travel directly from a local site to a remote site (and vice versa) over a telephone line and not a packet-switched network.

Furthermore, an examination of the '627 patent's prosecution history confirms that Multi-Tech viewed its inventions as being limited to communications over a telephone line. In response to the examiner's first office action, Multi-Tech took the opportunity to provide a "summary of the invention" before addressing the § 103 rejection. It stated:

In their specification, Applicants disclose a communications system which operates over a standard telephone line. Such a telephone line is commonly referred to in the art as a "plain old telephone service" (POTS) line and establishes a point-to-
point connection between telephone equipment on each end of the line. Applicants' invention...transmits the packets across a POTS line to a remote site.

(citations omitted). That statement, which expressly related to the specification shared by all three patents and the communications system disclosed in all three patents, makes clear that Multi-Tech viewed the local and remote sites of its inventions as communicating directly over a telephone line. Again, it does not describe just the connection at the "ends" of the claimed communications system, but explicitly states that the data packets travel "across a [telephone] line to a remote site" and further describes that path as being a "point-to-point" connection "between" each end. That statement unambiguously reflects Multi-Tech's own understanding of its inventions in the '627, '649, and '532 patents as being limited to the transmission of data packets over a telephone line. We cannot construe the claims to cover subject matter broader than that which the patentee itself regarded as comprising its inventions and represented to the PTO.

n5 During prosecution of the '627 patent, Multi-Tech went on to distinguish Lewen, which discloses the use of a token-ring local area network ("LAN") to transmit voice, data, and image information, by explaining that "in contrast, Applicants' voice packets do not circulate around a LAN but proceed directly from the communications system through the [telephone] line to a receiving communications system at the other end of the line." (emphasis added). Multi-Tech further distinguished the Arbel reference on the basis that it does not disclose the transmission of packetized voice data "across" or "over" a POTS line. Those statements add further credence to our claim interpretation. However, because they refer more specifically to the references cited against the claims of the '627 patent only, we limit their relevance to our interpretation of the '627 patent.

Moreover, the prosecution history statements that we rely on were made by Multi-Tech in May 1997 and relate to the communications system disclosed in the common specification. We do not, as the dissent suggests, rely on the November 1997 "modem" amendment, which applies only to the '627 patent.

Moreover, although Multi-Tech made the above-quoted statement during prosecution of the '627 patent, it is also applicable to both the '649 and the '532 patents. In the past, we have held that the prosecution history of one patent is relevant to an understanding of the scope of a common term in a second patent stemming from the same parent application. E.g., Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990); see also Laitram Corp. v. Morehouse Indus., Inc., 143 F.3d 1456, 1460 n.2 (Fed. Cir. 1998) (applying the prosecution histories of two sibling patents, which shared a common written description, to one another). We likewise believe that Multi-Tech's statement made during prosecution of the '627 patent is relevant to an understanding of the common disclosure in the sibling '649 and '532 patents. Multi-Tech's statement was expressly directed to the "communications system" disclosed "in the[] specification." That communications system encompasses the inventions of all three patents, see '289 patent, col. 1, ll. 35-37 (stating that the "communications system...contains multiple inventions"), and as noted above, the specification is identical for all three patents. Multi-Tech's statement to the PTO was thus not limited to the invention disclosed in the '627 patent, but was a representation of its own understanding of the inventions disclosed in all three patents. We therefore conclude that that statement from the '627 patent's prosecution history is pertinent to an interpretation of the later issued '532 patent. See Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 980 (Fed. Cir. 1999) (applying the prosecution history of one patent to a related, subsequently issued patent).

Furthermore, even though the '649 patent had already issued, we think that it is not unsound to apply the same interpretation to that patent. We take the patentee at its word and will not construe the scope of the '649 patent's claims more broadly than the patentee itself clearly envisioned. We also reject Multi-Tech's argument, based on Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1333 (Fed. Cir. 1999), that the statements made during prosecution of the '627 patent should not be applied to the '649 patent because the examiner could not have relied on those statements in allowing the claims of the '649 patent. We have stated on numerous occasions that a patentee's statements during prosecution, whether relied on by the examiner or not, are relevant to claim interpretation. Laitram Corp., 143 F.3d at 1462 ("The fact that an examiner placed no reliance on an applicant's statement distinguishing prior art does not mean that the statement is inconsequential for purposes of claim construction."); E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1438 (Fed. Cir. 1988) ("Regardless of the examiner's motives, arguments made during prosecution shed light on what the applicant meant by its various terms."). Georgia-Pacific is not to the contrary. In that case, we rejected the argument that the patentee was
"bound by" statements made by the applicant in connection with a later application after the patent in suit had already issued. Georgia-Pacific Corp., 195 F.3d at 1333. The accused infringer argued that the patentee was foreclosed by the later statement from arguing in favor of a broader construction of the earlier patent, even though intrinsic evidence supported that broader construction. We rejected the argument that the patentee was bound, or estopped, by a statement made in connection with a later application on which the examiner of the first application could not have relied. We did not suggest, however, that such a statement of the patentee as to the scope of the disclosed invention would be irrelevant. Any statement of the patentee in the prosecution of a related application as to the scope of the invention would be relevant to claim construction, and the relevance of the statement made in this instance is enhanced by the fact that it was made in an official proceeding in which the patentee had every incentive to exercise care in characterizing the scope of its invention. Accordingly, we conclude that Multi-Tech's statements made during the prosecution of the '627 patent with regard to the scope of its inventions as disclosed in the common specification are relevant not only to the '627 and '532 patents, but also to the earlier issued '649 patent.

In sum, based on our analysis of the claim language, the specification, and the prosecution history, we conclude that the district court properly interpreted the "sending," "transmitting," and "receiving" limitations of the '627, '649, and '532 patents as requiring the direct transmission of data packets between the local and remote sites over a telephone line and excluding the use of a packet-switched network such as the Internet. This conclusion in and of itself leads to our affirmance of the district court's decisions. However, inasmuch as other issues of claim construction were decided by the district court and argued before us, we consider it to be in the interest of judicial efficiency, as well as in the interest of any future litigation concerning these patents, to review the other contested claim limitations. n6

n6 Net2Phone has not responded to Multi-Tech's arguments regarding the remaining claim terms because the district court's final judgment of noninfringement in the Net2Phone case was based solely on the court's interpretation of the "sending," "transmitting," and "receiving" limitations. However, because the final judgment of noninfringement in the Microsoft case was based on the court's claim construction in its entirety and not just its interpretation of particular limitations, we will review all of the disputed claim terms that Multi-Tech has appealed.

This court today concludes that the invention claimed in any patent sharing the specification of the '649, '627, and '532 patents cannot encompass the use of a packet-switched communications network like the Internet. As all parties agree, the claim language in no way rules out the use of a packet-switched network. The specification also does not foreclose use of the Internet. The prosecution history of the '627 patent falls far short of a "clear and unambiguous" disclaimer of Internet coverage (as the majority finds), but rather suggests the contrary conclusion. Finally, this court today dismisses the rule in Georgia-Pacific Corp. v. United Gypsum Co., 195 F.3d 1322 (Fed. Cir. 1999) and applies the prosecution history of a later patent to limit the narrower claims of a patent issuing before such statements were made. For these reasons, I must respectfully dissent.

This court today asserts that the language in the specification regarding "over" and "through" a telephone line somehow requires the claims to cover only those communication networks where nothing but a telephone line lies between the two end sites. To my eyes, that leap in logic is akin to Evel Knievel jumping the Snake River Gorge on a motorcycle. Like Mr. Knievel, this court's conclusion falls short. In the first place, this limitation does not appear anywhere in the claims. In addition, nothing in this record indicates that a person of skill in this art would find that limitation in the specification.

When I connect to the Internet (a packet-switched network) at home using my modem, I do it "over a telephone line." When I send email to my colleagues from home, I do it "through a telephone line" as well as across the Internet. If I travel over the river and through the woods to grandmother's house, this court would apparently conclude that I have traveled through nothing but rivers and woods. The terms "over" and "through" do not denote the sole medium of transmission or travel. If a
person asks me to send them a file "over" the Internet, that request certainly would not preclude the use of a telephone line connected to a modem connected to the Internet. In sending the file, I would be sending data over my telephone line as well as over the Internet. The record contains no evidence to support the leap that "over a telephone line" must mean exclusively over a telephone line.

Most of the claims at issue never refer to the communication network between the end sites of the system. The claims focus on the "ends" of the communication system. The "middle" portion is essentially irrelevant to the invention. Claim 1 of the '532 patent is a method claim directed to "multiplexing," "transmitting," "receiving," and "demultiplexing" voice and video data. Claim 1 of the '649 patent identifies a method that places headers on outgoing video and computer data packets, and then multiplexes, transmits, receives, and demultiplexes the data packets. These claims address what happens at each end of the communication system, not the travel routes for the packets between the ends.

This court today, however, goes beyond merely importing a limitation from the specification into the claims. First the court manufactures an unreasonable limitation out of vague specification references to "over" and "through." Then the court imports that unstated limitation into the claims. At most, the specification can be read to require that all of the claims require the use of a telephone line in the transmitting, sending, or receiving elements. To my eyes, this court leaps into thin air when it says that the claims require the exclusive use of telephone line transmission.

To bolster the absence of limitation in the claims or specification, the court stretches to find a clear and unambiguous disclaimer in the prosecution history of the '627 patent. To the contrary, the examiner, who actually participated in that history, considered the applicant's statements regarding the '627 patent and found that the claims do not limit themselves to a standard telephone line. In fact, because the claims encompassed more than a mere telephone connection, the examiner renewed a rejection. In response to the examiner's rejection in light of the Lewen reference, the applicant stated that Lewen operates using a "local area network (LAN)" requiring the data packets to "circulate around the LAN until reaching either the gateway or the node" where they can be sent to a remote site. The applicant explained that the '627 patent claims a system that does not use a LAN, but "operates over a standard telephone line . . . and establishes a point-to-point connection between . . . each end of the line."

The examiner responded by renewing the rejection and explaining that "the claims do not recite a limitation of a POTS telephone connection" and that "Lewen's token ring transmission medium is a telephone line in the sense that it carries voice between telephones [] separated by some distance." Thus, the examiner did not limit the invention to an exclusive telephone line connection. The examiner even considered the LAN in Lewen to satisfy the telephone connection proposed by the applicant. The LAN in Lewen connects to a packet-switched network.

Ultimately, the applicant amended the '627 claims to include the limitation of a modem. At that point, the PTO allowed the claims. The entire discussion in this prosecution history focused on the structure at each end of the communication system, not the middle medium of transmission. The applicant unambiguously disclaimed the use of a LAN and any system that does not connect modems at each end site. Neither the applicant nor the PTO, however, considered that disclaimer to extend to the use of a packet-switched network between sites. How can such circumstances show a clear and unambiguous disclaimer?

Rather than disclaiming connection to the Internet, the prosecution history more convincingly suggests that the inventor and the PTO saw these inventions as directly relevant to the Internet. The applicant eventually added the term "modem" to the '627 patent claims in order to distinguish the LAN in the Lewen reference. At the time of this amendment, a modem was the common and accepted way to connect to the Internet over a standard telephone line. U.S. Patent No. 5,594,490, which issued January 4, 1997, states: "Modem 45 communicates with a corresponding modem 17 at distribution station 3 via a conventional point-to-point land-link such as a public switched telephone network (PSTN) or internet."

Col. 9, ll. 47-56 (emphasis added). Contrary to this court's conclusion, a person of ordinary skill in the art at the time of invention would consider the addition of a modem as a clear indication that the inventor intended to connect the invention to packet-switched networks, such as the Internet. Even though modems connect to the Internet, as even the examiner acknowledged, this court emphasizes the "point-to-point" phrases in the prosecution history to exclude the Internet. This conclusion leaps to assume that the Internet does not allow point-to-point connections. The record, however, indicates exactly the opposite. As cited above, U.S. Patent No. 5,594,490 describes a point-to-point connection using the Internet. Moreover, according to Microsoft's Computer Dictionary of 1997, Third Edition, a point-to-point communication protocol is "[a] data link protocol developed . . . in 1991 for dial-up telephone connections, such as between a computer and the Internet." Thus, within the
context of this art, and at the time of the amendment, the term point-to-point referred to a variety of communication networks, including the Internet.

As a question of law, however, this court's conclusion significantly erodes the requirement that a disclaimer of subject matter must be clear and unambiguous. See, e.g., Schwing GmbH v. Putzmeister Aktiengesellschaft, 305 F.3d 1318, 1324-25 (Fed. Cir. 2002) ("Prosecution history . . . cannot be used to limit the scope of a claim unless the applicant took a position before the PTO that would lead a competitor to believe that the applicant had disavowed coverage of the relevant subject matter.") This record - the examiner's responses and understanding, the definitions of "point to point" in the patents and the art, and more - do not show clarity and a lack of ambiguity, to say the least. See Omega Engineering, Inc. v. Raytek, Corp., 334 F.3d 1314, 1326 (Fed. Cir. 2003) ("To balance the importance of public notice and the right of patentees to seek broad patent coverage, we have thus consistently rejected prosecution statements too vague or ambiguous to qualify as a disavowal of claim scope."). The only subject matter unambiguously disclaimed in this case was a connection other than a modem-telephone line at each communication end.

To make this court's conclusion a longer leap, the alleged disclaimer by its terms applies only to the "modem" amendment that distinguished Lewen. Only the '627 patent's claims use the term "modem." In fact, the '627 patent was the only patent in this case rejected in light of Lewen. The '649 and '532 patents actually relied on Lewen as prior art. The examiner did not cite Lewen to reject the claims in those patents. The other patents do not even refer to a "modem." Because the inventions in the various patents are different, the '627 patent needed to distinguish Lewen while the others did not. The '649 patent claims the transmission of packetized voice and computer data. The '532 patent claims the transmission of packetized voice and video data. In contrast, the '627 patent claims only the transmission of packetized voice data. According to the PTO, the transmission of voice data only was not sufficiently narrow to avoid the Lewen reference. Thus, the applicant added the limitation of a modem connected to a standard telephone line. This simply illustrates that the broad claims of one patent, in this case the '627, may require an additional limitation to avoid prior art, while narrower claims in related patents do not need the same limitation to avoid the same prior art. The '627 amendment does not explain the reason that this court extends the limitation to narrower claims in the other patents.

By way of illustration, assume three patents (A, B, and C) share a common specification directed to a method for hanging a picture. Patent A claims an attaching step and a leveling step. Patent B claims an attaching step and a centering step. Patent C claims only the attaching step. The prior art contains a reference to attaching pictures using nails. Because they contain limitations beyond attaching, patents A and B issue without rejection. Patent C, however, is rejected in light of the prior art. To distinguish the prior art, the applicant clarifies the attaching step is limited to using Velcro, not nails. Under what logic would a court limit the claims in Patents A and B to Velcro based on the later and inapplicable prosecution history of Patent C? That, however, is exactly what the majority does in this case.

Finally, the majority essentially disregards the holding of Georgia-Pacific. In this case, for the first time, this court applies the prosecution history of one patent to limit the claims of a related patent that was allowed before the creation of the prosecution history at issue. The '649 patent issued before the prosecution history of the '627 patent. Georgia Pacific states that for an applicant "to be bound by the statement made to the PTO in connection with a later prosecution of a different patent, the statement would have to be one that the examiner relied upon in allowing the claims in the patent at issue." 195 F.3d at 1333. In this case, the statements during the prosecution of the '627 patent could not have influenced the allowance of the '649 patent, because the '649 patent issued before those statements occurred.

In short, I cannot support this court's many leaps of illogic. I would not import the exclusive telephone line limitation, if it even exists in the specification, into the claims. Moreover, I cannot find a clear and unambiguous disclaimer in the prosecution history of the '627 patent. Even if the modem amendment in that patent disclaimed subject matter, I cannot find a justification to apply that limitation to the unambiguous claims of the '649 and '532 patents, which cover different inventions. For these reasons, I cannot join this opinion of the court.

F. Sending Information Collected from the Pavement Construction Material Mixture to the Server

This term is found in independent claim one. The Plaintiff argues that this term does not need construction, but it proposes
"sending data collected from the testing of the pavement construction mixture to the server." The Defendants contend that this term means that information is sent to the server computation spooler, and so they propose the term "sending test data that has been collected from testing of the pavement construction material mixture to a server computation spooler." The fundamental dispute over this term is whether it requires the information to be sent to the server computation spooler.

The Plaintiff argues that it is improper to limit the claims to a preferred embodiment. The Plaintiff also cites col. 4:3-5, which describes part of FIG. 2: "browser based user interfaces are used to collect test result inputs (step 201). These inputs are collected by the server 100 . . . " The Defendants argue that the Plaintiff's intrinsic evidence is really an explanation of collecting the information, not sending it as is used in this disputed phrase. The Defendants argue that the description of FIG. 2 is the only depiction of information being sent to a server, and that the figure shows the information from the "Inputs via Browser I/F" going to a computation spooler. The Defendants again cite to col. 8:15-19 as limiting the patent to the specific embodiments given in FIG. 2, as they have for other terms. As explained previously, col. 8:15-24 is not a clear limitation of the claims to any specific embodiment provided.

The only explicit mention of sending information to the server in the patent comes in the claims or in language echoing the claims (e.g., in the abstract) without providing further guidance as to their meaning. Although claims are to be construed in light of the specification, of which they are a part, it is important not to import limitations from the specification that are not found in the claims. Phillips, 415 F.3d at 1323. Here, the specification does not give a meaning to the disputed phrase to one of ordinary skill in the art that requires sending information to the server to mean that information is sent to a computation spooler. The Defendants are improperly attempting to import this limitation.

**Construction: Sending data collected from the testing of the pavement construction mixture to the server.**

5. "message originator sending the caller ID with the picture to the message center"

The disputed claim term "message originator sending the caller ID with the picture to the message center" appears in claims 1, 2, 4, 7, 25, 35, and 36 of the '416 Patent and claims 1, 2, 4, 5, 8, 10, 13, 14, 17, 34, and 35 of the '186 Patent. As an initial matter, the court notes that it has already determined that the phrase "message originator sending the caller ID with the picture to the message center" does not require that the message originator actually undertake the action of sending the message. Instead, as this court previously found,

> [t]he plain language of the claims indicates that direct infringement is limited to a communication device possessing the recited structure and capable of receiving a message from the message originator via the message center; infringement does not require that "the message originator [send] the caller ID with the picture to the message center."

(Dkt. No. 199, 10/8/09 Mem. Op. & Order 10.) The phrase "message originator sending the caller ID with the picture to the message center," therefore, although not directly describing a function of the claimed personal communication device, is akin to functional language explaining the type of message the personal communication device must be capable of receiving. See Manual of Patent Examining Procedure § 2173.05(g) (8th ed. 2001, rev. 2008) ("A functional limitation is an attempt to define something by what it does, rather than by what it is (e.g., as evidenced by its specific structure or specific ingredients).") Having made that observation, the court now turns to the parties' respective claim construction arguments.

Kyocera argues that "message originator sending the caller ID with the picture to the message center" means that "the third party from whom the picture is received sending the caller ID together with the picture to the message center." Intellect Wireless, on the other hand, contends that the proper construction is "a message originator sending a picture to a message center, the picture being associated with the message originator's caller identification information."

According to Intellect Wireless, Kyocera's proposed construction is flawed for two reasons. First, it requires the message originator, as opposed to the cell phone and/or personal communication device, to send the caller ID and the picture to the message center, thereby suggesting that the message originator must manually enter the caller ID. Second, Kyocera's proposed construction could be interpreted to mean that "the picture must be sent simultaneously with the caller identification information to the message center." (Intellect Wireless's Resp. 24.) As explained below, the court agrees with
Intellect Wireless but ultimately construes the claim term with a slightly modified definition from Intellect Wireless's proposed construction.

a. Manual Entry by the Message Originator Is Not Required

As discussed more thoroughly above in the court's discussion of the "automatically provided by a communications network" claim term, the court has determined that the message originator does not manually enter the caller ID, but rather the caller ID data is "supplied by either the telecommunications network or the telecommunications network via the message originator's device without manual entry by the message originator." Because the court agrees with Intellect Wireless that Kyocera's proposed construction is susceptible to an improper interpretation that manual entry by the message originator is required, the court declines to adopt it.

Intellect Wireless's proposed construction, however, is also problematic. To address its concern that the claim language be inappropriately interpreted as requiring manual entry of the caller ID by the message originator, Intellect Wireless eliminates the phrase "message originator sending the caller ID," from the claims, instead replacing that language with "the picture being associated with the message originator's caller identification information." Cognizant that it should not rewrite the claims, see Lucent Technologies, Inc. v. Gateway, Inc., 525 F.3d 1200, 1215 (Fed. Cir. 2008), the court instead construes the first part of the disputed claim term, "message originator sending the caller ID," to mean "message originator sending the caller ID, without manual entry of the caller ID," which reiterates that in composing and sending the message, the message originator does not manually enter the caller ID.

b. Simultaneous Transmission of the Caller ID and the Picture Is Not Required

Regarding Intellect Wireless's second contention that Kyocera's use of "together with" in its proposed construction improperly implies that the caller ID must be sent simultaneously with the picture, the court agrees with Intellect Wireless that such a temporal limitation is not supported by the intrinsic evidence. Claim 1 in both the '186 and '416 Patents simply states: "the message originator sending the caller ID with the picture to the message center"; the court does not find that the use of "with" in this context imposes a limitation requiring that the "sending" of the caller ID and the picture occur simultaneously. See Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1346 (Fed. Cir. 2008) (declining to "impose[] a temporal constraint" in claim because use of the term "with" in specification did not "unequivocally preclude a different order of steps").

Nor do the specifications support such a limitation. For example, as described in one embodiment, the caller-identification information is transferred separately from the additional "optional data" entered by the message originator:

[The caller identification information, if any exists, is automatically transferred to the central office, where it is decoded and preferably utilized in accordance with the software block 255 in a recorded menu exchange, wherein the information is verified and/or corrected and/or supplemented.]

In software block 257, the page-originating communicant enters optional data. This optional data may be numeric data, alphanumeric data, digitized speech, facsimile messages, or images.

'186 Patent, col.42 ll.49-58. The court, therefore, disagrees with Kyocera's position that the caller ID is sent "together with" the picture. Instead, the court finds that one of ordinary skill in the art would have understood the claim phrase "message originator sending the caller ID with the picture to the message center" to mean "message originator sending the caller ID, without manual entry of the caller ID, and the picture to the message center."
3948

2. sense signal (Claims 29, 32, 34, 64 and 65)

Arbitron asks the Court to adopt the ordinary and customary meaning of "a sense signal" as "a signal indicating that something is sensed." Arbitron notes that wherever the term is used in the claim language, it describes what is being sensed: "whether the device is being carried with the person of the audience member."

The '276 patent claims include several disputed terms with parallel usage in a means plus function format and non-means plus function format. As defendants point out, the format used by the apparatus claims includes a claim element written in means plus function format, such as: means for providing [a specific signal] [to perform a specific function]. The parallel method claim uses the same term in a non-means plus function format, such as: providing [a specific signal] [to perform a specific act]. Defendants argue that where the same term is used in such parallel claims, the non-means-plus-function method claim term, [a specific signal], should be construed consistently with the other related means plus function term. To this end they argue once the Court has construed the supporting structure for the means plus function term, the parallel non-means plus function term should simply be construed as the output of such structure. For instance, in this case, Ipsos asks the Court to construe 'sense signal' as "the output of either one or more of a pressure detector, motion detector, or temperature sensor." Their construction is based on their proposed means definition for the related means plus function limitation "means for providing a sense signal." In support of its approach to the construction of such related terms, defendants cite Federal Circuit case law requiring courts to give same terms appearing in different portions of the patent claims the same meaning, unless the specification and prosecution history make clear otherwise. See PODS, Inc. v. Porta Stor, Inc., 484 F.3d 1359, 1366 (Fed. Cir. 2007); see also Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995) ("The fact that we must look to other claims using the same term when interpreting a term in an asserted claim mandates that the term be interpreted consistently in all claims."); Georgia-Pacific Corp. v. U.S. Gypsum Co., 195 F.3d 1322, 1331 (Fed. Cir. 1999) ("Unless the patent otherwise provides, a claim term cannot be given a different meaning in the various claims of the same patent."). Further, defendants argue the requirement of construing a term in context of the entire claim mandates such an approach. See Pause Technology, LLC v. TiVo, Inc., 419 F.3d 1326, 1331 (Fed. Cir. 2005).

Although the Court agrees with the defendants with regard to consistently construing same terms, the Court finds that these related terms are in no way the "same" terms. The Federal Circuit has made clear the distinction between the scope entitled to means plus function claim terms as compared to non-means-plus-function claim terms. See O.I. Corp. v. Tekmar Co., Inc., 115 F.3d 1576, 1580-81 (Fed. Cir. 1997) (explaining this difference). Adopting the defendants' approach would simply limit the scope of these non-means-plus-function terms to the disclosed embodiments. This approach has been rejected by the Federal Circuit. See SciMed Life Sys. Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001) (describing "reading a limitation from the written description into the claims" as "one of the cardinal sins of patent law"); Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) ("[A]lthough the specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments.").
The parties agree on the function part of most of the means plus function limitations in this claim construction.

Finally, in support of their argument, defendants contend that the inventors in this case acted as their own lexicographer, defining and limiting the meaning of the non-means-plus-function terms through such use. See Sinorgchem, Co., Shandong v. Int'l Trade Comm'n, 511 F. 3d 1132, 1138 (Fed. Cir. 2007) ("We have frequently found that a definition set forth in the specification governs the meaning of the claims."). The Court finds nothing in the specification of the '276 patent that indicates that the inventors intended to limit these related terms to specific structures or define these related terms in any manner.

The Court concludes that in each of these cases, there is no reason to limit these non-means-plus-function terms to the embodiment disclosed in the patent. Therefore, this and all other constructions proposed by the defendants for such related terms are rejected. The Court adopts plaintiff's construction: "A signal indicating that something is sensed."

3949

(3) "sensing a torque occurring at a drive shaft of the washer due to an impact from the clothes"

The parties also dispute the term "sensing a torque occurring at a drive shaft of the washer due to an impact from the clothes," which appears in Claims 3 and 4. LG proposes construing the term to mean "sensing torque occurring at a drive shaft of the washer due to an impact [i.e., contact] from the clothes." (Chart at 6.) Whirlpool proposes instead that the term be construed to mean "sensing a torque occurring at a drive shaft of the washer due to a collision from the clothes." (Id.) For reasons already discussed, the Court will adopt Whirlpool's proposed construction. The term "sensing a torque occurring at a drive shaft of the washer due to an impact from the clothes" is therefore construed to mean "sensing a torque occurring at a drive shaft of the washer due to a collision from the clothes."

GO BACK

3950

(2) "sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes"

The parties also dispute the term "sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes," which appears in Claim 1. LG proposes that the term be construed to mean "sensing torque occurring at a drive shaft of the washer due to the twisting [i.e., uneven distribution] of clothes, to sense the distribution of impact [i.e., contact] applied to an agitator of the washer by the clothes." (Chart at 5.) Whirlpool proposes instead that the term be construed to mean "sensing a torque occurring at a drive shaft of the washer due to clothes that are entwined together, to sense the distribution of collisions between the clothes and the agitator of the washer." (Id.)

Comparing the parties' proposed constructions, the main issue is whether the term "impact" should be construed to mean "contact" or "collision[.]") Figure 3 is an illustration of a washer to which the invention was applied. ('474 Patent, col. 3, ll. 21-23.) The written description of Figure 3 states that "[i]n accordance with the present invention, the clothes twist determining apparatus comprises a clothes twist sensing unit 10 for sensing a torque occurring at the drive shaft 6 due to the distribution of impact applied to the agitator 8 and generating a clothes twist signal according to the sensed torque." (Id., col. 3, ll. 42-47.) The use of the word "applied" favors Whirlpool's argument that the term "impact" means "collision" rather than "contact." The written description also states that "[b]y the normal and reverse rotations of the agitator 8, the clothes 1 are agitated normally and reversely. The clothes 1 being agitated strike against the agitator 8, so that the agitator is subjected to an impact." (Id., col. 5, ll. 18-21.) The use of the word "strike" in describing how the "impact" is applied to the agitator further supports Whirlpool's proposed construction.
The claimed invention seeks to distinguish twisted and untwisted clothes based on the "distribution of impact applied to the agitator . . . ." (Id., col. 3, ll. 42-47.) LG, however, fails to explain how determining the distribution of "contact" -- for example, differences in the amount of surface area in contact with the agitator -- would affect the torque occurring at the drive shaft.

The Court will therefore construe the term "sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes" to mean "sensing a torque occurring at a drive shaft of the washer due to clothes that are entwined together, to sense the distribution of collisions between the clothes and the agitator of the washer."

J. ‘472 Claim 18: "sensing an abnormal cardiac rhythm, wherein cardioversion is required."

In contrast to the first several disputed elements in Claim 18, the recited step of "sensing an abnormal cardiac rhythm, wherein cardioversion is required" is actually a step in the method claim rather than a recitation of components. The parties dispute whether "sensing an abnormal cardiac rhythm" is a step-plus-function element subject to 35 U.S.C. § 112 P 6. St. Jude argues that 35 U.S.C. § 112 P 6 controls and that the sensing step is performed by human intervention in both disclosed embodiments of the invention. Def. Br. at 38. CPI contends that the element recites an act, not subject to 35 U.S.C. § 112 P 6 and that the element should not be confined to "sensing" that involves human judgment. Pl. Reply Br. at 47-48.

The 35 U.S.C. § 112 P 6 limitations apply to an element in a method claim "only when steps plus function without acts are present." O.I. Corp. v. Tekmar Co., 115 F.3d at 1583 (emphasis in original). Thus, the initial task is to determine whether the contested element recites an act or a function. Judge Rader has provided extensive comments on the often difficult-to-draw distinction between acts and functions:

Claim elements without express step-plus-function language may nevertheless fall within 35 U.S.C. § 112, P 6 if they merely claim the underlying function without recitation of acts for performing that function. Unfortunately, method claim elements often recite phrases susceptible to interpretation as either a function or as an act for performing a function. Both acts and functions are often stated using verbs ending in "ing." For instance, if the method claim element at issue in this case had merely recited the "step of" "spreading an adhesive tack coating," it would not have been clear solely from this hypothetical claim language whether "spreading" was a function or an act. In such circumstances, claim interpretation requires careful analysis of the limitation in the context of the overall claim and the specification.

In general terms, the "underlying function" of a method claim element corresponds to what that element ultimately accomplishes in relationship to what the other elements of the claim and the claim as a whole accomplish. "Acts," on the other hand, correspond to how the function is accomplished. Therefore, claim interpretation focuses on what the claim limitation accomplishes, i.e., it's [sic] underlying function, in relation to what is accomplished by the other limitations and the claim as a whole. If a claim element recites only an underlying function without acts for performing it, then 35 U.S.C. § 112, P 6 applies even without express step-plus-function language.

The preamble of Claim 18 recites the overall purpose of the claimed method and introduces a series of steps for accomplishing that purpose with the words "steps of." Such a general statement of purpose in the preamble does not constitute an associated function for each of the method steps that follow. See O.I. Corp. v. Tekmar Co., 115 F.3d at 1583. In addition, functions are more likely to be introduced by the phrase "steps for" rather than "steps of." See Seal-Flex, 172 F.3d at 850 (Rader, J., concurring). Thus, the language in the preamble of Claim 18 suggests that 35 U.S.C. § 112 P 6 does not apply. However, the language of the specific claim element in question -- "sensing an abnormal cardiac rhythm" -- recites a step at a very abstract level. Upon encountering the step of "sensing an abnormal cardiac rhythm," even one skilled in the art could reasonably ask how does the device sense the abnormal cardiac rhythm? The language of the disputed "sensing" element in this claim provides nowhere near as much detail as the "passing" steps found to be acts in O.I. Corp. v. Tekmar Co. See 115 F.3d at 1579, 1583 ("passing the analyte slug through a passage heated to a first temperature higher than abient,
as the analyte slug passes from the sparge vessel to the trap” is not a step-plus-function limitation). In Serrano v. Telular Corp., the Federal Circuit found that the step of “automatically determining the last-dialed number of the telephone number dialed on the telephone communications-type device” was an act and not a function. 111 F.3d 1578, 1583 (Fed. Cir. 1997). The “determining” step in Serrano was actually a sub-step to a more general step stated in the claim and explains a detailed point in the claimed method that is simply not comparable to the generic step of "sensing an abnormal cardiac rhythm.

Analyzing the "sensing" limitation in the context of the overall claim and the specification, the court concludes that the step recites a function rather than an act, even though the element is not introduced by "step for" language. First, the "sensing" step obviously is critical to the overall process. Second, the rest of the language in Claim 18 does not aid construction of the "sensing" step by filling in details that would answer the critical "how" question. Third, the specification discloses specific acts for accomplishing the sensing function. In light of the need to answer the critical question of how the patentee intended to accomplish the step of "sensing an abnormal cardiac rhythm," the court concludes that the "sensing" step in Claim 18 is a step-plus-function element controlled by 35 U.S.C. § 112 P 6.

The specification expressly teaches two manual "sensing" methods. In the physician-operated embodiment of Figure 1 and Figure 2, the external display and control console receives an ECG signal through an input device. The physician views a display of the ECG signal and determines the presence of an abnormal cardiac rhythm. In the patient-operated embodiment, the patient is taught to recognize the symptoms of arrhythmia based on sensing his or her heartbeat. Once the patient senses an arrhythmia, he or she places the magnet over the proper switch on the implanted device. 11

--- Footnotes ---

11 CPI claims that a second "automatic" sensing process takes place in the patient-operated device. According to CPI, the circuitry in the device "automatically" senses that an abnormal cardiac rhythm is present "due to the expiration of the time out period of timer 116 before the magnet is removed by the patient." Pl. Reply Br. at 47. The court disagrees. The "sensing" done by the timer, if anything, is sensing the elapse of the time delay and sensing that the magnet is still in place. If the first shock to the heart corrects the arrhythmia, but the magnet is left in place and the timer expires, another shock will be delivered to the heart even though the patient is no longer experiencing arrhythmia.

--- End Footnotes ---

The court intends to define "sensing an abnormal cardiac rhythm" as limited to the disclosed sensing methods of (1) displaying the ECG signal for observation and interpretation by a physician, or (2) direct observation of the heartbeat by the physician or patient, or (3) sensing methods equivalent to method (1) or (2).

3952

B. "sensing intervals between successive synchronization codes"

The last phrase disputed in this order is "sensing intervals between successive synchronization codes." Proposed constructions are shown below.

</tr>
</tbody>
</table>

As stated, keeping the decoder synchronized with the audio bitstream was one of the primary objects of the present invention. The invention ideally accomplished this task by performing three steps: (1) calculating the expected interval between successive synchronization codes using the bitrate and sampling frequency of the audio data; (2) measuring the actual interval between successive synchronization codes; and (3) comparing the expected interval with the actual interval.
If the two intervals matched, then the decoder and bitstream would be "in sync" with each other (see col. 2:66-3:4).

A person having ordinary skill in the relevant art at the time the patent application was filed would have understood that the asserted claims covered this three-step approach. In particular, such a person would have understood that the "predetermined interval" found in the claims referred to the interval that was calculated using bitrate and sampling frequency information contained in the data header (see col. 10:5-25, 10:38-58, 11:29-47, 12:1-17).

The question presented is whether the phase "sensing intervals between successive synchronization codes" is limited to one specific approach disclosed in the specification for measuring the actual interval between synchronization codes (step two of the three-step process), or whether alternative approaches at measuring the interval between synchronization codes could be used. Specifically, LSI's construction limits the "measuring" step to counting the number of bits between successive synchronization codes, while SanDisk's construction does not.

The claims provide insight into the proper construction of this phrase. Both claim 1 and claim 5 include a "sensor for sensing intervals between successive synchronization codes" (col. 10:38-58). LSI's proposed construction would require this sensor to "measure the frame length" between successive synchronization codes "based upon the number of bits between the codes." This construction, however, is inconsistent with claim 15. As shown below, claim 15 -- which is dependent upon claim 5 -- adds a new element to the system called a "counter." The "counter" performs the very function that LSI's proposed construction would impart on the "sensor":

15. A system as in claim 5, wherein:

said bitstream comprises bits of data such that said intervals between successive synchronization codes corresponds to a number of said bits; and

the system further comprises a counter for counting said bits between successive synchronization codes to determine said number of said bits and said interval between successive synchronization codes.

Given this language, claim differentiation weighs strongly against a finding that the "sensor for sensing intervals between successive synchronization codes" in claim 5 is limited to the exact same function as the "counter" in claim 15. Additionally, nowhere in the claim language is the term "frame length" -- used in LSI's proposed construction -- used to describe the interval between successive synchronization codes. Rather, the claims exclusively refer to the term "interval" to describe the separation between successive synchronization codes. In light of the clear language of the claims, LSI's proposed construction must be rejected.

SanDisk's proposed construction, by contrast, properly employs the term "interval" used throughout the claims, and is consistent with the description of the present invention set forth in the specification (see 2:66-3:3, 3:37-42). Moreover, it does not improperly limit the "sensor" or the "sensing" step to counting "the number of bits between" synchronization codes. Given the intrinsic evidence set forth above, a person having ordinary skill in the relevant art would have understood "sensing intervals between successive synchronization codes" to mean "measuring the interval between successive synchronization codes."

IV. Interpretation of the Term "Sensor"

The parties dispute the meaning of the term "the sensor" in claim 107 of the 855 Patent and claims 12, 20, and 47 of the 480 Patent. Hunter Douglas argues that these claims are indefinite under 35 U.S.C. § 112, P 2 because they refer to a non-existent element called "the sensor" in preceding claims from which they depend.

Under 35 U.S.C. § 282, a patent is presumed valid. See 35 U.S.C. § 282. The defendant has the burden of proving facts by clear and convincing evidence establishing that the patent is invalid. See North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1579 (1993). Indefiniteness is a question of law. See id. The determination of whether a claim is invalid as indefinite "depends on whether those skilled in the art would understand the scope of the claim when the claim is read in
light of the specification." Id. While claims may be rendered indefinite for lack of antecedent basis, such claims may nevertheless remain definite when read in light of the specifications. See Slimfold Mfg. Co. v. Kinkead Indus., Inc., 810 F.2d 1113, 1116-17 (Fed. Cir. 1987); Messerschmidt v. United States, 29 Fed. Cl. 1, 42 (1993).

The language of the disputed claims refers to "the electronic circuit [that includes] a switch electrically connected to the sensor for receiving the control signal." Neither the disputed claims nor the claims from which they depend refer to or define a sensor element. The independent claims, however, do refer to a "control signal generator for generating a control signal." Hunter Douglas argues that it is unclear whether the term "the sensor" refers to "the sensor for receiving the control signal" from the control signal generator of the independent claims or whether "the sensor" is part of the control signal generator itself. Hunter Douglas argues further that the specifications do not resolve the ambiguity because they refer to two sets of sensors, one that generates signals and one that receives those signals.

Contrary to Hunter Douglas' argument, the specifications of the patents at issue do resolve the ambiguity. The specifications refer to "[a] control signal generator, preferably a daylight sensor 28 . . . [that is] electrically connected to electronic components within the actuator 10 to send a control signal to the components." 480 Patent, col. 9, lines 30-38; 855 Patent, col. 8, lines 22-30. The specifications also refer to "another control signal generator, preferably a signal sensor 29 . . . [that is] electrically connected to the electronic components within the actuator 10 [and] that can generate an electrical control signal to activate the actuator 10." 480 Patent, col. 9, lines 43-58; 855 Patent, col. 8, lines 34-49. Thus, it appears that the term "the sensor" in the disputed claims refers to the control signal generator in the independent claims.

Hunter Douglas is correct that the specifications refer to a second set of sensors, namely the "first and second stages 144, 146 of a type 4538 activity sensor." 480 Patent, col. 13, lines 39-40; 855 Patent, col. 12, lines 26-27. But the specifications also make clear that these devices receive the signals produced by the signal sensor 29 through the means of an electrically connected "switch." Thus, it appears clear that the "switch" in the disputed claims is the device that "receives" the control signal generated by "the sensor."

Because the specifications resolve the ambiguity of the claim language, the Court is inclined to find that the claims are not invalid as indefinite. Furthermore, the Court is also inclined to find that one of ordinary skill in the art would understand the term "sensor" to mean a "device designed to respond to a physical stimulus (as heat or cold, light, a particular motion) and transmit a resulting impulse for interpretation or measurement or for operating a control." Webster's Third New International Dictionary (unabridged edition) (1986), p. 2068.

3954

E-Watch proposes "a server-controlled network device that contains a sensor for monitoring an area and which generates and transmits an IP signal indicating a condition in the monitored area." March Networks suggests "a device which detects occurrence of an event and generates an output indicating that the event has occurred."

The specification teaches that a "sensor appliance" is different than just a sensor. See 183 patent, col. 5, 1. 7 ("multiple sensors and appliances . . ."). The two are also listed separately in col. 5, ll. 39-43.

The parties agree that a "sensor appliance" is a "network device," which means that it generates an output or signal that is internet protocol compliant. This distinguishes the sensor appliance from a conventional sensor which generates a signal or an output that must be modified or processed before it can be transmitted over the internet. Examples of a conventional sensor would be a household fire alarm with a siren, or a pressure monitor with an analog dial gauge.

March Networks limits its definition to detecting an event. However, an IP camera, an audio monitor, or a thermostat might monitor both static, unchanging conditions in an area, as well as discrete events in the same area. E-watch limits its definition to a device that indicates a condition. There is no support in the specification for limiting the device in either way. The sensor appliance may monitor conditions, such as temperature and/or events, such as an intrusion into an area. See 183 patent, col. 5, ll. 39-50 (specifications describe detection for temperature and smoke conditions); see also 183 patent, col. 7, ll. 50-55 (specifications describe "event detection such as by motion detection, contact closure. . . ."). At the Markman
hearing, the parties seemed to agree that a sensor appliance may monitor a condition or event. Transcript from July, 12, 2006 Markman Hearing ("Tr.") pp. 17-24.

Contrary to the E-watch proposal, the claim is not limited to a device which is server controlled. There are sensor appliances which monitor continuously and/or automatically and which may be unresponsive to any "control" from a server. See 183 patent, col 42, ll. 17-19. E-Watch is not opposed to deletion of the term "server-controlled." See Tr. p.15. The court therefore defines the term as follows:

"Sensor appliance" means: "a network device which contains one or more sensors for monitoring an area and which generates and transmits an IP signal indicating a condition or event in the monitored area."

Where an element in a claim is expressed as a means or step for performing a specified function without reciting structure, it "shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112, P 6. This two-step inquiry involves determining (1) whether § 112, P 6 applies and, if it does, (2) identifying the claimed function and corresponding structures in the written description. Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1360 (Fed. Cir. 2000).

The court recognized that the use of the word "means" in the claim language invokes a rebuttable presumption that § 112, P 6 applies; conversely, the failure to use "means" invokes a presumption that § 112, P 6 does not apply. Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1365 (Fed. Cir. 2003). Here, the key disputed phrases are "sensor means," "control circuit means," and "switching means." Nonetheless, the presumption that § 112, P 6 applies may be rebutted if the claim recites no function or recites sufficient structure for performing that function. Sage Prods. v. Devon Indus., 126 F.3d 1420, 1427, 28 (Fed. Cir. 1997).

The district court ultimately rejected DESA's argument that the asserted claims contained sufficient structural language to escape the application of § 112, P 6. Hr'g Tr. at 659:12-15.

Although the district court seemed to rely upon expert testimony, we note that its conclusion could have been reached without the aid of extrinsic evidence. First, the claims use both means-plus-function language (i.e., "sensor means," "control circuit means," etc.) and structural language (i.e., lamp, zero crossing detect circuit, etc.), which suggests that the patentee intentionally used "means" language to invoke § 112, P 6. Second, the claims recite a function for each of these "means" limitations without specifying what structure(s) would be required to perform that function. Third, we reject DESA's argument that the use of "sensor," "control circuit," and "switching" before the word "means" was sufficient to denote structure. Rather, those modifiers were simply used to distinguish between subsequent references to different "means" limitations within the same claim, i.e., "said first and second sensor means" as opposed to "said control circuit means." Finally, DESA argues that this court has previously stated that "it is clear that the term 'circuit' by itself connotes some structure." Apex, 325 F.3d at 1373. In Apex, however, the word "means" was not used, so the reverse presumption--i.e., that § 112, P 6 does not apply--was invoked. Here, we agree with the district court that DESA failed to overcome the presumption that § 112, P 6 does apply to "sensor means," "control circuit means," and "switching means."

n4 While the court did not explain in detail the reasons behind its oral decision, we infer that the court found the expert testimony of Mr. Thesz and Professor Massengill to be more persuasive.
3. "separate from"/"the operation terminal which is separate from the business office device and connected to the business office device"/"separate device"

The next disputed claim terms concern the meaning of "separate" in the context of the patents. These terms appear in various claims of the '289 and '120 Patents. (Chart at 15-17). Claims 62, 68, 69 and 72 of the '289 Patent recite that the operation terminal is "separate from" the business office device. The relevant claims of the '120 Patent recites either a "separate device" or a computer that is "separate from" the business office device. See e.g., '120 Patent, Claims 1, 16 & 126. The parties agree that these variations of the claim term "separate" should be construed in the same way. (Chart at 17).

Ricoh argues that "[a] module of an office machine system is separate from another module if it has its own intelligence and communication capability and is an interchangeable module." (Id. at 15). Ricoh further argues that the "intelligent modules communicate by using an intelligent communication protocol." (Id.). Pitney asserts that the operation terminal and the business office device are "physically apart" from each other and are only connected by a communication line. (Id.). Pitney also contends that a "separate device" means "[a] device that is external or apart from another device during operation, but connected to the external device by a communication line." (Id. at 17).

Again, this Court must determine whether the claim term requires "physical separation" between the devices. Ricoh offers a construction analogous to the one offered for "office machine system" -- that is, one focused on the modular communication between the devices. Ricoh relies on various portions of the '289 Patent specification and the prosecution histories of the '779, '554 and '289 Patents in support of its construction.

Pitney likewise offers an analogous construction which emphasizes the physical configuration of the invention. Pitney relies on the plain language of the claims of the '289 Patent and '120 Patents. For example. Claims 62 reads:

A system, comprising:

a business office device including:

a memory which stores state data of the business office device;

a transmitting device which transmits the state data out of the business office device;

a receiving device which receives commands; and

an engine for performing mechanical functions within the business office device,

an operation terminal, separate from the business office device and connected to the business office device . . . .

'289 Patent, Claim 62. Additionally, Pitney relies on similar intrinsic evidence that it relied on in support of its construction of "office machine system."

Consistent with this Court's analysis and conclusion regarding "office machine system," and based on the plain meaning of the word "separate" which suggests distance between the elements, the Court concludes that these disputed claim terms also require physical separation between the devices. The Court does not find, nor does Ricoh provide, sufficient support that would lead this Court to a different conclusion. Since Pitney's construction best supports this interpretation, the Court adopts it. Accordingly, the term "separate" in the context of the relevant claims requires "physical separation."
The parties dispute whether the "separate and discrete additional element" can be combined with the discrete lottery elements, for example by adding the additional element if color to a discrete lottery element like a number. FortuNet asserts that adding color to the number was one of the specific embodiments in the specification as shown in Figure 6. FortuNet also contends the claim language does not indicate the additional element must be mother game piece. Additionally, FortuNet argues the patentee withdrew its distinction of the Grossman patent, and therefore the patentee's statements related to that distinction no longer apply. FortuNet also argues dependent claim 5 includes the limitation of separate game pieces, so this limitation should not be read into independent claim 1.

Planet Bingo argues the claim language requires the additional elements be "discrete," "separate," and "distinct" from the discrete lottery elements. Planet Bingo contends the patentee had to make these distinctions to overcome the Grossman reference which mixed together the usual element and an additional factor by coloring the die face. Planet Bingo notes this interpretation is consistent with the embodiment in Figures 9-12, and requiring the additional element to be a unique game piece is critical to the invention's operation because each additional element drawn affects the player's odds of matching the remaining lottery elements drawn. Planet Bingo further continues its argument that FortuNet cannot rely on other embodiments in the specification other than Figures 9-12 because the patentee elected not to pursue those embodiments.

Claim 1's plain language requires the additional element to be "separate and discrete" from the discrete lottery elements. Separate does not mean combined. The plain meaning is bolstered by the patentee's own statements during prosecution. In response to the examiner's rejection, the patentee distinguished his invention from Grossman by stating Grossman combined elements whereas the present invention had entirely separate game pieces. The prosecution history does not support FortuNet's assertion that the patentee withdrew this distinction in a subsequent amendment. First, the patentee did not expressly withdraw his distinction of Grossman. Second, in the same amendment the patentee removed the word "single" which he originally used to distinguish Grossman, he inserted the word "separate" to describe the additional elements. FortuNet offers no explanation for what significance the Court should give to the word "separate," and is unable to articulate a difference between "single" and "separate." Further, the patentee made no effort to distinguish Grossman on a different basis during the subsequent amendment. Finally, in the amendment in which the patentee added the word "separate," he remarked that the dependent claims "have been amended for consistency with the amendments made to the independent claims from which they depend and in particular that the 'single' and 'individual' nature of the game pieces is now part of the independent claims." (JA0309 (emphasis added).)

The prosecution history is clear. The patentee amended his claims to overcome prior art. The additional elements must be separate and cannot be combined with the lottery elements. The patentee's understanding is reflected in the amended claim language which requires the additional elements be "separate."

This construction does not render superfluous dependent claim 5. Dependent claim 5 adds the limitation that "the lottery elements are game pieces which are identically shaped and have different indicia thereon, and wherein said adding step includes the adding of at least one additional game piece which is identically shaped to the lottery game pieces as the additional element to a group formed from the lottery game pieces." (JA0207.) Claim 5 adds the limitations of game pieces of identical shape, a limitation not expressed in independent claim 1.

The Court therefore holds that "separate and discrete additional element" means "an element having no value, and not being available for designating by the player as one of the winning numbers or symbols of the usual lottery series. A separate and discrete additional element cannot be combined with a discrete lottery element."

3958

B. "a Separate Audio Programming channel of the television carrier"; "an SAP associated with television signals" 5

--- Footnotes ---

5 The term "a Separate Audio Programming channel of the television carrier" is used in claim 5 of the '195 patent, and the term "an SAP associated with television signals" is used in claim 30 of the '334 patent. See Rawlinson Decl., Exhs. 4 ('195 patent), 6 ('334 patent).
The parties dispute with respect to these two terms is limited to the scope of the term "Separate Audio Programming channel" (hereinafter, "SAP channel" or "SAP subchannel"). Plaintiff contends that "persons of ordinary skill in the art understand and use 'SAP channel' to [include] any channel that carries [separate audio programming]." Reply at 12:9-13. Defendant, however, contends that the term is more limited:

Separate Audio Programming channel (also known as the 'Second Audio Program' or 'SAP' subchannel) is the channel containing the frequency-modulated second audio program subcarrier. The second audio program subcarrier is the particular subcarrier of the standard terrestrial analog television signal designated by the BTSC (Broadcast Television System Committee of the Electronics Industries Association) to carry the second audio program, if any.

Opposition at 7:5-10 (emphasis added).

In support of its definition, Defendant relies primarily on the Office of Engineering and Technology's ("OET") Bulletin No. 60, Revision A (February 1986), entitled Multichannel Television Sound Transmission and Audio Processing Requirements for the BTSC System (hereinafter, "the Bulletin"). See Rawlinson Decl., Exh. 8. The Bulletin contains the "standards for the BTSC system," including (1) definitions, (2) transmission standards, (3) transmission system requirements/multichannel sound requirements, and (4) modulation levels. Id. at A434-47.

The Bulletin defines a "multiplex transmission" as "[t]he simultaneous transmission of the TV program main channel audio signal and one or more subchannel signals." Id. at A435. One of the four subchannels discussed in the Bulletin is the "SAP subchannel," 7 which is defined as "[t]he channel containing the frequency-modulated second audio program subcarrier." Id. at A436. Therefore, according to the Bulletin, an "SAP broadcast" is "[t]he multiplex transmission of a second audio program utilizing the second audio program subchannel." Id. at A435. The Bulletin also indicates that the "SAP subchannel" exists at a specific location on the terrestrial analog broadcast signal. Id. at A437 ("[t]he subcarrier frequency shall nominally be equal to the fifth harmonic of the horizontal line rate"; "the second program encoded signal shall frequency modulate the subcarrier to a peak derivation of +/- 10kHz")

7 The additional subchannels are the (1) stereophonic subchannel, (2) non-program related subchannel; and (3) pilot subcarrier. Rawlinson Decl., Exh. 8 at A435.

Analog cable broadcasts are no different (i.e., the "SAP channel" is similarly situated in both terrestrial and analog cable transmissions). See Rawlinson Decl., Exh. 9 (Walter Ciciora, et al., Modern Cable Television Technology, Morgan Kaufman Publishers, Inc., 1999) at A452 ("[a] limited bandwidth (10 kHz) monaural second audio program (SAP) channel is frequency modulated onto a carrier at five times the horizontal scan frequency"). The only distinction is the mode of transmission (i.e., a cable signal is transmitted over wires as opposed to terrestrially). Thus, the Bulletin's limitation to terrestrial signals is of no moment. 8

8 This is also consistent with the Court's prior ruling that the terms "data from a television carrier" and "television signals"
were not limited to terrestrial audio signals. See April Order 4:9:21-10:10.

The more difficult question is whether the term "SAP channel" is broad enough to include digital broadcast transmissions. In order to resolve this question, the Court must first explain how a digital broadcast system works in context (e.g., digital satellite television). First, the analog programming, including the information inserted into the "SAP channel," is "converted into a high-quality, uncompressed digital stream" at a central location or broadcast center. Baker Decl., Exh. G (Karim Nice & Tom Harris, How Satellite TV Works (online)) at 3. After the digitalized programming is compressed and encrypted, the broadcast center transmits the signal directly to a satellite; the satellite, in turn, retransmits the signal to individual satellite dishes. Id at 4. The end component is the receiver, which de-scrambles the encrypted digital signal and "converts it into an analog format that a standard television can recognize." Id. at 6.

Although the programming, including information inserted into the "SAP channel," still exists while in digital form, it is no longer cognizable in the same way. In other words, the broadcast signal described in the Bulletin does not exist in the digital medium. Id. at 4 (describing the digital data in terms of megabits per seconds (Mbps)). However, it is evident that, even in the context of a digital broadcast system, the programming both begins and ends in analog format. Thus, the dispute here revolves around the interim period during which the programming is digitized.

Unfortunately, the parties provide little information regarding the implication of digitalization on the definition of "SAP channel." Although the technical sources submitted by Defendant (the Bulletin and pages from Modern Cable Television Technology) provide a clear explanation of analog broadcast signals (including the contours of the term "SAP channel"), they are silent with respect to digitalization of an analog signal.

Plaintiff's expert, Charles Jablonski, is equally uninformative. First, Mr. Jablonski asserts that "the only difference between the SAP channel of an analog television carrier and the SAP channel in a digital broadcast is that in the latter signal the SAP channel has been digitalized." Declaration of Charles H. Jablonski ("Jablonski Decl.") P 5. This statement, of course, belies the fact that the "SAP channel," which exists as part of an analog signal, does not exist in the same way in the digital medium, although the content remains.

Moreover, Mr. Jablonski concludes that "[b]ecause users can listen to Second Audio Programming channels either when they are broadcast as BTSC standard subchannels or when they are digitized for satellite or digital cable broadcast, persons of ordinary skill in the art understand and use 'SAP channel' to mean both the standard subchannel (i.e., spectrum allocation) and any channel that carries SAP." Id. P 6. However, it is clear from the intrinsic record that the term "SAP channel," as used in the '195 and '334 patent, is not broad enough to include any channel that carries separate audio programing. The claims themselves distinguish the "SAP channel" from other locations that might carry the prescribed "data" or "audio." See Rawlinson Decl., Exh. 4 ('195 patent), Claim 4 ("wherein the tuner extracts data from a vertical blanking interval of the television carrier"); Exh. 6 ('334 patent), Claim 35 ("wherein the audio is carried in an FM subcarrier associated with television signals") (emphasis added). This distinction would be rendered meaningless if these additional locations were also defined as "SAP channels" whenever they carried separate audio programming. See CAE Screenplates, Inc. v. Heinrich Fiedler GmbH & Co. KG, 224 F.3d 1308, 1317 (Fed. Cir. 2000) ("[i]n the absence of any evidence to the contrary, we must presume that the use of these different terms in the claims connotes different meanings")

However, the disputed claims themselves provide the Court with some guidance on this issue. First, claim 5 of the '195 patent, as a dependant of claim 1, describes a "receiver" which is comprised, in part, of a "tuner [which] extracts data from a Separate Audio Programing channel." See Rawlinson Decl., Exh. 4. Moreover, claim 30 of the '334 patent describes a "receiver" that is comprised, in part, of "a controller coupled to the television tuner and which provides audio from a signal received at the television tuner, wherein the audio is carried in an SAP associated with television signals received at the tuner." Thus, the only requirement with respect to the two disputed terms respectively is that the "tuner" "extract []" or "receive []" "data" or "audio" from the "SAP channel." In other words, the events that transpire prior in time to extraction or receipt by the "tuner," including prior digitalization, are not the subject of these terms.

Therefore, the Court defines "SAP channel" as "the part of the analog signal specifically designed to carry second audio programming," but notes that this definition must be applied in light of the preceding discussion.
Ventana next urges that the verdict of infringement with regard to claim 8-15 of the '061 patent should be set aside because the district court erred in its construction of "separate electrical power connections being provided to said first and second heating elements" in those claims. n8

The district court construed the phrase to mean "each heating element has a separate connection to power and ground." (J.A. at 30.) The district court's construction did not require the separate connections to be off the moving platform. Ventana argues that its devices would not infringe if the phrase were construed to include an "off the moving platform" limitation.

The language of claim 8 makes no reference to an "off the moving platform" limitation. Claim 8 of the '061 patent reads:

8. A microscope slide stainer with random access slide staining capability comprising:

   a moving platform adapted to carry microscope slides, said moving platform moving the slides to a dispensing station for adding liquid reagent to said slides;

   a first heating element positioned on the moving platform, said first heating element adapted to move with the platform and to be located immediately adjacent to at least one microscope slide and having a first electrical power connection;

   a second heating element positioned on the moving platform, said second heating element adapted to move with the platform and to be located immediately adjacent to at least one microscope slide and having a second electrical power connection, separate electrical power connections being provided to said first and second heating elements;

   a motor drive capable of indexing said microscope slides adjacent to said dispensing station; and

   electronic control for heating the first and second heating elements.

There is no requirement in the claim that the electrical power connections be "off the moving platform." Furthermore, the preferred embodiment of the invention described in the specification has electrical power connections that are on the moving platform. See '061 patent col. 5, l. 50-col. 6, l. 4 & Fig. 7. We have previously held that "[a] claim construction that excludes a preferred embodiment . . . is rarely, if ever, correct." SanDisk Corp. v. Memorex Prods., Inc., 415 F.3d 1278, 1285 (Fed. Cir. 2005) (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996)). Ventana's tortured arguments based on the specification and prosecution history do nothing to undermine the plain language of the claims and the fact that the preferred embodiment has electrical power connections on the moving platform. The district court correctly construed the phrase. We sustain the jury verdict concluding that the "separate electrical power connections" limitation of claims 8-15 of the '061 patent is satisfied.
B. "A separate set of queue replenishment control rules"

Independent claims 13 and 23 both recite a step of "monitoring the subscriber rental queue with a computer in accordance with said set of notification rules and a separate set of queue replenishment control rules." Plaintiff proposes that "a separate set of queue replenishment control rules," in this context, be construed to mean "a set of rules (distinct from the set of notification rules) relating to the refilling of the subscriber's rental queue." Defendants contend that the claim term is indefinite, or in the alternative, if the claim term is amenable to construction, it should be construed to mean "a set of rules (distinct from the set of notification rules) governing when to review the subscriber's rental queue and whether to automatically add media items to the queue."

1. Indefiniteness

As discussed above, defendants' argument in support of rendering the claim terms indefinite is based on the fact that the specification of the '243 patent fails to explicitly define the boundaries of the terms "notification rules" and "replenishment control rules." However, the Court finds that reasonable efforts will enable a person of ordinary skill in the relevant art to understand the meaning of these terms, thereby rendering these terms amenable to construction.

2. Claim Construction

With regard to construction of the claim term, plaintiff argues that defendants are attempting to improperly narrow the construction of the claim term to cover only one portion of a preferred embodiment of the claimed invention that is disclosed in the specification. Defendants contend that, based on the plain meaning of the terms "replenishment," "control," and "rules," and the specification describing the options and parameters related to queue replenishment, the term "queue replenishment control rules" must be construed to govern when to review the rental queue and whether to automatically add items to the queue.

First, defendants contend that the queue replenishment control rules must govern whether to automatically add items to the queue. Defendants assert that the plain language of the term "queue replenishment control rules" means the rules must control the replenishment of the subscriber's queue. Defendants also assert that the specification confirms that the replenishment is under the control of the computer system so that it must be performed automatically, rather than manually by the subscriber. Defendants further assert that during prosecution of the '243 patent, the patentee confirmed that he was claiming "a set of rules which automatically cause a modification to a subscriber's rental queue." Amendment A and Response 9, Chivvis Decl., Ex. J (Docket No. 171-6). Second, defendants contend that the "queue replenishment control rules" must also govern when to review the subscriber's rental queue in light of the claim language indicating that the computer uses the notification rules and the queue replenishment control rules to monitor the subscriber's rental queue and determine if an electronic notification should be sent to the subscriber. '243 patent 27:21-28, 27:36-39, 28:20-29.

Plaintiff argues that defendants are attempting to construe the claim language to cover only the preferred embodiments described in the specification. Plaintiff particularly objects to defendants' proposed construction to limit "queue replenishment control rules" to rules governing whether media titles should be automatically added to the queue, and exclude rules for simply determining whether the queue is in need of replenishment and rules relating to the type of media items with which the queue may be replenished.

Again, the Court finds that while plaintiff's construction of the claim term is overly broad, defendants' construction is too narrow. Step (b) as recited in claim 13 reads as follows:

"monitoring the subscriber rental queue with a computer in accordance with said set of notification rules and a separate set of queue replenishment control rules authorized by the subscriber so that said computer can determine if a composition of such rental queue should be altered through additions of playable media titles and/or ordering of playable media titles in the subscriber rental queue should be altered."

'243 patent, 27:21-29 (emphasis added). Step (b) as recited in claim 23 reads as follows:
monitoring the subscriber rental queue with a computer in accordance with said set of notification rules and a separate set of queue replenishment control rules authorized by the subscriber so that said computer can determine if a composition and/or ordering of playable media titles in the subscriber rental queue should be altered.

Id. 28:20-25 (emphasis added). Based on the claim language, it is clear that "a separate set of queue replenishment control rules" refers to a set of rules that is used by a computer to determine whether to add media titles to the subscriber queue. As defendants point out, the term "queue replenishment" clearly implies addition, and not just alteration, of media titles. Also, during prosecution of the '243 patent, the patent examiner made claim rejections based on the fact that queue replenishment rules "employed to determine if the ordering of the titles in the queue should be changed" are disclosed in the prior art Hastings patent. See First Office Action 6. In response, the patentee argued that "[i]n the Hastings system . . . titles are taken out, but there is no 'replenishment' shown or suggested." The patentee further asserted that his invention is distinguishable over the prior art in that it includes a feature of altering the subscriber queue "through additions of playable media titles." Amendment A and Response 9-10 (emphasis in original). 6

Further, it is clear from the intrinsic evidence and the prosecution history that the asserted claims only cover automatic replenishment of the subscriber queues. First, the claim language clearly indicates that a computer determines "if a composition . . . and/or ordering of playable media titles in the subscriber's rental queue should be altered" based on the notification rules and the queue replenishment control rules. This language clearly implies that the computer, not the subscriber, determines whether it should automatically modify the subscriber's rental queue. '243 patent, 27:25-26, 28:24-25. 7

Second, a non-automatic queue replenishment feature is neither taught nor suggested in the '243 patent. Any feature related to queue replenishment is described as being automatically implemented by a computer system in the specification. See e.g., '243 patent, 10:28-31 (disclosing automatically replenishing a queue without burdensome participation by the subscriber), 18:36-40 (disclosing a service provider server device that includes a function for prompting a subscriber to select automatic notice/auto-replenish/auto-ship options). Also, the background of the '243 patent describes how, in the prior art system, subscribers run the risk of unwittingly leaving their queues empty and thereby not receiving media items they would otherwise be entitled to receive "unless they constantly monitor their own rental queue to make sure it is stocked with selections for shipping." '243 patent, 2:15-18. The summary of the invention states that its object is "to provide a recommender system that coordinates with a queue monitoring system, so that the subscribers/purchasers can enjoy the benefits of such system even during periods when they are not actively engaged with an online rental/purchase system." '243 patent, 3:17-21. The detailed description specifies one of the advantages of the claimed invention as "automatically ensuring that [the subscriber's] preference queue is never allowed to completely run 'dry' so to speak." Id. 5:60-62. Further, plaintiff does not refute defendants' assertion that the queue replenishment feature must be automatic and instead argues that the automatic modification of the subscriber queue is merely an optional feature of the claimed invention in light of the language in the specification that describes the primary advantage of the claimed invention as providing automatic

- 4222 -
notification to a subscriber about his/her queue status. This argument, however, struthiously ignores the fact that both claims 13 and 23 explicitly recite the term "queue replenishment control rules." Although a subscriber may choose not to benefit from the automatic queue replenishment feature, the subscriber still has to be presented with this option, and a computer must determine whether the subscriber has selected this option. In other words, the feature of determining whether to automatically replenish media titles is an essential element of the claimed invention, not merely an optional feature.

Third, the patentee confirmed during prosecution of the '243 patent that his invention was directed to techniques "in which a user can set up a set of rules which automatically cause a modification to a subscriber rental queue." Amendment A and Response 9 (emphasis added). Plaintiff argues that the patentee merely noted that a user "can" (but does not necessarily have to) set up rules for causing automatic modification of the subscriber queue. However, plaintiff's somewhat forced reading of the "can" language is inconsistent with the claim language explicitly reciting the term "queue replenishment control rules" and the intrinsic evidence describing the queue replenishment feature as an automatic feature implemented by a computer.

The Court notes that claim 13 recites language further requiring the queue replenishment control rules to include "a trigger event to be used in determining when said subscriber rental queue should be modified." '243 patent, 27:29-31 (emphasis added). However, in light of the fact that this language is not recited in claim 23, the Court finds that defendants' proposal to construe the term "queue replenishment control rules" to govern "when to review the subscriber's rental queue" is improper. Therefore, the Court shall construe "a separate set of queue replenishment control rules" to mean "a set of rules (distinct from the set of notification rules) governing whether to automatically add playable media titles to the subscriber's rental queue."

I. Claim Construction of "interposed field oxide film"

The plain meaning of the claim language common to both patents is that a field oxide film is interposed between and separates the impurity diffusion layers associated with the buffer MOSFETs from the impurity diffusion layers associated with the protection MOSFETs. The buffer MOSFETs are those that are part of the output buffer circuit. The protection MOSFETs are those that are part of a protection circuit provided to protect the above-mentioned output buffer circuit. Taken as a whole, the structural and functional relationships among the elements as required by the plain meaning are apparent: protection MOSFETs are part of the protection circuit that functions to protect an output buffer circuit, and the impurity diffusion layers of the protection MOSFETs must be separated from, and have a field oxide film interposed between, the impurity diffusion layers of buffer MOSFETs that are part of said output buffer circuit.

The claims make no express qualifications as to whether "any," "at least one," "some," "most," or "all" of the various MOSFETs are the subject of the claims. The plain meaning, however, is that all of the MOSFETs comprising the respective circuits are subject to the limitations. The claim language provides that the set of buffer MOSFETs are separated from the set of protection MOSFETs by an interposed oxide film; the plain language does not permit an interpretation that some within the set might not be separated, notwithstanding the open claim language introduced by the term "comprising" in the claim preamble.

The specifications of the patents further support the Court's construction. The title and field of the invention inform the reader that the aim of the invention is to provide a "protection device" or "protection elements" for preventing the electrostatic breakdown of output buffer MOSFETs. '571 patent at [54], 1:9-12. The patentee notes that a device having buffer MOSFETs and offset gate MOSFETs (for the prevention of electrostatic breakdown), wired in parallel, were known in the prior art. Id. at 1:14-30. Because these prior art devices were still subject to electrostatic breakdown, the purpose of the invention is to provide improved circuitry "capable of more effectively preventing... electrostatic breakdown." Id. at 1:38-40.

The specification implies that at least one improvement over the prior art included separating the protection elements from the buffer elements. The specification describes this in detail:

When the electrostatic discharge flows into the channels and the semiconductor substrate 12 near the channels, a potential
at the semiconductor substrate is raised. Since, however, each of the impurity diffusion layers 18 of the buffer MOSs [sic] 14 and 14' and each of the impurity diffusion layers 20 of the protection elements 16 are separated from one another by the semiconductor substrate 12 and the field oxide film 44 as mentioned above, the resistance between the impurity diffusion layers 18 and 20 increases. Thus, since a voltage drop is developed by the resistance, the potential at each of the channels of the buffer MOSs 14 and 14' and the potential at the semiconductor substrate 12 provided near the channels can be prevented from increasing or being reduced. As a result, the drain withstand voltages BV[sd] of the buffer MOSs 14 and 14' are little reduced, thereby making it possible to prevent snapback of each of the buffer MOSs 14 and 14'.

'571 patent at 6:35-52. Thus, the specification explains that the underlying cause of electrostatic breakdown in the devices is due to the lack of a sufficiently resistive medium between the respective MOSFETs, that is, it is a consequence of the chip construction and layout.

The layout of the device of the invention is described as "the impurity diffusion layers of each buffer MOS 14 and the impurity diffusion layers 20 of each protection element 16 are respectively separated from one another and disposed so as to be spaced away from one another. This is because the substrate 12 and the field oxide film 44 are interposed between the impurity diffusion layers 18 and 20." Id. at 6:4-10 (emphasis added). All the embodiments described in the specification adopt a similar physical separation between the respective sets of buffer and protection MOSFETs.

n5 The specification enumerates six embodiments and proceeds to describe only those features that differ from the previously described embodiments. Nothing in the specification contradicts the concept that the buffer and protection elements have a field oxide film interposed between each element as a set.

n5 The prosecution history of the '571 patent also supports the interpretation derived from the plain meaning of the claim language. In the response to the first office action, the patentee describes the "present invention," as a prelude to addressing the substantive rejections, as follows: "The buffer MOSFETs have impurity diffusion layers (18) which are spaced from impurity diffusion layers (20) of the protection MOSFETs. A field oxide film separates the buffer MOSFETs from the protection MOSFETs. This arrangement of semiconductor device (10) prevents electrostatic breakdown of each buffer MOSFET."

Id. at 18. The patentee uses similar language to distinguish the claimed invention from a reference applied under section 103 for obviousness. The patentee explains that the reference does not "disclose that the impurity diffusion layers of the buffer MOSFETs are spaced from the impurity diffusion layers of the protection MOSFETs, and that a field oxide film is disposed between the buffer MOSFETs and the protection MOSFETs." Id. at 18-19. The patentee consistently characterized the invention as having the set of buffer MOSFETs separated from the set of protection MOSFETs.

The Court thus concludes that the limitation "said buffer MOSFETs having impurity diffusion layers separated from said impurity diffusion layers of said protection MOSFETs by an interposed field oxide film" requires that all impurity diffusion layers of the protection MOSFETs be separated by an interposed field oxide film from the impurity diffusion layers of the buffer MOSFETs that the protection MOSFETs serve to protect.
The term "respective separately executed" appears in claim 1 of the 037 Patent. 037 Patent, 55:27. The related term, "executed separately from said kernel," is found in claims 7 and 11. Id. at 56:41-42, 57:10-11. Plaintiff argues that no construction of these terms is necessary, while defendant requests that the court construe "respective separately executed" to mean "executed by a processor that does not execute the kernel or any other facility." Defendant also argues that "executed separately from the kernel" should be construed as "executed by a processor that does not execute the kernel."

Once again, the court looks first to the language of the claims. Plaintiff contends that "respective separately executed" is unambiguous. However, from the plain meaning of the term alone, it is unclear that a person of ordinary skill in the art would be able to discern what is being separately executed from what. Fortunately, the court need go no further than the language of claim 1 to answer this question. In that claim, the phrase "respective separately executed" describes a "software entity"—i.e., one the operating system peer-level facilities. See id. 55:26-27. The claim language also recites a processor unit that is associated with each of the peer-level facilities and executes the "respective separately executed software entity." Id. at 55:21-25. Synthesizing these elements, the court construes the term "respective separately executed software entity" as "an operating system peer-level facility executed separately from other operating-system peer-level facilities." 8

--- Footnotes ---
8 As discussed above, the specification of the 037 Patent defines the kernel as a peer-level facility. Thus, by implication, the court agrees with defendant's assertion that the definition of "executed separately" must mean executed separately from the kernel.

--- End Footnotes ---

Similarly, Claims 7 and 11 recite "operating system peer-level facilities" or "additional component facilities executed separately from said kernel." Id. at 56:37-42, 57:10-11. Taking claim 11 as an example, the claim also recites "a plurality of processors executing [the] operating system, each of said processors including local memory for the storage and execution of a respective component facility," Id. at 57:16-20. In other words, each of the component facilities—including the kernel as well as the "additional component facilities"—are executed by a separate processor. Accordingly, the court, adopting defendant's proposed construction, construes "executed separately from the said kernel" to mean "executed by a processor that does not execute the kernel."

3963

D. Claim Construction of "separately, independently, and simultaneously"

To determine the proper construction of this term, the Court first turns to the claim language. Claims 1, 2, 5, and 6 of the '511 Patent call for "display means responsive to said first and second electrical signals for separately, independently, and simultaneously producing first and second separate visual displays, said display means including a first display means responsive only to said first electrical signals to produce said first visual display . . ., a second display means responsive only to said second electrical signals to produce said second visual display . . . ."

Plaintiff argues this term means that the images resulting from the transmission and scatter detection are not displayed as one integrated image, but that an image could be colorized based on images derived from either detector. Defendants argue that "separately, independently, and simultaneously" means that the visual displays are all produced and made perceptible at the same time, and each display is derived from electrical signals arising solely and completely from a distinct single source. Essentially, Plaintiff argues that the phrase applies only to the image, while Defendants argue that the phrase applies to the entire process that produces the images.

A person of ordinary skill in the art would understand that this phrase means that there are two display means which operate without reliance on each other and produce images at the same time. This clearly suggests that the phrase applies to the process rather than the end product, as claim reads that the display means are separately, independently, and simultaneously producing images, rather than that the display means are producing separate, independent, and simultaneous images.
The Court next turns to the specification. In distinguishing this patent from prior art, the specification states that

the present invention does not combine the signals produced by any detector with signals produced by any other detector. Rather the signal produced by each of the detectors is separately, independently, and simultaneously displayed in the form of a video image. The images are independent in the sense that each image is produced by the respective signal, without addition of any other data. . . . Applicants have found . . . that attempts to combine the signals from different detectors has the drawback of obscuring significant information.

(‘511 Patent, Col. 3, lines 10-23.) The description of the invention includes "display means responsive to said electrical signals for separately, independently, and simultaneously displaying said electrical signals as a function of time." (‘511 Patent, Col. 3, lines 62-64.) The description of preferred embodiments also states that it would be "inappropriate to sum the forward transmitted and any scatter signal . . . [because] it would reduce the effectiveness of the result as compared to either signal alone." Thus, the specification accords with the construction based on the claim language. The Court is not aware of any prosecution history directly relevant to this term.

Because the Court finds that the claim language is clear and supported by the specification, there is no need to consider extrinsic evidence. Accordingly, the Court FINDS that the term "separately, independently, and simultaneously" as defined in the ‘511 Patent means that each display means responds to different and distinct electrical signals to produce different and distinct visual displays (i.e. images) at the same time.

3964

2. separating into frequency components (Claim 1)

Arbiron argues that this term means "splitting up the digital sound signal to frequency components by digital transform processing." Ipsos argues for a narrow construction of this term, proposing that the Court specifically identify the type of digital transform processing used to split up the digitized signal. It proposes the following construction of this term: "splitting up the digitized signal into multiple frequency bands by a Fourier or wavelet transform." Such a construction would unnecessarily limit the scope of the claims to the embodiment disclosed and is rejected. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) ("This court has expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment."). The specification recites that splitting is "conventionally performed by a Fourier transform, or else by a wavelet transform." ‘962 patent, 6:12-16. It states that "the data processing means 14 are designed to perform an operation of splitting up the digitized signal provided by the converter into frequency components" Id. Given this broad disclosure, the Court is persuaded to adopt plaintiff's proposed construction. This term means "splitting up the digital sound signal to frequency components by digital transform processing."

3965

4. "separator layer"

Claim 4 of the ‘919 Patent discloses "a separator layer between the conductive gel layers of the electrodes to enable the electrical interconnection of the conductive gel layers." Claim 16 of the ‘919 Patent, a dependent claim, discloses a packaged set of electrodes wherein "the separator layer enables the electrical interconnection of the gel layers to form an electrical circuit." The parties agree that "a separator layer between the conductive gel layers of the electrodes" means "a thickness of material that physically separates the gel layers of the electrodes." It appears undisputed that the separator layer allows the rescuer to physically separate the first electrode from the second electrode before applying the electrodes to the patient. However, the parties dispute the further qualities of the "separator layer." Philips contends that "the separator layer is conductive to facilitate a low impedance path between the electrodes." Cardiac Science, on the other hand, asserts that "the separator layer is a liner that permits an electrical connection between the two gel layers."

Philips also asserts that the separator layer is a solid layer that physically separates the gel layers of the two electrodes and
does not allow them to touch. Further, Philips asserts that the layer must be formed of a conductive/resistive material. ('919 Patent at c. 7, ll: 19-20.) The Court finds no merit to Philips' arguments. First, neither the claim language nor the specification requires that the separator be a continuous layer. Second, although the preferred embodiment describes the "conductive/resistive" properties of the separator layer, the Court finds no reason to import this embodiment into the structure. The context of the two claims that include the separator layer specify that the separator layer "enables the electrical interconnection" of the gel layers. Thus, the term "separator layer" speaks for itself and needs no further construction.

3966

D. "Sequence encoder."

1. The term "sequence encoder" has no ordinary and customary meaning.

In addition to Claim 1, the term "sequence encoder" is also used in Claims 7, 17, 18, 32 and 33 of the 702 patent. In its tentative conclusion, the Court determined that the term "sequence encoder" had no ordinary and customary meaning in the field of the invention.

Initially, Acacia objected to that conclusion. n1 However, at the September 2005, hearing, Acacia tendered Mr. S. Merrill Weiss as an expert witness on how persons of ordinary skill would understand the terms used in the 702 patent claims and specification in 1991.

n1 Acacia contended that an encoder is "a device or system that encodes data." Acacia asserted that a "sequence encoder" is "an encoder which creates a sequence."

Mr. Weiss opined that the field of the invention disclosed in the 702 patent was "system design" in the broadcast television industry. (TR. 18:23-25, 19:1-1.) Mr. Weiss opined that he had a sufficient background to express an opinion on the education and experience of a person skilled in that field in 1991. In that regard, Mr. Weiss testified that one skilled in system design in the television broadcast industry was one who had a Bachelor of Science degree in electrical engineering, computer science or computer engineering or the equivalent in experience in the broadcast television industry. (TR. 43.)

Specifically, with respect to whether the term "sequence encoder" had an ordinary and customary meaning to one skilled in system design in the television broadcast industry, Mr. Weiss testified:

Q. In 1991, did the term "sequence encoder" have an ordinary meaning to one of ordinary skill in the art?

A. No.

* * *

Q. In 1991, would the term "sequence encoder" have been a term of art to one of ordinary skill in the art?

A. No.

* * *

Q. Are you aware of any dictionary in 1991 where it would have defined the term "sequence encoder"?

A. No.
Accordingly, the Court confirms its tentative finding that the term "sequence encoder" is a technical term which had no ordinary and customary meaning in the field of the invention at the time the patent was filed.

2. "Sequence encoder" is a coined technical term which is not expressly defined.

A patentee is free to act as his or her own lexicographer. Acting as lexicographer, the patentee may either define a term used in a claim differently from its ordinary meaning or coin a new term. However, if the patentee chooses to act as his or her own lexicographer, the special definition must be clearly stated within the patent specification or file history. Vitronics Corp., 90 F.3d at 1582.

Acacia now acknowledges that the term is a "coined term," meaning that the patentee made up the term acting as lexicographer. However, there is no clear statement of definition of the coined term "sequence encoder" in the specification or file history. Indeed, as the Court noted in its July 12 Order, other than in the claims themselves, the term "sequence encoder" is never used in the specification of the 702 patent and was never used or referred to in the prosecution of the 702 patent.

If a patentee uses a coined technical term as an element of a claim and fails to clearly define the term elsewhere in the specification or prosecution history, the meaning of the term is left to speculation and subjective judgment. A patent claim, which includes as an element a term, the meaning of which is left to speculation and subjective judgment, is indefinite.

To avoid an ultimate finding of indefiniteness, Acacia contends that, although the term is not expressly defined in the specification, a person skilled in the art would infer a meaning for the term "sequence encoder" from the description in the specification of other devices. Specifically, Acacia contends that one skilled in the art would infer that by "sequence encoder" the patentee meant "a time encoder."

3. A patent claim is not indefinite if based on the specification, a meaning for an otherwise undefined term can be inferred from the specification.

Acacia directs the Court to two decisions of the Federal Circuit which it asserts as authority for a methodology of defining coined claim terms that have no meaning in the art and are not referred to in the specification: Bancorp Services L.L.C. v. Hartford Life Insurance Co., 359 F.3d 1367 (Fed. Cir. 2004) and Network Commerce, Inc. v. Microsoft Corp., 422 F.3d 1353 (Fed. Cir. 2005).

In Bancorp a patent describes a system for administering and tracking the value of life insurance policies in separate accounts. Bancorp Services, 359 F.3d at 1369. The independent claims used the term "surrender value protected investment credits." Except for use in the claims themselves, the term was not used in the patent. The trial judge found the term to be unclear in meaning as to render the patent claims invalid. Bancorp argued that the challenged term meant the same as "stable value protected investment," a term which was commonly understood in the insurance field and which was used and defined in the specification. Id. at 1370. On appeal the Federal Circuit agreed with Bancorp that based on the specification the terms were equivalent to one another. Id. at 1373. Thus, Bancorp Services stands as authority that the failure to define a term is not fatal if the meaning of the term can be fairly inferred from terms in the specification which were commonly used in the field and which those of skill in the industry regarded as synonymous.

In Network Commerce the term "download component" was used in the claims. Network Commerce, 422 F.3d at 1357. It was found to be a term which had no commonly understood meaning nor one with a specialized meaning in the field of the invention. However, the Federal Circuit gave a definition to the term based on the specification. The claims stated how the "download component" functioned in the claimed method. The Circuit Court relied on references to "download file" in the specification to define "download component." Id. at 1360-1361.

This Court notes that Network Commerce is not a case where the claim was being reviewed to determine if it met the "definiteness" requirement. The issue in Network Commerce was whether or not the definition of the term should include a "boot program" which interacts with the operating system of the computer. The Circuit held that it did:
In summary, the specification makes clear that the download component must include a boot program, and that the boot program interacts directly with the operating system of the computer without the assistance of any other program. Accordingly, we construe "download component to mean . . .

Id.

Acacia is correct, however, that in both cases, the Federal Circuit gave definition to a coined term which was not expressly defined in the specification. However, in both cases, the Federal Circuit relied on the intrinsic language of the patent specification to construe the meaning of the subject terms. The question in this case becomes whether based on the specification of the 702 patent, it can be reasonable inferred that the term "sequence encoder" means "time encoder."

4. A "time encoder" is referred to in the specification.

The term "time encoder" is itself a coined technical term with no ordinary and customary meaning to one skilled in the field of system design at the time the 702 patent was filed. Mr. Weiss, though, testified that in his opinion a "time encoder" was essentially a "time code generator," which was known at the time of the invention (TR. 173:23-25.)

The Court considered the device called "time encoder" when the Court defined the term "ordering means" in construing the 992 patent. The 702 patent shares the same specification as the 992 patent. With respect to "time encoder," the specification states:

"The transmission system 100 of the present invention also preferably includes ordering means for placing the formatted information into a sequence of addressable data blocks. As shown in FIG. 2a, the ordering means in the preferred embodiment includes time encoder 114. After the retrieved information is converted and formatted by the converter 113, the information may be time encoded by the time encoder 114. Time encoder 114 places the blocks of converted formatted information from converter 113 into a group of addressable blocks. The preferred addressing scheme employs time encoding. Time encoding allows realignment of the audio and video information in the compressed data formatting section 117 after separate audio and video compression processing by precompression processor 115 and compressor 116."

('702 patent, 7:50-64.)

From this and other references in the specification, the Court finds that the "ordering means" may include a "time encoder" which is a device that can be used in a preferred embodiment of the claimed "transmission system." If a "time encoder" is used as part of the ordering means, its function is to place blocks of converted data into a "group of addressable data blocks." The "time encoder" uses "time encoding" to do so. There is nothing in the specification which discloses that the "time encoder" can encode any sequence other than "time." Thus, to give "sequence encoder" the definition of the "time encoder disclosed in the specification" would limit the "sequence encoder" to encoding "time" as the only sequence it is capable of encoding.

5. There is no suggestion in the specification that "time" is the only "sequence" which could be used to practice the invention.

There is nothing in the specification of the 702 patent which supports the contention that the patentee intended time to be the only encodable sequence.

If a patentee uses a broad undefined term (such as "sequence encoder") in claiming an invention, when the validity of the patent is called into question in a legal proceeding, the owner of the patent cannot avoid invalidity by adopting a more limited definition (such as "time encoder"), unless that limitation can be fairly inferred from the specification.

Mr. Weiss opined that, since the patent is "fundamentally" about audio and video information and since such information is naturally processed and stored using time, a person of ordinary skill in the art would understand "sequence encoder" to be a "time encoder."

Q. Now, if as you said earlier without regard to any part of the patent the term "sequence" can mean any sequence and not necessarily a time sequence, why would a person of ordinary skill in the art understand the term "sequence encoder" to be a
time encoder rather than some other encoder in the context of this patent?

A. Because this patent is fundamentally about video and audio processing and storage and handling and the natural way that video and audio are, are -- their inherent structure is along a time line. They are naturally divided by -- into time.

(TR. 161:2-13.)

However, on cross-examination, Mr. Weiss acknowledged that, based on the specification, time was not the only natural sequence for organizing the type of data covered by the invention:

Q. And so you agree that as of the time of the filing of the patent application in January of 1991 packets of data were organized and in sequences that were unrelated to time?

A. I think you last said they could be and yes they could be.

Q. And they actually were; correct?

A. In some applications they were.

(TR. 210:9-16.)

Later, in his testimony, Mr. Weiss acknowledged that a "time encoder" was only "one example" of the broader term "sequence encoder." (TR. 225:10-14.) He stated his opinion that the terms were synonymous was based on a process of elimination. In other words, since a "time encoder" and an "identification encoder" were the only encoder mentioned in embodiments of the invention, by process of elimination, Mr. Weiss drew the conclusion that the "sequence encoder" meant the "time encoder." Mr. Weiss' testimony went beyond the bounds of his expertise. The Court rejects his methodology.

Furthermore, it is fundamental that while the specification should be consulted to obtain an understanding of a claim, the limitation of a preferred embodiment disclosed in the specification is not to be read into a claim, unless reading the limitation in is required by the language of the claim. As the Federal Circuit observed in Phillips v. AWH Corp., "although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments." 415 F.3d 1303 at 1323 (Fed. Cir. 2005). There are notable exceptions to the rule for not limiting the claim to a preferred embodiment, such as when the preferred embodiment is described in the specification as the invention itself. In other words, where the patentee describes an embodiment as being the only way of utilizing the invention, it is permissible to limit the claim to the embodiment.

In this case, given the types of materials which can be transmitted in practicing the invention (books, photographs, musical instruments and other items-digitized for transmission) from the specification, there is no basis for the Court to conclude that "time" is the only sequence which one skilled in the art would have used in 1991 to practice the invention.

6. To import into "sequence encoder" the definition "time encoder" as disclosed in the specification would be importing a limitation which the patentee expressly did not import.

Accepting Acacia # s definition of "sequence encoder" would violate the doctrine of claim construction, called "claim differentiation." n2

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n2 The Court has previously considered and rejected Acacia's argument that "sequence encoder" should be defined as the time encoder disclosed in the specification. The Court reconsiders its ruling in light of the briefs and testimony presented at the September hearing.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

In deciding the scope of a claim, the Court is obliged to consider the other claims in the patent. Howes v. Medial

- 4230 -
Components, Inc., 814 F.2d 638, 643 (Fed. Cir. 1987); Moeller v. Ionetics, Inc., 794 F.2d 653, 656 (Fed. Cir. 1986). Under the doctrine of "claim differentiation," the presence of limitations in narrow claims is evidence that these limitations are not to be read into a broader claim. The patentee is entitled both to a narrow claim particularly directed to a preferred embodiment described in the specification and to a broad claim which defines the invention without reference to those details. The presence of the narrow claim negates limiting the broad claim to the preferred embodiment. The presence of a specific limitation in one claim gives special significance to the absence of that specific limitation in another claim, in that it shows that when the limitation was intended it was expressed. Hoganas AB v. Dresser Indus., Inc., 9 F.3d 949, 950 (Fed. Cir. 1993) (quoting E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir.), cert. denied, 488 U.S. 986, 109 S. Ct. 542, 102 L. Ed. 2d 572 (1988); SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1122 (Fed. Cir. 1985).

In this case, dependent claim 7 reads:

A communication system as recited in Claim 1, wherein said sequence encoder transforms digital data blocks into a group of addressable data blocks.

The Court has construed the apparatus which transforms digital data blocks into a group of addressable data blocks to be the "time encoder," which is part of the ordering means. The same terms should be given the same meaning in all of the claims, unless it is clear from the specification that the terms have different meanings. Fin Control SYS. Pty. v. AM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). Based on their common function, the Court finds that "sequence encoder that transforms digital data blocks into a group of addressable data blocks" in claim 7 is the same device as the one described in the specification as part of the ordering means called the "time encoder," which transforms the data into a "group of addressable blocks," employing "time" as the preferred addressing scheme.

Claim 1 differs from claim 7 in that it does not limit the sequence encoder to one which transforms digital data blocks into a group of addressable data blocks nor is it limited to using time as the preferred addressing scheme. Therefore, claim 1 is broader than the sequence encoder disclosed in claim 7. The sequence encoder in claim 1 could possibly be the ordering means and the structure in claim 7 could possibly be the time encoder. n3 Hence, the Court cannot infer that the "sequence encoder" is a "time encoder" as that term is used in the patent specification.

n3 The "sequence encoder" in claims 7 could be construed to read on the "ordering means" in the written description. This is consistent with the testimony of Mr. Weiss, where he said that other encoding schemes, besides time encoding, may be used in the system (TR. 212:20-24, 224-225.) These other encoding schemes would be necessitated by source library items that contained other than audio/video information, like books or violins. There may also be other functions associated with the ordering means. Mr. Weiss said that he would have known how to build a time encoder, since time encoding techniques were well known in 1991 (TR. 174.) However, it would not have been obvious how to build the "ordering means," since the written description does not fully specify all the functions nor does it teach any structure for the "ordering means" from which such functions could be deduced.

n4 The Court also considered Masami Corp. v. Mallinckrodt, Inc., 18 Fed. Appx. 852 (Fed. Cir. 2001), where the court found "adaptive filter" and "adaptive signal processor" to mean an "adaptive noise canceler." The latter term was used interchangeably with the other terms during the prosecution of the patent and in dependent claims. No such interchangeable use is involved in this case.
However, upon reconsideration the Court limits its finding of indefiniteness to the independent claims 1, 17 and dependent claim 32. Dependent claims "shall be presumed valid even though dependent upon an invalid claim." 35 U.S.C. § 282. The Court leaves for later consideration upon motions by the parties whether or not the limitations in dependent claims 7, 18 and 33 provide additional information about "sequence encoder" to allow the Court to define it and to satisfy the definiteness requirement.

7. There is a lack of indication of a cooperative relationship between the "sequence encoder" and the other elements of the claim.

Patents claiming a system, are indefinite under § 112 if the claim does not recite structural relationships of essential elements. See In re Collier, 397 F.2d 1003, 55 C.C.P.A. 1280 (C.C.P.A. 1968). If the system is one for which the relationship of elements is conventional and commonly known, the Court can take notice of a relationship, even if one is not stated. However, when the element is not known in the field of invention, the claim must specify the relationship.

Claims 1 and 32 of the 702 patent disclose a communication system, comprising a transmission system and a reception system. The "sequence encoder" is disclosed as an element of the transmission system. Unlike other elements of claims 1 and 32, n5 the term "a sequence encoder" omits disclosure of a cooperative relationship with the other elements. There is no specification of its input or its output. This omission is particularly troublesome because as a coined term which is not defined, there is no way to determine a relationship.

n5 Claim 7 also lacks an express relationship between the "sequence encoder" and the other elements. The term "in data communication with" is lacking. However, if the "sequence encoder" in Claim 7 is equated with the "time encoder," the specification shows a relationship.

Thus, an additional basis for indefiniteness of claims 1 and 32 is the lack of a disclosed cooperative relationship between the "sequence encoder" and the other elements leaves a gap between essential structural connections. n6

n6 As shown in claims 17 and 18, the patentee was capable of specifying a relationship between the "sequence encoder" and other claim elements if there are any.

2. "[A] sequence of groups of digital bits which represent the respective values of said analog electrical output signal at said periodic instants."

DTL argues that the term should mean, "a series of groups of digital bits in which each group of bits corresponds to values taken at the periodic instants of the analog electrical output signal." Cingular proposes "successively ordered groups of digital bits in the same order as the sampled values they represent. The sampled values refer to the values of said analog electrical output signal at said periodic instants." The primary dispute is whether the groups of digital bits must be in the same order as the sampled values. Cingular argues that the word "respective" combined with the word "sequence" connotes a lockstep order of the groups of digital bits.

The analog to digital converter changes the output of the transducer into a "series of digital pulses" representing the incoming acoustic signal. '799 patent, Abstract. In addition, the specification discloses that the output of the analog-to-
digital converter is a "stream of digital bits", '799 patent, col. 5, ll. 55-56. Therefore, it appears that the specification does not suggest that the groups of digital bits must be in the same order as the sampled values. In the claim, "respective" refers to the relationship between the sampled values and the periodic instants when values are taken. This requires that each group of bits correspond to the values of the analog signal taken at periodic time instants. The court cannot find, and Cingular does not point to, any place in the specification which require that the groups of digital bits must be in order. One skilled in the art reading the claim term in context of this particular claim and in the context of the entire patent, including the specification, would not conclude that the sequence must be "successively ordered." Therefore, this court finds that:

"[A] sequence of groups of digital bits which represent the respective values of said analog electrical output signal at said periodic instants" means: a series of groups of digital bits in which each group of bits corresponds to values taken at the periodic instants of the analog electrical output signal.

"sequence of tournament games" first appears in claim 1(b), a means-plus-function claim. Pursuant to 35 U.S.C. § 112, a means-plus-function claim expresses a "means or step for performing a specified function" without identifying the equipment used to perform the function. To construe a means-plus-function claim, it is necessary to first identify the claimed function, and then, determine what, if any, structure named in the specification performs the disclosed function.

Merit contends that the function disclosed in claim 1(b) is "programming in advance at least one sequence of tournament games from the more than one tournament game." 5 Merit's Claim Construction Presentation '887 patent, Ex. 4 at 14 ("Pl.'s '887 Presentation"). JVL defines "sequence of tournament games" as "two or more successive tournament games. A series of standard games played as rounds in a single tournament is not a sequence of tournament games." Def.'s '887 Presentation at 11.

JVL advances a number of arguments in support of its construction. First, the plain and ordinary meaning precludes a sequence of games from including any less than two games. While acknowledging that dictionaries are extrinsic evidence that are not determinative of claim construction, it points out that in the initial, pre-reexamination Markman briefing in this case, both parties offered dictionary definitions of "sequence" as meaning "following of one thing after another; succession." JVL's Opening Markman Br. at 62; Merit's Opening Markman Br. at 90.

In this instance, the dictionary definition is valuable to "understanding the commonly understood meaning" of "sequence." Phillips, 415 F.3d at 1322-23. ("[J]udges are free to consult dictionaries … and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents.") (citations omitted). The "following of one thing after another" undoubtedly references more than one thing. Notwithstanding this commonly understood meaning of "sequence," Merit argues that playing a game once is enough to constitute a sequence. Tr. At 118-19. Given that the claim language itself refers to a sequence of "tournament games," not a sequence of "a tournament game," JVL insists it would be nonsensical to construe a "sequence of tournament games" to be one game.

Resolution of this dispute hinges on the significance afforded certain drawings included in the patent. Figures 11 (a) through 11(d) are "four examples of programmable tournament sequences." '887 patent at 7:20-21. The depictions of each of the four sequences includes five spaces, labeled from left to right, "current," "next," "next + 1," "next + 2," "next +3." Within each space is either the name of one of five video games or a repeat or end symbol. As the patent describes, "[i]n the example shown in the figures, a series of five consecutive tournaments can be set at one time and may be set to repeat in

- 4233 -
Merit points to Figure 11 (c), in which Solitaire is listed in the "current" space, and the end symbol appears in the space labeled "next." Three different game names appear in the spaces labeled "next +1," "next +2" and "next +3." Figure 11(c) states, 'The Sequence will run SOLITAIRE and then END.'

Relying on Figure 11(c), Merit insists that playing a game once constitutes a sequence. Tr. At 118-19. In further support of its position, it notes that in describing the Figure 11 examples, the specification states "[i]f the video game 12 is dedicated to playing only a single game, the tournament sequence will be set to either continuously run the tournament using a single game or to run the tournament for only a discrete number of times." Id. at 9:25-29. This language allows for the possibility that a tournament sequence might include only one type of game, such as Solitaire or Royal Flash. However, it does not demonstrate that a "sequence" can be comprised only of a single play of one type of game. It would be inconsistent with the meaning of "sequence" to define it as including anything less than two.

This is not an instance in which Merit acted as its own lexicographer to give "sequence" a definition different from its commonly understood meaning. To do so, it would have had to "clearly express that intent in the written description." Merck & Co., Inc. v. Teva Pharmaceuticals USA, Inc., 395 F.3d 1364, 1370 (Fed. Cir. 2005). Yet, Figure 11(c) is what Merit relies on to support its redefinition of "sequence." This depiction, which is subject to varying interpretations, does not evidence the patentee's intent to impart a novel meaning to the word "sequence." See Elekta Instrument S.A. v. O.U.R. Sci. Int'l, Inc., 214 F.3d 1302, 1307 (Fed. Cir. 2000).

As explained above, a "tournament game" is a game playable in the tournament mode. Merit's arguments to the contrary, "sequence" retains its plain and ordinary meaning. Here, "sequence of tournament games" refers to "one or more types of tournament games played at least two times in succession." A single play of a single tournament game is not a "sequence."

3. "sequence transformation object"

The term "sequence transformation object" appears in three claims of the '670 patent (claims 13, 25, 39) and three claims of the '775 patent (claims 1, 9, 11). Information proposes the term be construed as "A transformation object that generates keys from an initial value." BODI proposes the term be construed as:

A transformation object that is used for creating unique keys for records as they are processed in a mapping. Each instance of a sequence transformation is created with an initial value, which is used at the start of an execution, an increment value to compute the values of subsequent indexes, and an end value. Default values will be used if any of these parameters are omitted. This transformation has two predefined output ports, curval and nextval, that contain the current value and the next value of the sequence index, respectively.

A sequence has the following specification:

CREATE Sequence <sequence_name> (  
curval INTEGER OUT,  
nextval INTEGER OUT,  
[Startvalue [<integer>] ATTR,]  
[increment [<integer>] ATTR,]  
[Endval [<integer>] ATTR,]

- 4234 -
Once again, BODI's proposed construction comes directly from the specification of the '670 and '775 patents, and the parties present essentially the same arguments regarding the appropriate use of the limitations disclosed in the specification. For the reasons stated above, the Court declines to import those limitations into the claim language. The Court adopts Informatica's proposed construction and construes the phrase "sequence transformation object" to mean: A transformation object that generates unique keys from an initial value.

3970

1. Sequencer

Defendant claims that the term sequencer has no common meaning in the telecommunications field and that because the use of the term in Claim 1 does not specify what is necessary to a sequencer, Seeq proposes that the term be construed to include the column-length description of the sequencer found in the specification. Level One asserts that sequencer does have a common meaning in the field, and cites to the IEEE Dictionary, which apparently defines it as a device that sequences the items in a set. Plaintiff contends that consistent with this common definition, the sequencer in Claim 1 ensures that the multiplexer outputs waveform data in a sequence that represents a desired waveform. Level One proposes the following construction: "The sequencer described in the specification and any equivalent device that utilizes digital logic, a clocking function, and the input NRZ data to generate a unique set of "mode" and "step" select signals for controlling the selection of data representing a waveform from memory by a multiplexer.

Neither of the proposed definitions is satisfactory. Seeq's would improperly incorporate the entire description of the preferred embodiment into the claim as a limitation. See Laitram, 863 F.2d at 865 ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations."). The court is unwilling to treat detailed descriptions as definitions. Furthermore, while it is axiomatic that patentees can choose to be their own lexicographers, they are only assumed to do so when the special definition is clearly stated in the patent specification or file history. Vitronics, 90 F.3d at 1582; Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996) (unless the inventor gives it a special meaning, a technical term is interpreted to have the meaning given by persons with skill in the relevant art).

However, Level One's construction is also distressingly unrelated to the claim language and, with the exception of mentioning the utilization of digital logic and a clocking function, loosely restates the claim language. Seeq objects to Level One's definition on the grounds that it is functional rather than structural. Yet Seeq cites no authority for the proposition that all claims must be defined structurally. Absent defendant's desire to incorporate the preferred embodiment into the claim, the court cannot see what about the term is ambiguous. The sequencer indeed sequences data through its mode select and step select outputs, which are addressed below. Accordingly, the court believes that the claim language is plain enough for someone skilled in the art and that it defines a sequencer as a device that performs certain tasks, namely "receiving data in a non-return to zero format and providing a mode select output for selecting one of a plurality of data patterns and a step select output for selecting one of a plurality of time segments in response thereto." '269 Patent at 6:51-53.

3971

14. "sequencing data"

Power-One advocates two proposals. The first is "data used to control the order of operation of multiple POL regulators."
The Court finds this proposal to be incorrect because this term is used in relation to a single POL regulator. See, e.g., '999 patent, claims 2, 15, and 17. Power One's second proposed construction is "data used to determine a delay period between some event and the generation or termination of an output." Artesyn proposes "data specifying the duration of a delay period between the POL's receipt of a turn-on or turn-off command and generation or termination of a desired output."

This term is found in several claims of the '999 patent. For example, claim 2 recites "sequencing data providing a delay period between either a turn-on or turn-off command and actual generation of a corresponding output." Claim 10 calls for "sequencing data" and recites "using said sequencing data to determine when said output should be generated." Claim 15 also calls for "sequencing data" and recites "using said sequencing data and said enable data to determine when said output should be generated." Thus, from the claims, "sequencing data" is information related to the timing of the generation of an output. The specification of the '999 patent states that "the delay period can either be provided by the controller 210 (e.g., sequencing data) or calculated using data that has been provided by the controller 210 (e.g., turn-on data)." From the specification, the "sequencing data" specifies a delay period between some event (e.g., activation) and the generation of an output. '999 patent, col. 4:23-32. In this example, the event from which the generation of an output is delayed is the activation of the POL. However, the Court sees no basis in the claims or the patent specification for limiting the event or events from which the delay can be measured.

Accordingly, the Court will construe "sequencing data" to mean "data specifying a delay period between some event and the generation or termination of an output."

A. Support by the Written Description

The jury found claims 15 and 16 "not supported by the description contained in the specification." M3 Systems explains that the issue was the meaning of the claim terms "sequential energizing" and "energizing means." The district court had permitted the jury to resolve this disputed issue of claim construction. On this appeal we give de novo review to the issues relevant to the construction and interpretation of the claims. See Cybor, 138 F.3d at 1454-56, 46 U.S.P.Q.2D (BNA) at 1172-75.

M3 Systems states that "sequential" should be construed, and was construed by the jury, to permit no overlap of needle movement during the energizing step. M3 states that since the patent shows that the second needle can start to move before the first needle has completed its movement, the written description does not support the claims. M3 states, as it did at trial, that since the specification does not describe how to obtain elimination of all overlap of needle movement, the claims are not supported by the written description and are invalid.

Bard agrees that the specification shows a slight overlap in the movement of the needles, whereby the second needle starts to move just before the first needle has completed its movement and the first spring latches. Thus, Bard contends, correct interpretation of the claims allows for this slight overlap in needle movement. Bard states that it is incorrect to construe the claims contrary to the specification, and then to hold the claims invalid because they are contrary to the specification. Bard is of course correct; the claims are construed in accordance with the rest of the specification of which they are a part, and not contrary to it. See Slimfold Mfg., 810 F.2d at 1116, 1 U.S.P.Q.2D (BNA) at 1566; SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1125, 227 U.S.P.Q. (BNA) 577, 585 (Fed. Cir. 1985) (in banc).

The specification illustrates the sequential energizing of the needles as having some overlap in movement of the needles. The term "sequential" in the claims is in accordance with this description in the specification; no usage or exemplification of the sequential movement requires eliminating all overlap. It is incorrect to construe the claims as barring all overlap, as urged by M3 Systems. On the correct claim construction, no reasonable jury could have found that the claims are not supported by the description in the specification. It is thus apparent that the jury either adopted M3's erroneous claim construction, or incorrectly applied the law governing claim construction to the undisputed facts of the structure described in the specification.

On the correct claim construction the written description is in accordance with and in support of the claims. The judgment of invalidity on this ground is reversed.
2. "Sequential from each said data line"

In prior litigation, Datastrip brought suit against Symbol Technologies, Inc. in the U.S. District Court for the District of Delaware, alleging infringement of the '221 patent. During the litigation, the court construed the term "sequential" in claim 1 to mean "that the data in the data strip is written, or encoded, sequentially from beginning to middle to end." Datastrip Ltd. v. Symbol Techs., Inc., No. 97-70, at 9 (D. Del. Apr. 20, 1999). The parties agree that this is the correct construction; thus, the Court need not decide whether to apply the doctrine of issue preclusion. See Markman, 517 U.S. at 391 ("principles of issue preclusion would ordinarily foster uniformity"); Blonder-Tongue Labs., Inc. v. Univ. of Ill. Found., 402 U.S. 313, 350, 91 S. Ct. 1445, 28 L. Ed. 2d 788 (1971) (non-mutual defensive collateral estoppel may be raised as defense to patent infringement claim). Compare Abbott Labs., Inc. v. Dey, L.P., 110 F. Supp. 2d 667, 669-71 (N.D. Ill. 2000) (doctrine of issue preclusion barred plaintiffs from relitigating claim construction issues decided in prior action against different alleged infringer), with Graco Children's Prods, Inc. v. Regalo Intl', LLC, 77 F. Supp. 2d 660, 664-65 (E.D. Pa. 1999) (declining to apply doctrine where claim construction in previous litigation was not essential to final judgment).

Intacta, however, urges the Court to construe the phrase "sequential from each said data line" to mean that the "sequential information within the said data lines is sequentially related to the information in the lines preceding and following the data line." (Def.'s Mot. for Summ. J. at 15.) Datastrip disagrees with this interpretation.

Thus, the Court need not construe "sequential" because the parties agree on its meaning, but the clause "from each said data line" is in dispute. Beginning again with the ordinary meaning of the words, "from" is "used as a function word to indicate a starting point ...." Webster's at 913. As used in the patent specification, data lines consist of "a totality of dibits .... running sequentially." (Springut Decl. Ex. 2, '221 patent, col. 4, 11. 33-35.) Figure 4 of the patent depicts "an enlarged view of a portion of a data strip." (Id. at Sheet 2.) From this figure and the specification, it is apparent that the data lines in a data strip are "parallel, contiguous, and start along a common line." (Id. col. 4, 11. 47-48.) The specification further states: "Preferably, information is encoded sequentially along each data line 11, and sequentially along contiguous data lines, beginning at the top of encoded portion 23 and running to the bottom of portion 23, though other sequencing may be used." (Id. col. 4, 11. 49-54.) The consistent use of the word "contiguous" in the specification supports Intacta's construction.

"Contiguous" means "touching along boundaries often for considerable distances;" "immediately preceding or following in time or sequence." Webster's at 492. Reading the plain meaning of "sequential from each said data line" with the patent specification, it appears that not only is the information encoded from beginning to middle to end within each line, but it is also encoded from beginning to middle to end starting at one line and moving to the next.

This construction is supported by the prosecution history. The phrase under consideration was not part of claim 1 in the original application. (See Toone Decl. Ex. D at D-3 (showing original language).) Indeed, the applicants added the phrase to overcome prior art references, in particular, the Ogden patent. As the applicants explained, Ogden's "lines are laid out to be read in parallel, rather than sequentially." (Toone Decl. Ex. D at D-69.) Indeed, the applicants distinguished the data strip by explaining, "the information in one data line of the data strip is sequentially related to that in the preceding and following line, making the data portion an integrated whole." (Id. at D-68 (emphasis added).) Thus, the prosecution history is consistent with the ordinary meaning of the words and supports a construction that acknowledges that data is encoded sequentially from beginning to middle to end and from one line to the next. Accordingly, the Court construes the language "sequential from each said data line" to mean that the sequential information within the data lines is sequentially related to the information in the preceding and following lines.

3. "sequentially display four calibration marks" (claims 13, 17-19)

PolyVision's proposed construction
Four calibration marks are displayed

Smart's proposed construction
Four calibration marks are displayed

- 4237 -
individually in four separate successive images.

PolyVision contends that this claim limitation is ambiguous and requires construction because it can be construed in one of two ways: (1) that four calibration marks are displayed in sequence any number of times; and (2) that an individual calibration mark is displayed four times in sequence. Smart contends that the term is unambiguous and should be given its plain meaning, although it offers a construction that essentially permits either meaning.

The Court agrees with PolyVision that the term is ambiguous and requires construction. The specification and drawings support PolyVision's construction. Figs. 12 and 13a-13d illustrate that four individual calibration screens with alignment images are presented in sequence. The written description confirms this as well, describing a "first alignment image" or "calibration screen," a "second calibration screen," a "third calibration screen," and finally a "fourth calibration screen." (Col. 8, ll. 17-18, 45-47, 62-64; Col. 9, ll. 11-13.) Smart argues that this construction improperly imports limitations from the specification into the claim language. However, the Court disagrees. As noted above, Phillips not only authorizes, but requires courts to resort to the written description in order to resolve claim construction issues. The Court believes that construing the claim language as PolyVision suggests constitutes a permissible use of the intrinsic record and not an improper limitation of the claim language.

III. CLAIM CONSTRUCTION

Having considered the papers submitted by the parties and the arguments of counsel during the claim construction hearing, the court interprets the disputed claim terms as set forth below.

CLAIM LANGUAGE                          CONSTRUCTION
"data error detection and correction circuitry" means "any error detection and correction circuitry."
"precluded from accessing" means "the BSY bit indicates when it is impossible for the host computer to access the ATA command block registers." Access is precluded when a read request is directed away from the command block register.
"sequentially contiguous" requires the device to have the ability to store multiple command bytes in a sequentially contiguous manner
"drive controller" includes translation circuitry but excludes circuitry located on an external adapter card.
"ATA register address" The ATA register address of claim 3 is not required to receive both single-byte and multi-byte commands from the host computer.
ATA block registers and multi-byte command packet buffer It is not required that the ATA block registers and multi-byte command packet buffer be distinct or separate structures.
of the previous data unit to the bus master is complete."

As a preliminary matter, the Court notes that the question of what constitutes a data transfer does not appear to be in dispute. OPTi characterizes a "transfer" as "moving data units from one place to another, in this instance, between the bus master and the secondary memory." Likewise, nVidia describes a "transfer" as the process of "moving data units on the bus . . . from secondary memory . . . to the bus master." These definitions are consistent with one another and with the use of the term in the Pre-Snoop patents.

The primary dispute between the parties appears to be whether the language calling for a sequential transfer means that the transfer of one data unit cannot begin until the transfer of the prior unit is complete as nVidia contends. The principal application for the invention described in the Pre-Snoop patents was "burst" transfers. Sequential ordering in which data units are transferred is what makes the basic mechanism of the burst transfer possible:

The PCI bus achieves very high performance, in part because its basic data transfer mode is by burst. That is, data is always transferred to or from a PCI device in a known sequence of data units defined by a known sequence of data unit addresses in an address space. In the "cache line" burst mode, exactly four transfers take place. In the "linear" burst mode, any number of transfers (including 1) can take place to/from linearly sequential addresses until either the initiator or the target terminated the transaction. In either mode, the initiator need only specify the starting address because both parties know the sequence of addresses which follow.

'n906 patent, Col. 5:5-16. This would tend to undermine nVidia's proposed construction. In fact, the Court can find nothing in the specification or prosecution history of the Pre-Snoop Patents that would limit the construction in the manner nVidia proposes.

nVidia's principal basis for its proposed construction is the assertion that claim limitations must be construed from the perspective of the PCI bus or bus master. The Court finds this argument unpersuasive, albeit novel. nVidia has not pointed to, nor has the Court found, any support in the specification for the requirement that certain limitations be read from the perspective of the bus master or PCI bus. Nor has nVidia cited to any case law to support this position. nVidia's argument is simply an attempt to limit the construction to the preferred embodiment. Such a methodology must be rejected. Accordingly, "sequentially transferring data units between said bus master and said secondary memory" is construed to mean "moving data units from the bus master and the secondary memory in the sequence in which they are stored."

Bellcore further defines the phrase "consisting of a continuum of an interleaved multiplicity of data bytes of predetermined size derived from a plurality of identically-formatted contributory frames each containing a plurality of said data bytes" to mean that the serial bit stream consists of transmitted SONET-like frames greater than STS-1. In proffering this definition,
Bellcore specifically defines "a continuum of an interleaved multiplicity of data bytes of predetermined size" as a sequence of interspersed bytes, usually eight bits in size, but not required to be eight bits in size. Bellcore also defines "derived from a plurality of identically-formatted contributory frames each containing a plurality of said data bytes" as the format of the sequence of interspersed bytes. Specifically, Bellcore contends that this phrase means having a format based on multiple basic frames having the same byte format.

In contrast to Bellcore's interpretation, FORE contends that the preamble requires each frame of the serial bit stream that is being demultiplexed to have been formed by interleaving all eight bit bytes of two or more contributory frames. (D.I. 146 at 25). In other words, FORE's definition focuses on how the serial bit stream referred to in the claim was formed. According to FORE, the serial bit stream consists of a train of repeating higher-level frames. Each higher level frame is constructed by combining two or more pre-existing, distinct and complete lower-level frames called "contributory frames." FORE further contends that this language means that there can be no gaps or pauses or breaks in the interleaving of the contributory frames. In support of its position, FORE contends that the specification makes clear that demultiplexing is the process of disassembling previously multiplexed (or combined) lower-level SONET frames. ( '768 Patent, col. 1, lines 37-44; col. 2, lines 28-30; col. 5, lines 41-47). Stated another way, FORE contends that "demultiplexing" is the process of separating higher-level, higher speed STS-N frames transmitted in the serial data bit stream into the lower-level, lower speed STS-1 frames that make up each STS-N frame. Thus, according to FORE, the claim is limited to taking multiplexed STS-N frames and separating them into the original STS-1 frames that were previously combined to create the STS-N frames.

In addition, FORE specifically disputes Bellcore's construction of the words "continuum," "interleaved" and "byte." FORE contends that the word "continuum" means "continuous" and not "a sequence" as Bellcore contends. As for Bellcore's interpretation of the words "interleaved" and "byte," FORE contends that Bellcore's definitions are overly-broad, and therefore, inconsistent with the patent's specification.

The Court agrees with FORE that the preamble limits this claim of the patent to taking multiplexed STS-N frames and separating them into the original STS-1 frames that were previously combined to create the STS-N frames. The specification of the '768 Patent speaks solely in terms of multiple, lower-speed frames that are multiplexed together to form a higher speed frame. The patent does not address the type of SONET framing structure which consists of larger frame formats generated in a single operation, using the higher bit rate and multiple STS-1 frame format. In order for the invention to perform its demultiplexing function, the bit stream must be multiplexed. The specification of the '768 patent expressly defines a multiplexed bit stream as follows: "[A] multiplexed serial bit stream is assembled by interleaving repeated sequential extractions of one byte from each of the component STS-1 frames." ( '768 Patent, col. 1, lines 37-40). The patent specification further provides:

It is necessary, therefore, that the signal receiver [the device receiving the SONET-formatted serial bit stream] reconstruct from this serial bit stream the original base frame, or some frame multiple thereof, in order that the correct substance of the transmitted signal may be recovered.

***

[The] stream must be reformatted into the original bytes and frames in order for the receiver processing circuitry to properly extract the transmitted data and messages.

( '768 Patent, col. 1, lines 37-44 (emphasis added); col. 2, lines 28-30 (emphasis added)). Further, the specification explains:

Upon completion of the formatting of the high-speed input serial data stream to a low-speed, properly synchronized byte-parallel data stream, there remains the problem of identifying the boundaries of each frame of the original transmission in order that the payload, as well as the relevant overhead information bytes, may be demultiplexed to the basic STS-1 level.

( '768 Patent, col. 5, lines 41-47 (emphasis added)). Accordingly, based on the claim language and the specification, the Court concludes that the phrase "demultiplexing a bit stream" refers to taking multiplexed STS-N frames and separating them into the original STS-1 frames that were previously combined to create the STS-N frames.

The Court further agrees with FORE that the serial bit stream that is being demultiplexed must have been formed by interleaving the bytes of two or more contributory frames, that each of the contributory frames must have exactly the same
format, and that there can be no gaps or pauses in the interleaving. In the Court's view, the specification and Figure 2 support FORE's position that the bytes are continuously interleaved from each of the contributory frames. ( '768 Patent, col. 1, lines 37-40; col. 4, lines 9-27). Indeed, byte-interleaving is described in the specification as requiring a byte to be taken, one at a time, from the same byte position of each contributory frame and placed in the bit stream. ( '768 Patent, col. 4, lines 9-27). However, the Court cannot accept FORE's contention that a byte is limited to 8 bits. Although Bellcore concedes that a byte is usually 8 bits, the Court cannot conclude that the patent limits a byte to 8 bits, because the express language of the claim indicates that the data bytes are of a "predetermined size." If bytes were limited to 8 bits only, then the language "predetermined size" would be superfluous and unnecessary. Each and every word in a claim must have meaning and cannot be ignored. See e.g. Exxon Chem. Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 1557 (Fed. Cir. 1995). Accordingly, in order to give effect to the language "predetermined size" the Court will not exclude the possibility that a byte could be more than 8 bits.

As to the parties' dispute concerning the phrase "consisting of," the Court concludes that in this case, the phrase "consisting of" is used as a transition between the claim element "a serial data bit stream" and the clause that follows and modifies the claim element. Because the phrase "consisting of" introduces the modifying clause, "a continuum of an interleaved multiplicity of data bytes of a predetermined size derived from a plurality of identically-formatted contributory frames each containing a plurality of said data bytes," the Court concludes that it excludes any bit stream that does not have the exact limitations recited in the modifying clause. Georgia-Pacific Corp. v. U.S. Gypsum Co., 195 F.3d 1322, 1327 (Fed. Cir. 1999); Mannesmann Demag Corp. v. Engineered Metal Prods. Co., 793 F.2d 1279, 1282 (Fed. Cir. 1986).

In sum, the Court concludes that the phrase: "The method for demultiplexing a serial data bit stream consisting of a continuum of an interleaved multiplicity of data bytes of predetermined size derived from a plurality of identically-formatted contributory frames" means that each frame of the serial bit stream that is being demultiplexed was formed by interleaving the bytes of two or more contributory frames. Each contributory frame must have exactly the same format and there can be no gaps or pauses in the interleaving.

2. "Serial data packet"

The district court interpreted the term "serial data packet" in the claims of the '176 patent as "one that can, but need not, include both keyboard and mouse signals." The district court determined that the specification and Examiner's Reasons for Allowance of the '176 patent "required" the serial data packet to be capable of including both keyboard and mouse signals. The Examiner's Reasons for Allowance stated:

The prior art of record does not teach nor fairly suggest the system arrangement as claimed with circuitry for creating serial data packet from keyboard and mouse electronic signals, and crosspoint switch for connecting keyboard/mouse/video monitor from a number of workstations to plurality of remote computer systems.

This standard reason for allowance, however, states only that the prior art does not teach or suggest the claimed system arrangement. This reason for allowance merely summarizes the claimed invention and fails to specifically state that patentability is based on the serial data packet including both keyboard and mouse signals.

According to claim 1, a serial data packet "includes the electronic signals." The electronic signals are produced by the keyboard and mouse. A "data packet" is defined as "a unit of information transmitted as a whole from one device to another on a network." Microsoft Computer Dictionary, (4th ed. 1999). This definition suggests that a data packet, contrary to the district court's decision, need not be capable of including both keyboard and mouse signals.

Moreover, claims are interpreted in light of the written description and with the knowledge and understanding of those of ordinary skill in the art. Vitronics, 90 F.3d at 1582, 39 USPQ2d at 1576-77. Nothing in the written description suggests that a keyboard signal must accompany a mouse signal. In fact, while the district court interpreted "serial data packet" to require the capability of including both keyboard and mouse signals, it recognized that the packet could include only mouse or only keyboard signals. In other words, the district court recognized that one of ordinary skill in the art would understand that a signal data packet includes a mouse signal, a keyboard signal, or both. The prosecution history does not evidence a need to
depart from the ordinary meaning supported by the written description. Accordingly, the term should be given its ordinary meaning. Inverness Med. Switz. Gmbh v. Princeton Biomeditech Corp., 309 F.3d 1365, 64 USPQ2d 1926 (Fed. Cir. 2002). The ordinary meaning of serial data packet is a unit of information transmitted as a whole from one device to another on a network that includes a keyboard signal, a mouse signal, or both. Therefore, we reverse the district court's claim construction of the term "serial data packet."

3979

3. "Serial Interface"

The parties also offer differing constructions of the term "serial interface" in the phrase, "An information station comprising . . . a serial interface coupled to said computer and capable of receiving said digital electronic signals produced by said facsimile transceiver." Plaintiffs propose that the phrase be constructed to as follows:

The computer includes an interface through which the computer is connected to the facsimile transceiver. One or more electrical conductors connect the interface of the computer to the facsimile transceiver. The interface allows digitized information from the facsimile transceiver to be sent to the computer.

Joint Claim Construction Statement at 10. Defendants suggest that the phrase be constructed to state:

Within the context of the '911 patent claims and specification, the term "serial interface coupled to said computer and capable of receiving said digital electronic signals produced by said facsimile transceiver" must include as part of it a modem connected to the computer. A modem is a devise for encoding digital electronic signals compatible with a computer into analog signals and decoding analog signals into digital electronic signals compatible with a computer.

As the claim language states, this limitation means: "serial interface coupled to said computer and capable for receiving said digital electronic signals produced by said facsimile transceiver."

The term "serial" means transmitting information over a single date line sequentially. The term "serial" does not include "parallel" in which information is transmitted in parallel over a plurality of date lines.

The term "serial interface" does not include an RS-232C interface, a Centronis interface, or any other computer interface that does not include a modem or not for transmitting information sequentially over a telephone-compatible line.

The phrase "receiving said digital electronic signals produced by said facsimile transceiver" refers to the digital electronic signals produced by the facsimile transceiver representing printed information scanned by the facsimile transceiver and transmitted by the modem of the facsimile transceiver over a telephone-compatible line to the modem of the computer.

Id. at 12.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 Plaintiffs' proposed claim construction initially contained the following sentence: "Serial interface' covers standard parallel interfaces as well as serial interfaces." Plaintiffs have removed this sentence from its proposed claim construction for this limitation, stating that it was "intended to convey Kirsch's argument regarding the range of equivalents for the term rather than its literal construction." See Pls.' Reply Br. at 6 n.1.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Defendants claim that the "serial interface" referred to in claim 1 must be construed as being limited to an interface having a modem for communicating with the modern of a facsimile transceiver. See Defs.' Br. at 24-27, Plaintiffs respond that such a limitation is unjustified. See Pls.' Resp. Br. at 8.

The term "serial" is commonly understood to mean that data is transmitted sequentially, one bit at a time. See Pls.' Br. at 6;
The Court notes that the plain language of claim 1, which expressly states that the serial interface is coupled to said computer and receives signals produced by said facsimile transceiver, supports Kirsch's contention that his invention contemplated the serial interface being "coupled to said computer," and not to the facsimile transceiver. Similarly, the plain language of claim 1 does not support a construction requiring a common interface between the computer and facsimile transceiver. See Pls.' Br. in Supp. of Proposed Claim Construction at 6 (hereinafter referred to as "Pls.' Br.").

Defendants contend that intrinsic evidence adds a limitation not evinced by the plain language of claim 1. For support, Defendants cite the '911 patent to argue that the serial interface described in claim 1 contains a modem. Defendants observe that the '911 patent states:

"The computer includes a serial interface in the form of a synchronous communication circuit and modem for communicating with the facsimile transceiver." (911 patent, col. 2, lines 60-63; emphasis added.)

"[T]he modem 20 . . . together with synchronous communication card 18 comprises a serial interface for connection to computer 10." (911 patent, col. 8, lines 8-11; emphasis added.)

"The computer has a serial interface including a synchronous communication interface and modem for communicating with the facsimile transceiver. (sic) (911 patent, Abstract; emphasis added.)

"Preferably modem 20 provides a serial communication link at least 9,600 baud in a synchronous fashion," (911 patent, col. 4, lines 27-29; emphasis added.)

"The digital electronic signals are transmitted by the serial communication link comprising modem 20 and synchronous communication card 18 to the personal computer 10." (911 patent, col. 4, lines 62-67).

"The information station of claim 1 wherein said serial interface comprises a synchronous communication interface attached to said computer and a modem coupled to said synchronous communication interface." (911 patent, claim 4; emphasis added.)

Defendants have not attempted to rebut the citations of intrinsic evidence specifically cited above. Instead, Plaintiffs claim that "[t]he language of claim 1 does not include the word 'modern.'" See Pls.' Resp. Br. at 8. Plaintiffs further claim that "the specification and prosecution history of the '911 patent use the term 'serial interface' in a manner consistent with its ordinary meaning." Id. Defendants do not contest this latter point. See Defs.' Br. at 24.

Because the language of claim 1 states that the interface is "capable of receiving digital electronic signals produced by said facsimile transceiver," Plaintiffs contend that the limitation does not allow for a construction requiring a modem as part of the serial interface, since "a computer modem is designed to receive analog signals from an external device such as a facsimile transceiver." See Pls.' Resp. Br. at 8-9 (emphasis in original). Plaintiffs asserts this same argument in connection with their contention that the specification refutes Defendants proposed construction.

Plaintiffs next argue that constructing the "serial interface" limitation in claim 1 to require a modem would render claim 4 superfluous. See Pls.' Resp. Br. at 9. Claim 4 recites the specific embodiment "wherein said serial interface comprises a synchronous communication interface attached to said computer and a modem coupled to said synchronous communication interface." Citing Clearstream Wastewater Sys., Inc. v. Hydro-Action, Inc., 206 F.3d 1440, 1446 (Fed. Cir. 2000), Plaintiffs contend that adopting Defendants proffered construction of claim 1 would violate the principle of claim construction requiring claim differentiation. See Pls.' Resp. Br. at 9.

Referring to the prosecution history, Plaintiffs assert that Defendants' construction must be rejected because "[c]laim 1 was initially rejected by the U.S. Patent and Trademark Office . . . as anticipated by U.S. Patent No. 4,652,933 ("Koshiishi")." Id. at 10. Plaintiffs argue that the interface connecting the computer and facsimile transceiver in Koshiishi does not include a modem in its reference. Because each element of a prior art reference must be disclosed in the reference, Plaintiffs claim that the U.S. Patent and Trademark Office did not construe the "serial interference" limitation as requiring a modem. Id. Defendants did not rebut this particular argument.
The Court conurs with the Plaintiffs' arguments. Defendants' proposed construction of "serial interface" is not tenable. As stated earlier, the portion of claim 1 relevant to this discussion states that the embodiment contemplates "a serial interface coupled to said computer and capable of receiving said digital electronic signals produced by said facsimile transceiver."

The plain language of this claim and the specification do not allow for Defendants' assertion "that the modem of the computer's serial interface (i.e., the "modem coupled to said computer") is capable of being directly connected to the modem of the fax modem to modern serial communication of analog signals through their respective telephone-compatible ports." See Defs.' Reply Br. at 6. The plain language of the claim does not state that analog transmission must be used. Rather, the claim embodies the transmission of digital electronic signals. It is undisputed that a modem cannot receive digital electronic signals. Therefore, the serial interface cannot be read to include a modem. If such a construction were adopted, the serial interface could not, as the claim requires, receive digital electronic signals produced by a facsimile transceiver.

The Court notes that the examples cited by Defendants are susceptible to Defendants' interpretation. Notwithstanding the fact that Plaintiffs have not attempted to address the examples Defendants offer as support for their construction, the Court is not convinced that these examples are definitively determinative of the appropriate construction of claim 1.

Further, Plaintiffs' argument that adopting Defendants' construction of claim 1 would render claim 4 superfluous is persuasive. Under Clearstream, 206 F.3d at 1446, the doctrine of claim differentiation requires this Court to presume that different words used in different claims result in a difference in meaning and scope for each of the claims. While this doctrine cannot be used to make a claim broader than what is contained in the written description, it does prevent the "narrowing of broad claims by reading into them the limitations of narrower claims." Id. In accordance with this principle, the Court concludes that the "serial interface" embodied in claim 1 does not necessarily include a modem; claim 4 evinces that Kirsch knew how to qualify a claim's embodiment by so indicating.

Finally, the Court finds Plaintiffs' contention regarding the Koshiishi patent convincing. Under In re Robertson, 169 F.3d 743, 745 (Fed. Cir. 1999), "[a]nticipation under 35 U.S.C. § 102(c) requires that 'each and every clement as set forth in the claim is found, either expressly or inherently described, in a single prior art reference'"(citing Verdegaal Bros., Inc. v. Union Oil Co. of Cal., 814 F.2d 628, 631 (Fed. Cir. 1987)). That claim 1 was initially rejected by the U.S. Patent and Trademark Office under § 102(c) informs the Court that a modem was not expressly or inherently described in the Koshiishi patent. A finding that claim 1 does not envision the "serial interface" containing a modem is consistent with the Patent and Trademark Office's initial rejection or claim 1 of the '911 patent.

This claim term appears in claim 14, which reads in relevant part:

wherein said registration number algorithm combines information entered by a prospective registered user unique to that user with a serial number generated from information provided by the environment in which the software to be protected is run.

'216 Patent, col. 14, ll. 52-56. From claim 14, therefore, it is clear that the serial number is a number generated from computer environment information, which obviously forms the basis of Uniloc's proposed construction. Microsoft, however, points out that Uniloc's proposal reads the word "serial" out of the claim term and simply adds a layer of redundancy to the language of claim 14. This Court agrees and finds that the ordinary meaning of the term "serial number" is readily apparent from its widely accepted definition.

Accordingly, this term shall be construed as follows: A number that is one of a series.
1. "Serially connected intelligent cell[s] ("SICs")"

SercoNet contends that SICs should be construed as: "two or more intelligent cells directly connected using point-to-point medium", where "intelligent cells" refers to programmable elements for providing remote control, sensing and/or communications that when interconnected with other like elements form a communications, control and sensing network or system with distributed intelligence." NetGear agrees with SercoNet's construction of "intelligent cells." NetGear differs in its interpretation of "serially connected", and its proposed construction is: "A device, which is connected to at least one other such device, by means of a bi-directional communication channel. The devices are arranged in a serial (i.e., daisy-chained) fashion, but not a bus or star topology."

To begin its analysis, the court first turns to the claims themselves. The term "serially connected intelligent cell[s]" appears in claims 1-6 and claim 21 of the '360 patent and claim 1 of the '510 patent. Claim 1 of the '510 patent -- which sets forth the general type of local area network for data communication, sensing, and control claimed by SercoNet -- generally states that the network consists of a plurality of "serial intelligent cells" interconnected "exclusively by electrically-conducting media into at least one communicating pair" wherein each said media "interconnects no more than two of said serial intelligent cells" and each pair includes one conducting media and exactly two serial intelligent cells." Claim 1 of the '360 patent similarly sets forth the "network topology" claimed by SercoNet, which comprises a power source, and a "plurality of line-powered, serially connected intelligent cells coupled to the power source and to each other via respective communication channels each allowing mutually independent communication in either or both directions and comprising at least two electrical conductors." Claims 2-6 and 21 of the '360 patent also refer to line-powered serially connected intelligent cells, further defining where the controls, components, and various elements are located in the technology.

Reviewing the claims in which the phrase is used, there is no indication that the phrase is to be given a specific definition in any one claim versus another, and no indication that the phrase has been particularly defined, or referred to differently, in any specific claim. This being the case, the next question is whether any language from the claims is useful in helping to define precisely what "serially connected" is. The claims themselves do not really define this term. The claims do, however, describe how the cells are connected to one another, noting how many cells each connecting media connects, and defining that each pair of cells includes one conducting media. The language therefore defines the connections at the cell-to-cell level, indicating that the term "serial" is focused on how each cell is connected to another cell, rather than referring to a pattern of cells in a larger topology. However, because the claim language does not define the term, the court turns to the specification for further guidance.

The '510 patent specification explicitly states that every communication between SICs is a "point-to-point communication" which term herein denotes a "communication that takes place between exactly one sender and exactly one receiver." See '510 patent at 4:35-39; see also '510 patent abstract (noting that "a LAN can be configured from a plurality of SICs interconnected so that all communications between two adjacent SICs is both point-to-point and bidirectional"). It notes that this is in contrast to a bus-based communication, in which there are many potential receivers and many potential senders. This type of connection allows chaining. Id. at 4:1. The specification, therefore, makes clear that the unique feature of the communication is that each conducting media connects and communicates with no more than two intelligent cells, consistent with SercoNet's proffered construction. While this is also consistent with NetGear's exclusion of bus-based topologies from the claim, importing this exclusion would be redundant, as point-to-point communications by definition cannot be bus-based.

As to whether "point-to-point" is a more accurate description of "serial" than "daisy-chained," the parties noted at the hearing that both terms essentially mean one after the other. Because the phrase "point-to-point" explicitly appears in the specification, and is a clearer term than "daisy-chain," the court finds that this term is more appropriate. Furthermore, the patent makes clear that each SIC can be connected to one or more other SICs, forming branching chains. See '510 patent at 4:3-5 (inner SICs may be equipped with multiple connections, noting that one SIC is equipped with three connections and more are possible); Figure 7. The term "daisy-chain" might imply one single chain, which would improperly limit the claim. The term "point-to-point" does not have the same potentially misleading connotation, as "point-to-point" communications are defined in the specification, but the term "daisy-chain" is not.

NetGear's proposed construction also excludes star topologies. Figure 7 in the '510 patent specification, however, shows SICs arranged in a modified star topology. It is true that the background section of the '510 patent distinguishes SICs from prior art that used star and bus topologies. See '510 patent at 1-2. The background emphasizes that prior art star topology
generally used a multiplexer (i.e., a network "hub"), in which a connection between each unit and the hub is required. Id. at 2:20-25. See also '360 patent at 2:54-60 (which sets apart a topology allowing serial connection of the cells which allows for data to be passed in either direction from one cell to an adjacent cell from hitherto proposed systems employing star or bus topology). While SercoNet's patented technology does not require a network hub, each SIC in the invention can have multiple connections emanating from it -- which is like a star topology. SercoNet's definition of "intelligent cell" itself excludes a topology which depends upon a central hub: it requires a "system with distributed intelligence," which directly contradicts a system with centralized intelligence such as the star topology. Importing NetGear's proffered exclusion of "star topologies" therefore would be redundant, given the limiting definition of "intelligent cells." It would also be potentially inaccurate, since the figures and description in the patent specification show that SICs may be deployed within a variety of networks, including a star (or at least a hybrid/modified star) topology. See Fig. 7 of '510 patent. The court cannot read these unstated limitations excluding certain topologies into claim language.

The court, therefore finds that the claim language and specification support SercoNet's construction. While NetGear argues that the patent prosecution history shows that "serial connection" means "daisy-chain", that history would not alter the court's construction. While the prosecution history states that the claimed network employs daisy chain architecture, noting that each node receives power from a preceding node and feeds it to a succeeding node, this description of the overall architecture does not focus on the type of connection between each cell, and it describes how power is fed across lines, not how each cell is connected to another cell. See Parry Decl., Ex. 1 at 4. In addition, while SercoNet drew the patent examiner's attention to figures depicting bus and star topologies, noting that these examples do not show the type of network in the invention, the inventor used these examples to focus the examiner's attention on the peer-to-peer connection between cells allowing independent communication. See id., Ex. 1 at 7. As discussed above, defining this connection according to the claim language and specification eliminates the need to exclude bus and star topologies from the construction, as such exclusions are redundant and potentially inaccurate.

In sum, and for all the reasons set forth above, the court adopts SercoNet's proposed construction of "SICs" and construes the term "SICs" as: "two or more intelligent cells directly connected using point-to-point medium", where "intelligent cells" refers to "programmable elements for providing remote control, sensing and/or communications that when interconnected with other like elements form a communications, control and sensing network or system with distributed intelligence."

A. Infringement

Daewoo states that the jury's finding of infringement was due to the district court's erroneous claim construction. Referring to the requirement in claim 5 of "a series circuit connecting in series through a series junction point said entire-width erasing head and said linear record erasing head," Daewoo argues that the district court incorrectly construed the "series circuit" limitation by "vitiating" the phrase "through a series junction point." The question is whether the claim requires that the series junction point must lie between the erasing heads, or whether the claim is met when the series circuit includes a series junction point that is not between the heads. The district court construed the claims, stating that "[t]he claim language does not require that the series junction point must be between the two heads, but only that all three must be in series." (Emphasis in original). The court referred to the specification, and observed that Figure 2 of the patent shows the series junction point located between the two erasing heads, and Figure 5 shows a series junction point that is not located between the two erasing heads.

Daewoo argues that the claim requires that the series junction point lies between the two erasing heads. The district court stated that Daewoo's argument is an "attempt[.] to limit the claim to a preferred embodiment, even though this limitation is not found in the language of claim 5." We affirm the district court's claim construction, for it is in accordance with the specification including the drawings, whereas Daewoo's construction would exclude the embodiment in Figure 5. See, e.g., Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996) (a claim construction that excludes a preferred embodiment is rarely, if ever, correct).

On the district court's construction of the claims, the jury verdict of infringement is not challenged on appeal.
C. "a server"

"a server" is found in the '414 patent, claim 4: "A media asset management system comprising: a server comprising: a user account . . . a server database application . . . ; and a server application . . . ." The plaintiff contends that "a server" means "one computer server or a group of computer servers, where each computer server is a computer used to provide services (such as stored data or files, processing power, or management of network resources) to other computers or devices in a network." According to the defendant, "a server" should be construed as "a computer or device on a network that manages network resources."

The plaintiff argues that "a server" should not be limited to a single server, but may mean one or more servers. See Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1342 (Fed. Cir. 2008) ("That 'a' or 'an' can mean 'one or more' is best described as a rule, rather than merely as a presumption or even a convention."). But Apple points out that the claim language requires the server to have specified features, and these requirements are not satisfied by one or more servers collectively having those features. See Summit Tech., Inc. v. Nidek Co., 363 F.3d 1219, 1228 (Fed. Cir. 2004) (holding that the limitation "a light spot" requires a single light spot, not a combination of light spots). Therefore, while an accused system may have multiple servers, each server must independently be capable of performing all of the limitations listed in the claim language.

Next, Apple proposes a dictionary definition that includes "manages network resources." There is no need for the servers in this context to manage network resources. Thus, the court construes "a server" as "one or more computers or devices on a network, with each computer or device having user account(s), server database application(s), and server application(s)."

B. "server, " as used in claim 14.

The term "server" appears only in claim 14, 17 a system claim. Plaintiff proposes the construction, "a provider of a data," while defendants propose the construction, "a computer that communicates, (i.e., provides documents) with a client over a network by using any communication protocol." Again, dispositive of this dispute is the claim construction principle recognizing the patentee's ability to act as his own lexicographer. When this principle is applied, it becomes clear that "server" means "a computer that provides data."

In the '670 patent, the patentee explicitly defines "server" as "refer[ring] to a computer's general role[] as a . . . provider of data (the server)." '670 patent Specification col. 11 11.49-51; see also id. col. 4 11. 28-30. Significantly, the patentee's intention to act as lexicographer is evidenced by two recognized indicators: (i) the use of quotation marks around the claim term and (ii) the patentee's use of the word "are." See Sinorgchem Co., 511 F.3d at 1136 ("The term 'controlled amount' is set off by quotation marks--often a strong indication that what follows is a definition. . . . Moreover, the word Ms' . . . may signify that a patentee is serving as its own lexicographer."). Here, the patentee's intent to define the term "server" is manifest and accordingly controls.

By contrast, both parties' proposed constructions are inconsistent with the patentee's lexicography. Plaintiff's proposed construction--"a provider of data" is underinclusive because it omits the part of the definition referencing a computer. See Sinorgchem Co., 511 F.3d at 1136-39 (holding that plaintiff's construction incorrectly encompassed only part of the
In sum, because the patentee "has elected to be a lexicographer by providing an explicit definition in the specification for a claim term . . . the definition selected by the patentee applicant controls." Renishaw PLC v. Marposs Societa per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1999). Accordingly, the claim term "server" is construed, pursuant to the patentee's instruction, to mean "a computer that provides data."
This term is found in claims one and claim thirteen. The Plaintiff contends that the term does not require construction, but submits "a computer that provides services to another computer." The Defendants submit "a computer that applies one or more test methodologies to the collected information; generates one or more reports from the test methodologies; and sends the one or more reports to a project manager."

The Plaintiff's definition is supported by citation to technical dictionaries. The Defendants state that claim thirteen and the description in the specification of server 100 gives a particular meaning to the disputed term in the context of this patent. In particular, the Defendants point to col. 4:1-3, where the patentees state that FIG. 2 is an exemplary process for providing a Laboratory Information Management System on the server.

The patent specification does not support the Defendants' definition. The server is accessed on a wide-area network and receives information collected from the material mixture. Col. 1: 62-64. The server is connected to a network and can have a web site. Col. 3:6; 10-12. In one embodiment, the server collects inputs (col. 4:5). The server can be an individual server or a collection of several. Col. 3:25-26. The server can be protected by a firewall. Col. 3: 46. It allows a consumer to log on to a software package incorporating standard testing methods. Col. 3:60-65. None of these uses requires that the server apply the test methodologies, generate the reports, and send the reports to a project manager.

It is possible for a patentee to act as his own lexicographer and redefine a term away from its ordinary meaning. Phillips, 415 F.3d at 1316. But when he does so, the patentee must express an intent to redefine a term. Honeywell Int'l, Inc. v. Universal Avionics Sys. Corp., 493 F.3d 1358, 1367 (Fed. Cir. 2007)(citation omitted). The patentees in this case have not expressed intent to redefine this term.

The Defendants are attempting to require that tasks explicitly assigned to the server in claim thirteen also be included as limitations in claim one through the redefinition of the word "server." While the server must be capable of performing the functions explicitly recited in claim thirteen, the definition of server in claim one is not limited to the functions of claim thirteen. Claims are presumed to have differing scopes. AllVoice Computing, 504 F.3d at 1248 (citations omitted). To redefine "server" so that it has the same functions in claim one as in claim thirteen without some other basis for doing so would be improper. 2

Footnotes

2 It is also unnecessary to define "server" to include the claim language that follows it in claim thirteen since the claim already has that language.

End Footnotes

In some cases, the ordinary meaning of the claim language is readily apparent and involves little more than the application of the widely accepted meaning of a commonly understood word. Phillips, 415 F.3d at 1314. That is the case with this term. The Plaintiff supports its construction with technical dictionaries that have definitions for "server" such as "a computer or software package that sends requested information to a client or clients in a network." MCGRAW-HILL DICTIONARY OF SCIENTIFIC AND TECHNICAL TERMS 1905 (6th ed. 2003). Another relevant definition is "on the Internet or other network, a computer or program that responds to commands from a client." MICROSOFT COMPUTER DICTIONARY 403-04 (4th ed. 1999). Finally, a server is also defined as "a computer whose role in a network is to provide services and resources to users." MICROSOFT ENCYCLOPEDIA OF NETWORKING 1107 (2000). The Defendants do not offer contradictory dictionary citations, but merely rest on the argument that the patent specifically defines this term.

The Defendants also contend that this term is part of a means-plus-function term only in its use in claim thirteen. For the reasons discussed in construing the term "Server Applying One or More Test Methodologies to the Collected Information;
Generating One or More reports from the Test Methodologies; and Sending the One or More Reports to a Project Manager" below, this Court does not agree. The Defendants also provide no basis for departure from the rule that claim terms are to be interpreted consistently throughout various claims of the same patent. See Callicrate v. Wadsworth Manuf. Co., 427 F.3d 1361, 1371 (Fed. Cir. 2005); Research Plastics, Inc. v. Federal Packaging Corp., 421 F.3d 1290, 1295 (Fed. Cir. 2005) (citing Phillips, 415 F.3d at 1313-14 and Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001)).

Construction: A computer that provides services to another computer.

6. "server"

The parties dispute the construction of the term, "server," as it appears in claim element 3 ("server"). 6

--- Footnotes ---
6 The term, "server," appears in claim elements 1 ("file server means"), 1(b) ("file server means"), 3 ("file server means"), 3(b) ("file server means"), 3(c) ("file server means"), 3(d) ("file server means"), 3 ("file server means"), 5 ("server's unit"), 6 ("server's unit"), 7 ("server's unit"), and 8 ("server's unit"). (Herbst Decl. P 5, Ex. 3.)

--- End Footnotes ---

Plaintiffs' proposed construction for the term, "server," is "a computer system that receives requests and provides responsive information." Defendants' proposed construction is "system that receives digital property information and stores digital property information." As such, the parties agree that the proper "server" construction should describe "server" as a "system." The parties also agree that under the doctrine of claim differentiation, the construction of "file server means" and "server's unit" are presumed to be different. See Inpro II Licensing, S.A.R.L. v. T-Mobile U.S.A., Inc., 450 F.3d 1350, 1354 (Fed. Cir. 2006) (citing Tandon Corp. v. U.S. International Trade Com., 831 F.2d 1017, 1023-24 (Fed. Cir. 1987) (stating that under the doctrine of claim differentiation, different claims are presumed to be of different scope.). However, because the Court separately construes the terms, "file server means" and "server's unit," the Court will limit its current construction of the term, "server," only to the extent it appears in claim element 3.

In support of their competing constructions of "server," both parties primarily rely on the '025 Patent specification. However, before turning to the specification, the Court must first addresses the claim language. See Vitronics Corp., 90 F.3d at 1582 (stating that in construing disputed terms, the Court first looks to the words of the claims ascribing the words their ordinary and customary meaning.) ["T]he ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention, i.e., as of the effective filing date of the patent application." Phillips, 415 F.3d at 1313. In construing the ordinary and customary meaning, the Court notes that the dictionary definition for "server" reads, "[a] computer that manages centralized data storage or network communications resources. A server provides and organizes access to these resources for other computers linked to it." American Heritage Science Dictionary (2007); See also Microsoft Computer Dictionary (4th Ed. 1994) (defining "server" as "[o]n a local area network, a computer running administrative software that controls access to all or part of the network and its resources (such as disk drives or printers). A computer acting as a server makes resources available to computers acting as workstations on the network."). Although not dispositive, the Court finds that the claim language in light of the ordinary and customary meaning of "server" to be illustrative.

--- Footnotes ---
7 Dictionary definitions and other objective reference materials available at the time that the patent was issued may also provide evidence of the ordinary meaning of a claim. Phillips, 415 F.3d at 1322; Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002). A dictionary "has the value of being an unbiased source, accessible to the public in advance of litigation." Phillips, 415 F.3d at 1322 (internal quotation omitted). Thus, district courts "are free to consult such resources at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584 n. 6. A court should be cautious, however, not to place too much reliance on dictionaries, as the resulting construction may be too broad. Phillips, 415 F.3d at 1321.
Turning to the '025 Patent specification, Defendants insist that it clearly defines "server" as, "Server--The computer system which stores all files. Input facilities for raw data may be located at the Server's location." (Herbst Decl., P 5, Ex. 3 at col. 5, ll. 23-25.) Plaintiffs argue that Defendants misapply the specification because the specification explicitly qualifies its "server" description by providing that "the following terminology is used for consistency and should in no way limit the scope of the invention." (Id. at col. 5, ll. 2-4.) Plaintiffs also assert that Defendants' construction unduly restricts "server" to "digital property information" per the disclosed embodiment.

The Court finds that construction of term, "server," is somewhere in between the parties' proposed constructions. Most compelling is the specification's description of the term, "server." See Vitronics, 90 F.3d at 1582 ("Usually, [the specification] is dispositive; it is the single best guide to the meaning of a disputed term."). From that description it is clear that "server" includes a "system which stores files" and also has "input facilities for raw data." (Herbst Decl., P 5, Ex. 3 at col. 5, ll. 23-25.) Also instructive is the specification's description of the invention. The specification repeatedly describes "server" as a component with an "input/output [device]" for "receiving and providing [or transmitting] data [and database storage]." (Id. at col. 3, ll. 33-35; col. 4, ll. 10-14.) As such, the Court construes "server," in part, as "computer system that receives, stores, and provides data." The remaining issue is whether the "data" at issue should be limited to "digital property data."

It is evident that the disclosed embodiments of the '025 Patent describe "server" as a component "storing digital real estate information," (id. at col. 3, ll. 35-36) and "stor[ing] information regarding property profiles, real estate professionals, community profiles, real es [sic] state financing, local businesses and services . . . ." (id. at col. 4, ll. 2-5). However, because it is improper to read limitations from the specification into the claim, the Court may not limit "data" to "digital data" as Defendants' proposed construction does. See, e.g., Phillips, 415 F.3d at 1323. For this reason, the Court refuses to adopt Defendants' proposed limitation.

Having considered the claim terms, the specification, and the relevant patent prosecution history, the Court construes "server" as "computer system that receives, stores, and provides data."

M. Server Applying One or More Test Methodologies to the Collected Information; Generating One or More Reports from the Test Methodologies; and Sending the One or More Reports to a Project Manager

This term is found only in claim thirteen. Here, the claim language specifies that the server must perform the steps. The Court has previously construed the components of this term, so this construction includes the previous constructions.

The Defendants also argue that this term is a means-plus-function term. The Defendants argue that there are three functions in the claim - "applying one or more test methodologies to the collected information," "generating one or more reports from the test methodologies," and "sending the one or more reports to a project manager." The Defendants acknowledge that none of these terms employs the classic "means-for" language that invokes a rebuttable presumption that means-plus-function claiming applies. Callicrate, 427 at 1368. The lack of the use of the word "means" invokes a rebuttable presumption that means-plus-function claiming does not apply. Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1358 (Fed.
Cir. 2004) (citation omitted). The Defendants, however, argue that the claim recites a function without sufficient structure, which is sufficient to invoke means-plus-function claiming without using the word "means." See Duratech Indus. Int'l v. Bridgeview Mfg., 292 Fed. Appx. 931, 933 (Fed. Cir. 2008).

The Defendants' argument is inconsistent with its previous arguments. The Defendant previously addressed the terms "applying one or more test methodologies to the collected information," "generating one or more reports from the test methodologies," and "sending the one or more reports to a project manager" in claim one without arguing that they lacked sufficient structure such that means-plus-function claiming would apply. The Defendants now argue that the addition of the word "server" means that there is insufficient structure in these phrases.

The Defendants' argument is backwards. If means-plus-function applies, then a server alone is not sufficient structure. Aristocrat Techs. Austl. PTY Ltd. v. Int'l Game Tech., 521 F.3d 1328, 1333 (Fed. Cir. 2008). Here the Defendants are arguing that the addition of the server invokes means-plus-function claiming. The Defendants rely only upon the words of the claim to do so; they do not cite the prosecution history or other intrinsic evidence to show a use of the term that comports with means-plus-function claiming. The Federal Circuit has held that the presumption against means-plus-function treatment is strong in claim terms that do not include the word "means." See Mass. Inst. of Tech. v. Abacus Software, 462 F.3d 1344, 1356 (Fed. Cir. 2006) (citing Lighting World, 382 F.3d at 1362 ("[W]e have seldom held that a limitation not using the term 'means' must be considered to be in means-plus-function form," and "the circumstances must be [unusual] to overcome the presumption . . ."). It is an error to require that the claim limitation identify specific structure instead of a generic term that includes a wide variety of structures. Lighting World, 382 F.3d at 1359. "[I]t is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function." Id. at 1359-60. The Federal Circuit went on to state that "[w]hat is important is whether the term is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term 'means for.'" Id. at 1360.

As with the disputed word in that case, dictionary definitions in evidence here make clear that a server is a noun that denotes a type of structure. In this case, the noun is modified by the functional phrases - "applying . . .," "generating . . .," and "sending . . .." Thus the structure of the server is further specified by the function that it is performing in each step.

While it may seem a paradox that the patentee be allowed to use a server performing specific functions in a claim to avoid means-plus-function language, it is because the statute allows the patentee the choice to present his claim in means-plus-function format and rely on the specification for structure or to specify a particular claim that passes the patent examination in non-means form. The patentees used means-plus-function language in dependent claims, proving that they knew of the doctrine and how to employ it in the claims. For this disputed term, the patentee chose non-means language, and the Defendants have not met the their burden to show that this Court should overturn that choice.

Construction: A server that (1) performs calculations for one or more test methodologies using the data collected from the testing of the pavement construction material, (2) generates one or more reports based on the results of the test methodologies, and (3) provides the one or more reports to a project manager.

3991

14. Server computer

This term is used throughout the '542 patent claims. Seven contends that the term means "a machine on a network that provides a particular service to other machines," Visto argues that the term means "the FormLogic Server responsible for directly manipulating the client database, including retrieving data and inserting new data." Visto's construction would limit the claims to the preferred embodiment and is rejected. The court construes the term "server computer" to mean "a machine on a network that provides a particular service to other machines."

GO BACK
C. First Server Computer and the "Selected Computer Resources of at least a [or said] first server computer . . ."

Plaintiff contends that the first server computer, or "subscription access server," does not need to actually store all of the selected computer resources it makes available to subscribers. Rather, Plaintiff contends, the first server computer can act as a gatekeeper, controlling access to those resources by instructing a "Service Function" to make those services, applications or content available. (D.I. 266 at 27; D.I. 305 at 17-18).

Defendants contend that the claim language and specification of the '416 Patent require that the first server computer physically store all of the protected content it communicates to subscribers, pointing to language in the specification stating that the invention "control[s] access to selected computer resources of at least a first server computer." (D.I. 306 at 20, citing '416 Patent, col. 35, ll. 26, 29-31)(emphasis added). Defendants contend that the use of the word "of" implies possession of resources by the first server. (Id. at 20). However, reading the claim in the context of the entire patent, the Court concludes that Defendants' contentions rely on an overly restrictive concept of possession, and that, given a broader reading, the language cited by Defendants is consistent with the specification.

The specification discusses a system whereby various web sites are hosted through web servers operating in conjunction with first server computers that protect the contents of the sites. (See e.g. col. 5, ll. 14-16, col. 27, ll. 3-4). Figure 3 shows the protected contents residing outside of the first server computer, with the path over which protected contents can be sent crossing through the "Service Function" block rather than the server. (Id., Fig. 3). Likewise, in Figure 4, the protected content resides outside the first server, and is accessed by the server through the "Service Function," which also resides outside the first server computer. (Id., Fig. 4). Thus, the Court concludes that the system disclosed in the specification and corresponding figures does not require the first server computer to store the resources it communicates to subscribers. Rather, it allows the server to act as a gatekeeper, accessing selected computer resources protected by the invention either itself or through a "Service Function" block, and communicating those resources to subscribers.

Accordingly, the Court construes "First Server Computer" to mean "a computer that makes available information or other resources." The Court also construes "selected computer resources of at least a [or said] first server computer" to mean "computer services, applications, or content that can be accessed by (either directly or indirectly) said first server computer."

C. Server Remote From the Client Computer System (Claims 1, 8, 14)

HP proposes that this term be construed as "a computer or a program that can be connected to a network and that can respond to requests from one or more client computer systems and that is located at a distance from the client computer." Intergraph contends that the proper construction of the term is "a computer that responds to requests from the client computer system via the Internet." Once again, the parties disagreement focuses on whether the definition of a contested term incorporates the use of the Internet.

HP argues that its proposed construction is consistent with the ordinary meaning that the term would have to those of ordinary skill in the art. HP directs the Court to the following language in the specification: "Client computer 300 also includes a network adaptor 390 that allows the client computer 300 to be intercepted to a network 395 via a bus 391. The network 395, which may be a local area network (LAN), a wide area network (WAN), or the Internet, may utilize general purpose communication lines that interconnect a plurality of network devices." '028 Patent, col. 3:44-49. Based on this language, HP concludes that the client computer system and remote server are not restricted to the Internet.

Intergraph argues that the term "network" is used interchangeably with the term "Internet." Intergraph illustrates this point by stating that the figure number 395 assigned to designate "Internet" has been used to denote the term "network" in a number of figures. See Figs. 1, 2, 3A, 3B, 3C, and 9. Intergraph also notes that Fig. 13 clearly depicts a client computer that is enabled to transmit a request to access and download a web page from the Internet.
HP concedes, as it must, that the Internet is obviously one example of a network that can be used with the systems of the '028 Patent. Indeed, the preferred embodiments of the patent often use the Internet as the "network" connection in the designed system. However, as previously noted, the Court should not "limit [] the claimed invention to preferred embodiments or specific examples in the specification." Ekchian, 104 F.3d at 1303. As noted by HP, the claims of the patent consistently use the word "network," and not "Internet." Therefore, Intergraph's attempt to limit the claims to server requests "via the Internet" is ultimately unpersuasive. The Court construes "server remote from the client computer system" as a computer that responds to requests from the client computer system through a network connection.

The parties dispute the construction of the term, "server's unit." The term at issue appears in Claim 5 of the '025 Patent as follows:

5. A system of tracking real estate and real estate related demographic information using a computer network system comprising:

... 

a server's unit, said server's unit having:

a computer, said computer having storage capabilities; communication means, said communication means enabling said server to interact with remote terminals;

a plurality of databases, at least one of said plurality of databases being an automatically updated demographic pattern database, said demographics pattern database being updated automatically by analyzing database information requests, said database information requests being a plurality of inquiries from a plurality of individual remote terminals, said remote terminal inquiries being the retrieving and viewing of text and/or graphic data from a database;

demographic database updating means, said updating means automatically updating said demographics pattern database by compiling and merging a plurality of end user inquiries and storing said compiled and merged inquiries in said demographics pattern database.

(Herbst Decl. P 5, Ex. 3 at col. 15, ll. 67-col. 16., ll. 18.)

Plaintiffs' proposed construction of the term is "a server system providing storage information." Defendants' proposed construction of the term is "a single unit that includes a modem, computer and multimedia database." In support of their respective constructions, the parties primarily rely on the '025 Patent specification.

The Court finds that Defendants' proposed construction is improper for the same two reasons as its previously proposed construction. First, by limiting the claimed function to "modem, computer and multimedia database," the proposed construction improperly imports limitations from the specification. See, e.g., Phillips, 415 F.3d at 1323. Second, by restricting the claim in such a manner, the proposed construction also improperly limits the claimed function to the preferred embodiment. See Northern Telecom Ltd., 215 F.3d at 1292; see also Kemco, 208 F.3d at 1362. Accordingly, Defendants' proposed construction is too narrow. However, Plaintiffs' proposed construction is too broad and is therefore similarly unacceptable.

Having considered the claim terms, the specification, the relevant patent prosecution history, and construction of earlier claim terms, the Court construes "server's unit" as "a computer unit with storage capabilities and communication means that also contains demographics databases."
5. Terms 14 and 15 (703 Patent, Claim 5) 18

18 The terms to be construed appear in claim 1, upon which claim 5 depends.

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>… at least one first level name server that provides a first level domain name service (DNS) resolution … [Term 14]</td>
<td>… a computer or program running on a computer in the hosting framework that receives a request to resolve a name or other identifier into an IP address, and returns the IP address of a name server or servers …</td>
</tr>
<tr>
<td>… and at least one second level name server that provides a second level domain name service (DNS) resolution … [Term 15]</td>
<td>… a computer or program running on a computer in the hosting framework that receives a request to resolve a name or other identifier into an IP address, and returns the IP address of a content server or servers …</td>
</tr>
</tbody>
</table>

Akamai argues that a proper construction of these terms should include the regular Internet DNS root 19 and top-level (e.g. ".com") name servers, while Limelight insists that the patent limits the invention to name servers within the "distributed hosting framework" cited in the claim preamble. (703 Patent, Claim 1.) Akamai bases its argument on an appellate decision in a prior case, Akamai Techs. v. Cable & Wireless Internet Servs., 344 F.3d 1186 (Fed. Cir. 2003) ("C&W"). Akamai, however, misreads that decision. The issue addressed by the Federal Circuit in C&W was "a single point of contention--the placement of the load balancing software at either the DNS servers or the origin server." Id. at 1193. The court found that claim 1 of the '703 Patent did not require the load balancing software to be located at the DNS server, and therefore was anticipated by an earlier C&W patent. Id. at 1194.

19 The root servers are a worldwide set of domain name servers at fixed IP addresses which can be queried to provide the location of the next level of lower-level DNS servers supporting the top-level domains such as .com, .org, etc. They provide a known starting place at the top of the domain name hierarchy for a client's local name server to begin in order to resolve a hostname. (See Docket # 84, 14.)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -
This additional argument, however, fails to address C&W's contention that hierarchical DNS is inherent in any Internet system. Indeed, C&W proffered documentary evidence and testimony at trial that redundant domain name servers are inherent in any Internet-based application. See Dayco, 329 F.3d at 1369.

Id. at 1195 (emphasis added). Contrary to Akamai's contention, this language does not construe the terms of claim 1 concerning limitations on the location of the claimed name servers. Indeed, the Federal Circuit had no reason to examine claim 1 further, having already determined it invalid. Rather, it holds that, given an invalid claim 1 anticipated by an earlier patent, the additional limitation of a redundant name server in claim 3 does not sufficiently limit claim 1 to create a valid claim.

A plain reading of claim 1 in the ’703 Patent describes the two-level DNS service as part of "[a] distributed hosting framework operative in a computer network . . . the framework comprising: . . . at least one first level name server . . . and at least one second level name server . . ." (’703 Patent, Claim 1.) The specification supports a construction of this language that limits the location of the name servers to the claimed invention's hosting framework:

The hosting framework of the present invention comprises a set of servers operating in a distributed manner. . . . In particular, the framework includes a second set of servers (or server resources) that are configured to provide top level Domain Name Service (DNS). In addition, the framework also includes a third set of servers (or server resources) that are configured to provide low level DNS functionality. (Id. col.3 11.4-5, 19-24 (Summary of the Invention) (emphasis added).)

[T]he global hosting system 35 comprises three (3) basic types of servers (or server resources): hosting servers (sometimes called ghosts) 36, top-level DNS servers 38, and low-level DNS servers 40. (Id. col.3 11.51-54 (Summary of the Invention) (emphasis added).)

Step 3: As previously described, preferably there are two types of DNS servers in the inventive system: top-level and low-level. The top level DNS servers 38 for ghosting.com have a special function that is different from regular DNS servers like those of the .com domain. (Id. col.911.31-35 (emphasis added) (distinguishing the DNS servers in the inventive framework from those of the Internet root and top-level servers).)

Thus, both the claim and the specification limit the invention to a global framework containing two levels of DNS servers different from the DNS servers providing root and top-level name resolution.

The Court finds little support in the claims or specification for Defendants' proposal. However, the Court finds that the repeated use of the term "service" in the claim denotes something more specific than the generic construction proposed by Beneficial. Beneficial provides definitions for service as "conduct or performance that assists or benefits someone or something" and "an act of assistance or benefit." The specification of the ’702 patent has numerous references to service or services. The Summary of the Invention states that the present invention exchanges information on goods and/or services between the players or users and the sponsors or advertisers. ’702 patent, 4:2-7. Further, the specification repeatedly refers to "goods or services" of the sponsor or advertiser, that the user has the ability to purchase or view sponsor goods and/or services, that the product or service relates to an advertisement, that the service presentations can be informational or interactive, and that the user may access gaming and advertisement services of the website. See ’702 patent, 4:3-66; 29:52-56. Thus, "services" is referenced throughout the specification in conjunction with a sponsor's products or goods, information exchange service within a gaming context, and advertisement services of a website. See id. Further, the parties
acknowledge that in dependent claim 54 the service is a "game." The Court finds that the term is not as limited as the Defendants' proposed construction. Thus, the Court construes the term "service" to mean "beneficial activity provided to a user."

A. The preamble

Pixion argues that the preamble gives meaning to the claims and, therefore, must be construed. Specifically, Pixion contends that the term "service application" requires interpretation. PlaceWare disagrees, arguing that the body of each claim "describes the three basic steps of prompting, forwarding, and transferring required for a structurally complete invention." Def.'s Opening Br. at 6:9-10. Further, PlaceWare contends that the preamble term "service application" is similar to "first application server," a term used in the body of each claim. Citing Catalina Marketing Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002), PlaceWare argues that because the claim body defines a structurally complete invention the preamble is not limiting.

Regarding the relevance of the preamble for claim construction, the Federal Circuit has held the following: "Whether to treat a preamble as a limitation is a determination 'resolved only on review of the entire [] . . . patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim.' Catalina Marketing, 289 F.3d at 808 (citing Corning Glass Works v. Sumitomo Electric U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989)). Catalina Marketing goes on to state that "in general, a preamble limits the invention if it recites essential structure or steps, or if it is 'necessary to give life, meaning, and vitality' to the claim." Id. (citing Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999)). There is no definitive test to determine when a preamble limits claim scope, but there are some guideposts. The following are among the things that can be considered: (i) indication of intent to use the preamble to define the claimed invention; (ii) dependence on a particular disputed preamble phrase for antecedent basis; and/or (iii) importance of the preamble for understanding the limitations or terms in the claim body. See Catalina Marketing, 289 F.3d at 808.

In the '694 patent, the preamble has greater weight than PlaceWare acknowledges. The Court finds that the preamble is, in fact, "necessary to give life, meaning, and vitality" to the claim. In fact, the preamble is the very thing that differentiates the two claims at issue. Without the preambles of these two claims there would be no need for claim 9 as the "three basic steps of prompting, forwarding, and transferring required for a structurally complete invention," Def.'s Opening Br. at 6:8-11, have already been disclosed in claim 1. Claim 1 identifies a method of redirecting a client service session from a first application server to a second application server without terminating the client service session. Claim 9 identifies a computer-readable medium having computer-executable instructions for performing the method described in Claim 1. The preamble gives each claim its identity. Without the preamble, Claim 9 would be pure repetition.

Finding that the preamble gives "life, meaning, and vitality" to the claim, the Court considers the term in dispute: "service application."

Pixion proposes the following construction for "service application": "On-line services offered to end-users in the form of client server application program, including a server portion that runs on one or more of the servers, and a client portion that runs on a microcomputer of an end user." Pixion borrows this construction of "service application" from the detailed description of the preferred embodiments. See Col. 6:57-64. Limitations from a preferred embodiment described in the specification generally should not be read into the claim language. See Comark, 156 F.3d at 1187. The detailed description of a preferred embodiment of the invention "in no way sheds light on either the meaning of the term to the inventor, or the common meaning of the term to one of skill in the art." Id. Pixion's construction is too narrow because, based on the preferred embodiment, it limits the claim to on-line services. The patent explicitly contemplates applicability to other types of distributed systems. See Col. 4:47-52 ("Although the architecture is described in the context of an on-line services network, it will be recognized that various aspects and features of the architecture are applicable to other types of distributed systems.").

PlaceWare provides an alternative construction of "service application": "a program running on a server that provides a service to a client." Def.'s Reply Br. at 5:23-24 The Court finds that PlaceWare's construction is true to the meaning of the
term in the claim language as well as the specification. See Col. 6:58-59 ("client-server applications programs (or 'server applications')"); Col. 7:24-26 ("The term 'service' refers generally to the abstract function or functions performed by a particular service application (or group of related service applications)"). Accordingly, the Court construes "service application" as follows:

"a program running on a server that provides a service to a client"

'027 patent, col. 10, 11. 7-22 (emphasis added).

The '027 specification contains the following description of the service center:

A central location service center is established at which a call-back telephone number is provided for each subscribing call originator. A number is assigned for use for all calls that are placed by that originator. This assigned number is used to call the service center whereupon the originator is identified by the service center.

A signal is sent from the service center to the originator, thus indicating that the originator is identified whereupon the originator is instructed or prompted to terminate the call. Termination by the calling party is sensed at the service center followed by seizing of a first outbound circuit over which the service center outputs the call-back number for the identified originator. This operation reconnects the service center via a voice connection to the originator.

The originator is prompted to input the telephone number of the called party the originator intends to call. A second outbound circuit is seized at the service center whereupon the called party number is outputted to this second outbound circuit. Finally, the originator is bridged to the second outbound circuit thus connecting the originator with the called party.

The process, or system apparatus, in accordance with this invention, is preferably contained at a central location or service center. Since it is essentially self-contained for its purpose and requires a minimal number of lines connecting it to an exchange, the present invention is adaptable for relatively easy relocation to interface with the most economic tariff rate location wherever that might physically present itself throughout the world.

'027 patent, col. 3, 11. 33-62 (emphasis added). The paragraphs that follow describe the function of the "central location":

The process and apparatus of this invention interactively establishes communication links between a calling party and one or more parties called by that calling party. It employs input and output connections to a telephone exchange that provides interface switching of the calling party with the central location. A signal is generated containing data uniquely identifying the originating station of the calling party which signal is placed on the input connection to the central location whenever the calling party places a call to that input connection from their station.

The central location stores the unique identifying data of one or more authorized calling party subscribers. A signal on the central station input connection attempting to establish communications between the exchange and the central location
causes the system to compare the data of the identifying signal associated with the connection attempt with the contents in the data storage.

In response to a favorable comparison, a call is originated from this central location to the calling party station. Signals are then received from the calling party station for identifying a called party station with which the calling party desires to establish a communication connection. That is, these calling party originated signals identify a third party station. The central location finally bridges a communication connection between the calling party station and the third party station.

Preferably, the present invention responds to a favorable identification comparison as mentioned above by returning an audible signal to the calling party. This indicates the favorable comparison result so that the calling party will know to terminate the call attempt so as to allow the central location to originate a call to the call originating station. Failure of the calling party to terminate the call attempt a predetermined period of time after the recognition signal is given or from the time of commencement of an attempt to establish a connection from the calling party station terminates further processing of the connection attempt at the central location.

Connection attempt termination, because of the time-out function or a failure to produce a favorable comparison, can trigger a process which results in temporarily establishing a communication connection with the calling party station for presenting an audio message thereto. The central location typically will disconnect from the calling station after completion of an audio message.

The present invention is particularly well suited for advantageously utilizing the calling party identifying data in the form of the contemporary direct inward dial number produced by the exchange. Thus, the central location stores in a memory the direct inward dial number for each calling party authorized to utilize the system. Following a favorable comparison of the calling party number with a stored number, the system obtains the direct inward dial number from storage for placing that number on an output connection to the exchange.

A failure of the called party to answer the call attempt from the central location can result in provision of an indication to the calling party that they can select between terminating connection attempts or attempting to establish a connection with another third party. The invention can accommodate establishment of a multiple party conference call in response to calling parties instructions to the central location.

The system is likewise well suited for receiving and collecting management and billing information on calls established by the system. This enables a determination of the extent of use of the system by authorized and/or unauthorized calling parties. After establishing a communication connection with the calling party station, the central location can respond to a special signal originated from the calling party station so as to terminate further communication and communication attempts with the calling party station. This invention can utilize a dual tone multi-frequency signal as the above mentioned special signal from said calling party station.

The method and apparatus of this invention provides an economical telephone service by employing the most advantageous tariff between all originator and one or more called parties. A service center is established at which a call-back telephone number is provided for each originator, and at which a number is assigned for use for all calls that are placed by that originator. The assigned number is used to call the service center whereupon the originator is identified by the service center.

A signal is sent from the service center to the originator thus indicating that the originator is identified whereupon the originator is instructed to terminate the call. Sensing originator call attempt termination, the service center responds by seizing a first outbound circuit over which the service center outputs the call-back number for the identified originator thereby reconnecting the service center to the originator.

The originator is prompted to input the telephone number of the called party the originator intends to call. A second outbound circuit is seized at the service center whereupon the called party number is outputted to the second outbound circuit. Bridging the originator to the second outbound circuit thus connects the originator with the called party.
From this, it appears the inventor used "service center" and "central location" interchangeably. Defendants argue that "service center" means "a single location housing the service center master system which has: (a) a computer or switch including integrated components for performing switching functions to handle circuit connections, including a circuit connection to receive DID service from the LEC central office, (b) the database controller, (c) the DTMF generator, (d) the bridging function, and (e) the subscriber table server (the database)." Cygnus argues that "service center" "certainly does not mean 'a single location housing' particular equipment" because "it is commonplace for international call-back providers to have equipment and personnel at more than one location." Regardless of what the standard industry practice may now be, the patent itself shows that the inventor clearly preferred that the process or system apparatus of the invention be located at a "central location" ("service center") and adaptable for easy relocation to interface with the most economic tariff rate location wherever that was physically located. Therefore, although the inventor may have contemplated the possibility of having the system equipment located at more than one place despite his preference for a central location, by use of the term "service center" in claim 1 of the '027 patent the inventor is referring to a "central location" rather than a series of separate locations. "Service center" means the central location at which the system apparatus carries out the process of the invention.

6. "Service monitor": n6 A network monitor that provides local real-time analysis of network packets transmitted by a network entity, such as a gateway, router, firewall or proxy server.

Fenner argues "service profile" "describes the services for which a personal identification number is authorized," but Defendants contend this term means, "a description of the valid service area and any authorized calling services (e.g., call waiting, paging, voicemail)." For the following reasons, the Court construes "service profile" to mean, "a description of services for which a personal identification number (as construed herein) is authorized."

Defendants agree that a service profile describes services a PIN is authorized to use, but do not agree to Fenner's construction because it suggests that a PIN may only have one service profile. By inserting "the" before "services," Fenner's construction may improperly suggest that a PIN may only be authorized for one service profile, but it is clear from the patent that a PIN may be associated with more than one service profile. Thus, the Court will cut the word "the" from Fenner's proposed construction.
Regarding whether "valid service area" is necessarily a part of the "service profile," n4 Defendants point out that Claim 8 is dependent from Claim 1, and provides, "a mobile user is denied log-on if the switch is not in valid service area for the service profile maintained by the billing authority identified by the billing code." Col. 6, In. 59-62. Defendants argue Claim 8 establishes that the service profile referred to in Claim 1 includes a "valid service area," but the language of Claim 8 does not necessarily require such a limitation, and the specification provides "[a] service profile identifies the services available to a particular personal identification number." Col. 2, In. 45-47. Accordingly, the Court construes "service profile" to mean "a description of services for which a personal identification number (as construed herein) is authorized."

n4 Defendants' examples of calling services "call waiting, paging, and voicemail" are not supported by the claims or specification, and the Court will not include them in the construction.

4001

B. "service provider"

The term "service provider" is found in the preamble of the '404 patent's claim 9: "A method of making communication process management decisions in a wireless over-the-air communications system having a plurality of service providers and an MTSO comprising . . . ." This term is used throughout the specification, e.g., "a wireless over-the-air communications system that can efficiently work with emergency service providers," ('404 patent, 8:25-27), "billing and taxing issues are important to current land based wireless communications systems service providers," ('404 patent, 14:37-39), and "two or more bordering service providers could erect single cells on or very near the border," ('404 patent, 14:61-62) (emphasis added). The plaintiffs state that the ordinary meaning of "service provider" is clear and unambiguous and thus requires no construction. The defendant's proposed construction is a "provider of wireless communications service (i.e., wireless carrier)."

Centennial contends that one of ordinary skill in the art, reading the claim language and specification, would understand that the term "service provider" refers to wireless service providers (providers of wireless communications services). Centennial argues that whenever the specification uses the term "service provider" without qualifiers, the term always refers to wireless service providers: e.g., "competing service providers can locate their cell sites anywhere where the wireless reception will allow them to provide the best wireless coverage of their territory." ('404 patent, 8:58-61) (emphasis added).

EMSAT and LBS argue that the plain and ordinary meaning of "service provider" is self-evident, and the scope of this term should not be limited to wireless carriers. The plaintiffs note that the specification's use of "service provider" is not limited to only wireless service providers: "It is another object of the present invention to provide a wireless over-the-air communications system that can efficiently work with emergency service providers." ('404 patent, 8:25-27) (emphasis added). Most importantly, claim 39 illustrates that the term "service provider" includes emergency service providers: "wherein said service provider includes an emergency service provider." See Phillips, 415 F.3d at 1314 (noting that "the usage of a term in one claim can often illuminate the meaning of the same term in other claims"). 1 As such, the court holds that "service provider" is not limited to wireless service providers and construes this term to mean "a company that makes services available to third parties."

GO BACK
8. "a service providing network accessible node" ('702 patent)

**Beneficial's Proposed Construction**
"a device or devices (such as computers or servers) used for providing a service that is accessible over a network"

**Defendants' Proposed Construction**
"server that provides a particular service and that can be accessed via the communications network"

The Court finds that the primary difference between the parties' proposed constructions is that Defendants limit the term to a singular node of a specific type, a server, whereas Beneficial argues for a much broader construction for the term node as device or devices. The Court finds that the term network, as used in the claims and illustrated throughout the specification, exists separate and apart from the "network accessible node" and the "SPNAN." The Court finds that in the claims, "node" appears in the context of a "service providing network accessible node" and a "first network accessible node." The Court finds that there is no limitation in the specification or prosecution history that the service providing network accessible node be limited to a server. Thus, the Court rejects Defendants' proposal. The parties agree that the phrase "first network accessible node" means "a user's device that can be accessed via the communications network." The parties' agreed upon construction implies that a node is a type of "device." Thus, the Court construes the phrase "service providing network accessible node (SPNAN)" to mean "a device used for providing a service that is accessible via the communications network."

**4003**

"Service request(s)"

"Service request(s)" means "a solicitation of services from a client to a server. A service request may entail the exchange of any number of messages between the client and the server." See IEEE Standard Dictionary of Elec. & Elecs. Terms, at 974-74 (6th ed. 1996). Amazon's proposed construction limits this to an HTTP request message using the 1995 version of HTTP. For reasons already discussed, the Court rejects this limitation.

**4004**

Disputed Claim Term 5: Service Response

A significant portion of the oral argument was consumed with the dispute over the meaning of the term "service response." Tacoda proposes that it be construed as follows: "Information stored in association with the Web address of the downloaded Web page that controls user access to additional Web page functionality." Modavox offers a much more general definition: "A response to a query, including a reply or non-reply."

It behooves me to place the phrase in context.

The first thing that happens after the first code module issues the first command to retrieve the second code module is that the a second code module "having a service response" is "assembled" in response to "said issuing operation." The first code module then issues a second command, which initiates execution of the second code module at the end user's computer (the processor platform) in response to the request. ('636 patent Claim 1). So the service response is something that is assembled (built/programmed) into the second code module.

Modavox's proposed definition is quite broad; literally any answer to any type of question would fall within the term "service response." Tacoda's proposal is narrower. It contends that the service response is information, stored in connection
with the downloaded Web page (i.e., the one that contains the first code module embedded therein), that "controls user access" to some additional functionality (such as streaming media, as in the preferred embodiment). Tacoda adopts this definition because, in its view, the specification discloses only three possible service responses -- predetermined service (which is, for Tacoda, the default mode), denial of service, or customized (conditional) service. Whatever the "service" is, the "response," as far as Tacoda concerned, is either, 'You can access the service," "You can't access the service" or "You can access a customized form of the service." The "service," it seems, is whatever functionality is supposed to be added to the Web page.

The problem with Tacoda's proposed definition is that it conforms exactly to a dependent claim in the patent, which means that the principle of claim differentiation would be violated if the term were so defined. Dependent Claim 8 of the '636 patent discloses, "A method as claimed in claim 1 wherein said service response is one of a denial of service indication, a conditional service indication, and a predetermined service." Under the doctrine of claim differentiation, discussed above, one presumes that Dependent Claim 8 adds some new and different requirement that is not present in the independent claim (Claim 1) from which it derives. The only new requirement that is apparent from the language of the claim limits the service response to one of the three responses claimed in Dependent Claim 8. Thus, the term "service response," which appears in Claim 1, must not be limited to the three possible responses set forth in Claim 8 -- which is to say, it must be possible for a "service response" to me something other than one of the three answers specified in Claim 8.

Similarly, Dependent Claim 11(as well as Independent Claim 17) identifies the "service response" as "a metaphor," which the parties advise (and the specification confirms, see 5:47-53) is a software device that exists in the realm of electronic communication and has a counterpart in the real world -- for example, a graphic (visual) representation of something that looks and behaves like its real world counterpart. In the specification, the patentee uses the example of a representation of a radio image, which, when mouse-clicked by an end user, "turns on" to connect the end user with a music channel. So while not all "service responses" are "metaphors," some service responses may be (indeed, pursuant to Claim 17, will be). This accords with the preferred embodiment disclosed in the specification, which uses metaphors to indicate whether service is accepted or denied.

In light of the above, the court concludes that the service response referred to is indeed, the "reply to a query" (the answer to a question), as Modavox contends -- but it is not the answer to any and every question. Rather, as used in these patents, it is the answer to a very specific question: "Will you, the end user, accept this service and on what terms?" The answer need not be limited to "yes" or "no" and it need not be displayed in the form of a metaphor. But it must be an answer to that singular question.

This definition is in keeping with the specification's disclosure that the invention is "able to tailor the added function based on information about the Web page in which the first code module is embedded and based on visitor specified preference." (14:35-38)(Emphasis added). At oral argument, Tacoda suggested that "visitor specified preferences" would include pop-up blockers, cookie blockers and parental controls -- features that render a particular web site compatible with the end user's preferences. In defendant's view, the "service response" determines whether an end user will have access to the additional Web page functionality that is added as a result of the plaintiffs' invention. I agree that all of the disclosures of the patent support such a view of what the "service response" might be. Additionally, defining "service response" as the answer to the question, "Will you accept this service and on what terms?" accords with the natural meaning of the words "service" (something that is provided) and "response" (answer or reply).

Defendant insists that its definition is the only possible definition in view of the prosecution history. Among the prior art cited by the Patent Examiner in his Office Action rejecting the '791 application as "obvious" was the Fields patent. The Examiner drew a parallel between the "service response" claimed by Modavox and an aspect of Field called the "filter definition." In a January 2003 Amendment filed to the '791 application, Modavox explained the difference between the "service response" and the "filter definition" as follows:

[Certain] passages from Fields [were] cited in the Office Action Although the correlation is unclear, Applicants presume that the Examiner is drawing a parallel between the claimed service response and the Fields filter definition. Applications describe the claimed service response on page 14, lines 17-26 as being a media appliance metaphor, a media appliance metaphor with a slash through it, or the absence of any media appliance metaphor. Moreover, as recited in amended claim 6, the service response is included in the second code module. The Fields filter definition is not a service response included in the second code module, as recited in amended claim 6. Rather, the Fields filter definition is used to modify the content of
Tacoda argues that this response to the Examiner effectively disclaims any other meaning for the term "service response" than one of the three media appliance metaphors described in the preferred embodiment.

Modavox's use of the words "the claimed services response" (highlighted in the paragraph quoted above) could be read as indicating that it intends to limit what it is claiming in that manner. However, I do not so read it. Rather, Modavox is specifying what is claimed at a particular point in the specification; it them distinguishes Fields on the basis that the feature of Fields considered analogous to the service response by the Examiner -- the filter definition -- is not included in the second code module.

The citation to the patent application in the above-quoted passage refers to language found in the '636 patent at 7:42-60. That language plainly and unmistakably supports the court's conclusion, it clearly discusses "service response" in terms of whether the end user's processor will accept or reject the "service" offered -- the "service" being the Web page with added function. Whether the answer to that question takes the form of a metaphor (with or without a slash) appears irrelevant to the meaning of the term.

I thus conclude that the answer to the question, "Will you accept service and on what terms?" is not limited to Claim 8's "Yes, yes with explanation and no" -- and is certainly not limited to metaphor form -- in all instances. Such a conclusion accords with the doctrine of claim differentiation.

Therefore, the court will define the term "service response" as follows:

"The service response is the answer to the question, "Will you the end user accept (display) the web page containing added function, and on what terms will you accept it?"

C. "service-specific information about a state of the client service session"

PlaceWare's proposed construction for the above claim phrase is "the current conditions of an active communication between the server running a particular service application and a client computer." Again Pixion splits the claim phrase, construing it in three parts: (i) "service-specific information," (ii) "state of the client service session," and (iii) "client service session." For "service-specific information," Pixion professes: "information that describes the internal state of the service session." For "state of the client service session," Pixion proposes: "information about the services that is normally meaningful only to the specific service." Finally, Pixion construes "client service session" as "the use of a particular service by a single client-user (from the opening of the service to the closing of the service)." The Court finds Pixion's three-part construction confusing and, most importantly, inconsistent. The construction of the individual claim terms does not provide a coherent construction of the claim phrase "service-specific information about a state of a client service session."

Here, again, Pixion relies too heavily on the preferred embodiment, see Pixion's Br. at 8 and col. 17:62-66, without illuminating the disputed claim terms. In other words, Pixion's proposed constructions are recitations of the terms themselves, which PlaceWare accurately points out. See Reply Br. at 7-9. While Pixion's constructions are generally accurate they are unhelpful. In contrast, the Court finds PlaceWare's proposed construction accurate as well as comprehensive. The Court notes Pixion's concerns about the improper broadening of the claim language with PlaceWare's inclusion of "active communication." Pixion argues that "the 'communication' must be limited to 'server-specific information' as contemplated in the specification and claim language." Pixion's Br. at 8:24-26. However, the Court finds that PlaceWare's proposed definition does clarify that the "active communication" is one that occurs between the server running a particular service application and a client computer. This sufficiently sets the boundaries of the claim phrase.

Accordingly, the Court construes "service-specific information about a state of a client service session" as follows:

"the current conditions of an active communication between the server running a particular service application and a client computer"
"Session"

"Session" means "a series of requests and responses to perform a complete task or set of tasks between a client and a server system." Amazon's proposed construction limits a session to an "uninterrupted series of requests and responses." This limitation is unsupported by the specification. The specification contrasts two embodiments in which the user gains access to a document. In one, the user has a prepaid subscription and gains access by an authorization indicator embedded in a session identifier, allowing the user to access the document multiple times during the prepaid period. In the other embodiment, the user is charged and billed each time he views the document. Taken together, these embodiments disclose that a session can be either interrupted or uninterrupted. Additionally, Amazon's proposed construction requires that the client be identified by its network address and user name or address. This limitation is unsupported by the claim language. Claim 2, which is dependent to claim 1, requires that the session identifier include a user identifier. It is presumed that an independent claim does not include a limitation that is expressed in a dependent claim. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004). Accordingly, in order for claim 2 to have any meaning, claim 1 must not require the inclusion of a user identifier in the session identifier. Thus, the preferred embodiments and the claim language contradict Amazon's proposed limitations.

"Port" as "a defined physical or logical connection where data enters or leaves a network device."

"Switching" and "transferring" as "shifting or reassociating PPP state to another session associated with the new call set-up message."

The court construed "session" to be "a PPP session."

The parties' agreed upon construction of "PPP Session" is "the time during which a communications device and a network access server are maintaining a negotiated PPP state."

The parties' agreed upon construction of "PPP State" is "a set of parameters negotiated pursuant to PPP sufficient for a PPP session."

Based on the parties' agreement at the claims construction hearing, the court construed "dormant PPP Session" as "a PPP session in a dormant state."

Claim Four of the '531 Patent recites, "The method of claim 1 which further allows a user to repeatedly add and interchange recordable CDs between a CD reader and a recordable CD drive using sessions." (531 Patent, col. 6, ll. 41-43). Similarly,
Claim Fifteen of the '686 Patent states, "The method of claim 1 wherein the method is repeated to create multiple sessions on the same compact disc." (686 Patent, col. 19, ll. 56-57).

Each party's proposed claim construction of "Session" is as follows:

<table>
<thead>
<tr>
<th>Optima's Proposed Claim</th>
<th>Roxio's Proposed Claim</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Session&quot;</td>
<td></td>
</tr>
<tr>
<td>An area on a recordable compact disc consisting of a Program Area, where user data is recorded, and when finalized (closed), a Lead-In Area and a Lead-Out Area.</td>
<td>A finalized portion of a recordable disc.</td>
</tr>
</tbody>
</table>

The parties' dispute over the term "Session" is based on whether a session must be finalized or not. The customary meaning of the term "Session," as established in the Orange Book, is "[a]n area on the [compact] disc consisting of a Lead-In area, a Program area and a Lead-Out area." ORANGE BOOK, p. 141. Moreover, the Orange Book makes clear that a session need not be finalized, but can be "if the Lead-in and Lead-out Areas of the Session are recorded." Id at 179. The Court finds that this is the correct construction of the term "Session" as used in the '686 Patent.

Again, however, the Court finds that Optima acted as its own lexicographer and modified the customary definition of "Session" in its '531 Patent. Under the "Definitions" section of that patent, a "Session" is defined as "A finalized portion of a recordable CD." ('531 Patent, col. 3, l. 41.) The Court finds this definition controlling in the '531 Patent because it, like other terms defined in the "Definitions" section of the '531 Patent, is sufficient to provide notice of the term's intended meaning to an individual of skill in the art. See In Re Paulsen, 30 F.3d at 1480. 15

13. Session module

Seven contends that the term "session module" simply means "software on the server." Visto suggests that the term means "a software module on the gateway computer/server computer that controls the tasks for a communication session. The session module may not reside on the client." As the proposals reflect, the parties agree that the session module must reside on the server computer. They disagree, however, on the functionality of the module and, in particular, that the module must "control" the tasks for a communication session.

The specification describes one aspect of the invention as "a server computer, comprising a server data source, a session module, in communication with the server data source, to non-persistently connect to the communications module and access the client database from time to time." '542 patent, col. 2, ll. 52-55. One limitation of claim 1 of the '542 patent reads similarly, requiring "a session module, in communication with the data storage, to non-persistently connect to the communications module and directly manipulate the client database during the connection from time to time." '542 patent, claim 1. From these passages, it does not appear that the claims require the session module to "control the tasks for a communication session." Instead, the claim language describes the functionality required by the routines. Compare '542 patent, claim 1 ("a session module .. to non-persistently connect ... and directly manipulate") with claim 22 ("plurality of session modules executing on the server computer, each session module in data communication with the other session modules, wherein one of the plurality of session modules non-persistently connects to at least one of the plurality of
The court accordingly construes the term "session module" as "a group of software routines located on the server." The balance of the claim language defines the functionality required by the module.

II. Construction of the '684 Patent

Neither party has pointed to extrinsic evidence, other than dictionary definitions of the word "set," to support its claim construction position. The parties agree that the Federal Circuit indulges a "heavy presumption" that a claim term carries its ordinary and customary meaning. Johnson, supra at 989; C.C.S. Fitness, Inc., v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). Further, VendingData agrees that the term "set" should be given its "ordinary" meaning. Opposition Brief at 15. VendingData does not contend that the patentee "acted as his own lexicographer" to explicitly define the term as VendingData would have the court construe it, or that the patentee has disavowed or described the scope of coverage by using words or expressions that manifest exclusion or restriction. The court's task, therefore, is to determine the ordinary meaning of the word "set."

Initially, the court considers the context provided by the remainder of claim 20 and the other claims of the '684 patent. See, e.g., Abbott Labs. v. Syntron Bioresearch, Inc., 334 F.3d 1343, 1351 (Fed. Cir. 2003)("The usage of disputed claim terms in the context of the patent claims as a whole informs the proper construction of the terms."); see also Vitronics, supra at 1582 ("we look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention"). The term "set" appears more than once in claim 20. The third and fourth elements of claim 20 refer to delivery of an "individual set." Shuffle Master contends that its proposed construction is consistent with its different use of "set" and "individual set." Specifically, Shuffle Master contends that "the use of the more specific term 'individual set' for the delivery tray confirms that the more general term 'set' is entitled to a broader scope consistent with the ordinary meaning of 'set."

Opening Brief at 12. VendingData argues that since claim 20 discloses a "method for delivering hands of randomly mixed cards from an apparatus," and claim 20 addresses the delivery of a "first individual set" or a "second individual set," an "individual set" must be one hand. Opposition Brief at 17-18. Thus, if an "individual set" is one hand, then "at least one set" means one or more hands (or parts of hands). Id.

The claim language supports VendingData's construction. First, the court is reluctant to construe "set" to mean one thing in one element and something quite different in another element of the same claim. "Certainly, the same word appearing in the same claim should be interpreted consistently." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1310 (Fed. Cir. 1999)(citations omitted); see also Frank's Casing Crew & Rental Tools, Inc. v. Weatherford Int'l Inc., 389 F.3d 1370, 1377 (Fed. Cir. 2004)("The same terms appearing in different portions of the claims should be given the same meaning unless it is clear from the specification and prosecution history that terms have different meanings at different portions of the claims.").

Secondly, a review of the prosecution history indicates that the term "individual" was not used to narrow the scope of the term "set." Rather, because the Patent Examiner had rejected claim 20 as being "anticipated by [the] Kelley [patent]," the term "individual" was simply used to distinguish the '684 patent from U.S. Patent No. 5,431,399 (the Kelley patent). Opening Brief, Exh. J ("File History") at 11. The Kelley patent discloses an apparatus that evenly divides a 52-card deck directly into four 13-card bridge hands, without forming any set between the deck and the outputted hands. See id. generally at Exh. L. It appears that the term "individual" was used in order to "more clearly define" that the '684 patent delivers individual hands, one at a time, whereas the Kelley patent is designed to form multiple hands at the same time. File History at 10. As explained to the Patent Examiner:

Kelley deals all of the hands at the same time into distinct shelves from which the hands are directly removed, each
distinct shelf holding a distinct hand. These shelves are the equivalent of a delivery tray. The nature of the Kelley device requires that all hands be formed at the same time in the distinct shelves.

The present claim requires that sets of cards be formed inside the apparatus and then that individual sets of cards be provided to a delivery tray from the sets of cards (either with one set of cards being a complete hand or by sets of cards being combined to form a complete hand) and that subsequent hands be provided to the delivery tray after an earlier hand has been removed, providing a second individual hand into the delivery tray ...

Id. at 14-15, see also Opening Brief at 14-16 (illustrating Kelley patent).

Finally, the fact that the claim language refers to "at least one" set is significant. The "at least one" language contemplates that there are one or more sets of cards within the apparatus. According to the specification, more than one "set" of cards can be contemplated within the apparatus only if the term "set" refers to the cards within each compartment. The specification explains that each card-receiving compartment is filled with the assigned number of cards for a hand or with discards. The "first individual set" (or hand) is delivered to the delivery tray from these compartments filled with cards. Because a hand is delivered to the delivery tray, and the cards in that hand come from the "at least one set" of cards within the apparatus, the cards in that compartment cannot simply refer to a "number of cards." If it did, then the method contemplated by claim 20 - "delivering hands of randomly mixed cards from an apparatus" - could not be accomplished.

Shuffle Master also contends that consideration of unasserted claim 36 strengthens the conclusion that the term "set" is used more broadly than urged by VendingData. Ordinarily, each claim in a patent has a different scope. See, e.g., Karlin Tech. v. Surgical Dynamics, 177 F.3d 968, 972 ((Fed. Cir. 1999). Under the doctrine of claim differentiation, "when a patent claim does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim in determining either validity or infringement." SRI Intern. v. Matsushita Elec. Corp. Of Am., 775 F.2d 1107, 1122 (Fed. Cir. 1985). Claim 36, like claim 20, refers to activity within the apparatus. However, unlike claim 20, claim 36 uses the terms "first individual group" and "second individual group." Claim 37 specifies that each formed group of cards is a "hand of cards." Claim 36 is not particularly helpful. VendingData has not attempted to use the term "individual" in claim 36 to modify or limit claim 20's "at least one set." VendingData does not rely on the term "individual" to support its position that "set" means a hand or part of a hand. See Opposition Brief at 18-19.

Lastly, looking to the '684 patent specification and prosecution history, there is additional evidence supporting VendingData's construction of claim 20. Because the words in a claim are not meant to be considered in a vacuum, the particular use of those words in the patent cannot be ignored. See Toro Co. v. White Consol. Indus., 199 F.3d 1295, 1301 (Fed. Cir. 1999). The specification is "the single best guide to the meaning of a disputed term." Vitronics. supra at 1582. Contrary to Shuffle Master's contention, VendingData has not read limitations into claim 20 by relying on a preferred embodiment in the specification. See Zenith Lab., v. Bristol-Myers Squibb Co., 19 F.3d 1418, 1423 (Fed. Cir. 1994). Rather, VendingData points to the specification as a whole to determine the ordinary meaning of the claim. Its references to the specification are not limited to how the terms are used in the preferred embodiments. See Generation II Orthotics, Inc., v. Medical Tech., Inc., 263 F.3d 1356, 1367 (Fed. Cir. 2001) (a claim's scope cannot be limited by "importing a characteristic of a disclosed or preferred embodiment into that term"). For instance, the specification provides:

In one embodiment, an apparatus moves playing cards from a first group of unshuffled cards ["the at least one deck of playing cards"] into shuffled hands of cards, wherein at least one and usually all of the hands contains a random arrangement or random selection of a preselected number of cards. In one embodiment, the total number of cards in all of the hands is less than the total number of cards in the first group of unshuffled cards (e.g., one or more decks of playing cards). In another embodiment, all of the cards in the first group of unshuffled cards are distributed into hands.

'684 Patent at col.4:25-34 (emphasis added). Moreover, in addition to the specification's references to the broader fact that the '684 patent supports the delivery of hands from the apparatus, the specification contains repeated, specific references to the formation of hands within the apparatus. The following excerpts are illustrative:

Each slot or compartment [located within the apparatus] may therefore be identified or treated to receive individual hands or defined numbers of randomly selected cards or the slots may be later directed to deliver individual cards into a separate hand forming slot or tray. In the first example, a hand of cards is removed as a group from an individual slot. In the second example, each card defining a hand is removed from more than one compartment (where one or more cards are removed
from a slot), and the individual cards are combined in a hand-receiving tray to form a randomized hand of cards.

* * *

Generally, the operation of the card handling apparatus of the present invention will form at least a fixed number of hands of cards corresponding to the maximum number of players at a table.

* * *

Preferably, a vertical rack assembly or the carousel or partial carousel assembly has nine compartments. Seven of the nine compartments are for forming player hands, one compartment forms dealer hands and the last compartment is for accepting unused or discard cards.

* * *

When actuated, the second card moving mechanism empties a compartment by pushing the group of cards therein into a card receiving platform. In this way, a complete hand is pushed out, with usually one hand at a time fed to the card receiving platform (or more properly, card retrieving platform). The hands are then, usually, manually retrieved by a dealer and placed at player positions.

Id. at col. 4-5:61-4 (emphasis added), col. 6:22-26 (emphasis added), col. 13: 46-51 (emphasis added), col. 20-21:65-6 (emphasis added); see also col. 5:45-48, col. 7: 31-34. On the other hand, the specification contains no reference to the formation of "a number of cards" within the apparatus. Hence, the language of the specification does not support Shuffle Master's argument that to one skilled in the art, the term "set" means "a number of cards."

Additionally, because claims issue after an examination process, the particular use of claim language and the applicant's statements in the patent's prosecution history cannot be ignored. Toro, supra at 1299. Here, the prosecution history contains express representations made by Shuffle Master regarding the scope of the meaning of "set." Originally, the Patent Examiner rejected original claim 20 under 35 U.S.C. § 102(b) as being anticipated by the Kelley patent. In response, Shuffle Master amended claim 20 and dependent claims 21-26 to add many of the terms now at issue. All references to "hands" were changed to "sets of randomly mixed playing cards." Shuffle Master also advanced an argument to the Patent Examiner why the claim, as amended, was not anticipated by Kelley. Referring to the method disclosed by the '684 patent, Shuffle Master stated:

This method is impossible to perform with the Kelley apparatus. It is practiced in the present invention, for example, by the formation of the complete or partial hands within the apparatus, then delivery of the complete hands or partial hands plus cards to complete the partial hands, into the delivery tray.

File History at 15 (emphasis added).

Shuffle Master contends that its statements in the prosecution history are insignificant because it never used "words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Opening Brief at 13-14 (emphasis in original). The court disagrees. Because VendingData has not relied on the prosecution history to support an interpretation that constricts the usual meaning of the terms or the meaning supplied in the written description, VendingData need not show that Shuffle Master expressly limited the scope of the term "set." See, e.g., Storage Tech. Corp. v. Cisco Sys., 329 F.3d 823, 833 (Fed. Cir. 2003)(clear and unambiguous disavowal of claim scope required to depart from the meaning provided by the written description). Rather, Vending Data relies on the prosecution history to support an interpretation of claim terms that is consistent with both the specification and the usual meaning of the term. Indeed, VendingData concedes that the ordinary meaning controls.

Relying on Gemstar-TV Guide Int'l, Inc. v. ITC, 383 F.3d 1352, 1375 (Fed. Cir. 2004), Shuffle Master contends that the use of the expression "for example" illustrates that it was merely giving examples of the differences between its patent and the Kelley patent. Citing to other portions of the prosecution history, VendingData contends that Shuffle Master did more than merely provide examples of what could comprise the "at least one set" of cards formed within the apparatus of claim 20. VendingData contends that Shuffle Master "unambiguously defined" the meaning of "set." Opposition Brief at 22.
VendingData relies on the following statements made by Shuffle Master to the Patent Examiner:

The present claim 20 requires at least one set of cards to be formed in the apparatus and then a first individual set to be delivered to a delivery tray from the sets of cards (either with one set of cards being a complete hand or by sets of cards being combined to form a complete hand), subsequent removal of the first individual hand, and the forming of a second individual hand on that deliver tray.

* * *

The present claim requires that sets of cards be formed inside the apparatus and then that individual sets of cards be provided to a delivery tray from the sets of cards (either with one set of cards being a complete hand or by sets of cards being combined to form a complete hand) and that subsequent hands be provided to the delivery tray after an earlier hand has been removed, providing a second individual hand into the deliver tray (either with one set of cards being a complete hand or by sets of cards being combined to form a complete hand) ... .

File History at 14-15 (emphasis added). VendingData correctly notes that none of these statements uses the words "for example" or otherwise suggests that the parenthetical definitions were merely illustrative. According to Shuffle Master's unequivocal statements to the Patent Examiner, the "sets" formed in the apparatus either constitute a complete hand or part of a hand. Shuffle Master specifically inserted language ("either ...or ...") to alert one skilled in the art to the ordinary meaning it now asks this court to reject. See, e.g., Voice Techs. Group, Inc. v. VMC Sys., Inc., 164 F.3d 605, 615 (Fed. Cir. 1999)("The inventor cannot by later testimony change the invention and the claims from their meaning at the time the patent was drafted and granted."). Thus, the '684 patent specification, and the arguments made by Shuffle Master to the Patent Examiner in order to obtain issuance of claim 20, provide further support for VendingData's construction of the term "set."

Finally, the court notes that in advancing their respective constructions the parties point to dictionary definitions of the term "set." According to the Cambridge Advanced Learner's Dictionary, a "set" is defined as "a group of similar things that belong together in some way." Opening Brief, Exh. I. For instance: "We bought Charles and Mandy a set of cutlery as a wedding present ... I always keep a tool set in the back of my car ... The doctor said that he hadn't seen this particular set of symptoms before ... We need to establish a new set of priorities." Id. The second definition defines "set" as "a number of items or pieces of equipment needed for a particular activity, especially playing a game: a chess/train/chemistry set." Id. (italics in original). Based on these definitions, Shuffle Master contends that "at least one set of cards" should be construed to mean "a number of cards." VendingData argues that Shuffle Master's construction of "an undefined, fluctuating, functionless number of cards" fails to comport with either of the above dictionary definitions of the term "set." Opposition Brief at 16. Specifically, VendingData argues that

Shuffle Master's view of a 'number of cards' is not 'a number of items or pieces of equipment needed for a particular activity, especially playing a game.' Logically, the number in a 'set' must mean the number of items needed for someone to engage in the activity or to play the game. What are involved in this case are card games. A 'set' of cards accordingly must be a hand or hands, or part of a hand or hands.

Because the intrinsic evidence provides a sufficient basis for construing the term "set" as used in claim 20, the court need not address the parties' disagreement over the dictionary definitions in question. See Phillips v. AWH Corp., supra.

The intrinsic evidence in this case compels the conclusion that VendingData's construction is most consistent with the ordinary meaning of the words in the claim and specification, and the patentee's statements during prosecution. Based on the foregoing, the court concludes that the word "set" as used in claim 20 means "a hand or part of a hand" of cards, such that the second element of claim 20 should be construed to mean "creating one or more discrete hands or discrete parts of hands within the apparatus from the at least one deck of playing cards."
The parties' dispute with respect to the construction of this term is the same as their dispute with respect to claim terms three, four, and five: whether runlengths of zero length are necessarily required by the claim terms. Plaintiff proposes that this term should be construed as: "A sequence of zero or more values;" while Defendants propose that it should be construed as: "A count of consecutive first values followed by said second value;" "A count of consecutive first values followed by one or more of said other values." As with the proposed constructions of term five, the Court perceives little if any substantive difference between the proposed constructions for term nine. While neither construction necessarily requires that runlengths of zero length be used, both allow runlengths of zero length as a possibility. Additionally, the Court is not persuaded that this term would be clarified further by using either "sequence" or "count" instead of set. No party has addressed whether there is any difference between the terms "sequence" and "count" or why it would be beneficial to use either of these terms rather than "set." Accordingly, without any persuasive argument for giving term nine any construction other than its plain meaning, the Court will provide no additional construction for this term.

Shuffle Master owns U.S. Pat. No. 6,655,684 ("the '684 patent"), which is entitled "Device and Method for Forming and Delivering Hands from Randomly Arranged Decks of Playing Cards." Only claim 20 of the '684 patent is at issue here. Shuffle Master alleges that one of VendingData's automatic shufflers, the PokerOne, infringes that claim. VendingData contends that the PokerOne does not fall within the scope of the claim, as properly construed.

Automatic card shufflers, which have been available for some time, deliver hands of randomly mixed playing cards. Claim 20 of the '684 patent recites a particular method for delivering shuffled hands, which comprises:

- providing at least one deck of playing cards;
- forming at least one set of cards within the apparatus from the at least one deck of playing cards;
- delivering to a delivery tray from the at least one set of cards within the apparatus a first individual set of randomly mixed playing cards for a game;
- delivering the first individual set of randomly mixed playing cards from the delivery tray of the apparatus, with all cards in the first individual set delivered at the same time, and then providing a second individual set of randomly mixed playing cards into the delivery tray.

For present purposes, the critical claim limitation is the one that recites "forming at least one set of cards within the apparatus from the at least one deck of playing cards." Before the district court, VendingData contended that the PokerOne does not form a "set of cards within the apparatus" within the meaning of that phrase in the asserted claim.

VendingData offered evidence that the PokerOne operates by randomly ejecting cards from an unshuffled deck to form an "internal stack" within the apparatus. The random ejection process continues until the internal stack contains at least 21 cards. When the number of cards required for at least two hands of the game that is being played have been collected in the internal stack, the device begins the dealing process. The PokerOne deals by delivering cards to the output tray, one-by-one from the bottom of the internal stack, until a complete hand is formed in the output tray. When that first hand of cards is removed from the output tray, the dealing process begins again, and new cards are delivered, one-by-one from the bottom of the internal stack, to the output tray to form a second hand. After each hand of cards is removed from the output tray, additional cards are ejected from the unshuffled deck into the internal stack, while at the same time new cards are delivered to the output tray to form another hand.

Shuffle Master argued to the district court that the internal stack formed in the PokerOne falls within the limitation requiring that "at least one set of cards [be formed] within the apparatus." In its papers opposing the motion for a preliminary injunction, VendingData argued that the specification and the prosecution history make clear that the internal stack formed within the PokerOne device does not read on that limitation, because the "set of cards" limitation covers only a set of cards...
constituting a single hand or a part of a hand. Consequently, according to VendingData, the internal stack is not a "set of cards," because no hands or portions of hands are formed there. Instead, cards simply accumulate in the internal stack until the stack contains at least 21 cards, and the dealing process does not begin until the number of cards in the internal stack is equal to at least two hands of cards. The hands, according to VendingData, are formed for the first time when cards are delivered, one-by-one, to the output tray.

In making its claim construction argument in the district court, VendingData referred to the portion of the specification in which the patentee described the operation of the claimed shuffler. According to the specification, the device described in Shuffle Master's patent randomly places cards into slots or compartments. Each of those slots or compartments, according to the specification, "may therefore be identified and treated to receive individual hands of defined numbers of randomly selected cards or the slots may be later directed to deliver individual cards into a separate hand forming slot or tray." '684 patent, col. 4, ll. 62-65. In the first case, "a hand of cards is removed as a group from an individual slot." Id. col. 4, ll. 66-67. In the second case, "each card defining a hand is removed from more than one compartment (where one or more cards are removed from a slot), and the individual cards are combined in a hand-receiving tray to form a randomized hand of cards." Id. col. 4, line 67 through col. 5, line 4.

VendingData also relied on the prosecution history to support its proposed construction of the "set of cards" limitation. VendingData argued that the patentee restricted the method to "forming hands inside the unit." In particular, VendingData noted that in response to a rejection by the patent examiner, the patentee stated that claim 20 requires sets of cards to be formed within the apparatus and requires individual hands to be formed from those sets, "either with one set of cards being a complete hand or by sets of cards being combined to form a complete hand."

Following arguments by counsel regarding the request for a preliminary injunction, the district court issued an injunction barring the sale of the Poker One. Although the question of the proper construction of claim 20 was clearly in dispute, the court did not address the claim construction arguments made by VendingData and did not provide an explicit construction of the critical claim language. Rather, the court simply concluded that Shuffle Master was likely to succeed on the merits in proving that the operation of the PokerOne infringes Shuffle Master's rights under claim 20 of the '684 patent. The district court also found that Shuffle Master was likely to succeed on the merits in proving that the '684 patent is valid, that Shuffle Master showed that the effect of sales of the PokerOne would result in irreparable harm to Shuffle Master, and that the public interest in protecting patent rights supported the issuance of a preliminary injunction.

VendingData subsequently made requests for modification and clarification of the preliminary injunction order. VendingData also requested a stay of the injunction pending appeal. In its request for a stay, VendingData argued that the district court had failed to construe the critical language of claim 20 and that its failure to do so undermined its conclusion that the operation of the PokerOne likely infringed the claim. The district court denied each of those requests. A panel of this court, however, granted a stay of the injunction pending the disposition of the appeal, noting that the district court had failed to construe the claim.

II

As its principal ground for appeal, VendingData asserts that this case turns on the proper construction of the limitation that requires the formation of "at least one set of cards within the apparatus." Accordingly, VendingData contends, the district court's failure to provide any explicit construction of that claim language renders the preliminary injunction improper.

A

Shuffle Master argues at the outset that VendingData did not preserve its present argument that the district court should have conducted at least a preliminary claim construction. We have reviewed the parties' submissions to the district court, and we conclude that VendingData adequately preserved its argument on that point. First, VendingData featured its claim construction argument in its papers in opposition to the preliminary injunction. Second, in its motion to the district court for a stay of the preliminary injunction order, filed approximately three weeks after the original order was entered, VendingData complained that the district court "did not analyze any specific claim or claim element of the patent." Third, VendingData made the same point in its reply memorandum to the district court in support of its motion for a stay. n1
In support of its argument that VendingData waived its right to contest the district court's failure to conduct an adequate claim construction, Shuffle Master points to VendingData's submission of a proposed order in the injunction proceedings. The submission of such an order does not constitute a waiver of challenges to the propriety of entering the injunction. The order simply reflected VendingData's understanding of the grounds for the court's ruling. In any event, when it submitted a proposed order granting the injunction, VendingData stated that it "reserved its right to challenge" the court's findings of fact and conclusions of law "at a later time."

From our review of the record, including those pleadings, it is evident that the definition of the term "set of cards" played a prominent role in the proceedings. In particular, VendingData made it clear that the outcome of the case would likely depend on the court's construction of claim 20. VendingData raised the claim construction issue prior to the court's ruling and protested the inadequacy of the court's claim construction after the ruling. For that reason, we do not agree with Shuffle Master that VendingData has waived its right to raise on appeal the district court's failure to provide a sufficient construction of the claim language.

We have held that a district court does not have to conduct a comprehensive and final claim construction in a preliminary injunction proceeding. Sofamor Danek Group, Inc. v. DePuy-Mitech, Inc., 74 F.3d 1216, 1221 (Fed. Cir. 1996). Similarly, it is not necessary for a court to conduct an explicit claim construction if the claim construction issue is a simple one that needs no analysis, or in which there is no reasonable ground for dispute as to claim meaning. Toro Co. v. Deere & Co., 355 F.3d 1313, 1322 (Fed. Cir. 2004). However, a district court in a preliminary injunction proceeding has the duty to determine whether the movant is likely to prevail on the merits, and if that question turns on a contested issue of claim construction, the court must give the claim construction issue the attention necessary to determine the likelihood of success. In this case, the dispute over the meaning of the "set of cards" limitation is central to determining whether Shuffle Master is likely to prevail on the merits of its infringement claim. The district court was therefore required to provide some form of claim construction, even if abbreviated, preliminary, or tentative.

Shuffle Master argues that the phrase "at least one set of cards within the apparatus" means any number of cards that serve as the source from which the apparatus delivers hands to the delivery tray. Under that construction, it appears likely that the PokerOne device would infringe, since the internal stack in the PokerOne forms within the device and serves as the source from which dealing begins after the collection reaches a size equal to two hands of cards of the game being played. On the other hand, VendingData argues that the "set of cards within the apparatus" must be construed to refer to a set consisting of no more than one hand of cards. Under that interpretation, it appears likely that the PokerOne device would not infringe, since the internal stack accumulates cards until it contains at least two hands of cards before dealing begins. Thus, resolution of the claim construction issue framed by the parties is of critical importance to the issue of infringement.

Seizing on the fact that the dealing process in the PokerOne device begins as soon as the internal stack contains the number of cards needed for two hands, Shuffle Master contends that the PokerOne therefore operates in accordance with claim 20, even under VendingData's proposed construction, because the PokerOne "forms two hands of cards within the apparatus as the source for the delivery of the first and second hands of cards to the tray." In other words, Shuffle Master argues that the PokerOne device infringes even under VendingData's proposed claim construction (or at least the construction put forth before the district court). That, however, does not appear likely to be the case.

In the court below, VendingData argued that claim 20 requires "that a hand (or partial hand) of cards be formed inside the shuffler from a deck of cards" and that "no hands are formed within the PokerOne." VendingData further argued that the PokerOne "does not form a hand (or partial hand) until the number of cards required for a hand have been delivered one-at-a-time to the external output tray." In other words, under VendingData's proposed construction the PokerOne likely does not infringe because no hand or hands are actually formed within the apparatus; the accumulation of a number of cards equal to two hands is not the same as the formation of a hand or hands within the device. Accordingly, in the absence of any claim construction by the district court we cannot accept Shuffle Master's argument that the dispute over claim construction is immaterial to the outcome of this case and that Shuffle Master is likely to succeed on the merits regardless of which claim construction is ultimately adopted.
While claim construction is a question of law, the district court's analysis is important to the process of claim construction, and in this context, as in others, we decline to construe the claim without the guidance of the district court's construction. See Nazomi Commun., Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1371 (Fed. Cir. 2005) ("This court's review of a district court's claim construction, albeit without deference, nonetheless is not an independent analysis in the first instance. Moreover, in order to perform such a review, this court must be furnished 'sufficient findings and reasoning to permit meaningful appellate scrutiny.'"); Anchor Wall Sys., Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1311 (Fed. Cir. 2003) ("In order to review the court's finding of noninfringement, we must know what meaning and scope the district court gave to the asserted claims."); Gechter v. Davidson, 116 F.3d 1454, 1460 (Fed. Cir. 1997) (vacating and remanding decision of the Board of Patent Appeals and Interferences because it failed to "set forth ... specific findings of fact and conclusions of law adequate to form a basis for ... review"; noting that "claim construction must ... be explicit, at least as to any construction disputed by [the] parties"); Graco, Inc. v. Binks Mfg. Co., 60 F.3d 785, 791 (Fed. Cir. 1995) ("entire omission of a claim construction analysis from the opinion ... provides an independent basis for remand"). We therefore vacate the preliminary injunction and remand this case to the district court for further proceedings consistent with this opinion.

MAYER, Circuit Judge, dissenting.

While I agree that trial courts should provide an express claim construction, I do not believe this case requires vacatur and remand. Instead, because the trial court would not have abused its discretion in granting the preliminary injunction under either party's proposed claim construction, I would affirm.

We have recognized that the lack of an express claim construction by the trial court may require a remand in certain circumstances. See Graco, Inc. v. Binks Mfg. Co., 60 F.3d 785, 791 (Fed. Cir. 1995). However, common sense dictates that if a likelihood of infringement is established under both parties' proposed constructions, then the trial court did not abuse its discretion in granting the preliminary injunction, so long as all other criteria were met. * Cf. Toro Co. v. Deere & Co., 355 F.3d 1313, 1322 (Fed. Cir. 2004) (affirming an infringement finding in the absence of an express claim construction because no claim construction was offered that would avoid infringement); Optical Disc Corp. v. Del Mar Avionics, 208 F.3d 1324, 1334 n.4 (Fed. Cir. 2000) (reviewing a noninfringement judgment on the merits based on a claim construction inferentially set forth by the trial court). Here, bearing in mind that the application of the claims to the accused device is a question of fact upon which we afford deference to the trial court, Bai v. L & L Wings, 160 F.3d 1350, 1353 (Fed. Cir. 1998), I believe a finding of likelihood of infringement under either party's proposed claim construction is fully supported.

* Although the trial court must independently construe the claims and may reject either party's proposed claim construction, it appears that the only possible constructions here are those alternatives argued by the parties.

It is clear from the evidence, as the court concedes, ante at 6-7, that Shuffle Master established a likelihood of infringement under its own proposed construction. The disputed contention, however, is whether infringement was shown to be likely under VendingData's proposed construction. VendingData contends that "a set of cards" means "a discrete hand or part of a hand." Under that construction, however, the trial court could have determined that the internal stack consisted of multiple sets, wherein each set consisted of no more than one hand of cards. This determination is possible since the claims clearly allow more than one set of cards within the apparatus. See U.S. Patent No. 6,655,684 claim 20 (requiring "at least one set of cards within the apparatus" (emphasis added)). Although the sets are not physically divided, they are arranged or organized in the internal stack. ** Moreover, requiring that the sets be physically separated, such as placed into slots or trays as in the embodiment disclosed in the specification, would amount to reading a claim limitation into the claims from the specification. See Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005) ("Although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments." (citations omitted)).
** After the trial court issued its injunction, the magistrate conducted a claim construction analysis and issued his recommendations to the district court. Vendingdata Corp. v. Shuffle Master, Inc., 2005 U.S. Dist. LEXIS 38685, No. 04-1373 (D. Nev. Sept. 26, 2005) (Report & Recommendation). Although these recommendations were not before the trial court when issuing the preliminary injunction and have not yet been accepted by the trial court, it is worth noting that the parties appear to have agreed that "forming" means "create" where "create" includes "arranging," "organizing," and "ordering." 2005 U.S. Dist. LEXIS 38685 at *7 n.1.

This understanding is further supported by the fact that the PokerOne recognizes each set within the internal stack as separate and distinct. In particular, the PokerOne delivers the first set, which is a single hand of cards, from the internal stack to the output tray. After the first hand is removed from the output tray, a second set, which also constitutes a single hand of cards, is delivered to the output tray. Therefore, a factual determination by the trial court that the PokerOne is likely to infringe under VendingData's construction is not reversible error.

Finally, despite VendingData's arguments to the contrary, I believe that Shuffle Master sufficiently established the remaining criteria necessary for a preliminary injunction, including irreparable harm. In particular, Shuffle Master presented evidence that its commercial product under the patent accounts for 50% of its business and that VendingData sought to significantly decrease pricing. This evidence is sufficient to support a finding of irreparable harm and the remaining factors are not challenged on appeal. Therefore, bearing in mind that "the decision to grant a preliminary injunction is within the sound discretion of the district court," Ranbaxy Pharms., Inc. v. Apotex, Inc., 350 F.3d 1235, 1239 (Fed. Cir. 2003) (citations omitted), I dissent.

** A Claim Construction Order was issued construing the disputed claim language of the '694 patent, including "set" and "color" from the claim language "reference set of colors." In the '694 patent, set denotes "a group of two or more articles grouped together according to a system of classification" and color means a "particular hue or tint being one of the constituents into which white or colorless light can be decomposed, the series of which constitutes the spectrum; also any mixture of these" as well as "the quality or attribute in virtue of which objects present different appearances to the eye."

Claim Construction Order at 2, 24. In addition, the Claim Construction Order noted that "[a]s is recited in Claim 1 of the '694 Patent, the end goal of the color-matching system [of the '694 patent] is to generate a 'colour map and/or enhanced photograph identifying the colour(s) of the associated articles relative to an absolute set of colour(s) so that an objective color-match can be made. …[And c]omparing an article's colors against that of an absolute reference set with a single color would result in a binary match or no-match result, effectively eviscerating the purpose of the patent."

Claim Construction Order at 2, 24. In addition, the Claim Construction Order noted that "[a]s is recited in Claim 1 of the '694 Patent, the end goal of the color-matching system [of the '694 patent] is to generate a 'colour map and/or enhanced photograph identifying the colour(s) of the associated articles relative to an absolute set of colour(s) so that an objective color-match can be made. …[And c]omparing an article's colors against that of an absolute reference set with a single color would result in a binary match or no-match result, effectively eviscerating the purpose of the patent." Claim Construction Order at 16, 18-19 (quoting '694 patent, col. 6: 30-32) (footnote omitted).

Set of identification information; set of log-in information; set of log-in data

The parties agree all three terms should be accorded similar meanings, but propose different constructions. MyMail proposes that "set of identification information" be construed as "information reflecting a user's identity, such as a PAP ID, used to authenticate the user's right to communicate with an ASP via an NSP" and the other two terms be construed as "information or data used to authenticate a user's right to connect to the network via an NSP." Defendants propose all three terms be construed as "user ID and password." The Court adopts elements of both proposed definitions for "set of identification information" and substantially adopts MyMail's definition for the other two terms.

"Set of identification information" appears in Claim 13. Read in the context of that claim, it is synonymous with "access information," which "comprises the previously mentioned access telephone number, the PAP ID, the PAP password, and
additional ISP specific information required by the user [] to gain access to the Internet [] via the predetermined ISP." 6:42-46. MyMail's definition, in large part, flows from this portion of the specification. Defendants assert their definition is correct since, according to the specification, the "set of identification information" must include at least a user ID and password. Defendants also assert that the structure of the claim language already reflects that additional information may be included, so the definition of "set of identification information" should only reflect the minimum requirements of a user ID and password. Although the Court agrees in principle with Defendants' argument, adopting Defendants' proposed construction would in practice do little to "elaborate the normally terse claim language in order to understand and explain . . . the scope of the claims." Embrex, 216 F.3d at 1347. The Court instead adopts a definition with a structure similar to MyMail's proposal and defines this term as "information reflecting a user's identity, such as a PAP ID or PAP password, used to authenticate the user's right to communicate with the network." This definition reflects the open-ended nature of this term yet also sets the elements necessary to authenticate a user's rights as threshold requirements.

"Set of log-in information" and "set of log-in data" are cleanly defined by the claims in which they appear. To the extent definition is necessary, the Court defines both terms as "information or data used to authenticate the user's right to connect to the network." This definition flows directly from the claim language. As such, MyMail's "via an NSP" limitation is redundant.

"Set of indices for referencing data in said information database." Used in claims 1 and 37.

To one skilled in the art, the terms "index" and "indices" do not always refer to a list, such as one finds at the back of a reference book. In the context of data management, an index can be a single data item. This is how the term is used in this patent. See 505 patent, col. 6, 11. 31-36; see also The IEEE Standard Dictionary: Compilation of IEEE Standard Computer Glossaries: 610 107 (1990) (definition one).

The parties initially disputed whether an index was used to "identify and/or locate specific items of data" (Finsar's proposal), or merely to "locate specific items of data." (DirecTV's suggestion). At the hearing the following definition was discussed: "pieces of digital information, (each of which contains an identification value, and in many cases other information) used to reference specific items of information in the database." Finisar agreed with this formulation. DirecTV preferred to replace "reference" with "select."

The claim language itself is "referencing data in said information database." The patentee did not provide a special definition of "reference." There is no indication in the patent that "referencing" has any special technical meaning, or is used in any sense other than the widely accepted and commonly understood meaning of "refer to." The specification describe:

1. a "set of indices referencing all of the data in the information database . . . ." 505 patent, col. 6, 11. 38-39;

2. "a set of assigned indices to reference each distinct portion . . . ." of the information in the database. 505 patent, col. 13, 11. 23-24; and

3. "The indices associated with reference data . . . may be embedded in various portions of the transmitted data for the purposes of cross-referencing related information." 505 patent, col. 13, 11. 33-36.

It is true that the indices may be used in various ways, such as to select data packets, col. 5, 11. 28-30, or to request data, col. 5, 11. 45-52. While various uses are illustrative, they are not needed for the jury to understand the definition, nor to describe how a person skilled in the art would understand the word. This claim term is therefore defined as follows:

"Set of indices for referencing data in said information database" means "the pieces of digital information, (each of which contains an identification value plus, in many cases, other information) used to refer to specific items of information within the database."
Set of identification information; set of log-in information; set of log-in data

The parties agree all three terms should be accorded similar meanings, but propose different constructions. MyMail proposes that "set of identification information" be construed as "information reflecting a user's identity, such as a PAP ID, used to authenticate the user's right to communicate with an ASP via an NSP" and the other two terms be construed as "information or data used to authenticate a user's right to connect to the network via an NSP." Defendants propose all three terms be construed as "user ID and password." The Court adopts elements of both proposed definitions for "set of identification information" and substantially adopts MyMail's definition for the other two terms.

"Set of identification information" appears in Claim 13. Read in the context of that claim, it is synonymous with "access information," which "comprises the previously mentioned access telephone number, the PAP ID, the PAP password, and additional ISP specific information required by the user [] to gain access to the Internet [] via the predetermined ISP." 6:42-46. MyMail's definition, in large part, flows from this portion of the specification. Defendants assert their definition is correct since, according to the specification, the "set of identification information" must include at least a user ID and password. Defendants also assert that the structure of the claim language already reflects that additional information may be included, so the definition of "set of identification information" should only reflect the minimum requirements of a user ID and password. Although the Court agrees in principle with Defendants' argument, adopting Defendants' proposed construction would in practice do little to "elaborate the normally terse claim language in order to understand and explain . . . the scope of the claims." Embrex, 216 F.3d at 1347. The Court instead adopts a definition with a structure similar to MyMail's proposal and defines this term as "information reflecting a user's identity, such as a PAP ID or PAP password, used to authenticate the user's right to communicate with the network." This definition reflects the open-ended nature of this term yet also sets the elements necessary to authenticate a user's rights as threshold requirements.

"Set of log-in information" and "set of log-in data" are cleanly defined by the claims in which they appear. To the extent definition is necessary, the Court defines both terms as "information or data used to authenticate the user's right to connect to the network." This definition flows directly from the claim language. As such, MyMail's "via an NSP" limitation is redundant.

<td>Comparing a detected program classification code to one or more user selected codes.</td>
</tr>
</tbody>
</table>

Both Guardian and the NG Parties agree that "comparing the detected code" means "comparing a detected program classification code." The sole dispute centers on the term "to a set of selected codes," which appears in claims 8, 9, 19, and
20.

i. Parties' Arguments

The NG Parties urge the Court to define "set of selected codes" as "more than one code." They argue the phrase "set of codes" is clearly plural, therefore, requires the inclusion of multiple codes. In their reply, the NG Parties make a cursory reference to the specification.

Guardian argues "set of selected codes" means "one or more user selected codes." First, Guardian relies on mathematical definitions. Guardian cites the definition of the word "singleton" in Webster's dictionary, which means "a set consisting of one given element." (Harsell Decl. ISO Def. Motion, Ex. 7 at 5.) Additionally, Webster's defines a "set" as "a collection of objects or elements classed together." Id. Further, Guardian cites two cases finding "set" to have a plain meaning of "one or more." Dow Jones & Co. v. Ablaise, Ltd., 2007 U.S. Dist. LEXIS 49750, at *12 (D.D.C. July 11, 2007); Power-One, Inc. v. Artesyn Techs., Inc., 2007 U.S. Dist. LEXIS 20458, at *26-27 (E.D. Tex. Mar. 22, 2007).

Moreover, Guardian believes the NG Parties represented to the PTO that a "set" means "one or more" during reexamination. Guardian asserts the NG Parties argued a prior art reference involving "one or more" codes satisfied the "set of selected codes" limitation in the '158 patent. (Hartsell Decl, Ex. 16, "Request for Ex Parte Reexamination" at 15.) The PTO agreed and found when a user selects "one or more rating levels," a set has been selected. Id. at 5, 12. Guardian believes the Court should not allow this inconsistent argument because the NG parties violated their duty to act with "candor and good faith" during reexamination, citing Ball Corp. v. Xidex Corp., 967 F.2d 1440 (10th Cir. 1992).

ii. Analysis

The claim language supports the proposed construction by the NG Parties. Regardless of how the Court defines the word "set," the Court's interpretation of the word "codes" is dispositive. Turning to the language of the claim, the patentee decided to use the plural word "codes" when defining the contents of the set. This indicates he intended the contents of the set to be multiple selected codes. If he had intended the set to contain only one code, he could have used the singular word "code." Accordingly, the use of the plural "codes" weighs in favor of the NG Parties' construction.

This inference is supported by the claim language adjacent to the disputed term. The patentee used the word "code" earlier in the claim element. Specifically, the claim requires the "comparing of the detected code to a set of selected codes." The use of the singular "detected code," closely followed by the plural "codes," indicates an intent to distinguish between the plural and singular forms. Accordingly, the claim language supports the definition proposed by the NG Parties.

The specification does not compel a different conclusion. Throughout the specification, the patent only exemplifies "set of codes" as multiple codes. (See '158 Patent, Col. 3:37 - 4:31.) For example, in column four of the patent, the specification describes an embodiment where the set of codes is comprised of "three bits, corresponding to the classifications: (1) Violent, (2) Sexually explicit, and (3) Adult only." (158 Patent, 4:11-15.) Although the specification cannot impose additional limitations into the claim, in this case, it reinforces the plain meaning of the claim.

The "duty of candor and good faith" does not estop the NG Parties from presenting their definition. The "duty of candor and good faith" requires parties to a patent reexamination to "bring materials to the attention of the PTO as they 'are aware, or become aware' of them." Ball Corp., 967 F.2d at 1447. This duty is codified at 37 C.F.R. § 1.555, which only addresses the duty to disclose information. The section simply does not apply to arguments made during the reexamination. During reexamination, the NG Parties argued a specific piece of prior art, the Chard reference, allowed "a user to select one or more rating levels that will be blocked, for both video and audio, thereby 'enabling selection of a of a set of classification codes.'" (Hartsell Decl., Ex. 16 at 12.) Guardian does not indicate what materials were withheld from the PTO, therefore, the Court rejects this argument. 4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 Moreover, even if a reviewing court believed estoppel could apply, the statement regarding the Chard reference is not in direct contradiction to the current position of the NG parties. The NG Parties noted the Chard reference allowed a user to select ratings levels for both the video or audio. This would require the selection of two codes, a.k.a., more than one code.
The extrinsic sources submitted by Guardian are unpersuasive. Guardian submits the declaration of Richard Ferraro, an expert in the field. Ferraro believes one ordinarily skilled in the art would understand "set of selected codes" to mean "one or more selected codes." (Ferraro Decl., Ex. 11 to Hartsell Decl., P99.) However, the opinion is conclusory and only addresses the definition of "set" without explaining why "codes" would mean one code.

In sum, the language of the claim, the specification, and extrinsic sources all support the proposed construction of the NG Parties.

iii. Construction

The Court construes the term "comparing the detected code to a set of selected codes" as "comparing a detected program classification code to more than one code, each of which has been assigned a value by the user."

C. "Set-Up Signaling Associated with the Call"

Claims 1 and 35 of the '064 Patent include the phrase "set-up signaling associated with the call." Sprint would construe this phrase to mean a message or messages used to set up the call, a construction that follows the Court's construction of the term "set-up signaling" in V onage. See 518 F. Supp. 2d at 1317-18. Big River seeks to construe the phrase to mean a signaling message created at call initiation used to select a pre-provisioned virtual connection for the call. Big River thus seeks to inject two additional limitations into the Court's prior construction.

In V onage, the Court noted that its construction was supported by excerpts from the specification's background and summary of the invention. See id. at 1318. The Court rejected V onage's attempt to limit the claim term to mean a narrowband signaling message, noting that the specification's references to initial address messages (IAMs) (a type of narrowband signaling) were merely exemplary. See id. at 1317-18.

Big River first argues that the construction of this phrase should include the requirement that the signaling message be "created at call initiation." The claims do not include such a limitation. The Court does not agree that the language "associated with the call" bears on this issue of whether the message must be created at call initiation. Big River also points to the very same references in the specification to IAMs that the Court found to be merely exemplary in V onage. Big River stresses that it is not attempting to limit the claim to IAMs, but argues that the IAM examples are consistent with, and therefore support, its argument based on the claim language. Again, however, the Court cannot conclude that the claim language permits Big River's inclusion of the "created at call initiation" requirement.

With respect to its addition of language relating to the selection of a PPVC, Big River relies on its previous argument concerning the construction of the term "identifier". The Court rejects that argument for the same reasons stated above. See supra Part IV.B. Moreover, as Sprint points out, the claim language indicates that the set-up signaling is processed to select a DS0 connection, not a PPVC.

Accordingly, the Court rejects Big River's additions to its previous construction, and it construes the phrase "set-up signaling associated with the call" to mean a message or messages used to set up the call.

4021

G. "Set-up Signaling"

Claim 1 of the '064 patent recites the claim term "set-up signaling." Sprint contends that this claim term should be construed
to mean information or commands used to set up calls. In support of this argument, Sprint relies on a portion of the background of the invention which states that "[s]ignaling refers to messages that are used by telecommunications networks to set-up and tear down calls." '064 Patent at 1:25-26. Vonage contends that this claim term should be construed to mean a narrowband signaling message. Vonage relies on an excerpt from the summary of the invention which states that "[t]he signaling for the call could be a call set-up message, such as Signaling System # 7 (SS7) initial address message (IAM)." id. at 2:25-27 (emphasis added), and a portion of the detailed description which states that IAM (which is indisputably a narrowband signaling message) "initiates the call and contains call set-up information, such as the dialed number. LAMs [another abbreviation for initial address message] are transferred in the calling direction to set up the call." Id. at 17:43-46.

Vonage's argument is an attempt to limit the plain meaning of the claim term based on the specification. An inventor may use the specification to intentionally disclaim or disavow the broad scope of a claim. Phillips, 415 F.3d at 1316. This intention, however, "must be clear." Conoco, Inc. v. Energy & Envtl. Intl, L. C., 460 F.3d 1349, 1357 (Fed. Cir. 2006); see also Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002) ("The patentee may demonstrate an intent to deviate from the ordinary and accustomed meaning of a claim term by including in the specification expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope."). Here, the specification of the '064 patent does not contain a clear disavowal of claim scope. The background of the invention broadly refers to messages that are used to set-up and tear down calls. The summary refers to signaling that could be a call set-up message, and gives IAM as an example. The detailed description which sets forth a description of IAM call processing appears to be simply a continuation of IAM being an example of call set-up messaging. Consequently, the specification does not clearly disclaim or disavow the broad scope of the claim.

The excerpts from the background and summary of invention establish that "set-up signaling" means "messages used to set-up calls." Sprint also contends that the disclosed "messages" necessarily contain "information or commands." Sprint has not, however, directed the court to any evidence in the intrinsic record which requires such a claim construction and therefore the court rejects that argument. Accordingly, the court construes the claim term "set-up signaling" to mean a message or messages used to set up calls.

B. The Meaning Of The Disputed Term "Set(s) Of Information"

Adobe contends that the phrase "set(s) of information" should be construed to mean "a collection of tools or commands used to perform operations on a document." (D.I. 241 at 18). Macromedia contends that the phrase "set(s) of information" should be construed to mean "data naturally connected by location or order." (D.I. 292 at 5).

In construing the phrase "set(s) of information," the Court has considered the specification of the '528 Patent and the prosecution history of the '528 Patent. (See D.I. 255, Ex. A, '528 Patent, Col. 1, lines 8-20, 56-65, Col. 2, lines 43-67; D.I. 255, Ex. B, Paper # 4 at 4-5). Based on this review, the Court construes the phrase "set(s) of information" to mean a collection of tools or commands used to perform operations on a document.

13. Setting the traffic path analysis data of the web site cookie to initial values if the website cookie has expired (First Appearing in claim 1 at col. 12, ll. 65-67, and as used similarly in claims 1-31)

The parties dispute the meaning of the phrase "setting the traffic path analysis data of the website cookie to initial values if the website cookie has expired." See Joint Claims Construction Chart at 6. Websidestory contends that the phrase does not need construction outside of the individual terms which the Court has already construed. Joint Claims Construction Chart at 6. Netratings contends that the phrase should be construed as "replacing existing website traffic analysis data in the website cookie with the website traffic path analysis data for the current website consisting of the current website page requested and cumulative values and statistics set to zero." Joint Claims Construction Chart at 6.
The Court concludes that the terms "setting . . . to initial values" and "expired" have readily apparent ordinary and customary meanings, and do not need to be construed by the Court. Though Netratings argues that "setting . . . to initial values" actually requires the replacing of the data in an expired cookie with a new set of data, the Court concludes that Netratings' proposed construction which utilizes the word "replacing" in lieu of "setting" would improperly import limitations into the claims from the specification. Callicrate, 427 F.3d at 1368; Phillips, 415 F.3d at 1312. The Court also notes that there is no evidence that the '479 Patent intended the word "setting" to be used in a manner inconsistent with its ordinary meaning. Teva Pharms., 395 F.3d at 1370-72. Finally, the Court notes that it cannot re-write claims in a patent. ChefAm., 358 F.3d at 1374.

After reviewing the '479 Patent and the parties' arguments, the Court concludes that no construction is necessary.

4024

3. "shadow set"

HP asks the Court to construe this term as: "Two or more copies of data that may be located in different places. If a change is made to any copy, that change is reflected in the others." EMC proposes: "Two or more identical copies of data that has been written to a storage medium, and that are treated as one from the host processor's point of view. If a change is made to any copy, that change is automatically made to the other copies."

At first glance, the plain language of the claim appears to indicate that a "shadow set" is composed of storage media that are accessible by one or more host processors for I/O requests. The claim states that data are transferred between different storage media within a shadow set and that the storage media are accessed by a host processor. The shadow set thus would comprise defined storage media that contain the data to be transferred within the defined storage media. However, in the context of the claim, the language "shadow set of storage media" could mean a limited set consisting of part of the storage media that contain a shadow set. In other words, a shadow set could be composed of data that are moved between storage media, in which case the identity of the storage media would be irrelevant. Indeed, the parties characterize a shadow set as "copies of data" either written to a storage medium or located in different places. Thus, it is unclear from the claim language itself whether the shadow set is composed of storage media or data.

The specification indicates that "shadow set" refers to data. For example, the "preferred embodiment is described in connection with a system for establishing and maintaining one or more duplicate or shadow' copies of stored data." 618:1/27-30. Similarly, "systems have been developed that create multiple copies of stored data, usually on separate storage devices. . . . Such multiple copies are known as the shadow set." 618:1/42-47. However, the parties each seek to add an additional limitation relating to whether all copies in a shadow set are identical or reflect each other and whether a change to one copy results in a change on all copies. The specification provides that "[i]n a shadow set, typically data that is stored in particular blocks on one member of the shadow set is the same as data stored in corresponding blocks on the other members of the shadow set." 618:1/47-50. Thus, because the shadow set by definition contains redundant copies of the data, each copy must be the same, and necessarily, any change in one copy correspondingly is made in other copies within the shadow set. If a change in one copy is not made to the others, then that copy no longer can be a member of the shadow set. Dictionary definitions support this interpretation. For example, "shadow" is partially defined as "a link between duplicate objects. . . . If a change is made in either the duplicate or the original, the change takes effect in the other as well." Landgraft Decl., Separate Appendix, vol. 1, p. 0197 (IBM Dictionary of Computing).

EMC proposes adding additional limitations, requiring the copies of data to be "treated as one from the host processor's point of view" and updated "automatically." However, nothing in the claim language or specification supports or requires limiting the claim in this way.

Accordingly, a person of ordinary skill in the art would have understood the "shadow set" term of claim 1 to mean: "Copies of data located on one or more storage media. If a change is made to any copy, that change is reflected in the others."
b. "Shape"

Macromedia contends that the term "shape" should be construed to mean "a definition of an open or closed geometric region, made up of curved or straight lines." (D.I. 470 at 14). Adobe contends that the term "shape" should be construed in accordance with the definition expressly provided in the specification, namely "a mathematical representation of a geometric construct, which can be open or closed, and which is composed of curves or straight lines." (D.I. 479 at 13).

In construing the term "shape," the Court has considered the specification of the '443 Patent. ( '443 Patent, Col. 2, lines 30-32). Because the specification expressly defines the term "shape" as Adobe contends, the Court construes the term "shape" to mean "a mathematical representation of a geometric construct, which can be open or closed, and which is composed of curves or straight lines."

GO BACK

3. Wherein a Shape of Said Predetermined Pressure Profile . . .

This phrase is found in Claims 21 and 43 of the '575 Patent.

Phrase: Wherein a shape of said predetermined pressure profile is set independently of any monitored respiratory characteristics of such a patient

Construction: Wherein the magnitude and duration of the predetermined pressure profile are set without reference to or consideration of any monitored breathing characteristics of such a patient.

Reasoning: The dispute between the parties is whether the shape of the Predetermined Pressure Profile is synonymous with its magnitude and duration, or is a wholly different characteristic. After close review of the intrinsic record, we find that the shape of the profile is made up of its duration and magnitude.

The predetermined pressure profile is used in the less complex, and more cost effective version, of the invention. The predetermined pressure profile is applied to reduce the constant pressure of CPAP or the reduced EPAP pressure of bi-level therapy once the device detects the expiratory breathing phase. According to the teachings of the patent, the predetermined pressure profile has two parts: a magnitude, that represents the drop in pressure from the higher pressure value; and a duration that is ideally based on an average expiration period of the patient. These pre-set or pre-programmed magnitude and duration values approximate the values that would be generated by the proportional version of the invention. '575 Patent, cl. 20, lns. 44-65. Read in context of the language of the patent, the predetermined pressure profile is programmed into the computer with a magnitude value and a duration value so that the device can reduce the pressure during expiration independently of the patient's breath (other than sensing when exhalation begins). '575 Patent, cl. 20, lns. 66-67 and cl. 21, lns. 1-8.

The term shape appears in the '575 Patent four times, apart from being included in Claims 21 and 43. The first three times it appears, it does not refer to the shape of the predetermined pressure profile. '575 Patent, cl. 16, lns. 21, 55; cl. 18, lns. 43-44. The last time the word appears, it does refer to the predetermined pressure profile. '575 Patent, cl. 20, ln. 25. In describing a preferred embodiment of the invention, the patent states that the defined pressure profile has a shape that generally corresponds to a patient's normal flow. Because, in the proportional version of the invention, the patient's normal flow is used to determine the magnitude and duration of the pressure, this reference to the term "shape" indicates that the shape of a profile is comprised of its magnitude and its duration. This reading is further supported by the overall context of the patent, wherein pressure profiles, sometimes called waveforms, are consistently comprised of magnitudes and durations. '575 Patent, cl. 20, lns. 54-58.

This construction is also supported by the prosecution history. The limitation that the shape be set independently of any
patient monitored characteristic was added to these claims to differentiate them from prior art. The prior art generated an expiratory model waveform based on the inspiratory waveform, which was set by monitoring patient flow. Prosecution History, '575 Patent, Response to Office Action (Nov. 24, 1999) at 13. At the time, plaintiff distinguished the prior art by explaining that the shape of its predetermined profile is not based on any monitored respiratory characteristics. Id. In the context of these inventions, the pressure profiles are defined by how large a drop in pressure there will be, and for how long. In that context, the argument that the profile is independent of the respiration of the patient, indicates that these factors, i.e., magnitude and duration, will be set without reference to the patient.

Our construction is also in accord with the dictionary definition of the applicable term. In discussing this issue in the office action response, plaintiffs used the terms waveform profile, waveform, model waveform, and shape of the expiratory waveform model interchangeably. The dictionary definition of a waveform is a graphic representation of the shape of a wave that indicates its characteristics (as frequency and amplitude), called also waveshape. Merriam-Webster's Medical Dictionary (2002).

We do not accept plaintiffs' argument that the "shape" of the profile is separate and apart from the characteristics that define the profile. According to plaintiffs, the pressure profile's shape is "a bathtub." There is no support in the patent for such a construction. The only time that the patent describes how the waveform or profile might look it speaks to the pressure dropping off quickly at the start of expiration and then rising slowly toward the baseline pressure, which actually describes more of an off-center U, or rounded checkmark, shape, rather than a "bathtub" shape. '575 Patent, cl. 20, lns. 61-65. Regardless, in so describing this form, the patent labels it the "contour", not the shape, of the profile. Id.

Based on the patent language and the prosecution history, and buttressed by the dictionary definition of the relevant term, the shape of the pressure profile is its magnitude and duration. And, according to the plain language of the patent, these values must be set independently of any respiratory characteristic of the patient.

Finally, there is no support for plaintiff's argument that the magnitude and duration are not set in Claim 21 because Claim 22 recites the act of setting the magnitude or duration. Claim 22 claims an apparatus "comprising the means for setting" these values. A claim for the means for doing an act does not mean that Claim 21 does not claim the act itself.

4. By Shaping Input Signals and Selected Unwanted Frequencies

The third element of claim 10 also provides:

"… causing the data storage device to alter seek trajectory shape by shaping input signals to the data storage device to reduce selected unwanted frequencies from a plurality of frequencies…" (emphasis added)

The two underlined terms are in dispute. Plaintiff argues that the term "shaping" includes frequency-based filtering, and that "selected unwanted frequencies" can be some or all of the unwanted frequencies. Defendant insists that filtering, which is found in prior art references, cannot be encompassed by the invention. They also argue that the term "selected" precludes selection of all unwanted frequencies.

Defendants' assertion that including filtering in the term "shaping" would result in invalidity is premature. The specification unambiguously indicates that shaping includes conventional filtering techniques. ('473 patent, Col. 22:60 - 67). The patentee's offered construction does not conflict with the explicit language of the claim, and follows from the plain meaning of the term. Rhino v. Casio, 183 F.3d 1342, 1346 (Fed. Cir. 1999) (the court should "sustain the patent and the construction claimed by the patentee himself, if this can be done consistently with the language which he has employed.") This construction may later be found invalid, but it is inappropriate to argue invalidity during claim construction. Rhino v. Casio, 183 F.3d 1342, 1346 (Fed. Cir. 1999) (defendant "cannot avoid a full-blown validity analysis by raising the specter of invalidity during the claim construction phase.")

Accordingly, the term "shaping" as used in claim 10 is interpreted to mean: "applying a transformation to a signal."
The third element of claim 10 also provides: "shaping input signals to the data storage device to reduce selected unwanted frequencies" (473 patent Col. 44 lines 43-45) (emphasis added).

Plaintiffs assert that "selected unwanted frequencies" should be interpreted to mean some unwanted frequencies, and could include, but need not include, all unwanted frequencies. (Pls.' Claim Construction Br. For U.S. Patent No.'s '635, '267, and '473 at 29). Defendants respond that selected cannot encompass all unwanted frequencies. (Defs' Responsive Brief for '473 Patent at 24).

Neither party has presented any special meaning of the term "selected" in the art. The dictionary definition most relevant to the context of the patent is "choose from a number or group." Merriam-Webster's Third New International Dictionary Unabridged, Merriam-Webster, Inc., 1993. Plaintiffs note particularly that when the method reduces certain specific unwanted frequencies, such as would be the case if less than all unwanted frequencies are selected, other unwanted frequencies may also be reduced. (Transcript of Markman Hearing on 3/31/2004 at 278). As a natural consequence of the robustness built into the system, plaintiffs maintain, when any specific frequency is reduced, there will be collateral reductions in other frequencies. (Transcript of Markman Hearing at 279). These arguments do not directly address the question of "selection" of frequencies. A method which reduces frequencies other than those selected is not excluded from the patent since there is no limiting language requiring that only specific frequencies are reduced.

Defendants agree on the ordinary meaning of the term "selected" (Transcript of Markman Hearing at 254), but assert that the prosecution history of the '473 patent discloses a surrender of any method where all unwanted frequencies are reduced. In an interview on May 9, 2001, the PTO asserted that U.S. Patent 6,011,373 (hereinafter "McConnell patent") teaches selection by the user between fast response time and noise reduction mode. Plaintiffs amended the language "reduce unwanted frequencies" to "reduce selected unwanted frequencies from a plurality of frequencies" in the '473 patent. The PTO rejected the "reduce unwanted frequencies" language since "McConnell et al teach that the user can select between the fast response time and noise reduction modes. However, McConnell et al can't reduce selected unwanted frequencies …" (Akerley Dec. Exh. V, PLFS-C 008898). The McConnell invention "allow[s] the user to select a command input from a given group of command inputs … by ranking the importance of three characteristics … response time, robustness, and noise generation potential." (McConnell patent Col. 11 lines 21-25). Whereas the '473 patent identifies specific unwanted frequencies to reduce, and generates a command input which reduces them, the McConnell patent takes a set of pre-determined command inputs, categorizes these commands by the three characteristics above, and applies the input best suited to the user's preference.

Amendments made during prosecution are a guide to understanding the language of the patent, although they do not "enlarge, diminish, or vary the limitations in the claim." Markman, 52 F.3d at 980. Plaintiffs did not give up any claim to a reduction of all unwanted frequencies. The amendment made to overcome rejection by the PTO clearly indicates that the '473 patent is differentiated from the McConnell patent by the fact that the McConnell patent does not perform selective reduction of unwanted frequencies. The McConnell patent applies methods known to reduce all frequencies, and picks one based on the user specified criteria. The term "selected" was imposed to distinguish the '473 patent from the McConnell patent, and it is a significant distinction that the '473 patent targets specific frequencies to reduce as opposed to indiscriminately reducing all frequencies. The fact that under this interpretation the '473 patent could result in a reduction of more than the selected frequencies is unimportant. The inventor has disclosed a method which provides that certain targeted frequencies will definitely be reduced, which the PTO considered sufficiently novel in light of the prior art to grant a patent.

Accordingly, the term "selected unwanted frequencies" as used in claim 10 is interpreted to mean: "at least the chosen unwanted frequencies."

B. "Shared Addressable Memory Space"

Here, the parties' dispute appears to focus on whether the "shared addressable memory space" must be addressed by a common addressing scheme. Oracle asserts that it must, while Mangosoft disagrees. Specifically, Mangosoft says:

The shared addressable memory space is shared by the plural computers. That method of sharing and addressing,
however, need not be through the use of common addresses. Indeed, it is the shared memory subsystem, . . . that allows the different computers to address the shared addressable memory space without the requirement of common addresses. As [Mangosoft's expert] explained, the shared memory subsystem provides the necessary translation to allow the various nodes to address the shared addressable memory space, even if they don't utilize common addresses, or by the analogy, a common language (e.g., some speak English, some French, some Norwegian). While Oracle argued that the nodes all must speak English (or use common addresses), that argument ignores entirely the role of the shared memory subsystem in providing the necessary translation. Moreover, it ignores the claim language that does not contain the "common addresses" limitation, the Federal Circuit law that prohibits reading into the claim limitations from the preferred embodiment, and the doctrine of claim differentiation.

Mangosoft's Supplemental Brief (document no. 46) at 11.

Claim 1 of the '377 patent does not specifically require that the nodes participating in the shared memory system utilize a "common" addressing scheme. Instead, claim 1 simply provides that the memory subsystem component of each participating node tracks the data and available memory space in the system. See, e.g., '377 patent 7:27-37 ("The memory subsystems further track the data stored in the local memory of each node and further operate network connections with network 38 for transferring data between the nodes 12a-12c. In this way, the memory subsystems 32a-32c access and control each memory element on the network 38 to perform memory access operations that are transparent to the operating system 16. Accordingly, the operating system 16 interfaces with the memory subsystem 32 as an interface to a global memory space that spans each node 12a-12c on the network 38."). It would, then, appear that the "memory subsystem" functions in a manner similar to a traditional network server, translating the various addressing schemes utilized by each node on the system.

In other words, the memory subsystem is capable of translating the various "languages" spoken by each participating node; they need not all speak a common language. And, contrary to Oracle's suggestion, claim 1 of the '377 patent does not require the use of either "common memory addresses" or "global memory addresses;" those requirements appear only in particular embodiments of the patented system. The court will not read those embodiments into the patent as limitations. See, e.g., Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) ("Although the specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments.").

Accordingly, the court construes the phrase "shared addressable memory space" to mean memory space distributed across the volatile and non-volatile memory of all nodes participating in the patents' shared memory system (though not necessarily all nodes on the network), which shared memory space can be accessed by the various participating nodes using one or more addresses. The participating nodes need not, however, utilize a common or global addressing scheme. As described in the embodiment depicted in Figure 3 of the '377 patent, the use of a "global address generator" is optional. '377 patent at 8:41-47.

19. Shared context storage mapping (SCSM) information

Claim 35 of the '945 patent recites the phrase "shared context storage mapping information." Biax contends that this term means "information identifying a context file." Intel and ADI argue that this term means "static and dynamic information attached to each instruction identifying the context file assigned to a given user and the register level assigned to a given instruction."

Once again, this term was not defined in the art as of 1985. As such, the court turns to the specification. The patent states:

The additional and required information comprises two components, a static and a dynamic component; and the information is termed "shared context storage mapping" (SCSM). The static information results from the compiler output and the TOLL software gleaned from the compiler generated instruction stream and attaches the register information to the instruction prior to its being received by an LRD. The dynamic information is hardware attached to the instruction by the LRD prior to its issuance to the processors. This information is composed of the context/LRD identifier.
corresponding to the LRD issuing the instruction, the absolute value of the current procedural level of the instruction, the
process identifier of the current instruction stream, and preferably the instruction status information that would normally be
contained in the processors of a system having processors that are not context free.

'945 patent, col. 34, 1. 61-col. 35, 1. 10. Although the language appears in the description of the preferred embodiment, use
of the phrase "is termed" suggests that the patentees were defining the term "shared context storage mapping information."
The court accordingly defines "shared context storage information" as "static and dynamic information that identifies the
register level for the instruction as well as the context file."

8. "shared folder"

The term "shared folder" appears in claims one and two of the '374 patent. Informatica proposes the construction: "A folder
whose contents may be accessed through or by a local repository." 4 BODI proposes the construction "A folder represents
the abstraction for grouping related objects and metadata in a repository. Folders can be of type regular or shared. The
content of shared folder can be accessed by other folders in the same repository, and by other linked repositories if the
shared folder is in a global data mart repository through the use of a 'reference.'"

--- Footnotes ---

4 Again, Informatica indicated in its opening brief that it does not object to the use of BODI's "linked" modifier in lieu of its
proposed modifier "local."

--- End Footnotes ---

Informatica argues that the term should be given its plain meaning. BODI counters that the term has no ordinary meaning in
the art, and thus points the Court to the specification. Informatica's proffered construction is too broad and provides
insufficient detail to be useful going forward. The specification and drawings contemplate that the term "folder" represents
an abstraction for grouping related objects and metadata in a repository. Folders can be of type regular or shared. The
content of shared folder can be accessed by other folders in the same repository, and by other linked repositories if the
shared folder is in a global data mart repository through the use of a 'reference.'"

BODI's proffered construction, on the other hand, is too narrow. The proposed construction reads in detail that is
unnecessary to the definition of a "shared" folder, i.e. that folders can be either regular or shared. Further, the construction
includes a specific feature that is addressed separately in the claim language, namely that the content of a shared folder in a
global data mart repository can be accessed by other linked repositories. This feature in the claim language would be
unnecessary if persons of skill in the art inherently understood that the contents of a shared folder located in a global data
mart repository could be accessed by other linked repositories. Moreover, the final construction can be structured to convey
similar meaning to the term without reading in a limitation from the preferred embodiment.

The only remaining issue is whether the definition of "shared folder" must include the limitation that a reference is used to
access the metadata in the shared folder. A review of the patent reveals that the invention was directed, in part, at a "method
and system for accessing and sharing metadata amongst a number of data marts through the use of object referencing." The
Summary of the Invention teaches that "[g]iven proper authorization, the metadata is accessed through the use of object
referencing." Finally, the detailed description states that the "actual mechanism which allows for the sharing of metadata is
through the use of 'object references.'" Thus, the specification teaches that the invention, as a whole (and not merely as a
preferred embodiment), requires that the content stored in the shared folders is accessed through the use of a reference.

The Court construes the phrase "shared folder" to mean: A folder represents the abstraction for grouping related objects and
metadata in a repository. The contents of a shared folder may be accessed by other folders in the same repository and/or by
other linked repositories through the use of a reference.
B. Effect of Prior Litigation

As stated above, SunTiger prevailed in a prior patent infringement suit against Scientific Research Funding Group (SRFG) on the same patents now in question. Both SunTiger and Sunglass Products have stipulated that the claim construction in the prior suit will control here:

The patents-in-suit have already been construed by the U.S. District Court for the Eastern District of Virginia [and that] construction . . . is binding on the parties in this case. To the extent that the terms in the asserted claims were not construed in the said prior litigation, the parties are asking the Court to make a claim construction based on the arguments submitted in the summary judgment motions.

Stipulation at 1-2. "In a patent litigation action, where the parties do not dispute any relevant facts regarding the accused product but disagree over possible claim interpretations, the question of literal infringement collapses into claim construction and is amenable to summary judgment." Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1324 (Fed. Cir. 2002).

The relevant terms and their stipulated construction are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Stipulated Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;substantially block&quot;</td>
<td>&quot;... in reference to wavelengths, it is defined as blocking over 99% of the incident radiation at each and every wavelength&quot; and &quot;[in] reference to polarization, it is defined as blocking 80% or more of the horizontally polarized incident radiation at each and every wavelength&quot;</td>
</tr>
<tr>
<td>&quot;substantially transmit&quot;</td>
<td>&quot;... in reference to wavelengths, [it] is defined as transmitting more than 1% of the incident radiation at each and every wavelength&quot; and &quot;[in] reference to polarization, it is defined as transmitting more than 20% of the horizontally polarized incident radiation at each and every wavelength&quot;</td>
</tr>
</tbody>
</table>
| "sharp cut-on" | "... sharp cut-on is defined in the context of a dye or filter, having a cut-on slope that at some concentration or dye density rises more than one half percent (0.5%) change in transmission for every one nanometer of increasing wavelength change. The cut-on slope is that portion of the transmission spectra of a cut-on dye that represents the transition between [the] substantially blocking and the substantially transmitting region."
| "cut-on filter" | "... an optical filter that substantially blocks all wavelengths shorter than the cut-on wavelength and substantially transmits all wavelengths that are longer than the cut-on wavelength. The cut-on wavelength is that wavelength in the transition zone at which the transmission is 1%." |
| "portion" | "... part or share of something"

Plaintiff SunTiger contends that this Court cannot apply the stipulated construction in a way that would contradict the finding of the Eastern District of Virginia that YE-82 infringed SunTiger's patents. Pl.'s Mot. at 1 ("[T]he YE-82 lens material must literally infringe whatever claim construction the Court adopts in this case."). In essence, SunTiger argues the following: (1) the parties have stipulated to the prior construction, (2) the decision in the prior suit does not bind this Court, but (3) any ruling that this Court issues must not be inconsistent with the fact that YE-82 was found to infringe its patents.

I disagree with this assessment. My decision is not foreordained by the result in SunTiger, Inc. v. Scientific Research Funding Group. SunTiger attempts to elevate the prior claim construction to the level of a decision. Despite the parties' agreement that the prior claim construction would be binding, that prior court's decision applying its own construction is only persuasive. Although the parties have agreed to be bound to the use of the prior construction, they have not agreed that this Court's application of that construction must be consistent with prior decisions involving a different defendant and different lenses. Indeed, were consistency with prior results necessary, that would be tantamount to an improper form of collateral estoppel against a current party, i.e., Sunglass Products, which was not a party (nor a party in privity) to SunTiger v. Scientific Research Funding Group. Cf. MCA Records, Inc. v. Charly Records, Ltd., 865 F.Supp. 649, 654 (C.D. Cal. 1994) ("[D]ue process requires that the party to be estopped must have had an identity or community of interest with, and adequate representation by, the losing party in the first action as well as that the circumstances must have been such that the party to be estopped should reasonably have expected to be bound by the prior adjudication.").

**4032**

1. "Sheet" and "Sheet-like"

The parties contend that the proper construction of claim terms "members of conductive sheet material" (claim 1) and "electrically conductive sheet-like members" (claim 6) is critical to this appeal. We agree. The pertinent portion of the district court's "claim meanings" reads as follows (emphasis added):

"Sheet" or "sheet-like" mean conductive material that can be shaped to furnish electrical contact between the resistor and the outside contact in the steering column and can be shaped into contacts with a long dimension along the axis of the key. The use of the sheet in the claims merely shows the advantages of that method and is not a part of the claim.

The district court erred when it instructed the jury that the use of the term "sheet" is "not a part of the claim." The claimed "members of conductive sheet material" (claim 1) and "electrically conductive sheet-like members" (claim 6) are clearly limitations of the claims. Although the claims themselves do not define the terms "sheet" and "sheet-like," the specification variously refers to "sheet metal," "flat sheet metal," "conductive sheet metal," and "electronically conductive sheet metal." In addition, the applicants added the references to "sheet" and "sheet-like" to the independent claims in their response to the first examiner's action. This is apparent from the following example, which is the result of our comparison between originally filed claim 1 and issued claim 1 (text that is present in the issued claim but absent from the original claim is underlined and text that is absent from the issued claim but present in the original claim is bracketed):

A packaged electronic component includes an insulating body, [completely enclosing] an electronic chip disposed within the insulating body and having a pair of terminals, and two members of conductive sheet material which connect to opposite terminals, the two members extending laterally from said terminals to the outside of the insulating body and forming a pair of runner-like leads that terminate said laterally extending members [which are electrically connected to the terminals of the chip and which extend outwardly from said body, said leads being particularly adapted for making and breaking sliding electrical contact with stationary contacts in an electronic circuit].

As may be seen, the added limitations more particularly define how the terminals of the electronic chip are electrically connected to the runner-like leads. In their amended claim, the applicants made it clear that conductive sheet material connects to the terminals of the electronic chip and forms the runner-like leads. Similar limitations were added in the other independent claim that eventually issued as independent claim 6. Importantly, the applicants also specifically relied on these new limitations in the remarks portion of their first amendment. They distinguished the teachings of U.S. Patent No. 3,808,506, which describes wire leads electrically connecting circuit elements to button contact pads, by arguing that in their claimed invention the electrical connection between the electronic chip and the runner-like leads is provided by members of conductive sheet material, as opposed to wire leads, extending laterally from the terminals of the electronic chip.
to the outside of the insulating body.

A review of the '482 patent and its prosecution history reveals that the terms "sheet" and "sheet-like" do not have any special meanings in the art and that the '482 inventors used these terms in their ordinary, everyday sense, i.e., to describe something flat with a fairly broad surface relative to its thickness. The claims thus include within their literal scope only devices with conductive material that comprises a fairly broad surface relative to its thickness.

**4033**

I. "shift register"

a shift register connected to said latching device; and wherein:

the display data and timing signals enter said shift register;

said shift register passes on a portion of display data to said latching device for retention for a certain period of time; and

said interface means receives display data from said shift register via said latching device and provides signals to said first and second sets of drivers.

Defendants propose that this term should be construed as "[a] register in which, at each common shift clock cycle the pattern of 0's and 1's in the register shifts to the right or left, with the data at the input of the register entering from the left or right, respectively." Honeywell agrees that Defendants' proposed construction is a well known description of a "shift register," but Honeywell contends that the term "shift register," as used in the '823 patent, also has a broader meaning, i.e. "a circuit 1 that includes an array of linearly connected cells which receive binary digits that, in response to clocking, shift in a common direction." Honeywell's proposed construction essentially states that a shift register is any circuit that contains a "shift register" as construed by Defendants.

--- Footnotes ---

1 A register is a single component; a circuit is an interconnection of components. Def.'s Br. at 8-9.

--- End Footnotes ---

The block diagram of Figure 6 is an embodiment of an LCD column driver for applying digital display data to an LCD and is covered by claim 1. The parties agree that block 34 in Figure 6 is a shift register in accordance with Defendants' proposed construction.

[SEE Fig. 6 IN ORIGINAL]

The '823 patent also discloses an embodiment of a column driver for applying analog display data to an LCD. This embodiment is shown in Figure 10. The analog column driver shows analog intensity data being applied to an inverting amplifier 62, which in turn provides the analog data to first and second ping-pong sample-and-hold capacitor banks 68 and 70.

[SEE Fig. 10 IN ORIGINAL]

Honeywell relies upon claim 7 and the embodiment of Figure 10 to support its proposed construction of "shift register." Honeywell argues that, because timing signals are shown entering shift register block 76 and display data is shown entering capacitor banks 68 and 70, in order to read claim 7 onto the embodiment of Figure 10, the shift register recited in claim 7 must be read in a broader sense to include the capacitor banks 68 and 70 and not restricted to just shift register block 76. Honeywell argues that its construction of "shift register" is required in order for claim 7 to be read consistent with the embodiment of Figure 10, which claim 7 is intended to cover.
Defendants counter that claim 7 separately recites the shift register from the first and second capacitor banks. Moreover, claim 7 specifies that the shift register is "connected to" the capacitor banks. In view of that claim language, Defendants argue that Honeywell is advancing a clearly erroneous interpretation of claim 7 that combines the shift register and capacitor banks. Defendants are correct. Honeywell's analysis of claim 7 in relation to Figure 10 is flawed and, therefore, does not support its proposed construction of the term "shift register."

Honeywell offers no further intrinsic evidence to support its construction. Defendants, on the other hand, point out that their construction is consistent with every other use of the term "shift register" in the '823 patent. For example, the specification twice refers to "shift register 76," which strongly implies that box 76 in Figure 10, standing alone, embodies a shift register. See '823 Patent at 7:18-7:19; 7:38-7:41. In addition, the specification refers to box 76 as a "timing mechanism," and states that its purpose is to "provide[] timing for sampling the input analog voltage." See '823 Patent at 7:18-7:19; 7:38-7:44. These statements contradict Honeywell's contention that both timing data and display data enter the "shift register" in Figure 10. Defendants also point out that their construction is consistent with several pieces of extrinsic evidence, including technical treatises and data sheets for off the shelf shift registers sold at the time of the patented invention. See, e.g., THE ART OF ELECTRONICS 525 (2d ed. 1989); ELECTRICAL ENGINEERING FUNDAMENTALS 571 (2d ed. 1986). 2

--- Footnotes ---

2 Honeywell argues that THE ART OF ELECTRONICS contains statements consistent with Honeywell's construction, but this argument mischaracterizes statements made in that book. Honeywell claims that it refers to a RAM circuit as a shift register. THE ART OF ELECTRONICS 527. More accurately, the book states that a RAM circuit can be used as a shift register, not that a RAM circuit is a shift register.

--- End Footnotes ---

The Court therefore rejects Honeywell's proposed construction of "shift register," which would include a circuit structure that, in response to timing signals, shifts a "1" bit from cell to cell in one array of cells ("walking 1") while entering display data into a separate array of cells. Honeywell's proposed construction would broaden the term "shift register" to merely require a circuit structure operative to perform serial-to-parallel conversion of binary data. While a shift register can be used to perform serial-to-parallel conversion of binary data, the term "shift register" denotes a more particular type of electronic component in accordance with Defendants' proposed construction.

Accordingly, the Court adopts Defendants' construction.

--- 4034 ---

33. The term "shopping cart model" is described in the Background of the Invention section of the '411 patent beginning at column 2 line 17: "The selection of various items is generally based on the 'shopping cart' model. When the purchaser selects an item from the electronic catalog, the server computer system metaphorically adds that item to a shopping cart. When the purchaser is done selecting items, then all the items in the shopping cart are 'checked out' (i.e., ordered) when the purchaser provides billing and shipping information." As described at column 2 lines 34 through 43, in some cases the billing and shipping information may be prestored by the merchant and need only be confirmed to complete the checkout process.

34. The definition of shopping cart model in the background section of the '411 patent is consistent with that provided by Amazon.com's e-commerce experts Dr. Johnson and Mr. Mulligan. (See Ex. 10, Johnson Decl. at P 14; Ex. 12, Mulligan Del. at P 7; Tr. at 167:19-168:9 (Mulligan)).

35. Dr. Lockwood defined a shopping cart model more broadly in a manner that could potentially include any method for buying on-line. (Tr. at 279:5-282:4). In general, the Court found Dr. Lockwood's description of the term "shopping cart model" to be confusing and inconsistent. Barnesandnoble.com's Chief Information Officer, Mr. King, gave a similarly broad definition of shopping cart model. (Tr. at 428:1-21). According to its own expert Dr. Lockwood, under Defendants' definition of shopping cart model, claims 1 and 11 would appear to be internally inconsistent. (See Tr. at 284:22-285:22).
Similarly, Mr. King testified that with Barnesandnoble.com's definition of shopping cart model, claims 1 and 11 would not cover the single-action purchasing method described in the '411 patent. (Tr. at 428:1-21).

36. A claim interpretation that excludes the preferred embodiment is "rarely, if ever, correct." Vitronics Corp. v. Conceptronics, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). "When claims are amenable to more than one construction, they should when reasonably possible be interpreted so as to preserve their validity." Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1557 (Fed. Cir. 1996). The Court, therefore, rejects the definition of "shopping cart model" propounded by Defendants.

37. The Court adopts instead a definition which is consistent with the patent specification, preserves the validity of the claims, and allows the claims to be read on the preferred embodiment described in the patent specification. In construing the claims, the Court, therefore, takes the term "shopping cart model" to mean a method for on-line ordering in which a user selects and accumulates items to be purchased while browsing a merchant's site and then must proceed to one or more checkout or confirmation steps in order to complete the purchase. (Ex. 12, Mulligan Supp. Decl. PP 5-6).

**GO BACK**

**4035**

(2) *In claim one, the term "short wavelength spectral range."* The term refers to the photons that will excite the fluorophore in the target material. Defendants contend that this phrase should be given its ordinary meaning and that, while the specification includes examples of short wavelength, it does not specify a particular definition. Rather, short wavelength is relative to the long wavelength light photons emitted by the laser, as recited in claim element 1[c], and depends on the particular target material. Plaintiffs allege that the specification requires that the term be limited to 315 nanometers (nm) or the UV wavelength range. 613 Patent at 6:6 ("short wavelength, for example, ultraviolet"); 7:33-44 (describing figure 2).

For the Defendants, Dr. Walmsley testified that a person of ordinary skill in the art would interpret the phrase to mean the excitation wavelength associated with the target material, that is, the wavelength that causes the fluorophore in the target material to fluoresce. Tr. 124. Dr. Walmsley asserted that language in the patent made the meaning of this phrase quite clear. For example, claim one states that "the target material [to be imaged includes] fluorescent means responsive to excitation by photons in short wavelength spectral range to produce characteristic fluorescence." 613 Patent at 9:65-68. According to Dr. Walmsley, the definition of "short" depends on the target material, since the exciting short wavelength is a "characteristic" of the fluorophore in the target material. Tr. 181. Dr. Walmsley explained that the short wavelengths are the absorption wavelengths and are related to the long wavelengths. 5 He also explained that a person of ordinary skill in the art would not expect the term short wavelength range to be limited to 315 nm or the ultraviolet range and pointed to several places in the patent that supported his interpretation. See, e.g., 613 Patent Abstract ("Fluorophores having single photon absorption in the short (ultraviolet or visible) wavelength range are excited by a stream of strongly focused subpicosecond pulses of laser light of relatively long (red or infrared) wavelength range."); 6:48-53 ("Thus, for example, two photons in the visible red region at 630 nm would combine to excite a fluorophore which normally absorbs light in the ultraviolet region at 315 nm, while two photons in the infrared region of, for example, 1070 nm, would excite a fluorophore which absorbs at 535 nm in the visible light region."); 5:68-6:10 ("To accomplish this, the laser produces a very short pulsed laser beam of high instantaneous power and of a relatively long wavelength, for example in the visible red or the infrared range. This light is directed to a specimen containing a fluorophore normally excited by a single photon in the short wavelength, for example, ultraviolet range . . . ").

--- Footnotes ---

5 As will be explained below, Dr. Walmsley stated that the long wavelength is also a characteristic of the target material and is the laser light that illuminates the target material. Tr. 175.

--- End Footnotes ---
normally respond. The particular wavelengths are a function of a fluorophore to be detected, the point of the invention being that the fluorophore will respond to two photons of the long wavelength." Prosecution History at 88 & 107. After this explanation by the applicants the patent examiner allowed the claims. Tr. 196

Finally, Defendants' second expert, Dr. Karel Svoboda, defined short wavelength spectral range as "the characteristic fluorescence of the fluorophore that one is imaging, but it is clearly referred to as short compared to the long wavelength spectral range that is used for exciting the fluorophore." 6 Tr. 334. He testified that the term is as precise as the subject matter allows because "two photon excitation microscopy can be done with fluorophores that have characteristic fluorescence in many regions of the wavelength spectrum, and so short wavelength spectral range certainly covers all those and some more." Tr. 335.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -
6 The Court recognized Dr. Svoboda as an expert in the field of two-photon microscopy. Dr. Svoboda received his bachelor's degree cum laude in physics from Cornell and a doctorate in biophysics from Harvard. He has extensive research and teaching experience and has lectured and published frequently. He is currently an associate professor at Cold Springs Harbor Laboratory and the State University of New York at Stony Brook. Curriculum Vitae of Karel Svoboda, Defendants' Markman Ex. 31. Dr. Svoboda testified that a person of ordinary skill in the art at the time of the invention would have a bachelor's degree in physiology, biophysics, physics or engineering, some postgraduate education and some experience with microscopy and laser scanning microscopy. See Tr. 318-19.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

Plaintiffs' expert, Dr. Fraser, testified that short is synonymous with ultraviolet and pointed to the patent in support. Tr. 446; 613 Patent 2:57-58 ("a short wavelength, typically ultraviolet"), 3:65-4:1 ("normally requires excitation by light in the ultraviolet range"), 6:3-10 ("short wavelength, for example ultraviolet range"). Although ultraviolet is clearly given as an example of the short wavelength range and Dr. Fraser testified that the term "for example" would not narrow the definition, he claims ultraviolet is the only example offered. Tr. 464-65.

The Court finds that Plaintiffs' interpretation of "short wavelength range" is unsupported by the intrinsic evidence. The abstract clearly states that short can be in the ultraviolet or visible range. The patent provides an example contemplating absorption in the visible light region. 613 Patent 6:53. Also, the inventors explained in the prosecution history that "short wavelength range" depends on the target material's fluorophore and the long wavelength illuminating light. Accordingly, the Court adopts the Defendants' definition: "This short wavelength light has a wavelength that is shorter than the wavelength of the long wavelength light recited in claim element 1[c]. The specific wavelengths of the 'short' and 'long' wavelengths recited in Claim 1 depend on the particular fluorophore used in the target material."

4036

Shortest path

The Court modifies Ciena's construction and construes the term as “path through the network having the shortest distance (distance being a function of the time delay incurred by a packet moving from one switch to another, sometimes referred to as ‘cost’ or ‘delay’).” The parties do not dispute that the term “shortest path” is not limited to physical distance. However, the parties disagree as to how distance should be explained in the definition of the term. Nortel argues that the term should be construed as “the best path according to established criteria (such as, for example, least cost, least delay and least traffic).” Nortel relies on the declaration of its expert Dr. Enslow for this definition.

In discussing Figure 5d, which depicts the distance of each trunk to the next switch, the specification states,

Note that the use of the term “distance” in the present context does not mean physical distance but rather is a term well known in this art that is a function of the time delay incurred by a packet moving from one switch to another. A normalized value of distance is typically used (ranging, for example, from 0 to 2,048 for a single trunk). This concept is also sometimes referred to as “cost” or “delay.”
Col. 3:63-4:2. “Words of a claim ‘are generally given their ordinary and customary meaning.’” Phillips, 415 at 1312 (citing
Vitronics, 90 F.3d at 1582). “[T]he ordinary and customary meaning of a claim term is the meaning that the term would
have to a person of ordinary skill in the art in question at the time of the invention . . . .” Id. at 1313. In determining the
meaning of a claim term as understood by persons of skill in the art, courts should look to “‘the words of the claims
themselves, the remainder of the specification, the prosecution history, and extrinsic evidence concerning relevant scientific
principles, the meaning of technical terms and the state of the art.’” Phillips, 415 F.3d at 1314 (citing Innova/ Pure Water,
381 F.3d at 1116).

Phillips instructs the Court to first look to the specification to determine the ordinary and customary meaning of a claim
term. Here, the specification indicates the definition of the term distance, a term which is integral to the understanding of the
claim term “shortest path,” as it was understood within the art at the time of the invention. In this situation, it is not
necessary to look to extrinsic evidence such as an expert’s declaration. Accordingly, the Court defines “shortest path” using
the word distance and explains the definition of distance as the specification indicates it would have been understood by a
person of skill in the art at the time of the invention.

JVL’s construction of "showing … a number of game credits associated with a deposit of one coin of a particular type" is
"showing a specific number of game credits associated with a deposit of one coin of a particular type." Def.’s '799
Presentation at 35. Merit's construction simply substitutes the word "insertion" for "deposit." Pl.'s '799 Presentation, Ex. 3 at
13. Thus, the only two issues are whether to adopt JVL's insertion of the word "specific" and Merit's inclusion of "insertion"
into the claim construction.

The plain and ordinary meaning of this term is best expressed in the language of the claim itself. The proffered
constructions do not add value to the understanding. The specification does not require that "specific" be included in the
construction. Nor is it necessary to construe "deposit" to mean "insertion." The only support that Merit offers for this
construction is in the specification's description of Figure 3, which states "[t]he ratio of 'coins inserted to game credits
granted per coin can be individually adjusted for each coin type." '799 patent at 6:41-43 (emphasis added). However,
construing the claim term to include "inserted" is not necessary because the plain and ordinary meaning of "deposit" is clear.
Thus, no construction is required.

JVL argues that "selecting the number of game credits to be associated with each coin type" means "that an operator
individually sets the specific number of game credits that are directly associated with each of the distinct symbols
representing the different coin types." Merit's only change is to substitute "choosing" for "selecting" and "type of coin" for "coin type."

For the same reasons discussed above, the substitution of "choosing" for "selecting" is unnecessary and "type of coin" for "coin type" is unnecessary. Accordingly, they are not adopted.

The specification teaches that different numbers of game credits may be selected for each of the coin inputs. '799 patent at 6:24-25. The fact that this occurs does not justify JVL's expanded construction. Once again, JVL's proposed construction unnecessarily adds to the plain and ordinary meaning of the claim term. Thus, this term does not require construction.

"showing … the total number of currency units associated with each coin type"

JVL's construction of "showing … the total number of currency units associated with each coin type" is "showing a specific number of meter pulses to be associated with each of the distinct symbols on the setup screen representing the different coin types." JVL's Markman Hrg. Presentation, '799 patent at 12 ("Def.'s '799 Presentation"). On the other hand, Merit construes this claim as "showing the total number of cents associated with each coin type." Merit's Markman Hrg. Presentation, '799 patent, Ex. 3 at 3 ("Pl.'s '799 Presentation"). The inquiry focuses on whether the "the total number of currency units" is a "specific number of meter pulses" as JVL contends or "cents" as posited by Merit.

As JVL explains, the "meter pulses" column of Figure 3 indicates that a certain number of "meter pulses' are associated with each coin input. In describing the preferred embodiment of Figure 3, the patent states "the meter pulse is equal to the number of currency units deposited in the game device (i.e. the total currency amount deposited in the game device)" '799 patent at 6:35-37. JVL emphasizes that the patent uses the generic term "currency units" and not a particular form of currency such as "cents" or "pesos." Furthermore, Figure 4 of the patent depicts, among other things, a currency input device 110 that sends a signal to the computer 102 which then sends "pulses" to a tally meter 120.

Both parties place unjustified limitation on the meaning of the term "currency units." In fact, Merit concedes that the machine is not limited to being programmed for United States cents, and can, as JVL argues, be set up to receive pesos or other forms of currency. Tr. at 173. It offers no basis in the patent for its use of the term "cents" and admits that the term "currency units" might not require construction. Id. ("… the machine can be set up for pesos, pounds or anything else. Maybe we should have left it as currency units.") Similarly, JVL relies on Figure 3 and its description to argue that "currency units" and "meter pulses" are interchangeable, without explaining why we should not also associate "coin type" with "credits" which are listed in the third column of Figure 3 and can also be adjusted for each individual coin type. '799 patent at 6:3-14.

"Currency units" are neither "cents" nor "meter pulses" exclusively. Neither of the proffered constructions is adopted. Indeed, the term "showing … the total number of currency units associated with each coin type" as used in the '799 patent, says it all and does not require construction.

III. "shuffled bit result" and its relevant permutations

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

8 The term "shuffled bit result" is contained in claims 1, 3, and 18 of the ’646 patent.

9 The term "bit shuffling operations" is contained in claim 18 of the ’646 patent.

10 The term "bit shuffling function" is contained in claim 19 of the ’646 patent.

11 The term "function to shuffle bits" is contained in claim 1 of the ’612 patent.
The term "bit shuffle computer program" is contained in claim 12 of the '646 patent.

The patents-in-suit both contain permutations of claim terms that will be collectively referred to as the "shuffle bit terms." The shuffle bit terms include "shuffled bit result," "bit shuffling operations," "bit shuffling function," "function to shuffle bits," and "bit shuffle computer program." In all instances, the parties agree that shuffling requires mixing bits, but they disagree as to whether shuffling also requires mapping bits. The primary dispute for these claims terms is whether mapping should be included in the definition of "shuffling".

PACid argues that the '646 specification supports an understanding of the shuffle bit terms that singularly includes the mixing of bits. OPENING at 6 (citing '646 patent at 4:60-65; and 5:1-2). PACid contends that the specification distinguishes between shuffling and mapping, and that mixing is the result of a specific algebraic, cryptographic, and/or logic function that is not random. Id.Arguing that the term "shuffled" in the context of the '646 and '612 patent means mixed, PACid also suggests that the meanings of the shuffle bit terms is "readily understood by a lay jury" and does not require separate construction. REPLY at 6.

Defendants argue that "bit-shuffle" is not a term that has a well-known definition in the field of encryption and must be construed in light of the patent specifications. RESPONSE at 16. Defendants then cite to relevant portions of the specifications to argue that the Summary of the Invention section requires both mixing and mapping and that the disclosed embodiments require a bit shuffling generator "to mix the input bits and to map the input bits to a result." Id. at 16-17 (citing '646 patent at 3:22-28 (Summary of the Invention); '646 patent at 4:60-5:1; '612 patent at 4:47-53). Defendants also maintain that the specification supports the suggested mixing and mapping to occur "randomly."

"When the parties present a fundamental dispute regarding the scope of a claim term, it is the court's duty to resolve it." O2 Micro, 521 F.3d at 1362. Appreciating that the shuffle bit terms present both disputed meanings and divergent depiction as to the terms' technical scope, the instant terms require construction. See U.S. Surgical Corp. v. Ehticon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997).

1. Bit Shuffling does not require "mapping"

While the patents provide no definition for the word "mapping," the context of its usage is clear, particularly in view of the parties' briefings and arguments. The intrinsic record coupled with the common meaning of the term instruct that a mapping of an input value into an output value requires a correlation between particular input bits and particular output bits. In effect, the non-technical common meaning of the word "map" would also imply input-output correlation in that it would suggest a path between an input bit and an output bit. However, unlike the common meaning of "map," the patents clearly discuss many-to-few bit mapping, and in doing so, clearly eschew any notion that mapping requires that each input bit maps to a unique output bit.

The intrinsic record presents that mapping and shuffling are distinct concepts, and therefore, mapping should not be included in the definition of shuffling. Starting with the language of the claims, claim 1 of the '612 patent approaches "shuffle bits" and "many-to-few bit mapping" as separate actions: "combining a constant value and secret plural bit sequence in accordance with an algebraic function to shuffle bits, perform a first many-to-few bit mapping, and produce a first pseudo-random result." '612 patent at 7:36-39 (claim 1) (emphasis added). A plain reading of this claim language supports the conclusion that mapping and shuffling are not one and the same. Defendants suggest there is a double requirement to mix and map because certain portions of the specification use the words "mixed" and "mapped" when describing the same bit shuffling process. This conjunctive language, however, does not support the conclusion that mapping necessarily occurs when shuffling takes place. Instead, the specification distinguishes between the two concepts by using "mixing" and "mapping" in alternative forms. In particular, the '646 patent recites: "employs a many-to-few bit mapping and a combination bit shuffle." '646 patent at 1-4. The patentee is clearly requiring that the bits be mapped, but this mapping is not required to be one and the same as the alternative mixing process.

This point was further illustrated at the Markman hearing, where the meaning of "mapping" was flushed out in the context of a logical XOR function. 13 The '646 specification provides, as an example of a preferred embodiment, a bit-shuffling
generator that employs the XOR function as expressed in the equation $A \oplus B = C$. In this example embodiment, the XOR function operates on the two input values "A" and "B," and results in the output "C." The parties agreed at the hearing that the XOR function effects a mapping. TRANSCRIPT at 76. The Court agrees because the application of the XOR function correlates or maps the particular input bits ("A" and "B") to one particular output bit ("C"). Thus, through use of the logical XOR function as a bit-shuffling example, the patent is clear that mapping may occur during the process of bit-shuffling. There is equal clarity, however, that bit-shuffling need not employ a logical function such as "XOR." The patent clearly states that bit-shuffling may employ algebraic, cryptographic and/or logic function. See '646 patent at 4:60-65. Unlike the logical functions--such as the XOR function--algebraic and cryptographic functions do not necessarily yield output bits that specifically correlate to input bits. Thus, mapping is not a requirement of bit shuffling.

13 A two-input logical XOR function yields a true ("1") result if one or the other of two inputs is true ("1"), but not if both inputs are true ("1").

Lastly, during the hearing, Defendants argued that bit-shuffling requires mapping (correlation), but not a one-to-one correlation between input and output bits. This argument offers only a limited explanation as to how a larger number of input bits may be mapped into a smaller number of output bits--i.e., that mapping is nevertheless mapping even if two or more input bits map to fewer output bits. Although this argument is well-taken, the premise does not bear on whether mapping itself is a requirement of bit-shuffling. Furthermore, while the Court finds that "mixing" is a requirement of shuffling, the Court does interpret mixing so confined as Defendants' implied during the hearing. See TRANSCRIPT at 69.

2. Bit Shuffling is not random

Additionally, the proposed constructions dispute whether to include a limitation that the mixing occurs "randomly." PACid argued to exclude this language because it imposes a requirement that is contrary to the pseudo-random result in the specification. REPLY at 6-7; '646 patent at 3:22-28 (reciting in the '646 patent: "a bit-shuffling which results in the mapping of a large number of bits into a first pseudo-random number"); '612 patent at 3:18-24 (reciting in the '612 patent: "shuffles the bits and provides a pseudo-random result"). Defendants, however, maintain that the specification expressly requires that the bits are "randomly mixed and mapped." RESPONSE at 17 (citing '612 patent at 4:47-53) ("The bits. . . thereby are randomly mixed and mapped from a large binary length to a smaller binary length.").

While acknowledging the specification's use of "randomly" in its description of the claimed invention, the Court concludes that rather than limiting the claims, this language is an express example that uses the world "random" in a broad capacity that includes "pseudo-random." This is apparent because the word "random" is expressly applied to the XOR operation discussed above. As indicated above, an XOR operation is completely deterministic and not random. As such, a skilled artisan would understand that only a pseudo-random result may apply to an XOR function.

This result is also supported by the express deterministic requirements of the claims and specifications. The patents are directed to deterministic keys and the specifications explain what that means: "Encryption keys may in addition be classified as deterministic or non-deterministic. A deterministic encryption key is one which is repeatable each time a specific input is applied to the encryption key generator." '612 patent at 2:19-23. Given these teachings, the result of the key creation operation could not employ randomness in the manner suggested by Defendants and yet remain deterministic. Thus, the isolated citation to the word "random" in the '612 patent at column 4, lines 47-53 must be interpreted broadly in including a pseudo-random operation.

Accordingly, finding that (1) shuffling does not include both mixing and mapping, and (2) that mixing, as used in the shuffled bit terms, is not "random," the Court provides the following constructions:

- The term "shuffled bit result" means "the result of an operation that mixes the bits of its inputs."
- The term "bit shuffling operations" means "operations that mix the bits of inputs."
The term "bit shuffle computer program" means "a computer program that mixes the bits of its inputs."
Still another alternative is for the CPE unit to stop sending ADSL framing information . . .

The shut-down signal may be an expressly transmitted signal or may be inferred . . .

Therefore, the Court construes "shut-down condition" as "an express signal used for the purposes of entering a low-power state or a loss of framing."

GO BACK

4042

B. Side View

The dispute over the term "side view" in claim 1 raises two issues: first, whether the side view image created by the second camera must be crescent shaped; and second, what range of angles generates a side view image. As to the first issue, Scanner asserts that a side view image is not limited to only a crescent shape; ICOS contends that a side view image must be a crescent shape. As to the second issue, Scanner asserts that with no crescent shape limitation, a side view image is not limited to one taken at a low angle; ICOS contends that a side view image must be taken from an angle between 14 and 25 degrees. I first address whether the term "side view" is limited such that a side view image must be crescent shaped.

The plain language of the patents and the doctrine of claim differentiation show that while the preferred embodiment may include a crescent shaped side view image, a side view image is not limited to only crescent shapes. In analyzing the language of the patents, the Court first looks to the claim language; here, the language of claim 1, the independent claim, does not expressly include such a limitation. (See, e.g., Col. 18, ll. 46-47).

Next, the Court looks to the language of the specification for aid in construing the claims. Kraft Foods, 203 F.3d at 1368. See also Ethicon Endo-Surgery, 93 F.3d at 1578. Here, in the specification, side view is described as producing a crescent shape. (See e.g., Col. 4, l. 16 & Col. 12, l. 41). Nowhere in the specification, however, are side view images limited only to crescent shapes. The specification, instead, demonstrates that the preferred embodiment includes a crescent shaped side image. But "there is no basis for reading a limitation from the preferred embodiment into the language of the claim."

Turbocare Div. of Demag Delaval Turbomachinery Corp. v. Gen. Elec. Co., 264 F.3d 1111, 1123 (Fed. Cir. 2001) (citing Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988)) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.").

ICOS argues that the limitation written in the specification may be read into the claim, and ICOS relies on the recent Federal Circuit decision in Kraft Foods for that proposition. Kraft Foods, 203 F.3d at 1368 (adopting written description of rigidity of back panel where claim lacks language of rigidity). While the Federal Circuit decision in Kraft Foods does support this argument, the same court held otherwise in another recent decision. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1343, 2001 U.S. App. LEXIS 24810, 60 U.S.P.Q.2D (BNA) 1851 (Fed. Cir. 2001) (reversing the district court's decision because the district court "relied solely on the preferred embodiment in the written description and its drawings (which admittedly read on the narrower meaning of the key word) and . . . the prosecution history").

The two Federal Circuit cases, however, are not contradictory because the facts differ. After careful analysis it is apparent that Rexnord is applicable here. Specifically, the language of the written description in Kraft Foods -- that "any of the back panels would be constructed of a relatively stiff material[,]" Kraft Foods, 203 F.3d at 1367 (emphasis in original, internal quotation omitted) -- indicates that there is only one embodiment, i.e., one with relatively stiff material. Here, the language of the specification does not limit the side view image to only crescent shapes. Instead, the mere fact that the specification refers to the side view image as crescent shaped suggests that the preferred embodiment is one that creates a crescent shaped image. Accordingly, the plain language of the patents does not limit a side view image to a crescent shaped image.

Under the doctrine of claim differentiation, independent claim 1 and dependent claim 2 must be read to have different limitations. Because claim 2 expressly defines the second image as a crescent shape, and because claims 1 and 2 are presumptively different in scope, the doctrine would suggest that a crescent shape limitation cannot be read into claim 1. Wenger Mfg., Inc. v. Coating Mach. Sys., Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001). See also 35 U.S.C. § 112. The only different limitation added by claim 2 is that the second image is a crescent shape; the requirement of a crescent shape therefore cannot be found in claim 1.

Although "claim differentiation only creates a presumption that each claim in a patent has a different scope[,] . . . at least
one limitation must differ." Kraft Foods, 203 F.3d at 1368 (citation omitted). Here, if a crescent shape limitation were read into claim 1, claim 2 would be superfluous. Moreover, the doctrine applies here because "claim differentiation . . . is clearly applicable when there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims." Wenger Mfg., 239 F.3d at 1233.

Hence, I conclude that the term "side view" in claim 1 is not limited to a view that produces only crescent shapes.

I turn next to the issue of the position of the second camera such that the camera produces a side view image. As an initial note, it is uncontested that a side view image cannot be one taken from a 90 degree angle or a top angle view, and it must differ from one taken by the first camera. (See Scanner Br. at 14-15; ICOS Post-Hr. Br. at 19).

Scanner asserts that there are no limits to the viewing angle other than those that are uncontested. ICOS argues that to produce a side view image, the viewing angle must be a low angle, specifically between 14 and 25 degrees. ICOS's argument to limit the viewing range is based on the presumption that the side view image is crescent shaped. Specifically, ICOS argues that it is this range of angles that will produce the crescent shaped image. Because the Court has concluded that there is no crescent shape limitation, and because the patents contain no language limiting the viewing angle to 14 to 25 degrees, ICOS's argument to limit the viewing angle to 14 to 25 degrees is rejected.

ICOS's argument that the viewing angle must be a low angle fails under the doctrine of claim differentiation. Because claim 7 is dependent on claim 1, and because claim 7 expressly states that the second image is obtained at a low angle, a low angle limitation cannot be read into the term "side view." See 35 U.S.C. § 112. If a "low angle" limitation were read into claim 1, then claim 7 would have no limitations separate from claim 1. Wenger Mfg., 239 F.3d at 1233.

In sum, as to the term "side view": the side view image is not limited to crescent shaped; the viewing angle may not be a 90 degree angle, a top view angle, or identical to the angle created by the first camera; and the viewing angle is not limited to a "low angle."

5-6. **single instruction multiple data mode (SIMD mode)/ multiple instruction multiple data mode (MIMD mode)**

These terms appear in dependent claim 8, which reads "the apparatus of claim 7 wherein each sub-tree is operated in a single instruction multiple data mode and the plurality of sub-trees are operated in a multiple instruction multiple data mode." '201 Patent at 72:29-32. The parties agree that SIMD mode and MIMD mode are two modes by which the binary tree computer system divides tasks and handles data and instructions. Pl. Reply at 14; Def. Br. at 16-17. The patent specification states that "in SIMD mode, each [processing element] is first loaded with its own data and then a single stream of instructions is broadcast to all [processing elements]. . . . In MIMD mode, each [processing element] is first broadcast its local program and data and then each [processing element] is logically disconnected from its neighbor [processing elements] and executes independently." '201 Patent at 10:41-43, 48-51.

Defendant's constructions track almost verbatim the definitions of these terms provided in the specification. See Def. Br. at 15. By contrast, plaintiff construes SIMD mode to mean that "[e]ach processing element has its own data but executes the same instruction as other processing elements," and construes MIMD mode to mean that "[e]ach processing element has its own program and data and executes independently of its neighbor processing elements." Pl. Reply at 14. According to plaintiff, in SIMD mode, processors execute the same instructions on different sets of data, whereas in MIMD mode, processors execute different instructions on different sets of data. Id. The crux of plaintiff's objection to defendant's construction is that defendant has imported into the claim from the specification how each mode is initiated, thus imposing a limitation from the preferred embodiment. In short, plaintiff objects that the manner in which these modes are implemented are distinct and separate from the modes themselves. See tr., 08/20/09, at 75.

The Court disagrees. The terms are undefined in the claim, and thus the specification, upon which defendant predominantly relies, provides the appropriate definition of those terms. See Phillips, 415 F.3d at 1321 (emphasizing that the specification "acts as a dictionary when it expressly defines terms used in the claims . . . ."); Irdeto Access Inc., v. Echostar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004) ("Even when guidance is not provided in explicit definitional format, the
specification may define claim terms by implication...

The '540 Patent, which is incorporated by reference, see Pl. Br. at 7, provides additional support for defendant's construction. It confirms that the SIMD mode is operative where "data processing elements contain multiple subsets of the data set F and each operate on the same instruction." '540 Patent at 6:43-45. Moreover, it further specifies that "the data processing elements remain logically connected to the root data processing element to receive inquires [sic] (as simply instructions or unknown data) and to report the results of the data processing operation." '540 Patent at 46-50. This at least confirms that in SIMD mode, in contrast with MIMD mode, the processing elements are provided a data set and then remain connected to the root processor so as to receive the instructions that all of the processing elements will execute. Similarly, for MIMD mode, the patent indicates that data processing elements can be provided with different instruction sets to be used on their own data: "The logical disconnection state of a data processing element from its parent during the data processing is called multiple instruction multiple data (MIMD) mode." Id. at 6:59-62. Hence, the '540 Patent corroborates that in MIMD mode, the processing elements are disconnected from other processing elements while executing their independent set of instructions.

Accordingly, the Court confirms the construction of the two terms set forth in the August 31 Order. SIMD mode is "where each processing element is first loaded with its own data and then a single stream of instructions is broadcast to every processing element in the binary tree." MIMD mode is "where each processing element has broadcast to it its local program and data and then each processing element is logically disconnected from its neighbor processing element and executes independently."

Claim term seven
"sign value" (claims 3 and 8)

A sign indicates whether a number is positive (+) or negative (-). The value of the number without the sign is a magnitude (i.e., an absolute value). For example, the numbers -3 and 3 have the same magnitude, but with different signs. Plaintiff argues that "sign value" should be construed as "A bit or code which indicates the sign." Defendants suggest that it should be construed as "An indicator of the sign of a value-i.e., whether a value is positive or negative-independent of the representation of the magnitude of the value."

The essence of the parties' disagreement is whether the sign value must be "independent of the representation of the magnitude of the value." Defendants argue that, for the purpose of later establishing infringement, Plaintiff seeks to construe "sign value" in such a way as to establish that a "one's complement" system of coding uses a sign value. The following charts show two possible systems for indicating positive and negative values:

<table>
<thead>
<tr>
<th>n14</th>
<th>Defendants provided these examples in their brief, and they have not been challenged by Plaintiff.</th>
</tr>
</thead>
<tbody>
<tr>
<td>-3</td>
<td>011 -3 00</td>
</tr>
<tr>
<td>3</td>
<td>111 3 11</td>
</tr>
<tr>
<td>-4</td>
<td>0101 -4 011</td>
</tr>
<tr>
<td>4</td>
<td>1101 4 100</td>
</tr>
</tbody>
</table>

In the first coding system, the magnitudes of each value are represented by the same code, and the first bit of each code represents the sign value. In this case, "0" represents negative and "1" represents positive. In the "one's complement" coding system, the negative and positive values of each magnitude are represented by inverting the code. However, in this example, each positive value begins with a "1" and each negative value begins with a "0." Defendants suggest that Plaintiff's
proposed construction inappropriately would allow for an interpretation of "sign value" that would include the first bit of the code in a "one's complement" coding system, even though the first bit is "integrally part of the representation of the value itself." Defendants and Declaratory Judgment Plaintiffs' Responsive Markman Brief ("Responsive Br."). p. 42 n.37.

Defendants contend that "sign value" must be construed as "independent of the representation of the magnitude of the value" because it must be distinct from "first values, second values and other values" in independent claims 1 and 6. Dependent claims 3 and 8 state:

The method of claim [1/6] further including the step of encoding said first and second runlength code values with a sign value.

'672 Patent, col.23, 11.63-65; col.24, 11.30-32 (emphasis added). Dependent claims 3 and 8 represent distinct elements which, arguably, require that the sign value is encoded separately and during a separate step than the magnitude of first and second runlength code values. However, this does not necessarily imply that the term "sign value" must itself encompass the requirement that the sign value is construed independently from the magnitude. As stated in the specification, it is possible to encode the sign within a table:

The TABLES 6 and 7 were formed based upon the assumption that a separate sign bit, S or S, not in the tables is to be used to indicate the sign of each value coded in the manner indicated in TABLE 5. Alternatively, the sign information can be encoded into TABLE 6 or TABLE 7. For example, a table like TABLE 6 can be used to represent runlengths of 0's that are followed both by positive and by negative non-zero numbers. Such a table would be greater in length than TABLE 6 (expanded essentially to double the length) to provide entries for runlengths of 0's followed by both negative and positive non-zero numbers. Of course, such a table would be ordered in accordance with the statistical frequency of both positive and negative numbers.

'672 Patent, col.18, 11.6-17 (emphasis added). The possibility that a table may include positive and negative values, not necessarily with the sign value separately encoded, does not lead to the conclusion that claims 3 and 8 do not require separate encoding of a sign value. However, this possibility does caution against incorporating an unnecessary limitation into the construction of the term "sign value."

The Court will not incorporate the requirement that a "sign value" is "independent of the representation of the magnitude of the value" into the construction of this term. However, the first portion of Defendants' proposed construction is consistent with the use of "sign value" in the patent. Accordingly, the Court construes "sign value" as "An indicator of the sign of a value-i.e., whether a value is positive or negative."

E. "Signal"

"Signal" means, "A visual, aural or other indication used to convey information."

Defendants' proposed definition of "signal" -- which I accept -- also comes from the DICTIONARY OF SCIENTIFIC AND TECHNOLOGICAL TERMS, page 1929. The dictionary definition captures the plain meaning of the word and encapsulates precisely what a signal is. The word "signal" is quite common in our language, and there is not the slightest indication in the specifications that plaintiff intended anything other than the word's plain and ordinary meaning. Indeed, the dictionary definition is completely consistent with the repeated use of the word "signal" in the 61 pages of quotations from the '725 patent. I cannot imagine what else the word could mean -- in any of the quoted passages -- if it did not mean what the dictionary says it means.

Plaintiffs' proposed definition, "Something having information," is not only vague and uninformative, but wildly overbroad. Lots of things have information but are not signals. A book has information; a book is not a signal. The periodic table of elements has information; the periodic table is not a signal.

Plaintiffs' proposed alternative definition, "An indication having data, information, and/or a message, and/or an indication
conveying data, information, and/or a message," when parsed (or "deconstructed," as English scholars would put it), is nothing more than a complicated and inelegant way of rephrasing the dictionary definition's spare, non-redundant prose.

Plaintiffs' complaint that the dictionary definition is "too limiting in light of the manner in which Plaintiffs have used the term throughout the specification" is unpersuasive. For example, plaintiffs contend that the word "signal" corresponds to a "transaction." If plaintiffs are suggesting that the word "signal" equates to the word "transaction," then they are simply talking nonsense. "Signal" does not mean "transaction" in either common or technical parlance. If, on the other hand, they are saying that there exists a signal corresponding to a particular transaction (which is, in fact, what the claim says -- "a processing device for processing the transaction information and for generating a first signal corresponding to the transaction" -- then I fail to understand plaintiffs' objection, since there is no necessary inconsistency between the dictionary definition of "signal" and the fact that a particular signal would correspond to a particular transaction. The "visual, aural or other indication" -- the "signal" -- would "convey information" about a particular transaction. That appears to be the way the word is used in the specifications highlighted by plaintiffs.

4046

B. The Claims on Appeal

The claims whose disallowance Nuijten appeals are not traditional step-by-step process claims, nor are they directed to any apparatus for generating, receiving, processing, or storing the signals. As mentioned above, such claims have been allowed. The claims on appeal seek to cover the resulting encoded signals themselves. Claim 14 of Nuijten's application is the only independent claim of the four rejected by the PTO. It reads:

A signal with embedded supplemental data, the signal being encoded in accordance with a given encoding process and selected samples of the signal representing the supplemental data, and at least one of the samples preceding the selected samples is different from the sample corresponding to the given encoding process.

(emphasis added). Claims 22, 23, and 24 depend on Claim 14, respectively adding requirements that the embedded data be a watermark, that the signal be a video signal, and that the signal be an audio signal.

C. Procedural History

The Examiner rejected a number of claims in Nuijten's application for obviousness-type double patenting, and rejected Claims 14, 15, and 22-24 as directed to nonstatutory subject matter under § 101. On appeal, the Board reversed the double-patenting rejections. As to Claim 15, it found that "[t]he storage medium in claim 15 nominally puts the claim into the statutory category of a 'manufacture'" and thus reversed the Examiner's § 101 rejection of that claim. However, it affirmed the Examiner's § 101 rejections of Claims 14 and 22-24 on two grounds. First, it noted that "[t]he signal . . . has no physical attributes and merely describes the abstract characteristics of the signal and, thus, it is considered an 'abstract idea'" unpatentable under Diamond v. Diehr, 450 U.S. 175, 185, 101 S. Ct. 1048, 67 L. Ed. 2d 155 (1981). Second, the Board determined that the claims at issue fell into none of the four statutory categories of patentable subject matter: "process, machine, manufacture, or composition of matter." 35 U.S.C. § 101. In the Board's view, the claims were not directed to a process because they did not "recite acts"; not a machine because "the signal . . . has no concrete tangible physical structure"; and "not composed of matter and [therefore] clearly not a 'composition of matter.'" Finally, the Board noted that "[t]he signal does not have any physical structure or substance and does not fit the definition of a 'manufacture' which requires a tangible object." Accordingly, the Board rejected Claims 14 and 22-24 solely on the basis of unpatentability under § 101. Nuijten timely appealed the Board's decision to this court, which has jurisdiction under 28 U.S.C. § 1295(a)(4)(A).

II. DISCUSSION

Whether a claim is valid in light of § 101 is a question of law that we review de novo. AT&T Corp. v. Excel Communs., Inc., 172 F.3d 1352, 1355 (Fed. Cir. 1999). Section 101 states:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.
Language setting forth a variety of categories of matter deemed patentable has existed throughout the history of American patent law. The country's first patent statute permitted a patent on "any art, manufacture, engine, machine or device." Patent Act of 1790 § 4, 1 Stat. 109, 111 (1790). Soon thereafter, Congress amended the patent laws, changing the language to allow a patent for "any new and useful art, machine, manufacture or composition of matter." Patent Act of 1793 § 1, 1 Stat. 318, 319 (1793). The next substantial amendment to the patent laws left this statutory language unchanged. Patent Act of 1836 § 6, 5 Stat. 117, 119 (1836). This four-category language has persisted to the present day, with the exception of the technical change of "art" to "process," defined as "process, art or method," in 1952. 35 U.S.C. § 100; see Part II.B.1, infra.

The claims on appeal cover transitory electrical and electromagnetic signals propagating through some medium, such as wires, air, or a vacuum. Those types of signals are not encompassed by any of the four enumerated statutory categories: "process, machine, manufacture, or composition of matter." Before addressing in detail our rationale for this rejection, though, we begin by resolving a dispute between Nuijten and the PTO about the claims' scope.

A. Claim Construction

As in any other context in which the scope and meaning of the claims bears on the ultimate determination at hand, we must start by considering the issue of claim construction. See State St. Bank & Trust Co. v. Signature Fin. Group, 149 F.3d 1368, 1370 (Fed. Cir. 1998) (stating that "whether the . . . patent is invalid for failure to claim statutory subject matter under § 101[:] is a matter of both claim construction and statutory construction"). Claim construction is a question of law reviewed de novo on appeal. In re Baker Hughes, Inc., 215 F.3d 1297, 1301 (Fed. Cir. 2000); Cybor Corp v. FAS Techs., Inc., 138 F.3d 1448, 1451 (Fed. Cir. 1998) (en banc).

The claim construction dispute between Nuijten and the PTO turns on a somewhat esoteric and metaphysical point, namely: are the claims at issue limited to covering only physical instances of signals, or do they also cover intangible, immaterial strings of abstract numbers? The PTO suggests that "claim 14 can be read to claim a signal that is merely data"--that is, merely numerical information without any physical embodiment. Nuijten disagrees, arguing that "a signal must have sufficient physical substance to be discerned and recognized by a recipient." That is, a signal can be sensed and received by some physical apparatus, if not directly by a person.

Nuijten's position on this issue is correct in a limited way. A "signal" implies signaling--that is, the conveyance of information. To convey information to a recipient a physical carrier, such as an electromagnetic wave, is needed. Thus, in order to be a "signal," as required by the claim, some carrier upon which the information is embedded is required. See Arrhythmia Research Technology, Inc. v. Corazonix Corp., 958 F.2d 1053, 1059 ("The view that there is nothing necessarily physical about 'signals' is incorrect." (quotation marks omitted)).

However, while the claims are limited so as to require some physical carrier of information, they do not in any way specify what carrier element is to be used. The only limitations in Claim 14 address the signal's informational content. Specifically, the signal must encode some supplemental data, it must have been encoded according to a "given encoding process," and a sample, or single data point, located before the location of the supplemental data must be different from the original. The text of the claims is not limited by any specified physical medium, nor do the dependent claims add any physical limitations. They again require only that the signal carry certain information--a watermark, video, or audio. Therefore, any tangible means of information carriage will suffice for all of the claims at issue. Nuijten's claims can of course be embodied by conventional, known means, such as electrical signals, modulated electromagnetic waves, and pulses in fiber optic cable. So long as some object or transmission carries the information specified by Nuijten's claim, it falls within that claim's scope regardless of its physical form. In summary, some physical form for the signal is required, but any form will do, so long as a recipient can understand the message--the nature of the signal's physical carrier is totally irrelevant to the claims at issue.
The Court is asked to construe three similar terms that appear in the '213 and '059 Patents: test pulse, test signal, and signal. The term "test pulse" appears in Claims 1, 10, 17, and 26 of the '213 Patent and Claims 1 and 8 of the '059 Patent. The purpose of the "test pulse" is to test the condition of the defibrillator and its electrodes. Philips asserts that this term should be construed as "any pulse that is associated with testing." Cardiac Science maintains that this term should be defined as "a simulated shock." "Test signal" appears in Claims 8, 10, 15, and 24 of the '213 Patent. The parties acknowledge that "test signal" differs in meaning from "test pulse," but each party presents a different proposed construction of "test signal." Cardiac Science asserts that "test signal" should be construed as "a simulated ECG signal." Philips contends that "test signal" should be construed as "any signal associated with testing." "Signal" appears in Claims 1 and 9 of the '059 Patent. Philips asserts that "signal" should be construed as "a detectable physical quantity or impulse (as voltage, current, or magnetic field strength) by which messages or information can be transmitted." Cardiac Science contends that "signal" should be defined as "a simulated ECG signal."

The specifications describe the test pulses as follows:

If the system passes the ECG tests, it then performs a defibrillator test by generating a pulse through its normal pulse generating circuitry and sending the pulse to the electrodes 204. To initiate the pulse test, the microprocessor sends a charge command to a charge controller 230, which begins charging capacitor 232 in a known manner from power supply 234. When the charge on capacitor 232 has reached the required level (either the charge level required for normal operation or some other test charge level), switch relay 228 moves switches 212 to their other position. This switch position permits the pulse circuit to discharge the capacitor to deliver a damped sinusoidal shock to the electrodes. (213 Patent at c. 5, ll: 47-59; 059 Patent at c. 5, ll: 43-55.) Yet, the specification also states that "the test pulse may be a voltage pulse of any magnitude, including but not limited to voltage magnitudes used for actual defibrillation." (213 Patent at c. 3, ll: 39-42.) The test pulses of the '213 and '059 Patents are not limited to a pulse that reaches the magnitude of a shock to a patient, as Cardiac Science suggests. The Court finds that "test pulse" is appropriately construed as "a pulse of any magnitude associated with testing."

The specification repeatedly refers to test signals. (213 Patent at ll: 24-45.) Cardiac Science asserts that "test signal" is used only in reference to the ECG test. However, the claim language alone points to a broader construction. A comparison of the claims in which "test signal" appears makes clear that the "test signal" is not limited to an ECG signal. (See '213 Patent at cls. 8, 10, 24, 27.) The Court construes "test signal" as "a signal associated with testing."

The specification of the '059 Patent refers to many different types of "signals." The term is not limited to ECG signals, as Cardiac Science proposes. In fact, the specification describes "[a] signal substantially similar to an ECG signal," thus ruling out the "signal = ECG signal" construction that Cardiac Science proposes. (059 Patent at c. 3, ll: 59-65.) The Court finds that the patent's usage of the term signal is consistent with the dictionary definition set forth by Philips, and the Court construes "signal" accordingly: "a detectable physical quantity or impulse (as a voltage, current, or magnetic field strength) by which messages or information can be transmitted."
6. "signal"

The plaintiff asserts that "signal" does not require construction. Defendant EchoStar argues that "signal" means a television baseband video and/or audio signal. Joint Claim Construction Brief, Exh. B. The DIRECTV defendants argue that "signal" means an information service signal (e.g., a television program signal) that is directed to a user output (e.g., a television screen). Id.

I have construed "scrambling" to apply to both analog and digital signals. Consistent with that, I construe the term "signal" to include both analog and digital signals. I reject EchoStar's attempt to limit the term to an analog baseband video and/or audio signal.

The DIRECTV defendants seek to narrow the term to an information service signal that is directed to a user output. This requested construction improperly imports to the claim limitations from disclosed embodiments in the specification. For example, although the specification describes an embodiment of the invention where the end user is a consumer of a television broadcast (e.g., "the user having previously purchased the card at a local card distribution outlet," '066 Patent, col. 4, lines 25-34), the specification does not necessarily preclude use of the invention where, for example, a scrambled satellite signal is received, unscrambled, and retransmitted by cable to more than one end user. In this example, the signal is not "directed to a user output (e.g., a television screen)" as the DIRECTV defendants propose.

I reject the limited constructions of the term "signal" advanced by the defendants. I adopt the ordinary and customary meaning of the term and construe "signal" to mean an impulse by which messages or information can be transmitted. Webster's Ninth New Collegiate Dictionary, 1096 (1984).

D. Signal-Dependent noise; Signal-Dependent branch metric function

Following the claim construction hearing, it is apparent that the parties' dispute over the "signal-dependent noise" terms centers around whether the "signal-dependent noise" must come from the "media noise." See (Docket Nos. 128 at 8-10; 129 at 10-11). Both parties agree that "media noise" as used in the patents is limited to magnetic recording. (Docket No. 119 at 25:11-21; 34:4-21; 38:20-23). Furthermore, based on the language, "[t]he non-stationarity of the media noise results from its signal dependent nature" '839 Patent col. 1 ln. 39-41, it would be clear to the PHOSITA that "media noise" is a type of "signal-dependent noise. The dispute becomes whether "media noise" is the only type of "signal-dependent noise" being referred to in the claims.

"Signal-dependent noise" is used in claims 2 and 5 of the '839 Patent and claim 1 of the '180 Patent. "Signal-dependent branch metric function" is found in claims 3 and 4 of the '839 Patent and claim 2 of the '180 Patent. Claims 2 and 5 of the '839 Patent and claim 1 of the '180 Patent are reproduced above. Supra at 16-17. Claim 3 of the '839 Patent is illustrative of how "signal-dependent branch metric function" is used and is as follows:

3. The method of claim 1 wherein said branch metric functions for each of the branches are selected from a set of signal-dependent branch metric functions.

CMU's construction of "signal-dependent noise" and "signal-dependent branch metric function" are as follows:

"Signal-dependent noise" means "media noise in the readback signal whose noise structure is attributable to a specific sequence of symbols (e.g., written symbols)."
"Signal-dependent branch metric function" means "a branch metric function' that accounts for the signal-dependent structure of the media noise."

RDCTC at 11-12.

Marvell's constructions of "signal-dependent noise" and "signal-dependent branch metric function" is:

"Signal-dependent noise" means "noise that is dependent on the signal."

"Signal-dependent branch metric function" means "a 'branch metric function' that accounts for 'signal-dependent noise.'"

RDCTC at 11-12.

The entire term "signal-dependent noise" does not appear in the specification. However, the terms "signal-dependent" and "signal-dependence" do appear in the specification and are used as follows:

The trellis/tree branch metric computation of the present invention is correlation-sensitive, being both signal-dependent and sensitive to correlations between noise samples.

These covariance matrices are different for each branch of the tree/trellis due to the signal dependent structure of the media noise.

Due to the signal dependent nature of media noise in magnetic recording, the functional form of joint conditional pdf \( f(r_1, \ldots, r_N | a_1, \ldots, a_N) \) in (1) is different for different symbol sequences \( a_1, \ldots, a_N \).

[The branch metric] is also dependent on the postulated sequence of written symbols \( ai -K1, \ldots, ai +L+Kt \), which ensures the signal-dependence of the detector.

The noise is now considered to be both correlated and signal-dependent.

First, \( wi \) and \( \sigma_i^2 \) can be obtained directly from Equations (20) and 2 (16), respectively, once an estimate of the signal-dependent covariance matrix \( Ci \) is available.

It is important to point out that, due to the signal-dependent character of the media noise, there will be a different covariance matrix to track for each branch in the tree-trellis of the Viterbi-like detector.

The reason for this is that the PR4 shaping filter averages noise samples from different symbols, which masks the signal dependent nature of the media noise.

'839 Patent col. 1 ln. 39-51; col. 2 ln. 9-12; col. 2 ln. 18-20; col. 4 ln. 24-27; col. 5 ln. 49-52; col. 6 ln. 38-39; col. 8 ln. 11-14; col. 10 ln. 18-21; col. 12 ln. 51-54. (emphases added). It is apparent from these sections of the specification that the only conjunction of the terms "noise" and "signal-dependent" is with the term "media noise."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 The term "signal-dependent" appears in both patents with and without a hyphen. No distinction is made based on the hyphen and for the sake of consistency, except where being quoted in the patents, the Court will use the term with the hyphen.
Another intrinsic use of the terms is found in two of the articles cited in the specification by the patentee as "combating media noise and its signal dependent nature," which describe what is defined in the specification as the "variance dependent branch metric." In Zeng, et al., "Modified Viterbi Algorithm for Jitter-Dominated 1-D2 Channel," IEEE Trans. Magn., Vol. MAG-28, pp. 2895-97, Sept. 1992, the abstract states that "one way to improve data capacity in magnetic recording is to increase linear density by storing magnetic transitions more closely in each track. . . . Transition noise cannot be modeled as additive noise since it is data-dependent." 11 (Docket No. 82-10 at 2). In the Zeng article, the metric that is concluded to account for the data-dependent transition noise is "ln σk² + (Zk - yk) / σk² rather than (Zk - yk)², the standard error metric for the [Viterbi algorithm]." (Docket No. 82-10 at 3). The PHOSITA would recognize this metric to be the same as what is represented in the specification as the variance dependent branch metric, equation (10).

11 Marvell does not dispute that data-dependent and signal-dependent have the same meaning. (Docket No. 119 at 36:2-10).

Similarly, in Lee et al., "Performance Analysis of the Modified Maximum Likelihood Sequence Detector in the Presence of Data-Dependent Noise," Proceedings 26th Asilomar Conference, pp. 961-64, Oct. 1992, the abstract states "as recording densities grow in magnetic storage, transition-dependent noise becomes more significant . . . . A first conclusion is perhaps to derive a new error metric that considers data-dependent noise . . . ." (Docket No. 82-9 at 2). The Lee article explains what the authors mean by data-dependent media noise as follows:

There are two main sources of data-dependent media noise. The first is non-deterministic transition shift. As the boundary of transition, inter-reaction of the magnetic material causes transition shift, depending on write patterns. The second is pulse amplitude fluctuation, caused by fluctuation of transition width with data pattern.

(Docket No. 82-9 at 2)(emphasis added). The Lee article then provides an error metric for data-dependent noise that is the same as what is found in equation (10) in the specification.

Based upon the above articles, the PHOSITA would understand the variance dependent branch metric to be a signal-dependent branch metric. The specification explains for the variance dependent branch metric the "variance depends on the written sequence of symbols." 839 Patent col. 6 ln. 17-18. From this, the PHOSITA would conclude that the noise attributable to the written sequence of symbols on the disk is "media noise", and would further conclude that the variance dependent or signal-dependent metric function is specifically stated to account for the noise from the written sequence of symbols, that is to say "media noise." This is further confirmed by the language discussing the branch metric function from which the euclidean, variance dependent and correlation-sensitive branch metric functions are derived. "[The branch metric] is also dependent on the postulated sequence of written symbols ai -Kt, . . . , ai +L+Kt, which ensures the signal-dependence of the detector." 839 Patent col. 5 ln. 49-52. Thus, to ensure signal-dependance, the branch metric accounts for the sequence of written symbols.

Marvell cites to the last paragraph of the specification as evidence that the patentee intended the scope of patent to be
beyond magnetic media.

While the present invention has been described in conjunction with preferred embodiments thereof, many modifications and variations will be apparent to those of ordinary skill in the art. For example, the present invention may be used to detect a sequence that exploits the correlation between adjacent signal samples for adaptively detecting a sequence of symbols through a communications channel. The foregoing description and the following claims are intended to cover all such modifications and variations.

'839 Patent col. 13 ln. 51-59. The Court is cognizant that, as stated above, "there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification." Phillips, 415 F.3d at 1323 (citing Comark, 156 F.3d at 1186). However, based upon the consistent pairing of "signal-dependent" with "media noise" as well as the specification's explicit statements that metrics are signal-dependent because they account for the written sequence of symbols, the PHOSITA would conclude that "signal-dependent noise" is media noise attributable to the written sequence of symbols.

Thus, the construction of the terms "signal-dependent noise" and "signal-dependent branch metric function" is as follows:

Signal-dependent noise means "media noise in the readback signal whose noise structure is attributable to a specific sequence of symbols (e.g., written symbols)."

Signal-dependent branch metric function means "a 'branch metric function' that accounts for the signal-dependent structure of the media noise."

2. "signal point"

The plaintiff proposes that the term "signal point" means "a value that is transmitted by a modulator in one signaling interval." The defendants propose "a single mapped point in a signal constellation." The defendants support this construction by arguing that one of ordinary skill in the art would understand the term "signal point" to refer to a mapped point in a signal constellation. The defendants also contend that signal constellations include many different dimensionalities. In addition, the defendants argue that a "signal point" is not actually transmitted; instead, a waveform representing the bits values associated with the signal point is transmitted.

The plaintiff responds by arguing that the '627 patent does not mention "mapping." The plaintiff also points to the specification which states that "signal points are thereupon communicated over the channel." '627 patent, 4:1-3.

The court agrees with the plaintiff that the intrinsic evidence fails to require a signal point "mapped" in a constellation. Based on the cited portion of the specification, the court agrees that the proper construction for this term is "a value that is transmitted by a modulator in one signaling interval."

1. "signal processing circuit"

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;signal processing circuit&quot;</td>
<td>a circuit, within a communications controller circuit, that executes program instructions to process communications signals and executes program instructions to encipher or decipher such signals</td>
</tr>
</tbody>
</table>
The claims at issue require that enciphering/deciphering and signal processing be performed by a "signal processing circuit." The parties proposed constructions for this term are essentially equivalent except that Saxon's proposal is broad enough to include general purpose microprocessors and signal processors, but Defendants' proposal requires a "signal processing circuit" to be a signal processor. Saxon argues that Defendant is importing a limitation from the preferred embodiment into the claim language. Defendants argue that the patentee disclaimed broader scope in the specification and the prosecution history.

The claims at issue do not explicitly require that a "signal processing circuit" must be a signal processor. The plain meaning of the word "circuit" implies a broader structure, which may or may not include a signal processor. Thus, the Court will presume that Defendants' proposed construction is improper unless Defendants identify statements of "clear disclaimer" expressly indicating "manifest exclusion or restriction." Liebel-Flarsheim Co., 358 F.3d at 913; Brookhill-Wilk 1, LLC, 334 F.3d 1294, 1301; see also Phillips, 415 F.3d at 1312-13.

Defendants argue that the only embodiment disclosed in the specification is one in which enciphering/deciphering and signal processing are performed by a single digital signal processor ("DSP"), rather than different portions of circuitry within a circuit. '555 Pat. at 4:39-47, 6:52-55. Defendants further argue that the patentee disclaimed broader embodiments when it told the PTO that "[e]ach of Claims 1, 21 and 43 require signal processors having an integrated ability to perform enciphering or deciphering functions." '555 Pat. Amendment at 30 (July 17, 1996). The patentee made this statement to distinguish a prior art reference which incorporated separate devices to perform the enciphering/deciphering and signal processing functions. Id. However, in the same paragraph, the patentee also stated that the prior art reference was distinguishable because the claimed invention "implements encryption/decryption as an additional task performed by the signal processing circuit." Id.

While the Court recognizes Defendants' concern that the patentee should not be able to acquire claim scope over devices present in the prior art, Defendants have not shown that the patentee has disclaimed claim scope. Omega Eng'g, Inc., 334 F.3d at 1324. While Defendants are correct that the only embodiment discussed in detail uses a DSP to perform enciphering/deciphering and signal processing, Defendants have not shown that the limitation of this embodiment should be imported into the claims. See Comark Commc'ns, Inc., 156 F.3d at 1187. In fact, the patent specification contemplates a variety of embodiments. '555 Pat. at 10:52-59 (stating that "[t]he present invention makes possible digital signature authentication and message encryption using either a single DSP or a single microprocessor, or using both a DSP and a microprocessor"). Similarly, Defendants have not presented a valid prosecution disclaimer argument. At best, Defendants have cited to an ambiguous passage in the prosecution history. Cf. Omega Eng'g, Inc., 334 F.3d at 1323.

Saxon's proposed construction is consistent with the specification's use of the term "signal processing circuit." '555 Pat. at 10:23-28. However, the phrase "within a communications controller circuit" is superfluous since this limitation is already present in the claims. The Court finds that the proper construction for this term is "a circuit that executes program instructions to process communications signals and executes program instructions to encipher or decipher such signals."

1. "signal processor"

Defendants argue that a signal processor is a processor specifically tailored to perform signal processing operations. Saxon argues that this term refers to a general purpose microprocessor, which need not be specifically designed to perform signal processing. 4 Contrary to Saxon's argument, the '394 Patent reinforces the idea that there is a generally recognized distinction between signal processors and general purpose microprocessors.

---

4 This position is arguably inconsistent with Saxon's proposed construction for the term "signal processing circuit" discussed above, which Saxon supported by arguing that the term was broad enough to cover "both a DSP and a general microprocessor." PL.'S REPLY at 6.

---

The '394 Patent specification states: "The above and other objectives of the invention are accomplished by a system which includes a general purpose microprocessor and one or more streamlined signal processors to which critical functions can be dedicated." '394 Pat. at 2:5-8. This statement strongly implies that a "signal processor" is not simply a synonym for a "general purpose microprocessor." The Court finds that Saxon's proposal would read the word "signal" out of the claim term at issue. Therefore, the Court adopts Defendants' proposed construction.

---

3. The term "SIGNAL PROCESSOR" (claim 17) requires no construction.

---

H. Signal Representative of the Differences Between Said Interval Speech Pattern and the Interval Representative Set

The parties also dispute the meaning of the phrase "signal representative of the differences between said interval speech pattern and the interval representative set" (the "Differences Phrase"). ( ’580 patent, Col. 19:10-12.) Both parties maintain that this phrase requires construction.

AT&T urges the Court to adopt its proposed construction: "a sequence of values representative of the differences between the interval speech pattern and the predicted speech pattern based on the set of signals representative of the speech pattern of said time interval." (Joint Letter, Ex. B.) Microsoft's proposed definition is: "a sequence of values representing the subtraction between the speech pattern for an entire time segment and the representative signal set for that entire time segment." (Joint Letter, Ex. B.) The two main points of contention between the parties' positions are: (1) the construction of the Differences Phrase as a whole; and (2) whether the term "differences" encompasses the concept of the degree or amount things differ or, in contrast, a mathematical subtraction.

1. The "Differences Phrase"

The parties both acknowledge that the Differences Phrase, as written, is unclear in that it describes a comparison of unlike items: a speech pattern with an interval representative set. AT&T, however, asserts that the specification teaches that the "difference" between the two values may be formed in the predictor residual generator 118. More specifically, AT&T urges the Court to consider the specification's description of the operation of the Differences Phrase:
The delayed samples are supplied to the input of prediction residual generator 118. The prediction residual generator, as is well known in the art, is responsive to the delayed speech samples and the prediction parameters a(k) to form a signal corresponding to the difference there between. The formation of the predictive parameters and the prediction residual signal for each frame shown in predictive analyzer 110 may be performed according to the arrangement disclosed in U.S. Pat. No. 3,740,476 issued to B.S. Atal June 19, 1973 and assigned to the same assignee or in other arrangements well known in the art.

(‘580 patent, Col. 3:41-53.) AT&T also points to Figure 7 to demonstrate the specification's illustration of the Differences Phrase.

Microsoft argues that the Court should not impermissibly re-draft the claim phrase to accommodate AT&T's proposed construction, and acknowledges that its proposed construction would render claims incorporating the Differences Phrase invalid.

Although the claim language itself is unclear, the ‘580 patent's written description clarifies the meaning of the Differences Phrase by describing how the comparison operates. See Teleflex, 299 F.3d at 1325 ("The intrinsic evidence may provide context and clarification about the meaning of claim terms.") The passage describing Element 118, the residual generator signal, makes clear that the proposed comparison is performed on interval speech pattern and the predicted speech pattern based on the set of signals representative of the speech pattern. (See ‘580 patent, Col. 3:40-53.) See Teleflex, 299 F.3d at 1325 ("The specification may assist in resolving ambiguity where the ordinary and accustomed meaning of the words used in the claims lack sufficient clarity to permit the scope of the claim to be ascertained from the words alone.") (citing Eastman Kodak Co. v. Goodyear Tire & Rubber Co., 114 F.3d 1547, 1554 (Fed. Cir. 1997)).

Analyzing the prosecution history, it is silent concerning the Differences Phrase despite the fact that the PTO examined the reissue patent twice. See Interconect Planning Corp. v. Feil, 774 F.2d 1132, 1139 (Fed. Cir. 1985) (the "burden of proving invalidity [is] made heavier" with respect to a reissue patent).

AT&T urges the Court to consult certain expert testimony to confirm the meaning of the Differences Phrase as understood by one of ordinary skill in the art. Microsoft counters by emphasizing that "expert testimony is often useful to clarify the patented technology and to explain its meaning through the eyes of experience, but it may not correct errors or erase limitations or otherwise diverge from the description of the invention as contained in the patent documents." Aqua-Aerobic Sys, v. Aerators Inc., 211 F.3d 1241, 1245 (Fed. Cir. 2000). Expert testimony "may be used only to help the court come to the proper understanding of the claims; it may not be used to vary or contradict the claim language." Vitronics, 90 F.3d at 1584 (citing Markman, 52 F.3d at 967); accord Pitney Bowes, 182 F.3d at 1308; Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1216 (Fed. Cir. 1995); see also Teleflex, 299 F.3d at 1328 (referring to expert witnesses' testimony concerning the ordinary meaning of a claim term); Budde v. Harley-Davidson, Inc., 250 F.3d 1369, 1382 (Fed. Cir. 2001) (considering expert testimony concerning the view of one skilled in the art). "It is entirely appropriate, perhaps even preferable, for a court to consult trustworthy extrinsic evidence to ensure that the claim construction it is tending to from the patent file is not inconsistent with clearly expressed, plainly apposite, and widely held understandings in the pertinent technical field." Pitney Bowes, 182 F.3d at 1309.

In this case, both parties submitted expert testimony concerning the interpretation one skilled in the art would attribute to the Differences Phrase: AT&T presented Dr. Nikil S. Jayant and Microsoft presented Dr. Allen Gersho, both accomplished engineers. In paragraph 7 of his declaration, Dr. Jayant states that one of ordinary skill in the art of speech compression in 1981 would have understood that the Differences Phrase
refers to the difference between an original speech signal a prediction or estimate of the original speech signal. The person of ordinary skill in the art would have understood that a residual signal, or a prediction error, would be consistent with such a difference between the original speech signal and the prediction or estimate of the original speech signal.

(Jayant Decl. at P 7.)

Microsoft's expert, Dr. Gersho averred in his declaration:

I agree that persons skilled in the art of speech compression in 1981 would have understood that the inventors intended the 'differences' phrase to refer to the difference between (1) 'an original speech signal' and (2) 'a prediction or estimate of the original speech signal,' but I disagree that the differences phrase, as written by the claim drafter so states.

(Gersho Decl. at P 12.)

Microsoft conceded, however, at the Markman hearing that its own expert, Dr. Gersho, supports Dr. Jayant's position in his declaration, (Tr. at 239-40), and similarly acknowledged that the Court should consider the experts' declarations in analyzing the disputed phrase. (Tr. At 228.) See Teleflex, 299 F.3d at 1328; Budde, 250 F.3d at 1382; Vitronics, 90 F.3d at 1584; Pitney Bowes, 182 F.3d at 1309. Thus, the Court's consultation of the experts' determinations confirm the teachings of the specification that one of ordinary skill in the art of speech compression in 1981 would have understood the Differences Phrase to refer to the difference between an original speech signal and a prediction or estimate of the original speech signal. See Renishaw, 158 F.3d at 1250 ("Ultimately, the interpretation to be given a term can only be determined and confirmed with a full understanding of what the inventors actually invented and intended to envelop with the claim."); accord Vitronics, 90 F.3d at 1584; Pitney Bowes, 182 F.3d at 1309.

The instant situation is distinguishable from the decisions upon which Microsoft relies. For example, in Aqua-Aerobic Sys., Inc. v. Aerators Inc., 211 F.3d 1241, 1245 (Fed. Cir. 2000), the Federal Circuit declined to rely on expert testimony to vary or contradict the terms of the claims stating: "[the expert's testimony] is directly contrary to the limitations in the claims and the description in the specification." Aqua-Aerobic Sys., 211 F.3d at 1245; see also Process Control Corp. v. HydReClaim Corp., 190 F.3d 1350, 1357 (Fed. Cir. 1999) (declining to apply contrary written description where one skilled in the art would understand that the "claim was susceptible to only one reasonable construction"); Allen Eng'g Corp. v. Bartell Indus., 299 F.3d 1336, 1349 (Fed. Cir. 2002) (finding claim invalid where specification described a claim structure in "contrary terms" to the claim language). Here, however, a review of both experts' testimony confirms that the specification describes the Differences Phrase consistent with, not contrary to, the understanding of one skilled in the art. See Vitronics, 90 F.3d at 1583-84 (stating a court may consider expert testimony to aid it in "coming to the proper understanding of the claims"); accord Pitney Bowes, 182 F.3d at 1308. Thus, the construction of this claim term is appropriately based on the intrinsic evidence, as confirmed by the experts' testimony.

2. Differences v. Subtraction

The parties also disagree as to whether the proper construction of the Differences Phrase should retain the term "differences" or instead use the term "subtraction." To restate, AT&T's proposed definition is: "a sequence of values representative of the differences between the interval speech pattern and the predicted speech pattern based on the set of signals representative of the speech pattern of said time interval." (emphasis added.) Microsoft's proposal is: "a sequence of values representing the subtraction between the speech pattern for an entire time segment and the representative signal set for that entire time segment." (Joint Letter, Ex. B) (emphasis added.)

AT&T argues that the term "differences" should retain its plain meaning, since infusing the term "subtraction" into the phrase would render the encompassing claims inoperable. See ACS Hosp. Sys., 732 F.2d at 1577 ("claims should be … construed, if possible, as to sustain their validity"). AT&T further asserts that the patentees did not manifest a clear disavowal of the plain meaning of "differences."

Microsoft counters that its version of the plain meaning of "differences" should apply: "the result of subtracting one number from another." (See Microsoft PHB at 24-25; citing McGraw-Hill Dictionary of Scientific and Technical Terms at 448 (3rd ed. McGraw-Hill 1984).) Microsoft argues that the written description supports the use of the word "subtraction," in that the correlation processor 125 generates "a signal corresponding to the weighted difference" between "signals Y and [YHAT].", (580 patent, Col. 4:60-64), and that this difference is the result of subtractions, as illustrated by the source code in Appendix A, line 201, depicting a subtraction between the "Y" signal and the "YHAT" signal.
Starting with the words of the claim, Microsoft cites to the mathematical definition "the result of subtracting one number from another" in support of its proposed "subtraction" claim language. See McGraw-Hill Dictionary of Scientific and Technical Terms at 364. AT&T offers two dictionary definitions of "difference" in support of its broader proposed language: "the amount by which one quantity is greater or less than another," Am. Heritage Dictionary of the English Language at 367 (Am. Heritage Publishing Co., Inc. 1973), and "the degree or amount by which things differ in quantity or measure," Webster's New Collegiate Dictionary, at 315 (G.&C. Merriam Co. 1981). AT&T also submits a definition for "differ": "to be unlike or distinct in nature, form, or characteristics." Webster's New Collegiate Dictionary at 315 (G.&C. Merriam Co. 1981). Where terms have multiple dictionary definitions "the intrinsic record must always be consulted to identify which of the different possible dictionary meanings of the claim terms in issue is most consistent with the use of the words by the inventor." Texas Digital Sys., 308 F.3d at 1203 (citing cases). Here, the specification's description of the operation of the Differences Phrase ( '580 patent, Col. 3:41-53) confirms a broader definition of the term "differences," as it depicts a comparison rather than a mathematical subtraction between the interval speech pattern and the predicted speech pattern.

Further, the patentees did not clearly disavow the broader, comparative definition of "differences" in the specification or the prosecution history. The specification source code in Appendix A, to which Microsoft cites in support of its proposed term, is merely one embodiment of the mathematical operation in Element 118, which itself is one part of the embodiment described in Figure 1. To narrow the claim term as Microsoft suggests would be to impermissibly import a limitation from the specification. See Teleflex, 299 F.3d at 1325. Accordingly, the intrinsic evidence does not support the infusion of the word "subtractions" into the Differences Phrase.

In conclusion, this Court construes the claim phrase "signal representative of the differences between said interval speech pattern and the interval representative set" as "a sequence of values representative of the differences between the interval speech pattern and the predicted speech pattern based on the set of signals representative of the speech pattern of said time interval." See '785 Patent, col. 26:57-60.

4055

"motion requesting signal set"

Claim 52 of the '785 Patent contains the term "motion requesting signal set." IPI contends the term means "signals representative of data for viewpoint motion and/or point of interest motion in a three-dimensional workspace." Google contends the term means "a group of commands indicating a point of interest motion and a viewpoint motion relative to the point of interest."

The term "motion requesting signal set" appears in claim 52 in the following context: "receiving a first motion requesting signal set from the user input means, the first motion requesting signal set requesting a first viewpoint motion and a first point of interest motion." '785 Patent, Col. 26:57-60. IPI argues that a preferred embodiment of the patented invention includes at least two different types of signal sets: (1) a signal set requesting viewpoint motion relative to a stationary point of interest and (2) a signal set requesting both viewpoint motion and point of interest motion. IPI's Opening Brief, at 25. However, this statement is not completely accurate. The preferred embodiment includes only a single signal set, but that content of the signal set may request either (1) only viewpoint motion relative to a stationary point of interest or (2) both viewpoint motion and point of interest motion. See '785 Patent, col. 9:27-37.

Google again takes issue with IPI's inclusion of "and/or" in its proposed construction. However, here it is clear that IPI uses "and/or" to indicate that one type of motion requested by the signal set may be "no motion." For example, a signal set requesting viewpoint motion and no point of interest motion would result in only viewpoint motion relative to a stationary point of interest. However, the "and/or" language in reference to the two types of motions is unnecessary in view of the further claim language specifying the two types of motion that can be requested. '785 Patent, col. 26:57-60 ("the first motion requesting signal set requesting a first viewpoint motion and a first point of interest motion"). Google's proposed construction suffers from the same error. Further, Google's reference to "a group of commands" deviates from the plain language of the claim and specification which describe the requests in terms of "signals" or "signal sets."

Accordingly, the Court rejects both parties' proposed constructions and construes the term "motion requesting signal set" to
mean "data indicating a user's request for movement of an image presentation on a display." Other recitations in the claim control any further limitations such as those addressed by the parties' proposed constructions.

GO BACK

4056

1. The '359 patent

With respect to the phrase "signal structure identification data," the district court noted that the parties did not dispute that "signal structure" was defined in the specification to mean "infrared signals having particular characteristics that the appliance understands, such as frequency, pulse width, and bit timing." It thus focused the inquiry on the claim terms "identification" and "data," adopting their ordinary meanings as proffered by Philips. The phrase was construed to mean "information (data) that identifies a signal structure.

CMT argues that the district court erred in failing to adopt its own proposed construction, i.e., "information (data) that constitutes part of an address used to address one table in a multiplicity of product code tables." It makes three arguments on this issue. First, it argues that the specification uses this phrase only in describing the particularly preferred embodiment, wherein it is made clear that "the stored signal structure identification data constitute part of an address, the remainder of the address being provided by user selection of the category to which the appliance belongs. . . [which] is used to address one table in a multiplicity of product code tables." '359 Patent col. 2, ll. 35-41. Second, it points out that during prosecution, the claim was amended from "storing signal structure identification data corresponding to said required signal structure of said response-evoking signal, thereby creating stored product identification data" to "thereby creating stored signal structure identification data." Third, CMT stresses that the claim language itself requires "generating subsequent appliance command signals at least in part under control of said selected category signal and said stored signal structure identification data," which suggests that the latter is only part of an address used to look up product codes.

We agree with the district court that the phrase "signal structure identification data" is entitled to its plain and ordinary meaning. The district court correctly rejected CMT's invitation to read into the phrase a limitation from the preferred embodiment. See Electro Med. Sys., S.A. v. Cooper Life Sciences, 34 F.3d 1048, 1054 (Fed. Cir. 1994). It also accepted, as we do, Philips' explanation that the claim amendment was only made to maintain consistency, as the final phrase of Claim 1 refers to "said stored signal structure identification data," which otherwise does not appear earlier in the claim.

We review a district court's grant of summary judgment de novo. IPXL Holdings, L.L.C. v. Amazon.com, Inc., 430 F.3d 1377, 1380 (Fed. Cir. 2005). Here, because CMT stipulated that the accused products would literally infringe the '359 patent under the definition of "signal structure identification data" proffered by Philips and adopted by the district court, we must affirm the summary judgment of infringement.

GO BACK

4057

1. "signal transfer device"

The plaintiff asserts that "signal transfer device" does not require construction. The defendants, by contrast, argue that the term means a device that incorporates both a transmission circuit and a reception circuit and transfers signals there between. Joint Claim Construction Brief, Exh. B.

I agree with the defendants, based on the ordinary and customary meaning of the claim language. Claim 8 expressly claims a "signal transfer device" comprising (1) a scrambling means; (2) a transmitter transmitting the signal; (3) a receiver receiving the signal from the transmitter; and (4) an unscrambler for removing the interference or distortion from the signal. '066 Patent, col. 6, lines 30-40.

I construe the term "signal transfer device" to mean a device that incorporates both a transmission circuit and a reception circuit and involves the transfer of signals between the two.
D. "Signaling Message"

The parties ask the Court to construe the term "signaling message," found in the '561 Patent, claims 1, 3, 6, 24, and 26. Sprint argues that the term means a message used to set up or tear down a call, which is the same construction that the Court adopted for this term in Vonage. See 518 F. Supp. 2d at 1318. Big River argues that term means signaling in a particular format used to set up or tear down a communication path for a call. Thus, Big River seeks to add the concepts of a "particular format" and a "communication path" to the Court's previous construction.

With respect to the latter addition, Big River relies on its prior argument that a communication path is needed, and it points to language in the specification defining "signaling" as the transfer of information "to establish communications paths." (605 Family at 5:23-25.) The Court again rejects this construction, based on the same reasons stated above. See supra Part III.A. Moreover, as Sprint notes, this excerpt from the specification refers to "paths" in the plural, and therefore it cannot support a limitation of a single path for a call. The excerpt also describes "signaling" and not "signaling message." Big River has clearly not attempted to define "signaling" generally, as it repeats that term in its proposed construction. Finally, Big River's limitation is further undermined by the language of the claim itself, which requires the "signaling message" to select not a path, but rather a network code. (561 Patent, claim 1.) The Court rejects Big River's proposed addition of a reference to "a communication path" in its construction of "signaling message."

In support of its other proposed addition, Big River cites to references in the specification that distinguish between a "signaling message" and mere "signaling". Big River thus argues that "message" connotes "format", in the sense that if one changes the format, then a new signaling message results. Sprint finds it unremarkable that a given signaling message would have a format, as all messages must. On this issue, the Court agrees with Sprint. In retaining "signaling" in its construction, Big River has essentially attempted to define "message", but it has not explained why that word needs defining. Moreover, the Court finds Big River's proposed language potentially confusing, as it suggests that the signaling must be in one particular format without defining that required format, instead of merely suggesting that messages have formats (as apparently intended by Big River).

Accordingly, the Court retain its previous construction of "signaling message" to mean a message used to set up or tear down a call.

H. "Signaling Message"

Claim 38 of the '572 patent, claim 1 of the '561 patent, and claim 19 of the '294 patent recite the claim term "signaling message." Sprint contends that these claim terms should be construed to mean information or commands used to set up or tear down a call. In support of this argument, Sprint relies on essentially the same specification language set forth above. Vonage contends that these claim terms should be construed to mean a message used to transfer information among points and network elements to establish communication paths. In support of this argument, Vonage relies on narrowing disclaimers that Sprint made during prosecution history in which Sprint amended claimed phrases in the '928 patent from receiving and processing "information" to receiving and processing "signaling." But, as set forth above the court finds that the intrinsic record does not support the claim construction "information or commands" in any event. Vonage offers no further argument in support of its proposed claim construction. Accordingly, for essentially the same reasons set forth above, the court construes the claim term "signaling message" to mean a message used to set up or tear down a call.

2. "Signaling modes" (Claims 1, 7)
The key issue regarding this term is whether a "signaling mode" is always used to transmit a "packet of data," as Broadcom suggests, or whether this construction would constitute an improper limitation of the claim term, as Agere suggests. Broadcom's expert, Dr. Cox, admits that this claim term does not have a customary meaning in the field. (Cox Rep. at 44.) Furthermore, the term "packet" cannot be found anywhere in the claim language. Nonetheless, Broadcom draws support for its limiting construction from two sources.

First, as noted above, this patent describes the transmission of symbols of equal length. According to Dr. Cox, a person of ordinary skill in the art at the time the '786 patent was filed "would understand packets of data to contain data symbols of the same length in the payload portion of the packet because in OFDM systems of that time, symbol and guard time lengths were not generally changed in the middle of the transmission of a packet of data." (Cox Rep. at 45.) This statement, however, employs questionable logic. Even assuming that a person of skill in the art would understand a "packet" to consist of data symbols of equal length, this does not compel the conclusion that a claim describing the transmission of data symbols of equal length must necessarily describe the transmission of a packet. Accordingly, the disputed claim term will not be limited on this basis.

Second, Broadcom draws support for its limitation from the description of the preferred embodiment in the specifications:

In the preferred embodiment of the present invention, a first signaling mode (the 'normal' mode) uses signal length T, a guard time T[G ]and a set of N sub-carriers and a second mode (the 'fallback' mode) uses a symbol length KT, a guard time KT[G ]and the same set of N sub-carriers, where K is an integer greater than unity.

('786 patent, col. 1, l. 66-col. 2, l. 4.) According to Dr. Cox, one of ordinary skill in the art would understand the terms "normal mode" and "fallback mode" to refer to the transmission of an entire packet of data, rather than some subset of a packet. (Cox Rep. at 45.) Even if Dr. Cox's opinion is accurate, however, the terms "normal mode" and "fallback mode" are only found in the description of one preferred embodiment. As Broadcom readily admitted at the Markman hearing, this invention is not limited to the preferred embodiment. (R. at 116 (May 7, 2004).) Accordingly, the Court will not limit the claim term on this basis. See Teleflex, 299 F.3d at 1328 ("To the extent that the district court construed the term 'clip' to be limited to the embodiment described in the specification, rather than relying on the language of the claims, we conclude that the district court construed the claim term . . . too narrowly.").

In conclusion, as the claim language describes the transmission of symbols, not packets, ('786, col. 1, ll. 62-63, col. 4, ll. 54-55, col. 5, ll. 21-23 (describing devices operating in one of a "plurality of signaling modes in each of which the duration of each information-carrying symbol is KT where K is a positive integer" (emphasis added))), and as Broadcom has not provided a persuasive reason to limit the claim term, the Court finds no basis to accept the limitation Broadcom proposes. Although Agere's proposed construction does not contribute greatly to an understanding of the term, it is an accurate reflection of the claim text, and therefore is adopted: "One of a plurality of OFDM transmission modes."

4. "first signals"

Klausner contends that the term needs no construction. Vonage proposes "signals received with a voice message recognizable by the telephone answering device and generally unique to the caller." To support its proposal, Vonage cites to a portion of the specification that provides "[i]t is to be understood that any incoming signals over the telephone line with a voice message that is recognizable by the TAD and is generally unique to the caller may be used instead of DTMF tones." See Col. 9:51-54.

The claim language itself describes the "first signals" as "specifying each caller of each incoming call." See Col. 13:47-48. The Court fails to see how the portion of the specification cited by Vonage does anything more than clarify that signals other than "DTMF tones" may be used to specify the caller. To hold that this statement constitutes the exclusive definition of the term would seem to clearly import unnecessary limitations into the claim language. See Phillips, 415 F.3d at 1323. Moreover, the proposed limitations, "recognizable by the telephone answering device" and "generally unique to the caller," are ambiguous and could inject confusion into the construction.
The Court notes that in the prosecution history of the '236 patent, 4 the Applicant describes "signal" as a "[g]eneral term referring to a conveyor of information." See Ex. 12 to Klausner's Claim Constr. Br. at 7. Also, the Applicant refers to "caller identity information," "identifying information" and "caller identifying information." See Ex. 6 to Klausner Opening Br., p. 21, and Ex. 7 to Klausner Opening Br., p. 20.

The Court finds that the meaning of "first signals" in the context of the patent is "information."

C. "Signals Representative Of"

Claim 1 of the '080 patent further requires that the apparatus have "an input for receiving signals representative of a position of the aircraft, a flight path angle of the aircraft and the speed of the aircraft coupled to a data base of stored terrain information." (emphasis added). The district court interpreted the phrase "signals representative of" to mean "[t]he signals received by the apparatus are instantaneous values of the recited variables; i.e. they indicate the numerical value of that variable at a given sampling time." Claim Construction Decision, 264 F. Supp. 2d at 145. In explaining this claim construction, the district court stated:

Honeywell argues that its patent covers any signal relating to the angle, position, and speed of the flight . . . The terrain awareness systems compare flight data with stored terrain information, in order to warn the pilots of danger. If the court construed Honeywell's patent to include any signal representing one of the previously mentioned variable, it would claim both signals which indicate threat, and signals which do not. Since the point of the invention is to warn of dangerous conditions, the patent should be limited to signals which represent threat. Because a pilot cannot read a signal, the signals are transformed into numbers, thus "dangerous signals" are understood in terms of numbers . . . Thus, reading the patents in the broad manner that Honeywell proposes, that is, allowing the patents to apply to the entire spectrum of signals, would defeat the purpose of the patent.

Id. at 145-46.

Honeywell argues on appeal that the district court unduly narrowed the term "signals." Honeywell contends that the term should encompass any electronic, visual, audible, or other ways to convey such information. Further, Honeywell argues that "signals representative of" are, by definition, such signals that represent or portray. Honeywell argues that nothing in the claims, specification, or prosecution history limits the signals to instantaneous and numerical values.

Universal states that the term "signals representative of" should mean "that the input receives signals from other devices which represent discreet and instantaneous numeric values of recited variables that warn a pilot of dangerous conditions." However, Universal offers no argument to support this interpretation.

Sandel supports the district court's construction as based on the claim language itself; i.e. that the claim requires "signals representative of" position, flight path angle, and speed in calculating distances and creating alert envelopes. According to Sandel, only numerical terms allow the system to function, but Sandel offers no evidence in support of this assertion.

This court has acknowledged: "In some cases, the ordinary meaning of claim language . . . involves little more than the application of the widely accepted meaning of commonly understood words." Phillips, 415 F.3d at 1314. Consistent with that guidance, this court perceives that the signals represent the inputs into the system, namely the position, flight path angle, and speed of the aircraft. The patent does not require numerical or instantaneous signals. In context, one of ordinary skill in this art would consider the district court's construction too narrow.
Apparently the district court unduly narrowed the claim based on its overall perception of the invention. Specifically, the district court assumed that the pilot reads the signals at issue. Claim Construction Decision, 264 F. Supp. 2d at 145-46. To the contrary, the signals represent the inputs into the system about aircraft position, speed, and flight angle, not a data representation for pilot consumption. The pilot does not read these inputs. Instead the system's software processes these inputs to generate visual and aural warnings. Thus, the trial court erred by stating that the pilot would read these signals.

In sum, one of ordinary skill in this art would not limit this term to numerical or instantaneous values. Rather these signals are inputs into the system which uses its algorithms to process this information into appropriate warnings.

"Signing," "Key," and "Signed File"

As used in the patent claims' language and specifications, the definitions of "signing," "key," and "signed file" are closely related. "Signing" appears in each disputed patent claim (536 Patent: 1,6; 709 Patent: 1,17). The defendants contend that "signing" means "the process of hashing input to compute a hash result and using a cryptographic function with a private key to transform the hash result into a digital signature" (Doc. 62 at 12). The plaintiff argues "signing" means simply "applying a unique identifying characteristic of a unique entity" (Doc. 60 at 12). The plaintiff's significantly elastic definition admittedly encompasses "a lawyer signing a brief" and "an illiterate person marking their X" (Doc. 60 at 11). However, the intrinsic evidence directly contradicts the plaintiff's unbounded construction.

Attempting to distinguish his invention over prior art, the patentee, in the specifications in both patents, expressly and unambiguously defines "signing":

To sign a document, or for that matter any other digital data file, a "signer" must first delimit the borders of the digital data file to be signed. As used herein, the term signer refers to any person who creates a digital signature for a message, such as message 110. The information delimited by the signer, in turn, refers to that message 110. A hash function 120 in the signer's software is used to compute a hash result 130, which is unique for all practical purposes to the message 100. Thereafter, a signing function 140 is used to transform the hash result 130 into a digital signature 160, but only after input of the signer's private key 150.

(536 Patent at 8:9-20; 709 Patent at 8:5-16). The patentee expressly defines signing as "creatin[g] a digital signature" by hashing a document or "any other digital data file" (536 Patent at 8:9-20; 709 Patent at 8:5-16). This definition reveals that "signing" does not encompass a physical, written signature.

Further, the patents' claims ubiquitously speak of "maintaining trust in the content of a digital data file" by "signing said digital data file," "hashing said signed file to produce a digest," and "signing said digest with a key to produce a certificate" (536 Patent at 40:22-41:21; 709 Patent at 43:4-43:67). The patent's use of "sign" consistently depicts "digital data" as the recipient of a signature, and the patent is unconcerned with the unlimited application of "a unique identifying characteristic
of a unique entity." In this context, "signing" obviously means the signing of digital data and the creation of a digital signature. "The claims of a patent define the invention to which the patentee is entitled the right to exclude." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005). Nothing in the patents' claims supports the plaintiff's suggestion that "signing" encompasses a non-digital, handwritten signature.

Because the claims of both patents' limit "signing" to digital signing, the plaintiff's proposed construction is inconsistent with the written descriptions' express definition. As the defendants persuasively argue, one of ordinary skill in the art understands "signing" (as used in the patents) to mean creating a digital (but not a written) signature. Consistent with the patent and its specifications, "signing" means "the process of computing a hash result, which result is converted into a digital signature using a cryptographic function and the signer's private key."

The patents' definition of "signing" contemplates the use of a signer's private "key" (536 Patent at 8:9-20; 709 Patent at 8:5-16). The patents expressly state that a key is not used for encryption:

Thereafter, a signing function 140 is used to transform the hash result 130 into a digital signature 160, but only after input of the signer's private key 150. This transformation is sometimes referred to as a process of encryption. However, such a characterization would be inaccurate, because message 110 itself may, or may not be, confidential.

Further, the specifications state "[s]ystems that generate and employ a secure key pair (i.e., a 'private key' for creating the 'digital signature' and a 'public key' for verifying that digital signature) are typically known as asymmetric cryptographic systems" (536 Patent at 7:48-51; 709 patent at 7:45-49). Consistent with the language of the patents, "key" means "a unique sequence used to create or verify a digital signature."

Finally, the defendants propose that a "signed file" is "a file with its digital signature" (Doc. 62 at 17). The plaintiff argues that a "signed file" means simply "a file with its signature" (Doc., 60 at 16). However, the patents' claims specify that a digital file joined with a date and time is signed to create a "signed file" (536 Patent at 40:37-40, 41:15-18). Accordingly (and perforce the above constructions), a "signed file" means "a file with its digital signature."

2. The term "SIGNIFICANT" (claim 19) requires no construction. Nellcor's argument that the term is indefinite is based on the erroneous notion that unless something can be quantified to an exact amount, it must be invalid. One of the main purposes of requiring patentees to set forth specific claims is to provide proper notice to the public. Where exactitude is possible, it clearly advances this goal. However, a patentee is not required to draw bright lines for the sake of clarity when those bright lines would obscure rather than enhance disclosure. See Exxon Research and Eng. Co. v. U.S., 265 F.3d 1371, 1377-80 (Fed. Cir. 2001).

Here, the question of how much the signal must be a function of the primary or secondary signal defies an exact description. That the significance cannot be quantified by an absolute value does not render the notice function of the element meaningless. Lack of meaning is a determination reached only if Nellcor can demonstrate that as stated, the claim is indeterminate to those of ordinary skill in the art. The mere fact that a term cannot be quantified into an absolute value, even when taken in conjunction with the fact that the specifications do not provide examples of what is or is not significant, cannot be said to rise to the level of meeting the "clear and convincing standard to show that one of ordinary skill would not understand" what is included in claim 19. N. Amer. Vaccine v. Amer. Cyanamid Co., 7 F.3d 1571, 1579 (Fed. Cir. 1993).

B. "Significant Oxide Growth"

As a separate claim element, the '584 patent cautions that the temperature and time of heating used during the partial reflow step must be "insufficient to form a significant oxide growth on the exposed portion of the semiconductor body." The term "significant oxide growth" is not defined within the claims, nor is it a term that has a generally accepted meaning.
independent of the patent. Nevertheless, a review of the specification and the background to the invention reveals the proper scope of this disputed term.

As the patent makes clear, the partial reflow step that is central to the claimed invention is designed to improve metal connection within the semiconductor by tapering the edges of a formed contact hole while otherwise maintaining the essential integrity of the hold. Yet, reheating may inevitably result in some new oxide formation within the contact hole, which if significant, could defeat the purpose of the partial reflow step. Thus, the patent teaches that the temperature and heating time during the reflow step must be such that any formation of oxide growth "will be so thin that any subsequent deposition of a metallic interconnect thereon will readily punch through and provide good contact to the surface of the silicon." '584 patent, col. 3, 11. 50-53. It follows from this passage that the meaning of the disputed term "significant oxide growth" is a thickness of oxide growth that a metallic interconnect will not readily punch through when deposited thereon.

Yet, this interpretation does not end the claim construction process, for although the specification suggests that a separate etching step will not be necessary to remove any oxide growth that has formed, the claims of the patent do not preclude such a step. Rather, the patent merely describes the potential disadvantage of a separate etching. Specifically, etching to remove the undesirable oxide that has formed during the reflow step may also remove the desirable oxide from the insulating layer, and thereby disrupt the integrity of the hole. It is this complication associated with a separate etching step, and not the step itself, which must be avoided under the '584 patent. Thus, an alternative definition of "significant oxide growth" is a thickness of oxide growth that requires removal by a separate etching step that will simultaneously remove desirable oxide and thereby disrupt the integrity of the contact hole. Thus, the term "significant oxide growth" is properly defined in full, as follows:

A thickness of oxide growth on the exposed portion of the semiconductor body (1) that a metallic interconnect will not readily punch through when deposited thereon, or (2) that requires removal by a separate etching step that will simultaneously remove desirable oxide and thereby disrupt the integrity of the contact hole.

And, in the instant case, while Atmel performs a separate etching to remove the oxide formed during the reflow step, the record does not disclose (1) whether a metallic interconnect would readily punch through that oxide layer were it not removed, nor (2) whether the separate etching removes desirable oxide and thereby disrupts the integrity of the contact hole. Accordingly, it is unclear whether the temperature utilized in the accused process is "insufficient to form significant oxide growth," and hence whether the accused process infringes this element either literally or under the doctrine of equivalents.

"Signing," "Key," and "Signed File"

As used in the patent claims' language and specifications, the definitions of "signing," "key," and "signed file" are closely related. "Signing" appears in each disputed patent claim (536 Patent: 1,6; 709 Patent: 1,17). The defendants contend that "signing" means "the process of hashing input to compute a hash result and using a cryptographic function with a private key to transform the hash result into a digital signature" (Doc. 62 at 12). The plaintiff argues "signing" means simply "applying a unique identifying characteristic of a unique entity" (Doc. 60 at 12). The plaintiff's significantly elastic definition admittedly encompasses "a lawyer signing a brief" and "an illiterate person marking their X" (Doc. 60 at 11). However, the intrinsic evidence directly contradicts the plaintiff's unbounded construction.

Attempting to distinguish his invention over prior art, the patentee, in the specifications in both patents, expressly and unambiguously defines "signing":

To sign a document, or for that matter any other digital data file, a "signer" must first delimit the borders of the digital data file to be signed. As used herein, the term signer refers to any person who creates a digital signature for a message, such as message 110. The information delimited by the signer, in turn, refers to that message 110. A hash function 120 in the signer's software is used to compute a hash result 130, which is unique for all practical purposes to the message 100. Thereafter, a signing function 140 is used to transform the hash result 130 into a digital signature 160, but only after input of the signer's private key 150.
(536 Patent at 8:9-20; 709 Patent at 8:5-16). The patentee expressly defines signing as "create[ing] a digital signature" by hashing a document or "any other digital data file" (536 Patent at 8:9-20; 709 Patent at 8:5-16). This definition reveals that "signing" does not encompass a physical, written signature.

Further, the patents' claims ubiquitously speak of "maintaining trust in the content of a digital data file" by "signing said digital data file," "hashing said signed file to produce a digest," and "signing said digest with a key to produce a certificate" (536 Patent at 40:22-41:21; 709 Patent at 43:4-43:67). The patent's use of "sign" consistently depicts "digital data" as the recipient of a signature, and the patent is unconcerned with the unlimited application of "a unique identifying characteristic of a unique entity." In this context, "signing" obviously means the signing of digital data and the creation of a digital signature. "The claims of a patent define the invention to which the patentee is entitled the right to exclude." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005). Nothing in the patents' claims supports the plaintiff's suggestion that "signing" encompasses a non-digital, handwritten signature.

Because the claims of both patents' limit "signing" to digital signing, the plaintiff's proposed construction is inconsistent with the written descriptions' express definition. As the defendants persuasively argue, one of ordinary skill in the art understands "signing" (as used in the patents) to mean creating a digital (but not a written) signature. Consistent with the patent and its specifications, "signing" means "the process of computing a hash result, which result is converted into a digital signature using a cryptographic function and the signer's private key."

The patents' definition of "signing" contemplates the use of a signer's private "key" (536 Patent at 8:9-20; 709 Patent at 8:5-16). The patents expressly state that a key is not used for encryption:

Thereafter, a signing function 140 is used to transform the hash result 130 into a digital signature 160, but only after input of the signer's private key 150. This transformation is sometimes referred to as a process of encryption. However, such a characterization would be inaccurate, because message 110 itself may, or may not be, confidential.

Further, the specifications state "[s]ystems that generate and employ a secure key pair (i.e., a 'private key' for creating the 'digital signature' and a 'public key' for verifying that digital signature) are typically known as asymmetric cryptographic systems" (536 Patent at 7:48-51; 709 patent at 7:45-49). Consistent with the language of the patents, "key" means "a unique sequence used to create or verify a digital signature."

Finally, the defendants propose that a "signed file" is "a file with its digital signature" (Doc. 62 at 17). The plaintiff argues that a "signed file" means simply "a file with its signature" (Doc. 60 at 16). However, the patents' claims specify that a digital file joined with a date and time is signed to create a "signed file" (536 Patent at 40:37-40, 41:15-18). Accordingly (and perforce the above constructions), a "signed file" means "a file with its digital signature."

"substantially similar in design" and "similar in design"

Claims 1, 5, and 7-10 of the '8,415 Patent; claims 1, 2-7, 17-18, 25-26, 33-38, 81-82, and 84-85 of the '981 Patent; claims 1-5, 31, 55-57, 65, 74, 79, and 84 of the '297 Patent; claims 79, 86, and 88 of the '3,415 Patent; and claims 1 and 3-10 of the '416 Patent either include limitations of "substantially similar in design" or "similar in design," or depend either directly or indirectly on a claim that includes these limitations. An exemplary claim containing the "substantially similar in design" limitation recites:

A computer system . . . comprising . . . a plurality of computer modules . . . wherein each of the computer modules is substantially similar in design to each other to provide independent processing of each of the computer modules in the computer system, and wherein any two of the computer modules can replace each other in operation.

'8,415 Patent, col. 10:46-62. Defendants contends the terms are indefinite and thus the claims containing these limitations are indefinite. After a review of the arguments and relevant evidence, the Court concludes that the terms "substantially similar in design" and "similar in design" meet the definiteness requirement of 35 U.S.C. § 112, ¶ 2.
Defendants contend that nothing in the specifications or the claims of the patents-in-suit provide any guidance or measure of when two or more computer modules are "substantially similar in design" or "similar in design" to each other. Defendants further contend that the terms have no ordinary meaning to those of skill in the art, and there is nothing in the patents-in-suit that enables one of skill in the art to determine what aspects of the computer modules must be similar, or the required extent of similarity necessary to satisfy the limitations. Specifically, Defendants contend that the claims require that each computer module (1) have the specified components identified in the claim, and (2) be "substantially similar in design" to the other modules. Defendants assert that the specified component requirement cannot be equated with the "substantially similar in design" requirement because the two requirements are separately recited, and equating the two would improperly read out the "substantially similar in design" limitation. Defendants' central argument is that the claims are indefinite because they fail to specify whether the "substantially similar in design" limitations apply to the additional components in the computer modules, to the physical layout of the components in the modules, to the design, shape, and dimensions of the modules, or to the intended operation and performance of the modules.

ACQIS counters that the patent specifications inform one of skill in the art to determine when computer modules are "substantially similar in design" or "similar in design" by providing clear examples of computer modules that meet these limitations. ACQIS contends that Figures 2 and 3 of the patent specifications provide illustrations of computer modules that share common "architecture" and are "substantially similar in design." ACQIS further identifies portions of the specifications that address the "substantially similar" language and demonstrate the scope of the computer module "architecture." See ACQIS's Responsive Indefiniteness Brief, Docket No. 286, at 8-10, 13-14. For example, the written description relating to Figure 2 of the '8,415 Patent, produced below, provides that "[t]he second ACM has the same or similar components as the first ACM." '8,415 Patent, col.7:5-6. Although ACQIS correctly points to the module components and circuit configuration in characterizing the scope of the "substantially similar in design" and "similar in design" limitations, it incorrectly characterizes the scope of the limitations in terms of "architecture," rather than "design."

GET DRAWING SHEET 3 OF 5

The terms "substantially similar in design" and "similar in design" are clearly limited in scope by specifying that substantial similarity is in regard to "design." The specification and the claims provide a framework for one of skill in the art to determine what "design" means within the context of the claimed subject matter (i.e., "a computer system for multi-processing purposes" comprising "computer modules"). The claims define the computer modules as having the same electronic components and specify that the computer modules are interchangeable. The meaning of "design" would be understood by one of skill in the art to refer to the "electronic circuit configuration operative to implement the processing operations of the computer system." Characterizing the scope of the limitations in terms of computer module "design" is more restrictive than ACQIS's "architecture" characterization because one of skill in the art would understand "architecture" to refer broadly to "the structure and organization of a computer system's hardware," rather than the specific circuit configuration or design of the computer module.

One of ordinary skill in the art would understand the scope of the claims and be able to determine what constitutes infringement. Because Defendants have not shown by clear and convincing evidence that the terms "substantially similar in design" and "similar in design" are insolubly ambiguous rendering the claims indefinite, the Court DENIES Defendants' Motion for Partial Summary Judgment of Indefiniteness Under 35 U.S.C. § 112, ¶ 2 (Docket No. 274). In addition, the claim language is clear and understandable to the fact finder and any substitute for the claim language is likely to cause confusion rather than aid. Thus, the terms do not require construction.

GO BACK

4069

Defendants CHE and York move for summary judgment on the '569 Patent, claiming invalidity (# 617) and non-infringement (# 616). Both issues depend upon interpretation of the term "simulated LMU."

Claim construction presents purely legal questions. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 978 (Fed. Cir. 1995), aff'd 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). Claim terms are given their "ordinary and customary meaning," which is the meaning that a "person of ordinary skill in the art" would give the term, "not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification." Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005) (en banc). The court's primary resource is intrinsic evidence,
including the claim itself, other claims of the patent, "both asserted and unasserted," the patent's specification or written description, and the prosecution history. Id. at 1314-15. The specification may "teach and enable those of skill in the art to make and use the invention," but it does not define the scope of the claim terms, and courts therefore "avoid importing limitations from the specification into the claims." Id. at 1321. Extrinsic evidence—though "less significant" than intrinsic evidence—may nevertheless "shed useful light" on a claim term. Id. at 1317 (internal quotation marks omitted). Such evidence may include dictionaries, treatises, and expert testimony. However, extrinsic evidence is considered "less reliable" than intrinsic evidence; courts assume it is "unlikely to result in a reliable interpretation . . . unless considered in the context of the intrinsic evidence." Id. at 1318-19.

The Patent describes a method for testing the Library Storage Module ("LSM") component of an STK silo system. The LSM stores data cartridges, which are retrieved and read by a robotic arm. Several LSMs are controlled by an LMU, which in turn receives commands from host computers. The method is intended to aid STK library owners when they wish to add additional LSMs to an existing system. ('569 Patent 1:25-27). Before a new LSM is added, it must undergo diagnostic testing. (Id. at 1:39).

Such testing was previously accomplished after an LSM was assembled and connected to the library, but it required customers to "shut down . . . operations." (Id. at 1:47-48). The '569 Patent reduces this downtime. Instead of first connecting the new LSM to the system and thereafter performing diagnostic testing, the patent describes a method for testing a new LSM "prior to its incorporation into the library." (Id. at 2:6-7).

Such testing is accomplished by means of a "simulated LMU," a term that appears in each asserted claim. The parties offer divergent definitions of the term and hotly dispute each distinction. One of these disputes, however, is dispositive as to infringement. CHE argues that a simulated LMU must be "capable of being used to perform diagnostic testing on an LSM . . . before such LSM is ever connected to an LMU." This assertion is supported by the intrinsic record, though the diagnostic testing is perhaps more accurately described taking place before the LSM is connected to a library, rather than an LMU. As STK concedes (# 683, at 8-9), unasserted Claims 1 and 8 of the '569 Patent both specify that diagnostic testing be conducted via a simulated LMU before the LSM is connected to a library. ('569 Patent, 5:58, 6:37-39). Because Claims 1 and 8 therefore use the term "simulated LMU" to refer to a device that is capable of conducting diagnostic testing before the LSM is attached to a library, and because claim terms are "normally used consistently throughout the patent," Phillips, 415 F.3d at 1314, the same definition applies to the asserted claims. That the purpose of the simulated LMU is to perform such prior testing is further apparent from the rest of the patent. (569 Patent, Abstract (simulated LMU "tests[ ] the new LSM prior to its incorporation into the library"); Summary, 2:4-7 (same)). Therefore conclude that term "simulated LMU" refers to a device capable of being used to perform diagnostic testing on an LSM before the LSM is connected to a library.

4070

U. "simulating a virtual file system"

The phrase "simulating a virtual file system" is found in Claim One of the '449 Patent as follows: "wherein the interface device is arranged for simulating a virtual file system to the host, the virtual file system including a directory structure." '449 Patent, col. 12:4-6; see also id., col. 14:4-7 (Claim Seventeen) ("the virtual file system including a file allocation table and a directory structure"); id., col. 14:29-32 (Claim Eighteen) (same). The phrase might be thought a bit circuitous, in that a virtual file is already a simulated file. See Tr. 3:119 (Papst) ("[T]his is unusual language. It probably wouldn't have been my first choice . . . ."). With the additional word "system," however, the phrase can be readily construed.

As Claims One, Seventeen, and Eighteen of the '449 Patent make clear, the Patent covers a virtual system of files, with a virtual directory structure. See '449 Patent, col. 12:6. Dependent Claim Two identifies additional types of virtual files which could be in the virtual system referenced in Claim One: a virtual configuration file, a virtual executable or batch file, or a virtual data file. See id., col. 12:8-12; see also id. col. 12:27-28 (Claim Seven) (referencing a "virtual boot sequence"). A "virtual file system," such as that described in the '449 Patent, is one that is "not physically existing as such but made by software to appear to do so." Oxford English Dictionary at 674 (defining "virtual" in the context of computers) (attached to CMs' Markman Br. as Ex. P); accord New IEEE Dictionary at 1461 ("virtual record" is a record that "appears to be but is not physically stored") (attached to CMs' Markman Br. as Ex. G). The Court construes "simulating a virtual file system" to mean "appearing to be a system of files, including a directory structure, that is not physically stored; rather, it is constructed
5. "Simulation"

Although neither party requested that the Court construe the claim term "simulation," the Court ordered the parties to brief the proper interpretation of the term because the term is central to Plaintiff's contentions in opposition to Defendant's invalidity arguments. (See Order of July 28, 2009; see also Part II.C.2.) In the parties' supplemental briefs, Defendant asks the Court to construe "simulation" to mean an "interactive representation for a prospective application," whereas Plaintiff proposes that the Court construe the term to mean simply "an interactive representation." 7 (See Def.'s Supp. Brief 1; Pl.'s Supp. Brief 1.) As such, the parties' proposed constructions vary only with Defendant's addition of "for a prospective application."

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

7 Plaintiff's supplemental brief also includes a proposed construction of the term "simulation of a computer application." (See Pl. iRise's Supp. Brief Re "Simulation" Supp. Opp'n Def. Axure Software Solutions, Inc.'s Mot. Summ. J. Non-Infringement & Invalidity ("Pl.'s Supp. Brief") 1.) The Court declines to construe this term because not only is it unnecessary but also the Court ordered additional briefing only on the term "simulation" and Defendant therefore did not have an opportunity to brief this additional term that Plaintiff unilaterally decided to include. (See Order of July 28, 2009; Axure's Supp. Brief Re: Meaning Term "Simulation," Submitted Supp. Axure's Mot. Summ. J. Non-Infringement & Invalidity ("Def.'s Supp. Brief").)

a. The Claim Language

The independent claims, Claims 1, 10, 20, 30, and 40, feature the term "simulation" several times: in the preamble, "a programming environment for programming of a simulation of a computer application," in the first limit, "for programming of the simulation of the computer application," and in the second limit, "receiving control indications from the user to arrange the one or more primitives to program the simulation." U.S. Patent No. 7,349,837 col.83 l.38-46, col.84 l.38-l.47, col.85 l.46-l.56, col.86 l.61-col.87 l.3, col.88 l.8-17 (filed Jan. 22, 2004). This claim language suggests that Plaintiff's proposed construction is proper because substituting Defendant's construction for "simulation," "an interactive representation for a prospective application," into the claim language "simulation of a computer application" creates the phrase "an interactive representation for a prospective application of a computer application," which is repetitive and nonsensical.

Claims 8, 18, 28, 38, and 48 feature the language "wherein at least one of the primitives simulates computation available in the computer application." U.S. Patent No. 7,349,837 col.84 l.33-35, col.85 l.39-l.41, col.86 l.54-l.56, col.88 l.1-l.3, col.90 l.4-6 (filed Jan. 22, 2004). Although this claim language is not particularly helpful in deciding between the parties' proposed constructions, it does suggest a distinction between a simulation and what will ultimately be available in the computer application. In other words, it emphasizes that a simulation of a computer application is merely an interactive representation of a computer application.

Accordingly, the claim language supports Plaintiff's proposed construction of simulation as an "interactive representation."

b. The Specification

The specification further supports Plaintiff's proposed construction of the term "simulation." Defendant contends that the term "simulation" is "expressly defined" in the specification of the '837 Patent, which states: "Each user accesses the interface and/or simulator applications to manage the requirements and access the interactive representation, sometimes referred to as the 'simulation,' for a prospective application." U.S. Patent No. 7,349,837 col.61 l.63-65 (filed Jan. 22, 2004);
Def.'s Supp. Brief 1. The Court is not convinced that this is an express definition of the term "simulation," as "sometimes referred to" does not demonstrate an unambiguous and explicit intent to define the term. See Renishaw PLC, 158 F.3d at 1249 (internal citations omitted); see also Jack Gutman, Inc., 302 F.3d at 1360. Nevertheless, even if this portion of the specification were construed to define the term "specification," it would support Plaintiff's construction of the term as an "interactive representation." The comma placement in the quoted language makes clear that an "interactive representation" is "sometimes referred to as the simulation," not that an "interactive representation . . . for a prospective application" is "sometimes referred to as the simulation." See U.S. Patent No. 7,349,837 col.61 l.63-65 (filed Jan. 22, 2004).

Similarly, another portion of the specification shows that the added phrase in Defendant's proposed construction is improper. The specification states: "For the purposes of the present invention, the term interactive representation means (1) a simulation of the behavior of a prospective application that is used to review conformance of behavior to the desired or necessary behavior of the prospective application before it is developed and deployed." U.S. Patent No. 7,349,837 col.7 l.45-49 (filed Jan. 22, 2004). The portion demonstrates the interchangeability of "interactive representation" and "simulation." Furthermore, it shows the impropriety of Defendant's additional limitation "for a prospective application" because, like in the claim language, replacement of Defendant's proposed construction, "interactive representation for a prospective application," for "simulation" in this portion of the specification leads to the phrase, "interactive representation for a prospective application of the behavior of a prospective application," which again is repetitive and nonsensical. 8

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

8 In addition to aiding the Court in deciding which of the parties' proposed constructions is proper, this portion also suggests that the purpose of a "simulation," i.e., an "interactive representation," is to review the prospective application's conformance with the expected traits of the application "before it is developed and deployed." See U.S. Patent No. 7,349,837 col.7 l.45-49 (filed Jan. 22, 2004) (emphasis added). As such, the simulation is an interactive representation of a computer application before it is actually developed. In other words, a user is not viewing an actual application, but merely a representation of the application.

Similarly, in describing the purpose of "simulation" and "simulcasting," the specification states that the "user[] or several users determine if the requirements and the IRM are completed sufficient . . . to warrant proceeding to providing outputs to design and delivery of the actual code for the prospective application . . . ." See U.S. Patent No. 7,349,837 col.13 l.32-36 (filed Jan. 22, 2004) (emphasis added). This portion of the specification again suggests a distinction between the simulation, i.e., the interactive representation, and an application that is actually developed and coded.

Finally, the specification states that "simulation" presents the user "with an experience very similar to what would be experienced if that user were interacting with the completed proposed application." U.S. Patent No. 7,349,837 col.12 l.61-64 (filed Jan. 22, 2004). Again, this portion of the specification of the '837 Patent suggests that the "simulation," though similar to the completed application, is distinguishable from the completed, coded application. This provides further support for the idea that a simulation is merely a representation of a computer application, it is not the actual application itself.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The construction of "simulation" as an "interactive representation" also conforms with the specification's usage of the term "simulator." For example, the specification defines the term "simulator" as "a software component of the present invention that renders an interactive representation of a proposed application and related requirement information based on an interactive representation model and associated requirement information" and later states that a "simulator[] is a computer program that renders interactive representations of prospective computer applications." U.S. Patent No. 7,349,837 col.11 l.62-67, col.53 l.62-65 (filed Jan. 22, 2004) (emphasis added). Replacing the term "simulation" for the term "interactive representation" in these portions of the specification demonstrates the propriety of the proposed construction, as it is entirely appropriate that the "simulator" renders a "simulation" of the proposed application.

Accordingly, the specification of the '837 Patent demonstrates that Plaintiff's proposed construction of the term "simulation" as an "interactive representation" is proper.

c. Extrinsic Evidence
Because the intrinsic evidence is unambiguous as to the meaning of the term "simulation," see Vitronics Corp., 90 F.3d at 1584 (internal citation omitted); see also Omega Eng'g, Inc., 334 F.3d at 1332 (internal citations omitted), the Court finds it inappropriate to consider the positions of the parties' experts on the term.

d. Conclusion

Based on the claim language and the specification of the '837 Patent, the Court adopts Plaintiff's proposed construction of the term "simulation," specifically "an interactive representation."

4072

c. Automatic and Simultaneous

Again, unless the patentee has clearly acted as his own lexicographer, the terms data and information are presumed to have their plain and ordinary meaning. Johnson Worldwide, 175 F.3d at 989. The Court finds no evidence that the patentee acted as his own lexicographer and, therefore, construes these terms to have their plain and ordinary meaning.

The Court finds that in construing these terms, it is appropriate to consult dictionaries. Phillips, 415 F.3d 1303, 2005 WL 1620331 at *6. According to the Merriam-Webster's online dictionary, "simultaneous" means "existing or occurring at the same time" and automatic means "having a self-acting or self-regulating mechanism." Merriam-Webster Online Dictionary, available at www.merriam-webster.com. The same conclusion results from a plain reading of the specification.

4073

A

We agree with the district court that claims 1 and 15 require that information be presented to the user in a manner that allows the user to access the information at the same time that he is observing the field of view. Claim 1 requires the information to be "simultaneously presented to the user as the user observes the field of view" (emphasis added), and claim 15 requires the information to be "provide[d] . . . to the user . . . in real-time as the user observes the field of view." Especially when followed by the preposition "to," the verb "present" (or "provide," in the case of claim 15) suggests the act of making something immediately accessible for the user to view. Webster's New International Dictionary 1955 (2d ed. 1954) (defining "present" as "[t]o exhibit or offer to view"); id. at 1994 (defining "provide" as "[t]o supply for use"). It would be strange to say that an image is "presented to" a user as the user observes the field of view if the user is not in a position to view the image while observing the field of view.

In the context of the '203 patent, there is a significant difference between displaying information on a side screen that the user cannot see while observing the field of view, as opposed to simultaneously presenting information to a user as the user observes a celestial object in the field of view. The specification makes it clear that one of the key features of the invention is that the user can receive information about a particular celestial object while using the device to observe the object in the field of view. For example, the patent explains that one of the main disadvantages of observing aids such as star charts is that the observer "has to refer back and forth from the sky to the star chart." '203 patent, col. 1, ll. 30-31. But that is precisely what users of Yamcon's accused device must do with respect to the screen display, because Yamcon's device lacks the simultaneity feature touted in the patent.

All of the embodiments described in the patent allow information to be presented so that the user is exposed to the information and field of view at the same time. In one embodiment, the device "superimposes on the observed night sky within the instrument's field of view an image in the form of a graphic representation of a prominent astronomical feature such as a constellation." '203 patent, col. 2, ll. 22-25. In discussing alternative embodiments, the specification notes that the "display is placed in the user's line of sight for direct viewing." '203 patent, col. 4, ll. 20-21. Nothing in the specification indicates that the relevant claim language can be interpreted to cover devices that do not present information to the user while the user is viewing the field of view.
Meade makes several arguments in support of its interpretation, but they are not persuasive. First, Meade challenges the district court's conclusion that the "user of the device must actually be aware of and receive the data at the same time that he or she is viewing the celestial object." Meade argues that the claims do not require "awareness" of the information on the part of the user, but only require that the information be "presented or provided." While it is true that the claim limitations are directed to the capabilities of the device, not the capabilities of the user, we do not interpret the district court's claim construction to require that the user actually absorb textual information at the same time that he is viewing an object. All that is required is that the information be made available to the user so that the user can access it while observing the field of view. In that regard, the district court's claim construction is entirely consistent with the prosecution history of the '203 patent, in which the applicant asserted that the invention "provides a device that a user can hold in his or her hand, point it in a desired direction, look through it at the night sky, and see both the actual night sky (in some limited field of view) and also see educational information about the prominent feature or features in that portion of the sky."

Second, Meade makes the related argument that the district court's claim construction excludes the embodiments disclosed in the specification, because even in the embodiments that call for overlaying information on the field of view it would be impossible for a user to read the displayed textual information and look at a celestial object in the field of view at the same moment. That is because, according to Meade, a user must shift the focus of his eyes away from the celestial object in order to focus on the overlaid visual display. Again, that argument overlooks the claim language. The claims require that the user be able to access the information at the same time that he is "observ[ing] the field of view." If the user can detect the information while using the device to observe the field of view, then even if the user must shift his attention from the celestial object in order to read the information that is displayed in or around the eyepiece field of view, the user is still observing the field of view as he accesses the information.

Finally, Meade raises a claim differentiation argument in support of its interpretation of the claim language. Meade argues that the only distinction between independent claim 1 and some of the dependent claims, such as claims 2 and 3, is that the dependent claims require real-time display of textual information overlaid on the field of view. Thus, in Meade's view, claim 1 must include some means of presentation other than overlaying information on the field of view. Although we agree that claim 1 must be broader than the claims that depend on claim 1, we disagree that the broader scope of claim 1 includes Yamcon's side screen display. Rather, the additional breadth of claim 1 includes methods of simultaneous presentation to the user other than overlaying the information as text on the field of view. For example, claim 1 may include audio presentation of information, see '203 patent, col. 11, ll. 39-42 ("certain data from the database may be provided to the user aurally with known speech synthesis integrated-circuit chips in place of the visual display"), or overlaying textual information within the observer's vision but outside the field of view of the eyepiece. Particular embodiments are not at issue in this appeal, so we need not rule on whether they would fall within the scope of claim 1; it is sufficient simply to note that there are various embodiments that might fall within claim 1 but outside the dependent claims. Therefore, we reject Meade's claim differentiation argument.

The second dispute over construction of the asserted claims of the '306 patent concerns the requirement imposed by the district court that "two or more empty frames are filled at the same time by different data sources." The district court drew this requirement from the preamble language, "for transmitting data from said plurality of sources simultaneously via said bit stream." The dispute, as presented by the parties, is whether this limitation requires two or more data sources to be inserting data into empty frames at the same moment in time.

We agree with Bellcore that data sources need not insert data into empty frames at the same moment in time. The claim speaks not of simultaneous insertion of data into empty payload fields, but of the simultaneous transmission of data from several sources in the bit stream. Perhaps the term "simultaneously" is ambiguous because it could refer either to events taking place at the same moment in time, or to events that both take place within a defined interval of time. But reference to the specification unquestionably shows that the latter meaning is correct. The entire '306 patent is directed to time division multiplexing, and the essence of time division multiplexing is that a single communications line transmits the signals from two or more sources by allocating sequential portions of the bit stream to the competing input sources. '306 patent, cols. 1-2, 5. While any given point of the bit stream is dedicated exclusively to a single input source, over an interval of time (determined by the bit rate of the slowest data source) the bit stream will carry data from all the input sources. Hence, a time division multiplexed signal carries several input signals "simultaneously" without regard to the precise timing of data.
The district court drew the opposite conclusion—interpreting "simultaneously" to mean at the same moment in time—from the specification's single use of the term "simultaneously" to describe the operation of demultiplexing circuitry. '306 patent, col. 13, ll. 49-51. But this portion of the specification refers to an entirely different aspect of the invention. Moreover, as Bellcore notes, the disclosure nowhere suggests that data is inserted into two or more empty frames at the same moment in time. According to the specification, the timing with which interface units insert data into the bit stream is controlled solely by whether the interface unit has data stored in its FIFO, and whether upstream interface units have left empty frames available in the bit stream. Id. col. 9, ll. 50-53; col. 7, ll. 46-61. There is no mention of any mechanism to coordinate simultaneous insertion of data.

FORE points out that it is possible for multiple data sources to insert data simultaneously into the bit stream, if two or more interface units have data stored in their FIFOs and have empty frames positioned in their framer units at the same time. But of course, a claimed invention is not limited to a particular mode of operation simply because it is capable of operating in that mode. We conclude that "simultaneously" in the claim preamble refers to the capability of the multiplexed bit stream to carry signals from multiple sources during a finite interval, not to any requirement that several data sources must be inserting data into empty frames at the same instant in time.

IV. "simultaneously" in the 351/696 patent

Lexar's proposed construction: at the same time
Toshiba's proposed construction: at the same time without intentional delay

Claim 6, wherein "simultaneously" appears in the 351 patent, reads as follows:

The memory system of claim 1, wherein the memory cells are divided into a plurality of erase blocks each of said erase blocks are erased simultaneously, and a plurality of data groups are written in each of said erase blocks.

"Simultaneously" appears in claim 7 of the 696 patent as follows:

The memory system according to claim 2, wherein the program termination detector simultaneously determines whether each data latch circuit stores the second logic level.

Lexar argues that the plain meaning of "simultaneously" is "at the same time," and that the Court should adopt this as the proper construction of the term. Lexar notes the Federal Circuit's finding in Linear Technology Corp. v. Impala Linear Corp., 371 F.3d 1364 (Fed. Cir. 2004), that the plain meaning of the word "simultaneously," according to Webster's Third New International Dictionary, is "at the same time; concurrently." Lexar also contends that the 351 specification supports its construction in that it equates the term "simultaneously" with the language "at the same time." Indeed, column 2, lines 3-4 of the 351 says that "[i]n the erase operation, data in all memory cells within the NAND cell are erased at the same time."

Toshiba argues that the context of the claim language requires that the claim term be construed as "at the same time without intentional delay." Toshiba suggests that Lexar's proposed construction is overly broad and that Toshiba's proposed construction is better because it clarifies that it is the erasing that occurs simultaneously, not the condition of being erased that is simultaneous. However, Toshiba's argument relies on the specification of the 933, unrelated to the 351 or the 696. The Court declines to import limitations from one patent into the construction of a common claim term in a wholly unrelated patent. Moreover, however, Toshiba's proposed construction does not add anything substantive to the term's meaning. The Court finds that the ordinary meaning of the term, as offered by Lexar, is the proper construction. "Simultaneously" in the 351/696 is therefore construed as at the same time.

V. "simultaneously" in the 933 patent

Lexar's proposed construction: at the same time
Toshiba's proposed construction: at the same time without intentional delay
Claims 1, 4, 15, 18, 31, and 34 of the 933 patent employ the disputed claim term "simultaneously." The parties propose the same respective constructions of "simultaneously" in the 933 patent that they proposed in the 351/696 patent. The Court looks first to the claim language itself. Claim 1 of the 933 patent teaches:

A semiconductor memory device comprising:

a memory cell array having a plurality of memory cells arranged in a matrix; and word lines, each word line being connected to plural memory cells and forming one page, wherein a number of pages selected simultaneously when a read or write operation is performed, is variable.

Claim 4, dependent from claim 1, teaches that "the number of pages selected simultaneously is varied by a command input from outside a chip." Claim 15 teaches a semiconductor memory device comprising a memory cell array with a plurality of sub-cell arrays, wherein "each of the sub-cell arrays includes a memory cell which is coupled to a word line and a bit line, a data circuit being coupled to the bit line, and a number of sub-cell arrays to be selected simultaneously is variable when a read or a write operation is performed." Claim 18, dependent from claim 15, teaches that the number of sub-cell arrays selected simultaneously is varied by a command input from outside a chip. Claim 31 teaches a semiconductor memory device comprising a memory cell array with a plurality of sub-cell arrays wherein each of the sub-cell arrays has at least one page respectively, and a number of pages selected from said plurality of sub-cell arrays simultaneously when a read or a write operation is performed, is variable. Claim 34, dependent from claim 31, teaches that "the number of pages selected simultaneously is varied by a command input from outside a chip."

Lexar, citing Linear Technology Corp., argues that the ordinary meaning of the word "simultaneously" should be adopted as the proper construction of the term. 371 F.3d 1364 (the plain meaning of "simultaneously," according to Webster's Third New International Dictionary, is "at the same time; concurrently"). Lexar contends that there is nothing about the claim language or the specification that suggests that the inventor intended a different meaning for the term and that, in fact, the specification supports adopting the ordinary meaning. Indeed, column 10, lines 42-43 explain that "[w]hen the page size is 1024 bytes, the sub-cell arrays A, B, C, and D are selected at the same time." This language appears in the Detailed Description of the Invention Section and strongly suggests that "simultaneously," as that term is used in claims 15, 18, and 31, means "at the same time." Similarly, column 10, lines 50-54 and 63-64 explain that pages are selected "at the same time." This language, also appearing in the section that describes the invention itself, suggests that "simultaneously," as that term is used in claims 1, 4, and 34, means "at the same time."

Toshiba argues that it is the selection of pages and sub-cell arrays that occurs simultaneously, "not the condition of being selected that is simultaneous." The Court agrees but does not find that Lexar's proposed construction suggests otherwise. Moreover, Toshiba's proposed language "without intentional delay" does not clarify the meaning of "simultaneously," but instead, as Lexar suggests, muddles its construction further.

The Court finds that Lexar's proposed construction is more appropriate here and construes "simultaneously" in accordance with its ordinary meaning. Simultaneously in the 933 patent is therefore construed as at the same time.

In its Opening Brief, St. Clair lists several terms that it contends may be disputed by the parties. However, the only remaining term disputed by the parties is the use of the word "simultaneously" in claim 8 of the '219 patent.

Claim 8 of the '219 patent describes simultaneously storing digital audio signals associated with subject images. St. Clair contends that "simultaneously storing" means "storing at or about the same time." (D.I. 427 at 21.) Canon contends that "simultaneously storing" means "recording at exactly the same time." (D.I. 426 at 22.) Each party contends that its construction conveys the plain and ordinary meaning of the term.

After reviewing the claim language in the context of the specification of the patents, the Court concludes that "simultaneously" should be construed to mean "at or about the same time." This construction is consistent with the
specification of the '219 patent, which describes concurrent operations being performed in a certain interval of time at different rates of speed. '219 patent, col. 6, 11. 2-5. This construction is also consistent with the plain meaning of the word "simultaneous" as it is used in the computer context. See Microsoft Press Computer Dictionary 410 (4th ed. 1999) ("Loosely, concurrent operation in which more than one task is processed by dividing processor time among the tasks.").

In making its findings of invalidity in its second order, the court further construed additional claim terms as follows:

- simultaneously active windows - two or more defined and separated areas on the computer screen which are open at the same time and may be operated on by the user;

- active - simultaneously available for operation.

2. Apple next argues that the district court's construction of "simultaneously active windows" is incorrect in that it improperly fails to lend separate meaning to the requirement that the claimed active windows be operable on. Claim 1, argues Apple, is exemplary of this distinction in the '540 patent in that it first recites that "both" the first and second windows are "simultaneously active," and then, in a separate limitation, requires "said user operating on both said first window and said second window without altering the window order." Apple also argues that this same distinction is present in claim 23 and in the patent specification.

"Operating on a window," Apple insists, must mean manipulating the window or data in the window as if an actual file or other physical object were being manipulated. Thus, Apple claims, an operable window is distinct from an active window. And taking this construction, Adobe Photoshop does not anticipate claims 1 and 23 because, while the tool palette is active, it may not be "operated on" within Apple's proposed definition. It may be moved about the display screen, but it may not be resized, nor may the contents be reorganized, nor may the palette be otherwise manipulated.

We reject this argument as well. The district court correctly found that, in the context of the '540 patent, "active" means available for operation, 7 As the specification describes:

Using the techniques of the present invention, the presentation window 300 or access window 130 'floats' above other application windows, such as window 302, and are simultaneously active, thereby allowing the user to operate on both windows 302 and 300 without altering the ordering of the window layers.

Col. 12, lines 46-55 (emphasis added). In contrast, prior art systems were distinguished in that they required an initial mouse click to activate the window before operation on that window was possible. Thus, "active," in the context of the '540 patent, means available for operation, and the invention of the '540 patent allowed multiple windows to be available for operation (active) without the need of a preliminary mouse click.

7 Specifically, the district court found that "active' means simultaneously available for operation." Viewed in context, however, the court actually defined "simultaneously active" in order to construe the limitation "simultaneously active windows."

As for the separate recitation of the requirements that both windows be active and operable on without changing the ordering of the windows, contrary to Apple's assertions, the district court's interpretation does preserve these separate limitations. The second limitation concerns the effect of a user operating on a window, not the fact that it may be operated on. Both windows could potentially be active (or operable on), yet, operating on the windows could change the display order. In contrast, the claim separately specifies that the windows are both active (operable on) and that operating on these
windows will not change their display order; one window "floats" over the other. Thus, both limitations are preserved.

4078

A. The Rejection of Claims 4 and 6

Our first task on the merits is to decide whether the PTO's rejection of claims 4 and 6 under section 102(b), as being anticipated by Rockwell, was proper. Claims 4 and 6 read as follows:

4. A test system and method for testing the integrity of the interconnections of electronic systems by testing for continuity from each point on the interconnect of an electronic system under test simultaneously to multiple selected power, ground and other connection points or wires, comprising the steps of:

(a) controllably applying a test signal sequentially [sic] to each point on the interconnect of the electronic system under test;

(b) simultaneously monitoring the selected multiple connection points or wires for presence of the test signal which is applied sequentially [sic] to each point on the interconnect of the system under test;

(c) identifying each interconnect point and selected multiple connection point or wire which are connected or shorted together; and

(d) comparing test data to records of the system under test for errors.

6. An automatic test system for testing the integrity of the interconnections of electronic systems versus selected multiple connection points or wires using a continuity test technique, comprising:

(a) a testpoint select and control circuit portion for controllably applying a test signal sequentially [sic] to single points on the interconnect of an electronic system under test;

(b) a processor interface circuit portion for interfacing a processor to both the testpoint select and control circuit and the multiple selected connection points or wires;

(c) a processor portion for performing automatic testing;

(d) a computer program portion for system operation and control[;]

(e) a recording device portion such as a printer for data collection; and

(f) a power source portion for supplying electrical power to said testpoint select and control circuit portion, the processor portion and the recording device portion.

The Board found that Rockwell teaches continuity testing of wire harnesses and using scanners to apply test signals and to monitor their presence. According to the Board, Rockwell teaches obtaining test data and comparing it to known good data. The Board also found that Rockwell describes an interface adapter, a processor unit, a read-only memory, a recorder, a frequency shifted key modulator, and a power supply. In view of the above, the Board concluded that Rockwell meets all of the limitations of claims 4 and 6 and thereby anticipates these claims. We agree and accordingly affirm the rejection.

The dissent expresses the view that Rockwell fails to teach element (b) of claim 4. This raises two issues: proper construction of claim 4 and what Rockwell teaches.

As construed by the dissent, element (b) requires the simultaneous monitoring of each of multiple connection points or wires (i.e., each of multiple output points). The Board, on the other hand, construed element (b) to require the simultaneous monitoring of input and output points, but not necessarily the simultaneous monitoring of an input point and multiple output
points. We conclude that the Board properly gave claim 4 as broad a reading as possible not inconsistent with the applicant's disclosure. See, e.g., DeGeorge v. Bernier, 768 F.2d 1318, 226 U.S.P.Q. (BNA) 758 (Fed. Cir. 1985) ("Claims during prosecution . . . are also given the broadest reasonable interpretation possible, consistent with the specification." Id. at 1322 n.2, 226 U.S.P.Q. (BNA) at 761 n.2 (citing In re Yamamoto, 740 F.2d 1569, 222 U.S.P.Q. (BNA) 934 (Fed. Cir. 1984))); In re Sneed, 710 F.2d 1544, 1548, 218 U.S.P.Q. (BNA) 385, 388 (Fed. Cir. 1983).

Even assuming, however, that the dissent's construction of claim 4 is correct, Rockwell nevertheless anticipates claim 4, even if it does not specifically disclose simultaneous monitoring of the output points, if simultaneous or parallel monitoring is within the knowledge of a skilled artisan. See, e.g., In re LeGrice, 49 C.C.P.A. 1124, 301 F.2d 929, 133 U.S.P.Q. (BNA) 365 (CCPA 1962) (anticipates a claim if it discloses the claimed invention "such that a skilled artisan could take its teachings in combination with his own knowledge of the particular art and be in possession of the invention." 301 F.2d at 936, 133 U.S.P.Q. (BNA) at 372 (emphasis in original)); In re Donohue, 766 F.2d 531, 533, 226 U.S.P.Q. (BNA) 619, 621 (Fed. Cir. 1985) (same) (citing In re LeGrice, 301 F.2d at 939, 133 U.S.P.Q. (BNA) at 373-74). Even the applicant, in item 12 of his request for reconsideration of the Board's 30 September 1994 decision, stated that one with knowledge of "basic electronics and simple logic" would understand the difference between the operation of the series circuit of Rockwell and the parallel circuit of the claimed invention. Thus, even under the dissent's construction of claim 4, the Board correctly held that a skilled artisan could take Rockwell's teachings in combination with his own knowledge and be in possession of the device of applicant's claim 4.

In summary, we find that the Board's claim construction is reasonable, and its determination of what Rockwell teaches is not clearly erroneous. We cannot say, therefore, that the Board's conclusion that Rockwell anticipates claims 4 and 6 is clearly erroneous.

I would reverse the Board's decision that claim 4 is anticipated by Rockwell. Claim 4 requires "simultaneously monitoring the selected multiple connection points or wires for presence of the test signal." I construe that claim language to mean that multiple points must be monitored for the test signal, a single test signal, at the same time -- i.e., "simultaneously." The Board concluded that Rockwell taught this claim element "since continuity testing requires that the input and output points be simultaneously selected for application of an input potential and an output 'ground' potential." Under this construction, with which the majority apparently agrees, the word "simultaneously" is rendered superfluous. It is axiomatic that, in a continuity test of a wire, one must monitor the connection point at the same time the test signal is applied.

Regarding the construction of claim 4, the majority states:

The Board, on the other hand, construed element (b) to require the simultaneous monitoring of input and output points, but not necessarily the simultaneous monitoring of an input point and multiple output points. We conclude that the Board properly gave claim 4 as broad a reading as possible not inconsistent with the applicant's disclosure.

While I agree with the majority's restatement of the Board's construction, that construction is inconsistent with plain language of the specification. Graves' specification clearly states, in several different places, the "one-to-many" concept of applying a single test signal and simultaneously monitoring multiple points for the presence of the test signal. For example, the specification recites:

No prior test systems or methods utilize [sic] the present invention's technique for testing the integrity of an electronic system's interconnections versus selected multiple connection points or wires. The technique comprises applying a test signal sequentially [sic] while simultaneously monitoring all the selected multiple points for the presence of said test signal, thus indicating continuity to the single point under test.

* * * *

The present invention tests for possible miswires, missing wires and shorts from each point on the interconnect simultaneously to selected multiple power, ground, processor control and other connection points or wires.
The present invention applies a test signal sequentially [sic] to single points on the interconnect of an electronic system unit under test while simultaneously monitoring the different selected multiple connection points or wires for the presence of said test signal. The presence of such signal indicates continuity between the (multiple point) connection point(s) or wire(s) to the single interconnect point under test.

This language squares with claim 4, which recites the steps of (1) controllably applying a test signal sequentially to each test point, and (2) simultaneously monitoring the selected multiple connections points for the presence of the test signal. As such, I can only conclude that both the Board and the majority have utterly failed to give claim 4 "as broad a reading as possible not inconsistent with the applicant's disclosure." Indeed, the majority's claim interpretation is indisputably inconsistent with the unambiguous language of the specification.

4080

g. "Can be simultaneously operated"

Claims 1 and 10 disclose that "each of the plurality of self-contained pieces of surgical equipment can be simultaneously operated with the operation thereof controlled and monitored from the surgeon's operating station." '688 Pat. col.20 l.7-10; id. at col.21 ll.16-19.

KSEA argues that "can be simultaneously operated" should be construed as "are operable at the same time." (Proposed Constructions Chart 3.) S&N proposes instead "all of the surgical equipment can be controlled and monitored at the same time from the surgeon's control panel." (Id.)

The claims' language suggests that S&N's proposed construction is correct. The word "operation" is key in this regard. The claims teach both that the surgical equipment may be "simultaneously operated," '688 Pat. col.20 l.8, and that the surgical equipments' "operation [is] controlled and monitored from the surgeon's operating station," '688 Pat. col.20 ll.9-10. The latter use of operation indicates that operation relates to the control and monitoring of the surgical equipment, rather than merely meaning "turned on" or "connected" as KSEA contends.

The Court construes "can be simultaneously operated" as meaning that "all of the surgical equipment can be controlled and monitored at the same time from the surgeon's control panel."

4081

C. Simultaneously supplying

The parties dispute the meaning of the term "simultaneously" in the "means for simultaneously supplying the first input-output bus line with one of a logic 1 or 0 signal and the second input-output bus line with the other of a logic 1 or 0 when the memory circuit is enabled in the write operation mode" element of claims 6, 7, and 8 of the '865 patent. Hyundai argues that two events happen "simultaneously" when one continues while the other occurs, claiming that this is the meaning of the term "simultaneously" in ordinary English usage, and that the term "simultaneously" in the '865 patent should be construed accordingly. Specifically, Hyundai argues that the application of a logic "1" signal to one data bus line while the other data bus line is already at a logic "0" signal works to supply a "1" and "0" signal to the two input/output lines "simultaneously." NEC advocates a narrower construction of "simultaneously," reading it to require both events (i.e., the application of a "1" and a "0" signal) to commence at the same time.

Words in a claim are usually "given their ordinary and customary meaning," but a patentee "may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or history." Vitronics, 90 F.3d at 1582. The technological context of the claim may also make reliance on a common, dictionary definition for a word inappropriate, since "[a] word describing patented
technology takes its definition from the context in which it was used by the inventor." Anderson v. International Eng'g and Mfg., Inc., 160 F.3d 1345, 1998 U.S. App. LEXIS 27995, at *9, 1998 WL 770652, at *3 (Fed. Cir. 1998).

The context of the word "simultaneously" in the '865 patent compels construction of the term "simultaneously" according to the narrower definition propounded by NEC. In the '865 patent, the structure of the "means for simultaneously supplying" is a pair of write gates shown as 19 and 19' and transistors Q[26] and Q[26'] in Figures 4 and 5 of the patent. The parties do not dispute that these devices are activated by the same signal at the same time. The specification states that "the low and high level signal [sic] are applied to terminals IN and /IN through the write timing signal W, respectively." The fact that these high and low signals are applied by the same signal at the same time is made even more explicit by the prosecution history of the '865 patent, which includes the statement that "if it is assumed that the potential at the terminal of the differential amplifier is at the logic "0" level after a read operation, and the potential at the other is at the logic "1" level, to write logic "1" level information in the memory cells, the logic "1" and "0" level signals are applied to the terminals /IN and IN at the same time through the write gates operated by the write timing signal W" (emphasis added). Thus, in a "read modify write" operation complementary signals are sent at the same time to the terminals at both sides of the differential sense amplifier, rather than conveyed through a two-step process involving a greater time lag, in which both terminals are brought to the same level initially and then one of the terminals is brought to the desired level. Since this ability to send complementary signals quickly during a RMW operation appears to lie at the heart of the '865 patent, "simultaneously" is construed as meaning starting and subsisting at the same time.

4082

F. "Simultaneously Testing to Determine if at Least One of at Least Two Predefined Sequences Are Present in the Digital Data Received"

In Claim 6, the patent claims "[t]he method of claim 1 wherein said screening step includes simultaneously testing to determine if at least one of at least two predefined sequences are present in the digital data received." '776 Patent, col. 17, Ins. 42-45. The parties dispute the meaning of this claim.

1. "Simultaneously Testing"

Plaintiff contends that "simultaneously testing" means testing for at least two predefined sequences "at the same time." JCCS, Appx. A, at 9 (term 37). Defendant contends that simultaneous testing does not require testing for at least two predefined sequences at the same instant of time, but rather requires testing "in one pass over the digital data[.]" Id.

Plaintiff's construction of the phrase accords with the ordinary dictionary definition of "simultaneously." See OXFORD ENGLISH DICTIONARY (2d ed. 1989) (online edition available at www. dictionary. oed. com/cgi/entry/5 022519 8? query_type=word&queryword=simultaneously); MERRIAM-WEBSTER ONLINE (online edition available at www.m-w.com/cgi-bin/dictionary?book=Dictionary&va=simultaneously). Nothing in the specification indicates an intent by the patentee to adopt a different definition. Although the description of the preferred embodiment does indeed show a simultaneous testing in which it appears that only one pass over the digital data occurs, that same description also shows a testing protocol in which the various predefined sequences are tested at the same time. See '776 Patent, col. 4, Ins. 59-64. Nothing in the specification or the claims indicates that the former aspect was meant to define the term "simultaneously." Further, despite its argument that plaintiff's construction would render the claims unworkable, defendant does not indicate why testing for multiple predefined sequences cannot be done at the same instant in time. Accordingly, the Court adopts plaintiff's proposed construction.

2. "To Determine if at Least One of at Least Two Predefined Sequences Are Present"

Plaintiff contends that, under this claim, the simultaneous testing must test "for the presence of at least two predefined sequences." JCCS, Appx. A, at 9 (term 37). Defendant contends that the phrase should be construed exactly as it is written, requiring testing only for at least one of multiple predefined sequences. See id. Defendant argues that plaintiff's construction implies that the search must find at least two predefined sequences, whereas the language of the claim requires only that the search encompass at least two predefined sequences.
It does not appear to the Court that there is any significant difference between the parties' constructions. Plaintiff's proposed construction requiring "testing for the presence of at least two predefined sequences" implies nothing about the results of that search. Nevertheless, the Court does agree with defendant that its proposed construction is more complete, as well as consistent with both the plain language of the claim and the specification. See '776 Patent, col. 4, lns. 59-64. Accordingly, the Court will adopt defendant's proposed construction.

4083

41. The third point of disagreement concerns the terms "single action" and "single-action ordering component" as used in claims 1, 6, 9, and 11.

42. The term "single action" is not defined by patent specification. However, the patent specification provides that "once the description of an item is displayed, the purchaser need only take a single action to place the order to purchase that item." (Ex. A-1 at col. 3, ll. 64-66). The specification also provides that "a single action may be preceded by multiple physical movements of the purchaser (e.g., moving a mouse so that a mouse pointer is over a button)." (Ex A-1 at col. 10, ll. 2-4). In addition, the specification indicates "in general, the purchaser need only be aware of the item or items to be ordered by the single action and of the single action needed to place the order." (Ex. A-1 at col. 4, ll. 14-17 (emphasis added)). As a result, the term "single action" as used in the '411 patent appears to refer to one action (such as clicking a mouse button) that a user takes to purchase an item once the following information is displayed to the user: (1) a description of the item; and (2) a description of the single action the user must take to complete a purchase order for that item.

43. The parties dispute what mouse clicks "count" in determining whether the single-action requirement of the '411 patent claims is satisfied. The Court finds that clicks "count" after both information identifying the item and a description of the single action the user must take to complete a purchase order for that item are displayed to the user.

4084

V

It is clear from the district court's opinion that the meaning it ascribed to the "single action" limitation includes a temporal consideration. The "single action" to be taken to complete the purchase order, according to the district court, only occurs after other events have transpired. These preliminary events required pursuant to the district court's claim interpretation are the presentation of a description of the item to be purchased and the presentation of the single action the user must take to complete the purchase order for the item.

Amazon defends this temporal interpretation based on statements made by the applicant during prosecution of the patent. These statements, set forth below, are significant, because they were made at the point in the file history where the claims were amended to include the single action limitation.

In remarks accompanying an amendment dated February 26, 1999, Amazon provided the following comments (not limited to specific claims) to explain proposed amendments to the claims and to "clarify that the claimed single-action ordering technology is different from the shopping cart metaphor":

Applicants' single action ordering technology facilitates electronic ordering of items by reducing the number of purchaser interactions needed to place an order and reducing the amount of sensitive information that is transmitted between a client computer and a server computer when placing an order. To order an item using single-action ordering technology, the purchaser first locates the item by browsing through a catalog of items, by searching for the item, by selecting a link to the item, or by using any other means for locating the item. Once the item is located, the purchaser need only perform a single action to generate an order for the item and to fulfill that generated order. The single action may be, for example, the selecting of a button that is displayed on the web page or the speaking of a command. Because information (e.g., billing and shipping) about the purchaser has been saved (e.g., from a previous purchase), that information can be combined with the identification of the located item to generate and fulfill an order when the single action is performed.
On its face, this passage from the file history establishes that once a purchaser has located an item by any means, only a single action is required to generate an order for the item. Amazon, however, would put a special reading on the concept of a purchaser locating an item by any means. In Amazon's view of the file history, a purchaser has not located the item, for the purpose of counting the number of steps thereafter to generate the order, until the purchaser has made the decision to purchase the item. As applied to the present case, Amazon argues that display of information about an item on BN's menu page does not indicate an item located with an intent to place the order; only after one moves from BN's menu page to its product page has one "located" the item for purposes of placing the order by a single action. Since it only takes a single action on BN's product page to place the order, Amazon contends that BN likely infringes the '411 patent.

Amazon's reading of the key passage from the file history injects subjective notions into the infringement analysis. For example, if a would-be purchaser has made the decision to purchase an item before coming to BN's menu page, and there the purchaser sees the item displayed, Amazon would have to concede that no single action taken after the item display would achieve placement of the order. Instead, the purchaser would need to take a first action to advance from the menu page to the product page, and then a second action to place the order. We are not prepared to assign a meaning to a patent claim that depends on the state of mind of the accused infringer. We thus reject Amazon's special meaning for the location of an item to be purchased.

However, as we now discuss in detail, we ultimately agree with Amazon and construe all four independent claims (i.e., claims 1, 6, 9, and 11) to call for the single action to be performed immediately after a display of information about an item and without any intervening action, but not necessarily immediately after the first display or every display.

Our analysis begins with the plain language of the claims themselves. The term "single action" appears in the independent claims of the '411 patent in the following forms: "in response to only a single action being performed" (claims 1 and 9), "single-action ordering component" (claims 1, 6, and 9), "in response to performance of only a single action" (claim 6), "in response to only the indicated single action being performed" (claim 11), and "displaying an indication of a single action that is to be performed to order the identified item" (claim 11).

In claims 1, 6, and 11, the context of the claim makes it clear that the single action is performed after some information about the item is displayed. Claim 1 provides for "displaying information identifying the item," and then immediately recites that "in response to only a single action being performed," a request to purchase the item is sent to a server system. Claim 6 provides for "a display component for displaying information identifying the item," and then immediately recites "the single action ordering component that in response to performance of only a single action" sends a request to purchase the item to a server system. Claim 11 provides for "displaying information identifying the item and displaying an indication of the single action," and then immediately recites that "in response to only the indicated single action being performed" a request to purchase the item is sent to a server system. The context also indicates that the single action is performed, or is capable of being performed, after information about the item is displayed, without any intervening action. Nothing suggests, however, that the single action must be performed after every display or even immediately after the first display of information. Claim 9 does not explicitly provide for displaying information. It merely recites that a request to order an item is "sent in response to only a single action being performed." However, although claim 9 does not recite "displaying," the written description defines the claim 9 language of "single action being performed" to require that information has been displayed.

The ordinary meaning of "single action" as used in the various claims is straightforward, but the phrase alone does not indicate when to start counting actions. Therefore, we must look first to the written description of the '411 patent for further guidance.

The written description supports a construction that after information is "displayed," single-action ordering is an option available to the user, and the counting falls within the scope of the claim when single-action ordering is actually selected by the user. To the extent that the claims are considered ambiguous on this point, the written description defines "single action" to require as much. In the Summary of the Invention, the written description describes an embodiment that "displays information that identifies the item and displays an indication of an action . . . [and] in response to the indicated action being performed" orders the item. Col. 2, ll. 54-59. Similarly, in the Detailed Description of the Invention, the written description states that "once the description of an item is displayed, the purchaser need only take a single action." Col. 3, ll. 65-66. This is consistent for all of the disclosed embodiments.
Therefore, neither the written description nor the plain meaning of the claims require that single action ordering be possible after each and every display of information (or even immediately after the first display of information). The plain language of the claims and the written description require only that single action ordering be possible after some display of information. Indeed, the written description allows for and suggests the possibility that previous displays of information will have occurred before the display immediately preceding an order.

The Detailed Description of the Invention describes the first figure (Fig. 1A) by stating that "this example Web page [containing a summary description of the item] was sent . . . when the purchaser requested to review detailed information about the item." Col. 4, ll. 7-9 (emphasis added). Given that the written description earlier described on-line purchasing as involving "browsing" (col. 1, l. 55), it is reasonable to conclude that some less detailed information about the item has already been displayed.

This passage also allows for the possibility that the purchaser sees a display of the less detailed information on an item, decides to browse elsewhere, then ultimately returns to obtain more detailed information on the item and to finally order it. Thus, there could be intermittent displays of information on an item, in addition to successive displays of information on an item, and each and every display need not have single action ordering capability.

The above passages indicate that the written description is not concerned with what happens on every display of information, or even immediately after the first display, but only that there be some display from which single action ordering can be performed.

The prosecution history of the '411 patent also supports the above claim construction. In response to an office action, in the passage from the prosecution history cited earlier in this opinion, the patentee stated "a purchaser first locates the item [1] by browsing through a catalog of items, [2] by searching for the item, [3] by selecting a link to the item, or [4] by using any other means for locating the item. Once the item is located, the purchaser need only perform a single action to generate an order" (enumeration added). This enumeration of the various ways an item may be located allows for information on the item to be displayed prior to single action ordering being enabled. This is seen most clearly in the third enumerated method, "selecting a link to the item." If it is to serve as "a link to the item" (emphasis added), then there must be some display of information on the item either in the link or around the link. Thus, information on the item may sometimes be displayed before "locating" the item (and, hence, before single action ordering is enabled).

Likewise, the first enumerated method (browsing) is explained in the written description to entail requesting "detailed information" about an item before single action ordering is enabled. This presumes that "un-detailed" or general information was previously displayed. Similarly, the second enumerated method (searching) commonly entails first displaying information on various items that match a search string, such as a list of all books written by a particular author or dealing with a particular subject. The purchaser then typically selects one of these items to receive more detailed information, at which point the selected item is presumably "located" and single action ordering is enabled.

Facing arguments overlapping with the "order entry region" debate, we once again see no need to depart from the construction we adopted during the preliminary injunction phase. Thus, we construe "single action of a user input device" to be "an action by a user within a short period of time that may comprise one or more clicks of a mouse button or other input device." Defendant eSpeed has attempted to resuscitate its argument that "single action" must send a "single computer command to make the selection." Again we reject such a limitation. eSpeed's attempt harkens back to the pop-up window, and focuses the "single action" on the computer, rather than the user. As we have continually noted, however, plaintiff's patents generally were written from the perspective of the user. Therefore, this claim refers to the user's single action, not the action(s) the computer performs to execute the user's command. Further, eSpeed's reference to a single line in the prosecution history for support (". . . a trader places a trade order with the pointer in the area of the order entry region of the dynamic market depth region, through a single computer implemented action . . .") (notice of allowability, eSpeed claim construction, exh. G, at eS65384), without any support in the claim language or specification, is insufficient evidence for us.
to include such limiting language in the construction. See Phillips, 415 F.3d at 1317 ("because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes")

Defendant CQG advocates limiting the construction of "single action" to a "single click or a double click of a user input device" and defendant RCG advances a construction focused on invalidity, using "double clicking a mouse button and striking the Enter Key" as an example of a single action. We reject both constructions. The patents' specifications clearly state:

"[T]he specification refers to a single click of a mouse as a means for user input and interaction with the terminal display as an example of a single action of the user. While this describes a preferred mode of interaction, the scope of the present invention is not limited to the use of a mouse as the input device or to the click of a mouse button as the user's single action. Rather, any action by a user within a short period of time, whether comprising one or more clicks of a mouse button or other input device, is considered a single action of the user for the purposes of the present invention."

(‘132,4:9-19; ’304, 4:13-23). We will not disregard such a clear explanation. And, while the issue of double click/enter was repeatedly raised at the Markman hearing, invalidity is not before us at the moment, and therefore we decline to decide the issue during the construction phase.

GO BACK

4086

Defendants move for judgment as a matter of law that plaintiff's patents-in-suit are indefinite and thus invalid. Defendants argue that the claim term "single action of a user input device" is indefinite because it fails to alert one of ordinary skill in the art as to the bounds of the claimed invention. For the following reasons, we deny defendants' motion.

After the Markman hearing, this court defined the disputed claim term as "an action by a user within a short period of time that may comprise one or more clicks of a mouse button or other input device." That definition was based mainly on the language located in the patent description, which states:

"Further, the specification refers to a single click of a mouse as a means for user input and interaction with the terminal display as an example of a single action of the user. While this describes a preferred mode of interaction, the scope of the present invention is not limited to the use of a mouse as the input device or to click of a mouse button as the user's single action. Rather, any action by a user within a short period of time, whether comprising one or more clicks of a mouse button or other input device, is considered a single action of the user for the purposes of the present invention."

During trial, plaintiff presented this court with a motion in limine seeking to preclude expert testimony that it argued contradicted this court's construction of "single action." We granted the motion in part, holding that it was very clear that defendants' purported evidence of the Tokyo Stock Exchange (TSE) system, in which an order is entered by means of a double click, followed by the entry of a quantity, followed by an "enter," did not constitute a "single action" as we construed the term. Trading Techs. Int'l v. eSpeed, Inc., No. 04 C 5312, 2007 U.S. Dist. LEXIS 68115 (N.D. Ill. Sept. 12, 2007). The jury did not render a verdict on indefiniteness.

Defendants argue that the claim term is indefinite as construed because it fails to alert one of ordinary skill in the art as to what is claimed by the invention. Specifically, defendants argue that the phrases "one or more clicks" and "short period of time" are indefinite because nothing in the specification or description provides guidance as to the boundaries of these terms. Plaintiff's arguments are that (1) because the court was able to construe the term, "single action," it cannot be indefinite under controlling Federal Circuit precedent; (2) defendants' arguments improperly focus on certain words used to construe the term, instead of the claim language itself, and fail to note the requirement that a single action must be determined from the perspective of the user; (3) this court's determination that the TSE order entry system did not constitute a single action demonstrates that the claim term is not indefinite.

The Federal Circuit has stated that a patent claim is sufficiently definite if "one skilled in the art would understand the bounds of the claim when read in light of the specification." Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001); Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005). "The statutory
requirement of particularity and distinctness in claims is met only when [the claims] clearly distinguish what is claimed from what went before in the art and clearly circumscribe what is foreclosed from future enterprise." United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 63 S. Ct. 165, 87 L. Ed. 232, 1943 Dec. Comm'r Pat. 758 (1942); see also SmithKline Beecham Corp. v. Apotex Corp., 403 F.3d 1331, 1340 (Fed. Cir. 2005).

However, absolute clarity is not required, and only claims "not amenable to construction" or "insolubly ambiguous" are indefinite. See Datamize, LLC, 417 F.3d at 1347; Energizer Holdings v. ITC, 435 F.3d 1366, 1371 (Fed. Cir. 2006); Honeywell Int'l, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332, 1338 (Fed. Cir. 2003); Exxon, 265 F.3d at 1375. Further, patents enjoy a statutory presumption of validity and a challenger must demonstrate indefiniteness by clear and convincing evidence. See 35 U.S.C. § 282; Budde v. Harley-Davidson, Inc., 250 F.3d 1369, 1376 (Fed. Cir. 2001). "By finding claims indefinite only if reasonable efforts at claim construction prove futile, we accord respect to the statutory presumption of validity." Exxon, 265 F.3d at 1375.

We agree with plaintiff that the claim term is sufficiently definite. First, the fact that the term is amenable to construction -- that it can be construed to alleviate ambiguity -- renders it definite. Exxon, 265 F.3d at 1375. We found the term to be amenable to construction because it was essentially construed by the patent description itself. Additionally, the phrases, "one or more clicks" and "short period of time," do not render the term indefinite. These phrases are not part of the claim language, and thus, to the extent defendants argue that the claim term is indefinite based on those phrases, their argument is improper. See Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1567 (Fed. Cir. 1992) (improper to use language of court's construction to render claim indefinite). Regardless, "one or more clicks" merely describes how the single action may be performed, and "short period of time" is not unduly ambiguous when taken in the context of the market for the patent -- commodity trading.

Furthermore, both phrases are necessarily less than precise because a single action is determined from the perspective of the user. See Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1576 (Fed. Cir. 1986). As defendants themselves point out, users vary in their skill, their speed, their background and their customization of the software. Therefore, what constitutes a single action from the perspective of a very experienced trader, or one who has customized his software to certain specifications, may be different than a single action from the perspective of a new trader or one unsure of the shortcuts and customization possibilities available. For example, a user who changes the default setting so that his mouse only recognizes double-clicks as two mouse clicks that occur within .3 seconds of each other, would consider two clicks that took 1 second as two separate actions, whereas a person who has a setting recognizing two clicks of the mouse within 1 second as a double-click, would consider that to be a single action. Both fall within the scope of the patents-in-suit because both users perceive that they are engaging in a single action -- a double-click. Since the benchmark for determining indefiniteness is one of ordinary skill in the art, in other words, the "average" user, any attempt to further pin down the boundaries of this claim term would import limitations into the claims that do not exist. It is enough that one of ordinary skill in the art would understand that, in the hypothetical above, whether the double-click took .3 seconds or 1 second, the fact that it was a double-click from the perspective of the user makes it a single action.

In addition, we find that the claim term, as construed, does alert one of ordinary skill in the art as to the boundaries of the claimed invention. This court was easily able to determine that the TSE system’s method of order entry did not fall within the boundaries of the patents-in-suit because the combined actions of double-clicking, entering quantity, and pressing "enter," even though it literally constitutes "one or more clicks" of a mouse button, et cetera, did not constitute a single action from the perspective of a user. Our very ability to determine that the TSE does not fall within the claim's ambit is evidence that the claim term is sufficiently definite. Therefore, defendants have failed to meet their burden of proving by clear and convincing evidence that the claim term "single action" is indefinite.

GO BACK

4087

VI.

The parties dispute whether the limitation "single action of a user input device" is indefinite as construed. A patent specification must "conclude with one or more claims particularly pointing out and distinctively claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P.2. "The statutory requirement of particularity and distinctness in claims is met only when [the claims] clearly distinguish what is claimed from what went before in the art and

This court agrees with the district court that the claim term as construed is sufficiently definite. The district court construed "single action of a user input device" to mean "an action by a user within a short period of time that may comprise one or more clicks of a mouse button or other input device." Trading Techs., 2006 U.S. Dist. LEXIS 80153, at *11. In this context, the word "an action" means one user action. An action may include multiple sub-elements as long as the user views all sub-elements as one user action (e.g., double-click comprising of two single-clicks is "an action"). The invention is different from prior art inventions that required a trader to click on multiple locations before submitting the order. The district court's construction correctly sets objective boundaries by distinguishing the invention from multiple-action systems found in the prior art.

Moreover, one of ordinary skill in the art would distinguish user actions as singular or multiple. The claim construction provides an example of a singular action--one or more clicks of a mouse button. Importantly, the district court's construction requires that the "action" must be done in a "short period of time." Although a "short period of time" may vary slightly from one circumstance to the next, an artisan of ordinary skill would not find the term insolubly ambiguous. In fact, eSpeed's expert agreed that the following actions are all single actions: a single mouse click, double mouse clicks, a single key press, and a modal shift on the keyboard (such as combination of the Control key or the Alt key with another key). eSpeed's expert also agreed that other actions, such as a right click followed by a left click, and pressing two keys in sequential order, constituted multiple actions. Given the record and the trial court's definition of the term "single action," this court agrees that the claim terms set forth the boundaries of the claim scope.

C.

The district court determined that the dialer unit of the claimed invention has only a "single, bi-state switch" operable from the exterior of the case for activating the signal. In other words, the district court observed that the term "single, bi-state switch" bolsters its claim construction excluding a keypad from the dialer unit. A keypad, after all, has a number of switches.

The "single, bi-state switch" refers to a switch on the dialer unit that can activate "said signal means to produce said sequence of dual tone modulated frequency [DTMF] signals during said dialing mode corresponding to said digits in said reprogramming memory means." See element [f] of claim 22. In other words, a single switch on the dialer unit activates the tones to dial a telephone number. Col. 4, ll. 53-58 ("In the preferred embodiment, switch means 207 is a single bi-state . . . switch that is operable from the exterior of the case. Switch means 207 . . . serves to activate the last number redial feature of the signal means."); col. 6, ll. 1-6 ("The operator then depresses switch means 207. . . . This activates the last number redial feature of the signal means 201 to produce a sequence of [DTMF] signals corresponding to the digits stored in the reprogrammable memory means 203."). This language about "a single, bi-state switch," however, does not preclude a dialer unit from having other switches as long as a single switch activates the signal means to produce dial tones. The claim language explains well the function of the single switch. This language alone does not preclude other switches for other functions that may not be specified in this claim. Indeed, by using the transition term "comprising" at the outset of the claim, the claim drafter signaled that an accused device could have additional elements - such as switches - beyond those expressly recited and still literally fall within the claim terms. AFG Indus. v. Cardinal IG Co., 239 F.3d 1239, 1244-45, 57 U.S.P.Q.2d (BNA) 1776, 1780 (Fed. Cir. 2001).

For the reasons stated above, the dialer unit does not have a keypad. The term "single, bi-state switch," as well as the specification describing that term, do not limit the dialer unit to only one bi-state switch. The claim language does not preclude other switches on the exterior of a dialer unit, such as another switch to choose a different preprogrammed telephone number. The term "single," however, precludes the use of multiple switches to perform the activating function for one phone number. Only a single switch activates the dialing function for a preprogrammed number.
The critical claim in the '998 patent to defendants' motion is claim 34, set forth below:

A physiological electrode system providing for the connection of a monitoring device, a therapeutic device or a stimulating device to a patient through a single common instrument-to-body interface and comprising:

first and second electrode elements to be attached to the patient's body, said electrode elements constructed to have the characteristic required for monitoring, stimulating and therapeutic applications, including the capability of handling relatively large energy requirements for stimulating and therapeutic applications and the sensitivity to low level signals required for monitoring applications;

standardized connecting plug means;

first and second electrically conducting lines connected from said electrode elements to said connecting plug means, said electrode elements, said connecting plug means and said conducting lines constituting a disposable electrode set;

connector means to engage said connecting plug means; and

cable means electrically joined to said connector means for selectively connecting the monitoring device, the therapeutic device or the stimulating device to said electrode elements by engagement of said connector means and said connecting plug means.

--- Footnotes ---

13 Claims 35, 36 and 37 each depend on the limitations set forth in claim 34. Therefore, if there is no infringement of these limitations, either literally or under the doctrine of equivalents, then the dependent claims also are not infringed. Teledyne McCormick Selph v. U.S., 214 Ct. Cl. 672, 558 F.2d 1000, 1004 (Ct. Cl. 1977).

--- End Footnotes ---

Figures 1 and 28 of the '998 patent illustrate a system simultaneously connecting the electrode set through three types of cables to all three devices. Figure 28 reveals the system in its entirety, with the connectors and protective circuitry to permit all three of the cables to connect the electrodes simultaneously to the three devices. 14

--- Footnotes ---

14 In particular, the specification describes a "low pass filter network" and "high voltage protection circuit" to protect the ECG monitor from damage and undue interference from the employment of simultaneously attached defibrillation and therapeutic devices.

--- End Footnotes ---

The parties' dispute focuses on the meanings of a "single common instrument-to-body interface" and "cable means." Defendants contend that "single common interface" must refer to a system capable of simultaneous connection to all three devices in light of the plain language, the specification, and the file history. First, because the claim requires the devices attach to a "single common instruments-to-body interface," defendants argue that claim 34 must refer to one apparatus actually hooked to all three devices. Otherwise, defendants question what meaning the adjectives, "single common," add to the description. Consequently, defendants contend that the claim must refer to a cable system constructed with all components necessary, such as the connecting cables and protective circuitry, to permit the simultaneous connection to all three devices.
Defendants also point to the specification and its drawings as limiting claim 34 to a system simultaneously attached to all three devices. Without dispute from R2, defendants argue that the cable component of the invention, the "cable means," is presented as a "means-plus-function" limitation. 35 U.S.C. section 112, paragraph 6 restricts a "means-plus-function" limitation to equivalents of the structures provided in the specification to carry out the function. See Valmont Industries, Inc. v. Reinke Mfg. Co., Inc., 983 F.2d 1039, 1043 (Fed. Cir. 1993). Defendants contend that these specifications only set forth a structure capable of simultaneous connection to all three devices.

Third, defendants argue that the prosecution history reveals that the inventor disavowed a system incapable of simultaneous connection in order to obtain the patent grant from the Patent Examiner. The inventor, Heath, originally submitted 117 claims and 28 figures in relation to the '998 patent. In response, the Examiner issued a requirement for restriction asserting that these claims were "specific to more than one species of the generic invention," and identified the species by reference to the drawings. Pursuant to 35 U.S.C. section 121, the Examiner directed Heath to elect a single species. Heath elected the species disclosed by figures 1 and 28, depicting the system simultaneously connected to all three devices, and 45 of the 117 claims that Heath asserted read on the species. Defendants argue that, through this election, Heath abandoned any claims covering systems incapable of connection to all three devices as depicted in figures 1 and 28.

R2 responds that the "single common interface" refers to the multifunctional electrodes, connector plugs and sets of cables that may be combined in various permutations to permit attachment to any of the three devices, but not necessarily to two or three devices at once. In support, R2 argues that defendants' interpretation would render claim 34 redundant of the '998 patent's other independent claim that expressly provides for the "simultaneous" connection to two or more devices. With respect to "cable means," R2 argues that the specification discloses an embodiment that includes a system that only selectively attaches to any of three devices. Finally, R2 contends that Heath abandoned only claims related to the electrodes alone, the cables alone, or to systems using only the electrodes and one or two types of devices irrespective or their ability to selectively connect to the other devices. Accordingly, R2 interprets the inventor's remarks to elect claims related to a species that contemplates both the selective connection of the multifunctional electrodes with the three devices as well as one including the connectors and circuitry necessary for simultaneous connection.

2. Interpretation of Claim 34

a. The Claims Themselves

In contrast to defendants' reading, the plain language of claim 34 does not indicate a cardiac system including cables and protective circuitry permitting simultaneous connection to all three cardiac care devices. Claim 34 describes an "interface" capable of connecting "a monitoring device, therapeutic device or a stimulating device" to the patient. This interface is comprised of a disposable electrode set, a connector plug, connector means and cables. Neither the monitoring device, therapeutic device nor stimulating device, themselves, are presented as elements of the invention. Rather, electrodes, connectors and cables constructed for connection to these devices comprise the invention. The "cable means" is defined as intended for "selectively connecting the monitoring device, therapeutic device or stimulating device" to the electrode sets. None of the limitations refer to simultaneous connection or use. Thus, the "selective" character indicates that the "cable means" refers to any of three cables that may be attached at any one time to employ the desired device.

In contrast, another independent claim of the '998 patent, claim 1, specifically describes a system using connectors and protective circuitry for "simultaneous" connection. Claim 1 and claim 34 read substantially similar in providing the fundamental limitations on invention. Instead of calling for a "cable means," however, claim 1 requires the use of an "interrelating means" that provides for "the simultaneous connection of said electrode elements to at least two said devices." Claim 1 also requires the additional element of a "protective means associated with said interrelating means for selectively permitting desired combinations of . . . [the three devices] . . . to be simultaneously connected to the patient solely through first and second said electrode elements." Thus, in contrast to claim 34, claim 1 explicitly refers to a system using cables and circuitry that permit the simultaneous connection of two or more devices. 15

--- Footnotes ---

15 In fact, there are a total of seven independent claims in the '998 patent; claims 1, 20, 25, 27, 31, 32 and 34. Claims 20, 25, 27 and 31 all require an "interrelating means" as well as the attachment of a "protective means" for "permitting the
desired combination" of devices to be "simultaneously connected to the patient." Claim 32 appears to require the actual connection of all three types of devices to the system.

Under the interpretive doctrine of "claim differentiation," an interpretation of a claim should be avoided if it would make that claim read identically to another claim in the same patent. Autogiro, 181 Ct. Cl. 55, 384 F.2d 391, 404; see Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987); DMI, Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed. Cir. 1985). Defendants respond that "claim differentiation" only restricts the reading of express limitations from a dependant claim into an independent claim, and is not applicable to the comparison of two independent claims in the same patent. As defendants note, the doctrine has greater argumentative force when an interpretation would render an independent claim identical to its own dependant claim. See Hormone Research Foundation, Inc. v. Genentech, Inc., 904 F.2d 1558, 1567 n. 15 (Fed. Cir. 1990) ("It is not unusual that separate claims may define the invention using different terminology, especially where . . . independent claims are involved"). Dependant claims are generally used to narrow an independent claim by describing the disclosed invention with greater detail, and so, stricter scope.

However, defendants cite no precedent limiting "claim differentiation" to this context. Cf. id. (interpreting independent claims as identical where specification and file history require that interpretation). More importantly, the Federal Circuit has applied the doctrine to interpret one independent claim in light of another independent claim. See Uniroyal, Inc. v. Rudkin-Wiley Corp., 837 F.2d 1044, 1055 (Fed Cir. 1988); Caterpillar Tractor Co. v. Berco, SPA, 714 F.2d 1110, 1116 (Fed. Cir. 1983). Defendants have not pointed to any distinction between claim 1 and claim 34 other than claim 1's limitations describing an "interrelating means" and "protective means" and claim 34's "cable means." Therefore, the redundant character of defendants' interpretation of "cable means" further supports R2's more natural interpretation of "cable means."

This interpretation of claim 34 does not render the terms "single common," modifying the "instrument-to-body interface," superfluous. As a general matter, the fact that "single common instrument-to-body interface" appears in the preamble of claim 34 does not necessarily indicate that it imposes a structural limitation on the claim. See Gerber Garment Technology, Inc. v. Lectra Systems, Inc., 916 F.2d 683, 688 (Fed Cir. 1990) (description in preamble constitutes limitation only if necessary to precisely define and give meaning to the invention set forth in the formal limitations). Regardless, the "single common interface" refers to the fact that the same disposable electrode set, connector plug and set of cables are used regardless of the device selected. The fact that the specific cable connected at any one time is different does not contradict the description of a "single common" interface between the patient and the device chosen. The other elements of the actual entity used, the disposable electrode set, remain the same. Only the final element of the cable used at any one time is altered.

b. Mean-Plus-Function Analysis

Defendants argue that 35 U.S.C. section 112, paragraph 6, restricts claim 34 to devices capable of simultaneous connection. Instead of reciting a particular structure, a "means-plus-function" limitation describes an element of a product claim as "a means or step for performing a specified function." 35 U.S.C. § 112 P 6. In contrast to the usual interpretive rule against reading limitations from the specification into the patent claims, see Constant, 848 F.2d 1560, 1571, a "means-plus-function" limitation is restricted to the description, and equivalents thereof, of structures set forth in the specification intended to carry out the function described in the limitation. Valmont, 983 F.2d 1039, 1043-44. The parties do not dispute that the "cable means" constitutes a "means-plus-function" limitation. Claim 34 never describes the structure of its "cable means" other than to note its connection to the connector means and the cardiac care devices. If the specification only presents the structure of a "cable means" that is capable of simultaneous connection, then this limitation must be read into claim 34 regardless of the tenant of the "claim differentiation." Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991).

Defendants point to the specification's description of "the preferred approach disclosed" with the utilizing of a cable "electrically joined to the desired instrument or instruments," where "these cables may then be relatively permanent, with only the electrode sets being replaced for each usage." In the subsequent more detailed section on the preferred embodiment, the specification describes cable structures for each of the three devices, as well as connectors and circuits to be attached with each cable that protect the devices from damage when employing another simultaneously connected device. In addition, the drawings in figures 1 and 28 depict a system using a "cable means" with protective circuitry that
simultaneously hooks the electrodes to a monitor, a defibrillator and an electrosurgical device. As these drawings in the specification illustrate a configuration of the cables and connectors permitting simultaneous connection, defendants argue that the "cable means" must be limited to equivalents of such a configuration.

As defendants argue, the specification presents a preferred embodiment where all three devices are simultaneously attached to the electrode set. In setting forth the system in structural detail, the specification further describes connectors and circuitry attached to each of the cables for various permutations of simultaneous connection to the devices. But a "means-plus-function" limitation is not limited to the equivalents of a single preferred structure. Rather, it is limited to the equivalents of any structures described therein necessary for carrying out the function. See United States v. Telectronics, Inc., 857 F.2d 778, 782 (Fed. Cir. 1988) (defining means-plus-function limitation as including structural alternative presented in specification).

In addition, a "means-plus-function" limitation incorporates only the disclosed structure necessary to perform the specified function. See General Elec. Co. v. U.S., 215 Ct. Cl. 636, 572 F.2d 745, 776 (Ct. Cl. 1978) (refusing to incorporate elements into limitation from the specification not necessary for performing function); see also Lockheed Aircraft Corp. v. U.S., 213 Ct. Cl. 395, 553 F.2d 69, 81 (Ct. Cl. 1977) ("a 'means-plus-function' claim covers the structure necessary to perform the specified function"). The function which defines the limitation is determined by the terms of the claim, not the specification. See DMI, 755 F.2d 1570, 1573. As explained above, claim 34 does not indicate that the "cable means" is for the function of simultaneous connection of the devices, but rather that it is for the function of "selectively connecting the monitoring device, the therapeutic device or the stimulating device" to the connector means and electrode sets.

In the preferred embodiment, the specification details the structure of a cable for each device, and the necessary connector means so that the cable may attach to a standardized connector plug. Although the specification further describes connectors and protective circuitry to connect the devices together and the disposable electrode set, these additional structures are only required for the preferred embodiment. Accordingly, the preferred embodiment presents an "interrelating arrangement" depicted in figures 1 and 28 that includes the attachment of the protective circuitry and connector means for the simultaneous connection of all of three cables and devices.

But the specification never limits the "cables means" to either figure 1 or 28. Cf. Hormone Research Foundation, 904 F.2d at 1563 (specification and prosecution history explicitly limited claimed invention to single accompanying figure). Instead, the specification provides that in addition to the preferred embodiment the invention includes sub-systems using many of the same elements:

Each of these instruments be connected to the patient's body through the electrode elements by itself or in combination with one or more of the other instruments by means of an appropriate interrelating arrangement.

After presenting the preferred embodiment, the specification explains that the invention includes the separate connection of each of the devices to the electrode elements:

In addition to the provision of a multiplicity of functions through a single pair of electrode elements, this invention also provides for the separate connection of each of the instruments to that pair of electrode elements. . . Therefore this invention not only relates to the unique system, but it also relates to a number of novel and unobvious sub-systems and components of that physiological electrode system.

The specification details the structures of all the elements necessary for a system capable of only selective connection to the cardiac care devices. Therefore, the specification presents an embodiment of the "cable means" where only one device is connected at a time as well as one in which a number of devices are connected.

c. Prosecution History

Under 35 U.S.C. section 121, and regulations promulgated thereunder, the patent examiner has the discretion to restrict a patent application to one invention if "two or more independent and distinct inventions are claimed in one application." A species of an invention is a particular embodiment of the invention disclosed in a patent application. Manual of Patent Examining Procedure (MPEP) § 806.04(e) (6th ed. 1995). A species claim, in turn reads on that embodiment. Id. If there is no disclosed relationship between different species, the patent examiner generally will consider them "independent"
inventions. MPEP § 808.01(a); see § 806.04(b). A generic claim, in contrast, is defined as a claim with limitations that both include the primary organizational structure of more than one disclosed species and whose limitations read on each of the pertinent species. MPEP § 806.04(d).

Where an application contains a generic claim for all of the disclosed species, a restriction usually is not proper. 16 See MPEP § 809.02(d). But if an application contains no generic claim that covers separate species disclosed in that application, then the patent examiner may issue a restriction requiring the applicant to elect a single disclosed species and those claims that read upon that species. 37 C.F.R. § 1.141. Although the applicant may contest ("traverse") the restriction and try to convince the patent examiner that the identified separate species does not reflect independent and distinct inventions, the applicant must provisionally elect one of the species. If the patent examiner concludes that the species are independent and distinct, he or she may make the requirement final. Subsequently, the patent examiner has the authority to restrict, and so refuse to consider, any submitted claims that are not directed to the elected species. 17 At the time of the final action on the application, the patent examiner may compel the applicant to either cancel the unelected, and unreviewed, claims or petition the restriction to the Commissioner of Patents. See MPEP § 821.01. If not appealed through the petition process, the applicant may either pursue the unelected claims in a divisional application for a separate patent or abandon them.

--- Footnotes ---

16 It also is improper to issue a restriction if the separate species are not "mutually distinctive"—if either species would be clearly obvious in light of the other species. MPEP § 806.04(h). Because contesting a restriction on this basis involves arguing for the obviousness of the invention, it is unlikely that applicants would contest a restriction on this basis.

17 To restrict a claim from a species thereafter, it must contain "mutually exclusive" limitations with those claims considered to read upon the species—each claim must contain an element that is not contained in the other claim. MPEP § 806.04(f).

--- End Footnotes ---

Heath originally submitted 117 claims in relation to the '998 patent, along with the 28 figures currently set forth in the specification. Considering these claims to disclose several distinct inventions, the Examiner issued a requirement for a restriction in his first office action:

This application contains claims specific to more than one species of the generic invention, as for example, the species of Figs. 1-4 and 28; Figs. 5-7; Figs 8-9; Figs. 10-13; Figs. 14-17; Figs. 18-20; Figs. 21-25 and Figs. 26-27, respectively. Applicant is required under 35 USC 121 (1) to elect a single disclosed species of and the preferred embodiment to which the examiner's action will be limited until a generic claim is finally held allowable, and (2) to list all claims readable on such elected species includes any claims subsequently added.

In his response, Heath attempted to traverse the restriction requirement, arguing that the figures and claims disclosed the related embodiments of a single invention of a system combination, sub-systems, sub-combinations and related components and functions. In explaining the claims, Heath stated in the response:

Turning now to the claims, it should be understood that the relating of the claims to particular portions of the drawing is for purposes of identification and it is not for intended to limit the scope of the claims to which the applicant is entitled in any way. Thus, [the ultimately elected claims] are directed to a system able to selectively obtain a multiplicity of functions through a single pair of electrodes. These claims relate to the overall system, and its equivalents, depicted Figures 1-4 and 28, but many of the features of the system, as claimed in these claims are included in the various portions of the system illustrated more fully in other figures of the drawing.

After reviewing all of the claims and arguing that they presented a single invention, Heath provisionally elected to prosecute 45 claims that he described were "basically directed to the subject matter, and its equivalents, illustrated in figures 1-4 and 28, with other features of the dependent claims shown in various other figures of the drawing." 18 This list included the claim currently designated as claim 34. Ultimately, the Examiner made his restriction final:

--- End ---
The requirement for restriction is repeated and made final. Applicant argues that only one invention is disclosed. It would appear that the combined units is only one way the individual units can be used separately or in various combinations. Therefore, the alleged system combination represents one species.

--- Footnotes ---

18 Apparently, Heath did not abandon all of the remaining 72 claims, but pursued and obtained a number of them, in altered or identical form, in the related electrode patents, the '356 patent or the '552 patent. These include claims covering the electrode elements, a monitoring system, a defibrillation system, and various cable constructions for use with ECG and defibrillation devices.

--- End Footnotes ---

Defendants contend that this prosecution history demonstrates that Heath limited his invention under the '998 patent to the system capable of simultaneous connection to all three devices ("simultaneous system"). Regardless of Heath's intent, defendants interpret the Examiner's restriction to require Heath to exclude any claims that did not disclose a simultaneous system. When the Examiner made his restriction final, defendants argue that his action acted as collateral estoppel to prohibit Heath thereafter from asserting that any of the claims under the '998 patent that do not disclose a simultaneous system.

The prosecution history informs the interpretation of a patent claim "by excluding any interpretation of the claim language that would permit the patentee to assert a meaning for the claim that was disclaimed or disavowed during prosecution in order to obtain claim allowance." Zenith, 19 F.3d 1418, 1421. As a general matter, the claim is construed in light of the applicant's arguments and remarks seeking to establish the patentability of the invention by distinguishing references to the prior art. See, e.g., Carroll Touch, 15 F.3d 1573, 1577. Narrowed language or discarded broader claims may indicate surrendered subject matter. Similarly, applicant's explanations of why the new or previous language is nonobvious often assert specific interpretations of the limitations and thereby disavows subject matter.

In contrast to this standard usage of prosecution history, defendants interpret claim 34 in light of the administrative matter of a requirement for a restriction. In a restriction, an applicant and patent examiner do not dispute what subject matter is included in the invention versus the public domain, or even if the application employs adequately descriptive language to satisfy the requirements of 35 U.S.C. section 112. Rather, for the purposes of case management and control of filing and search fees, the patent examiner requires the applicant to divide his or her claims among distinct, though related, patent applications. See Application of Weber, 580 F.2d 455, 458 (C.C.P.A. 1978) (purpose of restriction power is to permit Patent and Trademark Office control over research filing fees and caseload management). Neither an applicant's traverse nor his election of species attempts to induce the grant of patent protection. A restriction is not a rejection. See id. The applicant is free to pursue withdrawn claims in divisional applications, usually enjoying the same priority date and scope of prior art as the original patent. 35 U.S.C. § 121; see 37 C.F.R. § 1.147. Consequently, there is some question whether an applicant's response to a restriction has the same preclusive effect as a response to a rejection. In fact, the court has not identified any precedent using prosecution history of the election of a species in order to restrict or otherwise interpret the scope of a patent claim.

However, "the court has broad power to look as a matter of law to the prosecution history of the patent in order to ascertain the true meaning of the language used in the patent claims." Markman, 52 F.3d 967, 980. The "avowed understanding of the patentee, expressed by him, or on his behalf," may confirm the construction of the patent. See id. (quoting Goodyear Dental Vulcanite Co. v. Davis, 102 U.S. 222, 227, 26 L. Ed. 149 (1880)). Although this record may aid in understanding the terms of the claim, "it too cannot 'enlarge, diminish, or vary' the limitations in the claims." Id. (citations omitted). Accordingly, the court will review the prosecution history in order to discern if it reveals an "avowed understanding" that claim 34 discloses a system capable of simultaneous connection.

As an initial matter, the prosecution history does not reveal that Heath expressly abandoned from the '998 application subject matter relating to a system capable of selective but not simultaneous connection to the three devices from his patent application ("selective system"). None of the unelected claims require an electrode system capable of connecting any of the three devices. Some of these unelected claims disclose specific components, such as cables or electrodes. Others disclose an electrode system for attachment to only one or two of the devices. But even these do not require the cables or connectors.
necessary for selective connection to all of the three devices. Similarly, none of the figures depicting the ultimately unelected species, as identified by the Examiner, illustrated a selective system. Rather, some figures illustrate a system connected to a single specific device while others illustrate a system connected to two devices. As no single unelected group of figures depicts all three types of cables, it is questionable whether claim 34, as interpreted to disclose a selective system, would read upon any one group of these unelected figures. Therefore, none of the explicitly unelected species or claims embody a selective system.

Neither does the record reveal that Heath clearly expressed an understanding of his elected claims as limited to a system capable of simultaneous connection. Although he stated in his response that the elected claims, including claim 34, "relate to the overall system" depicted in figures 1 and 28, it is not clear that this "overall system" does not embody a system capable only of selective connection as well as one capable of simultaneous connection. See Lemelson v. TRW, Inc., 760 F.2d 1254, 1263 (Fed. Cir. 1985) (noting that "the enumeration of figures in which an elected species is illustrated cannot always be interpreted as meaning that everything in those figures is part of the elected species"). The preferred embodiment of the invention illustrated in figures 1 and 28 contain all of the essential elements in the selective system that R2 proposes is disclosed by claim 34. As noted, none of the figures in the unelected groups depicted all of the elements necessary for such a selective system. Thus, of the figures in the drawings, only figures 1 and 28 illustrated all three cables and connectors as required for each device under either a selective system or a simultaneous system. Further, interpreting Heath's reference to figures 1 and 28 as limiting the scope of the claims to a simultaneous system would ignore his immediately preceding caution that the use of figures was for identification only and "not intended to limit the scope of the claims." In sum, Heath's response does not indicate that he interpreted the elected species or claims to disclose only a simultaneous system.

Defendants argue that Heath's statements and intent are irrelevant to determining what subject matter he abandoned. Defendants contend that it only matters what subject matter the Examiner required Heath to surrender. Arguing that the Examiner required the '998 patent to be restricted to an invention capable of simultaneous connection to three devices, defendants propose that Heath may not assert subsequently granted claims beyond the scope of that subject matter. In construing the meaning of the claim, neither the applicant's nor the patent examiner's subjective intentions is determinative. See Markman, 52 F.3d at 985-87. Rather, the meaning of the claim is affected by what the written record of the file wrapper confirms. Id. at 980. If the record demonstrates that the Examiner restricted the species elected by Heath to a simultaneous system, then Heath's subsequent election of claims may constitute an avowed understanding that those claims were directed to that subject matter. Therefore, if the Examiner identified the elected species as directed to a simultaneous system, then Heath's response that the elected claims, including claim 34, were directed to that species may constitute an avowal that claim 34 is directed only to a simultaneous system.

The problem with defendants' position is that the prosecution history does not reveal that the Examiner ever clearly identified the elected species as restricted to a simultaneous system. Because the restriction occurred in the first office action before any review of the merits of the claims, it is not entirely surprising that the exact boundaries of these species were vague. In issuing the restriction, the Examiner only identified the alternative species through reference to groups of figures. As noted, none of the unelected groups of figures illustrate a selective system. Figures 1 and 28, in contrast, illustrate an embodiment that contains all of the principle components of a selective system. Therefore, these references do not reveal whether the Examiner perceived the elected species as requiring simultaneous connection.

The Examiner's only other characterization of the elected species occurred after Heath had provisionally elected his claims and the restriction was made final. The Examiner concluded that "the alleged system combination represents one species." However, the language of the claims and specification indicate that Heath's "alleged system combination" involves both the combination system for simultaneous connection and the combination system for only selective connection. Further, both a simultaneous system and selective system involve all of the cables and the selective use among any of the three cardiac care devices. This scant prosecution history on the scope of the elected species does not demonstrate that it excluded systems capable of only selective connection to all three devices. In light of the plain language of claim 34 and the specification, the court finds that the Examiner's restriction requirement did not circumscribe the identified elected species to only simultaneous systems. See Intervet Am. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1054 (Fed. Cir. 1989) (ambiguous prosecution history may not vary unambiguous claim language).

For the reasons set forth above, claim 34 discloses a cable system capable of selective connection to either a monitoring device, a stimulating device, or a therapeutic device. It does not require that the system protected is capable of simultaneous connection to all three devices.
2. "Another single connector on the housing, said single connector comprising a set of pins, said set further comprising a plurality of subsets of computer-peripheral-device-specific pins being in electrical communication with said microprocessor such that one of each of said subsets of computer-peripheral-device-specific pins provides the same computer-peripheral-device-specific data link as said each of said plurality of computer-peripheral-device-specific connectors, said single connector for making all connections from the microprocessor to said specific computer peripheral devices"

For ease of reference, I will adopt the parties' convention and refer to this phrase as the "long phrase." The long phrase appears in independent claims 17(c), 20(d) and 28(d) of the '645 patent. The parties raise four construction issues concerning it. I will start with the dispute that was resolved at the claims construction hearing.

At the hearing, the parties agreed that the claims of the '645 patent establish two paths through which the microprocessor may communicate with peripheral devices. First, the devices may be connected to the microprocessor through their corresponding individual connectors, which are mounted on the housing. Second, the devices may be connected to the microprocessor through a docking connector, which mates with a single connector found on the housing. At the hearing, plaintiff stated that it was under the impression that defendants' construction of the long phrase required the connections between the microprocessor and the peripheral devices to pass through the single connector, even when the peripheral devices were connected to the microprocessor through their individual connectors. Trans., dkt. # 101, at 53. As a result, when the peripheral devices are connected to the microprocessor through the individual connectors, the claims would be infringed only when the signals to each peripheral device passed from the microprocessor to the single connector and then from the single connector to the individual connectors. Defendants stated that this was not their position. Id.

The remaining three disputes concerning the long phrase are as follows. First, defendants contend that a portion of the long phrase is indefinite under 35 U.S.C. § 112. Second, defendants argue that another section of the long phrase, "said single connector for making all connections from the microprocessor to said computer peripheral devices," should be construed to require that "all individual peripheral devices connections on the housing that connect to the microprocessor also pass through the single connector." Dfts.' Opening Br., dkt. # 86, at 10. Third, defendants contend that this section should be construed to require that "the microprocessor directly drives all peripheral devices, either through the housing's individual connectors or through the single connector." Id.

a. Indefiniteness

Defendants contend that a portion of the long phrase, "one of each of said subsets of computer-peripheral-device-specific pins provides the same computer-peripheral-device-specific data link as said each of said plurality of computer-peripheral-device-specific connectors," is indefinite under 35 U.S.C. § 112. Defendants argue that this portion is indefinite because it is subject to more than one reasonable interpretation. Plaintiff contends that defendants have failed to carry their burden on this point. In addition, they argue that the portion is not indefinite, citing a construction provided by the applicants in the prosecution history. I agree with plaintiff that defendants have not shown that the portion is indefinite. I am persuaded that the applicants' intent was to establish a one-to-one ratio between the subsets of pins on the single connector and the plurality of individual connectors. In other words, each subset of pins on the single connector provides the same computer-peripheral-device-specific data link as one of the individual connectors.

Section 112, P 6 requires that a patent's specification have "one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." "The legal standard for definiteness is whether a claim reasonably apprises those of skill in the art of its scope." In re Warmerdam, 33 F.3d 1354, 1360 (Fed. Cir. 1994). This standard is satisfied if "one skilled in the art would understand the bounds of the claim when read in light of specification." Exxon Research & Engineering Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001); see also Marley Mouldings Ltd. v. Mikron Industries, Inc., 417 F.3d 1356, 1359 (Fed. Cir. 2005). Absolute clarity is not required; rather, definiteness is present only when "a claim is insensibly ambiguous, and no narrowing construction can properly be adopted." Exxon Research, 265 F.3d at 1375; see also Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005). A claim is not indefinite merely because it is subject to more than one reasonable interpretation. Exxon Research, 265 F.3d at 1375. Because issued patents are entitled to a presumption of validity, indefiniteness must be shown by clear and
At the claims construction hearing, defendants focused their indefiniteness argument on the words at the beginning of the portion of the long phrase at issue, "one of each of." According to defendants, the words "one of" and "each of" do not make sense when they are placed together. Therefore, defendants contend, the court must ignore either "one of" or "each of" to arrive at a coherent construction. If the words "one of" are read out, the portion becomes "each of said subsets of computer-peripheral-device-specific pins provides the same computer-peripheral-device-specific data link as said each of said plurality of computer-peripheral-device-specific connectors." Under this reading, each of the subsets of pins on the single connector would have to provide the same data links as each of the individual connectors. Defendants provide the following illustration for this construction.

Dfts.' Opening Br., dkt. # 86, at 25. On the other hand, if the words "each of" are read out, the portion becomes "one of said subsets of computer-peripheral-device-specific pins provides the same computer-peripheral-device-specific data link as said each of said plurality of computer-peripheral-device-specific connectors." Under this reading, the claims would require one subset of pins on the single connector to provide the same data links as all of the individual connectors. Defendants illustrate this reading as follows:

Plaintiff contends that this last construction is the correct construction. It notes that the applicants advanced this construction during prosecution of the '645 patent. Specifically, in a supplemental amendment dated July 21, 1992, the applicants amended claims 17 and 20 by adding the long phrase in its entirety to both claims. (The long phrase was already included in claim 28.) The applicants made the following remarks to explain their amendments:

The Applicants' system also provides a separate single connector which allows peripheral devices to communicate with the microprocessor. The connector consists of a set of pins which consists of subsets of pins, each subset being specific to a single computer peripheral device.

Aff. of Vito Canuso, dkt. # 87, exh. N, at 11 (emphasis added).

Plaintiff has the better of this argument. In determining whether a claim is indefinite, it is appropriate to consult the specification and prosecution history. Datamize, 417 F.3d at 1348. In this case, the specification does not discuss the correlation between the subsets of pins on the single connector and the individual connectors. However, the July 21 amendment indicates that each subset of pins corresponds to one peripheral device, and by implication, that device's individual connector. At a minimum, this indicates that the phrase "one of each of said subsets of computer-peripheral-device-specific pins provides the same computer-peripheral-device-specific data link as said each of said plurality of computer-peripheral-device-specific connectors" is subject to a narrowing construction and therefore is not "insolubly ambiguous." Exxon Research, 265 F.3d at 1375. Accordingly, I conclude that the phrase is not indefinite under 35 U.S.C. § 112 P 2.

b. "All connections" limitation

Defendants argue that a portion of the long phrase, "said single connector for making all connections from the
microprocessor to said computer peripheral devices," should be construed to require that all connections on the housing pass through the single connector. In other words, the single connector must provide a connection to each peripheral device that could be connected to the microprocessor through an individual connector on the housing. At the hearing, the parties agreed that the practical effect of defendants' proposed construction is that all of the connections on the housing must be replicated on the docking station. Trans., dkt. # 101, at 54-55.

Plaintiff argues that the section should be construed to require "that there be a 'plurality' of individual connectors and that the single connector is only required to replicate those connectors which comprise that 'plurality.'" Plt.'s Reply Br., dkt. # 98, at 13. Under plaintiff's proposed construction, the claims would be infringed by a computer that had three individual connectors on its housing and a single connector that replicated only two of those connectors because two constitutes a plurality of the connectors on the housing. Plaintiff argues that the words "said computer peripheral devices" at the end of the portion refer to "a plurality of computer-peripheral-device-specific connectors," which appears in claims 17(b), 20(c) and 28(c).

I will adopt defendants' proposed construction because it is the most natural reading of the claim language and because it is supported by the specification and prosecution history.

Beginning with the claim language, the section at issue indicates that the function of the single connector is to make "all connections from the microprocessor to said specific computer peripheral devices." Plaintiff's proposed construction would read out the word "all" and replace it with "a plurality of." Plaintiff is correct that the claims require a plurality of individual connectors on the housing but its argument goes off the rails when it transfers that "plurality" to the number of connections that must pass through the single connector. In all of the independent claims, the single connector makes all of the connections from the microprocessor to the peripheral devices. Accordingly, all of the connections that pass through the individual connectors on the housing pass through the single connector as well.

The specification provides further support for defendants' proposed construction. Repeatedly, the applicants describe the single connector as making all of the connections between the peripheral devices and the microprocessor. '645 pat., Abstract ("The use of the docking connector allows all peripheral connections to be realized through a single connector."); col. 1, Ins. 29-31 ("A docking connector allows all peripheral connections to be realized through a single connector."). Moreover, the applicants stated that the advantage of their invention is that it allows the user to connect and disconnect his computer to peripheral devices by connecting and disconnecting a single connector. The peripheral devices are connected through the connectors on either the docking station itself or on a "peripheral connection port" that is connected to the docking station. Id. at col. 4, Ins. 47-51. Nowhere in the specification is an embodiment discussed in which some of the peripheral devices are connected to the microprocessor through the single connector while others are connected through their corresponding individual connectors on the housing.

Finally, defendants' proposed construction is supported by the prosecution history, specifically the June 15 response and the notice of allowability. The patent examiner rejected the applicants' original application in light of the patent issued to Herron, which disclosed a docking module in which each individual connector on the housing mates with a corresponding connector on the docking module. The peripheral devices connect to the mates on the docking module and the connections pass from the microprocessor through the individual connectors and through the mates on the docking module to the peripheral devices. In the June 15 response, the applicants distinguished their system from Herron in part by noting that "[a]ll of the interface connections from all of the device interfaces are provided at [the] single connector." Aff. of Vito Canuso, dkt. # 87, exh. F, at 13. One of the reasons given by the patent examiner for allowing the claims was that the prior art did not disclose a computer microprocessing system that has a plurality of individual connectors and a single connector "such that all connections between specific computer peripheral devices and the microprocessor can be made through either the plurality of connectors or the single connectors." Notice of Allowability, Aff. of Vito Canuso, dkt. # 87, exh. O, at 3.

In sum, the evidence indicates that the claims in the '645 patent require all of the connectors on the housing to be replicated in the single connector. Therefore, I will adopt defendants' proposed construction of the phrase "said single connector for making all connections from the microprocessor to said specific computer peripheral devices." That phrase will be construed to require that all individual peripheral device connections on the housing that connect to the microprocessor also pass through the single connector.

c. "Directly drives" limitation
Defendants invoke the doctrine of prosecution disclaimer as support for their argument that the phrase "said single connector for making all connections from the microprocessor to said computer peripheral devices" should be construed to require that the microprocessor "directly drive" the peripheral devices, whether they are connected to the microprocessor through the individual connectors or through the single connector. Defendants contend that, in the June 15 response, the applicants distinguished their invention from other systems that connected to peripheral devices through a single connector on a docking device on the ground that those systems connected the microprocessor to the peripheral devices through a system bus:

There are other laptop systems which dock via a single connector, but these systems only implement the system bus on the docking connector. Therefore, in order to drive the peripheral devices, it is necessary for the docking device to emulate the peripheral device drivers in order to drive the devices. The Applicants' system on the other hand, provides access to the actual device interfaces themselves as an alternative to the individual peripheral connectors. The device drivers within the microprocessor housing drive the peripheral devices, either through the individual connectors or through the docking device.

Aff. of Vito Canuso, dkt. # 87, exh. F, at 15.

Plaintiff cites the same excerpt from the June 15 response in support of a similar limitation. Plaintiff argues that the section of the long phrase requiring each subset of pins on the single connector to provide the "same computer-peripheral-device-specific data link" as the individual connectors "means that the data link between the microprocessor and the peripherals through the single connector is identical to the data link between the microprocessor and the peripherals through the plurality of individual connectors." Plt.'s Opening Br., dkt. # 84, at 13. When peripheral devices are connected to the microprocessor, either through the individual connectors or the single connector, data links are established between the microprocessor and the devices. Plaintiff argues that the "same data link" limitation in the long phrase means that the signal from the microprocessor is not changed or processed by the docking device. Instead, the single connector on the docking device acts as a passive conduit for the signal.

At the claims construction hearing, the parties suggested that the "directly drives" limitation and the "same data link" limitation were different ways of stating the same limitation. Trans., dkt. # 101, at 60-61, 71. I agree that the proposed constructions address the same limitation. Defendants' contention that the claims require the microprocessor to directly drive the peripheral devices whether they are connected to the microprocessor through the individual connectors or the single connector is captured in the language of the long phrase that requires each of the subsets of pins on the single connector to provide the same "computer-peripheral-device-specific data link" as one of the individual connectors. Accordingly, it is unnecessary to construe the phrase "said single connector for making all connections from the microprocessor to said computer peripheral devices" to include defendants' "directly drives" limitation.

B. What does "single ended forward converter" mean?

Lambda argues that a single ended forward converter must be defined as "a device in which a single switch gates all the power transfer across the transformer, and power is transferred from the transformer's primary winding to its secondary winding only during the ON period of that switch." Vicor, on the other hand, contends that the term should be construed so as to allow for the transfer of energy either during the primary switch's ON or OFF periods. It seeks the following claim construction:

A 'forward' converter is one in which the power transformer is simultaneously connected to source and load. A 'single ended' converter is one in which all the power flow from source to load is gated by a single switch (the 'primary switch').

Lambda's devices transfer power from the primary winding to the secondary winding during the primary switch's OFF period, as well as during the ON period.

Again the analysis begins with the plain language of Claim One. The preamble begins, "In a single ended forward converter
in which energy is transferred from a primary to a secondary winding of a transformer during the ON period of a primary switch . . . " Here the inventor was his own lexicographer. The specification provides an explicit definition of single ended forward converter in the opening paragraph of the "Background of the Invention":

The invention relates to converters of the forward type, in which the power transformer is simultaneously connected to the source and the load. More particularly, the invention relates to forward converters of the single ended type, in which the power flow from source to load is controlled by a single solid state switch.

Col. 1, ll. 15-28.

In Unitrode , in a background description of single ended forward converter technology generally, I wrote: "The necessity of resetting the core introduces a significant inefficiency into the converter since during periods of core reset, no power transfer is occurring." 130 F. Supp.2d at 181. Because the period of "core reset" means the OFF period of the primary switch, this statement means that in a single ended forward converter there is no energy transfer during the OFF period of the primary switch. However, the construction of "single ended forward converter" was not in controversy in the Unitrode litigation, and this statement did not refer specifically to the invention claimed by the '098 patent. Accordingly, tempting as it may be simply to recycle (that means use again) this Unitrode claim construction, the Court must move forward with a new one.

Lambda makes several arguments in support of its position that single ended forward converters must be construed as devices that transfer power only during the ON period. First, it argues that the intrinsic evidence mandates this construction even though the claim language does not explicitly state that the time of power transfer is limited to the ON period of the switch. Lambda places heavy emphasis on language in numerous places in the specification that in a single ended forward converter "power flow" from source to load is gated (controlled) by a single solid state switch. See e.g., Col. 1, lines 25-29; Col. 1, lines 31-37, stating:

This invention relates to the class of DC-to-DC converters which incorporate the topology represented in Fig. 1. A converter in that class is referred to as a "single ended forward converter" because power flow is gated by a single switch and energy is transferred forward from the primary winding to the secondary winding of the transformer 11, during the ON period of the switch 10.

See also "Summary of the Invention," stating that "the primary switch controls the converter's power flow." (Col. 3, l. 67 to Col. 4, l. 1). Lambda also points to the prosecution history, in which Vicor explained that its invention was different from the prior art because in its invention magnetizing energy recycled to reset the core "between power transfer periods (ON periods)." (Response, Tab. 4, p.2).

Based on these references, Lambda urges the Court to find that because a single primary switch gates the flow of power, power will not flow when the switch is OFF. The problem with this argument is that there is no intrinsic evidence that supports this scientific proposition. It is not self-evident given the complexity of the technology and energy flows within these power converters.

Implicitly acknowledging this flaw, Lambda resorts to extrinsic evidence in the form of the expert report of Dr. Horenstein, who states: "A circuit with the configuration of Figure 1, in operation, will only transfer power from the primary to the secondary winding during the ON period of the primary switch." (Horenstein Report, Tab A, pp. 4-5). However, as Lambda notes, if one were to add additional elements to Figure 1, one could modify the behavior of the resulting circuit so that power was transferred at other times. This point vitiates Lambda's argument because the patent states that it "relates to the class of DC-to-DC converters which incorporate the topology represented in Fig. 1." Col. 1, l. 31-32. (Emphasis added). The use of the word "incorporate" does not preclude converters with additional elements.

Pressing forward, Lambda points out that every circuit described in the specification Figure 4a (the preferred embodiment), and Figures 4e and 4f (other embodiments) conforms to Lambda's proposed construction, and no embodiment is presented in which power also is transferred during the OFF period of that switch. Again, Lambda fairly points out that Figure 4a is discussed under the heading "Detailed Description of the Invention." This argument invokes the prong of the caselaw that narrows the breadth of claims in certain circumstances: where a particular feature is neither disclosed nor suggested in the specification, it cannot be within the reach of the claims "even though the language of the claims, read without reference to
the specification, might be considered broad enough to encompass the feature in question." Scimed Life Sys. Inc., 242 F.3d at 1341.

In response, plaintiffs point out that the patent states: "Other embodiments are within the following claims." (Col. 8, l. 50). Moreover, they flag two articles in the "Description of the Prior Art" section of the '098 Patent, both of which describe single ended forward converters which, through added circuitry, transfer energy to the load during the OFF period as well as during the ON period. (See Col. 2, ll. 36-43) ("Similar limitations apply, to a varying degree, to any other reset mechanisms which involves a variable dead time to accommodate variations in the switch duty cycle. Reset methods falling into this category are found in S. Hayes, Proceedings of Powercon 8, Power Concepts Inc. 981 and in R. Severns, ibid.") 2; Hearing Tr. Day 3, 16-25, 43-46, 87.)

These prior art articles describing an embodiment transferring power during an OFF period do not resolve the dispute because the Court must construe the claim in light of the patent's specification. While there were single ended forward converters in 1982 that permitted the transfer of energy to the load during the OFF period, neither the claim nor the specification expressly includes them in the description or summary of the invention.

Finally, Lambda points to extrinsic evidence to support its claim construction. For example, in the background section of another patent (U.S. Patent 5,805,434), Vinciarelli stated "In some such converters, called 'single-ended forward converters,' forward energy transfer from the input source toward the load occurs during the time that the switch is closed . . . In yet other single-ended converters a portion of the energy may be transferred during the ON and OFF times of the switch." ( '434 Patent, Col. 1, lines 12-24). Vicor retorts that the specification of the '434 patent was filed in 1995, thirteen years after the specification of the '098 patent was filed.

On balance, Vicor has the better argument under the reasoning of Teleflex:

"Claims take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope."

Teleflex, 299 F.3d 1324. Here the express words of the claim do not preclude energy transfer during the OFF period. Although the embodiments described in the specification of the invention do not include transfers during the OFF period, there are no "words or expressions of manifest exclusion or restriction representing a clear disavowal of claim scope." Id. at 10. Lambda has failed to overcome the heavy presumption in favor of the claim language. Id. at 10. Accordingly, I reject Lambda's claim construction that precludes energy transfer during the OFF period. 3

3 I decline to be drawn into the emerging debate on the meaning of a single primary switch "gating" power flow because no one has pressed me to construe that term and the record is inadequate to determine whether various additional features and/or different circuit topologies are infringing. Vicor's claim construction chart in the Artesyn litigation states: "A 'single ended' converter is one in which all power flow from source to load is gated by a single switch (the 'primary switch'). A switch gates the flow of power to the transformer if it intermittently enables and blocks the flow of current to the transformer and the current flowing in the switch results in a net transfer of energy to the transformer." Vicor's Response to Lambda's Claim Construction Brief at 15-19. However, in this litigation, Vicor has not asked for this construction. (Hearing Day 3, Tr. 66.) Accordingly, I do not address it. This is not an invitation for more briefs; indeed any request for a Markman hearing on that claim will be denied as untimely.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
CONCLUSION AND ORDER

For the foregoing reasons the Court construes the '098 patent as follows:

I. "Recycling the magnetizing energy stored in said transformer to reset it" means that all of the magnetizing energy stored in the transformer (except that lost due to the non-ideal nature of the circuit elements) must be recycled from the transformer, back to the transformer, for the purpose of resetting the transformer.

II. "Single ended forward converter" means a device in which (a) the power flow from source to load is controlled (gated) by a single solid state primary switch; (b) energy is transferred forward from the primary winding to the secondary winding of the transformer during the ON period of the switch; and (c) the power transformer is simultaneously connected to the source and the load.

We agree with VLT that the district court did not err in its interpretation of the term "single ended forward converter." The preamble of claim 1 refers to "a single ended forward converter in which energy is transferred from a primary winding to a secondary winding of a transformer during the ON period of a primary switch." Lambda and Lucent argue that claim 1 establishes the complementary nature of the primary switch's ON and OFF periods and, in so doing, implicitly requires that forward energy transfer occur only during the ON period. We cannot agree, for nothing in the intrinsic evidence restricts the term "single ended forward converter" in such a way. On the contrary, the patentee acted as his own lexicographer in defining the term. The specification states:

The invention relates to converters of the forward type, in which the power transformer is simultaneously connected to the source and the load. More particularly, the invention relates to forward converters of the single ended type, in which the power flow from source to load is controlled by a single solid state switch.

A converter in that class is referred to as a 'single ended forward' converter [sic] because power flow is gated by a single switch 10 and energy is transferred forward, from the primary winding to the secondary winding of the transformer 11, during the ON period of the switch 10.

'098 patent, col. 1, ll. 22-37. The district court's interpretation of the term "single ended forward converter" is entirely

- 4355 -
consistent with - indeed, it is identical to - the specification's definition: it requires that a single switch control power flow from source to load, that energy be transferred forward from the primary winding to the secondary winding of the transformer during the ON period of the primary switch, and that the transformer be simultaneously connected to the source and the load. Again, nothing in the intrinsic evidence mandates a narrower interpretation. We therefore affirm the district court's claim construction and hold that the term "single ended forward converter" does not require that forward energy transfer from source to load occur only during the ON period of the primary switch.

1. **Single In-line Memory Module (SIMM)**

A compact circuit board with memory chips mounted on it which can be inserted into a connector within a computer system to expand the computer's memory and which derives all necessary electrical signals from the connector.

### 4094

F. **Single Memory Cell**

1. Proposed Constructions

The "single memory cell" term does not appear in the specification; it appears solely in claims 1 and 2 of the '726 patent as part of the memory subsystem. The parties do not dispute that the single memory cell is a component of the shared memory subsystem and must be shared. Defendants' '736 Br. at 18; Plaintiffs' '736 Br. at 20. Plaintiffs assert that "single memory cell" should be construed as "a shared memory" where the "single memory cell" is shared between the decoders called for in the respective claims. Plaintiffs' '736 Br. at 20. Defendants, however, propose that "single memory cell" be construed as the circuitry for storing one bit of data. Defendants' '736 Br. at 17. 10

--- Footnotes ---

10 Defendants also contend that plaintiffs' expert has gone through a number of definitions of "single memory cell" over the course of the ITC Investigation. Defendants' '736 Br. at 18, n.16.

--- End Footnotes ---

2. Claim Language

Claims 1 and 7 incorporate "single memory cell." Specifically, claim 1 includes a "single memory cell coupled to the memory data output register and the memory data input register." Claim 7 includes a "single memory cell coupled to the signal processor, a write [FIFO] buffer, a read [FIFO] buffer, and an MPEG [FIFO] interface." Claim 7 also describes the "single memory cell receiving data via the write FIFO buffer and providing data to the [ECC] subsystem via the read FIFO buffer." 11

--- Footnotes ---

11 Plaintiffs assert that the claim language, specification, and prosecution history dictates that the single memory cell be shared by system components responsible for both DVD and CD data, but this point is not in contention between the parties. Plaintiffs' '736 Br. at 20; Defendants' '736 Br. at 18.

--- End Footnotes ---

3. Ordinary Meaning
Defendants assert that since the terms "single memory cell," "memory cell," and "cell" are not used in the specification, "single memory cell" should be given its customary meaning. Defendants contend that the plain meaning of "single memory cell" is "a single storage element of a memory, (viz, one bit), together with associated circuits for inserting and removing one bit of information." Defendants' '736 Br. at 17; DiEuliis Decl. P 88 (relying upon dictionary definitions from the 1997 McGraw-Hill Electronics Dictionary defining a "single memory cell" as a "single storage element of a memory, together with associated circuits for storing and reading out 1 bit of information" and The 1999 Modern Dictionary of Electronics for a similar definition).

4. Specification

To rebut defendants' interpretation of the specification, plaintiffs argue that the "single memory cell" of claim 1 is coupled to two registers. Plaintiffs' '736 Br. at 20. Plaintiffs contend that those registers hold more than a bit of data and actually hold either a byte or word of data, which, respectively, are equivalent to eight and sixteen bits. Id. Giving an example to support their assertions, plaintiffs note that the shared memory resource of the preferred embodiment is dynamic random access memory (DRAM) 116 in Fig. 5. Id. at 21; '736 patent at 8:14-18, Fig. 5. Plaintiffs assert that a DRAM is generally not a single bit storage device and that the specification teaches that a DRAM 116 specifically stores information via MDRO 112 using a 16-bit bus interface, not a single bit data line. Plaintiffs' '736 Br. at 21; see '736 patent at 8:14-21.

In support of their own construction that "single cell memory" is a single memory cell shared between the decoders called for in the claims, plaintiffs contend that the '736 patent does not indicate that the single memory cell must be in the integrated circuit along with the rest of the controller. Plaintiffs' '736 Br. at 20. Plaintiffs also assert that the preferred embodiment explains that the shared memory resource holds more than one bit of data. According to plaintiffs, the specification states that Figure 1 "depicts a typical prior art playback system" that "typically includes . . . a CD digital signal processor (CD-DSP) 22 along with its associated memory 24" and "a digital audio processor 34, a DVD DSP 26 along with its associated memory 28. . . ." Reply at 11; Plaintiffs' '736 Br. at 21. Plaintiffs assert that this specification language means that prior art Fig. 1 depicts separate memories, each of which is dedicated to its own processor and each of which is a multi-bit memory capable of storing thousands of bits. Id. They contend that the specification does not teach consolidating all such memory into a "single memory cell" capable of holding a single bit as required by defendants' construction.

5. Prosecution History

To validate their construction of "single memory cell," plaintiffs argue that the prosecution history amendment through which "single memory cell" was first introduced into the claims used "memory cell" to refer to multi-bit memories. Reply at 11; Plaintiffs' '736 Br. at 21. According to plaintiffs, the prosecuting attorney stated that the prior art playback system of Fig. 1 had "separate memory 24 and 28 for storing processed CD and DVD data" in arguing that the admitted prior art does not disclose the "single memory cell." Id.; see Schwartz Decl., Ex. B at ZC000339, ZC000341, ZC00256-61. Specifically, plaintiffs cite to the following commentary by the prosecutor in the file wrapper:

[w]ith respect to amended claims 5, prior art playback system 1 does not disclose a single memory cell for storing processed data received from a CD and a DVD. Playback system 1 has separate memory 24 and 28 for storing processed CD and DVD data.

Schwartz Decl., Ex. B at ZC000339. Plaintiffs further contend that it would be impossible to perform the complicated signal processing tasks done by the respective signal processors with a memory that stored only one bit of information, as required by defendants' construction of "single cell memory." Id.

In response, defendants contend that the statement in the prosecution history regarding the prior art not utilizing a single memory cell does not constitute an express intent to impart the novel meaning of "shared memory" to the claim term, as required by Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002), and thus, "single memory cell" should take on its ordinary meaning. Defendants' '736 Br. at 19; see Schwartz Decl., Ex. B at ZC000339. 12 They further contend that even if the prior art memories were multi-bit memories, that does not also make the shared, single memory cell a multi-bit memory. Defendants' '736 Br. at 19.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
12 Defendants also argue the following: 1) that plaintiffs made this allegation at the time that plaintiffs added "single memory cell" to the then-pending claim 5 to distinguish over prior art and 2) that plaintiffs cite to this fact in their brief at 20-21. Defendants' '736 Br. at 19.

--- End Footnotes ---

6. Conclusion

It is undisputed that the controller of the '736 patent contains a memory subsystem that provides memory resources used for storing data output from the signal processor and error correction code subsystems and used as input to the MPEG decoder. The claim language is not particularly helpful in determining whether "single memory cell" is a shared memory or not. As Phillips suggests, when the claim language is insufficient, it is appropriate to look to the specification for guidance. The specification indicates that shared memory is an important feature, '736 patent at 4:31:39, and that DRAM 116 provides memory resources in the Fig. 5 embodiment, id. at 8:8-13. The court also finds that the prosecution history supports the construction, as it agrees that the accompanying statement to the amendment adding the "single memory cell" limitation cited above supports plaintiffs' construction that "single memory cell" is a shared memory. In discussing the multiple memories required to store processed CD and DVD data in the prior art, the prosecutor distinguished the present invention by stating that the prior art did not have a "single memory cell." This indicates that the prosecutor intended to refer to the number of memories, not the number of bits that memory was capable of storing. Thus, based on the specification and prosecution history, it is clear that "a single memory cell" refers to a single storage element of memory.

--- Footnotes ---

13 At the claim construction hearing, defendants asserted that DRAM could not be the shared memory, presumably because they contend that it is not depicted as integrated into the memory subsystem in the specification.

Likewise, the claim language alone, in light of the prosecution history indicating the "single memory cell" provides a shared memory for memory elements 24 and 28 of the prior art, does not provide sufficient context to determine the size and scope of the memory storage provided. In the specification, the memory resource in the memory subsystem is described in Fig. 5 as DRAM 116. See also '527 patent at 8:12-14. The plain meaning of DRAM is a computer memory capable of storing thousands or millions of bits of data. The specification teaches that the size of the memory resource component of the memory subsystem 102 is merely illustrative of an embodiment of the invention rather than representative of the scope of the invention. Defendants' argument that single memory cell should be construed as storage for single bit of data would render the preferred embodiment inoperable. Thus, the court construes "a single memory cell" as a "shared memory."

GO BACK

4095

6. "sink object" and "obtains data stream buffers"

TiVo argues these terms require no construction beyond a definition for "object," or, if construed, should mean "the portion of computer program that [1] obtains data stream buffers from said transform object and [2] outputs said streams to a video and audio decoder." See TiVo's Op. Br. at 23; '389 patent at cols. 7:48-50, 8:39-40, 15:3-5, 18:19-21; TiVo's Markman Slides at 140-49, 158-62.

EchoStar argues "sink object" means "a software object that receives video and audio data." See '389 patent at cols. 7:47-57, 8:8-18, 8:52-65; EchoStar's Opening Br. at 23-25; EchoStar's Slide Presentation at 127-28. EchoStar further argues that "obtains data stream buffers" means "obtains a set of buffer memory addresses from the transform object and reads the data from that buffer." See EchoStar's Opening Br. at 28; EchoStar's Response Br. at 14.

The term "object" will be construed throughout the patent as set forth above. In light of the claims and specification, a "sink object" will be construed as "a collection of data and operations that (1) obtains data stream buffers [memory where data can be temporarily stored for transfer] from a transform object and (2) outputs the streams to a video and audio decoder."

- 4358 -
Further, the Court finds that the claim phrase "obtains data stream buffers" has a plain meaning readily understood by persons of ordinary skill in the art. For clarification purposes, however, the Court incorporates its definition of "buffer" and construes the claim phrase as "obtains data stream buffers [memory where data can be temporarily stored for transfer]."

4096

Defendants argue the patent specification sets forth the minimal hardware configuration for a slave game device, and thereby limits the definition of this term to at least those hardware components. One of these components is a transceiver, which Defendants argue by definition must be capable of both receiving and transmitting data. Defendants also argue the specification requires the slave game device be capable of transmitting data to the master device because the specification states communication between master and slave is bi-directional. Defendants differentiate dependent claim 6, which requires the slave send game status and accounting data to the master, from independent claim 1. Defendants assert claim 6 requires the actual transmission of the data, whereas Defendants' definition of "slave game device" would require it merely to be capable of such transmission through means such as a transceiver. Defendants note claim 6 does not specify any means for transmitting the data because independent claim 1's definition of "slave game device" already includes transceiver means.

FortuNet responds that nothing in claim 1's language requires the slave be capable of transmitting data to the master. FortuNet also argues the specification's reference to bi-directional communication is in the context of the preferred embodiment. With respect to the minimal hardware configuration, FortuNet argues this is only a description of the preferred embodiment, not a definition of "slave game device."

Figure 2 in the patent application shows a diagram of a slave game device. (JA003.) The patent specification states:

Although the FIG.2 shows only the simplest, minimal hardware configuration of the slave game device, the opportunities of playing a broad number of different games within the framework of the suggested game network can be greatly enlarged by expansion of the input and output (I/O) means 11 of the slave game device 7 as shown in FIG. 7.

(JA0010, Col. 4 at 29-35.) The description of the preferred embodiment states Figure 2 is "an intelligent (smart) game terminal comprising the microprocessor 10, the local data input and output means 11 including the keypad 8, and the transceiver 12, the latter providing the direct interface with the rest of the network 6 via the coaxial cable 13." (JA0009, Col. 2 at 57-62.)

Defendants argue that because the specification describes Figure 2 as the "minimal" hardware configuration for a slave game device, and further describes Figure 2 as containing a transceiver as part of this minimal configuration, the patentee defined the slave game device to include a transceiver. Defendants argue that, by definition, a transceiver both sends and receives information, so a slave game device must be capable of both sending and receiving data, even if claim 1 does not require that it actually makes the communication back to the master game device.

Beginning with the claim language, claim 1 does not define the term slave game device other than that it be connected through the network to the master, that it execute concurrently two games, and that it is at least partially controlled by the master. (JA0011, Col. 6 at 18-30.) The claim language does not suggest a minimal hardware configuration requiring the slave be capable of transmitting data to the master.

The specification states the minimal configuration of a slave game device includes a transceiver, implying anything less than that would not qualify as a slave game device. However, the specification makes this comment in the context of describing the preferred embodiment. The preferred embodiment includes bi-directional communication, so for the preferred embodiment, this would be the minimal configuration. The discussion of the minimal configuration in context of the preferred embodiment therefore is not necessarily definitional of the general claim term "slave game device." While the slave game device must have some means of connecting to the network and receiving commands from the master, claim 1 does not define a "slave game device" to include the capability of transmitting information back to the master. Nothing in the prosecution history suggests the patentee limited or altered the meaning of this term to require the capability of bi-directional communication. The Court therefore holds a "slave game device" means "a secondary data processing device for
b.  

Identix argues that properly construed the term "slice data" provides an alternative ground on which to affirm the district court's judgment. See Ethicon, 93 F.3d at 1582, 40 U.S.P.Q.2D (BNA) at 1027 (appellate court "must affirm the decision of the district court if it is supported by any ground properly preserved on appeal"); Mark I Mktg. Corp. v. R.R. Donnelley & Sons Co., 66 F.3d 285, 289, 36 U.S.P.Q.2D (BNA) 1095, 1098 (Fed. Cir. 1995) (appellate court can affirm on alternative basis that is "purely legal and was fully briefed to the district court").

Identix argues that the phrase "slice data" is synonymous with "active area." According to Identix, because the TP-600 does not generate a two-dimensional sub-set of the full image by filtering some of the image data before merging the remaining data into the "composite array," in the words of the patent, the TP-600 does not "generate arrays of slice data" as required by claim 16. Therefore, the TP-600 does not infringe.

DBI, on the other hand, offers the following definition: "A slice is a broader term than active area. A slice is each piece which is used to make up the final rolled fingerprint, and slice data is the data in that slice." Reply Brief of Appellant 9. Furthermore, DBI argues that an active area is a subset of the slice data "that is calculated to approximate the actual slice's data." Id. DBI distinguishes "slice data" from what it calls in its brief "blue sky data," which is the data in the image array that corresponds to that portion of the image propagating surface that is not in contact with any part of the finger. DBI does not argue that the image array itself is an array of slice data.

The written description supports the conclusion that a slice is an active area and the data therein is "slice data." "Slice" is used synonymously with "active area" in two instances in the written description. See col. 6, ll. 37-38 ("Following the copying of the first 'slice' or active area"); col. 7, ll. 16-17 ("the current active area or slice being processed"). The written description also speaks of the overlap between the current active area and the composite array in terms of "slice data": "In the preferred embodiments, the composite array is generated as a mathematical function of a comparison and an average of the overlapping slice data characteristic of the overlapping portions of adjacent slices." Col. 2, ll. 15-19 (emphasis added). The only description given is that of merging the overlapping portions of the active areas. Thus, the written description fully supports the conclusion that "slice data" in claim 16 refers to the data in the active area. See also col. 7, ll. 34-37 ("Processor 12 requires a predetermined minimum overlap such as eight pixel values PVn,m/ between the active areas of the current image array and the composite array.")

In contrast, DBI's proposed claim construction finds no support in the written description. Nowhere is there a description of identifying merely the non-blue-sky data and merging that data into the composite array. The patent only describes merging active areas into the composite array. Moreover, absent some form of processing, the system has no way to distinguish between blue-sky data and non-blue-sky data. The only processing that is described is defining the left, right, top, and bottom boundaries of the active area, not some amorphous combination of pixels in the image array, as DBI's claim construction would require.

DBI finds support for its position in the other claims, which explicitly use the phrase "active area." The argument is that because "active area" was used in some of the claims and not others, the term must have a meaning unique to itself. This argument might have some force if the claims that used "active area" actually depended from claim 16, but none do. As used here, we disagree with DBI's premise. Just because certain words are used in different claims does not mean that those terms cannot have application elsewhere in the patent. See Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1024, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987).

The prosecution history supports this reading. Claim 16, then 19, was originally presented in the preliminary amendment. It initially read:

19. A method for generating data characteristic of a rolled fingerprint image, including:
generating arrays of data characteristic of adjacent and two-dimensional slices of the fingerprint images; and

merging the arrays of data into a composite array of data characteristic of the rolled fingerprint image.

That claim was rejected under 35 U.S.C. § 102(b) "as being anticipated by Ruell (German Patent No. 3423886 A1)." (Ruell describes a system much like the present system in that it records a digital representation of a fingerprint image, but it does so in a different way.)

In response to that rejection, the applicants amended the claim as follows (with words added underlined and words deleted in square brackets):

19. A method for generating data characteristic of a rolled fingerprint image, including:

generating arrays of slice data characteristic of adjacent and over-lapping two-dimensional slices of the fingerprint images; and

[merging the arrays of data into] generating a composite array of data characteristic of the rolled fingerprint image as a mathematical function of overlapping slice data from a plurality of overlapping slices.

In the accompanying remarks, applicants' attorney distinguished Ruell, with our emphasis added:

Unlike the applicants' claimed invention, there is no provision for generating the composite array as a function of overlapping image portions of the finger. Similarly, Ruell does not teach a system which identifies active portions of the image which are representative of the fingerprint features as a mathematical function of the stored data, and generates the composite array as a mathematical function of the data representative of the identified active portions.

Appellants ask us to parse through the prosecution history and limit these remarks to those claims in which "active area" explicitly appears. The remarks are not as limited in scope as DBI suggests. The remarks contained in the block quote recited above were made without reference to a particular claim. Instead, the remarks were made with respect to "all of the pending claims [that] stand rejected under 35 USC 102(b) or 35 USC 103 over the Ruell German Patent 3,432,886." While it is true that the applicants went on to specifically distinguish each claim, or group of claims, including claim 19, from Ruell on more narrow grounds, that does not eliminate global comments made to distinguish the applicants' "claimed invention" from the prior art.

The public has a right to rely on such definitive statements made during prosecution. Notice is an important function of the patent prosecution process, as reflected by the statute itself, see 35 U.S.C. § 112, P 2, and recently confirmed by the Supreme Court, see Warner-Jenkinson Co. v. Hilton Davis Chem. Co., 520 U.S. 17, 117 S. Ct. 1040, 41 U.S.P.Q.2D (BNA) 1865, 137 L. Ed. 2d 146 (1997). Absent qualifying language in the remarks, arguments made to obtain the allowance of one claim are relevant to interpreting other claims in the same patent. Cf. Southwall Techns., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed.Cir. 1995) ("Arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary.").

Even were we to agree with DBI that its claim construction was plausible, we would still be compelled under Athletic Alternatives to adopt Identix's claim construction. Identix's narrow construction is clearly supported, if not compelled, by the intrinsic evidence. As in Athletic Alternatives, we were to construe claim 16 in the manner suggested by DBI, we are not sure the resulting claim would be enabled. In fact, this case is even more compelling than Athletic Alternatives because in that case the only question was whether the distance between strings of a tennis racket could be varied in a particular manner, not a particularly difficult technological step. Just the opposite is true in this case. To adopt DBI's claim construction would require the steps of distinguishing between the blue-sky data and the non-blue sky data, storing those data in an array, and combining some, but possibly not all of those data. The manner in which such steps would be performed are not readily apparent and, thus, raise precisely the same question of notice as the court faced in Athletic Alternatives. Accordingly we reject DBI's claim construction on that ground as well.
"slot"

Various asserted claims of the '981, '446, '297, '3,415, and '416 Patent contain the term "slot." ACQIS contends the term means "a space for receiving a module and providing guidance to a connector," while Defendants contend the term means "an opening capable of housing only one computer module." The parties' main dispute is whether a "slot" is limited to receiving a single computer module.

Although the relevant specifications describe a preferred embodiment where a "slot" receives only a single module, see '8,415 Patent, col. 4:25-27 ("Each ACM module has a respective slot 121, 119, which mechanically houses and electrically couples each ACM to the computer console.")., importing limitations from a preferred embodiment into the claims is improper. Phillips, 415 F.3d at 1323. Furthermore, limiting the claims in this manner would be inconsistent with the claim language. See, e.g., '446 Patent, 21:63-65 ("each coupling site comprising a connector and a slot"); 22:1-2 ("a plurality of computer modules, each coupled to one of the coupling sites through the connector and the slot"). Accordingly, the Court construes the term "slot" to mean "a space for receiving a computer module," where "a computer module" means "one or more computer modules." Tate Access Floors, Inc. v. Interface Architectural Res., Inc., 279 F.3d 1357, 1370 (Fed. Cir. 2002) ("It is well settled that the term 'a' or 'an' ordinarily means 'one or more.'").

"A Small Magnitude of Electromagnetic Energy"

Plaintiffs suggest that the term "a small magnitude of electromagnetic energy" in claims 1 and 23 does not require construction. Defendants propose that the term be construed to mean "the electromagnetic energy associated with an applied magnetic field of approximately 100 Oe or less." Contrary to plaintiffs' suggestion, we find the term "a small magnitude of electromagnetic energy" to be in need of construction, because quantifying electromagnetic energy is not something with which the jury can be expected to be familiar.

Although the claims do not define the term, they do provide some guidance. According to claims 1 and 23, "a small magnitude of electromagnetic energy" is a magnitude of energy sufficient to "reverse at least one of the magnetization directions" and cause "a change in the resistance by at least 10% at room temperature." '922 patent at 8:50-54; 10:33-37. For additional context, we look to the remainder of the patent. See Phillips, 415 F.3d at 1313.

The Background and Summary sections of the patent state that an important attribute of the present invention is its ability to achieve a change in junction resistance of at least 10% at room temperature. '922 patent at 2:9-12, 44-46, 61-64. The patent states that prior-art devices were only capable of creating very low changes in resistance at room temperature. '922 patent at 1:65-67. Although some prior-art devices achieved moderate resistance change (2-6%), this was only at extremely low
temperatures (-450[degrees]F). Id. at 1:62-64. By obtaining such a high change in resistance at room temperature, the patentee believed that the present invention provides "significant promise for application in magnetic recording devices, such as high density fixed disk drives found in personal computers." Id. at 2:59-61.

The invention achieves this all-important change in resistance through manipulation of the relative magnetization directions of the ferromagnet layers ("FM layers"). As noted above, "[t]he junction resistance is higher when the magnetization of one [FM layer] is antiparallel to that of the other [FM layer] and lower when they are parallel to one another." Id. at 1:29-32. Therefore, to achieve a change in resistance of at least 10%, electromagnetic energy is applied to the junction in such a way as to reverse the magnetization direction of one FM layer, but not the other. By manipulating the magnetization of only one FM layer, the relative directions of magnetization of the two layers can be modulated between parallel and antiparallel states, thereby causing a fluctuation in resistance. By contrast, if the magnetization direction of both FM layers were reversed, then the magnetization direction of each FM layer relative to the other would remain constant, and a change in resistance would not result. Therefore, it is essential that only one FM layer experience a reversal in magnetization direction.

6 For the purposes of this section we describe the first and second "electrodes" or "film layers" as FM layers. However, the claims themselves are not limited to this one, specific embodiment.

To ensure that the magnetization direction of only one FM layer is affected, the patent provides that each of two FM layers have a different coercive field magnitude or "coercivity." Id. at 8:55-58; 10:38-41. Coercive field magnitude, measured in oersteds (Oe), relates to the gross magnitude of applied electromagnetic energy required to reverse the magnetization direction for a particular type of ferromagnetic material. Id. at 2:29-31. By fabricating one FM layer with a material that exhibits lower coercivity, and the other with a material that exhibits higher coercivity, a quantity of electromagnetic energy can be applied which is large enough to reverse the magnetization direction of one FM layer but not the other, thereby changing the alignment of the two magnetization directions and causing a change in resistance of at least 10%.

7 For example, Fig. 3A shows the change in resistance measured in a device in which one FM layer was constructed using cobalt (Co), which has a coercive field magnitude of 100 Oe, and the second FM layer constructed using cobalt-iron (CoFe), which has a coercive field magnitude of 200 Oe. '922 patent at 5:3-17.

Defendants would have us restrict the term "a small magnitude of electromagnetic energy" to "the electromagnetic energy associated with an applied magnetic field of approximately 100 Oe or less." Although this limitation is found nowhere in the claims, defendants argue that such an interpretation is compelled by statements in the patent's Summary and Abstract.

The Summary states "[a] small change of magnitude, approximately 100 oersted (Oe), in applied magnetic field is capable of changing the junction resistance of the device by at least 10% at room temperature." Id. at 2:19-22. The Summary goes on to say that this change in magnitude of the applied magnetic field is appropriate where the material used in the bottom FM layer provides a coercive force of 100-1000 Oe and the material used in the top layer provides a coercive force of 20-100 Oe. Id. at 2:24-29. Clearly, when a device is constructed with FM layers exhibiting these specific coercive force values, a 100 Oe change in magnitude of the magnetic field would be sufficient to reverse the magnetization direction of the bottom layer but not the top layer.

However, this level of change in magnitude is entirely relative and contingent on the materials used to create the FM layers. The claims themselves do not specify the materials with which the FM layers may be constructed. Although the specification provides examples of devices wherein the FM layers were constructed with particular materials, it does not "demonstrate[] a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Liebel-Flarsheim, 358 F.3d at 906 (internal quotation marks omitted). To the contrary, the patent explicitly disclaims using
the examples as placing limitations on the claims. See '922 patent at 3:2-7; 8:38-42. The specification merely provides examples of ways in which the patent could be constructed, not how it must be constructed, and we therefore refuse to read defendants' suggested limitation from the specification into the claims. See In re Cruciferous Sprout Litig., 301 F.3d at 1348-49.

Nor will we read the Abstract to limit the claim language. The Abstract reads: "[f]erromagnetic/insulator/ferromagnetic tunneling has been shown to give over 10% change in the junction resistance with H less than 100 Oe, at room temperature …." Again, this language does not demonstrate a clear intention to limit the claim scope. Liebel-Flarsheim, 358 F.3d at 906. As noted above, a change in magnitude of 100 Oe is sufficient only where the device is constructed using certain materials for each FM layer, a limitation which does not appear in the claims.

Thus, having read the claim term in light of the remainder of the claims and the specification, we find that a person of ordinary skill in the art at the time of the invention would understand "a small magnitude of electromagnetic energy," as used in claims 1 and 23, to mean that magnitude of electromagnetic energy which is sufficient to reverse the magnetization direction of the electrode or film layer with a lower coercive force (thereby achieving a change in resistance of at least 10%) but less than the amount necessary to reverse the magnetization direction of the electrode or film layer with a higher coercive force.

4100

Smart card

Again, the parties propose similar constructions except that Defendants seek to impose an additional limiting phrase. Plaintiff proposes the construction, "a card that contains an integrated circuit such as a microprocessor or a memory," while Defendants advance the construction, "card containing an integrated circuit, such as a microprocessor or a memory, that can be used to make purchases."

This is the same issue as presented by "debit card," although the term "smart," unlike the term "debit" does connote a structural aspect. Likewise, the Court declines to include the additional phrase proposed by Defendants and construes the term "smart card" as "a card that contains an integrated circuit such as a microprocessor or a memory."

4101

K. Ref. No. 16 "Smart card" and "smart card for storing."

These terms are recited or referred to in Claims, 6, 7, 9, 19, 20, 22, 24, 25, 26, 27, 29, 40, 44, 45, 46, 48, 54, 55, 73, and 77.

As to these terms, the parties disagree about the size of a "smart card." Column 4, lines 22-37 describes a smart card's function and uses. It is of "convenient size for handling and for printing desired indicia or other information on the surfaces thereof." (Col. 4, ll. 26-28.) "Also typically, the card is about the size of a conventional credit card or the like, but may be larger or smaller." (Id. ll. 33-35.) Smart cards may be referred to as "chip cards" or "access cards." (Id. ll. 35-37.)

The key word is "card," as in "credit card." The description allows for larger or smaller sizes, but the term "card" limits the range. Larger or smaller, the item is a "card."

For these reasons, the Court construes the term "smart card" in Ref. No. 16 as: "A credit card-sized and shaped, portable memory device, separate and independent from the memory of the voting machine."

4102

3. "SNOOP Signal"
The main dispute between the parties appears to be whether a "SNOOP signal" indicates whether an address refers to a cached memory or whether it merely triggers that determination. The proper construction of SNOOP signal can be ascertained by reviewing the specification and asserted claim of the patent. First, in the Background section of the patent, the term SNOOP signal is introduced in the context of prior art where a bus master asserts a SNOOP signal on a single bus to check whether "a second bus master [. . .] is using a cache memory for data stored at that memory address." '369 patent at 1:36-45. Next, the Summary section explains in the context of a two-bus system that the SNOOP signal is a signal "indicating whether the Futurebus address references a cached data storage location on the Futurebus." '369 patent at 2:19-30. This portion of the Summary makes it clear that two buses are involved: the first address originates from the VMEbus and the Futurebus address corresponds to a second address. Finally, in the claims, SNOOP is again defined as a signal "indicating when a generated second address is mapped to one of said particular subset of the second data storage locations." '369 patent at 13:23-14:2. This language is consistent with that set forth in the Summary section. In either the context of single bus (prior art) or two buses (the invention), the SNOOP signal indicates whether an address references a cached storage location, it does not merely trigger a determination whether data is cached.

Defendants' proposed claim construction seeks to limit a SNOOP signal to determining whether a "second generated address" references a cached location. However, as plaintiff points out, part of the claim specifies that the first mapping means generates "a SNOOP signal of a state indicating when a generated second address is mapped to one of said particular subset of the second data storage locations." '369 patent at 13:24-14:12. Because this portion of the claim specifies that a SNOOP signal must be in a particular state "indicating when a generated second address is mapped" to a cached location, it cannot be that the general definition of SNOOP signal must always include determining whether a "second generated address" references a cached location. However, although the construction of term "SNOOP signal" is not limited to indicating whether a second generated address references a cached data storage location, the language of the claim itself requires the first mapping means to generate a SNOOP signal with the particular "state indicating when a generated second address is mapped to one of said particular subset of second data storage locations." '369 patent at 13:23-14:2.

Based on the foregoing, the court construes "SNOOP signal" as "a signal indicating whether an address references a cached data storage location."

4103

I. Citation of Athletic Alternatives

At claim construction, the court construed the term "SNOOP signal" as "a signal indicating whether an address references a cached data storage location." Claim Construction Order at 10:9-11:17. The parties then disputed the meaning of the phrase "cached data storage location" at summary judgment. According to Intel and VIA, the court's use of "cached data storage location" meant that the SNOOP signal must indicate that data is in fact cached at the referenced location. Summary Judgment Order 13:17-19. CCCC contended that the SNOOP signal indicated only whether a particular address was subject to caching (in other words, whether the address was "cacheable"). Id. at 13:19-22 The court concluded that the language of claim 1 "strongly indicates that the SNOOP signal understands which addresses are in cache" (id. at 18:15 9-20), and, therefore, that "the SNOOP signal is only asserted by the interface device when an address map to an address on the second bus at which data is known to be cached" (id. at 18:27-28). After reaching that conclusion, the court wrote, "[f]urther, if after the reasoned analysis set forth above, both [CCCC's and defendants'] interpretations are equally plausible, the patentee's statutory burden to distinctly claim subject matter favors the narrower construction." Id. at 19:6-9 (citing Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996)).

In its motion for reconsideration CCCC contends that the court misapplied Athletic Alternatives and argues that the case does not stand generally for the proposition that the narrower of two equally plausible constructions should be adopted.
According to CCCC, Athletic Alternatives held only that a narrower enabled construction should be selected over a broader non-enabled one.

Before considering whether the court correctly cited to the principle of Athletic Alternatives, it must be recognized that the court did not base its claim construction on any purported rule or principle from Athletic Alternatives. Rather, it based its construction on the intrinsic evidence including the abstract and, most importantly, the claim language itself.

Only after explaining the basis for its construction, did the court suggest that if after a reasoned analysis CCCC's and defendants' proposed claim constructions were equally plausible, the defendants' narrower construction should be favored because of the inventor's statutory burden to distinctly claim the subject matter which he or she regarded as the claimed invention. The court followed this proposition by "[s]ee Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996). "See' is used . . .when the proposition is not directly stated by the cited authority but obviously follows from it: there is an inferential step between the authority cited and the proposition that it supports." THE BLUEBOOK, A Uniform System of Citation (Seventeenth Edition 2000) at 22-23. CCCC contends that Athletic Alternatives does not hold either directly or inferentially what it was cited for.

Courts have read Athletic Alternatives to require adoption of only a narrower enabled construction over a broader non-enabled one. See Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998); Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir. 1996). As these cases note, Athletic Alternatives relies on the requirement in 35 U.S.C. § 112 that a patentee "distinctly claim[] the subject matter which the applicant regards as his invention." Athletic Alternatives, 73 F.3d at 1581. In light of this requirement, adopting a broader, non-enabled construction would "undermine the fair notice function of the requirement that the patentee distinctly claim the subject matter disclosed in the patent from which he can exclude others temporarily." Id. Because narrower constructions are not intrinsically more definite (a broad claim can be as distinctly described as a narrow one), Athletic Alternatives may not have application to the present case and arguably should not have been cited even following the signal "see" because the claim as construed may not be enabled. The specification does not disclose how the interface device would know that an address has been cached. Nevertheless, as noted above, the court's construction was not dependent, or even based, on Athletic Alternatives.

The Court construes the term "soft mask" in claim 11 of the '339 patent and claim 3 of the '442 patent as "a mask is an erodable layer of material used to cover selected areas of a surface during etch. A soft mask erodes more rapidly than a hard mask, which erodes slowly or not at all." The patents-at-issue use "soft mask" as a relative term to "hard" mask, which is described as a mask which "erodes slowly or not at all." See '339 Patent col. 3:54-55. These terms lack an ordinary and accustomed meaning in the relevant art, and no other definition of "soft mask" or "hard mask" is provided in the patent.

Samsung's proposed construction--"an erodable layer of material used to cover selected areas of a surface during etch"--improperly reads "soft" out of the term. MEI's construction--"a rapidly erodable layer of material used to cover selected areas of surface during the claimed step of applying a first etch or applying a second etch"--reflects the relative erosion of hard and soft masks, but adds a limitation of "rapid" erosion that is not supported by the claims or specification and would itself likely require construction. Furthermore, MEI's proposed limitation that a mask be used in an etch is an improper and redundant inclusion of other limitations from the claims.

The parties propose the following constructions for the term "soft switch." Peerless's proposed construction is:

"telecommunications equipment required to switch calls for which policy-based call control and services is separated
from the underlying transport network and hardware, and which includes software that manages network devices to set up calls across IP, ATM, and circuit networks."

NT's proposed construction is "a system with call control and service decoupled from the underlying transport and switching network hardware."

Both sides cite the following language from the specification in support of their positions: "The separation of policy-based call control and services from the underlying transport network and hardware is a key defining element of soft switches." NT asserts that a soft switch is switching equipment that separates hardware devices from the software that controls how calls are switched. NT's proposed construction is consistent with the cited language from the specification. By contrast, Peerless does not explain how its proposed construction is derived from the quoted language. Therefore, the Court construes "soft switch" as "a system with call control and service decoupled from the underlying transport and switching network hardware."

1. "Software-adjustable memory for storing an ion output current reference value"

ITW offers the following construction: "a digital data storage element that holds a value which can be changed (i.e. adjusted) to a new value. The value is changed via software, as opposed to hardware or circuitry." Pl.'s Revised Proposed Order Regarding Claim Construction at 2. Ion proposes: "a semiconductor memory device that preserves a binary number used as a reference value that corresponds to an ion current output in a storage device." Def.'s Proposed Order re Claim Construction for the '756 patent at 5.

I have already defined the words "reference" and "value" for purposes of understanding the phrase "ion output current reference value." See supra. These definitions should be used consistently throughout the patent. See Epcon Gas, 279 F.3d at 1030-31. I will therefore ignore Ion's repeated effort to insist that "value" must be a digital number. Those words that remain to be defined are therefore "software-adjustable memory" and "storing."

The dictionary definition for "to store" is: "to reserve or put away for future use." American Heritage Dictionary of the English Language (4th 2000). This definition is similar to the parties' own proposals, "hold" and "preserve". The computer science definition for "memory" is: "a unit of a computer that preserves data for retrieval." Id. The parties have offered no intrinsic evidence for why these dictionary definitions, insofar as they represent the words' ordinary and accustomed meaning, should be altered. For this reason, I will define the term "software-adjustable memory for storing an ion output current reference value" as follows: "a unit of a computer that holds a value that can be changed to a different value via software."

5. "Operational software for executing unique functions with the transducer scanhead"

Plaintiffs' construction: system executable code for executing specific applications such as cardiac analysis, neo-natal analysis, gynecology analysis and prostate analysis

Defendant's construction: software that is collectively used to operate functions that a particular model of the transducer scanhead is capable of performing

The parties' dispute regarding the proper construction of this term focuses on two issues: (1) whether the term "software" in the context of the '839 patent means "executable code" and (2) the proper definition of the "unique functions" of the "transducer scanhead." With respect to the second issue, the plaintiffs' arguments appear to be the same as their arguments regarding the terms "operational data for the scanhead" and "operational data unique to the transducer scanhead." As discussed above, I find plaintiffs unpersuasive when they argue that these terms are limited in scope by the patent.
specification. However, with respect to this term, defendant has not explained why its construction is correct (or even better). On its face, defendant's construction appears to expand the scope of the claim term. Absent some evidence that this expansion is appropriate, I cannot adopt defendants' construction.

The remaining question is whether "software" means "executable code," as plaintiffs contend. (By its inclusion of the term "software" in its proposed construction, defendant appears to take the position that the term software requires no additional construction in the context of this phrase.) The claim language itself provides a clear answer. Claim 7 of the '839 patent discloses: "The ultrasound diagnostic instrument as defined by claim 1 wherein the software and data stored in the second memory includes system executable code for the digital processor." This claim language would make very little sense if "software" meant "system executable code."

At a minimum, the patent's use of both words raises a presumption that they do not mean the same thing. Applied Medical Resources, 448 F.3d at 1333 n.3 ("in the absence of any evidence to the contrary, we must presume that the use of . . . different terms in the claims connoted different meanings."). Plaintiffs are unable to overcome this presumption with persuasive evidence. Instead, they attempt to support their position with their expert's broad statement that a person of ordinary skill in the art would understand that software must be system executable code in order for the invention to provide its stated improvement over the prior art, that is that it obviates the need for manual field upgrade or system swap.

Therefore, I conclude that "operational software for executing unique functions with the transducer scanhead" as used in the '839 patent would not benefit from either proposed construction.

K. Client Software Means

The parties agree that "Client Software Means" is a means-plus-function element construed pursuant to 35 U.S.C. § 112, P 6. (D.I. 207, at 7). They disagree, however, about the scope of the function and the corresponding structure.

1. Scope of the Function

Under Section 112, P 6, the Court must first determine what function is performed by the claim element. In making this determination, the Court must be careful to neither "narrow the scope of the function beyond the claim language" nor "broaden the scope of the claimed function by ignoring clear limitations in the claim language." Cardiac Pacemakers, Inc. v. St. Judge Med., Inc., 296 F.3d 1106, 1113 (Fed. Cir. 2002). The parties disagree about two different parts of this element's functional scope. First, they disagree as to whether the language "adapted to" is part of the function. Second, they disagree about whether the function should be temporally limited.

As to the first dispute, Plaintiff contends that, by including the language "adapted to," the claim demands only a capability, not a requirement, to forward a subscriber client computer's identity data to a first server computer. (D.I. 266 at 12). Defendants contend that the "adapted to" language should be read out of the function, just as the word "for" would be in a conventional means-plus-function clause. (D.I. 306 at 2-3). The result of Defendants' proposed construction would be to require the client software means to forward a subscriber client computer's identity data to said first server computer. Id.

As to the second dispute, Plaintiff contends that the functional recitation is not temporally limited. While acknowledging that this element's language includes the phrase "at the beginning of an operating session in which access to selected computer resources is requested[,]" Plaintiff contends that this language is not a functional limitation of the element, and, therefore, should be subject to traditional claim construction principles rather than means-plus-function construction. (D.I. 266 at 7). Conversely, Defendants contend that the function must include the temporal limitations of the claim language to avoid improperly broadening the scope of the claimed function. (D.I. 266 at 30-32). They contend that the claimed function for "Client Software Means" is not forwarding the identity data at any time, but rather, forwarding the identity data at a particular time. Id.

Often means-plus-function limitations are written as a "means for" performing a recited function. See Lucent Techs., Inc. v. Extreme Networks, Inc., 367 F. Supp. 2d 649, 669 (D. Del. 2005). Here, the applicants used the formulation "means adapted
to" perform a recited function. The issue before the Court, then, is whether "adapted to" merely precedes the claimed function or whether it is a part of the claimed function. The Court agrees with Plaintiff that ignoring the "adapted to" language introduces an unintended requirement into the claim element, because the claim language only discloses a capability. See Berg Tech., Inc. v. Foxconn Int'l, Inc., 1999 U.S. App. LEXIS 2796, at *8 (Fed. Cir. 1999) ("adapted to" is commonly understood to mean "capable of"). Therefore, the "adapted to" language does more than precede the recited function; it is a part of the recited function.

A means-plus-function clause does not limit all terms in the clause to what is disclosed in the patent or equivalents. 
"[Section] 112, P 6 applies only to interpretation of the means or step that performs a recited function when a claim recites insufficient structure or acts for performing the function." IMS Tech., Inc. v. Haas Automation, Inc., 206 F.3d 1422, 1432 (Fed. Cir. 2000). In this case, the client software means is "adapted to forward the subscriber client computer's identity data to said first server computer at the beginning of an operating session in which access to selected computer resources is required." (See '416 Patent, col. 256, line 42-45). The beginning of an operating session, however, is not the means or step for performing the data forwarding, and therefore, is not subject to Section 112, P 6. Accordingly, the Court concludes that while "client software means" is a means-plus-function element, the means-plus-function interpretation does not apply to the phrase "at the beginning of an operating session in which access to selected computer resources is requested."]

Thus, the function performed is "adapted to forward a subscriber client computer's identity data to said first server computer." "At the beginning of an operating session in which access to selected computer resources is requested[,]" is not construed pursuant to 35 U.S.C. § 112, P 6, and is instead construed in accordance with the Court's previous construction of "operating session."

2. Corresponding Structure

Second, the Court must determine what structure corresponds to the claimed function. The parties disagree about the structure of the client software means, and the algorithm to be performed by that structure. The Court finds that the '416 Patent specification links the claimed function of the client software means to software products that were available at the time of the patent application. ('416 Patent at 5:48-50, 56-63). Therefore, the structure is that software identified in the specification that can carry out the function, namely "that portion of the identity and access components (e.g. that portion of the subscriber software running on the subscriber client computer (Fig. 2)) that preferably uses the transmission control protocol/internet protocol (TCP/IP) and/or user datagram protocol/internet protocol (UDP/IP) to communicate with the first server computer and equivalents there of." (contra McKesson Info. Solutions LLC v. TriZetto Group, Inc., 2006 U.S. Dist. LEXIS 16097, at *9 (D. Del. 2006)(structure limited to disclosed algorithm only because specification linked to software that did not exist at time of patenting).

- - - - - - - - - Footnotes - - - - - - - - -

n4 The Court declines to define the exact algorithm disclosed in the specification, but notes that the client software means structure is limited to carrying out the algorithms described in the '416 patent. See WMS Gaming Inc. v. International Game Tech., 184 F.3d 1339 (Fed. Cir. 1999).

- - - - - - - - - End Footnotes - - - - - - - - -

E. Construction of "a software modem"

The disputed term appears in Claim 1 of the 305 patent as follows:

a software modem adapted to convert digital samples from the device to data values transmitted to the UART emulation and adapted to convert data values from the UART emulation to digital samples for the device.

PCTEL contends that the claim means "software that performs modulation and demodulation" whereas Agere proposes "a modem that utilizes the software executed by the host processor to perform modem signal processing functions rather than
including a digital signal processing (DSP) chip."

Agere contends that the term "software modem" as construed by PCTEL gives it a greater scope than that which was actually claimed by the 305 patent. Pointing to the title of the patent, "Host Signal Processing Modem Using a Software Simulation of a UART", and sections of the prosecution history in which PCTEL describes its invention as a HSP modem, n11 Agere argues that the term "software modem" should be understood as synonymous with "HSP modem," Agere cites portions of the prosecution history in which PCTEL distinguished the 305 patent from the prior art on the basis that the prior art contained DSP chips, whereas the 305 patent performed digital function processing using software. n12 The patentee distinguished the 305 patent from the prior art, stating that the prior art:

"[D]id not even recognize the desirability of replacing the DSP chip (i.e. the element for performing digital processing functions) with a software modem."

Malz Declaration, Ex. 9 at 17972 (1/6/03 Response).

Based on this language, Agere contends, PCTEL cannot now claim that the patent covers non-HSP modem devices, such as those that contain DSP chips.

--- Footnotes ---

n11 See Malz Declaration, Ex. 7 at AL 17658 (12/23/97 Response), Ex. 9 at AL 17974 (1/6/03 Response).

--- End Footnotes ---

PCTEL counters that the digital system processing which occurred in the prior art was modulation and demodulation. Thus, PCTEL contends, the disclaimer concerning modems with DSP chips is entirely consistent with their construction of "software that performs modulation and demodulation" because that functionality is performed in the 305 patent through software. PCTEL cites the claim language following the phrase "software modem" in which the modem is "adapted to convert digital samples from the device to data values . . ., arguing that this is simply modulation and demodulation, in accordance with PCTEL's construction.

Under the plain meaning of the claim, illuminated by the context of the surrounding words, the term "software modem" is explained by the language "adapted to convert digital samples from the device to data values." However, PCTEL expressly distinguished the 305 patent from the prior art based upon the fact that the prior art had a dedicated DSP chip, and the 305 patent did not. It is well established that "the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Springs Window Fashions LP v. Novo Industries, L.P., 323 F.3d 989,994 (Fed Cir. 2003). The Court finds that the patentee disclaimed systems which include digital signal processing performed by hardware. Accordingly, the Court construes the claim "software modem" to be "a modem that utilizes the software executed by the host processor to perform modulation and demodulation rather than including a digital signal processing (DSP) chip."

6 The court discusses this limitation at page 75 of its memorandum opinion of the same date.

--- End Footnotes ---

GO BACK
"Solely contained within" is found in claim 1 of the '493 Patent and claim 16 of the '882 Patent. Claim 1 of the '493 Patent is representative and covers:

1. A system for facilitating a windowed content manifestation environment within a web browser, comprising:

   a server system . . . ; and

   a web browser client . . . coupled to said server system . . . having a content manifestation environment, said web browser client . . . to process said software system and said associated content to produce window objects solely contained within said content manifestation environment, each window object of said window objects is associated with a set of controllable attributes and is . . . [configured] to . . . manifest at least a portion of said associated content therein, said controllable attributes configured to affect manifestation of said each window object by said web browser client within said content manifestation environment, wherein said each window object executes within and is directly controlled by said web browser client which operates within said data processing system, . . . .

'493 Patent Cl. 1 (emphasis added). Having placed the disputed term within the context of the patents in suit, the Court will discuss the Special Master's recommended construction, Simple's objection and CA's corresponding counter-arguments.

A. The Special Master's Recommended Construction

The Special Master recommended that "window objects solely contained within said content manifestation environment' means that the window objects only appear inside the boundaries of the content manifestation environment." (R&R at 162.) The Special Master arrived at his conclusion in a three step process. First, he used a dictionary to define "within" as "inside." (Id. at 161.) Second, the Special Master used a dictionary to define "contain" as "to keep within limits." (Id.) Finally, the Special Master interpreted the glossary definition of a content manifestation environment which stated that "a CME is a 'controllable WWW browser content display window,'" to conclude that "solely contained within" dealt with the visual appearance of a window object within the boundaries of a content manifestation environment. (Id.)

B. Simple's Objection and CA's Counter Argument

Simple argues that the "proper construction [of solely contained within] is [that] ' . . . window objects are only kept inside the boundaries of the content manifestation environment." (Simple's Claim Construction Objections at 17.) According to Simple's statements during the Markman hearings as well as its expert testimony, for a window object to be solely contained within a content manifestation environment: (1) a user must not be able to drag the entire window object out of the content manifestation environment and (2) no portion of the window object can be displayed outside the content manifestation environment. (Markman Tr. 23:2-23; HC Belgard Expert Report P 167 (referring to a representation of CA "Portal Components," p. 44 fig. 1.).

SPECIAL MASTER PETERSON: . . . And the full phrase is . . . -- quote, "... to process said software system and said associated content to produce window objects solely contained within said content manifestation environment,..."  

MR. UNGERMAN: [on behalf of Simple] And that's as opposed to window objects which might move outside the content manifestation environment. That's the limitation that it's getting at.

SPECIAL MASTER PETERSON: All right. Jumping to the bottom line, what you're saying is that that means you could not drag one of those windows outside the CME?

MR. UNGERMAN: Correct, and still be within the limitations of the claim.

SPECIAL MASTER PETERSON: So if a software system allowed you to drag a window outside the CME, that would
take it outside the scope of the claim as you interpret it?

MR. UNGERMAN: Right, Your Honor.

SPECIAL MASTER PETERSON: Okay.

(Markman Tr. at 23:3-23.) For its part, CA argues that the Special Master correctly placed a visual emphasis on content manifestation. (CA's Claim Construction Response at 17-18 ("As the Special Master correctly concludes, so long as the window object does not appear outside the CME it does not violate the requirement of being 'solely contained within' it.").) Having summarized the Special Master's proposed construction of the term as well as the parties' corresponding objections and counter arguments, the Court will put forth its own analysis.

C. Analysis

The Court's analysis of the disputed phrase "solely contained within" will focus on the 84 functional aspects of window objects within the context of the patents in suit and then address the deficiencies in the Special Master's proposed construction.

1. The Phrase "solely contained within" Should Be Construed so as to Comport with the Functional Aspects of Window Objects and the Claimed Content Manifestation Environment

The Court does not base its interpretation of "solely contained within" solely on visual parameters because window objects can deliver content without it being seen by a user. The Court takes care to note that a window object can be "solely contained within" a content manifestation environment even when part of it cannot be seen because: (1) window objects, particularly DMODs, "act like any other window such as those within a windows based operating system desktop environment" and (2) the specifications of the '493, '563, and '882 Patents clearly establish that content manifestation is more than what appears on screen. See, e.g., '493 Patent col. 8, ll. 29-34, col. 9, ll. 7-20. Indeed, windows within a windows based operating system desktop environment can be moved partially out of the viewable display area but still be solely contained within a windows desktop operating environment. For example, even if one were to move a window object such that only its control section could be seen, the window object would still be contained solely within a content manifestation environment despite the fact that part of it was hidden. This is analogous to window objects equipped with scroll bars to "allow [for the] management of content that extends beyond a bottom edge of a visible area." E.g., '493 Patent col. 9, ll. 7-20 (describing the scroll function in modules); see also, e.g., '493 Patent fig. 1D. At this point, a working example may be in order.

Indeed, CA's own implementation of the source code disclosed in the '493 Patent shows that a window object can be solely contained within a content manifestation environment without being seen. (Supplemental Decl. of Danny Goodman in Supp. of CA's Objections to the Special Master's R&R as to Anticipation & Obviousness (Dkt. No. 620) ("Second Goodman Supplemental Anticipation and Obviousness Decl.").) CA's expert, Mr. Goodman, "was asked . . . to reconstruct the browser page of . . . the '493 Patent . . . from the source code . . . displayed within the patent's text." (Id. P 2.) Although certain typographical errors needed to be corrected and some source code was missing, such as the "d&d.js [file necessary] for dragging and dropping operations," Goodman was able to "reconstruct the rest of the HTML and JavaScript files to . . . load the page into Microsoft Internet Explorer 4." (Id.)

In addition to completing his reproduction, Goodman provided the Court with two screen illustrations. (Id. at 2-3.) The first screen illustration shows a content manifestation environment displaying "three window objects" corresponding to the "News, Homepage, and Chat" functions. (Id. P 3.) Goodman's description of the first screen shot provides:

3. The following screen illustration shows the results of loading the reconstructed code into an Internet Explorer 4 browser window maximized to fill an 800x600 pixel screen, a very common screen resolution at the time of the patent filing. Because I did not have access to the image files referenced in the code, the browser displays a placeholder (white box with a red "x" and alternative text) where an image would have appeared. The titlebars of three window objects (News, Homepage, and Chat) can be seen in the initial view.

4. In this example, the browser window is maximized to fill the display screen. Even in this configuration, one of the
5. When I clicked the unmaximize button of the browser window, the browser window reduced in size, as shown in the following screen illustration. This reduces the size of the browser display area.

(Id. PP 3-5.) A copy of the Screen illustration is shown below:

[SEE FIGURE IN ORIGINAL]

(Id. at 2.) As one can observe, certain window objects can only be partially seen. Even so, they are still solely contained within their content manifestation environment. Though Goodman's initial screen illustration was "maximized to fill an 800x600 pixel screen," his subsequent illustration showed the same web page, but in a web browser window that did not take up the entire screen. (Id. at 3.) Goodman observed that by reducing the size of the web browser window, the "News window" became only partially visible and the "Chat window" could not be seen at all. (Id. P 6 ("Upon reducing the browser window size, the News window is partially not visible. Additionally, the Chat window is now not visible at all.").)

Goodman's second screen illustration is produced below.

[SEE FIGURE IN ORIGINAL]

Notably, Goodman does not claim that the "Chat window," which cannot be seen, is not "solely contained within" its content manifestation environment. This is because it is possible for one to scroll further down the web browser in an Internet Explorer 4 web browser. Indeed, just as window objects can be equipped to manage "content that extends beyond a bottom edge of a visible area," the Internet Explorer 4 web browser can deliver content that extends beyond the bottom edge of its visible area. See generally '493 Patent col. 9, ll. 7-20 (describing the scroll function in module window objects); col. 2, ll. 18-23 (stating that prior art browsers had "scroll bars" which could be used to "scroll through a relatively large amount of text"). In short, merely because a window object is: (1) partially obscured by another window object; (2) in a portion of the web browser that the user must scroll to, to see; or (3) minimized so that only its control section can be seen, does not mean that it is not solely contained within its content manifestation environment. Goodman's screen illustrations serve as an excellent visualization of the Court's finding, that the term "solely contained within" should not be based solely on visual perception. Having analyzed the relevant intrinsic evidence and filings on record, the Court will define the term "solely contained within."

2. "[S]olely contained within" Defined

The Court interprets "solely contained within" to mean that a window object cannot be moved from or displayed, in whole or in part, outside a content manifestation environment. "Solely contained within" a content manifestation environment includes the following requirements: (1) the user cannot move a window object out of the content manifestation environment; (2) no portion of the window object can be displayed outside the content manifestation environment; and (3) though a portion of a window object may not be displayed or may be obscured or hidden, said window object is still solely contained within a content manifestation environment.

3. The Special Master's Recommended Construction Overemphasizes Visual Perception

In view of the foregoing analysis, the Court declines to adopt the Special Master's proposed construction of the term "solely contained within" because it focuses too much on a user's visual perception of a window object. As discussed above, a window object need not be seen to be within a content manifestation environment.

D. The Court's Ruling on the Phrase "solely contained within"

The Court sustains, in part, Simple's objection to the Special Master's recommended construction of "solely contained within." The Court agrees with Simple, and finds that the phrase "solely contained within" should not be linked exclusively to the visual representation of a window object but adopts a more detailed construction of the term, which better comports with the behavior of window objects rather than adopting Simple's proposed construction. (See Simple's Claim Construction Objections at 16-17.)
B. Solid Modeler (Claims 1 and 11)

HP contends that the term means "a computer representational system for describing objects in 3D space." Intergraph states that the term means "a software package for representing solid objects, which, unlike wireframe and surface modeling, ensures that all surfaces meet properly and that the object is geometrically correct."

HP states that its proposed construction is consistent with the explicit definition of "solid modeler" found in the specification. Specifically, HP relies upon language in the section entitled "Background of the Invention" in which "solid modeling" is described as "a computer representational system for describing objects in three-dimensional space. '241 patent, col. 1:12-14; see also '241 Patent, col. 3:61-63 ("A method is described for interfacing between a solid modeler system which describes objects in three-dimensional (3D) space . . .")."

Intergraph supports its proposed construction by citing specification language which provides that "solid models are commonly constructed either with primitive or boundary definition, which permit modeling the solid nature of the object, though the models often appear on the output device in a similar manner as wire frame representations." '241 patent, col. 1:16-20. Intergraph relies upon this language to support its conclusion that wireframe modelers and surface modelers are functionally different from solid modelers and the inventors clearly made this distinction in the '241 patent.

The parties disagreement stems from whether "solid modeling" as used in the claim is distinct from "wireframe modeling" and "surface modeling." After examining the claims, it is far from clear that the inventors intended to exclude "wireframe modeling" or "surface modeling" from their claims. The claims do not require that a solid model be created. Rather, the claims describe using a "solid modeler" to create "an original 3D analytical model," and throughout the claims the term "3D model" is used. Accordingly, although the specification language cited by Intergraph could lead to the inference that "wire frame" and "solid" modeling are distinct processes, such a conclusion is certainly not compelled by the claim language. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997) (cautioning "against limiting the claimed invention to preferred embodiments or specific examples in the specification"). Thus, Intergraph's proposed construct cannot be correct.

Rather, the Court adopts HP's proposed construction in light of the fact that the Court's analysis must "remain centered on the language of the claims themselves." Vitronics, 90 F.3d at 1582. The claims state that a solid modeler "describes objects in a three-dimensional [] space." (Claim 1 and 11). The Court relies heavily upon this language in defining a "solid modeler" as a computer representational system for describing objects in three-dimensional (3D) space.

A. The Claim Term "Song" Means "Studio Quality Musical Recording" and Has No File Size Limitation

Most of the asserted patent claims at issue in this dispute recite the claim term "song." In September 2009, the parties agreed that "song" would be construed as a "studio quality musical recording." (See Mot. 3; Opp. 7.) The parties now disagree as to the meaning of "studio quality."

In its motion for summary judgment, TouchTunes contends that "studio quality" music has a size-per-minute of at least 10.1 megabytes ("MB"), and can have sizes-per-minute as high as 66 MB. (Mot. 5.) In support of this construction, TouchTunes cites Arachnid's efforts to distinguish prior art, in which it confirmed that "studio quality" songs require the songs to "take[] around 10MB per one minute of stereo sound." (Id. (citing Declaration of Patrick Rice ("Rice Decl.")) ¶ 9.) According to TouchTunes, Arachnid repeatedly argued before the U.S. Patent and Trademark Office (the "PTO") that its claims were patentable because the prior art technology could not accommodate the large volume of data contained in "complete songs of studio quality." (Mot. 9.) TouchTunes also states that the MP3-128 files used in its jukeboxes have a size-per-minute of only 0.94 MB, and argues that these files therefore do not contain "studio quality" recordings and are not "songs" as the parties have construed the claim term. (Id. 5-6.)
In its opposition, Arachnid argues that the prior art it sought to distinguish before the PTO concerned karaoke devices, which utilized Musical Instrument Digital Interface ("MIDI") files rather than recorded music or complete songs. (Opp. 3.) Arachnid used the term "studio quality" and similar terminology throughout the reexamination proceedings before the PTO as a way to define and refer to commercially available recorded music, as opposed to the MIDI data utilized by karaoke devices. (Opp. 4.) For example, with respect to the reexamination of the '834 Patent, Arachnid stated that once a patron has selected a desired song, "[t]he jukebox would then play the selected song, which was typically an artist's studio recording of a commercially available song." (Id.) In its submissions to the PTO, Arachnid consistently defined the phrase "studio quality," as that phrase relates to the jukebox patents at issue, as musical recordings that are suitable for commercial distribution. By doing so, Arachnid acted as its own lexicographer. See Edwards Lifesciences LLC v. Cook Inc., 582 F.3d 1322, 1329 (Fed. Cir. 2009); Phillips v. AWH Corp., 415 F.3d 1303, 1316 (Fed. Cir. 2005). Nothing in the intrinsic record indicates that Arachnid used the term "studio quality" to refer to any file size requirements.

Because the claim term "song" is in dispute, the Court must construe that term, as a matter of law. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). This is true even though the parties had previously reached an agreement as to the construction of the term "song." See, e.g., Civix-DDI, LLC v. Celco P'ship, No. 03 C 3792, 2005 U.S. Dist. LEXIS 43908, 2005 WL 831307, at *8 (N.D. Ill. Apr. 6, 2005) (construing a term where "the parties have a finite and well-defined dispute over the meaning of what they thought was an agreed construction"); Fernandez Innovative Techs., L.L.C. v. Gen. Motors Corp., No. 07 C 1397, 2008 U.S. Dist. LEXIS 41537, 2008 WL 2168843, at *7 (N.D. Ill. May 23, 2008).

The Federal Circuit has instructed that claims are to be construed in light of the claim language and the specification. "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Phillips, 415 F.3d at 1316. The plain meaning of the claim term "song," the specifications, and all of the intrinsic evidence make it clear that a "song" is not limited to a specific or minimum file size. Each of the specifications in the patents at issue explain how the song is taken from its original source — specifically, a commercially available recording — to a central management station, where the song is compressed to reduce its size before being transmitted to the computer jukebox. The file sizes for songs in the preferred embodiments are minimized, and the preferred embodiments do not mention any particular file size. It would be improper to apply numerical limitations to a claim term when the specification provides no such limitation. See, e.g., Kapusta v. Gale Corp., 155 Fed. Appx. 518, 521 (Fed. Cir. 2005) ("Because numerical dimensions are absent in the specification, it was improper for the district court to construe the claim term with the lower limit dimensions.").

For its definition of "studio quality," TouchTunes relies on the opinion of a retained expert and two sentences from the Declaration of Patrick Rice, which refer to a single example file format. The former is extrinsic evidence that is outweighed by the intrinsic record showing Arachnid's repeated definition of studio quality songs as musical recordings suitable for commercial distribution. The excerpted language from the Rice Declaration is mischaracterized by TouchTunes. Read in context, Rice's statement did not constitute a disavowal of claim scope or a definition of any specific claim terminology. Rather, Rice merely provided background information about the size of the most popular type of uncompressed music file format — the WAV format — used to convert songs stored on compact discs to computer files in 1992.

Because the specifications and intrinsic evidence do not teach that the phrase "studio quality," as it relates to the patents in dispute, reflects any minimum file size requirement, the claim term "song" is construed to have no file size limitations. Rather, based on the intrinsic record, "song" is construed to mean a "studio quality musical recording," where "studio quality" means that the recording is suitable for commercial distribution.

**4114**

a. "song record"

Plaintiffs contend that the term "song record" should be interpreted to mean that there must be information regarding at least one of the following categories: song title, song category, song address, song size, graphics address, graphics size, and play count. Defendants contend that the term means that...
the song record must include at least one piece of information for each of those fields. The patent teaches that for any single song, the song record can only have a maximum of one record for each category. For example, a song can only have one title, category, etc. See Opening Brief, Ex. 4 at 3:41-55. Defendants' proposed construction would therefore render superfluous the claim's use of the words “at least one of.” In other words, if “song record” required information in each of the seven categories as defendants propose, the claim would not need the phrase “at least one of.” Rather, it would describe “a song record including song identity data comprising a song title, a song category, song address ... [etc.]”. Defendants contend that SuperGuide Corp. v. DirecTV Enters., Inc., 358 F.3d 870, 884-86 (Fed.Cir.2004), requires that the term be construed to require at least one piece of information in every field. SuperGuide, however, did not state a universal rule for construction of the phrase “at least one of.” Rather, SuperGuide was fact-specific; the court's construction of the term was consistent with the specification of the patent in that case. Id. at 887. In the present case, defendants' proposed construction would render claim language superfluous and would be inconsistent with the specification, which teaches that, at least sometimes, certain fields may be blank. Opening Brief, Ex. 4 at 3:50-51 (“graphics address field” is used for “a graphic image, if any, to be associated with a song.”) (emphasis added). The Court therefore adopts plaintiffs' proposed construction.

4115

b. “song selector”
The term “song selector” in claim 1 of the 575 patent is similar to the term “selection keys” in the 189 patent, which the Court construed to mean “keys that allow a user to select a song.” The term “song selector” is similarly straightforward and should be given its ordinary meaning. Defendants contend, however, that “song selector” should be limited to a “keyboard that is separate from the display.” They argue that there is no disclosure that supports a broader construction in any of the patents at issue in this case. Defendants overlook, however, that the patent applicants utilized different terminology in the various patents to describe how a user selects a song. The 302 patent disclosed “song selection means” in a means-plus-function format (in which the corresponding structure is a keyboard); the 189
patent disclosed "selection keys." The term "song selector" is broader than both of these other terms; there is no corresponding structure to identify, and, on its face, the term is not limited to keys. The Court sees no reason to limit "song selector" to the examples shown in the specification and therefore construes the term to mean "a device that allows a user to select a song."

7. Claim Terms Involving "sorter"

The Court will analyze disputed terms [30] and [31] together as they both depend on the Court's construction of the term "sorter." The first disputed term, which is found in Claim 12, is "sorter for supplying signal amplitudes supplied by the trellis coder to storage locations of the IFFT apparatus identified by the respective carrier indices." (Chart at 10). Plaintiff asserts that this element is governed by 35 U.S.C. § 112, P 6. Plaintiff contends that the functions are: 1) "sorting" and 2) "supplying signal amplitudes supplied by the trellis coder to storage locations of the IFFT apparatus identified by the respective carrier indices," and that no corresponding structure is disclosed in the specification. (Id.). Defendants submit that the term is not governed by § 112, P 6 and should be construed to mean an "apparatus that sorts." (Id.). In the alternative, should the Court conclude that this term is a means-plus-function limitation, Defendants argue that the function is "supplying signal amplitudes supplied by the trellis coder to storage locations of the IFFT apparatus identified by the respective carrier indices," and that the corresponding structures are the sorter 42 and the microprocessor control unit 68. (Id.).

The second term, which is found in Claim 22, is "sorter for sorting the carriers in accordance with the stored values." (Id.). Again asserting that § 112, P 6 governs, Plaintiff submits that the function is "sorting the carriers in accordance with the stored values" and that there is no corresponding structure in the specification. (Id.). Conversely, Defendants argue that this is not a means-plus-function limitation. Defendants propose that the term should be construed as "an apparatus that sorts." (Id.). In the alternative, Defendants propose that the function is "sorting the carriers in accordance with the stored values," with the same corresponding structure as the two previous terms. (Id.).

Thus, the Court must determine whether the strictures of § 112, P 6 are applicable to these two terms. In both instances, the word "means" is not used. Instead, the patentees purposely used the term "sorter." As previously discussed, "a claim term that does not use 'means' will trigger the rebuttable presumption that § 112, P 6 does not apply." Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1371 (Fed. Cir. 2003) (citing CCS Fitness Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002). The presumption may collapse, however, "when a limitation lacking the term 'means' nonetheless relies on functional terms rather than structure or material to describe performance of the claimed function." Id. at 1372. That is not the case here. The Court concludes that "sorter" connotes structure. First, the claim itself uses the structural language "sorter," as opposed to a functional term such as "sorting means," which the patentees chose to use in Claim 11. Second, "sorter" is constantly referenced throughout the patent in structural terms and is depicted as a structure in a figure. See '604 Patent, col. 3, ll. 60-62; col. 5, ll. 34 & 42; col. 8, ll. 3, 15 & 28; figure 2. Additionally, Defendants' expert Dr. Williams opines that a "sorter" is a structure with a well-understood meaning in the field of digital communications. (Williams 2d Report, P 27). Dr. Williams cites various references in which "sorter" is used as a term connoting structure. (Id.). Therefore, the Court finds that the claim recites sufficient structure, that is a "sorter," and does not rely on functional terms.

Having concluded that the term is not a means-plus-function limitation, the Court is left to construe the term "sorter."
Unfortunately, the Court finds the record devoid of any assistance by the parties. Neither Plaintiff nor Defendants provide the Court with the ordinary meaning or dictionary definitions for "sorter," the key word in these disputed terms. The only definition given to the Court is the one proposed by Defendants, namely "an apparatus that sorts." 22 Plaintiff offers no other definition, nor stated any objection to Defendants' proposed construction if the Court were to conclude that § 112, P 6 did not apply. Without any other information from which a construction may be drawn, the Court adopts Defendants' proposed construction for "sorter."

22 The Court notes that Defendants offered a dictionary definition for the term "sorting," but does not offer a definition for "sorter." Defs.' Opening Br. at 31.

Accordingly, the Court concludes that disputed term [30] "sorter for supplying signal amplitudes supplied by the trellis coder to storage locations of the IFFT apparatus identified by the respective carrier indices" and disputed term [31] "sorter for sorting the carriers in accordance with the stored values" are not governed by § 112, P 6. The Court further concludes that the term "sorter" means "an apparatus that sorts."

7. Sorting said memory requests based on their addresses

The plaintiff urges that "sorting said memory requests based on their addresses" means "segregating memory requests into one or more groups based on their addresses." The defendants argue that the disputed phrase means "segregating memory requests into two or more groups according to their addresses." At issue is the number of groups into which "memory requests" can be segregated. The court adopts the plaintiff's construction of "sorting said memory requests based on their addresses" and construes this phrase accordingly.

5. "sorting the subcarrier-indexed estimates of the transmission quality, scaled by the desired subcarrier bit-error-rates, into an invertible ordering" 9

9 The parties stipulated that the meaning of "bit-error-rates" is "on average, the ratio of the number of bits in error to the total number of bits received." (Chart at 16).
invertible." '447 Patent, col. 7, 11. 49-52; col. 8, 1.65 - col. 9, 1. 1. Based on this disclosure, Dr. Hartogs suggests that a person of ordinary skill in the art would understand "that the result of the sort is an ordering of estimates from the highest to the lowest." (Hartogs Report, P 42).

Conversely, Defendants argue that the claim does not require a reordering of the data. Defendants contend that the term is used in a manner that is consistent with its ordinary and customary meaning. (Defs.' Opening Br. at 33-34.) Defendants offer a general definition of the word "sort" from Webster's New World Dictionary. According to this reference, "sort" means "to arrange according to class or kind." WEBSTER'S NEW WORLD DICTIONARY 563 (1995). Defendants also provide a technical definition for "sort" from the International Organization for Standardization. In this reference, "sort" means "to segregate items into groups according to specified criteria without necessarily ordering the items within each group." INT'L ORG. FOR STANDARDIZATION, ISO 2382-6 Info. Processing Sys. - Vocabulary - Part 6: Preparation and Handling of Data 10 (2d ed. 1987) (emphasis in original).

This Court agrees that the term "sorting" does not require reordering of the data. The ordinary meaning of the word "sort" suggests that mere placing or arranging into a class is sufficient. Although the claim uses the words "sorting. . . into an invertible ordering," Plaintiff's construction rests on the incorrect assumption that "invertible ordering" is synonymous with a "new order." This assumption is unsupported. The word "invertible" does not mean "new." The plain meaning of the word "invert" means "to reverse the order, position, direction . . . of." WEBSTER'S NEW WORLD DICTIONARY 313 (1995). Consequently, an "invertible ordering" is something that is capable of being reversed, not necessarily a new order.

The Court concludes that the preferred embodiment should not limit the meaning of the term. To sort the estimates into a "descending order," as described in the preferred embodiment, is only one example of how the estimates may be "sorted." To adopt the requirement that the estimates must be "sorted," and thus "reordered," on this basis would violate the general prohibition against importing a limitation from the specification into the claims. See Storage Tech. Corp. v. Cisco Sys., Inc., 329 F.3d 823, 831 (Fed. Cir. 2003). Therefore, Plaintiff's construction must be rejected.

Accordingly, the Court concludes that disputed term [5] "sorting the subcarrier-indexed estimates of the transmission quality, scaled by the desired subcarrier bit-error-rates, into an invertible ordering" requires mere "sorting" of the estimates, i.e., segregating the estimates into groups based on specified criteria, and does not require reordering.
examples in the specification including a stereophonic sound system with a tape player or tuner near the automobile dash, requires the more limited "audio system" interpretation of the claim language. In the patent's description of preferred embodiments, however, the listed examples are introduced with the phrase "such as" and are thus not presented as an exhaustive list or definition of the sound signal. Nor does the patent's specification limit any claim terms to a "tuner or tape player." Consequently, limiting the recited "sound signal source" to a "music" signal source as suggested by Bose, would violate In re Yamamoto's prohibition against reading limitations appearing only in the specification into the claims. See id.

Moreover, the Board correctly determined that the Electronics phone system provided an "acousto-electrical transducer" as a source of a sound electrical signal, and thus disclosed the "sound signal source" element. Beyond question the transducer converts sounds to sound electrical signals. Because it is the source of a sound electrical signal, the transducer falls within the broadest reasonable interpretation of "sound signal source" in Bose's claims. Thus, Bose fails to show that the Board's determination that the sound signal source element is disclosed in Electronics is clearly erroneous.

10. Sound signals generated from digital information

The phrase "sound signals generated from digital information" appears in claim 1 of the '482 Patent. Diagnostic asserts that "sound signals generated from digital information" should be construed as "analog signals representative of voice instructions and/or messages." Benson does not propose a definition, but asserts that the "digital information" must be stored in the computer, arguing that this phrase should be construed as a "sound signals generated from digital information in the computer."

"Sound" is defined as a "sensation perceived by the sense of hearing." Webster's Third New Int'l Dictionary of The English Language Unabridged 2176 (2002). A "signal" is "a detectable physical quantity or impulse (such as voltage, current, or magnetic field strength) by which messages or information can be transmitted." Webster's 2115. Therefore, the ordinary meaning of "sound signal" is "a detectable physical quantity or impulse that can be perceived by the sense of hearing and by which messages or information can be transmitted."

Next, the Court turns to the intrinsic evidence to determine whether the ordinary meaning has been rebutted. Both parties refer to the Description of the Preferred Embodiments to support their proposed constructions. Diagnostic argues the '482 Patent specification explains that "sound signals from digital information" are analog signals representative of voice instructions and/or messages. ('482 Patent, col. 10,11. 28-35; col. 11,11. 13-21; col. 12,11. 56-69.) Benson, on the other hand, argues that it would be improper to rewrite the limitation that, in the end, makes the claim language more complicated. Benson also argues that the specification language requires that the digital information be in the computer because the description of a preferred embodiment provides that "the test subject may . . . receive the following instructions generated from the digital data stored by [the] computer." ('482 Patent, col. 11,11. 37-39.)

While the Court acknowledges that "sound signals generated from digital information" certainly can be representative of voice instructions and/or messages, the specification does not explicitly set forth a definition different than the claim language. The '482 Patent specification also indicates that "the particular signals could be representative of virtually any type of information which is subject to derivation from digital data … for example, visual graphics and images and others." ('482 Patent, col. 10, 11. 35-40.) Even though the claim itself specifically limits its scope to sound signals, it does not specifically limit it to sounds representative of the human voice.

The Court finds that there is nothing in the patent specification that rebuts the presumption giving "sound signals generated from digital information" its plain and ordinary meaning and therefore refuses to import the limitations proposed by Diagnostic into the claim. In addition, as previously discussed, the Court rejects Benson's attempt to import structural limitations into claim 1. The Court therefore construes the term as "detectable physical quantities or impulses, generated from digital information, that can be perceived by the sense of hearing by which messages or information can be transmitted."
Source information; destination information; channel identification information

The Court adopts Ciena’s proposed construction and construes the terms as “information identifying the source, destination, or channel.” Nortel argues that the terms should be construed as “bits included in an appended bit stream that identify the source, destination, or channel.” Nortel claims that the specification of the ‘176 patent “expressly explains that source, destination, and channel identification information are bits appended to an existing data frame through an overhead bit stream.” Nortel cites Column 6, Lines 47 through 52 of the specification, which state:

Advantageously, forward error correction in the [wavelength division multiplexing] optical system of the present invention enables a “channel trace” function that encodes the channel ID, source, and destination into a small overhead bit stream which would permit the remodulating channel selector to respond only to an incoming signal with the proper addressing.

Nortel argues that this excerpt from the specification supports its proposed construction by indicating that the identification, source, and destination information are bits that are added to the existing data by appending an “overhead bit stream.” Ciena argues that the terms do not require construction, and alternatively that the term should be construed as “information identifying the source, destination, or channel.”

The language of claim one states “transmitting a plurality of signals . . . each of said plurality of optical signals carrying data associated with a respective one of said plurality of encoded information streams and source information associated with a respective one of said plurality of optical channels.” Col. 10:54-64. The claim language indicates that each optical signal carries source information related to one of the optical channels. Neither this claim language nor any other claim in the patent indicates that the source, destination, or channel identification information is added to an optical signal in the form of “bits included in an appended bit stream.” Furthermore, the language from the specification cited by Nortel describes a preferred embodiment of the invention. “Although the written description may aid in the proper construction of a claim term, limitations, examples, or embodiments appearing only there may not be read into the claim.” Kraft Foods Inc. v. Int’l Trading Co., 203 F.3d 1362, 1366 (Fed. Cir. 2000). Accordingly, the Court does not read the preferred embodiment into the claim and construes the terms as “information identifying the source, destination, or channel.”

IV. Disputed Terms to be Construed

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>Fast Memory's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;source leakage&quot; (&quot;whereby source leakage of the semiconductor device is reduced&quot;)</td>
<td>This phrase does not require construction. In the alternative substrate only, construe as: &quot;an unwanted and slow escape or entrance of particles or material which may be conveyed between the source terminal and ground or other parts&quot;</td>
<td>leakage from the source terminal to the terminal that occurs during source erase</td>
</tr>
</tbody>
</table>

Defendants argue that the ‘959 patent is limited by its specification to source erase. Plaintiff Fast Memory contends that source leakage occurs during multiple erase procedures, including channel erase, and that the reference to a reduction of source leakage covers all such procedures.
Fast Memory argues that the term "source leakage" should not be construed, since it appears in a "whereby" clause, which generally states the result of a patented process. However, when a term in a whereby clause "states a condition that is material to patentability, it cannot be ignored in order to change the substance of the invention." Such an issue must be decided on the particular facts of the case. A court may find that words in a whereby clause limit the claim when it "is more than the intended result of a process step; it is part of the process itself." The words in a whereby clause are analyzed in light of the specification and prosecution history.

20 See Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 988 F.2d 1165, 1172, 1175 (Fed. Cir. 1993) (holding that a "whereby" clause was not limiting when it only expressed the necessary result of what was recited elsewhere in the claims); see also Lockheed Martin Corp. v. Space Systems/Loral, Inc., 324 F.3d 1308, 1319 (Fed. Cir. 2003) ("a whereby clause that merely states the result of the limitations in the claim adds nothing to the substance of the claim.").

21 Hoffer v. Microsoft Corp., 405 F.3d 1326, 1329 (Fed. Cir. 2005).

23 Hoffer, 405 F.3d at 1330; see, e.g., Lonestar Inventions LP v. Nintendo of America, Inc., No. 6:07-CV-261, 2009 U.S. Dist. LEXIS 31753, *29, 2009 WL 1011734 (E.D. Tex. Apr. 14, 2009) ("Although 'said first and second nodes form two opposing nodes' appears in a 'whereby clause,' the term requires construction because nowhere else in claim 1 is there a requirement to form 'opposing nodes' other than in the whereby clause. Thus, 'opposing nodes' adds a meaningful limitation to claim 1 rather than only stating an intended result.").

24 See id.

Footnotes:

25 '959 Patent, at Title ("Semiconductor device having reduced source leakage during source erase").

26 '959 Patent, at Abstract ("In one aspect, the current invention provides a method for reducing the source leakage of a semiconductor device.").

27 '959 Patent 1:2-9 ("More particularly, the current invention relates to reducing leakage during source erase of flash EPROM cells. More specifically, the present invention provides new process techniques that reduce source leakage during source erase of flash EPROM cells. The current invention also provides novel semiconductor devices with a differentially doped source region that reduces leakage during source erase.") (emphasis added).

28 '959 Patent 2:2-3 ("Source diode leakage must be minimized to increase source erase speed.").

29 '959 Patent 3:27-28 ("The present invention addresses this need by providing new process methods that minimize source diode leakage."); 4:13-16 ("The second doped region has a higher concentration of dopant than the first doped region, which reduces source leakage of the semiconductor device."). 30 '959 Patent 7:40-42 ("The culmative [apparently meaning cumulative] effect of these aforementioned advantages is to provide a semiconductor device with reduced levels of leakage during source erase."); 9:29-30 ("These aforementioned advantages provide a semiconductor device with reduced levels of leakage during source erase.")
Defendants urge that the reference to "source leakage" in Claim 1 should be construed to refer only to leakage from the source to the substrate that occurs during source erase. Plaintiff broadly defines "source leakage" to encompass leakage during source erase, channel erase, drain erase, and gate erase. As a preliminary matter, the Court must address a disputed technical issue—whether source leakage occurs only during source erase, or whether there is also source leakage during other erase procedures.

The '959 specification discusses source leakage in the context of source erase, and does not refer to source leakage during channel or other erase procedures. However, the specification does not disclaim the possibility of source leakage during channel or other erase procedures. Fast Memory offers evidence from its expert, Dr. Liu, whose published article shows that source leakage occurs during channel erase, though there is less band-to-band tunneling than in source erase. In deposition, Dr. Liu states that source leakage can travel from the source to other parts of the semiconductor device, such as the drain. In response, Defendants cite the declarations of their experts, Drs. Brown and Taylor. Dr. Brown concludes that "[t]here is no source diode leakage problem or current leakage problem in channel erase . . . particularly those that float the source and drain . . . ." Dr. Taylor opines that source leakage does not occur during channel erase, because no voltage is applied to the source terminal, and the source is left floating. Thus, the parties' experts disagree on this important issue.

The Court is persuaded by Dr. Liu's peer-reviewed work, which was published in a respected technical journal, prior to this litigation, in which he concludes that source leakage can occur during other erase procedures. Defendants produced no published works contradicting Dr. Liu's conclusions.

Although source leakage during channel erase is seemingly possible, that does not end the inquiry. The claims of a patent cannot be "of broader scope than the invention that is set forth in the specification." Fast Memory's proposed construction of source leakage to include "an unwanted and slow escape or entrance of particles or material to ground or other parts" is not found in or supported by the intrinsic record. The specification states that source leakage is to the substrate during erasure, without mentioning the ground or other parts. While Defendants cite no fewer than six statements in the specification describing the invention as limiting leakage during source erase, Plaintiff Fast Memory points to no language in the specification which discusses the benefits of the patent in other erase procedures. In fact, the patent distinguishes channel erase as a "different method" from source erase, and the specification critiques channel erase for requiring source isolation by the triple well process, which is complicated and expensive. In contrast, the specification extols the benefits of source erase, which is "simpler and less expensive to implement than channel erase." All of the embodiments apply to source erase. The specification addresses the problem of leakage to the substrate, not to other parts of the cell. The sole support in the specification for Plaintiff's broader interpretation is a reference to "alternative ways of implementing both the process and apparatus of the present invention." An analysis of that statement in context reveals that the inventor was referring to dopant concentrations, not to the patent's applicability to channel erase. As noted in Praxair, the "claims of the patent must be read in light of the specification's consistent emphasis on [the]
fundamental feature of the invention." 46

37 On Demand Machine Corp. v. Ingram Indus., Inc., 442 F.3d 1331, 1340 (Fed. Cir. 2006) (limiting a claim to the patent's specification despite a "comprising" term); see also Alloc, 342 F.3d at 1370 ("[W]here the specification makes clear at various points that the claimed invention is narrower than the claim language might imply, it is entirely permissible and proper to limit the claims.").

39 '959 Patent 1:2-4 ("More particularly, the current invention relates to reducing leakage during source erase of flash EPROM cells."); 1:4-6 ("More specifically, the present invention provides new process techniques that reduce source leakage during source erase of flash EPROM cells."); 1:6-9 ("The current invention also provides novel semiconductor devices with a differentially doped source region that reduces leakage during source erase."); 2:17-20 ("Thus, the difficulties caused by band to band leakage in generating and maintaining the voltage required to erase the device are frequently the limiting factor in source erasing flash cell."); 7:40-42 ("The culmative [apparently meaning cumulative] effect of these aforementioned advantages is to provide a semiconductor device with reduced levels of leakage during source erase."); 9:29-30 ("These aforementioned advantages provide a semiconductor device with reduced levels of leakage during source erase.").

40 '959 Patent 1:50-51.

41 '959 Patent 1:56-58. See, e.g., Edwards Lifesciences LLC v. Cook Inc., 582 F.3d 1322, 1332-33 (Fed. Cir. 2009) (limiting a claim to its specification, where the inventor disparaged prior art in the "background art" section of the specification); see generally Astrazeneca AB v. Mut. Pharm. Co., 384 F.3d 1333, 1340 (Fed. Cir. 2004) ("Where the general summary or description of the invention describes a feature of the invention . . . and criticizes other products . . . that lack that same feature, this operates as a clear disavowal of these other products . . . .").

44 '959 Patent 1:66-2:1 ("However, a significant problem with source erase of flash EPROM cells is source diode leakage to the substrate during erasure."); 2:13-15 ("Band to band leakage wastes power since some of the diode current is dissipated in the substrate during erasure.").

46 Praxair, Inc. v. ATMI, Inc., 543 F.3d 1306, 1324 (Fed. Cir. 2008).

Citing Epistar, Fast Memory argues that Defendants' proposed construction would impermissibly limit the '959 patent to one of its preferred embodiments. 47 However, source erase is not merely a preferred embodiment; analysis of the specification leads to the "inescapable conclusion" that the claims address only source erase. 48 In contrast to Epistar, support for limiting the disputed term is found throughout the specification, and the reduction of source leakage during source erase is critical to the invention. 49 Even Dr. Liu, in his declaration, noted that the '959 patent "addresses the issue of reducing source leakage during erasure of the source of a semiconductor device." 50 Reading the claim in light of the specification, a person of ordinary skill in the art would clearly understand that the invention refers to source erase, not to other types of erase procedures. Thus, the Court construes "source leakage" as: "leakage from the source terminal to the substrate terminal that occurs during source erase."

"Source Means" in the '146 Patent's Claim 19

Claim 19 of the '146 Patent includes this language:

[a] source means having AC terminals and being operative to provide an AC voltage thereat.

Because the word "means" is present, the presumption is that the claim is in means-plus-function form. Here the claim is in purely functional language ("being operative to provide..."), except possibly for the use of the word "source."

In that respect Nilssen contends that "source" is a structural term denoting a device that is a source of power. Even so, "source of power" alone is hardly a sufficient structural recitation to remove the claim from the presumed ambit of Paragraph 6. Cole, 102 F.3d at 531 is not to the contrary, because the presumption in that case was overcome by the claim element's "precise structural character." There is no way that, as N. Mem. 18-19 attempts to argue, the word "source" amounts to a detailed recitation of structure that overcomes the claim element's functional language. Indeed, the definition offered by N. Mem. 18--"any device that produces electrical energy"--is purely functional and denotes no structure whatever. 14 Nor does the claim's added description of the "source means" as "having AC terminals" serve to convert the imprecision of the term "source means" into a term of "precise structural character."

Hence this Court concludes that the "source means" element of claim 19 in the '146 Patent is in means-plus-function form. 15 As such, claim 19 is limited to the structure set forth in the corresponding specification and its equivalents.

14 N. Mem. 18 uses the definition for the term "power supply" and equates that term with "source."

15 See, e.g., Unidynamics Corp. v. Automatic Prods. Int'l, Ltd., 157 F.3d 1311, 1318-19 (Fed. Cir. 1998), holding that the claim limitation "spring means tending to keep the door closed" was in means-plus-function form because, though "spring" was a structural term, it did not sufficiently connote a specific structure to perform the claimed function.
point, a brief hearing is needed to decide exactly what portion of the specification corresponds with the claim. 16

--- Footnotes ---

16 As the rest of this opinion reveals, this is the sole claim for which a Markman hearing will be necessary. Neither Nilssen nor Motorola should regard that hearing as an opportunity to reargue any other claims.

4125

e. "source node" and "destination node"

(i) does the meaning of source node and destination node include intermediate nodes

The parties dispute the meaning of the terms "source node" and "destination node." According to Intel, a "source node" is a node that has the capacity to transmit data, whether it is the original creator of the data that is first transmitting the data or is another node (i.e. an intermediate node) that is transmitting the data. A "destination node" is a node that has the capacity to receive data, whether it is the ultimate recipient of the data, or is another node (i.e. an intermediate node) that is receiving the data. In support of this construction, Intel argues that for these terms the 830 inventors were their own lexicographers. When the terms "source node" and "destination node" were first introduced in the patent specification, the specification identified what those terms meant:

Data is transferable from one node (the "source node") to another node (the "destination node") over the communication medium (e.g. cable 1). Typically, but not necessarily in every case, each node is capable of functioning as a source node (i.e. has the capability to transmit data) and as a destination node (i.e. has the capability to receive data).

Col. 2:46-52. In the above section, in contrast to the non-exhaustive example of a communication medium, indicated by "e.g.," the inventors indicated the definitional nature of their references regarding the nodes by using "i.e.," an abbreviation for the Latin term id est, which means "that is" or "that is to say." See Black's Law Dictionary (6th ed. 1990). Intel, thus, contends that by linking the terms to the phrases in parentheses with the term "i.e." the inventors were stating that each phrase in parentheses was another way to express the terms "source node" and "destination node." The definitions that they gave to those respective terms are, "[a node that] has the capability to transmit data" and "[a node] that has the capability to receive data." This meaning is consistent with the language of claim 1, which recites that the data is to be transmitted from a source node, a node capable of transmitting data, to a destination node, a node capable of receiving data.

Broadcom argues that the terms "source node" and "destination node" are not explicitly defined in the specification because the statement referred to by Intel merely states that to function as a source node, a node must be able to transmit data and to function as a destination node, a node must be able to receive data. Broadcom, thus, contends that in the context of this patent, a person of ordinary skill in the art would understand that the plain meaning of the term "source node" as a device that initiates the transfer of data. Broadcom similarly contends that the plain meaning of the term "destination node" is a device that is the intended recipient of the data.

When the inventors explicitly state the meaning that they are assigning to certain claim terms, the court should give that meaning to those terms. See Renishaw, 158 F.3d at 1249 ("The definition selected by the patent applicant controls"). Broadcom's reading of the "i.e." language above is strained. The specification does not describe certain nodes that function as source nodes or destination nodes, but are nonetheless not source nodes or destination nodes. Nothing in the patent indicates that the inventors intended to adopt the narrower meaning that Broadcom seeks, which requires the source node to be the original source of the data to be transmitted and the destination node to be the ultimate destination of the transmitted data. Rather, the patent provides, as specific examples of nodes, devices such as bridges and gateways that would rarely, if ever, be the original source of the data or the ultimate destination of data, but would instead act as intermediate nodes. Nowhere in the specification does the patent indicate that such nodes could not function as source or destination nodes. Rather, the specification states that "data is transferable from one node (the "source node") to another node (the "destination node") and pointed out that a single node can be both a "source node" and a "destination node" if it is both capable of
sending and receiving data.

Therefore, the court finds that the meaning of the term "source node" is a "node," as defined above, that has the capability to transmit data. A "destination node" is a "node," as defined above, that has the capability of receiving data.

(ii) Are the meanings of source node and destination node limited to include network addresses or to store information about its own data transfer format capabilities and the data transfer format capabilities of other nodes coupled to the network

Broadcom further submits that the meanings of the terms "source node" and "destination node," as used in the claims, are limited in a number of ways. First, each "source node" is required to store information about its own data transfer format capability (or capabilities), as well as the data transfer format capability (or capabilities) of the other nodes coupled to the network. Second, each "source node" and each "destination node" must have a network identification or address to permit a source node to select a destination node to which it wishes to transfer data.

With respect the Broadcom's argument that each "source node" must have the capability to store information about its format sets and the format sets of other nodes coupled to the network, Intel argues that Broadcom's argument finds no support in the claim language. Rather, Intel notes the "cache" element is not brought into the claims until dependent claim 2, which claims:

A computer communication system in accordance with claim 1 wherein said transfer format selection means is comprised of a source node cache for node format sets and a destination node cache for node format sets; and wherein transfer format selection is made by the source node by searching for the destination node format set in said source node cache and by selecting a format which is included in said destination node format set and the source node format set.

Col. 11: 56-64.

The court finds that although the examples in the specification support Broadcom's contention that each "source node" must have the capability of storing such information in its cache, or memory, see Col. 4:59 - 5:11, claim 1 cannot be so limited. In interpreting claims, it is improper for courts to read into an independent claim a limitation that is explicitly set forth in another claim. D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed. Cir. 1985). Rather, each claim of a patent constitutes a separate invention and gives rise to separate rights. Jones v. Hardy, 727 F.2d 1524, 1528 (Fed. Cir. 1984). This concept, known as claim differentiation states that claims should be presumed to cover different inventions.

In one example given, which appears to be an implementation of the more narrow claim 2, the format capability (or capabilities) of the destination node must be stored because that is what the source node's transfer format selection means uses to select the proper data transfer format. The specification notes that, in this particular embodiment, when the cache of a given node is incomplete and does not contain an entry for the destination node's formats, an inquiry dialog must be initiated, in which the source node cache determines the destination node supported transfer formats and updates its cache with the format set of the destination node. However, because "cache" is the only element that is added in dependent claim 2, under the doctrine of claim differentiation, the court rejects Broadcom's proposed limitation on claim 1. See Beachcombers Intl v. Wildewood Creative Prods., 31 F.3d 1154, 1162 (Fed. Cir. 1994).

If the court were to adopt Broadcom's proposed construction, claim 2 and other claims, such as claim 7, that are dependent on claim 2 would be rendered superfluous. See id. Therefore the court declines to adopt a construction that so limits the source node's "transfer format selection means" as disclosed in claim 1.

Second, as noted above, the 830 patent does not indicate that only nodes called out by particular fields in a frame can be "source nodes" and "destination nodes." The examples cited by Broadcom for the proposition that the source node address and the destination node address are always included in a frame data transmission between the source and destination nodes, see Fig. 9-13, are only examples of the preferred embodiment, Appletalk. Specialty Composites, 845 F.2d at 987. The broad claim language and express language of the specification indicate that the invention is not to be limited to that particular system or a system that uses the same data types as that system. Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 973 (Fed. Cir. 1999) (stating that "the general rule, of course, is that the claims of a patent are not limited to the preferred embodiment, unless by their own language"). Therefore, the court finds that the definition of "source node" and "destination node," like the definition of "data" is not limited to require a "source node address" or "destination node address." Naturally,
the transfer format selection means element must have some ability to identify the supported format sets that are compatible with the destination node in order to allow it to select a data transfer format that is compatible with the destination node. However, this ability to identify is not limited to implementations that use an addressing scheme with specific "source addresses" and "destination addresses" that are transmitted in frames. Moreover, it is part of the function and corresponding structure of the transfer format selection means, and not a limitation on the definition of "source node" or "destination node."

In sum, the court finds that a "source node is a "node" that has the capability to transmit data. A "destination node" is a node that has the capability to receive data.

4. "source object"

TiVo argues an "object" is "a collection of data or operations, i.e., portions of a computer program." See TiVo's Opening Br. at 11-12; TiVo's Op. Br. at 21-22, citing IEEE 100: THE AUTHORITATIVE DICTIONARY OF IEEE STANDARD TERMS at 752 (7th ed. 2000)(defining "object" as "a collection of data and operations"); TiVo's Markman Slides at 140-53. It further argues no construction beyond "object" is needed for "source object" or, if construed, should mean "the portion of a computer program that (1) 'extracts video and audio data from said physical data source,' (2) 'converts video data into data streams,' (3) 'obtains a buffer from said transform object,' and (4) 'fills said buffer with said streams.'" See TiVo's Op. Br. at 22; '389 patent at cols. 7:48-50, 8:39-40, 14:59-61, 14:65-67, 18:9-10, 18:13-15; TiVo's Markman Slides at 140-53.

EchoStar argues "object" means "an item written with an object-oriented computer programming method (for example, in C++) that encapsulates data and the procedures necessary to operate on that data and can inherit properties from a class or another object." See '389 patent at cols. 8:9-18, 8:40-42, 11:27; EchoStar's Opening Br. at 22-23; EchoStar's Response Br. at 10-14; EchoStar's Slide Presentation at 113-20.

EchoStar further argues "source object" means "a software object that serves as a point of origin of video and audio data." See '389 patent at cols. 7:47-50, 8:9-18; 8:38-65, & Fig. 8; EchoStar's Opening Br. at 23-25; EchoStar's Slide Presentation at 127-28.

After a thorough examination of the intrinsic record, the Court has concluded that "object" is used according to its plain meaning to one of ordinary skill in the art at the time of the invention. Neither the claims nor specification, however, elaborate on the plain meaning of this term. The Court therefore turns to extrinsic evidence in order to assist its understanding of the term. Phillips, 415 F.3d 1303, 2005 WL 1620331 at *15. In this instance, the Court looked to a technical dictionary, the IEEE 100: THE AUTHORITATIVE DICTIONARY OF IEEE STANDARD TERMS at 752 (7th ed. 2000) which defines "object" as "a collection of data and operations." The Court notes that EchoStar's expert witness, Dr. Rhyne, has acknowledged that this is a widely accepted technical dictionary in the electrical engineering field. Rhyne Decl. at 45. Thus, for clarification purposes the Court construes "object" as "a collection of data and operations." This same construction of "object" applies to the terms "transform object," "sink object," and "control object."

The Court further finds that persons of ordinary skill in the art readily understand the meaning of "source object" upon a reading of the claim language and its context in the specification. See '389 patent at cols. 14:59-61, 14:65-15:2, 15:15-16, 18:9-10, 18:13-17, 18:29-30. The specification states: "[w]ith respect to FIG. 8, the program logic within the CPU has three conceptual components: sources 801, transforms 802, and sinks 803." Id. at col. 7:48-50. In addition, specification describes a class hierarchy of the program logic according to the invention and refers to the source 901, transform 902, and sink 903 objects. See id. at col. 8:9-18 & Fig. 9. Therefore, in accordance with its ordinary meaning, the Court construes "source object" as "a collection of data and operations that (1) extracts video and audio data from a physical data source, (2) obtains a buffer [memory where data can be temporarily stored for transfer] from a transform object, (3) converts video data into data streams, and (4) fills the buffer [memory where data can be temporarily stored for transfer] with the streams."
12. "a source of more than one and up to M direct sequence spread spectrum codes, where M is the number of chips per direct sequence spread spectrum code;"

<td>Invalid for failure to meet 35 U.S.C. § 112, if M does not equal N</td>
</tr>
<tr>
<td>&quot;Alternatively, a source of more than one and up to M direct sequence spread spectrum codes, where M is the number of chips per direct sequence spread spectrum code, where M equals N&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Claim 2 requires a source of M direct sequence spread spectrum codes, where M is the number of chips per code. The specification provides that "[t]he computing means shown in FIG. 1 includes a source 16 of N direct sequence spread spectrum code symbols and a modulator 18 to modulate each Ith data symbol from each set of N data symbols with the Ith code symbol from the N code symbol to generate N modulated data symbols, and thereby spread each I data symbol over a separate code symbol." ‘802 patent, 4:7-12. Similar to the "first computing means" term of claim 33, Defendants argue that the "source" term in claim 2 is indefinite, and thus renders claim 2 invalid, if M does not equal N. Defendants argue that, like independent claim 33, dependent claim 2 is invalid because the specification does not provide structure corresponding to the "M" chips per code function. Similar to its previous findings as to the "first computing means" term of claim 33, the Court finds that changing N to M for certain terms is not an impermissible broadening of the claims during reissue. The Court finds that M need not equal N, and conversely, the Court is not convinced that M cannot be a different number than N. Thus, the Court rejects Defendants' arguments that claims 2, 4, 12, and 33 reciting the term "M" is invalid if M does not equal N. The Court further rejects Defendants' argument that this dependent claim is broader than claim 1 by eliminating the fixed numerical relationship between the number of data symbols and chips per code. The Court finds that the ordinary meaning of the term "source" is any thing or place from which something comes, arises, or is obtained; the point of origin; or the point at which something springs into being or from which it derives or is obtained. Wi-LAN proposes a definition for the term "a source of" that is consistent with the ordinary meaning of that term, while Defendants do not provide a definition and only argue that M must equal N. The Court finds that while a source can be a device, it may not necessarily be limited to a device. Thus, the Court construes the term "source of" to mean "place or device that originates."

3. "source of illumination"

Avago submits that "source of illumination" does not require construction and that the ordinary meaning should apply. Elan proposes that "source of illumination" be construed as "a device that provides illumination at a grazing angle."

As detailed in Claim 4, the source of illumination "illuminates a portion of the work surface opposite the aperture" thus "producing a pattern of highlights upon surface height irregularities." Just as the shadows cast by the sun decrease in length as the sun approaches noon, illumination directly perpendicular to the work surface micro texture would be unlikely to produce a "pattern of highlights and shadows from the surface height irregularities of the illuminated portion of the work" required by Claim 4.

Elan argues that inherent in the illumination disclosed in Claim 4, is the concept of grazing angle, and thus the angle of incidence must be between 5 and 20 degrees. In support of its position Elan relies on the following line in the specification: "A surprisingly wide variety of surfaces create a rich collection of highlights and shadows when illuminated with a suitable
angle of incidence. That angle is generally low, say, on the order of five to twenty degrees, and we shall term it a 'grazing' angle of incidence” and argues that anything outside 5 to 20 degrees therefore must not be suitable by the terms of the specification.

A comparison of Claim 1 with Claim 4 indicates that a particular angle limitation should not be included in the construction of Claim 4. Claim 1 specifies "an angle of incidence in the range of about five to twenty degrees," whereas Claim 4 contains no such limitation. The plain language of Claim 4 requires that the source of illumination produce a pattern of highlights and shadows, and Elan may very well be correct that nothing outside of a 5-20 degree range will produce such a pattern, but that is a question of fact for future determination. The Court declines to construe "source of illumination" in Claim 4 as requiring an angle. The Court declines to further construe the phrase at this time.

4129

(8) In claim one, the phrase "a source of subpicosecond monochromatic coherent light pulses of high instantaneous energy . . . to produce in target material at said object plane simultaneous absorption of two incident photons to thereby excite characteristic fluorescence." Plaintiffs assert this phrase, which is combined from two separate paragraphs ([c] and [e]), must be read together as a means-plus-function clause. Plaintiffs argue that the first portion of the phrase describes a means of producing light pulses and the second portion recites the function of producing in the target material a simultaneous absorption of two incident photons. According to Plaintiffs, there is no recited structure in the claim for the performance of the function. Thus, Plaintiffs submit, the structure must be garnered from the specification, which, they submit, dictates that the structure be a colliding pulse mode-locked dye laser.

Defendants disagree. Defendants argue that the word "means" is not used in the term, the specification does not specify a function that necessarily corresponds to this claim element and the claim element provides sufficient structure, thus making § 112, P 6 inapplicable. For example, Defendants argue that the terms "light source," "subpicosecond monochromatic coherent light pulses," "light pulses of high instantaneous energy intensity comprised of photons in a long wavelength spectral range" and "pulses having a high repetition rate" are all recited in claim one and establish sufficient structure and material for the claim -- that is, a laser. Tr. 345.

The applicants were clear and signaled their invocation of the means-plus-function analysis with the word "means" throughout the patent. See, e.g., 613 Patent 9:64 ("stage means"); 10:1 ("lens means"). In the claim elements that the parties agree are to be interpreted as means-plus-function elements, there is no description of structure provided. That is not the case here where sufficient structure is recited. Because the word "means" does not appear in the phrase at issue, the Plaintiffs must overcome the presumption that § 112, P 6 will not apply. The Plaintiffs have not met their burden. The Court finds there is sufficient structure recited in the claim and the phrase will not be construed as a means-plus-function element.

5. Spacer layer defining a well (claims 28, 38)

Plaintiff contends that "spacer layer defining a well" means "a layer that defines a gap that will be created when the layer is removed," while Defendants contend that it means "a layer forming walls that define an empty space."

The terms "spacer layer" and "well" appear only in the claims of the '663 patent. Neither term appears anywhere else in the specification. As described below, however, the claims and the specification reveal that the "spacer layer" is polyimide layer 196 in a preferred embodiment, while the "well" that the spacer layer defines is the space that exists between the resistor and the ground plane in a completed bolometer (the "vacuum gap" illustrated in Fig. 4a).

The claimed "spacer layer" is the polyimide layer 196 described in a preferred embodiment method of the '663 specification. See '663 patent, 9:8-10:12. As described in the specification, the polyimide layer 196 is deposited in step (b) prior to depositing, in situ, the layers that will form stack 144. Id. at 9:8-19. As illustrated in Figs. 8b-8g, the thickness of the spacer layer defines the spacing between stack 144 and the aluminum layer 192 in the completed bolometer, because the layers that
form stack 144 are deposited on top of polyimide layer 196 during the fabrication process. See id. at 9:18-29; Fig. 8c. The specification describes how, after the layers of stack 144 are deposited in situ (among other steps), the photoresist layers 204 and 208, together with the polyimide layer 196, are etched away to leave the completed bolometer. Id. at 10:9-11. The "spacer layer" is thus used during the fabrication process to define the spacing between the resistor and the ground plane in the completed bolometer, but is thereafter etched away--it is not a physical layer that exists in the completed bolometer.

Defendants' primary argument in opposition to Plaintiff's proposed construction is that the claims in which this term appears are directed to a final, functional array of bolometers, and, therefore, the claimed "spacer layer" must be a physical layer that is present in the completed bolometer (and not a layer that has been removed). In support of this argument, Defendants rely on the preamble, which states "An array of bolometers having resistors which vary with received radiation in a spectral range of infrared radiation . . . ." '663 Reexamination Certificate, 3:48-50; 6:17-19. According to Defendants, the resistor that exists in an intermediate bolometer in the fabrication process (such as that illustrated in Fig. 8g) would not vary with received radiation, so the claim must necessarily be directed to a completed bolometer. And because the claim is directed to a completed bolometer, Defendants argue, it would be illogical to construe this term to require a "spacer layer" that is removed during the fabrication process and that does not exist in a completed bolometer. 3

3 Defendants also point to subsequent claim language requiring "resistors supported by said spacer layer" in support of their argument. According to Defendants, if the claim is directed to a completed bolometer, and the spacer layer "support[s]" the resistors, the "spacer layer" must necessarily be in existence in the final product.

Defendants' argument is more accurately characterized as an argument for non-infringement than an argument related to construction of this term. Whether the resistor in an intermediate bolometer in the fabrication process, such as that illustrated in Fig. 8g, varies with received radiation is a fact question better left to the jury. According to Defendants' argument, either the claims are directed to a completed bolometer, in which case a "spacer layer" is no longer present (and a requirement of the claims would be missing), or the claims are directed to an intermediate bolometer, in which case the resistors do not vary with received radiation (and a requirement of the claims would be missing). 4

4 The parties did not address whether or not the preambles of claims 28 and 38 are limitations of the claims. The court, therefore, declines to construe the preambles or determine whether they are limitations of the claims at this time.

In the context of the specification and the claims, "a layer forming walls that define an empty space" does not define a "spacer layer." Defendants did not identify any structure in the completed bolometer--either in their briefing or at the Markman hearing--that would qualify as a "spacer layer" under their proposed construction. Indeed, under Defendants' proposed construction (as Plaintiff points out), interconnects 156 and 158 appear to be the only structures that may possibly qualify, as they are the only structures that arguably "form[] walls that define an empty space" in the completed bolometer. The intrinsic record, however, does not support a construction that renders the interconnects a "spacer layer."

"Spacer layer," in the context of the intrinsic record, is a layer that is deposited during the fabrication process, upon which materials comprising the resistor are deposited, that is thereafter removed to form the space between the resistor and the ground plane (reflector layer). (See Fig. 4a). The court, therefore, construes this term to mean "a layer that defines a space that will be created when the layer is removed." Indeed, when read in conjunction with the next disputed claim term ("supported by said spacer layer"), it is clear that the "spacer layer" is a layer, such as polyimide layer 196, that supports the resistor during the fabrication process and that defines a space that will be created when the layer is removed.
c. "source pad"

LGD contends that the term "source pad" means "a portion of patterned, electrically conductive material that is provided near the periphery of the thin film transistor array to receive a data signal." D.I. 376 at Exh. C-13. LGD contends that the '449 patent discloses that the source pad receives signals for the driving circuit, but the source pad may extend past the point of contact with the data driving circuit. D.I. 1396 at P 1445-1446.

The constructions of AUO and CMO are similar, except that AUO does not provide for "a portion," and both AUO and CMO require "the thin film transistor array to receive a data signal from a data driving circuit." D.I. 376 at Exh. C-19. In this regard, CMO and AUO point out that the specification of the '449 patent makes it clear that the gate and source pads receive data from "gate drive and data driver respectively." '449 patent col. 1, ll. 27-30. AUO also contends that there is no intrinsic support to limit the gate/source pad to only "a portion."

The '449 patent was previously the subject of litigation in the Central District of California between LG Phillips LCD Co., LTD. and Tatung Co. of America, Tatung Company and Chunghwa Picture Tubes, Ltd. (the "California litigation"). In the California litigation, the court construed source pad consistently with the construction proffered by CMO. LG Phillips LCD Co., Ltd. v. Tatung Co. of America, Civ. Act No. 02-6775-CBM (JTLx), at 17 (C.D. Cal. May 5, 2005). While the Court is not bound by this construction, the Court concludes that it is consistent with the specification which makes it clear that the data is received from the gate drive and data driver respectively. '449 patent col. 1, ll. 27-30. AUO also contends that there is no intrinsic support to limit the gate/source pad to only "a portion."

Accordingly, the Court concludes that the term "source pad" means "a portion of patterned, electrically conductive material that is provided near the periphery of the thin film transistor array to receive a data signal from a data driving circuit."

4132

The Shaffer-Moore Patents

The parties also dispute the meaning of the term "spatial key" which appears in the claims of nearly all of the Shaffer-Moore Patents. Defendants' proposed definition is "a single number that identifies a small, specific geographically defined area, line, or point that is defined by a set or sets of coordinates." (Doc. No. 240, pp. 19-20). In support of this definition, Defendants point to the use of the term in the specification of the patents and to the construction given to this term by the United States District Court for the Eastern District of Virginia. (Id.).

800 Adept argues that "spacial key" should be construed as that term was defined in the Shaffer-Moore Patents. (Doc. No. 268, pp. 17-20). Plaintiff contends that it would be inappropriate to insert "small" in the definition of this term because (1) the specification does not limit spatial keys to "small" geographic areas but merely calls these "preferred" or "unique," (2) "small" adds nothing to the definition because it is a relative term, and (3) the ruling of the District Court of the Eastern District of Virginia is not binding on this Court. (Id.).

Although the Court recognizes that a uniform treatment of claim construction is desirable, the claim construction of another district court in no way binds this Court under the instant circumstances. The parties provide only a single Order of the Court, without its reasoning, discussion of the arguments of the parties, or reference to the underlying facts. The claim construction of the Virginia District Court was not appealed to the Federal Circuit. Defendants do not provide any authority that would afford that Order preclusive effect. Defendants do not argue that issue preclusion, collateral estoppel, or judicial estoppel are applicable. Simply put, this Court "will render its own independent claim construction." See Maurice Mitchell Innovations, L.P. v. Intel Corp., 2006 U.S. Dist. LEXIS 41453, 2006 WL 1751779, *4 (E.D. Tex. 2006).

The Court construes "spacial key" as that term is taught in the specification of the '897 Patent. It is defined there as:

The spacial key is a single number that identifies a specific geographically defined area, line, or point that is defined by a set of coordinates.

('897 Patent, col. 9, ll. 39-42). The specification discloses that the spacial key can be "a coded version of the coordinate description of" "simple geographies like points and rectangles." (Id., col. 9, ll. 43-45). Further, the specification teaches:
The postal zip+4 code is the preferred spacial key used to link the master table to the client table, but there are other small geographic areas capable of having unique spacial keys, such as zip+6 code areas, census blocks, or very small latitude/longitude grids, tiles, windows, or quad-trees. (Id., col. 9, ll. 46-50). Except for this single reference, the figures, tables, and disclosure of the specification only disclose the use of a zip+4 code as a spacial key. (See id., col. 11, l. 45 to col. 12, l. 12; id., col. 12, ll. 40-50; id., col. 13, ll. 8-30; id., col. 17, ll. 29-33; id., col. 21, ll. 38-40; id., col. 24, ll. 13-16; id., col. 24, ll. 30-34).

The specification also characterizes the operation of prior routing systems and their problems. Prior art systems, the applicants note, "are very coarse in their level of precision and cannot handle small service areas with legally defined franchise territories like pizza delivery." (Id., col. 3, ll. 35-37). Another problem with prior art routing systems "is that they divide the United States into many large arbitrarily defined areas and there is no ability to route a call to the closest service location if the closest location is not located in the same artificially created area as the caller." (Id., col. 3, ll. 48-52). Moreover, the specification teaches that the desired system should "not use artificially created areas such as telephone wire centers, telephone prefixes, or 5-digit zip codes where calls can only be routed within their area." (Id., col. 3, ll. 56-59). The specification also characterizes U.S. Postal Service zip+4 codes as "small geographic areas" and the first six digits of the Automatic Number Identification system as designating a "fairly large" area. (Id., col. 4, ll. 53-56; id., col. 4, ll. 64-67).

Accordingly, two strands wind through the disclosure of the Shaffer-Moore Patents. On the one hand, the Shaffer-Moore Patents teach that a spacial key is a single number that identifies a specific geographic area. The size of the geographic area is omitted; it is the specificity or "uniqueness" of the area that is important. On the other hand, the specification also systematically discloses the advantages of choosing "small" geographic areas to use a spacial keys. In particular, the use of telephone exchange numbers and five-digit zip codes where calls can only be routed within their area. In that case, the patent-in-suit claimed a wet-shave safety razor with multiple blades. Id. at 1369. Specifically, the patent claimed a "safety razor comprising . . . a group of first, second, and third blades," but the defendant manufactured a four-blade safety razor. Id. After reviewing the patent specification, the District Court limited the scope of the claim to a razor having solely three-blades. Id. On appeal, the Federal Circuit reversed this claim construction. Id. at 1374.

After discussing the use of open language in the claim, the Court focused on the patent's written description. Id. at 1373. The specification, noted the Court, first characterized the scope of the invention broadly when it taught that the invention relates to safety razors having blade units with a plurality of blades. Id. The Court then emphasized that although the specification makes numerous references to a preferred embodiment with three blades, such "narrower embodiment does not impose a limit on the broader claim language as elucidated by the reference to 'the invention' as embracing a 'plurality of blades.'" Id. at 1374. Additionally, despite the numerous cites to three-bladed razors plucked from the written description, the Court noted that "no statement in the patent surrenders or excludes a four-bladed razor." Id.

The written description of the Shaffer-Moore Patents is similar to the written description at issue in Gillette. In each case, the written description broadly defines a claim term but nonetheless provides a disclosure of examples of limited scope. As in Gillette, this Court will construe the term broadly because there is no explicit or manifest disclaimer of claim scope in the Shaffer-Moore Patents.

Accordingly, the Court construes "spacial key" to mean "a single number that identifies a specific geographically defined area, line, or point that is defined by a set of coordinates."
The parties also disputed the construction of several terms from the Civix patents. After briefing, and a Markman hearing on March 14, 2005, the Court made the following claim construction rulings. "Spatial detail" means "geographic information relating to an area or region." "Internet" means "a system of linked computer networks, worldwide in scope, that typically is associated with using TCP/IP as a standard protocol" and "internet" means "a group of networks that have been connected by means of a common communications protocol." "Remote" or "Remotely" means "separated by an interval or distance" with "separated" meaning "to be set or kept apart." (R. 273-1.)

4134

b. "Heads Up"/"Eyes Free" Writing; "Symbol Independent Delimiting" with "Spatial Independence of Symbols"

Palm argues that Unistrokes' "spatial independence" limitation requires that symbols be recognized no matter where they are written on the writing surface or in relation to each other, enabling "heads up" writing. Palm asserts that Graffiti is not "heads up" because the exact same symbol will be interpreted differently depending on where it is written on the writing surface. Symbols must be written on the left side of the writing surface to be recognized as letters. The exact same symbols written on the right side of the writing surface will be recognized as numbers. Defendants have obtained a patent on this split-screen technology.

Xerox argues that this spatial independence feature of Unistrokes is not a separate limitation on any of the patent's claims, but rather is part of the claimed delimiting operation, such that all that is required by the 656 patent is that the delimiting operation must distinguish unistroke symbols from each other "totally independent of and without reference to their spatial relationship with respect to each other". Thus, Xerox argues that the defendants' addition of separate writing areas "has nothing to do with" pen-up delimiting. However, Xerox's proffered interpretation is broader than the patent language and the prosecution history will allow.

The language of all four of the independent claims of the '656 patent requires that the unistroke symbols be distinguished "from each other totally independently of [and] without reference to the spatial relationship with respect to one another." ('656 Patent, Col. 7, lines 18-21; see also Col. 8, lines 45-48; Col. 9, lines 3-6; and Col. 10, lines 17-20).

The prosecution history provides some meaningful guidance as to the intended meaning of this "spatial independence" requirement. Upon re-examination of the '656 patent, the PTO patent examiner noted that one of the "crucial features" of the invention is that "Unistroke recognition is spatially independent; i.e. the symbols can be written in any location, even on top of each other, and still be properly distinguished." (May 24, 1999 Examiner's Interview Summary, p. 2) (emphasis supplied). Xerox's summary of the May 24, 1999 PTO interview clarified that the "features" of the 'Unistrokes' invention include "...delimiting of unistroke symbols is spatially independent, i.e., a unistroke symbol can be written without reference to where a previous unistroke symbol was written (in a preferred embodiment, symbols can be written on top of one another), and still be properly distinguished and recognized;" (Xerox's May 24, 1999 Interview Summary, p. 2) (emphasis supplied).

The '656 patent specification also provides some guidance as to the meaning of "spatial independence". In the "Field of the Invention" section, the patentee notes that "this invention . . . [is] especially well-suited for "eyes-free" (e.g. "heads up") applications and for other applications where it is inconvenient or impractical to spatially distinguish between successive, manually entered alphanumeric characters." ('656 Patent, Col. 1, lines 8-14). The "Detailed Description of the Preferred Embodiments" also notes that "unistroke symbols may be written one on top of another because they are interpreted in the order in which they are written and they are unambiguously differentiated from each other by being different strokes." ('656 Patent, Col. 6, lines 16-20).

Furthermore, in order to distinguish the prior art during the original patent prosecution, Xerox argued that Unistrokes was different from the prior-art Whitaker system because some of the Whitaker symbols differ only in their positioning within the so-called "character space," pointing specifically to the Whitaker symbols for "2" and "8". (Xerox January 23, 1996 Information Disclosure Statement, p. 3, para. 2). In Whitaker, the symbol for "2" and "8" is the same, but must be written in different areas of the "character space" in order to be recognized correctly. The symbol must be written in the northeast quadrant to be recognized as a "2", or written in the southwest quadrant to be recognized as an "8". Xerox argued that "symbols appear to be delimited by Whitaker based on their spatial relationship to each other, rather than by a user controlled predetermined, symbol independent, delimiting operation. (Xerox January 23, 1996 Information Disclosure
Xerox's arguments to the PTO in 1996 in order to obtain its patent are inconsistent with the interpretation Xerox now urges.

I find that "spatial independence" is a limitation on all four of the '656 patent's independent claims. I further find that "spatial independence" requires the invention to be capable of properly distinguishing and recognizing symbols without reference to where a previous symbol was written on the writing surface.

The district court noted that the '656 patent discloses that "the performance of interpreted text entry systems could be improved if all text was entered using characters that are well separated from each other in 'sloppiness space.' . . . If there is little, if any, overlap between the variants of different symbols, the symbols are 'well separated from each other in sloppiness space.'" '656 patent, col. 1, l. 61 - col. 2, l. 9. However, the term "sloppiness space" appears only in claims 9 and 11, which require that "said unistroke symbols are well separated from each other in sloppiness space." Id., col. 8, ll. 28-30, 54-56. The dependent limitation for the symbols to be well separated from each other in sloppiness space is clearly separate and additional to the requirements to be considered a "unistroke symbol." If we were to read the "even when perfectly formed" requirement into the graphical separation limitation for all claims, we would effectively be rendering claims 9 and 11 superfluous. This we will not do. Comark Comms., Inc. v. Harris Corp., 156 F.3d 1182, 1187, 48 U.S.P.Q.2D (BNA) 1001, 1005 (Fed. Cir. 1998) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." (quoting Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987))).

Xerox argues that the spatial independence feature of Unistrokes is part of the claimed delimiting operation, which requires only that the delimiting operation must distinguish unistroke symbols from each other "totally independent of and without reference to their spatial relationship with respect to each other." The specification of the '656 patent states that "unistroke symbols may be written one on top of another because they are interpreted in the order in which they are written and they are unambiguously differentiated from each other by being defined by different strokes." '656 patent, col. 6, ll. 17-20. During original prosecution, Xerox argued that unistrokes were different from the prior art Whitaker system because some of the Whitaker symbols differ from each other only in their positioning within the so-called "character space." Xerox specifically asserted "symbols appear to be delimited by Whitaker based on their spatial relationship to each other, rather than by a user controlled predetermined, symbol independent, delimiting operation." Xerox, slip op. at 21-22 (emphasis omitted). During reexamination, Xerox clarified in its summary of the May 24, 1999, PTO interview that the "unistrokes invention includ[e the feature that] delimiting of unistroke symbols is spatially independent, i.e., a unistroke symbol can be written without reference to where a previous unistroke symbol was written (in a preferred embodiment, symbols can be written on top of one another), and still be properly distinguished and recognized." Id. at 20.

The key to the spatial independence requirement, as shown in the plain language of the claims, the specification, and Xerox's arguments over the prior art, is the recognition of symbols without reference to where the last symbol was drawn. The district court properly found "spatial independence" requires the invention to be capable of properly distinguishing and recognizing symbols without reference to where a previous symbol was written on the writing surface. We therefore affirm the court's claim construction that (1) the definition of "unistrokes" itself does not require an entire alphabet, (2) the term "unistroke symbols" requires sufficient graphical separation that the computer can definitively recognize a symbol immediately upon delimitation or pen lift, and (3) "spatial independence" requires the accused device to be capable of properly distinguishing and recognizing symbols without reference to where a previous symbol was written on the writing surface.
Multi-Tech next argues that the district court erred in its interpretation of the terms "hands-free speaker phone," "full-duplex speaker phone," and "full-duplex hands-free speaker phone" in claims 1, 2, 5, 7, and 13 of the '627 patent. Multi-Tech maintains that the court erred in limiting the "speaker phone" limitations to traditional speaker phones because the claim language discloses a speaker phone that is simply a microphone and a speaker, regardless of its physical housing. Multi-Tech further argues that the court improperly construed the "full-duplex speaker phone" limitations to require echo cancellation, an optional feature disclosed in the specification.

Microsoft responds that, according to its ordinary meaning, the term "speaker phone" must include structure beyond just a microphone and a speaker in order to be a telephone. Microsoft also argues that the term "full-duplex speaker phone" must include echo cancellation because the specification states that the use of a microphone and a speaker "necessitates the use of an acoustical echo cancellation algorithm to prevent feedback from destroying the voice signals."

We agree with Multi-Tech that the district court construed the "speaker phone" limitations too narrowly. Neither the claims nor the specification describes any physical housing that must comprise the "hands-free speaker phone." Claim 1 of the '627 patent simply recites a "hands-free speaker phone" with a microphone and a speaker. '627 patent, col. 46, ll. 37-39. Dependent claims 2 and 5 further require that the "hands-free speaker phone" include, respectively, a "deskset microphone" and a "deskset speaker," id. at col. 46, ll. 55-57, or a "headset microphone" and a "headset speaker," id. at col. 46, l. 66 to col. 47, l. 1. Claim 7 recites a "full-duplex speaker phone," id. at col. 47, l. 7, and claim 13 recites a "full-duplex hands-free speaker phone," id. at col. 48, ll. 22-23. Moreover, the specification repeatedly refers to three alternative telephone interfaces: a handset, a headset, and a hands-free microphone and speaker. E.g., '289 patent, col. 8, ll. 20-21 & fig. 3. It consistently describes the hands-free interface as simply a microphone and a speaker. To require more structure would impermissibly exclude a preferred embodiment from the claim limitation. Vitronics Corp. v. Conceptronics, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) (stating that it is "rarely, if ever, correct" to interpret a claim to exclude a preferred embodiment). We therefore conclude that the term "speaker phone" requires no physical structure beyond a microphone and a speaker.

We agree with Microsoft, however, that the district court properly construed the "speaker phone" limitations to require the use of echo cancellation. Although the language of the independent claims does not expressly refer to echo cancellation, the specification provides that the "use of the speaker and microphone necessitates the use of an acoustical echo cancellation algorithm to prevent feedback from destroying the voice signals" and that "a line echo cancellation algorithm is needed no matter which telephone interface . . . is used." '289 patent, col. 31, l. 67 to col. 32, l. 4 (emphasis added). Those statements clearly mandate the use of acoustical and line echo cancellation. We therefore conclude that the "speaker phone" limitations require the use of echo cancellation.
other regards. Although the system envisions that each accounts' code is unique from the others', nothing in the specification precludes the system operator from using, for example, a user's home phone number or credit card number as a special code. Indeed, to the extent the specification speaks to this possibility, it suggests it is within the scope of the disclosed invention. (See col.3 ll.6-9 ("The code, the credit amount and telephone numbers may be acquired, for example[,] through the regular credit card companies and charged to the acquirer's credit card.").) The Court therefore rejects Telco's contention that the special code cannot be tied to an existing identifier, such as a user's home phone number. Rather, the Court agrees with the Washington Court that the special code must be sufficiently unique to connect only one credit account to only one code. See Washington Court, 16-18.

The Court also finds that the claim and specification do not support the limitation that the special code is obtained "by a user from a prepaid service provider." Clearly, such a limitation is not required by the language of step (a), which is written in the passive voice and speaks only to "obtaining a special code by depositing a prepayment amount[]." The specification is similarly ambiguous, as are the statements that Telco cites to show a narrowing of the claim during reexamination. (See, e.g., col.3 ll.3-5 ("The customer, such as a regular telephone user or a traveler[,] acquires a special code . . . ." (emphasis added)); col.4 ll.45-46 ("Here again the customer calling party must have a prepaid code number . . . ." (emphasis added)); Reply to Office Action in Reexamination 3 (Feb. 20, 2001) ("In the prepayment transaction, the customer pays a predetermined amount and receives a ticket . . . ."), Maldonado Decl. Ex. 3.) The Court therefore finds that the claim does not require that any particular person deposit the prepaid amount. 6

6 The Court further notes, for the sake of clarity, that claim 1 contains no limitation requiring that the prepayment amount be paid directly to the prepaid system operator. The language of the claim contains no such limitation, which would be inconsistent with the process of acquiring a special code described at col.3 ll.6-12.

Telco's suggestion that the code must be received in return for the deposit of a prepayment, however, is well-supported. In a single grammatical unit, step (a) refers to "obtaining a special code by depositing a prepayment amount." Similarly, the specification teaches that "[t]he customer . . . acquires a special code, a credit amount and the telephone number of the special central offices by either a cash or credit payment." (Col.3 ll.3-6.) In both the claim and the specification, the preposition "by" signals how the code is acquired--namely, in return for receipt of a prepayment amount. The Court therefore finds that the code is received in return for a prepayment amount.

"Special code" means a code that is received in return for the deposit of a prepayment amount that is linked to a particular account.

7. "special read instruction" (claim 6)

The plaintiff asks the court to construe this term to mean "output from driver's conversion of a read command," and the defendant asks the court to define the term to mean "a read instruction in a format different from the read command." The plaintiff opposes the defendant's proposed construction because of the defendant's use of "format." The plaintiff agrees that a "special instruction" is different from the read command, but does not agree that the difference is necessarily format.

The parties' proposed constructions debate whether the read command must be in a different format from the read instruction. The specification states that the standard magnetic disk operation format is different from the operation format of the USB and flash memory. Col. 10, ll. 14-18. The specification further mentions the conversion of magnetic disk operation requests into special instructions at col. 2, ll. 51-57 and col. 3, ll. 26-28.

Claim 6 depends on claim 1 and reads in part as follows:

The external storage method according to claim 1, wherein a read operation comprising steps: upper layer operating
system receives the read command from user, wherein the command format is the conventional magnetic disk operation format; upper layer operating system sends said read command to the driver; the driver converts the read command into special read instruction with can be understood and executed by the firmware. . . .

(emphasis added)

The claim explicitly requires the driver to convert the read command in the conventional magnetic disk operation format into a special read instruction that can be understood and executed by the firmware. By requiring the driver to convert the read command into an instruction that can be understood and executed by the firmware, the driver must change the format of the read command or else the word "converts" has no meaning in light of the claim language and the specification.

The court defines "special read instruction" to mean "a read instruction in a format different from the read command."

V. "specific driver for the multi-purpose interface"

Claim Eleven of the '399 Patent states:

wherein the first command interpreter is configured in such a way that the command interpreter, when receiving an inquiry from the host device as to a type of a device attached to the multi-purpose interface of the host device, sends a signal, regardless of the type of the data transmit/receive device attached to the second connecting device of the interface device, to the host device which signals to the host device that it is an input/output device customary in a host device, whereupon the host device communicates with the interface device by means of the specific driver for the multi-purpose interface . . . .

'399 Patent, col. 14:4-15 (emphasis added). Claim Seventeen of the '449 Patent cites the same phrase as:

wherein the interface device is configured using the processor and the memory in such a way that the interface device, when receiving an inquiry from the host device as to a type of a device attached to the multi-purpose interface of the host device, sends a signal, regardless of the type of the data transmit/receive device attached to the second connecting device of the interface device, to the host device which signals to the host device that it is a storage device customary in a host device, whereupon the host device communicates with the interface device by means of the specific driver for the multi-purpose interface . . . .

The Camera Manufacturers contend that "the specific driver for the multi-purpose interface" means the set of software routines that control the multi-purpose interface that are developed for the particular multi-purpose interface. CMs' Slides at 240. Ignoring the word "specific," Papst asserts that this means a driver for the multi-purpose interface, i.e., a software driver that enables a host system to communicate via a multi-purpose interface. Papst's App. at 5.

The specification explains why the word "specific" is used in these Claims:

[C]ommunication between the host device and the multi-purpose interface can take place not only via drivers for input/output devices customary in a host device which reside in the BIOS system of the host device but also via specific interface drivers which, in the case of SCSI interfaces, are known as multi-purpose interface ASPI (advanced SCSI programming interface) drivers. This ASPI driver, which can also be referred to as an ASPI manager, is specific to a special SCSI host adapter, i.e. to a special multi-purpose interface, and is normally included by the manufacturer of the multi-purpose interface.

Papst's construction ignores the term "specific." Because the Court should avoid interpreting the Claims in a way that
renders any term superfluous, see Merck, 395 F.3d at 1372, the Court will not adopt Papst's proposal. "Specific driver for the multi-purpose interface" is deemed to mean "the set of software routines that control the multi-purpose interface and that are developed for the particular multi-purpose interface." 

4140

Specification for the parts and Specifications corresponding to the . . . parts

Defendants urge the Court to construe these terms as "specific characteristics of the parts, such as part numbers, part attributes or part descriptions." Defendants contend "the patent specification lists part number,' part attribute' and part description' as examples of specifications.' Dictionaries, in turn, consistently define specification' to include a specific character.' Defendants entirely fail to inform the Court why these terms should be limited to what the specification "may" include. See col. 6:33-35. To support their construction, Defendants also turn to the Oxford English Dictionary as an example of the "consistent dictionary definition." Thus, Defendants do not contend that the terms have any meaning unique to the technology-at-issue. Defendants' only explanation for why these terms need construction is so that "Orion is not allowed to argue any meaning to the jury." The same could be said for every single word in any claim. This is not a sufficient reason to construe a term.

<tbody>
<tr>
<td>specified parameters</td>
<td>criteria which limit the available choices or options in a generated menu</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Term</th>
<th>Defendants' Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>specified parameters</td>
<td>Other than parameters, Defendants do not believe that a construction is required for this term. If the Court concludes that a construction is required, the term should be construed as: Specified means &quot;user selected&quot; and &quot;parameters&quot; has the meaning discussed above.</td>
</tr>
</tbody>
</table>

The disputed term is located in claim 9 of the '325 patent: "wherein the facilitation of second menu generation by said application software takes into account specified parameters." Quoted below is the only use of the term "specified parameters" in the specification:

"For example, in the restaurant menu generation embodiment, a modified menu can be generated to comply with a particular specification or group of criteria such as, e.g., "dinner", "low cholesterol", "low fat", "fish", "chicken", or "vegetarian". In this embodiment, only items from the master menu that satisfy specified parameters will be included in the generated menu."

('850 patent, 13:64-14:3) (emphasis added). The defendants do not believe that a construction of "specified parameters," apart from "parameters," is necessary. In contrast, Ameranth believes that "parameters" and "specified parameters" are defined separately by the patents. In particular, dependent claim 10 of the '325 patent further limits "specified parameters" to
"recipe content." It is doubtful that recipe content would be a modifier or sub-modifier below a menu item. Therefore, "specified parameters" is different from "parameters." "Specified parameters" is construed to mean "criteria that limit the available choices or options in a generated menu."

F. "specifying a selected one of the attractions"

This disputed phrase appears as follows in claim 5: "[A]t least one personal communication device (PCD), each PCD associated with at least one patron, each PCD for generating at least one reservation request specifying a selected one of the attractions . . . " (col. 27, ll. 29-32) (emphasis added). Similarly, claim 19 provides for "generating on a personal communication device (PCD) a reservation request specifying a selected one of the attractions." (col. 31, ll. 16-18) (emphasis added). The Plaintiff claims that the phrase means "identifying one of a plurality of attractions." The Defendants do not propose a different construction of this phrase. Rather, they simply state that the plain language of the phrase makes clear that the generated reservation request must specify one attraction and that the particular attraction must have been chosen by the patron. (Defs.' Responsive Claim Construction Br. at 9.) Therefore, it appears that the parties are effectively in agreement as to the proper construction of this phrase. Seemingly relying on a dictionary definition of "specifying," neither party addresses how a reservation request "specifies" the selected attraction. However, as discussed above in relation to "reservation request," the specification indicates that the particular attraction is identified in the reservation request through an Attraction ID:

ATTRACTION ID 423 is a unique identification number that identifies the attraction for which the reservation is intended. This enables the communications modules 207, 211 to properly direct the request to the appropriate attraction computer 101.

(col. 16, ll. 12-16.) Although the ordinary meaning of "reservation request" by itself does not require inclusion of an Attraction ID, it is clear that this data is used to specify the attraction for which a reservation is requested. Therefore, based on the intrinsic evidence, the Court construes "specifying a selected one of the attractions" as "identifying one of a plurality of attractions chosen by the patron through a corresponding Attraction ID."

I. specifying for each described action and condition of the series one of said stored definitions

Ricoh proposes that this term be construed as "specifying for each desired function to be performed by the desired ASIC one of the definitions of the architecture independent actions and conditions stored in the library of definitions that is associated with the desired function." Aeroflex contends that the proper construction of the term is "the designer assigns one definition from a set of stored definitions to each of the logical steps and decisions represented in the flowchart." The parties dispute centers around whether the "specifying" step must be performed manually by a user, or whether the assignment of macros can be done automatically.

Ricoh admits that the patent discloses a "manual mapping" embodiment. '432 patent, col. 7:24-25 ("Edit actions allows the designer to assign, actions to each box."). However, Ricoh argues that the construction of the claim should not be limited merely because it is the only embodiment disclosed. See Liebel-Flarsheim Co., 358 F.3d at 913. Furthermore, Ricoh contends that the patent describes macros being "mapped" automatically through the application of rules. See '432 patent, col. 9:14-18. Ricoh argues that if col. 9:14-18 is read in context, the passage shows that the quoted rules are to be applied "during this stage," which refers to the "first step of cell list generation." Accordingly, Ricoh contends that this passage does not apply to a statelist in which the "macros" have already been assigned to the desired actions.

Aeroflex disagrees with Ricoh's proposed construction. First, Aeroflex argues that the prepositional phrase "for each described action and condition of the series" refers only to the fact that the "specifying" step is performed for each action and condition in the described series resulting from the previous "describing" step. Thus, Aeroflex concludes that the claim
language for this "specifying" step requires that "the designer assigns one stored definition for each logical step and decision described in the flowchart." Second, Aeroflex argues that other claims demonstrate that for each action and condition described, this step requires the designer to specify one stored definition (from a macro library) and that this "specifying" step and the previous "describing" step together are the steps that define the input specification for the claimed invention's method. Third, Aeroflex argues that Ricoh's proposed construction impermissibly attempts to replace the phrase "for each described action and condition" with the phrase "for each desired function to be performed by the desired ASIC" Finally, Aeroflex argues that the '432 patent does not contain an automated "mapping" embodiment.

The Court finds that Aeroflex's attempt to limit the "specifying" step to encompass only a user manually assigning a single definition to each action and condition is too narrow of a construction. The plain language of the claim simply does not support this construction, and the Court should not "limit[] the claimed invention to preferred embodiments or specific examples in the specification." Ekchian, 104 F.3d at 1303. Moreover, while Aeroflex is correct that claim 1 and claim 9 require the designer to "specify" one stored definition for each action and condition described, this contention alone does not suggest that the Court should juxtapose these claims onto claim 13. Claim 13 simply does not contain similar language.

9 Aeroflex's proposed construction is also flawed because of its inclusion of the phrase "logical steps and decisions represented in the flowchart." See discussion supra.

Additionally Ricoh's attempt to replace the phrase "for each described action and condition" with the phrase "for each desired function to be performed by the desired ASIC" is permissible. Throughout the specification, each "action and condition" is referenced as a "function." See '432 patent, col. 2:21-30. Therefore, the Court construes "specifying for each described action and condition of the series one of said stored definitions" as specifying for each desired functional specification to be performed by the desired ASIC one of the definitions from the set of stored definitions.

GO BACK

4144

1. "Spectral Analysis"

Comark argues that the term "spectral analysis" means "analysis of a signal to determine its components over the range of frequencies of the relevant portion of the spectrum of the signal." Harris contends that the term means "analysis of a signal to determine its component frequencies in terms of amplitude and frequency over the range of frequencies for the relevant portion of the spectrum."

Neither the claims of the '904 patent nor its specification address the two issues in dispute: (1) whether spectral analysis requires identification of noise levels at each individual frequency or whether one can perform spectral analysis by looking at a band of frequencies; and (2) whether an oscilloscope is capable of performing a spectral analysis. (Pl.'s Post-Hr'g Mem. at 20; Def.'s Post-Hr'g Mem. at 23-33.)

The third step of the aural carrier correction method recited in Claim 14 requires "performing a spectral analysis of the demodulated aural signal to determine the presence and frequency of unwanted aural signal noise resulting from unwanted aural carrier modulation[.]." (Ex. DMX-1 at col. 8, lines 7-10.) Claim 20 also refers to this spectral analysis. Id. at col. 8, lines 43-50. The patent's specification states that the spectral analysis "determine[s] the presence and frequency of unwanted aural noise." Id. at col. 4, lines 8-11. The '904 patent depicts a flowchart of the method, step three states: "perform spectral analysis of demodulated aural signal to determine presence of unwanted aural signal noise." Id. at Fig. 2. Thus, while the patent describes the function of a spectral analysis, it sheds no light on whether it requires the identification of noise levels at each individual frequency or whether it can be done by looking at a band of frequencies.

Based on the expert testimony offered at the claim construction hearing, the court finds that "spectral analysis" is a process for determining the components of a signal at specific frequencies or at a band of frequencies. (Tr. 10/21/96 at 95.) The
The court will adopt Comark's proposed construction.

The court will decline to decide, as part of its claim construction analysis, whether the spectral analysis claimed in the '904 patent can be performed by an oscilloscope. Whether an oscilloscope is capable of performing a spectral analysis has nothing to do with determining the meaning of "spectral analysis," which is the court's only task. The court believes that this is a question of fact to be decided by a jury, not a question of law that the court to be decided by the court in its interpretation of the disputed claims of the patent.

The term "spectral analysis" in Claim 14 means a process for determining the components of a signal at specific frequencies or at a band of frequencies.

A. Spectral Representative Signals

The limitation "spectral representative signals" is found in claims 34, 36, 37, 39, 40 and 42. Those claims describe a process or apparatus to decode information to form a speech message. The phrase does not appear in the specification, and both parties argue that this term requires construction. AT&T proposes the definition "signals that relate to, represent, or describe the frequency characteristics of speech for a time interval." (Joint Letter, Ex. B.) Microsoft counters that the term's definition should be "speech parameters needed to form predicted speech and reflecting the frequency spectrum (i.e., the whole range of frequencies) of speech for a time interval." (Joint Letter, Ex. B.) At the Markman hearing, Microsoft also agreed to the definition, "speech parameter constants needed to form predicted speech and that reflect the frequency spectrum, that is the whole range of frequencies of speech." (Tr. at 81.)

This Court construes "spectral representative signals" to mean "signals representing the frequency spectrum (i.e., the whole range of frequencies) of speech for a time interval."

1. "Frequency Spectrum"

First, this Court agrees with Microsoft that "frequency spectrum (i.e., the whole range of frequencies)" should be used to describe "spectral representative signals" rather than AT&T's proposed "frequency characteristics." The word "spectral" is derived from "spectrum," which the parties have agreed to define as "the range of frequencies of a particular sound (as a noise or speech sound)." (JCCS Tab A at 1-3; Webster's Third New Int'l Dictionary at 2188 (G. & C. Merriam Co. 1981).) Similarly, the parties agree that "signals" refers to "sequences of numbers or values." (See, e.g., JCCS Tab B at 34-36.) In contrast, AT&T's suggested phrase "frequency characteristics" reads the term "spectral" out of the phrase completely. See Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1582-83 (Fed. Cir. 1996) (declining to read a limitation out of a claim).

The specification and prosecution history also confirm the inclusion of "frequency spectrum" as opposed to "frequency characteristics" in the definition. The specification states that the spectral representative signals reflect a "short time spectrum" of speech. ('580 patent, Col. 3:33-39; Col. 3:55-56 ("speech spectrum.").) Further, the prosecution history supports use of the term "spectrum" rather than AT&T's broader proposed definition "frequency characteristics of speech." ('580 Pros. Hist. at 51; Tr. at 83-86).

Second, this Court rejects AT&T's assertion that the word "whole" is improper in the definition. The word "whole" does not change the scope of the claim, but merely aids the fact finder in understanding the claim's language. While AT&T argues that the encoder removes speech frequencies above 4.0 KHz, as shown in an embodiment in the specification ('580 patent, Col. 3:25-27), the phrase "spectral representative signals" only appears in the decoder claims of the '580 patent. (See Claims 34-43.) The decoder generates speech from the "spectral representative signals" without adding back the speech frequencies above KHz that were removed at the encoder. ('580 patent, Col. 7:3-10.) Thus, the "spectral representative signals" necessarily reflect the whole range of speech frequencies generated by the decoder.
2. Intrinsic Record

The Court declines to read into the claim Microsoft's narrow proposed language "speech parameters needed to form predicted speech." (Joint Letter, Ex. B), and instead adopts AT&T's broader proposed word "signals," which most reflects the plain meaning of the phrase. See RF Delaware, Inc. v. Pacific Keystone Techs., Inc., 326 F.3d 1255, 1263 (Fed. Cir. 2003). Specifically, the adoption of Microsoft's proposed phrase (1) would not harmonize with the evidence in the intrinsic record, and (2) would violate the doctrine of claim differentiation, as that interpretation renders claims 37 and 39 identical. See Wenger Mfg., Inc. v. Coating Mach. Sys., Inc., 239 F.3d 1225, 1233-35 (Fed. Cir. 2001) (declining to limit independent claim with language recited in dependent claim).

First, Microsoft's claim that the intrinsic record demonstrates that the patentees disavowed a broader meaning of the claim phrase is misplaced. Microsoft cites to part of the prosecution history in support of its proposed, narrower construction: "The object of the instant invention is to provide high quality speech …. This is accomplished in the instant application by analyzing each successive interval of a speech pattern … to generate a set of predictive parameter signals …." (Prosecution History for U.S. Patent No. 4,472,832 ("Pros. Hist.") at 111-12.) 4 However, this general statement does not evince an intent by the patentee to "clearly and unambiguously" disclaim or disavow a broader reading of the claim term as "signals." Middleton, Inc. v. Minnesota Mining & Mfg. Co., 311 F.3d 1384, 1388 (Fed. Cir. 2002) (finding statements made during prosecution were not a clear and unambiguous waiver of claim scope); accord Inverness Med. Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1372 (Fed. Cir. 2002) (same). Accordingly, the Court declines to include the narrowing phrase "needed to form predicted speech."

4 Unless otherwise indicated, all references to "Pros. Hist." relate to the prosecution of the underlying '832 patent.

Second, although the written description and embodiments ( '580 patent, Col. 3:33-39; Col. 3:54-55; Col. 10:47-49; Figure 1) convey a parameterized nature of the values used to represent the frequency range of speech for a time interval, Microsoft's proposed language "speech parameters needed to form predicted speech" would violate the doctrine of claim differentiation. 5 "Under the doctrine of claim differentiation, 'each claim in a patent is presumptively different in scope."

Ecolab Inc. v. Paracle Inc., 285 F.3d 1362, 1376 (Fed. Cir. 2002) (quoting Intermatic Inc. v. Lamson & Sessions Co., 273 F.3d 1355, 1364 (Fed. Cir. 2001); accord Donald S. Chisum, 5A Chisum on Patents, § 18.03[6] (Matthew Bender 2002) ("Ordinarily language of one claim should not be so interpreted as to make another claim, such as a claim dependent on the first claim, identical in scope."). "This presumption is especially strong where there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim …." Ecolab, 285 F.3d at 1376. Although "the doctrine of claim differentiation creates only a presumption that each claim in a patent has a different scope that 'can not broaden claims beyond their correct scope,'" that presumption is usually only overcome when the patentee has expressly disclaimed the subject matter in the prosecution history. Fantasy Sports Properties, Inc. v. Sportsline. com, Inc., 287 F.3d 1108, 1115-16 (Fed. Cir. 2002) (quotation omitted).

5 Microsoft's proposed construction would also have the phrase "spectral representative signals" equate to "predictive parameters." While the specification refers to predictive parameters in discussing the embodiments, predictive parameters are merely one type of spectral representative signal. Indeed, the specification expressly states that other spectral representative signals may be used such as "formant parameters or other speech parameters well known in the art." ( '580 patent, Col. 10:47-48.) Thus, any restriction to "predictive" parameters would be misplaced. See ATD Corp. v. Lydall, Inc., 159 F.3d 534, 540 (Fed. Cir. 1998) (claim terms must be read in light of the specification).
overcome by express disclaimer of subject matter in the prosecution history). In examining the claims, the only difference between claims 37 and 39 is that independent claim 37 recites the broad phrase "spectral representative signals," ('580 patent, Col. 22:50-23:4), while dependent claim 39 more narrowly asserts that the "spectral representative signals are speech interval predictive parameter signals." ('580 patent, Col. 23:21-24.) The only meaningful difference between the two claims is the limiting term "predictive parameters." Without that limiting term, the claims would be redundant. Thus, this Court declines to read such limiting language from the dependent claim into the independent claim. Dow Chem. Co. v. United States, 226 F.3d 1334, 1341-42 (Fed. Cir. 2000) (applying doctrine of claim differentiation, finding independent claim should be given broader scope than dependent claim to avoid rendering dependent claim redundant).

Microsoft argues that while claim 37 refers to "signals," the meaning of that word in the claim is unclear in that neither the claim nor the specification provide any further explication of "signals" separate and apart from parameters. Thus, Microsoft asserts that the claims bear only one interpretation, and the presumption of claim differentiation does not apply. In this vein, Microsoft's citation to Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991), for the proposition that if the claims "will bear only one interpretation similarity will have to be tolerated" (Tr. at 75), is inapplicable to the phrase at issue. In Laitram, the Federal Circuit found that pursuant to 35 U.S.C. § 112, P 6, the usual prohibition on reading a limitation from a dependent claim into the independent claim was inapplicable to the means-plus-function claim at issue. 939 F.2d at 1538; accord Wenger Mfg., 239 F.3d at 1233. As Laitram's holding is limited in application to means-plus-function claims, this Court declines to apply Microsoft's proposed exception to the phrase at issue, and instead applies the customary presumption of claim differentiation, namely that an independent claim should be given a broader scope than a dependent claim to avoid rendering the latter redundant. RF Delaware, Inc. v. Pacific Keystone Techs., Inc., BCA, 326 F.3d 1255, 1263-64 (Fed. Cir. 2003).

3. Representative

Finally, the Court declines to construe the term "spectral representative signals" to incorporate the word "reflecting," as Microsoft proposes, and instead adopts AT&T's view that "representing," the plain meaning of a term in the disputed phrase, should be used here. (Tr. at 60.) Webster's Dictionary defines "representative," as "serving to represent, portray or typify." Webster's Third New Int'l Dictionary on the English Language Unabridged at 1926 (G.&C. Merriam Co. 1981); see Inverness Med. Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1369 (Fed. Cir. 2002) ("It is well settled that dictionaries provide evidence of a claim term's ordinary meaning"). Additionally, the word "representing" is the present participle of "represent." Webster's Third New Int'l Dictionary at 1927. Accordingly, this Court adopts the term "representing" rather than "reflecting," which is not found within the language of the claim here. See Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1369-71 (Fed. Cir. 2003).

In conclusion, the Court construes the term "spectral representative signals" to mean "signals representing the frequency spectrum (i.e., the whole range of frequencies) of speech for a time interval."

F. Speech Pattern

The phrase "speech pattern" appears in several '580 claims, including claims 2, 11, 40 and 42. Microsoft proposes the definition "an audible speech message formed from or into a sequence of time varying values." AT&T asserts the definition should be "a configuration (e.g., a waveform) of information that is based on audible speech." (Joint Letter, Ex. B.) The crux of the dispute is whether "speech pattern" must be audible, as Microsoft contends, or whether it can be merely based on audible speech, as AT&T asserts.

As the term "speech pattern" is not defined in the specification, the dictionary meaning of the phrase sheds light on its ordinary meaning. Texas Digital Sys., 308 F.3d at 1202; Vitronics Corp., 90 F.3d at 1584 n.6. Webster's Dictionary defines "speech" as "something that is spoken: an uttered word: statement", and "pattern" as "a natural or chance configuration (as of markings or of events)." Webster's Third New Int'l Dictionary at 2189, 1657 (G. & C. Merriam Co. 1981). Additionally, a technical treatise defines "speech" as an "audible set of sounds." McGraw Hill Dictionary of Scientific and Technical Terms, 21. Both dictionaries contemplate speech as audible.
Neither the claims nor the specification explicitly define "speech pattern" or its component words. However, the use of the phrase in the specification is instructive. ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988) ("The specification aids in ascertaining the scope and meaning of the language employed in the claims."). The specification contemplates "speech pattern" as audible speech. In describing Figure 1, the specification states "a speech pattern such as a spoken message is received by [a] microphone" on the speaking end. (‘580 patent, Col. 3:20-22.) In describing the output of the claimed invention on the listening end, the specification states that in Figure 1, "an analog signal [is] … transformed into a speech pattern by transducer [speaker] 160." (‘580 patent, Col. 7:8-10.) AT&T points to Figure 7, the depiction of a "waveform" to justify its position that a "speech pattern" is "a configuration … of information that is based on audible speech," because "one doesn't hear anything from the speech pattern [illustrated by the waveforms] coming off this page." (Tr. at 180; Joint Letter, Ex. B.) Figure 7, however, does not suggest that a "speech pattern" refers to anything other than audible speech; rather, it merely depicts waveforms that "illustrate[] a typical speech pattern." (‘580 patent, Col. 3:15-16, 61-62.) Indeed, even considering the waveform of Figure 7 as an analog electrical signal, the specification teaches that such signals merely "correspond[]" to a "speech pattern, such as a spoken message," and are not themselves speech patterns. (‘580 patent, Col. 3:20-23.)

The Court declines to adopt Microsoft's proposed phrase "formed from or into a sequence of time varying values." Such a phrase is not within the plain meaning of "speech pattern." See Texas Digital Sys., 308 F.3d at 1201-02 (recognizing the "heavy presumption" that the terms in the claims have their ordinary meaning).

Accordingly, this Court construes the ordinary meaning of "speech pattern" as "an audible speech message configuration."

1. "Speech synthesis, "voice synthesis" or "synthesized voice messages." Electronically creating specific units of sound and combining those units of sound to produce audible words that are output from the robotic surgical system to the surgeon.

--- Footnotes ---

1 The ’984 patent refers to "synthesized voice messages" as one type of "audible" message issued from the robotic surgical system. (Claims 24, 32; col. 16, ln. 55 to col. 17, ln. 3) The patent being otherwise silent on the nature of "synthesis," the court concludes that the plain meaning of the term is instructive, i.e., an "action of putting together" or a "combination of parts or elements so as to form a whole." (Webster's Third New Int'l Dictionary 2321 (1993)) Because the court finds that the term requires an assembly of fabricated elements of sound, the pre-recorded playback of sound does not constitute "synthesis."

--- End Footnotes ---

3. "A speech synthesis system to provide the surgeon with voice messages containing information about the operation of the system," "a voice synthesis system for providing audible information to a surgeon regarding operation of the system during the surgery" or "a speech synthesis system provides the surgeon with voice messages containing information about the operation of the system." Requires synthesized speech informing the surgeon about the state of the system or a change in the state of the system.

I. "Spending Vehicle"

</tbody>
</table>

Plaintiff argues that Defendant's proposal improperly broadens the definition of the term. Although the specification does not specifically define spending vehicles, it does provide context and support for construing the term more narrowly than anything of value to the payee. Plaintiff contends that spending vehicles operate like financial products, and that all the recited examples of spending vehicles are financial products used in place of regular cash payments.

Defendant counters that the specification defines a spending vehicle as "something of value to the taxpayer." Thus, Defendant urges the Court to construe the term to include anything of value to the taxpayer that may be accepted in place of a regular payment. Defendant argues that, contrary to the specification's broader language, Plaintiff's proposal limits the construction of the term to disclosed embodiments.

The '829 specification provides context limiting the scope of the term "spending vehicles" such that it is narrower than "anything of value." The patent's abstract describes a spending vehicle as "a credit, debit, or cash card, spending account, coupon, or rebate. . . ." The specification later identifies a spending vehicle as "a financial vehicle such as a credit card, debit card, e-wallet account, gift card, or any other type of spending vehicle that would enable the holder of the spending vehicle to purchase products or services." '829 Patent col. 3:27-32; see also '829 Patent col. 4:1-7 ("The spending vehicle may take the form of many different embodiments, including but not limited to, credit cards, debit cards, cash cards, spending accounts, electronic spending accounts, coupons, discount certificates, rebate certificates, and any other vehicle in which a taxpayer receives spending power in a particular dollars amount . . ."). The "something of value" language identified by Defendant does not describe the spending vehicle, but rather what the spending vehicle can be used for. See '829 Patent col. 4:5-6, 9-11 (a "vehicle in which a taxpayer receives spending power in a particular dollar amount useable at . . . any participating entity through which a taxpayer may purchase something of value to the taxpayer" (emphasis added)). Thus, the specification creates context for construing the term by providing examples of spending vehicles and disclosing their intended use. Given this context, the Court rejects Defendant's contention that a spending vehicle may constitute anything of value to a taxpayer.
Having resolved the parties' claim scope dispute, the Court must now determine how best to communicate the term to a lay jury. The Court finds that the term does not have a plain and ordinary meaning that would be readily understood by a lay jury. Although the Court agrees with Plaintiff's proposal to the extent that it recites examples of spending vehicles identified in the specification and excludes cash, the Court finds it unnecessarily lengthy and potential confusing to a jury. Therefore, the Court will construe the term "spending vehicle" as "a financial product, but not cash, used for purchasing something of value."

2. "Spiculation information" is construed to mean "the computation of all spiculation features. Spiculations are lesions within the breast that have diffuse, irregular appearances such as radially oriented filamentous structures or lines."

J. "Split Personal Computer System"

The term "split personal computer system" appears in claim 16 of the '253 patent. ABC asserts that a "split personal computer system" is "a system where a local computer acts as the input/output device communicating through the remote system controller to operate a remote computer." 262 WebEx contends that the term should be defined as "a single personal computer that has its components split into an input/output portion and a processing/storage portion the portions spaced a large distance apart and operable to provide the illusion of a complete personal computer." 263

1. One or Multiple Computers

ABC's definition of split personal computer system involves two computers: a local computer and remote computer. Conversely, WebEx asserts that a split personal computer system consists only of a single personal computer system with its physical components located in two different locations. WebEx contends that two separate, complete computers cannot constitute a split personal computer system under any circumstances.

Claim 16 provides that the split personal computer system is composed of a "local portion" and a "remote portion." 264 The remote portion includes one of "a plurality of remote computer units selectively performing the computational portions and the storage portions of the personal computer tasks . . . ." 265 The local portion is "located remotely from the remote computer units and [is] adapted to selectively perform the video portions and the input/output portions of the personal computer tasks . . . ." 266

264 '253 patent, claim 16 (as amended).

265 Id.

266 Id.
As the quoted language illustrates, the claim does not define or limit the local portion and the remote computer unit in terms of their respective physical components. Instead, the claim defines the local portion and the remote computer unit in terms of their respective functions when they are linked by the remote system controller and operating collectively as a split personal computer system. The claim language requires only that, when linked by the remote system controller, the local portion performs the "video portions and the input/output portions of the personal computer tasks," and the remote computer unit performs the "computational portions and the storage portions of the personal computer tasks." 267 Importantly, the claim does not limit what functions the local portion and remote computer units may perform on their own when they are not linked via the remote system controller. Accordingly, the claim language itself does not limit the split personal computer system to a single personal computer as WebEx asserts. It does not foreclose the possibility that either or both the local portion and/or the remote computer unit could, on their own, be a complete personal computer. On the other hand, the claim does not require that either component be a complete computer as ABC’s definition suggests.

267 Id.

The court must therefore consider whether the specification and/or prosecution history limits the scope of the term "split personal computer system." WebEx first points to the summary of the invention included in the specification. It provides that

[t]he remote portion of the split personal computer system is adapted to perform the heavy computational and storage portions of the personal computer tasks, and the local portion of the split personal computer system is adapted to solely perform the video and the input/output portions of the personal computer tasks so that an individual manipulating the local portion of the split personal computer system is provided with the illusion of utilizing a complete personal computer system. 268

WebEx contends that the necessary implication of the statement that the invention provides an "illusion" of operating a complete personal computer system is that the local portion, of which the user has actual physical possession, cannot itself be a complete personal computer.

268 '253 patent, col.2 ll.18-26 (emphasis added).

WebEx also cites an excerpt from the prosecution history of the '253 patent. In an amendment to a Response to an Office Action submitted by ABC to the Examiner during the prosecution of the '253 patent, ABC explained that

[f]rom the standpoint of the user, the inventive concept of claims 1 and 18-22 in effect converts the personal computer industry from a hardware and software product industry to a service industry. That is, the split personal computer system of claim 1 and 18-22 provides a service to at least one user and preferably a large number of users such that the user(s) do not have to purchase an entire personal computer system. The user(s) only have to purchase or obtain a 'local portion' and sign up with a service provider, such as AOL, to provide the 'remote portion.'

[O]nce the user signs up with the service provider, the user is no longer concerned with many of the problems set forth above. The user does not care whether Intel or AMD have come out with a new chip; it is the service provider's job to maintain an adequate amount of processing power. Likewise, the user does not care how much memory the remote portion has; it is the service provider's job to maintain an adequate amount of memory. As a practical matter, the user is mainly
concerned about who to complain to if the split personal computer system is to [sic] slow. 269

WebEx asserts that because ABC represented to the Examiner that an advantage of the invention is that a user only has to purchase a "local portion," and not a complete personal computer, the local portion alone cannot be a complete personal computer, and the split personal computer system is necessarily limited to only a single personal computer.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

269 Amendment in Response to Office Action Mailed 02/14/2001, at 6-7 (June 4, 2001) (included in WebEx's Brief, Docket Entry No. 156, at Exhibit 4D). These statements refer to prosecution claims 1 and 18-22. WebEx asserts that claim 16 was referred to as claim 34 during prosecution. WebEx's Brief, Docket Entry No. 156, at 7. Therefore, these statements do not directly relate to the claim at issue in this litigation. These statements do, however, relate to the term "split personal computer system," as it is used in other claims in the same patent. "Because claim terms are normally used consistently throughout the patent," the court finds these statements relevant. Phillips, 415 F.3d at 1314.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

In response, ABC points to other portions of the specification and prosecution history that explicitly discuss the possibility that the local portion may, by itself, be a complete personal computer. The specification, in describing a particular embodiment of the invention, explains that the local portion can include a "local computer," which "can be any type of suitable computer and desirably includes temporary and permanent storage devices, and an operating system loaded thereon." 270 Furthermore, in the same amendment to a Response to an Office Action cited by WebEx, ABC explained to the Examiner that

the local portion can be a personal computer having communication software thereon for communicating with a remote portion of the split personal computer system. In this instance, the personal computer may solely perform the video and the input/output portions of the personal computer tasks when acting as a local portion of the split personal computer system, even though the personal computer functioning as the local portion is capable of performing other tasks. 271

270 '253 patent, col.6 ll.8-10.

271 Amendment in Response to Office Action Mailed 02/14/2001, at 8 (June 4, 2001) (included in WebEx's Brief, Docket Entry No. 156, at Exhibit 4D).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

The excerpts from the specification and prosecution history cited by ABC effectively refute WebEx's position. Accordingly, the court concludes that the split personal computer system is not limited to being a single personal computer with its components physically split and located in different locations as WebEx contends. The local portion and the remote computer unit may each, on their own, be a complete computer if, when they are linked via the remote system controller, the local portion solely performs the input/output functions and the remote computer unit performs the processing/storage functions.

Although the court disagrees with WebEx's position that the split personal computer system is limited to a single personal computer, the court is not persuaded that ABC has correctly described the local and remote components of the split personal computer system. Specifically, ABC's definition uses the terms "local computer" and "remote computer" instead of the terms used in the claim itself, i.e., "local portion" and "remote computer unit." 272

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

272 '253 patent, claim 16 (as amended).

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -
By using the terms "local computer" and "remote computer," ABC's definition implicitly suggests that the local portion and the remote computer unit must each consist of a complete computer. Although the specification and prosecution history reveal that the local portion may include or consist of a complete computer, neither suggest that the local portion must include or consist of a complete computer. Moreover, as explained above, ABC explicitly stated during prosecution that one advantage of the claimed invention is that a user need not purchase an entire personal computer, but need only purchase the "local portion." 273 This statement implies that the "local portion" need not constitute a complete computer. It would therefore be misleading and inaccurate to refer to the local portion as a "local computer." The court will use the term "local portion" in its definition.

273 See Amendment in Response to Office Action Mailed 02/14/2001, at 6 (June 4, 2001) (included in WebEx's Brief, Docket Entry No. 156, at Exhibit 4D).

Similarly, the cited excerpts from the prosecution history and specification do not require that the remote computer unit be a complete computer. The claim language does not use the term "remote computer," but instead speaks in terms of a "remote computer unit." It would therefore be misleading and inaccurate to refer to the remote computer unit as a "remote computer." The court will use the term "remote computer unit" in its definition.

2. Large Distance Apart

During the prosecution of the '253 patent ABC attempted to differentiate prosecution claims 1 and 18-22 from a particular prior art reference known as "Naiff." In doing so, ABC stated the following:

[T]he communication means defined in claims 1 and 18-22 and described in the Specification specifies that the remote portion and local portion of the split personal computer system be spaced a large distance apart. The user interface module 24 and the personal computer 20 of Naiff, on the other hand, are located in close proximity to each other. For this reason, it is respectfully submitted that Naiff does not teach or suggest a remote portion, as such term is defined in claims 1 and 18-22. 274

274 Amendment in Response to Office Action Mailed 02/14/2001, at 11 (June 4, 2001) (emphasis added) (included in WebEx's Brief, Docket Entry No. 156, at Exhibit 4D).

WebEx asserts that, in light of this representation, the definition of split personal computer system should specify that the local portion and the remote computer unit must be "spaced a large distance apart." ABC argues that including this indefinite distance limitation in the definition is not helpful or necessary because the definition already uses the words "local" and "remote," which adequately convey that the local portion and remote computer unit are physically separated by a significant distance.

The court agrees with ABC. "Local" means "pertaining to, characteristic of, or restricted to a particular place." 275 "Remote" means "far apart; far distant in space." 276 These two adjectives effectively communicate that the local portion and remote computer unit are not located in close physical proximity to each other. Adding the phrase "spaced a large distance apart" is redundant and unnecessary.

3. The Functions of the Local Portion and the Remote Computer Unit

WebEx’s proposed definition includes the function of the local portion, describing the local portion as "an input/output portion" of the split personal computer system. Similarly, ABC’s definition describes the local portion as "the input/output device." The claim itself explains that the local portion "perform[s] the video portions and input/output portions of the personal computer tasks." Consistent with the claim language, the court’s definition will explain that the local portion performs the video and input/output portions of the personal computer tasks.

WebEx’s definition also includes the function of the remote computer unit, describing the remote computer unit as the "processing/storage portion" of the split personal computer system. ABC’s definition omits the function of the remote computer unit. Claim 16 states that the remote computer unit "perform[s] the computational portions and the storage portions of the personal computer tasks." Consistent with the claim language, the court’s definition will explain that the remote computer unit performs the computational and storage portions of the personal computer tasks.

4. The Role of the Remote System Controller and the Purpose of the Split Personal Computer Unit

ABC’s proposed definition explains that the local portion communicates through the remote system controller to operate the remote computer unit. WebEx’s definition, on the other hand, completely fails to mention the remote system controller, a key component of the split personal computer system. It also describes the purpose of the split personal computer system as "provid[ing] the illusion of a complete personal computer system."

The court concludes that this aspect of ABC’s proposed definition better captures the core purpose of the split personal computer system described in claim 16. It also describes the role of the remote system controller, a key component of the split personal computer system, while WebEx’s definition omits any mention of the remote system controller. Accordingly, the court concludes that the definition of split personal computer system should explain that the local portion communicates through a remote system controller to operate the remote computer unit.

5. Conclusion

The court concludes that a "split personal computer system" is "a system where a local portion, which performs the video and input/output portions of the personal computer tasks, communicates through a remote system controller to operate a remote computer unit, which performs the computational and storage portions of the personal computer tasks."

H. "sponsored community with prescribed rules and procedures for participants"

As to this term, this Court ordered the following claim construction:
A group defined by a user or a third-party sponsor, having a facility to conduct negotiations according to prescribed rules and procedures.

Tr. 45:16-20; 48:22-24.

4153

G. "sponsorship software which enables the creation of a sponsored community with prescribed rules and procedures for participants"

As to this term, this Court ordered the following claim construction:

Software that permits rules and procedures to be created by a user or a third-party sponsor, which are applicable to a group of participants and provides a facility to conduct negotiations.

Tr. 43:15-18; 44:7-45:9.

4154

I

Claim Construction

"The construction of a patent, including the terms of art within its claim, is exclusively within the province of the court."
Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1386, 134 L. Ed. 2d 577 (1996). In determining the meaning of a claim, the court first examines the intrinsic evidence of the record, including the claims, specification, and the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Intrinsic evidence is "the most significant source of the legally operative meaning of the disputed claim language." Id. at 1582. If the intrinsic evidence does not sufficiently resolve ambiguities, then the court may consider extrinsic evidence, including expert and inventor testimony, in order to arrive at a "proper understanding of the claims." Id. at 1583.

1. Intrinsic Evidence

a. Language of the Claims

HP first argues that the meaning of the phrase "spots of different sizes" as used in the claims of the '272 patent is ambiguous. They contend that the term "spot" can mean either a light spot generated by the laser beam or a discharged region on the photoreceptor. HP argues that "the claim language alone does not reveal its intended meaning."

PB responds that the claim language clearly indicates the term "spots" means "discharged regions on the photoreceptor which attract toner." They argue that the claims reveal that "spots of different sizes" give rise to "generated shapes" which have the appearance of "smoothed edges." They contend that since "a single laser beam projected spot... will not result in generated shapes having the appearance of smoothed edges," the word "spot" must refer to discharged areas on the photoreceptor.

Interpreting the claim language is of primary importance. The "language of the claims frames and ultimately resolves all issues of claim interpretation." Abtox, Inc. v. Exitron Corp, 122 F.3d 1019, 1023 (Fed. Cir. 1997). Claim terms are to be given their ordinary and customary meaning, unless it is apparent that the inventor expressly intended a different meaning. Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir.), cert denied, 519 U.S. 911, 117 S. Ct. 275, 136 L. Ed. 2d 198 (1996). When reviewing claim language, a court must apply the "normal rules of syntax" and consider the context of the claim. Eastman Kodak Co. v. The Goodyear Tire and Rubber Co., 114 F.3d 1547, 1553 (Fed. Cir. 1997).
In the instant case, the plain language of the claims does not unambiguously support either proposed definition of the phrase "spots of different sizes." As used in the claims of the '272 patent, the term "spot" could mean either light spots or discharged areas on the photoreceptor. The relevant dictionary definition for the word "spot" is "any small portion of a surface differing from the rest." See Funk and Wagnall, Standard College Dictionary (1963). This definition alone does not differentiate between the two proposed definitions. Additionally, applying the normal rules of syntax to the claims do not clearly delineate the meaning of the word. For example, the phrases "each beam of light generating a spot" and "controlling a parameter of the light beams to produce spots of different sizes" could be construed to mean either spots of light or discharged areas on the photoreceptor.

Further, PB's assertion that shapes with smoothed edges can not be generated by light spots is not determinative of the meaning of the terms "spots." The claims are not directed toward the generated shapes themselves, but rather a method of making those shapes (Claims 1 and 2) or an apparatus for generating those shapes (Claim 3). The formation of different sized light spots is the first step in the process which gives rise to the shapes. Thus, the shapes are generated by the formation of light spots.

The claim language does not plainly reveal whether the term "spot" means a light spot or a discharged area on a photoreceptor. Since the language of the claims is ambiguous, we turn to an analysis of the specification, "which is the single best guide to the meaning of a disputed term." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

b. The Specification

HP next argues that the specification of the '272 patent "clearly uses the word spot to refer to a light spot." They point to numerous instances where the specification "refer[s] to [the] motion of a spot, a property . . . certainly not possessed by an exposed region on a photoreceptor."

PB replies that the word spot has two different meanings in the specification. They claim that "up to column 5, line 62, the terms 'spots' is used in the specification to refer to the laser light beam spot." However, PB argues that "there is a clear transition in the context and usage of spots" after that point. They argue that after column 5, line 62, the term spots is used to refer to discharged areas on the photoreceptor, and this definition should be applied when interpreting the claim language.

After reviewing the claim language, the court must review other parts of the patent document, including diagrams or figures, which are collectively referred to as the specification. Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1387-88, 134 L. Ed. 2d 577 (1996); see also Al-Site Corp. v. Bonneau Co., 22 F.3d 1107 (Fed. Cir. 1994). "The specification contains a written description of the invention that must enable one of ordinary skill in the art to make and use the invention. For claim construction purposes, the description may act as sort of a dictionary, which explains the invention and may define terms used in the claims." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (internal citations omitted). Although "inventors may be their own lexicographers, they must use words in the same way in the claims and in the specification." Fonar Corp., v. Johnson and Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987). When a patentee uses "words which were defined in the specification," they "must be given the same meaning when used in the claims." McGill Inc. v. John Zink Co., 736 F.2d 666, 673 (Fed. Cir. 1984). A court reviews the patent specification to determine whether the patentee "used any terms in a manner inconsistent with their ordinary meaning." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

In the instant case, the specification of the '272 patent indicates that the word "spot" means a spot of laser light. The word "spot" is used 44 times in the specification. PB concedes that 42 of the 44 times the word "spot" is used it refers to the light spot created by the laser beam. Their assertion that the remaining two uses of the word "spot" require a different definition is incorrect. Specifically, they refer the court to the following section:

The use of different spot sizes can effectively be employed as letters or numbers are created so as to avoid roughened edges and improve character formation. The system of this invention can also employ two power sources using parallel laser beams with each of the beams being of a different diameter and corresponding spot size. This will provide a matrix of dots having different sizes for forming a single generated character. The different dot size will intermesh to create letters and numerals having smoother appearance.
When read in light of the entire specification, this section is consistent with the word spot meaning a spot of laser light. PB's invention does employ light spots to form generated characters. The characters are not formed directly by the light spots themselves, but by the discharged areas on the photoreceptor subsequently created by the light spots. The discussion in the cited section above is fully consistent with this interpretation. It discusses how the laser beams create spots which "in turn provide a matrix of dots." These "different size dots intermesh to create letters and numeral having a smoother appearance."

Read in its entirety, the specification of the '272 patent indicates that the word "spot" means a light spot. Since inventors "must use words in the same way in the claims and in the specification," it is logical to conclude that the word spot also means a light spot when used in the claims of the '272 patent. Fonar Corp. v. Johnson and Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987); see also McGill Inc., v. John Zink Co., 736 F.2d 666, 673 (Fed. Cir. 1984) (holding that words defined in the specification must be given the same meaning when used in the claims). 2 Allowing PB to employ two different definitions for the same word in a single specification would undermine the requirement that the claims clearly "demarcate the boundaries of the purported invention." Athletic Alternatives Inc. v. Prince Mfg. Inc., 73 F.3d 1573, 1581 (Fed Cir. 1996).

2 PB also argues that interpreting the word spot to mean light spot would exclude the preferred embodiment from being covered by the claims of the '272 patent. Specifically, they contend that varying the intensity of the laser beam, which is the preferred embodiment as recited in claim 2, "does not change the size of the diameter of the projecting laser beam light spot." However, the court's determination that "spot" means "light spot" does not invalidate or exclude any claim of the '272 patent. One common convention in the digital printing field is to define the size of a light spot as the area of light where the intensity exceeds a fixed threshold. Under this definition, the size of a projected light spot would change when the intensity of a light beam is varied. Thus, the preferred embodiment as recited in claim 2 is encompassed by the court's claim construction and no new limitations have been introduced. See Eastman Kodak Co. v. The Goodyear Tire & Rubber Co., 114 F.3d 1547, 1556 (Fed. Cir. 1997) (courts should seek to interpret claims to preserve, rather than defeat, their validity).

The prosecution history is consistent with the conclusion that the word "spots" means "light spots" in the '272 patent. According to Patent Office procedure, "where the title is not descriptive of the invention claimed, the examiner should require the substitution of a new title that is clearly indicative of the invention." M.P.E.P. § 606.01 (1979). After evaluating the application, the examiner was in the best position to fully understand the nature of the invention and the meaning of the terms used in the patent. It is relevant that he chose to modify the noun "spots" with the adjective "light." This is reflective of his understanding that the word "spots" means "light spots" in the '272 patent.

2. Extrinsic Evidence

The court concludes that the use of extrinsic evidence is unnecessary in this case. Extrinsic evidence may be evaluated "in
order to aid the court in coming to a correct conclusion as to the true meaning of the language employed in the patent."
Markman v. Westview Instruments, Inc., 52 F.3d 967, 981 (Fed. Cir. 1995) (internal citations omitted). However, "reliance on such evidence is unnecessary, and indeed improper, when the disputed terms can be understood from a careful reading of the public record." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996).

In this case, the meaning of the phrase "spots of different sizes" can be understood from a careful reading of the claims, the specification, and the prosecution history. Accordingly, consideration of extrinsic evidence is unnecessary and improper.

* * * * *

CONCLUSION

For the forgoing reasons, the court concludes that the phrase "spots of different sizes" as used in the '272 patent means light spots of various sizes. Since it is undisputed that the accused devices do not employ light spots of different sizes, the defendant's motion for summary judgment (document no. 178) is GRANTED.

II.

The principal question we address on appeal concerns the first of these two analytical steps. Specifically, we must decide, based upon a de novo review, whether the district court's construction of the claim term "spots of different sizes" was erroneous. Our review of the patent document as well as the pertinent aspects of the prosecution history leads us to conclude that the district court erroneously interpreted the term to refer to spots of light generated by the beam of light, rather than the spots of discharged area on the photoreceptor. Because the district court's summary judgment of non-infringement derived from its erroneous claim construction, we vacate its judgment and remand for further proceedings consistent with this decision.

The claim language

The starting point for any claim construction must be the claims themselves. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). Here, both independent claims 1 and 3 contain a preamble stating that they claim either a method of, or an apparatus for, "producing on a photoreceptor an image of generated shapes made up of spots . . . ." '272 pat., col. 6, ll. 22-24, 33-35. Based upon this language, the "spots", which are the subject of this dispute, "produce . . . an image of generated shapes". The "generated shapes" are, of course, the letters, numbers or other characters formed with fewer jaggies than under the prior art methods. These characters, "made up of spots", are "produced on a photoreceptor". Thus, based upon this preamble language, the "spots" are the constituent parts that make up the image of the desired character on the photoreceptor. The spots of light generated by the light beam cannot be the "spots" referenced in the preamble because the spots of light generated by the light beam are, it is not disputed, transient and do not themselves form the image of the desired character. The spots of discharged area created by the beam of light, however, last long enough to combine to form images of characters and they produce those images "on the photoreceptor". Accordingly, the language in the preamble of the claims strongly militates towards construing the claim term "spots of different sizes" to refer to the spots of discharged area on the photoreceptor, not the light spots generated by the beam of light.

Although our initial discussion has focused on the preamble, as opposed to the remainder of the claim language, this does not undercut its significance. "[A] claim preamble has the import that the claim as a whole suggests for it." Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620, 34 U.S.P.Q.2D (BNA) 1816, 1820 (Fed. Cir. 1995). If the claim preamble, when read in the context of the entire claim, recites limitations of the claim, or, if the claim preamble is "necessary to give life, meaning, and vitality" to the claim, then the claim preamble should be construed as if in the balance of the claim. Kropa v. Robie, 38 C.C.P.A. 858, 187 F.2d 150, 152, 88 U.S.P.Q. (BNA) 478, 480-81 (CCPA 1951); see also Rowe v. Dror, 112 F.3d 473, 478, 42 U.S.P.Q.2D (BNA) 1550, 1553 (Fed. Cir. 1997); Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257, 9 U.S.P.Q.2D (BNA) 1962, 1966 (Fed. Cir. 1989). Indeed, when discussing the "claim" in such a circumstance, there is no meaningful distinction to be drawn between
the claim preamble and the rest of the claim, for only together do they comprise the "claim". If, however, the body of the claim fully and intrinsically sets forth the complete invention, including all of its limitations, and the preamble offers no distinct definition of any of the claimed invention's limitations, but rather merely states, for example, the purpose or intended use of the invention, then the preamble is of no significance to claim construction because it cannot be said to constitute or explain a claim limitation. See Rowe, 112 F.3d at 478, 42 U.S.P.Q.2D (BNA) at 1553; Corning Glass, 868 F.2d at 1257, 9 U.S.P.Q.2D (BNA) at 1966; Kropa, 187 F.2d at 152, 88 U.S.P.Q. (BNA) at 480-81.

Here, the preamble is "necessary to give life, meaning, and vitality" to the claim. Kropa, 187 F.2d at 152, 88 U.S.P.Q. (BNA) at 480-81. The preamble statement that the patent claims a method of or apparatus for "producing on a photoreceptor an image of generated shapes made up of spots" is not merely a statement describing the invention's intended field of use. Instead, that statement is intimately meshed with the ensuing language in the claim. For example, both independent claims conclude with the clause "whereby the appearance of smoothed edges are given to the generated shapes". Because this is the first appearance in the claim body of the term "generated shapes", the term can only be understood in the context of the preamble statement "producing on a photoreceptor an image of generated shapes made up of spots". Similarly, the term "spots" is initially used in the preamble to refer to the elements that make up the image of generated shapes that are produced on the photoreceptor. The term "spots" then appears twice in each of the independent claims. 1 That the claim term "spots" refers to the components that together make up the images of generated shapes on the photoreceptor is only discernible from the claim preamble. In such a case, it is essential that the court charged with claim construction construe the preamble and the remainder of the claim, as we have done here, as one unified and internally consistent recitation of the claimed invention.

--- Footnotes ---

1 In claim 1, the first appearance of the term is in the singular, but its context indicates that it is used to refer to the same type of "spots", albeit in the singular, that are mentioned in the preamble.

--- End Footnotes ---

Having noted the support in the preamble of the claims for construing the term "spots" to refer to the spots of discharged area on the photoreceptor and having further noted the necessity of the term's construction being consistent with that preamble language, we find further support for our claim construction in the language of the body of the claims. The independent claims refer to beams of light "generating a spot on the photoreceptor" (claim 1) or "generating a plurality of spots on the photoreceptor" (claim 3). '272 pat., col. 6, ll. 26-27, 37-38. While not dispositive, the reference to "spots" as being generated on the photoreceptor certainly supports a construction of "spots" as being the spots of discharged area on the photoreceptor. Indeed, it would seem to be more accurate to describe the spots of discharged area as being "generated . . . on the photoreceptor", than to describe the spots created by the light beams in that manner.

The final clause of both of the independent claims also supports construing the term "spots" to mean the spots of discharged area on the photoreceptor. This clause, which is materially the same for both claims, refers to producing or generating "spots of different sizes whereby the appearance of smoothed edges are given to the generated shapes". '272 pat., col. 6, ll. 28-30, 39-41. To be consistent with the preamble, this clause must mean that the "spots of different sizes" make up "the generated shapes", which have "the appearance of smoothed edges". However, the spots of light created by the beam of light do not make up "the generated shapes". Rather, they cause the elimination of charge at certain locations on the photoreceptor, which spots of discharged area make up "the generated shapes".

The expert affidavits

The use of the term "spots of different sizes" in the final clause of the independent claims also supports construing "spots" to refer to the spots of discharged area on the photoreceptor. The diameter of the beam of light is not altered when the intensity or pulse width is changed. However, changing these parameters does change the size of the discharged area on the photoreceptor. Thus, assuming argendo that the size of the light spot generated by the beam of light is the same as the diameter of the beam of light, the parameters of pulse width and intensity cannot be used to create "spots of different sizes" and, consequently, based upon this assumption, the term "spots" would have to refer to the spots of discharged area on the photoreceptor.

Although Pitney Bowes argued before the district court that the size of the light spot generated by the beam of light does not
alter in size when these parameters are adjusted, the district court rejected that argument. Instead, the district court reasoned that:

One common convention in the digital printing field is to define the size of a light spot as the area of light where the intensity exceeds a fixed threshold. Under this definition, the size of a projected light spot would change when the intensity of a light beam is varied.

March Non-Infringement Ruling, slip op. at 13 n.2. Pitney Bowes argues on appeal that, by relying upon this "common convention" in its claim construction, the district court erroneously relied upon extrinsic evidence to contradict the meaning of the claim term "spots" otherwise apparent from the intrinsic evidence.

The district court's statement that there exists a "common convention" in the "digital printing field" to define spot size "as the area of light where the intensity exceeds a fixed threshold", mirrors the terminology used in a supplemental affidavit submitted by William J. Hanson that was attached to Hewlett-Packard's reply brief in support of its motion for summary judgment of non-infringement based upon the "spots of different sizes" limitation. Adopting the terminology later used by the district court, Mr. Hanson averred that there was a "common convention" in the "digital printing field" to define spot size "as the area of the light spot where the intensity exceeds a fixed threshold". Mr. Hanson's affidavit responded to an earlier affidavit submitted by Michael Bass in support of Pitney Bowes's opposition. Professor Bass had declared:

[Hewlett-Packard's] interpretation of Claims 1, 2 and 3 as referring only to projected laser beam spots rather than the exposed regions on the photoreceptor or developed spots is wrong. Anyone skilled in the art of optics recognizes that a projected light spot does not change by varying the intensity of the laser beam. In other words, if a laser was pointed at a wall and the intensity of a laser was increased, the size of the projected beam on the wall would not change. By varying the intensity of that laser, however, one can vary the size of the developed spot in the electro photographic process. Thus, it is clear that the spot referred to in Claims 1, 2 and 3 is not simply referring to the size of the projected spot.

Rebuttal Aff. of Michael Bass, P 6 (Oct. 3, 1997). In response, Mr. Hanson, Hewlett-Packard's expert, declared:

Professor Bass'[s] reasoning . . . may apply in the field of optics where optical spot size is typically defined as the diameter where the intensity is at a specified fraction of the maximum intensity. However, in fields other than optics, such as the digital printing field of the '272 patent, various definitions of light spot size are employed depending on the circumstances. For example, in high contrast imaging processes (of which laser printing is one), a common convention is to define the spot size as the area of light spot where the intensity exceeds a fixed threshold. Under this common convention, the size of the project light spot does change by varying the intensity of the laser beam.

Supplemental Decl. of William J. Hanson, P 3 (Dec. 9, 1997). In earlier deposition testimony, Professor Bass had testified that he had "never heard of" spot size being measured in this manner. Dep. of Michael Bass, at 154, l. 23 (Jun. 17, 1997). Neither party cites, nor have we found, any other reference to this "common convention" in the record. Pitney Bowes argues that, while the district court might have considered the existence of this "common convention" to be an uncontested background fact, the affidavits demonstrate that there was conflicting expert testimony regarding whether there was a "common convention" to define spot size in this particular manner. Pitney Bowes contends that reliance upon this "common convention" was ultimately determinative of the March Non-Infringement Ruling because, unless this "common convention" is accepted, the claim language and the written description both suggest that the "spots" are the spots of discharged area on the photoreceptor.

In Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584, 39 U.S.P.Q.2d (BNA) 1573, 1578 (Fed. Cir. 1996), we explained that "extrinsic evidence is that evidence which is external to the patent and file history, such as expert testimony, inventor testimony, dictionaries, and technical treatises and articles." Despite the district court's statements to the contrary, Vitronics does not prohibit courts from examining extrinsic evidence, even when the patent document is itself clear. See, e.g., March Non-Infringement Ruling, slip op. at 15 ("In this case, the meaning of the phrase 'spots of different sizes' can be understood from a careful reading of the claims, the specification, and the prosecution history. Accordingly, consideration of extrinsic evidence is improper."). Moreover, Vitronics does not set forth any rules regarding the admissibility of expert testimony into evidence. 2 Certainly, there are no prohibitions in Vitronics on courts hearing evidence from experts. Rather, Vitronics merely warned courts not to rely on extrinsic evidence in claim construction to contradict the meaning of claims discernible from thoughtful examination of the claims, the written description, and the prosecution history -- the intrinsic
evidence. See id., 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1579 ("In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances, it is improper to rely on extrinsic evidence. In those cases where the public record unambiguously describes the scope of the patented invention, reliance on any extrinsic evidence is improper." (citations omitted and emphasis added)); see also Bell & Howell Document Management Prods. Co. v. Altek Sys., 132 F.3d 701, 706, 45 U.S.P.Q.2D (BNA) 1033, 1038 (Fed. Cir. 1997) ("Use of expert testimony to explain an invention may be useful. But reliance on extrinsic evidence to interpret claims is proper only when the claim language remains genuinely ambiguous after consideration of the intrinsic evidence . . . ." (emphasis added)). As Vitronics states:

the district court relied on the expert testimony and other extrinsic evidence solely to help it understand the underlying technology, we could not say the district court was in error. But testimony on the technology is far different from other expert testimony, whether it be of an attorney, a technical expert, or the inventor, on the proper construction of a disputed claim term, relied on by the district court in this case. The latter kind of testimony may only be relied upon if the patent documents, taken as a whole, are insufficient to enable the court to construe disputed claim terms. Such instances will rarely, if ever, occur.

Vitronics, 90 F.3d at 1585, 39 U.S.P.Q.2D (BNA) at 1579. Thus, under Vitronics, it is entirely appropriate, perhaps even preferable, for a court to consult trustworthy extrinsic evidence to ensure that the claim construction it is tending to from the patent file is not inconsistent with clearly expressed, plainly apposite, and widely held understandings in the pertinent technical field. This is especially the case with respect to technical terms, as opposed to non-technical terms in general usage or terms of art in the claim-drafting art, such as "comprising". Indeed, a patent is both a technical and a legal document. While a judge is well-equipped to interpret the legal aspects of the document, he or she must also interpret the technical aspects of the document, and indeed its overall meaning, from the vantage point of one skilled in the art. See Smithkline Diagnostics, Inc. v. Helena Lab. Corp., 859 F.2d 878, 882, 8 U.S.P.Q.2D (BNA) 1468, 1471 (Fed. Cir. 1988). Although the patent file may often be sufficient to permit the judge to interpret the technical aspects of the patent properly, consultation of extrinsic evidence is particularly appropriate to ensure that his or her understanding of the technical aspects of the patent is not entirely at variance with the understanding of one skilled in the art. See Mantech Envtl. Corp. v. Hudson Envtl. Servs., Inc., 152 F.3d 1368, 1373, 47 U.S.P.Q.2D (BNA) 1732, 1737 (Fed. Cir. 1998) ("Although [expert testimony] always may be admitted by the trial court to educate itself about the patent and the relevant technology, the claims and the written description remain the primary and more authoritative sources of claim construction."); Fromson v. Anitec Printing Plates, Inc., 132 F.3d 1437, 1444, 45 U.S.P.Q.2D (BNA) 1269, 1274 (Fed. Cir. 1997), abrogated on other grounds by, Cybor, 138 F.3d at 1456, 46 U.S.P.Q.2D (BNA) at 1174 ("Extrinsic evidence may be particularly helpful to the court when a specific technical aspect that is potentially of dispositive weight was not discussed in the specification or explored during the patent prosecution.").

--- Footnotes ---

2 Although the case was not cited by the parties, the additional views considers pertinent the Supreme Court's recent statement "that the trial judge must have considerable leeway in deciding in a particular case how to go about determining whether particular expert testimony is reliable." Kumho Tire Co. v. Carmichael, 526 U.S. 137, 143 L. Ed. 2d 238, 119 S. Ct. 1167, 1176 (1999). The Supreme Court in Kumho Tire was discussing whether expert testimony was "reliable" for purposes of the "basic gatekeeping obligation" imposed on trial judges under Federal Rule of Evidence 702 to ensure that scientific, technical or other specialized knowledge is sufficiently "reliable" to be admitted into evidence. 119 S. Ct. at 1174. Vitronics, however, did not decide under what circumstances expert testimony should be admitted or excluded, but merely concerns whether and under what circumstances courts can rely on already admitted extrinsic evidence as dispositive in their claim constructions. Thus, contrary to the implication of the additional views, Vitronics did not discount the skill of trial judges in serving as gatekeepers, because Rule 702's gatekeeper function, as discussed in Kumho Tire, relates solely to the admissibility of evidence -- a separate issue to claim construction.

--- End Footnotes ---

In the instant case, therefore, had the district court relied upon the extrinsic evidence to contradict the claim construction unambiguously apparent from the intrinsic evidence it would have been error. However, we do not doubt the district court's express statements that it did not rely on extrinsic evidence in its claim construction. Having concluded that the claim language "did not unambiguously support either proposed definition", March Non-Infringement Ruling, slip op. at 9, the
district court found support for its claim construction in the written description and the examiner's amendment of the patent title, see id. at 11-15. The district court merely referred in footnote two of its opinion to there being "one common convention in the digital printing field" in order to address the collateral argument made by Pitney Bowes that Hewlett-Packard's proffered construction would exclude the preferred embodiment from being covered by the claims of the '272 patent. The extrinsic evidence of this "common convention", therefore, was not relied upon by the district court to contradict the meaning otherwise apparent from the intrinsic evidence. Rather, the district court relied upon the intrinsic evidence to reach its claim construction, albeit an erroneous construction, and referred only briefly to the extrinsic evidence, which it quite properly examined, in discussing a collateral argument made by Pitney Bowes.

This did not constitute error.

The written description and the prosecution history

To ascertain the meaning of claims, we consider three sources: the claims, the written description, and the prosecution history. See Markman, 52 F.3d at 979, 34 U.S.P.Q.2D (BNA) at 1329 (quoting Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1561, 19 U.S.P.Q.2D (BNA) 1500 (Fed. Cir. 1991)). We thus turn next to the two remaining sources for claim construction -- the written description and the prosecution history.

The district court placed significant weight on Pitney Bowes's concession that in forty-two out of forty-four uses of the term "spot" in the written description that usage referred to the spots of light generated by the beam of light and not the spots of discharged area on the photoreceptor. See March Non-Infringement Ruling, slip op. at 12. Based essentially upon this, the district court reasoned that "since inventors 'must use words in the same way in the claims and in the specification,' it is logical to conclude that the word spot also means a light spot when used in the claims of the '272 patent." 3 Id. at 12-13 (quoting Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1987)).

--- Footnotes ---
3 The district court also relied upon our statement in McGill Inc. v. John Zink Co., 736 F.2d 666, 674, 221 U.S.P.Q. (BNA) 944, 949 (Fed. Cir. 1984), overruled on other grounds, Markman, 52 F.3d at 976, 979, 34 U.S.P.Q.2D (BNA) at 1327, 1329, that "words which were defined in the specification must be given the same meaning when used in a claim." March Non-Infringement Ruling, slip op. at 11.
--- End Footnotes ---

As a general principle, we agree with the district court's "logic". Certainly, "the same word appearing in the same claim should be interpreted consistently." Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345, 47 U.S.P.Q.2D (BNA) 1418, 1425 (Fed. Cir. 1998). Indeed, our conclusion that the district court's claim construction was erroneous because it would assign a different meaning to the term "spot" in the preamble from that in the rest of the claims is broadly based upon this very principle. Nevertheless, we have also recognized that a patent's written description can set forth more than one definition of a claim term. In Genentech, Inc. v. Wellcome Foundation, Ltd., 29 F.3d 1555, 31 U.S.P.Q.2D (BNA) 1161 (Fed. Cir. 1994), we noted that with respect to the claim term "human tissue plasminogen activator", "there are at least four possible definitions of the phrase set forth in the specification." Id. at 1563, 31 U.S.P.Q.2D (BNA) at 1167. We explained that, to select among these definitions, we would "avoid those definitions upon which the PTO could not reasonably have relied when it issued the patent." Id. at 1563, 31 U.S.P.Q.2D (BNA) at 1167.

The case at bar presents a somewhat analogous situation to Genentech. The portion of the written description which Pitney Bowes contends uses the term "spot" to mean a spot of discharged area on the photoreceptor occurs at the very end of the written description and reads, in relevant part:

"The scanning system of this invention, however, can be implemented by introducing an intensity modulator 64 for applying an amplitude modulated correction signal for maintaining laser illumination at a constant level. The intensity modulator 64 could also be used for control of spot size by varying the intensity. The use of different spot sizes can effectively be employed as letters or numbers are created so as to avoid roughened edges and improve character formation."

'272 pat., col. 5, l. 64 to col. 6, l. 5 (emphasis added). That the PTO focused on this part of the written description in
granting the ’272 patent is demonstrated by the irrelevance of the earlier parts of the written description to the invention actually claimed in the ’272 patent. Indeed, the earlier parts of the written description relate to the inventions claimed by the ’157 and the ’757 patents. For instance, the written description describes in detail an apparatus and method for correcting imperfections in the polygonal mirror during the scanning process, as claimed in the ’157 patent. The written description further describes in detail apparatus for correcting the scanning speed during the scanning process, as claimed in the ’757 patent. As may be recalled, the ’272, ’157, and ’757 patents all stemmed from the same parent application, or a divisional or continuation application thereof. Thus, it is perhaps unsurprising that their written descriptions are apparently identical and, consequently, not relevant in toto to all three inventions.

The earlier parts of this apparently identical written description do, indeed, use the term "spot". However, the usage of the term "spot" is noticeably different in the earlier portions of the written description. These earlier uses of the term refer to a "spot" in the sense of a moving spot, which surely must be the spot of light produced by the beam. Thus, for example, the written description explains that:

The edge detector 62 will indicate when spot 34 has passed a fixed terminal point beyond the scan path. The time differential as detected between the first edge detector 58 and the second detector 62 can be interpreted through logic circuitry to indicate the flight time for spot 34 to cover a fixed length scan path.

’272 pat., col. 5, ll. 52-57. The spot of discharged area on the photoreceptor cannot, of course, have a "flight time" and thus it is apparent that this usage of the term "spot" must refer to a spot of light. The two uses of the term "spot" in the later part of the written description, however, do not refer to "spot" in the context of a moving spot, but rather in the context of the "spot size" to be employed "so as to avoid rough edges and improve character formation." This usage of the term appears quite distinct from the dynamic "spot" referred to earlier in the written description. Indeed, read in context, this usage of the term "spot size" relates to the spots that are used as the constituent parts of the printed characters, not the "spot" that moves within the apparatus described in the written description. Moreover, the earlier uses of the term referred generally to "the spot 34", in reference to the identical Figure 1 of all three patents, whereas these later uses referred only to "spot size", again indicating a different usage.

In circumstances such as this, where the language of the written description is sufficient to put a reader on notice of the different uses of a term, and where those uses are further apparent from publicly-available documents referenced in the patent file, it is appropriate to depart from the normal rule of construing seemingly identical terms in the same manner. This entirely accords with the public notice function of claims. See Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1577; Hoganas AB v. Dresser Indus., 9 F.3d 948, 951, 28 U.S.P.Q. 2D (BNA) 1936, 1939 (Fed. Cir. 1993). The prosecution history indicates to a reviewing member of the public that the ’272 patent was one of several patents to be issued based upon the same written description disclosure. Parsing the written description, in the context of the prosecution history, puts the reader on notice that the term "spot" has different meanings in the written description depending on its context. Like Genentech, therefore, the term must be read to correspond to the only plausible meaning in each context. In light of the prosecution history, the only plausible meaning of the term "spot size", as used in the disputed part of the written description, is the area of discharge on the photoreceptor. The district court therefore erred when it relied upon the frequency of occurrences of the term "spot", in the context which all parties agreed meant the spot of light from the laser beam, to draw a "logical" conclusion that the two disputed occurrences of the term in the written description and all the occurrences of the term in the claims must also have that meaning.

The patent title

Under the general heading of "The Prosecution History", the district court considered the effect of the amendment of the title of the ’272 patent to include the term "Light Spots". See March Non-Infringement Ruling, slip op. at 13-15. The district court reasoned that:

In the instant case, the prosecution history is consistent with the conclusion that the word "spots" means "light spots" in the ’272 patent. According to Patent Office procedure, "where the title is not descriptive of the invention claimed, the examiner should require the substitution of a new title that is clearly indicative of the invention." M.P.E.P. [The Manual of Patent Examining Procedure] § 606.01 (1979). After evaluating the application, the examiner was in the best position to fully understand the nature of the invention and the meaning of the terms used in the patent. It is relevant that he chose to modify the noun "spots" with the adjective "light." This is reflective of his understanding that the word "spots" means "light spots" in the ’272 patent.
Id. at 14-15.

We conclude that the district court attached too much weight in its claim construction to the patent title and to the amendment of that title. Certainly, the district court is correct that Section 606.01 of the M.P.E.P. provides that the examiner may require a change in the title if the proffered "title is not descriptive of the invention claimed". However, Section 606.01 goes on to explain that "this may result in slightly longer titles, but the loss in brevity of the title will be more than offset by the gain in its informative value in indexing, classifying, searching, etc." Thus, as indicated by the M.P.E.P., the purpose of the title is not to demarcate the precise boundaries of the claimed invention but rather to provide a useful reference tool for future classification purposes. In any event, if we do not read limitations into the claims from the specification that are not found in the claims themselves, then we certainly will not read limitations into the claims from the patent title. See E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433, 7 U.S.P.Q.2D (BNA) 1129, 1132 (Fed. Cir. 1988). Consequently, an amendment of the patent title during prosecution should not be regarded as having the same or similar effect as an amendment of the claims themselves by the applicant.

The near irrelevancy of the patent title to claim construction is further demonstrated by the dearth of case law in which the patent title has been used as an aid to claim construction. We are only aware of one case from this court in which the patent title was accorded any significance whatsoever in a claim construction. In Exxon Chemical Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 35 U.S.P.Q.2D (BNA) 1801 (Fed. Cir. 1995), the court reasoned that:

Exxon's claims are drawn to a specific product which has particularly defined ingredients. Nothing in the claims, the specification, or the prosecution history suggests that Exxon's claims are not drawn to a product that contains particular ingredients. Indeed, to the contrary, the title to the '890 patent reads . . . "Lubricating Oil Compositions Containing Ashless Dispersant, [ZDDP], Metal Detergent and a Copper Compound". See Titanium Metals Corp. of Am. v. Banner, 778 F.2d 775, 780, 227 U.S.P.Q. (BNA) 773, 777-78 (Fed. Cir. 1985) (referring to patent's title as interpretative aid). 4

64 F.3d at 1557, 35 U.S.P.Q.2D (BNA) at 1804. While the court in Exxon Chemical Patents mentioned the patent title in its claim construction, this one-sentence statement was made simply to illustrate the point that the patent-in-suit claimed a product containing certain ingredients. Indeed, the claim construction relied, not upon the patent title, but upon the standard sources of the claims, the specification, and the prosecution history. See id. ("In sum, a review of the claims, the specification, and the prosecution history all point to the conclusion that Exxon claims a product, not merely a recipe for making whatever product results from the use of the recipe ingredients."). Consequently, that the patent title has only been mentioned once by this court in the context of claim construction and, even then, merely to make an illustrative point in one sentence, makes a powerful statement as to the unimportance of a patent's title to claim construction. It was therefore error for the district court to impart as much weight in its claim construction as it did to the amendment of the title of the '272 patent.

4 Titanium Metals was cited as "referring to patent's title as interpretative aid". The issue being addressed in Titanium Metals was not claim construction but rather anticipation under 35 U.S.C. § 102. In this context the Titanium Metals court stated:

The patent law imposes certain fundamental conditions for patentability, paramount among them being the condition that what is sought to be patented, as determined by the claims, be new. . . . The title of the application here involved is "Titanium Alloy," a composition of matter. Surprisingly, in all of the evidence, nobody discussed the key issue of whether the alloy was new . . . .

Titanium Metals Corp. of Am. v. Banner, 778 F.2d 775, 780, 227 U.S.P.Q. (BNA) 773, 777-78 (Fed. Cir. 1985). The Titanium Metals court, therefore, did not refer to the patent's title as an "interpretative aid", but instead merely expressed surprise that the apparent simplicity of the patent's title did not alert the parties to present evidence as to whether the invention claimed in the patent application was novel and unanticipated by the prior art as required by section 102.

The grant of summary judgment of no literal or equivalent infringement based upon the claim construction of the term "spots"

The district court's grant of summary judgment of no literal or equivalent infringement was entirely derivative of its claim construction of the term "spots". Because the accused Hewlett-Packard devices do not have "spots" of light produced by their laser beams that can be "of different sizes", the district court concluded that they could not infringe either literally or equivalently. See March Non-Infringement Ruling, slip op. at 16-20. However, because we hold that the "spots" that can be "of different sizes" are the spots of discharged area on the photoreceptor, not the spots of light produced by the laser beam, we vacate the district court's grant of summary judgment to Hewlett-Packard and remand for further proceedings in accordance with this decision.

IX. "a plurality of spread-spectrum devices for spread-spectrum processing the plurality of subchannels of data, thereby generating a plurality of spread-spectrum-subchannel signals, respectively" 22

22 The term "a plurality of spread-spectrum devices for spread-spectrum processing the plurality of subchannels of data, thereby generating a plurality of spread-spectrum-subchannel signals, respectively" is contained in claim 33.

Plaintiff's Proposed Construction
"a plurality of devices that process signals using a form of communication in which the signal energy of the data is distributed across the allowed spectrum, where that spectrum is typically greater than or equal to the bandwidth required to carry the data."
Linex does not believe that the construction of this phrase should be governed by 35 U.S.C. § 112(6).

Defendant's Proposed Construction
This phrase is a means plus function claim element. The corresponding structure that performs the function of "spread-spectrum processing the plurality of subchannels of data, thereby generating a plurality of spread-spectrum-subchannel signals" is a plurality of multiplication circuits or exclusive-or gates that multiply a plurality of subchannels of data by a plurality of pseudonoise (PN) chip-sequence signals, respectively.

Plaintiff argues that although Linex's prosecution counsel specifically noted during prosecution of the '322 patent that claim 33 uses means-plus-function claim language, this statement was incorrect and a mere mistake. REPLY at 9. Plaintiff asserts that no less than thirty-one of the claims of the '322 patent are written in traditional means-plus-function format, specifically using the word "means," and claims 9 and 33 are not, indicating they were not intended to be construed as means-plus-function claims. Id. at 9-10.

Defendant responds that Linex specifically advised the patent examiner during prosecution that "claims 33 and 41 employ means plus function, as elements in the claims," and therefore Linex should be held to this representation. RESP. at 29. Defendant also argues that this claim limitation is defined in terms of a function, and therefore it is appropriate to construe this claim limitation as being in means-plus-function format. RESP. at 30. In support of this argument, Defendant cites to two Federal Circuit cases which construe claim limitations lacking the word "means" to be in means-plus-function format. Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1214 (Fed. Cir. 1998); Welker Bearing Co. v. PHD, Inc., 550 F.3d 1090, 1095-96 (Fed. Cir. 2008).

In the Request for Reconsideration after a denial of a Certificate of Correction filed with the Patent Office after the '322 patent originally issued, Linex's prosecution counsel noted that "claims 33 and 41 employ means plus function, as elements
that claim 33 is in means-plus-function format, as Plaintiff points out there is evidence that this may have been a mere prosecution counsel's statement that claim 33 is in means-plus-function format. While in isolation the statement indicates not in means-plus-function format--the Court finds that, like C.R. Bard, it is unclear what import, if any, to affix to Linex's draft patent claim 33. It discloses "a plurality of despreading devices for detecting" the first and second spread-spectrum signals.

Similarly here, a correction to claim 33 was allowed based on the understanding that claim 33 was in means-plus-function format, despite the fact that--unlike claim 41--it failed to use the word "means." As Defendant argues, claim 33 was drafted in language that could be considered functional. It discloses "a plurality of despreading devices for detecting" the first and second spread-spectrum signals. '322 patent at 20:36-40. As long as "a plurality" of despreading devices is not sufficient structure to take the limitation outside the realm of section 112, paragraph 6, it could be construed as a means for detecting the first and second spread-spectrum signals.

Given the competing doctrines at issue--prosecution history disclaimer and the rebuttable presumption that the limitation is not in means-plus-function format--the Court finds that, like C.R. Bard, it is unclear what import, if any, to affix to Linex's prosecution counsel's statement that claim 33 is in means-plus-function format. While in isolation the statement indicates that claim 33 is in means-plus-function format, as Plaintiff points out there is evidence that this may have been a mere mistake. Specifically, the term "means" is used in claim 41, but not in claim 33. Further, absent this single statement in the
Request for Reconsideration asserted to be a mistake, there is no evidence to suggest that the claim limitation was intended to be in means-plus-function format. In other words, the patent issued after a thorough prosecution without any indication that the limitation was in means-plus-function format. This single indication that claim 33 is in means-plus-function format arose only when Linex's prosecution counsel filed a Request for Reconsideration of a denial of a Certificate of Correction. As previously noted, the Court cannot simply ignore the remainder of the file history, specification, and claim set, none of which include any indication that claim 33 was intended to be in means-plus-function format. Given the entirety of the evidence, it seems highly likely that the statement that claim 33 was in means-plus-function format was a mere mistake. As such, the Court cannot say that this was a clear disavowal, and the presumption that the claim term is not in means-plus-function format has not been rebutted.

23 Defendant's citations to Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1214 (Fed. Cir. 1998), and Welker Bearing Co. v. PHD, Inc., 550 F.3d 1090, 1095-96 (Fed. Cir. 2008), have no bearing on this conclusion. Defendant cites both cases merely for the proposition that it can be appropriate to interpret a claim limitation as means-plus-function when a structure is defined in terms of its function. See RESP. at 29-30.

Therefore, the Court finds no justification for construing this claim term as being in means-plus-function format. The term "a plurality of spread-spectrum devices for spread-spectrum processing the plurality of subchannels of data, thereby generating a plurality of spread-spectrum-subchannel signals, respectively" is therefore properly construed as "a plurality of devices for processing the plurality of subchannels of data with one or more codes that distributes the signal across the available bandwidth, thereby generating a plurality of signals which correspond to each of the subchannels of data."

Plaintiff's Proposed Construction
subchannel signals processed using a form of communication in which the signal energy of the data is distributed across the allowed spectrum, where that spectrum is typically greater than or equal to the bandwidth required to carry the data

Defendant's Proposed Construction
signals, each corresponding to a different one of the subchannels of data, and each having been processed with a different pseudonoise (PN) chip-sequence signal

Plaintiff contends that the parties' main dispute underlying all of the spread-spectrum terms centers on a different understanding of spread-spectrum modulation. OPENING at 10. Plaintiff asserts that spread-spectrum modulation "spreads a signal carrying data across an allowed spectrum of frequencies, such that the allowed spectrum is typically greater than or equal to the bandwidth of frequencies required to carry the provided data." Id. Plaintiff argues that Defendant's proposed construction improperly limits the claimed spread-spectrum system to that disclosed in the preferred embodiment. Id. at 14. Further, Plaintiff contends that adopting Defendant's proposed construction would violate the doctrine of claim differentiation, as dependent claim 49 specifies a particular type of spread-spectrum that uses chip sequence signals. REPLY at 5.
Defendant responds that the term is defined by the specification. RESP. at 19. Defendant argues that the specification repeatedly points to a chip-sequence code and notes that the signals are created or defined by processing the signal with the chip-sequence spreading code. Id. at 19-20. Specifically, Defendant asserts that the '322 patent discloses that spread-spectrum processing is performed by a "chip sequence signal generator" involving a pseudonoise ("PN") spreading code. Id. Finally, Defendant argues that Plaintiff's proposed construction is overly broad and ignores the portion of the claim that requires that the subchannels be spread. Id. at 21-23. Defendant also argues that spread-spectrum processing is not a "form of communication." Id. at 21-22.

As previously noted, the parties' main dispute underlying all of the spread-spectrum terms centers on a different understanding of spread-spectrum modulation. See OPENING at 10. While actively contested, the parties do agree on a number of aspects of spread-spectrum modulation. The parties agree that spread-spectrum systems spread the transmitted signal over a particular bandwidth of frequencies that is generally larger than that required to carry the signal. See id. at 12; DEFENDANT'S TUTORIAL ON WLAN CONCEPTS ("DEF.'S TUTORIAL") at 50. The parties also agree that direct sequence ("DS"), frequency hopping ("FH"), and time hopping ("TH") are all spread-spectrum modulation techniques. OPENING at 14; DEF.'S TUTORIAL at 55.

However, the parties disagree on the breadth of modulation techniques encompassed by the term "spread-spectrum." Plaintiff asserts that Defendant's proposed construction is unduly narrow because it limits the term to DS systems and omits FH and all multicarrier spread-spectrum systems such as orthogonal frequency division multiplexing ("OFDM"). OPENING at 14. Defendant, on the other hand, asserts that Plaintiff's construction is overly broad and would improperly encompass OFDM processing. RESP. at 21. This dispute essentially centers on how spread-spectrum signals are processed. Defendant asserts that the '322 patent requires that spread-spectrum processing be performed by a chip sequence signal generator involving a PN code, RESP. at 20, while Plaintiff asserts that this would limit the patent to a particular modulation technique and the '322 patent discloses that it may be implemented with any spread-spectrum modulation scheme. REPLY at 3-4.

A. Intrinsic Evidence

Looking first to the intrinsic evidence, the patent specification, claims, and prosecution history fail to reconcile this dispute. While the claims and specification of the '322 patent repeatedly refer to "a spread-spectrum communications system," '322 patent at 1:59-60; "spread-spectrum devices," id. at 2:14-15; "spread-spectrum subchannel signals," id. at 2:21; and "spread-spectrum devices" which "spread-spectrum process" the data, id. at 3:25-26, the patent does not disclose what the term "spread-spectrum" means in this context. The prosecution history similarly fails to explain this fundamental principle. As a result, both parties have submitted extrinsic evidence which they contend shows how one of ordinary skill in the art at the time the patent was filed would understand the "spread-spectrum" terms.

Defendant contends that the '322 patent specification and claims together resolve the dilemma, but submits extrinsic evidence to rebut Plaintiff's arguments. Defendant contends that the '322 patent requires that the spread-spectrum processing be performed by a chip sequence signal generator involving a PN code. RESP. at 20. The specification repeatedly refers to chip sequence signals and chip sequence signal generators. See, e.g., '322 patent at 2:16-17, 3:43, 5:17-19, 6:28; see also id., Figs. 1, 2, 4, 5. However, the use of a PN code is only referenced twice in the specification. Id. at 6:28-30 ("The first, second, third and fourth chip-sequence signals . . . typically are pseudonoise (PN) spreading sequences."); id. at 7:9-11 ("A chip-sequence signal typically is generated from a pseudo noise (PN) sequence, as is well known in the art."). It is also worth noting that the asserted claims never refer to a PN code, spreading code, spreading function, or chip sequence signal.

With respect to the PN code, the patent fails to limit itself to the use of a PN code for the disclosed spread-spectrum modulation technique. This specific method of spread-spectrum processing is referenced only twice within the patent, and each time is within the preferred embodiments. The Federal Circuit has directed district courts to focus on the specification and prosecution history during claim construction, while taking care not to read particular embodiments into the claims. Tate Access, 222 F.3d at 966 ("[a]lthough claims must be read in light of the specification of which they are part . . . it is improper to read limitations from the written description into a claim"). Because the use of a PN code is not required by the claims and is disclosed only in the preferred embodiments, it would be improper to read this limitation for generating chip sequence signals into the asserted claims.

Moreover, in each of these two references, the specification notes that a chip sequence signal is "typically" generated from a PN sequence, implying that a chip sequence signal may be generated by other techniques. '322 patent at 6:28-30 ("The first,
A means of transmission in which the signal occupies a bandwidth in excess of the minimum necessary to send the information; the band spread is accomplished by means of a code which is independent of the data, and a synchronized

A means of transmission in which the signal occupies a bandwidth in excess of the minimum necessary to send the

second, third and fourth chip-sequence signals . . . typically are pseudonoise (PN) spreading sequences." (emphasis added); id. at 7:9-11 ("A chip-sequence signal typically is generated from a pseudo noise (PN) sequence, as is well known in the art.") (emphasis added). For these reasons, the Court declines to adopt Defendant's proposed construction.

Despite the fact that the specification repeatedly refers to the use of a chip sequence signal as the means for spread-spectrum processing, the Court is not convinced that this is a necessary limitation either. Looking first to the asserted claims, the patent fails to disclose how the transmitted signal is spread across the available bandwidth. Looking to the other claims, claim 61 discloses:

61. The method as set forth in claim 25 with the step of detecting the first spread-spectrum signal and the second spread-spectrum signal, including the step of detecting, responsive to a first chip-sequence signal and to a second chip-sequence signal, the first spread-spectrum signal and the second spread-spectrum signal as the first plurality of detected spread-spectrum signals and the second plurality of detected spread-spectrum signals, respectively.

'322 patent at 24:23-30. If the Court were to hold that the spread-spectrum modulation techniques disclosed in the asserted patent necessarily utilized a chip-sequence signal to spread the transmitted signal, this would render claim 61 unnecessary, as it would be identical in scope to claim 25. Noting the importance of both asserted and unasserted claims in properly construing claim terms, the Federal Circuit has noted that "[d]ifferences among claims can also be a useful guide in understanding the meaning of particular claim terms." Phillips, 415 F.3d at 1314 (citations omitted). Particularly relevant here, the Federal Circuit has specifically said, "the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim." Phillips, 415 F.3d at 1314-15 (citations omitted). Thus, the Court presumes that the chip-sequence signal limitation is not present in independent claim 25.

Furthermore, although the specification repeatedly refers to a chip sequence signal as a means for spread-spectrum modulation, nothing in the intrinsic evidence requires the use of this modulation technique. This modulation technique is disclosed in the preferred embodiment, however nothing in the claims, specification, or prosecution history limit the invention to the use of a chip sequence signal. To import this limitation from the preferred embodiment would be improper. Tate Access, 222 F.3d at 966 (Fed. Cir. 2000) ("[a]lthough claims must be read in light of the specification of which they are part . . . it is improper to read limitations from the written description into a claim"); Arbitron, 2009 U.S. Dist. LEXIS 1381, 2009 WL 68875 at *3 ("although the specification may indicate that certain embodiments are preferred, particular embodiments appearing in the specification will not be read into the claims when the claim language is broader than the embodiments").

Having fully reviewed the intrinsic record and taking the parties' agreements into consideration, the Court is left with undisputed examples of spread-spectrum modulation--DS, FH, and TH--but no resources from which to ascertain the scope of a proper construction consistent with the understanding of one skilled in the art. The patentee uses the term "spread-spectrum" repeatedly throughout the specification and claims to describe devices, signals, the system, and a type of processing. See '322 patent at 1:59-60; 2:14-15; 2:21; 3:25-26. However the patentee neither explains how one skilled in the art would understand this term, nor explicitly defines this term. See Johnson Worldwide, 175 F.3d at 990. The intrinsic evidence fails to disclose what one skilled in the art would understand this term's ordinary and customary meaning to be. See Phillips, 415 F.3d at 1313 ("the ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention"). After fully reviewing the intrinsic evidence, the meaning of this disputed term is ambiguous.

B. Extrinsic Evidence

Because the intrinsic evidence fails to disclose the proper scope of the term "spread-spectrum" as used in the '322 patent, the Court will now look to the extrinsic evidence submitted by the parties to ascertain a proper construction. Vitronics, 90 F.3d at 1584 (noting that if ambiguities remain after consideration of all available intrinsic evidence, only then should a trial court resort to extrinsic evidence in order to properly construe the claims). Plaintiff submits a tutorial co-written by Dr. Schilling entitled, "Theory of Spread-Spectrum Communications--A Tutorial." OPENING, EXH. C ("Schilling Tutorial"). Because it was published in 1982, this tutorial only provides background information regarding spread-spectrum techniques that existed sixteen years prior to the grandparent application being filed. This tutorial defines spread-spectrum as:

A means of transmission in which the signal occupies a bandwidth in excess of the minimum necessary to send the information; the band spread is accomplished by means of a code which is independent of the data, and a synchronized
reception with the code at the receiver is used for despreading and subsequent data recovery.

Id. at 855. The tutorial also notes the importance of the "means by which the spectrum is spread," before going on to describe how signals are spread in DS, FH, and TH systems. 8 Id.

8 The tutorial also notes that "to adequately cover the spread-spectrum system completely is the task for an entire text," and given the parties' considerable dispute over the term, the Court finds this conclusion applicable here as well.

Plaintiff also submits a section from the Code of Federal Regulations entitled, "Frequency Allocations and Radio Treaty Matters; General Rules and Regulations." OPENING, EXH. D ("CFR Regs."); 47 C.F.R. § 2.1 (1996). This section defines many of the terms and principles discussed herein. DS systems are defined as "spread-spectrum system[s] in which the incoming information is . . . added to a higher speed code sequence. . . . [which] is the direct cause of the wide spreading of the transmitted signal." Id. at 330. FH systems are defined as:

[S]pread spectrum system[s] in which the carrier is modulated with the coded information . . . causing a conventional spreading of the RF energy about the carrier frequency. . . . [which] changes at fixed intervals under the direction of a pseudorandom coded sequence. . . . [requiring a] wide RF bandwidth . . . to accommodate the range of frequencies to which the carrier frequency can hop.

Id. at 331. Similarly, TH systems are defined as "spread-spectrum system[s] in which the period and duty cycle of a pulsed RF carrier are varied in a pseudorandom manner under the control of a coded sequence." Id. at 338. Finally, spread-spectrum systems are defined as "information bearing communications system[s] in which: (1) [i]nformation is conveyed by modulation of a carrier by some conventional means, (2) the bandwidth is deliberately widened by means of a spreading function over that which would be needed to transmit the information alone." Id. at 337.

Defendant also submits a number of exhibits that it contends are relevant extrinsic evidence. First, Defendant submits portions of Newton's Telecom Dictionary. RESP., EXH. D ("Telecom Dict."). This dictionary defines spread-spectrum:

    Spread Spectrum . . . is a modulation technique in wireless systems. The data to be transmitted are packetized, and spread over a wider range of bandwidth than demanded by the content of the original information stream. Spread spectrum takes an input signal, mixes it with FM noise, and spreads the signal over a broad frequency range. Spread spectrum receivers recognize a spread signal, acquire and de-spread it and thus return it to its initial form (the original message).

Id. at 672.

Second, Defendant submits two patents listing Dr. Schilling as the inventor. The first patent describes spread-spectrum as providing a "means for communicating in which a spread-spectrum signal occupies a bandwidth in excess of, or equal to, the minimum bandwidth necessary to send the same information." RESP., EXH. E, U.S. Patent No. 5,081,643 ("the '643 patent") at 1:54-57. Defendant points to the portion of the patent which notes that this spread is "accomplished using a chip-code signal which is independent of an information-data signal." Id. at 1:58-59. The second patent notes that a spread signal may be despread by a receiver by "using a product detector with a chipping sequence . . . or a matched filter having an impulse function matched to the chipping sequence of the received spread-spectrum signal." RESP., EXH. F, U.S. Patent No. 5,422,908 ("the '908 patent") at 1:54-60.

Defendant also submits a number of other exhibits which, while probative on the issue of whether OFDM is a spread-spectrum modulation technique, are not probative of how one skilled in the art would understand the term "spread-spectrum" during the relevant time period. Defendant submits a decision from the Federal Communications Commission regarding spread-spectrum devices. RESP., EXH. G ("FCC Decision"). However, this decision is from 2001 and therefore does not assist the Court in determining how one skilled in the art would have understood the term spread-spectrum in 1998 when the patent application was filed.
Defendant also submits two decisions from this District which generally discuss spread-spectrum modulation and OFDM processing. RESP., EXHS. H, I. The decisions are from 2006 and 2008, respectively, and both involve a patent entitled, "Wireless LAN." See U.S. Patent No. 5,487,069 ("the '069 patent"). The application for this patent was filed in 1993, and the patent teaches a combination of three techniques for overcoming multipath interference in a wireless networking environment: 1) specific parallel-subchannels; 2) data reliability enhanced by forward error correction; and 3) data reliability enhanced by bit interleaving. Microsoft Corp. v. Commonwealth Scientific and Indus. Research Organisation, 572 F. Supp. 2d 786 (E.D. Tex. 2008). Importantly, the patent does not teach, nor focus on spread-spectrum modulation. In fact, the patent refers to spread-spectrum processing only once to note that the technique "consume[s] too much bandwidth . . . to be effective." '069 patent at 2:6-9. As a result, the discussion of spread-spectrum in Defendant's Exhibits H and I were not only unnecessary to the holdings--dicta--but were included merely as general background to the patents-in-suit. Therefore, this extrinsic evidence does not assist the Court in determining a proper construction for the "spread-spectrum" terms.

The extended time period from which the parties' extrinsic evidence was produced is further evidence that the term "spread-spectrum" was well-known in the art at the time the patent application was filed. One of ordinary skill in the art would have attributed meaning to this term, and the repeated and differing uses of the term within the specification and claims of the '322 patent support this conclusion. As a result, the Court will next move to framing a construction which embodies the ordinary and customary meaning of this term.

C. Means for Modulating a Spread-Spectrum Signal

As a result, it is clear and undisputed that DS, FH, and TH are all spread-spectrum modulation techniques. What remains in dispute is whether this Court's construction of the "spread-spectrum" terms should include a limitation regarding the means for modulation and, if so, how that means should be defined. The intrinsic evidence denotes a chip sequence signal for modulating the signal, but as previously noted, the patent is not so limited. The extrinsic evidence denotes multiple modulation means: 1) a code, SCHILLING TUTORIAL at 855; 2) a high speed spreading code (DS), CFR REGS. at 330; 3) a PN coded sequence causing spreading about changing carrier frequencies (FH), id. at 331; 4) a coded sequence which varies the period and duty cycle of the signal carrier in a PN manner (TH), id. at 338; 5) a spreading function, id. at 337; 6) a chip code signal, '643 at 1:58-59; and 6) a chipping sequence, '908 at 1:54-60.

While Plaintiff argues that a proper construction does not require a limitation as to the means of modulation for the spread-spectrum terms, such a construction--as proposed by Plaintiff--would be improperly broad. Plaintiff's proposed construction defines spread-spectrum by the function resulting from the modulation, but fails to limit the term to any means for modulation. Both the intrinsic and extrinsic evidence discuss and define spread-spectrum systems in terms of the means of modulation. With only one exception, each of the exhibits surveyed above defines spread-spectrum by its means for modulation. SCHILLING TUTORIAL at 855 ("the band spread is accomplished by means of a code with is independent of the data"); CFR REGS. at 337 ("the bandwidth is deliberately widened by means of a spreading function"); '643 patent at 1:58-59 (spreading is "accomplished using a chip-code signal which is independent of an information-data signal"); '908 patent at 1:54-60 (despreading occurs by "using a product detector with a chipping sequence . . . or a matched filter having an impulse function matched to the chipping sequence"). 9 Further, the importance of the means for modulation is highlighted by the '322 patent's repeated references to chip sequence signals and chip sequence signal generators. See, e.g., '322 patent at 2:16-17, 3:23, 6:17-19, 6:28; see also id., Figs. 1, 2, 4, 5. Merely defining this term by the result of the modulation is insufficient, and as a result, the Court finds that it is necessary to define the "spread-spectrum" terms by the signal spreading means. See, e.g., SCHILLING TUTORIAL at 855 ("The means by which the spectrum is spread is crucial.").

--- Footnotes ---

9 Newton's Telecom Dictionary is the only exhibit which does not explicitly define spread-spectrum in terms of the means for modulation. Instead, this exhibit notes that, "[s]pread spectrum takes an input signal, mixes it with FM noise, and spreads the signal over a broad frequency range." TELECOM DICT at 672. However, even the FCC Decision submitted by Defendant, which was not discussed in detail previously, defines spread-spectrum in terms of the means for modulation, further supporting this Court's conclusion. See FCC DECISION at 7 ("the bandwidth is deliberately widened by means of a spreading function").

--- End Footnotes ---
Therefore, the Court finds that a spread-spectrum system is a wireless communications system in which data to be transmitted is processed with one or more codes to generate a signal which is distributed across the available bandwidth. Incorporating that definition, the term "spread-spectrum subchannel signals" is properly construed as "signals, corresponding to each of the subchannels of data, which have been processed with one or more codes that distributes each signal across the available bandwidth."

4158

A. The District Court's Claim Construction

The district court looked to the prosecution history of the '745 patent to interpret the claim term "sputter-deposited dielectric." The district court concluded the prosecution history requires that a "sputter-deposited dielectric" be formed by a one-step reactive sputtering process and specifically not by a two-step process in which a metal layer is first deposited and then later oxidized. Because Cardinal's titanium oxide layer is formed by a two-step process in which the titanium is first deposited as a metal layer and then later oxidized, the district court concluded Cardinal's titanium oxide layer could not be a "sputter-deposited dielectric." Because Cardinal's product does not have a "sputter-deposited dielectric" layer "directly contiguous" with the silver layer, the district court further held that, as a matter of law, Cardinal's product could not literally infringe the '745 patent.

6 Although the district court erred in assuming that the entirety of Cardinal's dielectric layer, rather than only the titanium oxide layer, was formed by a two-step process, this error did not undermine the court's analysis because claim 14 requires that the "sputter-deposited dielectric" layer be "directly contiguous" with the silver layer. Thus, if the titanium oxide layer, which is "directly contiguous" with the silver layer, cannot be described as a "sputter-deposited dielectric," Cardinal cannot literally infringe that claim even though its zinc oxide layer can be described in this manner.

We agree with this analysis. Arguments and amendments made during the prosecution of a patent application and other aspects of the prosecution history, as well as the specification and other claims, must be examined to determine the meaning of terms in the claims. E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1438, 7 U.S.P.Q.2d (BNA) 1129, 1135 (Fed. Cir.), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988). The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580, 6 U.S.P.Q.2d (BNA) 1557, 1561 (Fed. Cir. 1988); Senmed, Inc., 888 F.2d at 818-20, 12 U.S.P.Q.2d (BNA) at 1511-13 (rejecting patentee's interpretation of claim term "on" as inconsistent with position taken during prosecution of patent application). Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers. Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562, 19 U.S.P.Q.2d (BNA) 1500, 1504 (Fed. Cir. 1991).

In the office action, dated July 5, 1988, the examiner made only one rejection based on prior art, rejecting all the pending claims as anticipated by, or alternatively, as obvious in view of Franz, U.S. Patent No. 3,846,152:

Franz teaches employing alternate layers of metal/metal oxide to a transparent substrate such as glass or plastic and the use of a protective layer to make a transparent heat reflecting window . . . . The metal layer is sputter deposited and the metal oxide layer is sputter deposited as a metal and then oxidized, see col. 4, lines 25-28. It is unclear whether the "metal oxide is sputter-deposited" limitation is meant to encompass the situation where the metal oxide is sputter deposited as a metal and later oxidized. Until clarification the examiner most [sic, must] interpret the claims broadly.

In response, Southwall amended an independent claim to describe the dielectric as a "sputter-deposited inorganic metal oxide, compound or salt." 7 Southwall explained the amendment:

7 Earlier versions of some original '745 claims had also used the narrower limitation "inorganic metal oxide, compound or salt" rather than "dielectric," which was used later. Although Southwall attempts to make much of this difference, it does not
affect our analysis because in both instances the key phrase the meaning of which is at issue, "sputter-deposited," is used in exactly the same manner, to modify the general class of dielectric materials as the list of specific dielectric materials. The arguments regarding the "sputter-deposited inorganic oxide, compound or salt" made during prosecution are thus relevant to our interpretation of "sputter-deposited dielectric" for purposes of literal infringement as well as to the application of prosecution history estoppel to limit the range of equivalents accorded that term.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

It is believed that the claims as last presented distinguished patentably over the Franz and Yatabe disclosures but to provide yet additional clear bases for distinction the claims have been amended to specify that the dielectric layer is laid down as a sputter-deposited inorganic metal oxide, compound or salt[.] As pointed out in the specification such layers can be laid down directly by reactive sputtering processes in which the metal is sputtered off of a metal target and directly converted to the oxide, compound or salt by the presence of a suitable gaseous reactant.

(Emphasis added.) In this response Southwall necessarily disclaimed the examiner's interpretation of "sputter-deposited" metal oxides as encompassing a two-step process in which metal is first deposited as a metal and then oxidized. In contrast to the examiner's interpretation in his office action being responded to, Southwall explained that its sputter-deposited dielectric is laid down in a one-step reactive sputtering process. Thus, the prosecution history limits the interpretation of "sputter-deposited dielectric" layer to exclude any dielectric layer formed by the two-step process. Because Cardinal's titanium oxide layer is formed in this manner it cannot be a "sputter-deposited dielectric."

Southwall argues, however, that Cardinal's two-step process is an indirect method of forming a "sputter-deposited dielectric," but is still a sputter-deposition process because Cardinal's titanium dioxide layer exists only by virtue of sputter-deposition. The titanium metal is sputter-deposited and converted to the oxide during sputter-deposition of zinc oxide. According to Southwall, the statement in the prosecution history, "such layers can be laid down directly" implies that the layers can also be laid down indirectly. However, Cardinal's titanium oxide layer is not laid down by sputter deposition as defined in the '745 patent, only the titanium metal layer is. The titanium oxide is formed by treating deposited titanium metal with oxygen. Although this occurs while a different material, zinc oxide, is being sputter-deposited, the reason for the presence of the oxygen does not change the post-deposition oxidation process by which the titanium oxide is formed and does not convert that process into a sputter deposition, i.e., a one-step process.

Because we conclude that a "sputter-deposited dielectric," as that term is used in claim 14, cannot be formed by a two-step process in which a metal layer is first sputter-deposited and then oxidized, we can only conclude that Cardinal's product does not have a "sputter-deposited dielectric" layer "directly contiguous" with the silver layer. Therefore, like the district court, we hold that as a matter of law Cardinal's product cannot literally infringe the '745 patent.

B. Southwall's Arguments

Southwall argues that "sputter-deposited dielectric" must be interpreted to also include a dielectric layer formed by the two-step deposition process oxidizing it because Southwall presented evidence that persons of ordinary skill in the art construe the expression to include any dielectric that results from materials laid down by sputtering. Southwall's evidence is affidavit testimony by its two experts describing Cardinal's titanium oxide layer as a "sputter-deposited dielectric." Alternatively, Southwall argues that any conflict between its experts and the prosecution history as to the meaning of "sputter-deposited dielectric" creates a genuine fact issue which makes summary judgment inappropriate.

Southwall imposes a contorted and incorrect analytical framework on the issues of claim interpretation and literal infringement when it argues:

2. The uncontroverted testimony of the experts below establishes that those skilled in the art consider a dielectric layer formed either by reactive sputter-deposition or by sputter up-oxidation [the two-step process] of a sacrificial layer to constitute a "sputter-deposited dielectric." Thus, the term "sputter-deposited dielectric" is literally met by the accused Cardinal structure;

3. Therefore, since the claim as written literally describes the Cardinal structure, the arguments made with respect to that term in the file history must be reviewed to determine whether that expression was given a special meaning in Southwall's
arguments which excludes the Cardinal structure. If the phrase was accorded a special meaning in the file history, a determination must be made as to whether the file history should be used merely to "interpret" the claims, or whether a file history estoppel by argument exists as to one or more of the claims.

Appellant's Brief at 35.

Southwall's framework fails in several respects. First, the evidence offered by Southwall does not establish the ordinary meaning of "sputtered-deposited dielectric" to one skilled in the art. In his declaration Dr. Stephen F. Meyer merely stated "it seems to me that [Cardinal's] dielectric layer as a whole (including both the titanium dioxide [sic. oxide] and the zinc oxide) could quite fairly be characterized as a 'sputter-deposited dielectric.'" Similarly, Robert L. Cormia's declaration states, "it is my opinion that the 'titanium' barrier layer that Cardinal deposits immediately after each of the silver layers is a 'sputter-deposited dielectric' in the LOE2 coatings, as that phrase is used in the '745 Patent." Neither Meyer nor Cormia testified as to how one skilled in the art would interpret the term "sputter-deposited" when viewed in light of the claims, specification and prosecution history. This testimony provides only conclusory legal opinions as to whether Cardinal's titanium oxide is a "sputter-deposited dielectric" rather than evidence of how that term is commonly used and understood in the art. See Becton Dickinson & Co., 922 F.2d at 797, 17 U.S.P.Q.2D (BNA) at 1100 (affidavit of expert on what constitutes an "extension" in the context of the asserted claim was only legal opinion which did not create a material fact issue).

Second, Southwall assumes that a claim term is only interpreted by first looking to its meaning in the art and then limiting that meaning in accordance with any relevant prosecution history, by either interpretation or prosecution history estoppel. The terms in a claim, however, are not given their ordinary meaning to one of skill in the art when it appears from the patent and file history that the terms were used differently by the applicant. Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387, 21 U.S.P.Q.2D (BNA) 1383, 1386 (Fed. Cir. 1992). A patentee may not proffer an interpretation for the purposes of litigation that would alter the indisputable public record consisting of the claims, the specification and the prosecution history, and treat the claims as a "nose of wax." Senmed, Inc., 888 F.2d at 819 n.8, 12 U.S.P.Q.2D (BNA) at 1512 n.8. In other words, evidence extrinsic to the patent and prosecution history, such as expert testimony, cannot be relied on to change the meaning of the claims when that meaning is made clear by those documents.

Because the meaning of "sputter-deposited dielectric" as used in claim 14 is clear from the prosecution history of the '745 patent, Southwall's expert affidavits cannot alter that meaning. Even if Southwall could show that "sputter-deposited dielectric" has a meaning to one skilled in the art different from the definition in the '745 specification and file history, the definition in the patent documents controls the claim interpretation. See Markman, slip op. at 21. Thus, we may not consider Southwall's opinion expert testimony as we interpret claim 14 as a matter of law. Because the expert testimony is entitled to no weight, it cannot create a genuine issue of material fact precluding summary judgment. Claim interpretation, as a question of pure law, is amenable to summary judgment and disagreement over the meaning of a term within a claim does not necessarily create a genuine issue of material fact. See id. at 18; Intellicall, Inc., 952 F.2d at 1387, 21 U.S.P.Q.2D (BNA) at 1386. Any other rule would be unfair to competitors who must be able to rely on the patent documents themselves, without consideration of expert opinion that then does not even exist, in ascertaining the scope of a patentee's right to exclude.

Third, Southwall seems to imply that principles of prosecution history estoppel are relevant in the claim construction step of a determination of literal infringement. There is, however, a clear distinction between following the statements in the prosecution history in defining a claim term, and the doctrine of prosecution history estoppel, which limits expansion of the protection under the doctrine of equivalents when a claim has been distinguished over relevant prior art. Biodex Corp. v. Loredan Biomedical, Inc., 946 F.2d 850, 862, 20 U.S.P.Q.2D (BNA) 1252, 1262 (Fed. Cir. 1991), cert. denied, 504 U.S. 980, 119 L. Ed. 2d 579, 112 S. Ct. 2957 (1992). Claim interpretation in view of the prosecution history is a preliminary step in determining literal infringement, while prosecution history estoppel applies as a limitation on the range of equivalents if, after the claims have been properly interpreted, no literal infringement has been found. See Senmed, Inc., 888 F.2d at 819-21, 12 U.S.P.Q.2D (BNA) at 1511-13. The limit on the range of equivalents that may be accorded a claim due to prosecution history estoppel is simply irrelevant to the interpretation of those claims.

Southwall further argues that the district court erred by failing "to recognize that in some claim combinations, the two-step process would not be literally covered by the claims, while in other claim combinations, the claim may be patentable for other reasons and literally cover a two-step dielectric process." Appellant's Brief at 44. Southwall then presents extended discussion tracing the development of claim 14 from the application through the prosecution to show that the cited
arguments it made during prosecution did not apply to any earlier version of claim 14.

Whether claim 14 derived from any application claim discussed in the prosecution history is irrelevant to our interpretation of claim 14 in light of that history. "Sputter-deposited dielectric" cannot be interpreted differently in different claims because claim terms must be interpreted consistently. See Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2d (BNA) 1109, 1113 (Fed. Cir. 1987), cert. denied, 484 U.S. 1027, 98 L. Ed. 2d 764, 108 S. Ct. 751 (1988).

Interpretation of a disputed claim term requires reference not only to the specification and prosecution history, but also to other claims. Id. at 631, 3 U.S.P.Q.2d (BNA) at 1112. The fact that we must look to other claims using the same term when interpreting a term in an asserted claim mandates that the term be interpreted consistently in all claims. Id. at 632, 3 U.S.P.Q.2d (BNA) at 1113 (examining use of term "standard" in nonasserted claims to interpret same term in asserted claims). Accordingly, arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary.

II. Infringement Under The Doctrine of Equivalents

The issue presented by this appeal is whether, because of the manner of its manufacture, Cardinal's titanium oxide layer is excluded, as a matter of law, from the range of equivalents that can be accorded the limitation "sputter-deposited dielectric." 8 The district court applied prosecution history estoppel in holding that the range of equivalents could not extend to Cardinal's dielectric layer because, "the Examiner specifically rejected any process where the 'metal oxide is sputter-deposited as a metal and later oxidized.' The Cardinal process is such a process." Slip op. at 20. Having concluded that the range of equivalents accorded this limitation in claim 14 could not encompass Cardinal's titanium oxide layer, the district court correctly held that as a matter of law Cardinal's product could not infringe the '745 patent under the doctrine of equivalents.

8 Cardinal does not contest for purposes of this appeal that "but for" the titanium oxide sacrificial barrier layer, factual issues exist as to whether its product infringes claim 14 under the doctrine of equivalents. Because claim 14 recites a "sputter-deposited dielectric" layer which is "directly contiguous" with a silver layer, additional layers in Cardinal's product intervening between its own "sputter-deposited dielectric" and silver layers would prevent infringement because a limitation would be entirely lacking from the accused device. Southwall suggests no way in which Cardinal's product can satisfy the "directly contiguous" limitation, even equivalently, if the titanium oxide layer is not a "sputter-deposited dielectric."

1. "Second Stage"

Fiori asserts that claim 28 calls for a "second stage," operatively coupled to the first stage, for generating an output signal which is a sum of the at least one intermediate signal generated in the first stage minus a potential of the at least one return reference signal plus an output return reference signal. (Pl.'s Markman Br. at 27-28.) Fiori claims that the specification of
the Reissue Patent provides explicit guidance as to the meaning of this terminology. According to Fiori, "second stage" is clearly described in an example as an operational amplifier in connection with resistors. 

n27 As set forth at column 7, lines 24 to 44, the process whereby this output operational amplifier produces a potential at its output which is a sum of the intermediate signal generated in the first stage minus a potential of the one return reference signal plus an output return reference signal.

Defendant submits that the "second stage" of claim 28 of the Reissue Patent specifies a gain factor of one (1). (Def.'s Markman Br. at 2, 31.) Rockford claims that the specification in the Reissue Patent and a comparison of claims 28 and 36 illustrate that the patent uses the word "proportional" synonymously with "gain." Rockford concludes that claim 36 defines the term "intermediate signal" as "the sum of the input source reference potential and a proportion of the input signal." Id. at 31. According to Rockford, "sum" cannot inherently encompass gain because if it did, the word "proportion" would add no meaning to claim 36. Id. Thus, similar to "output portion" of claims 1 and 17, Rockford argues that claim 28 specifies a gain factor of one (1) because the ordinary meaning of the words of claim 28 specify such and the claim calls for addition and subtraction of signals without multiplication. Id.

As previously discussed, there is no gain factor recited in either patent-in-issue. There is no requirement that "gain" have any value in any of the claims, let alone a requirement that gain have a value of 1 or unitary gain. Moreover, similar to its previously discussed interpretation of the term "output stage," Rockford overwhelmingly relies upon the testimony and the intent of the inventor Fiori. As previously stated, the testimony and the intent of the inventor offers extremely little probative value in determining the scope of the claims, except to the extent that it is documented in the prosecution history. See Engel Indus., Inc. v. Lockformer Co., 96 F.3d 1398, 1405 (Fed. Cir. 1996) (citing Markman, 52 F.3d at 985). As a matter of law, Fiori's testimony is irrelevant to the matters which presently face this Court. Thus, Rockford's interpretation of the term "second stage" is erroneous and unsupported. Finally, an indefinite article "a" in patent parlance, as in the "a sum" clause of claim 28 carries the meaning of "one or more" in open ended claims containing the transitional phrase "comprising." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351 (Fed. Cir. 2000). Thus, Rockford's interpretation that claim 28 specifies a gain factor of one (1) is erroneous and unsupported by intrinsic evidence.

5. "staging data in a first said plurality of transformation components"

The phrase "staging data in a first said plurality of transformation components" appears in claim one of the '990 patent. Claim one reads (with the disputed phrase in bold):

1. A computer implemented method for transforming data in a data warehousing application, comprising the steps of:

   specifying at least one source containing data;
   constructing a plurality of transformation components for manipulating data according to pre-determined sets of rules;
   coupling the transformation components to form one or more pipelines;
   specifying a target for storing data generated by one or more of the pipelines;
   staging data in a first of said plurality of transformation components; and
   streaming data in a second of said plurality of transformation components, wherein said staging and said streaming of data are performed automatically by software without human intervention.
Informatica proposes the definition "in a first transformation component, storing some amount of incoming data far processing." BODi proposes the construction "Staging data is the storing of incoming data fields as the transformation component processes the data fields. The degree of requisite staging by each transformation component is automatically determined and implemented, without any human intervention. Depending on the nature of the transformation, each transformation component will automatically select the optimal amount of staging. The staging can range continuously from zero staging (also known as streaming) to full staging."

Informatica contends that the term "staging" when used in the context of data is generally understood in the field to mean storing data prior to processing. Further, Informatica maintains that the patent sets out that staging can range continuously from zero, which is referred to as streaming, to full staging. Therefore, staging involves storing some amount of incoming data. BODi derives its proposed construction from the Summary of the Invention section of the specification. The complete text surrounding the language BODi urges states (with the BODi's proposal in bold):

The autonomy of each transformation software component is manifested in two dimensions: The first dimension of a component autonomy relates to how each transformation component implements staging (storing) the incoming data fields as it processes these data fields. The degree of requisite staging by each transformation component is automatically determined and implemented, without any human intervention. Depending on the nature of the transformation, each transformation component will automatically select the optimal amount of staging. The staging range continuously from zero staging (also known as streaming) to full staging. A transformation with zero staging is called streaming transformation. The second dimension of component autonomy relates to how each transformation component automatically selects its own mode of manipulating data input/output. Depending on the nature of the transformation, each transformation component, together with the server, automatically selects a push mode, a pull mode, or a push and pull mode that optimizes throughput.

Informatica posits that BODi's construction is incorrect for two primary reasons. First, the portion of the specification upon which BODi relies is discussing only a preferred embodiment. Second, the proposed construction reads into this term specific features that are included separately in the claim language, namely that the requisite degree of staging of data is performed automatically by software without human intervention. The Court agrees that BODi's construction results in redundancy in the claim language and renders portions of the remaining claim language superfluous. Claim one explicitly teaches that "staging and said streaming of data are performed automatically by software without human intervention." It is unlikely that the patentee contemplated that the phrase "staging data in a first said plurality of transformation components," appearing earlier in the same claim, also contained that feature. Indeed the additional text would be unnecessary if persons of skill in the art understood that staging data in a first said plurality of transformation components inherently serve such a function.

The Court adopts Informatica's proposed construction and construes the phrase to mean: In a first transformation component, storing some amount of incoming data for processing.

4161

A. "Data aggregation server" and "stand-alone data aggregation server"

The term "data aggregation server" appears with the modifier "stand-alone" only in the preamble of independent claim 1 and in the preambles of its dependent claims. As used in claim 1, it is apparent that "data aggregation server" and "stand-alone data aggregation server" refer to the same structure. See '544 patent at claim 1 ("A stand-alone data aggregation server" later referred to as "the data aggregation server comprising"). Hence, although these terms were briefed separately, the court construes them simultaneously.

Hyperion contends that "data aggregation server" means a "computer system programmed to perform data aggregation functions and not analysis or graphical user interface functions." Joint Cl Const at 48. Hyperion further contends that a "stand-alone data aggregation server" is a "data aggregation server that is external (self-contained) and operable independently from an OLAP server." Id at 51.

HyperRoll contends that both of these terms should not be construed because Hyperion did not assert they needed
construction in Hyperion's original Pat L R 4-1 contentions. Id at 48. Hyperion also contends that these terms do not need to be construed because they appear in only the preamble of the claims. HyperRoll Br at 4, 7. To the extent the court does construe these terms, HyperRoll defines "data aggregation server" as a "system or computer program for performing data aggregation functions" and "stand-alone data aggregation server" as a "data aggregation server that works with an independently operable OLAP server." Joint Cl Const at 48, 51.

First, the preamble of independent claim 1 appears to limit claim scope because limitations in the bodies of various claims derive their antecedent basis from the preamble. Compare '544 patent at claim 1 preamble ("A stand-alone data aggregation server for use with any one of a plurality of different OLAP servers **.") (emphasis added)) with id at claim 1 body ("the interface receiving requests communicated from any one of said plurality of different OLAP servers") and id at claim 2 body ("wherein the plurality of different OLAP servers comprise a plurality of different OLAP servers distributed by different vendors"). See also Catalina Marketing Intl, 289 F3d at 808 ("[D]ependence on a particular disputed preamble phrase for antecedent basis may limit claim scope because it indicates a reliance on both the preamble and claim body to define the claimed invention. Likewise, when the preamble is essential to understand limitations or terms in the claim body, the preamble limits claim scope.").

Turning to construction of the term, the crux of the dispute between the parties appears to center on two issues: (1) whether the data aggregation server can perform "analysis or graphical user interface functions" or whether it is limited to performing "data aggregation functions" and (2) whether the data aggregation server is "external (self-contained) and operable independently from an OLAP server" or whether the server merely works with an independently operable OLAP server.

Regarding the first issue, the court finds that Hyperion's construction improperly limits the functions that a data aggregation server can perform. This is evident based on dependent claim 5, which states: "The stand-alone data aggregation [sic] server of claim 1, wherein computational tasks performed by the aggregation engine is [sic] restricted to data aggregation operations." Because Hyperion's proposed construction would render this claim superfluous, it conflicts with the doctrine of claim differentiation and is disfavored. See Free Motion Fitness, 423 F3d at 1351 (Fed Cir 2005) (quoting Comark, 156 F3d at 1187). On the other hand, HyperRoll's proposed definition for "aggregation server" is consistent with the specification and claim language. See, e.g., '544 patent at 10:17-21 ("[T]he stand-alone Aggregation Server [in FIG 6A] performs aggregation functions (e.g. summation of numbers, as well as other mathematical operations, such as multiplication, subtraction, division etc) and multi-dimensional data storage functions"); id at claim 1 (the "data aggregation server" includes an "aggregation engine" that "perform[s] data aggregation operations").

Regarding the second issue, HyperRoll appears to interpret the modifier "stand-alone" as requiring the OLAP server to be "independently operable." But "stand-alone" does not modify "OLAP server"; "stand-alone" modifies "aggregation server," thereby suggesting that the aggregation server must be the claim element that is able to stand by itself.

But what does it mean to "stand alone?" The specification uses the term "external" interchangeably with "stand-alone." See '544 patent at 6:52-53 ("novel stand-alone (i.e., external) data aggregation server"). The specification also teaches that a stand-alone aggregation server could be physically external to an OLAP server. See, e.g., id at 13:19-27 ("[T]he Aggregation Server 603 can be plugged into (e.g. interfaced to) OLAP Servers (two shown as 605' and 605") of different users or vendors. ** This dramatic move discontinues the restricting dependency of aggregation from the analytical functions of OLAP **."). But the specification further teaches that a "stand-alone" aggregation server need not be physically external to the OLAP server, as demonstrated by one embodiment in which the data aggregation server "shares the same hardware platform and operating system (OS) that is used to run the [OLAP server]." Id at 15:44-46. Hence, "standing alone" does not necessitate physical separation between the aggregation server and the OLAP server.

Rather, the specification consistently describes the "stand-alone" aggregation server as functionally separate from, but working with, an OLAP server. See, e.g., FIGS 6A, 6E, 7A, 7B. It would appear that, at a minimum, this would require the software module for the stand-alone aggregation server to be "separate" from the software module for the OLAP server; otherwise, the "stand-alone" limitation would be meaningless. This usage fits with Hyperion's proposed construction, which requires the "stand-alone aggregation server" to be "external [to] and operable independently from an OLAP server." Relevant technical dictionaries also support Hyperion's construction. See Webster's New World Computer Dictionary 354 (10th ed 2003) ("standalone *** [s]elf-sufficient; not requiring any additional component or service"); IBM Dictionary of Computing 644 (10th ed 1994) ("stand-alone *** [p]ertaining to operation that is independent of any other device,
In sum, the court adopts HyperRoll's definition of an "aggregation server" as a "system or computer program for performing data aggregation functions." The court adopts a blend on the parties' constructions for a "stand-alone aggregation server," which is "an aggregation server that could operate independently from, but works with, an OLAP server."

### 4162

(5) Standard Control Module

Independent claim 1 includes the term "standard control module." The parties propose the following meanings to this term:

<table>
<thead>
<tr>
<th>Braun's Proposed Construction</th>
<th>VMI's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>A controller that controls features or components installed by the OEM.</td>
<td>Indefinite, limited to body control module (CBM); or simply another controller.</td>
</tr>
</tbody>
</table>

Braun's and VMI's interpretations of "standard control module" concentrate on two different things. Braun defines "standard control module" by what it controls, that is, features or components installed by the OEM, whereas VMI defines the same instrument by what it is, namely, a mere controller or a body control module ("CBM"). In a word, neither definition excludes the other.

Therefore, the Court adopts Braun's definition: "standard control module" is a controller that controls features or components installed by the OEM. Neither the claims nor the specification limit the "standard control module" to just body control module, as suggested by VMI. At the same time, the specification recognizes that a "standard control module" need not be a device installed by the OEM (see '628 Patent col. 4:64-65 ("Standard control module is typically an OEM installed component." (emphasis added); see also id. at col. 5:5-8 ("... standard control module [is] standard component[] supplied by a manufacturer of vehicle or installed by the vehicle owner or a third party." (emphasis added))); it only controls OEM equipment.

### 4163

13. "[S]tandardized tasks:" 13 "Tasks commonly performed." The parties agree with the court's construction. The specification provides that the task library contains the list of "all the standardized tasks across the organization," col. 104:66-67, thus suggesting that "standardized tasks" are tasks common to the entire organization. The court's construction results from supplementing this sparse intrinsic guidance with the plain and ordinary understanding of "standardized" as "common."

--- Footnotes ---

13 '284 patent, claim 3.

--- End Footnotes ---
Cisco's proposed construction for "standby router" is "a router that backs up the active router and may become the active router under certain circumstances." Alcatel's proposed construction is "the router operating in the standby state based on an election to designate that router as the router that will assume the duties of the active router when the active router leaves the network."

Once again, the parties' arguments follow the same pattern: Alcatel argues that, because this is not a term generally known to one of ordinary skill in the art, the Court must look to the patent specification to ascribe meaning to the term; Cisco argues that the claim language does not limit the term in the manner that Alcatel suggests, and hence the term should be construed as broadly as the claim language supports. Again, the Court finds it necessary to look to the language and the purpose of the patent in order to discern the claim term's intended meaning, which cannot be inconsistent with the manner in which the term is used in the claims. See Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d at 1332 ("The specification of the patent in suit is the best guide to the meaning of a disputed term."); Apple Computer v. Articulate Sys., 234 F.3d at 25.

The essential differences between the parties' proposed constructions for "standby router" is that Alcatel contends that (1) there can only be one standby router existing at a given time, (2) the standby router is selected by an "election," and (3) the standby router will automatically assume the duties of active router when the active router leaves the network. Cisco's proposed construction does not contain these limitations.

Alcatel points to portions of the specification that support its construction. In particular, the specification describes an example of when the standby router is selected by election, in order to replace the previous standby router that automatically took over as the active router when the previous active router left the group. See Li, at 9:6-26. Furthermore, the specification and the claim language appear to contemplate only one standby router operating at a time. See, e.g., Li, at 9:67-10:11, 17:67-18:1.

However, Cisco points out that claim 19 adds an additional limitation to claim 10 that includes a "means for determining a priority of the routers in the network segment." Id. at 18:47-50. Cisco contends that the routers' priorities are the values by which an election may be held, 37 and thus the standby router discussed in claim 10 cannot be limited to a designation by election, because the criteria used in such an election (i.e. the routers' priorities) are specifically incorporated in dependent claim 19.

Nevertheless, there is no other indication in the patent of how the new standby router is to be designated once the previous standby router becomes the active router, other than by election. This process is so fundamental to the patent, that it is even explained in the abstract: "If the standby router becomes inoperative or takes over for the active router, other routers in the group hold an election to determine which of them should take over for the standby router." Li, at Abstract. However, nothing in the claims or the specification require that the standby router always be designated by election (for example, if the network administrator chooses to designate the standby router), and therefore the Court will not read this requirement into the claim.

Finally, while the patent allows for only one router to function as the standby router at a given time, as Alcatel asserts, the patent does contain instances where the standby router does not become the active router when the active router leaves the network, as Cisco asserts. In particular, when the active router resigns in response to a coup message, as defined above, the active router unicasts a resign message to the sender of the coup message, and the sender, not the standby router, then becomes the active router. See Li, at 12:61-13:3. However, the patent does require that the standby router automatically

- 4437 -
become the active router when the standby router receives a resign message from the active router, or when the standby router does not receive a hello message from the active router within a specified amount of time. See, e.g., Li, 14:1-7, 14:57-15:3. Additionally, the patent recognizes other scenarios under which a standby router will become the active router. See id. at 9:60-64.

Therefore, the Court construes the term "standby router" to mean "the router that backs up the active router and becomes the active router under certain circumstances, such as upon receipt of a resign message from the active router, or when a hello message is not received from the active router within a specified amount of time."

4165

(3) star-topology network

N-Data and National both agree that the court should give this term its plain and ordinary meaning. N-Data also provides an alternative construction. Dell asserts that the court should construe the term in accordance with the specification. N-Data argues that Dell's definition improperly includes unnecessary configuration and activity requirements. Dell points to a specific paragraph of the specification, which states "[p]referably, the present system is implemented as a star-topology network with data sources transmitting to a central hub which, in turn, transmits the data to data sinks. A single node can act as both a source and a sink." '261 Patent, col. 4, ll. 10-16 (emphasis added). This cited passage clearly defines what the patentee intended "star-topology network" to require.

As such, the court defines "star-topology network" as follows: "network configuration with data sources transmitting to a central hub which then transmits the data to data sinks. A node can act as both a data source and a data sink."

4166

2. starting a formatting process for said optical disc as a background process (claims 8 and 9)

Plaintiff's Construction: "Starting formatting of an optical disc, which an optical disc drive does as a background process"

Defendants' Construction: "initiating or beginning a formatting operation for said optical disc, in which a recording operation or a reproducing operation can be accepted while the formatting operation is being performed"

This term represents the strongest example of the parties' tendency to make much ado about nothing. Plaintiff admitted when addressing this term at the hearing that "the distinction between parties' position[s] is not obvious from looking at their proposed constructions." Dkt. # 186, at 42. I will take this one step further by saying that the substance of the parties' respective definitions is essentially identical, with the only difference being that defendants propose replacing the word "starting" with "initiating or beginning." However, during the hearing, defendants conceded that "I think everyone pretty much knows what starting means." Dkt. # 186, at 55.

If the parties' constructions are the same, what is the dispute about? Both in its briefs and at the hearing, plaintiff devoted much argument to the question whether the formatting process must remain in the background at all times. However, nothing in plaintiff's proposed construction reflects the answer to this question and I am not going to invent a construction when neither side advanced one, particularly because the term addresses the "starting" of a formatting process, not any other part. Plaintiff argues also that this term should not be construed to require that the formatting process begin as a background process. On its face, this proposal is directly contrary to the claim language. Plaintiff does not explain how "starting a formatting process . . . as a background process" can be read to mean that the formatting process does not start as a background process. In any event, plaintiff does not propose a construction that reflects its understanding. Accordingly, I conclude that this term cannot be construed further at this time.

Court's construction: No construction needed.

GO BACK

- 4438 -
7. First state and second state.

Samsung contends that the court should define the terms "first state" and "second state" to mean modes of operation. In other words, an accused device would operate in a "first state" or "first mode of operation" and a "second state" or "second mode of operation." Samsung argues that O2, in the case against MPS, suggested a similar construction. In particular, Judge Wilken's order reflects O2's argument that "conduction state" should be construed with reference to the ordinary usage of "state." O2 contended that the ordinary usage of "state" was the "mode or condition of something." Moreover, O2 sponsors a similar definition in this case. See O2's Amended Opening Claim Construction Brief, at 28 ("Rather, 'conduction state' means 'the mode of a switch, either on or off'). This court agrees that the ordinary usage of state means the "mode or condition" of something and as such defines a "state" for purposes of this case to mean "a mode or condition." The term "first state" means "first mode or condition" and the term "second state" means "second mode or condition.

Changes in State Characteristic of an Event

Claims 1, 20, and 40 of the '525 Patent contain the term "changes in state characteristic of an event." SFA contends that the term means "changes in information relating to the status of an event." SFA argues that its definition is in accord with technical dictionaries that define "state" as "status." SFA suggests that the word "status" is more commonly understood than "state" and will thus aid the jury in understanding the scope of the patent. Defendants contend that the term is indefinite, but alternatively argue that the term means "changes in a data field stored in the database of the event manager." Defendants urge that because the term is borderline ambiguous, the term should be limited to the four corners of the preferred embodiment disclosed in the specification in order to serve the notice function of the claim. In support of their indefiniteness argument, Defendants suggest that the patentee served as his own lexicographer in defining "state characteristics" but failed to provide any soluble definition. However, as explained below, the term is not indefinite and means "a change in a unique configuration of information within the system that is indicative of the occurrence of an event within the system."

Both parties provided definitions for the term "state characteristics," and assumed that the patentee had coined the noun "state characteristics" to describe some aspect of an event. However, the term "state characteristics" never appears in any of the claim language. In fact, the proper reading of the phrase separates "state" from "characteristic" and applies the term "characteristic" as an adjective. Therefore, the correct reading is to the effect that changes in state are characteristic of an event occurring within the system.

The confusion regarding this term is understandably based on the Patent's prosecution history. In response to a rejection of all the claims in the original patent application as obvious in light of prior art (specifically the "Negrino reference"), the claims in the application were dramatically amended. See Plaintiff's Opening Construction Brief Ex. 2, Amendment of December 10, 1997. The phrase "changes in state characteristic of an event" was first added to the claims during this amendment. Id. at 2, 7-8. In conjunction with these amendments, and in an attempt to distinguish the invention from the Negrino reference, the patentee explained that the invention "has the ability, based on the particular changes in state detected, to infer the particular context in which the event occurs." At this stage of the prosecution history, there is no reference to events having "state characteristics" or the patentee's intention to be his own lexicographer with respect to the term. Similarly, there seems to be no indication that the patent examiner mistook the phrase "state characteristic" to be a new term coined by the patentee. See Plaintiff's Opening Ex. 2, Office Action dated March 1, 1998 at 5. However, the examiner rejected claim 1 as indefinite for failing to particularly point out the subject matter of the invention. Specifically, the function of the "event manager" was described in claim 1 as "inferring occurrence of an event based on detecting a change in state characteristic to said event," and then described in the specification as "recognizing the occurrence of events and then determining the context in which the event occurred." The examiner believed that because of the differences in these descriptions, the patentee was describing the "event manager" as having inconsistent functions. Id. at 5-6.
In response to the March 1998 office action, the patentee explained that the two descriptions described the same function. See Plaintiff's Opening Ex. 2, Amendment of July 14, 1998 at 2. The term "state characteristics" first appears in that explanation. In trying to provide a word-for-word translation of the two descriptions the patentee sloppily equated both the occurrence and context surrounding an event (words used in the specification description) with "state characteristics" (words used in the claim description). In reviewing this word-for-word translation, the examiner incorrectly concluded that the patentee was attempting to redefine "state characteristic" in order to conform the claim description with the description in the specification. See Plaintiff's Opening Ex. 2, Office Action of September 9, 1998 at P 4 ("The Examiner recognizes that Applicants can be their own lexicographers and accepts their explanation regarding 'state characteristic of an event'.").

After reviewing the entire record including the descriptions of the function of the "event manager" in the specification and the claims, it is evident that the descriptions describe the same function to one skilled in the art without necessitating a unique definition of "state characteristic." Therefore, both sides' suggested definitions must be rejected. It is also evident that the patentee did not intend to redefine "state characteristic" when explaining the discrepancy to the patent examiner. Rather, the explanation in the July 1998 Amendment was a muddled attempt to explain that the "event manager" performs its function by recognizing changes in unique data configurations, and thus, the claim language and specification description were in agreement. A "state" is well understood in the art to mean a certain unique configuration of information. This definition of "state" is well illustrated in the specification. For example, data concerning customer interests provided to the "lead generation" component of the system will change the unique configuration of information, thus prompting the "event manager" to transfer the data to other components of the system for "action or follow-up." See '525 Patent at 11:23-26. There are numerous other examples. See, e.g. id. at 13:20-24, 15:4-16, 27:41-46. Given the examples provided in the specification, along with the generally understood definition of state, one skilled in the art would understand "changes in state characteristic of an event" to mean "a change in a unique configuration of information within the system that is indicative of the occurrence of an event within the system."

4169
"Shuffler State Information"

VendingData asks the court to construe the term "shuffler state information" to mean:

either a "shuffle counting" or "card counting," where "shuffle" means "riffle."

VendingData again argues that because the dictionary offers multiple definitions for the terms "state" and "information," the terms are ambiguous and require construction. VendingData acknowledges that the term "shuffler state information" is not used in the written description, but asserts the prosecution history reflects that the patentee distinguished this claim term from the prior art Lorber patent by identifying shuffle counting and card counting as part of the display function of the shuffler. Thus, VendingData argues the patentee defined the term "shuffle cycle" for the '373 patent as "single riffle." Therefore, "shuffle counting" means "riffle counting."

The term "shuffler state information" appears in claims 8 and 9 of the '373 patent. VendingData concedes that the construction it offers is not the ordinary meaning of the term "shuffler state information." Although the terms "state" and "information" have multiple dictionary definitions, it does not take an exercise in genius to eliminate the dictionary definitions that do not apply to the claims described. The claim can easily be construed to encompass all consistent dictionary meanings. Viewed in the context of the intrinsic record before the court, it seems clear the term "shuffler state information" means "shuffle counting" or "card counting."
information" refers to information concerning the condition of the shuffler, or the machine that mixes the cards as described in the patent. VendingData has not overcome the presumption of ordinary meaning, and no claim construction is required.

E. "state object" and "state information" as used in claims 1, 9, 10, and 14.

The parties' dispute focuses on whether (i) "state object" and "state information" should have identical constructions, and (ii) if construed separately, what those constructions should be. Each question is discussed in turn.

1. State Object and State Information Are Different Claim Terms

Dispositive of this issue is the Federal Circuit's prohibition against stripping claim terms of their meaning. See, e.g., In re Gabapentin Patent Litig. 503 F.3d 1254, 1263 (Fed. Cir. 2007) (accepting district court's construction because it "gives full meaning to every word of the entire claim term"); Bicon, Inc. v. Straumann Co., 441 F.3d 945, 950 (Fed. Cir. 2006) (refusing construction that would leave a claim term with no meaning). Further, as a corollary rule, the Federal Circuit has sensibly held that "[i]n the absence of any evidence to the contrary, we must presume that the use of these different terms in the claims connote different meanings." CAE Screen Plates v. Heinrich Fiedler GmbH & Co. KG, 224 F.3d 1308, 1317 (Fed. Cir. 2000).

The application of these principles here points persuasively to the conclusion that the patentee ascribed different meanings to "state object" and "state information," and that defendants' attempt to give an identical construction is unavailing. For example, in claims 9 and 10, substitution of "state object" for "state information" yields: "receiving[/transmitting] a state object which specifies a state object." Likewise, reverse substitution leads to the equally awkward result of "receiving[/transmitting] state information which specifies state information." Clearly, then, the terms "state object" and "state information" cannot have identical meanings because, absent evidence to the contrary, it is presumed that the patentee did not intend such redundancy. See Ortho-McNeil Pharm., Inc. v. Mylan Labs., Inc., 520 F.3d 1358, 1362-63 (Fed. Cir. 2008) (rejecting nonsensical result).

Defendants' arguments to the contrary are unpersuasive. Specifically, they point to a statement in the specification that allows the "term state object [to] also [be] used herein to refer to the state information." '670 Patent Specification col. 7 11. 26-27. While defendants correctly observe that the two claim terms can be used interchangeably in some instances, the quoted statement does not require that the claim terms bear the same construction. Indeed, it is natural to use the claim terms interchangeably in some circumstances, given their close relationship. For instance, it would be appropriate to make reference either (a) to a server's sending a state object containing state information, or (b) to a server's sending the state information itself.

In sum, because the use of different claim terms gives rise to the presumption that the claim terms should be construed separately, and because defendants present no persuasive evidence rebutting this presumption, "state object" and "state information" are given separate constructions here.

2. Construction of "State Object" and "State Information"

Plaintiff offers two separate constructions for these two claim terms. As to "state object," plaintiff proposes that the claim term be construed as "data having a predetermined structure that specifies state information." Relatedly, plaintiff proposes that "state information" be construed as "information, such as a cookie, that specifies an identity, a characteristic, or a condition of a client and/or a server." By contrast, because defendants believe the two claim terms are one and the same, they propose a single construction--"information concerning the web server's condition or transition as a result of the web user/client's request"--for both claim terms.

a. "State Object," as used in claims 1, 9, 10, and 14.

In this instance, it is appropriate to begin with the language of the claims. See Advanced Cardiovascular Sys., 265 F.3d at 1304. Here, claims 9, 10, and 14 make clear that a "state object" is the form by which "state information" is transmitted. See
'670 Patent Claims 9, 10, 14 (referring to "a state object which specifies state information"). This construction is confirmed by two embodiments found in the patent specification's summary of the invention. See '670 Patent Specification col. 2 11. 32-33 ("[S]tate information . . . is typically in the form of a state object."); id- col. 2 11. 52 (describing a "state object, which specifies the state information"). By contrast, defendants' proposed definition--"information concerning the web server's condition or transition as a result of the web user/client's request"--is more appropriately considered with reference to the claim term "state information" because it relates to the type of data transmitted, rather than its form. Accordingly, because the claim language, confirmed by the specification, makes clear that a state object contains state information, the claim term "state object" is construed to mean "data having a predetermined structure that specifies state information." 

b. "State Information," as used in claims 1, 9, 10, and 14.

The disagreement between the parties' interpretations of "state information" focuses on whether state information includes client state information, server state information, or both. Plaintiff argues that "state information" encompasses both client and server information. Defendants agree that server state information is included, but argue that client state information was disclaimed in the course of patent prosecution. Dispositive here is the specification's explicit reference to both client and server state information.

Where, as here, the ordinary meaning of the claim term is ambiguous, it is the specification that provides the "single best guide to the meaning of a disputed term." Vitronics, 90 F.3d at 1582. The parties sensibly agree that the specification describes an online shopping embodiment establishes that "state information" may contain server state information, such as memory of the products presently held in an online shopping cart. See, e.g., '670 Patent Specification col. 2 11. 60-62. In addition, the specification plainly indicates that

the client system may access a Web server that is specified in the received cookies such that the client system transmits the cookies to the server, thus providing state information about the client system to the server system.

Id. col. 7 11. 40-44 (emphasis added). Accordingly, the intrinsic evidence strongly supports a construction of "state information" that includes data pertaining to both a client or server. 18 "State information" is therefore construed to mean "information, such as a cookie, that specifies an identity, a characteristic, or a condition of a client and/or a server."

18 Defendants contend that plaintiff may not rely on the online subscription service embodiment to support its argument that "state information" includes data relating to the client because the embodiment was disclaimed during the patent's prosecution in the PTO. Whether the patentee in fact disclaimed the online subscription service need not be reached, given that the specification clearly evidences the possibility that state information may contain data about the client. Nonetheless, out of an abundance of caution, and to define the scope of the disputed claim term more precisely, it is noted that the record evidence weighs against finding a prosecution disclaimer. Importantly, a district court undertaking claim construction may only recognize a clear and unambiguous disclaimer excepting a given construction from the scope of the patent. See Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1374-75 (Fed. Cir. 2008) (citation omitted). No such showing can be made here, as the prosecution history evidence points persuasively to the conclusion that the patent examiner included the online subscription service embodiment within the '670 patent's scope. Specifically, paragraph 1 of the Notice of Allowability, which states the patent examiner's reasons for allowing the patent prosecution to proceed, makes reference to the following passage, now found at column 7, lines 45-54 of the issued '670 patent:

Examples of new applications [using this claimed extension of the http protocol] include on-line shopping that stores information about items currently selected by consumers, fee-for on-line services that can send back registration information and thus free users from retyping a user-id on next connection, and Web sites that can store per-user preferences on the client system and have the client supply those preferences every time the site is later accessed.

'670 Patent Specification col. 7 11. 45-54. The patent examiner's reference to these "applications" of the claimed invention in its Notice of Allowability evidences an understanding that the online subscription service embodiment was included within the scope of the '670 Patent. Accordingly, defendants fall short of establishing a clear and unambiguous disclaimer.
C.

An additional limitation of claim 1 is found in the requirement that the "conversation type record structure" define the "state of the conversation." '603 patent, col. 8, l. 63. Although the district court did not explicitly construe the term "state of the conversation," the court determined that no reasonable juror could conclude that this limitation was not met in MONSTR because the MONSTR system defines various states of conversation such as "in-transit" and "accepted." See Action Techs., 1997 WL 337577, at *5. Furthermore, the district court determined that the action of accepting an STR has communicative content and therefore changes the state of the conversation. See id. The court noted that acceptance of an STR in MONSTR indicates to the party sending the STR that the receiving party is taking responsibility for the problem. See id.

The specification addresses "state of the conversation" as follows:

For the programming of the current embodiment the programming notational convention of naming "States of Conversations" was adopted. The notation is used in this way: a series of States, corresponding to general conditions of incompletion found recurringly in conversations, is named. Then, based upon the incompletions found in those states, rules are developed about what roles may be permitted what moves at that state.

'603 patent, col. 20, ll. 53-61. This is consistent with the ordinary meaning of the term "state" which is "a set of circumstances or attributes characterizing a person or thing at a given time." Webster's at 1309. We therefore construe the phrase "state of the conversation" to mean a set of attributes characterizing the conversation at a particular point in time. The Designing Systems reference discloses that MONSTR tracks the state of each STR and checks the state of the STR to determine what actions are permitted. See Designing Systems at 187. Specifically, the reference shows that MONSTR characterizes the conversation at a particular point in time based on the activity being performed on the STR. MONSTR tracks this information using states with names such as "generate query," "evaluate patch proposal," and "in transit." We have no difficulty concluding that the district court did not err in holding that there was no genuine issue of material fact as to whether this limitation was met in MONSTR. We reject the argument advanced by Action Tech that MONSTR does not meet this limitation because accepting an STR does not constitute acceptance of responsibility for fixing software bugs, but merely acknowledges receipt of the STR. As Communication-Oriented and Designing Systems make clear, the acceptance of an STR and the selection of options under MONSTR do have conversational significance.

b. "state transformation operation"

The parties dispute the meaning of the phrase "state transformation operation." The Court has already defined the word "state." See supra A(2). The word "transformation" is a common term generally meaning "to change." The Court finds no basis for giving the phrase "state transformation operation" any different construction than its plain ordinary meaning of "a process for changing the state." The Court declines to include in its construction the phrase "mathematical function," on the ground that its inclusion would improperly import a limitation into the claim.

1. "state variable" Used in independent Claims 1, 6, & 20 and in dependent Claim 25.

This term is commonly used in the mathematical modeling of systems. It was not specifically defined by the patentee acting as his own lexicographer. Cisco proposes that it should mean "something that represents data or a type of data that is used to determine whether to update a memory." Telecordia contends that "state variable" should be defined as "information describing an aspect of a network element."
The arguments of both parties concerning this term are terse, citing only a few places in the specification where the term is used, and making no reference to the prosecution history. In fact, "state variable" is used ten times in independent Claims 1, 6, and 20, once in independent Claim 25, and no fewer than twenty times in the specification.

Cisco points to '656 patent, col. 6, ll. 47-56, which describes three "variables" representing information about, or information stored in, a network element. The specification states that these or other "state variables stored in MIB 24" can be used to determine whether to perform a full or partial database reconciliation. '656 patent, col. 6, ll. 57-59.

Claim 1 describes how the "state variable" is used by the network manager to determine whether to update part of the memory. '656 patent, col. 13, ll. 9-16. See also, '656 patent, col. 6, ll. 3-8. Accordingly, as Cisco agreed at the hearing, describing how a state variable is used, in the definition of "state variable," is not necessary.

Telcordia suggests that a state variable is "information describing an aspect of a network element." But the specification makes it clear that each state variable represents certain information - it is not information itself. For example, the variable SRNE represents the number of set requests . . . " '656 patent, col. 6, ll. 51-53 (emphasis added). See also, '656 patent, col. 6, ll. 45-56. As soon as a value is assigned to that variable, the network manager has information about the number of set requests that have been made at that particular time.

In construing this term, one of ordinary skill in the art would know, and the parties agreed at the hearing that:

1. "Variable" means that it is a data item, the value of which can change;
2. A value can be assigned to a state variable;
3. When a value is assigned to a state variable in this case it tells us something about (or defines) a characteristic of, or event concerning, a network element.

In other words, there is no indication that the patents are using "state variable" in any way other than as commonly used by those skilled in the art, in references cited in the '656 patent, and as defined in technical dictionaries. See U.S. Patent No. 6,058,445, col. 3, ll. 34 - col. 4, ll. 14. "a variable that defines one of the characteristics of a system or component," in this case, a network element. See also, IEEE Standard Dictionary of Electrical and Electronics Terms 1040 (6th ed. 1990). The court will define this term as follows:

"State variable" means "the value of a data item, the value of which can change, that defines a characteristic of, or event concerning, a network element."

The parties dispute the meaning of "static" in "static display of prices" and "common static price axis." Plaintiff argues that the price axis is static, or unmoving, in relation to a change in the inside market. Plaintiff further argues that the patents limit the movement of the price axis in order to increase the likelihood that a trader will not miss his price. Therefore, plaintiff encourages us to adopt a construction of "price levels that do not normally change positions when new market data reflecting a change in the inside market is received," Defendants urge adoption of their various constructions, all of which limit movement of the price axis to a manual re-centering or re-positioning command. At the center of this fight is the question of automatic re-centering-do plaintiff's patents cover automatic re-centering? Plaintiff answers in the affirmative and, not surprisingly, defendants answer in the negative.

Although our preliminary injunction construction aligned with plaintiff's view, such construction was, simply put, preliminary. Jack Guttman, Inc. v. Kopykake Enterprises, Inc., 302 F.3d 1352, 1361 (Fed.Cir. 2002) ("District courts may engage in a rolling claim construction, in which the court revisits and alters its interpretation of the claim terms as its understanding of the technology evolves"). Today we have a better understanding of the technology, and all parties have had
the opportunity to flesh out their arguments.

We now choose to alter our initial construction, construing "common static price axis" as "a line comprising price levels that do not change positions unless a manual re-centering command is received and where the line of prices corresponds to at least one bid value and one ask value." We construe "static display of prices" similarly, as "a display of prices comprising price levels that do not change positions unless a manual re-centering command is received." Defendant eSpeed pointed us to MSN Encarta Dictionary to set forth the ordinary and customary definition of static: "motionless: not moving or changing, or fixed in position." Our search of Webster's II New College Dictionary yielded similar results: "Having no motion: at rest" While we recognize that Phillips teaches us that a dictionary definition should only be used for context. Phillips also teaches that the "words of a claim are generally given their ordinary and customary meaning."...[is] the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." 415 F.3d at 1312-13. Plaintiff has given us no reason to think that such a person of ordinary skill in the art would construe "static" as anything other than non-moving at the time of the invention. n4

n4 We do find it interesting that in all of plaintiffs filed exhibits with regard to claim construction, including two dictionary excerpts, plaintiff has never argued that the ordinary and customary meaning of "static" is something other than stationary or non-moving.

If "static" ordinarily means non-moving, then we cannot see how we can construe it any other way. The only exception can be the one explicitly stated in the specifications and prosecution history—movement due to receipt of a manual re-centering command. If we were to construe the term inclusive of additional unstated exceptions, such as automatic re-centering, we would not know where to stop. Defendant eSpeed aptly asks, "Why is a price display which automatically recenters after every two seconds 'static,' but a price display which automatically recenters after every five seconds is not?" Why is a price display that automatically recenters when the inside market exceeds three ticks from the center price 'static,' but a price display which automatically recenters after every fifth tick is not?" (eSpeed's post-Markman brief, at 6, n4). Plaintiff's own argument raises the same questions. Plaintiff notes, "In fact, with eSpeedometer (which contains a slow drift recentering component,) a price level never suddenly changes position under a trader's cursor causing him to miss his intended price. This is in contrast to the eSpeed product addressed by the Court at the PT hearing which provided for an instantaneous automatic recentering when the inside market moved off the top or bottom of the screen. Thus, eSpeedometer is more 'static' than eSpeed's previous product because it provides the trader with virtually a 100% guarantee that he will not miss his intended price" (plf's post-Markman brief, at 8-9, n5). n6 How can any movement be "more static"? What is static enough to fall within the ambit of plaintiff's static construction? Because we cannot say, we must construe the term "static" in its ordinary meaning, non-moving, and allow for the only exception plainly stated in the written description: manual re-centering.

We now choose to alter our initial construction, construing "common static price axis" as "a line comprising price levels that do not change positions unless a manual re-centering command is received and where the line of prices corresponds to at least one bid value and one ask value." We construe "static display of prices" similarly, as "a display of prices comprising price levels that do not change positions unless a manual re-centering command is received." Defendant eSpeed pointed us to MSN Encarta Dictionary to set forth the ordinary and customary definition of static: "motionless: not moving or changing, or fixed in position." Our search of Webster's II New College Dictionary yielded similar results: "Having no motion: at rest" While we recognize that Phillips teaches us that a dictionary definition should only be used for context. Phillips also teaches that the "words of a claim are generally given their ordinary and customary meaning."...[is] the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." 415 F.3d at 1312-13. Plaintiff has given us no reason to think that such a person of ordinary skill in the art would construe "static" as anything other than non-moving at the time of the invention. n4

n4 We do find it interesting that in all of plaintiffs filed exhibits with regard to claim construction, including two dictionary excerpts, plaintiff has never argued that the ordinary and customary meaning of "static" is something other than stationary or non-moving.

If "static" ordinarily means non-moving, then we cannot see how we can construe it any other way. The only exception can be the one explicitly stated in the specifications and prosecution history—movement due to receipt of a manual re-centering command. If we were to construe the term inclusive of additional unstated exceptions, such as automatic re-centering, we would not know where to stop. Defendant eSpeed aptly asks, "Why is a price display which automatically recenters after every two seconds 'static,' but a price display which automatically recenters after every five seconds is not?" Why is a price display that automatically recenters when the inside market exceeds three ticks from the center price 'static,' but a price display which automatically recenters after every fifth tick is not?" (eSpeed's post-Markman brief, at 6, n4). Plaintiff's own argument raises the same questions. Plaintiff notes, "In fact, with eSpeedometer (which contains a slow drift recentering component,) a price level never suddenly changes position under a trader's cursor causing him to miss his intended price. This is in contrast to the eSpeed product addressed by the Court at the PT hearing which provided for an instantaneous automatic recentering when the inside market moved off the top or bottom of the screen. Thus, eSpeedometer is more 'static' than eSpeed's previous product because it provides the trader with virtually a 100% guarantee that he will not miss his intended price" (plf's post-Markman brief, at 8-9, n5). n6 How can any movement be "more static"? What is static enough to fall within the ambit of plaintiff's static construction? Because we cannot say, we must construe the term "static" in its ordinary meaning, non-moving, and allow for the only exception plainly stated in the written description: manual re-centering.

We find unpersuasive plaintiff's argument that the patent only increases but does not guarantee the user's likelihood of accurately selecting his desired price. Plaintiff's patents are designed to achieve simultaneous goals: speed and accuracy. With regards to accuracy, the patent specification states, "The 'Mercury' display and trading method of the present invention ensure fast and accurate execution of trades by displaying market depth on a vertical or horizontal plane, which fluctuates logically up or down, left or right across the plane as the market price fluctuates" ('132, 3:5-9; '304, 3:9-13) (emphasis added). Like defendants, we read such language as a guarantee. It is only with regard to speed that the patents cannot guarantee accuracy -it is impossible to know how quickly a trader will process a desired price, move his hand to the user input device, and select the bid or ask region. It is with that in mind that the patent states "[t]he faster a trader can trade, the less likely it will be that he will miss his price and the more likely he will make money" ('132, 2:60-62; '304, 2:65-67).
find that the purpose of the patents' invention would be frustrated by the inclusion of any movement uncontrolled by the user. See Curtiss-Wright Flow Control Corp. v. Vclan, Inc., 438 F.3d 1374, 1379-81 (Fed.Cir. 2006) (limiting the claim term "adjustable" to the patent's consistent description that adjustment occurs during operation of the de-header system, in part because "]any construction to the contrary is not consistent with the overall context of this invention and this field of art as described in the specification"). Thus, we are further convinced of our construction.

We take time to note that the construction of "common static price axis" includes the phrase, "where the line of prices corresponds to at least one bid value and one ask value." We do so to clarify that with regard to the 'Mine of prices," orientation of the axis is irrelevant - it can be horizontal, vertical or angled, for example. We find that use of the claim language "common," "corresponding to" and "aligned" are all used as synonyms for "in relationship with." See Id., 438 F.3d at 1380 ("this court has acknowledged that two claims with different terminology can define the exact same subject matter"). The specification's language states that "Mercy displays market depth in a logical, vertical fashion or horizontally or at some other convenient angle or configuration' ("304, 7:42-45, '132, 7:22-25). That market depth, which includes the best bid and the best ask, can be displayed on an angle gives further support to plaintiff's contention that "common" connotes no more than a relationship between the price axis and the hid and ask display regions.

We also note our use of the term "price levels" in the construction of both "common static price axis" and "static display of prices." While recognizing that the '132 patent does not use the term "price level" in the claims, as compared to the '304 patent, we find that the intrinsic evidence compels us to adopt such language in both constructions. We re-assert our preliminary injunction analysis regarding this issue: "the real issue is what 'static display of prices' means, and we understand that phrase to include price levels, which is where the prices are located and displayed. In other words, the display of prices is a region in which prices, represented by numbers, are shown." Trading Technologies Int'l. Inc. v. eSpeed, Inc., 370 F.Supp.2d 691, 699 (N.D.II.). ("Trading Technologies Int'l"). We reject defendants' contention that "price levels" are synonymous with prices or representation of prices. The written descriptions of both patents consistently refer to "price rows" and "price levels." For example, "The market depth display shows the trader the interest the market has in a given commodity at different price levels" (304, 6:17-19, '132, 5:50-52). "The status of each order is displayed in the price row where it was entered" (204, 8:23-24, '132, 7:56-57). "Thus, a right click in the AskQ column in the 87 price row will send a sell order to market at a price of 87 and a quantity of 150" (304, 10:46-48, '132 10:8-10). "A left click would enter an order with a price corresponding to the price row clicked . . ." (304, 11:21-22, '132, 10:50-51). n6 Found in the preferred embodiment, it is clear that both patents intended to showcase a "price level" that was broader than simply price. Pfizer, Inc. v. Teva Pharmaceuticals. USA. Inc., 429 F.3d 1364, 1374 (Fed.Cir. 2005) ("A claim construction that excludes a preferred embodiment...is 'rarely, if ever, correct'"). Thus, we define "price level" as "a level on which a designated price or price representation resides."

--- Footnotes ---

n6 Defendant eSpeed argues that the use of "price levels" with respect to Figure 2 ("The working bid and ask quantity for each price level is also displayed in columns 202 and 205 respectively" (304, 5:27-29, '132, 5:23-25)), wherein 202 and 205 are on the same horizontal row, proves that "price levels" are synonymous with "prices." Plaintiff counters by arguing that Figure 2 does contain "price levels" under its proposed construction - the trading screen has a level or region on which the price resides that does not extend across the entire row, as compared to patents' preferred embodiments-We find plaintiff's argument persuasive.

--- End Footnotes ---

4175

We begin with plaintiff's primary concern -- our previous construction of "static." In TT Markman I, we construed "common static price axis" (304 patent) as "a line comprising price levels that do not change positions unless a manual re-centering command is received and where the line of prices corresponds to at least one bid value and one ask value." 2006 U.S. Dist. LEXIS 80153, 2006 WL 3147687, at *4. Similarly, we construed "static display of prices" (132 patent) as "a display of prices comprising price levels that do not change positions unless a manual re-centering command is received." Id. Plaintiff assures us that it does not take issue with our construction, but urges clarification that the claim element would be met "if the accused product ever embodies the claimed element, irrespective of how long it does so or whether such a product also
has the capacity to act in an uncovered manner” (TT’s motion, at 1).

Analysis of a patent infringement claim is a two-step process. First, we construe the claims, an issue of law for the court to determine. Warner-Lambert Co. v. Teva Pharmaceuticals USA, Inc., 418 F.3d 1326, 1340 (Fed.Cir.2005). Second, we compare the accused product or process to the properly construed claims, an issue of fact for the fact-finder. Id. Plaintiff's patent infringement claim will be successful "only where the accused product or process contains each limitation of the claim, either literally or under the doctrine of equivalents." Id. (citing Deering Precision Instruments, L.L.C. v. Vector Distrib. Sys., Inc., 347 F.3d 1314, 1324 (Fed.Cir.2003)). Defendants argue that plaintiff is conflating the two steps. By arguing that defendants' products may still infringe on plaintiff's patents under a part-time infringement theory, eSpeed suggests that TT is putting the cart before the horse. eSpeed contends that "[t]he theory of part-time infringement is not a canon of claim construction and does not override the plain meaning of the claim or the disclosures in the specification and file history... It is the claim construction, which is derived from the plain meaning of the claim and intrinsic evidence, that dictates whether the theory of part-time infringement has any relevance to the infringement analysis. Under the plain meaning of the claim and the Court's claim construction, part-time infringement is inapplicable because a price axis that moves other than through a manual re-centering command is not a static one’’ (eSpeed response, at 5).

We agree with defendants that the analysis of part-time infringement is, as the name implies, one of comparison -- the second step of patent infringement analysis. Because there seems to be some confusion on the construction of the term "static," however, we will address the merits of plaintiff's arguments. Specifically, we will address whether the term "static" in "common static price axis" and "static display of prices" requires a permanent state of lack of movement.

Plaintiff's arguments center on two overlapping principles. First, plaintiff contends that Claim 1 of each patent-in-suit is an open claim, designated by the term "comprising" in its preamble. Plaintiff asserts that such a claim does not preclude the existence of additional unrecited features of an accused product or process. Second, plaintiff asserts that part-time infringement- infringement for any length of time, regardless of whether the accused product or process also has times of non-infringement -- covers its claims. Although plaintiff's briefs imply that the two arguments are part of the same theory, we are not so sure. TT's "comprising" argument seems to assert that automatic re-centering is an unrecited additional feature that is made possible by the fact that the price axis was already in a static condition (TT reply, at 2). We read that to mean that the automatic re-centering is separate from the static claim limitation. TT's part-time infringement theory, on the other hand, seemingly suggests that the mere presence of a static price axis -- regardless of whether it moves at some time-- is still infringing (id., at 1). In our view, such an argument suggests that automatic re-centering takes an accused product or process out of the purview of plaintiff's patent protection, but only for the split second that it is moving, so that the time when the accused product's price axis is not moving, it is still infringing. Ultimately, however, plaintiff's arguments both suggest that the addition of movement does not preclude a finding of infringement.

We begin by assessing plaintiff's "comprising" argument. To do so, we must lay out Claim 1 of each patent-in-suit. Patent '304, Claim 1, reads:

A method for displaying market information relating to and facilitating trading of a commodity being traded in an electronic exchange having an inside market with a highest bid price and a lowest ask price on a graphical user interface, the method comprising:

[1] dynamically displaying a first indicator in one of a plurality of locations in a bid display region, each location in the bid display region corresponding to a price level along a common static price axis, the first indicator representing quantity associated with at least one order to buy the commodity at the highest bid price currently available in the market;

[2] dynamically displaying a second indicator in one of a plurality of locations in an ask display region, each location in the ask display region corresponding to a price level along the common static price axis, the second indicator representing quantity associated with at least one order to sell the commodity at the lowest ask price currently available in the market;

[3] displaying the bid and ask display regions in relation to fixed price levels positioned along the common static price axis such that when the inside market changes, the prices levels along the common static price axis do not move and at least one of the first and second indicators moves in the bid or ask display regions relative to the common static price axis;

[4] displaying an order entry region comprising a plurality of locations for receiving commands to send trade orders, each location corresponding to a price level along the common static price axis; and

[5] in response to a selection of a particular location of the order entry region by a single action of a user input device, setting a plurality of parameters for a trade order relating to the commodity and sending the trade order to the electronic
A method of placing a trade order for a commodity on an electronic exchange having an inside market with a highest bid price and a lowest ask price, using a graphical user interface and a user input device, said method comprising:

[1] setting a preset parameter for the trade order
[2] displaying a market depth of the commodity, through a dynamic display of a plurality of bids and a plurality of asks in the market for the commodity, including at least a portion of the bid and ask quantities of the commodity, the dynamic display being aligned with a static display of prices corresponding thereto, wherein the static display of prices does not move in response to a change in the inside market;
[3] displaying an order entry region aligned with the static display prices comprising a plurality of areas for receiving commands from the user input devices to send trade orders, each area corresponding to a price of the static display of prices; and
[4] selecting a particular area in the order entry region through single action of the user input device with a pointer of the user input device positioned over the particular area to set a plurality of additional parameters for the trade order and send the trade order to the electronic exchange.

Plaintiff correctly notes that the addition of unclaimed unrecited elements does not traditionally defeat a finding of infringement where the patent uses an open transitional phrase such as "comprising." Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1347 (Fed.Cir.2005); CollegeNet, Inc. v. ApplyYourself, Inc., 418 F.3d 1225, 1235 (Fed.Cir.2005); Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1371 (Fed.Cir.2005). Therefore, when the term "comprising" appears in the preamble of the claim, as it does here, it is generally read to mean including, but not limited to, the following elements. Nazomi Communications, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1370 (Fed.Cir.2005) ("Comprising' is often synonymous with 'including"); Crystal Semiconductor Corp. v. TriTech Microelectronics Int'l., Inc., 246 F.3d 1336, 1348 (Fed.Cir.2001) ("In the parlance of patent law, the transition 'comprising' creates a presumption that the recited elements are only a part of the device, that the claim does not exclude additional, unrecited elements").

Plaintiff's "comprising" argument, however, fails. Unlike many of the cases cited by plaintiff, its patents' claims include a limitation of a static or non-moving condition. n5 Any movement takes a product or process outside the scope of plaintiff's claim. See W.E. Hall Co., Inc. v. Atlanta Corrugating, LLC, 370 F.3d 1343 (Fed.Cir.2004) (where an accused product failed to meet each of the elements or limitations required by the claim language itself, a partially open transition term could not enlarge the scope of the claim); Moleculon Research Corp. v. CBS, Inc., 793 F.2d 1261 (Fed.Cir.1986) (the term "comprising" did not affect the scope of the particular structure recited within the method claim's step). Unlike Smith & Nephew, Inc. v. Ethicon, Inc., 276 F.3d 1304 (Fed.Cir.2002), failure to include movement of the static price axis in plaintiff's claims would not exclude a reasonable practice taught in the specification of the patent. And unlike CollegeNet, Inc., 418 F.3d at 1235, failure to include movement of the static price axis in plaintiff's claims would not be inconsistent with the problems the invention sought to redress. Rather, including movement of the static price axis would work against the patents' stated purpose: "If a trader intends to enter an order at a particular price, but misses the price because the market prices moved before he could enter the order, he may lose hundreds, thousands, even millions of dollars" (304, 2:61-65, '132, 2:57-61). It is a basic principle of patent law that an infringing use of a patented method or claim requires practice of every limitation of the claim or every step of the method. Zoltek Corp. v. U.S., 442 F.3d 1345, 1359 (Fed.Cir.2006). Addition of the term "comprising" does not remove the limitations that are present in the claim, Power Mosfet Technologies, L.L.C. v. Siemens AG, 378 F.3d 1396, 1409 (Fed.Cir.2004). Therefore, we do not read "comprising" as allowing some movement of the static price axis. Our earlier constructions remain, and we clarify that the price axis never changes positions unless by manual re-centering or re-positioning.

n5 We have already determined that "static" means non-moving. TT Markman I, 2006 U.S. Dist. LEXIS 80153, 2006 WL 3147697. In addition to the plain and ordinary meaning we focused on in TT Markman I, we also note several instances in the intrinsic record suggesting such a construction. See, e.g., '304, 7:65-67 ("The values in the price column are static; that is, they do not normally change positions unless a re-centering command is received..."); Amendment and Reply under 37 CFR § 1.111 (eSpeed Markman exhibits, Exh. E, at eS0000064873) (same); Notice of Allowability (id., Exh. OO, at
An examination of the Supreme Court's ruling in Markman shows multiple references to factual components of claim construction. The Court was addressing under which category, fact or law, claim construction should fall. Cybor, 138 F.3d at 1455. This court interpreted Markman as holding that claim construction was solely a question of law, which this court should review without deference. Nevertheless, in Cybor Corp. v. FAS Technologies, Inc., 138 F.3d 1448 (Fed. Cir. 1998) (en banc), this court interpreted Markman as holding that claim construction was solely a question of law, which this court should review without deference. The Supreme Court in Markman held that "the construction of a patent, including terms of art within its claim, is exclusively within the province of the court." Id. at 372. The Supreme Court recognized that claim construction "falls somewhere between a pristine legal standard and a simple historical fact." Id. at 388 (quoting Miller v. Fenton, 474 U.S. 104, 114, 106 S. Ct. 445, 88 L. Ed. 2d 405 (1985)). Although claim construction is not a purely legal matter, the Supreme Court found "sufficient reason to treat construction of terms of art like many other responsibilities that we cede to a judge in the normal course of trial, notwithstanding its evidentiary underpinnings." Id. at 390.

Once we determine that the term "comprising" does not allow for any movement of the static price axis, it is easy to dispose of plaintiff's part-time infringement argument. Plaintiff correctly points out that "an accused product that sometimes, but not always, embodies a claimed method nonetheless infringes." Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 622 (Fed.Cir.1995). The statute governing patent infringement, 35 U.S.C. § 271(a) (2003), also suggests that any infringement -- even de minimis infringement -- is actionable; the level of infringement is a question of damages, not liability. Embrex, Inc. v. Service Engineering Corp., 216 F.3d 1343, 1352-53 (Fed.Cir.2000) (Rader, J., concurring). Where, however, the claim limitation itself -- here, a static condition -- requires permanency, any movement (outside of manual re-centering or re-positioning) negates one of the specified claim limitations. Therefore, introduction of such movement takes an accused device out of the protection of plaintiff's patents.

The situation at hand is different from those cases finding part-time or de minimis infringement. For example, the court in Seal-Flex, Inc. v. Athletic Track and Court Const., 172 F.3d 836, 845 (Fed.Cir.1999) found infringement where defendant's customary method was non-infringing, and defendant only used plaintiff's patented method one time. Or, in SmithKline Beecham Corp. v. Apotex Corp., 403 F.3d 1331, 1341-42 (Fed.Cir.2005), the Federal Circuit affirmed the district court's determination that trace amounts of the patented compound found in the infringing device would infringe under the construction of the claims. Or, in Embrex, 216 F.3d 1343, the court found infringement when defendants engaged in testing for commercial purposes using plaintiff's patented technology. In this case, in order to literally infringe, defendants must practice all elements of plaintiff's patented technology. Zoltek Corp., 442 F.3d at 1359. Therefore, any movement of the static price axis leaves accused technology outside the protection of plaintiff's patents.

Plaintiff makes various other arguments and points to various extrinsic evidence in support of its position that any period of a static condition falls within our construction of "common static price axis" and "static display of prices." None is persuasive. We have already determined the influence of the phrase "ensure fast and accurate execution" in the claim construction. Free Motion Fitness, a case cited by plaintiff to support its argument that the patents did not guarantee accuracy, tells us "to scrutinize the intrinsic evidence in order to determine the most appropriate definition" of a claim term. 423 F.3d at 1349. That is exactly what we did -- we turned to the specification, which suggested that the patented technology would "ensure fast and accurate execution" to construe "common static price axis" and "static display of prices." Thus, we need not alter our construction. And the extrinsic evidence presented -- in light of our construction, based almost entirely on intrinsic evidence -- will not change our construction.

The Supreme Court in Markman held that "the construction of a patent, including terms of art within its claim, is exclusively within the province of the court." Id. at 372. The Supreme Court recognized that claim construction "falls somewhere between a pristine legal standard and a simple historical fact." Id. at 388 (quoting Miller v. Fenton, 474 U.S. 104, 114, 106 S. Ct. 445, 88 L. Ed. 2d 405 (1985)). Although claim construction is not a purely legal matter, the Supreme Court found "sufficient reason to treat construction of terms of art like many other responsibilities that we cede to a judge in the normal course of trial, notwithstanding its evidentiary underpinnings." Id. at 390.

Nevertheless, in Cybor Corp. v. FAS Technologies, Inc., 138 F.3d 1448 (Fed. Cir. 1998) (en banc), this court interpreted Markman as holding that claim construction was solely a question of law, which this court should review without deference. Id. at 1451. The question presented before the Supreme Court was "whether the interpretation of a so-called patent claim . . . is a matter of law reserved entirely for the court, or subject to a Seventh Amendment guarantee that a jury will determine the meaning of any disputed term of an art about which expert testimony is offered." Markman, 517 U.S. at 372. Although the Supreme Court addressed only the role of the trial court in claim construction, this court understood that "the Supreme Court was addressing under which category, fact or law, claim construction should fall." Cybor, 138 F.3d at 1455. This court concluded that "[n]othing in the Supreme Court's opinion supports the view that the Court endorsed a silent, third option—that claim construction may involve subsidiary or underlying questions of fact." Id.

An examination of the Supreme Court's ruling in Markman shows multiple references to factual components of claim construction.
A construction:

. "[C]onstruing a term of art following receipt of evidence" is "a mongrel practice." Id. at 378.

. Claim construction "falls somewhere between a pristine legal standard and a simple historical fact." Id. at 388.

. "We accordingly think there is sufficient reason to treat construction of terms of art like many other responsibilities that we cede to a judge in the normal course of trial, notwithstanding its evidentiary underpinnings." Id. at 390.

These references in the Supreme Court opinion leaves this court stranded between the language in the Court's decision and the language in this court's Cybor decision.

In order to resolve this case, this court must confront findings by the trial court about the meaning of the disputed claim term "static." In reaching the meaning of that term, the trial court explored and made findings about the technical background of the invention--the inventive features and the timing of those features against the backdrop of the prior art. In addition, the district court determined the meaning that an artisan of ordinary skill in this discipline would assign the term "static." The trial court also made findings about the understanding of such an ordinary artisan about the metes and bounds of the asserted claims. In still another factual setting, the district court determined the way that the ordinary artisan would interpret the patent applicant's statements made to the PTO examiner during the prosecution of the patents-in-suit. These factual determinations about the timing and nature of the history of the patent acquisition process also informed the trial court's claim construction. In sum, claim construction involves many technical, scientific, and timing issues that require full examination of the evidence and factual resolution of any disputes before setting the meaning of the disputed terms.

Of course, as the Supreme Court repeatedly clarified in Markman, the trial court occupies the best vantage point and possesses the best tools to resolve those evidentiary questions:

. "[A] jury's capabilities to evaluate demeanor to sense the mainsprings of human conduct or to reflect community standards are much less significant than a trained ability to evaluate the testimony in relation to the overall structure of the patent." Id. at 389-90 (citations and internal quotation marks omitted).

. "The decisionmaker vested with the task of construing the patent is in the better position to ascertain whether an expert's proposed definition fully comports with the specification and claims and so will preserve the patent's internal coherence." Id. at 390.

Despite the Supreme Court's emphasis on the trial court's central role for claim construction, including the evaluation of expert testimony, this court may not give any deference to the trial court's factual decisions underlying its claim construction. This court's prior en banc decision requires a review of the district court's claim construction without the slightest iota of deference. See Cybor, 138 F.3d at 1451.

B.

To construe a claim, courts must determine the meaning of disputed terms from the perspective of one of ordinary skill in the pertinent art at the time of filing. Chamberlain Group, Inc. v. Lear Corp., 516 F.3d 1331, 1335 (Fed. Cir. 2008). The claim terms "are generally given their ordinary and customary meaning." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc) (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). "The claims themselves provide substantial guidance as to the meaning of particular claim terms." Id. at 1314.

But the claims "must be read in view of the specification, of which they are a part." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). A patent's specification "is always highly relevant to the claim construction analysis." Phillips, 415 F.3d at 1315 (quoting Vitronics, 90 F.3d at 1582 (Fed. Cir. 1996)). When consulting the specification to clarify the meaning of claim terms, courts must not import limitations into the claims from the specification. Abbott Labs., 566 F.3d at 1288. Therefore, when the specification uses a single embodiment to enable the claims, courts should not limit the broader claim language to that embodiment "unless the patentee has demonstrated a clear intention to limit the claim scope using 'words or expressions of manifest execution or restriction.'" Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 905 (Fed. Cir. 2004) (quoting Teleflex, Inc. v.
Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002). In addition, "other claims of the patent . . . can also be valuable sources of enlightenment as to the meaning of a claim term." Id. (citing Vitronics, 90 F.3d at 1582).

In claim construction "a court should also consider the patent's prosecution history . . . ." Phillips, 415 F.3d at 1318 (quoting Markman, 52 F.3d at 980). "[T]he prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Id. (citing Vitronics, 90 F.3d at 1582-83). For example, "a patentee may, through a clear and unmistakable disavowal in prosecution history, surrender certain claim scope to which he would otherwise have an exclusive right by virtue of the claim language." Vita-Mix Corp. v. Basic Holding, Inc., 581 F.3d 1317, 1324 (Fed. Cir. 2009) (citations omitted). At the same time, because prosecution history represents an ongoing negotiation between the PTO and the inventor, "it often lacks the clarity of the specification and thus is less useful for claim construction purposes." Netcraft Corp. v. eBay, Inc., 549 F.3d 1394, (Fed. Cir. 2008).

TT disputes the construction of the word "static" in the phrase "static display of prices" in the '132 patent and in the phrase "common static price axis" in the '304 patent. All asserted claims of the '132 patent include the limitation "static display of prices." Likewise, all asserted claims of the '304 patent include the limitation "common static price axis." TT and eSpeed agree that the difference in terminology between "static display of prices" and "common static price axis" is immaterial.

The district court construed "static display of prices" in the '132 patent as "a display of prices comprising price levels that do not change positions unless a manual re-centering command is received." Trading Techs. Int'l, Inc. v. eSpeed, Inc., 2006 U.S. Dist. LEXIS 80153, at *11 (N.D. Ill. Oct. 31, 2006) (emphasis added). The district court similarly construed "common static price axis" as "a line comprising price levels that do not change positions unless a manual re-centering command is received and where the line of prices corresponds to at least one bid value and one ask value." Id. (emphasis added). A "price level" is "a level on which a designated price or price representation resides." Id. at *15. The district court later clarified that "a static condition -- requires permanency" and, thus, "the price axis never changes positions unless by manual re-centering or re-positioning." Trading Techs. Int'l, Inc. v. eSpeed, Inc., 2007 U.S. Dist. LEXIS 12965, at *20, 22 (N.D. Ill. Feb. 21, 2007) (emphasis added). Under the district court's construction, the patents-in-suit only cover software with a manual re-centering feature and without automatic re-centering feature. Given that Dual Dynamic and eSpeedometer automatically re-center the price columns in response to changes in the inside market, TT argues for a broader construction of the word "static" (i.e., "static" does not mean immovable).

The inventors acted as their own lexicographers and defined the word "static:"

The values in the price column are static; that is, they do not normally change positions unless a re-centering command is received (discussed in detail later).

'132 patent col.7 ll.46-48; '304 patent col.7 ll.65-67. The district court made two important changes to this express definition in construing the word "static." First, the district court added the word "manual" in front of the term "re-centering command." Second, it deleted the word "normally." The district court's definition may seem narrower than the inventors' express definition at first glance. However, the claims, the rest of the specification, and the prosecution history support the district court's definition. Therefore, this court, after reconstruing this term based on its own understanding of the claims, specification, prosecution history, and record, agrees with the district court's claim construction of the word "static."

In the first place, the "re-centering command" must indeed occur as a result of a manual entry. The specification shows that the inventors defined the term "static" in the specification. Notably, that definition expressly promises to discuss "a re-centering command . . . later" in the specification. Id. From that point forward, the specification only discusses manual re-centering commands. The specification contains no reference to automatic re-centering. Perhaps in response to the promise to discuss re-centering later, the patents describe the invention as follows:

As the market ascends or descends the price column, the inside market might go above or below the price column displayed on a trader's screen. Usually a trader will want to be able to see the inside market to assess future trades. The system of the present invention addresses this problem with a one click centering feature.

'132 patent col.8 ll.49-54; '304 patent col.9 ll.14-19 (emphasis added). This reference to "the present invention" strongly suggests that the claimed re-centering command requires a manual input, specifically, a mouse click. See Honeywell Int'l,
Inc. v. ITT Indus., 452 F.3d 1312, 1318 (Fed. Cir. 2006) (concluding that the invention was limited to a fuel filter because the specification referred to the fuel filter as "this invention" and "the present invention").

This court recognizes that this interpretation relies heavily on the specification and risks reading improperly a preferred embodiment into the claim. See Saunders Group, Inc. v. Comfortrac, Inc., 492 F.3d 1326, 1332 (Fed. Cir. 2007) (holding that claim scope is not limited to the disclosed embodiments "unless the patentee has demonstrated a clear intention to [do so]"). This court takes some comfort against this risk from the inventors' use of the term "the present invention" rather than "a preferred embodiment" or just "an embodiment." The inventors' own specification strongly suggests that the claimed re-centering feature is manual.

Because an inventor must evince a "clear intention" to limit the claim terms to a specification embodiment, this court examines other claims to detect any contrary intentions. In that respect, this court observes that all claims of the '132 patent have a "wherein" clause explaining that "the static display of prices does not move in response to a change in the inside market." '132 patent col.12 l.1-col.16 l.57. Although the "wherein" clause does not exclude automatic re-centering from the claim scope (it does not exclude software that automatically re-centers whenever the trader enters an order, for example), it expressly excludes software that automatically re-centers when the inside market changes. These clauses thus support the district court's claim construction.

TT argues that even if this court construes the "re-centering command" as manual, this court cannot limit the claims to only the enumerated elements (i.e., manual re-centering command). According to TT, because the claims use the transitional phrase "comprising," they also cover un-recited features such as automatic re-centering. To the contrary, automatic re-centering is not an additional feature, but rather negates a claimed requirement that the price level remains static and does not move. See Spectrum Int'l v. Sterilite Corp., 164 F.3d 1372, 1380 (Fed. Cir. 1998) ("Comprising' is not a weasel word with which to abrogate claim limitations."). A price level that only moves in response to a manual re-centering command cannot also move in response to an automatic re-centering command. Thus, this court construed the claims to require a manual re-centering command.

The claims also contain a limitation that "the price axis never changes positions unless by manual re-centering or re-positioning." Trading Techs., 2007 U.S. Dist. LEXIS 12965, at *22. The district court found that the ordinary and customary meaning of "static" was "motionless: not moving or changing, or fixed in position." Trading Techs., 2006 U.S. Dist. LEXIS 80153, at *11. TT did not present evidence or dispute that a person of ordinary skill in the art would understand the word "static" differently. Moreover, allowing the price axis to automatically change positions would defy the invention's goal to "ensure[] fast and accurate execution of trades." '132 patent col.3 ll.5-6. The invention would present the same problem as the prior inventions if the price axis moved automatically even in rare instances. The "static display of prices" could automatically re-center just as the trader was getting ready to execute a trade, causing the trader to miss the intended price.

Also, the inventors jettisoned the word "normally" during prosecution. The PTO examiner initially rejected the claims because the term "'static display' [was] vague and indefinite." The examiner requested the applicants 'to claim 'to what extent', 'to what degree', and 'on what basis' the displays 'change.' In response, the applicants explained that "the values in the price column . . . do not change (unless a re-centering command is received)." The examiner allowed the claims at least partly based on the understanding that the price column did not re-center itself automatically. The manual re-centering feature also avoided the possibility of mistakes when the price column moved automatically at the same time a trader wished to make a purchase. Of course, traders might make mistakes despite precautions built into the software. Nonetheless, to "provide the trader with improved efficiency and versatility in placing," '132 patent col.3 ll.21-24, the price column cannot shift unexpectedly.

This court also addresses claim 55 of the '132 patent, a dependent claim from claim 1:

The method of claim 1 wherein the market depth is based on an exchange order book and the static display of prices never moves in response to a price change in the exchange order book relating to a price which is displayed.

Id. col.16 ll.52-55 (emphasis added). TT argues that construing "static" to mean the price axis never moves would render dependent claim 55 superfluous. To the contrary, claim 55 adds another limitation to claim 1, namely, that the market depth is based on "an exchange order book." Moreover, problems with any overlapping claim scope "will be overcome by a contrary construction dictated by the written description or prosecution history." Regents v. DakoCytomation, 517 F.3d
1364, 1375 (Fed. Cir. 2008). The invention's contribution to the prior art, its specification, and its prosecution history show that the static display of prices cannot move without a manual re-centering command from the trader. Accordingly, the district court correctly construed the disputed word "static."

4177

1. Means (160) for statically adding intelligence to each instruction in each of said plurality of basic blocks

This phrase appears in claims 11, 12, and 13 of the '755 patent. It is a means-plus-function limitation. The parties dispute the proper construction of the function as well as the proper identification of the structure. In particular, the parties dispute whether "statically adding intelligence" should be construed to mean adding information prior to program execution (as the plaintiff contends) or after compilation and prior to execution (as the defendants contend). The defendants argue that this is a means-plus-function limitation, and the only embodiment described in the patent has the TOLL software operating on the output from the compiler.

The function is construed to mean "statically adding intelligence to each instruction of said plurality of basic blocks." The term "statically adding intelligence" means "adding information prior to program execution." See '755 patent, col. 2, lines 42-46 ("Static allocations' are performed once, prior to execution, whereas "dynamic allocations" are performed by the hardware whenever the program is executed or run. The present invention uses a static allocation strategy and provides task allocations for a given program after compilation and prior to execution."). The corresponding structure is the TOLL software operating on output from the compiler. The court includes in the corresponding structure the corresponding algorithms disclosed in Figs. 1, 8, 9, 10, and 11.

n1 Pursuant to the relevant statute, the claim is construed to cover the corresponding structure described in the specification and equivalents thereof 35 U.S.C. § 112 P 6.

End Footnotes

4178

3. Station

Claim 1 refers to a system comprising "at least two stations." The word "station", in context, means a location at which there is a monitor, input and transmission means. This would include, for example, a desk or table 6 on which a person would have a computer input device and monitor connected to the system even if the "computer" or central processing unit itself were not at the same location.

n6 Or anything else for that matter, so that even if the computer input device and monitor were on the floor of an unfurnished room, that room would be a "station" within the meaning of the claim language.

End Footnotes

4179

The next claim term at issue is "a statistical decoder coupled to said I/O port for decoding variable-length-encoded compressed video signals." The term "statistical decoder" means a device that takes as input variable-length-encoded data and reverses the encoding process to provide decoded data as output. As stated previously, the term "coupled" means
electronically connected, either directly or indirectly. The "said I/O port" refers to the "I/O port" that has been construed above in section II.B.2.b.

15. "A statistical detection method": n15 A method of detecting suspicious network activity by applying one or more statistical functions in the analysis of network traffic data. This method is not a signature matching detection method.

b. Claim term two

"[to form statistically coded signals such that] the more frequently occurring values of digital signals are represented by shorter code lengths and the less frequently occurring values of digital signals are represented by longer code lengths" (claims 1 and 38)

"[to form statistically coded signals such that] the more frequently occurring values in the digital numbers are represented by shorter code lengths and the less frequently occurring values of coded signals are represented by longer code lengths" (claim 6)

The constructions proposed by Plaintiff and Defendants reflect disagreement over two issues. First, the parties dispute whether "values" should be construed to encompass "groups/sets/sequences of values" or instead to include only "each value in the 'digital numbers' or 'digital signals'" or an "individual value." Second, the parties dispute whether the term "how often," which would require that the statistical coding be based on the actual number of times a value occurs in a digital signal, should be included in the construction of term two. Plaintiff proposes the following construction for term two:

To form coded signals based on the statistical frequency of occurrence such that more frequently occurring values or groups/sets/sequences of values are represented by shorter code lengths and less frequently occurring values or groups/sets/sequences of values are represented by longer code lengths. See also the definitions of digital signals and digital numbers set forth above.

Defendants propose that term two should be construed as:

To form statistically coded signals such that the length of the code representing each value in the 'digital numbers' or 'digital signals' depends on how often that individual value appears in the 'digital numbers' or 'digital signal.'

During oral argument, the parties initially conceded to using the plain language of the term without further construction. Tr. 201:9 -- 202:24. However, Defendants later withdrew their concession as to the second issue, that is, whether the statistical coding must be applied to the actual values being coded. n10 With respect to the first issue, the Court will not give additional construction to the term "values."

n10 Counsel for Defendants stated: "We said we thought we would be okay with this construction, but we were concerned
that there might be more guidance actually needed. And, in fact, what's been pointed out to me is that it appears that there
still, in fact, is an issue hanging out there. And I don't know if the proposed construction resolves that. And here's the issue:
The issue is whether the statistical coding is applied to the values in the signals that are actually being coded, if you will, or
processed." Tr. 208:15 -- 209:2.

Defendants argue that the language of the specification and claims requires that the statistical coding of signals be done with
actual data rather than with representative or model data. Defendants argue that the following language in claim 6 requires
statistical coding of actual data: "processing the input signals to form processed signals where the processed signals are
digital numbers having first values, second values, and other values" and "that the more frequently occurring values in the
digital numbers are represented by shorter code lengths." '672 Patent, col.24, 11.13-24 (emphasis added). However, this
language does not establish clearly that the actual data must be coded. While it is possible to infer that the clause "that the
more frequently occurring values in the digital numbers" indicates that the values in the particular digital data must be
coded, this is not the only conclusion that may be drawn from this language. It is also possible to conclude that this term
simply specifies what type of code length is assigned to the more frequently occurring values, without inferring how the
frequency of the values is determined.

Neither Plaintiff's nor Defendants' arguments based on the opinions of their experts are persuasive. Plaintiff's expert, Dr.
Sheila Hemami, explained that "the required frequency of occurrence information can be computed from a statistical model,
from a set of training data, or from a particular signal-there is no requirement that it represent only how often a particular
value appears in a signal or group of signals." Declaration of Tibor L. Nagy ("Nagy Decl."), Ex. 2, p. 20. Dr. Hemami
concludes that requiring "the length of the code to represent how often a value appears is not commensurate with any
practical implementation." Id. Defendants' expert, Dr. James A. Storer, stated that "it was well-known in the mid-1980s to
create statistical codes from the actual data being compressed." Declaration of Dr. James A. Storer in Support of Defendants
and Declaratory Judgment Plaintiffs' Responsive Markman Brief ("Storer Decl."), P 69. Dr. Storer's statement that it was
well known at the time of invention how to compute frequency with the actual data is consistent with Dr. Hemami's
statement that it is possible to compute frequency of occurrence from a model. To the extent that Dr. Hemami reaches the
further conclusion that the analysis of actual data would not be practical, that opinion is conclusive and without clear
evidentiary support. Accordingly, the Court relies on neither expert's opinion in reaching its conclusion as to the proper
construction of term two.

Defendants' argument that the specification requires coding of the actual data is not persuasive. While Table Three does
describe how to create statistical codes from the amplitude values, it is merely an example of a preferred embodiment. '672
Patent, col.14, ll.3-6 ("The TABLE 3 formulation is for one preferred embodiment of the ordered redundancy coding. Many
variations, some hereinafter described, are possible."). n11

n11 When arguing that runlengths of zero length are not required, Defendants themselves point out that Table Three is
merely an example. Responsive Br., p. 21; Tr. 178:16-24.

Instead, the specification indicates that coding of "probable frequencies"-rather than actual frequencies-may be used:
"Typically, the statistical frequencies of the values to be coded have an order. Particularly, that order is based upon the
probable frequency of occurrence of the different values." '672 Patent, col.5, 11.22-25. Defendants argue that "probable
frequency" applies to "the probability that any value in the digital signals to be coded will have a particular numerical
value." Responsive Br., p. 36, n. 28. However, this interpretation of "probable frequency" is not required by the language
cited by Defendants:

The signals to be coded are typically multiple values where the multivalued digital numbers, X(k), are typically the
integers 0, 1, 2, 3, 4, . . ., and so on arranged in any order. Frequently, some values are repeated in forming digital numbers
and hence the probable frequency of occurrence of some values is different than for other values.
'672 Patent, col.3, 11.16-22 (emphasis added). The specification merely explains that some values are more likely to occur than others; it does not establish a clear requirement that the probable frequencies are generated from the actual data that is coded. Moreover, this portion of the specification expressly describes a typical scenario.

Accordingly, the Court concludes that there is no clear evidence in the language of the claim terms nor in the specification that statistical coding of the actual data is required. The Court will adopt neither of the parties' proposed constructions. Instead, as it suggested it would do during oral argument, the Court will use the plain language of the claim term as its construction.

K. Statistically Comparing Test Results in Determining Pay Factor Adjustments and Material Acceptance

This term is found in claim twelve, which depends from independent claim one. The Plaintiff proposes that this term does not need to be construed, but offers "using a computer to perform statistical analysis and to compare the results of the analysis to the specification requirements for the pavement construction material mixture in order to determine pay factor adjustments and material acceptance." The Defendants propose "the server performing statistical analysis and comparing the results of the analysis to the specification requirement for the pavement construction material mixture in order to determine pay factor adjustments and material acceptance."

As is clear from the proposed definitions, the only dispute is whether the step must be performed by a server or by a computer. Here the Defendants again argue that the claims are limited to the embodiment in FIG. 2. This argument has been previously rejected and the Court rejects it here for the same reasons.

The patent describes statistical analysis in col. 7:4-14. It states that the software can statistically compare the test results and that statistical comparisons are performed by plotting test results against quality acceptance results. It also states that various statistical tests can be used that are important for both contractors and owners to determine pay factor adjustments and determine material acceptance. The patent does not limit statistical analysis to performance by a server.

Construction: Using a computer to perform statistical analysis and compare the results of the analysis to the specification requirement for the pavement construction material mixture in order to determine pay factor adjustments and material acceptance.

4183

c. "Status information"

The term "status information" appears in Claims 61 and 64, both of which depend from Claim 44. "Status information" appears as an additional limitation on the "indicating step" of Claim 44. The indicating step is "indicating the operational status of the defibrillator based on the result of the self-test." The court already construed this term to mean "providing a visible or audible alert of whether the defibrillator is capable of treating a patient and possibly other indications of operational status." October 25 order at 23. n9 Claim 61 requires the defibrillator to display the "status information" on a "visible display." Claim 64 requires the defibrillator to provide the "status information" audibly.

n9 The court reiterates its implicit holding from the October 25 order that "operational status" is broader than "operable" (or "inoperable") status.

Given the relationship between these claims, the court concludes that "status information" is simply any subset of the
information required in Claim 44. There is no indication that the inventors intended Claims 61 and 64 to introduce a novel concept of "status information" that differs from "operational status." Instead, these claims were intended to limit the method of indicating status to a user -- visually or audibly. The use of "status information" instead of "operational status" means simply that the visual or audible displays of Claims 61 and 64 need not be responsible for displaying all operational status information. For example, a defibrillator according to Claim 61 could indicate a "stuck button" indicator visually, while indicating the inoperable/operable status with an audible alarm, a vibration, or some other means. Likewise, a defibrillator according to Claim 61 could indicate an inoperable/operable status audibly, while using other means to indicate other operational statuses. "Status information" is thus "any subset of information related to whether the defibrillator is treating a patient or other indications of operational status."

4184

1. "Status information" is construed to mean "information about the state or condition of something."

4185

M. Term 18: Status information therein regarding the status of the electrical device after adjustment of the status in response to the control information as affected by the control information and the manual actuator (as used in claim 84).

Lutron contends that Term 18 means "Information regarding the status of the electrical device, whether the electrical device is being controlled based on control information or based on adjustment of the manual actuator of the control device."

Control4 contends it means "Information regarding the true status of the electrical device after adjustment in response to the control information, where the status information indicates the effect that the control information and the manual actuator have had on the status of the electrical device."

The disputed term in the claim is essentially the same as Term 8, discussed in section I.F above, except it adds on the following language in the middle of the term: "after adjustment of the status in response to the control information." (Emphasis added.) Claim 84 provides a method for controlling the electrical device discussed in claim 62. Claim 62 requires a command signal that changes the status of the electrical device, without use of a repeater. Otherwise, claim 62 is substantially similar to claim 1. While the apparatus claims are substantially similar, this method claim does involve a specific timing element through use of the term "after." Because this is a limitation, the claim construction should include the added phrase.

The term has an internal conflict, however, because of another phrase. On the one hand, the term states that status is adjusted in response to control information. On the other hand, it states that status is affected by the control information and the manual actuator. A main point Lutron made to distinguish this invention from prior art is that status can be changed either by control information or by the manual actuator. That point is present throughout the patent, and was reaffirmed during the Markman hearing when Lutron indicated the phrase "in response to the control information" likely was a drafting error when Lutron modified the claim language during the patent prosecution.

The term is clearer when that phrase is removed. Nevertheless, "courts may not redraft claims to cure a drafting error made by the patentee," unless the error "is an obvious administrative or typographical error not subject to reasonable debate." 36 The exception does not appear to apply here. Consequently, the Court concludes the term means "Information about the condition of the electrical device, after the condition has been altered in response to the control information, regardless of whether the condition of the electrical device is being directed by control information or by the manual actuator."

--- Footnotes ---

36 Lucent Techs., Inc. v. Gateway, Inc., 525 F.3d 1200, 1215 & n.8 (Fed. Cir. 2008) (citations omitted).

--- End Footnotes ---
10. Status signal

With respect to the term "status signal," Foundry contends that the term does not require construction. Lucent submits that "status signal" should be construed to mean "a signal providing information regarding the response of the target telephone to the call such as ring-no-answer, busy, or live answer." After considering the parties' submissions, the court construes "status signal" to mean "a signal that provides the status of a telephone call such as ring-no-answer, busy, or live answer." (See '864 patent, col. 5, ll. 22-24.)

3. "steering circuit"

The '054 Patent also describes a "steering circuit." Cardiac Science asserts that this term be construed as "a circuit containing multiple switching elements that can produce at least two different paths for delivery of electrical energy from a single storage circuit to thereby create a multiphasic or biphasic waveform." Philips, on the other hand, proposes that "steering circuit" be construed as "a circuit for directing the therapeutic electrical energy from a storage circuit to the patient through at least two different paths." Thus, both parties agree that the steering circuit "steers" electrical energy along two different paths. However, the parties dispute whether the paths originate at a single energy source, as Cardiac Science contends.

The preferred embodiment of the '054 Patent teaches a steering circuit directing electrical energy along two different paths, with those paths originating at a single capacitor (or energy source). However, the term "steering circuit" is not limited to that preferred embodiment. ('054 Patent at sheet 3, Fig. 3; c. 10, ll. 1-15.) Nothing else in the patent restricts the steering circuit to one specific circuit configuration. Thus, the Court construes the term "steering circuit" as a "circuit for directing the therapeutic electrical energy from a storage circuit to the patient through at least two different paths."

I.

Caterpillar Inc. filed this suit against Detroit Diesel Corporation alleging that Detroit Diesel's "CruisePower" feature infringes its United States Patent No. 4,914,597 ("'597 patent"). The patent relates to a system providing variable engine power while using vehicle cruise control; the claim at issue--Claim 1--involves a method of operating a vehicle engine with cruise control by use of a fuel delivery system that controls the rate of fuel delivery by responding to a command signal generated through the retrieval of sets of data from memory, the set retrieved depending on whether the cruise control is "engaged."

Claim 1 of the '597 patent provides the following:

1. A method of operating a vehicle engine (12) equipped with a cruise control (44) which is engageable to control the speed of the vehicle (38) in response to a set speed wherein the engine includes a fuel delivery system (14) which is responsive to a command signal to in turn control the rate of fuel delivery to the engine, comprising the steps of:

   providing a memory (86) having stored therein two sets of data representing two different fuel delivery limit curves wherein each fuel delivery limit curve defines predetermined fuel delivery limits as a function of engine speed;

   determining when the cruise control (44) is engaged;

   retrieving one of the sets data from the memory (86) representing one of the fuel deliver limit curves when the cruise
control (44) is engaged;
retrieving the other set of data from the memory (86) representing the other fuel delivery limit curve when the cruise control (44) is not engaged; and
using the retrieved data to develop the command signal.

The parties agree that under the Markman decision, the court must determine the meaning of Claim 1 as a matter of law before the issue of infringement may be resolved with reference to the claim's meaning. In construing a patent as a matter of law, the court considers the claim itself, the specification, and the prosecution history ("file wrapper"). Markman v. Westview Instruments, 52 F.3d 967, 979 (Fed. Cir. 1995) (citing Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1561 (Fed. Cir. 1991)). The court is to construe the claim's language; the court cannot narrow or broaden the scope of a claim to give the patent owner something different than what is set forth. E.I. DuPont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988); Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 396 (Ct. Cl. 1967). The court may also consider extrinsic evidence as an aid in understanding the meaning of the claims' language, Markman v. Westview Instruments, 52 F.3d at 980, though extrinsic evidence may not be used "for the purpose of varying or contradicting the terms of the claims." Id. 52 F.3d at 981.

--- Footnotes ---

1 Extrinsic evidence consists of all evidence external to the patent and prosecution history, including expert and inventor testimony, dictionaries, and learned treatises. This evidence may be helpful to explain scientific principles, the meaning of technical terms, and terms of art that appear in the patent and prosecution history. Extrinsic evidence may demonstrate the state of the prior art at the time of the invention. It is useful to show what was then old, to distinguish what was new, and to aid the court in the construction of the patent.

… The court may, in its discretion, receive extrinsic evidence in order to aid the court in coming to a correct conclusion as to the true meaning of the language employed in the patent.

52 F.3d at 979 (internal quotation omitted).

--- End Footnotes ---

A claim must be read in light of the entire specification, which contains an explanation of the invention that must enable one of ordinary skill in the art to make and use the invention. "The description may act as a sort of dictionary, which explains the invention and may define terms used in the claims." 52 F.3d at 979. Although the patentee is granted license to define his terms, 2 any special definition assigned to a word must be clearly defined in the specification. Id. (citing Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1388 (Fed. Cir. 1992)); see Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580 (Fed. Cir. 1995) ("The words of a claim will be given their ordinary meaning to one of skill in the art unless the inventor appeared to use them differently."); cert. denied, 134 L. Ed. 2d 666, 116 S. Ct. 1567 (1996). The claim defines the scope of the invention, SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121 (Fed. Cir. 1985) (en banc), and although the specification may aid in divining the true meaning of the claim, the court cannot read into a claim a limitation that appears in the specification but not the claim. Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, 976 F.2d 1559, 1566 (Fed. Cir. 1992); E.I. DuPont de Nemours, 849 F.2d at 1433. References to a preferred embodiment, such as those in the specifications or drawings, are not claim limitations. Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988); Raytheon Co. v. Roper Corp., 724 F.2d 951, 957 (Fed. Cir. 1983). And although the patent's prosecution history is relevant to determining claims' meaning, 52 F.3d at 980 (citing Graham v. John Deere Co., 383 U.S. 1, 33, 15 L. Ed. 2d 545, 86 S. Ct. 684 (1966)), it similarly cannot change the scope of the claims, 52 F.3d at 980.

--- Footnotes ---

2 The Court of Claims described the reasoning for this in Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 397 (Ct. Cl. 1967):
An invention exists most importantly as a tangible structure or a series of drawings. A verbal portrayal is usually an afterthought written to satisfy the requirements of patent law. This conversion of machine to words allows for unintended idea gaps which cannot be satisfactorily filled. Often the invention is novel and words do not exist to describe it. The dictionary does not always keep abreast of the inventor. It cannot. Things are not made for the sake of words, but words for things. To overcome this lag, patent law allows the inventor to be his own lexicographer.

II.

The parties disagree on the meaning of Claim 1, as well as on the more fundamental question of the proper categorization of Claim 1, and thus the proper method employed to determine the claim's meaning. Detroit Diesel contends that the '597 patent contains "step-plus-function" components that the court must, pursuant to paragraph 6 of § 112 of the Patent Act, construe with reference to the corresponding portions of the specification. Caterpillar argues that the '597 patent is a method patent, and that no authority exists for the application of paragraph 6 to method claims.

A. Background

The Patent Act provides that "whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title." 35 U.S.C. § 101; see also Diamond v. Chakrabarty, 447 U.S. 303, 309, 65 L. Ed. 2d 144, 100 S. Ct. 2204 (1980) (Congress intended § 101 to include "anything under the sun that is made by man"). A "process" is further defined as a "process, art or method." 35 U.S.C. § 100(b). Three of the four classes of utility inventions--machines, manufactures, and compositions of matter--may be grouped into "products," leaving products and processes as the two general categories of patents. 1 Donald. S. Chisum, Patents, § 1.01, at 1-5, 1-7 (1996).

A patent specification contains a description of the invention, a description of how to make and use the invention that would allow one reasonably skilled in the art to make and use it, and a description of the "best mode" contemplated by the inventor for carrying out the invention. 35 U.S.C. § 112(1). The specification must conclude with "one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112(2). Patent claims may be drafted in "functional" language, which "describes an invention in terms of what it accomplishes rather than in terms of what it is." 2 Chisum, Patents, § 8.04 at 8-53. Functional language is by its nature broad, and may run afoul of the Patent Act's requirement that a patent claim "particularly point[] out and distinctly claim[] the subject matter which the applicant regards as his invention." 35 U.S.C. § 112(2) (based on 35 U.S.C., 1946 ed., § 33).

Just such a situation occurred in Halliburton Oil Well Cementing Co. v. Walker, 329 U.S. 1, 91 L. Ed. 3, 67 S. Ct. 6 (1946), in which the Supreme Court held that a claim drafted as a "means-plus-function" was invalid. The functional language of the patent at issue in Halliburton 4 described a resonator in relation to the rest of the apparatus as "means associated with said pressure responsive device for tuning said receiving means to the frequency of echoes from the tubing collars of said tubing section to clearly distinguish the echoes of said couplings from each other." 329 U.S. at 8-9. "The language of the claim," the Supreme Court explained, "thus describes this most crucial element in the 'new' combination in terms of what it will do rather than in terms of its own physical characteristics or its arrangement in the new combination apparatus." Id. at 9. It was this "broadness, ambiguity, and overhanging threat of the function claim" that troubled the Supreme Court:

What he claimed in the court below and what he claims here is that his patent bars anyone from using in an oil well any device heretofore or hereafter invented which combined with the Lehr and Wyatt machine [(the prior art)] performs the function of clearly and distinctly catching and recording echoes from tubing joints with regularity. Just how many different devices there are of various kinds and characters which would serve to emphasize these echoes, we do not know. The Halliburton device, alleged to infringe, employs an electric filter for this purpose. In this age of technological development
there may be many other devices beyond our present information or indeed our imagination which will perform that function and yet fit these claims. And unless frightened from the course of experimentation by broad functional claims like these, inventive genius may evolve many more devices to accomplish the same purpose. Yet if Walker's blanket claims be valid, no device to clarify echo waves, now known or hereafter invented, whether the device be an actual equivalent of Walker's ingredient or not, could be used in a combination such as this, during the life of Walker's patent.

329 U.S. at 12 (citations omitted).

In 1952 Congress reacted to the Halliburton decision by enacting paragraph six of § 112 (then paragraph 3), which provides that "an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112(6). As explained in Greenberg v. Ethicon Endo-Surgery, Inc.:

The record is clear on why paragraph six was enacted. In Halliburton Oil Well Cementing Co. v. Walker, 329 U.S. 1, 91 L. Ed. 3, 67 S. Ct. 6 (1946), the Supreme Court held invalid a claim that was drafted in means-plus-function fashion. Congress enacted paragraph six, originally paragraph three, to overrule that holding. In place of the Halliburton rule, Congress adopted a compromise solution, one that had support in the pre-Halliburton case law: Congress permitted the use of purely functional language in claims, but it limited the breadth of such claim language by restricting its scope to the structure disclosed in the specification and equivalents thereof.

The court in Motorola, Inc. v. Interdigital Technology Corp., 930 F. Supp. 952, 963 (D.Del. 1996), described this simple example regarding the effect of paragraph 6: "If a patent contains a means-plus-function limitation claiming a 'means for fastening' and the specification discloses a 'button' as a possible fastening means, under Markman a court must resolve any disputes regarding both the 1) function of the fastening means, and 2) the meaning of the word 'button,' as a matter of law."

B. Paragraph Six Applies to Methods Claims

Though Caterpillar is correct in its observation that case law directly on point is sparse, the court concludes that, contrary to Caterpillar's assertion, paragraph six of § 112 applies to method claims, and not only to apparatus claims. The court's conclusion is based on the statute's plain language, commentary of one of its drafters, case law at the time of enactment of
paragraph six and since then, and on Patent and Trademark Office guidelines.

Contrary to Caterpillar's expert's interpretation, 6 paragraph six of § 112 does not define a new and distinct variety of patent claim. Rather, the plain language of paragraph six makes clear that the method it prescribes applies on an element-by-element basis and that it applies to both apparatus and methods claims: "An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof …" (emphasis added). From the statute courts derive the terms "means-plus-function" and "step-plus-function" for functional language contained in apparatus and methods claims respectively.

6 Caterpillar's expert, James M. Amend, asserts in his affidavit that, "depending on the type of patent (e.g. method, means-plus-function, apparatus, etc.), certain statutory and/or common law rules will govern the manner in which the claims of the patent should be construed," and that "because Claim 1 of the '597 patent is a method claim, P6 of 35 U.S.C. § 112 does not apply to the construction of that claim." Amend Aff. (exh. B to Caterpillar's response), P 15.

The last paragraph of section 112 relating to so-called functional claims is new. It provides that an element of a claim for a combination (and a combination may be not only a combination of mechanical elements, but also a combination of substances in a composition claim, or steps in a process claim) may be expressed as a means or step for performing a specified function, without the recital of structure, material or acts in support thereof.

7 That paragraph six applies to method/process claims also finds support in PTO guidelines published in the wake of the Federal Circuit's decision in In re Roberts, 470 F.2d 1399 (C.C.P.A 1973), and Ex parte Zimmerley, 153 U.S.P.Q. 367 (Bd. App. 1966), respectively:

(5) reducing the coefficient of friction of the resulting film [step plus function; "step" unnecessary], and

(6) raising the Ph [sic] of the resultant pulp to about 5.0 to precipitate …

The guidelines also provide that "step" and "act" are related in the same way as "means" and "structure." 47 Pat Trademark & Copyright J. (BNA) at 573.

7 The court is mindful of the Federal Circuit's warning in In re Donaldson, Inc., 16 F.3d 1189, 1193 n.3 (Fed. Cir. 1994), that Mr. Federico's comments do not constitute legislative history per se because Mr. Federico, though a textual author of the 1952 Patent Act's provisions, was not a legal author, and so was "merely stating his personal views." Lawrence Kass, Comment, Computer Software Patentability and the Role of Means-Plus-Function Format in Computer Software Claims, 15 Pace L. Rev. 787, 852-853 (1995). The Donaldson court's warning, however, was made in the context of a different issue (whether application of paragraph six of § 112 is appropriate during patent examination). With respect to the application of
paragraph six, the United States Court of Customs and Patent Appeals expressed its agreement with Mr. Federico's interpretation of paragraph six as applying to "not only a combination of mechanical elements, but also a combination of substances in a composition claim, or steps in a process claim." Application of Fuetterer, 50 C.C.P.A. 1453, 319 F.2d 259, 264 (C.C.P.A. 1963).

In Roberts the Court of Customs and Patent Appeals reversed the examiner's rejection of four method claims. 470 F.2d at 1403. The examiner's rejection was based on the claims' functional language; the examiner thought the step of "reducing the coefficient of friction--to below about 0.40' defined a result but failed to identify the specific act or acts required to produce the result claimed." Id. at 1402. The court disagreed with the examiner's conclusion because "the [sixth] paragraph of [section 112] specifically allows the use of functional language to define claim limitations." Id. at 1402. "The absence in the claim of specific steps which would bring about the desired friction property is no defect. The claims define the limits of the claimed invention, and it is the function of the specification to detail how this invention is to be practiced." Id. at 1403. In Zimmerley, the Patent Office Board of Appeals reversed a rejection of a method claim for failing to particularly point out and distinctly claim the invention; specifically, the examiner thought that the claim element of "raising the pH level of the resultant pulp to about 5.0 to precipitate dissolved molybdenum as molybdenum trihydroxide" should have recited a specific way of raising the pH level. 153 U.S.P.Q. at 369. The court found the examiner's rejection improper because paragraph six of § 112 "sanctions functionally defined steps in claims drawn to a combination of steps." Id. at 369.

From Roberts, Zimmerley, and Cohn, the court concludes that § 112 applies to functional methods claims where the element at issue sets forth a step for reaching a particular result, but not the specific technique or procedure used to achieve the result. Such an interpretation is consistent with the statute's plain language, which exempts from the purview of § 112 (6) an element in a claim for a combination that is expressed as a means or step for performing a function with the recital of supporting acts. 8

8 Indeed, the Federal Circuit has found § 112(6) inapplicable in situations where an element's language is functional, but some recitation of structure exists and the "means" is not tied to the function. York Products, Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1574 (Fed. Cir. 1996).

The Federal Circuit's treatment of means-plus-function language reveals that paragraph six's application is not triggered simply by the use of functional language or the magic words "means for 'ing" or "step for 'ing." 9 In Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580 (Fed. Cir. 1996), the Federal Circuit found that the district court erred in applying § 112(6) to a claim element that defined a component as a "detent mechanism." The district court based its decision on the functionality of the "detent" (i.e., "a device for positioning and holding one mechanical part in relation to another"), and on the fact that the "detent means" was used twice in the specification's summary of the invention. Id. at 1583. The Federal Circuit disagreed with the district court's reasoning on three bases. First, the court explained that "the fact that a particular mechanism ... is defined in functional terms is not sufficient to convert a claim element containing that term into a 'means for performing a specified function' within the meaning of section 112(6)." Id. More important than the fact that "detent mechanism" was defined in terms of what it does was the fact that "the term, as the name for structure, has a reasonably well understood meaning in the art." Id. Second, that the specification contained the term "means" was of little significance because "means" was used "simply as a shorthand way of referring to each of the key structural elements of the invention," and that those elements later were described in detail without using "means." Lastly, the court considered the patentee's intent: "the element in question did not use 'means-plus-function' language, no other element of the claim was in means-plus-function form, and nothing cited to use from the prosecution history or elsewhere suggests that the patentee intended to
claim in that fashion." Id. at 1584. The court then noted the general principle that "the use of the term 'means' has come to be so closely associated with 'means-plus-function' claiming that it is fair to say that the use of the term 'means' (particularly as used in the phrase 'means for') generally invokes section 112(6) and that the use of a different formulation generally does not." Id. at 1584.

9 For a broader view of the application of § 112(6) to method claims, see Kenneth R. Adamo, Drafter's Dilemma: Means Plus Function and Guidelines and Hilton Davis. 78 J. Pat & Trademark Off. Soc'y 367, 389 (1996) ("It is fundamental that nearly all steps recited in process claims fall within this provision [§ 112, para. 6] of the Patent Statute," (citations omitted)). Though the Federal Circuit has not directly addressed the issue, the Federal Circuit has clearly not adopted such an expansive view of the application of § 112(6) to method claims.

Greenberg thus teaches that an element's language is not dispositive of whether § 112(6) applies, see York Products, Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1574 (Fed. Cir. 1996) ("Mere incantation of the word 'means' in a clause reciting predominantly structure cannot evoke section 112, P 6."). And, the court should consider whether the functional term has a "reasonably well understood meaning in the art," and the drafter's intent, as may be evidenced by the language, reference to other elements or claims, and the prosecution history.

C. Section 112(6) Does Not Apply to the Elements of Claim 1 of the '597 Patent

Applying the factors discussed above to the elements of Claim 1, the court concludes that § 112(6) is not applicable. The elements of Claim 1 of the '597 patent are written as steps-plus-functions, which support an intent to invoke § 112(6): "steps of: providing a memory ... determining when the cruise control is engaged; ... retrieving one of the sets [of] data ...; retrieving the other set of ...; and using the retrieved data...." That factor, however, is not determinative, and the remainder of the factors counsel the court not to apply § 112(6). Nothing in the prosecution history suggests an intent to invoke § 112(6), see ex. D to Caterpillar's response, and the elements at issue in Claim 1 are not result-oriented, as were those in Roberts, Zimmerley, and Cohn, in which the Federal Circuit discussed the application of § 112(6) to method or process claims. The elements of Claim 1 involve the actions of "providing," "determining," "retrieving," and "using," which do not merely describe an achieved result, but are specific acts in themselves. The acts set forth in Claim 1's elements are "functional" only in the manner in which all acts are functional, and nothing before the court suggests that the acts set forth in the claim lack a "reasonably well understood meaning in the art." See Greenberg, 91 F.3d at 1583.

4189

1. "Step Plus Function"

As an initial matter, the parties dispute whether subsection (a) of claim 1 of the '446 patent is a "step-plus-function" claim subject to 35 U.S.C. § 112, P 6, which provides:

An element in a claim for a combination may be expressed as a means or a step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6. Under this provision, an inventor "can describe an element of his invention by the result accomplished or the function served, rather than describing the item or element to be used (e.g., 'a means of connecting Part A to Part B,' rather than 'a two-penny nail')." See Warner-Jenkinson Co., Inc. v. Hilton Davis Chemical Co., 520 U.S. 17, 27, 117 S. Ct. 1040, 137 L. Ed. 2d 146 (1997).

The statute "can apply not only to a combination of mechanical elements, but also to 'a combination of . . . steps in a process claim.'" See Masco Corp. v. United States, 303 F.3d 1316, 1326 (Fed. Cir. 2002). The Federal Circuit has held that the statute permits "an element in a combination method or process claim [to] be recited as a step for performing a specified
function without the recital of acts in support of the function." See O.I. Corp. v. Tekmar Co. Inc., 115 F.3d 1576, 1583 (Fed. Cir. 1997). "The price that must be paid for use of that convenience," however, is that "such a claim covers only the specific acts recited in the specification for performing that function, and equivalent acts." See id.; see also Seal-Flex, Inc. v. Athletic Track and Court Construction, 172 F.3d 836, 850 (Fed. Cir. 1999) (Rader, J., concurring).

There is a presumption that the claims are in step-plus-function format when the drafter uses the term "steps for." See Masco, 303 F.3d at 1326. By contrast, where the claim employs the term "steps of," there is no presumption that the claims are in step-plus-function format, see id. at 1327, because "[m]ethod claims necessarily recite the steps of the method, and the preamble words that 'the method comprises the steps of' do not automatically convert each ensuing step into the form of § 112 P 6." See Cardiac Pacemakers, Inc. v. St. Jude Medical, Inc., 381 F.3d 1371, 1382 (Fed. Cir. 2004). "[W]here a method claim does not contain the term 'step[s] for,' a limitation of that claim cannot be construed as a step-plus-function limitation without a showing that the limitation contains no act." See Masco, 303 F.3d at 1327. 3

3 "[T]he 'underlying function' of a method claim element corresponds to what that element ultimately accomplishes in relationship to what the other elements of the claim and the claim as a whole accomplish. 'Acts,' on the other hand, correspond to how the function is accomplished." See Masco, 303 F.3d at 1327 (quoting Seal-Flex, 172 F.3d at 849-50 (Rader, J., concurring) (emphasis in original)); see also O.I. Corp., 115 F.3d at 1583-84 ("We interpret the term 'steps' to refer to the generic description of elements of a process, and the term 'acts' to refer to the implementation of such steps.").

"[E]ven where the drafter employs the "step for" language," however, "section 112, P 6 is implicated . . . only when steps plus function without acts are present" in the claim language. See Masco, 303 F.3d at 1326 (quoting O.I. Corp., 115 F.3d at 1582) (ellipses and emphasis in original). If the claim language sets forth an act to perform the desired function, then the claim is not in step-plus-function format. See id. at 1327. In addition, "merely claiming a step by itself, or a series of steps, without recital of a function does not trigger the application of § 112, paragraph 6." Epcon Gas Systems, Inc. v. Bauer Compressors, Inc., 279 F.3d 1022, 1028 (Fed. Cir. 2002).

"Only a few cases have found the existence of a step-plus-function claim element." See Seal-Flex, 172 F.3d at 850 n.5 (Rader, J., concuring) (citing In re Roberts, 470 F.2d 1399 (CCPA 1973) and Ex Parte Zimmerley, 153 U.S.P.Q. 367 (BPA 1966)). In Roberts, the claim language at issue provided: "The method of corrugating polyethylene terephthalate film which comprises shaping said film at a temperature in the range of about 100 [degrees] to 175 [degrees] C. by pressing said film between two coacting rotating surfaces and reducing the coefficient of friction of the resulting film to below about 0.40 as determined by the Bell test." See Roberts, 470 F.2d at 1400. The Court of Customs and Patent Appeals held that the phrase "reducing the coefficient of friction of the resulting film to below about 0.40" fell within the scope of § 112 P 6 (then codified as § 112 P 3) because of "the absence in the claim of specific steps which would bring about the desired friction property." See id. at 1402-03. In Zimmerley, a lengthy process claim set forth a number of steps, including "raising the pH of the resulting pulp to about 5.0 to precipitate dissolved molybdenum trihydroxide, leaving the ferrous iron values in solution." See Zimmerley, 153 U.S.P.Q. at 368. The Patent Office Board of Appeals held that this claim language fell within the scope of § 112 P 6 (then codified as § 112 P 3) and, accordingly, there was no need for the claim to "recite a specific way of raising the pH." See id. at 369.

Here, claim 1 of the '446 patent states:

An automated method for designing an initial integrated circuit layout of a digital circuit with a computer, based upon an electronic circuit description and by using a cell library containing cells, comprising the steps of:

(a) selecting a plurality of cells from the cell library that are intended to be coupled to each other with a plurality of wires and that can be used to implement the digital circuit based on the electronic circuit description input to the computer to obtain a selected plurality of cells, having an initial intended delay associated therewith for ensuring that predetermined timing constraints are met;

(b) determining a placement of the selected plurality of cells and the wires coupled thereto using a sequence of
instructions from the computer program; and

(c) determining the area of the some cells, the area of each some cell being determined using the lengths of the wires coupled to each of said some cells such that the initial intended delay of each some cell is realized, the length of each wire being determined by the placement of the cells coupled to that wire.

('446 patent at 17:14-35.) As noted, the parties dispute whether subsection (a) is stated in step-plus-function format.

Because the claim "does not contain the term 'step[s] for,' a limitation of that claim cannot be construed as a step-plus-function limitation without a showing that the limitation contains no act." See id. at 1327. In subsection (a), the claim specifies the act of "selecting a plurality of cells from the cell library . . . at least some of the selected plurality of cells having an initial intended delay associated therewith" as a way of achieving the specified function, in particular, "ensuring that predetermined timing constraints are met." (See '446 patent at 17:18-26.) As subsection (a) includes both a function and an act, it is not in step-plus-function format. See Masco, 303 F.3d at 1327.

4190

1. The Order of the Steps of Claim 21

The parties dispute the order of the steps of Claim 21. Claim 19, in the first "storing" step, has only one step, namely that of "storing" information in the compressed data library 118, performed by the compressed data storing means 117. Claim 21 further limits Claim 19 to storing in more than one compressed data library. Claim 21 also necessitates that the first "storing" step in Claim 19 actually performs the step of storing information in the compressed library. If this were not the case, Claim 21 would be invalid. Independent claims are not to be construed to invalidate dependent claims.

The Court construes Claim 21 the '992 Patent as follows:

In a distribution method in which a transmission system is storing information in a compressed data form, the storing of the information can be in any order in several compressed data libraries.

D. The '992 Patent - Claim 41

Claim 41 of the '992 Patent provides:

A method of transmitting information to remote locations, the transmission method comprising the steps, performed by a transmission system, of:

storing items having information in a source material library;

retrieving the information in the items from the source material library;

assigning a unique identification code to the retrieved information;

placing the retrieved information into a predetermined format as formatted data;

placing the formatted data into a sequence of addressable data blocks;

compressing the formatted and sequenced data blocks;

storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code; and

sending at least a portion of the file to one of the remote locations.
1. The Preamble of Claim 41

For the reasons stated with respect to Claim 19, the Court finds that the Preamble of Claim 41 of the '992 Patent is limiting in that the method of transmitting information must be performed by a "transmission system," capable of performing the method.

2. The Order of the Steps of Claim 41

The parties agree that the steps of Claim 41 must be performed in the order enumerated in the claim. However, there is a dispute with respect to whether a prior step must be completed before a succeeding step may commence. (See Joint Chart of the Parties Proposed Definitions for Claim Terms From the '992 and '275 Patents at 9, P 22.)

The language of Claim 41 makes each step antecedent to each succeeding step. As discussed in the order of the steps of Claim 19, a step, which is an antecedent to a succeeding step, must commence before the succeeding step commences, and the antecedent step must finish before the succeeding step can finish.
Luma's construction is set forth in (Luma May 4, 2005, p. 4).

Luma proposes hardware or software and a video image. The Master has not used "hardware" or "software" or "video" in the construction. They may or may not be included depending upon how they fit with the Master's Construction. The still frame buffer is not to be limited; however, to those terms. The evidence does not limit the "still frame buffer" with "hardware", "software" or "video".

STRYKER'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

Stryker's position is set forth in (Stryker May 23, 2005, p. 10).

Stryker argues that this Patent Specification does not provide any support for Luma's Construction that the "still frame buffer" refers to any medium in "hardware" or "software". The Master agrees. The Master has not made "medium in hardware or software" part of the construction. Stryker's objection to "piecemeal construction" has been addressed by the Master in "# 2" above.

KSEA'S POSITION AND MASTER'S COMMENTS ON THAT POSITION

KSEA's position is set forth in (KSEA May 23, 2005, Sheet 8).

KSEA objects to using "video". The Master has not inserted "video" in the Construction and agrees with KSEA. KSEA argues that using "saves" is improper. The Master has not used the word "saves" in the Masters' Construction.

4192

2. Construction of Disputed Claim Language

The '776 patent discloses an improvement to a personal computer data transfer program. The claimed advance over the prior art is the invention's ability to prevent computer viruses from entering and infecting a computer system in the first instance by transferring digital data virus-free to a destination storage medium. 3 The '776 patent discloses a method for scanning for computer viruses during the transfer of incoming digital data and before storage on the destination storage medium, and, in response to the screening step, for automatically inhibiting virus-infected data from being stored and automatically storing virus-free data. 4 At issue here are Claims 1, 2, 6, and 18 of the '776 patent. Claims 1 and 18 are independent claims, whereas Claims 2 and 6 are dependent claims. 5 Accordingly, a finding that Network's accused product does not infringe either of the independent claims will dispose of Plaintiff's case. See Desper Products, Inc. v. QSound Labs, Inc., 157 F.3d 1325, 1338 n.5 (Fed. Cir. 1998); London v. Carson Pirie Scott & Co., 946 F.2d 1534, 1539 (Fed. Cir. 1991).

Footnotes

3 The '776 patent specification asserts that the claimed invention solves the problems of the prior art "by performing an in transit detection of computer viruses... which allows multiple virus signatures to be simultaneously tested for... on the fly" and by inhibiting "the virus from entering the computer in the first place." '776 patent, Col. 1, Lines 45-62. 4 The '776 patent specification discloses that "if any one or more of the [virus] signatures are detected, the file into which the incoming bitstream would have been stored is closed or aborted so the virus does not take up residency on the storage medium." Id. at Col. 1, Lines 65-69, Col. 2, Line 1 (emphasis added). Thus, the inventive advance of the '776 patent is its capability to scan for viruses during the transfer and before the incoming digital data is stored on the destination storage medium thus preventing viruses from infecting this computer system in the first instance. 5 Hilgraeve does not dispute Defendant's contention that Claims 2 and 6 are dependent upon Claim 1.

End Footnotes

The parties' dispute focuses on the meaning and scope of language contained in Claims 1 and 18. 6 To resolve their dispute, the Court must construe these claims, ascertain the specific order in which the disclosed sequential steps are to be performed, and define the "storage" and "prior to storage" terms as used in Claims 1 and 18.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

--- Footnotes ---

6 This dispute centers around the meaning and scope of the language highlighted below.

Claim 1 reads as follows:

1. In a system for transferring digital data for storage in a computer storage medium, a method of screening the data as it is being transferred and automatically inhibiting the storage of screened data containing at least one predefined sequence, comprising the steps of:

   causing a quantity of digital data resident on a source storage medium to be transferred to a computer system having a destination storage medium;

   receiving and screening the transferred digital data prior to storage on the destination storage medium to determine if at least one of a plurality of predefined sequences are present in the digital data received; and

   in response to said screening step:

   (a) automatically causing the screened digital data to be stored on said destination storage medium if none of the plurality of predefined sequences are present, and

   (b) automatically inhibiting the screened digital data from being stored on said destination storage medium if at least one predefined sequence is present.

'776 patent, Col. 17, Lines 9-29 (Emphasis added).

Claim 18 reads as follows:

18. A method of preventing the spread of computer viruses to a computer having a storage medium, comprising the steps of:

   simultaneously searching for a plurality of virus signatures, each of which comprising an identifiable digital sequence, while said computer is receiving a stream of digital data for storage on said storage medium;

   providing an indication of the detection of a virus from said searching step; and

   automatically inhibiting the storage of said digital stream on said storage medium if any of said virus signatures have been detected.

'776 patent, Col. 28, Lines 45-57 (Emphasis added).

--- End Footnotes ---

The parties agree that these are method claims which disclose sequential steps of operation and that the steps must be performed in a particular order. See Plf.'s Resp. at 4, n.5. The disclosed order is as follows: (1) incoming digital data is first screened for viruses while the digital data is being received or is "in transit" and before storage on the destination storage medium, and (2) in response to the screening step, virus-infected digital data is automatically inhibited from being stored whereas virus-free data is automatically stored.

Because Claims 1 and 18 require that virus screening be completed during transfer and before storage on the destination medium, the Court must construe the meaning of the word "storage" as used in those claims. The parties' essentially agree on the meaning of storage. This Court construes "storage" as follows: storage occurs when the incoming digital data is sufficiently present on the destination storage medium, and accessible by the operating system or other programs, so that any viruses contained in the data can spread and infect the computer system. The intrinsic evidence; i.e., the '776 patent
The '776 specification discloses that:

which is the place "most computer operating systems buffer data being written to the storage medium." Id. at Col. 4, Lines 24-26. The screening process is performed at step 32. Thus, in the '776 invention, incoming data is screened before it reaches buffer 38 comprising a portion of RAM 20." Id. at Col. 3, Lines 64-67. Unlike the prior art, the invention's error and virus infection prevention mechanism using the invention to test the data transmission in transit". Id. at Col. 2, Lines 65-66. Below is a drawing from the '776 patent diagraming the invention using a telecommunications link between two computer systems.

The processing or screening step (step 2) is pivotal here and best understood when examined along with the embodiments described and illustrated therein, corroborate this claim construction. They disclose that Claims 1 and 18's sequential steps are to be performed as follows. First is the transmission or screening step. Here, incoming digital data is received and screened "in transit" for computer viruses and before storage on the destination storage medium. Second is the processing or screening step. Here, digital data is caused to be transmitted from one computer storage medium to another. Third is the inhibiting step. Here, in response to the screening performed in step (2), virus-free digital data is automatically stored on the destination storage medium and virus-infected digital data is automatically inhibited from being stored on the destination storage medium.

The '776 patent specification, including the embodiments described and illustrated therein, corroborate this claim construction. They disclose that Claims 1 and 18's sequential steps are to be performed as follows. First is the transmission step. Here, digital data is caused to be transmitted from one computer storage medium to another. Second is the processing or screening step. Here, incoming digital data is received and screened "in transit" for computer viruses and before storage on the destination storage medium. Third is the inhibiting step. Here, in response to the screening performed in step (2), virus-free digital data is automatically stored on the destination storage medium and virus-infected digital data is automatically inhibited from being stored on the destination storage medium. Id. at Col. 2, Lines 17-34.

The '776 invention first "simultaneously" searches for "a plurality of virus signatures" "while said computer is receiving a stream of digital data for storage". Id. at Col. 18, Lines 48-52. Second, if a virus is detected "from said searching step", an indicator is provided showing that a virus has been detected. Id. at Col. 18, Lines 53-54. Finally, if any viruses have been detected, the '776 invention "automatically inhibit[s] the storage of said digital stream on said storage medium." Id. at Col. 18, Lines 55-57. Accordingly, both Claims 1 and 18 teach that the virus screening or searching is done while the digital data is being received or transferred and before it is stored on the destination storage medium.

The '776 patent specification, including the embodiments described and illustrated therein, corroborate this claim construction. They disclose that Claims 1 and 18's sequential steps are to be performed as follows. First is the transmission step. Here, digital data is caused to be transmitted from one computer storage medium to another. Second is the processing or screening step. Here, incoming digital data is received and screened "in transit" for computer viruses and before storage on the destination storage medium. Third is the inhibiting step. Here, in response to the screening performed in step (2), virus-free digital data is automatically stored on the destination storage medium and virus-infected digital data is automatically inhibited from being stored on the destination storage medium. Id. at Col. 2, Lines 17-34.

The processing or screening step (step 2) is pivotal here and best understood when examined along with the embodiments illustrated in Figures 1 and 2 of the '776 patent. These illustrations provide diagrams of "a data communications system in which data transmitted over a telecommunications link between two computer systems is tested in transit using the invention," Id. at Col. 2, Lines 59-64, an overall flow diagram of the in transit detection process", Id., and "a file copying mechanism using the invention to test the data transmission in transit". Id. at Col. 2, Lines 65-66. Below is a drawing from the '776 patent diagraming the invention using a telecommunications link between two computer systems.

[SEE DRAWING IN ORIGINAL]
Typically, the input buffer 30 is configured to hold one or more blocks of data which have been transmitted over communication line 26 by the computer system 12. A cyclic redundancy check (CRC) or other error checks are performed on the data in input buffer 30. If a transmission error is detected, many communications protocols cause the block containing the error to be resent.

When the incoming data stream has been error checked and the input buffer becomes filled, in a conventional data communications system, the data in buffer 30 would be stored on the destination medium 24b. The present invention intervenes at this point by subjecting the buffered data to a character by character virus signature string search analysis depicted at 32.

Id. at Col. 3; Lines 67-68; Col. 4, Lines 1-13 (emphasis added).

In the preferred embodiment, the "string search routine" disclosed in the '776 patent is performed at step 32 and is implemented using a finite state machine based on preloaded finite state tables 34", Id. at Col. 4, Line 1, which tests each character as it enters looking for a match to a virus signature. Id. at Col. 5, Lines 2-21. Blocks of data are transmitted, screened for viruses, and stored in the designed receive file if virus-free, and then the next block of data is transferred and the process is repeated. Id. at Col. 6, Lines 22-68; Col. 7, Lines 1-14. If, in response to the "in transit" screening step, a virus is detected in a block of data being transmitted, "the transfer will of course be cancelled prematurely." Id. at Col. 6, Lines 14-16. Also, "if a virus was detected during the transfer," the data in the file can be purged or deleted by overwriting. Id. at Col. 6, Lines 24-31 (emphasis added). "For added safety, any portion of the file already written can be overwritten with 1's or 0's to ensure that none of the virus remains." Id. at Col.2, Lines 1-3.

The patent specification further teaches that, if "a virus signature is detected" during the incoming virus screening step at 32, "the user is alerted at step 36, typically by an appropriate warning message displayed on the computer system monitor," Id. at Col. 4, Lines 16-19, and any storage of the data onto the destination medium 24b is terminated, with the receiving file being deallocated or marked to be overwritten", Id. at Col. 4, Lines 19-22. However, "if no virus signature is detected, the data is stored on destination medium 24b as depicted at 38 and 40." Id. at Col. 4, Lines 23-24.

Accordingly, only virus-free digital data passes through to buffer 38 on the way to storage on the destination storage medium 40. Virus-infected digital data is automatically inhibited from storage. Virus-infected data will cause the transfer to be interrupted mid-stream, will trigger a flag which notifies the user that a virus signature has been detected in a block of incoming data, and will notify the user that it must decide whether the transfer should be prematurely terminated. If the transfer is terminated, then virus-infected data is stopped before it reaches buffer 38 and is never stored on the destination storage medium 40. Moreover, blocks of virus-free data which have passed through and have been stored on the destination storage medium can be purged or deleted by overwriting as an added anti-virus safety.

In sum, the '776 patent-in-suit operates as follows: The invention receives a quantity of data in buffer 30 during the transfer of digital data from a source medium to a destination medium. The invention scans the data in buffer 30 for the presence of a predefined digital sequence, such as a virus signature, before storing the data on the destination medium 40. If a predefined sequence is found in the digital data, the data in buffer 30 is inhibited from being stored on the destination storage medium. If a predefined sequence is not found in the digital data, the virus-free data is transferred from buffer 30 to a file on the destination storage medium where it is then stored. If a predefined sequence is subsequently detected in an incoming block of digital data, the previously stored, virus-free block of digital data can be purged or overwritten as an added anti-virus safety.

The patent's prosecution history likewise supports the Court's construction of the order within which the sequential steps of Claims 1 and 18 are to be performed as well as the Court's construction of "storage." The Court is mindful that "the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Southwall Technologies, 54 F.3d at 1576. The Court is also mindful that it may consider the prior art cited in the prosecution history for clues as to what the disputed claim does not cover. See Vitronics, 90 F.3d at 1583. The Court cannot, however, use the prosecution history to "enlarge, diminish, or vary the limitations in the claim." Markman, 52 F.3d at 980 (internal quotes and citations omitted). The prosecution history below reveals that, in the screening step, the "prior to storage on the destination storage medium" requirement was added to distinguish the '776 invention from the prior art.
As originally filed, Claim 1 disclosed a method for identifying and inhibiting the storage of data containing at least one predefined sequence or virus signature. Unlike the final amended version of the screening step of Claim 1, there was no sequential limitation that virus screening be performed before storage on the destination storage medium. See Def's Ex. 11, 4/19/90 Patent Application at 25.

In the first Office Action, dated October 24, 1991, the examiner rejected all the claims as unpatentable under 35 U.S.C. § 103 for obviousness in view of an existing patent to Nagata et al. (No. 4,979,210). See Def's Ex. 12, 10/24/91 Patent and Trademark Office Correspondence at 3. All claims were likewise rejected under 35 U.S.C. § 112, second paragraph, "as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention." Id. at 8.

The applicants responded by submitting the following November 7, 1991 amendment: 8

1. (Amended) In a [data transfer] system for [receiving a transmission of] transferring digital data for storage in a computer storage medium, a method of [identifying and] inhibiting the storage of data containing at least one predefined sequence, comprising the steps of:

   causing a [transmission] quantity of digital data resident on a source storage medium to be transmitted to a computer system having a destination storage medium;

   receiving and processing the [transmission] transmitted digital data to determine if at least one of a plurality of predefined [sequence is] sequences are present in the [transmission] digital data received; and

   in response to said processing step:

   (a) causing the digital data of said transmission to be stored on said destination storage medium if none of the plurality of predefined sequences are present, and

   (b) inhibiting the digital data of said transmission from being stored on said destination storage medium if at least one predefined sequence is present.

Def.'s Ex. 13, 11/7/91 Amendment at 2, 4-5. Claim 18 was also added as a new claim. Id. at 4.

--- Footnotes ---

8 Consistent with Patent Office practice, deletions are shown in brackets and additions are underlined. See 37 C.F.R. § 1.121.

--- End Footnotes ---

Applicants also argued that the examiner's rejection for obviousness under § 103 was inappropriate because, unlike the prior art, the '776 invention scanned for viruses in transit and thus prevented viruses from infecting the computer system in the first instance:

While virus scanning programs exist, they do not provide an effective answer to the problem, as they scan files which have already been stored. In other words, a computer virus has the opportunity to attack, mutate and otherwise spread before the file containing the virus is scanned. In contrast, the present invention provides a real and complete solution to this problem by providing a way to check for virus signatures while a digital data file is in transit, so that the receiving computer is protected in the first instance from ever being infected.

Importantly, the present invention has the capability to simultaneously test for a multitude of virus signatures while the digital data is being received. . . . The present invention also has the capability to respond to the detection of a virus by not only preventing the copying of the complete file, but also to mark the file for erasure, and even write over any portion of the file that was copied at the option of the operator.
Id. at 6-7 (emphasis in original).

The examiner did not agree with the applicants' arguments, and, in the next Office Action, dated February 13, 1992, continued the prior rejection and made it final. See Def.'s Ex. 14, 2/13/92 Patent and Trademark Office Corresp. at 4. It was explained that the rejection of all claims under § 103 was in view of prior art; i.e., IBM's Virus Scanning Program and John Rex's "Simultaneous Searching for Multiple Strings", and was based on the fact that the combination of these prior art references disclosed all the features of claims 1 and 18 and others in the '776 patent application. As to the only missing feature; i.e., causing or inhibiting the storage of data on the destination medium, the examiner considered it obvious to inhibit a detected computer virus from being stored on the computer system. Id. at 5-6.

An interview was conducted on June 19, 1992 without any agreement being reached as to patentability. See Def.'s Ex. 15, 6/19/92 Patent and Trademark Office Memo. Thereafter, in August 1992, applicants submitted a proposed amendment, together with a declaration of one of the inventors, Matthew Gray. The proposed amendment was not entered because the examiner found that it raised new issues. See Def.'s Ex. 16, 8/13/92 Amendment; Ex. 17, 8/12/92 Decl. of Matthew H. Gray. Subsequently, applicants filed a continuation application, refiled the amendment, and the claims were allowed. By this action, Claims 1 and 18 were amended to read as follows:

1. (Twice Amended) In a system for transferring digital data for storage in a computer storage medium, a method of screening the data as it is being transferred and automatically inhibiting the storage of screened data containing at least one predefined sequence, comprising the steps of:

   - causing a quantity of digital data resident on a source storage medium to be [transmitted] transferred to a computer system having a destination storage medium;
   - receiving and [processing] screening the [transmitted] transferred digital data prior to storage on the destination storage medium to determine if at least one of a plurality of predefined sequences are present in the digital data received; and
   - in response to said [processing] screening step:
     - (a) automatically causing the screened digital data [of said transmission] to be stored on said destination storage medium if none of the plurality of predefined sequences are present, and
     - (b) automatically inhibiting the screened digital data [of said transmission] from being stored on said destination storage medium if at least one predefined sequence is present.

   * * * *

18. (Amended) A method of preventing the spread of computer viruses to a computer having a storage medium, comprising the steps of:

   - simultaneously searching for a plurality of virus signatures, each of which comprising an identifiable digital sequence, while said computer is receiving a stream of digital data for storage on said storage medium;
   - providing an indication of the detection of a virus from said searching step; and
   - automatically inhibiting the storage of said digital stream on said storage medium if any of said virus signatures have been detected.

Def.'s Ex. 16, 8/13/92 Amendment at 1-2, 4.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

9 Added language is underlined.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
Important here is the addition of the requirement in the screening step that the screening be performed "prior to storage on the destination storage medium."

The Gray Declaration emphasized that the unique feature of the '776 invention was its ability to screen for a multitude of virus signatures while digital data was being transferred and its ability to stop the transfer midstream when a virus was detected and "before the virus was copied into the system." See Def.'s Ex. 17, Gray Decl. of 8/12/92 at P 4. Because it would preclude the copying and storage of virus-infected data on the computer system in the first instance, the '776 invention was "the best method of protecting against computer viruses". Id. It was this prophylactic feature which distinguished the '776 invention from the prior art which scanned, detected and then removed "infected files from a computer's storage media such as a hard disk drive." Id. at P 3. It is also the key feature that distinguishes the '776 invention from Defendant's accused product, VirusScan.

Having properly construed the language in Claims 1 and 18, the Court now addresses the question whether Defendant's accused product infringes Hilgraeve's '776 patent by practicing the same method steps.

a. Claim construction

Since the proper construction of claims 1 and 18 of the '776 Patent is the identical issue previously adjudicated in McAfee Associates, and because this issue can be determined regardless of the particular defendant before the Court, the claim construction provided by Judge Edmunds has collateral estoppel effect to the extent that the determination of the scope of the '776 Patent claims was essential to a final judgment on the question of non-infringement. See Pfaff v. Wells Electronics, Inc., 5 F.3d 514, 518 (Fed. Cir. 1993); Molinaro v. Fannon/Courier Corp., 745 F.2d 651, 655 (Fed. Cir. 1984); A.B. Dick Co. v. Burroughs Corp., 713 F.2d 700 (Fed. Cir. 1983)). Therefore, this Court adopts Judge Edmunds' opinion on claim construction and only will summarize the relevant analysis below.

In the claim construction step, the Court must consider three kinds of intrinsic evidence: (1) the patent claims, (2) the patent specification, and (3) the prosecution history, if it is in evidence. See e.g., Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996); Markman, 52 F.3d at 979; McAfee Associates, 70 F. Supp. 2d at 742. First, in construing the language of the patent claims, the Court must give the words their "ordinary and customary meanings" unless the patentee has given the terms special definitions as "clearly stated in the patent specification or file history." Vitronics Corp., 90 F.3d at 1582; see McAfee Associates, 70 F. Supp. 2d at 742. Second, the patent specification is the written description of the invention and "may act as a sort of dictionary, which explains the invention and may define terms used in the claims." Markman, 52 F.3d at 979; see Vitronics Corp., 90 F.3d at 1582; McAfee Associates, 70 F. Supp. 2d at 742. A claim construction should include the preferred embodiment set forth in the patent specification, see Hoechst Celanese Corp. v. BP Chemicals Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996), although the preferred embodiment does not necessarily limit the scope of a claim, see Transmatic, Inc. v. Gulton, Industries, Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995). See McAfee Associates, 70 F. Supp. 2d at 742. Third, the prosecution history, if in evidence, "limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution," Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995), but it may not "enlarge, diminish, or vary the limitations in the claim." Markman, 52 F.3d 967 (quotation omitted); see McAfee Associates, 70 F. Supp. 2d at 743.

If the meaning and scope of a claim is clear after considering the language of the patent claims, the patent specification, and the prosecution history, then the Court should not consider any extrinsic evidence. See Vitronics Corp., 90 F.3d at 1583; McAfee Associates, 70 F. Supp. 2d at 743. If, however, the meaning and scope of a claim remains unclear, then the Court may consider extrinsic evidence "including expert and inventor testimony, dictionaries, and learned treatises." Markman, 52 F.3d at 980; McAfee Associates, 70 F. Supp. 2d at 742.

In the instant case, Plaintiff accuses Defendant of infringing claims 1, 2, 6, 12, 14, 16, and 18 of the '776 Patent. Claims 1 and 18 are independent claims, whereas claims 2, 6, 12, 14, and 16 are dependent upon claim 1. A finding that Defendant's accused products do not infringe the independent claims will dispose of Plaintiff's case. See Desper Products, Inc. v. Qsound Labs, Inc., 157 F.3d 1325, 1338 n.5 (Fed. Cir. 1998); London v. Carson Pirie Scott & Co., 946 F.2d 1534, 1539 (Fed. Cir.
Claim 1 reads as follows:

1. In a system for transferring digital data for storage in a computer storage medium, a method of screening the data as it is being transferred and automatically inhibiting the storage of screened data containing at least one predefined sequence, comprising the steps of:

causing a quantity of digital data resident on a source storage medium to be transferred to a computer system having a destination storage medium;

receiving and screening the transferred digital data prior to storage on the destination storage medium to determine if at least one of a plurality of predefined sequences are present in the digital data received; and

in response to said screening step:

(a) automatically causing the screened digital data to be stored on said destination storage medium if none of the plurality of predefined sequences are present and

(b) automatically inhibiting the screened digital data from being stored on said destination storage medium if at least one predefined sequence is present.

( '776 Patent, column 17, lines 9-29 (emphasis added).)

Claim 18 reads as follows:

18. A method of preventing the spread of computer viruses to a computer having a storage medium, comprising the steps of:

simultaneously searching for a plurality of virus signatures, each of which comprising an identifiable digital sequence, while said computer is receiving a stream of digital data for storage on said storage medium;

providing an indication of the detection of a virus from said searching step; and

automatically inhibiting the storage of said digital stream on said storage medium if any of said virus signatures have been detected.

( '776 Patent, column 18, lines 45-57 (emphasis added).)

As Judge Edmunds explained, "claims 1 and 18 teach that virus screening or searching is done while incoming digital data is being received or transferred and before it is stored on the destination storage medium." McAfee Associates, 70 F. Supp. 2d at 746. Claim 1 discloses that incoming digital data is first screened for viruses while the digital data is being received and "prior to storage on the destination storage medium," and then, "in response to said screening step," the "screened digital data" is either automatically "stored on the destination storage medium" if a virus is not detected or automatically inhibited from "being stored on said destination storage medium" if one is detected during the screening step. Claim 18 discloses simultaneous searches for "a plurality of virus signatures . . . while said computer is receiving a stream of digital data for storage," and then, if a virus is detected "from said searching step," the '776 Patent invention "automatically inhibit[s] the storage of said digital stream on said storage medium."

Judge Edmunds concluded that the term "storage" used in claims 1 and 18 required some clarification. Plaintiff had urged the McAfee Associates Court to recognize that "storage occurs 'when the incoming file or data is sufficiently present on the destination disk medium so any viruses can spread and infect the system.‘" McAfee Associates, 70 F. Supp. 2d at 745 n.7. The defendant in that case had asserted that "storage occurs 'when the digital data is written to, and present on, the destination medium, and accessible by the operating system or other programs, so any viruses contained in the data can spread elsewhere in the computer system.'" Id. Judge Edmunds noted that "the parties essentially agree on the meaning of
storage," id. at 745, and concluded that, "storage occurs when the incoming digital data is sufficiently present on the destination storage medium, and accessible by the operating system or other programs, so that any viruses contained in the data can spread and infect the computer system." Id.

Defendant here, in effect, urges this Court to delete from this definition the requirement that data must be "accessible by the operating system or other programs" in order to be considered stored. (See Def. Br. at 14-15.) Defendant argues that "because claim interpretation is a question of law, . . . a claim should not be interpreted based on an agreement by the parties in a related, but different, case." (Id. at 15.) While the "related, but different, case" to which Defendant refers has preclusive effect on this Court's claim interpretation, as explained above, this Court agrees that proper claim interpretation may not be based solely on the agreement of the parties.

As explained above, when construing patent claims, this Court is required to consider only the intrinsic evidence of the patent claims, the patent specification, and the prosecution history, unless the meaning and scope of those claims are unclear. Furthermore, while the Court is not required to adopt the meaning proffered by one or more of the parties, see Exxon Chemical Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 1555 (Fed. Cir. 1995), a party should not be permitted to argue for a different definition than the one it successfully urged the court below to adopt. Therefore, in light of there being no apparent requirement in claims 1 or 18, the patent specification, or the prosecution history that the stored data be "accessible by the operating system or other programs," and Plaintiff having argued below that "storage" occurs "when the incoming file or data is sufficiently present on the destination disk medium so any viruses can spread and infect the system," this Court will construe "storage" here as follows: storage occurs when the incoming digital data is sufficiently present on the destination storage medium so that any viruses contained in the data can spread and infect the computer system. By omitting from the definition a restriction that does not have a basis the patent claims, patent specification, or prosecution history, this definition is closer to the ordinary and customary meaning of the term in this context and still appears to be consistent with the definitions offered by the parties' experts.

According to the patent specification, the invention receives part of the incoming digital data in a buffer during the data transfer. McAfee Associates, 70 F. Supp. 2d at 748. The invention scans the data in the buffer for the presence of a predefined digital sequence, such as a virus signature, before storing the data on the destination medium. Id. If a predefined sequence is found in the digital data, the data in the buffer is inhibited from being stored on the destination storage medium. Id. If a predefined sequence is not found in the digital data, the data is then transferred from the buffer to a file on the destination storage medium where it is then stored. Id. If a predefined sequence is subsequently detected in an incoming block of digital data, the previously stored, virus-free block of digital data can be purged or overwritten as an added anti-virus safety. Id.

In the preferred embodiment, the "string search routine" disclosed in the '776 Patent tests each character within a block of data as it enters the buffer by searching for a match to a virus signature. ( '776 Patent, column 5, lines 2-21.) See McAfee Associates, 70 F. Supp. 2d at 747. A block of data is transmitted, screened for viruses, and stored in a file if it is virus-free, and then the next block of data is transferred, and the process is repeated. ( '776 Patent column 6, lines 22-68; column 7, lines 1-14.) See McAfee Associates, 70 F. Supp. 2d at 747. If, in response to the screening step, a virus is detected in a block of data being transmitted, the transfer is canceled prematurely, (id. column 6, lines 14-16), and the data in the file can be purged or deleted by overwriting. (id. column 6, lines 24-31.) See McAfee Associates, 70 F. Supp. 2d at 747.

Finally, the prosecution history shows that "prior to storage on the destination storage medium" was added to distinguish the '776 Patent invention from the prior art. See McAfee Associates, 70 F. Supp. 2d at 748.

4. "Storage"

The court next turns to the term "storage." Like the term "message receiver," the parties' primary dispute is whether the term "storage" is drafted in means-plus-function format. The patentee did not use the term "means" and a presumption arises that the claim term is not drafted according to § 112 P 6. The court concludes that the term "storage" connotes specific structure and that the term is not drafted in means-plus-function format. The also concludes that the claim term does not need any further construction.
2. '472 Claim 18: "a storage element for storing electrical energy"

The first step defined in Claim 18 of the '472 patent is the step of "implanting an electronic package beneath the skin of a wearer." The claim then identifies various components of the electronic package, several of which are nearly identical to the components identified in the apparatus Claim 1 and will be interpreted similarly.

The "implanting" step of Claim 18 states that the electronic package must include "a storage element for storing electrical energy to convert an abnormal cardiac rhythm to normal sinus rhythm." '472 Patent, col. 10, ll. 65-67. The significant difference between this statement and the similar statement in Claim 1 is the substitution of the word "element" for the word "means." Because the claim language does not use the word "means" there is no presumption that 35 U.S.C. § 112 P 6 applies. However, the element is stated in purely functional terms, so 35 U.S.C. § 112 P 6 still controls. See Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213-15 (Fed. Cir. 1998) (interpreting "lever moving element" and "movable link member" under 35 U.S.C. § 112 P 6); accord, Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318 (Fed. Cir. 1999) ("When it is apparent that the element invokes purely functional terms, without the additional recital of specific structure or material for performing that function, the claim element may be a means-plus-function element despite the lack of express means-plus-function language.").

The proper construction of "storage element" in Claim 18 is identical to the construction provided for "storage means" in Claim 1 above. The term "storage element" in Claim 18 will be defined as "a capacitor and equivalents thereof."

4. "storage facility"

The next term disputed by the parties is "storage facility," which appears in claims 5 and 6 of the 037 Patent. The parties proposed claim language parallels the definitions advanced in support of their construction of the term "network communications facility" and "filesystem facility." Thus, adopting the reasoning set forth above, the court construes "storage facility" to mean "a peer-level facility for performing storage control functions." See 037 Patent, 3:53-3:56.

5. "Storage means" (Claims 1-3)

a. The Parties' Proposed Constructions

Motorola's Proposal
Not subject to 35 U.S.C. § 112(6). The "storage means" is "a memory element."

* * *

Vtech's Proposal
Subject to 35 U.S.C. § 112(6):

b. Discussion

If §112, P6 was found to apply, and it has been herein, the parties agreed that the structure for the "storage means" is "memory within the communication receiver." (Docket Entry # 93 at A8).

Motorola asserts that the storage means function is "storing at least one user-programmed call-back number along with data defining at least one corresponding special audible alert, and further for storing data defining a user-programmed default
audible alert." (Docket Entry # 93 at A8). VTech asserts that the function is: "electronically storing at least one user programmed call back phone number previously entered into the memory by the user. The user also programs and stores in the memory data defining an audible alert associated with the previously entered phone number and comprising alert cadence and alert tone frequency. The user also programs and stores in the memory data defining a default audible alert comprising alert cadence and alert tone frequency." Id.

As urged with "receiver means," Motorola argues the functional language for the "storage means" should track the claim language. (Docket Entry # 76 at 24-25) (Docket Entry # 88 at 12). VTech asserts that its construction is consistent with and supported by the specification. (Docket Entry # 83 at 29). For the same reasons as stated above with regard to "receiver means," the Court construes the function of the "storage means" to be the function as stated in the claim language.

c. The Court's Construction

Accordingly, the Court construes the structure of the "storage means" term to be "a memory within the communication receiver" and the function as "storing at least one user-programmed call-back number along with data defining at least one corresponding special audible alert, and further for storing data defining a user-programmed default audible alert."

"storage means"

The term "storage means" appears twice in the '705 Patent. See '705 Patent, claims 1 & 2. Claim 1 from the '705 Patent reads as follows:

1. An audio/video transceiver apparatus comprising:

   input means for receiving audio/video source information, said audio/video source information comprising a multiplicity of video frames collectively representing at least one full motion video program;

   compression means, coupled to said input means, for compressing the said audio/video source information into a digital time compressed representation thereof, wherein said digital time compressed representation of said audio/video source information is capable of being transmitted in a burst transmission period that is substantially shorter than a time period associated with a real time viewing by a receiver of said audio/video source information;

   storage means, coupled to said compression means, for storing said digital time compressed representation of said audio/video source information; and

   transmission means, coupled to said storage means, for transmitting said digital time compressed representation of said audio/video source information away from said audio/video transceiver apparatus in said burst time period.

Burst argues that the court does not need to construe this term. It argues that this term conveys, with requisite specificity, a set of structures to one ordinarily skilled in the art. Burst provides dictionary definitions--from lay as well as technical dictionaries--and an expert declaration to support this point. However, unlike the definitions discussed previously, the technical definitions provided do not contain the requisite specificity. The most specific definition provided, that from the IEEE Standard Dictionary of Electrical and Electronic Terms, defines storage as "any device in which information can be stored, sometimes called a memory device." IEEE Standard Dictionary of Electrical and Electronic Terms at 956. In contrast to the definitions and declarations provided for "input", the description of storage as a "memory device" underscores the conclusion that "storage" is a functional term. Id. A memory device does not connote a particular structure--such as an input port, according to definitions provided. Burst's proposed construction of the term does not solve this issue: "a medium in which data is retained for subsequent retrieval." In this regard, "storage" is sufficiently similar to "lever moving element," a term which the Federal Circuit concluded invoked section 112(6). See Mas-Hamilton, 156 F.3d at 1214. The court concludes that section 112(6) applies to "storage means."
In their proposed constructions pursuant to section 112(6), the parties offer substantially similar descriptions for the corresponding structure for "storage means." Apple contends that the '705 Patent discloses DRAM, SRAM, CMOS memory, optical disc memory, bubble memory, magnetic disk and digital paper. See '705 Patent at 6:16-29. Burst identifies DRAM, SRAM, CMOS, magnetic disk, or optical disk memories, plus equivalents. n6

--- Footnotes ---
n6 At the claim construction hearing, Burst expanded its proposed construction under section 112(6) to include bubble memory and digital paper.

--- End Footnotes ---

Therefore, the court construes "storage means" to include "DRAM, SRAM, CMOS, optical disc memory, bubble memory, magnetic disk and digital paper, plus equivalents." n7

--- Footnotes ---
n7 Section 112(6) requires the inclusion of equivalents in the construction of a means-plus-function term. 35 U.S.C. 112, P 6 ("[S]uch [a] claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof."); see also Caterpillar, Inc. v. Deere & Co., 224 F.3d 1374, 1379 (Fed Cir. 2000). Therefore, for each term governed by section 112(6), the construction will include the identified structure and equivalents.

--- End Footnotes ---

4199

4. Data Storage Means, Storage Means

Romtec argues that the term "data storage means" in Claims 1, 8, and 13 invokes a means-plus-function limitation. 35 U.S.C. § 112, paragraph 6 provides that

An element of a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Where a claim uses the word "means" to describe a limitation, a court must presume "that the inventor used the term advisedly to invoke the statutory mandates for means-plus-function clauses." Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1240, 1247 (Fed. Cir. 1997) (citation omitted). The presumption may be rebutted where the claim, in addition to the functional language, recites structure sufficient to perform the claimed function in its entirety. Id. at 1247-28. Once the court has determined that the claim limitation is a means-plus-function limitation, it must identify the function of the limitation. Micro Chem., Inc. v. Great Plains Chem. Co., 194 F.3d 1250, 1258 (Fed. Cir. 1999). Next, the court must determine the corresponding structure in the written description that is necessary to perform that function. Id. "Structure disclosed in the specification or prosecution history is 'corresponding' structure only if the specification or prosecution history clearly links or associates that structure to the function recited in the claim. B. Braun Med. v. Abbott Labs., 124 F.3d 1419, 1424 (Fed. Cir. 1997).

**The Court finds that "data storage means" is a means-plus-function limitation.** The presumption of a limitation has not been rebutted by the inclusion of a structure sufficient to perform the function of data storage. Therefore, the Court looks to the specifications to determine whether there is some corresponding structure necessary to perform that function.

The specifications are quite clear that, although the preferred embodiment depicts the use of a fixed IDE hard drive and a removable IDE hard drive to store data, "it is contemplated that the . . . invention can be used with other forms of data storage such as SCSI drives, read/write optical drives, etc." Col. 3, ll. 3-10. Romtec seeks further to narrow the structures by
requiring that the IDE hard drive, SCSI hard drive, or read/write optical drive be disconnected from the drive active and ground lines, be connected to a switching means through an interrupt request line and a single chip select line, and be directly connected to the motherboard through all remaining lines. While the preferred embodiment admittedly contains the recited structural features, such features do not actually perform the claimed function of data storage and thus do not constitute claim limitations. Wenger Manufacturing, Inc. v. Coating Machinery Systems, Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001); Asyst Technologies, Inc. v. Empak, Inc., 268 F.3d 1364, 1370 (Fed. Cir. 2001). The Court may not import structural limitations that merely enable the pertinent structure, here the IDE hard drives, to operate as intended. Asyst Technologies, Inc., 268 F.3d at 1371. Accordingly, the Court construes the term "data storage means" to mean a device associated with a computer system for storage of data, including an IDE hard drive, a SCSI drive, or a read/write optical drive, or an equivalent structure.

4200

O. First Store/Second Store

The '192, '131, and '708 patents use the term "first store" and "second store." Visto proposes the term "store" means "a storage location for data that may reside on any type of memory device." Seven argues that the term "first store" means "a permanent storage device, such as a magnetic hard disk, but not including temporary memory such as random access memory (RAM) which is located within a firewall-protected corporate LAN and stores workspace elements." According to Seven, the term "second store" means "a permanent storage device, such as a magnetic hard disk, but not including temporary memory such as random access memory (RAM), which is located on a global server and stores independently modifiable copies of workspace elements."

Seven is attempting to particularize the location of the stores as well as the type of the memory that can serve as a store by pointing to the disclosed embodiments. Seven asserts that those of skill in the art would disagree about whether "store" could include all types of memory or whether a more limited definition is appropriate in the context of the patents. The parties agree, however, that a "store" suggests some type of memory device and, in the context of these patents, the court is not convinced that the patentee limited the term as Seven proposes. The court defines the term "store" as a "storage location for data that may reside on any type of memory device." The court declines to define further the terms "first store" and "second store."

4201

6. "a store for storing user identification" ('702 patent)

<table>
<thead>
<tr>
<th>Beneficial's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>No construction is necessary.</td>
<td>&quot;medium that stores user registration information&quot;</td>
</tr>
<tr>
<td>Alternatively, &quot;a device or medium that stores data used to identify a user.&quot;</td>
<td></td>
</tr>
</tbody>
</table>

The Court finds that the primary dispute between the parties as to this term is whether the stored information is the generic "data used to identify a user" or the more specific "registration information." Because the phrase "a store for storing user identification" and the relevant claim language does not limit the stored information merely to "registration information," the Court finds that Defendants' construction improperly limits the phrase to an example in the specification. Thus, the Court finds that "user identification" information is not limited to merely "registration information." Because the medium is the material within the storage device that retains the stored information, the Court finds that the more appropriate term for where the information is stored is "medium." Thus, the Court construes the term "a store for storing user identification" to mean "a medium that stores data used to identify a user."
Claims 1 and 13-16 of the '516 Patent contain the term "stored" or "storing." Individual Networks contends the term means "retained/retaining, other than temporarily for display purposes." Apple contends that the term means "retrievable from memory upon request." The parties' dispute, therefore, is whether the term should be construed broadly to include data that is merely being held and made available for access within the user's computer or whether the term should be construed more narrowly to exclude data that has merely been put into temporary internet cache memory at the user's computer to be used, for example, for display purposes. See Apple's Responsive Claim -Construction Brief at p. 14.

Claim 1 recites a method that includes steps of "storing" the customized media list and the customized media at the computer system. Claim 1 also requires that the customized media be delivered to the user "without storing the customized media local to the user." See col. 14:1-4. Claim 13 recites a method that includes steps of "storing" the customized media list at the computer system, wherein the customized media list is "not stored at the user. See col. 15:1-3. Method claim 14 is similar to claim 1 in that customized media delivered to a user is received without storing it local to the user. See col. 15:20-25. Claim 15 recites that personal profile information is not stored local to the user. See col. 15:31-33. Claim 16 recites that media preference information is not stored local to the user. See col. 15:51-52.

As discussed above, these negative limitations were added by amendment to the claims to gain allowance over the Logan reference. Specifically, in characterizing the Logan reference, Applicant argued as follows:

In Logan et al., the customized media (download compilation) is downloaded into program data storage 107, i.e. stored, in the client/player 103 (see col. 6, line 56 through col. 7, line 3 in Logan et al.) then the user accesses the downloaded customized media at the client computer 103.

'516 Patent file history, Response After Final With a Request for Continued Examination, Oct. 21, 2005 at 12 (APP 0271) (italics added). Thus, Applicant defined "stored" in the context of Logan's downloading into program storage 107 in the client (user) computer 103.

Logan describes use of a data storage system that would exist in a conventional laptop or desktop computer and that includes both high speed RAM storage and a persistent mass storage device such as a magnetic disk memory. Audio, text and image data are stored locally in program storage device 107. The program content data may include compressed audio recordings and/or text files. See col. 3:1-18. To one skilled in the art, in conventional personal computer architecture, RAM storage provides the main memory accessed by the CPU during software program execution and stores the currently executing software program and immediately needed data, including image data that is to be sent to a display. The disk storage provides archival data storage for software programs and data. Further, downloading is understood by one skilled in the art to refer to transferring a file to a user computer's archival data storage, which will later be transferred to RAM storage for execution. Logan indicates that downloading of the programming content for the user is made in segments stored in randomly addressable locations in the local mass storage unit. Thus, the downloading described in Logan, and what is referenced by Applicant in the prosecution history as "stored," is a data transfer that is placed into the persistent mass storage device of the data storage system and is other than a temporary storage of data for display purposes.

The arguments in the prosecution history regarding Logan's download into program storage indicates that the terms "stored and storing" are being used by Applicant in the context of the persistent mass storage device portion of the data storage system in Logan. Accordingly, the Court adopts Individual Networks' proposed construction that "stored/storing" means "retained/retaining, other than temporarily for display purposes."
H. "said data storage unit having a song storage location storing song data and an advertisement storage location receiving advertisement data"

Touchtunes argues that the "song storage location storing song data" and the "advertisement storage location storing advertisement data" in this term are expressed as separate and predefined storage locations in the data storage unit and proposes that the term be construed as "a data storage unit having separate structural advertisement and song locations within the data unit." Arachnid contends that the only word of this claim term about which the parties disagree is "location," which it defines as "a place in the memory where information is stored." Contrary to Arachnid's contention, however, Touchtunes appears to agree as to the definition of location. The parties disagree as to whether these locations are "separate" and "structural."

Touchtunes' proposed construction tracks the specification, which discloses that the "advertisement data is stored at a separate location on the storage unit 93 so that they can be easily located and tracked." '834 Patent 9:11-12. Touchtunes' construction is also supported by Arachnid's statements to the PTO during the prosecution of the '834 Patent, when it sought to distinguish the prior art ("Wain" and "William"):

Clearly, a separate advertisement location within the data storage unit is a structural limitation . . . . Much like Wain, William simply does not describe separate structural advertisement and locations within a data storage unit.

Decl. of Joseph S. Presta ("Presta Decl.") Ex. 14. Arachnid argues that this statement is taken out of context and that it merely conveys Arachnid's argument that the prior art did not teach advertising, much less a data storage unit with locations for advertisement and song data. The Court agrees with Touchtunes, however, that Arachnid sought to distinguish the prior art by relying on separate and predefined storage locations for song data and advertisement data. Arachnid may not now change its position. See Bd. of Regents of the Univ. of Texas Sys. v. BENQ Am. Corp., 533 F.3d 1362, 1372-73 (Fed. Cir. 2008).

Arachnid also cites Judge Kennelly's rejection in the Ecast case of a "structural" or "physical" limitation in this term. However, the prosecution history was not discussed in the Ecast decision, and there is no suggestion in Touchtunes' proposed construction that "structural" means "physical." Rather, Touchtunes clarifies that the term "structural" corresponds to the terms "folders" or "subfolders" used by Arachnid, in that it describes a predefined and preexisting place for receiving and storing particular data.

Touchtunes' proposed construction is consistent with the intrinsic evidence, including the prosecution history of the '834 Patent. The disputed term is therefore construed as "a data storage unit having separate structural advertisement and song locations within the data unit."

4204

B. '472 Claim 1: "storage means for storing"

The second disputed phrase in Claim 1 of the '472 patent is "storage means for storing." In addition to the standard hierarchy of intrinsic and extrinsic interpretive resources, this phrase is the first of several elements in the '472 patent that potentially brings into play a special subset of interpretive rules under paragraph 6 of 35 U.S.C. § 112 ("35 U.S.C. § 112 P 6"). Section 35 U.S.C. § 112 P 6 provides:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Claims phrased under 35 U.S.C. § 112 P 6 are often called "means-plus-function" or "step-plus-function" claims. In operation, 35 U.S.C. § 112 P 6 allows a patentee to state claims in broad, general language by stating the "functions" of the invention, rather than by repeating the detailed structures or materials (in apparatus claims) or detailed acts (in method claims) that perform the claimed functions. A "means-plus-function" or "step-plus-function" statement in a claim may be an economical way of expressing the more complex structure or acts covered by the claim. The patentee may use 35 U.S.C. §
112 P 6 function statements so long as the "missing" detail appears in the specification. See Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1360 (Fed. Cir. 2000) (the duty to link structure to function is the "statutory quid pro quo" for the convenience of employing 35 U.S.C. § 112 P 6). The relevant structural details or relevant acts from the specification are then essentially incorporated into the function claims. See Multiform Desiccants, 133 F.3d at 1479 (discussing the form and purpose of claims containing functional limitations written in the 35 U.S.C. § 112 P 6 "means-for" form).

The "cost" of using a 35 U.S.C. § 112 P 6 function statement, especially if done unintentionally, is that the scope of the claim is restricted to the particular structures or acts disclosed in the specification, as well as their equivalents. See Personalized Media Communications, LLC v. International Trade Comm'n, 161 F.3d 696, 703 (Fed. Cir. 1998) ("35 U.S.C. § 112, P 6 operates to restrict claim limitations drafted in such functional language to those structures, materials, or acts disclosed in the specification (and their equivalents) that perform the claimed function.").

Structure in an accused device will be a 35 U.S.C. § 112 P 6 "equivalent" if (1) it performs the identical function as the function stated in the claim, and (2) it is otherwise insubstantially different with respect to structure as the disclosed structure. See Kemco Sales, 208 F.3d at 1364, citing Odetics, Inc. v. Storage Tech. Corp., 185 F.3d 1259, 1267 (Fed. Cir. 1999); Pennwalt Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 934 (Fed. Cir. 1987) (en banc). Significantly, the test developed for the doctrine of equivalents is not wholly transferable to the 35 U.S.C. § 112 P 6 statutory equivalence context due to the functional identity requirement. See Odetics, 185 F.3d at 1267.

The word "means" is a generic description of an apparatus element, and the implementation of such a concept is by structure or material. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1582-83 (Fed. Cir. 1997). The term "steps" refers to the generic description of elements of a process, and the term "acts" refers to the implementation of such steps. Thus, for apparatus claims, means-plus-function interpretation rules apply if the claim is expressed as a means for performing a specified function without also identifying in the claim itself the specific material or structure that accomplishes that function. For method claims, step-plus-function rules apply if the claim element is expressed as a step for performing a specified function without stating in the claim itself the more specific acts that explain how to accomplish the function. See id.

If 35 U.S.C. § 112 P 6 applies to a claim, a court construing the claim must then (1) "construe the function recited in that claim," and (2) "determine what structures [or acts] have been disclosed in the specification that correspond to the means [or steps] for performing that function." Kemco Sales, 208 F.3d at 1361. Sometimes, however, the threshold issue is whether 35 U.S.C. § 112 P 6 applies at all. The Federal Circuit has established some general rules of thumb.

First, the specific language of the claim can create a presumption that 35 U.S.C. § 112 P 6 either does or does not apply:

Use of the word "means" creates a presumption that 35 U.S.C. § 112, P 6 applies, see York Prods., Inc. v. Central Tractor, 99 F.3d 1568, 1574 (Fed. Cir. 1996) ("In determining whether to apply the statutory procedures of [35 U.S.C. § 112, P 6], the use of the word 'means' triggers a presumption that the inventor used this term advisedly to invoke the statutory mandates for means-plus-function clauses.")., and . . . the failure to use the word "means" creates a presumption that 35 U.S.C. § 112, P 6 does not apply, see [Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213 (Fed. Cir. 1998)]. These presumptions can be rebutted if the evidence intrinsic to the patent and any relevant extrinsic evidence so warrant.

Personalized Media, 161 F.3d at 703-04 (footnotes omitted); see also Kemco Sales, 208 F.3d at 1361 (discussing the quoted language from Personalized Media with approval; "plastic envelop closing means" limitation invokes the presumption and is in means-plus-function format). Similarly, if a claim drafter uses "steps for" to express a method claim element, it is a signal that the drafter intended to invoke 35 U.S.C. § 112 P 6. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996).

Second, if an apparatus claim element itself arguably identifies some structure, the test is whether one of skill in the art would understand the term at issue to connote sufficiently definite structure. See Personalized Media, 161 F.3d at 703-05 (finding that the term "digital detector" recited sufficient structure to avoid 35 U.S.C. § 112 P 6; "Even though the term 'detector' does not specifically evoke a particular structure, it does convey to one knowledgeable in the art a variety of
structures known as 'detectors.'"; Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d at 1583 (stating that the inquiry is whether the term used as the name for structure "has a reasonably well understood meaning in the art"). Where a claim recites a function but the claim itself also sets forth sufficient structure or material to perform entirely the recited function, the claim is not a means-plus-function claim even if it uses the term "means." See Personalized Media, 161 F.3d at 704, citing Sage Products, Inc. v. Devon Industries, Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997).

Third, in method claims, merely claiming a step without recital of a function is not analogous to a means plus a function. See O.I. Corp. v. Tekmar Co., 115 F.3d at 1583 (holding that the step of "passing the analyte slug through a passage . . ." was not subject to 35 U.S.C. § 112 P 6). Thus, claiming a "step" by itself, or even a series of steps, does not invoke 35 U.S.C. § 112 P 6. See id. Under this rule, a patentee can define a method or process claim containing steps that begin with a gerund such as passing, heating, reacting, transferring, etc. without necessarily subjecting the claim to 35 U.S.C. § 112 P 6 limitations. See id.

Applying these rules to Claim 1 of the '472 patent, the parties disagree as to whether 35 U.S.C. § 112 P 6 controls the element "storage means for storing." St.Jude contends that "storage means for storing" is a means-plus-function recital and that "storage means" therefore should be limited to "a capacitor" -- the structure disclosed in the specification that performs the stated function. CPI initially asserts that 35 U.S.C. § 112 P 6 does not apply and that there is no need for further interpretation of the phrase. Pl. Reply Br. at 37. Arguing in the alternative, and assuming that 35 U.S.C. § 112 P 6 does apply, CPI offers the following construction: "The corresponding structure is a capacitor and equivalents thereof. A combination of capacitors is the equivalent of a single capacitor." Pl. Amd. Prop. Conc. of Law at 5.

The phrase "storage means for storing" is subject to 35 U.S.C. § 112 P 6. As written in the claim, some unidentified "storage means" performs the function of "storing energy to convert an abnormal cardiac rhythm to normal sinus rhythm." '472 Patent, col. 8, ll. 65-66. The claim is stated in means-plus-function form. Because the claim uses the key phrase "means for," it is presumed that the claim falls under 35 U.S.C. § 112 P 6. CPI has not shown any basis for departing from the presumption in this instance. One skilled in the art would not understand the broad term "storage means" to connote sufficiently definite structure.

Because 35 U.S.C. § 112 P 6 applies, the court must identify the structure disclosed in the specification that performs the function of "storing energy to convert an abnormal cardiac rhythm to normal sinus rhythm." See Kemco Sales, 208 F.3d at 1361. The court agrees with St. Jude that the capacitors disclosed in the two embodiments of the device are the only structures that perform the function at issue. See '472 Patent, Figs. 1 & 3; col. 7, ll. 44-64.

CPI has asked the court to include in the claim construction the statement that a combination of capacitors is the equivalent of a single capacitor. It is not appropriate to define as a matter of law at the stage of claim construction the structures that may be "equivalents" of the disclosed means. "Whether an accused device or method infringes a claim either literally or under the doctrine of equivalents is a question of fact. Literal infringement of a 35 U.S.C. § 112, P 6 limitation requires that the relevant structure in the accused device perform the identical function recited in the claim and be identical or equivalent to the corresponding structure in the specification." Caterpillar Inc. v. Deere & Co., 224 F.3d 1374, 1379 (Fed. Cir. 2000) (internal quotation and citation omitted); accord, IMS Technology, Inc. v. Haas Automation, Inc., 206 F.3d 1422, 1430 (Fed. Cir. 2000) ("Whether an accused device or method infringes a claim with a 35 U.S.C. § 112, P 6 limitation, i.e., whether it performs the identical function with the same structure, materials, or acts described in the specification or an equivalent thereof, is a question of fact."). The court therefore will not adopt the portion of CPI's proposed construction stating that a "combination of capacitors is the equivalent of a single capacitor." It is not possible to say at this point that a reasonable jury would be required to conclude that multiple capacitors are the equivalent of a single capacitor. The term "storage means" in Claim 1 of the '472 patent will be defined as "a capacitor and equivalents thereof."

5 In its brief, Gemstar appears to dispute the construction of "supplying program schedule information to a data processor"
in claim 32 of the '121 patent. Appellant's Br. Appx. at 1-A. Gemstar noted that the ITC made no independent findings pertaining to claim 32. Appellant's Br. at 60. Gemstar presented no independent claim construction arguments for claim 32, stating only that its arguments pertaining to claim 18 of the '121 patent also applied to claim 32. Id. The ITC interpreted "data processor" in claim 32 consistent with its preceding interpretation of "data processor" in claim 18. FID Opinion 2002 ITC LEXIS 812 at *123. On this limited record, it appears that the only aspect of claim 32 that Gemstar is appealing is the construction of the term "data processor" in claim 32. Thus, our revised construction of "data processor" for claims 18 and 66 also applies to claim 32 of the '121 patent.

The relevant limitation of claims 18 and 66 of the '121 patent is: "supplying program schedule information to a storage means in a data processor." Gemstar argues that dictionaries establish that the phrase "storage means in a data processor" meant, to persons skilled in the art in the mid-1980s, the internal memory of a computer. In support of its proffered ordinary meaning, Gemstar relies on dictionary definitions of "data processor" and "internal storage." Gemstar argues that the ITC erred by ignoring the ordinary meaning and instead reading in limitations from the written description in construing this term to encompass the five particular buffers referenced in the written description. Scientific-Atlanta responds that the ITC correctly found that "storage means" had no clear meaning to a person of ordinary skill in the art. Scientific-Atlanta disputes Gemstar's proffered definitions, instead arguing that the ITC correctly construed the limitation in accordance with the written description and prosecution history.

The ITC construed "data processor" to be a CPU. This construction was based on the "relevant evidence" of the abstract, which four times matched "data processor" with reference number "110." FID Opinion 2002 ITC LEXIS 812 at *67. The ITC found that, because the front page of the patent identified CPU by the reference number 110, therefore the "data processor" was a CPU. Id. The ITC next concluded that the "storage means" had to be located physically within a CPU. 2002 ITC LEXIS 812 at *66. Citing its own precedent, the ITC found that the ordinary meaning of "in" was "within." Id. The ITC further concluded that the "storage means" had to be physically located within the "data processor" because the examiner rejected Gemstar's proposed amendments to claim 18 that an electronic memory was "associated with" a data processor. 2002 ITC LEXIS 812 at *68.

The ITC then construed "storage means" to be the five buffers of a CPU disclosed in the '121 patent: the program list buffer, theme buffer, screen buffer, channel buffer, and prime time buffer. 2002 ITC LEXIS 812 at *59. Holding that "storage means" did not have a clear meaning to one of ordinary skill in the art, 2002 ITC LEXIS 812 at *58, the ITC looked to the following passage of the written description in defining "storage means" as these five buffers:

A search of the program listing 352, stored in program list buffer 303, is made. The search is dependent on the status of the channel buffer, the theme buffer, the prime time buffer, and the direction of search. . . . The search continues until the screen buffer is full 354 in which case the search is terminated. The status lines information is passed to the screen buffer and displayed 355 by the TV. Program list buffer 303, screen buffer 353, and the other buffers discussed above comprise a data storage means.

Re'121 patent, col. 2, ll. 38-52 (amending the '121 patent, col. 17, ll. 38-49) (emphases indicate material added during reexamination) (quoted in FID Opinion 2002 ITC LEXIS 812 at *447). The ITC also considered several of Gemstar's proposed reexamination amendments in early 1993 which attempted to define "storage means" as an electronic memory. FID Opinion 2002 ITC LEXIS 812 at *115. The ITC noted that Gemstar eventually abandoned the proposed amendments and instead amended the '121 patent written description to add the above-quoted passage concerning "data storage means." 2002 ITC LEXIS 812 at *446; see also Re'121 patent, col. 2, ll. 38-52.

The ITC's construction of "storage means in a data processor" is erroneous. The ITC initially held that "storage means" did not have a clear meaning to one of ordinary skill in the art. FID Opinion 2002 ITC LEXIS 812 at *58. Our consideration of technical dictionaries reveals otherwise. See Inverness Med. Switz. GmbH v. Warner Lambert Co., 309 F.3d 1373, 1378 (Fed. Cir. 2002) (noting that technical dictionaries are useful in "providing specialized meanings as used in particular fields of art"). Further, the ITC failed to consider whether the specific expression "data processor" had an ordinary meaning to one skilled in the art that would have provided insight and context for the claim language "storage means in a data processor."

Contemporaneous technical dictionaries defined "data processor" as "[a] device capable of performing operations on data,
such as a digital computer, an analog computer, or a desk calculator," Charles J. Sippl, Computer Dictionary 117 (4th ed. 1986) ("Computer Dictionary"), or "a device capable of performing data processing, such as a desk calculator, a punched card machine, or a computer," Jerry M. Rosenberg, Dictionary of Computers, Data Processing, and Telecommunications 128 (1984) ("Dictionary of Computers"). These dictionaries also defined "storage" as "[a] device capable of receiving data, retaining them for an indefinite period of time, and supplying them upon command," Computer Dictionary at 473, and "a device, or part of a device, that can retain data," Dictionary of Computers at 504. General use dictionaries define "in" as "used as a functional word to indicate location or position in space or in some materially bounded object." Webster's Third New International Dictionary 1139 (1993). From these definitions, the ordinary meaning of "storage means in a data processor" is a device capable of retaining data located within a data processing device or system.

The passages the ITC relies upon from the written description fail to redefine this claim term or to expressly disclaim or disavow claim scope. The ITC relies on the following passage: "Program list buffer 303, screen buffer 353, and the other buffers discussed above comprise a data storage means." Re'121 patent, col. 2, ll. 50-52 (amending the '121 patent, col. 17, ll. 38-49) (emphasis added). This passage falls far short of a clear disavowal of claim scope using words of manifest exclusion. See ACTV, 346 F.3d at 1091. Instead, this passage provides only an example or embodiment of a "data storage means" and does not limit the otherwise broad claim language. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998) (cautioning against the limitation of the claimed invention to preferred or specific embodiments or examples in the specification). Thus, the written description provides no basis for redefining or otherwise limiting the construction of this claim term.

Based on the foregoing, we conclude that the ITC erred and should have construed the claim limitation "storage means in a data processor" in the '121 patent to mean a device capable of retaining data located within a data processing device or system.

II. Claim Construction Issues

As noted above, this is our second case involving the '776 patent. In McAfee II, we accepted the claim construction of "storage" urged by both parties and adopted by the district court in McAfee I. That claim construction differs slightly from the claim construction adopted below in the district court in this case in that the McAfee II claim construction views "storage" as occurring "when the incoming digital data is sufficiently present on the destination storage medium, and accessible by the operating system or other programs, so that any viruses contained in the data can spread and infect the computer system." McAfee II, 224 F.3d at 1351 (emphasis added to differing language).

Symantec argues that "storage" should not be construed to occur when data become "accessible by the operating system or other programs," Hilgraeve, 90 F. Supp. 2d at 857, or when "any viruses contained in the data can spread and infect the computer system," but that "storage" should be construed to occur when the data become physically present (i.e., magnetically recorded) on the storage medium.

We need not decide here whether our claim construction in McAfee II is binding on us in this case as a matter of stare decisis. Our decision in McAfee II was precedential, but it merely adopted the district court's claim construction in McAfee I based on the parties' agreement that the district court's claim construction was correct. We have independently considered the issues of claim construction and conclude that the construction of "storage" in McAfee II is indeed correct.

The '776 patent distinguishes prior art virus scanning programs because they "do not automatically prevent the virus from being stored on the medium in the first place, hence they cannot totally prevent the virus from attacking or spreading." '776 patent, col. 1, ll. 51-54. Thus, "storage" of the virus is identified with the virus's ability to spread and infect the computer system. A virus may not spread or infect the computer system, however, unless it is accessed by the operating system or other programs. Given this, we agree with the McAfee II court that "storage" occurs "when the incoming digital data [are] sufficiently present on the destination storage medium and accessible by the operating system or other programs so that any viruses contained in the data can spread and infect the computer system." 1 McAfee II, 224 F.3d at 1351.
The parties also dispute whether "destination storage medium" as used in claim 1 and "storage medium" as used in claim 18 mean the ultimate destination of the digital data or whether the terms may be construed to include an intermediate storage medium. In accordance with the definition of "storage" we have adopted, we conclude that "storage medium" refers to any storage medium of the computer system, if the data, when stored on the medium, are accessible to the operating system or other programs, such that viruses in the data can spread and infect the computer system.

The disputed term is located in each of the asserted independent claims: "said first menu stored on said data storage device." The parties dispute whether "stored" requires persistent storage or whether data that is stored is merely saved temporarily. The plaintiff argues that persistence would undermine the goal of the invention because it would allow obsolete menu configurations to be retained. The only support for limiting storage to persistent storage comes from the preferred embodiment, and the court declines to import that limitation into the claim. The term "stored" means "saved temporarily or permanently."

GO BACK

4208

I. Store/Storing

Defendants propose that the term "store/storing" be construed as "kept/keeping for use while disconnected from the Internet." Defendants contend that this construction is consistent with the patent's description of the invention as a computer program product for storing content on a user device. They argue that the only embodiment disclosed in the patent is one in which content is stored by a user on a user device, rather than on a server. Because the user would not need an Internet connection to access this stored content, Defendants argue that the content is stored for use while disconnected from the Internet. Aloft argues that no construction is necessary, and that none of the claims are limited to storing content on a user device for offline use.

The Court begins its construction by consulting the claim language. Phillips, 415 F.3d at 1314. In general, courts must impose a "heavy presumption" in favor of the ordinary meaning of claim terms, which can only be overcome by statements of "clear disclaimer" expressly indicating "manifest exclusion or restriction." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 913 (Fed. Cir. 2004); Brookhill-Wilk 1, LLC v. Intuitive Surgical Inc., 334 F.3d 1294, 1301 (Fed. Cir. 2003); see also Phillips, 415 F.3d at 1312-13. In this case, the plain and ordinary meaning of the term "storing" is not limited to storing for use while disconnected from the Internet or solely on a user device. Nothing in the claim language contradicts this conclusion.

In fact, Defendants' construction is inconsistent with other claim language in the patent. Phillips, 415 F.3d at 1314 ("Other claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment as to the meaning of a claim term."). Independent claim 40 recites "selected content . . . is capable of being manually added by the user, for being stored in user computer memory." This claim limitation strongly implies that the term "storing" does not inherently mean storing on a user device. See Phillips, 415 F.3d at 1314 ("the claim in this case refers to 'steel baffles,' which strongly implies that the term 'baffles' does not inherently mean objects made of steel").

Defendants argue that their construction is mandated by the specification and prosecution history. They argue that the only
type of data storage described in the specification is storage on a user device. Defendants point out that the only "memory" described in the patent is random access memory ("RAM") and read only memory ("ROM") coupled with a central processing unit ("CPU") of a workstation. '443 Pat. Fig. 2, 4:65-67. They cite numerous statements in the specification which describe information being "stored in memory," and identifiers being correlated with URLs by "the processor coupled to the memory." See '443 Pat. Figs. 6, 10, 5:57-60, 9:1-20. Based on these statements, Defendants argue that the only embodiment disclosed in the specification is one in which content is stored by a user on a personal computer. See Praxair Inc. v. ATMI, Inc., 543 F.3d 1306, 1324 (Fed. Cir. 2008) ("The claims of the patent must be read in light of the specification's consistent emphasis on [the] fundamental feature of the invention."); see also Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1351-52 (Fed. Cir. 2004).

While Defendants correctly point out that the word "memory" is only used to describe RAM and ROM, and that Figure 2 depicts a user device with RAM and ROM connected to a CPU, Defendants have failed to show that the patentee disclaimed storing content on a server or that storing content for offline use is a "fundamental feature" of the invention. The patent specification explains that Figure 2 is a "representative hardware environment that may be associated with the various network components of Fig. 1." '443 Patent at 4:58-60. Because Figure 1 depicts both user devices and servers, '443 Patent at 3:17-19, one of ordinary skill in the art would understand that Figure 2's depiction of a "representative hardware environment" would not necessarily limit the memory discussed in the patent to that found on a user device. Thus, one of ordinary skill in the art would also understand that the portions of the specification cited by Defendants are consistent with the idea that storage may occur on a user device or a server. At best, Defendants have shown that one preferred embodiment may store content only on a user device. See Comark Commc'ns, Inc., 156 F.3d at 1187 (courts must not read limitations of the preferred embodiment into the claim language).

Furthermore, the patent describes storing content "in memory of a present machine or across a network." '443 Pat. at 10:38-40. Although this passage appears to describe an aspect of the invention not covered by any of the asserted claims in this case, it strongly implies that content may be stored either on a user device or on a network server. At the very least, this passage indicates that the patentee did not implicitly define the term "storing" as "storing for offline use," or disclaim storage across a network. See Liebel-Flarsheim Co., 358 F.3d at 913.

Finally, the one feature of the invention described as "critical," is that "the documentation related to the selected URLs may be archived for later use . . . as content of URLs are often subject to change." '443 Pat. at 9:6-10. Because, as shown above, documentation or content may be stored for later use on a user device or a server, the patent specification offers no indication that storage for offline use is a "fundamental feature" of the invention. See Praxair Inc., 543 F.3d at 1324.

Defendants also look to the prosecution history for support. "[W]here the patentee has unequivocally disavowed a certain meaning to obtain his patent, the doctrine of prosecution disclaimer attaches and narrows the ordinary meaning of the claim congruent with the scope of the surrender." Omega Eng'g, Inc., 334 F.3d at 1324. During prosecution, the patentee criticized the prior art reference Microsoft Internet Explorer, because it required a user to enable a "Make available offline" feature in order for a user to store content. The patentee argued that the claimed invention did not require this sort of cumbersome step for a user to "store content for offline use." '443 Pat. Pet. to Make Special, May 3, 2004, at 5-7. Later, during prosecution, the patentee stated: "By this claimed feature [of pre-selecting identifiers], the cumbersome nature of the above prior art is avoided, since a user does not have to post-select an identifier when attempting to store content for offline use." '443 Pat. Amendment D, May 5, 2006, at 16. Defendants argue that these statements constitute a clear disavowal of claim scope.

Defendants' argument is unavailing. The primary purpose of prosecution disclaimer is to prevent a patentee from recapturing claim scope that was disclaimed in order to obtain claim allowance. Omega Eng'g, Inc., 334 F.3d at 1323-24. In this case, the patentee distinguished the prior art by emphasizing the pre-select feature of the claimed invention and its lack of cumbersome steps, not the fact that the invention could store content for offline use. '443 Pat. Amendment D, May 5, 2006, at 16; '443 Pat. Pet. to Make Special, May 3, 2004, at 5-7. In fact, the prosecution history clearly shows that both the prior art and the claimed invention were capable of storing content for offline use. '443 Pat. Pet. to Make Special, May 3, 2004, at 5-7. Thus, the Court cannot conclude that the patentee's recitation of storage for offline use as a feature of the invention constitutes a clear and unequivocal disclaimer of any other sort of storage.

Having rejected Defendants' proposed construction and thereby resolving the parties' claim scope dispute, the Court finds that the term "stored/storing" will be easily understood by a jury and that no construction is necessary.
## II. Stored Association

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposal</th>
<th>Defendants' Proposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stored Association</td>
<td>No construction necessary</td>
<td>an index value, created by arithmetically compressing a MAC address, that points to a record that relates that MAC address to a communications port on the node</td>
</tr>
</tbody>
</table>

In the alternative:
A table record that relates a MAC address to a communications port on the node.

Defendants argue that the term "stored association" does not have an ordinary meaning either to a lay person or to a person having ordinary skill in the art. Instead, the Court should construe the term to require the use of arithmetic compression for constructing and accessing routing tables. Defendants contend the meaning of the term is limited by the specification because the patent described arithmetic compression as a feature of the invention. See Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1308 (Fed. Cir. 2007) ("[w]hen a patent thus describes the features of the 'present invention' as a whole, this description limits the scope of the invention").

Plaintiff agrees with the rationale behind the Court's earlier determination that construction of the term "association" was unnecessary and argues that construction of the "stored association" is similarly unnecessary. Alternatively, it argues that, in the context of the claim, the term means "a table record that relates a MAC address to a communications port on the node." Plaintiff contends that Defendants' language would improperly limit the claim term to a preferred embodiment. See Comark Communications, 156 F.3d at 1187.

In general, courts must impose a "heavy presumption" in favor of the ordinary meaning of claim terms, which can only be overcome by statements of "clear disclaimer" expressly indicating "manifest exclusion or restriction." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 913 (Fed. Cir. 2004). However, this "heavy presumption" does not arise when the patentee acts as his own lexicographer and gives a claim term a different meaning than the term would otherwise possess. See Irdeto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1301 (Fed. Cir. 2004). In these situations, the inventor's lexicography governs. Phillips, 415 F.3d at 1316.

In this case, the relevant claim language of the '906 patent recites a "stored association" utilized when a packet is either received or forwarded. The term does not appear elsewhere in the '906 patent. Defendants argue that the claim language implicates a routing table, and that the specification describes the use of arithmetic compression to construct and access routing tables. Defendants urge the Court to find this discussion disclaimed embodiments of the invention that do not employ arithmetic compression.

A patent specification may contain an intentional disclaimer of claim scope despite broadly worded claims. See Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1345 (Fed. Cir. 2001). The Federal Circuit has found disclaimers where the specification describes features as "critical" or distinguishable over the prior art. See Verizon, 503 F.3d at 1308. In contrast, when a patentee addresses several problems present in the prior art, the patentee may direct a claim to a solution for only one of those problems. See Resonate Inc. v. Alteon Websystems, Inc., 338 F.3d 1360, 1367 (Fed. Cir. 2003); Honeywell Inc. v. Victor Company of Japan, 298 F.3d 1317, 1326-27 (Fed. Cir. 2002).
Defendants attempt to distinguish the present term from the term "associated" as construed by the Court in the '061 opinion. In the previous opinion, the Court found that the '224 patent disclosed two solutions to problems in the prior art: 1) a fixed, unique, and unchanging logical address and 2) arithmetic compression for quickly accessing information in directory tables. Defendants argue that the Court declined to impose the arithmetic compression limitation because the claim included the logical address limitation. Here, the logical address limitation is absent; thus, Defendants argue that limiting the claim term to stored associations created by arithmetic compression is now proper. The Court disagrees.

Footnotes

1 In the '061 opinion, the Court focused on the '224 patent, because the '224 patent and '906 patent were children of the '480 Patent and, most, if not all, of the '224 patent citations provided appeared verbatim in the '906 patent.

Plaintiff identifies several inventive concepts that constitute the solutions disclosed by the claimed inventions. The present term appears in claims directed toward the inventive concept of source address filtering based on a packet's MAC source address. While it is true that the claim is not directed toward the logical address concept, the Court's prior opinion does not compel the conclusion that the claim is directed at the arithmetic compression concept. The source address filtering concept identified by Plaintiff does not involve either the logical address or the arithmetic compression concepts. The Court finds the claim is not directed toward the arithmetic compression concept. Therefore, it is improper to import the arithmetic compression limitation from the preferred embodiment. See Resonate Inc., 338 F.3d at 1367; Honeywell, Inc., 298 F.3d at 1325-26; see also Comark Communications, 156 F.3d at 1187. Furthermore, it is clear from the claim language that the disputed term refers to whether a record exists in a table. It is immaterial to the construction of this term how the record was created. Thus, the Court does not find a clear disclaimer of the ordinary meaning of the claim term. See Liebel-Flarsheim, 358 F.3d at 913.

Finally, the Court finds that some claim construction is necessary to insure that a jury will understand what is claimed. See Sulzer Textile A.G. v. Picanol N.V., 358 F.3d 1356, 1366 (Fed. Cir. 2004). The Court construes the term consistent with its plain meaning as understood by a person of ordinary skill in the art. See Phillips, 415 F.3d at 1312-13. Therefore, the Court construes the term "stored association" as "a table record that relates a MAC address to a communications port on the node."

1. Claim interpretation.

Claim 1 of the '326 patent recites:

In a method for synthesizing a musical tone signal on the basis of a predetermined modulation operation employing a modulating signal and a carrier signal, wherein a predetermined waveshape signal is generated in accordance with a stored waveshape table and is used for defining at least one of a modulating wave function and a carrier wave function, wherein the predetermined waveshape signal is a periodic signal having a regularly progressing form within each period, the steps comprising:

specifying a phase section of each period of the waveshape signal, said phase section including plural table values and being less than one period of the waveshape signal;

modifying the waveshape signal in the specified phase section to provide a modified waveshape signal which has a different form in the specified phase section than that of the remainder of the waveshape signal; and

executing said modulation operation by utilizing the modified waveshape signal as said modulating signal or said carrier signal.

(emphasis added).
The disputed issue with respect to this claim is the meaning of the words "stored waveshape table." The district court construed this phrase as "requiring the use of some type of memory, such as a ROM." Yamaha contends that this interpretation is unduly narrow.

The ordinary meaning of "stored" is data retained in a device from which it can be copied or obtained at a later time. See The New IEEE Standard Dictionary of Electrical and Electronics Terms 1296 (5th ed. 1993). A "waveshape" is "the graph of the wave as a function of time." Id. at 1485. Finally, a "table" is "an array of data, each item of which may be unambiguously identified by means of one or more arguments." Id. at 1335.

Defined in this manner, the claim requires that an array of data representing the wave as a function of time be retained in a device for subsequent retrieval. This definition is equivalent to that of the district court because the New IEEE Dictionary of Electrical and Electronics Terms defines "memory" as "any device in which information can be stored . . . ." Id. at 979, 1294.

Although an inventor may be his own lexicographer, Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2D (BNA) 1162, 1165 (Fed. Cir. 1995), nothing in the specification indicates that these terms are to have other than their ordinary meanings. Similarly, the prosecution history reveals that the words "stored waveshape table" were added for clarification, but it does not indicate that the words had extraordinary meaning. We therefore agree with the district court's interpretation of "stored waveshape table."

4211

I. "storing said state object on said http client" or "storing said state object in one of said memory and said computer readable medium."

Defendants urge construction of the term "store" to mean "placing the state/object information in memory such that it can be sent back to the server from which the web user/client requested the HTML document." Plaintiff, meanwhile, asserts that no construction of the "storing" step is necessary. Here, the parties' disagreement, sharply focused, centers on whether the claim term "store" should reference the fact that a state object must be stored in a client system such that it may be sent back to a server. Dispositive of this interpretive dispute is the claim construction principle that "the words of the claims themselves . . . define the scope of the patented invention." See Vitronics, 90 F.3d at 1582 (citation omitted). When this principle is applied to the instant dispute, it becomes clear that "store" simply means "placing the state object in memory or a storage device."

The parties sensibly agree that the definition of "store" includes, at the least, "placing the state object in memory," as such a construction is fully supported by the language of claims 1 and 14. In particular, claim 14 reads, as follows: "[S]toring said state object in one of said memory and said computer readable medium." See ‘670 Patent Claim 14. Yet, defendants seek to attach an additional attribute to the claim term "store," namely that a state object must be stored in a manner that allows for later retransmission. This argument, however, impermissibly relies on a description found in the specification, rather than the claim language itself, to define the claim term, thereby redefining the word "store" apart from its plain meaning and contravening a "bedrock principle" of patent law. See Markman, 52 F.3d at 980 ("The written description part of the specification itself does not delimit the right to exclude. That is the function and purpose of the claims."). Put simply, the plain meaning of "store" does not imply that storage must occur in a particular manner.

Accordingly, "store," as used in the ‘670 patent claims, means exactly what its plain meaning would suggest: "placing the state object in memory or a storage device."

4212

3. "storing"

<table>
<thead>
<tr>
<th>Claim</th>
<th>FotoMedia's Proposed</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
</table>

- 4491 -
The parties disagree over whether storage requires storage in a database. The defendants contend that in every instance where the specification refers to storage, the only storage disclosed is database storage. The defendants point out that the specification includes an entire section dedicated to describing the various databases, entitled "Database on Server," describing both temporary and permanent storages as being in databases. See '774 Patent, col. 4, ll. 65-67, col. 5, ll. 37. Defendants argue that the lack of disclosure of any other type of storage medium in the specification mandates a limiting construction.

Fotomedia argues that defendants' proposed construction would be improper under the doctrine of claim differentiation. Fotomedia points out that the patentee has used the word "database" in claim 17 of the '936 patent, reciting "storing the received image in a database." See '936 Patent, Cl. 17. Fotomedia, therefore, contends that this requires that the term "storage" not be construed as a "database." Claim 17, however, includes other significant limitations that differentiate it from other claims. Moreover, the Federal Circuit has held that doctrine of claim differentiation cannot serve to broaden claims beyond their meaning in light of the specification. Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1302 (Fed. Cir. 1999); see also Netcraft Corp. v. eBay, Inc., 549 F.3d 1394, 1400 n. 1 (Fed. Cir. 2008) ("While claim differentiation may be helpful in some cases, it is just one of many tools used by courts in the analysis of claim terms.").

Next, Fotomedia points to the specification as disclosing that "data are stored in the file system of the server in a directory specifically created to store the temporary image files, herein designated as the Temp Image Database 65." See '774 Patent, col. 5, ll. 19-22. FotoMedia argues that the inventors at least contemplated a file system storage, which need not necessarily be a database. The Court finds this argument unpersuasive. Turning to the very section of the specification that Fotomedia points to, the patentee designates these file systems as the "Temp Image Database." Defendants properly note that the specification lacks any teaching or support for storage in any other type of storage medium, either hardware or software. In light of the intrinsic record, the storage related terms are limited to database storage systems. See Phillips, 415 F.3d at 1317.

"Storing" means "placing into a database."
or claims suggests that the ordinary meaning of the term does not control. Because it is consistent with the ordinary meaning of the term, the Court adopts the Plaintiff's construction of "storing."

6. Storing

The Court's Construction: Data written to a nonvolatile form of storage medium (nonvolatile means the data is not lost when the circuit is broken). Markman Tr. 48:9-11; 60:23-61:1, 63:9-10.

Ethos accepted the Court's construction of this term. Id. 48:12. RealNetworks argued that the term "storage" means placing data in either volatile memory (not capable of being retained when the power is turned off) or nonvolatile memory (capable of being retained when the power is turned off). Def. Rep. at 9; see Markman Tr. 32:23-34:25. At the outset, the language of the claims belies RealNetworks' position. Claim 7 of the '892 patent and claim 1 of the '709 patent refer to "storing said data successfully received by the client computer." '892 patent, claim 7, col.14 11.13-14; '709 patent, claim 1, col.12 11.9-10. For data to be received by or transferred to a computer, at a minimum it must be placed in a computer's volatile memory. As Ethos noted at the hearing, all data received by the computer "comes initially into volatile memory." Markman Tr. 39:10-11. RealNetworks, in arguing for its construction of "downloading" as "transferring," suggested that a download of data only involved a transfer into a computer's volatile memory. Def. Rep. at 5 ("To Ethos, downloading must include storing in nonvolatile memory, otherwise the file may not be 'retained' after the transfer is complete. . . . Computers, of course, use both volatile and nonvolatile memory. Ethos ignores the fact that files can be transferred without being stored . . . ."). As such, the "storage" of such data successfully received must do something beyond placing data -- or leaving data -- in the computer's volatile memory. n7

Footnotes

n7 "The amount of data successfully received by the client is stored when an error is detected that terminates the download." '892 patent col.3 11.48-50 (emphases added).

The specifications support the construction of storage as referring only to nonvolatile memory. In both patents, Figure 1 purports to illustrate "a server computer and a client computer which improves the likelihood of a successful download of information." See '892 patent fig.1 & col.5 11.18-20; '709 patent fig.1 & col.5 11.26-27. The figure has a box labeled "client computer" within which there is a smaller box labeled "executed client program." '892 patent fig.1; '709 patent fig.1. Below, but separate from the box representing the client computer, is a cylindrical figure -- labeled number 24 -- connected to the client computer by a line. '892 patent fig.1; '709 patent fig.1. The specifications discuss figure 24 in one embodiment, stating: "This process monitors the data as it is received and while it is stored on the storage medium 24." '892 patent col.6 11.29-30; '709 patent col.6 11.37-38. This suggests storage removed from the typical workings of the client computer. The server computer side of the diagram has the same cylindrical figure - labeled number 20 and identified as "client program and other files." '892 patent fig.1; '709 patent fig.1. The specifications, in discussing the invention generally, refer to figure 20 as a "storage device." '892 patent col.5 1.67, col.6 1.1; '709 patent col.6 1.25. It would seem reasonable to conclude that the same cylindrical figure on the client side is the storage device where the data file is stored after being downloaded.

RealNetworks pointed to the following statement in the specifications to support its construction: "It should also be understood that the invention is not limited to a particular memory system." Def. Rep. at 10 (quoting '892 patent col.8 11.2-3); Markman Tr. 42:20-43:8. This, however, does not appear to refer to the type of memory - nonvolatile versus volatile. In describing the makeup of a computer system, the specifications identify the memory system as one of the components of the computer system. '892 patent fig.2 & col.7 11.6-10; '709 patent fig.2 & col.7 11.14-19. The specifications go on to identify the components of that memory system as typically consisting of a "nonvolatile recording medium" and a "volatile, random access memory such as dynamic random access memory (DRAM) or static memory (SRAM)." See '892 patent fig.3 & col.7 11.46-61; '709 patent fig.3 & col.7 11.54-67, col.8, 11.1-2. The Court concluded, therefore, that the statement -- "the invention is not limited to a particular memory system" -- does not relate to the different types of memory available within a memory system, volatile and nonvolatile.

These terms appear in the claim language as follows:

1. A method of displaying stored intra-oral radiographs, comprising:
   displaying a stored intra-oral radiograph corresponding to said selected target intra-oral radiological site.

2. A method for storing and displaying intra-oral radiographs, comprising: generating and displaying intra-oral radiographs of dentition;
   storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation along with indicia of respective selected intra-oral radiological sites; and
   subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation.

3. A program storage device readable by a machine and tangibly embodying a representation of a program of instructions adaptable to be executed by said machine to perform the method of any one of claims 1 or 2.

4. A device for storing and displaying intra-oral radiographs, comprising:
   a memory in which said x-ray images are stored;
   means, responsive to selection of said selectable sites, for displaying corresponding stored x-ray images.

5. The device of claim 4, further comprising:
   an image digitizer for digitizing x-ray images produced by said sensor before storage in said memory.

The parties originally submitted an agreed construction of "stored, storage, and memory" as referring to "any form of volatile or non-volatile data storage, including but not limited to hard disk drives, random access memory ["RAM"], floppy disks, and optical media, in addition to any other data storage devices or means." However, Plaintiffs later withdrew their agreement to this construction.

Defendants argue that the Court should order that these terms include any means or device for data storage, including but not limited to random access memory ("RAM"). Otherwise, Defendants assert, jurors might incorrectly draw a distinction between easily recognizable and dedicated devices for data storage, such as floppy disks and hard drives, and RAM. However, Defendants argue, the specification clearly includes RAM as a means for storing information in conjunction with the claimed invention, and thus the jury should have clear guidance that RAM is one possible form of memory and carries out the function of storage.

Plaintiffs agree that "memory," "storage," and "stored," encompass all types of computer memory, but take issue with Defendants' request for clear guidance that RAM carries out the function of storing because it would conflate the media on which the action of storing may be done with the action of storing. Plaintiffs assert that whether the RAM in an accused device or an alleged prior art device is being used to perform the function of recording, retaining, or preserving radiographic images and whether that function is being done "responsive to selection" is a fact issue that should be reserved to the jury. Thus, whether the RVG performed the function of "storing" is a fact issue for the jury. Plaintiffs contend that the terms are plain and ordinary on their face and need no construction. Plaintiffs argue that construing these terms could be confusing to the jury. Plaintiffs are also opposed to a jury instruction stating or suggesting that the mere existence of data in volatile
memory or RAM necessarily and always establishes that the data has been stored there.

"Storage" is used in claim 3 in the context of a "program storage device." Program storage devices are defined in claim 3 as being readable by a machine and tangibly embodying a representation of instructions adaptable to be executed by said machine, and thus program storage device refers to a device for storing the software that performs the methods of claims 1 and 2, which is loaded onto a computer. The specification states that "program storage medium can be any machine readable storage medium such as, for example, a floppy or hard magnetic or optical disk, or a programmable read-only memory."

Column 3, lines 4-7. Contrary to Defendants' argument, see Joint Claim Construction Statement (docket no. 75) at 11, this portion of the specification does not describe the memory onto which x-ray images are stored, but describes only the program storage medium, i.e., the media on which the software to be loaded onto the computer memory can be stored. The program storage medium (item 23 on Figure 1) and the memory (item 22) are clearly distinct, and thus the listing of program storage media does not apply to the memory.

Claims 4 and 5 refer to a memory in which x-ray images are stored and to x-ray images being digitized before storage in said memory. The summary of the invention also states that, "the images are then stored, preferably after digitization, in a computer memory." Column 2, lines 18-20. Figure 1 depicts the memory, and the specification also states that the CPU loads software embodying the present invention into memory. However, neither Figure 1 nor the specification describe the memory. The only possible description can be in the preferred embodiment, which describes a computer with 8 megabytes of system RAM and 40 megabytes of hard disk drive. The claim language also makes clear that stored x-ray images correspond to selectable sites and are stored in response to selection of those sites. Further, the images are "subsequently" retrieved and displayed in response to selection of the sites, indicating that they are stored for subsequent retrieval. Thus, "storing" means "placing in memory for subsequent retrieval," and "stored" means "placed in memory for subsequent retrieval." "Storage" as used in claim 5 means "placement in memory for subsequent retrieval." The real dispute centers on what is meant by the term "memory" and whether it includes random-access memory ("RAM"). n7

n7 This is relevant because the parties dispute whether the RVG 32000, which apparently utilized RAM but not long-term storage media, "stored" the radiographs or merely displayed them.

As noted, Plaintiffs originally stipulated that "memory" could include RAM, but now oppose a construction stating that placement of the x-rays in RAM would constitute the act of storing. Plaintiffs argue that placement of the x-rays in RAM or volatile memory "does not necessarily establish that the action of storing' has occurred -- at least not in the sense of saving the information long-term for later retrieval, as described on columns, 5-6 of the 579 specification." Further, Plaintiffs argue, though the specification describes a preferred embodiment of a computer system that includes RAM, it never describes RAM as a storage device, and the specification indicates that a radiographic image can reside on display memory (RAM) before it is stored.

Defendants argue that Plaintiffs should be held to their prior agreed construction, which is consistent with the specification's description of the preferred embodiment and is consistent with the extrinsic evidence. Defendants point to Dr. Dove's deposition testimony in a related case over the same patent, in which he testified that "stored" means "it resides somewhere . . . it can be in computer RAM memory, on memory. It could be stored on the hard drive, CD-ROM. It could be stored somewhere. There are more storage devices in computers." He also agreed that "both volatile [RAM] and nonvolatile memory is what the patent was referring to in terms of retrieving images that were stored." Defendants further point to Plaintiffs' argued construction in the recently filed and settled patent infringement suit (involving this same patent) against Planmeca U.S.A., in which they stated that "the 579 specification supports a broad construction of these computer memory and storage terms. The 579 specification describes both volatile and non-volatile types of computer memory. The preferred computer at that time included 8 megabytes of RAM,' which is a type of volatile memory, and 40 megabytes of hard disk drive,' which is a type of non-volatile memory."

The Court agrees with Defendants that "memory" is not limited by the specification to any particular type of memory, but could include RAM or hard disk space as described in the specification. Plaintiffs argue that placement in RAM is not storage "in the sense of saving the information long-term for later retrieval, as described on columns 5-6 of the 579
specification." However, while the specification indicates that various exams corresponding to different dates and times can be stored, see Column 3, line 59-60, Column 4, lines 3-5, and Figure 2 (displaying four intra-oral examinations conducted over sixteen months), tending to indicate a long-term storage, a close reading of the specification reveals that there is no indication that the invention relates only to such long-term storage. It does not even state that the x-rays will continue to be stored after the computer or program is shut down. Thus, the Court construes the term "memory" as "any form of volatile or non-volatile computer memory, including random-access memory (RAM) and hard disk drive space."

4216

B. Storing

The '490 patent frequently uses the term "storing" in the claims and specification. Hill suggests that the term should be given its "ordinary, well understood meaning of 'recording (information) in an electronic device (as a computer) from which the data can be obtained as needed.'" Hill's Post-Hearing Brf. on Claim Construction (hereafter "Hill's Brf.") at 16. Compuserve, on the other hand, offers a more detailed definition of the claim term. According to Compuserve, storing means "permanently keeping it in a computer memory so that it is not deleted by the electronic catalog system. Such storing also does not mean storage in a cache memory." Def's Markman Post-Hearing Brief (hereafter "Def's Brf.") at 20. The gravamen of the parties' dispute about the meaning of this term is whether storing should include a period of time in which the information must be kept available. In other words, the question is whether storing must be defined to include a temporal element.

The Court finds that it does, given the objective of the invention, the context of the specification, and the import of both parties' proposed definitions. First, however, it is helpful to review the use of the term "storing" or "stored" in some of the claims at issue. Claim 1, which is an independent claim and one of the broadest, describes a method with seven steps, designated as follows:

1. A method for generating information related to a product, the method comprising the steps of:

   storing and maintaining variable data and constant data . . . in a memory of a main computer . . . .

   storing constant data related to the at least one product . . . in a memory of a remote computer . . . .

   *

   *

   *

   updating constant data stored in the memory of the remote computer with constant data maintained in the memory of the main computer that is different from the constant data stored in the memory of the remote computer . . . .

'490 Patent, Col. 21-22 (emphasis added).

The term is also used in Claim 10, which depends on Claim 1, and which is a method claim with three steps. It provides:

10. The method of claim 1, wherein the constant data updating step includes the steps of:

   determining updated portions of the constant data stored in the main computer that are different than the constant data stored in the remote computer;

   transmitting the updated portions of the constant data stored in the main computer from the main computer to the remote computer; and

   replacing portions of the constant data stored on the remote computer with the updated portions of the constant data.
received from the main computer.

'490 Patent, Col. 22, Cl. 10 (emphasis added).

In the specification's summary of the invention, the term "storing" or "stored" is used to reflect the notion of data being "contained" on the remote and main computer. Id., Col. 1, ll. 51-53 ("Catalog data is stored on both the vendor's computer and the customer's computer . . . vendor's computer contains variable data"), ll. 56-58 ("customer's computer contains all constant data"). It is also used to suggest some degree of permanence, as when the summary describes the customer browsing "through general catalog data residing on the customer's computer." Id., Col. 2, ll. 5-7 (emphasis added). Although the claim language differentiates between data that is "stored and maintained" on the main computer, but only "stored" on the remote, the Court finds that the distinction relates to the meaning of the term "maintain" and not to the word "store." See Col. 3, ll. 11-14. For example, both the specification and the claim language refer to constant data as being "stored" in the remote and the main computers. When accurate product information is needed, the system automatically "updates" the constant data on the remote computer with constant data "stored" in the memory of the main computer. Col. 3, ll. 19-21; Col. 21, ll. 60-61; see also Col. 22, ll. 50-53 ("determining the updated portions of the constant data stored in the main computer"); Col. 23, ll. 17-20, Col. 23, ll. 45-46 ("updating . . . with constant data stored in the memory of the main computer"); Col. 22, ll. 35-38 ("constant data stored in the memory of the main computer and . . . in the memory of the remote computer includes both graphics data and textual data."). The use of the term "stored" when referring to data in both computers suggests that the data is expected to remain in the memory in which it is stored.

By reviewing the background and summary of the invention, the Court finds that "storing" suggests a temporal element in that, as long as a remote user wants to take advantage of the invention (i.e., the distributed data electronic catalog system), constant data must be available on the remote computer. See Tr., Vol. I at 48 (agreeing that the data must stay on the main computer for the system to work). Otherwise, a customer could not reap the benefits of instant access to the most up-to-date product information available or minimize on-line computer time. Both of these objects would require the availability of constant data on the remote computer. Moreover, in considering the dictionary definitions of the verb "store," the Court notes a temporal element in many of the ordinary definitions, including the one proposed by Hill. In Hill's proposed definition, the phrase "data can be obtained as needed" connotes some degree of permanence or availability in that the data cannot be "obtained as needed" from a device that allows the data to be involuntarily deleted or removed. Plf's Ex. 104, citing Webster's New Int'l Dictionary of the English Lang. (3d ed. 1993).

A second dictionary meaning offered by Hill declares that to store is "to leave or deposit in a store, warehouse, or other place for keeping, preservation, or disposal." Id. (emphasis added). Using an earlier version of that same dictionary, the Court notes alternative definitions of "to stock or furnish against a future time" and "to collect as a reserved supply." Webster's Third New Int'l Dictionary of the English Lang. (1981) (emphasis added). Another dictionary provides similar definitions: "to reserve or put away for future use" and "to deposit or receive in a storehouse or warehouse for safekeeping." American Heritage Dictionary (1976) (emphasis added). What each of these definitions has in common is the notion that the one who is doing the storing intends for it to be available for subsequent retrieval and use.

The full import of the ordinary meanings found in the cited dictionaries is consistent with the meaning that can be discerned in the patent claims and specification. A key aspect of the invention is that all catalog data will be kept on the main computer to be accessed by users of remote computers who need the latest product information. Tr., Vol. I at 28-29, 33, 51, Direct Testimony of Dr. Hubert E. Dunsmore, Jr. ("Dr. Dunsmore"). Claim I specifically refers to constant data on the main computer; Col. 21, ll. 60-61 ("indicating revision level of the constant data stored in the main computer"). Another key aspect of the invention is that some data will be left on the remote computer to minimize the amount of time it takes later to obtain the most complete, up-to-date information about a product. Tr., Vol. I at 24-25 (explaining the technology of a "distributed data design"), 28 ("concepts in the Hill invention are to try to make it as efficient as possible so that information is available on the remote, or customer's computers, with a minimal amount of time required to transfer that from the main to the remote.").

Another important concept in the patent is that the "constant data stored in the memory of the remote computer" will be updated "with constant data maintained in the memory of the main computer that is different from the constant data stored in the memory of the remote computer." Id., Col. 22, ll. 5-8 (Claim 1). This step in Claim 1's method suggests that constant data be present in the memory of the remote computer so that it can be updated, and the language "that is different from" suggests a comparison between information stored in the memory of the remote computer and information in the memory of
the main computer. For either of these steps to be useful, there must be constant data in the memory of the remote computer. Again, this language suggests that storing means more than just placing the data in a memory of the remote computer without regard for what happens to it. It suggests that the data remain there for some period of time.

Hill's proposed definition addresses this temporal notion with the phrase, "can be obtained as needed," but the wording leaves the definition vague and subjective. Essentially, Hill states that "storing" is a "simple word" with an ordinary, well-understood meaning. Hill's Brf. at 20. Nevertheless, Hill argues that because the claims use the word "storing" followed by "in a memory," the Court should eliminate the qualifying language "in an electronic device from which the data can be obtained as needed" to avoid any redundancy. Hill's Brf. at 21, n. 11. To do so, however, would eliminate the temporal element from the definition, which would be inconsistent with the meaning of the word in the context of the patent. The Court finds that the better definition for "store" is "to place or record in a storage device so that it will not be involuntarily removed or deleted." This definition varies the "ordinary" definition Hill proposed by refining the element of being able to obtain the information as needed -- a refinement that is consistent with both the patentee's claimed objectives of instant access and minimizing on-line time, and the concept of a distributed data design.

Hill's claim construction theme has been that Compuserve is attempting to narrow the broad language of the claims with extraneous limitations from the specification, which is improper. In Markman I, the court identified two aspects of claim construction: 1) determining the meaning of the language in the claim; and 2) ascertaining the scope of the claim. 52 F.3d at 979. The rule against importing limitations from the specification into the claim relates more to the second step, ascertaining the scope of the claim, and not to the first, determining the meaning of a specific claim term. In Renishaw, the Federal Circuit reiterated the two familiar canons of claim construction cited frequently by the parties: 1) a court may not read a limitation into a claim from the written description; and 2) the court may look to the written description to define a term already in the claim limitation. 158 F.3d at 1248. When trying to determine the meaning of the term "when" in a disputed claim, the Renishaw court noted that the issue brought into "sharp focus the convergence of the two canons. . . ." Id. at 1251. On appeal, the patentee argued that the trial court erred by reading a narrowing limitation into "when" from the written description, while the defendant asserted that the meaning of the term "when" was "embedded throughout the specification." Id.

To resolve the dispute, the court reviewed the specification's description and the preferred embodiment, both of which described the mechanism in terms of an electrical signal occurring as soon as possible after contact between a probe and an object. Noting that the descriptions in the specification could not be read into the claims "without some hook," the court found the hook to be the term "when" in the disputed claim Id. at 1252. The patentee's suggested meaning was found to be so broad that it would require the court to ignore "the abounding statements in the written description that point decidedly the other way." Id. Similarly, the claim language here uses a term that does not have a technical meaning in the applicable industry, yet has several common meanings, and one that provides a hook for reading the written description's intent into the claim. The written description shows that the invention is directed at providing the most accurate, up-to-date information available about a product in the least amount of time. It also specifically refers to the constant data as "residing" on the remote computer. Moreover, the whole point of distributing the data between the two computers is so that it would not take as long to transmit the information from the main computer to the remote. This would be defeated if the constant data being "stored" on the remote computer could be put in a memory where it could be involuntarily deleted.

If the relevant objects of the invention are to provide instant access to data and to minimize on-line computer time, then defining "storing" broadly enough to include temporary storage in random access memory ("RAM") or cache memory, both of which are temporary and subject to involuntary deletions, Tr. at 20, 43-44, 46, would be inconsistent with any of the invention's objectives. Instead, it is much more sensical, in light of the purpose and description in the specification, that the constant data be recorded with the expectation that it would remain until the user removes it of his or her own volition. In sum, the claim term "storing" means "recording in a storage device so that it will not be involuntarily removed or deleted."
argues that because its software deletes data from the cache memory of a user's personal computer when the cache is full and space is needed for newer data, the data that is copied into the cache is not "stored" within the meaning of the '490 patent. Hill responds that just because data is removed from the user's cache when the user's cache is full and removing some data is necessary to make space for newer material does not mean that there is no "stored" data in the cache.

We agree with Hill. The '490 patent expressly contemplates that some constant data stored on the remote computer will be deleted automatically by the system, and such deletions are clearly involuntary from the user's perspective. The patent recites that when a user logs on to the remote computer and clicks on a particular product, the remote computer sends the revision number of its constant data to the main computer, and the software compares that number with the revision number of the constant data stored on the main computer. If the revision number on the remote computer indicates that its constant data related to the product is not current, the constant data files on the remote computer are automatically updated, which means that the outdated information is deleted and replaced with current information. The deletion process is automatic and involuntary; there is no indication in the patent specification or in the claims that the user is asked for permission, consulted, or even notified that outdated product information is being deleted.

CompuServe argues that "storing" is compatible with automatic updating but not with the involuntary removal of material from a personal computer's cache. That argument is not persuasive, as it is based on an artificial distinction between data that is automatically removed by updating and data that is automatically removed to make room for more data. If data is "stored" even though it is subject to automatic removal upon updating, it is hard to see why it is not "stored" simply because it is subject to automatic removal when removal is required by space limitations in the user's cache.

The ordinary meaning of the term "stored" does not require that "stored" material will never be subject to involuntary removal. For example, goods that are retained in a warehouse for retrieval would be considered to be "stored" in the warehouse even if the goods were subject to being discarded if they were not retrieved within a year. The fact that CompuServe's system uses a system such as the "Least Recently Used" algorithm to remove some data when necessary to make space in the cache does not mean that data is not "stored" in the cache prior to its removal. As long as data remains in the user's cache for a period long enough that it could be retrieved in accordance with the retrieval system described in the '490 patent, that data can be said to be "stored" within the meaning of the patent. The fact that some data may be removed from the user's cache and therefore not be available to be compared with the corresponding data in the main computer means that the comparison and updating process would no longer work with regard to the deleted data, but the remainder of the data in the cache would still be subject to comparison and updating, and thus would be "stored" as that term is used in the '490 patent.

Because the district court's summary judgment of noninfringement was based in part on its construction of the term "stored," and because we disagree with the court's construction of that term, we cannot uphold the court's ruling on that ground.

3. "storing a first image as a reference image"

Agilent construes the above phrase as "storing a first set of pixel values, in which each pixel value is indicative of light intensity received at a particular photosensor at a specific time." Elan submits that the phrase, properly construed, means "storing a first set of pixel values representing a field of view of the array as the reference image."

The method by which a reference image is acquired is detailed in the '804 patent: "The two-dimensional array of photosensors is used to acquire a reference frame for tracking attitude of the device." Col. 3, ll. 28-30. The patent also describes the optics of the photosensors that acquire the reference frame: "While not critical, the device includes optics which provide a focus nominally at infinity, intentionally presenting an off-sharp image to the array of photosensors." Col. 3, ll. 35-38. The remainder of the written description similarly includes a disclosure of the reference image as captured by an array of photosensors. Absent any other indication that the reference image could be acquired by any other means, the Court reads the claims in light of the specification and construes "storing a first image as a reference frame" as "storing a first set of pixel values representing that which is captured by the array of photosensors as the reference image."
1. STEP [of] STORING (a LICENSE in a LICENSE FILE)

The first determination necessary to the proper construction of the term "step [of] storing," is whether step-plus-function interpretation is warranted. "Method claim elements may begin with the phrase 'steps of' without invoking application of § 112, P6." Seal-Flex, Inc. v. Athletic Track and Court Construction, 172 F.3d 836, 849 (Fed.Cir. 1999) (Rader, concurring) (citing O.I. Corporation, 115 F.3d at 1583).

In Seal-Flex, the court dealt with a claim which referred in its preamble to "steps of . . .," and referred in the element under consideration to "spreading an adhesive tack coating for adhering the mat to the foundation . . .." Seal-Flex, 172 F.3d at 850 (Rader concurring). Judge Rader noted in his concurring opinion that the element was not in step-plus-function form because, despite the expression of an ultimate function ("adhering the mat to the foundation"), it also expressed the act necessary to accomplish the function ("spreading an adhesive tack coating"). Judge Rader further explained as follows:

Claim elements without express step-plus-function language may nevertheless fall within § 112, P 6 if they merely claim the underlying function without recitation of acts for performing that function. Unfortunately, method claim elements often recite phrases susceptible to interpretation as either a function or as an act for performing a function. Both acts and functions are often stated using verbs ending in "ing." For instance, if the method claim element at issue in this case had merely recited the "step of" "spreading an adhesive tack coating," it would not have been clear solely from this hypothetical claim language whether "spreading" was a function or an act. In such circumstances, claim interpretation requires careful analysis of the limitation in the context of the overall claim and the specification.

In general terms, the "underlying function" of a method claim element corresponds to what that element ultimately accomplishes in relationship to what the other elements of the claim and the claim as a whole accomplish. "Acts," on the other hand, correspond to how the function is accomplished. Therefore, claim interpretation focuses on what the claim limitation accomplishes, i.e., it's underlying function, in relation to what is accomplished by the other limitations and the claim as a whole. If a claim element recites only an underlying function without acts for performing it, then § 112, P 6 applies even without express step-plus-function language.

Unlike the element at issue in Seal-Flex, the predicate language of the first element of Claim 18 contains but a single verb. It is therefore not clear "solely from this . . . claim language whether [\'storing\'] is a function or an act." Id. at 849. The first step in resolving whether "storing," is a step or an act is to determine the meaning of the word. In the context of the '297 Patent, "storing" conceivably could refer either to the initial action of placing "at least one of said licenses in a license file," or alternatively to the feat of maintaining the license(s) in the license file. Reference to earlier use of the word "storing," in Claim 3 is instructive. Specifically, with regard to the term "license file means for storing," the arguments of all parties tacitly rely upon the a definition of "storing" which contemplates the maintenance rather than the initial placement of data. See section III(B)(2), herein.

Therefore, if the first element of Claim 18 warrants step-plus-function interpretation, then the relevant function is "[maintaining] at least one of said licenses in a license file." 14 The Court does not believe that there are any substeps (or acts) described in the specification which may be interpreted to comprise the "step" of "storing." Consequently, if the first element of Claim 18 requires step-plus-function analysis, then Claim 18 is open to a validity attack for failing to disclose an embodiment corresponding to the disclosed function.

Footnotes

14 Such a function of course implies the pre-existence of a license file and of at least one license within the license file.

End Footnotes

However, maintaining data in a computer file when the computer file has already been created and the data to be maintained
already has been deposited does not require explication of component acts. That is, once the function is defined as "maintaining" data it is clear that an act, rather than a step, is at issue. 15

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

15 In O.I. Corporation, the court carefully explained why the trial court's stated reasons for applying step-plus-function analysis were incorrect. The Federal Circuit gave no alternative reasoning however, as to why it ultimately concluded that the word "passing," there at issue, did not describe a function. This Court has defined "maintaining" to be an act rather than a step for accomplishing a function. Given that the Court is venturing into largely unmapped territory, it is proper to make explicit the assumption underlying the characterization of "maintaining" as an act. Specifically, the Court believes that the characterization of "act" is appropriate when a person skilled in the relevant art would find the algorithm for performing a function to be virtually dictated by the description of that function. Further, because the "step of" terminology creates no presumption that step-plus-function analysis applies, the Court believes that by default the opposite presumption applies, that is, plain meaning prevails unless the drafter clearly has indicated his intent to act as his own lexicographer.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

So far, the Court has concluded that "step of storing a license in a license file," means "maintaining a license in a license file." The term "license" has already been defined, and the meaning of "license file," is easily deduced from the prior section of this Order to mean "an area of memory on a disk capable of storing at least one license and containing at least a UID."

"STEP OF STORING A LICENSE IN A LICENSE FILE," is maintaining a LICENSE on a disk in an area of memory which is capable of storing at least one LICENSE and which contains at least a UID. 16

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

16 There are limitations in the first element of Claim 18 in addition to those contained in the phrase here interpreted. For example, the license file at issue must be "on a workstation."

</tbody>
</table>

The core dispute between the parties appears to be whether the "result" of the "decoding step" must be "extracted data" (Defendant's position) or not (Plaintiff's position). The Court sees no need to construe the "result" of the "decoding" step to refer to "extracted data." In light of the Court's construction of the "decoding" limitation, which already calls for the limiting data to be "extracted" from the "data stream," such language would be superfluous. Likewise, the Court is reluctant to adopt Plaintiff's construction, which, in the Court's view, is merely a verbose paraphrasing of the claim language that otherwise offers little to assist one of skill in the art in understanding the claims. Indeed, Plaintiff, relying on dictionary definitions, contends that their proposed construction simply corresponds to the ordinary meaning that, for this term, is "readily apparently to even lay judges." (See D.I. 64 at 14 (citing Phillips v. AWH, 415 F.3d 1303, 1314 (Fed. Cir. 2005))). The Court agrees with this sentiment, but disagrees with Plaintiff that the claim term needs paraphrasing with dictionary
definitions. Thus, the Court will not adopt Plaintiff's proposed construction either.

The parties' proposed constructions further appear to reflect a dispute as to whether the result of the decoding step must be stored "at the user site" (Defendant's position) or not (Plaintiff's position). However, after reviewing the briefing, the Court is unable to discern a genuine dispute over this aspect of Defendant's construction. Indeed, at no point in its briefing does Plaintiff directly address this issue. Likewise, during the Markman hearing Plaintiff did not address this issue. Furthermore, Plaintiff appears to agree with Defendant that the "decoding" and "comparing" steps of the claims occur at the "user site." It would make little sense for Plaintiff to contend that the "storing" of the decoded information takes place at a location other than the location of its "decoding" and subsequent use in determining whether viewing limits have been exceeded.

In any event, the Court concludes that the claims confirm that the "storing" of the decoded information takes place at the user site. In particular, the claims explicitly recite that the limiting data is transmitted to the "user site." ('402 patent at 6:3-7, 5:3-7, 4:58-61.) Having been transmitted to the "user site," the limiting information must also be stored there. Plaintiff does not point to any evidence in the specification or claims suggesting any other possibility. The Court will thus adopt Defendant's construction to the extent it calls for the decoded information to be stored at the "user site."

Accordingly, the Court will construe "storing a result of said decoding step" to mean "storing at the user site a result of said decoding step."

4221

1. Paragraph (1) of Claim 20 of the '998 Patent - "Storing A Sound Waveform"

Macromedia contends that the phrase "sound waveform" must be construed before the phrase "storing a sound waveform" can be addressed. Macromedia contends that it is well recognized in the art that sound is a vibration transmitted in a medium, such as air. (D.I. 243 at 9). When sound is transmitted in air, Macromedia contends that the energy in a sound produces small regions in which the air pressure is lower than average (rarefactions) and small regions in which it is higher than average (condensations). (D.I. 243 at 9). According to Macromedia, these regions of rarified and condensed air propagate in the form of an air pressure wave, comprising of both positive (condensation) and negative (rarefactions) pressure variation. (D.I. 243 at 9). In light of these well recognized principles of sound, Macromedia contends that the phrase "sound waveform" is used in the art to describe a "pattern of pressure variation." (D.I. 243 at 9).

In response, Adobe contends that a "sound waveform" can be either one of pressure (amplitude) or frequency (pitch). (D.I. 305 at 13). Adobe contends that frequency is typically represented as an absolute value representation (i.e. positive) of the pitch of the waveform. (D.I. 305 at 13). Because a "sound waveform" can be used to describe a pattern of pressure or frequency, and because frequency does not necessitate the positive/negative variation requirement, Adobe contends that Macromedia's attempt to limit the meaning of "sound waveform" to a "pattern of pressure variation" is improper. (D.I. 305 at 13). According to Adobe, the phrase "sound waveform" should be construed to mean "an auditory impression of a sound represented as a waveform." (D.I. 243 at 9).

In construing the term "sound waveform," the Court has considered the phrase's ordinary and accustomed meaning, as well as the specification and prosecution history of the '998 Patent. (See D.I. 248, Ex. B, '998 Patent, Col. 1, lines 24-26, 48-50, 54-58; D.I. 248, Ex. C; D.I. 244, Roads Opening Decl. at PP21-23). Based on this review, the Court concludes that a sound waveform as described in the '998 Patent is not one of either pitch (i.e. frequency) or amplitude as suggested by Adobe. Rather, pitch (i.e. frequency) and amplitude are merely characteristics of a sound waveform by which the '998 Patent teaches a means to alter. (D.I. 248, Ex. B, '998 Patent, Col. 1, lines 48-50 (stating "the system provides means to alter the pitch (i.e. frequency) or amplitude of a particular part of any waveform by moving a segment of a line adjacent to the waveform on the screen, which line corresponds to the pitch or amplitude for the adjacent part of the waveform")). Because the Court also concludes that the ordinary and accustomed meaning of sound waveform is a pattern of pressure variation, the Court will construe the phrase "sound waveform" to mean a "pattern of pressure variation." The Court will now turn to the phrase "storing a sound waveform."

Macromedia contends that the phrase "storing a sound waveform" should be construed to mean "storing a pattern of pressure variation in an electronic device (such as memory) from which the information can be obtained as needed." (D.I. 243 at 9).
Adobe contends that the proper construction is "storing an auditory impression of a sound in a computer memory (i.e. RAM) from which the information can be obtained." (D.I. 305 at 16). Because the Court has construed the phrase "sound waveform," the only remaining issue with respect to the construction of the phrase "storing a sound waveform" is whether a sound waveform should be construed to be stored in "a computer memory (i.e. RAM)" or "an electronic device (such as memory)."

Macromedia contends that the phrase "storing a sound waveform" is presented in a method claim that recites a combination of steps or acts. (D.I. 311 at 2). Because method claims should be construed according to their ordinary and accustomed meaning and should not be limited to any particular structure described in the specification, Macromedia contends that Adobe, by its proposed construction, is attempting to improperly read the structure described in the specification (i.e. "a computer memory (i.e. RAM)") into method claims at issue in the '998 and '969 Patents. (D.I. 311 at 2-4).

In opposition, Adobe contends that the phrase "storing a sound waveform," while presented in the form of a method claim, nonetheless implicates 35 U.S.C. § 112 because it recites a step plus function limitation without defining a specific act. (D.I. 305 at 15). Specifically, Adobe contends that the steps and structure disclosed in the specification of accomplishing the act of "storing" must be considered in construing the phrase "storing a sound waveform." (D.I. 305 at 15). Because the specification discloses that sound waveforms are stored in a computer memory, and because computer memory, as it was understood by those of skill in the art in the relevant time frame, refers only to the random access memory (RAM) of a computer, Adobe contends that a sound waveform should be construed to be stored in "a computer memory (i.e. RAM)." (D.I. 305 at 16).

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claims shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereto.

In determining whether a claim element is subject to Section 112, P6, a court considers the phrasing of the element at issue. For example, when determining whether a claim element contains a step plus function limitation, if the claim element uses the phrase "step for," then a step plus function limitation is presumed to exist, and thus, Section 112, P6 is presumed to apply. On the other hand, the term "step" alone and the phrase "steps of" tend to show that Section 112, P6 does not govern that element. See Seal-Flex, Inc. v. Athletic Track & Court Constr., 172 F.3d 836, 849 (Fed. Cir. 1999).

In the present case, Claim 20 of the '998 Patent uses the phrase "steps of" in the preamble to introduce several "steps." The specific element at issue recites the step of "storing a sound waveform." Because the phrase "step for" is lacking in both the preamble and the disputed claim element, this language tends to show that the verb "storing" recites an act rather than a function. Accordingly, the Court concludes that the phrase "storing a sound waveform" is not drafted in step plus function form, and therefore, will construe this phrase in accordance with the normal principles of claim construction.

In construing the disputed phrase "storing a sound waveform," the Court has considered the specification and prosecution history of the '998 Patent. (See D.I. 248, Ex. B, '998 Patent, Col. 1, lines 33-36; D.I. 248, Ex. C). Based on this review, the Court concludes that the phrase "storing a sound waveform" requires storing a sound waveform in a computer memory. (See D.I. 248, Ex. B, '998 Patent, Col. 1, lines 33-36 (stating "the system of this invention provides means for entering and storing sound waveforms in a computer memory . . ."). The Court also concludes that a computer memory, as understood by one of ordinary skill in the art during the relevant time period, is limited to RAM memory. (See D.I. 307 at 3-4). Accordingly, the Court construes the phrase "storing a sound waveform" to mean "storing a pattern of pressure variation in a computer memory (i.e. RAM) from which the information can be obtained."

Plaintiff argues that this term should be construed to mean that the "system stores a transaction ID" while Defendant
proposes that it means "storing an identifier of a specific person." The language of claims 1 and 15 requires that the identification of the user will be used to determine whether the user is authorized to add a record in the database. See claims 1 and 15 of the '940 patent. Based on the specification, the transaction ID is different from the user ID. For example, the specification provides that a unique transaction ID is assigned to each entry. See, e.g., 6:24-28. The specification effectively defines or at least clearly distinguishes a user ID from a transaction ID in columns 7 and 8:

Users providing the requested information are assigned a user ID to be used during subsequent accesses and are requested to choose a password. The password may be required to access some system services. To further encourage voluntary login, users that have complied with the login request and have been assigned a user ID may be afforded the ability to customize the user interface and maintain the resulting look and feel between uses. The customization is performed in a known manner by storing on the host a user preferences file and accessing the file to restore user preferences when a valid user ID is provided.

The patent specification demonstrates that the transaction ID is tied to a particular database entry, while the user ID is tied to a particular user. Plaintiff asks the court to construe this term such that the line between a user ID and a transaction ID is eliminated. The court rejects Plaintiff's proposed construction. The term "storing an identification of said user" means "storing an identifier of a specific person."

### 4223

3. "storing at least one timing control bit in a control register"

The dispute is whether "storing" means "loading and holding" or simply means "holding." The plaintiff argues that "loading" is necessary because programming requires the system to load data into the control register. According to the plaintiff, simply "holding" values is passive because it requires no action whereas "storing" requires data to be "placed" in a particular location. To support its contention that "storing" includes "loading," the plaintiff points to the Summary of the Invention which states that "timing control bits are preferably loaded into a control register" and the Description of the Preferred Embodiment which states that the information stored in the control register is taken or "loaded" from a read only memory. '924 patent, 2:12-14, 3:23-25; 4:16-19.

The defendant contends that the patentee used "load" and "store" to refer to two different actions in the specification and, therefore, they must mean different things. '924 patent, 1:55-56, 2:12-14. The defendant argues that there is a preference for values loaded during initialization, but that "storing" occurs throughout the operation of the memory controller, not just at startup. The defendant further argues that this phrase appears in Claim 1 of the '924 patent, and, therefore, must be construed consistently. According to the defendant, construing "storing" to include "loading" would not make sense in Claim 1 (the apparatus claim) because a memory controller cannot load something into itself.

The Court agrees with the plaintiff. Although the same terms in different claims are typically given the same meaning, the same terms in different types of claims may be given different meaning. See Epcon Gas Systems, Inc. v. Bauer Compressors, Inc., 279 F.3d 1022, 1031 (Fed. Cir. 2002) (stating that the same term used in a different manner in two phrases does not necessarily have to be interpreted to mean the same thing in both phrases). In this case, Claim 1 involves a means plus function claim whereas Claim 7 is a method claim. A means plus function claim is limited to the disclosed embodiment while a method claim is not so limited. Furthermore, one of ordinary skill in the art would understand that the term "storing" in the context of programming involves "loading and holding." It would be difficult for a register to hold a control bit without first having it loaded. Accordingly, the Court construes the phrase to mean "loading and holding at least one timing control bit in a register."

GO BACK

### 4224

2. "storing cells arriving for transmission on said virtual path in a buffer for transmission of cells on said virtual path in
The plaintiff contends that no construction is needed because all the technical terms ("buffer," "cells," and "virtual path") have agreed definitions. The defendants seek a two-part construction for the first limitation of Claim 1.

For the first part, the defendants propose "storing cells arriving for transmission on the VPC in the buffer for that VPC." The dispute is whether a specific buffer is required for each virtual path. The court agrees with the plaintiff that the plain language of the claim requires "a buffer," and not "a buffer for that VPC." Accordingly, the court rejects the defendants' attempt to limit this claim element.

For the second part, the defendants propose that the phrase "when in accordance with said constraint on said rate" modifies, and thus limits, the word "storing," as opposed to the word "transmission." The plaintiff contends that the syntax of the claim language requires the phrase to modify "transmission" and not "storing." Given the claim language, the plaintiff has the better argument. The limitation requires that cells arriving for transmission on the virtual path are stored in a buffer "for transmission of cells on said virtual path in conformance with said constraint on said rate." In the context of the patent, the word "rate" suggests a transmission rate, not a storage rate. As a result, the court holds that the rate constraint portion of this phrase modifies "transmission" as opposed to "storing."

C. "Electronic Storage Media" is "Memory Configured to Store Information in a Format that an Electronic Device Can Read" and "Storing, in Electronic Form, Information" Means "Storing Information in a Format that An Electronic Device Can Read."

The terms "electronic storage media" and "storing, in electronic form, information" appear in asserted claims 1, 3, 6, and 19. In each of these claims, the unit in communication with the central information bank contains a "memory for storing, in electronic form, information transmitted to" the unit from the central information bank.

The unit in turn is configured to transfer information to the "electronic storage media" of system users. The parties' proposed definitions are equivalent – both agree that the terms refer to the storage of information in an electronic format. The parties disagree sharply, however, over the meaning of "electronic." Digeo contends that "electronic" is a generic term that covers a wide variety of storage media, including but not limited to computer hard drives, floppy disks, magnetic tapes, and compact disks. Audible contends that "electronic," as it is used in the claims, covers only memory that stores information in the form of "electrical signals," and excludes all other memory, including magnetic memories (such as hard disks, floppy disks, and magnetic tapes) and optical memories (such as compact disks).

Digeo's interpretation of the term "electronic" seems to the court to be consistent with the ordinary meaning of the term and its use in the claim language. Audible's interpretation seems strained, but as the court is not of skill in the art of networked information systems, the court looks to the specification to illuminate the ordinary meaning.

The court finds the specification inconsistent with Audible's narrow interpretation. The patentees were aware of a broad range of storage mediums, including "tapes, diskettes, cartridges, laser disk[s]," and "compact disk[s]." 823 Patent at 1:22-23. In a list of storage mediums on which publishers might provide content for the invention, the patentees mentioned "magnetic or electronic disks, cartridges, or tape reels or compact disks, laser disks, tape cassettes, etc." Id. at 3:62-63. Audible seizes upon the first "or" in the phrase, insisting that the patentees drew a distinction between "magnetic" media.
and "electronic" media. In Audible's view, because the patentees only claimed "electronic" media, they surrendered all else.

In its briefs, Digeo contended that Audible's interpretation of "electronic storage media . . . would exclude any known computer-readable storage device." Digeo Reply Br. at 11. When the court echoed that concern at oral argument, Audible responded with a 12-page supplemental brief (Dkt. # 41) with extrinsic evidence showing that there is a species of media that is electronic, but not magnetic or optical, and that this species was known in the art during the prosecution of the 823 Patent. With apologies to Shakespeare, the court finds that Audible doth protest too much. The question is not whether specialized "electronic" media existed, but whether the patentees intended to limit the practice of their invention solely to such media. If they had so intended, one would expect the specification to indicate this choice with something other than a single ambiguous use of the word "or." If the patentees had so intended, one would expect the intrinsic evidence to contain a reference to the specialized "electronic" media. If the inventors intended to exclude the most common storage mediums (i.e., hard disks, floppy disks, and compact disks), the court expects that the inventors would have said so.

Moreover, the claims themselves suggest that the patentees were not concerned with specialized "electronic" media. Although several claims refer to the end user's media as "electronic storage media," e.g., Claims 1-5, several others refer simply to "storage media," e.g., Claims 11-14, 17-18, whereas others use the term "memory unit," e.g., Claims 6-10, 27, 29-30. In Claim 19, the inventors simultaneously claimed the more general "storage media" with the supposedly more specific "electronic storage media." In claims depending from Claim 19, the patentees continued to switch between the two terms without explanation. If the court were to follow Audible's logic, it would be forced to conclude patentees sometimes chose to exclude a vast array of media, and sometimes did not, and did so with no explanation whatsoever. The court finds this implausible.

Audible also points to the prosecution history in support of its proposed construction, but again asks the court to read too much into the inventors' choice of words. In a preliminary amendment at the outset of the 292 Application, the patentees inserted the word "electronic" to modify "storage media" in the claims. PH at 500-618-23. Nowhere in the history, however, is there a suggestion that the patentees were making a distinction between "electronic" media in the sense that Audible uses the term and other forms of media. n5 The patentees did not make the distinction in their remarks accompanying the preliminary amendment. PH at 500-628-33. The PTO did not acknowledge the distinction in rejecting the preliminary amendment. PH at 500-638-42. The patentees did not make the distinction in their response to the rejection. PH at 500-645-653. The PTO did not note any distinction when it allowed the claims as drafted in the preliminary amendment. PH at 500-655-56. As the court has already noted, there can be no prosecution disclaimer absent a clear and unambiguous disavowal of claim scope. The court finds no disavowal of claim scope inherent in the patentee's use of the word "electronic."

n5 Although Audible does not acknowledge it, the patentees used the phrase "storing, in electronic form" in their claims since they filed the 056 Application. PH at 500-435. This casts more doubt on Audible's assertion that they surrendered claim scope when they later added the word "electronic" to the claim phrase "storage media."

For the reasons stated above, the court concludes that "electronic storage media" means "memory configured to store information in a format that an electronic device can read," and that "storing, in electronic form, information" means "storing information in a format that an electronic device can read." The term "electronic" does not exclude magnetic or optical media such as hard drives, floppy disks, or compact disks.
Storing in memory

Fenner argues for no construction, while Defendants would define "storing in memory" as "storing in the database memory of the radio frequency communication switch." Defendants argue that "memory" in Claim 1 provides antecedent basis for "the database memory" in Claim 3, and one skilled in the art reading the claims together would understand the "memory" in Claims 1 and 3 to be the same memory. The Court agrees.

Claim 1 describes the switch receiving a PIN and billing code, then requesting a service profile from the billing authority based on the PIN and billing code, and storing the service profile in memory. Claim 3 describes maintaining "a service profile for each mobile user active on the communications switch." Reading the claims together, leads to the conclusion that "the database memory" in Claim 3 refers to the "memory" contained in Claim 1. See Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1331 (Fed Cir. 1999), citing Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 USPQ2d 1673, 1679 (Fed. Cir. 1995). Further, the specification lends support for this reading. See '706 Patent, Figure 2.

Therefore, the Court construes "storing in memory," to mean "storing in the database memory of the radio frequency communication switch (as construed herein)."

Storing product pictures, product environment pictures and text segments and The computer storing product images, product environment images and text segments

Defendants argue these terms should be construed as "storing each of the product pictures, product environment pictures and text segments as separate and distinct items." Defendants argue that the claims, the specification, and the prosecution history support their proposed construction. This issue of whether the product pictures, product environment pictures, and text segments are "separate and distinct" implicates many of the remaining claim terms in the '342 patent.

Claim language and specification

Defendants contend the claim language supports their proposed construction because the claims recite the product pictures and product environment pictures as separate elements, which are selected through an independent process according to particular customer answers. Further, Defendants argue, the storing step, the selecting step, and the customized proposal step each refer separately to product pictures, product environment pictures, and text segments. Defendants also argue the specification supports their proposed construction because the specification describes the pictures as "building blocks" to create a customized proposal and as being separate and distinct (though those words are not used in the specification). See Abstract; col. 5:31-40, 1:9-16. Defendants argue Figure 1A shows separately stored product pictures, product environment pictures, and text segments and Figure 1B shows how they are combined to create a customized proposal for specific customers. Defendants further contend that Figures 1A and 1B illustrate the invention itself rather than a preferred embodiment. See col. 2:57-59, 60-62.

Orion responds that the claims do not limit whether the pictures and text segments can be stored separately or in combination with one another. Orion contends that Defendants are attempting to limit the claims to the disclosed embodiment. According to Orion, this is improper because the patentee did not demonstrate "a clear intention to limit the
claim scope using words or expressions of manifest exclusion or restriction." See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). Further, Orion does not agree that the specification supports the Defendants' contentions. Orion contends that one statement from the specification that Defendants use to support their argument, "each combination of pictures for a finished template need not be pre-stored, since the system dynamically builds a template" actually supports Orion's position. See col. 5:37-40. According to Orion, "each combination . . . need not" allows for the possibility that some images may be stored as combinations or sub-combinations. Orion also contends that Figure 1A is merely illustrative and that, in an alternative embodiment, the shown pictures and segments can be stored in any combination. See col. 5:48-51.

The Court agrees with Orion that the claim language does not require that the product pictures, product environment pictures, and text segments be stored separately. Although the "selecting" steps require that three items be selected, the storing step does not limit how those items are stored. The Court also agrees with Orion that the specification does not require that the product pictures, product environment pictures, and text segments be stored "separately and distinctly." Although the preferred embodiment may do so, there is no clear evidence from the specification that the actual invention requires doing so. Given that claims are to be given their broadest meaning unless there is a clear disclaimer or disavowal, see Liebel-Flarsheim Co., 358 F.3d at 906, the Court will not impose this limitation based on the claim language and specification.

Prosecution history

Defendants argue that the prosecution history of both the 342 patent and its parent application, which became the 490 patent, support their proposed construction. Defendants contend that to overcome rejections based on Yourick and Donald, the Applicant argued that his invention did not use complete images but instead assembled different images based on customer-specific information. 490 patent, Amendment & Response 6/19/95, p. 3. Yourick did not combine customer-specific pieces of information, but simply retrieved and displayed predefined complete images. Id. at 4. Donald combined generic images, but did not disclose gathering and formatting customer-specific information. Id. at 3. The Examiner allowed the claim because

the prior art fails to teach or fairly suggest, either singly or in combination, the utilization of a customer's answers to computer-generated questions to select stored pictures of products, stored pictures of product environments, and stored text segments, and to compile this information accordingly, so as to generate a customized proposal for the sale of the product, as recited in independent Claim 30 (now renumbered 1)

490 patent, Notice of Allowance 8/10/95, p. 2 (emphasis added). According to Defendants, the Examiner understood that the product pictures, product environment pictures, and text segments were separate and distinct.

Defendants argue the Examiner also rejected various claims in light of Donald and Yourick reasoning that it would have been obvious to combine the references as discussed above. 342 patent, Office Action 8/29/96, p. 7. Defendants contend the Applicant overcame this rejection by arguing that neither Donald nor Yourick disclose the selection of "particular pictures" and text segments in response to a customer's answers to computer generated questions. The Examiner allowed the 342 patent stating:

The prior art fails to teach or fairly suggest, either singly or in combination, the utilization of a customer's answers to computer generated questions to select stored pictures of products, stored pictures of product environments, and stored text segments, and to compile this information accordingly, so as to generate a customized proposal for the sale of the product, and as recited in independent Claims 30, 35, 40, 45, and 50 (now renumbered 1, 6, 11, respectively).

342 patent, Notice of Allowance 10/2/96.

First, Orion responds that claim 30 of the 490 patent did not include a "storing" element, and the Examiner and Applicant did not discuss whether the product pictures, product environment pictures, and text segments were stored separately or in combination. Orion argues the Applicant distinguished Donald on the grounds that Donald did not teach the claimed steps of gathering and formatting customer-specific information. Orion contends that the Applicant did not make the statement that Donald "shows the combining of generic images and text to make a composite image" in an attempt to distinguish the Applicant's invention from Donald, but rather in an attempt to contrast Donald with Yourick who did "not combine various customer-specific pieces of information." See 490 patent, Amendment & Response 6/19/95, pp. 3-4. Orion argues the
Applicant distinguished Yourick because Yourick did not teach "formatting," not because Yourick taught "predefined complete images." Id. at 4. According to Orion, these statements to the Examiner do not meet the standard for disclaimer. Second, Orion contends the prosecution history of the '342 patent is silent as to how the product pictures, product environment pictures, and text segments are stored. Orion insists this term does not require construction since it retains its plain and ordinary meaning.

The Court agrees with Orion's characterization of the '342 patent's prosecution history. The Applicant distinguished the '342 patent from Donald and Yourick:

The claimed system selects a particular product picture, a particular product environment picture, and a particular text segment "in response to at least one of the customer answers." The selected pictures and text segment are used to generate "a customized proposal for the customer."

... Neither Donald nor Yourick teach, for example, teach or suggest the selection of particular pictures and text segments in response to a customer's answers to computer generated questions.

342 patent, Amendment & Request for Reconsideration 9/24/96, p. 3. The Applicant's statement cannot be fairly characterized as a disclaimer or disavowal of the plain meaning of the claim term.

The Court also agrees with Orion's interpretation of the 490 patent's prosecution history. The Applicant distinguished Donald and Yourick because "the present invention includes means for gathering customer-specific vehicle information' and for formatting the customer-specific vehicle information according to criteria related to a layout, of the customized proposal.'" 490 patent, Amendment & Response 6/19/95, p. 3. The Applicant argued that although Donald mentioned combining composite images, Donald did not disclose gathering and formatting customer-specific information including vehicle pictures, environment pictures, and text. Id. The Applicant also argued that because Yourick displayed complete images rather than assembled images, Yourick did not format the information for a particular layout. Id. at 4. The Applicant further argued that Yourick did not disclose associating a user's responses with product pictures, environments, and text. Id.

Conclusion

Although the claim language requires "storing in the computer product pictures, product environment pictures and text segments," neither the claim language itself, nor the specification, nor the prosecution history clearly limit the storing step to storing the product pictures, product environment pictures, and text segments as "separate and distinct" items. Since Defendants urge the Court to separately construe "product pictures" and "product environment pictures," these terms do not require further construction.

1. "storing items having information in a source material library" (claim 41 of the '992 patent)

The parties request that the Court construe the term "storing items having information in a source material library" that is an element in claim 41 of the '992 patent. Claim 41 in pertinent part recites: "[a] method of transmitting information to remote locations, the transmission method comprising the steps, performed by a transmission system, of: storing items having information in a source material library." ('992 patent, 24:54-56).

Acacia construes the phrase to mean "the act of placing items having information in a source material library for later use where a source material library is a place where source material is kept or a collection of such material, source material are physical things at the point of origin or procurement, items having information are units or members of groups which have information, and information is any meaning assigned to data by known conventions." (Joint Claim Construction Chart, Docket Item No. 151). Acacia rebuts Defendants' assertion that the transmission system has readily accessible for use source items of the transmission system in a library by citing the '992 patent, col. 18, lines 53-59, stating that act of retrieving the information for items is analogous to taking books off a shelf at the local public library.

Defendants construe "storing items having information in a source material library" to mean that "the transmission system has readily accessible for use (stores) source items of the transmission system in a library," where library requires
organization of the items. (Joint Claim Construction Chart, Docket Item No. 151). Defendants assert that Acacia initially required a library to be a collection of materials "arranged for ease of use" and that once Acacia abandoned its previous position Defendants added the phrase "organized collection."

The Court finds that the plain and ordinary meaning of the term "library" could mean either a collection of books or a place where books could be stored. The specification supports defining library to be a collection of material, which contains analog or digital information, that the transmission system may convert, compress, and transmit. In other words, the specification defines the source material library as a collection of sources of information. In the transmission system described in claim 41 of the '992 patent, the Court construes the phrase "storing items having information in a source material library" to mean "adding items having information to a collection of existing materials."

23. Storing partitioned data in registers

The plaintiff contends that "storing partitioned data in registers" means "storing in registers the data that was divided into separate and distinct data fields." The defendants, on the other hand, argue that "storing partitioned data in registers" means "the results of the dynamic partitioning of the data stream is [sic] stored in adjacent portions of registers." The plaintiff disagrees with the defendant's proposed construction because it requires that the results of the dynamic partitioning be stored in adjacent portions of the register. According to the plaintiff, the specifications of the media processor patents disclose storing partitioned data in non-adjacent portions. The defendants contend that a person of ordinary skill in the art would understand that the data are stored in adjacent portions of registers. After considering the arguments of counsel, the court construes "storing partitioned data in registers" to mean "the results of the dynamic partitioning of the data stream are stored in registers."

4232

G. "a programmable memory storing said song data representing the plurality of songs, said programmable memory also storing said advertisement data representing the at least one advertisement"

Arachnid contends that there is no dispute that the memory in this term stores songs and data, and that therefore the plain and ordinary meaning of "programmable memory" is "computer memory that can be programmed." Touchtunes challenges this proposed construction, arguing that it ignores the requirement that a programmable memory "store both said song data and said advertisement data." (Touchtunes Resp. 12.) Touchtunes therefore proposes the following construction: "A computer storage device that stores both said song data and said advertisement data."

Arachnid takes issue with Touchtunes' use of the term "device" to restrict the claim term to a single physical piece of equipment, contending instead that the programmable memory is not required to be in a single place or serve a single function, because the claim term uses the indefinite article "a" to qualify "programmable memory." See Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1342-43 (Fed. Cir. 2008) (observing that "an indefinite article 'a' or 'an' in patent parlance carries the meaning of 'one or more'"). However, the plain language of the disputed claim term makes it clear that the same programmable memory storing said song data must also store said advertisement data, because "said programmable memory" necessarily refers back to the "a programmable memory" recited earlier in the claim. See, e.g., Intamin, Ltd. v. Magnetar Techs. Corp., 483 F.3d 1328, 1333 (Fed. Cir. 2007) (use of the word "said" in a claim refers to an earlier use of that term in the claim). While the Baldwin case cited by Arachnid acknowledged the rule that "a" and "an" mean "one or more" and also held that the subsequent use of "the" or "said" does not change the potentially plural nature of the "one or more" structures claimed, 512 F.3d at 1342-43, it does not hold that a limitation requiring "said" structure to perform two tasks could be satisfied by splitting those tasks among multiple structures. Here, at least one programmable memory must itself store song data while "also storing said advertisement data" to satisfy the express limitation in the claim.

Arachnid relies on an opinion from a case in the Northern District of Illinois, in which the Honorable Matthew F. Kennelly rejected a construction of this same term that limited programmable memory to a "particular type of memory." Rowe Int'l
Corp. v. Ecast, Inc., No. 06 C 2703, 2008 U.S. Dist. LEXIS 97250, 2008 WL 5100319, at *2 (N.D. Ill. Nov. 28, 2008). In this case, however, Touchtunes does not seek to limit the term to a particular type of memory or challenge the notion that a programmable memory is a "computer memory that can be programmed," but rather it argues that the term requires both song data and advertisement data to be stored in the same programmable memory.

For the foregoing reasons, the Court adopts Touchtunes' proposed construction.

2. "Storing said telephone and said graphical icon together in memory" (Claim 1)

a. The Parties' Proposed Construction

<table>
<thead>
<tr>
<th>Motorola's Proposal</th>
<th>VTech's Proposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Storing both the telephone number and the association to the selected icon in the memory.&quot;</td>
<td>&quot;The telephone number and graphical icon are stored together in memory in the same memory location.&quot;</td>
</tr>
</tbody>
</table>

b. Discussion

Motorola contends its construction of this claim limitation is consistent with the claims, specification, and file history of the '356 patent. According to Motorola, the specification describes the method of claim 1 as a series of steps beginning with a user entering a phone number and then selecting an icon to "associate" with the phone number. ('356, 5:49-54; Fig. 4F). Then, "the information is stored in the memory of the radio communication device." ('356, 5:60-63)(emphasis added). Motorola asserts that this "information" includes: (1) the specific telephone number entered and (2) the "association" or link between the phone number and the selected graphical icon. Motorola states the "graphical icon" of claim 1, however, is to be selected from a "predetermined" set already stored in the phone's memory, and therefore it makes sense that the association or link to that icon (in another portion of the memory) would be stored along with the phone number. ('356, 5:52-59; 9:26-28; Figs. 4 (408) & 4F). Motorola contends the Examiner had a similar understanding of the claim language during prosecution of the '356 patent application.

Motorola takes issue with VTech's requirement that the graphical icon itself be stored in the "same memory location" with the telephone number. According to Motorola, it would make no sense to require a graphical icon already stored in memory be copied and re-saved every time a new contact entry is created by the user. Finally, Motorola asserts there is no requirement in claim 1 or the intrinsic record that the telephone number and graphical icon be stored in the "same memory location." Specifically, Motorola argues VTech's citations for its construction merely show that a "predetermined memory location" identifier can be used to access or display a specific contact entry with a phone number and associated icon ('356, 6:1-18; Figs. 5, 5-B-D) whereas claim 1 relates to storing a phone number and an association with a graphical icon. ('356, 9:20-30).

On the other hand, VTech contends the only disclosure in the specification of the '356 patent relating to the phrase "together in memory" discusses storing the phone number and associated icon together in the same memory location. ('356, 6:12-18) ("Alternatively, the predetermined memory location may be displayed with name and icon associated with the predetermined memory location being shown and with sequentially adjacent memory locations also being shown (FIG. 5-4)"). Therefore, according to VTech, the claim must be read to cover this specific disclosure as it is one of the preferred embodiments. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir.1996) (stating a construction that excludes the preferred embodiment "is rarely, if ever correct and would require highly persuasive evidentiary support").

The Court is not convinced, as urged by VTech, that the phone number and associated icon are required to be stored in the same physical memory location. However, the Court finds the term requires construction and agrees with VTech that the word "together" should be utilized in the Court's construction of this term. Both claims 1 and 5 include the word "together."

c. The Court's Construction
Accordingly, the Court construes the "storing said telephone number and said first graphical icon together in memory" term to mean: "storing together the telephone number and the association to the selected icon in the memory."

Storing the first IP address and associating it with a physical media path from which the first data packet was received

--- Footnotes ---
n8 This language appears in claim 1, but very similar language appears in claim 6, which, Defendants argue, should be construed in the same way.

--- End Footnotes ---

Defendants argue that this phrase should mean, "the 'first IP address' that is associated with the recited 'physical media path' is obtained from the 'first data packet.'" Although this construction is not necessarily incorrect or confusing, it simply reorganizes the claim language to state an idea that is already apparent from the plain and ordinary meaning and the Court's construction of the terms within the phrase. The Court declines to adopt Defendants' construction because it offers no more guidance than the claim language alone. Accordingly, this phrase will mean, "storing the first IP address (as construed herein) and associating it with a physical media path (as construed herein) from which the first data packet was received."

9. "storing ...information ... in a compressed data form the information including an identification code and being placed into ordered data blocks."

Claim 19 provides in relevant parts:

A distribution method * * * comprising the steps of: storing, in the transmission system, information from items in a compressed data form, the information including an identification code and being placed into ordered data blocks; ...

The parties dispute the proper construction of this first "storing" step in the distribution method. Claim 19 contains a second storing step which is part of the receiving system. The Court will refer to this first "storing" step as the "storing information in a compressed data form" step. As part of its construction of this first step, the Court is asked to decide when, in the disclosed method, the unique identification code is assigned.

The specification of the '992 Patent discloses as an invention both apparatus and method claims. The apparatus disclosed is a system for distribution of audio and video information. Claim 19 is a "distribution method" drawn to the inherent functions of this distribution apparatus. In construing the words and phrases of Claim 19, the Court relies on a description of an embodiment of the method which is contained in Figure 7 and in the specification at column 18, line 53. n6 The distribution method in Figure 7 must be performed in the following sequence:

(a) retrieve information for selected items,

(b) assign a unique identification code (storage encoding) n7,

(c) converting and formatting,

(d) ordering into addressable data blocks,
(e) compressing,
(f) compressed data formatting and storing into compressed data library,
(g) transmitting the information in response to a user request,
(h) receive at remote location,
(I) buffer the data,
(j) playback at time requested.

In light of the specification, the Court finds that before the "storing information in a compressed data form" step is performed, the information must already have been assigned an identification code, converted, placed in ordered data blocks and compressed.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

n6 Column 18, lines 50-52 provides: "Method 400 assumes that the items have already been stored in compressed data library 118." This provision contradicts the method illustrated in Figure 7 and described in Column 18: 53-19:36.

n7 The specification defines "storage encoding" and by its definition, it is clear that "storage encoding" is a step in the method different from "storing information in compressed data form." The specification provides:

Prior to being made accessible to a user of the transmission and receiving system of the present invention, the item must be stored in at least one compressed data library 118, and given a unique identification code by identification encoder 112. Storage encoding, performed by identification encoder 112, aside from giving the item a unique identification code, optionally involves logging details about the item, called program notes, and assigning the item a popularity code. Storage encoding may be performed just prior to conversion [conversion means 113] of the item for transmission to reception system 200, at any time after starting the conversion process [conversion means 113], or after storing the item in the compressed data library 118.

('992 Patent, Col. 6:35-47.)

Thus, assigning a unique identification code and other optional encoding of details or notes, all of which are called "storage encoding," may be performed: (a) just before conversion of the data to a suitable format for transmission; (b) during conversion of the data to a suitable format for transmission; or (c) after the data has been stored in the compressed data library.

- - - - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

Other passages in the specification clarify that the "storing information in a compressed data form" step takes place after the unique identification code has been assigned:

In the preferred embodiment, after identification encoding is performed by identification encoder 112, the retrieved information is placed into a predetermined format as formatted data by the converter 113.

* * *

In accordance with a preferred embodiment of the present invention, the transmission system 100 may further comprise compressed data storing means, coupled to the compression means, for storing as a file the compressed sequenced data with the unique identification code received from the data compression means. After compression processing by compressor 116, the compressed audio and video data is preferably formatted and placed into a single file by the compressed data storage means 117. The file may contain the compressed audio and/or video data, time markers, and the program notes. The file is addressable through the unique identification code assigned to the data by the identification encoder 112.
The first step of the method disclosed in Claim 19 is storing information in the compressed data library which, according to the specification, is performed by the compressed data storing means. Based on the language of this storing step, the information must have been assigned an identification code, compressed and put into order data blocks before the storing step.

The specification of the '992 Patent provides that, if information in the transmission system has already undergone a process otherwise performed by the transmission system, it may be passed directly to the compressed data formatter:

In some cases, such as in inter-library transfers, incoming materials may be in a previously compressed form so that there is no need to perform compression by precompression processor 115 and compressors 128 and 129. In such a case, retrieved items are passed directly from identification encoder 112 to the compressed data formatter 117.

It is apparent that assigning an identification code, formatting and compressing are essential functions which must be performed on the information before transmitting the information to the reception system. Accordingly, the Court interprets the storing step as operating on information which has already been encoded, formatted and compressed prior to the start of the method. Indeed, unless the "storing" step is construed in this fashion, an argument could be made that Claim 19 omits steps in the sequence which are essential to the distribution method as taught in the specification.

The step uses the phrase: "being placed into ordered data blocks." To preserve the validity of the Claim, the Court construes this phrase as "having been placed into ordered data blocks."

The Court construes "storing ... information from items in compressed data form" as follows:

In a distribution method as disclosed in Claim 19 of the '992 Patent, in which a transmission system sends information to receiving systems at remote locations in response to a user's request, "storing ... the information in a compressed data form, the information including an identification code and being placed into ordered data blocks" means: "storing the information, along with an identification code, in the compressed data library of the transmission system, when, previously to storing: (a) an identification code has already been assigned to the information; (b) the information has been placed into ordered data blocks, and (c) the information has been compressed."
Although the term "positions" seems, to the court, to not require construction, the court accepts Durr's proposal to replace it with the word "locations," which is consistent with the ordinary meaning of the word "positions." FANUC criticizes this construction as not being specific, but the court will not add precision when the simple language of this claim uses general terms, even if to do so would add specificity. See Liquid Dynamics Corp., 355 F.3d at 1368. Moreover, the court finds that FANUC's construction impermissibly attempts to add limitations to this phrase in the form of references to "joint axes" and "position-emitters," terms which appear in description of the preferred embodiment but should not be imported into this claim. See N. American Container, Inc., 415 F.3d at 1348. The claim requires only generally that the positions of the spraying device and the conveying device be stored, it does not detail exactly how those positions should be calculated.

The parties also debate the meaning of "storing," which Durr suggests construing as "to put . . . into a device capable of retaining the data." FANUC asserts that it should be construed, as before, as "placing and retaining." As the court found above, the court finds that "retaining" is a suitable construction of "storing," but that the additional term "placing" is redundant. n10 Thus, the court will construe "storing" as "retaining." n11 See Digital Biometrics, Inc. v. Identix, Inc. 149 F.3d 1335, 1345 (Fed. Cir. 1998) ("[W]hatever interpretation we assign should encompass both uses because the same word appearing in the same claim should be interpreted consistently."); see generally, Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1119 (Fed. Cir. 2004) ("Unless otherwise compelled, when different claims of a patent use the same language, we give that language the same effect in each claim."); see also Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632 (Fed.Cir. 1987), overruled on other grounds by Cardinal Chemical Co. v. Morton Intern., Inc., 508 U.S. 83, 113 S. Ct. 1967, 124 L. Ed. 2d 1 (1993).

n10 In any event, it does not appear that Durr has any real disagreement as to the use of the word "retaining," inasmuch as it also suggests that the data should be stored on "a device capable of retaining the data." (Am. Joint Claim Construction Chart at 3.)

n11 The court rejects FANUC's proposal to add the phrase "for later retrieval." As Durr suggests, this phrase implies that the data is stored on a device external to the computer. Moreover, the court finds unnecessary this attempt to "preview" what will occur during the repositioning stage.

Finally, the parties disagree on what type of device the data should be stored. FANUC states that the data should be stored on "an electronic storage medium," while Durr contends it should be stored on a "device capable of retaining the data." The court finds both constructions somewhat superfluous as they both essentially require storing data on a storage device, which does little to elucidate the meaning of the phrase. Nonetheless, FANUC's construction is more consistent with the language of the claim inasmuch as it requires storage on an "electronic storage medium," rather than a device merely capable of storing data.

Accordingly, the court's final construction of "storing the positions of the spraying device and the conveying device at the moment of a movement interruption" is "retaining on an electronic storage medium data representative of the spraying device and conveying device locations at the moment of a movement interruption."

5. "storing the positions of the spraying device and the conveying device after movement of the spraying device and conveying device has ended"

Similar to their previous arguments, Durr proposes that this phrase should be construed as "to put data representative of the spraying device and the conveying device locations after movement of the spraying device and conveying device has ended, into a device capable of retaining the data," and FANUC proposes instead that it should mean:

Placing and retaining on an electronic storage medium, for later retrieval in the repositioning step, the following: (1) the
positions of the spraying device's joint axes after their movement due to inertia has ended, as reported by position-emitters; and (2) the position of the conveying device after its movement due to inertia has ended, as reported by a position-emitter.

(Am. Joint Claim Construction Chart at 3.) Having previously construed the majority of terms at issue in this limitation, the court will logically construe this limitation consistent with its previous conclusions. Digital Biometrics, 149 F.3d at 1345. For this reason, the only additional terms which require construction are those referring to the time at which the devices positions are recorded, that is, "after movement [of the devices] has ended."

The difference between the parties' construction of this phrase is slight. Indeed, they both retain the exact language of the claim ("after . . . movement . . . has ended"). The only substantive distinction between their proposals is that FANUC seeks to add a qualifier to explain what caused the movement. Specifically, FANUC argues that the construction should read "after [the devices'] movement due to inertia has ended." (Am. Joint Claim Construction Chart at 3.) Durr's objection to FANUC's proposed construction focuses on those portions which the court has already rejected, and does not offer any specific resistance to the addition of "due to inertia." This proposed language is supported by the specification, which contains numerous references to the movement being caused by inertia. (See '538 Patent at abstract ("the workpiece would inertially overrun"); id at 1:36-37 ("because of their inertia"); id. at 2:39-40 ("continue to move because of their inertia").) This language is also supported by common sense, in that it is inertia which causes any movement after an unscheduled break in the process's operation.

While the court is inclined to adopt FANUC's proposed construction related to inertia, the court nonetheless finds that merely adding the term "due to inertia" to words already found in the limitation is not the best way to construe "after movement [of the devices] has ended." Instead, the court will replace the term "movement" by a phrase that Dr. David Bourne used during the claim construction hearing: "inertial drift." The court finds this phrase more accurately and succinctly describes the "movement" referenced in this limitation, as supported by the citations to the specification noted above.

Accordingly, consistent with its previous constructions and with the intrinsic evidence, the court's final construction is "retaining on an electronic storage medium data representative of the spraying device and conveying device locations after the inertial drift of the spraying device and conveying device has ended."

33. Claim 7 includes the language: storing the text of a plurality of books in a computer. Defendants argue that, in the context of the specification and prosecution history, the language "storing the text" means that such storage is required to be in a bit mapped format. Plaintiff argues that "storing the text" means that the text of two or more books are stored in a computer.

34. The court will first address the meaning of the words in the phrase "storing the text of a plurality of books in a computer." Plaintiff's cite common dictionary definitions of the terms of this phrase and urge the court to adopt those definitions. Defendants do not address the meaning of the specific words in this phrase. Arguably, however, Defendants urge the court to assume that the inventor was his own lexicographer and to consider the prosecution history more significant than the plain language of the claims. Defendants assert that, "in the context of the specification and prosecution history," this phrase requires that storage of the text be in a bit map format despite the fact that the phrase does not directly reference a bit map format. Doc. 69 at 39. The court, however, is bound by the Federal Circuit's holding that in most cases dictionaries will provide proper definitions and usages for claim interpretation, although the specification and prosecution history should be examined. See Inverness Medical, 309 F.3d at 1369.

"Text" is defined as "[t]he words or wording of something written or printed" or "the formal content of a printed work." Webster's II, New Riverside University Dictionary (1988). Plaintiff states that "text" is widely known to be "the main body of a book excluding the front and back matter." Doc. 68 at 23 (citing Webster's New World Dictionary (1979)). "Store" is defined as "to reserve or put away for future use." Websters II, New Riverside University Dictionary (1988). These terms are used repeatedly in Claims 7 and 8. The language of the patent does not suggest that the inventor intended definitions of the words "text" and "store" which differ from dictionary definitions. The court finds that the claims of the '213 patent, its specification, and its prosecution history do not "clearly set forth an explicit definition of the term[s] "text" or "store"
which are] different from [their] ordinary meaning." Texas Digital, 308 F.3d at 1201.

35. Defendants further argue that "computer" has its commonly accepted meaning of one computer comprised of a central processing unit and that the term "computer," as used in Claim 7 does not refer to collections of computers or networks. Defendants take the position that "a computer" is limited to "one computer comprised of a central processing unit, along with applicable memory, storage, and input and output devices." See Doc. 69 at 42. Plaintiff argues to the contrary and points to Figures 1 and 3 of the '213 patent, which figures display multiple computers connected in a network and connected to a central computer via a modem and public telephone network.

Defendants contend that the article "a" suggests a single computer. See Doc. 69 at 42 (citing AbTox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023 (Fed. Cir. 1997) (AbTox)). However, the Federal Circuit in AbTox recognized that "patent claim parol]e also recognizes that an article can carry the meaning of 'one or more.'" 122 F.3d at 1023 (citing North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1575-76 (Fed. Cir. 1993)). Most recently, in Altiris, 318 F.3d at 1373, upon determining whether "a" flag referred to a single flag or one or more flags, the Federal Circuit stated that "a generally means 'one or more' in open-ended claims." Because there were "no statements in the specification or the prosecution history inviting, much less requiring, [the court] limit the claims to the only disclosed embodiment," the Federal Circuit found that "a" referenced one or more flags. This court finds this reasoning of Altiris is applicable to the matter under consideration.

Additionally, there is nothing in the specification or the prosecution history of the '213 patent which suggests disavowal of any broad meaning of the term "computer" which would restrict its meaning to a single or stand alone computer which is not part of a network. This proposition is supported by Figures 1 and 3 which disclose multiple computers connected in a network and connected to a central computer via a modem and the public telephone network. The court finds, therefore, that the term "a" computer as used in the claim is not restricted to a single or one computer.

36. As stated above, Defendants argue that "storing the text a plurality of books in a computer," as stated in Claim 7, clause 2, requires that the text be stored in a bit mapped format, while Plaintiff argues that no format is specified. As also stated above, the plain language of this claim clause does not specify a bit mapped format. In support of their position regarding a bit mapped format, Defendants cite prosecution history including the reference of the inventor's attorney to the advantages of a bit map format system over other formats. In particular, Defendants cite the attorney's arguing to the Examiner that:

[O]ne of the main attributes of the invention of the '213 patent is to store text pages of the books in an "as scanned" format which is an "electronic picture" of the text and/or cover page. The digital data corresponding to the text pages are stored in the computer in this digital format … such that upon printing of these pages, the intellectual integrity of the book text is maintained. In contradistinction, with a program like Interpress, the user of the Interpress program has complete freedom to modify the data, to change it and to update it. If the Interpress language were to be used with the applicant's on-demand book publishing system, authors, publishers, and users of the system would have little or no confidence that the books published by the system would be the same as those intended by the author or the publisher. … For this reason, the Interpress system is highly unlike the Patent Owner's apparatus and method.

Def. Ex. 3 at FH 467-68.

Additionally, the inventor's attorney stated, in response to the Examiner's Action, that "there are major, fundamental differences between the vector-based page description Interpress language and the Patent Owner's system and method in which the text and cover of the books are required to be stored in a bit mapped format." See Def. Ex. 9.

Plaintiff acknowledges that On Demand did make arguments to the Examiner regarding the advantages of bit mapped files in regard to other claims that expressly stated the files were stored in the computer in a bit mapped format. Plaintiff argues, however, that these arguments did not apply to the claim terms of Claims 7 and 8, but rather to claims which expressly stated that files were stored in a bit mapped format. See Doc. 68 at 24. The court notes that Claims 1 and 6, which claims were disallowed, specifically mentioned a bit mapped format, and disallowed Claims 2 and 3 were dependent claims which incorporated Claim 1. Claim 7 references bit mapping in clause 3, in regard to storing a plurality of book covers, but does not reference bit mapping in clause 2, in regard to storing the text of a plurality of books.

The court further notes that upon reexamination, the Examiner stated that, with regard to Claim 1, Interpress, the alleged
invalidating prior art, discloses "the storage of bit-mapped images." Joint Ex. 1 at FH 533. The Examiner further stated that, with regard to Claim 5, this claim "has no limitations to storage of information in a bit-mapped format," and that, with regard to Claim 6, "Interpress discloses all the claim requirements for the same reasons discussed above with regard to claim I." Id. The Examiner further stated:

The comments in the request and the preliminary amendment have been considered and are deemed answered in the above rejection. It is further noted that patent owner's comments regarding the storage of information in bit mapped form have been considered. It is submitted that despite the discussion appearing at pages 6 and 7 of Interpress, the discussion at pages 240-243 and all of Chapter 6 clearly indicates the storing of text and graphics in bit mapped form in the system of Interpress.

Joint Ex. 1 at FH 555.

Significantly, the Examiner stated in his action, mailed September 18, 1998, in regard to comparing Claim 7 to prior art XPS, that "there is no disclosure [in XPS] of storing cover information in bit mapped format nor the storing of any sales information as described in the patent." Joint Ex. 1 at FH 556. The Examiner further stated that, in regard to comparing Claim 8 to prior art XPS, that "there is no disclosure [in XPS] of storing cover graphical information nor any feature of allowing a user to visually review the sales information." Joint Ex. 1 at FH 556. Likewise, in regard to comparing Claim 7 with the Gauronski patent, the Examiner stated that "there is no disclosure [in Gauronski] of storing cover information in bit mapped format." Joint Ex. 1 at FH 558. In agreement with Plaintiff, the court finds that these statements establish that the Examiner considered that Claim 7 expressly required covers to be stored in a bit mapped format and that text was not required to be stored in a bit mapped format. Even if statements made during prosecution of the '213 patent indicate that an embodiment of the invention could encompass a bit mapped format, the court cannot limit the scope of the invention to that bit mapped format [absent a clear disclaimer] of other formats. Brookhill-Wilk, 326 F.3d at 1223. Because claim language does not refer to storing the text in a bit mapped format, statements made during prosecution history cannot impose such a limitation. See Storage Technologies, 329 F.3d at 831.

Defendants also direct the court's attention to the specification, Column 11, lines 15-17, which state that "the book format include[s] the actual contents of the book including its cover and the body of the book which may consist of stored graphical images of the cover and the text pages of the book stored in a bit mapped or raster image format." (emphasis added). The court finds that because this reference uses the word "may," not shall, the reference does not limit the storage of books to a bit mapped format. Proper claim construction does not require that this limitation be read into the claim. See Storage Tech., 329 F.3d at 831.

The court finds that the prosecution history and the specification of the '213 patent do not evidence that Plaintiff surrendered the broad meaning of the term "storing the text of a plurality of books in a computer" so as to require that the text files for books be stored in a bit mapped format.

21. Storing the unified media data streams in a general register file

The plaintiff submits that "storing the unified media data streams in a general register file" means "storing the unified media data streams in a set of registers, which may be addressed by their number in the set, in which the registers can be used for various purposes." The defendants assert that the disputed phrase means "storing the unified media data streams in a set of hardware storage locations that are available to the user/programmer for a wide variety of functions." Primarily at issue is whether "a general register file" must be available for a "wide variety" of functions.

The plaintiff contends that the "general register file" need not be available for a wide variety of functions, but must be available for "different" or "various" purposes. The plaintiff asserts that its proposed construction is supported by the specifications of the 060 and 840 patents and that its construction would be understood by one ordinarily skilled in the art. According to the plaintiff, the patent specifications only require that the registers not be dedicated or specific purpose registers. The defendants, on the other hand, contend that the media processor patents use the term "general register file" consistent with its ordinary meaning, which requires that the register file be available for "a wide variety of functions." After
considering the submissions of counsel, the court construes "storing the unified media data streams in a general register file" to mean "storing the unified media data streams in a set of hardware storage locations that are available to the user/programmer for various purposes."

2. Stream of data

The Court's Construction: A stream of raw bytes or words with no used marking or framing for sending included by the application program. Markman Tr. 11:12-14.

This construction was taken directly from the prosecution history. In distinguishing between this patent and prior art, the prosecution history states:

The Miller invention [(prior art)] sends a data file as a stream of frames, responds to ACK's and NAK's of frames/blocks received, and may only send entire intact FRAMES to the client. Thus the Miller invention may only restart a terminated download at the boundaries of frames/blocks, not at any point between these boundaries as is true with the present invention. Claim 47 n5 specifically excludes Miller's stream of a file of frames, and specifically emphasizes that the resumption of the terminated transfer starts at any point within the data file, exclusive of the start of file and end of file, regardless of the presence of spurious markers, frame boundaries, and other boundaries that may occur within the data file. These limitations are included to specifically distinguish the Wanderscheid/Miller combination. . . . In effect the "stream of data" is now specifically defined as a stream of raw bytes or words with no used marking or framing for sending included by the application program.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

n5 Claim 47 of the '892 patent ultimately issued as claim 1 of the '709 patent. Pl. Br. at 18.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Ethos argued that the Court's construction was incorrect only as to the use of the word "used," which Ethos asserted was a typo in the prosecution history and that "user" should replace the word "used." Markman Tr. 11:20-23; 12:13-16. The Court had no evidence suggesting that this was, in fact, a typo.

RealNetworks argued for "stream of data" to be construed as "[a] sequence of generally undifferentiated bytes transferred with little or no formatting or processing, which can include a plurality of markers or frames." Def. Rep. at 6. RealNetworks relied in part on a sentence in the 11/99 Advisory Action in the paragraph preceding the quoted language above, which states: "The Examiner has rightly interpreted the 'stream of data' as a file that may contain a plurality of frames." Def. Br. at 9 (quoting 11/99 Action at 9); Markman Tr. 14:2-16. At the same time, however, RealNetworks challenged the Court's reliance on a subsequent passage in the same document, expressing doubt that a patent applicant can be his own lexicographer "in a prosecution history setting as opposed to the specification." Markman Tr. 13:22-25.

Although the prosecution history is less useful for claim construction than the specification, the prosecution history can "often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution." Phillips, 415 F.3d at 1317; Vitronics, 90 F.3d at 1582-83. The language relied on by the Court, though it purports to define "stream of data," actually limits the scope of that term so as to disclaim interpretations that would encroach on prior art. See Chimie v. PPG Industries, Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005) (explaining that "[t]he purpose of consulting the prosecution history in construing a claim is to exclude any interpretation that was disclaimed during prosecution" (quotation marks omitted)). The phrase relied on in the prosecution history by RealNetworks does not disclaim or limit the scope of the invention and, in fact, appears to broaden its scope, with the use of the permissive auxiliary verb "may."
13. "STREAM(S) OF ADDRESSED DIGITAL PACKETS"

AOL: "Continuous sequence of self-contained bundles of digital data, each including a destination address"

TWM: No construction required.

In the alternative, "A continuous sequence of bundles of digital data, including destination address information."

At the hearing, the parties agreed that the Court should adopt AOL's proposed construction with two alterations. Thus, the Court construes this claim as follows: "Continuous sequence of bundles of digital data, including a destination address."

---

a. "strip[e]-shaped phosphors"

Each of the asserted independent claims of the '590 patent require "stripe" or "strip-shaped" phosphors. See '590 Patent, cls. 1, 9, 10, & 11. The issue regarding this term is whether the bands of phosphors are necessarily a solid line. The '590 patent's claim of "stripe-shaped phosphor" is directed to the patent's disclosure of multiple columns of phosphors, where each column is entirely one color and arranged such that a stripe-pattern is formed. In its attempt at limiting the term to a solid line, LG cites the patentee's alleged attempt at limiting the phosphors to a "continuous" line. See id. at col. 5, ll. 31-32; col. 6, ll. 49-59. As indicated by LG, the seemingly limiting statement is prefaced by the phrase, "present invention." As argued, "when a patent uses the term 'present invention' to describe a disclosed feature, the specification ordinarily limits the scope of the invention." Defs.' Claim Construction Brief at A-8 (citing Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1308 (Fed. Cir. 2007)). The analysis regarding the patentee's use of "present invention," however, is not conclusive. Verizon instructs that, "[w]hen a patent thus describes the features of the 'present invention' as a whole, this description limits the scope of the invention." Verizon Servs. Corp., 503 F.3d at 1308 (emphasis added). The cited portion, while discussing a continuous layer, does so in the context of a specific embodiment. See '590 Patent, col. 5, ll. 32-33. Notwithstanding LG's argument, the court is unwilling to limit the term to an undivided line. While the patentee uses "continuous" in a number of instances in the patent, there is no disavowal of a divided line.

As such, the court defines "strip[e]-shaped phosphors" as "long, narrow bands of phosphor."

---

A. Stripline Sections, Stripline Segments and Stripline Elements

The parties first dispute the meaning of the term "stripline." "When consulting the specification to clarify the meaning of claim terms, courts must take care not to import limitations into the claims from the specification." Abbott Labs. v. Sandoz, Inc., 566 F.3d 1282, 1288 (Fed. Cir. 2009). Thus, "the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Liebel-Flarsheim Co. v. Medrad, 358 F.3d 898, 906 (Fed. Cir. 2004) (quotation omitted). This is especially true when the claim uses the word "comprising," which the Federal Circuit has consistently held to be an "open" transition phrase that means the claim's "scope may cover devices that employ additional, unrecited elements." AFG Indus., Inc. v. Cardinal IG Co., Inc., 239 F.3d 1239, 1244-45 (Fed. Cir. 2001), cert. denied, 552 U.S. 1141, 128 S. Ct. 1072, 169 L. Ed. 2d 808 (2008).

RYMSA contends that a stripline is not just any shape, rather, it is a flat. RYMSA's proposed construction of stripline is "a flat conductive strip for transmitting electric signals." This, RYMSA argues, is clearly demonstrated in the plan view shown in Figure 2 of the '130 Patent and the cross-section view of the exemplary embodiment shown in Figure 3. (Defs.' Claim
In Liebel-Flarsheim, the Federal Circuit held that "[a]lthough all the embodiments described in the common specification of the '669 and '261 patents include a pressure jacket, the written description does not contain a clear disavowal of embodiments lacking a pressure jacket." Id. at 908. Similarly, in the instant case, although Figure 3 of the '130 Patent shows a flat stripline section, that does not mean that every embodiment must be flat. (See '130 Patent, Fig. 3.) Moreover, Figure 3 was not intended to depict the structure of the stripline, but rather, to "explain the exemplary non-limiting capacitive coupling of the phase shift segment and of the center tap." (Id., Col. 3, ll. 55-58.) The specification further states that Figure 3 shows "that the stripline segments are likewise located at the same distance as the center tap from the reflective plate." (Id., Col. 4, ll. 60-65.) The figure's purpose is not to depict that the stripline sections are flat, and there is no disavowal of non-flat striplines. (Id.) Lastly, the plan view of the embodiment depicted in Figure 2 does not depict a flat stripline because it is not a cross-sectional view. (See '130 Patent, Fig. 2.) Neither the claims nor the specification indicate that the stripline must be flat.

Although RYMSA attempts to bolster its argument with extrinsic evidence, i.e., the declaration of its expert and prior art patents (Defs.' Claim Construction Br. 10), in this case, the Court is not persuaded by such extrinsic evidence because the Court is able to determine the meaning of the claim term from the intrinsic evidence. Further, because defendant's extrinsic evidence that the stripline sections must be flat diverges from the intrinsic evidence, such extrinsic evidence is not a reliable interpretation when considered in the context of the intrinsic evidence. See Phillips, 415 F.3d at 1318 ("[A] court should discount any expert testimony that is clearly at odds with the claim construction mandated by the claims themselves, the written description, and the prosecution history, in other words, with the written record of the patent."). Because the intrinsic evidence is generally controlling, the limitation of "flat" should not appear in the definition of stripline.

Addressing another aspect of the definition, RYMSA argues that the definition of a "stripline sections" is "devices, each comprising all or a portion of a flat conductive strip for transmitting electrical signals." RYMSA argues that because section and segment are used interchangeably, they should have the same ordinary meaning, i.e., all or a portion of an item. (Defs.' Claim Construction Br. 15.) The Court agrees. (See id., Ex. 2, June 4, 2008 Translation of German Patent Application No. 199 38 862.9-35 ("Ex. 2") at 43; see also '130 Patent, Col. 4, ll. 4-12.) However, the ordinary and customary meaning of the word "section" and "segment" is a portion of a larger whole, not "all or a portion." A reading of the claims and the specification clearly shows that the stripline sections or segments are part of the radio-frequency phase shift assembly. (See '130 Patent, Col. 5, ll. 61-67; id., Col. 6, ll. 1-19; id., Col. 4, ll. 4-12; see Defs.' Claim Construction Br., Ex. 2, at 43.) The Court finds that RYMSA's addition of the extraneous term "devices" does little or nothing to define the terms. The Court construes the term "stripline sections" and "stripline segments" to mean conductive strips that are a portion of the radio-frequency phase shift assembly that transmit electrical signals.

Lastly, RYMSA argues that the term "stripline elements" should be construed differently than "stripline section" and "stripline segment." "The doctrine of claim differentiation stems from the common sense notion that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope." Seachange Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1368 (Fed. Cir. 2005) (quotation omitted). "However, the doctrine only creates a presumption that each claim in a patent has a different scope; it is not a hard and fast rule of construction." Id. The doctrine "can not broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence. . . . [C]laims that are written in different words may ultimately cover substantially the same subject matter." Multiform Desicants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998).

In Pickholtz v. Rainbow Technologies, Inc., 284 F.3d 1365, 1373 (Fed. Cir. 2002), where the accused infringer argued that the patent's use of the terms "computer system" and "computer" showed that the term "computer system" should be given a broader construction, the Court stated that, although it typically would be "inclined to give meaning to word 'system,' rather than regard it as surplusage, the patent . . . provide[d] no indication that the two terms mean different things." Further, the Pickholtz court held that because the patent applicant did not attempt to distinguish "computer system" from "computer" when amending the claims to be allowed over prior art, the prosecution history did not necessitate a different result.

Likewise, in the instant case, the '130 Patent provides no indication that the "stripline elements," "stripline sections" and "stripline segments" mean different things. (Compare '130 Patent, Claim 1, Col. 5, ll. 61-67 & Col. 6, ll. 1-19, with id., Claim 22, Col. 7, ll. 38-41 & Col. 8, ll. 1-6, and id., Claim 23, Col. 8, ll. 23-25.) RYMSA notes that the term "stripline elements" only appears in Claim 22 and dependant Claim 23, which were added during the prosecution of the patent.
application. (Defs.' Ex. 3, March 30, 2004 Amended Patent Application, at 263-64.) However, the prosecution history of the '130 Patent does not indicate that Kathrein sought to distinguish "stripline elements" from the stripline sections or stripline segments in contrasting the claims from prior art. (SeeDefs.' Ex. 3, March 30, 2004 Amended Patent Application, at 263-64.) RYMSA merely presumes that Kathrein's use of the broader nature of the term "elements" in Claims 22 and 23 shows that it sought to obtain broader claim coverage. (Id.) However, RYMSA has not persuaded the Court that the term has a different meaning than "stripline section" or "stripline segment" because the meaning of the term "element" is necessarily dependant on the particular structural device that modifies or describes that particular "element." Having reviewed the intrinsic record, it is clear that Kathrein obstinately insists on using three different terms to mean the same thing. The Court agrees with Kathrein that "stripline elements" should be construed the same as "stripline sections" and "stripline segments" because the intrinsic evidence does not draw any distinction between these terms. (See '130 Patent, Claim 1, Col. 5, ll. 61-67 & Col. 6, ll. 1-19; id., Claim 22, Col. 7, ll. 38-41 & Col. 8, ll. 1-6; id., Claim 23, Col. 8, ll. 23-25; see also Pl.'s Claim Construction Br. 15.) Thus, the Court rejects RYMSA's proffered construction of "stripline elements" as "one or an associated pair." In sum, the Court construes the terms "stripline sections," "stripline segments" and "stripline elements" to mean conductive strips that are a portion of the radio-frequency phase shift assembly that transmit electrical signals.

"Stripping The Forwarding Protocol"

Cisco's proposed construction for the above term is "removing the layer 2 forwarding protocol information." Alcatel's proposed construction is "removing the layer 2 forwarding protocol header from the packet at the local network."

Both parties agree that the term "stripping" means "removing." The dispute lies in whether the construction should identify the location where the removing takes place, and identify exactly what is being removed. Alcatel is correct that the point at which the removing occurs is at the local network. Both claim 9 (the only claim in which the above term appears) and Figure 7 (the only embodiment of above function) reveal that the stripping occurs after the frames reach the local network. See Valencia, at 5:67-6:4, 16:9-21, Fig. 7. However, Alcatel is incorrect in requiring a construction specifically identifying the layer 2 forwarding protocol header as the item being removed when the forwarding protocol is being stripped. Certainly, if all of the layer 2 forwarding protocol information is contained in the header, the header will be removed. Nevertheless, even Alcatel admits that there is no requirement that the header be the only item removed. See Alcatel's '019 Responsive Brief, at 10. Since both parties acknowledge that parts of the packet other than the header may be removed during stripping, then there is no reason to cause confusion and impose a limitation in the construction that requires the header to be removed. That notwithstanding, both parties do agree that stripping requires the removal of information related to the layer 2 forwarding protocol.

Thus, the Court construes the term "stripping the forwarding protocol" as "removing the layer 2 forwarding protocol information at the local network."

4. "being structured"

Disputed Term the technical database being structured to enable a plurality of access modes comprising name of publication, key word, and identified profile with migration capability between related records

Plaintiff's Construction no construction needed due to plain meaning, but if construed, the proposed construction is "set up or arranged"

Defendant's Construction being organized or arranged, in a manner other than a one-dimensional database approach, which allows the same place to be reached through different methods

The parties dispute the term "being structured" as it appears in the following sentence: "A system to provide information to
maintain and repair equipment or provide services, comprising a program running on a computer to enable knowledge-based access to, and management of, a technical database comprising electronically stored publications which are displayable, the technical database being structured to enable a plurality of access modes..." ('806 Patent at 83:32-37.) Plaintiff contends that the "being structured" needs no construction because in context, the term means simply that the database (which stores the aircraft technical information) must be set up in a manner that allows information to be accessible from a variety of "modes." The Court concurs with this construction. As illustrated by the preferred embodiment, the system discloses various modes that can be selected by the user to facilitate his or her search of the database. Among others, there is "an aircraft specific mode," which allows the user to search the database based on the particular make, model and serial number of the aircraft. (Id. at 2:45-49.) Another is the "bookshelf mode," which allows access to information based on the subject and title of the publication. (Id. at 3:5-7.) Thus, it is evident the "being structured" means that the database must be set up in a fashion which enables it to provide the user with access to information based on the type of query or mode being used.

Defendant argues that "being structured" means "being organized or arranged, in a manner other than a one-dimensional database approach, which allows the same place to be reached through different methods." (Jt. Stmt. at 16.) There is nothing in the claim or patent specification to support this assertion. Instead, Defendant again relies on the statement of Plaintiff's expert Mr. Sandifer in his expert report submitted during the reexamination process. In his report, Mr. Sandifer opined that certain prior art was distinguishable because it "appears to manage all its data using a one-dimensional database approach..." (Lavorgna Decl. Ex. 19 at 25.) However, there is nothing in the claim language or specification to support the notion that Plaintiff intended to limit "being structured" to the use of a one-dimensional database. See Linear Tech. Corp. v. Int'l Trade Com'n, 566 F.3d 1049, 1058 (Fed. Cir. 2009) (statements made during patent prosecution insufficient to establish a "clear and unmistakable" intent to limit scope of a claim in a manner different from the claim language). In sum, the Court concludes that the claim term "being structured" means "set up or arranged."

i. Dependent Claim 4

Section 112 of the patent laws requires, among other things, that the "specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P 2. If one of ordinary skill in the art at the time of the patent application would not understand the limitations of a claim, the claim fails to meet this requirement and is "indefinite." E.g., Howmedica Osteonics Corp. v. Tranquil Prospects, Ltd., 401 F.3d 1367, 1371 (Fed. Cir. 2005). Whether a claim is indefinite is a question of law for the Court. Id.

Claim 4 depends from Claim 1 and reads as follows:

4. A system as recited in Claim 1 wherein said remote server assembly is structured internal site and identify an internal site address of said compact, portable and interchangeable computer readable medium relative to said local processor assembly.

Citrix contends, and Rothschild concedes, that the italicized portion of this claim is indecipherable and would have no meaning to one of skill in the art. Further, it is undisputed that the highlighted language in the foregoing quote is a typographical error which was made by the United States Patent and Trademark Office.

Rothschild introduced into evidence a certified copy of the application filed with the USPTO. The application reflects that Claim 4 provides: "A system as recited in claim 1 wherein said remote server assembly is structured to search for and identify an internal site address of said compact, portable and interchangeable computer readable medium relative to said local processor assembly."

Citrix argues that Rothschild should have filed a certificate of correction with the USPTO. Further, that in the absence of such a certificate, the claim is invalid for indefiniteness, and that the Court is without power to rewrite the claim in accordance with the obvious administrative error made by the USPTO. The Court rejects Citrix's argument.

The district court stated that it was powerless to correct the error. We do not agree that such correction exceeds the
judicial power. Absent evidence of culpability or intent to deceive by delaying formal correction, a patent should not be invalidated based on an obvious administrative error. The defendants did not state that they were prejudiced, or even confused, by the error. The district court held that it has no authority to correct or ignore even a typographical error in a patent. That is inaccurate. When a harmless error in a patent is not subject to reasonable debate, it can be corrected by the court, as for other legal documents. See Novo Indus., L.P. v. Micro Molds Corp., 350 F.3d 1348, 1356-57 (Fed. Cir. 2003). Here the error was apparent from the face of the patent, and that view is not contradicted by the prosecution history. We conclude that claim 22 was improperly invalidated.

Hoffer v. Microsoft Corp., 405 F.3d 1326, 1331 (Fed. Cir. 2005).

Here, as in Hoffer, "the error was apparent from the face of the patent, and that view is not contradicted by the prosecution history." Most importantly, the specification of the '534 patent makes clear both the error and what was intended.

In accordance with the previously recited security measures, the interface system 11 preferably includes a specific applet or "cookie" structured to direct the remote server assembly 50 to specifically look for and identify the internal site address of the compact, portable, interchangeable computer readable medium 36 relative to the local processor assembly 25', so that the auxiliary site addresses thereon can be searched.

The applet or cookie of the present invention directs the remote server assembly 50 to only look for and identify the internal site address of the interchangeable computer readable medium . . . .

'534 Patent at 15:3-10, 15:14-17.

The Court, taking all factors into account (including the case law cited by Citrix) finds that even with the typographical error, the construction proposed by Rothschild is consistent with the language of the '534 Patent. Thus, Claim 4 is construed to mean: the remote server assembly can identify where on the local processor assembly the compact, portable and interchangeable computer readable medium is found.

E. "Structured Store of Data"

Finally, the parties disagree as to the meaning of the phrase "structured store of data," as used in the '229 patent. See, e.g., '229 patent at 28:24. Specifically, they disagree as to whether the referenced data must reside exclusively in persistent storage. Oracle asserts that it must, while Mangosoft says storage of the structured data need not be limited to persistent (i.e., non-volatile) devices.

The claims of the '229 patent do not make clear whether the referenced structured store of data may be (or must be) located in any particular form of memory. In support of its view that such data must reside exclusively in non-volatile storage, Oracle points out that the specification repeatedly describes the structured store of data as being "persistent data." See, e.g., '229 patent at 3:19-22 ("The invention can be understood as structured storage systems, and related methods, that employ a globally addressable unstructured memory system to maintain a structured store of persistent data within a shared memory space."). Consequently, says Oracle, if the data themselves are "persistent," they must necessarily reside on a persistent (nonvolatile) storage medium. And, according to Oracle, by repeatedly stating throughout the specification that the data are "persistent," the patentees have (albeit implicitly) defined the phrase "structured store of data" to mean data which are stored on a persistent memory device. See, e.g., Bell Atl. Network Servs., Inc. v. Covad Communs. Group, Inc., 262 F.3d 1258, 1277 (Fed. Cir. 2001) ("The written description provides guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format. Because the patentees used the [disputed] term throughout the entire patent specification, consistent with a single meaning, they defined that term by implication.") (citations and internal punctuation omitted). See also SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1344 (Fed. Cir. 2001) ("While it is true, of course, that the claims define the scope of the right to exclude and that the claim construction inquiry, therefore, begins and ends in all cases with the actual words of the claim, the written description can provide guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format.") (citations and
The court is not persuaded that the "structured store of data" as referenced in the '229 patent's claims must, as a matter of construction or of necessity, reside in persistent storage. Claim 1 of the '229 patent teaches a "method for providing distributed control over a structured store of data" among all nodes of a cluster participating in the addressable shared memory space system. That system, as described above, includes the use of (and storage of data on) both persistent and volatile memory devices, which are shared and accessible by all participating nodes. See '229 patent at 28:32-37. Nothing in the claim language suggests that, unlike other forms of data (which may be stored in persistent memory, volatile memory, or both), the "structured store of data" is somehow unique and must, instead, reside exclusively in persistent storage. In fact, the entire purpose of the '229 patent would be defeated if such data were restricted exclusively to persistent storage.

The references in the specification to "persistent data" (rather than "persistent storage" or "persistent memory") simply suggest that the system is designed, and the data organized, in such a way that should one or even all of the participating nodes lose data stored in volatile memory, the "structured store of data" is still "persistent" and can be recovered (by, presumably, collecting and compiling the various redundant portions of it that were distributed to the non-volatile memory of the participating nodes). In other words, the "persistent data" are stored in the various volatile and non-volatile memory devices attached to participating nodes in such a way that even if all data are lost from volatile memory, they can be reconstructed from the various portions that were stored on non-volatile memory devices (there is, of course, no requirement that the data not be duplicated - in fact, it is possible that a particular piece of datum could be stored in multiple locations: in the RAM of one node, on the hard drive of another node, and again in the RAM of a third node). In short, the court is not persuaded by Oracle's assertion that by referencing the structured store of data as "persistent data," the patentees have limited the scope of the patent's claims to require that such data reside exclusively on non-volatile forms of storage media.

Accordingly, the court construes the phrase "structured store of data" to mean data that are organized in some recognized fashion (e.g., database files, word processing document files, or Web pages) and stored in the volatile and/or non-volatile memory of the various nodes participating in the shared memory system.

The parties' dispute regarding this limitation focuses on the word "access." Under the language of the claim, the local processor assembly must "access" the claimed primary site address (which contains primary site data stored on the remote server assembly) so as to achieve the claimed coupling between the local processor assembly and the remote server assembly. Rothschild proposes that to access something is to "communicate" with it. Citrix contends that the ordinary meaning of "access" to one of ordinary skill in the art is "to locate, gain entry to, and use."

Despite this disagreement it is noted that the experts for both parties agree that a person skilled in the art would interpret access to mean to either read or write. See Docket No. 49 at 10. Therefore, the definition of "access" proposed by Citrix is unreasonably limiting and, if adopted, would ascribe a meaning inconsistent with the term's ordinary meaning. Citrix also suggests that the phrase should be interpreted to mean that the local processor assembly creates the coupling between it and the remote server assembly. The '534 Patent does not state that the local processor assembly creates the coupling between it and the remote server assembly. In fact, the parties agree that it is the remote server assembly which initiates the utilization of data on the local processor assembly. The Court finds Citrix's definition to be inconsistent with the parties' agreement as well as the language of the '534 Patent.

Based on the foregoing analysis, the Court construes "said local processor assembly being structured to access said primary site address so as to achieve said data transmitting and receiving communication with said remote server assembly" to mean: the local processor assembly can communicate with the primary site address of the remote server assembly in a manner that permits the transmission and receipt of data.
Like the previous disputed term, the parties' dispute regarding this limitation also focuses on the term "access." Citrix proposes that the disputed term be construed as "the remote server assembly can locate, gain entry to, and use the remotely accessible site addresses to cause the select portions of auxiliary site data to be displayed by the local processor assembly in combination with the primary site data." Rothschild contends that the term is properly construed as "the auxiliary site address is capable of being remotely interacted with by the remote server assembly so as to cause the use of select portions of said quantity of auxiliary site data by said local processor assembly at the direction of, intermingled with, or otherwise with some of the primary site data."

There is no dispute between the parties that it is the remote server assembly which manipulates data on the local processor assembly in order to initiate access to data located on the local processor assembly. In addition, Citrix's proposed interpretation of "utilization" is inconsistent with the language of the '534 Patent and with the common, ordinary meaning of the term.

Therefore, the Court construes "said remotely accessible auxiliary site addresses being structured to be remotely accessed by said remote server assembly so as to initiate utilization of said select portions of auxiliary site data by said local processor assembly in conjunction with said primary site data" to mean: the auxiliary site address is capable of being remotely interacted with by the remote server assembly so as to cause the use of select portions of said quantity of auxiliary site data by said local processor assembly at the direction of, intermingled with, or otherwise with some of the primary site data.

ii. Dependent Claim 6

Claim 6 depends from Claim 1 and reads as follows:

6. A system as recited in Claim 1 wherein said compact, portable and interchangeable readable medium is structured to identify an internal site address thereof relative to said local processor assembly, thereby facilitating access thereto by said remote server assembly.

Rothschild contends that the boldface language in Claim 6 should be construed to mean: "[t]he remote server assembly can identify where on the local processor assembly the compact, portable and interchangeable computer readable medium is found so that it can interact with it." Rothschild points to the language of the claim which, it argues, supports the notion that the computer readable medium identifies its internal site address so that the remote server assembly can access the data contained on such medium.

Citrix argues that by its plain language, Claim 6 requires that the compact, portable and interchangeable readable medium be able to identify its location in the local processor assembly (i.e., its "internal site address") to the remote server assembly. Accordingly, Citrix urges the Court to construe Claim 6 to require that the compact, portable and interchangeable readable medium be "put together so as to identify to the remote server assembly the compact, portable and interchangeable computer readable medium's site address within the local processor assembly."

However, as established above, there is no dispute that the remote server assembly initiates the utilization of the auxiliary site data located on the local processor assembly. Therefore, it follows that the remote server assembly also identifies where on the local processor assembly the compact, portable and interchangeable computer readable medium is located, as suggested by Rothschild.
Thus Claim 6 is construed to mean: the remote server assembly can identify where on the local processor assembly the compact, portable and interchangeable computer readable medium is found so that it can interact with it.

A. "student task"

The term "student task" is used throughout independent claim 1. To illustrate, some of the limitations of claim 1 are "a central computer . . . for running individual classroom programs . . . which accept sequences of input associated with student tasks," "a plurality of student terminals . . . for receiving said student tasks from said central computer, for executing said student tasks." The plaintiff's proposed construction is "information representative of instructional activities." The defendants' proposed construction is "instructional activities."

The '491 patent's Summary of the Invention describes "student tasks" as "one or a combination of questions, quizzes, tests, . . . , and other instructional activities." ('491 patent, 4:43-47) (emphasis added). But elsewhere in the specification, according to the plaintiff, the patent explains that a "student task' is "[i]nformation representative of the highlighted question (or program or other instructional activity) [that] is sent in its appropriate respective form to student terminals . . . ." ('491 patent, 17:14-17) (emphasis added). The defendants argue that the preceding passage is not related to student tasks. The defendants point out that claim 1 includes an "activation means" which allows "the teacher to initiate and terminate said student tasks." According to the defendants, this claim language supports their proposed construction, i.e., teachers "initiate and terminate said instructional activities." In contrast, the defendants assert that this claim does not make sense using Better Education's construction, i.e., "initiate and terminate said information representative of instructional activities."

Based primarily upon the "initiate and terminate" limitation of claim 1, the court is persuaded that the defendants' proposed construction is correct. Therefore, the court construes "student tasks" to mean "instructional activities."

This term is used in Claim 1 of the '742 patent: "one of said layers comprising plural substantially parallel sub-layers. . . . each of said sub-layers having three-dimensional inclusions. . . ." Seoul argues that "sub-layer" should be construed as "a portion of a layer," while Nichia suggests "a distinguishable portion of a layer constituted of the same material as the layer." Figures 9 and 10 of the specification illustrate sub-layers. Each is distinguishable as a thin layer of InAs that separates the GaAs sub-layers containing InAs inclusions. The sub-layers are made of the same material as the other sub-layers and thus the overall layer, except that the inclusions are also part of the sub-layer. Thus, to require the entire sub-layer to be made of exactly the same material as the layer is inaccurate. Moreover, graded junction materials also exist in the scientific literature. See e.g. C.K. Peng, S. Sinha, and H. Morkoc, Characterization of graded interface In[x] Ga[1-x]/ In[0.52]Al[0.48]As (0.53 <x<0.70) structures grown by molecular beam epitaxy, 62 J. Appl. Phys. 2880 (1987); H. X. Jiang, Band Structure of Superlattice with Graded Interfaces, 61 J. Appl. Phys 624 (1987). The composition of graded materials varies, such that no two horizontal cross sections contain the same composition or bandgap.

In support of its position that the sub-layer be made of the same material as the layer, Defendant cites Col 4, l. 36-39 of the specification which states: "In particular, the confining layers 3 and 5 may each be constituted by several layers of the same material but with different doping concentrations" for the proposition that each sub-layer must be made from the same material. Tr. at p. 120, l. 20 - p. 121, l. 13. The specification used the word "may," which does not create a firm requirement.

The prosecution history further refutes the requirement that all sub-layers must be made of the same material. During prosecution, the patentee combined Claims 1 and 2 to create current Claim 1. The applicants amended the claims by incorporating the concept of "several substantially parallel planes [of inclusions]" in claim 1 as "plural substantially parallel sub-layers having . . . inclusions." See Pl. Br., Doc. # 53, Ex. 5 (Prosecution File History), Response to First Office Action at
2-3. The patentee and the examiner understood that different materials, namely a plane of inclusions, would be within each sub-layer. Nothing in the specification or prosecution suggests that the patentee acted as his own lexicographer to require the sub-layer to be made of exactly the same material as the rest of the layer.

Therefore, the court will construe the term as follows:

"sub-layer" means "a distinguishable thickness of material in a layer"

GO BACK

"sub-channel number" & "subchannel"

Sutton suggests that "sub-channel number" means "a value representing a service type or information path" and "subchannel" means "a service type or information path." Nokia urges that both terms should be defined as "one of the 256 addressable subdivisions of a receiver identification address." The central issues are whether a "subchannel" is limited to 256 subdivisions and whether the terms should be defined broadly as a "service type or information path" or more specifically as a "receiver identification address." The parties do not dispute that the term "number" used in claim 1 should have its ordinary meaning. Thus, the true term in dispute is "subchannel," and the term "subchannel number" as a whole does not necessitate a separate construction.

"Subchannel" is limited to 256 subchannels (0-255) in several locations within the patent. The specification explains that "[i]f a RIC channel is enabled to receive Data Messages, each message is assigned to one of the 256 subchannels within each logical channel." '238 Patent at 9:13-15. The specification further notes within the section entitled "summary of the invention" that the invention enables "accept[ing] or reject[ing] data information messages specified for a specific subchannel (0-255) for which the receiver respectively is or is not currently authorized to accept . . . ." Id. at 3:62-65. At times, the range of subchannels is described differently, but the number of subchannel subdivisions consistently remains at 256. See id. at 4:26-29 ("the targeting of encoded or unencoded data packets to subsidiary addresses (1-256) at each network destination receiver identification code (RIC) address"). These are merely examples. As Nokia observes, the patent restricts the number of subchannel subdivisions to 256 in fifteen different locations. In fact, the preamble to claim 3 itself restricts the term "subchannel" to 256 divisions. Id. at 15:11-13 ("as well as being able to accept or reject data information messages specified for a specific subchannel (0-255)").

As discussed above, the preamble acts as a limitation on the claims themselves, furthermore the specification clearly discusses a "subchannel" as having a range of 256 logical subdivisions. Sutton fails to identify any language either within the specification or the claims that suggest that a "subchannel" has a broader range. Additionally, the number of identifiable subdivisions that can logically be transmitted or received by an 8-bit byte is 256. Since the invention only pertains to transmitting and receiving 8-bit byte messages, limiting a subchannel to 256 subdivisions conforms with the context of the patent as a whole.

The specification further teaches that a "subchannel" pertains to subsidiary addresses recognized by a receiver. Id. at 3:62-65 ("data information messages specified for a specific subchannel (0-255) for which the receiver respectively is or is not currently authorized to accept . . . .") (emphasis added). The inventor explains that each "network destination" recognizes a "subchannel" or "subchannel number" as being an "address" corresponding to a particular "receiver identification code." Id. at 4:26-29. Again, Sutton provides no intrinsic or extrinsic evidence that supports defining a subchannel as a "service type or information path." While, generally, a "receiver identification address" may be a type of "information path," the inventor clearly uses the more specific definition when describing a "subchannel" for the purposes of the invention. Accordingly, "subchannel" is defined as "one of the 256 addressable subdivisions of a receiver identification address."

GO BACK

6. sub-harmonic signal
a signal at a frequency that is a common denominator of the frequency of the first clock signal and the second clock signal.

This term is defined in the following specification language as well as figures 1, 10, and 11 of the patent.

The sub-harmonic signal is selected to have a frequency that is a common denominator of the frequency of the system board clock and a clock signal for the operation of an enhanced microprocessor contained on the accelerator board. ('981 Patent Col 2:35-39)

The Sub-Harmonic generator 3, produces S-HCLK 23 which is a synchronized to SCLK as a low sub-harmonic of SCLK. This permits many different SCLK frequencies to be synchronized as different harmonics of S-HCLK. As an example a slow speed system board may use a 48 Mhz crystal clock and normally divide the clock by 2 to produce a 24 Mhz SCLK signal, but synchronously change SCLK to 16 Mhz for certain I/O operations by changing the divider to 3. By using a Sub-Harmonic frequency of say 4 Mhz, both the 24 Mhz and the 16 Mhz SCLK frequencies can be synchronized, as well as other frequencies of which S-HCLK is a common denominator, such as 12, 20, 28 and 32 Mhz. The Sub-harmonic frequency S-HCLK is sent to Phase Locked Oscillator 4 which multiplies in a standard Phase Locked Loop (PLL) fashion, the Sub-harmonic frequency by a whole number N to produce the high frequency clock signal PCLK for the new microprocessor. ('981 Patent Col 4:67-5:17)

AVID argues that the terms should be construed as "being able to prohibit, for an indefinite period of time, the ability to change the alterable data." AVID argues that the limitation calls for the ability to permanently disable the alterability of data stored in an alterable fashion. One embodiment described in the specification at 7:3-9 teaches using an EEPROM to store alterable data and explains that reprogramming of the EEPROM can be inhibited "by breaking a fused connection (i.e., 'blowing a fuse') in the EEPROM." According to AVID, however, the claim does not require the use of any specific method.

The Defendants contend that the phrase should be construed to mean that "the ability to reprogram the second type of memory can be permanently inhibited, for example, by breaking a fused connection (i.e., 'blowing' a fuse) by the application of a voltage of sufficient magnitude during initial programming prior to implantation in or attachment to the object to be identified." According to the Defendants, the phrase "subject to permanent disablement" serves to underscore the requirement of two distinct and physically different memories structures, that are used to store two different types of data ("unalterable data" versus "alterable data"). The Defendants argue that implicit in the requirement that the alterability is subject to permanent disablement is the understanding that the second type of memory be a type that is reprogrammable. In contrast, the first type of memory is non-reprogrammable and therefore lacks a programmable function that can be "permanently disabled." The Defendants cite the specification as support at 2:13-17 and 7:3-9. The Defendants also argue that AVID, in response to a rejection of the claim by the patent office based upon anticipation by a prior patent, emphasized the purported significance of storing data in two types of memories: a first that stores in an unalterable fashion whose (and thus is never reprogrammable) and a second that stores data in an alterable fashion whose reprogrammability may be permanently disabled.

After carefully considering the parties' proposed constructions, the Court construes the term to mean "being able to prohibit permanently the ability to change the alterable data."
AVID contends that the term should be construed as "being able to prohibit, for an indefinite period of time, the ability to change the data in the alterable memory." According to AVID, the specification makes clear that "the alterability of data in said alterable memory" refers to the ability to change data in the alterable memory. AVID further argues that the specification indicates that "being subject to permanent disablement" refers to the possibility that an event or signal can be indefinitely inhibited.

The Defendants argue that the term means that "the ability to reprogram the second type of memory can be permanently inhibited, for example, by breaking a fused connection (i.e., blowing a fuse) by the application of a voltage of sufficient magnitude during initial programming prior to implantation in or attachment to the object to be identified." The Defendants argue that AVID refuses to acknowledge that the alterable memory must differ from the unalterable memory and that AVID's construction is improperly motivated by its apparent understanding of the accused products.

In reply, AVID states that the Defendants impermissibly attempt to construe the phrase in structural terms and that the Defendants' reference to a "second type of memory" finds no support in the language of the claim or the specification. AVID states that the claim instead refers to "an alterable memory." AVID further argues that the Defendants' proposed construction narrows the scope of the claim limitation by redefining "alterability" to mean "reprogramming." AVID also contends that the Defendants' proposed construction makes no explicit reference to data-a critical element of the limitation. After carefully considering the parties' proposed constructions, the Court construes the term to mean "being able to prohibit permanently the ability to change the data in the alterable memory."

4257

1. Subjective Data

The specification of the '985 patent explains that "the term 'subjective' data will refer to that data which is input by the patient to the data logger, regardless of whether that data pertains to the patient or the patient's environment, and whether or not the information is objective or factual, such as medication dosage or consumption of a particular food." '985 patent, col. 5, 11. 40-45.

Noting that patentees may act as their own lexicographers, see, e.g., Abbott Labs. v. Novopharm Ltd., 323 F.3d 1324, 1330 (Fed. Cir. 2003), Invivodata and CRF ask the court to give the term "subjective data" the meaning expressly provided in the patent specification — namely, "data which is input by the patient to the data logger, regardless of whether that data pertains to the subject or the subject's environment, and whether or not the information is objective or factual." 1

--- Footnotes ---

1 eTrials believes that it is not necessary to construe the term "subjective data," but does not oppose the construction offered by Invivodata and CRF.

--- End Footnotes ---

PHT agrees that the patentees acted as their own lexicographers with respect to the term "subjective data," noting that the patentees plainly ascribed a meaning other than its ordinary meaning as the specification makes clear. (D.I. 39, at 7.) 2 Despite this agreement, PHT argues that a narrower definition should control. In particular, PHT contends that although the definition of "subjective data" provided in the specification is very broad, claim 22 provides an additional limitation on the type of "subjective data" that can be entered into the data logger. According to PHT, claim 22 requires the subjective data to be data "regarding the subject's psychological condition and subjectively observed physiological condition." (Id. at 8.) Thus, "subjective data," as used in the '985 patent, means "data input by the patient." (Id. at 7.) The court disagrees.

--- Footnotes ---

2 PHT and the defendants have filed the same claim construction briefs in each of the three above-captioned cases. For convenience, the court will cite to the 04-60 case docket.
"Patent law permits the patentee to choose to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term that could differ in scope from that which would be afforded by its ordinary meaning." Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001). A patentee acts as his own lexicographer when he "clearly set[s] forth an explicit definition for a claim term." Johnson Worldwide Assocs. v. Zebeo Corp., 175 F.3d 985, 990 (Fed. Cir. 1999). That is, when a patentee acts as his own lexicographer, the statement in the specification must have sufficient clarity "to put one reasonably skilled in the art on notice that the inventor intended to redefine the claim term." Bell Atl. Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001).

In the present case, PHT acted as its own lexicographer in clearly setting forth the meaning of the term "subjective data." PHT agrees, but then asks the court to limit the definition of "subjective data" based on the remaining claim language. PHT misses the mark. While the scope of the "subjective data" covered in claim 22 may be limited by the other language in the claim, that is an issue the court need not determine to construe this term. The only issue before the court is the meaning of the term "subjective data" and, as previously stated, PHT acted as its own lexicographer. Accordingly, the court will construe the term "subjective data" to mean "data which is input by the patient to the data logger, regardless of whether that data pertains to the patient or the patient's environment, and whether or not the information is objective or factual, such as medication dosage or consumption of a particular food." 4

--- Footnotes ---

3 The court finds this proposition interesting, especially in light of the fact that PHT maintains that Invivodata and CRF "attempt improperly to read a limitation from the specification into the claim." (D.I. 39, at 8.) According to PHT, the definition of "subjective data" in the specification is "very broad." (Id.) This is the very definition that Invivodata and CRF propose. Thus, the court does not understand how Invivodata and CRF are attempting to improperly read a limitation from the specification into the claim.

4 Further support for the court's interpretation lies in claim 14, which also contains the term "subjective data." PHT contends that "subjective data" as used in claim 14 does not include a limit on the type of subjective data that can be collected from the subject. (D.I. 39, at 8.) PHT's argument fails, however, because "interpretation of a disputed claim term requires reference not only to the specification and prosecution history, but also to other claims. The fact that [the court] must look to other claims using the same term when interpreting a term in an asserted claim mandates that the term be interpreted consistently in all claims." Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995). Accepting PHT's argument would require the court to interpret "subjective data" differently in claim 22 than in claim 14, and would be contrary to law.

--- End Footnotes ---

TERM # 12: "submitting said bid by transmitting at least some of said inputted data from said bidder's computer over said at least one electronic network" - Defendants propose in their construction that a bid can be submitted only after an interest cost value has been calculated and only entirely from the bidder's computer. We agree with plaintiff that there is no requirement that a bid can be submitted only after an interest cost value is calculated. Just as we have already dismissed defendants' notion that the "computing" step must be performed on the bidder's computer because information is input there, we find no requirement that this "submitting" step also be based solely on information stored in the bidder's computer. This phrase means: "transmitting at least some of the previously input data from the bidder's computer over at least one network for communicating data messages between said computers, including, but not limited to, the Internet."
(4) In claims one, two and seven, the term "subpicosecond." A picosecond is 10^-12 seconds, or one trillionth of a second. Defendants submit that "subpicosecond" should be given its ordinary meaning, which is anything less than a picosecond. Plaintiffs admit that read out of context, subpicosecond would mean "less than a picosecond." In fact, an expert retained by Zeiss testified during his deposition that subpicosecond means "something less than one picosecond." Tr. 396 (reading June 16, 2000 deposition testimony of Dr. Colin Sheppard). However, according to the Plaintiffs, when subpicosecond is read in light of the specification, the term must mean about 100 femtoseconds. 8 613 Patent 2:45-48 (referring to 100 femtoseconds as "these subpicosecond pulses"); 3:17-22 ("means of a stream of fast, high intensity, femtosecond pulses"), 65 (same).

8 A femtosecond is 10^-15 second.

Defendants' expert, Dr. Walmsley testified that a person of ordinary skill would understand a subpicosecond to be less than one picosecond. Tr. 197. While the patent offers 100 femtoseconds as an example of a picosecond, it is not the only definition. See 613 Patent at 2:46-48 (offering 100 femtoseconds as an example of subpicosecond). For example, the patent describes a possible laser light source as "a colliding pulse, mode-locked dye laser generating pulses of light having a wavelength in the red region of the spectrum, for example about 630 nanometers, with the pulses having less than 100 femtoseconds duration . . . ." 613 Patent 6:34-37. Further, according to Dr. Walmsley, equation 2 of the patent demonstrates that "one can vary the pulse duration consistent with obtaining enough fluorescence to obtain an image." Tr. 283 (citing 613 Patent 7:11). Additionally, the inventors explained in the prosecution history that a subpicosecond pulse has a width of less than one times 10 to the minus 12 seconds. Prosecution History at 118; Tr. 201.

Dr. Fraser testified for Plaintiffs that subpicosecond is defined as being 100 femtosecond pulses. Tr. 449. However, he admits that in isolation "subpicosecond" would be anything less than 10 to the minus 12 seconds. Tr. 449, 517. Yet, he insists that 100 femtoseconds is not an example of subpicosecond, it is the definition. Tr. 518. He testified that the patent language itself supports his definition because it refers to 100 femtosecond pulses as "these subpicosecond pulses." Tr. 451; 613 Patent 2:45. Additionally, he testified that at the time of the invention the laser community used the term subpicosecond for lasers of about 100 femtosecond pulses. Tr. 451. Further, Dr. Fraser pointed to a piece of prosecution history in which the applicants describe the embodiment and, according to Dr. Fraser, equate subpicosecond with 100 femtoseconds. See Plaintiffs' Markman Exhibit 87. However, the memorandum Dr. Fraser refers to states the pulses are "approximately 100 femtoseconds." Finally, in response to Dr. Walmsley's reliance on equation 2, Dr. Fraser testified that the equation concerns the two photon effect and does not teach pulse length.

The Court is mindful of its responsibility to impart the ordinary meaning to disputed claim terms. Further, the specification cannot be used to read a limitation into a claim term. Comark Communications, Inc. v. Harris Corp., 156 F.3d at 1186. The 613 Patent uses 100 femtoseconds as an example of a picosecond, but it is not used as a precise definition. 613 Patent 6:34 ("with the pulses having less than 100 femtoseconds duration"). Additionally, the prosecution history states a subpicosecond pulse has a width of less than one times 10 to the minus 12 seconds, it does not define subpicosecond as 100 femtoseconds. Prosecution History at 118. Accordingly, the Court construes the term "subpicosecond" as "less than one picosecond."

3. "subscriber"

The '184 patent claims a method directed to the addition of a PIC indicator whose value is a function of whether a terminating "subscriber," or both the terminating and originating "subscribers," have as an associated 9 PIC a particular IXC. Excel contends in their claim construction briefs that the "subscriber" identified in the '184 patent is "the originating or terminating telephone line as identified by the originating and terminating telephone numbers." (D.I. 190 at 31) Accordingly, Excel avers that the PIC of the terminating subscriber is "the carrier providing 1+ long distance service to the terminating subscriber for the line to which the call is made." (D.I. 300 at 33) AT&T, on the other hand, argues that "subscriber" refers to a particular individual, not a telephone line.
9 The parties agree that the term "associated with" means "PIC'd to." Thus, a carrier "associated with" a subscriber means the PIC of that subscriber.

Neither the claims nor the specification provide a specific definition of the term "subscriber." However, for the most part, the use of the term "subscriber" in the '184 patent is consistent with AT&T's proffered interpretation, drawing a distinction between "subscribers" and "telephone numbers." ('184 patent, col. 1, lns. 35-39, lns. 55-57; col. 2, lns. 17-24, lns. 51-53, lns. 56-61; col. 3, lns. 13-19, lns. 59-65) Commonly understood, "subscriber" means "an individual having commercial telephone equipment installed on his premises." Webster's at 2278. This definition is consistent with the meaning of the term "subscriber" in the telecommunications industry: "a person or company who has telephone service provided by a phone company." (D.I. 213, Ex. N at 618) These usages likewise are consistent with AT&T's proffered construction.

The construction proffered by Excel, on the other hand, would require the court to forego the ordinary meaning of "subscriber." Only two situations provide sufficient justification for defining a claim term in a manner other than its ordinary and accustomed meaning. See Johnson Worldwide Assocs., Inc. v. Zebco Corp., 175 F.3d 985, 990 (Fed. Cir. 1999). The first of those situations occurs when an inventor has chosen to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term. See id. This is not the case here. The other situation occurs when the term or terms chosen by the patentee so deprive the claim of clarity that there is no means by which the scope of the claim may be ascertained from the language used. See id.

Excel urges that the design requirements of the claimed invention mandate that the "subscriber" be a particular telephone line, identified by the telephone number called or used to place the call, rather than an individual. Such an argument ignores the very purpose of the claimed invention. The '184 patent relates to a method for "recording messages used to bill charges for interexchange calls." ('184 patent, col. 1, lns. 7-8) As such, the claimed invention is directed to the process of billing for interexchange calls. Subscribers are billed, not telephone lines. Thus, it is irrelevant whether the individual using a particular telephone to place a 1+ long-distance call is or is not the subscriber who selected the PIC for that telephone line. It is still the "subscriber" associated with that telephone line who will be billed for the call. Moreover, subscribers, not telephone lines, select the IXC over which the 1+ calls made using a particular telephone will be carried or routed.

That the claim language and specification require there to be one and only one PIC per phone call, i.e., that there be but a single PIC for said "terminating subscriber" and a single PIC for said "originating subscriber," is not defeated by equating the term "subscriber" with an individual rather than a telephone line. As Excel notes, the claimed invention operates in the framework of a specific call. With respect to that call, the originating "subscriber" will have associated with him/her one and only one PIC as will the terminating "subscriber." That those subscribers might be PIC'd to other IXCs with regard to other telephone lines is immaterial in the context of that specific phone call. Thus, use of the term "subscriber" as meaning a particular individual rather than a particular telephone line does not "so deprive the claim[s] of clarity" that the scope of the claims cannot be ascertained "from the language used."

The court, therefore, shall construe the term "subscriber" to mean a particular individual, not a telephone line. Consistent with this interpretation and the preceding constructions, "the PIC for said terminating subscriber" shall be construed to mean the IXC selected by the subscriber to provide (i.e., handle and/or arrange for handling) 1+ long-distance service to the telephone number called.

F. "subscriber areas"

Plaintiff initially contended that construction of the term "subscriber areas" could be "readily ascertained" from the specification. (Dkt. 64, p. 10). Plaintiff now relies on extrinsic evidence, including the Shames affidavit. As Defendant correctly points out, "subscriber areas" is not defined in the patent, although the term is used throughout the specification and claim. According to the plain language of the claim, a subscriber gains "secure access" to a "subscriber area," from
which "billing and data entry forms" are transferred to the subscriber, who completes the forms. The completed forms are electronically returned to a "corresponding subscriber area," which are then entered into the database. ('229 patent, col. 5, ll. 60-67). The specification explains this. (Id., col. 3, ll. 53-56, 58-59). The "subscriber areas" therefore provide (1) secure access to and transfer of forms to subscribers, and (2) transfer of data in the completed forms into the database.

Claim 1 provides that the home page provides only secure access by subscribers to one of a plurality of subscriber areas within the system. ('229 patent, col. 5, ll. 60-63)(emphasis added). The claim provides that once these subscriber areas are accessed, subscribers can obtain electronic transfer of "substantially only billing and data entry forms" and "real time electronic viewing and query access of stored data and billings." (Id., col. 5, l. 63-64, col. 6, l. 5-6). As noted, the specification provides that the subscriber area "provides access to data forms (not shown) of a software application which are transferred to, and appear on the screen of each remote subscribers PC" (Id., col. 3, ll. 50-57).

The specification provides that forms are transferred into the database server from Billing network PCs: "Input and query forms are developed within the system 11 by billing network PC work stations 38 which are connected at hub 36, all forms and information input being subject to business rules and logic at 34 before entered into the database server 32." (Id., col 4, ll. 13-18). The specification also provides that "once into the particular browser-based subscriber area 80 within the system 71, each browser-based subscriber 72 will have access to one of several customized forms that they will complete electronically at their work station and transfer to the database server 90. Form development and customization will be done within the system at internal work stations 106 by employees of the system." (Id., col. 5, ll. 12-18). According to the descriptions, Figure I depicts the developed forms passing through the database server in order to reach the subscriber areas.

While Defendants correctly note that the subscriber area is unique to each individual subscriber as evidenced by the secure access provided, Defendants' construction ignores the purpose of the subscriber areas, which is to facilitate the transfer forms and data. (See id., col. 3, ll. 52-54). Accordingly, the Court construes the term "subscriber area" to mean "a system component unique to that subscriber that transfers forms between a database server and a subscriber."

Claim 14 provides:

in response to the stored compressed, digitized data, transmitting a representation of the at least one item at a real-time rate to at least one of a plurality of subscriber receiving stations coupled to the local distribution system

* * *

decompressing the compressed, digitized data representing at least one item of audio/video information after the transmission step wherein the decompressing step is performed in the local distribution system to produce the representation of the at least one item for transmission to at least one subscriber station

- 4534 -
The parties dispute the proper construction of the phrases "subscriber receiving station" and "subscriber station" as those phrases are used in Claim 14 of the '863 patent.

Except for its use in some of the claims of the '863 Patent, neither the phrase "subscriber receiving stations" nor the phrase "subscriber station" appear elsewhere in the specification. In Section IA4 above, the Court defined "local distribution system" to mean "a reception system located geographically close to the subscribers of the system." The Court examines the specification to see if it provides a basis for inferring a definition of the phrases under consideration.

Claim 14 claims a method in which information is transmitted from a central processing location [transmission system] to a local distribution system [reception system], and from there to a "subscriber receiving station." There is no support in the written description or in the drawings for a reception system to communicate with another reception system. Therefore, the Court declines to construe "subscriber receiving stations" as a "reception system."

However, there is support in the written description for a reception system which outputs to a "receiving device." ('863 Patent, Col. 17:43-61). To avoid a construction which is not supported by the written description, the Court construes "subscriber receiving station" as a receiving device. Further, because "subscriber receiving stations" and "subscriber station" are used synonymously, the definition applies to both phrases.

The Court construes the terms "subscriber receiving station" and "subscriber station" as follows:

1. a receiving device at a subscriber's location.

2. "subscriber selectable receiver stations"

The parties dispute the proper construction of the phrase "subscriber selectable receiver stations." In Section IA6 above, the Court construed the phrases "subscriber receiving station" and "subscriber station" as they appeared in Claim 14 of the '863 Patent as "a receiving device at a subscriber's location." The Court finds that the apparatus claimed in Claim 4 of the '720 Patent is the same apparatus, except that as an additional limitation, it must be "selectable," a non-technical term which has a plain and ordinary meaning.

The Court construes the phrase "subscriber selectable receiver stations" as follows:

1. receiving device or devices which can be designated by the subscriber.

8. "Subscriber telephone station"

Cygnus wishes a broad construction of "subscriber telephone station" that would cover any method of making phone calls, including personal computers. The defendants advocate a very narrow construction that would limit the phrase to the telephone handset associated with the telephone number associated with the subscriber. Although in the preferred embodiment, the subscriber is "connected to the system via a telephone handset," '964 patent, col. 6, 11. 40-41, there is nothing else in the patent that suggests "subscriber telephone station" should only be a telephone handset. The Court therefore construes "subscriber telephone station" as "a device that allows audio communication over a telephone network."

The '170 patent uses the term "subscribers" to describe those businesses, historical sites or governmental sites included in the map of the predetermined region given to the user. CIVIX argues that "subscriber" means any and all businesses, historical sites, governmental sites and the like that have an identifiable location that can be stored in a database. Defendants argue that "subscriber" means a business or site that requests to be included in the invention's data. I agree with Defendants' interpretation.

In construing the terms of a patent, I must give such terms their ordinary and plain meanings unless the patentee has defined them differently within the patent. See Process Control, 190 F.3d at 1357 ("a patentee can act as his own lexicographer to specifically define terms of a claim contrary to their ordinary meaning"); see also Karlin, 177 F.3d at 971 (using dictionary to define terms). "Subscriber" in ordinary parlance means "one that agrees or consents." Webster's Third New Int'l Dictionary 2278 (3d ed. 1986). The ordinary meaning of the term "subscriber" implies action on the part of the one to which it refers (e.g., paying a fee or requesting to be part of a service). The '170 patent's specification does not teach differently when it explains that "the subscribers are typically businesses within the predetermined area surrounding the kiosk, or historical or governmental sites." ( '170 Patent, Col. 1 lines 39-42). "Subscribers" is not deliberately or precisely defined in a lexicographical manner by the inventors. Instead, the excerpt gives examples of types of subscribers. See, e.g., Renishaw, 158 F.3d at 1249 ("The patentee's lexicography must . . . appear with reasonable clarity, deliberateness, and precision before it can affect the claim."). The ordinary meaning of the term "subscribers" implies some action on behalf of the listed entities, otherwise the inventors could have used a more generic term such as "entities." Most likely, the patentees envisioned a profit making device whereby subscribers would pay to be included in the directory. (Custom Page Information and Rates, CIV 000083). I conclude that the term "subscribers" in the '170 patent means businesses, historical sites, governmental sites or the like that either agreed or requested in some manner to be a part of the database.

The parties agree that the term "set of subscribers" includes all "subscribers" in the predetermined region stored in the apparatus.

CIVIX contends that the term "group" of subscribers includes those subscribers that share "at least one characteristic." CIVIX disputes the Defendants' limitation of this to a single characteristic. CIVIX argues that a set of subscribers can clearly be searched using more than a single characteristic. Defendants dispute this and contend that "selected group" refers to all of the subscribers within a set of subscribers that have the particular characteristics identified via input means. Defendants contend that there is no indication in the '170 patent that the user station's database can be searched with respect to more than one characteristic at a time. However, I conclude that the language in Claim 1 reciting "input means at said user station for identifying at least one characteristic of said group" denotes that searching with more than one characteristic at a time was contemplated by the inventors. ( '170 Patent, Col. 4 lines 16-17) (emphasis added). I may not incorporate limitations from the specification that are not present in the claims themselves. See E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988); see also Burke, Inc., 183 F.3d at 1341 ("an attribute of the preferred embodiment cannot be read into the claim as a limitation.").

1. "subscription services"

The parties disagree about the meaning of the words "subscription services" found in the phrase "[a] method for providing subscription services involving transmissions from a remote location to a subscriber location" of the preamble of claim 1. Echostar argues that "subscription services" is limited to a group, tier or package of television programs purchased for a flat fee, while IPPV contends that "subscription services" includes pay-per-view programming that is purchased on impulse.

In support of its position, Echostar argues that "subscription services" is a limitation on claim 1 even though the term is only found in the claim's preamble. It then explains that the plain meaning of "subscription" is an arrangement for providing, receiving or making use of something of a continuing or periodic nature on prepayment plan. Echostar also refers the court to the deposition transcript of its expert, Graham Stubbs, where he testified that "subscription services do not include what are commonly referred to as pay-per-view services, wherein customers pay an amount for each program or event viewed." In light of its proposed plain meaning and Stubbs's testimony, Echostar contends that "subscription services" is limited to flat fee arrangements and does not include pay-per-view programming purchased on impulse.
IPPV counters by explaining that "subscription" generally refers to a purchase agreement where the subscriber agrees to purchase a certain number of goods or services to be delivered over a certain period of time. It argues, however, that "subscription" does not include a particular method of payment, and therefore, "subscription services" should not be limited to flat fee arrangements.

Moreover, IPPV contends that even if "subscription" implies flat fee payments, the specification expressly states that subscription programming may be impulsively purchased. As examples, it cites a portion of the specification stating that the present invention includes "an impulse purchase capability which allows a subscriber to purchase a certain amount of subscription programming outside the subscriber's normal prearranged programming at any time during which special information pertaining to that programming is being transmitted," and another portion stating that "the impulse purchase capability permits a subscriber to view subscription programming . . . for which payment is not predetermined in some ordinary manner such as a flat rate . . . ." IPPV argues that in both instances, the specification makes clear that "subscription services" includes pay-per-view programs.

As a preliminary matter, the court finds that "subscription services" of the preamble is a limitation of claim 1. The court further finds that the plain meaning of "subscription" does not require that a subscriber pay for services on a flat fee basis. The plain meaning only requires that a subscriber pay for services prior to delivery, and that the services be delivered over a period of time.

Prepayment for services is one of the main objects of the invention described in claim 1. When a purchaser chooses to view a program, the invention compares the cost of the purchased program against the purchaser's stored credit and only decrypts the programming if there is sufficient credit to cover the cost of the program. As a result, there is a prepayment before each program is viewed. It is of no consequence that the payment is made with stored credit rather than cash. Moreover, the pay-per-view programming is provided for a period of time. Thus, each purchase of a pay-per-view program by the method described in claim 1 falls within the plain meaning of "subscription."

In addition, the portions of the specification referenced by IPPV show that the inventors intended "subscription services" to include pay-per-view programming. In light of the plain meaning of the words and the specification, the court concludes that "subscription services" is not limited to arrangements in which a subscriber pays for services on a flat fee basis.

4267

4. "Detecting a subsequent launch." (Sixth step of Claim 1 and sixth means element of Claim 2).

The specification describes one way a subsequent launch may be detected. '630 patent, col. 4, ll. 54-63. Grammatically, the way the claims are written, this term refers to a launch of a program which occurs after the one which resulted in the creation of the final log file. See '630 patent, col. 8, l. 5 (stating the file is closed as step 98 of Fig. 5). The same step is shown in the flow chart at Figure 3. If a launch is detected (Fig. 3, item 72) and a log file exists (Fig. 3, item 74), then before the launch sequence executes, the computer program takes the steps for a more rapid launch (Fig. 6, item 102).

CAC suggested "detecting a launch after the log file is created." Microsoft proposed "identifying a launch of a computer program after the final log file for that computer program has been created, stored, and associated with that computer program." After some discussion with the court, the parties agreed on the following definition which the court finds is supported by the claims and specification and comports with the usage of words as understood by one of ordinary skill in the art:

"Detecting a subsequent launch" means: Detecting a launch of a computer program after the final log file for that computer program has been generated and stored in RAM, RAM cache, secondary storage, or some other storage.

GO BACK

4268

D. "subsequent services"
The term "subsequent services" is found in claim 10 of the '822 patent: "a data storage system for recording said exact geographic location and specific mobile unit identification for use in subsequent services." The specification does not use the term "subsequent services." Claim 22, which depends from claim 10, provides clarification of this term: "wherein said data storage system makes said exact geographic location information available for one or more of rate, message unit, tax, billing or location services provisioning." The plaintiffs initially proposed "a service that obtains the recorded exact geographic location and mobile unit identification after completion of the communication process that recorded them." Later, the plaintiffs offered an alternative construction: "a service occurring during a call in progress, including emergency 911, taxes, communication process rating, message unit, customer service frequency selection, changing frequencies, changing cell site (handover) and changing cell system." According to Centennial, "subsequent services" means "subscriber services occurring after the communication process between the network and the specific mobile unit has ended."

The plaintiffs argue that "subsequent services" includes both "Online Uses (Real Time)" (the left-hand column of '822 patent's Figure 8) and "One-Time Offline Uses" (the right-hand column of '822 patent's Figure 8). The plaintiffs contend that the claim language supports their position, because both sets of services occur "subsequent" to "recording said exact geographic location and specific mobile unit identification." EMSAT and LBS also note that the construction given by the Examiner during reexamination is "a service occurring during a call in progress, including emergency 911, taxes, communication process rating, message unit, customer service frequency selection, changing frequencies, changing cell site (handover)"; these services are the "Online Uses" illustrated in the left side of Figure 8.

Centennial responds that the court should give no weight to the Examiner's construction; the Examiner is required to give a claim its "broadest reasonable interpretation," while the court must apply the Phillips standard of the ordinary artisan's perspective at the time of the invention. The defendants also argue that the plaintiffs' construction renders "subsequent" superfluous because any service must occur after recording the exact geographic location and mobile unit identification. See Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005). Therefore, Centennial contends that the "subsequent services" are the "One-Time Offline Uses" shown on the right side of Fig. 8 and these services occur after the communication process has completed.

The court notes that claim 21, which depends from claim 10, further limits the "data storage" element and teaches that "emergency services provisioning" is one of the "subsequent services": "wherein said data storage system makes said exact geographic location information accessible for emergency services provisioning." Provisioning of emergency services, such as emergency calls made during a non-emergency communication process ('822 patent, 13:1-3, Fig. 8 block 120), must occur before the call has ended. Thus, subsequent services are not limited to offline services that occur after the call ends. The court therefore construes "subsequent services" to mean "a service that occurs after the exact geographic location and specific mobile unit identification have been recorded."

--- Footnotes ---

2 The "Emergency 911" service appears on both the left and right side of Figure 8. But the "Emergency 911" in the right-hand column, block 110, is "emergency 911 call accounting." (822 patent, 12:45-46).
--- End Footnotes ---

4269

J. "and having a transmittance level in substantial accordance with the formula T(l)=[D(l)-[S*(l)+(1-N)]/[S(l)+N]"

TLI contends that when construing terms according to their ordinary and customary meaning, the above phrase means "the coating transmits that portion of the element-emitted electromagnetic radiation that substantially satisfies the stated formula." See TLI's Br. at 22. TLI explains that the light-emitting element of the lamp emits electromagnetic radiation. See id. This radiation impinges the "lamp envelope" with its "at least one coating," and some of the radiation passes through the envelope and coating. See id. Accordingly, the coating has a transmittance level. 8 Claim 1, TLI asserts, requires this transmittance level to be only in "substantial accordance" with the above formula. 9 Further, TLI argues that the term "accordance" should be accorded its ordinary meaning. Thus, TLI contends that the claim states that the coating transmits a
portion of the element-emitted electromagnetic radiation that substantially satisfies the above formula. See id.

8 According to TLI, the term "transmittance" is well known in the art and is defined as the fraction of radiant energy that having entered a layer of absorbing matter reaches its farthest boundary. Id. TLI contends that the term "substantial" is defined as "the same or very close to." As discussed on page 6, this Court has rejected this definition of "substantial."

Sylvania argues that the word "substantial" is a word of degree and TLI's use of the word to modify the term "accordance" implies that the transmittance level of the coating need not be exactly in conformity with the formula recited in Claim 1 of the '017 patent. See Sylvania's Br. at 21. However, Sylvania contends that the specification of the '017 patent provides no standard for measuring the level of "substantial accordance" necessary to fall within the scope of the claim. See id. Moreover, Sylvania urges that using basic mathematical principles, a formula is either satisfied or not satisfied, that is, the terms on opposite sides of the equation are either equal or not equal. See id.

I find that the term "and having and having a transmittance level in substantial accordance with the formula T(l)=[D(l)-[S*(l)+(1-N)]][S(l)+N]" be given its ordinary meaning, and that the term requires that coating of the bulb transmit light energy that is in substantial accordance with the stated formula. The mathematical formula recited in the claim discloses a standard for transmittance that the bulb seeks to attain. The patent does not require that the light emitted from the bulb conform exactly to that standard, but instead, teaches that the light transmitted will be adequate as long as it is in "substantial accordance" with the standard defined by the formula.

4270

2. "substantial loss in transfer of line voltage"

HP asks the Court to construe this term as: "The voltage at the destination of the transfer is substantially less than that at the source." With respect to claim 1, EMC proposes: "A substantial loss in AC line voltage when switching from the first AC feed circuit to the second AC feed circuit. A loss in AC line voltage of 3dB or more is a substantial loss." With respect to claim 12, EMC proposes: "A substantial loss in AC line voltage when switching from the first AC energy source to the second AC energy source. A loss in AC line voltage of 3dB or more is a substantial loss."

Subparagraphs (c) of claims 1 and 12 indicate that the receiving circuits of claim 1 and the transfer circuits of claim 12 are energized without substantial loss from a single feed circuit or energy source, respectively, when compared to the amount of voltage transfer received from both feed circuits or energy sources. That is, each receiving or transfer circuit must be energized in substantially the same amount after failure of one of the two feed circuits or energy sources. Accordingly, for the purposes of this term, the voltage signal at the final destination (either the receiving circuits or the transfer circuits) prior to the de-energization of the first feed circuit or first energy source is compared to the voltage signal at the same final destination after the de-energization of the first feed circuit or first energy source.

The parties dispute whether there may be a "substantial loss in the transfer of line voltage" during the switch. Clearly, the object of the claimed invention is to prevent loss of energy to a circuit if an AC feed line or energy source fails. The specification describes an example of a switch that can achieve this object: for example, the "switching speed of relay 65 must be less than about one signal cycle of the AC main (i.e., about 20 ms), so that continuity of the signal is maintained for the power supply after switching AC mains. " 253:3/60-63. Thus, consistent with the claim language, the specification describes a device in which transfer of line voltage signal is never substantially lost, either during or after the switch, as measured against the extent to which the circuit was energized prior to the switch. Although there may be energy loss during the switch, that loss is not substantially less with respect to the final destination -- because of the nature of the AC signal -- than what would have occurred if there had been no switch. Although the Court concludes that the claim language indicates that substantial loss is measured after "the first feed circuit [or energy source] is de-energized" rather than after the switch is made, it must be noted that there may be energy loss associated with the switch as long as such loss occurs during a specific portion of the AC cycle so that there is not substantial loss of voltage at the final destination when compared to the voltage received prior to the de-energization of the AC energy source.
EMC also seeks to add a limitation defining "substantial loss" as a loss in AC line voltage of 3 dB or more. The term "substantial" is ambiguous. The specification does not expressly define -- indeed it does not discuss at all -- the concept of "substantial loss." In this context, the written description instead consistently describes the invention as providing for redundant sources of energy should a source fail. For example, various embodiments of the invention are described, in which "power supplies . . . remain energized for supplying power to the system," 253:4/4-5, the circuit "always suppl[ies] AC current to the off (third) power supply . . ., regardless of a loss of either of the redundant AC mains," 253:4/12-14, "no matter which AC main fails, all three power supplies remain powered for system 60 via the other live redundant main," 253:4/32-34, if a first AC main fails, a second AC main "provid[es] continued voltage," 253:4/43, and the system may "retain energized both power supplies . . . in the event of failure of either AC main," 253:4/48-49.

While the written description never quantifies the energy loss resulting from the use of "redundant" energy supplies, the patentee discloses an invention in which the circuits may function normally as if a source of energy had not been lost. Thus, it is clear that, whatever precise quantity the parties wish to assign to the term "substantial loss in the transfer of line voltage," it must have significance with respect to the functioning of the device. That is, for "substantial loss" to occur, the output of the electrical system or functioning of whatever device is powered by the claimed invention must be impaired by loss of the redundant energy source. Examples of such impairment are described in the specification. For example, loss of energy could result in "loss of data and down time upon failure." 253:1/14-15. Accordingly, in the claimed invention, the output of the electrical system is not affected by a failed AC line because, through the use of redundancies, there is not a substantial loss in the transfer of line voltage.

EMC argues that substantial loss must be quantified as "3 dB" because a reference discussing a signal loss of up to 3 dB was presented to the patent examiner during prosecution. However, this reference merely showed that a 3 dB signal loss is substantial, a characterization with which HP agrees. Plaintiffs' and Counterclaim Defendants' Reply Brief on Key Terms, p. 19. It did not preclude an argument that something less than 3 dB also is substantial. EMC does not explain what "3 dB" means in the context of the present invention. Because the reference to the prior art in the prosecution history did not address the issue of quantifying "substantial loss" and because the meaning of "3 dB" is ambiguous, the Court finds the prosecution history unhelpful in providing additional clarification.

Accordingly, the Court construes this term as: "Loss of receipt of energy -- as measured by the voltage at the final destination (either the receiving circuits or the transfer circuits) after the de-energization of the first feed circuit or first energy source compared to the voltage at the same final destination prior the de-energization of the first feed circuit or first energy source -- sufficient to impair the proper functioning of whatever device is powered by the claimed invention during and after loss of the redundant energy source."

Terms with "substantially"

Five disputed terms contain "substantially:" (1) "said select-transistor threshold voltage is substantially the same as said logic-transistor threshold voltage," (2) "said select-transistor-gate and said logic-circuit-gate having substantially a same thickness," (3) "substantially a same [thickness]," (4) "substantially the same [threshold voltage]" and (5) "substantially all memory read errors." Jt Cl Const, Ex B at 19-22, 23-25. These terms appear in claims 1 and 5 in the 229 patent and claims 1, 13, 14, 22 and 26 in the 148 patent. The court only construes the term "substantially" in each of these phrases because the other terms either are construed elsewhere in this order or are agreed upon by the parties.

For all terms except "substantially all memory read errors," UniRAM contends that "substantially" means "approximately, but not necessarily exactly." MoSys and TSMC instead propose that substantially means "identical except for differences that would necessarily result from the transistors being manufactured at the same time using the same process." Id.

For "substantially all memory read errors," UniRAM proposes a definition of "approximately all, but not necessarily all, memory read errors." Id at 25. MoSys's proposed construction is "[t]he number of read errors that an error code checking (ECC) and correction means of the prior art could correct." Id. TSMC asserts that this term does not need any construction, but if construed, TSMC proposes the same definition as MoSys but with "memory checking" replacing "error code checking."
(ECC)." Id. Neither MoSys nor TSMC provide any arguments in support of their proposed construction of this term. Other than one section of the specification in which the claims are simply paraphrased, the specification uses "substantially" only once, stating "[t]he sense amplifier used in the present invention is substantially the same as typical sense amplifiers used in the prior art." 229 patent at 11:33-35. UniRAM's construction of "substantially" is consistent with this use of the term, unlike MoSys's and TSMC's proposed constructions.

Nonetheless, both MoSys and TSMC contend that their proposed constructions mimic the specification, which provides many embodiments that teach simultaneously fabricating the select and logic transistors. 229 patent at 21:41-44, 23:10-23. But by importing this limitation from the specification, MoSys and TSMC are asking the court to limit the claims to particular embodiments, which is something that the Federal Circuit has admonished district courts not to do. Phillips, 415 F3d at 1323.

MoSys also notes that UniRAM adopts language similar to MoSys's construction in UniRAM's Patent L R 3-1 disclosure. Id at 36-37. But this disclosure only addresses how MoSys allegedly infringes UniRAM's 229 patent. The disclosure does not address the scope of UniRAM's claims. In other words, UniRAM's particular description how MoSys infringes UniRAM's patent in this case does not mean that UniRAM is limited to that description in all cases.

MoSys also argues that UniRAM's construction would render the claim indefinite because a standard for measuring "substantial" is required to provide notice to a person of ordinary skill what is covered by the claims. Id at 39-40. But the patents do provide some measure of what "substantially" means, albeit indirectly. UniRAM admits that it distinguished between threshold voltages of 0.7 and 1.1 volts, and oxide thicknesses of 70 and 100 angstroms. UniRAM Reply (Doc # 118) at 19:18-28; 229 patent at 21:39-22:44. Accordingly, the difference between two threshold voltages or thicknesses necessarily cannot be greater than or equal to 0.4 volts or 30 angstroms, respectively, if the two values are "substantially the same." Because substantially is not defined explicitly in the patent and does not appear to carry any special meaning in the relevant field, the court turns to the term's customary and ordinary meaning. Schumer v Laboratory Computer Systems, 308 F3d 1304, 1311 (Fed Cir 2002) ("The proper approach is to construe the claim language using standard dictionary definitions, because here, the claims have no specialized meaning."). UniRAM's proposed constructions for "substantially" fit comfortably with the term's usage in the patent. These constructions also match the term's dictionary meaning. See, e.g., Webster's Third New Intl Dictionary 2280 (1981) (substantially[ly]: "being that specified to a large degree or in the main"); Black's Law Dictionary 1428-29 (6th ed 1990) (substantially: "[e]ssentially; without material qualification; in the main; in substance ***"). And because there is no reason to think that the patentee intended to use "substantially" differently in different contexts, UniRAM's consistent definition for that term is preferable to defendants' piecemeal approaches. Accordingly, the court adopts UniRAM's constructions for the terms containing "substantially."

LGD contends that the phrase "interconnecting substantially all of said row lines to one another and substantially all of said column lines to one another" as required by the '002 patent means "electrically connecting with conductive material all or nearly all row lines to at least one other row line and electrically connecting with conductive material all or nearly all of the column lines to at least one other column line." D.I. 376 at Exh. B-3. LGD contends that its construction is supported by the intrinsic record which shows either each row line interconnected to one other row line and each column line interconnected to one other column line, or serially connecting the row lines and column lines where each row or column line is interconnected on one end to one row or column line and is interconnected on the other end to another row or column line.

In response, AUO contends that this phrase should be construed as "joining almost all of the row lines together and joining
almost all of the column lines together." Id. AUO contends that this construction is consistent with the plain meaning of the phrase, the teachings of the patent, and the claim construction the Court rendered in previous litigation concerning this patent. AUO also contends that LGD's claim construction reads out the word "substantially" from the claim and attempts to broaden the claim to include semiconductor material as conductive material.

CMO contends that this phrase should be construed as "electrically connecting with conductors nearly all, but not all, of said row lines to one another and nearly all, but not all, of said column lines to one another." Id. CMO contends that this construction is consistent with the Court's previous construction, and LGD should not be permitted to reargue a claim construction it already argued in previous litigation.

As AUO and CMO note, the Court construed at least part of this phrase in previous litigation involving the '002 patent. In LG Phillips LCD Co., Ltd. v. Tatung Co., the Court construed the term "interconnecting" to mean "electrically connecting with conductors." 434 F. Supp. 2d 292, 296 (D. Del. 2006). The Court is not persuaded that its previous reasoning with respect to this construction is erroneous, and the Court finds no support in the specification for AUO's proposed construction of "joining" as a means of clarifying any ambiguity that may exist from the term "interconnecting." The Court also considered LGD's argument in the previous litigation that the Court's construction improperly limits the claim term to conductors; however, the Court noted that "the consistent use of a claim term by the inventor in the specification may serve to limit the scope of a claim." Id.

In addition, the Court is persuaded that LGD's construction reads out the term "substantially all" from the claim language by permitting "all." Accordingly, the Court concludes that "interconnecting substantially all of said row lines to one another and substantially all of said column lines to one another" means "electrically connecting with conductors nearly all, but not all, of said row lines to one another and nearly all, but not all, of said column lines to one another."

a. Surrounding

To define "surrounding," Google suggests that the plain meaning of the word is to "enclose on all sides." The ambiguity latent in the term in this context is that the rendered display is somewhere between a two-dimensional and a three-dimensional object, so it is unclear whether a circle or a sphere would "surround" a point in the terrain. As Skyline correctly points out, Google's construction would imply that underground blocks of data would have to be downloaded for the "surrounding" data blocks to be considered gathered. It seems unlikely that this result was intended by the claim, because the '189 patent is primarily concerned with the rendering of surfaces with a minimal vertical dimension, not true three-dimensional terrain. Consequently, I find that "surrounding" does not imply a sphere surrounding a point on all sides, but a circle surrounding a point in two dimensions.

The next disputed issue with respect to "surrounding" is whether the area of excess blocks to be downloaded must necessarily be uniform in all directions (or whether a wider area of blocks could be pre-selected in the direction of travel, potentially creating an ellipse around a reference point, rather than a circle). n18 "Surrounding" is customarily read as encircling in a uniform manner, n19 and numerous references in the '189 patent support this reading. n20 At several points, the '189 patent mentions that the user can control the direction of view and look around in all directions, which necessitates downloading blocks in all directions. n21 Based on the common understanding of "surrounding," the specific use of the
term and concept in the '189 patent, and the broader context of the claimed method and apparatus, I construe "surrounding" to mean all of the blocks within a uniform distance from the point in question.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -
n18 I also note that the points in the terrain selected as the starting points in Claim 9 could be preferentially chosen based on the direction of travel. Although the blocks surrounding each point would be downloaded to a uniform distance, the points chosen could be weighted towards the direction of travel.

n19 See, e.g., Webster's Third New Int'l Dictionary (Unabridged) (1986) (listing as synonyms "encircle," "circle," "ring," and "encompass").

n20 See, e.g., col. 12, 11. 23-25 ("blocks, which are most preferably organized in a square centered directly below the location of the viewpoint"); col. 16, 11. 4-6 ("cache manager first downloads the eight blocks surrounding the block which is directly below the current viewpoint").

n21 See, e.g., col. 2, 11. 3-5 ("allowing the pilot to see the view seen at any point along the flight course at substantially any desired angle"); col. 2, 11. 19-21 ("A user may select at substantially each point along the route the direction of view and may change the direction dynamically"); col. 7, 11. 6-7 ("Preferably, the viewpoint is controlled by a user of the processor"); col. 11, 11. 9-10 ("there is no compulsory correlation between the flight direction and the view direction"); col. 15, 11. 63-67 ("if the queue is empty, cache manager fills cache memory with the blocks within the range of the current viewpoint, so that, for any direction of view from the current viewpoint, there is no need to download further blocks from the server") (emphasis supplied).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

b. Point in the terrain

The next dispute in the construction of this phrase is whether the "current viewpoint" is a "point in the terrain seen from the current viewpoint," as Skyline argues. The plain language of the phrase makes clear that it is not. The current viewpoint is the current viewpoint. A point seen from the current viewpoint is inherently different from the viewpoint itself. Consequently, I reject Skyline's argument that the current viewpoint is also a point seen from the current viewpoint.

Finally, Google includes "excess blocks" in its construction. This term is unnecessary, as Claim 9, a dependent claim of Claim 7, only covers the download of excess blocks.

Construction: (substantially all of the blocks surrounding a point in the terrain seen from the current viewpoint within a predetermined distance range) Substantially all of the data blocks covering terrain within a uniform predetermined distance from a point in the terrain that is seen from the current viewpoint.

4274

F. "substantially all" and "switching means"

The parties dispute the meaning of the related terms "substantially all" and "switching means." According to the claim language, the switching means must (1) be included in the transfer means and (2) cooperate with the selecting means to block "substantially all of the flow of current" from the high voltage generating means to unselected lines. '811 patent, 8:40-45.

The Court first construes the term "substantially all." Defendant urges the Court to hold that "substantially all" is indefinite. As support for its indefiniteness argument, defendant relies upon Amgen, Inc. v. Chugai Pharmaceutical Co., 927 F.2d 1200 (Fed. Cir. 1991), a case in which the Federal Circuit upheld a finding of indefiniteness for a patent that claimed a pharmaceutical product with a potency of "at least about 160,000" units. Defendant argues that the term "substantially all" is likewise a term of measurement that provides insufficient information about the range of values it encompasses. Amgen v.
Chugai Pharmaceutical, however, is distinguishable. In that case, the Federal Circuit emphasized the fact that products with a potency of about 120,000 units were known in the prior art. Id. at 1217-18. The court explained that when the meaning of claims is in doubt, it is proper to invalidate them "especially when, as is the case here, there is close prior art." Id. at 1218. In this case, by contrast, defendant cites deposition testimony that the '811 patent reduced current leakage over the prior art by "perhaps a factor of 100 to 1,000." (Def.'s Mot. For Summ. J. of Indefiniteness at 12 (testimony of Pl.'s expert, Mr. Callahan)). Given the vast difference between the '811 patent and the prior art in this respect, slight uncertainty about the precise meaning of "substantially" is less important than was the ambiguity in Amgen v. Chugai Pharmaceutical. For this reason, the Court holds that the term is not indefinite.

As an alternative position, defendant argues that "substantially all" means the amount of current blocked by the particular combination of devices 40 and 46, the devices it maintains constitute the switching means. Plaintiff contends that the term should be given its normal meaning of "all but an insignificant amount." Seeing no reason why the term should be given any other, out-of-the-ordinary meaning, the Court adopts plaintiff's construction.

C. Claim Construction: substantially automated process

Both parties appear to agree that automated process means "without human interaction"; however, the parties differ on the meaning of substantially and its effect on the level of human interaction. Defendant asserts that substantially automated process means "a process that takes place without human interaction such that the need for data entry staff or human screening of the information is eliminated." Relying on language in the patent specification and prosecution history, Defendant argues that Plaintiff's patent eliminates the need for human intervention. Defendant states that the more narrow definition was established when Plaintiff bargained with the PTO in order to overcome the prior art. (Def.'s Answer Mem. 4.) Relying on the terms "without," "eliminated," and "does not require," Defendant argues that Plaintiff previously admitted to these limitations and Plaintiff's current construction is in direct conflict with it's own PTO arguments.

Plaintiff asserts that the term means "a process that largely takes place without human interaction." Plaintiff points to the prosecution history where references to the process always describe it as substantially automated. Plaintiff also cites Federal Circuit case law and the English dictionary to support its argument that the word substantially must have meaning in the claim and can mean "significantly," "considerably," "largely," or "essentially." (Pl.'s Opening Claim Constr. Br. 15; Hr'g Tr. 62.) Plaintiff further argues that, by requiring the process to take place entirely without human interaction, Defendant's construction reads the word substantially out of the claim. Plaintiff's use of "largely without" to measure the level of human interaction does little to clarify the claim term. However, if Defendant's proposed construction were adopted, the word substantially would be re-defined to mean "entirely" and would otherwise be meaningless.

In analyzing the language of the claim, the Court must determine how a person of ordinary skill in the art would understand the term substantially automated process. Both a person of ordinary skill in the art and a layperson would understand that an automated process means that the process is not driven by human interaction. A person of ordinary skill would also understand that there may be some human interaction involved in the process. However, a person of ordinary skill could not determine from the claim language how much human interaction would be involved in a process that was substantially automated.

The Court must also look at the specification to determine the proper construction of the claim language. The '513 Patent specification expresses that the embodiments shown and described are "preferred embodiments," as the heading above the descriptions upon which Defendant relies reads "Detailed Description of the Preferred Embodiment." (Joint App. A80, 10:16-17.) The description of the embodiment states that "merchants can [interact with the system] directly and by themselves" (5:16-20); information can be organized "without the need for employing a large personnel staff . . ." (5:4-5); "operations . . . are all handled online, without the need for a human order taker or processor" (6:65-7:1); and "the need for data entry staff or human screening of the information is eliminated" (5:63-68). (Joint App. A78-A79.)

Next, the Court looks to the prosecution history "to determine whether it contains statements that narrow the scope of the claims." Phillips, 415 F.3d at 1317. During the prosecution of the patent, parties may make statements that clearly restrict the scope of the patent. "This may occur, for example when the patentee explicitly characterizes an aspect of his invention in
a specific manner to overcome prior art.” Id. (internal citations omitted). In distinguishing this patent from prior art the patentee stated: "Unlike the prior art, the present invention does not require the information to be reviewed and/or inputted by a human being associated with the system operator or third party prior to the information being posted onto the web page . . . .” (Joint App. A557.) On this basis, the patentee distinguished its patent from the prior art. In reviewing the prosecution history, the Court does not find any evidence that Plaintiff made any explicit disavowal of scope during the prosecution of the ‘513 Patent. The fact that the claim does not require human interaction does not equate to the claim precluding human interaction.

There is a distinction between construing a claim in light of the specification and inserting a limitation into the claim from the specification. Phillips, 415 F.3d at 1323. Here, the specification supports the Court's reading of the claim based on the claim language that merchants may input information for viewing by consumers through a substantially automated process. However, if the Court were to find that the substantially automated process takes place without any human interaction, the Court would be reading a limitation into the claim from the specification, which is not appropriate. Additionally, while the prosecution history supports a finding that human interaction for the instant claim would be limited, such interaction is not precluded or prohibited. Accordingly the Court FINDS that substantially automated process as defined in the ‘513 Patent means “process that takes place with minimal, if any, human interaction.”

B. Effect of Prior Litigation

As stated above, SunTiger prevailed in a prior patent infringement suit against Scientific Research Funding Group (SRFG) on the same patents now in question. Both SunTiger and Sunglass Products have stipulated that the claim construction in the prior suit will control here:

The patents-in-suit have already been construed by the U.S. District Court for the Eastern District of Virginia [and that] construction . . . is binding on the parties in this case. To the extent that the terms in the asserted claims were not construed in the said prior litigation, the parties are asking the Court to make a claim construction based on the arguments submitted in the summary judgment motions.

Stipulation at 1-2. "In a patent litigation action, where the parties do not dispute any relevant facts regarding the accused product but disagree over possible claim interpretations, the question of literal infringement collapses into claim construction and is amenable to summary judgment.” Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1324 (Fed. Cir. 2002).

The relevant terms and their stipulated construction are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Stipulated Construction</th>
</tr>
</thead>
</table>
| "substantially block" | . . . in reference to wavelengths, it is defined as blocking over 99% of the incident radiation at each and every wavelength and "[in] reference to polarization, it is defined as blocking 80% or more of the horizontally polarized incident radiation at each and every wavelength"
| "substantially transmit" | . . . in reference to wavelengths, [it] is defined as transmitting more than 1% of the incident radiation at each and every wavelength and "[in] reference to polarization, it is defined as transmitting more than 20% of the horizontally polarized incident radiation at each and every wavelength"
| "sharp cut-on" | . . . sharp cut-on is defined in the context of a dye or filter, having a cut-on slope that at some concentration or dye density rises more than one half percent (0.5%) change in transmission for every one nanometer of increasing wavelength change. The cut-on slope is . . . |
that portion of the transmission spectra of a cut-on
dye that represents the transition between [the]
substantially blocking and the substantially
transmitting region."

"cut-on filter" "... an optical filter that substantially blocks all
wavelengths shorter than the cut-on wavelength and
substantially transmits all wavelengths that are longer
than the cut-on wavelength. The cut-on wavelength is
that wavelength in the transition zone at which the
transmission is 1%.

"portion" "... part or share of something"

Plaintiff SunTiger contends that this Court cannot apply the stipulated construction in a way that would contradict the
finding of the Eastern District of Virginia that YE-82 infringed SunTiger's patents. Pl.'s Mot. at 1 ("[T]he YE-82 lens
material must literally infringe whatever claim construction the Court adopts in this case."). In essence, SunTiger argues the
following: (1) the parties have stipulated to the prior construction, (2) the decision in the prior suit does not bind this Court,
but (3) any ruling that this Court issues must not be inconsistent with the fact that YE-82 was found to infringe its patents.

I disagree with this assessment. My decision is not foreordained by the result in SunTiger, Inc. v. Scientific Research
Funding Group. SunTiger attempts to elevate the prior claim construction to the level of a decision. Despite the parties'
agreement that the prior claim construction would be binding, that prior court's decision applying its own construction is
only persuasive. Although the parties have agreed to be bound to the use of the prior construction, they have not agreed that
this Court's application of that construction must be consistent with prior decisions involving a different defendant and
different lenses. Indeed, were consistency with prior results necessary, that would be tantamount to an improper form of
collateral estoppel against a current party, i.e., Sunglass Products, which was not a party (nor a party in privity) to SunTiger
1994) ("[D]ue process requires that the party to be estopped must have had an identity or community of interest with, and
adequate representation by, the losing party in the first action as well as that the circumstances must have been such that the
party to be estopped should reasonably have expected to be bound by the prior adjudication.").

GO BACK

4277

substantially congruent to said first layer of conducting strips in a top view

Claim 1 contains the term "substantially congruent to said first layer of conducting strips in a top view." Lonestar proposes
that the term means "one layer of conducting strips is 'substantially congruent to' another layer of conducting strips 'in a top
view' when the strips of each layer, as viewed from the top, have about the same dimensions and about the same shape." Nintendo proposes that the term means "having the same dimension and the same shape within manufacturing tolerances." The parties disagree on whether "substantially" means "about" or "allowing variation within manufacturing tolerances."

The Court adopts Lonestar's approach and construes "substantially congruent to said first layer of conducting strips in a top
view" as "having the same or very close shape and dimensions when viewed from the top." Nintendo's construction is not in
line with the meaning of "substantially" as used in the intrinsic record, in the case law, and in common usage. Neither the
claims nor the specification explicitly construe "substantially." However, the specification equates congruent to being
"identically dimensioned." In particular the specification states, "the strips 26A and 26B are arranged parallel to the strips
24B and 24A and are identically dimensioned so that the strips 26A and 26B are congruent with the strips 24B and 24A
below." Col. 2:32-35 (emphasis added); see Figure 2. Inherently this citation teaches that "substantially congruent" is
something less than "identically dimensioned." Nintendo cites to the use of "alignment tolerances" as used in the
specification. Col. 6:43-55. However, this citation refers to the impact alignment tolerances has on the formation of vias
between the layers as opposed to the meaning of substantially. The specification does not limit "substantially" to
"manufacturing tolerances."

Dictionaries and case law often define "substantially" as having a meaning consistent with "the same or very close." The Federal Circuit has construed "substantially" consistently with "the same or very close" in cases where the specification did not define the term of approximation at issue. See Anchor Wall Sys. Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1310-11 (Fed. Cir. 2003) (stating that "words of approximation, such as 'generally' and 'substantially,' are descriptive terms . . . to avoid a strict numerical boundary"); see Ecolab, Inc. v. Envirochem, Inc., 264 F.3d 1358, 1366 (Fed. Cir. 2001) (defining "substantially" as "largely but not wholly that which is specified"); see Liquid Dynamics Corp. v. Vaughan Co., Inc., 355 F.3d 1361, 1368 (Fed. Cir. 2004) (stating that "'substantial' is a meaningful modifier implying 'approximate,' rather than 'perfect'"). Additionally, dictionary definitions define "substantially" to mean "about" and "being largely but not wholly the specified thing." BLACK'S LAW DICTIONARY 1428-29 (6th ed. 1990); THE PENGUIN ENGLISH DICTIONARY 938 (1992); WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 1176 (1986). Thus, in the context of the '725 patent, "substantially congruent" means "having the same or very close shape and dimensions." Accordingly, the Court construes "substantially congruent to said first layer of conducting strips in a top view" as "having the same or very close shape and dimensions when viewed from the top."

**4278**

1. substantially equal

AUO contends that the term "substantially equal" should be construed in accordance with its plain meaning such that "substantially equal" means "a level that is not completely the same but can be accepted as a substantially equal level." LGD contends that the phrase "substantially equal" is indefinite, or in the alternative, should be construed as "a level which is not completely the same but can be accepted as a substantially equivalent level, and includes a level which is closer to an ideal quantity of light than [sic] no preventive measures are taken." D.I. 1388 at 101.

The Court concludes that the term "substantially equal" is not indefinite and should be defined as AUO proposes. This construction is consistent with the plain meaning of the term and the specification, which explains that the "representation 'substantially equal level' refers to a level which is not completely the same but can be accepted as a substantially equivalent level." '160 patent, col. 4, ll. 56-58; col. 9, ll. 19-23 (referring to Fig. 6 and the desire to obtain a "quantity of light (S) . . . which is approximately the same as the quantity of light (S) . . . [from an LC with] ideal response characteristic[s] (S*.S)"); col. 8, ll. 45-47 (quantity of light is "almost the same as" that of an ideal LC). In the Court's view, LGD's construction, improperly imports limitations from the preferred embodiment into the claims.

**4279**

8. Substantially Equal

Step (G) of Claim 11 provides: "awarding the progressive prize to the player if the generated random number is substantially equal to the prize winning number."

Defendants claim that the meaning of "substantially equal" is undefined in the patent, and hence indefinite. Plaintiffs suggest that "substantially equal," as used in the claim, means "equal." If Defendants are correct that the meaning of "substantially equal" is indefinite, then the claim would be invalid, and their motion for summary judgment should be granted. See 35 U.S.C. 112 ("The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention."); Seattle Box Co., Inc. v. Indust. Crating & Packaging, Inc., 731 F.2d 818, 826 (Fed. Cir. 1984).

Rejecting "a broad concept of indefiniteness, [wherein] all but the clearest claim construction issues could be regarded as giving rise to invalidating indefiniteness in the claims at issue," the Federal Circuit has created the following standard for assessing indefiniteness: "If one skilled in the art would understand the bounds of the claim when read in light of the specification, then the claim satisfies section 112." Exxon Research & Eng'g Co. v. U.S., 265 F.3d 1371, 1375 (Fed. Cir.
2001). Noting the complexity of the inquiry, the Exxon court stressed that '[i]n determining whether that standard is met, i.e., whether the claims at issue are sufficiently precise to permit a potential competitor to determine whether or not he is infringing,' we have not held that a claim is indefinite merely because it poses a difficult issue of claim construction." Id. (internal citation omitted). "If the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds." Id. Once a patent has been issued by the PTO, it possesses a presumption of validity, and a challenging party must present clear and convincing evidence to overcome that presumption. Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347-48 (Fed. Cir. 2005).

When faced with a similar allegation that the use of the term "substantially equal" rendered a claim indefinite, the Federal Circuit emphasized the need to determine whether the specification provides a standard for measuring the degree of equality encompassed by the term "substantially." Seattle Box Co., 731 F.2d at 826 (rejecting indefiniteness where specification identifying the purpose of a device could support a standard for measuring the degree needed to be considered); see also Mickowski v. Visi-Trak Corp. 36 F. Supp. 2d 171, 178 (S.D.N.Y. 1999) ("In this case, it is clear that the term [of art] "substantially" has been included merely to bridge the gap between the abstract description of a method and its practical application in the real world. . . . [and] adds nothing to the claim."). An issued patent should not be invalidated, even where some amount of experimentation is necessary to determine the degree required, if the claims otherwise enable the patent. Exxon Research, 265 F.3d at 1379 (also distinguishing another "substantially" case involving patent application, as opposed to issued patent, and where determining precise degree was critical to invention); Seattle Box Co., 731 F.2d at 826.

Here the specification provides some minimal basis for determining what degree of equality is required. In the portions of the specification addressing the matching of the random number to the prize winning number, it states that the numbers must be equal. (460 patent, col. 23:50-51, col. 16:43-45.) Although the only time the term "substantially equal" is used outside the claims is in connection with total wager amounts, its use in that passage provides some guidance for the meaning of the term and how a person of ordinary skill would understand the term in order to avoid infringement. n4 (Id. at col. 12:66 - col. 13:2 ("From the regulatory viewpoint, these checks ensure that the theoretical total wager amounts are substantially equal."))

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n4 We reject Defendants' argument that because "substantially equal" is used elsewhere in the specification, Mr. Torango should have used it in the portion describing the random number comparison, and since he did not, the term is indefinite.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The purpose of the patent is to link international gaming devices with diverse regulatory standards and currency fluctuations. The numbers are generated by mathematical formulas which include multiplying incremental and surcharge percentages of such minimal size as .0000015979493 (id. at col. 14:26), indicating that some devices may not present exact integer matches. Furthermore, different devices in different zones may have different regulatory standards requiring different exactitude in matches. A person of ordinary skill in the art should be able to engage in some amount of experimentation with these standards and percentages in order to determine what degree of equality is required between the random generated number and the prize winning number in order to produce an effective match while meeting the regulatory standards. The fact that the specification does not specify this degree is not fatal, given the presumption of validity attached to this issued patent and the fact that the patent does not indicate that the precise degree of equality is critical to the invention. See Exxon Research, 265 F.3d at 1379.

Thus, we find that the use of the term "substantially equal" does not render Claim 11 indefinite and summary judgment should not be rendered in favor of Defendants on that basis. Furthermore, we construe the term "substantially equal" to mean "equal to the extent that diverse regulatory standards and currencies are applied and the purpose of the invention is enabled."
material used as a base for an electronic component or circuit." The term "a first axially symmetric region" means "a region that is symmetric about the central axis of the wafer." The term "substantially free of agglomerated vacancy [or interstitial] defects" means "a concentration of such agglomerated defects which is less than the detection limit of these defects, which is currently about 1000 defects/cm³." The term "agglomerated vacancy intrinsic point defects" means "defects caused by the reaction in which vacancies agglomerate to produce D-defects, flow pattern defects, gate oxide integrity defects, crystal originated particle defects, crystal originated light point defects, and other such vacancy related defects." Finally, "agglomerated silicon self-interstitial intrinsic point defects" means "defects caused by the reaction in which self-interstitials agglomerate to produce dislocation loops and networks, and other such self-interstitial related defects."

II. "wherein said first bandwidth is substantially greater than said second bandwidth" 4

4 The parties identified the term "substantially greater" for argument at the Markman hearing. TERMS FOR HEARING at 3. However, the parties include the term "wherein said first bandwidth is substantially greater than said second bandwidth" in the claim chart, so the Court will construe this term. See CLAIM CHART at 64. The term "wherein said first bandwidth is substantially greater than said second bandwidth" is contained in claim 17 of the '937 patent.

Plaintiff's Proposed Construction

wherein said first bandwidth is

defendants' Proposed Construction

indefinite

sufficiently greater than said

second bandwidth such that applying

compression methods would be beneficial

Defendants argue that the specification fails to provide some standard for measuring the degree of the term "substantially greater" in order to apprise those skilled in the art whether they are practicing the claimed invention or not. REPLY at 6. Defendants also contend that Plaintiff's arguments to the contrary rely on portions of the specification that do not relate to comparing bandwidths as recited in claim 17. Id.

Plaintiff contends that the term "substantially" is not only commonly used, but also has been held not indefinite on numerous occasions by the Federal Circuit. RESPONSE at 11-12. Plaintiff points to a portion of the specification where the compression ratio is 3:1 as being an example in the '937 patent where the first bandwidth is "substantially greater" than a second bandwidth. Id. at 12-13.

Claim 17 of the '937 patent sets forth:

17. A method comprising:

receiving a data stream over an input having a first bandwidth;

compressing, in at least real-time, said received data stream using a plurality of encoders to provide a compressed data stream;

transmitting said compressed data stream over an output having a second bandwidth, wherein said first bandwidth is substantially greater than said second bandwidth and said transmitting said compressed data stream effectively increases said second bandwidth; and

wherein said compressing and said transmitting of said compressed data stream over said output occurs faster than a transmission of said data stream in uncompressed form over said output.
'937 patent at 20:9-2.

To the extent that Defendants argue that this claim is indefinite because the specification fails to explicitly delineate numerical boundaries for the "substantially greater" term, this is not required. A patentee is not required to define a claimed invention with mathematical precision in order to comply with the definiteness requirement. Oakley, Inc. v. Sunglass Hut Int'l, 316 F.3d 1331, 1341 (Fed. Cir. 2003) (citing In re Marosi, 710 F.2d 799, 802-803 (Fed. Cir. 1983)). In Marosi, the Federal Circuit noted, "[i]nsofar as it requires appellants to specify a particular number as the cutoff between their invention and the prior art, the PTO's position is impractical [because the] invention does not reside in such a number." Marosi, 710 F.2d at 802. There, the Court held that one skilled in the art would determine if a source is "essentially free of alkali metal" when it contains "unavoidable impurities in starting materials and essential ingredients." Id. at 803. In Oakley, however, the numerical value of the "differential effect . . . producing a vivid colored appearance" was a distinguishing feature over the prior art, and therefore particular numerical values should be--and were--disclosed in the specification. 316 F.3d at 1341-42.

In this case, that a first bandwidth is substantially greater than a second bandwidth is not a distinguishing feature over the prior art. As used here, "substantially greater" is a term of degree. The capacity difference between the two bandwidths is merely an initial parameter in defining a system which performs the claimed method of accelerating data storage. Further, the novelty of the invention does not lie in the capacity difference between the two bandwidths. Thus, as in Marosi, the claimed invention does not reside in a number delineating the capacity difference between the two disclosed bandwidths.

Defendants argue that the specification fails to disclose a frame of reference for determining when a first bandwidth is "substantially greater" than a second bandwidth. REPLY at 6-7. Defendants further argue that the portions of the specification that Plaintiff points to for this frame of reference are irrelevant to the relative size of the first and second bandwidths. However, the Court disagrees. That there is a dispute, even among those skilled in the art, as to the proper meaning of "substantially greater" does not, itself, render the claim invalid. Verve, LLC v. Crane Cams, Inc., 311 F.3d 1116, 1120 (Fed. Cir. 2002). Ambiguities which remain after examination of the claims and specification "may be aided by extrinsic evidence of usage and meaning of a term in the context of the invention." Id. at 1119. Thus, the question is not whether the word "substantially greater" has a fixed meaning as applied to the first and second bandwidths, "but how the phrase would be understood by persons experienced in this field of mechanics, upon reading the patent documents." Id. at 1119-20. The Federal Circuit has explained:

Definiteness problems often arise when words of degree are used in a claim. That some claim language may not be precise, however, does not automatically render a claim invalid. When a word of degree is used the district court must determine whether the patent's specification provides some standard for measuring that degree. The trial court must decide, that is, whether one of ordinary skill in the art would understand what is claimed when the claim is read in light of the specification.

Seattle Box Co. v. Industrial Crating & Packing, Inc., 731 F.2d 818, 826 (Fed. Cir. 1984). Thus, the manner in which one skilled in the art would read and understand the '937 patent is the lens through which the Court should view this term in order to determine the proper meaning.

One skilled in the art would understand that the purpose of this invention is to accelerate the transmission of data in a system limited by the second bandwidth because existing memory storage devices at the time this patent issued limited the performance of many disk and memory intensive operations. '937 patent at 2:22-25. Both claim 17 and the specification disclose that compressing the data effectively increases the second bandwidth, resulting in transmission of data faster than would be possible uncompressed. '937 patent at 20:9-25 (claim 17) ("said transmitting said compressed data stream effectively increases said second bandwidth; [resulting in data stream output which is] faster than a transmission of said data stream in uncompressed form over said output"); id. at 2:16-18 ("data compression can reduce the time to transmit data by more efficiently utilizing low bandwidth data links"). Claim 17 is drafted in such a way that one skilled in the art would understand that the difference in the first and second bandwidths is a system constraint related to the problems experienced in the field at the time the patent issued. This system constraint derives directly from the problems in the art, as disclosed by the patentee:

One problem with the current art is that existing memory storage devices severely limit the performance of [] computers for all disk and memory intensive operations. For example, magnetic disk mass storage devices currently employed in a variety of [] applications suffer from significant seek-time access delays along with profound read/write data rate limitations. Currently the fastest available (10,000) rpm disk drives support only a 17.1 Megabyte per second data rate
The specification of the '937 patent also discloses an embodiment with an input data rate of 90 MB/sec, a compression ratio of 3:1, and a maximum data storage rate of the data storage device of 20MB/sec. '937 patent at 10:1-8. While Defendants are correct that this example is not discussed in terms of bandwidth, that does not mean it is bereft of information regarding the relative bandwidths. In other words, if an input data rate is disclosed to be 90 MB/sec, then the first bandwidth of this input transmission line must be at least 90 MB/sec. Further, if the output of the data storage accelerator is 30 MB/sec and the maximum data storage rate of the data storage device is 20 MB/sec, then the second bandwidth--either the output of the data storage accelerator or the incoming transmission line of the data storage device--must be able to accommodate at least 20 MB/sec. Thus, in this example, the first bandwidth is at least 60 MB/sec greater than the second bandwidth or the relative bandwidth transmission rates is a ratio of at least 90 MB/s to 30 MB/s or 3:1. Further, a similar example is disclosed where the first bandwidth is at least 40 MB/sec greater than the second bandwidth--a ratio of 60 MB/s to 20 MB/s or, again, 3:1. '937 patent at 5:40-46. Thus, the '937 patent discloses at least two examples that one skilled in the art would view as a frame of reference for determining when a first bandwidth is "substantially greater" than a second bandwidth.

The '937 patent also indicates that the term "substantially greater" in claim 17 is a term of degree because its bounds depend on a number of variables within the data transmission system--variables which may have differing levels of relative importance depending on the particular application. See '937 patent at 10:8-13 ("[the problem of transmission delay] may be solved by adjusting anyone of the system parameters as discussed above, e.g., by adjusting the compression ratio to provide a data output rate from the data storage accelerator 10 to be equal to the data storage rate of the data storage device 45"); id. at 5:35-40 ("to achieve optimum throughput, the rate that data blocks from the input data stream may be accepted by the data storage accelerator 10 is a function of the size of each input data block, the compression ratio achieved, and the bandwidth of the target storage device"); see also id. at 9:43-61; id. at 14-23. Additionally, different benefits, which may or may not be desirable in particular applications, can result from the degree to which the first bandwidth is greater than the second bandwidth:

Depending on [a number of] factors [including] the bandwidth of the data storage device, and the intended application, the delay may or may not be significant. For example, in a modern database system, recording data for archival purposes, the opportunity for increased data compression may far outweigh the need for minimum delay. Conversely, in systems such as a military real-time video targeting system, minimizing delay is often of the essence.

'937 patent at 8:9-19. Thus, whether the "substantially greater" limitation of claim 17 reads on a particular application is a question that one skilled in the art would look to the particular system parameters in order to resolve because, without the context of the particular application in mind, a pure numerical bandwidth difference will not always establish whether the first bandwidth is "substantially greater" than the second bandwidth. See '937 patent at 20:9-25 (claim 17), Figs. 1, 8. Further, because the claimed invention "applies to all forms and manners of memory devices including storage devices utilizing magnetic, optical, and chemical techniques, or any combination thereof," '937 patent at 2:53-56, the relative bandwidths, and the effect of data compression, will vary greatly among different applications in which the invention is utilized.

In light of the language used in claim 17, the examples disclosed in the specification, the subject matter at issue, and the frame of reference in which one skilled in the art would understand the invention, the Court finds that the term "substantially greater" is expressed in terms that are reasonably precise. Verve, 311 F.3d at 1116 ("usages such as 'substantially equal' and 'closely approximate' may serve to describe the invention with precision appropriate to the technology and without intruding on the prior art"); Exxon Research and Engineering, Co. v. United States, 265 F.3d 1371, 1379 (Fed. Cir. 2001) (holding the term "for a period sufficient" to attain a stated goal was not indefinite because an example of a preferable period was given in the specification and because "the patent makes clear that the period in question
The parties contest the definition of the term "substantially identical in uniformity to" as used in Claim 1. TLI contends that the term "substantially identical in uniformity to" does not need to be construed because it does not limit the claim. See TLI's Br. at 8. However, TLI argues that should the court decide that the preamble is limiting, the term "substantially identical in uniformity to" should be accorded its ordinary and customary meaning. See id. According to TLI, the ordinary and customary meaning of the term "substantially" is "same or very close to." Thorn EMI N. Am. v. Intel Corp., 936 F. Supp. 1186, 1198 (D.Del. 1996). See id.

Sylvania argues that the term "substantially identical" is explicitly defined in the specification of the '017 patent, and therefore, the court should adopt the patent's definition of this term. Phillips v. AWH Corp., 415 F.3d 1303, 1316 (Fed. Cir. 2005) (In cases where specification explicitly defines how term should be construed, inventor's lexicography governs). See id. According to Sylvania, there is no support in the specification of the '017 patent for TLI's proposed claim construction that the term "substantially identical" should mean "same or very close to." See id.

The specification of the '017 Patent states, in relevant part that:

As used in this specification, the term substantially identical refers to a total light output which, at each of the wavelengths between about 400 and 700 nanometers on a continuum, is within about 30 percent of the D(l) value determined by the aforementioned formula and wherein the combined average of all of said wavelengths is within about 10 percent of the combined D(l) of all of said wavelengths.

See Specification at col. 6 lines 45-51 (emphasis added). I find that because the inventor specifically defined the term "substantially identical" in the specification of the '017 patent, the patent's definition controls this court's interpretation of that term, and mandates that the term "substantially identical in uniformity to" as used in the '017 patent must be construed to require "a total light output which, at each of the wavelengths between about 400 and 700 nanometers on a continuum, is within about 30 percent of the D(l) value [as determined by a specified formula] and wherein the combined average of all of said wavelengths is within about 10 percent of the combined D(l) of all of said wavelengths." See '017 patent at Col. 6, lines 45-51.
The device of claim 13 wherein:

(i) said plurality of update operations is performed n times; and

(ii) the value of said updated secret parameter after said processor has performed said n update operations can be derived by said receiving device from the value of said secret parameter before said n operations with substantially less computational effort than would be required to perform n update operations.

The parties dispute the construction of the phrase "substantially less computational effort." The "Summary of the Invention" section of the specification describes the process as follows:

If the number of operations that can securely be performed by a client is n (i.e., n different transactions can be performed, without using the same secret value more than a fixed number of times), a server knowing or capable of obtaining the client's initial secret value K (or initial state corresponding thereto) can derive any resulting secret value (or corresponding state) in the series of transactions significantly faster than by performing n corresponding updates. Indeed, the state for any given transaction can often be derived by a server using $O(\log n)$ calculations of $F_A$ or $F_B$ (or their inverses).

('092 Patent, Col. 3:5-15.)

A person of ordinary skill in the art at the time of the invention would understand that the invention is a server which derives a "resulting secret value or corresponding state" by using an algorithm, which is different than the algorithm of the transformation operation used in the client device. Using this algorithm, the server arrives at the same result with fewer computations than it would have to perform if it repeated the transformation operations performed by the client device.

Accordingly, the Court construes "with substantially less computational effort" to mean: with substantially fewer computations.

ATC's argument that none of the experts in this case have heard of the term "substantially monolithic" prior to this case misses the point. Whether or not the phrase existed is not the issue; rather, the question is whether "one skilled in the art would understand the bounds of the claim when read in light of the specification." See Exxon, 265 F.3d at 1375 (citation omitted). In the present case, both Dr. Ewell and Dr. Huebner testified that the term was clear and understandable to persons of ordinary skill in the art. Moreover, a claim term is not indefinite as long as the meaning of the claim is discernible through construction, "even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree." Id. (citations omitted). In the present case, the Court was able to construe the term "substantially monolithic" by adopting the definition proposed by ATC. In light of this, whether or not the term was "new" or "unheard of" is legally irrelevant.

ATC next argues Dr. Ewell's "fracture test" does not cure the indefiniteness of the claim term, but rather confuses it even further. "The scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1350 (Fed. Cir. 2005) (citation omitted). Rather, "[s]ome objective standard must be provided in order to allow the public to determine the scope of the claimed invention." Id. According to ATC, these criteria are not satisfied with respect to the term "substantially monolithic" because it is not based on an objective standard, but rather depends on a questionable "fracture test" pursuant to which a capacitor may infringe when used in one activity, but not infringe when used in another. See Paragon Solutions, LLC v. Timex Corp., 566 F.3d 1075, 1090-91 (Fed. Cir. 2009); Halliburton Energy Services, Inc. v. M-I LLC, 514 F.3d 1244, 1254-55 (Fed. Cir. 2008) ("When a proposed construction requires that an artisan make a separate infringement determination for every set of circumstances in which the composition may be used, and when such determinations are likely to result in differing outcomes (sometimes infringing and sometimes not), that construction is likely to be indefinite.").

However, contrary to ATC's arguments, a claim term is not indefinite just because it was "intended to cover the use of the invention with various types of [end products]." See Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1575-76 (Fed. Cir. 1986) ("That a particular chair on which the claims read may fit within some automobiles and not others is of no moment. The phrase 'so dimensioned' is as accurate as the subject matter permits, automobiles being of various sizes." (citation omitted)). In the present case, one skilled in the art can easily use Dr. Ewell's objective "fracture test" to determine whether any resulting capacitor is "substantially monolithic." See id. More importantly, unlike the cases relied upon by ATC, this does not mean that the same capacitor will be infringing in one case and not infringing in another; rather, once built, a particular capacitor designed for a particular use will be either "substantially monolithic" or not. (See Trial Tr. Day 4, at 129:2-130:22; Trial Tr. Day 7, at 74:10-75:2.) Indeed, in light of Dr. Ewell's testimony that 100% "monolithicness" is not possible in any case, the phrase "substantially monolithic" might very well be "as accurate as the subject matter permits." See Orthokinetics, 806 F.2d at 1576.

In this context, the Court rejects ATC's argument that the Court cannot rely on Dr. Ewell's testimony at trial because it constitutes extrinsic evidence that contradicts the intrinsic record. See Phillips v. AWH Corp., 415 F.3d 1303, 1318 (Fed. Cir. 2005) ("[A] court should discount any expert testimony 'that is clearly at odds with the claim construction mandated by the claims themselves, the written description, and the prosecution history . . . '" (citation omitted) (emphasis added)). In light of the fact that the '356 patent does not anywhere define "substantially monolithic," Dr. Ewell's testimony regarding his "fracture test" cannot be "clearly at odds" with the intrinsic record. See id.

Similarly, to the extent ATC's first ground of indefiniteness raises the same arguments as with respect to enablement and written description, those arguments are rejected for the same reasons as set forth above. Specifically, the use of the term
"sufficiently close" does not make the whole claim term less definite. Just like the terms "about" or "substantially," the term "sufficiently close" appears to be a descriptive term used in patent claims to "avoid a strict numerical boundary to the specified parameter." See Ecolab, 264 F.3d at 1367; accord Verve, 311 F.3d at 1120. Moreover, there was sufficient evidence presented at trial to find that the novelty of the '356 patent was precisely the fact that once the external contacts are arranged "sufficiently close," a fringe-effect capacitance is formed. How "sufficiently close" they should be arranged would necessarily depend on the thickness of those contacts and the type of dielectric used. (See Trial Tr. Day 4, at 81:8-81:22.) To specify any particular distance between the contacts would have unnecessarily limited the scope of the claimed invention, thereby depriving the inventors of the "benefit of [their] invention." See Verve, 311 F.3d at 1120.

ATC next argues Dr. Ewell's proposed "test" for whether a fringe-effect capacitance is "determinable" compounds rather than clarifies the ambiguity. As previously noted, "[t]he scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention." Datamine, 417 F.3d at 1350 (citation omitted). Rather, "[s]ome objective standard must be provided in order to allow the public to determine the scope of the claimed invention." Id. In the present case, that requirement is satisfied because Dr. Ewell testified that one of ordinary skill in the art can use a capacitance meter--an objective test--to measure whether "determinable" fringe-effect capacitance is present between a particular set of external contacts. 21 (See, e.g., Trial Tr. Day 7, at 111:23-112:3, 114:12-114:17, 115:15-116:21, 119:23-120:12.) Likewise, Dr. Huebner testified that to determine whether the contacts were "sufficiently close" to form a determinable fringe-effect capacitance, a person of ordinary skill in the art could analyze the thickness of the external contacts, the separation distance, the dielectric itself, and the dielectric constant--all of which are objective details. (See Trial Tr. Day 4, at 81:8-81:22.) ATC's own expert, Dr. Dougherty, confirmed the propriety of both of these methods. (See, e.g., Trial Tr. Day 5, at 144:17-146:17.)

--- Footnotes ---

ATC next argues Dr. Ewell's proposed "test" for whether a fringe-effect capacitance is "determinable" compounds rather than clarifies the ambiguity. As previously noted, "[t]he scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention." Datamine, 417 F.3d at 1350 (citation omitted). Rather, "[s]ome objective standard must be provided in order to allow the public to determine the scope of the claimed invention." Id. In the present case, that requirement is satisfied because Dr. Ewell testified that one of ordinary skill in the art can use a capacitance meter--an objective test--to measure whether "determinable" fringe-effect capacitance is present between a particular set of external contacts. 21 (See, e.g., Trial Tr. Day 7, at 111:23-112:3, 114:12-114:17, 115:15-116:21, 119:23-120:12.) Likewise, Dr. Huebner testified that to determine whether the contacts were "sufficiently close" to form a determinable fringe-effect capacitance, a person of ordinary skill in the art could analyze the thickness of the external contacts, the separation distance, the dielectric itself, and the dielectric constant--all of which are objective details. (See Trial Tr. Day 4, at 81:8-81:22.) ATC's own expert, Dr. Dougherty, confirmed the propriety of both of these methods. (See, e.g., Trial Tr. Day 5, at 144:17-146:17.)

--- End Footnotes ---

ATC has also failed to show by clear and convincing evidence that the '356 patent fails to differentiate itself from the prior art identified in Figure 2A. "[W]hether the patent expressly or at least clearly differentiates itself from specific prior art... is an important consideration in the definiteness inquiry because in attempting to define a claim term, a person of ordinary skill is likely to conclude that the definition does not encompass that which is expressly distinguished as prior art." Halliburton, 514 F.3d at 1252. In the present case, the '356 patent adequately differentiates what is claimed from the prior art depicted in Figure 2A. For example, in describing Figure 10A, which depicts an embodiment of the claimed capacitor, the '356 patent notes that as compared to the capacitor in Figure 2A, "the external conductive plates 72 and 74 in the lower section 62 of the device have been extended toward each other so as to create a capacitance between plates 72 and 74 based upon fringe electric field extending to and from the adjacent edges of those plates." ('356 patent, col. 7:22-7:26.) In contrast, there is no discussion of any fringe-effect capacitance, much less capacitance that is "determinable," with respect to prior art depicted in Figure 2A. (See id., col. 2:17-2:44.) Likewise, with respect to Figure 2A, there is no discussion of any "external contacts" that are "sufficiently close" to each other. (See id.) Accordingly, the '356 patent sufficiently differentiates the prior art depicted in Figure 2A from what is claimed in the asserted claim 1.

[SEE FIG. 2A IN ORIGINAL]

[SEE FIG. 10A IN ORIGINAL]

Finally, ATC's "functional language" argument fares no better. Particular scrutiny is required where a claim is defined "by what it does rather than what it is." Halliburton, 514 F.3d at 1255. The vice of such "functional claiming" occurs "when the inventor is painstaking when he recites what has already been seen, and then uses conveniently functional language at the exact point of novelty." Id. (quoting Gen. Elec. Co. v. Wabash Appliance Corp., 304 U.S. 364, 371, 58 S. Ct. 899, 82 L. Ed. 1402, 1938 Dec. Comm'r Pat. 813 (1938)). The Federal Circuit, however, has held that claim language is not necessarily indefinite for using functional language. See, e.g., Microprocessor Enhancement Corp. v. Texas Instruments Inc., 520 F.3d
1367, 1375 (Fed. Cir. 2008). There is nothing intrinsically wrong with using functional language in claims, unless it fails to "provide a clear-cut indication of the scope of the subject matter embraced by the claim." Id. (internal quotation marks and citation omitted). In the present case, the '356 patent differentiates its invention from the prior art by requiring that there be external contacts that are located in such proximity to each other as to form a fringe-effect capacitance. In light of Dr. Ewell's testimony, this provides sufficient description of the scope of the asserted claims. See Halliburton, 514 F.3d at 1256.

iii. Conclusion

Accordingly, ATC has failed to show by clear and convincing evidence that the phrases "substantially monolithic" and "sufficiently close . . . to form a first fringe-effect capacitance" are indefinite as a matter of law.

2. "said substantially opaque material being a black polyimide material" (Claim Element 2) (Claims 4 and 8 of the '711 Patent)

ATI has proposed plain meaning for the term "black polyimide material." Dkt. No. 113, Ex. at 2. Sharp and DNP have proposed that this term means "a polymer with an imido as the monomer unit and is of the color black." Id. The Order construed this term to mean "the material that substantially prevents transmission (or passage) of light is a black polyimide material."

a. Objections

DNP objects that "[t]he Order also errs in failing to construe the term 'polyimide in Claim Element 2 because DNP's construction provides additional guidance on the meaning of the term and properly relies on a dictionary definition, whereas the intrinsic record provides no explanation of the term." Dkt. No. 126 at 18. ATI responds that "DNP's proposed definition of 'black polyimide' was not supported by any intrinsic or extrinsic evidence, as DNP cited but then modified a dictionary definition." Dkt. No. 130 at 19.

b. Discussion

The specification provides no guidance on the meaning of "black polyimide" other than that it is an example of a "polymeric material." '711 Patent at 4:50-55. DNP's proposed dictionary-based definition "provides no more guidance to the jury than 'black polyimide material,'" as the Order found. Dkt. No. 117 at 50. The objections should be overruled and the Order should be affirmed as to "black polyimide material."

C. "providing orientation information from a substantially omni-directional three-dimensional orientation of capture"

The term "providing orientation information from a substantially omni-directional three-dimensional orientation of capture" appears in numerous claims in the '524 Patent. Both parties cite to the file history of the '524 Patent in proposing constructions of this phrase. Cognex offers the following: "providing information that allows the symbol to be captured in substantially any orientation (up to 360 degrees of rotation) about an axis perpendicular to the plane of the symbol itself and with substantially any angle of tilt of the data field relative to that axis." Cognex contends language of rotation and tilt properly clarify the limitation that orientation information provided by the symbol must allow capture of the symbol both at substantially any angle or rotation of the symbol in a plane perpendicular to the axis of the camera imaging it and at substantially any angle of tilt of the plane of the symbol relative to that axis. Defendants argue Cognex's proposed construction improperly focuses on portions of the file history relating to the capture of the symbol to be acquired, and assert that the capture function is different from providing orientation information, the term that is at issue here. Citing to the file history, Defendants argue the term "omni-dimensional" is specifically defined in the prosecution history of the '524 Patent as meaning "any direction" and propose the following construction: "providing orientation information from
substantially any direction of capture in three dimensions."

The Court concludes that the ordinary and customary meaning of the term "omnidirectional three-dimensional" is "any direction." See Phillips, 415 F.3d at 1312-13; Vitronics, 90 F.3d at 1582 (citing Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996) (holding that a "technical term used in a patent document is interpreted as having the meaning that it would be given by persons experienced in the field of the invention, unless it is apparent from the patent and the prosecution history that the inventor used the term with a different meaning"). The Court's determination is reinforced by the prosecution history cited by Defendants. In a preliminary amendment to the '524 Patent dated May 3, 1995, the patentee, in distinguishing the invention over a prior art reference, remarked to the Patent Office: "The present invention also includes this ability to provide three dimensional orientation information in an 'omni-directional' or from 'any direction' of capture." Accordingly, the Court construes this disputed term as "providing orientation information from substantially any direction of capture."

27. Substantially peak rates

The court construes "substantially peak rates" to mean "simultaneous parallel processing using all or nearly all of the entire width of the data path."

GO BACK

4288

4. "side surfaces of said embedded insulator being substantially perpendicular to said semiconductor substrate"

This term appears in claim 1 of the '715 patent and a virtually identical phrase appear in claim 3 with the word "therein" inserted between "insulator" and "being." Toshiba does not believe the term requires construction but alternatively suggests the phrase means "side surfaces of the insulator are to a large degree perpendicular to the semiconductor substrate." Jt Cl Const, Ex C at 11. Hynix asserts that this term is indefinite, but in the alternative, proposes that it means "side surfaces of the embedded insulators are within one or two degrees of perpendicular to the semiconductor substrate." Id.

Hynix argues that the phrase "substantially perpendicular" is indefinite because "it is unclear what degree of taper, if any, may be present" in the side walls of the embedded insulators. Hynix Br at 24. In particular, Hynix argues this phrase embraces only the minor, one or two degree variations in perpendicularity incidentally formed by the reactive ion etching (RIE) techniques used in this invention. According to Hynix, "substantially perpendicular" cannot encompass deliberate attempts to taper the side walls of the embedded insulators through "RIE techniques under taper etching conditions."

But Hynix's arguments ring hollow. First, Hynix's contentions regarding "RIE techniques under taper etching conditions" have no bearing on the degree of taper in the side walls of the embedded insulators. The patent discusses this fabrication technique only once with respect to creating tapered side walls for the etch masks, not the embedded isolators. '715 patent at 25:9-12, FIG 37.

More importantly, the specification depicts numerous embodiments in which the side walls of the embedded insulator are slanted by more than one or two degrees. See '715 patent FIGS 15A, 15B, 18, 19, 20A, 20B, 21, 22, 23A, 23B, 24A, 24B, 25A, 25B, 29, 30, 31, 32, 33, 35, 36, 37, 38, 40. Indeed, the court's measurements of the embodiments in these figures indicate that these side walls deviate by at least seven (7) degrees. Hynix's construction would exclude these embodiments and is therefore disfavored. See C R Bard, 388 F3d at 865 ("[A] construction that excludes a preferred embodiment 'is rarely, if ever, correct.'").

Although the patent does not provide a numerical limitation for the term "substantially," the disclosed embodiments and the ordinary and plain meaning of "substantially" should be sufficient to guide a jury in performing its duties. If necessary, and if the parties marshal any new intrinsic evidence, the court would consider revisiting this issue at a later date. But for present purposes, the court rejects Hynix's construction and declines to construe this term.
10. "substantially replaceable" and "differing unscrambling circuits"

The terms "substantially replaceable" and "differing unscrambling circuits" appear in claim 8 in the following context:

Said unscrambling means being substantially replaceable with differing unscrambling circuits as appropriate to unscramble the particular one of a multiple of differing scrambling techniques selected for said scrambling means.

'066 Patent, col. 6, lines 40-46.

The plaintiff asserts that the terms "substantially replaceable" and "differing unscrambling circuits" do not require construction. Defendant EchoStar argues that "substantially replaceable" is indefinite under 35 U.S.C. § 112, P2 because it provides that some unidentified amount of circuitry or degree of functionality of the unscrambling means is replaceable. The DIRECTV defendants argue that "substantially replaceable" means a substantial part of the unscrambling means is located on a user exchangeable unscrambling card. All defendants argue that "differing unscrambling circuits" means the set of separate and distinct circuits, each of which unscrambles signals that are scrambled according to a single, matching scrambling technique.

The invention concerns a manner to inexpensively control access to a scrambled signal. '066 Patent, Abstract. It begins with a master programmable scrambling circuit which includes a number of differing coding techniques. Id. at col.2, lines 5, 37-47. However, as the patent notes:

To include the wide variety of coding capabilities in the master scrambling circuit would be expensive. However, since only one master scrambling circuit is necessary per system this cost is acceptable.

Id. at col. 2, lines 55-59. In addition, the specification notes that "in contrast with normal scrambling the number of differing techniques is more important to the invention than the sophistication of any particular one technique." Id. at col. 2, lines 50-53.

The invention is made inexpensive and secure through the use of, for example, user exchangeable plastic cards, about the size of credit cards, where "each plastic card contains an electronic circuit with accompanying electronic contacts." Id. at col. 3, lines 12-17. The specification explains:

When any particular unscrambling card is inserted into the slot in the decoding box, a series of spring loaded conductive fingers make electrical connection with the series of electronic contacts on such unscrambling card. This connection has the effect of including the electronic circuit on the card into the reception circuit. . . . By merely removing one card and replacing it with another, the entire decoding characteristic of the reception circuit can be completely changed in an instant.

* * *

Due to the incorporation of at least some of the decoding circuitry into the card, no amount of tinkering with a decoding box would enable a user to override the scrambling. The possession of a decoding box therefor does not advantage anyone--the decoding boxes by themselves are sufficiently worthless for unscrambling a signal that such boxes could even be given away without significant risk.

Id. at col. 3, lines 36-61, and col. 4, lines 34-42.

As noted earlier, "the definiteness inquiry focuses on whether those skilled in the art would understand the scope of the claim when the claim is read in light of the rest of the specification." Union Pacific Resources, 236 F.3d at 692. As the Federal Circuit explained in Seattle Box Co., Inc. v. Industrial Crating & Packing, Inc., 731 F.2d 818, 826(Fed. Cir. 1984), a case involving whether the term "substantially equal to" was so indefinite as to render the patent invalid:
Definiteness problems often arise when words of degree are used in a claim. That some claim language may not be precise, however, does not automatically render a claim invalid. When a word of degree is used the district court must determine whether the patent's specification provides some standard for measuring that degree. The trial court must decide, that is, whether one of ordinary skill in the art would understand what is claimed when the claim is read in light of the specification.

The thrust of EchoStar's indefiniteness argument is:

There is no way to know whether "substantially replaceable" refers to a percentage of the amount of circuitry in the unscrambling means that is subject to replacement, or instead to either the amount or significance of the functionality being replaced. Further still, there is no guidance on what percentage of circuitry or degree of functionality—which ever one it is—must be subject to replacement to be within the invention.

EchoStar's protestations notwithstanding, it is apparent that one of ordinary skill in the art would understand the term "substantially replaceable" as used in claim 8 to apply to either the amount of circuitry or its functionality, whichever technique is used to alter one user card from the others. The term merely means that when one user card is activated, that card's circuitry replaces the circuitry of any other user card for use in the unscrambling means. Only by inserting the presently activated user card into the decoding box is the unscrambling means able to unscramble the signal. The active user card may, but need not, vary from another user card in the percentage of the circuitry on the card or merely by the functionality of the circuitry on the active user card.

Consistent with this construction of the term, I reject the DIRECTV defendants' construction that a substantial part of the unscrambling means, e.g., a substantial part of the circuitry, must be located on the user exchangeable unscrambling card.

I agree that the term "differing unscrambling circuits" requires that each user card have distinct circuitry.

I construe the terms "substantially replaceable" and "differing unscrambling circuits" to mean that the distinct circuitry of the active user card must take the place of the circuitry of any other user card for use in the unscrambling means.

H. "Receiving and Substantially Simultaneously Processing the Second Quantity of Digital Data to Determine if at Least One of Said Predefined Sequences is Present in the Second Quantity of Digital Data"

Claim 17 of the patent claims the method of Claim 1, further comprising two additional steps: first, causing a second quantity of digital data to be transferred, and second, "receiving and substantially simultaneously processing the second quantity of digital data to determine if at least one of said predefined sequences is present in the second quantity of digital data." '776 Patent, col. 18, lns. 40-43. The parties dispute the meaning of this second step. Plaintiff contends that the phrase means that "the second quantity of digital data is received and processed at substantially the same time as the first quantity of digital data (from claim 1) is received and screened." JCCS, Appx. A, at 15 (term 57). Defendant contends that this phrase means that "the computer system of claim 1 receives the second quantity of digital data and, at substantially the same time as the computer system is receiving the second quantity of digital data, the computer system examines the second quantity of data to determine if the data contains at least one predefined sequence." Id. In other words, plaintiff construes the term as requiring substantial simultaneity between the receipt and screening of the first quantity of data and the receipt and screening of the second quantity of data, while defendant construes the term as requiring substantial simultaneity between receipt of the second quantity of data and the screening of that data.

Defendant contends that plaintiff's construction is open-ended, and would allow plaintiff to argue that different computers can receive and process the two packets of data. Even if that argument were valid in the abstract, it has little weight here in light of the Court's construction of "computer system" as meaning a personal computer or workstation. Claim 17 is dependent upon Claim 1, and requires the second quantity of data to be transferred to "said computer system"—i.e., to the same computer that receives and screens the first quantity of data. The specification does make clear that what is being
taught in the patent is, as defendant argues, multiple data transfers to a single computer system. It also makes clear, however, that Claim 17 relates to simultaneous receipt and screening of overlapping data packets, not merely simultaneity between receipt and screening of one, subsequent quantity of data. See '776 Patent, col. 6, lns. 47-52 ("By use of an assignable MachineHandle, the invention is able to support separate simultaneous data transfers which may overlap in time. In other words, the system could be configured with multiple input ports, such as multiple serial ports, all receiving the data at the same time.").

In other words, both parties are partially correct. Defendant is correct that Claim 17 is properly construed as requiring that receipt and screening of the second quantity of data occur in the same computer system as the receipt and screening of the first quantity of data, and plaintiff is correct that simultaneity refers to overlap between the receipt and screening of the two quantities of data. Accordingly, the Court adopts its own construction of the phrase--to wit, the phrase means: "the computer system of claim 1 receives the second quantity of data and the second quantity of data is received and processed at substantially the same time as the first quantity of digital data is received and screened."

4291

B. Effect of Prior Litigation

As stated above, SunTiger prevailed in a prior patent infringement suit against Scientific Research Funding Group (SRFG) on the same patents now in question. Both SunTiger and Sunglass Products have stipulated that the claim construction in the prior suit will control here:

The patents-in-suit have already been construed by the U.S. District Court for the Eastern District of Virginia [and that] construction . . . is binding on the parties in this case. To the extent that the terms in the asserted claims were not construed in the said prior litigation, the parties are asking the Court to make a claim construction based on the arguments submitted in the summary judgment motions.

Stipulation at 1-2. "In a patent litigation action, where the parties do not dispute any relevant facts regarding the accused product but disagree over possible claim interpretations, the question of literal infringement collapses into claim construction and is amenable to summary judgment." Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1324 (Fed. Cir. 2002).

The relevant terms and their stipulated construction are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Stipulated Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;substantially block&quot;</td>
<td>&quot;. . . in reference to wavelengths, it is defined as blocking over 99% of the incident radiation at each and every wavelength&quot; and &quot;[in] reference to polarization, it is defined as blocking 80% or more of the horizontally polarized incident radiation at each and every wavelength&quot;</td>
</tr>
<tr>
<td>&quot;substantially transmit&quot;</td>
<td>&quot;. . . in reference to wavelengths, [it] is defined as transmitting more than 1% of the incident radiation at each and every wavelength&quot; and &quot;[in] reference to polarization, [it] is defined as transmitting more than 20% of the horizontally polarized incident radiation at each and every wavelength&quot;</td>
</tr>
<tr>
<td>&quot;sharp cut-on&quot;</td>
<td>&quot;. . . sharp cut-on is defined in the context of a dye or filter, having a cut-on slope that at some concentration or dye density rises more than one half percent (0.5%) change in transmission for every one nanometer of increasing wavelength change. The cut-on slope is that portion of the transmission spectra of a cut-on dye that represents the transition between [the] substantially blocking and the substantially</td>
</tr>
</tbody>
</table>
transmitting region."

"cut-on filter" . . . an optical filter that substantially blocks all wavelengths shorter than the cut-on wavelength and substantially transmits all wavelengths that are longer than the cut-on wavelength. The cut-on wavelength is that wavelength in the transition zone at which the transmission is 1%."

"portion" . . . part or share of something

Plaintiff SunTiger contends that this Court cannot apply the stipulated construction in a way that would contradict the finding of the Eastern District of Virginia that YE-82 infringed SunTiger's patents. Pl.'s Mot. at 1 ("[T]he YE-82 lens material must literally infringe whatever claim construction the Court adopts in this case."). In essence, SunTiger argues the following: (1) the parties have stipulated to the prior construction, (2) the decision in the prior suit does not bind this Court, but (3) any ruling that this Court issues must not be inconsistent with the fact that YE-82 was found to infringe its patents.

I disagree with this assessment. My decision is not foreordained by the result in SunTiger, Inc. v. Scientific Research Funding Group. SunTiger attempts to elevate the prior claim construction to the level of a decision. Despite the parties' agreement that the prior claim construction would be binding, that prior court's decision applying its own construction is only persuasive. Although the parties have agreed to be bound to the use of the prior construction, they have not agreed that this Court's application of that construction must be consistent with prior decisions involving a different defendant and different lenses. Indeed, were consistency with prior results necessary, that would be tantamount to an improper form of collateral estoppel against a current party, i.e., Sunglass Products, which was not a party (nor a party in privity) to SunTiger v. Scientific Research Funding Group. Cf. MCA Records, Inc. v. Charly Records, Ltd., 865 F.Supp. 649, 654 (C.D. Cal. 1994) ("[D]ue process requires that the party to be estopped must have had an identity or community of interest with, and adequate representation by, the losing party in the first action as well as that the circumstances must have been such that the party to be estopped should reasonably have expected to be bound by the prior adjudication.").

2. The district court defined a "substantially uniform magnetic field" as a magnetic field that is "substantially uniform to obtain useful MRI images." Medrad proposes that a substantially uniform magnetic field is a magnetic field "that has largely, but not wholly, the same form throughout." Although Medrad may have waived that construction by arguing it to the district court only after the magistrate judge made his recommendation, we do not have to decide the waiver issue because we agree with the magistrate judge's definition.

Medrad bases its construction of "substantially uniform" on this court's interpretation of the same term in Ecolab, Inc. v. Envirochem, Inc., 264 F.3d 1358 (Fed. Cir. 2001). Ecolab involved a patent for a solid detergent cast used in commercial dishwashing machines. The disputed claim term described the cast as a "substantially uniform alkaline detergent for ware and hard surface washing." The district court construed "substantially uniform" in that case to mean "a level of continuity of the elements from top-to-bottom throughout the case such that a homogenous cleaning solution is formed over the life of the cast." Id. at 1365. This court reversed. We noted that the claim at issue was entirely structural and contained no functional limitations. In particular, we explained, the claim contained "no claimed functional requirement as to forming a homogeneous wash solution throughout the cast life," other than for the detergent "to contain components capable of 'ware and hard surface'" washing. Id. at 1366. In that setting, we held that there was "no basis on which to require adding a functional limitation" under the guise of construing the term "substantially uniform." A more appropriate definition, we held, would be "largely, but not wholly the same in form." Id. at 1369.

A particular term used in one patent need not have the same meaning when used in an entirely separate patent, particularly one involving different technology. In fact, there are many situations in which the interpretations will necessarily diverge. A patentee may define a particular term in a particular way, and in that event the term will be defined in that fashion for
purposes of that particular patent, no matter what its meaning in other contexts. See Hormone Research Found., Inc. v. Genentech, Inc., 904 F.2d 1558, 1563 (Fed. Cir. 1990). Moreover, claim terms are typically given their ordinary and accustomed meaning as understood by one of ordinary skill in the pertinent art, and the generally understood meaning of particular terms may vary from art to art. Interactive Gift Express, Inc. v. Compuserve Inc., 256 F.3d 1323, 1332 (Fed. Cir. 2001); Dow Chem. Co. v. Sumitomo Chem. Co., 257 F.3d 1364, 1372 (Fed. Cir. 2001). Even absent an express definition of a term in the specification or prosecution history, or a clearly established understanding of the meaning of the term in the art, the manner in which the term is used in the patent may dictate a definition that differs from the definition that would be given to the same term in a different patent with a different specification or prosecution history. See Young Dental Mfg. Co. v. Q3 Special Prods., 112 F.3d 1137, 1143 (Fed. Cir. 1997) ("The specification that is relevant to claim construction is the specification of the patent in which the claims reside.").

That is the situation in the present case. The use of a term in a patent on a detergent is of little pertinence to the use of a similar term in a patent on MRI RF coils. Rather, absent some particular reason to do otherwise, the claim terms must be interpreted as would one of ordinary skill in the art of MRI technology and in light of the particular patent in suit.

Apart from arguing that the Ecolab court's definition of "substantially uniform" should be applied in this case, Medrad invokes the Ecolab case in support of the broad proposition that it is never proper for a court, when construing claim terms, to consider how a claimed device functions. That is an overreading of Ecolab, however. The Ecolab court found no reason to import the requirement that the substantially uniform cast create a homogeneous cleaning solution over the life of the cast. Ecolab, 264 F.3d at 1369. In so doing, the court set forth and applied the unremarkable proposition that where a function "is not recited in the claim itself by the patentee, we do not import such a limitation." Ecolab, 264 F.3d at 1367. Medrad has taken the quoted language from Ecolab and extended it to reach a nonsensical result. Medrad argues that a court may not look to how an invention functions in determining the meaning of claim terms. Yet nothing in Ecolab or any other precedent of this court supports such a proposition, which is as unsound as it is sweeping. As we stated in Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998), "ultimately, the interpretation to be given a term can only be determined and confirmed with a full understanding of what the inventors actually invented and intended to envelop with the claim." It is therefore entirely proper to consider the functions of an invention in seeking to determine the meaning of particular claim language.

Medrad would have us look at the words of the claim with no context of what an RF coil does and how it works. We have repeatedly rejected that approach. "We cannot look at the ordinary meaning of the term … in a vacuum. Rather, we must look at the ordinary meaning in the context of the written description and the prosecution history." DeMarini Sports, Inc. v. Worth, 239 F.3d 1314, 1324 (Fed. Cir. 2001); see also K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1365 (Fed. Cir. 1999).

The record in the instant case makes it clear that the district court's construction was correct. Unfortunately, the claim itself provides little guidance. The term "substantially uniform first magnetic field" is ambiguous in that it fails to suggest how much a magnetic field may deviate from absolute uniformity before it is no longer uniform. That question is especially significant because Medrad's own expert admits that "magnetic field strength varies routinely in all RF coil systems." Medrad implicitly acknowledged the difficulty created by the use of the term "substantially uniform," and it contended before the magistrate judge that a substantially uniform magnetic field is one that is similar to the magnetic field produced by a "single birdcage coil." There is, however, no support anywhere in the record for that construction. Medrad apparently employed that construction because a birdcage coil is the "gold standard" for coils that generate uniform magnetic fields. But the patent itself rebuts Medrad's suggestion that a substantially uniform magnetic field is comparable to that produced by a birdcage coil. The specification states that RF coils may be "crossed saddle quadrature coils or Helmholtz pairs." '273 patent, col. 6, ll. 15-17. Yet Medrad's own expert admitted that crossed saddle quadrature coils or Helmholtz pairs cannot produce magnetic fields as uniform as a birdcage coil, so by its terms the patent encompasses coils that are not as uniform as birdcage coils. A "claim construction that does not encompass a disclosed embodiment is … rarely, if ever, correct." Johns Hopkins Univ. v. Cellpro, 152 F.3d 1342, 1355 (Fed. Cir. 1998). Thus, the construction that Medrad proposed to the magistrate judge fails as well.

The only guidance for the definition of "substantially uniform" in the claim language comes from the preamble, which claims an "imaging system for forming images of a region of interest." Both parties' experts agreed that it is important to remove inhomogeneities in the magnetic field generated by the RF coils, or the resulting MRI images will be permanently distorted. As Mr. Misic explained, if the coils do not uniformly transmit, the contrast in the images suffers: "it makes things look different" and "you can't re-correct that after the fact." The problem of image distortion puts an upper bound on the
degree of nonuniformity allowable in the magnetic field, which is part of an "imaging system for forming images of a region of interest." That interpretation is further supported by the specification, which gives as an object of the invention "to provide greater image uniformity than provided in the prior art." '273 patent, col. 2, ll. 38-39.

Additionally, that interpretation aligns with the conventional understanding of the term in the MRI industry. MRIDC's expert, Dr. Peter Roemer, explained that a substantially uniform magnetic field "means a sufficient uniformity to give a good image." Dr. Roemer also was able to give a quantitative estimate for the amount of field variation allowable that would "produce good images over a wide range of imaging sequences," putting that variation at around 200 percent. Medrad's expert refused to give quantitative estimates for the amount of field variation allowable. Rather, in defining substantial uniformity, Medrad's expert, Ken Belt, could only refer to the field produced by a birdcage coil. As we stated above, the patent claims are not limited to the uniformity of field produced by a birdcage coil. Still, Mr. Belt's testimony is implicitly consistent with Dr. Roemer's definition. Specifically, Mr. Belt was giving the example of an RF coil capable of producing a good image. Therefore, we hold that the claim language, the specification, and the expert testimony all illustrate that a "substantially uniform magnetic field" is a field that is sufficiently uniform to obtain useful MRI images.

3. What is the meaning of the phrases "substantially zero overlap" and "substantially aligned"?

Throughout this litigation, Intel has asserted that "substantially zero overlap" and "substantially aligned" mean that the edges of the source/drain regions cannot overlap the edges of the gate electrode to any degree. By contrast, TENA has contended that "substantially zero overlap" and "substantially aligned" do not require perfect alignment. Rather, TENA asserts that these phrases allows for a tolerance of +/-10% of the gate electrode length. Neither argument has much credibility.

a. Does the patent require zero overlap and perfect alignment?

Intel essentially wants the court to read the word "substantially" out of the claims. Intel argues that the claims, the specification, and the prosecution history use the phrases "zero overlap/perfect alignment" and "substantially zero overlap/substantial alignment" interchangeably. For example, the title of the patent, the abstract, the summary of the invention, and the preambles of claims 1, 10, and 15 recite "zero overlap," "perfect alignment," and "non-overlapping," whereas the preferred embodiment and step (e) of each claim recite phrases such as "closely aligned," "substantially aligned," "without substantial overlap," and "substantially zero overlap." Moreover, in Amendment B and the First Proposed Amendment, Manzo refers to "zero drain overlap devices" and "perfect alignment" in describing the inventions of the '943 patent.

Intel relies heavily on Amhil Enterprises Ltd. v. Wawa, Inc., 81 F.3d 1554 (Fed. Cir. 1996). In Amhil, the Court of Appeals for the Federal Circuit construed the phrases "substantially vertical sides," "substantially vertical side edges," and "substantially vertical side walls." The court observed that the preferred embodiment was completely vertical but stated that this was not determinative. Id. at 1559. Examining the entire specification, the court stated that the patentee used "substantially vertical" and "vertical" interchangeably, even within the claims themselves. Id. Examining the prosecution history, the court stated that the patentee narrowed "substantially" to overcome similar prior art and again used "substantially vertical" and "vertical" interchangeably. Id. at 1559-62. Finally, the court stated that to avoid prior art in a crowded field, "substantially vertical face" had to be construed "as the same as or very close to 'vertical face.'" Id. at 1562.

Although Amhil is certainly helpful in construing the claims, it is not precisely on point. The invention in Amhil, which is related to plastic coffee mug lids, involves a large physical structure whose dimensions are relatively easy to control and measure. By contrast, the invention of claim 1 of the '943 patent is submicroscopic and has dimensions that are difficult to control and measure. In addition, the '943 patent does not use the terms "substantially aligned" and "aligned" or "substantially vertical" and "vertical" interchangeably within the claims themselves. Furthermore, the Federal Circuit seemed to rely primarily on the fact that the invention in Amhil was in a crowded art that compelled a narrow construction. Finally, the court still found that "substantially" had some meaning in the claim, albeit a very narrow meaning. Therefore, Amhil does not support Intel's effort to deprive "substantially" of any meaning whatsoever.
b. Does the patent allow for a tolerance of +/- 10%?

TENA wants to give the word "substantially" a broad, specific numerical reading. TENA points to the declaration and testimony of Dr. Fair, who defines "substantially zero overlap" and "substantially aligned" as allowing a tolerance as +/-10% of the drawn gate length based on his "knowledge of MOS transistors." TENA also points to the specification, at column 1, lines 21-23, which uses the phrase "substantially aligned" in discussing the prior art: "Conventional fabrication techniques usually cause the edges of the source/drain regions to be initially substantially vertically aligned with the edges of their gate." Dr. Fair asserts that the alignment of these conventional fabrication techniques was within +/-10% of the gate electrode length. Finally, TENA observes that one of Intel's experts, Dr. Frey, testified in a previous litigation that the term "substantially aligned" allowed for tolerances of +/-10% of the gate electrode length.

TENA's evidence is less than convincing. It appears from Dr. Frey's previous testimony that he identified a range of +/-5% on either side of the edge of the gate electrode, making a total range of 10% instead of +/-10% for a total range of 20%. In addition, Dr. Chung testified, and Dr. Fair appeared to confirm, that an underlap of -10% would drastically reduce the performance of an MOS transistor, particularly with respect to the problem of Miller capacitance that the '943 patent seeks to avoid. Finally, Dr. Fair has not cited to anything in the claims or prosecution history in support of his opinion that the +/-10% range is appropriate. His attempt to bootstrap his definition of "substantially" in the claims by defining the word "substantially" in the specification to mean the same thing is questionable without some objective basis.

c. What does "substantially" mean?

The word "substantially" tends to become somewhat of a chameleon when it appears in patent claims. It sneaks in during the prosecution of a patent application without having much substance or importance. The applicant rarely imposes strict mathematical requirements or guidelines for the word unless forced to do so by the examiner or by the prior art. After the issuance of the patent, however, the word swells up to envelop potentially infringing products or processes. The plaintiff's expert opines that a specific percentage range exists and, coincidentally, that the range encompasses the defendant's accused products or processes. Likewise, the defendant's expert opines that a smaller range exists that, coincidentally, does not encompass the defendant's accused products or processes.

Courts are in a bind when it comes to construing the word "substantially." On the one hand, the court has a duty according to Markman to construe the word to provide guidance to the jury as to the proper scope of the claim for determining infringement. This duty is particularly important when the parties' experts have testified to conflicting mathematical ranges required by the claim. Moreover, the ordinary meaning of the word "substantially" -- "in a substantial manner" or "so as to be substantial" -- is practically useless as a guide to understanding or decision. On the other hand, a court should not impose mathematical certainty on a word when none exists. Often the claims, the specification, the prosecution history, and even all the extrinsic evidence will fail to provide any reasonable basis for selecting a mathematical range.

1 Webster's Third New International Dictionary 2280 (1986).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

In the present case, the specification and the prosecution history present only theoretical limits to the percentage range allowed by the word "substantially." The specification states that the amount of overlap and alignment must be sufficient to prevent the occurrence of Miller capacitances in order to increase the speed of the transistor, but it does not provide a mathematical reference. During the prosecution, Manzo specifically defined "substantially zero overlap" and "zero drain overlap" over the results achieved by Figure 10 of U.S. Patent No. 4,356,623 issued to Hunter, Figure 4D of EPO publication 24 125, and the Steinmaier patent, but he never provided a mathematical explanation of the prior art process. Furthermore, the parties have never offered extrinsic evidence to suggest mathematical ranges based on these theoretical limits, and the court lacks sufficient understanding or skill to ascertain such ranges itself.

The parties instead have offered what appear to be litigation-driven constructions of the term "substantially" that have little support in the claim language, the specification, the prosecution history, or the extrinsic evidence. Intel's construction seeks to write the word out of the patent and to impose a level a mathematical certainty that does not appear physically possible.
By contrast, TENA's construction ignores a specific goal sought by the inventions of the '943 patent and argued by Manzo extensively during the prosecution history: manufacturing an MOS transistor with as little overlap as possible to improve operating speed and reduce Miller capacitances. Thus, at the end of the claim construction hearing, the court was compelled to reject both parties' constructions in favor of its own.

The court adopted the following construction of the word "substantially" -- "the same as or very close to." In other words, "substantially zero overlap" means "the same as or very close to zero overlap" and "substantially aligned" means "the same as or very close to perfect alignment." The court bases this construction on the many references to zero overlap and perfect alignment in the patent and the prosecution history and the stated importance in the specification of near-perfect alignment for the speed and efficiency of the inventions of the '943 patent. No further guidance is possible, however, because nearly every attempt to restate the word "substantially" adds little to its inherent meaning.

The district court construed the phrases "substantially aligned" and "substantially zero overlap" to mean "the same as or very close to perfect alignment" and "the same as or very close to zero overlap," respectively. EMI does not challenge the latter definition, but contests the use of "perfect alignment" in defining "substantially aligned." According to EMI, the term "perfect" is superfluous and inappropriate. However, the district court extensively documented the statements in the '943 specification and the prosecution history that "perfect alignment," along with "zero overlap," was a key distinguishing aspect of this invention.

We also observe that this aspect of the claim construction does not affect the infringement decisions, which accepted that Intel employed, literally, the heat driving step of clause (e) to achieve the alignment and zero overlap required by clause (e).

Broadcom proposes construing the term "substantially zero" to mean "very low," and provides expert testimony supporting its position that a person of ordinary skill in the art would understand the term in this fashion. (Fair '194 Rep. PP 59-62.) Agere proposes to construe "substantially zero" to mean "zero," thereby reading the word "substantially" out of the claim entirely, but provides no technical or evidentiary basis for doing so. 61 Indeed, if the patentee had intended to say "zero static current," he could have done so. See Interactive Gift Exp., 256 F.3d at 1331 (noting that claim construction must "begin and remain centered on" language that patentee "chose to use"). Thus, the Court credits Dr. Fair's unrebutted testimony that a person of ordinary skill in the art would understand the term at issue to mean "very low static current." In total, therefore, the Court adopts Broadcom's proposed construction.

61 In fact, Agere argues that the term "substantially zero" is so ambiguous that it could even be construed to mean "more than substantially zero" (although Agere does not actually request that the Court adopt this construction). (Agere Resp. at 92.) To the extent that Agere contends that the specifications create such ambiguity, the Court rejects this argument because it is belied by Dr. Fair's unrebutted testimony that a person of skill in the art would understand the specifications to refer to "very low" static current dissipation. (Fair '194 Rep. P 62.)

--- End Footnotes ---
C.

The Commission construed "substrate" as "the supporting material in an LED upon which the other layers of an LED are grown or to which those layers are attached" and included the case in which "the supporting material functioning as the substrate is grown on top of, or attached to, the other layers." Commission Opinion, slip op. at 8-12. Epistar disputes the Commission's ruling that a "substrate" need not, by itself, provide adequate mechanical support for the LED. It argues a substrate can only be "a layer which is present as the supporting material that makes the device large and sturdy enough to manipulate, and which provides a surface upon which the other layers can be attached to, grown, or deposited."

Claim 1 of the '718 patent requires only "a semiconductor substrate" and does not impose any limitation on its thickness or amount of mechanical support. '718 patent col.5 ll.33-44. Epistar does not cite to any statement in the specification or file history suggesting that the substrate, by itself, must make the LED "large and sturdy enough to manipulate." While the '718 patent describes a thicker layer as a "substrate," the Commission followed this court's precedent in declining to limit the construction of "substrate" to that embodiment. See, e.g., Phillips, 415 F.3d at 1323 ("A[though the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments."). Commission Opinion, 2008 ITC LEXIS 1062 at *6. Moreover, the specification explains that the thickness identified for the substrate is merely "exemplary." '718 patent col.5 ll.3-4.

Epistar also would limit "substrate" to a single layer. Although Epistar urges this court to apply the ALJ's construction, which was modified by the Commission, Epistar does not point to any intrinsic evidence to justify this limitation on the broad term "substrate." The Commission correctly declined to limit "substrate" to the preferred embodiments in the specification.

Moreover, the Commission's construction is consistent with this court's precedent that the disclosure of a preferred or exemplary embodiment encompassing a singular element does not, without more, disclaim a plural embodiment. See KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000); see also AbTox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023 (Fed. Cir. 1997). Therefore, consistent with established precedent, the term "substrate" may include one or more layers of "supporting material" for the active LED layers.

Epistar argues that the ITC's construction renders the term "substrate" meaningless because "every layer below the active layers," such as confining layers, would qualify as a substrate. To the contrary, claim 1 and the specification prevent the substrate from encompassing these other layers. For example, even without the "adequate mechanical support" limitation, the confining layers cannot qualify as a substrate because they are part of the "active p-n junction layers," defined by claim 1 and the specification as "on top of" and "over the substrate." Id., col.2 ll.50-57; col.5 ll.36-37. Indeed, as disclosed in the embodiment of figure 2, the only layer below the active layers 21-23 is substrate 20, which meets the "semiconductor substrate" limitation of claim 1. See id., fig. 2; col.2 ll.48-59; col.5 ll.34-37. Accordingly, this court finds that the Commission did not err in construing the term "substrate."

2. Revising the Definition of "Substrate"

In Rothschild I, Judge Conner construed "substrate" to mean "an underlying base on which an epitaxial layer is grown." Rothschild I, 2007 U.S. Dist. LEXIS 33134, [WL] at *12. Rothschild asks the Court to revisit Judge Conner's allegedly "faulty" definition and to simply define "semiconductor substrate" as "the semiconductor material of interest." Rothschild Mem. Law Supp. Mot. Clarify Claim Construction at 17. In essence, Rothschild wants a definition of substrate that does not require an overlying layer, so that the uppermost Mg-doped GaN layers in twenty of the twenty-one accused processes would be infringing. This is not the first time Rothschild has proposed such an extraordinary definition for the term "substrate." In Rothschild I, Rothschild's proposed definition for "substrate" as "any semiconductor material" was expressly rejected by Judge Conner, who referred to Rothschild's reasoning as a "bewildering non-sequitur." Rothschild I, 2007 U.S.
In support of its position, Rothschild refers to Shealy's expert report on the meaning of "semiconductor substrate" in Claim 10 of the '499 Patent. See Ladow Decl. Supp. Mot. Clarify Claim Construction Ex. 7, Shealy Opening Rep. PP 32-33. Shealy opines that one of ordinary skill in the art would recognize that, "even if the term is not used in its most common manner . . . the term semiconductor substrate is . . . synonymous with the semiconductor material of interest." Id. P 33. Shealy relies on the absence of any discussion in the patent documentation "to the effect that the semiconductor material . . . necessarily must be an underlying base layer for another layer." Id. Further, Shealy states that "no additional epitaxial layer on top of the semiconductor layer of interest is needed, or even relevant to, carrying out the method disclosed and claimed in the patent." Id. In other words, since the claimed method could be applied to any layer, and not just a layer underneath another layer, the term substrate should essentially be read out of the term "semiconductor substrate."

This Court rejects Shealy's reasoning because in the absence of a clearly disclosed special meaning, claim language must be given its customary meaning to a person of ordinary skill in the art. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 980 (Fed. Cir. 1995), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996) ("[A]ny special definition . . . must be clearly defined in the specification."); Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1370 (Fed. Cir. 2005). First, the '499 Patent does not contain any special definitions for "substrate" or "semiconductor substrate." In Rothschild's deposition, she admitted that the '499 Patent expressed no intention to use the term "substrate" in any way other than its customary meaning in the art. Cree Supplemental Claim Construction Br. Ex. 4, Rothschild Dep. 140:16-21, Feb. 5, 2007. Second, Shealy conceded in his expert report that, in common usage, the term ""semiconductor substrate' . . . could mean an underlying base on which an epitaxial layer is grown." Shealy Opening Rep. P 33. At his deposition, Shealy even admitted that neither he, nor anyone in the semiconductor field, would refer to the topmost layer in his own semiconductor device as a "substrate." Shealy Dep. 39:13-23. Rothschild also testified that "the most customary usage" of the term "substrate" was to refer to "a slice of semiconductor material used as a base" or "something you deposited something else on." Rothschild Dep. 136:21-137:11. When writing the patent, Rothschild had the opportunity to define semiconductor substrate any way she desired. See Markman, 52 F.3d 967 at 980 ("[A] patentee is free to be his own lexicographer. The caveat is that any special definition given to a word must be clearly defined in the specification.") (citation omitted). Since Rothschild did not avail herself of that opportunity, the term "semiconductor substrate" must be given its customary meaning to a person of ordinary skill in the art, which requires an overlying layer. Accordingly, this Court rejects Rothschild's contention that "semiconductor substrate" is synonymous with the semiconductor material of interest.

3. Whether the Definition of "Substrate" Has a Mechanical Support Requirement

Cree argues that by using the term "supporting base," Judge Conner imposed a requirement that a "substrate" must provide mechanical support for itself and the layer grown on its surface. Cree Mem. Supp. Non-infringement at 19; Cree Reply Mem. Supp. Non-infringement at 13. Cree's argument centers around the following passage in Rothschild I:  

"Consistent with what was said above in discussing the term "epitaxial layer" in the '618 Patent, if, but only if, an epitaxial layer serves as a supporting base for another epitaxial layer grown on its upper surface, the underlying epitaxial layer may properly be described as a "substrate" for the layer above."

Cree should not place such significance on a single phrase in Judge Conner's discussion concerning the meaning of substrate. The discussions solely focused on the issue whether epitaxial layers should be expressly excluded from the definition of substrate. As Judge Conner stated, Rothschild's "real interest is in obtaining for the term 'substrate' a construction broad enough to cover epitaxial layers," while "Cree takes the diametrically opposite position that a 'substrate' cannot be an epitaxial layer, and that it should be given its plain and ordinary meaning." Rothschild I, 2007 U.S. Dist. LEXIS 33134, [WL] at *9-10. The purpose of the passage was to emphasize that an epitaxial layer can only be a substrate if there is "another epitaxial layer grown on its upper surface," and was directed towards Rothschild's proposed definition of substrate as "any semiconductor material," regardless of whether there is an overlying layer. Further, Judge Conner's declared construction makes no mention of "supporting base" but instead uses the term "underlying base." Rothschild I, 2007 U.S. Dist. LEXIS 33134, [WL] at *12. The term "underlying base" carries with it no thickness or mechanical support connotations. Moreover, Judge Conner's explanation of this definition shows no intention to impose a mechanical support
requirement. As Judge Conner explained: "in defining the term 'substrate,' we do not believe it appropriate, as advocated by Cree, either to specifically exclude epitaxial layers or to do so impliedly by use of the word 'slice,' which is appropriate only with reference to bulk crystals." 2007 U.S. Dist. LEXIS 33134, [WL] at *11. By rejecting Cree's exclusionary construction, and adopting a construction that makes no mention of "supporting base," Judge Conner surely intended that all epitaxial layers that serve as an "underlying base on which an epitaxial layer is grown" are "substrates," regardless of their thickness or ability to offer mechanical support. Finally, in defining "substrate," Judge Conner was mindful not to "exclude epitaxial layers or to do so impliedly." Id. (emphasis added). Importing a mechanical support or thickness requirement into "substrate" would impliedly exclude some or all epitaxial layers because an "epitaxial layer" is, by definition, "thin." Rothschild I, 2007 U.S. Dist. LEXIS 33134, [WL] at *7 (defining "epitaxial layer" as "a thin layer formed by epitaxial growth on a crystalline base"). It would make no sense for Judge Conner to include epitaxial layers that act as an underlying base in the definition of "substrate" only to impliedly exclude them.

For all the foregoing reasons, this Court rules that Judge Conner's definition of "substrate" as "an underlying base on which an epitaxial layer is grown" does not have any mechanical support or thickness connotations.

4298

1. "substrate"

Agere argues that the term "substrate" should be construed as "any material on which other materials may be formed or deposited." Atmel argues that the term "substrate" should be construed as "the underlying material upon which a device, circuit or epitaxial layer is fabricated." Atmel essentially contends that the term "substrate" applies only to the semiconductor wafer itself, whereas Agere wishes to construe the term more broadly. The Court concludes that the term should not be construed as referring only to the semiconductor wafer itself. However, because the Court finds Agere's construction to be unnecessarily broad, the Court shall provide its own construction of the term.

Claim 1 itself states that the first step of the process is "treating a substrate" and explains that this is accomplished by, first, "forming a passage through a region overlying a device junction," and second, "depositing a material over at least a portion of said region." '672 Patent at col. 6:50-54. The parties have agreed that "passage" as used in the '672 patent means "a hole that exposes a device junction," Joint Statement of Claim Terms at 4, and Atmel readily concedes that "a junction is essentially a region that has been created in the semiconductor substrate," Def.'s Second Brief at 43. It is also undisputed that this "region overlying a device junction" through which a passage is formed refers to a "dielectric layer positioned above the semiconductor substrate." Id.; see also '672 Patent at col. 1:29-32. Thus, since the claim 1 language itself expressly provides that the process of "treating a substrate" includes forming a passage through the dielectric layer above the semiconductor substrate, the "substrate" which is being treated must encompass both the semiconductor substrate and the dielectric region above it. Similarly, claim 1 also recites that tungsten is then deposited by a process in which "said substrate is heated to a deposition temperature in the range 250 [degrees] C. to 600 [degrees] C." '672 Patent at col. 6:65-66. At this stage in the process, it is clear that both the dielectric and the barrier layers have already been deposited on the silicon wafer. Thus, the term "substrate" here clearly refers to more than the silicon wafer alone.

Moreover, an examination of the specification reveals that the patentee consistently used the term "silicon substrate" or "silicon prototype wafer" to refer to a bare silicon wafer with no additional layers of material, and the term "substrate" to refer to the entire entity comprising an underlying silicon wafer and any additional materials, such as a dielectric layer, deposited over the wafer. See '672 Patent at col. 2:45-53; col. 3:22-67; col. 5:44-48. Thus, a person of ordinary skill in the art would have understood the term "substrate" when used without the modifier "silicon" to mean "any underlying material or materials (such as a silicon wafer alone or a silicon wafer combined with other layers such as a dielectric layer) upon which other materials may be formed or deposited."
As with "pattern" and "mask," the parties agree that the word "substrate" has an established meaning in scientific parlance. See, e.g., McGraw-Hill Dictionary of Scientific and Technical Terms (defining "substrate" as, inter alia, "the physical material on which [a] microcircuit is fabricated"). As with "pattern" and "mask," though, the parties disagree regarding the breadth the construction of "substrate" should take. ASML contends, and the court does not disagree entirely, that "substrate" signifies "an item such as a photosensitive member that is exposed with a pattern." But however initially valid ASML's broad phrasing, the term "substrate" does more than signify a purely generic type of device. "Substrate," as it is used in claim 1, denotes an item (e.g., a wafer) to which a photosensitive layer is affixed; the transfer of the pattern through the photolithographic exposure process has nothing to do with the meaning of the bare "substrate" term. A narrower, more particularized usage comports with ordinary meaning of the term and with the specification language, see '041 Patent at 1:19-24, two things the court plainly cannot ignore. See Vitronics, 90 F.3d at 1582.

When construing the "substrate" term, moreover, the court need not articulate a definition that reiterates the meaning of an entire claim or that revisits the function of an entire invention. To a significant degree, Nikon's attempt to affix "during a lithographic operation" as a modifier to its definition--like its "exposed with a pattern" addition--aims to fold a general description of the photolithographic process into the meaning of the unadorned "substrate" term, spurring unnecessary redundancy in the name of claim construction. The claim language suggests that a "substrate" is an item on which a photosensitive layer is placed, and the specification language supports this simple understanding. See, e.g., '041 Patent at 1:19-24 & 3:15-37. Nothing more need be added. Thus, consistent with this intrinsic evidence, the court construes "substrate" to mean "an item on which a photosensitive layer or pattern is formed or placed."

B. "substrate interval correction means"

Plaintiff argues that the phrase "substrate interval correction means" should be construed to mean a "structure located in the region of the sealing material where there is no conductive material that is connected to any electrical circuit." Defendants argue that the phrase should be construed to mean "a structure designed to displace the sealing material by the same amount that the sealing material at a corresponding location is displaced."

Plaintiff's proposal is irreconcilable with the language of the claim. First, plaintiff's construction omits any notion of "correction." Placing a "structure" in the portions of the seal region where no wiring lines exist, with no restriction on the size or shape of the structure, will not necessarily "correct" anything. Also, the additional requirement of plaintiff's proposed construction—that the interval correction means not contain conductive material that is connected to any electrical circuit—is already expressly required by the final element of claim 1: "said substrate interval correction means includes at least a conductive layer that is not electrically connected to one of the matrix circuit or the peripheral drive circuit." Id. at 16:61-64 (emphasis added). The matrix circuit and the peripheral drive circuit are the only two circuits expressly named in the claim. Plaintiff's proposed construction therefore omits a limitation that it should include and includes a limitation that it should omit.

Defendants' proposed construction is closer to what the claim requires, but is unclear in two respects. First, defendants argue that the interval correction means "displaces" the sealing material. Neither the claims nor the specification uses the word "displace" or provides any guidance as to its meaning. Second, defendants argue that the interval correction means must displace the sealing material by "the same amount" as "at a corresponding location." The definition does not make clear what the proper "corresponding location" is.

Looking at the disputed language, "substrate interval correction means," has two elements. First, the means must "correct." Second, the means must correct the "substrate interval." The problem which is the subject of the 189 patent is a lack of uniformity in the interval between the substrates as a result of asymmetry in the wires crossing the sealing region. See, e.g., id. at 2:43-52 ("the wiring structure has no symmetry with respect to top and down as well as right and left... It is difficult to make an interval between the substrates uniform"). The 189 patent solves the problem of asymmetry by placing compensating structures in the areas of the sealing forming region where no wires cross.

The proper construction of the disputed term is "a structure, located in the areas of the sealing forming region where no wires cross, which compensates for the asymmetry in the wires crossing the sealing region."
Subsystem

Claims 1, 4, 5, 6, 7, 8, 9, 10, 11, 12, 14, 15, 17, 18, 19, 20, 22, 23, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, and 40 contain the term "subsystem." SFA suggests that the term is self-defining and no limitations are necessary beyond the common meaning: "a system that is part of a larger system." Infor concedes that SFA's definition is commonly understood and does not dispute its accuracy. Regardless, it contends that reading the term in context reveals that a "subsystem" must be a) separate from the event manager, b) either hardware or software, and c) must correspond to a phase in the sales process. Thus, Infor defines "subsystem" as "a hardware or software module independent of the event manager and corresponding to a phase of the sales process."

Initially, Infor's use of the word "module" does little to clarify or assist the jury in understanding the scope of "subsystem" and creates more ambiguity than it corrects. Further, each of the limitations that Infor seeks to apply to "subsystem" are contained elsewhere in the claims. As explained, the limitation in independent claims 1 and 40 that the event manager is "coupled to" the subsystems sufficiently discloses the relationship between the event manager and subsystems. Additionally, all independent claims contain the limitation that the system, for which the subsystems are a part, must be "computer implemented" and thus comprised of hardware and software. Finally, all the independent claims require that the system, and thus the subsystems, be used to "facilitate the sales process." Therefore, "subsystems" used to facilitate another process would conspicuously fall outside the scope of the patent. In light of the claims and specification, no additional limitations must be imposed upon a "subsystem." Therefore, the term is construed in accordance with its ordinary interpretation: "a system that is part of a larger system."

D. "Subsystem"

1. Proposed Constructions

Defendants claim that "subsystem" should be construed to mean "an interconnected combination of a set of related components or circuits to form a subdivision of a system." Defendants' '736 Br. at 9. Specifically, defendants contend that the claimed subsystems of the '736 patent each perform a particular function or functions by receiving signals, processing those signals, and outputting the processed signals. Id.

On the other hand, plaintiffs assert that "subsystem" need not be separately construed at all. If construction of the term is required, however, plaintiffs argue that it should be construed according to its plain and ordinary meaning of "a portion of a larger system." Plaintiffs' '736 Br. at 10. Plaintiffs further assert that a "subsystem" may be formed out of a collection of circuits and/or functional blocks. Id. In that case, plaintiffs argue that each of the claimed subsystems would describe its own particular set of limitations, and the term "subsystem" would refer only to the collection of circuits that perform the specified functions. Id.

To clarify the difference between plaintiffs' and defendants' proposed constructions of "subsystem," plaintiffs explain that they do not attempt to construe "subsystem" in the abstract because it is always used in connection with additional language describing the type of subsystem being claimed. Reply at 4. Instead, plaintiffs assert that the context in which "subsystem" is used should be the basis for assigning a meaning to the term. Id.

Both parties contend that their construction comports with the ordinary meaning of the term. Plaintiffs assert that the plain and ordinary meaning of "subsystem" is their proposed construction of "a portion of a larger system." Plaintiffs' '736 Br. at 10. Defendants, on the other hand, assert that the ordinary meaning of "subsystem" is their proposed construction of "an interconnected combination of a set of related components or circuits to form a subdivision of a system." Defendants' '736 Br. at 9. Standing alone, neither assertion is persuasive.
2. Claim Language

Claims 1 and 7 utilize "subsystem" in the following three phrases: "read channel subsystem," "error code correction and detection subsystem," and "memory subsystem."

In support of plaintiffs' proposed construction of "subsystem" as "a portion of a larger system," plaintiffs argue that claims 1 and 7 always use "subsystem" in connection with additional language describing the type of subsystem being claimed, for example, "read channel subsystem," "error code correction and detection subsystem," and "memory subsystem." Plaintiffs' '736 Br. at 10. Defendants, however, argue that the claim language demonstrates that the claimed subsystems of the '736 patent each perform a particular function or functions by receiving signals, processing those signals, and outputting the processed signals. Defendants' '736 Br. at 9.

3. Specification

In support of defendants' proposed construction of "subsystem" as an "interconnected combination of a set of related component or circuits to form a subdivision of a system," defendants assert that the specification identifies the need to increase efficiency by making the processing subsystems "less complex, occupy less real estate (i.e., use less silicon resulting in smaller dies), have a smaller pin count, make efficient use of memory and processing resources, and be cheaper to manufacture than conventional playback systems." Id. at 10; '736 patent at 3:50-58. Defendants contend that the specification confirms that the claimed subsystems of the '736 patent each perform a particular function or functions by receiving signals, processing those signals, and outputting the processed signals. Defendants' '736 Br. at 9.

To refute plaintiffs' proposed construction that "subsystem" should be interpreted to mean "a portion of a larger system," the defendants contend that the specification identifies a problem of separate subsystems in the prior art that "occupy valuable real estate in the playback system and as a whole make the playback system bulky and expensive." Id.; '736 patent at 3:8-23. Defendants further contend that the specification states that this separate-subsystem problem "results in inefficient use of system processing and memory resources and hinders efficient sharing of distributed resources." Defendants' '736 Br. at 9-10; '736 patent at 3:8-23.

It would appear that by their proposed construction, defendants are attempting to define a particular level of integration of components making up a subsystem claimed in the '736 patent. The imposition of such limitations is not warranted by the intrinsic evidence. The court concludes that, because "subsystem" is always used in the claims to refer to the collection of circuits that performs a function specified in the claim, "subsystem" does not require separate construction.

4303

2. subtree

The term "subtree" likewise appears in every claim. Claim 1 explains that the input/output provides a "means for broadcasting received from a parent processing element to said child processing elements, such that common information is distributed to each processing element of the binary tree or a subtree thereof . . . ." '201 Patent at 70:62-66.

Plaintiff construes "subtree" to mean "a partitionable portion of a tree that is less than the entire tree created by arbitrarily denoting a node to be the root node in a tree," Fifth Generation's Opening Markman Brief on Claim Construction ("Pl. Br.") at 13, asserting that this construction is consistent with ordinary meaning "in the art of computing." 2 Id. Defendant construes the term as "a subset of the binary tree such that each node has a single parent and two children nodes, except the root node, which has no parent, and the leaf nodes, which have no children." Def. Br. at 10.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

2 Plaintiff originally omitted the term "arbitrarily" in the construction it proposed in a pre-briefing conference with defendant and subsequently added it in its briefs for the Markman hearing. IBM's Rebuttal Markman Brief ("Def. Reply") at 4 n.4.
The parties essentially agree that a subtree is a subdivision of the main binary tree and that a subtree is itself a binary tree with the full functionality of the main binary tree of which it is a subpart. Pl. Br. at 13; Def. Br. at 10-11; Pl. Reply at 7. U.S. Patent No. 4,843,540 ("the '540 Patent") is incorporated by reference into the '201 Patent, and the '540 Patent establishes that "one of the characteristics of the binary tree" is that "it includes sub-sets which are also binary trees." '540 Patent at 3:49-51.

To support its construction, plaintiff cites as extrinsic evidence IBM's Terminology webpage, which defines "subtree" as "a tree structure created by arbitrarily denoting a node to be the root node in a tree." Pl. Br. at 13; Pl. Reply at 6. The '201 patent, according to plaintiff, is consistent with this definition, which describes a binary tree as capable of being "partitioned into any number of subtrees, which maintain the functionality of the tree." Pl. Br. at 13. Yet this extrinsic evidence is insufficient to support this construction, especially in light of the intrinsic evidence, as well as this Court's determination of the proper construction of "binary tree." See Vitronics Corp. v. Conceptronic, 90 F.3d 1576, 1583 (Fed. Cir. 1996) ("In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances, it is improper to rely on extrinsic evidence."). Not only does the definition upon which plaintiff relies not reflect the meaning of the patent at the time of filing in 1986, see Phillips, 415 F.3d at 1313, but it impermissibly permits any node, including a node with zero children, such as one of the extremities, to be designated a root node, despite the fact that plaintiff concedes that the subtree must also be a binary tree. See Nystrom v. Trex, Co., 424 F.3d 1136, 1145 (Fed. Cir. 2005) ("In the absence of something in the written description and/or prosecution history to provide explicit or implicit notice to the public i.e., those of ordinary skill in the art that the inventor intended a disputed term to cover more than the ordinary and customary meaning revealed by the context of the intrinsic record, it is improper to read the term to encompass a broader definition simply because it may be found in a dictionary, treatise, or other extrinsic source."). Moreover, since the Court has rejected plaintiff's construction of binary tree, which would have permitted a parent node with zero children, so too must it reject plaintiff's similar construction of "subtree."

Plaintiff objects to defendant's construction on the ground that it requires that the "root node" have no parent node. Pl. Reply at 7. The '201 and '540 Patents both establish clearly that subtrees, as partitions, remain connected to higher level nodes in a larger tree. See '540 Patent at 15:61-64. Yet plaintiff concedes that defendant's construction is accurate if it is understood that a subtree's lack of a parent node does not mean that the subtree is not connected to a higher level node, but rather that the higher level node is itself not considered part of the subtree. Pl. Reply at 8 n. 2; see also tr., 08/20/09, at 55. The Court agrees that this is the proper understanding of that construction.

Nor does defendant improperly rely on the functionality of the subtree to dictate its structure, as plaintiff suggests. See Pl. Reply at 7. As it did in the context of a binary tree, plaintiff cites to a single statement in the '201 Patent for the idea that a subtree need not have the same structure: "Since the subtree that is computing the resolve need not be a complete binary tree, the value bits from the children may not arrive in the same clock cycle." '201 Patent at 21:46-49. Yet, as noted previously, this establishes only that the report and resolve functions would not happen simultaneously if a longer leg of the subtree were handling a particular task. See tr., 08/20/09, at 55. It does not, contrary to plaintiff's position, permit a subtree to have a different structure than a binary tree, namely, a parent with one or zero children. Indeed, plaintiff concedes that the subtree must have the same structure as the larger tree. See Pl. Reply at 8 n.3.

The Court thus confirms its construction that "subtree" means a subset of the binary tree such that each node has a single parent and two children nodes, except the root node, which has no parent, and the leaf nodes, which have no children. The Court's construction should be understood to mean that the parent node nevertheless remains connected to a higher level node in the main binary tree of which the subtree is a part because a subtree is always part of a larger binary tree.

4304

1. Succession of resolution levels

The parties dispute one term in Claim 2, "succession of resolution levels." Google proposes a construction of "in order of increasing resolution level" to capture the hierarchical underpinnings of the claim, while Skyline argues that no construction
is needed and does not propose an alternate construction.

When read in context, it is clear that the "succession" referred to is from lowest resolution to higher resolution. The phrase in question is directly followed by instructions to move "from the level immediately higher than the resolution level of the first block up to the maximal existent resolution level on the server not above the indicated resolution level." The process seems quite clear: an initial block (generally of fairly low resolution) is acquired, a new block is downloaded from the next highest resolution level, then additional higher resolution blocks are downloaded until an upper limit (either the highest resolution level stored in the database, or the requested top resolution level) is reached. Claim 2 specifically indicates that this process happens from low resolution to high resolution, in succession. The patent history also supports this reading, as Skyline distinguished the '189 Patent from prior art based on the ordered nature of the download. (See February 26, 1999 Amendment, Goog 000118, GOOG 000153) Consequently, I find that the blocks referenced in Claim 2 are, by definition, downloaded "in order of increasing resolution level."

Construction: (succession of resolution levels) In order of increasing resolution level.

B

The '073 patent has 17 claims. Claim 1, the only independent claim, recites an IGBT-like structure. It provides (emphasis added):

A vertical MOSFET device, comprising:

a semiconductor substrate, including in series, adjacent source, body, drain and anode regions of alternate conductivity type;

the body region being adjacent to a surface of the substrate;

the source and drain regions being spaced so as to define a channel portion in the body region at said surface;

the source, body and drain regions having a first forward current gain alpha [1] and the anode, drain and body regions having a second forward current gain alpha [2], such that the sum alpha [1][+] alpha [2] is less than unity, and no thyristor action occurs under any device operating conditions.

The dispute in this case centers on the emphasized portion of the claim.

In addition to Gentry, the prior art of record includes a U.S. patent issued in 1980 to Plummer. See James D. Plummer, Monolithic Semiconductor Switching Device, U.S. Pat. No. 4,199,774 (issued Apr. 22, 1980) (Plummer). Plummer discloses a four-layer semiconductor device with a structure identical to that of the device recited in claim 1 of the '073 patent. Plummer's device operates as a transistor at lower voltages and currents (i.e., it exhibits no latching behavior), but beyond a certain threshold of voltage or current it acts as a thyristor (i.e., it latches).

C

In 1994, Harris brought this action against IXYS, alleging infringement of the '073 patent. IXYS moved for summary judgment of non-infringement and patent invalidity. Harris cross-moved for summary judgment, arguing that the IXYS devices literally infringe claim 1 of the '073 patent, and that the patent is not invalid.

The district court denied IXYS's motion for summary judgment and, adopting Harris's claim construction, granted Harris's motion. The court ruled as a matter of law that IXYS's IGBTs infringe the '073 patent, and that the '073 patent is not invalid because of indefiniteness, obviousness, anticipation, or non-enablement.

II
On appeal, the parties debate the proper construction of claim 1 of the '073 patent. Specifically, they disagree as to the meaning of the last clause of the claim, which recites "such that the sum alpha [1] + alpha [2] is less than unity, and no thyristor action occurs under any device operating conditions." IXYS construes that clause as covering only four-layer devices that, because of their structure, never act as thyristors (i.e., devices in which the sum alpha [1] + alpha [2] is less than one under all circumstances). Harris, on the other hand, construes the disputed clause as covering four-layer devices that have a transistor (or non-latching) mode of operation in addition to a threshold point beyond which the devices act like thyristors, as long as the devices were intended to be operated below the thyristor threshold. We agree with IXYS.

A

With respect to the first part of the disputed clause, the phrase "such that the sum alpha [1] + alpha [2] is less than unity" merely restates a basic characteristic of four-layer semiconductor devices that is well known to any electrical engineering student and is recited in the 1967 Gentry reference. A four-layer device functions as a transistor whenever the sum of alpha [1] and alpha [2] is less than one, and as a thyristor whenever the sum of alpha [1] and alpha [2] is greater than one, as the specification of the '073 patent acknowledges. That part of the clause therefore does nothing to limit the scope of the claim language. Moreover, the second part of the clause, which refers to "device operating conditions," includes within the scope of the claim "any" device operating conditions, without qualification. Nothing in the language of the claim suggests that it should be construed as limited to conditions under which the device was "intended" to operate in order to ensure that it would not latch.

A further, compelling reason for rejecting Harris's proposed construction of the "any device operating conditions" limitation is that Harris's construction would make the limitation entirely circular. To say that the invention of claim 1 does not latch when the sum of alpha [1] and alpha [2] is less than one is to say only that the device does not latch when the sum of the forward current gains is not great enough to cause latching. The circularity of Harris's proposed construction is revealed by a passage in its brief in which it explains that the devices described in the '073 patent "will not latch 'under any device operating conditions,' i.e., so long as they are properly functioning as they were designed to operate." But Harris further argues that "the patented devices [are] 'operable' so long as the devices continue to operate as a transistor and are latch-free." In plain terms, Harris's claim construction argument is that the intended "operating conditions" of the patented device do not include conditions that cause the device to latch, and therefore the device does not latch under its intended "operating conditions."

We decline to assume, without a stronger textual basis, that the "any device operating conditions" limitation was intended simply to convey that the claimed device does not function as a thyristor as long as it is not operated under conditions that trigger thyristor action. That construction would contribute nothing but meaningless verbiage to the definition of the claimed invention. Nor can we accept Harris's argument that when an IGBT latches "under extreme adverse non-operating conditions," it has failed and therefore cannot be regarded as functioning under "device operating conditions." As the record before the district court makes clear, latching may lead to device failure, but does not necessarily do so. Two technical articles that were before the district court, one of them authored by an inventor of the '073 patent, say as much. It is therefore incorrect to suggest, as Harris does, that a latched state cannot be an "operating condition" for an IGBT.

An additional problem with Harris's proposed construction of claim 1 is that it would cause claim 1 to read on the prior art described in the Plummer patent. Harris attempts to distinguish Plummer's device on the ground that it has a low thyristor threshold and is intended to operate as a thyristor. The inventors of the '073 patent, according to Harris, came up with the novel idea of using the four-layer device in the transistor range, rather than in the thyristor range. Yet despite Harris's assertion that its device has a higher thyristor threshold than Plummer's device as a result of changing the geometries and conductivities of the device, the language of claim 1 of the '073 patent does not reflect that structural distinction.

Moreover, the fact that the inventors recognized that the Plummer device could be used as a transistor rather than as a thyristor would not be sufficient to avoid the effect of the prior art. It is well established that the discovery of a new property or use of an old product does not render the old product patentable. See In re Spada, 911 F.2d 705, 708, 15 U.S.P.Q.2D (BNA) 1655, 1657 (Fed. Cir. 1990); Titanium Metals Corp. of Am. v. Banner, 778 F.2d 775, 780-82, 227 U.S.P.Q. (BNA) 773, 777-78 (Fed. Cir. 1985). Thus, because claims should be read in a way that avoids ensnaring prior art if it is possible to do so, see Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1557, 37 U.S.P.Q.2D (BNA) 1609, 1617 (Fed. Cir.), cert. denied, 135 L. Ed. 2d 1048, 116 S. Ct. 2523 (1996); Deca, Ltd. v. United States, 210 Ct. Cl. 546, 544 F.2d 1070, 1080, 191 U.S.P.Q. (BNA) 439, 447 (Cl. Cl. 1976), the effect of the Plummer prior art device is to render Harris's...
proposed construction of claim 1 much less plausible than IXYS's competing construction.

B

The specification of the '073 patent provides further support for IXYS's proposed construction of the claim as reciting a device that does not latch under any conditions. The summary of the invention characterizes the invention as the product of manipulating "conductivities and geometries . . . so that the device functions substantially as a [non-latching] transistor." '073 patent at col. 1, 11. 58-60. Later, in the course of describing the claimed invention, the specification explains that although the invention "is a four layer device, it does not function as a thyristor having regenerative [i.e., latching] properties." Id. at col. 3, 11. 53-55.

C

The prosecution history of the '073 patent also provides substantial support for IXYS's construction of the disputed language of claim 1. The applicants repeatedly argued to the examiner that their claimed invention was structurally distinct from the prior art and that the structure of the claimed device prevented it from latching. When the examiner expressed concern that the applicants were merely seeking a patent on the Plummer device operating at voltage and current levels below its thyristor threshold, the applicants amended claim 1 to specify that the device would not latch under "any" operating conditions. In light of the series of exchanges between the applicants and the examiner, Harris cannot persuasively argue that the "any operating conditions" language of claim 1 should be read to include only those conditions under which the designer intended the claimed device to operate.

In the original application, the last clause of claim 1 recited "the source, body and drain regions having a first forward current gain and the anode, drain and body regions having a second forward current gain, such that the sum of the current gains is less than unity." The examiner initially rejected all of the claims as anticipated by Plummer and as obvious over Plummer in view of Gentry. In response, the applicants attempted to distinguish their claimed invention from Plummer's device by arguing that their "invention is structured so as not to operate as [a thyristor]" and that their "invention operates as a transistor at all times" (emphasis added). The applicants also argued that, unlike Gentry, "the sum of the current gains (alpha [1] + alpha [2]) in Applicants' invention is less than 1 at all times," and they represented to the examiner that, because of its structure, their invention "operates as a transistor at all times . . . and this is true at both low and high voltage operating conditions." In responding to the examiner's obviousness rejection, the applicants asserted that "there is no suggestion [in the prior art] of a four layer transistor structure such as [the applicants' structure], wherein the sum alpha [1] + alpha [2] is maintained less than 1 for all operating voltages" (emphasis added).

In the second office action, the examiner again rejected all of the claims as anticipated by Plummer and as obvious over Plummer in view of Gentry. The examiner characterized the applicants' invention as a "device configured to act as a transistor at all times, that is, so the sum [alpha [1] + alpha [2]] is less than unity at all intended operating voltages. This [limitation], however, is not in the claim."

The applicants responded to the second office action by amending the last clause of claim 1 so that it recited "the source, body and drain regions having a first forward current gain alpha [1] and the anode, drain and body regions having a second forward current gain alpha [2], such that the sum alpha [1] + alpha [2] is less than unity under device operating conditions, and no thyristor action occurs." In remarks accompanying their amendment, the applicants stated that they had amended claim 1 "so as to definitively specify that the structure of the present invention behaves at all times as a transistor and not as [a thyristor]" (emphasis added). The applicants characterized Plummer's device as functioning as a thyristor "beyond some threshold voltage," and argued that in contrast to Plummer's invention, their device was "structured such that it will never operate as [a thyristor]" (emphasis added). They contended that their device "does not have a threshold point above which it will change from a transistor to [a thyristor]" and that it "is not merely [a thyristor] operating in the [pre-latching] region." They further noted that they had amended the claim "to further emphasize this structural distinction."

The examiner again rejected all of the claims. The examiner pointed out that for the Plummer device, under certain voltage and current levels, the sum of the forward gains is less than one, "so that no thyristor action occurs under those operating conditions." The language of claim 1, the examiner explained, "does not appear to preclude the existence of device operating conditions under which thyristor action occurs, it appears only to state that there are device operating conditions under which thyristor action does not occur."
During a subsequent interview, the examiner suggested to the applicants that "language such as 'no thyristor action occurs under any device operating conditions' would appear to overcome the rejection" of claim 1. The applicants then adopted that language, which is the current text of the claim. In remarks accompanying the amendment, the applicants stated that "the present language of Claim 1 now precludes the existence of device operating conditions under which thyristor action occurs." The examiner subsequently allowed the claims, and the '073 patent issued.

Harris argues that the prosecution history of the '073 patent supports the proposition "that the '073 patent covers devices that . . . remain latch-free while they are functioning effectively as they were designed to operate." The prosecution history, however, does not support Harris's argument. As the excerpts quoted above illustrate, the applicants repeatedly sought to distinguish their claimed device from Plummer's device on the basis of their device's structure, not its intended operating conditions. The applicants stated to the examiner in their responses to the office actions that, because of its distinct structure, their claimed invention would not operate as a thyristor. In particular, the applicants repeatedly represented to the examiner that the claimed device "never" acts as a thyristor, that the device "does not have a [thyristor] threshold point," and that the device operates as a transistor "at all times." Nothing in the applicants' submissions to the examiner suggested an intention to qualify the terms "never" and "at all times" so as to limit those terms to the particular conditions under which the designer intended the device to operate. Instead, the applicants represented to the examiner that, because of structural differences between the claimed invention and the prior art, their device would "never" act as a thyristor, and we construe the claim consistently with those representations.

To be sure, as Harris points out, during the second office action the examiner characterized the applicants' claimed invention as a device in which the sum of alpha [1] and alpha [2] is "less than unity at all intended operating voltages." In light of the overall prosecution history of the '073 patent, however, that single remark is not sufficient to justify importing a qualification into the plain language of the claim, especially since the remark was not in a statement made by the applicants, but rather appeared in the examiner's characterization of the applicants' claimed invention. Moreover, it was long after the examiner's remark that the applicants substituted the final claim language ("no thyristor action occurs under any device operating conditions") for the earlier version ("under device operating conditions . . . no thyristor action occurs"), a change that emphasizes that thyristor action will not occur at all, rather than that it will not occur under certain conditions. We therefore construe claim 1 as reciting a four-layer IGBT device in which latching does not occur.

1. "Suitably or suitable" (claims 1, 5)

The parties agree that "suitably" and "suitable" mean "appropriate for a purpose." The dispute centers on whether the terms, which appear in the preamble of claims 1 and 5, operate as limitations on those claims. Cytyc argues that "suitably" is not a limitation; it merely describes the purpose or intended use of the invention. TriPath contends that the terms define the invention and therefore serve as substantive limitations on the claims.

A preamble "limits the invention if it recites essential structure or steps, or if it is necessary to give life, meaning, and vitality' to the claim." Catalina Marketing Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002) (quoting Pitney Bowes, Inc. v. Hewlett Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999)). However, "a preamble is not limiting where a patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use of the invention." Id. (quoting Rowe v. Dorr, 112 F.3d 473, 478 (Fed. Cir. 1997)). Ultimately, a judge determines whether a preamble is a limitation only after reviewing the entire patent "to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Id. (quoting Corning Glass Works v. Sumitomo Electric U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989)).

The word "suitably" in claims 1 and 5 is more than a mere statement of purpose; it is "essential to understand the limitations or terms in the claim body." Id. The claim body lists four steps:

(a) processing the biological specimen slide with the slide processing system;

(b) measuring at least one machine processing effectiveness parameter;
(c) checking if the at least one machine processing effectiveness parameter has exceeded a limit; and

(d) accumulating scan processing error flags.

'327 patent at col. 8, 11. 37-48. These steps alone do not describe a structurally complete invention. Without the preamble to explain that the steps comprise a slide suitability test, they are no more than a series of unrelated actions. Cf., Catalina Marketing, 289 F.3d at 810 (holding that preamble language confining the use of the claimed free-standing coupon distribution terminal to consumer stores was not limiting because the location of the terminals was not a structural component of the invention).

The specification emphasizes the importance of the term "suitability" to the claims. The abstract, the summary, and the preferred embodiment repeatedly describe the invention as a "suite of suitability tests." 327 patent, Abstract, 1. 2; col. 1, 1. 34; col. 2, 1. 17. The bulk of the specification is spent describing the claimed suitability tests and the mechanisms by which the invention performs the tests. See id. at col. 1, 11. 32-47; col. 2, 11. 3-48; col. 4, 11. 23-60; cols. 5-6. Indeed, only three paragraphs of the written description do not directly describe suitability testing. See id. at col. 2, 11. 49 -- col. 3.

Two of these paragraphs list related prior art that the patentee intended to incorporate by reference. The other describes Figures 1A-1C. Id. at col. 3, 11. 47 -- col. 4, 11. 23. The diagrams make no mention of suitability and appear to depict a stand-alone invention, not unlike the coupon terminal in Catalina Marketing, 289 F.3d at 805. However, as discussed above, the remainder of the specification makes clear that suitability testing is not just one possible use, purpose, or intended result of the invention; it is the only use, purpose, and intended result.

Cytyc argues that this case is analogous to Bristol-Myers Squibb Co. v. Ben Venue Laboratories, Inc., 246 F.3d 1368 (2001). The preamble at issue in that case provided, "A method for reducing hematologic toxicity in a cancer patient undergoing [antitumor drug] treatment . . ." Id. at 1371. The claims that followed consisted of two steps: premedicating the patient and administering a specific dosage of the antitumor drug over three hours. Id. The Court held that the preamble language "for reducing hematologic toxicity" did not limit the scope of the claims for two reasons. Id. at 1375. First, the steps of the three-hour infusion method were performed in the same way, whether or not the patient actually experienced a reduction in toxicity. Id. Second, the language of the claim itself strongly suggested independence from the preamble. Id.

Bristol-Myers does not apply here. In that case, "reducing hematologic toxicity" was a result that the invention intended to, but need not, reach with each use. Id. In contrast, the steps in claims 1 and 5 of the 327 patent comprise a suitability test. Each use of the steps invariably results in a test of the suitability of a slide. The language of the claims suggest not independence, but dependence on the preamble.

TriPath contends that "suitable" is a claim limitation because the patentee relied upon it during prosecution to distinguish the prior art. See Catalina Marketing, 289 F.3d at 808 ("Clear reliance on the preamble during prosecution to distinguish the claimed invention from the prior art transforms the preamble into a claim limitation."). In support, TriPath cites an Amendment dated December 18, 1995, in which the patentee stated that the prior art did not "disclose the detection of an intermediate cell or an intermediate cell nuclei for determining whether a slide preparation was suitable for processing." TriPath Ex. 8, 327 File History, Document 9, Amendment dated 12/18/95, at 6-7 (emphasis added).

TriPath misreads this statement. The very next paragraph in the Amendment makes clear that the distinction the patentee made between his invention and the prior art turned on the use of the intermediate cell, not on the use of the invention as a suitability test. n9

n9 That paragraph provides, in relevant part: 

"[The prior art fails to] disclose the detection of an intermediate cell or an intermediate cell nuclei for determining whether a slide preparation result is suitable for automatic processing. [The prior art] discusses a method of eliminating the effect of overlapping cells, not dilating the intermediate cell." TriPath Ex. 8, 327 File History, Document 9, Amendment dated December 18, 1995, at 6.

The absence of the word "suitable" in the examiner's Statement of Reasons for Allowance provides further evidence that the
The patentee's failure to rely on "suitable" or "suitably" during prosecution, however, does not prevent the words from limiting claims 1 and 5. The claims themselves and the specification amply support the conclusion that "suitable" or "suitably" give "life, meaning, and vitality" to the claims, and thus should be read as limitations. See Catalina Marketing, 289 F.3d at 808.

1. "Suitable bucket size"

SuperSpeed proposes the term should be construed as "bucket size selected based upon the size of the data to be cached." IBM's proposed construction is "bucket size selected based upon the size of the I/O access." The dispute concerns how the system and method determine which bucket size is "suitable."

IBM argues that the size is determined based on the size of the data transfer from the I/O device. SuperSpeed argues that "disk access" is ambiguous. Further, SuperSpeed argues, under IBM's construction, the patent would not achieve the invention's goal of using the cache memory effectively. IBM supports its position by citing to several parts of the specification where the preferred embodiment chooses where the data is put based upon "disk access": "disk data is . . . copied into an available cache bucket depending upon size fit." [226 Patent, 2:24-55], "total cache bucket size associated with it for small, medium, and large, disk access sizes." [226 Patent, 1:54-57], "[u]sing the size fo the read data access the cache driver selects which of the three caches . . . the data transfer fits." [226 Patent, 4:10-12].

Despite the illustrative passages, the invention's goal is to minimize wasted space and speed up retrieval of cached data. There is no support in the intrinsic evidence to support the limitation imposed by IBM's construction. Assuming arguendo that the disclosed embodiment does make some decision based on a "disk access," the invention is not limited to the preferred embodiment. The inventor intended the "suitable bucket size" to be a bucket size that was the most appropriate size available with the least amount of wasted space. The term "suitable bucket size," therefore means "a bucket size selected based on the size of the data to be cached."

"suitable escape character" & "complementary check character"

Sutton suggests that "suitable escape character" means "an indication that special treatment is needed." Nokia contends that the term means "a 7-bit sequence used to indicate that a complementary check character follows the sequence." Sutton contends that "complementary check character" means a "character whose value is relative to a known value" and Nokia urges the definition is "a 7 bit sequence representing a transformation of a prohibited character."

While the terms "suitable escape character" and "complementary check character" never appear in the specification, within the context of the described invention, the purpose and function of those terms are clearly and narrowly defined. When describing the transmission of a message, the specification explains that a "data packet which is in 7 bit format must [] be 'treated' to enable those 7 bit characters which are prohibited from transmission by the network . . . to be transformed. A Transformation Escape Character (TEC) is configured be [sic] selected from the remaining available character set. This character is located in the data string. The TEC character is inserted at that location. A second character is also generated and inserted immediately following." '238 Patent at 6:57-67. The specification then explains that the "second character," or the character following the "escape character," is a transformation of the prohibited 7-bit character. Id. at 6:65-7:14. A formula for transforming the prohibited 7-bit character and for choosing a TEC is provided. Id.
At the receiving end, the specification explains that the TEC is used to identify that the "second character" is a transformation of a prohibited 7-bit character. Id. at 7:47-50. The receiver then removes the transformations within the "second character" and deletes the TEC. Id. Thus, the original message is preserved without transmitting any prohibited 7-bit characters. Claim 1 refers to this process by replacing the terms "TEC" and "second character" with the terms "suitable escape character" and "complimentary check character." See id. at 14:66-15:3 ("analyzing the 7 bit byte packet to ascertain if it contains any prohibited characters and if so substituting such prohibited characters with a suitable escape character and a complimentary check character to produce the message packet").
