Even if the Court defined "endless" in accordance with its usual meaning, i.e., without an end, 8 this definition would not engender API's proposed limitations on the shape of "annular inner surface." To elaborate, one can trace with a pencil an outline of a circle or rectangle--which are the preferred embodiments of the inner surfaces of the '551 impact pads when viewed from above, see D.I. 36 at Figures 3-5--and API concedes this outline is "endless," or "without a definite ending." API seems to argue the inner surface fails to qualify as "endless" as soon as an irregular portion of the inner surface protrudes into the interior cavity of the pad; for example, API presumably characterizes the inner surface of an impact pad, when viewed from above, that forms a square with a triangular protrusion in each corner as lacking an "endless" quality. But this assertion is misplaced. First, as rehearsed earlier, the specification allows for any shape. Second, a continuous outline can be traced along such an inner surface--the pencil never reaches an ending point--despite the surface irregularity.

8 This differs from API's proposed definition of "without a definite beginning or ending."

Accordingly, the Court concludes CCPI's definition of "annular inner surface" is correct; that is, so long as an inner surface, when viewed from above, surrounds an interior space or cavity, that surface will be considered "annular."

1. "Annular locking means." This limitation is not a means plus function limitation. 1 Therefore, "annular locking means" shall be construed to mean a "ring-shaped locking device."

Plaintiff also argues that "annular locking means" should be defined as "a ring having two spaced apart ends." This argument must also fail since dependent claim 8 claims "the coupling assembly of claim 7, wherein said annular locking means is a ring having two spaced apart ends."

Plaintiff also argues that "annular locking means" should be defined as "a ring having two spaced apart ends." This argument must also fail since dependent claim 8 claims "the coupling assembly of claim 7, wherein said annular locking means is a ring having two spaced apart ends." Construing the limitation "annular locking means" in claim 7 as plaintiff suggests would render claim 8 meaningless. Furthermore, nowhere in the specification does plaintiff state or suggest that the only suitable annular locking means is a ring having two spaced apart ends. Rather, the specification states "in the present embodiment, the ring includes a space between ends ...." ( '682 patent, col. 2, 11. 47-49)

6. "annular member"

Agere argues that the term "annular member" should be construed as "a member with both an internal hole and expanded dimensions in the direction perpendicular to the major axis of the paddle support arm, and with a hole in the member." Atmel argues that the term "annular member" should be construed as "a deformation absorbing member that is ring-like, with expanded dimensions perpendicular to the major axis of the paddle support arm."
First, Atmel's reference to an "annular member" as being "a deformation absorbing member" seems unnecessarily redundant since claims 4 and 9, in which the term "annular member" appears, clearly provide that the annular member is a deformation absorbing member. See '269 Patent at col. 4:8-10 ("A package as recited in claim 1 in which said deformation absorbing member comprises an annular member."); '269 Patent at col. 4:34-46 ("A semiconductor integrated circuit package as recited in claim 6 in which deformation absorbing member comprises an annular member."). The only other significant difference between the parties' constructions is Agere's description of "an internal hole" as contrasted with Atmel's description of the member being "ring-like."

Atmel's description of the member being "ring-like" most closely comports with the only dictionary definition of the word "annular" offered by either party, which is "of, relating to, or forming a ring." Merriam-Webster's Collegiate Dictionary 47 (10th ed. 2001). However, in this case, the patentees clearly chose to be their own lexicographers, providing a specific definition for the term "annular member" in the specification. "In the embodiment depicted in FIG. 2, the deformation absorbing member 11 comprises an annular member, i.e., a member with expanded dimensions in the direction perpendicular to the major axis of the paddle support arm. The annular member is depicted as being circular although other shapes, e.g., oval, can be used." '269 Patent at col. 2:62-68. Moreover, there is no intrinsic or extrinsic evidence to support's Agere's description of the member having "an internal hole." Thus, although the word "annular" generally means "of, relating to, or forming a ring," the Court concludes that the term "annular member" as used in the '269 patent should be construed in accordance with the specific definition provided in the specification. Therefore, the term "annular member" is construed as "a member with expanded dimensions in the direction perpendicular to the major axis of the paddle support arm, which member may be, but need not necessarily be, circular or oval in shape."

3. Annular Peripheral Zone

The sixth clause of claim 1 recites "the burner (3, 30) having an annular peripheral zone (7) carrying a catalyst." Plaintiffs propose that the phrase needs no construction, that the burner has an annular peripheral zone that includes a catalyst. Defendants assert that the construction be narrowed to "an outer circular zone" which includes a catalyst.

Both parties appear to agree that the term periphery and, hence, the term "peripheral" means "the perimeter of a circle or other closed curve; also: the perimeter of a polygon." See Merriam-Webster Online, Doc. No. 58, Ex. 2, at 1-2, Additionally, both parties submit the dictionary definition of "annular," means "a thing in the form of a ring." Id. at 8. Defendants assert that because "peripheral" has an ordinary meaning of the "perimeter" (of some shape) and "annular" has an ordinary meaning of "ring," logic would dictate that the term "annular peripheral" would have an ordinary meaning of "outer circular." To not construe the term as "circular," Defendants argue, is to ignore the word "annular."

The exemplary embodiment of the burner stone illustrated in the patent has a round or circular shape. See '061 patent; Fig. 2; 1:8-10; 3:1-5; Fig. 8; 5:6. The claim is not limited to such a shape, however. Such structures may include circular or round configurations, but are not necessarily limited to such. Accordingly, the Court finds no basis for limiting the claims in such a manner.

12. annular reinforcing bead ('826 patent, claim 14; '875 patent, claim 50)

Crown's proposed construction is "[a] ring-like stiffening channel." 54 Rexam's proposed construction is "an outwardly concave generally 'U' shaped groove (also called a countersink or anti[-]peaking bead) that is stamped or pressed into the can end, and is located inwards from the bottom of the wall (chuck wall) when looking at a cross section of the can end, which encircles and supports the center panel of the can end."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
The court adopts Rexam's proposed construction as modified below.

Crown's proposed construction is based on a cobbled together series of dictionary definitions and it argues that Rexam's proposed construction improperly limits the phrase to the preferred embodiment illustrated by figure 4 of the common specification. The court declines to accept Crown's proposed construction and disagrees with the contention that Rexam's proposed construction erroneously limits the claim language to a preferred embodiment.

The common specification discusses several prior art can ends having reinforcing beads. U.S. Patent No. 4,093,102 "describes can ends comprising a peripheral cover hook, a chuck wall dependent from the interior of the cover hook, an outwardly concave annular re-inforcing bead extending radially inwards from the chuck wall and a central panel joined to an inner wall of the reinforcing bead by an annular outwardly convex bead. 56 U.S. Patent No. 4,217,843 describes an alternative design of can end in which the countersink has inner and outer flat walls, and a bottom radius which is less than three times the metal thickness. 57 U.S. Patent No. 4,571,978 describes a can end comprising "a peripheral flange or cover hook, a chuck wall dependant from the interior of the cover hook, an outwardly concave reinforcing bead extending radially inwards from the chuck wall from a thickened junction of the chuck wall with the bead, and a central panel supported by an inner portion of the reinforcing bead." 58 U.S. Patent No. 5,582,319 describes the use of a particular alloy for a can end, the use of such alloy, "permitted manufacture of a can end with a narrow, and therefore stronger reinforcing bead . . . ." 59

The common specification notes that known can ends "are held during double seaming by an annular flange of chuck, the flange being of a width and height to enter the anti-peaking bead. There is a risk of scuffing if this narrow annulus slips. Furthermore a narrow annular flange of the chuck is susceptible to damage." 60 The specification does not distinguish the prior art can ends on the basis that those ends had a concave annular reinforcing bead and the invention of Crown's patents-in-suit does not. It states that "[w]e have discovered that improvements in metal usage can be made by increasing the slope of the chuck wall and limiting the width of the anti peaking bead." 61 Figure 5 shows a modified chuck used in attaching a can end to a can body. Contrasting the prior art illustrated in figure 2, the modified chuck illustrated by figure 5 "is designed to drive initially on the relatively large chuck wall 32 without entering deeply into the anti-peaking bead 25." 62

Also, "typical dimensions" of the invention illustrated in figure 4 include measurements of the "concave radius in antipeaking bead"; "maximum diameter of antipeaking bead"; "minimum diameter of antipeaking bead"; "height to top of antipeaking bead"; and "outer wall height." 63
The common specification also describes differently shaped annular reinforcing beads. "In a preferred embodiment of the can end an outer wall of the reinforcing bead is inclined to a line perpendicular to the central panel at an angle between -15 [degree] and +15 [degree] and the height of the outer wall is up to 2.5 mm." 64 Another embodiment describes a reinforcing bead having "an inner portion parallel to an outer portion joined by said concave radius." 65 Each of these embodiments would describe a "generally 'U' shaped groove," however, Rexam is not seeking to limit the claim language to any of the specific dimensions of the annular reinforcing (or antipeaking) beads recited in the common specification.

Moreover, the recitations of the patents' in suit with regard to annular reinforcing beads is not limited to a description of a concave annular reinforcing bead with respect to prior art discussed and the preferred embodiments described therein. The annular reinforcing bead is generally described as outwardly concave prior to the detailed descriptions of particular embodiments.

The abstract of the '826 patent describes a can end including:

a peripheral cover hook, a chuck wall dependant from the interior of the cover hook, an outwardly concave annular reinforcing bead extending radially inwards from the chuck wall, and a central panel supported by an inner portion of the reinforcing bead . . . . 66

The common specification recites:

this invention provides a can end comprising a peripheral cover hook, a chuck wall dependant from the interior of the chuck wall, an outwardly concave annular reinforcing bead extending radially inwards from the chuck wall, and a central panel supported by an inner portion of the reinforcing bead, characterized in that, . . . the concave bead narrower than 1.5 mm (0.060"). 67

The court determines that the common specification supports Rexam's proposed construction with the exception of the portion reciting "stamped or pressed into a can end." Crown argues that this phrase limits the method of manufacture of an annular reinforcing bead. Rexam contends that phrase merely explains that a bead is a groove that is formed to extend into the can end and was included for clarity. The court does not find language in the claims or common specification that would warrant inclusion of that portion of Rexam's proposed construction. Therefore, the court adopts Rexam's proposed
construction as modified by the court: "an outwardly concave generally 'U' shaped groove (also called a countersink or anti peaking bead) that is located inwards from the bottom of the wall (chuck wall) when looking at a cross section of the can end, which encircles and supports the center panel of the can end."

224
The '554 Patent

At issue in plaintiff's '554 patent is the meaning of certain language in Claims 1, 3, and 5. One element of Claim 1, an apparatus claim, is "an annular shield wall extending axially beyond the distal end of said connector member..." Because Claims 3 and 5 are dependent upon Claim 1, these claims also contain the above phrase. In addition, Claim 5 includes the phrase "...annular shield wall extends axially from transverse wall." What is in need of interpretation here is the meaning of "annular shield wall."

Aided by the testimony of Vaillancourt, Browne, and Sheehan, the court concludes, based upon the language of the claims themselves, the specification, and the prosecution history, that an annular shield wall is a cylindrical hollow protective barrier which surrounds a centrally located hollow, elongated cylindrical blunt piercing member. (See column 7, lines 1-4). The claim also requires that this hollow protective barrier extend axially beyond the blunt cannula, or, in other words, be longer than the blunt cannula. The purpose of this protective barrier is to maintain the blunt piercing member in an aseptic condition by preventing touch contamination. (See column 7, lines 9-11).

The court finds its support for the above claim construction from the ordinary meaning of the words "annular," "shield," and "wall." Annular means ring-like or cylindrical; a shield is a structure, device or part that serves as a protective cover or barrier; and a wall is a partition. Inherent in the word shield is the function of the invention - to prevent touch contamination. The requirement that the shield go axially beyond the cannula also serves the function of protection. Thus, the phrase must be construed with that function in mind.

Further support for construing the phrase in light of its function is found in the '554 patent's prosecution history. Plaintiff's attorney argued, in light of an anticipation rejection, that neither Cox nor Herlitze have a member that prevents touch contamination, nor do these patents claim as a function of their "shields" protection from touch contamination (pgs 86-87 and 97-99 of Exhibit 401). Thus, plaintiff distinguished its shield on the basis of its touch-prevention function, and that must be included as part of the definition.

Defendant urges the court to construe the phrase as requiring the shield to extend axially beyond the cannula in every radial direction, such that any cut-out or hole in the shield would not meet the limitation. The court declines to read that requirement into the phrase. What is required is that the annular shield wall prevent touch contamination. It is for the jury to decide, when determining whether defendant's device infringes, what configuration of the wall would or would not perform this function.

225
b. The disputed term in Claim 25: "Annular sidewall . . . diverging radially outwardly to an upper terminal edge"

i. Claim language. The next claim term in the '909 patent that the court finds is actually "in dispute" at this time is in Claim 25. That disputed claim term is "annular sidewall . . . diverging radially outwardly to an upper terminal edge." Claim 25, with the disputed term highlighted, states the following:

25. A plastic washing machine basket comprising: a base wall having a peripheral portion, said base wall being formed of plastic; and an annular sidewall extending upward from the peripheral portion of the base wall and diverging radially outwardly to an upper terminal edge, said sidewall including inner and outer surfaces having spaced apertures extending therethrough with the outer surface being beveled at the apertures, said sidewall being made of plastic and integrally formed with both the base and the apertures such that the basket has a smooth, uniform construction.
The '909 patent, Claim 25 (emphasis added).

ii. The parties' definitions and arguments. The parties' proffered definitions of this term are the following, with bold and italic font indicating differences between their definitions. Again, the authority on which each party relies for its construction is shown just below that party's definition.

| "ANNULAR SIDEWALL . . . DIVERGING RADially OUTWARDLY TO AN UPPER TERMINAL EDGE" |
|----------------------------------------|----------------------------------------|
| **Maytag's Definition** | **Electrolux's Definition** |
| "a sidewall formed like a ring and having a radius measured from the vertical center axis to the sidewall that increases moving from the base wall to the edge of the access opening of the sidewall" | "the structure of the sidewall is disposed from a central axis a greater distance at the top edge than at the bottom" |
| **Maytag's Authority** | **Electrolux's Authority** |
| '909 patent, Fig. 2 and 4; col. 4, ll. 19-22; col. 4, ll. 32-34; col. 6, ll. 37-39; claims 11, 12 and 18; dictionary definitions of "diverging" and "radial" | '909 Patent at Fig. 2 (radially outwardly); Fig. 3; dictionary definitions of "radially" |

In its initial Markman brief, Maytag contends that its definition is correct, because it is consistent with the patent specification. For example, Maytag contends that the Detailed Description Of The Invention makes clear that some "slant" to the inner surface of the sidewall of the washing machine basket is necessary to allow for easy removal of the basket from the mold core. Maytag also contends that the illustrations show that the basket gets wider from the base to the open end. Indeed, Maytag contends that its construction is the only one that is consistent with both the ordinary meaning of the claim terms and the disclosures of the '909 patent. In contrast, Maytag contends that Electrolux's construction rewrites the claim by playing word games like inserting "structure of" before "sidewall." Maytag also contends that Electrolux's definition makes no sense, because it measures the increasing radius as the distance between the center axis and the outer surface of the sidewall, not the inner surface that is formed by the mold core. Maytag contends that Electrolux is attempting to maintain a frivolous argument of non-infringement based on its contention that its baskets do not have an increasing radius from the center axis to the outer surface of the sidewall, when the radius to the outer surface is irrelevant to aiding removal of the basket from the mold core.

In its initial Markman brief, however, Electrolux argues that its construction of this claim term is correct, precisely because the claim itself refers to the "sidewall," not merely to the "inner surface" of the sidewall. Thus, Electrolux contends that the entire sidewall must diverge outwardly from the bottom to the top of the washing machine basket and that such a construction is confirmed by the illustrations in the patent, which show the entire wall diverging. Electrolux contends that it is Maytag, not Electrolux, that is rewriting the claim language to focus only on the radius from the center axis to the inner surface.

In its rebuttal brief, Maytag reiterates that Electrolux's construction ignores the invention, which involves ease of removal from the mold core; instead, Maytag contends that Electrolux is attempting to read the language of the patent claim in the abstract. Indeed, Maytag points to parts of the specification that explain that the purpose of the radial divergence of the sidewall is to further facilitate removal of the basket from the mold assembly. Electrolux's construction, according to Maytag, does not align with the claim language or the specification. In its rebuttal brief, on the other hand, Electrolux contends that Maytag's construction disregards claim limitations and explicit definitions in the patent specification. Electrolux points out that the claim language expressly requires that the "sidewall," not merely the "inner surface" of the sidewall, diverge radially, and that the sidewall is defined to include both inner and outer surfaces. Thus, Electrolux
 contends that the construction of the disputed term must encompass radial divergence of the entire structure of the sidewall, not just the inner surface. Moreover, Electrolux contends that Maytag did not "invent" draft on a mold core, that is, radial divergence of the product formed, to facilitate removal of the product from the molding apparatus. Finally, Electrolux asserts that there is not a single reference in the patent to radial divergence of only the inner surface of the sidewall. In its surrebuttal brief, Maytag contends that its construction merely clarifies what one of ordinary skill in the art would understand: that the purpose of the radial divergence claim limitation is to allow the basket to be removed from the mold core. Moreover, Maytag contends that Electrolux's proposed definition is the one that imports a limitation into the claim language, by requiring radial divergence of both the inner and outer surfaces of the sidewall, and such a construction is not supported by the claim language or the specification. In its surrebuttal brief, on the other hand, Electrolux reiterates that the '909 patent teaches that the "sidewall" diverges radially, not that the "inner surface of the sidewall" diverges radially. Electrolux also points out that the claim language shows that, when Maytag wanted to refer to a specific part of the sidewall, it knew how to do so.

Although the parties also addressed the construction of this term during oral arguments at the Markman hearing, their oral arguments are best understood as responses to the court's proposed construction of the term. Therefore, those arguments will be addressed below.

iii. Analysis. The court notes that, as contentious as the construction of this claim term appears to be, there is some common ground between the parties' proffered constructions. First, the parties agree that an "annular sidewall" means a sidewall "shaped like a ring." See, supra, Section I.C., at page 23 (noting agreed term constructions, including the construction of "annular" as "shaped like a ring"). The parties also agree on the construction of "diverges radially" to the extent that they agree that the radius (distance from a central axis) of the annular sidewall is greater at the open end of the washing machine basket than it is at the base wall. Compare Maytag's definition ("having a radius measured from the vertical center axis to the sidewall that increases moving from the base wall to the edge of the access opening of the sidewall") (emphasis added), with Electrolux's definition ("disposed from a central axis a greater distance at the top edge than at the bottom") (emphasis added).

n9 This reading is also supported by the dictionary meanings of "radially" offered by both parties, for example, in their Joint Claim Construction Statement, concerning "annular sidewall . . . diverging radially outwardly to an upper terminal edge." See Maytag's construction (definition of "radial" as "relating to or placed like a radius: moving and retaking place along a radius: of, relating to, or adjacent to a bodily radius," quoting WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY, p. 1871); Electrolux's construction (defining "radially" as "radiating from or converging from a common center," citing AMERICAN HERITAGE DICTIONARY at 1490, n.1(b); as "characterized by divergence from a center," citing MERRIAM-WEBSTER DICTIONARY at 962, def. 1, n.2(b), and as "branching out in all directions from a common center," citing WEBSTER'S NEW WORLD DICTIONARY at 1170, n. 1(a)).

The crux of the parties' disagreement is whether the increasing radius should be measured to the inner surface of the sidewall only, as Maytag contends, or to both the inner and outer surfaces, as Electrolux contends. However, the court notes other differences between the parties' definitions that the court finds should be resolved before the court addresses the parties' primary disagreement.

One of those differences is that Electrolux insists on calling the reference points on the sidewall for measurement of the radii the "bottom" and the "top edge" of the washing machine basket, while Maytag refers to them as the "base wall" and the "edge of the access opening of the sidewall." The other difference is that Electrolux's definition suggests that only the radii at the "bottom" and the "top edge" matter, while Maytag's definition suggests that the radius "increases" from the "base wall" to the "edge of the access opening of the sidewall."

Beginning once again with the words of the claim, Nystrom, 424 F.3d at 1142; Biagro, 423 F.3d at 1302, the court finds that there is some justification for Electrolux's construction of opposite ends of the washing machine basket as the "bottom" and the "top edge," respectively. The court acknowledges that there are references to the "annular sidewall extending upward" from the base wall in both this claim (No. 25) and in Claim 23, and this claim (No. 25) also refers to an "upper terminal edge." See the '909 patent, Claims 23 & 25 (emphasis added). On the other hand, the court has found no similar references in the Detailed Description. See Phillips, 415 F.3d at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"). Rather, references in the Detailed Description are to an "annular sidewall 8 extending from a peripheral portion 10 of base wall 5," which suggests direction
away from the base wall, but not necessarily "upward." See the '909 patent, Detailed Description, col. 2, ll. 45-46 (emphasis added); id., col. 3, ll. 5-6 (same); but see id., Summary Of The Invention, col. 2, ll. 7-8 ("annular sidewall extending upward from a peripheral portion of a base wall") (emphasis added). Thus, the court reads references to "extending upward" to suggest a direction in which the annular sidewall extends from the base wall, rather than as a categorical limitation on the orientation of the plastic washing machine basket, such that it has a "top" and a "bottom." Moreover, the claims and the specification consistently refer to the closed end of the washing machine basket as the "base wall 5," not as the "bottom" of the basket, and refer to the open end only indirectly by referring to the "terminal edge 36" of the sidewall, not to the "top" of the basket. These references do not suggest that the "base wall 5" is necessarily the "bottom" of the basket or that the "terminal edge 36" is necessarily at the "top." Finally, even a lay judge has sufficient imagination to recognize that the washing machine basket could be mounted "on its side" for a front-loading washing machine, that is, with the central axis of the washing machine basket horizontal rather than vertical. Indeed, Figure 2, of the '909 patent, reproduced above on page 14, appears to show the washing machine basket in just that orientation.

In contrast, the court finds Maytag's construction of the closed end of the washing machine basket as the "base wall" to be consistent with the patent claims and the specification. Indeed, the court finds no other form of reference to the closed end of the washing machine basket anywhere in the patent claims or specification. The court cannot say the same, however, for Maytag's construction of the open end of the washing machine basket as the "access opening of the sidewall." Such a construction is untenable, because the "access opening," if such it is, is to the interior of the washing machine basket, not of, to, through, or into the "sidewall." Also, the court finds nothing in the patent claims or specification contrary to construing or describing the end of the washing machine basket opposite the "base wall" as the "open end." Such a definition plainly comports with the plain and ordinary understanding of an open end of a "basket," not to mention the illustrations and descriptions of the washing machine basket in the patent.

Thus, designating the "base wall" the "bottom" and the open end the "top" is misleading and inconsistent with the specification and illustrations. Electrolux has not pointed to any part of the patent claims or any part of the specification that makes inevitable or exclusive a construction of the washing machine basket as having "top" and "bottom" ends, even considering the references in Claim 23 and Claim 25 to "upward." Ultimately, the court finds that introducing "top" and "bottom" limitations on the washing machine basket is unwarranted, when accurate references to the "base wall" and "open end" will suffice. PPG Indus., 156 F.3d at 1355 (the task of the court is to "define[] the claim with whatever specificity and precision is warranted by the language of the claim and the evidence bearing on the proper construction"). Therefore, the court concludes that the two ends of the washing machine basket are properly defined as the "base wall" and the "open end," respectively.

Next, again relying on the words of the claim, Nystrom, 424 F.3d at 1142 (construction begins with the words of the patent); Biagro, 423 F.3d at 1302 (same), and the specification of the patent, see Phillips, 415 F.3d at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"), the court must reject Electrolux's assertion, or unintentional implication, that the radius from the central axis is relevant only at two points, at the base wall and at the edge of the sidewall at the open end. See Electrolux's definition ("the structure of the sidewall is disposed from a central axis at a greater distance than the top edge than at the bottom") (emphasis added). First, whatever the claim language means, "diverging radially outwardly" means that the radius continuously increases moving from the base wall to the edge of the sidewall at the open end, not just that it is greater at the open end than at the base wall. The difference, for example, is that a continuously increasing radius would suggest that the sidewall "slants" outward, while Electrolux's definition suggests a sidewall with a "stair-step" at the open end. To put it another way, Electrolux's construction reads "diverging radially outwardly" completely out of the claim limitation. Second, although the court has not found any portion of the Detailed Description Of The Invention, and the parties have pointed to none, that actually describes the "radially diverging sidewalk," n10 a careful examination of Figure 2 does reveal that the radius from the central axis to the sidewall 8 continuously increases from a point at the base wall 5 to a point at the edge of the sidewall at the open end of the washing machine basket, whether one considers the radius from the central axis to the inner surface or to the outer surface of the sidewall. See the '909 patent, Fig. 2 (reproduced above, page 14). Next, turning to extrinsic evidence, such as standard dictionaries, for guidance on "the widely accepted meaning of [this] commonly understood word[]," Phillips, 415 F.3d at 1314, the court finds that a standard definition of "diverging" is "moving or extending in different directions from a common point: drawing apart," MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY (10th ed. 1995) (definition 1 a of "diverge vb"), which suggests that the sidewalk continuously moves away from the central axis, rather than suddenly increases in a sort of "stair step." Finally, at the Markman hearing, Electrolux acknowledged that it did not mean to imply a stair-step configuration, but a regular or continuous divergence, so that the court's construction was appropriate in this
Maytag cites only portions of the specification that state that the mold core is "tapered" or "diverges inwardly," which Maytag apparently asserts imply that the sidewall of the washing machine basket molded upon such a core must also have a corresponding "taper" or "diverge outwardly." See the '909 patent, col. 4, ll. 11-19 and col. 4, ll. 37-39 (the mold core 90 has a "tapered outer surface 163"); id. at col. 6, ll. 37-39 ("The outer peripheral surface of core mold 90 diverges slightly inwardly from bottom to top as shown in FIGS. 3 and 4.").

The court also finds that use of the term "outwardly" suggests that the radius of the annular sidewall increases continuously from the base wall to the edge of the sidewall at the open end, as the nature of the change shown, for example, in Figure 2 of the patent is, indeed, "continuously increasing," and this construction also comports with the dictionary definition of "outwardly" as "toward the outside," again suggesting a continuous rather than an abrupt increase in the radius. See MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY (10th ed. 1995) (definition 1 b of "outwardly adv"). Therefore, the court provided the parties with its tentative construction of "diverging radially outwardly" to mean, at a minimum, that the radius of the annular sidewall continuously increases from the base wall to the edge of the sidewall at the open end.

At the Markman hearing, however, Maytag took issue with this part of the court's construction, asserting that "continuously" is unnecessary, because construing the term to require an increase in the radius "moving from base wall to open end" was sufficient. Somewhat more specifically, Maytag asserted that the court's insertion of "continuously" could require that there be no variation in the angle of divergence from the central access. In response, Electrolux asserted that "continuously" is what "diverges radially outwardly" means. The court is not persuaded that "continuously" should be stricken from the construction of this term. For the reasons stated above, "diverging" and "outwardly" both plainly suggest that the radius continuously increases from the base wall to the edge of the sidewall at the open end.

At last, the court reaches the crux of the parties' dispute, which is whether the continuously increasing radius should be measured only from the central axis to the "inner surface of the sidewall," as Maytag asserts, or to both the inner and outer surfaces of the sidewall, such that the entire "structure of the sidewall" "diverges radially outwardly," as Electrolux asserts.

The short answer to Maytag's assertion that only the radius to the inner surface of the sidewall matters is that there is no such limitation to be found in this or any other claim of the patent. See Nystrom, 423 F.3d at 1142 (construction begins with the words of the patent): Biagro, 423 F.3d at 1302 (same). Claim 25, instead, claims "an annular sidewall... diverging radially outwardly to an upper terminal edge," see the '909 patent, Claim 25, not just the "inner surface of the annular sidewall... diverging radially outwardly to an upper terminal edge." The claim then defines the sidewall as "including inner and outer surfaces," and clearly specifies which surface is intended when only one is relevant to a limitation, for example, by stating, "the outer surface [of the sidewall] [is] beveled at the apertures." Thus, the claim language expressly states that the "sidewall," not just the "inner surface of the sidewall," diverges radially outwardly" from the central axis of the washing machine basket.

Furthermore, attempting to read Maytag's "inner surface" limitation into this portion of the patent claim, on the basis that the specification refers to corresponding "draft" on the mold core, would be to improperly import or read a limitation from the specification into construction of the claim term. See Playtex Prods., Inc., 400 F.3d at 906 ("The court must take care in its analysis, when locating in the written description the context for a disputed term, not to import a limitation from that written description. It must use the written description for enlightenment and not to read a limitation from the specification [into the construction of the term].") (citing Comark Comms., 156 F.3d at 1186-87). Indeed, Maytag's construction is based on what the court finds to be, at best, a tenuous inference that only the radial divergence of the inner surface of the washing machine basket was intended, because only the outer surface of the mold core was correspondingly tapered, and the radial divergence was intended to facilitate removal of the washing machine basket from the mold core. See the '909 patent, Detailed Description, col. 4, ll. 19-22 (the mold core 90 has a "tapered outer surface 163"); col. 6, ll. 37-39 (the outer surface of the mold core 90 "diverges slightly inwardly from the bottom to top"); Claim 11 (claiming that the outward divergence is "to further facilitate removal of said tub from the mold assembly"); Claim 12 (same); Claim 18 (same). These portions of the specification plainly do not exclude the possibility that the outer surface of the sidewall, or the entire structure of the sidewall, also "diverges radially outwardly" from the central axis, because nothing about them suggests that a corresponding divergence of the outer surface of the sidewall or of the entire structure of the sidewall was intended, because only the outer surface of the mold core was correspondingly tapered, and the radial divergence was intended to facilitate removal of the washing machine basket from the mold core. Moreover, the corresponding "cavity sidewall member[s] 102" are defined as "extending about the periphery of mold core 90 with a first space therebetween," see, e.g., the '909 patent, col. 3, ll. 38-40, which suggests that the space between the mold core and the cavity sidewall members is uniform, rather than widening or thinning. Finally, the court suggested in its tentative draft of this ruling that the illustrations
of the washing machine basket, reproduced above, on page 14, plainly show that the sidewall is of uniform thickness, such that the outer surface of the sidewall also "diverg[es] radially outwardly." At the Markman hearing, Maytag took issue with this tentative finding, asserting that the sidewall as illustrated does grow thinner toward the open end. While Maytag may be correct that the sidewall, as illustrated, grows thinner toward the open end, the illustration unmistakably shows that both the inner and outer surfaces of the sidewall "diverg[es] radially outwardly." Maytag poses the question, what if only one surface of the sidewall "diverges radially outwardly," such that the inner surface "diverged radially outwardly," but the outer surface remained parallel to the central axis? Would the limitation "read on" such a configuration? The court finds it unnecessary to answer that question, which might require consideration of infringement under the doctrine of equivalents, for example, but certainly asks for an answer to a hypothetical question of infringement that is not pertinent to claim construction.

Finally, because the court's construction relies primarily on the unambiguous meaning of "sidewall" in Claim 25 as the entire sidewall, not just the inner surface of the sidewall, the court finds it unnecessary to accrete onto that construction Electrolux's "structure of" language, because to do so might be to construe the claim term with greater specificity than is warranted by the claim language. See PPG Indus., 156 F.3d at 1355 (the task of the court is to "define[] the claim with whatever specificity and precision is warranted by the language of the claim and the evidence bearing on the proper construction").

Thus, the court's construction of "annular sidewall . . . diverging radially outwardly to an upper terminal edge" is the following: "a sidewall shaped like a ring . . . continuously increasing in radius from the central axis moving from the base wall to the edge of the sidewall at the open end of the washing machine basket."
The Federal Circuit has concluded in this case that claim 20 is "limited to a double-drive mechanism which functions to impart the two described motions." Haney v. Timesavers, Inc., 1995 U.S. App. LEXIS 2535, No. 94-1287, slip op. at 6 (Fed. Cir. Feb. 10, 1995). The language in dispute here appears in the limitation found in claim 20 of Haney's '794 patent of "a double-drive mechanism interposed between and connecting the platen and frame, where the double-drive mechanism imparts at least one translational orbital movement superimposed on another movement to the platen relative to the frame."

The parties agree that "the double-drive mechanism imparts at least one translational orbital movement" in the Timesavers' machine, and that the Timesavers' machine superimposes a second reciprocating motion. Claim 20 of Haney's patent adds the phrase "superimposed on another movement to the platen relative to the frame."

Timesavers has maintained throughout this litigation that the language in claim 20 "superimposed on another movement" cannot cover a second reciprocating motion because such a motion is found in prior art devices. However, the court must interpret the language "another movement" to include a reciprocating movement as a matter of law.

"The words of a claim are generally given their ordinary and accustomed meaning, unless it appears from the specification or the file history that they were used differently by the inventor." Carroll Touch, Inc. v. Electro Mech. Sys., Inc., 15 F.3d 1573, 1577 (Fed. Cir. 1993). While the court recognizes the general rule that it is appropriate to interpret claims narrowly if necessary in order to sustain their validity, in this case Timesavers is asking the court to interpret the term "another-movement" to mean "another movement but not one with a reciprocating motion." To interpret a claim in a manner which would diminish or vary the claim language in order to sustain the validity of the claim would destroy the certainty that the patent statutes provide to the public. In Markman, the court explained:

It is only fair (and statutorily required) that competitors be able to ascertain to a reasonable degree the scope of the patentee's right to exclude. They may understand what is the scope of the patent owner's rights by obtaining the patent and prosecution history -- "the undisputed public record" and applying established rules of construction to the language of the patent claim in the context of the patent. Moreover, competitors should be able to rest assured, if infringement litigation occurs, that a judge, trained in the law, will similarly analyze the text of the patent and its associated public record and apply the established rules of construction, and in that way arrive at the true and consistent scope of the patent owner's rights to be given legal effect.

52 F.3d at 978-79 (citations omitted).

While a court, where possible, construes the language of a claim to sustain the validity of the claim, it is not possible to sustain the validity of a claim where the court must read limitations into or out of the language of the claim.

The term "another movement" is a broad term and cannot be interpreted to exclude a reciprocating movement without varying the claim limitations. A reciprocating movement is another movement. "Another movement" is not a disputed technical term which is ambiguous as to its meaning. There is nothing in the specification or the file history which indicates that the words "superimposed on another movement to the platen relative to the frame" were meant to have a meaning other than the ordinary accustomed meaning. When this portion of claim 20 is so interpreted, claim 20 literally reads on Timesavers' Series O/B Sanders.

Upon reconsideration of its opinion filed on August 9, 1995, the court finds that it was error for this court to find that it must make a factual determination as to the prior art in order to interpret Haney's claims. The issues raised by Timesavers regarding prior art are relevant to the validity of the claims and not to the interpretation of the language of the claims. There is a genuine issue of fact as to the validity of Haney's claims in light of the prior art. A jury must decide whether Haney's claims are invalidated by the prior art.

A. "Any Standard Meter" Or "Any Standard Electric Meter"

In independent claim 1 of the '623 patent, the patentees state that their claimed device has a housing with mounting holes
arranged such that said housing may be mounted in "any standard electric meter." 5 Itron contends that, in the context of the '623 patent, the terms "any standard meter" and "any standard electric meter" require that CellNet's claimed device be mountable on all "standard electric meters" as that term is defined in the specification. CellNet's position is that claim 1 should not be read to require the device to have mounting holes which permit it to be mounted on all of the standard electric meters. Rather, CellNet argues that "claim 1 refers to a housing amenable to use with various electric meters" because its counsel stated during the prosecution of the patent that the device could be mounted within "various" electric meters. CellNet further opines that "it is clear that CellNet simply intended to refer to the ability of their [sic] device to fit more than one of the standard meters." Thus, CellNet contends that it merely claimed a device that could be installed on more than one of the standard electric meters.

--- Footnotes ---

5 The parties agree that the terms "standard meter" and "standard electric meter" have the same meaning in the '623 patent.

--- End Footnotes ---

The parties' dispute focuses on the meaning of the word "any" since they appear to agree that the terms "standard meter" and "standard electric meter" are specifically defined in the patent specification:

The device of the present invention is configured to be mounted within the following Class 200 watthour meters as well as other meters having a similar internal structure: the D5S meter type manufactured by the Westinghouse Corporation, Raleigh, N.H.; the I-70-S meter type manufactured by the General Electric Corporation, Somersworth, N.H.; the MS meter type manufactured by Landis & Gyr (Duncan), Lafayette, Ind.; and the J4 meter type manufactured by Sangamo, Atlanta, Ga. Meters of the type just identified, including meters having a similar internal structure, will be hereinafter referred to as standard watthour meters or standard electric meters.

'623 patent, 3:40-52 (emphasis added).

The definition given to a disputed claim term in the specification is to be accorded substantial deference when construing the term. The Federal Circuit has declared that courts should generally begin their claim construction analysis with the patent specification because it is usually "dispositive." Vitronics, 90 F.3d at 1582. The Vitronics court described the patent specification as "the single best guide to the meaning of a disputed claim." Id. In this case, the patentees clearly and precisely defined the terms "standard meter" and "standard electric meter" in the patent specification. Since the patentees' express definition is consistent with the remainder of the intrinsic evidence, the Court hereby construes the terms as they are defined in the specification. '623 patent, 3:40-52.

2. The Court Construes "Any" To Mean "Every" Or "All"

Itron argues that claim 1 discloses a device which may be mounted on all four of the specifically-identified meters, including the Westinghouse, General Electric, Landis & Gyr, and Sangamo electric meters, and all other meters having similar internal structures. CellNet claims that the term "any" should be construed to mean "more than one." For the reasons given below, Itron's definition of "any" comports with the specification and prosecution history of the '623 patent application.

The patent specification contains several statements which contradict CellNet's argument that "any standard meter" and "any standard electric meter" merely mean "more than one standard electric meter." For example, the patentees explain that "the [mounting] holes are arranged so that the device may be mounted in any standard watthour meter." '623 patent, 2:63-65. The inventors also describe in detail the manner in which the mounting holes of the claimed device are arranged so that the mounting posts on each of the identified standard electric meters (including the Westinghouse, General Electric, Landis & Gyr and Sangamo meters) can be accommodated. '623 patent, 3:56-4:19 and 5:40-6:29. Moreover, in their introductory statement, the patentees state that their invention relates "to a device readily installed within standard electric meters for recording time of energy use." '623 patent, 1:5-8. Finally, the patentees leave little doubt that the disclosed device is designed to fit all four of the standard electric meters with these comments:
Excellent, highly-standardized, electromechanical meters for metering power consumption at fixed rates are currently in place at literally millions of locations throughout the United States. These meters are readily available and relatively inexpensive. Thus, the most practical and inexpensive way to provide for a multiple rate structure is to provide a device for recording time of energy use that is readily utilized with such standard electric meters. [P] Examples of such standard meters include: the D5S meter type manufactured by the Westinghouse Corporation, Raleigh, N.H.; the I-70-S meter type manufactured by the General Electric Corporation, Somersworth, N.H.; the MS meter type manufactured by Landis & Gyr (Duncan), Lafayette, Ind.; and the J4 meter type manufactured by Sangamo, Atlanta, Ga. ... [P] Accordingly, a general object of the present invention is to provide a relatively inexpensive device readily installed on standard meters for recording time of energy use.

'623 patent, 2:21-43 (emphasis added). Thus, the specification clearly provides that the device disclosed in claim 1 was designed to permit ready installation on all four of the specified standard electric meters. 6

6 CellNet does not argue that its construction is supported by the patent specification. CellNet's interpretation is based on the isolated comment of its patent counsel in reply to the November 23, 1987 Office Action and Mr. Johnson's testimony during the claim construction hearing.

The prosecution history also supports Itron's interpretation of "any standard meter" and "any standard electric meter." Although CellNet's patent counsel, William J. Egan III, stated in the Remarks section of the patenantes' Response to the Office Action of November 23, 1987 that the claimed device can be mounted on "various" electric meters, Mr. Egan also made statements contradicting CellNet's position. For instance, Mr. Egan argued to the examiner that the disclosed device was distinguishable over the identified prior art because it "may be mounted in any standard electric meter." Response to Office Action, 6:2-4. Mr. Egan also explained later that the device "may be mounted in standard electric meters." Such an unqualified statement clearly suggests that the inventors claimed a device which could be installed in all standard electric meters. The Court also notes that the examiner clearly understood the patentees to be claiming a universally adaptable meter module and the patentees never advised the examiner that they did not intend to assert such a claim. Office Action, P 2.

Finally, Itron's definition of the disputed terms is supported by reference to the dictionary definition of the word "any." 7 According to the dictionary, the word "any" can mean: 1) every; 2) all; 3) one, some, or all indiscriminately of whatever quantity; 4) one or another taken at random; and 5) one or more -- used to indicate an undetermined number or amount. Webster's Collegiate Dictionary (10th Ed. 1993). While the dictionary definition indicates that "any" can be construed to mean every, all, or an indeterminate number, it does not commonly mean "more than one." Thus, if the patentees intended to claim such a special definition of the word "any," their intent to do so must be reflected in the specification. In this case, no such intent is expressed in the specification of the '623 patent.

7 Both CellNet and Itron contend that their respective definitions of the word "any" is supported by the dictionary. They each submitted the relevant portions of dictionary at the July 24, 1998 hearing.

Accordingly, the Court construes the terms "any standard meter" and "any standard electric meter" to mean the D5S meter type manufactured by the Westinghouse Corporation, the I-70-S meter type manufactured by the General Electric Corporation, the MS meter type manufactured by Landis & Gyr, the J4 meter type manufactured by Sangamo, and all electric utility meters having similar internal structures.

- 644 -
III.

The first issue we address is Display's challenge to the district court's construction of the claim term "aperture." The term appears in the clause in claim 1 of the 176 patent that recites "an aperture through which an upright substantial portion of a lead article in said channel may be viewed." The district court concluded that "aperture" refers to a two-dimensional, rectangular space and, based on that construction, held that claim 1 was anticipated by the Allen and Vineyard patents. Display argues that the district court's claim construction was incorrect and that, under the correct construction of "aperture," the Allen and Vineyard patents do not anticipate claim 1.

Display urges a claim construction which would require the aperture to be three dimensional, revealing the lower front quadrant of the container from both front and side angles. Display defines the term aperture with reference to the written description of the patent, column 6, lines 17-20, where it is stated that "the aperture typically presents substantially a full quadrant of the lead article A' for view by the customer." According to the specification, "such a quadrant in the case of a bottle typically extends the full width of the bottle and upwardly for about one third to about one half the height of the bottle." 176 Patent, col. 6, ll. 21-23. Based on this language, Display concludes that any aperture revealing "substantially a full quadrant" must reveal a view of the bottle from both the front and sides (i.e., a three-dimensional view of the full quadrant). Display argues in its brief, therefore, that the Allen and Vineyard patents "cannot reveal 'substantially a full quadrant' of the lead article because the lead article cannot extend beyond the sidewalls of the display rack."

Essentially, Display takes the claim term "aperture," combines it with language in the specification describing an embodiment of the invention as revealing "substantially a full quadrant" comprising "the full width" of the container, and creates a limitation on the relationship between the sidewalls and the lead article to require that the lead article must extend beyond the sidewalls of the display rack. Display argues that "there is little room for dispute that the patentee . . . was acting as his own lexicographer and that the claim 1 language requiring 'an aperture through which an upright substantial portion of a lead article . . . may be viewed invites reference to the specification."

The district court did not err in its claim construction. "The general rule is, of course, that the claims in a term are to be given their ordinary and accustomed meaning." Johnson World Wide Assocs., Inc. v. Zebco Corp., 175 F.3d 985, 989, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999). The ordinary definition of the term "aperture" is "an opening; hole; gap." Webster's New World Dictionary Third College Edition 63 (1994). That definition does not indicate either a two dimensional or three dimensional space. Because the ordinary meaning of the term aperture does not resolve the issue before us, it is appropriate to consider the specification. See Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1331-32, 59 U.S.P.Q.2D (BNA) 1401, 1407 (Fed. Cir. 2001).

The district court based its construction of "aperture" on the following statement in the 176 patent's specification:

The aperture thus formed is preferably generally rectangular in outline. . . . Even where the front member is not transparent or not present, the aperture typically presents substantially a full quadrant of the lead article A' for view by a potential customer, the quadrant mentioned being the bottom half of the front half of the article. Such a quadrant in the case of a bottle typically extends the full width of the bottle and upwardly for about one third to about one half the height of the bottle, typically an area of about 10 square inches.

176 Patent, col. 6, ll. 10-24 (emphasis added). The court stressed that if the term "aperture" were to refer to a three-dimensional, cylindrical space, there would be a conflict with the language in the specification - quoted above - referring to the aperture being "rectangular in outline" and having "an area of about 10 square inches." The specification supports the district court's claim construction.

There is, we think, an additional consideration that weighs in favor of the district court's claim construction. As seen above, both claims 2 and 3 of the 176 patent, which depend from claim 1, are directed to a display rack in which the "front member is disposed forwardly of the front of said track." Claims 2 and 3 embody the kind of structure that Display urges is claimed in claim 1 (an aperture that reveals a bottle from both the front and the sides). In view of dependent claims 2 and 3, the district court's claim construction, in addition to being grounded in the specification, has the added virtue of being consistent with the doctrine of claim differentiation. See Wenger Mfg. v. Coating Mach. Sys., 239 F.3d 1225, 1233, 57 U.S.P.Q.2D (BNA) 1679, 1685 (Fed. Cir. 2001) (stating that claim differentiation "is clearly applicable when there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only
meaningful difference between the two claims”). Because we conclude that the district court did not err in construing the claim term "aperture," we affirm the holding that claim 1 is invalid.

230

1. aperture (claims 4, 9, 10, 11) n3

n3 Although the disputed terms often occur in claims other than those identified by the parties, the Court will limit itself to identifying those claims in which the parties indicate the disputed terms occur. In so doing, the Court notes that it has nevertheless considered each term in the context of the entire patent, including the specification and the unasserted claims.

Fargo: an opening, such as a hole, gap, or slit
Iris: an opening that extends completely through the end face of the supply roll assembly (claim 4) or through the member movable with the roll core (claims 9-10)

Both parties agree that an aperture is some type of opening. Iris contends that, "in the real world," the term "aperture" is used to refer to an opening that extends all the way through something. It cannot be identical to a "hole" or an "opening," Iris argues, because synonyms by their nature do not have identical meanings. Iris also points out that the specification shows the apertures extending all the way through the hubs. Both parties refer to dictionary definitions to support their arguments. Fargo's definition comes straight from a dictionary. While criticizing Fargo's reliance on a dictionary, Iris relies on a newer edition of the same dictionary to argue that the most common use of the word "aperture" is to describe the opening extending through the wall of a camera or a telescope.

The Court finds that Fargo's proposed definition is the most appropriate construction of the term "aperture." Iris has not shown that the ordinary meaning of the word "aperture" requires that the hole extend completely through the hub. While Iris's evidence concerning cameras and telescopes might be relevant in a different case, the patents at issue here do not involve cameras or telescopes. Although courts should not place blind reliance on dictionaries, there is no evidence in this case that the '519 patent is using "aperture" in a specialized manner, and all the dictionaries the parties cite define "aperture" in a manner similar to Fargo. Cf. Phillips, 415 F.3d at 1314 (noting that dictionaries are helpful in cases where the ordinary meaning is readily apparent and "claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words.").

Moreover, the fact that the specification shows openings extending all the way through the hub does not mean that Fargo must be limited to that meaning. While the specification is "the single best guide to the meaning of a disputed term," Phillips, 415 F.3d at 1315 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)), courts are not to import limitations from the specification into the claims. Comark Commc'n's, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998). While this distinction can be difficult to apply, it is helpful to keep in mind that the purpose of the specification is to enable those of skill in the art to make and use the invention. Phillips, 415 F.3d at 1323. In this case, where the specification uses the words "openings," "bores," and "apertures" interchangeably to refer to the holes in which pins are inserted, it is apparent that the patentee has not assigned any special meaning to the word "aperture" that would require an aperture to extend all the way through the hub.
There are additional references to "an aperture" in the Summary of the Invention and in the Detailed Description of the Preferred Embodiment which describe a structure or portions of structure of the fastener system as an "aperture" in like fashion. Clearly "aperture" is used to describe an opening or hole in a structural element. This construction is consistent with the dictionary definition. For example, Funk & Wagnall's Standard College Dictionary (1973) (the one immediately at hand) defines aperture as "an opening, orifice, hole, cleft."

This word is to be construed as follows:

- an opening or a hole

---

B. The Patent

Following the rules laid out above, we now construe the proper meaning of "aperture," as used in the Patent. Most important is the language of Claim 1, which has been invalidated by both the courts and the Patent and Trademark Office, see supra, but which remains central to our inquiry because it is the claim from which the presumptively valid claims at issue depend.

3

--- Footnotes ---

3 Claims 2, 3, 16, 30, 31, 33 and 34 are refinements of Claim 1, and therefore are read as containing all the elements described in Claim 1. Moreover, Claim 29 (added in the Reexamination Certificate), from which Claims 35-37 depend, describes the aperture in language identical to that in Claim 1.

--- End Footnotes ---

Claim 1 claims, inter alia,

the bottom of [the] front member, the top of the front of said track [i.e., the floor of the channel], and the front of said sidewalls [i.e., the vertical walls that separate adjacent channels] cooperatively defining an aperture through which an upright substantial portion of a lead article in said channel may be viewed.

Col. 10, ll. 24-31. The most logical interpretation of the term "aperture," as used here, is that it describes the empty space between these components. Not only does this make the most internal sense, but it makes the most sense in light of the fact that the preferred embodiment of the Patent uses transparent material, see Col. 5, ll. 39-52, in which case, if "aperture" simply meant "viewing window," as plaintiff argues, then the aperture here would not be "defined" by the bottom of the front track or the front of the sidewalls, but rather would extend across the entire front of the rack.
Plaintiff contends that the patent specification suggests a broader definition of "aperture." The specification states that "even where the front member is not transparent, but assuming that any secondary or auxiliary front wall is either transparent or not present, the aperture 30 typically presents substantially a full quadrant of the lead article." Col. 6, ll. 15-19 (emphasis added). Plaintiff reasons that, because this passage uses the word "aperture" to include an embodiment with a transparent solid front wall, the claimed aperture must include such a possibility as well. This argument, however, is unpersuasive.

The plaintiff must overcome the presumption that the ordinary meaning is the one intended by the patent. See K-2, 191 F.3d at 1363. The ordinary meaning of the word aperture, and the one that makes the most sense in the context of the claims, is "hole." A word can be redefined either explicitly or implicitly, by its clear and consistent use throughout the specification. See Id.; Bell Atl. Network Servs., Inc. v. Covad Communs. Group, Inc., 262 F.3d 1258, 1273 (Fed. Cir. 2001). In this case, however, the specification does not clearly redefine "aperture" to mean "viewing window." Only once does the specification allow for a transparent auxiliary front wall, and the numerous other references to the term "aperture" define it by its four edges, never mentioning its face. Moreover, as mentioned above, Claim 1 describes an "aperture" bound by the solid front parts, whether they are opaque or transparent, which further suggests the conventional meaning. For these reasons, we reject plaintiff's argument that defendant's transparent front member is an "aperture" as described in the Patent.

Plaintiff argues alternatively that the cutaway section in OmniGlide, which is undoubtedly an aperture, infringes. This aperture, however, is not "defined by" the two sides or bottom of the track, as specified in Claim 1. Plaintiff suggests that the cutaway aperture is covered by the Patent under the doctrine of "claim differentiation" 5--that because the invalidated Claim 10 covers the invention devoid of an upstanding lip, the Patent, by negative implication, covers the existence of an upstanding lip. We assume arguendo that an invalidated claim can be the basis for claim differentiation. Even if Claim 1 covers an upstanding lip or wall, it still claims an "aperture" defined by the bottom of the front member, the top of the track, and the front of the sidewalls. The aperture in OmniGlide, by contrast, is not defined by any external structures, but rather is cut out of the transparent front piece.

Accordingly, we find that OmniGlide does not contain the aperture element described in Claim 1, and therefore does not infringe related Claims 2, 3, 16, 29-31, or 33-37.

As was readily apparent during the Markman hearing, the parties' dispute is predominately about the meaning of the word "aperture." Minor disputes also exist as to the meanings of the terms "cavity," "longitudinal directions," and "upper, lower, and outer surfaces." At the most basic level, the parties are fighting about the scope of the patent. Medtronic would have the Court limit the invention to a device with at least one, "fully enclosed" aperture and with narrow limitations on shape and spacial orientation. Quickie seeks "the broadest construction of these claims reasonable." (Pl. Mem. at 13.)
There are two independent claims at issue, claims 13 and 33. Taking claim 13 as representative of the use of the words in the patent, the invention is "an apparatus body having a upper surface, a lower surface, an outer surface, and at least one aperture, the aperture having a longitudinal axis extending from the upper surface to the lower surface and defining an aperture surface, wherein a first longitudinal direction and a second longitudinal direction thereof each extends along the longitudinal axis in opposite directions." (Col. 15, lines 5-12) (emphasis added). Moreover, the aperture has a "middle portion [with] a first surface and second surface opposing each other and is wider than either of the upper portion and the lower portion and forms a cavity therein; and (b) a movable cam member [is] disposed in the middle portion of the aperture." (Col. 15, lines 20-25.)

Medtronic describes the Quickie invention as "a disk-shaped body having at least one hole ('aperture') through it, with a 'cavity' located inside the body and in which is housed a movable 'cam member' that alternatingly allows and restricts passage of a suture through the hole (aperture) in the body," and points to Figs. 5 and 7 in the patent. (Def. Reply at 1.) Medtronic argues that this embodiment of the device is "the only structure shown and described in the '160 patent that corresponds to the asserted claims." (Id. at 2.) Consistent with this structure, defendant argues that (1) the aperture must be "fully enclosed," meaning a hole through the device as opposed to any other opening, such as a crenelation, (2) the device must be disk-shaped with parallel upper and lower surfaces, (3) the cavity must be fully enclosed within the aperture, and (4) the longitudinal directions must run north-south. Quickie, in contrast, argues that the drawings in Figs. 5 and 7 merely represent one example of a device embodying the patented invention, and point to case law holding that the "law does not require the impossible. Hence it does not require that an applicant describe in his specification every conceivable and possible future embodiment of his invention." SRI Intl v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121 (Fed. Cir. 1985).(See also Pl. Reply at 2-3.)

To support its narrow construction, Medtronic focuses on Figs. 5 and 7 and on language in the claims describing the movable cam member as "captured" within the aperture. (See, e.g., Sept. 4, 2002, Tr. at 43.) Emphasizing that the cam member must be "disposed in the middle portion of the aperture" (col. 15, lines 24-25) (emphasis added), or "therein" (col. 18, lines 9-13) (emphasis added), or "captured within the cavity, since the largest dimension of the cam member is larger than either end opening of the aperture" (col. 11, lines 15-17); and that the main criticism of the prior art was harm caused by the cam member falling out (see, e.g., col. 2, lines 58-67, col. 3, lines 25-34, col. 3, lines 36-48, and col. 3, lines 52-65), Medtronic correctly argues that the aperture cannot be "just any opening" (Tr. at 45).

Because these functional constraints are essential to the claimed invention, Quickie goes too far in its assertion that the meaning of the term "aperture" is "unqualified," or encompasses "any three-dimensional opening, space or channel" (Tr. at 10). However, none of the intrinsic evidence warrants as narrow a definition of "aperture" as the one offered by Medtronic.

An "aperture" need not by definition be "fully enclosed" in the sense argued by Medtronic, but rather includes any form of opening. The only justification for reading the term more narrowly here is that the very essence of the invention described requires a spatial configuration of the various parts that will "capture[ ]" the cam within the device and prevent its falling out. Such configurations can be of various types, and still fit comfortably within the language of the claims. Therefore, there is no reason in evidence intrinsic to the patent to require, as Medtronic suggests, that the "aperture" be "fully enclosed." The patent fairly contemplates and covers any shape with the requisite "spatial relationship[s]" (col. 11, line 20) between the cam member, cavity, and aperture, and is not limited to the embodiment shown in Figs. 5 and 7, so long as the cam is contained within the device as a result of the spatial configuration of the aperture.
An aperture is ordinarily understood to mean an open space or opening as between parts or sections of solid matter. Webster's 3rd New International Dictionary (unabridged) 99 (1986). The specification provides that the aperture may take the form of a blind hole, groove or groove section. ('664 patent, Col. 2, ln. 39-42). But contrary to the contentions of the Defendants, the specification does not limit the meaning of "aperture" to only those structures. "Particular embodiments appearing in the specification will not generally be read into the claims." Specialty Composites, 845 F.2d 981 at 987. That is especially the case where, as here, the description explicitly states that the embodiments disclosed "are by no means exhaustive." ('664 patent, Col. 3, ln. 8); see also, Specialty Composites, 845 F.2d at 987.

Defendants fail to cite any other portion of the specification or the prosecution history that clearly demonstrates an intent on the part of the patentee to limit the ordinary understanding of the term "aperture" to a few structures. Neither do the Defendants offer any support that an aperture, as understood in the '664 patent, must be a structure that includes a "front wall and at least two side walls," other than to point to an illustration of one of the embodiments of the invention. Again, however, what is patented is not restricted to the examples. Specialty Composites, 845 F.2d at 987. "Aperture," as that term is used in the '664 patent, is simply an open space or opening as between parts or sections of solid matter.

A. '413 PATENT

All of SLT's contact probes have optically transparent distal ends made of either sapphire or quartz that transmit laser or radiant energy from a fiber optic cable. Almost all of the contact probes have an infrared coating that is sprinkled on this distal, transparent surface of the probe. This infrared coating, which does not cover the entire distal end, absorbs a limited portion of the radiant energy and converts it to thermal or heat energy. These contact probes also have a stainless steel connecting sleeve that secures the probe to the fiber optic cable. A coolant is supplied to the sleeve to prevent the connecting sleeve from heating. The sleeve also contains a port to vent the coolant.

The district court focused on claims 1 and 20, the only two independent claims of the '413 patent asserted against SLT. Claims 1 and 20 read as follows:

1. A localized heat applying medical device for applying heat to a site in a selected lumen in a patient's body, the device comprising in operative association:

an elongated light transmitting conduit having a proximal end and a distal end, and bulbous heat generating means mounted on the distal end, for converting light transmitted by the conduit in part to heat thereby raising the temperature
thereof, the diameter of the bulbous heat generating means being larger than the diameter of said conduit, the bulbous heat generating means including a light transmitting aperture therethrough enabling light transmitted by the conduit in part to pass through the means into the lumen to directly impinge on a region thereof.

20. A localized heat applying medical device for applying heat to a site in a patient's lumen, the device comprising in operative association:

an elongated light transmitting conduit having a proximal end and a distal end and a heat generating element defining a cavity with vent means therein for permitting gas to escape from the cavity, the element being mounted on the distal end such that light transmitted by the conduit to the element is in part converted by the element into heat to raise the temperature of the element and the element can then be contacted with material in the patient's lumen to alter the material, the element including a light transmitting aperture through which a part of the transmitted light can pass to impinge directly onto the material; the conduit and heat generating element being adapted for insertion into the patient's lumen.

The district court focused on the claim term "light transmitting aperture" common to both claims 1 and 20. The district court found that the term was described in the specification as a "hole," "window," or "port," and concluded that it should be defined as "an opening in the tip of the device through which laser energy passes." Trimedyne, slip op. at 3 (C.D. Cal. May 8, 1996). The district court found that the accused SLT probes do not have such an aperture because the SLT device tip was entirely light transmissive and there was no evidence that the amount of light transmission could be controlled for clinical effect. Id. The district court additionally found that the accused SLT probes do not have "a cavity with vent means therein for permitting gas to escape from the cavity" as additionally required by claim 20. Id. at 3-4.

The district court held that SLT's accused probes do not infringe under the doctrine of equivalents because SLT's probes perform in a different way from that claimed in the '413 patent. For instance, the district court found that SLT's probes are light transmissive, but also transmit a "mix" of laser and thermal energy over the entire tip, whereas radiant energy is transmitted straight ahead through a "light transmitting aperture" in the tip of the '413 claimed probe while the rest of the tip transmits only thermal energy. This difference the district court found creates a different therapeutic effect than SLT's contact probes. Therefore, the district court granted SLT's motion for summary judgment of non-infringement of the '413 patent.

* * *

II. DISCUSSION

A. '413 PATENT

First, Trimedyne argues that the district court improperly construed the claim term "light transmitting aperture" from independent claims 1 and 20 as requiring an opening in the tip of the probe through which laser energy passes when the specification of the '413 patent teaches that the aperture can be a quartz window or lens, as in SLT's contact probes. Trimedyne also argues that the district court improperly decided a question of fact when it determined that SLT's contact probe tips or distal ends are entirely light transmissive. SLT applies a heat absorbing coating of carbon particles to the majority of its contact probes. Because such a coating is not perfect, Trimedyne asserts that laser energy escapes from the probe tip through the spaces between the coating's carbon particles. These spaces, Trimedyne asserts, constitute "light transmitting apertures" as claimed in claims 1 and 20.

Trimedyne also argues that during use of SLT's contact probes such an aperture is created. During use, carbonized tissue particles adhere to the surface of the tip, which increases the tip temperature. Through further use, the laser light burns an aperture through the "blackened" tip, which Trimedyne argues independently satisfies the "light transmitting aperture" limitation of the patent claims at issue.

Second, Trimedyne asserts that the SLT contact probes have the vents described in claim 20. Trimedyne argues that a gap is created between the fiber optic cable and the probe when mounted together. A hole or port communicates with the gap and can allow gases as well as liquid coolant to pass from the gap through the hole or port. This ability to vent gases, regardless of whether SLT uses the vent to do so, Trimedyne asserts, meets the limitation of claim 20. Therefore, Trimedyne concludes that at least a triable issue of fact exists concerning whether SLT's contact probes literally infringe the asserted claims of the
'413 patent.

Lastly, Trimedyne argues that even if we agree with the district court, after construing the claims, that no literal infringement exists, triable issues of fact remain concerning whether SLT's contact probes infringe the '413 patent under the doctrine of equivalents. For instance, Trimedyne argues that SLT has admitted that its contact probes function to achieve the same therapeutic result as the claimed probe, i.e. to deliver heat to alter the tissue by coagulation, ablation, or vaporization.

SLT counters Trimedyne's arguments by asserting that its various contact probes do not infringe the '413 patent because they lack the claimed light transmitting aperture, vent means, and a bulbous heat generating means or element. First, SLT asserts that the district court properly construed the claim term "light transmitting aperture" to be a hole in an opaque heat generating element through which a portion of the radiant energy may be transmitted directly to the tissue. All of SLT's contact probes are made of quartz or sapphire, which are light transmissive, and therefore, SLT argues, they have no such discrete light transmitting aperture. Therefore, SLT's contact probes do not infringe the '413 patent, it argues, because the claimed probe allows laser energy to pass only through the small, single aperture, while laser energy may exit the entire surface of the distal end of SLT's contact probes.

Second, SLT asserts that the claimed means-plus-function element, "vent means," must function to "permit gas to escape from the cavity." SLT argues that its probes do not use the vents to perform the function of venting gas. Rather, force-driven coolant is used to keep the probe cool to avoid the build-up of such gases. Therefore, its vents do not perform the required function of venting gases.

Third, SLT asserts that its contact probes lack a heat generating element, an issue that the district court did not reach. The heat generating element or means when read in light of the specification, SLT asserts, requires an opaque material in which there is an aperture for transmitting direct laser radiation to the tissue. Because the distal end of SLT's probes are light transmissive with no opaque material, it asserts it lacks the claimed heat generating element. Finally, SLT asserts that its probes are not bulbous because during the prosecution of the '413 patent the applicants distinguished probes such as SLT's with a cylindrical body portion and distal ends having the same or smaller diameter as the body portion. Because of this increasing diameter, SLT's contact probes have an increasing point of contact with the walls of a vessel when the probe is urged forward; exactly what SLT argues the claimed probe of the '413 patent was intended to avoid. Therefore, SLT asserts that the district court properly found that SLT's contact probes do not literally infringe any asserted claim of the '413 patent.

SLT also agrees with the district court that none of SLT's contact probes infringe the '413 patent under the doctrine of equivalents. Taken on an element by element basis, SLT argues that its devices do not perform in substantially the same way because SLT's contact probes diffuse laser energy throughout the entire probe surface whereas the claimed probe transmits laser energy only through the light transmitting aperture. This leads to substantially different clinical results, SLT argues. The lesion formed by the claimed device is a double crater; the outer crater mirrors the shape of the heat generating element and the inner crater reflects the intense, direct laser irradiation of the tissue from the aperture. The lesion formed by SLT's probes, on the other hand, is a single, uniform crater.

1. LITERAL INFRINGEMENT

Summary judgment is properly rendered when "the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c); see also Johnston v. IVAC Corp., 885 F.2d 1574, 1576-77, 12 U.S.P.Q.2D (BNA) 1382, 1383 (Fed. Cir. 1989). In deciding whether a genuine issue of material fact exists, any evidence must be viewed in favor of the nonmoving party with any doubts resolved in its favor. O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1580, 42 U.S.P.Q.2D (BNA) 1777, 1779 (Fed. Cir. 1997). A grant of summary judgment is reviewed de novo. Conroy v. Reebok Int'l, Ltd., 14 F.3d 1570, 1575, 29 U.S.P.Q.2D (BNA) 1373, 1377 (Fed. Cir. 1994).

To determine on summary judgment whether SLT literally infringes any claim of either patent in suit, we first interpret the claims, and second, determine whether a reasonable trier of fact could find that every limitation in any construed claim at issue is found in SLT's accused probes. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1575, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir.), cert. denied, 516 U.S. 987, 133 L. Ed. 2d 424, 116 S. Ct. 515 (1995). The primary issue presented in the appeal from the grant of summary judgment of the '413 patent is whether the district court properly construed the claim terms "light transmitting aperture" and "vent means for permitting gas to escape from the cavity." Claim
construction is a question of law that we review de novo. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed. Cir. 1998). In defining the meaning of key terms in a claim, the court may refer to the specification, the prosecution history of a patent, prior art, and other claims. Minnesota Mining and Mfg. Co. v. Johnson & Johnson Orthopaedics, 976 F.2d 1559, 1566, 24 U.S.P.Q.2D (BNA) 1321, 1335 (Fed. Cir. 1992) (citing Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1021, 4 U.S.P.Q.2D (BNA) 1283, 1286 (Fed. Cir. 1987)).

The distal end or head portion of the claimed contact probe is a generally rounded, heat generating element preferably made of metal, such as stainless surgical steel, or a combination of metal and ceramic. '413 patent, col. 6, ll. 52-55. This head portion or heat generating element is designed to absorb the radiant energy from fiber optic cable and convert it to heat. Id. at col. 5, ll. 55-60; col. 12, ll. 25-32. This heat is transferred primarily by conduction to ablate any obstruction. Id. at col. 12, ll. 31-32. The heat generating element is thus not light transmissive.

The light transmitting aperture as claimed in the '413 patent is first introduced in one embodiment as

a central aperture or bore which permits a portion of the light transmitted to the heat generating element to pass through the aperture and directly impinge upon a selected region of the plaque obstruction. With this form of heat generating element, both radiant and heat energy can be applied sequentially or simultaneously to the lumen or to the obstruction therein.

'413 patent, col. 3, ll. 11-18.

Under the Description of the Preferred Embodiments, the light transmitting aperture is described in more detail in relation to Figure 10 reproduced below.

As illustrated in FIG. 10, tapered body portion 542 has a varying side wall thickness and partly defines a cavity 544. An optically transparent means such as a lens or window 546 is positioned within the head portion 543 so as to block the distal end of the cavity 544 against the inflow of body fluids and tissue components. The window 546 can be made of quartz, sapphire or other optically transparent material. Aperture or bore 550 in head portion 546 defines a communication port between the window 546 and the surroundings. The window 546 prevent bodily fluids or material that have entered the boring 550 from contaminating the end 532a of the fiber optic member 532. The thickness of the side wall of body portion 542 is less than the wall thickness of the head portion 543.

The light transmitting fiber 532 emits light or radiant energy from an end surface 532a which impinges upon a surface 548 of the window 546. As discussed earlier with respect to the embodiments of FIGS 1-8, radiant energy transmitted through the conduit 532 heats the heat generating element 536 when it impinges upon the surface 548. A portion of the radiant energy, such as the light beam designated by the legend R emitted from the surface 532a passes through the window 546 and the aperture 550 directly into the surrounding lumen. The radiant energy R then impinges upon a surface 154a of the obstruction 154. The sequential or simultaneous application of heat and radiant energy to the obstruction 154 softens or vaporizes the plaque thereby easing the advance of the heat generating element 536.

As a result of adding the port or aperture 530, light or electromagnetic energy as well as thermal energy, are sequentially or simultaneously applied to the obstruction 154 desired to be removed. By controlling the size of the aperture 550, it is possible to control the amount of power or energy delivered directly to the site.

'413 patent, col. 13, ll. 20-56.

On the basis of the above description of the aperture, we hold that the district court was correct in defining "light transmitting aperture" as a hole, window, port, or opening in the tip of the probe through which laser energy passes. The written description, including Figure 10, shows the aperture as a discrete hole or bore in the center of the distal end or head portion of the probe. Also, the aperture 550 and the transparent window 546 that is positioned within the aperture to transmit light are always described in the singular. Only one aperture and window are present within the distal head of the probe as described in the '413 patent, not a multitude of small apertures, as Trimedyne asserts, exist between the carbon particles of the infrared coating on some of SLT's contact probes. The reference to controlling the size of the aperture to control the
amount of radiant energy for use with Trimedyne's contact probes further supports the conclusion that the claim limitation "light transmitting aperture" refers to a single discrete hole or opening.

The dispute here is whether an "aperture" is a discrete opening, such as a perforation, or whether it includes more complex openings, such as those contained in frits and porous plates. According to ASM's expert, Douglas L. Peltzer ("Peltzer"), a frit is made by packing small particles together, which creates minute, randomly distributed interstitial spaces, called pores. (Peltzer Report at 8 n. 4.) A porous plate is another term for a frit. (Id.) Genus' expert, William Oldham ("Oldham") agrees with Peltzer that "in a frit an opening on one side does not correspond to an opening on the other side, and that in general the gas passageways are randomly located, occasionally interconnect within the frit, and can be described as tortuous." (Oldham Rebuttal Report at 2.) A frit thus appears to be similar to a layer of sand, or a sponge; although gas can flow through it, it does not have distinct or uniform holes passing through it. Instead, it has random passageways, some that dead-end, and others that allow gas to flow from one side to the other.

The language of the patent is silent on the issue. The term "aperture" is used in two different contexts.

First, the patent describes apertures through which the gas is directed towards the substrate. (See, e.g., '165 patent 3:35, 3:63.) For ease of reference, the Court will refer to these apertures as "gas flow apertures," in accordance with the language of claim 1. (Id. 5:40.) The diagrams of the patent show the gas flow apertures as discrete round holes. (Id., Figs. 1c and 4.) The parties often refer to the apparatus containing the gas flow apertures as the "showerhead.

Second, the patent describes apertures through which the gas is removed from the chamber containing the substrate. (See, e.g., id. 4:14, 4:31.) For ease of reference, the Court will refer to these apertures as "extracting apertures," in accordance with the language of claim 10. (Id. 6:45.) The diagrams of the patent show the extracting apertures as discrete round holes leading into what probably could best be described as an L-shaped tunnel. (Id., Figs. 5a and 5b.)

These diagrams of the gas flow apertures and the extracting apertures only describe preferred embodiments, however. They do not purport to describe all possible forms of apertures that could be used to practice the invention.

ASM argues that the apertures must be discrete openings, because the specification of the '165 patent refers at one point to "discrete apertures" and describes apertures located at the apexes of equilateral triangles. (Peltzer Report at 9.) That language appears in the description of the preferred embodiment and describes the gas flow apertures:

Because of the relatively small size of the apertures 74, the magnitude of the gas velocity will generally be uniform among all of the apertures 74 as the gas passes through toward the plane of substrate 10. To reduce the effects of any granularity that can result from the use of discrete apertures, and to smooth out any irregularities in distribution of the gas, the substrate 10 can be rotated during the period of gas flow. It has been found that a generally uniform flow can be obtained when the apertures 74 are located at the apexes of equilateral triangles, and are distributed uniformly over the region of surface 71 approximately the same size as substrate 10 and axially symmetrical therewith

(165 patent 3:65-4:4.) On the one hand, nothing in this language expressly requires the use of discrete apertures. Instead, it points out a possible problem with the use of discrete apertures, and offers a solution: rotating the substrate. On the other hand, it also points out that one way of obtaining a generally uniform flow is to use apertures that are located at the apexes of equilateral triangles. Although this language describing a preferred embodiment does not require that apertures be located at the apexes of equilateral triangles, it does strongly suggest that "apertures" in the context of the '165 patent must be holes that are capable of being arranged into patterns.

Claims 1 and 6 also require that the apertures be arranged "in a generally circular configuration." (165 patent 5:47-48, 6:22-23.) This language also requires that the apertures be arrangeable into patterns. The Court agrees with ASM that because the holes in a frit generally are dispersed randomly, they cannot be arranged in "a generally circular configuration" as required by the language of claims 1 and 6. As the patent requires that one must be able to arrange the apertures into various configurations, the Court agrees with ASM that the apertures must be discrete openings, rather than the loose, random network of openings generally found in a frit.
ASM also points to the prosecution history, but to less effect. ASM does not contend that there is a definition of "aperture" in the prosecution history, but rather points to the examiner's conclusion that three prior patents (the Nishizawa, Robinson and Brandolf patents) disclosed using a plurality of gas flow apertures. (Peltzer Expert Report, Ex. N ('165 Prosecution History) at FH-0090.) ASM contends that each of those patents used a discrete opening, rather than a frit. Even if that is true, however, it proves only that discrete openings are at least one type of aperture. The issue here is not whether the "apertures" must be the openings in a frit, but whether they can be the openings in a frit.

ASM's argument that holes are not apertures unless one can pass a beam of light through them has no support in the language of the patent, however. Moreover, it contradicts Figure 5b of the patent, which clearly shows an extracting aperture with an L-shaped bend that does not pass directly through the material.

ASM also points to a memorandum, dated September 26, 1984, by Mac Robinson ("Robinson"), one of the inventors of the '165 patent. (Peltzer Report, Ex. M.) ASM contends that this memorandum demonstrates that frits cannot be used to practice the invention because they absorb too much energy and a source of particular contamination. In that memorandum, Robinson discusses the likelihood of obtaining uniform silicon deposition when gas is introduced uniformly over the entire wafer, and states:

The gas will be injected normal to the wafer, through a fused quartz plate. Ideally, the plate should act like a porous frit. However a porous frit would absorb too much radiant energy, besides being a source of particulate contamination, so we must approximate a porous plate with an array of holes or slits.

(Id. at 1.) The '165 patent also mentions the possibility of using a fused quartz plate and provides that "if the substrate is to be heated, and particularly if the substrate is to be heated by optical radiation, the apparatus containing the apertures through which the gas is introduced will generally be made of a suitable transparent material, for example, fused quartz." ('165 patent 4:69-5:4.) Thus, it appears that Robinson's memo is referring to a process in which the substrate is heated. Robinson concluded that a frit would not be acceptable for use in that process because it would absorb too much radiant energy. (Peltzer Report, Ex. M.) None of the '165 patent claims require that the substrate be heated, however, and the specification's use of the language "if the substrate is to be heated," suggests that it need not be heated. Even if a frit would not be acceptable for use in a process where the substrate is heated, it does not necessarily mean that it would be unacceptable for use in a process where the substrate is not heated.

Robinson also states that a porous frit would be a source of particulate contamination. Nothing in his memo suggests whether particulate contamination would be a problem only in a process where the substrate is heated, or whether it would also be a problem where the substrate is not heated. Oldham's deposition testimony, however, suggests that contamination might generally be a problem with the use of certain types of frits. Oldham was asked when he last used a frit and responded:

I don't know. I mean, I haven't thought about it. Our -- the kind of business we're in is enormous emphasis on cleanliness and noncontamination and in particular sodium is a big problem. In the industry we'll do anything to keep sodium out of the processing and so you're very careful about the kind of materials you use and ordinary glasses are -- are not used in our laboratory. You use only very special semiconductor grade chemicals and materials. So you don't bring the common, as I say, these common materials in. Now, if I had occasion to want a, for instance, in connection with this -- with this -- the matter under discussion today, there's an issue of -- of gas distribution and if I had a need for a gas distribution and I decided to use a frit, I could have one made up or I could buy a high purity fused silica frit, for instance, or one of appropriate metal, but usually we've done other things.

(Oldham Dep. 7:20-8:15.) Counsel then clarified:

Q: Okay. So just so I understand your testimony, using a glass frit would be a problem in semiconductor processing because of the potential for contamination?
A: Yeah, you have to use a special glass.

(Id. 8:21-24.) Although Oldham's testimony makes clear that there are special types of frits that can be used that do not pose a risk of particulate contamination, it also suggests that one of ordinary skill in the art would not normally think of using a frit to function as the gas flow apertures due to a risk of particulate contamination.

ASM also argues that frits do not have holes that pass all the way through them, and thus the holes in a frit cannot be the "apertures passing therethrough" that are required by the language of claims 1 and 6. Although it is undisputed that each hole in a frit does not necessarily pass directly through the frit, it is also undisputed that at least some holes in a frit do connect to passageways that lead all the way through the frit; otherwise, gas could not pass through a frit. Accordingly, this argument is unpersuasive.

Finally, ASM argues that apertures must be discrete holes because, although the parties dispute whether a frit contains openings that could be used as gas flow apertures, there is no dispute that a frit does not contain openings that could be used as extracting apertures. The fact that two different types of apertures are described in the patent claims is highly relevant to determining the appropriate claim construction. The Federal Circuit has held that "unless the patent otherwise provides, a claim term cannot be given a different meaning in the various claims of the same patent." Georgia Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1331 (Fed Cir. 2000). Nothing in the '165 patent provides or even suggests that "aperture" is defined differently when referring to the gas flow apertures than when referring to the extracting apertures. Thus, the Court must construe the term "aperture" in a way that is applicable to both the gas flow apertures and the extracting apertures.

At deposition, Oldham was asked:

Q: Now, referring to the ASM patent in suit here, the '165 patent, there was some testimony before the -- the break about the use of the term "aperture" in connection with the apertures 53 that are used to extract the gas and do you have any view as to whether a person of skill in the art would think to use a frit as opposed to a through hole for extracting the gas?

A: My -- yeah, I have an opinion. I don't think one would be likely to use a frit in an application like that.

(Jackson Decl., Vol. 3, Ex. E (Oldham Rebuttal Report), Ex. A (Oldham Dep.) 129:22-130:4.) There was no further explanation from Oldham on this point, but his testimony suggests that the extracting apertures cannot be the type of openings generally found in a frit.

Peltzer also explains in his expert report that frits are impractical for use in injecting gases because they clog easily as a result of having such small pores. (Peltzer Expert Report at 10, 21.) A report on improvement of the Genus 8720 reactor also concluded that "a frit-type injection plate, however, can degrade due to clogging of the fine holes . . . ." (Peltzer Supp. Expert Report, Ex. A (Design Analysis and Performance Improvement of the Genus 8720 Reactor: Report on Modeling of and Recommendations for Showerhead Gas Injectors) at 83362.)

Peltzer concludes that a frit is even more impractical for extracting gases, particularly in CVD, where the gases react both in the chamber and on their way out of the chamber. (Peltzer Expert Report at 21.) He states that he knows of no one in research or industry who would propose that a frit could work as an extracting aperture. (Id. at 21-22.) As both Peltzer and Oldham agree that a person of ordinary skill in the art would be unlikely to use a frit as the extracting apertures, this last argument cuts against Genus' position that "apertures," as used in the '165 patent, include the type of openings found in a frit.

The Court finds most persuasive ASM's arguments that the patent language requires that apertures be able to be arranged in patterns, and that one of ordinary skill in the art would not think to use the type of openings generally found in a frit as extracting apertures. Accordingly, the Court agrees with ASM that the "apertures" of the '165 patent must be discrete openings, rather than the random passageways generally found in a frit. Accordingly, the Court construes "apertures" as follows:

Apertures are discrete, arrangeable, openings through a solid material that allow a gas to flow from one side to the other.
7. "Apex." Consistent with the specification and the claims, "apex" shall mean "the uppermost surface of the ramp and may be pointed, radiused, cylindrical or flat."

5. purge gas

The parties agree that "purge gas" should be construed as follows: "A gas that aids in the removal of unwarranted material." Alternately, the parties agree that no construction is necessary. In light of the substantial disputes surrounding "evacuate" and "purge" in the patents the Court has previously construed, the Court will adopt the parties' joint construction of this term, rather than leave the term unconstrued.

The dispute here is whether this is a means-plus-function claim, and thus is governed by 35 U.S.C. § 112 P 6. A "means-plus-function" claim is a special type of claim provided for in 35 U.S.C. § 112, paragraph 6, which states:

An element in a claim for a combination may be expressed as a means or a step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6. Under this provision, an inventor may describe an element of the invention by the result accomplished or the function served, rather than by describing the item or element to be used. Warner-Jenkinson Co., Inc. v. Hilton Davis Chemical Co., 520 U.S. 17, 27, 137 L. Ed. 2d 146, 117 S. Ct. 1040 (1997). When using means-plus-function language, however, "the applicant must describe in the patent specification some structure which performs the specified function." Valmont Industries, Inc. v. Reinke Manufacturing Co., Inc., 983 F.2d 1039, 1042 (Fed. Cir. 1993). A structure disclosed in the specification is only deemed to be "the corresponding structure" if the specification clearly links or associates that structure to the function recited in the claim. Kahn v. General Motors Corp., 135 F.3d 1472, 1476 (Fed. Cir. 1998). The duty to link or associate structure in the specification with the function is the quid pro quo for the convenience of employing the means-plus-function format. Id.

The use of the word "means" creates a presumption that § 112 P 6 applies. Personalized Media Communications, LLC v. International Trade Commission, 161 F.3d 696, 703 (Fed. Cir. 1999). Failure to use the word "means" creates a presumption that § 112 P 6 does not apply. Id. at 703-04. "These presumptions can be rebutted if the evidence intrinsic to the patent and any relevant extrinsic evidence so warrant." Id. at 704. "In deciding whether either presumption has been rebutted, the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112 P 6." Id. Where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format, even if the claim uses the term
"means." Id. (quoting Sage Prods. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997)).

Claim 5 does not use the word "means." Thus, there is a presumption that the claim is not a means-plus-function claim. Personalized Media, 161 F.3d at 703-04. The presumption that § 112 P 6 does not apply can be rebutted by showing that the claim element recites a function without reciting sufficient structure for performing that function. Watts v. XL Systems, Inc., 232 F.3d 877, 880 (Fed. Cir. 2000). Claim 5 requires that there be an "apparatus for introducing a purge gas on a reverse side of said substrate," but the claim does not recite any structure for performing that function.

A claim that is not a means-plus-function claim need not always specifically recite a structure for performing the function, however. In Personalized Media, the claim language at issue was "a digital detector for receiving said transmission and detecting said predetermined signal in said transmission based on either a specific location or a specific time[.]" Personalized Media, 161 F.3d at 698. The Federal Circuit held that this was not a means-plus-function claim because the term "detector" was a sufficient recitation of structure. Id. at 704. The court found that:

"detector" had a well-known meaning to those of skill in the electrical arts connotative of structure, including a rectifier or demodulator. No other extrinsic evidence, including the expert testimony, and no evidence intrinsic to the patent casts doubt on this conclusion. Moreover, neither the fact that a "detector" is defined in terms of its function, nor the fact that the term "detector" does not connotate a precise physical structure in the minds of those of skill in the art detracts from the definiteness of structure. Even though the term "detector" does not specifically evoke a particular structure, it does convey to one knowledgeable in the art a variety of structures known as "detectors." We therefore conclude that the term "detector" is a sufficiently definite structural term to preclude the application of § 112, P 6.

Id. at 704-05. ASM argues that persons of ordinary skill in the art would think of numerous structures for providing a purge gas to the reverse side of the substrate, and thus claim 5 is not a means-plus-function claim.

Personalized Media, however, found that the term "detector" itself conveyed a variety of structures to persons of ordinary skill in the art. In other words, it found that "detector" was, in and of itself, a structural term. Personalized Media relied on Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580 (Fed. Cir. 1996), in which the phrase "detent mechanism" was at issue. Personalized Media, 161 F.3d at 703 (citing Greenberg, 91 F.3d at 1583). There, the court held that:

The fact that a particular mechanism -- here "detent mechanism" -- is defined in functional terms is not sufficient to convert a claim element containing that term into a "means for performing a specified function" within the meaning of [§ 112, P 6.] Many devices take their names from the functions they perform. The examples are innumerable, such as "filter," "brake," "clamp," "screwdriver," or "lock." . . .

"Detent" (or its equivalent "detent mechanism") is just such a term. Dictionary definitions make clear that the noun "detent" denotes a type of device with a generally understood meaning in the mechanical arts, even though the definitions are expressed in functional terms. It is true that "detent" does not call to mind a single well-defined structure, but the same could be said of other commonplace structural terms such as "clamp" or "container." What is important is not simply that a "detent" or "detent mechanism" is defined in terms of what it does, but that the term, as the name for structure, has a reasonably well understood meaning in the art.

Id. In Personalized Media, the Federal Circuit distinguished "detector," as a specific type of structure, from vague, generic terms like "means," "element," or "device." 161 F.3d at 704.

By contrast, claim 5 contains no structural term like "detent mechanism." The only remotely structural term in claim 5 is "apparatus," which no one would claim calls to mind a structure for purging gas. Rather, "apparatus," without more, is just a synonym for "device," and just as inadequate to provide the requisite structure. See, e.g., The American Heritage Dictionary of the English Language, Fourth Edition, at http://www.dictionary.com (defining "apparatus" as "an appliance or device for a particular purpose.")

Unlike the claim language at issue in Personalized Media or Greenberg, claim 5 is stated in purely functional terms. Thus, claim 5 is more like Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206 (Fed. Cir. 1998), where "a substantially non-resilient lever moving element for moving the lever" failed to cite sufficient structure to avoid application of § 112 P 6. In Mas-Hamilton, as in claim 5, the only vaguely structural term used in defining the function was "lever moving element,"
which the court found did not have a generally understood structural meaning in the art. Id. at 1213.

Thus, claim 5 must be viewed as a means-plus-function claim. As a means-plus-function claim, claim 5 is invalid due to indefiniteness if the specification, as understood by a person of ordinary skill in the art, fails to describe some structure that performs the specified function. Atmel Corp. v. Information Storage Devices, 198 F.3d 1374, 1378 (Fed. Cir. 1999). "[A] court's determination of the structure that corresponds to a particular means-plus-function limitation is indeed a matter of claim construction." Id. at 1379. The structure does not have to be disclosed explicitly in the specification; rather, disclosure of structure corresponding to a means-plus-function limitation may be implicit in the specification if it would have been clear to those skilled in the art what structure must perform the function recited in the means-plus-function limitation. Id. at 1380.

The following language is the only reference in the specification to an "apparatus for introducing a purge gas on a reverse side of said substrate:"

The axially symmetric flow of gas (away from the axis) has the important benefit of reducing autodoping by creating a flow of gas in a direction, relative to the substrate, that is opposite from the flow of materials producing the autodoping. This effect can be enhanced and autodoping further reduced, by applying a purge gas to the bottom of the substrate. ('165 patent 5:15-22.) This language contains no structure for applying a purge gas.

Fulfillment of the § 112 P 6 tradeoff cannot be satisfied when there is a total omission of structure. There must be structure in the specification. This conclusion is not inconsistent with the fact that the knowledge of one skilled in the art may be used to understand what structure(s) the specification discloses, or that even a dictionary or other documentary source may be resorted to for such assistance, because such resources may only be employed in relation to structure that is disclosed in the specification.

Atmel, 198 F.3d at 1382.

The Court has previously declined to rule on indefiniteness arguments during claim construction. If the patent had arguably provided some structure for applying a purge gas, and the experts disagreed about what that structure would reveal to a person of ordinary skill in the art, the Court might possibly defer the indefiniteness inquiry to the summary judgment stage. Here, however, the failure to provide any structure for applying a purge gas requires that the Court find the claim indefinite as a matter of law. As a person of ordinary skill in the art could not read the specification as describing any structure for introducing a purge gas on a reverse side of the substrate, claim 5 is invalid for indefiniteness.

The Appearance of Smoothed Edges

Both Claims 1 and 3 of the 272 patent conclude with the limitation that the recited method or apparatus be used so that the "appearance of smoothed edges are given to the generated shapes." Pitney argues that this means "avoiding roughened edges and improving character formation so that the generated shapes have less of an uneven appearance or less 'jaggies' than under prior printing methods." Hewlett argues that the phrase has a broader meaning of "improves image quality or more precisely reproduces the details of an original image by reducing edge roughness."

The court first considers the ordinary meaning of "the appearance of smoothed edges." "Smooth" means "having a surface free from roughness, irregularities, or projections." Webster's II New College Dictionary (1995). "Appearance" means "outward aspect." Id.

The specification does not indication that Pitney meant to either expand or limit this definition. The specification states that "the use of different spot sizes can effectively be employed as letters or numbers are created so as to avoid roughened edges and improve character formation. . . . The different size dot will intermesh to create letters and numerals having a smoother appearance." 272 pat., col. 6, ll. 2-12. As the Federal Circuit said, "the 272 patent teaches an apparatus and method for combating the problem of jaggies by using toner dots of different sizes." Pitney III, 182 F.3d at 1301.
Hewlett argues that the term should be more broadly construed because, during the prosecution history of the related 021 patent, the Board of Patent Appeals stated that they "[did] not consider the terms 'smoothed' and 'smooth' to distinguish" the 021 patent from another which discloses an "image of high quality" or "an exact reproduction." HP Ex. CC at 626-43. However, the Yamada patent, the patent being distinguished, is an ink jet system which does not use a photoreceptor or create an image on a photoreceptor, nor does it create a plurality of beams of light or control a parameter of light beams. U.S. Patent No. 4,050,077 ("Yamada patent"). Under its plain meaning, the term "the appearance of smoothed edges" in the 272 patent is distinguishing the benefit of the 272 patent over prior products comparable to it, which is that the method and the apparatus disclosed produce generated shapes with the appearance of smoother edges. A person of ordinary skill in the art would know that this means the generated shapes will have fewer "jaggies."

Because there is nothing in the specification or prosecution history to suggest either a broader or a narrower meaning than the ordinary meaning of "the appearance of smoothed edges," the court concludes that "the appearance of smoothed edges" means avoiding roughened edges and improving character formation so that the generated shapes have less of an uneven appearance or less "jaggies" than under prior printing methods.

A review of the specification compels the conclusion that the disputed terms "rearward area" and "end area," also used interchangeably throughout the '445 patent claims and specification, are correctly defined as "the area facing away from the brake disk." See '445 Patent Specification, Column 1, lines 54-57 (providing that "a direct transmission of the braking forces into the caliper is permitted since the rearward area, which faces away from the brake disk, of the caliper receiving the application unit is essentially closed....") (emphasis added). The specification also teaches that the last disputed term, "application unit," is properly defined as "a mechanical mechanism that multiplies an input force using a lever to provide a greater output force that presses the brake shoes against the brake disk."

A. Claim 12

Claim 12 of the 844 patent states:

12. A method for the simultaneous removal of a plurality of hairs from a skin region . . ., the method comprising the steps of:

(a) placing an applicator in contact with the skin surface in said skin region; and

(b) applying optical radiation of a selected wavelength and of a selected fluence through said applicator to said skin region . . .;

pressure being applied to the applicator during steps (a) and (b) so as to cause the applicator to deform the skin region thereunder.

In this Court's claim construction order, the term "applicator" was construed as meaning "[a] device for applying optical radiation," and the phrase "pressure being applied to the applicator . . . so as to cause the applicator to deform the skin region thereunder" was construed as meaning "pressure being applied to the applicator so as to cause the applicator to compress the area of skin under it." (Feb. 24, 2004 Order, at 3).

Cutera seemingly concedes that the CoolGlide handpieces are "applicators" within the meaning of claim 12, but denies that pressure is applied to the handpieces. Cutera's first argument is that pressure is not applied to the CoolGlide handpieces because doing so would make little sense. Cutera points out that the 844 patent calls for pressure to be applied to the applicator in order to achieve a specific purpose, i.e., "more efficient delivery of light to the follicular target regions"
(Garretson Decl., Ex. A, at 6:60-66). Because applying pressure to Cutera's devices allegedly would not achieve this result, Cutera maintains that pressure is not applied to the accused devices within the meaning of claim 12.

However, claim 12 does not refer to the reasons for applying pressure to the applicator; it merely describes the application of pressure as part of the patented method. The Court's Markman order construed claim 12 simply as specifying that a certain amount of pressure (i.e., an amount sufficient to compress the underlying skin) be applied to the applicator. (See Feb. 24, 2004 Order, at 3). The issue before the Court, therefore, is not why pressure is applied to the accused devices (or why not), but rather whether or not pressure sufficient to compress the underlying skin is applied to the accused devices. On this issue, summary judgment is inappropriate. According to Cutera, no "appreciable" compression of the skin occurs during use of the accused products, and any compression of the skin is "minimal." (Cutera Jan. 14, 2005 Mem., at 13 n.6). The chilled footplate is, Cutera maintains, never pressed into the skin, but is instead "glided over the skin." (Id. at 12). Whether compression of the underlying skin occurs during use of the Cutera devices, however, and whether that pressure results in compression that is "appreciable" or more than "minimal" are disputed questions of fact. As Palomar notes, Cutera's training and instruction materials warn users to ensure that the footplate remains in contact with the skin, "especially over curves." (Saxton Decl., Ex. 15, at ALT 000137). Reasonable jurors could find that pressure sufficient to compress the underlying skin was required in order to maintain constant contact between the footplate and curved areas of skin. Furthermore, a video displayed at oral argument on Cutera's motion depicts through animation the application of a Cutera product; the animation shows the skin beneath the Cutera device being somewhat compressed as the footplate passes over the skin. Perhaps most significant, the record includes the notes of Michael Sasnett, the designer of a prototype of the CoolGlide products, which state that the handpiece is to be pressed upon the skin. (Saxton Decl., Ex. 22, at ALT 017390).

Cutera argues that even if the skin beneath the applicator is somehow compressed, there is no evidence in the record that such compression results from pressure being brought to bear upon the applicator, and further challenges the relevance of Sasnett's notes, which it claims reflect only early stages of product development. On a motion for summary judgment, however, the Court draws inferences in the nonmovant's favor; in doing so, it is clear that a material issue of fact exists as to whether pressure sufficient to compress the underlying skin is applied to Cutera's CoolGlide devices. For substantially the same reasons, a factual dispute exists as to whether Cutera intends that its customers apply pressure to its devices so as to compress the skin under them and thereby induces infringement. Accordingly, summary judgment as to both direct infringement and inducement of infringement of claim 12 is denied.

10. "applying a compressive force against said terminal by said electrodes"

This phrase appears in Claim 4, which states as follows: "[t]he method of claim 1, further including applying a compressive force against said terminal by said electrodes." Plaintiff asserts that this phrase means "using the electrodes to apply additional pressure against the terminal after the insulation has been removed from the armature wire." In support of its construction, Plaintiff refers to that part of the specification of the '015 Patent, discussed above, that explains that under the fusing process, pressure is "once again" applied after the insulation on the armature wire is burned off. See '015 Patent, col. 6:20-25. Plaintiff also notes that Claim 4 uses the term "further." Last, Plaintiff points to certain extrinsic evidence, such as deposition testimony and prior patents, also discussed above, which support its assertion that Claim 4 refers to a second, subsequent application of pressure than that referred to in Claim 1. Defendants take issue with Plaintiff's construction insofar as it interprets the disputed phrase as describing "additional" pressure. As discussed in section II.1, supra, Defendants have taken the position that under the proper construction of Claim 1, there is no "pressure" step in Claim 1, but rather the application of pressure is initially occurs as described in Claim 4. However, the Court finds that the evidence does not support such a construction of these claims.

Defendants proposed construction of this phrase in Claim 4 is "using the electrodes to press against the terminal." In support of this proposed construction Defendants cite only to the Webster's dictionary definition of "compressive." However, considering the evidence cited by Plaintiff, the Court shall construe the phrase "applying a compressive force against said terminal by said electrodes" consistent with Plaintiff's proposed construction as follows: "using the electrodes to apply additional pressure against the terminal after the insulation has been removed from the armature wire."
Defendants construe this phrase as teaching only full face adhesive coverage on either the interior surface of the panel or the wheel face outer surface. Defendants base this argument on the affidavit of Lacks' own engineering expert, James D. Varin, in which Varin interprets the '809 patent to teach only full face coverage by the adhesive. Lacks argues, however, that it would be improper for me to consider the extrinsic evidence of Varin's expert testimony pursuant to Vitronics. Lacks contends that the disputed language does not limit the coverage of the adhesive, and therefore the language encompasses any pattern of adhesive coverage, whether it be full, selective, or random.

Claim 1 only refers to adhesive in the second "applying" step: "applying an adhesive to one of said wheel face outer surface of said wheel and said interior surface of said thin solid formed ornamental panel." '809 patent, col. 11, lines 17-19. Claim 2 also refers to adhesive but once: "The method of claim 1 wherein said adhesive is applied to a recess formed in said wheel face outer surface of said wheel and said thin solid formed ornamental panel is positioned in said recess." '809 patent, col. 12, lines 11-14.

It is clear that this language limits the application of the adhesive in only two ways, neither of which gives defendants' full face construction any support. The first limitation exists for both claims 1 and 2: the adhesive must be applied to either the wheel face outer surface or the interior surface of the panel. The second limitation is a specific requirement for cladded wheels assembled according to the method of dependent claim 2: adhesive must be applied to a recess formed in the wheel face outer surface. Both limitations are silent as to how the adhesive should cover the surfaces to which it must be applied.

The specification mentions the cladding panel adhesive only twice. The first reference discusses the type of adhesive to be used in the first preferred embodiment: "The overlay 20 can be permanently adhered directly to the outboard surface of the wheel 11 by a suitable adhesive 30, such as a silicone or polyurethane adhesive, to form a permanent wheel." '809 patent, col. 8, lines 5-8. The second reference discusses the way in which the adhesive is to be applied in the second preferred embodiment: "The panel 22 is adhesively bonded directly to the outboard surface of the wheel 11 either with a suitable adhesive 30 as shown, or in any other suitable manner." '809 patent, col. 9, lines 56-58, referring to Figure 5. While the first reference in the specification is silent on the issue of the extent, or pattern, of adhesive coverage, the second reference, through its "any other suitable manner" language, clearly favors the broader construction of "applying an adhesive" offered by Lacks.

In light of the intrinsic evidence of record discussed above, I find that a person of ordinary skill in the art of cladded wheels would understand "applying an adhesive" as encompassing the full range of possible adhesive coverages not already within the prior art. The silence of the claim language on that point does not imply defendants' narrower construction of full face coverage. Rather, the silence indicates that the inventor did not consider the coverage of the adhesive to be an essential element of the '809 patent's claimed invention. Thus solely on the basis of questionable extrinsic evidence -- Varin's affidavit -- defendants have asked me to read into claims 1 and 2 an element that does not exist. Pursuant to Vitronics, I decline to do so. See id.

9 Neither party offered any prosecution history evidence on this issue.
construction of the term: "The application of force to the label(s) and container by holding and pressing apparatus that arises or acts from the outside; i.e., separate and independent from the labels and container." Joint Claim Construction ("JCC") at 1:9-13.

Defendants object to the extent Plaintiffs' proposed construction "attempts to make a dependant claim (claim 5 of the '269 patent) broader than its referenced independent claim (claim 1 of the '269 patent)." 3 Defendants' Opposition to Brief Re: Claim Construction of the '269 and '697 Patents ("Opposition") at 3:5-12; see also 35 U.S.C. § 112 ("a claim in dependant form shall be construed to incorporate by reference all the limitations of the claim to which it refers"). However, Defendants fail to offer--and the Court cannot find--any basis for determining that Plaintiffs' proposed construction would render claim 5 broader than claim 1. 4 Claim 5 is simply one of several dependant claims describing various methods of "temporarily coupling a leading end of an outer to the inner label while the outer label is wrapped about the object," as described in claim 1. See '269 Patent at Claims 2, 5-8. 5

--- Footnotes ---

3 Claim 1 of the '269 patent describes: "A method of applying a rotatable label to an object, comprising the steps of: [1] providing an object; [2] attaching an inner label with indicia disposed thereon about the object; [3] temporarily coupling a leading end of an outer label having indicia and a transparent portion thereon to the inner label while the outer label is wrapped about the object; [4] securing the outer label about the object; and [5] uncoupling the leading end of the outer label to permit the outer label to rotate about the inner label and the object."

Claim 5 of the '269 states: "The method according to claim 1, wherein the step of temporarily coupling further comprises applying an external physical pressure to the outer label." Id.

4 To the extent Defendants' argument is based on its proposed construction of the term "temporarily coupling," this argument is mooted by the Court's construction of that term. See infra Section C.

5 Defendants also object to Plaintiffs' proposed construction of the term "applying an external physical pressure" to the extent it affects the Court's construction of "temporarily coupling." It does not.

--- End Footnotes ---

Therefore, the Court adopts Plaintiff's proposed construction of "applying an external physical pressure"--"the application of force to the label(s) and container by holding and pressing apparatus that arises or acts from the outside; i.e., separate and independent from the labels and container"--which is consistent with the relevant dictionary definition of "external." See Plaintiffs' Supporting Evidence, Exh. E (Merriam-Webster's Collegiate Dictionary, Tenth Edition) ("of, relating to, or connected with the outside or an outer part…applied or applicable to the outside"); see Texas Digital Systems, 308 F.3d at 1203 ("dictionaries, encyclopedias and treatises, publicly available at the time the patent is issued, are objective resources that serve as reliable sources of information on the established meanings that would have been attributed to the terms of the claims by those of skill in the art").

247

E. "applying an overprinting layer over at least the scratch-off layer"

This claim term, which is found exclusively in the 504 patent, is identical to the above-construed phrase, the only difference being the addition of the words "at least." The parties agree that this addition should be construed in this context to mean "optionally printing the overprinting layer over a portion of the non-scratch-off layer." (See Pl.'s Resp. in Supp. of Mot. for Claim Construction, at 20.) Thus, the Court construes this claim term as follows: "printing an overprinting layer over the scratch-off layer and optionally printing the overprinting layer over a portion of the non-scratch-off layer."

GO BACK

- 663 -
D. "applying an overprinting layer over the scratch-off layer"

The only term in this disputed phrase that has not been construed previously is "applying." As a commonly understood word, construction of the term "applying" simply requires application of the widely accepted meaning of the term. In such circumstances, general dictionaries may be used to ascertain the meaning of the term. Phillips, 415 F.3d at 1322. "Apply" means "to put on." Webster's College Dictionary at 55. In the context of the present invention, a person of ordinary skill would understand that putting the overprinting layer on the scratch-off layer would be accomplished by printing the overprinting layer over the scratch-off layer.

The Court's previous construction of "overprinting layer" and the agreed upon construction of "scratch-off layer" mean that little, if any, additional construction of this disputed term is required. Nevertheless, the Defendant maintains that further construction is necessary. It argues that the phrase should be construed as "printing the overprinting layer over the scratch-off layer, thereby securely covering the variable printed indicia on the game area." Again, the Defendant proposes a construction that contains elements of security and variable printed indicia. And again, the intrinsic evidence fails to support the inclusion of these elements. As noted above, nothing in the specification requires that the printed indicia be variable. The Defendant argues, however, that the specification and prosecution history require that the printed indicia be "securely covered." According to the Defendant, this element must be included in the construction because the purpose of the overprinting technique of this invention is to improve lottery ticket security and enhance the overall appearance of the lottery ticket. ('647 patent, col. 1, 11. 60-65; 504 patent, col. 1, 1. 66 -- col. 2, 1. 1.) In addition, the Defendant argues that the prosecution history supports the limitation because the patentee distinguished prior art based on the fact that "there is no teaching or suggestion in the reference of the employment of an overprinting layer of the type used in the present invention as a security improving component of the lottery ticket." (Resp. to Office Action, Def.'s Proposed Claim Construction, Ex. 8) (emphasis added). This is not an express disavowal of claim scope. Rather, the patentee was distinguishing prior art based on the use of an overprinting layer of screened halftone images. The fact that this type of overprinting layer may have the effect of improving security does not translate into a requirement that the overprinting layer must "securely cover" the printed indicia. It is improper to limit a claim based merely on an articulated objective or purpose of an invention, unless the purpose is clearly expressed in the claim. Brookhill-Wilk 1, 334 F.3d at 1301; Applied Materials, Inc., 98 F.3d at 1574; see also Liebel-Flarsheim Co., 358 F.3d at 908 ("The fact that a patent asserts that an invention achieves several objectives does not require that each of the claims be construed as limited to structures that are capable of achieving all of the objectives."). The specification and prosecution history do not evidence a clear intention to limit the ordinary meaning of the phrase. Therefore, because "overprinting layer" and "scratch-off layer" have been construed and "applying" is afforded its common meaning, the Court construes the phrase "applying an overprinting layer over the scratch-off layer" to mean "printing an overprinting layer over the scratch-off layer."

The '234 Patent

At issue in plaintiff's '234 patent is the meaning of certain language in the first two steps of Claims 1, 2, and 3. At the outset, the court has concluded that these claims are mixed claims: the first two steps of Claims 1, 2, and 3 are method-of-manufacture steps, while the last two steps of Claims 1 and 2, and the last three steps of Claim 3 are method-of-use steps. This is readily apparent on the face of the claims, where the first two steps deal with applying respective forces to complete the manufacture of the product, while the remaining steps deal with steps taken by the clinician in the use of the product. Testimony by Vaillancourt that these are entirely method-of-use claims is not persuasive in light of the clear language of the claims, as well as the specification which shows, through the figures, the manufacturing of the injection site, including applying both axial and radial forces, respectively.

The first phrase at issue is included in all three claims of the '234 patent, in different iterations, and reads as follows:

Claim 1: "applying axially directed forces to the septum to form an outwardly, easily wipable exterior peripheral surface;"
Claim 2: "applying axially directed forces to the septum to form an outwardly curved, easily wipable exterior peripheral surface;"

Claim 3: "applying axially directed forces to the septum to form a curved, easily wipable exterior peripheral surface;"

Aided by the testimony of Sheehan, the court concludes, based upon the language of the claims themselves, the specification, and the prosecution history, that each of these phrases has the same meaning, regardless of the discrepancies in language. Furthermore, the court concludes that the "axially directed forces" have as their sole purpose the forming of the surface of the septum. That surface is formed by these forces as outwardly curved or domed. The court also concludes that the "exterior peripheral surface" is that part of the septum not covered by the housing, and thus easily wipable because it is exposed.

Support for the court's conclusions is as follows: First, support for the court's construction that each phrase has the same meaning is found in the prosecution history of the '234 patent, and especially in plaintiff's responses to the examiner's repeated rejections of Claims 1 and 2 (Claim 3 was added later) (See pgs 77 and 90 of Exhibit 403). Plaintiff argued for the allowance of such claims as a group, with the understanding that the language in each was the same and not slightly different as the above-quoted phrases reflect (See pgs 82-84, 94-96 and 101-111 of Exhibit 403). At no time did the prosecuting attorney distinguish between the claims based upon the phrases "outwardly," "outwardly curved," or "curved." All three claims were treated throughout the prosecution as having the same meaning.

Plaintiff argued during this trial that the first step in each claim has a different meaning due to the variation in language. Vaillancourt testified as such. However, this interpretation is inconsistent with the prosecution of these claims, especially in light of three separate arguments for allowance by plaintiff's prosecuting attorney in which he treated the first step of each claim as having the same meaning.

Second, as mentioned previously, the court concludes that the sole purpose for including axially directed forces is to form the shape of the septum surface. Throughout the specifications, plaintiff explained the purpose of both radially directed forces -- to reseal -- and axially directed forces -- to form the surface. Most tellingly, in column 6, lines 41-47 of the patent, plaintiff states: "The swaged end members apply axial forces to the septum thereby creating the domed exterior peripheral surface. In contradistinction, the tapered internal surface applies radially directed forces to the septum, thereby forcing the opening into a resealed condition."

In addition as Sheehan pointed out in his testimony, plaintiff's attorney argued throughout the prosecution that the invention was unique, and not anticipated by Pfister or Wolff-Mooij, because these patents do not teach applying axially directed forces to form an outwardly curved surface (See pgs 82-84, 94-96, and 101-111 of Exhibit 403). This is further support for the court's conclusion that the specific purpose of applying axially directed forces is to form the specified shape of the septum.

Third, there is ample support for the court's conclusion that the claims require the septum to be outwardly curved. The fact that each of the claims has a different iteration of the phrase "outwardly curved" is inapposite, and appears to be the result of sloppy drafting. On its face, Claim 1 does not make sense grammatically. "Outwardly" is an adverb which does not modify anything in this sentence. It only makes sense if you look at Claim 2, where "outwardly" is modifying "curved." Vaillancourt testified that "outwardly" in Claim 1 modified "wipable," but again this does not make sense. The court cannot conceive of a situation where a surface may be inwardly wipable. More likely, the discrepancy in the three claims is due to drafting errors rather than with the specific purpose of distinguishing the claims.

This is amply demonstrated in the prosecution history. Apparently, plaintiff's prosecuting attorney had the examiner add "outwardly" to both Claims 1 and 2 with the understanding that "curved" was still included in those claims. However, "curved" had been eliminated from the claim language by plaintiff's in-house counsel, and was only re-added to Claim 2 by a Certificate of Correction. Therefore, it was a lack of communication that resulted in the discrepancy in language rather than an intent to vary the claims.

Even further support for this construction is found in plaintiff's attempts to distinguish the prior art from the claims in the '234 patent. Plaintiff's prosecuting attorney argued vigorously on three separate occasions that the invention was not
anticipated by any prior art because the prior art "does not even arguably suggest applying axially directed forces to the septum to form an outwardly curved surface." (pg 82 of Exhibit 403). The attorney also distinguished the invention from Pfister by stating that Pfister contains "a deformable barrier means in the form of a split deformable resilient foam block, which is recessed inwardly from the open end so as to prevent accidental contact...", and thus teaches away from "an outwardly curved surface." (pg 83 of Exhibit 403). There is no doubt after reading the prosecution history that plaintiff distinguished its invention from the prior art based upon the outward curve of the septum, as well as applying axial forces to create that outward curve. Thus, each claim is read to contain the limitation "outwardly curved" despite the incomplete language actually used.

The specification also dictates this conclusion. The specification details the process of making the outwardly curved or domed surface, and explains how this surface is easily wipable. For example, column 6, lines 1 - 5 state: "The surface has been forced into a dome-like shape by annular, U-shaped, swaged end members carried by the first end. The dome-like shape of the surface can extend beyond a surface of the first end. This facilitates cleaning the surface."

Vaillancourt has testified to the contrary. In his opinion, under the claim language and specification the surface of the septum could be concave, convex, or flat. He interprets "outwardly" as the exposed section of the septum, and "curved" as merely a clarification. In his view, Claims 1 and 2 should both say "outwardly" only, with no reference to the shape of the septum. However, there is one major fallacy with this argument that demonstrates once again that "outwardly," "outwardly curved," and "curved" all have the same meaning: if outwardly means the exposed surface of the septum, then Claim 3 must describe a septum completely encased in plastic, since it does not contain the word "outwardly." Vaillancourt's reading of these three claims is nonsensical and borders on ridiculous. The court will therefore disregard it.

Similarly, one sentence in the specification states, contrary to the clear teachings of the specification as well as the prosecution history, that the septum could be flat. (Column 6, lines 48-49). This statement is not supported by the claims and is thus not persuasive that the septum could be other than outwardly curved.

Finally, as to this first step in Claims 1, 2, and 3, the support for the court's finding that the exterior peripheral surface is that portion of the septum that is exposed lies in the clear language of the claims themselves. "Exterior," in the ordinary, literal sense of the word, means external; that which is on the outside. Therefore, the exterior portion of the septum is that part which is outside the housing. In addition, exterior peripheral surface is modified, in each of the claims, by "easily wipable." A septum that is covered by a plastic housing is not wipable at all, let alone easily wipable. Only the exposed portion is easily wipable.

9. Applying Energy To (Claim 1, '803 Patent; Claims 1 and 18, '084 Patent)/Applying Energy ... To (Claim 1, '433 Patent)

Vnus argues the term "applying energy to"/"applying energy ... to" does not require construction. Defendants argue "applying energy to"/"applying energy ... to" should be construed as "applying energy directly to the inner wall of the [hollow anatomical structure/ vein] through physical contact between the electrode device and the inner wall of the [hollow anatomical structure/vein] and maintaining the electrode device in physical contact with the inner wall."

The Court, for the reasons stated by Vnus, finds "applying energy to"/"applying energy ... to" does not require construction.
Plaintiffs propose that this term means "applying pressure through a gas or liquid to the diaphragm to operate the pump chamber." Fresenius proposes that this term means "applying alternating positive and negative fluid pressure pulses to the diaphragm such that the diaphragm is flexed in and out and liquid moves through the pump chamber."

Thus, both sides agree that "applying" means "applying;" that "fluid pressure" means either "fluid pressure" or "pressure through a gas or liquid;" 2 that "to the diaphragm" means "to the diaphragm;" and that "pump chamber" means "pump chamber." What is left is the construction of the two words - "to operate." Plaintiffs contend that "to operate" should be construed as having its ordinary and customary meaning. Fresenius asserts, however, that under O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., Ltd., 521 F.3d 1351 (Fed. Cir. 2008), the court is required to construe "to operate" because the parties have raised an actual dispute regarding the proper scope of the term. See id. at 1361.

2 Plaintiffs note that Fresenius appears to accept plaintiffs' construction of "fluid" as "a gas or a liquid."

The claim language provides the starting point for analysis of the words "to operate." Claim 1 discloses that the pump chamber "operates" by the application of "fluid pressure to the diaphragm." The claim language also makes clear that "operation" of the pump chamber "either move[s] dialysis solution fluid from the peritoneal cavity" - "or move[s] dialysis solution into the peritoneal cavity." Thus, the meaning of "to operate" is explained by the claim language itself.

Nothing in the specification suggests that the patentees intended a meaning of "to operate" other than the plain and ordinary meaning of those words as used in the claims. The specification identifies preferred embodiments in which both positive and negative pressures are applied. See, e.g., '823 patent, 8:60-68, 13:22-29; 20:48-58; 21:40-50.

In addition, the "Summary of the Invention" explicitly identifies the embodiment in which both positive and negative pressures are applied as a preferred embodiment. See id., 2:52, 3:16-20). Because that configuration is described as "preferred" only (not required), and does not avow a broader claim scope, this claim term cannot be limited to require both positive and negative pressure. Where there is no narrowing limitation in the claim language and no express disavowal of broader language in the written description, it is error to rely on a preferred embodiment to limit the claim term. Gemstar-TV Guide Int'l, Inc. v. Int'l Trade Comm'n, 383 F.3d 1352, 1368-69 (Fed. Cir. 2004)

Neither the claims themselves nor the specification support Fresenius' narrow construction, and Fresenius has pointed to no language in either the claims or specification clearly limiting the claims to embodiments disclosed in the '823 patent specification. The '823 patent claim language itself is not limited to pneumatics, is not limited to alternating positive and negative fluid pressure pulses, and is not limited to flexing the diaphragm in and out.

Absent any indication that the patentees intended to define the phrase "to operate" to require both positive and negative fluid pressure pulses, the court will not read into the claim language limitations taken from the preferred embodiments. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). In addition, the doctrine of claim differentiation precludes Fresenius' proposed addition of the words "alternating positive and negative fluid pressure."

Under the doctrine of claim differentiation, when one claim does not recite a particular limitation that is recited in another claim, "that limitation cannot be read into the former claim." Amgen, Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003). Each claim is presumed to be different in scope, and that presumption "is especially strong where there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between two claims." Ecolab, Inc. v. Paraclipse, Inc., 285 F.3d 1362, 1375 (Fed. Cir. 2002); see also Liebel-Flarsheim, 358 F.3d at 909.

Here, independent claims 1, 10, 16, 21, and 25 of the '823 patent all recite "applying fluid pressure" generally, and do not specify any particular type of fluid pressure. However, claims that depend from those independent claims narrowly recite the specific types of fluid pressure. Dependent claims 5, 14, and 19 specify a "fluid pressure that is below atmospheric pressure" - that is, negative pressure. Dependent claims 6, 15, and 20 specify a "fluid pressure that is above atmospheric pressure."
pressure" - that is, positive pressure. Thus, under Fresenius' proposed construction, the limitation of negative pressure in dependent claims 5, 14, and 19, and the limitation of positive pressure in dependent claims 6, 15, and 20, would be redundant and superfluous.

It is true that the doctrine of claim differentiation is a rebuttable presumption, which may be overcome "by a contrary construction dictated by the written description or the prosecution history." Seachange, Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1368-69 (Fed. Cir. 2005). Here, however, Fresenius has pointed to no evidence from the intrinsic record to overcome this presumption.

With regard to the second and third limitations proposed by Fresenius - "pulses" and "such that the diaphragm is flexed in and out" - "fluid pressure" is used generically in independent claims 1, 10, 16, 21, and 25. Nothing in the patent dictates that the "fluid pressure" be applied in "pulses" or that it "flex" the diaphragm "in and out."

In short, nothing in the specification of the '823 patent indicates that the patentees intended to give some special meaning to the words "to operate." The claim language preceding and following "to operate" - "applying fluid pressure to the diaphragm" and "to either move dialysis solution fluid from the peritoneal cavity or move dialysis fluid into the peritoneal cavity - clearly explains how the "operation" occurs and what it accomplishes.

"Applying fluid pressure to the diaphragm to operate the pump chamber" means "applying pressure through a gas or liquid to the diaphragm to operate the pump chamber."

2. "Applying glue...to abutting wooden surfaces"

Staples defines "applying glue...to abutting wooden surfaces" as "applying an adhesive to touching wooden surfaces that are susceptible to outside air infiltration." (Joint Claim Construction Statement, P. 1). Defendants generally agree with Staples' definition, so long as the adhesive is applied, "prior to the installation of insulation." (Id.).

Upon consideration, the Court will not adopt Defendants' definition, because it "will not at any time import limitations from the specification into the claims." Stumbo v. Eastman Outdoors, Inc., 508 F.3d 1358, 1362 (Fed. Cir. 2007) (internal quotations and citations omitted). Defendants' construction attempts to do just that. In other words, although the specification at times appears to impose a temporal restriction (see, e.g., '088 Patent, P. 9, Col. 2, ll. 2-4, P. 10, Col. 3, ll. 7-9), the claims themselves do not. Furthermore, the specification itself states as follows: "As various changes could be made in the above embodiments without departing from the scope of the invention, it is intended that all matter contained in the above description shall be interpreted as illustrative and not in a limiting sense." (Id. at Col. 3, ll. 53-56). The Federal Circuit has refused to import limitations from the specification when nearly identical language was used. See Pfizer, Inc. v. Ranbaxy Labs. Ltd., 457 F.3d 1284, 1290 (Fed. Cir. 2006), cert. denied, 549 U.S. 1328, 127 S. Ct. 1928, 167 L. Ed. 2d 577 (2007). Accordingly, the Court will adopt Staples' construction, and define "applying glue...to abutting wooden surfaces" as "applying an adhesive to touching wooden surfaces that are susceptible to outside air infiltration."

3. What is the Proper Construction for the Phrase "thereafter applying pressure and shear to the heated mixture" in the '311 Patent?

Claim 1 and claim 94 of the '311 patent contain the phrase "thereafter applying pressure and shear to the heated mixture sufficient immediately to convert at least a portion of the binder material..." KXI contends this phrase means applying sufficient pressure and shear to convert the heated binder into either a continuous web matrix, as disclosed in claims 1 and 94, or forced point-bonds, as disclosed in claim 94. KXI contends no specific amount of pressure or shear is required. KXI argues its construction is supported by the plain meaning of the words in the claims.
Culligan contends this phrase means applying pressure and shear sufficient to convert at least a portion of the binder materials after the entire mixture has been heated to a temperature above the softening temperature of the binder. Culligan contends the pressure required during the conversion step must be (1) greater than the pressure applied during the heating step; and (2) greater than 400 psi to achieve "forced point-bonds" and greater than 4,000 psi to achieve a "continuous web matrix."

Regarding the temporal limitation, Culligan argues that the plain meaning of the claims imposes this requirement. Culligan responds to KXI's arguments by alleging KXI has ignored the "thereafter" limitation in the claim, which imposes a temporal restriction requiring that the pressure and shear sufficient to convert the mixture be applied after the heating step. Culligan argues that its definition of the claim takes into consideration the continuous nature of the extrusion process. According to Culligan, "if . . . you take a cross-section of mixture at any given position along the length of the extruder, the conditions that piece of mixture has to be seeing have to conform to the process steps. In other words, that piece of the mixture has to be first heated. Then it has to be pressurized."

Culligan argues the specification of the '311 patent establishes that the pressure required to achieve "forced point-bonds" is at least 400 psi. The patentee distinguished the Degen '683 patent (U.S. Patent No. 4,664,683) at column 2, lines 43-45 of the specification. This reads in relevant part:

The levels of compression disclosed by Degen et al. are exceedingly low, 0.3-10 psi . . . most preferred maximum 40 psi. . . . Accordingly, it describes process conditions well outside the range of compression utilized in the present invention, which would be 400-1000 psi . . . for granular materials . . . and approximately 8,000 psi . . . or more for powders . . . . Without such higher pressures, the binder resins are not activated and the novel structure produced by the current invention are not obtained.

Culligan argues KXI is estopped from arguing now that their process covers pressures lower than 400 psi, because KXI disclaimed lower pressures in distinguishing the Degen '683 patent.

Culligan argues the '311 patent's specification establishes that pressure required to achieve a "continuous web matrix" is at least 4,000 psi. Culligan cites passages from examples drawn from the patent's specification stating that successful examples of "continuous web matrix" formation occurred only at pressures in excess of 4,000 psi. Culligan cites passages from the examples section using pressures below 4,000 psi that produced unsuccessful results. Culligan argues that patent claims should be construed consistently with examples given in the patent, citing Johns Hopkins v. CellPro, Inc., 152 F.3d 1342, 1349 (Fed. Cir. 1998).

KXI argues in response that "no specific amount of pressure and shear is required by the claims." According to KXI, the '311 patent only requires the application of "sufficient" pressure and shear to convert the heated binder into either a "continuous web matrix" or a "forced point-bonding."

The court agrees with Culligan that the term "thereafter" applies a limitation that "applying pressure and shear to the heated mixture sufficient immediately to convert at least a portion of the binder material" occurs after the mixture is heated "substantially above" the binder's softening temperature.

The court finds that the specification does not define pressure to mean greater than 400 psi to achieve "forced point-bonds" and greater than 4,000 psi to achieve a "continuous web matrix." The court finds, however, that the patentee disclaimed using pressures below 40 psi in the claimed invention when the patentee distinguished the pressures used in the Degen '683 patent. Accordingly, the court construes the phrase "thereafter applying pressure and shear to the heated mixture sufficient immediately to convert at least a portion of the binder material" to mean applying pressure greater than 40 psi and shear sufficient to convert at least a portion of the binder materials after the entire mixture has been heated to a temperature above the softening temperature of the binder.
The first part of the analysis, claim interpretation, begins with the language of the claim itself. Stiftung, 945 F.2d at 1177 (citing SmithKline Diagnostics, Inc. v. Helena Laboratories Corp., 859 F.2d 878, 882 (Fed. Cir. 1988)). A court interpreting a patent claim may also look to the patent's specification, prosecution history, other claims, and expert testimony. Atlantic Thermoplastics Co., Inc. v. Faytex Corp., 970 F.2d 834, 837 (Fed. Cir. 1992); see also Stiftung, 945 F.2d at 1177; SmithKline, 859 F.2d at 882; ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1579 (Fed. Cir. 1988); Perini America, Inc. v. Paper Converting Machine Co., 832 F.2d 581, 584 (Fed. Cir. 1987). "This interpretation proceeds from the vantage point of one skilled in the art." Atlantic Thermoplastics, 970 F.2d at 837 (citing SmithKline, 859 F.2d at 882).

4 "To ascertain the meaning of claims, we consider three sources: The claims, the specification, and the prosecution history." Markman 52 F.3d at 967 (quoting Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1561 (Fed. Cir. 1991) (other citations omitted)). "Expert testimony, including evidence of how those skilled in the art would interpret the claims, may also be used." Markman 52 F.3d at 979 (citing Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 631 (Fed. Cir. 1987)).

The issue of claim interpretation presented on these motions, as already explained, is whether Claim 1 of the '745 patent excludes a seal assembly in which the wedge means touches only one of the two sealing lips.

a. Claim Language

Claim interpretation begins with the claim language itself. ZMI Corp., 844 F.2d at 1579; McGill, Inc. v. John Zink Co., 736 F.2d 666, 672 (Fed. Cir.), cert. denied, 469 U.S. 1037, 105 S. Ct. 514, 83 L. Ed. 2d 404 (1984). The language at issue in Claim 1 calls for:

integral annular wedge means cooperating with said circular recess for applying radial loads to said inner and outer sealing lips to force said lips into sealing relationship with said cylindrical rod and seal receiving bore, respectively, said circular recess and wedge means being proportioned so that the load applied to said inner sealing lip is greater than the radial load applied to said outer sealing lip . . .

whereby the radial load applied to said inner sealing lip is greater than the radial load applied to said outer sealing lip.

(Ralabate Aff. P 2, exh. 1, Col. 6, lines 1-9, 22-25; P2. Facts, exh. E, Col. 6, lines 1-9, 22-25.)

5 Claim 1 reads in its entirety:

In a seal assembly the elements comprising:

an annular elastomeric seal element having an outer annular side adapted to be received in sealing relationship within a seal receiving bore, a central axial bore generally concentric with said outer annular side and adapted to receive a cylindrical rod in sealing sliding relationship, a first end, a second end, and a circular recess in said second end extending generally concentrically with said axial bore and opening axially of said seal element to define an inner sealing lip adapted to seal with said cylindrical rod and an outer sealing lip adapted to seal with said seal receiving bore; and

a seal actuator element including guide means for aligning said actuator element with said seal element, and integral annular wedge means cooperating with said circular recess for applying radial loads to said inner and outer sealing lips to force said lips into sealing relationship with said cylindrical rod and seal receiving bore, respectively, said circular recess and wedge means being proportioned so that the load applied to said inner sealing lip is greater than the radial load applied to said outer sealing lip, the walls of said circular recess defining generally frusto-conical surfaces which diverge outwardly toward said integral annular means and the walls of said wedge means defining generally frusto-conical surfaces which converge inwardly toward said circular recess, said walls being proportioned so that the walls of said wedge means converge more rapidly relative to the radially inner wall of said circular recess than the radially outer wall of said wedge means converges
relative to the radially outer wall of said circular recess whereby the radial load applied to said inner sealing lip is greater than the radial load applied to said outer sealing lip.

(Ralabate Aff. P 2, exh. 1; P2. Facts, exh. E.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Enidine contends that the clear language of Claim 1 requires a wedge to apply radial loads to both an inner and outer sealing lip. "Applying radial loads to said inner and outer sealing lips" requires the annular wedge means to contact both lips. (D. Memo, pp. 12-20.) Hydraflow disagrees. It argues that this language does not exclude a structure in which a wedge contacts only one of the sealing lips. Claim 1 calls for a "wedge means cooperating with said circular recess for applying radial loads" and does not recite that the wedge means must contact both seal lips. Rather, the '745 patent teaches that two load sources cause the seal lips to bear against the rod and bore, namely the wedge and the lips themselves. The seal is larger than the bore into which it fits -- an "interference fit" -- generating radial loads independent of the wedge. The "cooperating" limitation of Claim 1, according to Hydraflow, requires both the wedge and the stress in the lips themselves to contribute to the recited loads. Since nothing in the language of Claim 1 requires the wedge to contribute to the radial loads on both lips, Claim 1 does not require the wedge to contact both lips. (P2. Memo, pp. 12-18.)

The problem with this interpretation is that Claim 1 clearly calls for a wedge applying radial loads to the inner and outer sealing lips. The claim specifically teaches that the wedge cooperates with the recess for applying radial loads to the seal lips. The claim, in other words, identifies the wedge, cooperating with the recess, as the source of the radial loads, not the lips themselves. Under Hydraflow's proposed interpretation, "whether [the Enidine wedge means] cooperates by wedging one or both lips against the adjacent structures is not required." (P2. Memo, p. 8.) Claim 1, however, does not call for a wedge applying radial loads to the inner sealing lip or the outer sealing lip; it calls for a wedge applying radial loads to the "inner and outer sealing lips" (emphasis added). The issue is whether a wedge can apply radial loads to both lips if it only contacts one lip. Hydraflow concedes that if the wedge does not contact a lip, the wedge itself does not apply a radial load to it. (P2. Memo, p. 13; P2. R.Memo, p. 4.) Dr. James E. Brunton, Hydraflow's patent law witness, agreed that the converging wall of the inner portion of the wedge would have to touch the wall of the inner sealing lip to exert a radial load on it. (Perlman Aff. P 13, exh. 6, p. 61.)

In short, Claim 1 calls for a wedge "applying radial loads to said inner and outer sealing lips." To apply a radial load, the wedge must contact the lip. Claim 1, by its own language, calls for a seal assembly in which the wedge contacts both lips.

The more specific language at issue in Claim 1, that explains the cooperation between the wedge and circular recess in detail, supports this conclusion:

the radially inner wall of said wedge means converging more rapidly relative to the inner wall of said circular recess than the radially outer wall of said wedge means converges relative to the radially outer wall of said circular recess whereby the radial load applied to said inner sealing lip is greater than the radial load applied to said outer sealing lip.

(Ralabate Aff. P 2, exh. 1, Col. 6, lines 17-25; P2. Facts, exh. E, Col. 6, lines 17-25.) This merely recites how the wedge applies the radial loads to the inner and outer sealing lips -- the wedge applies a greater load to the inner lip than to the outer lip. To apply the greater load to the inner lip, the wedge must contact it. To apply the lesser load to the outer lip, the wedge must contact it. The plain language of Claim 1 calls for a seal assembly with a wedge that contacts an inner lip and an outer lip.

b. Specification

The specification is also relevant to ascertain the meaning of Claim 1. ZMI Corp., 844 F.2d at 1579. "Claims must be read in view of the specification, of which they are a part." Markman, 52 F.3d at 979 (citing Autogiro Company of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 397 (Ct. Cl. 1967)). It is, however, "the claim, not the specification, [that] measures the invention." Environmental Designs, Ltd. v. Union Oil Co. of California, 713 F.2d 693, 699 (Fed. Cir. 1983) (citing Continental Paper Bag Co. v. Eastern Paper Bag Co., 210 U.S. 405, 420, 28 S. Ct. 748, 752, 52 L. Ed. 1122 (1908)), cert. denied, 464 U.S. 1043, 104 S. Ct. 709, 79 L. Ed. 2d 173 (1984); SRI International, 775 F.2d at 1118. "For claim construction purposes, the description [in the specification] may act as a sort of dictionary, which explains the invention and
may define terms used in the claims." Markman, 52 F.3d at 979.

Hydraflow contends that Enidine has wrongly argued that Claim 1 must include an unstated limitation found in the specification, namely that the wedge must contact both lips. (P. Memo, p. 6.) This contention is inapposite, however, since, for the reasons explained above, the plain language of Claim 1 does contain that limitation.

Enidine's argument, more accurately stated, is that the '745 patent's specifications and drawings simply confirm what the claim itself makes clear, that the wedge must contact both lips. The patent's background section explains that

the present invention provides a seal assembly in which a single, integral, annular wedging element applies radial loads to the inner and outer lips of a seal in such a way that the loads applied to the respective sealing lips are applied uniformly around the circumferences of the individual lips, but as between the two lips the loads are proportioned so that the inner lip on the dynamic side of the seal receives a greater load than the outer lip on the stationary side of the seal.

(Ralabate Aff. P 2, exh. 1, Col. 2, lines 45-50; P2. Facts, exh. E, Col. 2, lines 45-50.) The specification explains how the wedge applies radial loads to the inner and outer sealing lips:

At the base of annular inner wedge portion 40 where converging walls 74 and 76 are furthest apart, the wedge portion 40 is thicker than the distance between walls 54 and 56 at the top of the U-shaped recess so that as integral wedge portion 40 advances into circular recess 52 converging walls 74 and 76 contact diverging walls 54 and 56 at the top of the U-shaped circular recess 52 so as to force the outer-most edges 62 and 66 into contact with the respective adjacent structure to accomplish the intended sealing function. The diameters of circular recess 52 and annular inner wedge portion 40 are chosen so that converging walls 74 and 76 contact diverging walls 54 and 56 about simultaneously as wedge portion 40 is urged by helical compression spring 42 into circular recess 52. The converging wall 74 thus exerts a greater radial load on sealing lip 60 than is exerted by converging wall 76 on sealing lip 64.

(Ralabate Aff. P 2, exh. 1, Col. 4, lines 23-26, 41-43; P2. Facts, exh. E, Col. 4, lines 23-26, 41-43.) Figure 2 in the '745 patent, to which this specification refers, shows the inner side of wedge contact the inner sealing lip, and the outer side of the wedge contact the outer sealing lip.

The explanation in the specifications, with the corresponding drawing, that the wedge contact both the inner and outer sealing lips confirms the plain language of Claim 1. 6

--- Footnotes ---

6 A court may also look to the prosecution history to interpret a claim. ZMI Corp. 844 F.2d at 1580; McGill, Inc., 736 F.2d at 673. The parties barely addressed this factor beyond noting that the issue of contact between one seal lip and the wedge was not mentioned during prosecution of the application leading to the '745 patent. (P2. Memo, p. 20; D2. Memo, p. 19.)

--- End Footnotes ---

c. Other Claims in the '745 Patent

Also relevant to claim interpretation are the other claims in the patent. SmithKline, 859 F.2d at 882. Hydraflow argues that certain limitations in Claims 3 and 4 of the '745 patent indicate that Claim 1 does not exclude a structure in which the wedge only contacts one seal lip. (P2. Memo, pp. 14-15, P2. R.Memo, p. 5.) Claim 3 recites "an integral annular wedge means for contacting both said radially inner and radially outer sealing lips." Claim 4 also recites "an integral annular wedge means for contacting both said inner and outer sealing lips." (Ralabate Aff. P 2, exh. 1, Col. 7, lines 8-10, Col. 8, lines 2-3; P2. Facts, exh. E, Col. 7, lines 8-10, Col. 8, lines 2-3.) Under the doctrine of claim differentiation, Hydraflow argues, the "both" limitations of Claims 3 and 4 should not be read into Claim 1.

The concept of claim differentiation

states that claims should be presumed to cover different inventions. This means that an interpretation of a claim should be avoided if it would make the claim read like another one. Claim differentiation is a guide, not a rigid rule. If a claim will
bear only one interpretation, similarity will have to be tolerated.

Autogiro, 384 F.2d at 404; see also Laitram Corporation v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991). In other words, "when a patent claim does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim in determining ... infringement." SRI International, 775 F.2d at 1122 (citing Fromson v. Advance Offset Plate, Inc., 720 F.2d 1565, 1570 (Fed. Cir. 1983); Environmental Designs, Ltd., 713 F.2d at 699; Palumbo, 762 F.2d at 977). Claim differentiation serves to avoid interpretations that would render other claims superfluous. SRI International, 775 F.2d at 1122.

According to Hydraflow, Claims 3 and 4, not Claim 1, require the wedge to contact both sealing lips. To read that limitation into Claim 1, Hydraflow argues, would render the claims redundant. Claim 1, however, bears only one interpretation. It requires, for reasons already explained, that the wedge apply radial loads to, and therefore contact, both sealing lips. This one interpretation, which the specifications and drawings clearly support, does not render any other claims superfluous. Claim 3, for example, recites a guide means and changes and in the respective radial loads as the wedge moves axially toward the seal. Claim 4 calls for a snubber including a cylinder and rod with means for acting on fluid to dampen the movement between the rod and piston. The fact that Claim 1 recites a wedge applying radial loads to the inner and outer sealing lips does not render Claims 3 and 4 superfluous.

d. Conclusion

Construing the plain language of Claim 1, the specifications and drawings, and other claims in the patent, this Court must interpret Claim 1 to exclude a seal assembly in which the wedge contacts, and thus applies a radial load to, only one of two sealing lips. Hydraflow asks this Court to find that the '745 patent teaches that there are two sources for the radial loads applied to the seal lips, the loads which result from stretching and compressing the respective lips, and the loads which the wedge applies. (Soom Dec. P 6.) The specifications do clearly contemplate such an "interference fit" of the sealing lips. (Ralabate Aff. P 2, exh. 1, Col. 3, lines 48-61; P2. Facts, exh. E, Col. 3, lines 48-61.) The question is what bearing, if any, this has on the teachings of Claim 1.

Claim 1 calls for a wedge, cooperating with a circular recess, "for applying radial loads to said inner and outer sealing lips." Enidine responds that loads generated by seal lips are applied "to" something else, not to the seal lips themselves. Even if someone skilled in the art would understand that loads generated by the lips are applied "to" the lips as Hydraflow contends, the issue is not dispositive. Whether lips in an "interference fit" apply loads "to" themselves or "to" something else, the language of Claim 1 teaches that the wedge must apply loads to the inner and outer lips. Claim 1 speaks of radial loads that a wedge applies to the sealing lips, not radial loads the lips may apply to themselves. The specifications fully support this teaching. They depict a wedge applying radial loads to both the inner and the outer lips, which themselves are stretched and compressed.

Contrary to Hydraflow's contention, the teachings of Claim 1 clearly require that the source of the load on the inner lip include a load applied by the wedge element. Since Hydraflow concedes that a wedge must contact a sealing lip to apply a load to it, Claim 1 does exclude a structure in which the wedge contacts only one of the two sealing lips.

The second step of Claims 1, 2, and 3 of the ‘234 patent is also in need of interpretation by the court. Step two reads as follows in the respective claims:

Claims 1 and 2: "applying radially directed forces to the septum to reseal the slit therein;"

Claim 3: "applying sufficient radially directed forces to the septum to reseal the slit therein preventing fluid flow therethrough;"

The court concludes that because the purpose of the radially directed forces in all three claims is to reseal, the radially directed forces must be strong enough to affect the center of the septum, thus causing the slit to reseal and not leak.
Throughout the specification, plaintiff stressed the importance of having the slit reseal. For example, in column 1, lines 50 - 62, plaintiff discussed the reasons for strong resealability, including prevention of contamination and leakage. Again in column 2, lines 27 - 30, 32 - 35; column 3, lines 24 - 26; column 6, lines 19 - 26, 45 - 47; and column 8, lines 41 - 43, plaintiff discusses the use of radially directed forces to reseal.

Plaintiff in this case has presented testimony, again from Vaillancourt, that the presence of axial forces may meet the claim requirement of "radially directed forces" in that axial forces will result in radial forces that reseal. The court does not agree with such a broad interpretation of radially directed forces. As mentioned above, it is clear that axial and radial forces have distinct purposes in this patent. Nowhere in the specifications or prosecution history is it mentioned that axial forces alone can create a reaction that leads to resealing the slit. Indeed, as Sheehan pointed out, axial forces alone would urge the slit to remain open, since those forces push down on the edge of the septum to create the dome.

It is the radially directed forces -- forces emanating from the sides of the septum and directed inward toward the septum slit -- that reseal. Any radial force that comes from axially directed forces is a radially resultant force rather than a radially directed force.

The '350 patent, entitled "Automated Clutch Control and Calibration", relates to method and apparatus for reengaging a clutch in a truck transmission system after the clutch has been disengaged. The essence of the invention is a way to shorten the distance the clutch has to move between events of engagement and disengagement. Defendants object to the Special Master's recommended construction on the basis that it expands the scope of the claim beyond that described and supported by the specification, and that it interjects indefiniteness and ambiguity in the asserted claims because one of ordinary skill in the art is not able to determine their scope and boundary.

The claimed invention purports to improve responsiveness of the clutch during clutch engagement by defining clutch control parameters corresponding to an "approach point" as well as a "touch point". The touch point, also called the point of incipient engagement, is a theoretical point at which the clutch plates just begin to touch. The '350 patent describes touch point as the point "at which the master clutch just beg[ins] to transmit torque." This point cannot be observed directly because the clutch plates are enclosed in a bell housing. In addition, torque transfer cannot be directly measured. The term "touch point" was known to those skilled in the art at the time the '350 patent was issued. There is no agreed upon standard for determining touch point, and different prior art methods produce inconsistent results.

The term "approach point" is not a term of art used by automotive engineers. The '350 specifications state that approach point is not the same point as the touch point. The Special Master's Report states that "the approach point is a point intermediate full disengagement and the touch point, preferably almost to the touch point." Defendant contends that the approach point is a single point, while the recommended definition encompasses an infinite number of possible approach points, including points that the prior art teaches are touch points. Both experts used illustrations which demonstrate that the same points described in the prior art as a touch point can be an approach point under the recommended definition. Defendants urge the court to reject the recommended definition because the '350 patent teaches that the touch point and approach point must be different points. Rather, defendants invite a claim construction which includes using the algorithm set forth in FIG 4 of the '350 patent for determining the touch point and approach point.

The Special Master specifically addressed defendants' concerns in his Report, emphasizing that limitations in patent specifications are generally not imported into the claims, and that issues of infringement and validity generally are separate from claim construction. The Report concludes that the '350 patent sets forth express definitions for approach point and touch point, and such definitions are clear enough so that one skilled in the art can easily understand what is being read in light of the patent specifications. The Special Master notes that the claim construction leaves the claims "broad" as sought by plaintiff, i.e. not limited to the specific calibration technique disclosed in the patent.

The Report goes on to consider the issue of indefiniteness, which would render a claim invalid if those skilled in the art would not understand the scope of the claim when the claim is read in light of the specification. Atmel Corp. v. Information Storage Devices, Inc., 198 F.3d 1374, 1378 (Fed. Cir. 1999); Personalized Media Communications, LLC v. ITC, 161 F.3d 696, 705 (Fed. Cir. 1998). In this case the experts are in direct confrontation about "indefiniteness" and how those skilled in
the art would view the matter. The Special Master concludes that under Federal Circuit precedent, such a validity challenge is ripe for consideration at trial. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 911-14 (Fed. Cir. 2004).

This court adopts the Special Master's recommended claim construction without modification, as well as the recommendation to deny defendant's motion for summary judgment of invalidity for indefiniteness.

"About" and "Approximately"

The parties have requested that the Court construe the meanings of "approximately" and "about" in claims 8 and 11. These terms are closely related and appear in the same sections of the claims and therefore are addressed together.

Claim 8(b) states: "the heat treating step comprises the steps of heating the blank to approximately 1560 [degrees] F.; quenching the heated blank into a liquid salt bath at approximately 500 [degrees] F. for about 20 seconds; withdrawing the quenched blank from the salt bath and allowing it to air cool to room temperature; and tempering the cooled bank at approximately 300 [degrees] F." (6:17-23.)

Claim 11(b) states "the heat treating step comprises heating the blank to approximately 1560 [degrees] F.; quenching the heated blank into a liquid salt bath at approximately 500 [degrees] F. for about 20 minutes; and withdrawing the quenched blank from the salt bath and allowing it to air cool to room temperature." (6:35-40.)

"The word 'about' does not have a universal meaning in patent claims, and that the meaning depends on the technological facts of the particular case." Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1217 (Fed. Cir. 1995). Furthermore, the word "about," avoids a strict numerical boundary to the specified parameter. Id. Its range must be interpreted in its technologic and stylistic context. Id. The court in Pall considered how the term "about 5:1 to about 7:1" was used in the patent specification, the prosecution history, and other claims. Id. It is appropriate to consider the effects of varying that parameter, for the inventor's intended meaning is relevant. Id. Extrinsic evidence of meaning and usage in the art may be helpful in determining the criticality of the parameter, and may be received from the inventor and others skilled in the field of the invention. Id. (citing Markman, 52 F.3d at 980)). In Merck & Co., v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1371 (Fed. Cir. 2005), tasked with the construction of the word "about, "the court held that it should be given its ordinary meaning of "approximately."

Fisher-Barton urges that one of ordinary skill in the art would understand that the terms "approximately" and "about" permit reasonable ranges on either side for the times and temperatures stated and that the steps of the claimed process are not limited to the exact temperatures and time period recited. (Fisher-Barton Mem. 6.) Fisher-Barton relies upon the Turner Declaration as establishing that one with skill in the art would understand the temperatures to include plus or minus 10% of the stated temperature. (Id.) Thus, 500 [degrees] F would mean a range 450 [degrees] F. to 550 [degrees] F., 300 [degrees] F. would mean a range of 270 [degrees] to 330 [degrees] F. and 1560 [degrees] F. could vary between 1404 [degrees] F. and 1716 [degrees] F. (Id.)

Likewise, Fisher-Barton asserts that one skilled in the art of metallurgy would understand "about 20 seconds" in claim 8 as meaning plus or minus five seconds (15 to 25 seconds) and "about 20 minutes" in claim 11 as meaning plus or minus five minutes (15 to 25 minutes). (Id. at 7.) Fisher-Barton states that such ranges are well within the typical tolerances of the heat treating process. (Id.)

The Defendants claim that "approximately" should be construed to mean plus or minus five degrees. (Defs.' Opening Br. 16.) Thus, the 500 [degrees] F. quench temperature would have a range from 495 [degrees] F. to 505 [degrees] F. and the 300 [degrees] F. tempering temperature would have a range from 295 [degrees] F. to 305 [degrees] F. (Id. at 16-17.) The Defendants do not offer any construction of the range for the heating temperature of the metal.

Relying on the Krauss Declaration, the Defendants maintain that "about" with respect to the time in claims 8 and 11 should be construed to mean plus or minus 10%, which would mean a range from 18 to 22 seconds and a range from 18 to 22 minutes. (Id. at 17.) Krauss opines that one skilled in the art of metallurgy would consider a reasonable range for the
duration of the quench to be plus or minus 10% of the specified time. (Krauss Decl. P 27.) Krauss indicates that since claim 8:

appears to be aiming at martensite formation . . . it is important to allow the work piece to be in the quench long enough for the surface and interior of the work piece to equalize, but not so long as to allow for the formation of bainite or other non-martensitic structures. To allow the piece to stay in the quench much longer would result in the additional formation of bainite.

(Id.)

With respect to claim 11, Krauss avers that one skilled in the art would consider a reasonable range of plus or minus 10% of the specified time to be reasonable. He avers that to go below that time would create a high risk of preventing the austenite from fully transforming to bainite, and thus would allow the formation of other microstructures, such as martensite. (Id. at P28.) Krauss states that these other microstructures are certainly disfavored in trying to achieve a blade having the characteristics of high hardness and high toughness without tempering the blade once it has been cooled to room temperature. (Id.)

In response, Fisher-Barton asserts that Krauss offers a very narrow range of what "about" and "approximately" would mean to one skilled in the art. Fisher-Barton also relies upon the Declaration of Apolonio Ortiguera ("Ortiguera"). 10

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 Ortiguera is a consulting metallurgist retained by Fisher-Barton. Ortiguera has 35 years of experience in metallurgy. The Court has considered the Ortiguera Declaration but does not find it helpful in resolving the issues presented because it contains unsupported conclusory assertions. See Phillips, 415 F.3d at 1318.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In the Defendants' response, they state that given the accuracy of quench tank controls a skilled heat treater would read the language "approximately 500 [degrees] F" to mean plus or minus 5 [degrees] to 10 [degrees] F. (Defs.' Responsive Claim Construction Br. ("Defs.' Responsive Br.") 11.) They also proffer the Declaration of Glenn True ("True"). 11 The Defendants state that the specification and the claim language indicate that the close tolerances of their definition are the appropriate construction.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 True is the owner of Superior Metals Treating and Equipment Inc., located in Kansas City, Missouri. (True Decl. P 1.) Since 1964, True has been heat treating lawn mower blades using a variety of metals including 10B38 steel. (Id. at P 2.) Since 1972, True has treated lawn mower blades for defendant Frederick Manufacturing. (Id. at P 1.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Much of the evidence proffered on the meaning of "approximately" is extrinsic evidence. Having considered the varying opinions regarding "approximately" and what it means in the context of quenching, this Court finds the plus or minus 5 [degrees] F to 10 [degrees] F construction to be most persuasive. True is a person skilled in the art of heat treating steel blades and his opinion is consistent with the quenching range in the Handbook. Turner has attested to his reliance upon the Handbook (even though he has not relied upon it in his opinion of "approximately"). While Turner is skilled in the art and the inventor, his opinion as to the temperature range is a mere conclusion and no basis for his conclusion is explained.

Krauss's interpretation of "approximately" as meaning plus or minus 5 [degrees] is rejected as being a narrower temperature range than specified by the Handbook. The Defendants have not offered any evidence regarding the meaning of "approximately" when considering the temperature range in the heating process. But, patent terms are normally used consistently throughout the patent. Phillips, 415 F.3d at 1314. Thus, the Court adopts the 5 [degrees] to 10 [degrees] F range in interpreting the term "approximately" in claims 8 and 11 of the '114 patent.
In determining the meaning of "about" the Court notes that Turner testified at his deposition that attributing the meaning of five seconds to "about" that gives "a relatively small window of opportunity" to pull a rack of parts out of a marquenching tank and that "from a practical standpoint" you need "at least that much time for it to be workable." (Mansfield Decl. Supp.Defs.' Responsive Br. P 3, Ex. A. (Turner Dep.) 55.) Turner's explanation is the most persuasive of those offered and is therefore adopted. Since patent terms are to be construed consistently the Court construes "about" as follows; "about 20 seconds" in claim 8 means plus or minus five seconds (15 to 25 seconds) and "about 20 minutes" in claim 11 means plus or minus five minutes (15 to 25 minutes).

4. The term "approximately" in claims 8 and 11 of the '114 patent means plus or minus 5 [degrees] to 10 [degrees] F. 

258

A. 35 U.S.C. § 112 - Definiteness

Every patent's specification must "conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P.2. The Federal Circuit has stated the standard for assessing whether a patent claim is sufficiently definite to satisfy the statutory requirement as follows: "If one skilled in the art would understand the bounds of the claim when read in light of the specification, then the claim satisfies section 112, paragraph 2." Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001) (citing Miles Labs., Inc. v. Shandon, Inc., 997 F.2d 870, 875 (Fed. Cir. 1993)). "Because the claims perform the fundamental function of delineating the scope of the invention, the purpose of the definiteness requirement is to ensure that the claims delineate the scope of the invention using language that adequately notifies the public of the patentee's right to exclude." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005). "The statutory requirement of particularity and distinctness in claims is met only when [the claims] clearly distinguish what is claimed from what went before in the art and clearly circumscribe what is foreclosed from future enterprise." United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 236, 63 S. Ct. 165, 87 L. Ed. 232, 1943 Dec. Comm'r Pat. 758 (1942); see Morton Int'l, Inc. v. Cardinal Chem. Co., 5 F.3d 1464, 1470 (Fed. Cir. 1993) (claims must be "sufficiently precise to permit a potential competitor to determine whether or not he is infringing").

However, absolute clarity is not required, and only claims "not amenable to construction" or "insolubly ambiguous" are indefinite. See Datamize, LLC, 417 F.3d at 1347; Novo Indus., LP v. Micro Molds Corp., 350 F.3d 1348, 1353 (Fed. Cir. 2003); Honeywell Int'l, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332, 1338 (Fed. Cir. 2003); Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001). Further, an issued patent enjoys a statutory presumption of validity, and clear and convincing evidence must be shown to invalidate a patent. See 35 U.S.C. § 282; Datamize, LLC, 417 F.3d at 1347-48; Budde v. Harley Davidson, Inc., 250 F.3d 1369, 1376 (Fed. Cir. 2001). "By finding claims indefinite only if reasonable efforts at claim construction prove futile, we accord respect to the statutory presumption of validity." Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001).

"In the face of an allegation of indefiniteness, general principles of claim construction apply." Datamize, LLC, 417 F.3d at 1348. Indeed, "the determination of claim indefinite is a legal conclusion that is drawn from the court's performance of its duty as the construer of patent claims." Personalized Media Comm., LLC v. Int'l Trade Comm'n, 161 F.3d 696, 705 (Fed. Cir. 1998). "Intrinsic evidence in the form of the patent specification and file history should guide a court toward an acceptable claim construction." See Datamize, LLC, 417 F.3d at 1348. Specifically, the court should consider the patent's prosecution history, which may reveal "how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005). In addition, a court considering an allegation of indefiniteness may rely on extrinsic evidence when construing the claims at issue. Datamize, LLC, 417 F.3d at 1348. Such extrinsic evidence may include "all evidence external to the patent, including expert and inventor testimony, dictionaries, and learned treatises." Markman v. Westview Instruments, Inc., 52 F.3d 967, 980 (Fed. Cir. 1995).

Here, the language in the '621 patent claimed as indefinite by Hamilton is that describing the numeric value of the dimensions of the slot and tongue of the purportedly universal buckle. Specifically, Hamilton contends that those dimensions are indefinite because each numeric value is proceeded by modifying language that makes it so ambiguous as to prevent one skilled in the art from determining the scope of the '621 patent. The language in the claims at issue is the
the tongue section having a thickness of less than approximately 0.13", an overall width of less than approximately 0.8", and a front wall portion having a width of less than approximately 0.23" the slot having an overall width of greater than approximately 0.53" and a length of greater than approximately 0.99".

Claim 1 of the '621 patent. That language is present claims 1, 12, 19, 21, 25, 28 and 35 - all of the independent claims. Hamilton asserts that the use of the modifiers "less than approximately" and "greater than approximately" in those claims is vague, imprecise and internally inconsistent.

Looking first to the intrinsic evidence, the Court is unable to determine what numeric values would fall within the scope of the dimensions specified in the patent. It is clear from the patent prosecution history that O'Neill sought to distinguish his buckle from Ellwanger on the basis that Ellwanger merely taught a "universal buckle designed to fit almost all of the automobile and truck seatbelts manufactured today" and the '621 patent actually taught the numeric values of the dimensions necessary to achieve universality. However, O'Neill's argument that "a mere assertion of universality of a device does not make it so" applies equally to the '621 patent; the mere assertion that certain dimensions achieve universality does not make it so. Especially, here, where the dimensions specified in the claims themselves belie a clear determination of their numeric values. Moreover, the only true limitation to the dimensions specified in the '621 patent and the prosecution history is that those dimensions be within a range to allow universality. Because the Court cannot construe the numeric value of the dimensions of the tongue and slot of the purportedly universal buckle described in the '621 patent by looking solely to the intrinsic evidence, the Court must look to the extrinsic evidence.

A primary piece of extrinsic evidence before the Court is the testimony of the inventor himself. During O'Neill's deposition, Hamilton's counsel attempted to ascertain the numeric value of the outer boundaries of the dimensions in the independent claims. For example, counsel asked Hamilton whether a buckle with a tongue section of an overall width of 0.848" would fall within the claim language of "an overall width of less than approximately 0.8." O'Neill replied that it would. In fact, O'Neill replied that any measurement that would not cause fit failure would fall within the claims of the patent. Hamilton testified that: "On this device it is the function that is critical. It has to perform its intended function once its put into the female receiver. For this device the dimensions are actually non-critical as long as the device performs the way its intended to perform." 14 O'Neill went on to explain that: "So the wording approximately was used for a couple reasons. One, to prevent or discourage somebody from attempting to design around by changing the dimension by several thousandths or even a few tenths - hundredths rather, but also to allow for normal manufacturing tolerances." 15 Finally, the following exchange took place:

Q: What I want to find out is when you use the term with respect to tongue width less than approximately 0.8 inches, how far does that go on either side? Where is the proper line?

A: I guess, David, it doesn't really set a line. There is, when you're dealing with tolerances, you know, a tolerance would have to be defined because I had no belief manufacturers would tell me the design and dimensioning and the tolerancing of their systems, assuming that they would consider that proprietary in nature. I had to design a male to fit all manufacturers' buckles, and when I say all, just for the record, I'm talking the narrower design in figure Exhibit 2, the lower photograph, the narrow design. 16 But, you know, the word approximately is intended to again, because I don't know the manufacturers' dimensioning, I don't know what they use for tolerances, the word approximately is intended to allow tolerance and latitude in design, the key element being function, that when it is inserted into the female portion of the buckle system that it fits and functions as intended, okay?

* * *

Q: With respect to less than approximately 0.8, how far in either direction can they go and not have their product be read upon by your patent claim limitation of less than approximately 0.8?

A: They could go to the point in either direction that it causes fit or function failure.

February 20, 2007 deposition of O'Neill at 96-97. Accordingly, O'Neill's deposition does not assist the Court in construing or limiting the numeric value of the dimensions in the patent, other than limiting those dimensions to a mere assertion of
universality. Indeed, it appears that O'Neill has attempted to use assertions of numeric values in describing the dimensions of his buckle to achieve patentability over prior art, but also attempted to use the words "greater than approximately" and "less than approximately" to have his patent read on all universal buckles that function properly. Further, to the extent that O'Neill has asserted that the term "approximately" is used to account for manufacturing tolerances, he has testified that he is unaware of what the limitations of those tolerances would be and has provided no evidence to establish the limitations of such tolerances. Thus, that explanation does not assist the Court in its determination of the definiteness of the '621 patent.

13 February 20, 2007 deposition of O'Neill at 89.
14 February 20, 2007 deposition of O'Neill at 89.
15 February 20, 2007 deposition of O'Neill at 89.

16 The product actually sold by Hamilton contained two buckles, one with a long and narrow shape and intended for use with newer vehicles, and one with a shorter and wider shape, for use with vehicles produced prior to the mid-1990s. At his deposition, Hamilton asserted that the '621 patent did not read on the shorter and wider buckle. However, O'Neill did not otherwise limit the coverage of '621 patent, and did not explain that limitation or its numerical significance, other than to state that his patent was intended to read on seat belt buckles of vehicles produced prior to the mid-1990s. Moreover, such a limitation is not contained in the intrinsic evidence.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

In addition to the testimony of O'Neill, the Court has before it the report of Hamilton's expert, Herbert Joe, M.A., J.D., LL.M. Joe gives the opinion that the '621 patent is invalid as indefinite under § 112 based upon the use of the modifiers "greater than approximately" and "less than approximately." Specifically, the expert explains his reasoning as follows:

The points about the vagueness and internal inconsistencies of the words in the alleged O'Neill patent claims (and specification), and the variable imprecision in the measured values thereof are that they effectively invalidate the patent. Specifically, because one or more claims includes a measure of a parameter and there is more than one method to measure that parameter, where the different methods of measurement achieve different results, the O'Neill claims are, in my opinion, invalid for indefiniteness under 35 U.S.C. § 112. 17

For example, in Claims 1, 12, 19, 21, 28 and 35 (all of Mr. O'Neill's independent claims), the tongue section is described as "having . . . an overall width of less than approximately 0.8", . . . " (italics added).

* * *

However, to give a measurement of "less than about (or approximately)" or "greater than about (or approximately)" is not intuitive, not common sense and can reasonably lead to different results. For example, it is not illogical to conclude that (in our example with the 0.8" value) "less than about" 0.8" yields a measurement of 1) any value less than but not including 0.8" because of the phrase "less than" but without the phrase "or equal to", 2) any value less than or equal to 0.8" because of the phrase "less than" and the word "about", and 3) any value less than more or less than 0.8", including values just "greater than" 0.8" because a value greater than 0.8" gives import to the chosen word "about" (or approximately). (However, to give import to the word "about" can mean more or less than 0.8" in this example, but then that would seem to vitiate the import of the "less than" the example value of 0.8").

17 [footnote in expert report] Honeywell Int'l, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332 (Fed. Cir. 2004). However, if values encompassed by the claim language can be calculated or measured, so that the claim is not "insolubly ambiguous," the claim is not invalid for indefiniteness. Marley Mouldings, Ltd. v. Mikron Indus., Inc., 417 F.3d 1356 (Fed. Cir. 2005).
Accordingly, Hamilton has succeeded in carrying its burden to establish by clear and convincing evidence that the '621 patent is indefinite. The dimensions of the '621 patent are insolubly ambiguous and incapable of construction by the Court. O'Neill did not meet the statutory requirement of particularity and distinctness in the claims of the '621 patent because those claims do not "clearly distinguish what is claimed from what was done before in the art" and do not "clearly circumscribe what is foreclosed from future enterprise." United Carbon, 317 U.S. at 236; see Morton Int'l, 5 F.3d at 1470 (claims must be "sufficiently precise to permit a potential competitor to determine whether or not he is infringing").

This case is distinguishable from Ortho-McNeil Pharm., Inc. v. Kali Labs., Inc., - F. Supp. 2d -, 482 F. Supp. 2d 478, 2007 U.S. Dist. LEXIS 25459, 2007 WL 1071940 (D.N.J. April 5, 2007), in which the court construed "about 1:5" to encompass the specific numerical range of 1:3.6 to 1:7.1. In Kali, the court was able to definitely construe that numerical range because the specification in the patent read over a ratio of the subject pharmaceutical mixture covering - in terms of efficacy - a 95% statistical confidence interval. Kali, 2007 U.S. Dist. LEXIS 25459, 2007 WL 1071940; see Ortho-McNeil Pharm., Inc. v. Caraco Pharm. Labs. Ltd., 476 F.3d 1321 (Fed. Cir. 2007). The patentee then presented expert extrinsic evidence that the term "about" encompassed the statistical variation of efficacy to that 95% confidence interval, an interval that experimentation showed consisted of a definite range of ratios from 1:3.6 to 1:17.1. Kali, 2007 U.S. Dist. LEXIS 25459, 2007 WL 1071940. Here, the specification of the '621 patent contains no benchmark similar to the 95% confidence interval present in Kali and O'Neill has presented this Court with no way to definitely gauge the numeric value of the dimensions of his universal buckle. Moreover, the use of "less than approximately" and "greater than approximately" in the '621 patent adds a level of ambiguity not encountered by the Kali court, which simply interpreted the modifier "about."

Additionally, this case is distinguishable from Orthokinetics, Inc. v. Safety Chairs, Inc., 806 F.2d 1565 (Fed. Cir. 1986), in which the Federal Circuit found that a claim not invalid as indefinite that contained the following claim language of an orthopaedic chair for use in automobiles: "wherein said front leg portion is so dimensioned as to be insertable through the space between the doorframe of an automobile and one of the seats thereof." In Orthokinetics, the court reasoned that: "The phrase 'so dimensioned' is as accurate as the subject matter permits, automobiles being of various sizes. As long as those skilled in the art realized that the dimensions could be easily obtained, § 112, 2d P requires nothing more. The patent law does not require that all possible lengths corresponding to the spaces in hundreds of different automobiles be listed in the patent, let alone that they be listed in the claims." Id. at 1577. That reasoning clearly indicates that the device in Orthokinetics would be manufactured in varying lengths depending upon the automobile in which the user of the device intended to place it. In stark contrast, the universal buckle in the '621 patent was designed and intended for the explicit purpose of creating not multiple buckles of varying dimensions, but a single buckle that would fit universally in the female portion of any automobile seatbelt buckle. In addition, the numeric values of the dimensions in the '621 patent are particularly critical to its validity, because it is undisputed that those dimensions are what made it patentable. 18 Indeed, if those dimensions read on any buckle that could be termed "universal", then they actually have no meaning. As such, the patent is invalid as indefinite.

18 The only material difference between the '621 patent and the Snyder and Ellwanger patents is the inclusion in the '621 patent of the numeric values of the dimensions of the universal buckle. See February 20, 2007 deposition of O'Neill at 161. As the Court will explain in the next section, the '621 patent is invalid for obviousness because it is indistinguishable from the prior art, especially because the dimensions in the '621 patent are indefinite and may only be construed as a mere assertion of universality.
follower plate surface that would face the confronting surface. The Plaintiff avers that the term should be construed as
meaning coplanar within the limits of machine tolerances. See Potter Dep. at 215. The Defendants contend that the claim
limitation is indefinite such that one could not determine what falls within and what avoids the claim limitation. They
concede, however, that "to the extent that one of ordinary skill would interpret this claim, it would be interpreted as being
limited to the roller axes of rotation being in the same plane as the face of the driven member plate within a relatively small
tolerance corresponding to the machine tolerances of a few thousandths or tens thousandth of an inch." The Court agrees.
The Defendants do not contest that this definition of the term "approximately coplanar," which the Court adopts, does not
encompass a difference of this amount exhibited in the Berger plate.

B. Claim 10

The parties also disagree on the proper construction of claim 10. The court repeats claim 10 here for ease of reference:

In a pull-type harvesting machine as claimed in [claims 1-9], said steering structure including telescoping linkage having
a front pivotal connection with the tongue at a point which is at least approximately equidistant from said opposite ends of
the telescopic section.

The parties join issue first on the meaning of the term "telescoping." Defendant argues that the term should be construed to
encompass only linkages that have overlapping sections, as if in overlapping cylindrical sections. Plaintiff argues that the
term is broader, and encompasses any sliding linkage allowing for the adjustment of length.

The court agrees with defendant and holds, as a matter of law, that the term "telescoping linkage" as used in the '859 patent
means a linkage having overlapping cylindrical sections. The ordinary meaning of the term telescoping is "to slide or pass
one within another like the cylindrical sections of a hand telescope." Webster's Third International Dictionary, 2351 (1986).
The court believes the term telescoping is simply too narrow to encompass the entire class of sliding linkages which allow
for the adjustment of length.

The parties apparently do not contest the meaning of the phrase "a front pivotal connection with the tongue at a point."
Defendant urges the court to construe this phrase to mean that the steering structure must be connected to the tongue at a
spot which allows for pivotal movement. Because defendant's proposed construction comports with the plain meaning of the
claim terms, the court adopts this construction as a matter of law.

Finally, the parties join issue on the meaning of the phrase "at least approximately equidistant." Plaintiff urges the court to
construe this phrase as encompassing a placement of the front pivotal connection at a point where the angles of the U-joints
in the telescoping drive line are approximately equal. Defendant urges the court to construe this phrase to require a
placement of the front pivotal connection at a point equidistant or within manufacturing tolerances of being equidistant to
the opposite ends of the telescoping drive line.

The court rejects both parties' proposed formulations. As a matter of law, the court construes the phrase "at least
approximately equidistant" to require a placement of the front pivotal connection "at least reasonably close to" the exact
point on the tongue that is equidistant from the opposite ends of the telescoping drive line. The ordinary meaning of the term
approximately is "reasonably close to." Webster's Third International Dictionary, 107 (1986). Neither parties' arguments
have convinced the court that any meaning of the term approximately other than its ordinary meaning should apply. The
ambiguity of the term, if any exists, is inherent in claim 10, and cannot be cured by any strained construction by the court.

III. Motion for Summary Judgment of Invalidity for Claim Indefiniteness

Defendant contends that the phrase "at least approximately equidistant" in claim 10 renders the claim fatally ambiguous pursuant to 35 U.S.C. § 112, P 2. This statute requires patent specifications to "conclude with one or more claims pointing out and distinctly claiming the subject matter which the applicant regards as his invention." Id. Whether a claim is invalid for indefiniteness under section 112 depends on whether those skilled in the art would understand the scope of the claim when the claim is read in light of the specification. North American Vaccine v. American Cyanamid Co., 7 F.3d 1571, 1579 (Fed. Cir. 1993) (citing Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1576 (Fed. Cir. 1986)). "If the claims, read in the light of the specification, reasonably apprise those skilled in the art both of the utilization and scope of the invention, and if the language is as precise as the subject matter permits, the courts can demand no more." Shatterproof Glass Corp. v. Libbey-Owens Ford Co., 758 F.2d 613, 624 (Fed. Cir. 1985), quoted in North American Vaccine, 7 F.3d at 1579-80. Compliance with the definiteness requirement is generally a question of law. North American Vaccine, 7 F.3d at 1579; Shatterproof Glass Corp. v. Libbey-Owens Ford Co., 758 F.2d 613, 624 (Fed. Cir. 1985).

The court concludes that claim 10 is not invalid for indefiniteness. The court begins by noting that the mere use of the phrase "at least approximately" does not itself violate section 112. See Seattle Box Co. v. Industrial Crating & Packing, Inc., 731 F.2d 818, 826 (Fed. Cir. 1984) ("Definiteness problems often arise when words of degree are used in a claim. That some claim language may not be precise, however, does not automatically render a claim invalid."). (upholding "substantially equal to" claim language); see also Andrew Corp. v. Gabriel Electronics, Inc., 847 F.2d 819, 821 (Fed. Cir. 1988) (reversing district court's determination that terms such as "approach each other", "close to", "substantially equal", and "closely approximate" rendered claims fatally indefinite); In re Fisher, 57 C.C.P.A. 1099, 427 F.2d 833, 838 (C.C.P.A. 1970) (use of "at least" does not render claim indefinite); cf. Quantum Corp v. Rodime, PLC, 65 F.3d 1577, 1579 (Fed. Cir. 1995) (PTO allowed "at least approximately" language in amended claim without objecting on indefiniteness grounds). Moreover, every prior art patent cited on the face of the '859 patent uses terms in its claims that are very similar to, and in some cases even identical to, the "at least approximately" language.

The court believes that the "at least approximately equidistant" language, when read in light of the patent specification, reasonably apprises one of ordinary skill in the art of the scope of claim 10. Figure 6 of the '859 patent, read in conjunction with column 6, lines 35-40 of the specification, explains the geometric relationship envisioned by claim 10:

FIG. 6 shows the geometric relationship between the tongue 30, the drive line 90, and the steering structure 138. It will be noted that the connection point 144 of the steering structure to the tongue 30 is approximately equidistantly spaced from both of the U-joints 104 and 110.

'859 patent (emphasis added). One of ordinary skill would recognize, the court believes, that as the tongue 30 swings about its axis to position the operative cutting components of the machine in alternative positions, the "exact point on the tongue that is equidistant from the opposite ends of the telescoping drive line," see Hay & Forage, 1998 WL 420219, at *9, does not remain fixed. This is because one of ordinary skill would recognize that the geometry by which the exact center point is measured changes as the drive line telescopes. As the tongue swings, the distance between the connection point 144 and the U-joint 110 changes (in conjunction with the telescoping of the steering structure), but the distance between the connection point 144 and the U-joint 104 stays the same. Consequently, the imaginary exact point of equidistance moves a short distance away from the connection point 144. The court believes those of ordinary skill in the art would understand this geometry. The court also believes that this geometry reasonably apprises such artisans of the patent's scope.

Moreover, the "at least approximately equidistant" language is as precise as the subject matter permits. The precise limits of the distance away from which the front pivotal connection can stray from the exact point of equidistance and still be "at least approximately equidistant" from the opposite ends of the telescoping drive line or "at least reasonably close to," see Hay & Forage, 1998 WL 420219, at *9, the exact point of equidistance would be very difficult to determine. In the context
of the ’859 patent, "at least approximately equidistant" is sufficient to avoid invalidity for indefiniteness. See Andrew Corp., 847 F.2d at 823. ("The law imposes no obligation on a patent applicant to . . . set the claim limits at the precise technological edge of the invention. A claim is not fatally indefinite for failing specifically to delineate the point at which the change in physical phenomenon occurs."). A patentee has particular latitude in the use of relative terms in his claim where, as here, the prior art is remote from the claimed invention. 2 Cf. Amgen, Inc. v. Chugai Pharmaceutical Co., 927 F.2d 1200, 1218 (Fed. Cir. 1991) ("When the meaning of the claims is in doubt, especially when, as is the case here, there is close prior art, they are properly declared invalid. . . . In arriving at this conclusion, we caution that our holding . . . should not be understood as ruling out any and all uses of ["about" as a term of degree] in patent claims. It may be acceptable in appropriate fact situations.").

2 Defendant argues that the "Niemeyer" machine, which is the subject of cross motions for summary judgment not currently under consideration by the court, constitutes close prior art. The court disagrees because in the Niemeyer machine, the alleged "steering structure" contacts the tongue entirely or almost entirely at one end of the drive line; the connection is nowhere near the exact point of equidistance.

Defendant nonetheless contends claim 10 is invalid for indefiniteness. Defendant directs the court's attention to a number of cases purporting to support its position. In Amgen, 927 F.2d at 1217-18, for example, the Federal Circuit held invalid for indefiniteness a claim limitation reciting "a specific activity of at least about 160,000 IU per absorbance unit." Defendant, apparently seizing upon the analogy between "at least about" in Amgen and "at least approximately" in this case, argues that claim 10 is indefinite.

The court does not read Amgen as broadly as defendant urges. Unlike this case, the prior art in Amgen was very close. The patentee in Amgen had originally sought to patent claims with a specific activity limitation of "at least 120,000." Id. The PTO rejected this limitation because prior art disclosed a similar product having specific activity of 128,620. Id. In response, the patentee submitted the "at least about 160,000" language. Id. In the particular field at issue in Amgen, the recital of specific activity levels was such "an imprecise form of measurement with a range of error" that the "at least about" limitation did not sufficiently distinguish the invention over the close prior art. Id. Here, on the other hand, the record before the court does not indicate that the PTO had any problem with the "at least approximately equidistant" language because of close prior art. Moreover, the Niemeyer "prior art" referred to by the defendant is, in the context of this case, far more distant from the ’859 patent than the prior art in Amgen was distant from the patent there at issue. In Amgen "nothing in the specification, prosecution history, or prior art provided any indication as to what range of specific activity is covered." Id. Here, as the court explained above, the geometry demonstrated in the ’859 patent specification provides ample indication to those skilled in the art of the scope of the "at least approximately equidistant" language.

Defendant also believes that claim 10 is indefinite because the language, the specification, and the prosecution history provide no concrete indication of what numerical range is covered by the claim. Again, however, the court disagrees. Defendant finds support in Amgen for its theory that claim definiteness requires concrete numerical limits. Id. ("Nothing in the specification, prosecution history, or prior art provides any indication as to what range of specific activity is covered by the term 'about,' and . . . no expert testified as to a definite meaning for the term in the context of the prior art."). (emphasis added). Amgen does not support defendant's theory because in the context of Amgen, the existence of close prior art required more precision than is required here. See Andrew Corp., 847 F.2d at 823 ("It is the prior public knowledge--the "prior art"--by which patentability is tested. A patentee may set the metes and bounds of that which is sought to be patented, and it is not material whether the phenomena just outside those claim limits are qualitatively different from that which is claimed.").

Other cases upon which defendant relies for a requirement of concrete numerical limits have been either expressly or impliedly limited by the Federal Circuit. See, e.g., Helene Curtis Indus. v. Sales Affiliates, 233 F.2d 148, 154 (2d Cir. 1956) (patent invalid for indefiniteness where "nothing in the four corners of the patent defines" the relevant range), limited in Andrew Corp., 847 F.2d at 823 n.4 (district court misread Helene Curtis as requiring precise numerical range; "in . . . Helene Curtis the claim limitation fell in the midst of the prior art; . . . the claim in Helene Curtis was to an optimum range of a chemical property where the chemical was already known to have that property.") (emphasis added); see also Andrew Corp.,
847 F.2d at 823 ("To the extent that Brown-Bridge [Mills, Inc. v. Eastern Fine Paper, Inc., 700 F.2d 759, 763 (1st Cir. 1983),] may be read as holding, as the district court appears to have believed, that a claim is invalid unless it sets as a limitation the exact technological border of the invention, we expressly reject that holding."). 3

3 Although defendant did not cite Brown-Bridge, it is representative of the precise numerical limits approach the defendant would have this court adopt. See, e.g., Todd v. Sears, Roebuck & Co., 216 F.2d 594 (4th Cir. 1954).

The court believes an artisan of ordinary skill would understand the scope of claim 10 when it is read in light of the '859 patent specification. Accordingly, defendant's motion for summary judgment of invalidity for claim indefiniteness is denied.

262

F. "approximately one and one half inches," "approximately nine and one half inches," "approximately one fourth inch," and "approximately eleven and one fourth inches"

All parties contend (i) that "approximately one and one half inches" should be construed to mean "no less than one and three-eighths inches and no greater than one and five-eighths inches," (ii) that "approximately nine and one half inches" should be construed to mean "no less than nine and three-eighths inches and no greater than nine and five-eighths inches," (iii) that "approximately one fourth inch" should be construed to mean "no less than one eighth of an inch and no greater than three eighths of an inch," and (iv) that "approximately eleven and one fourth inches" should be construed to mean "no less than eleven and one-eighth inches and no greater than eleven and three-eighths inches." The terms appear in dependent Claims 5-8 and independent Claim 19. The proposed constructions are in keeping with the ordinary and customary meaning of the words of the terms, and the claim language does not suggest any need for recourse to other sources of evidence. I therefore conclude that these related terms should be construed as the parties propose.

263

G. "approximately one fourth to one fifth" and "approximately three fourths to four fifths"

All parties contend that "approximately one fourth to one fifth" should be construed to mean "no less than one fifth and no greater than one fourth," and that "approximately three fourths to four fifths" should be construed to mean "no less than three fourths and no greater than four fifths." The terms appear in dependent Claim 13 and independent Claim 19.

The proposed constructions ignore the presence of the word "approximately", which the parties would treat as meaningless (or as having the same meaning as "precisely"). This court does not construe a claim term as meaningless absent a sound evidentiary basis for so doing. See Merck & Co. v. Teva Pharm. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005) ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so").

Applicable Federal Circuit case law establishes that the words "approximately" and "about" have functionally equivalent meanings within a patent claim. See, e.g., Ortho-McNeil Pharm., Inc. v. Caraco Pharm. Labs., Ltd., 476 F.3d 1321, 1326 (Fed. Cir. 2007); Andrew Corp. v. Gabriel Electronics, Inc., 847 F.2d 819, 821-822 (Fed. Cir. 1988). With respect to the word "about," the Federal Circuit has held that the term "does not have a universal meaning in patent claims," but rather that "the meaning depends upon the technological facts of the particular case." Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1217 (Fed. Cir. 1995). The Pall court held that:

The use of the word "about" avoids a strict numerical boundary to the specified parameter. Its range must be interpreted in its technological and stylistic context. We thus consider how the term . . . was used in the patent specification, the prosecution history, and other claims. It is appropriate to consider the effects of varying that parameter, for the inventor's
intended meaning is relevant. Extrinsic evidence of meaning and usage in the art may be helpful in determining the
criticality of the parameter, and may be received from the inventor and others skilled in the field of the invention.

Id.; see also Conopco, Inc. v. May Dep't Stores Co., 46 F.3d 1556 (Fed. Cir. 1994) (discussing the criticality of the claimed
ratio to the invention and whether or not one of ordinary skill in the art would have read the modifier "about" expansively in
light of the intrinsic evidence); Ortho-McNeil, 476 F.3d at 1326-1327 (determining how narrowly to constrain the term
"about" by reference to the criticality of the claimed ratio to the patented invention).

Here, the only intrinsic evidence of the criticality of the ratios inheres in the fact that an approximate range has been
specified, rather than a single value. The only extrinsic evidence of criticality offered by either party lies in the fact that
through his counsel at oral argument, Messer expressed himself willing to stipulate to defendants' proposed constructions.
This evidence suggests that precision in the specified ratios is not significantly critical to the claimed invention.

For the foregoing reasons, I reject the construction proposed by the parties, and conclude instead that the term
"approximately one fourth to one fifth" should be construed to mean "no less than fifteen and no more than thirty percent," and
that the term "approximately three fourths to four fifths" should be construed to mean "no less than seventy and no more
than eighty-five percent."

H. Claim 8: "wherein said film is stretched approximately 200%"
The parties agree that this term should be construed as "the plastic film is stretched 200 percent, plus or minus standard
manufacturing tolerances." Defendant Sigma proposes to define the margin for manufacturing tolerances as +/-1% and
presented expert testimony in support of this narrow construction. Nothing in the specification or prosecution history
supports this narrow, numerical construction of the term "approximately." Cf. Cordis Corp., 339 F.3d at 1360 ("the question
presented here is whether there is anything in the prosecution history of either patent that justifies giving the 'substantially
uniform thickness' limitation an even narrower construction"). For this reason, the disputed term is construed as suggested
by Pliant without any further numerical limitation.

9. arbitrary child defined locations

This term appears in claims 1 - 24 of the '874 patent and in claims 1 - 20 of the '786 patent. The plaintiff proposes a
construction of "the child selects where to place the object on the work platform and can place the object at arbitrary
locations across the work platform. The object is sensed where the child places the object." The defendant counters with
"any location on the work platform chosen by a child." The parties' disagreement stems from whether an "arbitrary child
defined location" includes only those portions of the work platform that are capable of detecting an object (the plaintiff's
position) or whether the above term includes any location on the work platform, such as a "dead zone" (the defendant's
position). The plaintiff's definition of this term appears to incorporate other claim limitations. See '874 patent, cl. 1 ("the
graspable object capable of being placed and sensed in arbitrary child-defined locations on the work platform"). The court
concludes this term means "arbitrary locations on the work platform selected by the child."

1. "Arc Chamber"
The parties agree that the patentees acted as their own lexicographer by defining the term "arc chamber" as the area between
"a pair of spaced-apart electrodes . . . in which electric arcs are to be formed." '210 patent col. 2, 11. 59-61. Plaintiff
contends that this definition does not require elaboration. Defendant, by contrast, argues that the specification further limits
the term to the area between the cylindrical side surface of one electrode and the surface of another electrode.
Defendant's argument fails because it is based on the flawed premise that the '210 patent only covers plasma-arc systems that use cylindrical electrodes. This premise is plainly wrong. Claim 1 does not limit the shape that an electrode must take. Indeed, dependant claim 2 claims "the invention of claim 1 wherein said electrode is of generally rod shape so that the surface is cylindrical." '210 patent, col. 6, ll. 57-59. In cases like this, where a dependant claim contains a limitation that is not expressed in an independent claim, a presumption exists that the independent claim is not subject to the limitation described in the dependant claim. See Liebel-Flarsheim Co., 358 F.3d at 910. Defendant has failed to identify sufficient evidence to overcome this presumption. Thus, I reject its argument that the patentee's definition of arc chamber should be further limited to the area that lies between the cylindrical side surface of one electrode and the surface of another electrode.

--- Footnotes ---

2 This construction applies to claims 1-3, 13-16, 18, 19, 22, 24, 25, 26, 31, 33, 37-41 of patent 449.

3 The Court is not applying the shifting presumption framework set forth in Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002) and discontinued by Phillips, 415 F.3d at 1324. The claims, specification, and prosecution history reveal that one of ordinary skill in the art would understand arcuate to describe a lower portion that is curved like a bow or is arched. This definition does not broaden the meaning of arcuate beyond the meaning provided by the claims, specification, and prosecution history. See Nystrom, 424 F.3d at 1144. The issue presented by the parties is whether the specification and prosecution history provide the additional limitation that the lower portion has no flat sections. In addition, Ameritex argues that the Court must construe arcuate to include this limitation to avoid reading on prior art.

--- End Footnotes ---

Imposing limitations from the specification into claim terms.

Section 112 requires a patent to contain a specification which describes the claimed invention in "full, clear, concise, and exact terms." 35 U.S.C. § 112. Therefore, words of the claims must be based on the context revealed in the specification. Phillips, 415 F.3d at 1315. The specification limits a claim term when it uses the term in a manner inconsistent with the term's ordinary meaning. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir 1996).

However, a patentee is not required to describe every possible embodiment of the invention in the specification. Phillips, 415 F.3d at 1323. Consequently, a court must not limit a claim term based on specific examples found in the specification. Id. The Court must determine if the context of the specification indicates that the patentee did not intend for arcuate to claim a lower portion with flat sections, but the Court must not limit arcuate based solely on the examples provided in the specification.

The specification refers to the lower portion of prior art as flat. 449 patent, col. 1, ll. 16-26. The specification then states that the flat lower portion would not maintain continuous flush contact with the deck when the mounting member was twisted to conform it to the curvature of the windshield. 449 patent, col. 1, ll. 31-34. In addition, twisting the member made screwing the flat lower portion onto the deck difficult. 449 patent, col. 1, ll. 37-41.

The specification subsequently states that "[i]n contrast to this system, the lower portion on the claimed invention is
arcuate." 449 patent, col. 1, ll. 64-67. The arcuate lower portion enables "continuous flush contact without gaps between the mounting member and the flat deck throughout the length of the member." 449 patent, col. 2, ll. 15-20. Continuous flush contact is at "different arcuate or circumferential positions along the arcuate lower portion." 449 patent, col. 2, ll. 22-25.

The lower portion illustrated in figures 2 and 3 is labeled arcuate and concave, and the lower portion is a semi-circle. 449 patent, col. 4, ll. 18-25. However, the specification states that "[w]hile the preferred concave lower portion hereof constitutes a semi-circular section, it will be appreciated that other lower portions having non-circular arcuate cross-sections may be used." Id. Figure 4 depicts a mounting member with a lower portion that has a flat and a curved outer section. 4 The flat section is labeled flat and the curved outer section is labeled arcuate. 449 patent, col. 6, ll. 9-18. The specification explains that the lower portion depicted in figure 4 can shift on its arcuate outer section to maintain continuous line contact between the deck and the mounting member. Id.

4 Figure 4 is used for mounting wing panels to a boat deck. Wing panels have steeper angles of inclination than windshields. 449 patent, col. 5, ll. 64-68 and col. 6, ll. 1-2.

Ameritex contends that the specification uses arcuate to distinguish the claimed lower portion from the lower portion on the prior art that had flat sections. In addition, Ameritex argues that the description of the flat section in figure 4 demonstrates that an arcuate lower portion is void of flat sections.

The specification does not state that an arcuate lower portion cannot consist of flat sections. Rather, the specification distinguishes an arcuate lower portion from a lower portion that is entirely flat on the basis that the arcuate lower portion enables the mounting member to shift while maintaining continuous contact with no gaps between the mounting member and the boat deck. In addition, labeling the flat section found on figure 4 as flat emphasizes that the arcuate outer section enables the mounting member to shift. Therefore, the Court holds that the specification does not indicate that the lower portion must be void of flat sections.

2 Limiting a claim term based on the prosecution history

Ameritex also contends that the patentee disclaimed lower portions with flat sections during the prosecution of patent 449. "[T]he prosecution history can often inform the meaning of claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Phillips, 415 F.3d at 1317.

Independent claim 35 of patent 449 uses the phrase "shaped cross section" to describe the lower portion. The content found in claim 35 was originally set forth in claims 48 and 49. Examiner action dated January 21, 1988, P 4. Claim 48 described the lower portion as "shaped and engageable with the boat deck at different angular locations." Application dated May 27, 1987, p. 15. The examiner rejected independent claim 48 because a prior mounting member, the Loxcreen 5923, had a shaped lower portion, and this mounting member could engage the boat deck at different angular locations. 5 Examiner action dated January 21, 1988, P 4. To overcome this objection, the patentee added the limitations found in claim 49 to claim 48. Amendment dated January 26, 1988, p. 1-2.

5 Dependent claims 49 and 50 were rejected because they were dependent on rejected claim 48.
with the boat deck at various locations along the member depending on said angle. Application dated May 27, 1987, p. 15. With these additions, the examiner approved the claim. The patentee renumbered combined claims 48 and 49 to independent claim 35.

Nothing in the prosecution history indicates that the examiner required these limitations because only a lower portion with no flat sections could achieve them. Rather, the additional limitations distinguish the claimed mounting member on the basis of its ability to shift and maintain continuous contact with the boat deck, which eliminates the gaps caused by the Loxcreen's flat lower portion.

3 Limiting a claim term based on prior art

Ameritex argues that the Court must construct arcuate to claim a mounting member with a lower portion having no flat sections to avoid reading on prior art. If after applying all of the available tools of claim construction, the claim is still ambiguous, a court should choose the meaning that does not render the patent invalid. Phillips, 415 F.3d at 1327. When invoking this maxim, courts determine "whether it is reasonable to infer that the patent examiner would not have issued an invalid patent, and that the ambiguity in the claim language should be resolved in a manner that would preserve the patent's validity." Id.

However, this maxim does not allow a court to construe a claim differently from its plain meaning to preserve the claim's validity. Phillips, 415 F.3d at 1327. As explained above, the claims and specification provide the meaning for arcuate. Consequently, resort to this doctrine is unnecessary and improper. Id. at 1328. In addition, construing arcuate without imposing a limitation that the lower portion has no flat sections does not read on prior art. The mounting member's ability to shift at varying angles of inclination while its lower portion maintains continuous contact with no gaps between the lower portion and the boat deck sets the invention apart from the prior art.

The Court holds that the sum of the evidence does not reveal a limitation that arcuate claims a lower portion with no flat sections. Consequently, the Court construes a lower portion that is "arcuate in cross section" to mean a lower portion that is curved like a bow or arched.

5. "arcuate"

This phrase is found in claims 1, 8-9, 12-13, 16-17, 20, 22, 29-30, 33-34, 40-41, 43, 45-48, 52-53, and 55-75 of the '037 patent, and in claim 11 of the '255 patent. See Joint Statement, '037 and '255 Patents. Originally, plaintiffs contended that "arcuate" should be construed to mean "comprising a shape curved in the form of a bow," defendants contended that the phrase should be construed to mean "comprising a shape bent or curved in the form of a bow," and the intervenor contended that the phrase should mean "deviating from the axis of the longitudinal portion."

At the hearing on claim construction, however, the court indicated to the parties that it was likely to adopt plaintiffs' proposed construction, with a slight modification adding defendants' proposed term "bent." In view of the similarities between the court's likely construction and the parties' proposed constructions, the court requested that the parties attempt to reach agreement as to a jointly proposed construction. On November 12 and 13, the parties wrote separately to the court, indicating that they were unable to reach a compromise. Plaintiffs therefore now propose that the court construe "arcuate" as "comprising a shape bent in the form of a bow or curved in the form of a bow." Defendants, for their part, continue to propose that the court construe the phrase as "comprising a shape bent or curved in the form of a bow."

The court is completely flummoxed as to why, now that plaintiffs' proposed construction includes the term "bent," the parties have been unable -- and more likely, have refused -- to reach agreement on a proposed construction. The present constructions before the court are substantively indistinguishable, and any difference between the two is semantic-- as demonstrated by the fact that defendants' only objection to plaintiffs' new construction is that it "restates" defendants' proposed construction "in a longer, more convoluted way." As such, the parties' continued dispute calls to mind the classic phrase "you say tomato, I say tomahto," and warrants no greater analysis than this mainstream observation, and certainly no more of the court's time.
In view of the fact that there is no substantive difference between the parties' current proposed constructions, the court chooses to adopt plaintiffs' proposed construction and hereby construes "arcuate" as: "comprising a shape bent in the form of a bow or curved in the form of a bow."

B. The '728 Patent

The '728 patent uses nearly identical specification language and identical drawings as the 802 patent, although the wording of the claims is quite different. The dispute between the parties, however, is much the same. Here too, Plaintiff argues that certain cross-sections of the groove are "non-circular in part," meaning that most cross-sections will incorporate some circular curves (on the bottom of the groove) and some non-circular curves (on the sides of the tapered portion of the groove). Only the cross-sections very near the exit edge of the groove will be entirely non-circular. Plaintiff asserts that this construction is consistent with the disputed claim language, which describes the groove's cross-sections as "arcuate" and the groove as having "side walls having radii of curvature."

Defendants contend that these disputed terms describe an end tract with cross-sections that must be non-circular and elliptical throughout. According to Defendants, the claims of the '728 patent describe a groove with two different sections; one that has circular curvature that maintains a constant radius toward one end of the groove, and another section with "arcuate" cross-sections that decrease in radii (i.e., taper) toward the other end of the groove. Defendants acknowledge that the claims themselves do not describe where one section begins and the other ends, but argue that the specification and drawings indicate that the second section is indeed the same end tract as defined in the 802 patent and as evidenced by the network of cross-hatched lines in Figure 1.

In order to construe the meaning of "arcuate" as it is used to describe the cross-sections of the groove, the Court looks first to the actual wording of Claim 1 of the '728 patent. Significantly, the term "end tract" appears nowhere in the claim. Nor does the term "elliptical." Rather, the claim describes "an elongated body having an elongated groove therein," and goes on to describe the cross sections of the groove as being "arcuate" and decreasing in radius of curvature toward one end of the groove. Unlike the wording of the 802 claim, then, this claim does not limit its description to cross-sections of the end tract. It follows that, in contrast to the 802 patent, cross-sections of the groove in this patent do include the semi-circular curve of the bottom of the groove, as well as the non-circular portions of the groove where it tapers toward the exit edge.

The next question is whether the term "arcuate," as it applies to the non-circular portions of the cross-sections, means the same thing as "elliptical." Defendants assert that the term "arcuate" must describe elliptical cross-sections, because arcuate is not defined by the claim language, and the specification and drawings describe an end tract that is defined by elliptical shapes. Def.'s Brief at 18. Plaintiff argues that the term arcuate is broader than "elliptical" or "substantially elliptical." Indeed, Plaintiff chose to use the words "substantially elliptical" to describe the cross-sections of the end tract in the '728 patent, but chose different wording in this patent. Namely, C.M.L. used neither the term "elliptical," nor the term "end tract" in the '728 patent. It is well-established that "different words or phrases used in separate claims are presumed to indicate that the claims have different meaning and scope . . . ." Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999).

According to the actual wording of the claim, then, the term "arcuate" should be construed more broadly than "substantially elliptical." Whether the language of the specification changes this construction is a close question. Defendant argues that the specification in the '728 patent (which is nearly identical to that of the 802 patent) describes an end tract with cross-sections "made up of two arcs of equal ellipses, . . . which arcs are inferiorly radiused to each other by an arc of ellipse." 728 patent, Col. 2, Ins. 57-61. Defendants urge that "these repeated references to elliptical shapes demonstrates that the term arcuate must describe elliptical, and therefore, non-circular cross-sections in the end tract." Def.'s Brief at 18. The specification, however, is to be used only to interpret words or phrases of a patent claim, not to add to, or detract from, the language of the claims. See, In re Paulsen, 30 F.3d at 1480. Under this principle of claim construction, the Court concludes that the term "arcuate" includes, but is not limited to, elliptical cross-sections. To conclude otherwise would neglect Plaintiff C.M.L.'s choice of different language in the '728 patent.
This analysis also applies to the final disputed term, the requirement in Claim 3 that the groove have "side walls having radii of curvature." Here again, Defendants contend that this language means that the groove must have cross-sections that are elliptical and non-circular throughout. The Court finds, however, that this term, like "arcuate," does not restrict the shape of the side walls to that of an ellipse. Nothing in the claim language describe the side walls as being elliptical, and although the specification characterizes the end tract as being defined by elliptical shapes, the specification may not be used to detract from the actual wording of the claims. Therefore, the Court concludes that the term "side walls having radii of curvature" in Claim 3 does not require elliptical cross-sections.

For the foregoing reasons, the Court construes the term "arcuate contour" as:

Curved or arc shaped contour.

As to this phrase, the Court construes the following meaning: each magnet itself has a cross section that is curved like a bow, or arc-shaped. The drawings of the 787, 781, 386, and 539 patents support this interpretation even though the arcuate magnets are specifically claimed only in the 539 patent. The drawings in those four patents illustrate one example of the tool with elongated magnets and one with arcuate magnets. The Abstracts of those four patents support this interpretation as well, by explaining that magnets with an arcuate cross section are one of the options for the patented device, the other being, as discussed earlier, longitudinal magnets.

While this is not a technical term, out of an abundance of caution the Court also cites the Oxford English Dictionary definition of arcuate: "Curved like a bow, arc-shaped, arched," as additional support for this interpretation.

Claim 2:

1. "wherein the lining has an arcuate opening through which the spring operates on the blade"

Plaintiff proposes the construction of "an arcuate aperture in the lining through which force from the spring is transmitted to the blade to assist in opening the blade."
Defendant proposes the construction of "wherein the lining has an arc-shaped opening through which the spring imparts the rotational force onto the blade."

The court finds this to be clear on its face, except for the word "arcuate." The court's construction of this term is "wherein the lining has a curved opening through which the spring operates on the blade."

C. "arcuate path"

Precor proposes that this term be construed the same way Judge Zilly and the patent itself defines it, as "a circular oval or other such closed, curved path of travel." Fitness Quest proposes that this term be construed as "a circular path." The Court construes this phrase as Precor suggests, as "a circular oval or other such closed, curved path of travel."

Neither party argues that the term "arcuate" was used correctly in the patent. The term means "bent or curved in the form of a bow," Webster's Third New International Dictionary 115 (1981). This seems to contradict the inventor's own definition of the term: "Within the context of this application, 'arcuate' shall refer to a circular oval or other such closed, curved path of travel." Col. 3, lines 12-14. Regardless of the word's ordinary meaning -- which neither party argues for -- the Court must defer to the definition contained in the patent where the inventor has clearly set forth a definition. Johnson Worldwide Assocs. v. Zebo Corp., 175 F.3d 985, 990 (Fed. Cir. 1999) (patentee acts as his own lexicographer).

Fitness Quest's best arguments against this result are that (1) the patent figures, which include bell crank or fly wheel coupling members, teach a circular path, and (2) Miller refers to a "generally circular" path during patent prosecution. These arguments are unavailing. First, the figures are designed to illuminate, not limit, the patent. Amhil Enters. Ltd. v. Wawa, Inc., 81 F.3d 1554, 1559 (Fed. Cir. 1996). Second, the Court should not employ the patent prosecution history to aid interpretation where there is more reliable and less ambiguous evidence of the claim's meaning. Here, the inventor's lexicography in the specification serves that function.

b. area

LGD contends that the term "area" is indefinite because one of ordinary skill in the art would be unable to unambiguously discern the boundaries of the asserted claims. D.I. 1388 at P 168-170. In this regard, LGD contends that there is no disclosure on how the 30% of the area should be calculated. Alternatively, LGD contends that the term "area" refers to "material deposited and patterned on a substrate, such as glass, that covers part of the array substrate surface." Id. at P 171.

In response, AUO contends that "area" should be construed according to its ordinary meaning as a "specified region." D.I. 1384 at 23-24. Turning to the context of the claims more specifically, AUO contends that "area" refers to a region of the array substrate, specifically a region containing the dummy conductive patterns.

After reviewing the claim language in light of the specification, the Court concludes that the term "area" is not indefinite and should be construed according to its plain meaning as a "specified region." In the Court's view, this is consistent with the specification which explains that the substrate coverage "of the dummy conductive patterns themselves [is] 30% or more on an area of a specified surface." '629 patent, col. 5, ll. 55-61. Similarly, the specification explains that "dummy conductive patterns are formed on an area of a specified region where the dummy conductive patterns are formed." Id., col. 6, ll. 1-6. Thus, the Court concludes that an "area" is "a specified region," more specifically, the region where dummy conductive patterns are located. 
Braun contends that "arm" is a readily understandable term that does not require construction. (D.I. 74 at 24) If, however, it is construed, Braun proposes "a structure that extends of another part of the structure." (Id.) Terumo proposes that "arm" be construed as "a part of a structure, machine or an instrument projecting from a main part, axis, or fulcrum." (D.I. 97 at 10 & 11 n.7; Tr. at 111, 122) I recommend adopting Braun's proposed construction.

This conclusion essentially follows from my earlier recommendation that "extend[ing] distally of" be construed in a manner that does not require the arms to be attached to the proximal wall. I understand Terumo's proposed construction of "arm," and particularly the phrase "projecting from," to require attachment between the arms and the proximal wall (or at least attachment of the arms to some other structure). For the same reasons I rejected the requirement of attachment in connection with the "extend[ing] distally of" terms, I again reject it here. Reading a limitation of attachment into the claims would not be consistent with the claim language and is not supported by the specification. See generally Linear Tech. Corp. v. Int'l Trade Comm'n, 566 F.3d 1049, 1055 (Fed. Cir. 2009) (holding where "nothing in the claim language or specification . . . support[ed] narrowly construing the terms," terms would be "accorded their full scope").

Both parties cite to numerous dictionary definitions to support their proposals. (D.I. 71 at 12; D.I. 74 at 24) I find these extrinsic sources unhelpful to determining the proper construction of "arm" in the patent-in-suit. The proper construction here is one that accurately accounts for the context in which the claim term appears, in light of the entire patent, including all of the claims and the specification. Here, I conclude that the proper construction is the one proposed by Braun, which I recommend that the Court adopt.

Arm assembly

The Court construes “arm assembly” as “a structure having one or more constituent parts connected to and projecting from the support means.” At the hearing, the parties identified that the main dispute was whether “assembly” required a minimum of one or two constituent parts.

Defendants contend that the plain and ordinary meaning of “assembly” requires two or more parts. However, such a construction would contradict unasserted dependent claim 6, which states “an arm assembly is an elongate telescopic member.” ‘978 patent, Col. 9:25; see Phillips, 415 F.3d at 1314 (unasserted claims can help determine the meaning of a term as claim terms are usually used consistently). Claim 6 clearly defines that an arm assembly may be made up of one part, “an elongate telescopic member.”

The written description further supports a minimum of one constituent part. The Abstract refers to a particular embodiment where the arm assembly is “a single telescopic member.” ‘978 patent, Abstract. The Summary of the Invention also states “an arm assembly which supports the displays and which may comprise a single rotary arm, a pair of arms rotating about separate axes, a single arm locatable in two desired orientation [sic] or interchangeable arms of different length.” Id., Col. 1:30–34. Accordingly, the arm assembly does not require two parts. Therefore, the Court construes “arm assembly” as “a structure having one or more constituent parts connected to and projecting from the support means.”

Plaintiffs contend that the term "arm[s]" means "those portions of the auxiliary spectacle frame that extend outwardly and rearwardly of the side portions of the frame and secure the second magnetic members." JS, Exh. B at 38. Plaintiffs further construe the phrase "extending beyond" to mean "that at least some portion of each arm reaches past the rear side of the corresponding extension [of the primary frame]." Id. at 40.

Conversely, Defendant argues that the phrase in question means "an arm which extends back from the auxiliary spectacle
As in claim 12, the parties dispute whether the construction of the instant phrase requires that the arm not extend past the rear edge of the projection of the primary spectacle frame. As the Court has already held, the applicant never overcame the Examiner's objection that the arm cannot extend past the rear edge of the primary spectacle frame. Therefore, the court construes the phrase "an arm extended therefrom for extending beyond said rear side" in claim 16 to mean an arm which extends back from the auxiliary spectacle frame over the rear side of the side portion extension of the primary frame but not past the rear edge of the projection containing the magnetic members of the primary frame.

Plaintiffs contend that the term "arm[s]" means those portions of the auxiliary spectacle frame that extend outwardly and rearwardly of the side portions of the frame and secure the second magnetic members." JS, Exh. B at 15. Plaintiffs also contend that the phrase "extending toward and beyond" means that "at least some portion of each arm reaches in the direction of and past the rear side of the corresponding extension." Id. at 17.

Defendant argues that "an arm extended therefrom for extending toward and beyond said rear side" means "an arm which extends back from the auxiliary spectacle frame over to the rear side of the side portion extension of the primary frame." JS, Exh. D at 2. Defendant's construction of the instant phrase requires that the arms not extend "past the rear edge of the projection containing the magnetic members. . . ." Def.'s Opposition at 9:20-22. Defendant argues that its construction is supported by the prosecution history which, according to Defendant, reveals that the inventor canceled proposed Figure 8 (showing the arms extending past the projections) in response to a new matter rejection by the Examiner, and "eliminated all claims" encompassing that subject matter. Id. at 9:23-10:10. Plaintiffs argue that Defendant misreads the prosecution history because the Examiner ultimately withdrew his rejection. Pls.' Reply at 6:12-17.

In this case, during the April 4, 2001 interview, "the Examiner clarified his objection by stating that he was not objecting to a downwardly extending end portion per se, but to the fact that the end portion extends laterally past the rear edge of the projection [of the primary spectacle frame]." Interview Summary, 13 Koo Decl., Exh. E at 477. The Interview Summary then goes on to state why the applicant thinks "the original specification supports new Figure 8." Id. at 478. It then concludes by stating:

In any event, during the interview, the Examiner indicated that claims directed to the feature, "the end portion of the arm of the auxiliary spectacle frame extended downwards towards the projection [of the primary spectacle frame] for hooking on the primary spectacle frame," are supported by the original disclosure, and would not require a separate drawing figure to show this feature. Thus, the Examiner expressly waived the requirements of 37 CFR 1.83 with respect to this feature. Accordingly, Figure 8 and its corresponding description in the specification have been deleted.

Id.

- - - - - - - - - - Footnotes - - - - - - - - - - -

13 The Interview Summary was prepared by the applicant's patent counsel.

- - - - - - - - - - End Footnotes - - - - - - - - - - -

Based on the above, it is clear that the applicant, in canceling Figure 8, never overcame the Examiner's objection with regard to the end portion extending beyond the rear edge of the projection of the primary frame. Instead, the applicant accepted that limitation with the understanding that the arm could extend downward -- but still not past the rear edge of the projection of the primary spectacle frame. 14 See also Koo Decl., Exh. E at 460 (showing the annotations and the initials of the Examiner, H. Mai, with regard to Figure 8); Koo Decl., Exb. B at 12 (Figure 7 of the '545 Patent showing the arm not extending beyond the rear edge of the projection of the primary spectacle frame).
14 On February 13, 2003, Plaintiffs filed an Ex Parte Application for Leave to File Supplemental Brief on Claim Construction. In their proposed supplemental brief, Plaintiffs argue that the Federal Circuit's decision in Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572 (Fed. Cir. 1996), counsels against relying on the prosecution history to limit the claims as the Court has done in this instance. See Pls.' Proposed Supplemental Brief at 9-12. In Ethicon, the patent examiner had stated during the reissue proceedings that the "lockout mechanism" cannot be mounted on the "stapler," and that the original patent had disclosed a "lockout mechanism" mounted on the "cartridge." Id. at 1582 fn. 7. The district court erroneously interpreted the examiner's statement to mean that the "lockout mechanism" can only be mounted on the "cartridge." Id. The Federal Circuit disagreed and held that:

CLAIM 1 was properly rejected because it recited an element not supported by Fox's disclosure, i.e., a lockout on the stapler. It does not follow, however, that Fox's disclosure could not support claims sufficiently broad to read on a lockout off the cartridge.

Id.

The instant case is completely distinguishable. Here, the patent examiner held that the original disclosure did not support an end portion extending beyond the rear edge of the projection of the primary frame, but that it supported a downwardly extending end portion. By accepting the limitation imposed by the examiner, the patentee surrendered any matter that was covered by the examiner's limitation -- here, an end portion extending beyond the rear edge of the projection of the primary frame. See Schumer, 308 F.3d at 1313. Put differently, the patent examiner in Ethicon had stated that "X" cannot be "A," but can be "B." The district court held that "X" can only be "B" (and thus cannot be "A," "C," "D," etc.). In disagreeing with the district court, the Federal Circuit held the fact that "X" can be "B" but not "A" does not mean that "X" cannot be "C," "D," or even a "pink elephant," as along as such interpretation was not excluded by the prior art or prior disclosure. Here, the examiner stated that "X" cannot be "A," but can be "B," and the Court is simply holding that "X" cannot be "A."

Based on the above, the Court construes "an arm extended therefrom for extending toward and beyond said rear side" in claim 12 to mean an arm which extends back from the auxiliary spectacle frame over the rear side of the side portion extension of the primary frame but not past the rear edge of the projection containing the magnetic members of the primary frame.

C. Arm Means

Claim 1 further discloses:

a first arm means supporting one of said sealing and stripping means, a second arm means supporting the other sealing and stripping means,

This element also is written in means-plus-function format. The element recites the function of supporting the sealing/stripping means but does not describe any particular structure which performs this function. It is undisputed that the structures corresponding to the arm means are the arms 15 with respect to Embodiment 1 and the arms 45 with respect to Embodiment 2.

(c) "an arm pivotally connected to each of said hangers;"
Having reviewed the parties' proposed interpretations, the court construes element (c) as "an arm-like structure pivotally attached to each of said structures or things."

4. "armature wire having electrical insulation thereon"

This term appears in Claims 1 and 16. Plaintiff proposes a construction as follows: "an electrical conductor having an insulating coating used in the windings of an armature, such as magnet wire." Defendants assert that this phrase does not need to be construed because it is not dispositive of either the infringement or invalidity issues in the case. Alternatively, Defendants offer the following construction: "insulated wire of a moving part of an electromagnetic device." The Court finds that construction of the disputed phrase is appropriate given its significance within the relevant claims.

In support of their respective proposed constructions, Plaintiff points to the specification of the '015 Patent itself, and Defendants cite the definition of "armature" in Webster's College Dictionary (Random House 1991). The Federal Circuit has stated that a general purpose dictionary may be helpful in situations where "the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges." Phillips, 415 F.3d at 1314. However, as noted earlier, the Phillips court has emphasized the importance of the specification. Id. at 1315.

The specification for the '015 Patent states that the invention relates in part to "methods for fusing armature wires having an electrically insulating coating, e.g., magnet wires, to the tangs of a commutator." Buckingham Decl. at Ex. A, col. 1:8-10. The specification also refers to an "armature wire having an electrically insulating coating, e.g., magnet wire." Id. at col. 1:51-53. Consequently, the Court finds Plaintiff's proposed construction to be more consistent with the specification of the '015 Patent. The Court, therefore, shall construe "armature wire having electrical insulation thereon" as meaning "an electrical conductor having an insulating coating used in the windings of an armature, such as magnet wire."

B. Construction of the Claims

The essence of the dispute between the parties is whether the claims of the plaintiffs are construed to limit the patent grant to devices using a closure device fastenable at the surface of the backrest or equivalents, and, whether the claims are construed to require an armrest guard, or equivalents. Both of those disputed matters are within the scope of claim construction.

The plaintiffs' patent includes nine claims, with Claims Two through Nine dependent upon Claim One. Claim One includes a convertible seat including an adult size seat with a horizontal cushion for support, with the back support surface "having an aperture as an entrance to a cavity therein, with the operative having a closure means fastenable at the surface of the backrest." [emphasis added]. Claim One also includes "an armrest guard encircling the second cushion position when unfolded substantially parallel therewith and substantially vertical when folded."

The plaintiffs assert that the novelty of its claims are not dependent upon either the closure device (the method by which the smaller child's seat fits into the adult-sized seat) or the armrest. Relying upon the affidavit of Jerome Koziatek, the plaintiffs' assert that the "new and novel" aspect of the '216 Patent is the integration of a child seat into an adult seat.

The language of the claim itself, the prosecution history, and the prior art all refute the plaintiffs position. No fewer than three patents were issued prior to the '216 Patent which described various types of built-in automotive child seats. Previously issued patents clearly show an integrated child seat built into an adult size seat. The Bernier Patent (No. 3,094,354), for example, issued in 1963, shows one integrated child's seat which is pulled down from the back of an adult seat. (Appendix A) The same is true with respect to the Strahler Patent (No. 2,966,201) which describes an adult automotive seat which contains a built-in integrated pull down child's seat. (Appendix B)
Further, in the "Background of Invention" accompanying the '216 Patent, it is expressly noted that "the possibility of storing a child's seat within the normal built-in seats of the automobile has not been overlooked in the past..." (Def. Ex. 1, column 1, lines 39-43) The plaintiffs themselves admitted as much when, in response to the initial patent application, an amendment was submitted which noted that "the prior art does not show an aperture having a closure means fastenable at the surface of the backrest..." (Def. Ex. 5, p. 51)

Moreover, the plaintiffs noted to the PTO in their amended filing that "...none of the references [to prior patents] have a construction wherein the armrest is foldable to a position encircling the top of the second backrest in the folded position." (Def. Ex. 5, p. 51) Only after the plaintiffs submitted such limiting descriptions of the invention did the patent actually issue.

In this case, the precise language of the claim, the state of the prior patents, the prosecutive history of the original application, and the specifications of the claim, all dovetail in the process of construing the claim. Claim One clearly references an aperture having a closure means fastenable at the surface. The claim does not limit the precise closure means. The claim therefore includes snaps, zippers, buttons, and similar devices fastenable at the surface.

Other methods, such as an oversized cushion placed and maintained in the aperture through friction, are not fastenable at the surface but are instead held in place by pressure between the inserted cushion and the permanently placed surrounding seat cushion. Such pressure is asserted between the two at all points except the surface of the child's seat and the adult seat.

Claim One also includes specific reference to an armrest. The claim refers to an armrest which is substantially vertical when folded into the adult seat and substantially parallel to the child's seat when deployed. The armrest is described as "encircling the second cushion position when unfolded."

Under the heading "Background of the Invention," the patent document itself refers to "a secure guard encircling the child's upper body, a guard to receive the impact of the child's face in the event of a rapid deceleration." (Def. Ex. 1, column 1, lines 30-32) Further, in the description of the invention, it is noted that, "the armrest as it passes around the upper torso of the child serves as a guard for the descending face of the child if it [sic] should be thrown forward." (Def. Ex. 1, column 3, lines 18-21)

With respect to the elements of the claim at issue in this case, the Court construes the '216 Patent to require (1) a closure device fastenable at the surface which, through use of a zipper, buttons, hooks, or similar device, physically connects the surface of the backrest to the surface of the second cushion used as the foldable child's seat, and (2) an armrest guard which folds down from a vertical position and encircles the child, once such child is placed in the pulled down seat.

The parties agree that the arms of the header are generally parallel and form a channel for engaging the upper extremity of a boat windshield between the arms. The parties also agree that the arms have means along them for gripping the windshield. However, Ameritex contends that the meaning of arms must also include a requirement that a rail portion extends across the channel created by the arms.

The claims separately describe the limitations for the arms and the rail portion. The description of the arms does not include the required placement of the rail portion. One skilled in the art would determine the location of the rail portion by looking to the description of the rail portion and not the arms. Consequently, the Court finds that arms are structures that are...
generally parallel, form a channel between them for receiving the upper extremity of a boat windshield, and have means along the channel for gripping the windshield. The required placement of the rail portion is not included in the description of the arms.

284

(10) "arms having a rearwardly directed end for securing a magnetic member" (claim 24)

Plaintiffs argue that "arms" means "those portions of the auxiliary spectacle frame that extend outwardly and rearwardly of the side portions of the frame and secure the pair of magnetic members." JS, Exb. B at 49. Additionally, Plaintiffs construe the term "end" to mean "the outermost or farthest portion of the arms in relation to the location of their attachment with the lenses or lens rims (if provided). The ends' of the arms include those portions that secure the pair of magnetic members." Id. at 52-53.

Conversely, Defendant construes the instant phrase to mean "arm[s] which extend backward from the side portions of the auxiliary spectacle frame, the arms include an end for securing a magnet." JS, Exh. D at 6. Defendant further argues that the arms cannot extend past the rear edge of the projection of the primary spectacle frame. Def.'s Opposition at 10:15-18.

The Court has already held that the phrase "magnetic member" means a permanent magnet or a ferromagnetic member 15 and that the arms cannot extend beyond the rear edge of the projection of the primary spectacle frame. Based on this, the Court construes the phrase "arms having a rearwardly directed end for securing a magnetic member" to mean arms which extend backward from the side portions of the auxiliary spectacle frame but not past the rear edge of the projection of the primary frame and which include an end for securing a permanent magnet or a ferromagnetic member.

15 It is also to be understood, as the Court already stated above, that at least either the first or second magnetic member must be a permanent magnet.

2. applying the principles

Much of Porta's argument for a four-sided frame rests on its reading of the '062's prosecution history. True to Phillips's warning about prosecution history, the '062's history exemplifies the ambiguity that makes such evidence less useful than the specification for claims interpretation. Phillips, 415 F.3d at 1317. Irrespective, Porta seizes on patentee counsel's response to the examiner to make its estoppel argument, a response that dealt with the examiner's complaints about unclear language in claims 4, 6, 10-19, and 21-24: "[a]s the examiner acknowledges, the Dousset reference [prior art noted in the application] clearly lacks the teaching of the singular rectangular-shaped frame." See doc. 111-7, p. 18. 3 From this, Porta extrapolates PODS "surrendered any claims for a carrier frame having anything but a singular rectangular-shaped frame." See doc. 110 at p. 18. But that exchange, when considered in context, fails to support a clear, decisive surrender of subject matter. See Aquatex Industries, Inc. v. Techniche Solutions, 419 F.3d 1374, 1382-83 (Fed. Cir. 2005) (prosecution history estoppel and argument-based estoppel require a showing of clear and unmistakable surrender of subject matter by amendments or arguments to examiner); Salazar v. Procter & Gamble Co., 414 F.3d 1342, 1344 (Fed. Cir. 2005) (same). If anything, the examiner's perception about the clarity of the '062's language highlights the inherent difficulties encountered by using words to define the property boundaries of a technical invention. See Festo, 535 U.S. at 731 ("Unfortunately, the nature of language makes it impossible to capture the essence of a thing in a patent application.").
2 Phillips directs a claim construction court to "consider the patent's prosecution history, if it is in evidence." 415 F.3d 1317 (emphasis added). It also defined the prosecution history as "the complete record of the proceeding before the PTO and includes the prior art cited during the examination of the patent." Id(emphasis added). Neither party has submitted the '062's complete file wrapper. Instead, the parties offered only select portions. See doc. 111-7.

3 The examiner's report or documentation of his actions are not part of the record. The parties have submitted instead the patentee's response and characterization of the examiner's actions.

Initially, claim 29 appeared as claim 22. The examiner rejected that claim and others (4, 6, 10-19, and 21-24) because its language made "the limitations regarding the frame, carrier frame, and the carrier . . . unclear." See doc. 111-7 at pp.7, 16. Patentee's counsel answered the rejection asserting the examiner had misconstrued the prior art and the teaching of Dousset in particular. Unlike the '062' device which integrated frame, container, and transport vehicle in a connected unit, Dousset required "specially designed containers" so that spindles or pins could be secured to the corresponding female connections on the container. Id at 17-18. Dousset used two end-fitted hydraulic jacks (portals) with transverse frame elements to lift the container. The container's longitudinal frame elements added structural support for lifting (the lifting apparatus had no longitudinal support elements). The operator had to position these hydraulic jacks to and from the container by hand; thus, Dousset did not offer an easy and safe method for integrating the lifting mechanism, container, and transport vehicle. Nothing from Porta's quoted exchange supports its estoppel argument. Besides, the comments miss the clarity needed for surrendering all but a four-sided frame, particularly given patentee's counsel's prefatory remarks to the examiner: "[the applicant by amending claims was] not intending in any manner to narrow the scope of the originally filed claims." Id at p. 16.

Instead of surrendering subject matter, these remarks, when considered in the context of the specification, highlight the prior art's shortcomings and the '062's gains. Namely, whether the earlier art used two, three, or four-sided frames, all the devices suffered a common denominator. Each lacked a unit that integrated lift, frame, container, and transporting vehicle. Some lacked a transport vehicle, others made using the lifting device awkward and unsafe, and others made the relationship between container and the transporter difficult. Id. The '062, in contrast, promoted a unit that easily positioned the frame to the container and then moved the container onto or from the transport vehicle. This integration is the core of the invention—not the frame's configuration as Porta suggests. The specification bears this out:

"Accordingly, there is a need to provide a means for easy positioning of the frame around the container, and for moving and positioning the frame and the container together . . . to provide a method to adjust the width of the frame under power to clear the container when moving and positioning the frame . . . [and] to provide a means for releasably attaching the frame to the vehicle for safe transport."

See doc. 111-2, col. 2, lines 19-29.

These words echo claim 29's method. Porta's estoppel argument is misplaced. Accepting it would require sidestepping two basic principles of construction: guarding against limiting claims to the preferred embodiment and claims are considered to vary in scope.

D. Claim Construction Conclusion

The term "around," as used in Claim 29 means "on all four sides or on less than all four sides." The PODS "carrier frame" is not limited to a four-sided, rectangular shaped frame.
K. "arranged about/disposed about"

The parties have agreed that "arranged about" and "disposed about" are synonymous and should have the same construction. The plaintiff proposes "placed or set in a particular order." Defendants propose "covering substantially all of."

The plaintiff contends that its construction follows the plain and ordinary meaning of the phrases as defined in dictionaries. See, e.g., American Heritage Dictionary 129 (2d college ed. 1991). The plaintiff also argue that this dictionary meaning is supported by the prosecution history, and that Defendants' construction is limited to the preferred embodiment.

Defendants argue that the plaintiff's construction is not supported by the claims or the specification because they do not require "a particular order." Defendants argue that the specification shows LEDs covering substantially all of the surfaces. See '269 patent, fig. 8.

In reply, the plaintiff contends that it does not need to have "a particular order;" "specific order" or "proper order" would be sufficient as defined by other dictionaries. Furthermore, the plaintiff argues that Defendants' construction would not encompass the specification's figures showing 25-50% of surfaces covered by LEDs. See '269 patent, figures 5-8, 12.

The Court agrees with the plaintiff that the defendants' construction would exclude preferred embodiments. Accordingly, "arranged about" and "disposed about" mean "placed or set in a specific order."

F. CLAIM 18

Claim 18 reads:

A tension member according to claim 1 wherein said cords are arranged in spaced relation to each other.

Schindler asserts that "cords are arranged in spaced relation to each other" should be construed as "cords are positioned at predetermined positions relative to each other." Otis suggests that the term should be interpreted to mean "cords are positioned with predetermined separation(s) between adjacent cords."

Otis' construction inappropriately reads an extraneous limitation into the term by implying mandatory separation between the cords. See In re Cruciferous Sprout Litigation, 301 F.3d 1343, 1348 (Fed. Cir. 2002). As noted above, it is very likely that in practice the tension member will contain inner cords that do not touch each other. See Section III.A.6. Separation, however, is not a requirement, and the Court will not impart such a limitation on the claim. "Cords are arranged in spaced relation to each other" will be construed as "cords are positioned at predetermined positions relative to each other."

B. Construction of "cords are arranged in spaced relation to each other" in Claim 18

Claim 18 reads:

A tension member according to claim 1 wherein said cords are arranged in spaced relation to each other.

Schindler asserted that "cords are arranged in spaced relation to each other" should be construed as "cords are positioned at.
predetermined positions relative to each other." Otis suggested that the term should be interpreted to mean "cords are positioned with predetermined separation(s) between adjacent cords."

This Court previously found that Otis's construction inappropriately added a mandatory separation between the cords. See In re Cruciferous Sprout Litigation, 301 F.3d 1343, 1348 (Fed. Cir. 2002). The Court found that separation was not required, and refused to impart such a limitation on the claim. "Cords are arranged in spaced relation to each other" was, therefore, construed as "cords are positioned at predetermined positions relative to each other."

C. Motion for Reconsideration

In its motion for reconsideration, Otis asserts that "Cords are arranged in spaced relation to each other" should be construed to mean "cords are positioned at predetermined positions spaced relative to each other." That is, Otis (again) asserts that there must be separation between the cords in Claim 18. Otis asserts that without such a distinction, Claim 1 (independent claim) and Claim 18 (a dependent claim, which relies on Claim 1) would have the same scope. This result, Otis argues, is impermissible because the doctrine of claim differentiation provides a presumption that dependent claims must be narrower than the independent claim(s) from which they rely.

Schindler responds that Otis is not entitled to reconsideration as "claim differentiation is not a rigid rule, and dependent claims are not required to have a narrower scope than the independent claims from which they depend." Accordingly, Schindler argues that because there has been no error of law, reconsideration need not be granted. Next, Schindler argues, "even if the doctrine of claim differentiation is considered by the Court, the Court's constructions already result in dependent claim 18 having a scope narrower than the scope of independent claim 1."

This Court will address the two questions raised by the parties: (1) whether the doctrine of claim differentiation applies to this motion for reconsideration, and if so, (2) whether the construction already in place adequately differentiates the claims.

1. Has Otis Failed to Satisfy the Standard for Reconsideration?

As the Federal Circuit has explained, "dependent claims are presumed to be of narrower scope than the independent claims from which they depend" under the doctrine of claim differentiation. AK Steel Corp. v. Sollac and UGINE, 344 F.3d 1234, 1242 (Fed. Cir. 2003). The presumption created by the doctrine of claim differentiation, however, is "not a hard and fast rule and will be overcome by a contrary construction dictated by the written description or prosecution history." Seachange Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1369 (Fed. Cir. 2005). The doctrine of claim differentiation, accordingly, should be applied unless there is a contrary construction required by the written description or prosecution history (i.e., an indication that the dependant claim is, in fact, not narrower than the independent claim).

Previously, Otis's primary argument as to the construction of "arranged in spaced relation" was that there must be separation between the cords. Its argument on this point was essentially the same as its argument with respect to "arranged side-by-side" (of Claim 1). See Doc. No. 80, at 84 (noting that the "spaced relation" construction issue is the "same" as the "side by side" construction issue); see also Doc. No. 61, at 22; Doc. No. 66, at 6-7, 14. 1 This fact notwithstanding, at oral argument Otis also asserted that "Schindler's construction just reads the word 'spaced' out of that term entirely. It gives no meaning to 'arranged in spaced relation.'" See Doc. No. 101, at 67-68. This Court agrees.

1 This Court has already rejected this argument with respect to Claim 1, and construed "side-by-side" to mean that the cords are "arranged linearly along the width dimension" without requiring that there be "spacing" OR "no spacing" between the cords. 2010 U.S. Dist. LEXIS 2463, at *18, 27.

Accordingly, although Otis did not explicitly argue that "arranged in spaced relation" must be given a more narrow reading than "arranged side-by-side" based on the doctrine of claim differentiation, its position at oral argument did allude to such a rationale. Moreover, both parties acknowledge that the doctrine was discussed elsewhere in this matter. 2 The Court will, accordingly, consider the applicability of the doctrine to the dispute concerning the term "arranged in spaced relation" found.

2 See Doc. No. 92, at 3 n.2; Doc. No. 67, at 13-14; Doc. No. 80, at 60; Doc. No. 66, at 15-16

2. Is Claim 18 Narrower in Scope than Claim 1?

Having determined that the doctrine of claim differentiation applies to the construction of Claim 18 (in view of Claim 1), this Court must determine whether its construction of Claim 18 resulted in a claim that was not narrower in scope than Claim 1.

Schindler argues that, as is, Claim 18 has been construed narrower than Claim 1. Schindler notes that the term "side-by-side" in Claim 1 has been construed to mean "arranged linearly along the width dimension," and the term "cords are arranged in spaced relation to each other" in Claim 18 is currently construed to require the cords to be "positioned at predetermined positions relative to each other." Schindler asserts that the latter term has been construed to be more narrow than the former. The Court cannot agree, and finds that its initial construction of Claim 18 gave the claim a scope that was equal to that of Claim 1. In other words, in this context "arranged linearly along the width dimension" has a definition that is functionally the same as "positioned at predetermined positions relative to each other." The fact that the "positioning" of the cords (in Claim 18) takes place in "positions relative to each other" does not change this result—objects which are "arranged" are also necessarily arranged "in relation" to other objects (here, cords). Further, the Court cannot agree that the physical relationship described in Claim 18 requires that the spacing between the cords has a fixed and/or uniform distance between each cord.

Accordingly, this Court does not agree that Claim 18, as construed, is narrower than Claim 1.

* * * *

For the reasons stated, and in light of the doctrine of claim differentiation, the Court will reconsider its construction of the term "arranged in spaced relation" in Claim 18. The phrase "cords are arranged in spaced relation to each other" in Claim 18 will be defined as "cords are positioned at predetermined positions spaced relative to each other."

2. Arranged (A first set of elements arranged on the first side of said printed circuit board)

A well defined collection of memory elements arranged in a logical fashion on one side of the printed circuit board.

1. "Arranged to Bias"

Plaintiff argues that the claim language "arranged to bias" in claim 1 of the '946 patent means "placed in a certain location or in such a way as to cause a continuous tendency or preference toward a particular position." (Doc. # 26-2, at 18). Plaintiff relies on dictionary definitions to support its proposed construction. (Doc. # 26-2, at 19). Defendant argues that the term "arranged to bias" means "acts directly on." (Doc. # 26-2, at 20). Defendant refers the Court to the '946 patent prosecution history, whereby the patentee repeatedly states that "the coil spring 134 acts directly on the travel bar to move it so that the
hinge plates close the rings.” (Doc. # 26-4, at 12, 59; # 26-5, at 26) (emphasis added). Defendant further relies on Figures 15 and 18 in the '946 patent specification to support its construction. Although Figure 15 does not clearly illustrate the interaction between the spring and the travel bar, Figure 18 depicts the direct connection between the two components. As such, the Court believes that the intrinsic evidence supports defendant's alternative, proposed construction. Therefore, the Court finds that "arranged to bias" in the '946 patent means "acts directly on.

GO BACK

292

1. "Arranged to Bias"

Plaintiff argues that the claim language "arranged to bias" in claim 1 of the '946 patent means "placed in a certain location or in such a way as to cause a continuous tendency or preference toward a particular position." (Doc. # 26-2, at 18). Plaintiff relies on dictionary definitions to support its proposed construction. (Doc. # 26-2, at 19). Defendant argues that the term "arranged to bias" means "acts directly on." (Doc. # 26-2, at 20). Defendant refers the Court to the '946 patent prosecution history, whereby the patentee repeatedly states that "the coil spring 134 acts directly on the travel bar to move it so that the hinge plates close the rings." (Doc. # 26-4, at 12, 59; # 26-5, at 26) (emphasis added). Defendant further relies on Figures 15 and 18 in the '946 patent specification to support its construction.

Claims 1, 21, and 26 of the '946 patent refer to "a spring arranged to bias said travel bar toward the closed position for locking the hinge plates in the closed position." (Doc. # 1-2, '946 patent, col. 9, lines 65-67, col. 11, lines 27-29, col. 12, lines 27-30). As stated above, claims "must be read in view of the specification, of which they are a part." Vitronics, 90 F.3d at 1582 (citations omitted). Figure 15 does not clearly illustrate the attachment between the spring and the travel bar. Although the patentee stated that there is a direct connection between the spring and the travel bar, Figures 17, 18, 18A, 18B, 18C, 19, and 20 show that the spring, item 134, is directly connected to the tab, item 162, and that the tab is directly connected to the travel bar, item 142. Thus, the spring is indirectly connected to the travel bar. As such, the Court believes that the specification does not limit the scope of the term "arranged to bias" to include only a direct connection. The Court, therefore, finds that the term "arranged to bias" in the '946 patent means "acts directly or indirectly on.

GO BACK

293

L. "Arranged to Disorganize Scar Tissue"

Claim 9 of the '418 patent describes "[t]he sheet of claim 1 wherein the second surface is arranged to disorganize scar tissue." Plaintiffs contend that "arranged to disorganize scar tissue" means "arranged to disrupt the natural formation of scar tissue." Defendants claim that "arranged to disorganize scar tissue" means "a silicone elastomer configured into concentric nested close geometric shapes that force scar tissue into concentric nested rings."

The specifications of the '418 patent disclose that the implant exists to weaken the growth of scar tissue surrounding the implant by forcing the tissue to grow into the textured surface of the implant. See U.S. Patent No. 6,921,418, at 4:63-64. The textured molded covering of the implant may be made of "silicone elastomer or other suitable materials which serve to limit the force or scar contracture around the implant by disorganizing the scar tissue itself . . . ." Id. at 8:48-52; see also id. at 8:21-25. Because the express specifications of the '418 patent provide that silicone elastomer is not the only suitable material, it would be inappropriate for the Court to adopt Gore's proposed construction that the phrase "arranged to disorganize scar tissue" only includes silicone elastomer. Additionally, the '418 patent specifications do not limit the design to concentric nested rings. See id. at 8:65-9:4. Moreover, adopting Gore's proposed construction would have the effect of excluding the embodiment displayed in Figure 12 from claim 9 because Figure 12 utilizes channels rather than concentric rings. See id. at Fig. 12. Therefore, the Court determines that "arranged to disorganize scar tissue" means "arranged to disrupt the natural formation of scar tissue."

GO BACK

294

- 702 -
a. "arranging a weight sensor in connection with the seat such that the at least one morphological characteristic is the weight of the occupant"

Plaintiff argues that the court should construe this phrase to mean "measuring a sensor output and obtaining information corresponding to the force of the occupant on the seat." (Chart at 21.) Defendant maintains that the court should construe the phrase to mean "measuring the weight of the occupant by placing a weight sensor in the seat. The weight of the occupant is a calculation of the force gravity exerts on the occupant." (Id.) Plaintiff contends that Defendant's construction implies the existence of an extra step, requiring a measurement and then a calculation of actual weight. In response, Defendant argues that the plain language of its construction is best, it is support by the specification and prosecution history, and that Plaintiff proposes a construction by which it would encompass Defendant's PODS, which measures pressure rather than weight.

"[R]esort must be had in the first instance to the words of the claim,' words [which are ascribed] their ordinary meaning unless it appears the inventor used them otherwise." Bell Comm'ns Research, Inc. v. Vitalink Comm'ns, Corp., 55 F.3d 615, 620 (Fed Cir. 1995) (quoting Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984)). The claim makes clear that the "weight sensor" measures something called "weight of the occupant." Plaintiff argues that the sensor does not give a weight measurement in the way a bathroom scale might; however, the specification itself discusses an identification of the weight of the occupying item of the seat:

The control system 1030, e.g., a microprocessor, is arranged to receive the digital signals from the transducers 1010, 1011 and determine the weight of the occupying item of the seat based thereon. In other words, the signals from the transducers 1010, 1011 are processed by the control system 1030 to provide an indication of the weight of the occupying item of the seat, i.e., the force exerted by the occupying item on the seat support structure.

'516 Patent col. 27 l.64-col. 28 l.4. Nonetheless, the specification describes the action involved in this claim as follows: "An occupying item of the seat will cause a force to be exerted downward and the magnitude of this force is representative of the weight of the occupying item. Thus by measuring this force, information about the weight of the occupying item can be obtained."'516 Patent col. 20.165-col. 21 l.3. This description provides what is being measured by the weight sensor and takes into account the concern presented by Plaintiff's that no calculation of the weight of the occupant is performed in the ordinary sense of "weight." However, the court finds that it need not precisely define what is meant by "weight"; the ordinary meaning of "weight" is sufficient. See Texas Digital Systems, Inc., 308 F.3d at 1202 (finding that there is a heavy presumption that the words of a claim should be given their ordinary meaning). In addition, the court will address Plaintiff's concerns regarding measurement, in contrast to some kind of calibration, by using the verb "sensing" in its construction rather than "measuring."

Accordingly, the court will construe the phrase "arranging a weight sensor in connection with the seat such that the at least one morphological characteristic is the weight of the occupant" to mean "sensing the weight of the occupant by placing a weight sensor in the seat."

The point of contention between the Parties is the definition of the covers for the holes of the vent. To determine the scope of the claim, the Court must, therefore, define the terms and establish the elements prescribed therein. Looking first to the language of the claims, the Court notes that both Claims 1 and 6 contain the following language describing the covers:

an array of cowls integral with and positioned on the exterior surface of the plate, each of said cowls formed of an inflexible material, each cowl for shielding one of the holes, said holes and cowls, being sized shaped, and oriented to inhibit entry of fluids through the holes and into the envelope interior while allowing generally unrestricted air circulation between the envelope interior and exterior . . . .

Defendants argue that the definition of an array of cowls cannot encompass a strip of adjacent holes with a louver or slat covering that does not create separate hoods. Plaintiff asserts that a cowl is a more general term for hood than Defendants contend and that in fact Defendants' louver hood does fall within the scope of the claim. Furthermore, Plaintiff argues that the claim language does not require that there be multiple, individual or separate cowls and holes, but that even if the Court determines the claim so indicates, Defendants' vent contains multiple, individual holes which each have their own cowl, the
fact that they are adjacent to one another notwithstanding. Based on these arguments, the Court must define the terms "array" and "cowl" and the phrase "each cowl for shielding one hole."

--- Footnotes ---

2 In the instant case, Plaintiff Bickerstaff alleges infringement of claims 1, 4, 6 and 9 of the '911 Patent. Claims 1 and 6 are independent claims, while claims 4 and 9 are dependent on claims 1 and 6 respectively. Thus, if the scope of claims 1 and 6 cannot include Defendants' vent, then Plaintiff's assertion of infringement necessarily fails as to all four claims.

--- End Footnotes ---

An array is alternatively defined as "a rectangular arrangement of quantities arranged in rows and columns, as in a matrix," "an orderly, often imposing arrangement," or "an impressively large number, as of persons or objects." THE AMERICAN, HERITAGE DICTIONARY 102 (3d Ed. 1996). When this language is reviewed in light of the figures attached to the specification of the patent, it becomes clear that the intended definition of an array in this context is the first definition. See Fig. 2. Given that the prosecution history provides no contrary argument, the Court finds that the term "array" as used in patent '911 refers to "a rectangular arrangement of quantities arranged in rows and columns."

--- B. Array of Light Emitting Diodes ---

<table>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>array of light emitting diodes</td>
<td>a group of at least two light emitting diodes that function as a single light source</td>
</tr>
</tbody>
</table>

The term "array of light emitting diodes" is first mentioned in claim 1, which describes an "array of light emitting diodes integral within said brim and proximate to said rim." The term is subsequently mentioned reflexively in several claims, i.e., "said array of light emitting diodes [is] focused to form a contiguous beam." ('831 patent, claim 1.)

Defendant proposes construing "array of light emitting diodes" as "a group of at least two light emitting diodes that function as a single light source." (Def's Br. at 3.) While Plaintiffs agree that "array" denotes two or more LEDs, they disagree as to what the term means for the physical placement of the LEDs in relation to one another. Plaintiffs would construe the term to emphasize that the claim does not require the LEDs to physically touch one another. (Pl's Br. at 16.)

In the Court's view, neither party's construction is fully accurate. Defendant's construction seeks to build its preferred construction of "contiguous beam" (as a single light source) into the meaning of "array." Such a construction would result in an unnecessary redundancy, and the Court sees no purpose in injecting a duplicative construction of "contiguous beam" into a term that it construes separately. See Cross Medical Products, Inc. v. Medtronic Sofamor Danek, Inc., 424 F.3d 1293, 1307 (Fed. Cir. 2005)(holding that rules of construction disfavor redundant interpretation of claims).

Plaintiffs, in contrast, seek to insert a connotation of distance between LED components into the meaning of "array." Plaintiffs' proposed reference to "not necessarily touching" fails to add any clarity to the term. The term "array" neither intrinsically requires nor precludes any arrangement in which LEDs touch one another. One could imagine a variety of arrangements in which proximate and distant LEDs are still "arrayed" for an illuminating purpose. Plaintiffs' proffered...
emphasis on the distance between LEDs is not intrinsic in the ordinary meaning of "array" and finds no support in the contextual use of the term.

The ordinary meaning of the word array is \"[a] regular grouping or arrangement.\" MERRIAM WEBSTER COLLEGIATE DICTIONARY at 64 (10th ed. 1997). The word connotes a group of items that are organized in some orderly manner. (Id.) The patent employs this ordinary meaning of the word. The embodiments of the patent depict a group of LEDs aligned in straight parallel rows in close proximity to one another (‘831 Patent, Fig. 19.; Col. 13, ll. 58-61)(\"In this example LEDs are two white LEDs electrically parallel to each other, and LEDs are two red LEDs electrically parallel to each other.\") The LED grouping that is depicted and described in the patent is an orderly arrangement. Accordingly, the court adopts the following construction for \"array of light emitting diodes\:\" \"an orderly arrangement of at least two light emitting diodes.\"

IV. Array of Light-Sensitive Elements

For the following reasons, this court will not construe the term \"array of light sensitive elements\" in the ‘434 patent to have a meaning other than its plain meaning.

Claims 2, 3, 4 and 10 of the ‘434 patent recite the claim limitation \"array of light sensitive elements.\" Anoto argues that \"array of light sensitive elements\" should be interpreted to mean: \"A charged-coupled device (CCD) or any other grouping of multiple light sensors configured to detect indicia in either one or two dimensions.\" (Anoto's Claim Construction at 11.) Anoto, however, has provided no reason why any limitation should be read into the term \"array of light sensitive elements.\" The prosecution history quoted by Anoto does not support limiting the term to a CCD. The excerpt of the prosecution history primarily relied upon by Anoto states:

The Applicant believes that CCD bar code readers comprise light sensitive arrays grouped together in one dimension or straight line. Two dimensional arrays are reserved for devices like video cameras or the like. The device described in the present invention is not exclusively a bare [sic] code reader, although it can be used for that purpose with the proper programming. The device may be described as a hand-held two dimensional CCD scanner or camera. (A0112); (Anoto's Reply at 21.) This excerpt does not purport to define an \"array of light sensitive elements\" as a CCD. It cannot operate as a clear disclaimer of claim scope. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324-25 (7th Cir. 2003). Furthermore, Anoto has not made any argument that the terms require interpretation because they are unclear, but Anoto nevertheless has suggested construing the terms to mean an \"arrangement of light sensitive elements.\" (Anoto's Reply at 21.) However, Anoto provides no reason why the term \"arrangement\" should be used instead of \"array.\" This court finds no basis for departing from the ordinary meaning of the term \"array of light sensitive elements.\"

Plurality of Apertures Arrayed Along

Claim 1 requires that the elongated hollow tube include \"a plurality of filtering apertures arrayed along [the] tube for improving the diffusion into and out of the space within the tube.\" ‘332 Patent, col. 6, ll. 12-14. The district court construed \"a plurality of filtering apertures arrayed along [the] tube\" to mean \"a sample chamber with a minimum of two apertures located somewhere along the surface of the sample chamber.\" Finding and Recommendation at 15.

Digital Control asserts that this claim construction gives no meaning to the term \"arrayed along,\" thereby giving the '332 patent more breadth than that to which it is entitled. Digital Control also asserts that the applicant argued that a combination of references that \"clearly shows\" two apertures did not suggest the arrayed apertures limitation. We are not persuaded by these arguments.

We agree with the district court's analysis and adopt its construction of this claim limitation.
Defendant proposes that the court construe the term "arrayed on a line" as "positioned on a single line." As the court has construed the term "a line" above, the only term left to be construed is "arrayed." There is nothing to suggest that "arrayed" has a meaning other than its ordinary meaning, and the court therefore adopts the proposed construction of "positioned on a single line."

In its complaint, Worldwide alleges that defendant Microtek infringed upon the 233 patent by manufacturing and distributing the competing "RADbarrier" radiation shield. The parties' briefs and arguments have focused primarily upon Microtek, but the complaint also alleges that defendant Aadco infringed upon the 233 patent by manufacturing and distributing its "X-Drape" radiation shield. On August 30, 2007, this court heard oral arguments from attorneys for Microtek and Worldwide regarding defendants' summary judgment motion. Microtek has characterized this motion as seeking complete summary judgment, but Worldwide correctly notes that the instant motion for summary judgment relates only to claim 1 of the 233 patent, along with dependent claims 10-12 thereof. Claim 1 of the 233 Patent recites the following:

1. A flexible shield for covering an article and attenuating the flux of electromagnetic radiation to or from said article, comprising a polymeric matrix charged with an attenuating filler, said shield having a transmission attenuation factor of at least 50% of a primary 100 kVp x-ray beam, a durometer of less than about 100 Shore "OO" and a coefficient of sliding friction relative to said article of at least 0.15.

At the August 30 hearing, Worldwide noted that it alleges infringement of claim 21 of the 233 patent as well, and the complaint also asserts various trademark claims, the status of which is unclear to this court. It is thus appears that the present motion is, as stated by plaintiff, only one for partial summary judgment.

Microtek has represented to this court that, at this juncture, it is seeking summary judgment based solely upon non-infringement arguments and arguments that claim 1 of the 233 patent was invalid due to indefiniteness. Microtek has reserved the right, however, to subsequently file a separate summary judgment motion alleging that the 233 patent is invalid based on pre-existing prior art. Defendant conceded, however, that the question of invalidity based on prior art involves a more fact-intensive inquiry as to which discovery was not yet complete. In spite of this representation, the first portion of Microtek's oral presentation did include substantial arguments relating to its contention that claim 1 of the 233 patent actually represented no new invention. However, given defendant's representation that it does not presently seek summary judgment based upon invalidity due to prior art arguments, this court puts its concerns regarding these arguments out of its mind and considers solely the summary judgment arguments which were raised by defendant.

In seeking summary judgment, Microtek first alleges that there is no genuine issue of fact regarding whether it infringed upon the 233 patent. The determination of infringement is a two-step process. First, the court must construe the claims at issue. Claim construction is a question of law for the court. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 385, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996); Novartis Pharm. Corp. v. Eon Labs Mfg., Inc., 363 F.3d 1306, 1308 (Fed. Cir. 2004). Second, the patentee must prove that every limitation of the properly construed claims is present in the accused device or process. See Novartis Pharm., 363 F.3d at 1308; Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1330 (Fed. Cir. 2001) Disputes over claim construction are issues of law, properly determined on summary judgment. See, e.g., Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387 (Fed. Cir. 1992). Claim terms are generally given their ordinary and customary meaning to a person of ordinary skill in the relevant art at the time of the invention. Phillips v. AWH Corp., 415 F.3d 1303, 1312-13 (Fed. Cir. 2005) (en banc), cert. denied, 546 U.S. 1170, 126 S. Ct. 1332, 164 L. Ed. 2d 49 (2006).
The Federal Circuit has repeatedly cautioned, however, that the ordinary meaning of claim terms must be viewed in light of the intrinsic record, particularly the specification and prosecution history. See, e.g., id. at 1313 and 1315-17; Medrad, Inc. v. MRI Devices Corp., 401 F.3d 1313, 1319 (Fed. Cir. 2005). The specification is always highly relevant to claim construction: "Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." Phillips, 415 F.3d at 1315. It should be apparent that this standard leaves little room for evidence of extrinsic evidence, including subjective knowledge on the part of defendant.

Microtek argues that, properly construed, the language of the 233 patent supports a conclusion that its RADBarrier shield did not infringe upon the 233 patent. In so arguing, defendant emphasizes that claim 1 only covers radiation shields to be placed on "articles," which term, it argues, does not include people. The court agrees. In so concluding, the court would concede that this argument originally struck it as being somewhat hyper-technical in nature. Worldwide correctly notes that, throughout the patent specification, it is clear that the primary use of the invention is in radiological medical procedures performed on human patients. Indeed, the patent specifications contain numerous drawing sheets which depict various radiation shields which clearly appear to be designed to fit the human body. While the primary use of the 233 patent thus clearly seems to be for shields to be used on human beings, the court would emphasize that the patent contains 27 dependent and independent claims. In the court's view, it is far from unreasonable to conclude that one or more of those claims might relate only to radiation shields for inanimate objects.

Considered in this light, the most logical interpretation of the term "article" in claim 1 is its customary interpretation in the English language referring to something other than a human being. This conclusion is greatly strengthened by language in the patent which states that:

Thus, the radiation shield of the present invention is adaptable to such diverse applications as covering a patient and/or health care practitioner (or selected anatomical regions thereof) during a medical procedure or shielding a radiation [sic] such as a vial or canister or radionuclides.

Thus, the patent clearly envisions that it may be placed on inanimate objects such as "vials and canisters" and, accordingly, it is far from irrational to conclude that one or more of the 27 claims of the patent might, in fact, be limited to such objects.

In the court's view, this language clearly supports a conclusion that the term "article" used in claim 1 is intended to refer to something other than a human being. Any argument that the language quoted above merely constitutes an unfortunate misstatement is negated by the fact that, as noted in Microtek's brief, the patent specifications repeatedly distinguish between "articles" and "bodies," "patients" and "persons." For example, the patent makes reference to "a flexible shield for protecting an article or body," "the article or patient to be protected," and it notes that the "shield, when applied to a patient's body or an article (e.g. a table), not only conforms closely with any topical irregularities but has a sufficiently high coefficient of friction that it cannot be easily dislodged or moved." Thus, the patent itself clearly distinguishes between "articles" and human beings and, lest there be any doubt regarding the proper construction of the term, the patent offers a "table" as an example of an article.

The conclusion that claim 1 does not encompass shields to be placed on human beings is also strengthened by the language of claim 21 of the patent, which covers a "disposable radiological garment to be worn or selectively draped about a patient." Thus, the 233 patent was clearly able to specify when a particular claim was intended to cover shields to be placed on human beings, and the court can therefore only conclude that claim 1 is limited, on its face, to "articles." Having closely reviewed the patent in this case, it becomes clear that defendant's arguments are not hyper-technical, but, rather, constitute the proper legal construction of claim 1 of the 233 patent. In light of the foregoing, the court concludes that claim 1 only
covers radiation shields to be used on "articles," and that, within the context of the 233 patent, the term "article" does not encompass human beings. It is undisputed that the radiation shields manufactured by defendants Microtek and Aadco were designed for use on human beings, and the court therefore concludes that defendants are entitled to summary judgment as to any infringement claims relating to claim 1 of the 233 patent.

A. "Article Feeder Means"

The parties dispute whether the term "article feeder means" in claims 1, 20, and 24 is governed by Section 112, paragraph 6. Goss argues the statute does not apply despite the presumption that attaches because the word "means" is used in the claim. Pl. Memo. at 11. Goss contends the term "article feeder" recites sufficient structure on its own to rebut the presumption. Id. In addition, Goss argues the claims set forth sufficient structure because it contains detailed descriptions of the location and components of the article feeder means. Id. at 12. Goss draws support for its construction from the specification, the patent examiner's repeated use of the term "feeder" without discussion of its function, and a dictionary definition of the term. Id. at 13. According to Goss, a person of ordinary skill in the art would understand the term to describe a known structure. Id.

K&M responds that Goss has not rebutted the presumption in favor of means-plus-function analysis. K&M contends that the only structure identified to perform the function of "feeding sheet material articles to said receiving locations" is a variable speed motor. Def. Memo. at 10; Pat. at col. 14, ll. 51-53. But an article feeder requires structures in addition to a variable speed motor to move the sheet material to the pockets, such as a hopper, feed drum, sucker mechanism, gripper, variable speed feed motor, and feed motor drive circuit. Id. at 12; Pat. at Fig. 4 (included within the dashed line denoting the "sheet material article feeder 54" is a host of structures other than variable speed motor). K&M concludes the element is functional and falls under Section 112, paragraph 6. Id. at 13. Employing means-plus-function analysis, K&M argues for a construction that includes all the structures necessary to determine the position of the pockets and transport the sheet material to them. Id. at 13.

The "article feeder means" element is not governed by Section 112, paragraph 6. Although use of the term "means" presumes application of the statute, that presumption may be overcome if the claim recites structure sufficient to perform the claimed function. See Altiris, 318 F.3d at 1375. That structure is apparent. First, the term "article feeder" provides enough structural detail on its own to render Section 112, paragraph 6 inapplicable. In MIT v. Abacus Software, the court found means-plus-function analysis did not apply to the term "aesthetic correction circuitry." 462 F.3d 1344, 1355 (Fed. Cir. 2006). The court determined the word "circuitry," by itself, connotes structure." Id. The court based its decision on general-usage and technical dictionaries defining the term. Id. "Article feeder," like "circuitry," describes a known structure. The specification is rife with references to different types of feeders. See e.g., col 1, ll. 34-38; col. 2, ll. 46-47. None of the references are described functionally. In addition, the prosecution history makes clear that the patentees and the patent examiner understood the term "article feeder" to identify a specific item. See Pl. Memo. at Ex. B, PAT00185 (term is used without explanation or qualification in discussion of the Maoploski patent, which is referenced as prior art in the '724 patent). Moreover, as in MIT, dictionaries identify a "feeder" as a known device consistent with the '724 patent's use of the term. Id. at Ex. C, Ex. 7 ("feeder" defined as a "device that feeds materials into a machine for further processing"). See also Cole, 102 F.3d at 531 ("perforation means . . . for tearing" was not means-plus-function element because the element's precise structural character was defined by its own description).

Second, aside from the element's description, the claims set forth structure sufficient to overcome application of Section 112, paragraph 6. The claims describe the location of the article feeder means ("disposed along said conveyer") and some of its components ("each one of said article feeder means includes a variable speed motor"). Pat. at col. 14, ll. 52-54. By doing so, the claims do not merely depict the article feeder means as a function, they describe the element's structure by explaining its operation. When a structural term is coupled with operational terms, "sufficient structural meaning will generally be conveyed to persons of ordinary skill in the art." Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d 1311, 1320 (Fed. Cir. 2004); see also MIT, 462 F.3d at 1356 (structural term "circuit" described by reference to additional operational structure); Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1304-05 (Fed. Cir. 1999) ("positioning means" was not means-plus-function element because claim recited additional structures for performing function).

K&M argues the element's description does not embody all the structures necessary to perform the element's function;
therefore, the presumption in favor of means-plus-function analysis is not rebutted. This argument is unavailing. "It is well established that it is not necessary to claim in a patent every device required to enable the invention to be used." Asyst Techs., Inc. v. Empak, Inc., 268 F.3d 1364, 1371 (Fed. Cir. 2001). Thus, it is not fatal to Goss' position that the claim recites a variable speed motor as additional structure, but fails to recite more. Id. The recitation of operational components and the article feeder means' location indicates the element is structural.

In any event, K&M's proposed construction fails because it commits a cardinal sin of claim construction: it seeks to import structures unnecessary to perform the element's function. See Wegner, 239 F.3d at 1233. The majority of structures K&M includes in its construction relate to controlling the specific location sheet material is delivered to the pockets, e.g., feed motor position sensor, operator advance/retard control, home position and receiving location proximity sensors, etc. Def. Memo. at 14; Pat. at Fig. 3. But these structures are not necessary for the article feeders means to perform the limited function of "feeding sheet material articles to said receiving locations." Pat. at col. 14, ll. 51-53. The structures K&M adds enable or enhance, rather than perform, the specified function. See Asyst Tech., 268 F.3d at 1371. The court cannot construe claims in a way that adds unnecessary structures. Wegner, 239 F.3d at 1233. To be sure, the patent's drawings create some ambiguity regarding what structures are contained in the article feeder means. Pat. at Fig. 3 (item 54, identified as a "sheet material article feeder," drawn to include all structures within dotted-line); Fig 4 (item 54 points to unspecified group of structures). However, the specification clearly sets forth the element's function. Claim language, not the drawings, define the scope of the patent. See Cummins Engine Co. v. Gen. Motors Corp., 299 F. Supp. 59, 88 (D.C. Md. 1969).

Further, K&M's construction would violate the doctrine of claim differentiation, which requires the court to construe independent claims in a way to avoid nullifying dependant claims. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 908 (Fed. Cir. 2004). Many of the structures K&M includes as part of claim 1's "article feeder means" element are recited as separate elements in dependant claims. See e.g., Pat at col. 15, ll. 62-65 (construction of claim 1 includes sensors, but "sensor means" are described in claim 9). Adopting K&M's construction would render many dependant claims redundant. Therefore, the court construes the "article feeder means" element in claims 1, 20, and 24 consistent with Goss's proposed constructions.

As the engineer adjusts design parameters

The Court finds that it cannot reduce the term "as the engineer adjusts design parameters" to a more simple or clear construction based on the intrinsic evidence. Haliburton proposes the construction "during any time while the design engineer is adjusting design parameters of the bit, either automatically or manually," and Smith proposes "automatically as the engineer adjusts design parameters." "As" relates to time in that it means "while" or "during," and it implies that two things happen close in time but not necessarily instantaneously. Additionally, "as" implies that one thing causes another. Haliburton's construction "during any time" would allow the two things to occur far apart in time, and Smith's construction "automatically as" seems to require the two things to occur instantaneously. Thus, the proposed constructions either improperly restrict or expand the time in which the graphic display would represent the engineer's adjustments. Also, Haliburton's "manually" would perhaps eliminate the causal relationship implied by "as," and Smith's "automatically" could place undue restrictions on the causal relationship. In sum, the word "as" is incapable of simplification or more precise definition, and the Court can only give the parties the guidelines announced here.

End Cap Assembly

The parties contest the meaning of the term "end cap assembly" used in claim 1 and 12 of the 537 patent. Parker proposes the following construction: "collection of components including or comprising an end cap." Parker contends the intrinsic evidence supports this construction. First, the claims themselves define the components of the end cap assembly:

Claim 1: … and end cap assembly at the first end of the filter media including a first annular end cap sealingly bonded to
the first end of the filtration media, and a separate annular end piece located in the sealing relation with the first end cap…

Claim 12:…an end cap assembly at the first end of the filter media including a first flat annular end cap sealingly bonded to the first end of the filtration media…

Parker contends the above claim language clearly encompasses multiple components including the end cap. Because the claim is the best intrinsic evidence, Parker contends, it should control. Furthermore, Parker contends the extrinsic evidence supports its construction. Its expert, Professor Charles Garris, a mechanical engineering professor at George Washington University states:

An assembly is a unit containing the component parts of a mechanism, machine, or similar device. See McGraw-Hill Dictionary of Engineering 2d ed. 2003 p.33 (attached hereto as Exhibit H). It is the final product after putting together a machine or mechanism from its component parts. See Dictionary of Mechanical Engineering 4th ed. 1996 p. 14 (attached hereto as Exhibit I). Therefore, an assembly generally connotes a set of parts that are connected or related in some fashion.

Defendants contend the appropriate construction of "end cap assembly" should be:

end cap unit formed from two or more component parts that necessarily remain with the filter element when the filter element is removed from the housing.

At the heart of this claim dispute is whether the end cap assembly remains with the filter element upon removal or whether end cap assembly refers to the entire assembly that includes both the removed portion of the filter and the remaining housing. According to Defendants, the plain claim language supports its position. The claim language requires the end cap assembly include a "separate annular end piece located in sealing relation with the first end cap." The annular piece is the portion of the end cap having protrusions. This piece must remain with the filter element when the filter is removed from the housing. According to Defendants, the prosecution history of the '537 family of patents demonstrates, "the elongated protrusions remaining with the filter element when the filter element is removed from between the housing portions." Therefore, in order for the term "end cap assembly" to have any meaning, according to Defendants, the end cap assembly must include two or more components that remain with the filter element upon its removal from the housing.

The Wix Court construed the term as a "collection of components comprising the end piece of at least a combination of a flat annular end cap and a separate annular end piece."

Court's Construction

The Court finds that "end cap assembly" is not limited to the two or more components that remain with the filter element since the specification and claim language place no such limitation on the claim. The claim uses the term "including" which encompasses more than the specified components. The Wix Court determined that the terms "including" and "comprising" are interchangeable. This Court agrees the terms are synonymous. In light of the fact that the Federal Circuit has held, "The transitional term 'comprising' … is inclusive or open-ended and does not exclude additional, unrecited elements or method steps." Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1327-28 (Fed.Cir.1999). "A drafter uses the term 'comprising' to mean 'I claim at least what follows and potentially more.' " Vehicular Techs. Corp. v. Titan Wheel Int'l, Inc., 212 F.3d 1377, 1383-84 (Fed.Cir.2000). CollegeNet, Inc. v. ApplyYourself, Inc. 418 F.3d 1225, 1235 (Fed Cir. 2005). In light of the above caselaw, the Court finds Plaintiffs' interpretation more accurately captures the claim as stated without the limitations suggested by Defendants that are not found in the claim itself. Therefore, in agreement with the Wix Court, the Court interprets "end cap assembly" as "a collection of components including or comprising at least a flat annular end cap and separate annular end piece."

GO BACK

304

C. Retaining Assembly

'092 patent claim 76 states that the table comprises a "retaining assembly including a cross brace member." (Id., Claim 76.) GSC claims that its seven tables do not have a retaining assembly for two reasons. First, GSC claims that a retaining assembly must consist of more than one part. Second, GSC claims that a retaining assembly only applies to structures that
"interrelate the ends of the two support braces to one another thereby to nullify a force applied to one of them." We agree that a retaining assembly must consist of more than one part, but disagree that a retaining assembly is limited to the function described by GSC.

Similar to the term "frame," which we have already construed, the patent's claims do not explicitly define the term "retaining assembly," but claim 76 states that a retaining assembly includes "a cross brace member." (Id.) Once again, the specification broadly defines the disputed term. First, the specification states that a cross brace member is an example of a retaining assembly: "the retaining assembly (e.g., cross brace member)." (Id. at 10:7.) The specification even uses the terms "cross brace member" and "retaining assembly" interchangeably. (See id. at 10:10 (referring to structure 36 as the retaining assembly); 10:19-20 (referring to structure 36 as the cross brace member).) Additionally, the retaining assemblies in all four figures in the specification appear to be composed of single cross brace members. (Id. at Figs. 1-4.)

This broad construction of retaining assembly is, however, at odds with other patent claims. Claims 59 and 60 state that a "cross brace member connects the retaining assembly" to the frame and the table top respectively. (Id., Claims 59-60.) These claims indicate that the retaining assembly is distinct from a cross brace member. Construing the term "retaining assembly" to include structures that consist solely of a cross brace member would render these claims meaningless because the cross brace member would be the retaining assembly, rather than a structure that connects the retaining assembly to the frame and table top.

This broad construction is also inconsistent with the ordinary meaning of the term "assembly." The ordinary meaning of the term "assembly" is "the fitting together of manufactured parts into a complete machine, structure, or unit of a machine" and "a collection of parts so assembled." Claim terms are presumed to possess their ordinary meaning, and the party advancing a different meaning must overcome this strong presumption. Apex, 325 F.3d at 1370. Lifetime's proposed construction--that an assembly can consist of one part--would render certain claims meaningless, so we find that the broad usage of the term "retaining assembly" in the specification does not overcome the presumption that terms should be accorded their ordinary meaning. 5 Therefore, we construe the term "retaining assembly" as a structure that consists of more than one part. Accordingly, a cross brace member cannot constitute a retaining assembly.

5 We also note that Lifetime has previously relied on the ordinary definition of "assembly" when defending its patents. (See R. 74, GSC's Brief, Ex. 26, Lifetime's Reply at 7.)

We now turn to whether a retaining assembly only applies to structures that "interrelate the ends of the two support braces to one another thereby to nullify a force applied to one of them." We decline to adopt this narrow construction. First, the ordinary meaning of the term "retain" is much broader; it means "to hold secure or intact." Second, the patent's claims do not define this term in such a technical manner. Third, the only evidence GSC has provided in support of this claim limitation is the patent's specification. The specification states that:

the retaining assembly generally provides structural support to the center of the table top of the utility table. It will further be appreciated that with the distal ends attached contiguous each other in retention to the cross brace member, forces applied to the table top which would ordinarily be transferred through one of the support pivotal braces, respectively, into the table top causing it to bow, will substantially be nullified by the counter force provided by the opposing pivotal support brace, respectively.

(R. 58, Keller Decl., Ex. A, '092 Patent at 10:14-24.) We cannot read a limitation into a claim from the specification. Liebel-Flarsheim, 358 F.3d at 904. Fourth, although GSC makes an argument on the basis of the patent's prosecution history, it did not provide the Court with the relevant portion of the prosecution history. We cannot conclude without reviewing the prosecution history whether Lifetime affirmatively stated that the term "retaining" should be so limited. See Vitronics, 90 F.3d at 1582 (stating that the prosecution history should only be considered if it is in evidence). For all of these reasons, we decline to construe the term "retaining assembly" in this manner, but if GSC submits the relevant prosecution history, we will reconsider this one aspect of our opinion.

a. Meaning of "Blade Assembly Comprising at Least Two Blades"

The Court has not found, nor have the parties referred the Court to, anything in the patent specification that conveys an "express intent to impart a novel meaning," Optical Disc, 208 F.3d at 1334, to the claim term "blade assembly." The term blade assembly therefore takes on its ordinary meaning. Id.

The dictionary defines "blade" as: "1. The flat cutting part of a sharpened weapon or tool." American Heritage(R) Dictionary of the English Language: Fourth Edition (2000). The dictionary defines "assembly" as: "4a. The putting together of manufactured parts to make a completed product, such as a machine or electronic circuit. 4b. A set of parts so assembled." Id.

The ordinary meaning of "blade assembly," therefore, is a set of parts, put together to make a completed product, in which said set of parts includes at least one part that is the flat cutting part of a sharpened weapon. Further, the ordinary meaning of "blade assembly comprising at least two blades" is: a set of parts, put together to make a completed product, in which said set of parts includes among its members either (1) at least two parts that each are the flat cutting part of a sharpened weapon; or (2) one part that has at least two flat cutting parts of a sharpened weapon.

306

B. Means-Plus-Function Limitation

Defendant argues that "assembly means" as used in claims 1 and 8 is a mean-plus-function because it contains the terms "means" and recites a function. As I discussed, the use of the term "means" gives rise to the presumption of a means-plus-function element but it is not dispositive. Cross Medical Products, Inc. v. Medtronic Sofamor Danek, Inc., 424 F.3d 1293, 1303 (Fed. Cir. 2005); Sage Products, Inc. v. Devon Industries, Inc., 126 F.3d 1420, 1427 (Fed. Cir. 1997). The key is whether the means-plus-function term is followed by a function. Defendant argues that the following language found in claims 1 and 8 is the function of the assembly means: "retaining said stand portions in face-to-face [or sliding] engagement with the underside of said platform and permitting limited displacement of said bearing members at a horizontal direction." '420 Pat., col. 5, lns. 12-18, 30-32. However, this language is used to describe how the bearing member and platform are connected.

Regardless, defendants' contention is much ado about nothing. Even assuming its position that "retaining said stand portions . . ." was a function of the "assembly means," the court would need to determine whether the claim contains sufficient structure for performing that function. 35 U.S.C. § 112 P 6 ("An element of a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof"); Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1372 (Fed. Cir. 2003). Defendant contends that structure is not located in the claim language but rather in the specification. According to defendant, the specification teaches that the structure that allows the assembly means to retain the stand or bearing portions in a face-to-face or sliding engagement are "platform tabs inserted through the bearing member slots and bent over the base of the bearing member." Dkt. 28, at 1. Although the court did not agree with defendant that "assembly means" was a means-plus-function, it did construe "assembly means" as used in claims 1 and 8 means "[p]latform tabs or projections inserted into slots in the bearing member and bent over to connect the platform and the bearing member." It is hard to understand why defendant is concerned whether or not "assembly means" is a means-plus-function when the practical outcome is the same. The "assembly means" are the tabs and slots.

Also, now defendant argues that the tabs and slots are insufficient to perform the function of retaining the stand and bearing means and offers a new construction for "assembly means." However, defendant offers no argument from the claim language, specification or expert opinion to support its contention. Therefore, I will disregard this proposed construction.
A. The Disputed Claim Limitations

The parties have presented four claim terms for construction, two from each patent. Claim 11 of the ’668 patent recites (with the claim limitations at issue emphasized in bold):

11. An oven capable of preparing food product utilizing a first and second food preparation process, the oven comprising:

   a heating cavity defining an interior including an apparatus for supporting food product disposed therein, and a door providing selective access to the interior;

   a first food preparation assembly operable to prepare raw food product using steam and at least one of radiating heat and forced air convection;

   a smoking assembly configured to deliver heat to an aromatic smoke producing media that emits smoke into the heating cavity in response to the delivered heat; and

   a closed ventilating system that drains liquids produced during food preparation from the interior while preventing gasses from escaping from the interior when the interior is pressurized below a threshold pressure;

   wherein the oven is capable of operating the first food preparation assembly simultaneously with the smoking assembly or separately from the smoking assembly;

   wherein the heated cavity is configured to be a closed system so that air inside the heating cavity is not continuously in direct communication with air outside the oven.

Def. Opening App., Ex. 1 at 27 (col. 13, l. 56-col.14, l. 11) (emphasis supplied).

Claim 1 of the ’173 patent recites (with the limitations at issue emphasized in bold):

1. A combination oven capable of preparing food product, the combination oven comprising:

   a heating cavity defining an interior including an apparatus for supporting food product disposed therein;

   a door providing selective access to the interior;

   a first food preparation assembly comprising a steam assembly selectively providing steam into the interior to prepare food and a heat assembly selectively heating the interior to prepare food using at least one of radiating heat and forced air convection, the heat assembly comprising a heating element disposed in the heating cavity and an air mover capable of forcing incoming air across the heating element to produce heated air that is delivered to the interior of the heating cavity, the steam assembly comprising a steam producing assembly capable of delivering liquid across the heating element that transforms the liquid into steam that is delivered to the interior of the heating cavity; and

   a smoking assembly selectively delivering smoke into the interior independently of the first food preparation assembly; and

   a drain system configured to drain liquids produced during food preparation from the interior while preventing gasses from escaping from the interior when the interior is pressurized below a threshold pressure.

Id., Ex. 2 at 52 (col 12, ll. 43-67) (emphasis supplied).
B. Discussion

In its opening brief, Alto-Shaam asserts that "the claim terms in its patents should be construed according to their ordinary meaning[]." Pl. Opening Brief at 1. By contrast, Defendants contend in their opening brief that these claim terms should be construed as means-plus-function limitations under 35 U.S.C. § 112, P 6 since "each of the limitations at issue fails to identify a sufficiently definite structure[]." Def. Opening Brief at 10. In response, Alto-Shaam contends that since none of the limitations at issue in the '668 and '173 Patents use the term "means," "they are presumptively not means-plus-function limitations." Pl. Resp. Brief at 1 (citing Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1358 (Fed. Cir. 2004)). According to Alto-Shaam, "[t]hroughout their Opening Brief, Defendants attempt to minimize the force of this presumption and improperly shift the burden to Alto-Shaam. In the end, Defendants fail to overcome the strong presumption against means-plus-function." Id. By contrast, in their response to Alto-Shaam's opening brief, Defendants argue that: "None of the four disputed limitations discloses definite structure within the asserted claims. Instead, each disputed limitation uses the generic term, 'assembly.' Claims that merely use generic terms and do not include any definite structure are means-plus-function limitations." Def. Resp. Brief at 1 (original emphasis)(citing Mass. Inst. of Tech. and Elecs. for Imaging, Inc. v. Abacus Software ("M.I.T."), 462 F.3d 1344, 1353-54 (Fed. Cir. 2006)). Defendants further argue that "Plaintiff is not entitled to a construction that coversevery conceivable structure for performing the functions recited in the claim." Id. (citing Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1214 (Fed. Cir.1998)). In support of their respective positions, the parties rely on intrinsic and extrinsic evidence, as well as the same body of case law. 2 The Court necessarily begins with an analysis of the controlling case law.

1. Means-Plus-Function Claiming

Pursuant to 35 U.S.C. § 112, P 6, a patentee is permitted to express a claim limitation by reciting a function to be performed by some generic "means," instead of reciting in the claim the actual structure for performing that function. Specifically, section 112, P 6 provides:

[an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6 (1994). Section 112, P 6 thus "operates to restrict claim limitations drafted in such functional language to those structures, materials, or acts disclosed in the specification (and their equivalents) that perform the claimed function." Personalized Media Comm's, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 703 (Fed. Cir. 1999). "The point of the requirement that the patentee disclose particular structure in the specification and that the scope of the patent claims be limited to that structure and its equivalents is to avoid pure functional claiming." Aristocrat Techs. Australia Pty Ltd. v. Int'l Game Tech., 521 F.3d 1328, 1333 (Fed. Cir. 2008).

3 Claim construction of a means-plus-function limitation has two steps: "First, the court must determine the claimed function. Second, the court must identify the corresponding structure in the written description of the patent that performs that function." Applied Med. Res. Corp. v. U.S. Surgical Corp., 448 F.3d 1324, 1332 (Fed. Cir. 2006). The claimed function is recited in the claim itself, and the corresponding structure "must not only perform the claimed function [but] the specification must clearly associate the structure with the performance of the function." Cardiac Pacemakers, Inc. v. St. Jude Med., Inc., 296 F.3d 1106, 1113 (Fed. Cir. 2002). In the event the Court applies section 112, P 6 to the disputed claim terms,
the parties have agreed to the corresponding structure disclosed in the '668 Patent and '173 Patent. See Joint Claim
Construction and Prehearing Statement at 2 ("If the Court determined that means-plus-function analysis is appropriate, Alto-
Shaam agrees to accept Defendants' proposed constructions with respect to the corresponding structure.").

"The task of determining whether the limitation in question should be regarded as a means-plus-function limitation, like all
claim construction issues, is a question of law for the court, even though it is a question on which evidence from experts
may be relevant." Lighting World, 382 F.3d at 1358 (citations omitted). The court in Lighting World delineated the standard
to be used by courts to determine whether to apply section 112, P 6 to a disputed claim limitation:

A claim limitation that actually uses the word "means" invokes a rebuttable presumption that § 112 P 6 applies. By
contrast, a claim term that does not use "means" will trigger the rebuttable presumption that § 112 P 6 does not apply. The
use of the term "means" is central to the analysis because the term "means," particularly as used in the phrase "means for," is
part of the classic template for functional claim elements and has come to be closely associated with means-plus-function
claiming.

The presumption that a limitation lacking the term "means" is not subject to section 112 P 6 can be overcome if it is
demonstrated that the claim term fails to recite sufficiently definite structure or else recites function without reciting
sufficient structure for performing that function. Our cases make clear, however, that the presumption flowing from the
absence of the term "means" is a strong one that is not readily overcome.

Id. at 1358 (internal punctuation and internal citations omitted) (emphasis added). This presumption stems from the fact that
section 112, P 6 "providesthat an element in a claim for a combination 'may be expressed' as a means for performing a
function, which indicates that the patentee is afforded the option of using the means-plus-function format. The question then
is whether, in the selection of claim language, the patentee must be taken to have exercised that option." Greenberg v.

In Greenberg, the Federal Circuit found that the district court erred in characterizing "detent mechanism" as a means-plus-
function limitation. In so ruling, the court noted, among other things, that dictionary definitions made "clear that the noun
'detent' denotes a type of structure with a generally understood meaning in the mechanical arts, even though the definitions
are expressed in functional terms . . . It is true that the term 'detent' does not call to mind a well-defined structure, but the
same could be said of other commonplace structural terms such as 'clamp' or 'container.'" Greenberg, 91 F.3d at 1583
(reciting several dictionary definitions of "detent" including "a mechanism that temporarily keeps one part in a certain
position relative to that of another, and can be released by applying force to one of the parts.").

In Lighting World, notwithstanding the ruling in Greenberg that the disputed claim term need not call to mind a specific
structure to avoid the ambit of section 112, P 6, the trial court applied section 112, P 6 to the phrase "connector assembly,"
adopting defendants' argument therein that "in order to be regarded as structural for purposes of section 112, P 6, a claim
limitation must identify a specific structure and not use a generic term that includes a wide variety of structures." Lighting
World, 382 F.3d at 1359 (citing the district court opinion). Reversing the district court's decision as "unduly restrictive," the
Federal Circuit rejected the premise upon which the district court based its decision, namely, that "connector assembly" was
not structural because "it would cover every conceivable structure that could connect two elements and pivot." Id. Instead,
the Federal Circuit found that the term "connector assembly" provided sufficient structure, and therefore did not fall within
the ambit of section 112, P 6. Lighting World, 382 F.3d at 1360-63. Looking to various dictionary definitions of the term
"connector," which modified "assembly," the court found that "connector" has a "reasonably well-understood meaning as a
name for structure, even though the structure is defined in terms of the function it performs." Id. at 1361 ("connector"
defined as "any of various devices for connecting one object to another" and "connect" defined as "to join, fasten, or link
together usu. by means of something intervening"). From these definitions, the court held that the term "connector
assembly" "means a unit that joins, fastens, or links each pair of adjacent support members." In so holding, the court stated:

In considering whether a claim term recites sufficient structure to avoid application of section 112 P 6, we have not
required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in
common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of
structures and even if the term identifies the structures by their function.
Id. at 1359-60. The Lighting World court further stated: ""[T]he fact that a particular mechanism . . . is defined in functional terms is not sufficient to convert a claim element containing that term into a 'means for performing a specified function' within the meaning of section 112(6)."" Id. at 1360 (quoting Greenberg, 91 F.3d at 1583). Further, in reaching its conclusion that "connector assembly" did not fall within the purview of section 112, P 6, the court noted:

[W]hile it is true that the term "connector assembly" does not bring to mind a particular structure, that point is not dispositive. What is important is whether the term is one that is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term "means for."

382 F.3d at 1360.

In reaching its decision, the Lighting World court added that, in light of the principles enunciated in its ruling reversing the district court (see supra), "it is not surprising that we have seldom held that a limitation not using the term 'means' must be considered to be in means-plus-function form. In fact, we have identified only one published opinion since Greenberg in which we have done so, and that case provides a useful illustration of how unusual the circumstances must be to overcome the presumption that a limitation lacking the word 'means' is not in means-plus-function form. That exceptional case is Mas-Hamilton." Id. at 1362.

In Mas-Hamilton, the Federal Circuit held that "lever moving element" and "movable link member" recited in a patent involving a high security lock did not define structure, in that the phrases did not have a well understood structural meaning in the art, and the terms in the claim limitations did not provide any structure as necessary to remove the limitation from the ambit of section 112, P 6. Mas-Hamilton, 156 F.3d at 1213-15. Based on the entire record, the Mas-Hamilton court found that the terms "element" and "member" were mere proxies for the term "means for" and the presumption flowing from the absence of the term "means for" was overcome. See id.

In addition to pointing out the "exceptional" nature of that case, the court in Lighting World distinguished Mas-Hamilton, finding that the term "connector assembly," unlike "lever moving element" and "movable link member," had an understood structural definition in the relevant art, as defined by the patent specification, dictionaries, and expert testimony. See Lighting World, 382 F.3d at 1363. The court further distinguished Mas-Hamilton since the prosecution record showed that the patentee in that case, unlike the patentee in Lighting World, had used the terms "element," "member," and "means" interchangeably, and in the patent itself the patentee described the "lever moving element" and the "movable link member" as the "[m]eans . . . for moving the lever, and the "[m]eans . . . for releasably maintaining the pivotable lever in a position substantially disengaged." Id. at 1362 (internal citation omitted).

By way of contrast to the phrase "connector assembly," following the Lighting World decision, the Federal Circuit held in M.I.T. that the term "colorant selection mechanism" failed to connote sufficient structure to a person of ordinary skill in the art, and therefore the patentee could not avoid the application of section 112, para. 6. "M.I.T., 462 F.3d at 1354. The court in that case reiterated that the terms 'mechanism,' 'means,' 'element,' and 'device,' typically do not connote sufficiently definite structure" to avoid application of section 112, P 6. Id. (citation omitted). The court further stated, however, that "[c]laim language that further defines a generic term like 'mechanism' can sometimes add sufficient structure to avoid 57 Ore. 541, 112 P 6." Id. On the record before it, though, the court concluded that "colorant selection," unlike "detent" in Greenberg, failed to add sufficient structure to define the term "mechanism," rendering section 112, P 6 applicable. Id. ("In contrast [to 'detent'], the term 'colorant selection,' which modifies 'mechanism' here, is not defined in the specification and has no dictionary definition, and there is no suggestion that it has a generally understood meaning in the art.")

Thereafter, in Welker Bearing Co. v. PHD, Inc., 550 F.3d 1090, 1096 (Fed. Cir. 2008), the Federal Circuit found the phrase "mechanism for moving said finger" subject to the means-plus-function limitation for, inter alia, the following reasons:

The applicant for the '254 patent could have supplied structural context to claim 1 in any number of ways. If claim 1 of the '254 patent had recited, e.g., a "finger displacement mechanism," a "lateral projection/retraction mechanism," or even a "clamping finger actuator," this court could have inquired beyond the vague term "mechanism" to discern the understanding of one of skill in the art. If that artisan would have understood such language to include a structural component, this court's analysis may well have turned out differently. Instead the applicant chose to express this claim element as "a means or step

"
for performing a specified function without the recital of structure, material, or acts in support thereof." 35 U.S.C. § 112 P 6.

Welker Bearing, 550 F.3d at 1096-97. The Court now turns to the disputed claim terms and construes them in light of this body case law.

2. Analysis of Claim Limitations

Claim 11 in '668 Patent

"a first food preparation assembly operable to prepare raw food product using steam and at least one of radiating heat and forced air convection";

"a smoking assembly configured to deliver heat to an aromatic smoke producing media that emits smoke into the heating cavity in response to the delivered heat"

Claim 1 in '173 Patent

"a first food preparation assembly comprising a steam assembly selectively providing steam into the interior to prepare food";

"the steam assembly comprising a steam producing assembly capable of delivering liquid across the heating element that transforms the liquid into steam that is delivered to the interior of the heating cavity"; and

"a smoking assembly selectively delivering smoke into the interior independently of the first food preparation assembly"

As a threshold observation, these claim limitations clearly do not fit squarely within the standard means-plus-function analysis. Because the "first food preparation assembly" limitation and the "smoking assembly" limitation in Claim 11 of the '668 Patent do not contain the words "means" or "means for," the Court begins with the strong presumption that section 112, P 6 does not apply to this limitation. See Lighting World, 382 F.3d at 1358. Similarly, because the "steam assembly" limitation, the "first food preparation assembly" limitation and the "smoking assembly" limitation in Claim 1 of the '173 Patent do not contain the words "means" or "means for," the Court begins with the presumption that section 112, P 6 does not apply to these limitations. See id. Further, the disputed claim terms do not contain the "generic terms 'mechanism,' 'means,' 'element,' and 'device,' [which] typically do not connote sufficiently definite structure" See M.I.T., 462 F.3d at 1354 (quoting Personalized Media Communications, 161 F.3d at 704). Accordingly, to overcome the strong presumption that section 112, P 6 does not apply to these limitations, Defendants must "demonstrate[] that the claim term[s] fail[] to recite sufficiently definite structure or else recite[] function without reciting sufficient structure for performing that function."

Lighting World, 382 F.3d at 1358.

Defendants' Opening Brief

To rebut the presumption that section 112, P 6 does not apply, Defendants first contend that the claim limitations are defined in purely functional terms, rather than structural terms:

Claim 11 of the '668 Patent does not recite sufficiently definite structure for the "first food preparation assembly," thus making this limitation a means-plus-function limitation. The claim defines this limitation in functional terms by what it does, rather than by what it is. The recited function is being "operable to prepare raw food product using steam and at least one of radiating heat and forced air convection." This functional description says nothing about structure -- it reveals merely that there be some means to prepare raw food product with steam and either heat or forced air convection. The claim does not recite any definite structure for generating steam, generating radiating heat, or causing forced air convection.

Def. Opening Brief at 11 (original emphasis). Defendants make the same argument with regard to the phrase "smoking assembly" in Claim 11. See id. at 16 ("Claim 11 of the '668 Patent does not recite sufficiently definite structure for the 'smoking assembly' limitation. An analysis similar to the one applied to the 'first food preparation assembly' applies . . . Claim 11 uses only functional language for this limitation, describing the limitation by what it does rather than by what it is.") Similarly, with regard to the disputed claim terms in Claim 1, Defendants' arguments are essentially the same. See id. at 18 ("Claim 1 of the '173 Patent also does not recite sufficiently definite structure for the 'steam assembly' limitation. An analysis similar to the one used for the 'first food preparation assembly' and the 'smoking assembly' limitations applies.

- 717 -
First, Claim 1 again uses only functional language for this limitation, describing the limitation by what it does rather than what it is . . . None of the language discloses structure . . . id. at 19-20 (“For the same reasons discussed above with respect to the 'smoking assembly' limitation of Claim 11 of the '668 Patent, the 'smoking assembly' limitation of Claim 1 of the '173 Patent also is a means-plus-function limitation. While the stated function is slightly different (selectively delivering smoke into the interior independently of the first food preparation assembly), again the claim recites no definite structure to perform the function. Claim 1 defines this limitation in functional terms by what it does rather than by what it is.”).

In addition, Defendants contend that the term “assembly,” which is part of each disputed claim limitation, "is merely a generic term that does not connote sufficiently definite structure to avoid the application of § 112, P 6 . . . Indeed, if the term 'means' were substituted for the term 'assembly,' there would be no difference in the ultimate construction of the claim." Def. Opening Brief at 11-12. According to Defendants, "the term 'assembly' is like the term 'mechanism' -- standing alone it is a generic term that does not constitute sufficiently definite structure to avoid treatment under § 112, P 6." Id. at 12-13. Further, Defendants argue that "the myriad ways the term 'assembly' is used in the '668 Patent demonstrates that the term is not a definite structure." Id. at 12. Defendants point out that in the '668 patent, the term "assembly" is used 127 times, and in the specification is used "in connection with no less than 12 diverse types of structure[.]" Id.

Citing to M.I.T., where the court held that "colorant selection mechanism" was not sufficiently structural to avoid application of section 112, P 6, Defendants posit:

In analyzing the term "mechanism" alone, the Court determined that it did not recite sufficiently definite structure, noting that the term "standing alone connotes no more structure than the term 'means.'" "Assembly" has been treated no differently. In Lighting World, the Federal Circuit relied upon the dictionary definition of the term "connector" that demonstrated that it had a generally understood meaning, and, therefore, that "connector assembly" did recite definite structure. Notably, the Federal Circuit did not even analyze the term "assembly" to determine if it had a generally understood meaning. "Assembly" is generic, and the Federal Circuit has never suggested that the term "assembly," on its own, is a sufficiently definite recitation of structure."

Def.Opening Brief at 13 (internal citations omitted).

Defendants next argue that, unlike the terms "detent mechanism" in Greenberg, supra, and "connector assembly" in Lighting World, supra, where dictionary definitions showed the terms had sufficiently well understood structural meaning to persons of skill in the art, the addition of the modifiers "first food preparation," "smoking" and "steam," to the generic word "assembly" does not add sufficient structure. Id. at 13-19. According to Defendants, these are mere labels to differentiate the various types of assemblies, and these modifiers, which lack any dictionary definitions, are more akin to the modifier "colorant selection" in M.I.T., supra, where the court found that the presumption against application of section 112, P 6 had been rebutted.

In a further effort to rebut the presumption that section 112, P 6 does not apply to the disputed claim terms, Defendants cite to the deposition testimony of one of the patents' named inventors, Janus Bartelick. See Def. Opening Brief at 15 ("Named inventor Janus Bartelick agrees that Claim 11 does not disclose any definite structure and, instead, that Claim 11 would read on any combination oven('combi oven') having any structure that performs the recited function.") The deposition transcript provides:

Q. . . . [T]his is your issued patent I'm now talking about. It says "first food preparation assembly operable to prepare raw food product using steam in at least one of radiating heat and forced air convection." Do you understand what that means?

A. Yes, I do understand that you can cook in either steam, convection, or the combination of steam and convection.

Q. And you understand that that would cover anything that you used to generate steam, radiating heat or forced air convection as long as you could cook with steam and either heat or forced air convection?

A. This means basic functions of the combination oven, that you can cook in steam, convection or the combination of two.

Q. Right. And you understand the claim to cover anything that would perform those basic functions?
A. In the combi oven, yes.

Def. Opening App. at 152-153 (Ex. 7). Defendants conclude: "Thus, named inventor Bartelick agrees that the claim is described in terms of its function, rather than in terms of its structure." Def. Opening Brief at 15.

4 Defendants also seek to introduce deposition testimony from Janus Bartelick regarding the "smoking assembly" in Claim 11, contending that the testimony shows that Mr. Bartelick agrees that the claims do not disclose any structure, but are purely functional. See Def. Opening Brief at 16-18. Alto-Shaam contends that Defendants have selectively quoted from Mr. Bartelick's deposition, and that "taken in context, Defendants' characterization of Mr. Bartelick's testimony is without support." Pl. Resp. Brief at 11-12. Having read the portion of Mr. Bartelick's deposition in dispute (see Pl. Resp. App. at 1113-1115, 1116-1117), while it appears that Alto-Shaam is likely correct that Mr. Bartelick is testifying that the smoking assembly and/or smoker box could be internal or external, the testimony is, at best, ambiguous. The Court will therefore not consider it.

Alto-Shaam's Response

In response, Alto-Shaam contends that Defendants have failed to rebut the strong presumption against means-plus-function claiming. In support, Alto-Shaam argues that case law cited by Defendants is distinguishable or inapplicable, that reliance on Janus Bartelick's testimony is misplaced, that the specifications show that the disputed claim terms denote structure 5 , and that Alto-Shaam exercised its option to not claim in means-plus-function form. In further support, Alto-Shaam introduces a dictionary definition of "assembly," as well as the Declaration of named inventor William Hansen.

With regard to case law, Alto-Shaam contends that "first food preparation assembly," "smoking assembly," and "steam assembly," "refer to structures that take their names from the function they perform [and] [t]hese terms are therefore more like the 'connector assembly' in Lighting World than the 'lever moving element' or 'movable link member' of Mas-Hamilton. Mas-Hamilton therefore has no bearing on the issues in this case." Pl. Resp. Brief at 6. Alto-Shaam also distinguishes Mas-Hamilton since, as explained by the court in Lighting World, the prosecution record in that case showed that the patentee, unlike the patentee in Lighting World, had used the terms "element," "member," and "means" interchangeably, and in the patent itself the patentee described the "lever moving element" as the "[m]eans... for" moving the lever, and the "[m]eans... for releasably maintaining the pivotable lever in a position substantially disengaged." Lighting World, 382 F.3d at 1362 (internal citation omitted). Similarly, in M.I.T., in reaching its decision that "colorant selection mechanism" was subject to section 112, P 6, the court gave weight to the fact that the patentee had used the terms "mechanism" and "means" as synonyms. See generally M.I.T., 462 F.3d at 1354. No such evidence of synonymous usage is present in this case. As to Welker Bearing, where the court held that "mechanism for moving said finger" was a limitation subject to means-plus-function treatment, Alto-Shaam argues that, unlike in that case, the "patent claims as a whole makes it abundantly clear that the term 'assembly' denotes structure." Pl. Resp. Brief at 8.

As to Defendants' argument that named inventor Janus Bartelick's deposition testimony regarding the term "first food preparation assembly" supports application of section 112, P 6 to the disputed claim terms, Alto-Shaam argues that, based on the court's reasoning in Lighting World, Mr. Bartelick's testimony actually supports Alto-Shaam's proposed claim construction:
While the terms "connector" and "connector assembly" are certainly broad, and may in the end include any structure that performs the role of connecting, the same could be said of numerous other terms, such as "clamp," or "clip," or even "support member[.]" Those terms are routinely treated as structural by patent practitioners and courts, and we conclude there is no reason to treat the term "connector assembly" any differently for purposes of § 112, P 6.

Pl. Resp. Brief at 9 (quoting Lighting World, 382 F.3d at 1361). To review, Mr. Bartelick testified that "first food preparation assembly" could be any structure that performs the role of convection or combination steam and convection cooking in the combination oven. See Def. Opening App. at 152-53. Alto-Shaam argues that this testimony, contrary to Defendants' interpretation, is consistent with the court's reasoning in Lighting World.

Alto-Shaam also introduces extrinsic evidence in support of its argument that Defendants have failed to rebut the presumption that section 112, P 6 does not apply to the disputed claim terms. Specifically, Alto-Shaam introduces the Declaration of named inventor William Hansen. See Pl. Resp. App., vol. 1 Ex. A (Declaration of William Hansen). Mr. Hansen testified as follows:

A person with ordinary skill provided with nothing more than Alto-Shaam's patents would recognize that "smoking assembly" is a number of component pieces fitted together to form a whole capable of delivering heat to an aromatic smoke producing media. A skilled artisan would also easily determine that the "steam producing assembly" is a number of component pieces fitted together to form a whole capable of delivering liquid across the heating element which transforms the liquid into steam. A person of ordinary skill in the art of oven design is aware that combination ovens utilize multiple cooking processes to prepare food. Therefore, a person of ordinary skill would also understand that the "first food preparation assembly" is a number of component pieces fitted together to form a whole capable of cooking food using one cooking process -- in this case convection heat, steam, and/or radiant heat -- before a second food preparation process, such as smoke, is engaged to continue the cooking process.

Id. at 17 (Hansen Decl. P 28).

Alto-Shaam has also submitted the definition of "assembly" contained in the SHORTER ENGLISH OXFORD DICTIONARY 133 (5th ed. 2002). See Pl. Resp. App. at 1105-1107 (defining "assembly" as "a collection of objects; esp. a number of component pieces fitted together to form a whole; a device consisting of numerous parts.").

Defendants' Response to Alto-Shaam

Defendants first contend that: "Plaintiff's reliance on Lighting World is misplaced. In that case the determination that a 'connector assembly' was not a means-plus-function limitation had nothing to do with the use of the term 'assembly.' The Federal Circuit held that 'connector' had a well-known structural meaning to persons of skill in the art in light of dictionary definitions of 'connector.' No similar evidence exists in this case." Def. Resp. Brief at 4-5.

As to Alto-Shaam's statement that the claims of the '668 Patent themselves recite sufficient structure forthethe "first food preparation assembly," Defendants point out that Alto-Shaam supports this proposition by citing to Claim 1 of the '668 Patent, when the Court is concerned with the recitation of "first food preparation assembly" in Claim 11. Id. at 6 ("Once again Plaintiff confuses the issue. The issue is whether the term 'first food preparation assembly' in Claim 11 of the '668 Patent recites sufficient structure 'within the claim itself,' not whether sufficient structure is recited in other claims.") (original emphasis) (citations omitted). According to Defendants, "Claim 11 does not recite the structure that Plaintiff alleges is 'sufficient structure' for the 'first food preparation assembly.' By citing Claim 1, Plaintiff tacitly admits that Claim 11 does not recite sufficiently definite structure to avoid the application of 35 U.S.C. § 112, P 6." Id. (quoting Personalized Media Communications, 161 F.3d at 704) ("the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112, P 6").

With regard to the extrinsic evidence, Defendants argue that the Court should give little weight to Mr. Hansen's declaration, deeming itself-serving and conclusory. See Def. Resp. Brief at 1, 7-8. Defendants further argue that Mr. Hansen's testimony actually supports application of means-plus-function limitations, since he asserts that a person of skill in the art would understand all of the disputed claim limitations as a "number of component pieces" that collectively perform the functions cited in the claim. Id. at 1. According to Defendants, Mr. Hansen's "view would encompass every conceivable structure for performing the functions recited in the claim [and] Plaintiff is not entitled to such a construction[.]" Id. at 7 (citing Mas-
With regard to the dictionary definition introduced by Alto-Shaam, Defendants assert that an "assembly" is defined as a generic structure, "a collection of objects" or a "device consisting of numerous parts." Defendants cite to numerous cases where the term "device," like "mechanism," was held to be a generic term lacking sufficient structure to avoid the ambit of section 112, P 6. Id. at 7 (citations omitted). Defendants contend: "To the extent that Plaintiff is arguing that it somehow escapes means-plus-function treatment because an assembly has multiple parts instead of a single part, that argument is baseless." Id.

Further, to counter Alto-Shaam's argument that the disputed claim terms should be given their ordinary meaning, Defendants introduce the deposition testimony of one of the named inventors, Patrick Willis, who testified that he is not familiar with the disputed claim terms in this case:

Q. Do you know what that term means, "first food preparation apparatus"?
A. No.

Q. "First food preparation assembly," that's not a term you used around the office, correct?
A. No.

. . .

Q. But you've never used the term before?
A. I have not.

Q. Have you ever used the term "first food preparation assembly before?"
A. No.

Q. All right. Have you ever used the word "steam assembly" before?
A. No.

Q. The term "steam assembly" is not a term of art you're aware of?
A. No.

Q. The term "first food preparation assembly" is not a term you are aware of?
A. Correct.

Def. Resp. App., Ex. 8 at 7-8 (Deposition of Patrick A. Willis).

3. The Court's Ruling
a. Inventor Testimony

With regard to credibility assessments of experts in patent cases, the Supreme Court stated in Markman:

It is, of course, true that credibility judgments have to be made about the experts who testify in patent cases, and in theory there could be a case in which simple credibility judgment would suffice to choose between experts whose testimony was equally consistent with the patent's internal logic. But our own experience with document construction leaves us doubtful that a trial court will run into many cases like that. In the main, we expect, any credibility determinations will be subsumed within the necessarily sophisticated analysis of the whole document, required by the standard construction rule that a term
can be defined only in a way that comports with the instrument as a whole.

Markman, 517 U.S. at 389. Mr. Hansen's testimony is in no way inconsistent with the specification and file history in this case, and accordingly the Court will consider it. Defendants' contention that his Declaration is self-serving and conclusory would be of more concern to the Court were he to define the terms in a way that did not comport with the instrument as a whole. See id. The Court also takes into account Mr. Hansen's qualifications, including a Bachelor of Science Degree in mechanical engineering and significant experience in the industry, and concludes he is well-qualified as one of ordinary skilfin the art of combination oven design. See generally Pl. Resp. App., vol. 1 Ex. A (Hansen Decl. PP 2-3).

As to Mr. Willis's deposition testimony that he is unfamiliar in common parlance with the disputed claim terms, however, the Court agrees with Alto-Shaam that his testimony is entitled to little weight. As a review of his deposition transcript makes clear, Mr. Willis has little to no experience in engineering or combination oven design, and pursued a general business degree for two years, but never graduated from college. See Pl. Resp. App. at 1126-1128, vol. 3 Ex. F. Further, Mr. Willis testified that he did not participate in designing the prototype of the combination oven, but only provided the concept to the engineering team, which took the concept and designed the prototype. Id. at 1131-1135.

Finally, the Court will not consider the testimony of Cleveland Range engineer Robert McGhee offered by Alto-Shaam. As Defendants correctly argue, a review of Mr. McGhee's actual testimony reveals that he did not even provide testimony about a "smoking assembly" or mention the patents involved in this case, but rather discussed a "smoker box assembly." See Def. Resp. Brief at 11. Accordingly, his testimony is irrelevant.

b. Claim Construction

First, while the Court finds that, facially, the disputed claim terms do not appear to connote any specific structure, and can be interpreted as describing an apparatus based on the function it performs, as Defendants have argued, the case law provides that to avoid application of section 112, P 6, the delineation of a particular structure, and the identification of structure separate from its function, are not required. See Lighting World, 382 F.3d at 1359-60. Rather, to avoid falling into the ambit of section 112, P 6, the phrase must be used in common parlance or by persons of skill in the pertinent art to designate structure, even if the structure described is of a broad or amorphous class. See id. (to avoid application of "section 112 P 6, we have not required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function.") (emphasis added).

Further, the Court's analysis of the case law (see supra) reveals that both parties engage in arguments in an attempt to align this case to those previous cases they perceive are most favorable to their position regarding the reach of section 112, P 6. Contrary to Alto-Shaam's argument that the disputed claim terms in this case are somehow akin to the term "connector assembly" in Lighting World, as Defendants correctly point out, the court in that case did not even discuss the term "assembly," and focused instead on "connector." See generally Lighting World, supra. Thus, while the overarching principles governing means-plus-function claiming in this case are relevant to the Court's analysis today, with regard to the term "assembly," Lighting World sheds no light. With regard to the case law which Defendants cite to support their argument, the Court discerns that Defendants omit several key distinguishing factors present in those case. For example, two key factors relied upon by the court in M.I.T. to ultimately construe "colorant selection mechanism" as a means-plus-function element, are not present in the instant case. See generally M.I.T., 462 F.3d at 1354. In that case, the court took into account that "the patentee used 'mechanism' and 'means' as synonyms" in the patent, and that "one dictionary definition equates mechanism with means." Id. By contrast, the prosecution history of the '668 and '173 Patents lacks any synonymous usage of the terms "assembly" and "means," and the Court is unaware of any dictionary definition equating "assembly" with "means. In fact, the dictionary definition before the Court defines "assembly" in purely structural terms.

Similarly, several key factors relied upon by the court in Mas-Hamilton to construe "lever moving element" and "movable link member" as means-plus-function claim limitations, are not present herein. First, in Mas-Hamilton, the court pointed out that the patentee had "not directed [the] court to any evidence demonstrating the district court erred in determining that the term 'lever moving element' lacks a reasonably well understood meaning in the relevant lock art[.]" and "there was no evidence that 'movable link member' has a well-understood meaning in the art." 156 F.3d at 1213-15. By contrast, in this case Alto-Shaam has introduced into the record named inventor William Hansen's testimony that to one skilled in the art of combination oven design, the disputed claim terms connote structure, as well as a dictionary definition of "assembly" from
which the Court readily concludes that the term is defined as a structure. Further, as highlighted by the Lighting World court in distinguishing Mas-Hamilton, the prosecution record showed that the patentee in that case, unlike the patentee in Lighting World, had used the terms "element," "member," and "means" interchangeably, and in the patent itself the patentee described the "lever moving element" and the "movable link member" as the "[m]eans . . . for" moving the lever, and the "[m]eans . . . for releasably maintaining the pivotal lever in a position substantially disengaged." Lighting World, 382 F.3d at 1363. Again, no such evidence that the applicant used the disputed terms interchangeably with "means" or "means for" has been introduced in this case.

Welker Bearing, where the Federal Circuit found the phrase "mechanism for moving said finger" subject to the means-plus-function limitation, is also distinguishable. "Mechanism," which was not modified, is different from "assembly" in this case, which is modified. Further, unlike in Welker Bearing, Mr. Hansen, one skilled in the art of combination oven design and engineering, testified that such language includes a structural component. Contrast Pl. Resp. App. at 17 (Hansen Decl.) with Welker Bearing, 550 F.3d at 1096-97. ("If claim 1 of the '254 patent had recited, e.g., a "finger displacement mechanism," a "lateral projection/retraction mechanism," or even a "clamping finger actuator," this court could have inquired beyond the vague term "mechanism" to discern the understanding of one of skill in the art. If that artisan would have understood such language to include a structural component, this court's analysis may well have turned out differently.") (emphasis added). Here, the Court has been able to inquire beyond the term "assembly" to determine that an artisan understands the language to have a structural component. Finally, Welker Bearing is distinguishable because, as Alto-Shaam points out, in that case, "the limitation used the term 'for' -- one half of the phrase 'means for' that is 'part of the classic template for functional claim elements . . . [that] have come to be closely associated with means-plus-function claiming.'" Pl. Resp. Brief at 7 (quoting Lighting World, 382 F.3d at 1358). No such language appears in Claim 11 or Claim 1.

Further, while Defendants argue that Mr. Hansen's testimony supports application of means-plus-function limitations, since his "view would encompass every conceivable structure for performing the functions recited in the claim [and] Plaintiff is not entitled to such a construction[]" (Def. Resp. Brief at 7) (citing Mas-Hamilton, 156 F.3d at 1214), the Court is mindful of the principles enunciated in Lighting World, where the Federal Circuit held that section 112, P 6 is not implicated "even if the term covers a broad class of structures and even if the term identifies the structures by their functions." See Lighting World, 382 F.3d at 1359-60 (citations omitted). Contrary to Defendants' argument, that the disputed claim terms are understood to one skilled in the art as including "a number of component pieces fitted together to form a whole" (see Hansen Decl. P 28) capable of performing various function set forth in the patent does not automatically bring the claim terms at issue within the ambit of section 112, P 6. See id. 6

6 Although the Court has made a finding that Patrick Willis is not a person of skill in the art of combination oven design (see supra), even assuming arguendo that the Court were to consider his testimony that he is not familiar with the terms "first food preparation assembly" and "steam assembly" (see Def. Resp. App., Ex. 8 at 7-8 (Willis Depo .)), the Court would nevertheless reach the same conclusion based on the entire record that Defendants have failed to rebut the strong presumption that section 112, P 6 does not apply. Moreover, the Court notes that Mr. Willis does not provide any testimony regarding the disputed claim term "smoking assembly."

Also significant on this point is the Federal Circuit's rejection in Lighting World of the district court's decision to apply section 112, P 6, which the Federal Circuit characterized as "unduly restrictive," as it was based on testimony of a defense expert that the term "connector" "encompasses 'at least a single infinity of possible devices' and that the term 'would not provide [him] or others of ordinary skill in lighting fixture art with sufficient structural information to put [him] on notice as to what device or component would read on the claim element." 382 F.3d at 1359. The Federal Circuit rejected the premise "[i]mplicit in [the defense expert's] testimony" "that in order to be regarded as structural for purposes of section 112, P 6, a claim limitation must identify a specific structure and not use a generic term that includes a wide variety of structures." Id. This faulty premise is the basis of Defendants' argument that Mr. Hansen's testimony supports means-plus-function limitations in this case. As in Lighting World, this Court rejects the premise upon which Defendants' argument hinges as "unduly restrictive." See Lighting World, 382 F.3d at 1359. 7
Similarly, the Court rejects Defendants' argument that named inventor Janus Bartelick's deposition testimony regarding the term "first food preparation assembly" is effective to rebut the presumption against means-plus-function claiming. To review, Mr. Bartelick testified that "first food preparation assembly" could be any structure that performs the role of convection or combination steam and convection cooking in the combination oven. See Def. Opening App. at 152-53. Whether a "first food preparation assembly" could cover a broad class of structures is not the relevant inquiry. See Lighting World, 382 F.3d at 1359-60 (to avoid application of "section 112P 6, we have not required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function.") (emphasis added). At a minimum, Mr. Bartelick's testimony indicates that to one skilled in the art of combination oven design, the disputed claim term designates structure.

The Court also considers the dictionary definition of "assembly" introduced by Alto-Shaam. See generally Lighting World, 382 F.3d at 1360 (courts are encouraged to look "to the dictionary to determine if a disputed term has achieved recognition as a noun denoting structure, even if the noun is derived from the function performed."). Alto-Shaam has submitted the definition of "assembly" contained in the SHORTER ENGLISH OXFORD DICTIONARY 133 (5th ed. 2002). See Pl. Resp. App. at 1105-1107 (defining "assembly" as "a collection of objects; esp. a number of component pieces fitted together to form a whole; a device consisting of numerous parts."); see also THE NEW OXFORD AMERICAN DICTIONARY 95 (2001) (defining "assembly" as "a unit consisting of components that have been fitted together: the tail assembly of the aircraft"). Clearly this definition describes structure (albeit not a specific structure), and cannot be said to be a "nonce word" or a "verbal construct" that is "simply a substitute for the term 'means for.'" Lighting World, 382 F.3d at 1360. Further, it is significant that the Lighting World court looked to whether the disputed claim term was "understood to describe structure" in general, not a structure. 382 F.3d at 1360. To reiterate the court's reasoning in not applying section 112, P 6:

[W]hile it is true that the term "connector assembly" does not bring to mind a particular structure, that point is not dispositive. What is important is whether the term is one that is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term "means for."

Id.; see also id. (citing cases where the court rejected arguments that "broad" terms such as 'digital detector,' 'eyeglass hanging member,' 'reciprocating member,' and 'sealingly connected' joints trigger section 112 P 6.") (internal citations omitted).

While it is true that the term "connector assembly" does not bring to mind a particular structure, that point is not dispositive. What is important is whether the term is one that is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term "means for."

In short, having considered the entire record in the context of the applicable law, the terms "first food preparation assembly," "smoking assembly," and "steam assembly," in the context of Claim 11 of Patent '668 and Claim 1 of '173 Patent connote a sufficient degree of structure to one of ordinary skill in the art to avoid section 112, P 6. 9 Accordingly, the Court concludes that Defendants have failed to rebut the presumption that section 112, P 6 does not apply to the disputed claim terms.

In reaching this decision, the Court has taken into account Defendants' argument that Alto-Shaam cites to portions of Claim 1 and Claim 4 of the '668 Patent to support its assertion that the disputed claim terms in Claim 11 recite sufficient structure and makes similar arguments regarding the '173 Patent. Def. Resp. Brief at 6 ("By citing Claim 1, Plaintiff tacitly
admits that Claim 11 does not recite sufficiently definite structure to avoid the application of 35 U.S.C. § 112, P 6.” While the Court is concerned with the disputed claim terms as used in Claim 11, nothing prevents the Court from viewing the instrument as a whole. See generally Research Plastics, Inc. v. Fed. Packaging Corp., 421 F.3d 1290, 1295 (Fed. Cir. 2005) (“claim terms are presumed to be used consistently throughout the patent, such that the usage of a term in one claim can often illuminate the meaning of the same term in other claim”).

In reaching this decision, the Court additionally takes into account that the presumption against construing an element as means-plus-function arises from the premise that section 112, P 6 provides the patentee the option of drafting the patent in the means-plus-function format. See Greenberg, 91 F.3d at 1584. It appears to the Court that if the patentee had wished to exercise the option to invoke section 112, § 6, the patentee would have done so, and there is nothing in the record to suggest that patent counsel intended to claim in means-plus-function form. See generally Unidynamics Corp. v. Automatic Prods. Intern., Ltd., 157 F.3d 1311, 1319 (Fed. Cir. 1998), abrogated on other grounds by Egyptian Goddess, Inc. v. Swisa, 543 F.3d 665 (Fed. Cir. 1998) (use of the term "means" generally shows that the patent applicant has chosen the option of means-plus-function format invoking section 112, P 6). This case is therefore distinguishable from Welker Bearing, where the applicant "chose to express ['mechanism for moving said finger'] as a 'means or step for performing a specific function without the recital of structure, material or acts in support thereof.'” 550 F.3d at 1096-97 (quoting 35 U.S.C. § 112, P 6).

IV. Conclusion

Based on the foregoing, the Court concludes that Defendants have failed to overcome the presumption that section 112, P 6 does not apply to the claim limitations at issue in Claim 11 of the ’668 Patent and Claim 1 of the ’173 Patent. See generally Lighting World, 382 F.3d at 1358. As such, the Court construes the following limitations of the ’668 Patent and the ’173 Patent according to their ordinary meanings. 10

1. In Claim 11 of the ’668 Patent, "a first food preparation assembly operable to prepare raw food product using steam and at least one of radiating heat and forced air convection" means "a number of component pieces fitted together to form a whole capable of cooking food using one cooking process -- in this case convection heat, steam, and/or radiant heat -- before a second food preparation process, such as smoke, is engaged to continue the cooking process";

2. In Claim 11 of the ’668 Patent, "a smoking assembly configured to deliver heat to an aromatic smoke producing media that emits smoke into the heating cavity in response to the delivered heat" means "a number of component pieces fitted together to form a whole capable of delivering heat to an aromatic smoke producing media";

3. In Claim 1 of the ’173 Patent, "a steam assembly selectively providing steam into the interior to prepare food . . . the steam assembly comprising a steam producing assembly capable of delivering liquid across the heating element that transforms the liquid into steam that is delivered to the interior of the heating cavity" means:

a. "a steam assembly" -- "a number of component pieces fitted together to form a whole capable of providing steam into the interior to prepare food;" and

b. "steam producing assembly" -- "a number of component pieces fitted together to form a whole capable of delivering liquid across the heating element which transforms the liquid into steam."

4. In Claim 1 of the ’173 Patent, "a smoking assembly selectively delivering smoke into the interior independently of the first food preparation assembly" means, "a number of component pieces fitted together to form a whole capable of selectively delivering smoke into the interior independently of the first food preparation assembly";

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 See Phillips, 415 F.3d at 1312-13 (words of a claim "are generally given their ordinary and customary meaning, [which] . . . is the meaning that the [words] would have to a person of ordinary skill in the art in question at the time of the invention, i.e., as of the effective filing date of the patent application.") (internal quotation marks and citations omitted).
Claim 13 of the '839 patent covers:

A vend control circuit comprising

[a] a coin unit for accepting coins of at least two different denominations,

[b] accumulator means operatively connected to the coin unit including means for entering into the accumulator means amounts representing the value of each different denomination coin deposited during a vend operation,

[c] a price accumulator means having

[c.1] a plurality of input connections for the entry therein of a selected vend price, said last named means including

[c.2] a plurality of serially connected vend selection switches any one of which can be actuated by a customer depending on the vend he chooses,

[c.3] a vend price establishing device associated respectively with each of the vend selection switches, each of said vend price establishing devices having a corresponding number of input and output connections,

[c.4] means operatively connecting the output connections respectively to the input connections of the price accumulator,

[c.5] means establishing continuity between selected ones of the input and output connections of the price establishing means depending on the price to be established thereby for entry into the price accumulator,

[c.6] a source of pulses connected in circuit with the series connected selection switches, operation of a selected one of said selection switches establishing a circuit connection between the pulse source and selected inputs to the price accumulator through the associated vend price establishing device, and

[d] means for producing a vend signal to initiate a vend operation whenever the amount entered in the accumulator means at least equals the amount entered in the price accumulator.

(Def. Exh. 880.)

As is evident from the claim language, Claim 13 encompasses numerous limitations. Coinco created the paragraphing utilized above in order to identify the various limitations and facilitate analysis of the claim. Mars objects to the paragraphing as "incorrect and misleading" (Mars' Post-Trial Mem. at 8 n.5), but nevertheless used the designations in constructing its argument. Thus, although the Court has some reservations about Coinco's breakdown of the claim limitations, the Court will utilize them as well.

In order to prove direct infringement of Claim 13, Coinco must establish that Mars' accused coin changers (when used in "Type I" and "Type II" vending machines) satisfy each of the numerous limitations of the claim. Mars concedes that its accused changers connected to a "Type I" or "Type II" vending machine comprise a vend control circuit, and include "a coin unit for accepting coins of at least two different denominations," but disputes the presence of the remaining claim elements. Mars focuses primarily on four specific elements: [b], [c.3], [c.6], and [d]. For the reasons explained herein, the Court finds that element [c.3] is not present in Mars' changers. Accordingly, Coinco cannot prove direct infringement of the '839 patent and cannot succeed on its contributory infringement or inducement of infringement claim.

A. Claim Construction of Element [c.3]
Patent infringement analysis is a two-step process. Cybor Corp. v. FAS Techs., 138 F.3d 1448, 1454 (Fed. Cir. 1998). First, the Court must construe the claim—or in this case the particular limitation—at issue. The proper construction of the claim is a matter of law to be decided by the Court without reference to the allegedly infringing device. Markman v. Westview Instruments, 52 F.3d 967 (Fed. Cir. 1995) (en banc), aff'd 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996); Pall Corp. v. Hemasure Inc., 181 F.3d 1305, 1308 (Fed. Cir. 1999). "Ascertaining the meaning of the claims requires that they be viewed in the context of those sources available to the public that show what a person of skill in the art would have understood the disputed claim language to mean." MBO Labs., Inc. v. Becton, Dickson & Co., 474 F.3d 1323, 1329 (Fed. Cir. 2007) (internal quotation marks omitted).

When conducting this claim construction analysis, the Court may consider various sources. The starting point for the analysis is the claim language itself. Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999); Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Other than the actual claim language, [t]he most relevant source is the patent's specification, which is the single best guide to the meaning of the disputed term. Next in importance is the prosecution history, which is also part of the "intrinsic evidence" that directly reflects how the patentee has characterized the invention. Extrinsic evidence--testimony, dictionaries, learned treatises, or other material not part of the public record associated with the patent--may be helpful but is less significant than the intrinsic record in determining the legally operative meaning of claim language.

MBO Labs., 474 F.3d at 1329 (internal quotation marks and citation omitted).

Here, the disputed question is whether the proper construction of element [c.3] requires a one-to-one relationship between vend selection switches and vend price establishing devices. Mars argues that it does. Coinco disagrees and argues that there is no requirement of a one-to-one association.

To resolve this question, the Court turns first to the claim language. Element [c.3] requires "a vend price establishing device associated respectively with each of the vend selection switches." The article "'a' normally refers to the singular." North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1575-76 (Fed. Cir. 1993). Accordingly, the claim language can be restated as "one vend price establishing device associated respectively with each of the vend selection switches." Mars argues that the word "respectively" in this sentence mandates the one-to-one relationship between vend price establishing devices and vend selection switches. Coinco disagrees. Coinco maintains that the following illustration depicts a situation wherein a vend price establishing device ("PD") is associated--but not "associated respectively"--with each vend selection switch ("SW"): 

[SEE ILLUSTRATION IN ORIGINAL]

Coinco asserts that the PDs and SWs are not "associated respectively" in the above example because there is overlap--i.e., some selection switches are associated with more than one vend price establishing device. Coinco contrasts this situation with the one depicted below:

[SEE ILLUSTRATION IN ORIGINAL]

Coinco maintains that in this latter illustration, a vend price establishing device is "associated respectively" with each of the vend selection switches, despite the lack of a one-to-one relationship, because each selection switch is associated with only one price establishing device.

Accordingly, the proper construction of claim limitation [c.3] depends on whether the word "respectively" in the limitation requires a one-to-one relationship between PDs and SWs (as Mars contends), or whether it permits multiple SWs to be associated with a single PD as long as no SW is associated with more than one PD (as Coinco contends).

As a general rule, all terms in a patent claim are given their "plain, ordinary and accustomed meaning," Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001), "unless the text of the patent makes clear that the word was used with a special meaning," Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1299 (Fed. Cir. 1999). An example, as provided below, illuminates the ordinary use and meaning of the word "respectively," and indicates that Mars' interpretation of the
language as requiring a one-to-one relationship is more sensible.

Compare, for example, the following two sentences: (1) The cat and the dog belong to John and Jane, respectively. (2) The cat, the dog, and the fish belong to John and Jane, respectively. Sentence (1) represents a typical use of the word "respectively." The meaning of the sentence is clear and understandable--the cat belongs to John and the dog belongs to Jane. Sentence (2) by contrast is incoherent. Unlike in sentence (1), it is impossible to be certain which animal belongs to which person. The only difference between the two sentences is that there is a one-to-one relationship between animals and people in sentence (1), but not in sentence (2). The addition of a third animal in sentence (2) eliminates the one-to-one relationship, and renders the sentence effectively meaningless.

This indicates that the word "respectively" generally requires a one-to-one relationship between the words it modifies in order to remain meaningful. Translating this idea back to the context at hand, the word "respectively" in the claim limitation would require a one-to-one relationship between selection switches and vend price establishing devices. Accordingly, the Court finds that the plain language of the claim limitation supports Mars' construction of the claim as requiring such a one-to-one association.

Further support for this conclusion is found in the patent's specification, which, after the claim language itself, has been characterized by the Federal Circuit as the "most relevant source . . . [and the] single best guide to the meaning of the disputed claims." MBO Labs., 474 F.3d at 1329. Figure 1 is a "block diagram of the vending control circuit of the instant invention." '839 patent, col. 2, lines 22-23. The figure reflects a one-to-one relationship between vend price establishing devices and vend selection switches. Specifically, selection switch 74 is associated with price establishing device 96 via motor hold switch 158 and motor 78, and selection switch 90 is associated with price establishing device 136 via an unnumbered motor hold switch and motor 94. Id. at Fig. 1; see also id. at col. 4, lines 43-50; col. 5, lines 36-39. Nowhere in the figure are two or more selection switches associated with a single price establishing device. See id. at Fig. 1; see also Trial Trans. 39/27/19-29/9 (Kesner). This clearly bolsters the conclusion that the proper construction of limitation [c.3] requires a one-to-one relationship between vend price establishing devices and selection switches.

Moreover, the Court's task when construing a claim is to ascertain what a person of ordinary skill would have understood the claim language to mean. MBO Labs., 474 F.3d at 1329. Mars' expert witness, Mr. Kesner, testified that an engineer of ordinary skill would expect from the figure that if another selection switch were added, then another motor hold switch, motor, and vend price establishing device would be added as well, thus maintaining the one-to-one relationship reflected in figure 1. 2 Trial Trans. 39/29/9-19 (Kesner). Coinco offered no contrary evidence indicating that a person of ordinary skill would have understood the claim language any differently. Two of Coinco's witnesses did testify that additional selection switches could be added without having to add additional price establishing devices by creating a diode "or" connection to an existing price establishing device. See Trial Trans. 35/143/11-144/21 (Morley); 37/101/4-10 (Levasseur); see also Mars, Inc. v. Coin Acceptors, Inc., Civ. Act. No. 90-49 (JCL), 478 F. Supp. 2d 689, 2007 U.S. Dist. LEXIS 20094 (D.N.J. Mar. 21, 2007) (explaining "or" connections). However, the mere fact that one could modify the invention by attaching additional switches to existin price establishing devices does not indicate that such a configuration was covered by the '839 patent. Indeed, the Court sustained an objection by Mars to further questions on this topic for precisely this reason. See Trial Trans. 35/145/1-151/16. Nor does anything in the patent suggest that such a configuration was contemplated by the inventors. See Trial Trans. 39/29/30-31/11 (Kesner). Mr. Kesner testified that if such a configuration had been contemplated, one would expect to see certain features, such as diodes, in the figure 1 diagram of the vending control circuit. Id.

2 Although trial testimony is "extrinsic evidence," which is considered "less significant than the intrinsic record in determining the legally operative meaning of claim language," MBO Labs., 474 F.3d at 1329, the Court finds this testimony to be helpful--indeed critical--to illuminating and interpreting the meaning of the patent specification and how it would be understood by a person of ordinary skill.

Accordingly, the undisputed evidence indicates that the person of ordinary skill would understand figure 1 as requiring a one-to-one relationship between selection switches and vend price establishing devices. This, in conjunction with the Court's independent interpretation of figure 1 as well as the claim language, supports Mars' interpretation of claim limitation.
Mars also argues that aspects of the written description as well as "market factors" indicate that the '839 is limited to circuits having a one-to-one ratio of selection switches and vend price establishing devices. See Mars Post-Trial Br. at 14-18. The Court is not persuaded by these arguments. Nor, however, does the Court find that these factors weigh in favor of Coinco's broader interpretation of the patent claim. Notably, Coinco does not argue that these factors support its interpretation. Nor does Coinco point to any other evidence--intrinsic or extrinsic--that supports its position. Accordingly, the only relevant and informative sources of guidance (the claim language and the figure included in the patent specification) weigh in favor of Mars' claim construction position, which the Court accepts.

Alternatively, Coinco's arguments at most present a case of ambiguity in claim construction, and the Federal Circuit has stated that "where the claim is so ambiguous as to support two differing interpretations, and resort to other intrinsic and extrinsic evidence does not resolve the confusion, a court should adopt the narrower of the suggested interpretations." Quickie Mfg. Corp. v. Libman Co., 180 F. Supp. 2d 636, 645 (D.N.J. 2002); see also Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir 1996); Athletic Alternatives v. Prince Mfg. ("AAI"), 73 F.3d 1573, 1581 (Fed. Cir. 1996).

In the AAI case, AAI had patented a stringing arrangement for tennis rackets in which the strings were offset at distances which "varied between" a minimum and a maximum distance from the racket's central plane. AAI, 73 F.3d at 1577. Both parties agreed (1) that the phrase "varied between" unambiguously covered a stringing arrangement in which three or more offset distances were used and (2) that a stringing arrangement which employed only a single offset distance was anticipated by the prior art. Id. at 1577, 1575. The disputed question in the case was whether AAI's claim was sufficiently broad to cover a stringing arrangement which employed exactly two offset distances. The Federal Circuit examined the claim language as well as other intrinsic and extrinsic evidence, but ultimately concluded that the reach of the claim was ambiguous and that it was impossible to tell with reasonable certainty whether it covered a racket with only two offset distances. AAI, 73 F.3d at 1578-81. The Court then found, based on its understanding of the second paragraph of 35 U.S.C. § 112, that to the extent that a claim is ambiguous, a narrow reading which excludes the ambiguously covered subject matter must be adopted. AAI, 73 F.3d at 1581; see also Ethicon Endo-Surgery, 93 F.3d at 1581.

Applying this principle to the instant case, the Court finds that the narrow interpretation of the limitation proffered by Mars must be adopted. This conclusion is bolstered by the facts noted above, namely that both the claim language and figure 1 of the patent favor Mars' position and that Coinco does not point to any evidence demonstrating that its proffered interpretation should be accepted over any other. In sum, the Court finds that the proper construction of claim limitation [c.3] requires a one-to-one relationship between selection switches and vend price establishing devices.

2. "an associated value representing a desired quality of result" (claims 9 and 23)

Omax proposes that this phrase "means a value that itself represents desired quality of result, and that can be specified by selecting any numeric, verbal, pictorial or other symbol representing such desired quality, (and which value is stored in computer memory, and is a value that a computer mathematically combines, with one or more other parameters which affect(s) the quality of result, to determine motion control commands provided to the machine tool to adjust velocity or acceleration to achieve the desired quality of result)." Omax continues by noting that an "associated value representing a desired quality of result can be expressed as a so-called 'percentage of speed' if it meets the criteria stated above. It cannot, however, be an actual speed stated in distance/time if such speed specification causes the machine tool to move strictly at the specified speed, without adjustment of the speed to achieve the desired quality of result." Flow's proposed construction is as follows: "A single number that directly represents finished surface quality itself; but cannot be a variable that affects the finished surface quality such as a number related to velocity (e.g. normalized speed or percentage speed scale) or material thickness."

The parties' central dispute is how the value that is inputted by the user "represents" the quality of result that is desired by the user. Flow alleges that this claim was plainly defined during the claim prosecution, when Omax differentiated from prior art by declaring:
However, neither Cutler, nor any other cited art, suggests that the number which should be stored should represent finished surface quality itself rather than any one of many factors which contributes to surface quality. In the claimed invention, a single value is stored which value represents directly the quality of result.

FLO 2268-69. Therefore, Flow argues, the absence of the word "directly" in Omax's proposed construction, and their effort to include "normalized speed" in their definition, is an effort to retrieve ground lost during claim prosecution. Schriber-Schroth Co. v. Cleveland Trust Co., 311 U.S. 211, 220-21, 61 S. Ct. 235, 85 L. Ed. 132, 1941 Dec. Comm'r Pat. 802 (1940) ("It is a rule of patent construction consistently observed that a claim in a patent as allowed must be read and interpreted with reference to claims that have been cancelled or rejected, and the claims allowed cannot by construction be read to cover what was thus eliminated from the patent.").

Omax, of course, disputes this characterization of its statement during the prosecution. The context of the disclaimer was the Cutler prior art, which required an operator to enter velocities of the cutter in surface feet per minute and inches of feed per spindle revolution. These velocity values were typically derived in reliance on a chart that proposed different speeds based on desired quality. Omax was attempting to distinguish the previous system by explaining that the value was not a velocity, but rather the quality level itself. It used the word "directly" to emphasize this difference, and not to distinguish its claim from any claim where the input "inferred" quality. There is no unequivocal disavowal of a variable inputted into an equation which infers quality, so long as it is not an actual velocity. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325-26 ("Consequently, for prosecution disclaimer to attach, our precedent requires that the alleged disavowing actions or statements made during prosecution be both clear and unmistakable."). Thus, Omax's patent prosecution statement must be construed in the proper context--distinguishing the new method from the Cutler prior art.

The Court is persuaded by Omax's expert's representation that "representing" has no specialized meaning in the art that would require the explicit exclusion of Flow's method. Hutchins's '596 Expert Report at 15 ("[I]t is my opinion that in this context the term 'represents' would reasonably be understood by a person of ordinary skill as meaning 'symbolizes' or 'stands for'.") In its ordinary and customary meaning, and as used in the claim specification, the "value representing quality of result" is a variable that relates to or infers the ultimate quality of the piece that is cut. It is one of a number of factors included in a formula that ultimately dictates how the cutting head behaves.

Pursuant to the rules of claim construction, the Court will not determine infringement through its claim construction; instead, the Court will adopt a construction of this claim term without reference to Flow's "percentage" or "normalized" speed. Whether Flow's formula and input method infringe on Omax's patent will be a jury question. The claim will be construed as follows: "One value from a range of values representing the quality of a cut. This value is inputted into an equation containing other values that reflect characteristics of the task that will impact the quality of the cut, such as material type."

The Court, for the reasons stated by plaintiff, finds "associated with an exit station" is properly construed as "joined to or installed in the exit station." 10

10 The Court has not included in its construction plaintiff's proposed additional language, specifically, "of a processing machine," "where the exit station includes a wafer transfer means and can accommodate at least one wafer cassette," and "closely connected with." The first of these phrases is already included in Claim 21. See '689 Patent, col. 7, ll. 14-15. The
second is a proposed construction of "that includes a wafer transfer means and at least one wafer cassette," which is not one of the seven disputed terms before the Court. The third could be understood as covering a disclaimed construction. (See Duggan Decl. Ex. D at 11-12 (disclaiming "measurement device" located "adjacent to" exit station).)

--- End Footnotes ---

311

c. "Package Reader associated with the picking means"

The parties next dispute the proper construction of "package reader associated with the picking means," as that term is used in claim 1 of the '110 patent. McKesson proposes that this term be construed as "a device that provides the identity of a package to the computer directing the picking means." Swisslog counters that the proper construction is "a package reader attached to the picking means." I recommend that the Court adopt McKesson's proposed construction.

The disputed term appears in element e) of claim 1 of the '110 patent, which reads:

1. A system for selecting and delivering packages to fill orders comprising: . . .

   e) a package reader associated with the picking means and being positioned for reading the machine readable labels on packages located within the storage area, wherein only one type of package is stored in each x, y coordinate location.

'110 patent, col. 13 lines 34-38 (emphasis added).

The claim language does not include the word "attachment" or "attached" or contain any suggestion that the package reader must be physically affixed to the picking means. 8 Importantly, other claims do use the word "attached." '110 patent, col. 13 lines 41-42 (claiming "sensor attached to the picking means"); '267 patent, col. 13 lines 48-52 (claiming "A system as described in claim 3 wherein the picking means is comprised of: a housing; means for storing a plurality of medicine packages attached to the housing . . . .")

where, by contrast, the Applicants used "associated," as in claim 1 of the '110 patent, I believe they meant something broader than "attached." See '267 patent, col. 13 lines 33-38 ("A system as described in claim 1 including a conveyor in communication with the picking means; and patent prescription boxes which are moved by the conveyor to the picking means such that the picking means provides the medicine packages it has picked to fill a given prescription to an associated box.") (emphasis added).

--- Footnotes ---

8 The parties appear to be in agreement that a plain and ordinary dictionary definition of "associated" would be broader than such a definition of "attached," in that the former does not require a physical connection between the package reader and the picking means. (See, e.g., D.I. 351 at 26-27 (citing dictionary definitions); Tr. at 119 (McKesson stating that "extrinsic evidence" with respect to "attached" as that term is used "requires some type of fastening or physical connection, but associated with is united in action or purpose. It's a broader interpretation. It denotes a broader connection between elements that attach."); Tr. at 120 (Swisslog responding that "because of the specific arguments and statements which the inventors made to the Patent Office during the prosecution, they gave up the broader scope of the claim that otherwise might have been applicable with respect to the difference between the word association and attached.").)

--- End Footnotes ---

Likewise, in the specification, the patentees continued this distinction between things that are physically "attached" to one another and things that may merely be "associated" with one another. Compare '110 patent, col. 3 lines 21-24 ("The gripper assembly preferably has a movable rod or other carrier for holding selected items, at least one vacuum head and associated controls for gripping and moving selected items."); id. col. 3 lines 30-31 ("We provide a processing unit with associated memory and data entry peripherals."); id. col. 8 lines 4-7 ("The obtaining means 50 also preferably includes an extension rod 52 in fluidic communication with a pneumatic in/out cylinder 53 and associated valve 59, as shown in FIGS. 8 and 11.")
with id. col. 5 lines 29-30 ("Attached to the back 23 are sets of brackets 25 position to hold packages 27."); id. col. 7 lines 49-50 ("A third actuator 43 is attached to bracket 41."); id. col. 7 lines 60-61 ("The obtaining means 50 is slidlingly attached to the housing 49. . ."); id. col. 8 lines 7-9 ("The extension rod 52 is slidilngly attached with respect to the Y and Z directions to the housing 49."); id. col. 8 lines 24-28 ("The holding rod 48 is also attached to a cylinder 48B which allows the storage rod to retract and extend in reference to the obtaining means. The pusher plate 57B is also attached to a cylinder 57A ."). Thus, I conclude that the Applicants used the terms "associated" and "attached" differently and, therefore, claim 1's use of "associated" should not be narrowed to "attached."

Swisslog emphasizes that the specification discloses a package reader that is physically attached to the picking means, and McKesson does not disagree. When the package reader is physically attached to the picking means in a specific manner as shown in Figures 7-11, the specification notes an additional capability of reading the package label prior to picking to confirm picking of the proper packages. See '110 patent, col. 10 lines 2-6 ("When the end of gripper assembly 38 is properly positioned, the bar code reader 26 reads 190 the identity 16 on the medicine package 14 in order to confirm that it is the proper medicine package to be picked with respect to the patient's prescription."). 9 This is a preferred embodiment. '110 patent, col. 6 lines 9-12 ("The picking means 38 can also include means, such as a bar code reader 26 as shown in FIG. 7, for determining the identity 16 of a package 14 . . . and providing its identity 16 to the computer 24.") (emphasis added); id. col. 7 lines 64-67 ("Identifying means, for example, the bar code reader 26 shown in FIG. 8, is mounted on housing 49 such that it can identify a package 14 to be picked by the obtaining means 50.") (emphasis added). Nothing in the claim language limits the claimed invention to this preferred embodiment. Nor may the Court import a preferred embodiment into a claim limitation. See Phillips, 415 F.3d at 1323.

--- Footnotes ---

9 McKesson does not appear to dispute Swisslog's contention (D.I. 349 at 19) that to perform such "pre-pick verification" it is necessary for the package reader to be attached to the picking means.

--- End Footnotes ---

Swisslog additionally argues that during prosecution the Applicants disavowed any claim they might otherwise have had to package readers that are not physically attached to the picking means. (D.I. 349 at 18-23; D.I. 361 at 16-22; Tr. at 119-29) That is, Swisslog finds in the prosecution history an express disclaimer by the Applicants of the full scope of package readers that are "associated" with the picking means, narrowing the claim to just those package readers that are "attached" to the picking means. Such a disclaimer "must be clear and unambiguous." Seachange Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1373 (Fed. Cir. 2005). "Consequently, for prosecution disclaimer to attach, [Federal Circuit] precedent requires that the alleged disavowing actions or statements made during prosecution be both clear and unmistakable." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325-26 (Fed. Cir. 2003). Moreover, the disavowal must directly address the disputed term. See Schwing GmbH v. Putzmeister Aktiengesellschaft, 305 F.3d 1318, 1324 (Fed. Cir. 2002). "If the locus of the argument does not center on the disputed term, a court will face an ambiguity as to whether the statement or disclaimer affects the inventor's belief in the scope of the disputed term." Sky Techs., LLC v. Ariba, Inc., 491 F. Supp. 2d 154, 158 (D. Mass. 2007). Having reviewed the extensive prosecution history in the record here (see D.I. 349 at 18-23; D.I. 360 Ex. E; D.I. 361 at 16-22), I find that the statements on which Swisslog relies do not constitute a clear, unambiguous, unmistakable, and particularized disavowal. 10

--- Footnotes ---

10 The statement most helpful to Swisslog appears in the Applicants' February 15, 1994 "Remarks" accompanying proposed amendments, in which they attempted to distinguish a prior art reference (Morello) the PTO had cited in rejecting claims as obvious. The Applicants stated: "When the picker assembly [of the Morello reference] arrives at that [storage] location it cannot read the article identification while the article remains in the storage location. This teaching is quite different from the system of amended claim 1." (D.I. 387 Ex. 4 at T056471-72) (emphasis added) When read within the full context of the complex prosecution history here, even these two sentences do not rise to the level of clarity and particularity required to constitute a disclaimer. See generally Biogen, Inc. v. Berlex Labs., Inc., 318 F.3d 1132, 1141 (Fed. Cir. 2003) ("Every statement made by a patentee during prosecution to distinguish a prior art reference does not create a separate estoppel. Arguments must be viewed in context.").
These two sentences appear in the middle of a long paragraph that runs to three pages. The two sentences appear at the point in this long paragraph in which the Applicants move from describing multiple features of the Morello patent to describing multiple features of their own invention. Hence, the second of the two sentences -- "This teaching is quite different from the system of amended claim 1" -- is not referring just to the sentence immediately preceding it -- about how Morello's "picker assembly . . . cannot read the article identification while the article remains in the storage location" -- but, rather, refers generally to the many features of the Morello patent described to that point in the paragraph. Moreover, in the paragraph just before the long paragraph in which the two sentences appear, the Applicants explained that they "have amended the pending claims to distinguish over" prior art references including Morello, by adding three new requirements, only one of which deals with the package reader. See id. at T056470. That new package reader requirement is that a package reader be associated with the picking means which reader is positioned for reading the machine readable labels on packages located within the storage area; the requirement is not, therefore, that the package reader be "attached" to the picking means. Id. (emphasis added); compare id. at T056472 (distinguishing Morello reference as not including element of Applicants' system of "a sensor attached to the picking means"). To be sure, there are also suggestions in this long paragraph that the package reader may be attached to the picking means. See id. (explaining that in patentees' invention "[a]rticles are removed from storage locations after the reader confirms that the desired article has been found"); id. (explaining that, even if an associated computer knowing the locations of packages crashes, "applicants' system can still operate using the package reader to locate desired packages"). However, there is nowhere the clear, unambiguous, unmistakable, and particularized disclaimer that would be required to narrow the "associated" claim language to "attached." Given this ambiguity, there is also nothing in the prosecution history on which the public or a competitor of the Applicants could have reasonably relied in concluding that the Applicants disclaimed package readers that are not physically attached to picking means.

Accordingly, again, I recommend that the Court adopt McKesson's proposed construction of "package reader associated with the picking means."

2. “[P]ackage reader associated with the picking means”

The Magistrate Judge has recommended that the court construe "package reader associated with the picking means" as used in claim 1 of the '110 patent to mean "a device that provides the identity of a package to the computer directing the picking means." Swisslog objects 14 to the recommended construction, arguing that a "package reader associated with the picking means" is properly construed to mean a "package reader attached to the picking means."

14 Swisslog's objection is found nestled within its objection to the Magistrate Judge's recommended denial of its motion for noninfringement. (D.I. 553 at 10-11)

In support of its proposed construction, Swisslog alleges that the applicants made statements during prosecution of the '110 patent that resulted in a disavowal of claim scope, 15 requiring a package reader that is physically attached to the picking means. Swisslog primarily relies upon a selective quotation from the prosecution history in which the applicants sought to traverse a rejection made pursuant to 35 U.S.C. § 103 in view of, inter alia, U.S. Patent No. 4,896,024 to Morello ("the Morello patent"):

[T]he picker assembly [of the Morello patent] . . . cannot read the article identification while the article remains in the storage location. This teaching is quite different from the system of the amended claim 1.

(D.I. 350, ex. C at 56471-72) (emphasis added) Looking at these two sentences in isolation lends credence to Swisslog's position regarding the physical relationship between the picking means and the package reader. However, the clarity of any specific disavowal is belied by the bulk of the applicants' remarks, contained in a sizeable two-page paragraph terminating
in the aforementioned sentences, which distinguish the invention of the '110 patent from the Morello patent on various grounds. (Id. at 56470-72) The emphasized sentence characterizes the combination of elements taught by the Morello patent, and not solely the manner in which the picking means identifies an article. The court agrees with Judge Stark's conclusion that these remarks do not amount to a clear, unambiguous and unmistakable disavowal. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325-1326 (Fed. Cir. 2003) (holding that "for prosecution disclaimer to attach, [Federal Circuit] precedent requires that the alleged disavowing actions or statements made during prosecution be both clear and unmistakable."). Accordingly, the court declines to limit this claim limitation in the manner proposed by Swisslog, and adopts the Magistrate Judge's recommended construction.

--- Footnotes ---

15 The parties agree that "associated with" contemplates a broader connotation than "attached to," at least to the extent that "associated with" does not require a physical connection. (See, e.g., D.I. 351 at 26-27)

a. "Asymmetrical"

Tecnol's principal argument with respect to the "asymmetrical" limitation is that asymmetry is a term which is only applicable to a two-dimensional figure or structure. [TAB at 25]. This proposed construction is relevant because it ties in with Tecnol's arguments, previously rejected by the Court, that the invention is limited to a collar which must be transformable by a user from a two-dimensional to a three-dimensional configuration. The specification makes clear, however, that Garth used the word "asymmetrical" to describe a collar that fastened at the side as opposed to the back of a patient's neck. [PX 520 at 2/28-32; 3/61-65]. The parties do not dispute that the 911 collar closes at the side, therefore, the 911 collar is "asymmetrical."

3. "A Gantry at Each Treatment Station"

Claim 1 of the '287 patent recites "[a] proton beam therapy system comprising: . . . a gantry at each treatment station each rotatable about a different axis of rotation and carrying optics for receiving a proton beam on its axis of rotation. . . ." (Rosenberg Decl. Ex. 1, the '287 patent at 14:1-18.) Plaintiff contends the term "a gantry at each treatment station" should be construed as "a gantry at more than one treatment station." (Optivus P.&A. at 11:5-7.) The court cannot accept Plaintiff's argument that "each" means "more than one." Defendant Ion Beam, on the other hand, proposes that "a gantry at each treatment station" be defined as "a gantry at all treatment stations." (Ion Beam P.&A. at 6:14-16.)

In support of its preferred construction, Plaintiff argues the term at issue, "a gantry at each treatment center," relates back to an earlier recited element in Claim 1 - "a plurality of separate patient treatment stations each having a patient support." (Optivus P.&A. at 11:2-8; Optivus Opp'n at 9:11-18.) As the court has already found, supra, the term "a plurality of separate treatment stations" means "more than one separate treatment station." Plaintiff notes the claim terms of the '287 patent describe a system where there is more than one treatment station and each treatment station has a gantry. (See id.) As Plaintiff points out, however, this construction is plainly contradicted by Figure 1 in the '287 patent, depicting a "Stationary Beam Station" without a gantry in addition to several treatment stations with a gantry. (See Rosenberg Decl. Ex. 1 at Fig. 1; 2:44-56; and Optivus P.&A. at 11:12-14.) Plaintiff insists the claim term "a gantry at each treatment station" takes on the meaning "a gantry at more than one treatment station" when considered in light of this drawing and in view of the earlier recited claim term "a plurality of treatment stations." (Optivus P.&A. at 11.) The court does not agree.

The term "each" clearly does not mean "more than one." According to the Random House Dictionary, the definition of "each" is "1. every one of two or more considered individually or one by one . . . 2. every one individually . . . ." (Airhart
Similarly, the Oxford English Dictionary (2d ed. 1989) defines the word "each" as meaning "every." Accordingly, the court hereby finds the contested claim term to mean "a gantry at every treatment center" in a system where there is "a plurality" or "more than one treatment station." (See Rosenberg Decl. Ex. 1, the '287 Patent at 14:1-24.)

Just as the court is unwilling to import limitations from the patent specification to limit the claim term "injector," the court declines Plaintiff's invitation to alter the meaning of the claim term "each" based on information found in the patent specification, or in this case, Figure 1 portraying a treatment station without a gantry in addition to stations with gantries in the '287 patent. 9 "A second caveat [on claim construction] is that it is improper to eliminate or ignore (i.e., "read out") a claim limitation in order to extend a patent to subject matter disclosed [in the specification] but not claimed." 5A DONALD S. CHISUM, CHISUM ON PATENTS § 18.03[2][c][i] at 18-194 (2003) (citing Oak Technology, Inc. v. U.S. Int'l Trade Comm'n., 248 F.3d 1316, 1329 (Fed. Cir. 2001.) In Unique Concepts, Inc. v. Brown, 939 F.2d. 1558, 1562 (Fed. Cir. 1991), the Federal Circuit commented:

The statute requires that an inventor particularly point out and distinctly claim the subject matter of his invention. 35 U.S.C. § 112 (1988). It would run counter to this statutory provision for an applicant for patent to expressly state throughout his specification and in his claims that his invention includes right angle corner border pieces and then be allowed to avoid that claim limitation in a later infringement suit by pointing to one paragraph in his specification stating an alternative that lacks that limitation, and thus interpret the claim contrary to its plain meaning. Such a result would encourage an applicant to escape examination of a more broadly-claimed invention by filing narrow claims and then, after grant, asserting a broader scope of the claims based on a statement in the specification of an alternative never presented in the claims for examination.

Unique Concepts, supra, 939 F.2d at 1562. Significantly, in Gart v. Logitech, Inc., 254 F.3d 1334, 1342 (Fed. Cir. 2001) the Federal Circuit commented "drawings are not meant to represent "the" invention or to limit the scope of coverage defined by the words used in the claims themselves." 10 The term "each" is not ambiguous. Accordingly, there is no reason to rely on the patent specification in order to clarify the meaning of the term. Schering v. Amgen Inc., 18 F. Supp. 2d 372, 380 (D. Del. 1998), aff'd, 222 F.3d 1347 (Fed. Cir. 2000). 11

--- Footnotes ---

9 The figures or drawings disclosed in a patent are part of the specification or description of the patented device. See 35 U.S.C. § 113.

10 At the same time, the court recognizes there is Federal Circuit precedent that could be construed as contrary:

a common meaning, such as one expressed in a relevant dictionary, that flies in the face of the patent disclosure is undeserving of fealty . . . . "Indiscriminate reliance on definitions found in dictionaries can often produce absurd results. . . . One need not arbitrarily pick and choose from the various accepted definitions of a word to decide which meaning was intended as the word is used in a given claim. The subject matter, the context, etc., will more often than not lead to the correct conclusion.

Renishaw, supra, 158 F.3d at 1250 (citations omitted)

11 Defendant Ion Beam also argues that the prosecution history supports a rigid interpretation of "each" meaning "every" in the context of the disputed claim term. (Ion Beam Opp'n at 4:11-22.) However, the cited passage from the prosecution history (Rosenberg Decl. Ex. 6 at p .56) does not clearly take a position foreclosing Plaintiff's proffered construction.

--- End Footnotes ---
id.) Given the context of the claim terms, there is only one possible definition for the word "each," and the patent specification does not clearly show the patentees elected to be their own lexicographer. Accordingly, the court has little choice but to hold the contested claim term to mean "a gantry at every treatment center" in a system where there is "a plurality" or "more than one treatment station." (See Rosenberg Decl. Ex. 1, the '287 Patent at 14:1-24.)

5. Relationship of Duration of Heating Step to Its Temperature

'934 Patent, claims 23, 50; '814 Patent, claims 7, 19; '308 Patent, claim 1, 12, 24: heating material at a temperature and for a time at least equivalent to heating "at 50 [degree] C for 144 hours as defined by . . . Arrhennius' [sic] equation (14)."

The 9 claims at issue here require the heating of the material at a temperature and for a period at least equivalent to heating the material "at 50 [degree] C for 144 hours as defined by . . . Arrhennius' equation (14)." Defendants argue that this phrase needs no construction. But, they add, should the Court decide to interpret the phrase, it means "as defined by equation 14 from the patent specification." In its original claim construction brief, Howmedica argued that Arrhenius' equation, in the case of ultra-high molecular weight polyethylene, should be construed as dictating that for every 10 [degree] C increase of the heating temperature the required duration of heating is halved. In its supplementary filing of November 2006, Howmedica does not offer any construction of this term, implying that there is no need for construction. The Court agrees that construction of this phrase is not required at this time, because it clearly refers to Arrhenius' equation as it is defined by equation 14 in the '934, '814, and '308 Patent specifications.

5. controlling said supply of gas to such a patient during at least a portion of a breathing cycle based on said fluid characteristic signal and said first gain

(a) at least a portion of a breathing cycle

This phrase is found in Claim 23 of the '575 Patent.
Phrase: at least a portion of a breathing cycle

Construction: anywhere from a part of either the inspiratory or expiratory phase of the breathing cycle to an entire two-phase breathing cycle, and anything in between.

Reasoning: The dispute between the parties as to this phrase is difficult to discern. However, regardless, the proper construction of this phrase is elementary once the term breathing cycle is properly defined. There is no reasonable dispute that a breathing cycle is defined by the patent to be the expiratory phase and the inspiratory phase of a complete breath. '575 Patent, cl. 1, ln. 64; cl. 2, ln. 7; cl. 7, lns. 1-12. Therefore, "at least a portion of a breathing cycle", means anywhere from part of the inspiratory phase or part of the expiratory phase, to an entire expiratory-inspiratory cycle.

B. "covering at least a portion of the printed indicia with a scratch-off layer"

The parties have agreed to the construction of "printed indicia" and "scratch-off layer." Thus, the construction of this disputed phrase centers on the meaning of "covering at least a portion of." Unless the context suggests otherwise, common words should be interpreted according to their ordinary meaning. Desper Prods. v. Qsound Lab., 157 F.3d 1325, 1336 (Fed. Cir. 1998). "Covering" means "to place something on or over, so as to protect or conceal" or "to overlay or spread with something." Webster's College Dictionary at 260. "At least" means "at the lowest estimate: as the minimum." Webster's Third New Int'l Dictionary 1287 (1976). "Portion" means "a part of a whole." Webster's College Dictionary at 861. Nothing in the intrinsic evidence suggests that the ordinary meaning of these words does not control. Thus, the ordinary meaning of "covering at least a portion of the printed indicia with a scratch-off layer" is "concealing some or all of the printed indicia by applying a scratch-off layer."

Although the ordinary meaning of the phrase does not indicate as much, the Defendant argues that the construction should include a requirement that the printed indicia be variable and "securely and completely" concealed by the scratch-off layer. These limitations are not supported by the language of the claims or the intrinsic evidence. 5 Nowhere does the specification refer to variability as a requirement, or even a characteristic, of the printed indicia. Thus, this limitation will not be read into the claim. Likewise, there is nothing in the intrinsic evidence that requires the printed indicia to be "securely" covered. As discussed above, absent an express intent to import a limitation, the fact that increased security may be an advantage of the invention does not require the claim to be limited in that manner. Brookhill-Wilk1, 334 F.3d at 1301; Applied Materials, Inc., 98 F.3d at 1574. Finally, the language of the claim itself contradicts the Defendant's assertion that the printed indicia must be completely covered. Although the printed indicia may be completely covered, the claim language does not require as much. Rather, the claim states that only a portion of printed indicia is required to be covered with the scratch-off layer.

5 The Defendant also relies on the specification of an abandoned patent application filed by Desbiens in support of its proposed construction of this term. However, this patent application, while it relates to the patents at issue, amounts to extrinsic evidence. See Epic Metals Corp. v. Consolidated Sys., Inc., 19 F. Supp. 2d 1296, 1303 (M.D. Fla. 1998) (continuation-in-part of allegedly infringing patent considered extrinsic evidence). It will not be considered by the Court unless a genuine ambiguity remains after consideration of the intrinsic evidence.

In support of its construction, the Defendant relies upon a portion of the specification that refers to the printed indicia being "completely" covered. This is the only reference to complete coverage in the entire patent. The identified portion of the specification discusses the preferred manner of applying varnish, an optional release coating layer, the scratch-off layer, and the overprint layer that will keep the ticket aligned "to ensure that the printed indicia is completely covered by the scratch-off layer and the overprint layer." ('647 patent, col. 4, 11.20-30; 504 patent, col. 4, 1.55-col. 5, 1. 3.) This section begins by stating that "[t]he lottery tickets of the present invention can be produced by way of example, in the following manner." ('647 patent, col. 3, 11. 66-67; 504 patent, col. 4, 11. 33-34) (emphasis added). In addition, it states that the step of the operation concerning covering the game area and printed indicia is "preferably accomplished" by using a particular type of...
press that is equipped in such a manner that the ticket will remain aligned, allowing the printed indicia to be completely covered. (‘647 patent, col. 4,11. 20-30; 504 patent, col. 4, 1. 55 -- col. 5, 1. 3.) This section merely describes a preferred embodiment, which cannot be used to limit a claim. Phillips, 415 F.3d at 1323; Resonate Inc. v. Alteon Websystems, Inc., 338 F.3d 1360, 1364-65 (Fed. Cir. 2003). Thus, the Court rejects the Defendant's proposed construction.

Crown's proposed construction is "[a]t least part of the first portion of the can end wall is turned upwardly through an angle of at least about 16 [degree]." 80 Rexam's proposed construction is "[a] portion of the upper wall (chuck wall), which is above and adjacent to the first location, is bent upwards, when looking at a cross section drawing, around the first location by 16 degrees (less 1 degree or plus 1 degree or more)." 81

The court adopts Crown's proposed construction.

Crown's primary difference between the parties' proposed constructions is the precision with which "at least about 16 [degree]" should be defined. As with the claim element "between about 20 [degree] and about 60 [degree]," Rexam argues that Crown does not establish the meaning of the term "about." Although arguing that "about" in the that claim term should be completely ignored resulting in a construction of "between 20 [degree] and 60 [degree]," here Rexam proposes to define the phrase "at least about 16 [degree]" to mean "16 degrees (less 1 degree or plus 1 degree or more)."

As with the prior claim term, Rexam points out that the common specification (when describing particular embodiments) does not use the word "about" in connection with the chuck wall angle of the can end or the +/- 4 degree angle of the substantially cylindrical portion of the chuck. With regard to these claim elements, however, Rexam suggests that "at least about" does have meaning. 82 Curiously, Rexam ascribes the meaning of "less 1 degree" or "plus 1 degree or more" without explanation of why that meaning is appropriate with regard to these claim elements, but no meaning should be given to "about" in the prior claim terms. Despite its position that the common specification does not use the word "about" with reference to relevant aspects of the can end and seaming chuck, Rexam declares its "proposed construction is generous in this context." 83

Moreover, Rexam does not explain why it proposes that "about" should be construed restrictively as "less than one degree."

---

80 D.I. 325 at 6, 9.

81 Id. (emphasis and footnote omitted).

82 D.I. 294 at 30.

below 16 degrees but broadly as "plus 1 degree or more" above 16 degrees. The court, therefore, rejects Rexam's proposed construction and adopts Crown's proposed construction: "at least part of the first portion of the can end wall is turned upwardly through an angle of at least about 16 [degree]."

At Least About 0.1 mm / At Least 0.1 mm

These terms appear in the Impact Strength Patent and the Depth Patents and refer to the depth of the leached portion of the PCD element. ReedHycalog argues the terms do not require construction. Defendants contend the terms mean "a minimum of 0.1 mm." At the hearing, the parties agreed the term "at least 0.1 mm" required a minimum measurement of 0.1 mm.

The parties' dispute is identical to the dispute regarding the "to a depth" limitation. For the same reasons explained above, the Patents-in-Suit do not require a minimum leach depth of 0.1 mm. In addition, Defendants' construction improperly reads out of the claims the term "about." See Cohesive Techs., Inc. v. Waters Corp., 543 F.3d 1351, 1368 (Fed. Cir. 2008). Thus, the term "at least about 0.1 mm" is not limited to "a minimum of 0.1 mm." The terms "at least about 0.1 mm" and "at least 0.1 mm" are easily understood terms and do not require construction.

Rodime is the owner of the reexamined '383 patent, which issued on November 29, 1988. The reexamined '383 patent is directed to a micro hard-disk drive system (3.5 inch drive) suitable for use in portable computers with performance parameters comparable to those available in 5.25 inch disk drive systems. Quantum, the plaintiff in this declaratory judgment action, is the manufacturer of disk drives which, Rodime alleges in its counterclaim, infringe its patent.

The claim limitation at issue in this appeal relates to the storage capability of the hard-disk. The storage capability of a hard-disk is a function of the track density; the greater the track density, the more data that can be stored in a given area of the disk. Track density may be defined in terms of "tracks per inch" (tpi), calculated based on the number of concentric tracks present within an inch along the radius of the hard-disk.

On November 19, 1985, James G. McGinley and Roderick M. Urquhart, two engineers at Rodime, filed a patent application for the invention described above. Claim 1 of this application recited, inter alia, a track density of "approximately 600" tpi. The examiner, in a first office action, rejected all the claims as obvious under 35 U.S.C. § 103. With respect to the track density limitation in Claim 1, the examiner stated:

The art described in the preceding paragraph [regarding 5.25 inch disks] demonstrates that such a density is within the state of the art. Such a density would seemingly be achievable on a [3.5 inch] disk in the same manner by which it was achieved on a larger disk. Consequently it would seem that the subject matter of claim 1 - which is seemingly quite general - should not be considered patentable.

In a response dated May 23, 1986, applicants cancelled the original claims and inserted new claims some of which recited a track density of "at least 600" tpi. Although applicants had replaced "approximately" with "at least" in the track density limitation of these new claims, they made no reference to this in their response, but instead focused on the difference between the size of their disks (3.5 inch) and those in the prior art (5.25 inch) as a basis for overcoming the examiner's rejection. The examiner subsequently allowed these new claims, and the patent issued on January 20, 1987, as U.S. Patent No. 4,638,383 (the original '383 patent). Claims 4, 6, 7, 9, and 14 of the original '383 patent all recited a track density of "at least 600 concentric tracks per inch."

On September 28, 1987, Rodime, the owner of the original '383 patent pursuant to an assignment from the inventors, requested reexamination of its patent. Finding a substantial new question of patentability, see 35 U.S.C. § 303, the United
The States Patent and Trademark Office (PTO) granted Rodime's request for reexamination of all 16 claims in the original '383 patent. In an office action dated April 19, 1988, the examiner rejected all but two of the original claims. Rodime responded by cancelling certain claims, amending others, and adding dependent Claims 17-31. With respect to the claims at issue in this appeal, Rodime made substantial amendments including changing the track density limitation from "at least 600" tpi to "at least approximately 600" tpi. These claims were allowed, as amended, and the '383 reexamined patent issued on November 29, 1988, as U.S. Patent No. B1 4,638,383. As issued, independent Claims 4, 6, 7, 9, and 14 of the reexamined '383 patent all recite a track density of "at least approximately 600" tpi, and the newly added dependent claims which are at issue in this appeal, i.e. Claims 19-27, either explicitly contain this limitation or incorporate it through their dependency.

Illustrative of the amendments made is Claim 4 with the sections within the brackets being the matter that was deleted and the underlined sections indicating the additions made to the claim during reexamination:

4. A computer disk drive system [for operating a micro hard-disk, said disk drive system] comprising:

   a sealed housing;

   at least [one] two micro [hard-disk] hard-disks each having a diameter of between 92 and 96 millimeters and each having a plurality of concentrically adjacent tracks on both planar sides thereof, said micro hard-disks fixedly mounted in [a] the sealed housing;

   means for rotatably supporting said [hard-disk] micro hard-disks;

   means for rotating said [hard-disk] micro hard-disks;

   first and second transducer means [having two read/write heads] for writing digital information on and reading digital information from said [hard-disk] micro hard-disks on both planar sides of [said] each micro hard-disk in a format so that [said] each micro hard-disk has digital information stored on [concentric] said concentrically adjacent tracks at a density providing at least 5 Megabytes of storage per [disk] micro hard-disk with the digital information being stored at a density of at least [6000] approximately 600 concentric tracks per inch, said first and second transducer means each comprising two read/write heads; [and,]

   positioning means for moving said first and second transducer means between the concentrically adjacent tracks on said [hard-disk] micro hard-disks, said positioning means including:

   a positioning arm disposed within the sealed housing and mounted for movement relative to said micro hard-disks;

   a pivot shaft coupled to one end of said positioning arm and supporting said positioning arm for rotational movement relative to said micro hard-disks, four support arms, each supporting one of said heads at one end and each connected to said positioning arm at its other end; and

   means for moving said positioning arm including a stepper motor having a shaft extending into said sealed housing and means for operating said stepper motor in step increments, each increment causing [said transducer means] said read/write heads to move from one track to the next adjacent track on said [hard-disk] micro hard-disks.

Quantum filed the present action in the United States District Court for the District of Minnesota on February 26, 1993, seeking a declaration that the reexamined '383 patent is invalid, unenforceable and not infringed. Rodime subsequently filed an answer and a counterclaim for infringement. On February 22, 1994, Quantum filed a motion for summary judgment that Claims 4, 6, 7, 9, 14, and 19-27 of the reexamined '383 patent are invalid under 35 U.S.C. § 305 for being impermissibly
broadened by Rodime during reexamination. According to Quantum, Rodime's amendment during reexamination of the track density limitation from "at least 600" tpi to "at least approximately 600" tpi broadened the scope of the claims to cover certain disk drives with approximately but less than 600 tpi that were not covered by the original '383 patent claims, and therefore these claims are invalid under 35 U.S.C. § 305.

The district court, in an order dated April 11, 1994, granted Quantum's motion for summary judgment. The court, after examining the claims, specification, and prosecution history, concluded that the addition of the word "approximately" to the track density limitation during reexamination was not a mere clarification, as Rodime argued, but was instead a substantive change that expanded the scope of the claims at issue in violation of 35 U.S.C. § 305, and that no reasonable juror could have found otherwise. In support, the court relied on the difference in the ordinary meaning of the disputed claim limitations: a track density of "at least 600 tpi" indicates densities starting at, but greater than 600 tpi, whereas the addition of "approximately" in the track density limitation of the reexamined '383 patent modifies the 600 tpi value, thereby eroding the "not less than" meaning of "at least." Based on these definitions, it followed, according to the court, that the claims had been broadened during reexamination since the reexamined '383 patent covered devices with track densities less than 600 tpi that were not covered by the original '383 patent. The court then concluded, without analysis, that the improperly broadened claims were invalid.

Since the district court's ruling disposed of all the claims which Rodime in its counterclaim had alleged Quantum to infringe, the district court, on April 26, 1994, ordered that final judgment be entered under Fed. R. Civ. P. 58 in favor of Quantum for a declaratory judgment of nonliability and against Rodime for its counterclaim of infringement of the reexamined '383 patent. This appeal followed.

II. DISCUSSION

There are two issues in this case: first, whether Rodime broadened the scope of the claims at issue during reexamination in violation of 35 U.S.C. § 305 by changing the track density limitation from "at least 600 tpi" to "at least approximately 600 tpi," and, second, assuming the claims were impermissibly broadened, the legal effect of violating section 305. We review the district court's grant of summary judgment in favor of Quantum on these issues -- that the claims were broadened and are therefore invalid -- to determine whether any genuine issues of material fact are in dispute, and whether any errors of law were made. London v. Carson Pirie Scott & Co., 946 F.2d 1534, 1537, 20 U.S.P.Q.2D (BNA) 1456, 1458 (Fed. Cir. 1991).

A.

35 U.S.C. § 305 states, in relevant part, that "no proposed amended or new claim enlarging the scope of a claim of the patent will be permitted in a reexamination proceeding." An amended or new claim has been enlarged if it includes within its scope any subject matter that would not have infringed the original patent. In re Freeman, 30 F.3d 1459, 1464, 31 U.S.P.Q.2D (BNA) 1444, 1447 (Fed. Cir. 1994). "A claim that is broader in any respect is considered to be broader than the original claims even though it may be narrower in other respects." Id. (quoting Tillotson, Ltd. v. Walbro Corp., 831 F.2d 1033, 1037 n.2, 4 U.S.P.Q.2D (BNA) 1450, 1453 n.2 (Fed. Cir. 1987)). Accordingly, the claims at issue have been improperly broadened in violation of 35 U.S.C. § 305 if the track density limitation in the claims of the reexamined '383 patent -- "at least approximately 600 tpi" -- is broader than the track density limitation in the claims of the original '383 patent -- "at least 600 tpi."

Whether claims have been enlarged is a matter of claim construction, a question of law subject to complete and independent review on appeal. Id. at 1464, 31 U.S.P.Q.2D (BNA) at 1447. When construing the meaning of disputed terms in a claim, we look to the claims, specification and prosecution history. Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1577, 27 U.S.P.Q.2D (BNA) 1836, 1839-40 (Fed. Cir. 1993). Although a patentee can be his own lexicographer, the words of a claim will be given their ordinary meaning to one of skill in the art unless the inventor appeared to use them differently. Hoganas AB v. Dresser Indus., Inc., 9 F.3d 948, 951, 28 U.S.P.Q.2D (BNA) 1936, 1938 (Fed. Cir. 1993).

Rodime's principle argument on appeal is that the addition of the word "approximately" to the track density limitation only made explicit what was already implicitly included in the claim, and therefore did not expand the scope of the claims at issue. In support of this proposition, Rodime cites Laitram Corp. v. NEC Corp., 952 F.2d 1357, 21 U.S.P.Q.2D (BNA) 1276 (Fed. Cir. 1992), Tennant Co. v. Hako Minuteman, Inc., 878 F.2d 1413, 11 U.S.P.Q.2D (BNA) 1303 (Fed. Cir. 1989), and
Kaufman Co. v. Lantech, Inc., 807 F.2d 970, 1 U.S.P.Q.2D (BNA) 1202 (Fed. Cir. 1986). Specifically, Rodime asserts that to one of skill in the art the term "600 tpi" means "approximately 600 tpi." In support, Rodime proffers the testimony of various technical experts who maintain that, because of manufacturing tolerances and variations inherent in rotary actuator drives, industry literature referring to a specific track density value is understood by those skilled in the art to represent a range. This interpretation, according to Rodime, is consistent with the specification which uses the terms "600 tpi" and "approximately 600 tpi" interchangeably. Since "600 tpi" means "approximately 600 tpi" to one of skill in the art, it necessarily follows, Rodime argues, that one of skill in the art would interpret "at least 600 tpi" to mean "at least approximately 600 tpi." Accordingly, Rodime concludes that the district court erred in not granting summary judgment in their favor, or, at a minimum, concluding that this evidence created a genuine issue of material fact to be resolved at trial.

We disagree. The major flaw in Rodime's argument is that it focuses solely on the term "600 tpi" instead of the claim limitation as a whole, in context. See United States v. Telectronics, Inc., 857 F.2d 778, 781, 8 U.S.P.Q.2D (BNA) 1217, 1219-20 (Fed. Cir. 1988), cert. denied, 490 U.S. 1046, 104 L. Ed. 2d 423, 109 S. Ct. 1954 (1989). Even if "600 tpi" means "approximately 600 tpi," as Rodime argues, it is unnecessary to read in an implicit range when interpreting "at least 600 tpi" because this limitation as a whole already expressly represents an open-ended range, i.e. 600 tpi and up. Therefore, that one skilled in the art understands "600 tpi" to connote a range is irrelevant because the limitation in dispute is "at least 600 tpi," and Rodime offered no evidence to show that one skilled in the art understood "at least 600 tpi" to be the same as "at least approximately 600 tpi" or that the patentee defined it as such in the patent or during prosecution.

Absent such a definition or evidence that the claim limitation as a whole has a special meaning to one of skill in the art, we see no error in the district court's use of dictionary definitions to ascertain the ordinary meaning of the relevant claim limitation. See, e.g., Hoganas, 9 F.3d at 951 n.8, 28 U.S.P.Q.2D (BNA) at 1938 n.8 (using Webster's New World Dictionary, Third Edition, to define the word "straw"). Regarding the limitation "at least 600 tpi," the term "at least" means "as the minimum," Webster's Third New International Dictionary 1287 (1986), and therefore when coupled with a specific number sets forth an absolute lower limit of a range, i.e., 600 on up. See Lantech, Inc. v. Keip Mach. Co., 32 F.3d 542, 546, 31 U.S.P.Q.2D (BNA) 1666, 1670 (Fed. Cir. 1994) ("The term 'at least two' sets forth the minimum number of a particular element required."). The addition of "approximately" which means "reasonably close to," 3 eliminates the precise lower limit of that range, and, in so doing extends the scope of the range. The term "at least approximately 600 tpi" therefore defines an open-ended range starting slightly below 600. See, e.g., Hybritech, Inc. v. Abbott Labs., 849 F.2d 1446, 1455, 7 U.S.P.Q.2D (BNA) 1191, 1199 (Fed. Cir. 1988) (reasonable likelihood of success of proving that accused products with affinities of 4.8 x 107 and 7.1 to 7.5 x 107 liters/mole literally infringe patent with a recited claim limitation for affinity of "at least about 108 liters/mole"); Ex parte Neuwirth, 229 U.S.P.Q. (BNA) 71, 73 (Bd. Pat. App. & Int. 1985) (addition of the word "substantially" during reexamination as a modifier for "rounded bottom wall" broadened the scope of the claim in violation of 35 U.S.C. § 305).

3. "At Least Long Enough to Receive Most of Said External Threads From Said Similar Adjacent PVC Pipe Therein"

a. Claim Term:

"... said second enlarged interior diameter being at least long enough to received [sic] most of said external threads from said similar adjacent PVC pipe therein before threading ..."

b. Parties' Contentions

CertainTeed's proposed construction of "at least long enough to received [sic] most of said external threads from said similar adjacent PVC pipe therein" is "the second enlarged interior diameter must be at least long enough to receive most of, i.e. - 742 -
more than 50.00% of, the external threads on the male end or a similar adjacent PVC pipe, before any of the external threads at the male end are interlocked with the internal threads in the first enlarged interior diameter of the female end." The only issue disputed by the parties is how the words "said external threads" should be construed. Pl's Markman Brief at 15. CertainTeed contends that the phrase should be construed in accordance with its plain meaning to simply mean "the external threads on the male end of a similar adjacent PVC pipe."

The parties agree on the central issue in this claim element, namely that the words "at least long enough to received [sic] most of" should be construed in accordance with their plain, ordinary meaning. However, CertainTeed's proposed construction interprets "most of" to mean "i.e. more than 50.00% of, the external threads on the male end of a similar adjacent pipe." CertainTeed argues that this interpretation is in keeping with the teaching of the Federal Circuit that quantitatively precise claim elements must be construed precisely. See Elekta Instrument S.A. v. O.U.R. Scientific Int'l Inc., 214 F.3d 1302, 1307-08 (Fed. Cir. 2000).

Modern Products' proposed construction of "at least long enough to received [sic] most of said external threads from said similar adjacent PVC pipe therein" is "said second enlarged interior diameter is long enough to receive most of the external threads from said similar adjacent PVC pipe which mate with the internal threads of a similar adjacent PVC pipe, before any of the external threads at the male end are interlocked with the interior threads in the first enlarged interior diameter of the female end." Modern Products, in support of this proposed construction, states that this limitation, like the others, must be construed in context. The limitation contemplates threads that mate. "Because claim 1 qualifies the word 'threads' by their ability 'to mate,' this limitation requires the second enlarged diameter to be long enough to cover most of the threads that mate before they are threaded together." Def's Claim Construction Brief at 31.

c. Court's Construction

The Court concludes that "at least long enough to received [sic] most of said external threads from said similar adjacent PVC pipe therein" means "said second enlarged interior diameter is long enough to receive most of the external threads from said similar adjacent PVC pipe which mate with the internal threads of a similar adjacent PVC pipe, before any of the external threads at the male end are interlocked with the interior threads in the first enlarged interior diameter of the female end." This term is construed in accordance with the claim and specification, and dictated by its ordinary and customary meaning. Claim 1 contemplates that threads mate, and qualifies the term "threads" by their ability to mate. Thus, this limitation requires the second enlarged interior diameter be long enough to cover most of the threads that mate before they are threaded together. In addition, this Court notes that it is improper to read a limitation into a claim from the written description or specification, as CertainTeed has urged the Court to do by proposing the following language: "i.e. more than 50.00% of, the external threads on the male end of a similar adjacent pipe." See Elekta, 214 F.3d at 1307-08 (citing Renishaw, 158 F.3d at 1248). The term was not defined using quantitatively precise language, distinguishing it from Elekta, therefore, that language will not be added to the claim term. See Comark Communications v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) (citing Constant v. Advanced Micro-Devices, Inc., 848 F.2d 1560, 1577 (Fed. Cir. 1988)) ("Although the specification may aid the court in interpreting the meaning of disputed claim language, particular embodiments and examples appearing in the specification will not generally be read into the claims.").

iii. Claim 9 does not limit the term "at least one contact" to a pair of contact arms

Finally, the parties dispute the proper construction of the term "at least one contact." Although Invisible Fence argues that the term is defined as "one or more electrical contacts for electrical connection with the first terminal of the battery," Perimeter believes that the term means "[a] pair of electrically-conductive elongated arms that are interconnected by an elongated flexion spring." (Joint Statement 4.)

Perimeter again bases its construction on the Description, claiming that because it depicts a pair of contact arms, this limitation must be read into claim 9. See '900 Patent col.6 1.39-42 ("The contactor . . . includes two elongated contact arms. . ."); figs. 3, 8, 10. This construction, however, runs counter to the clear language of claim 9. Giving the language of claim 9 its ordinary meaning, see Johnson Worldwide Assocs., 175 F.3d at 989, the phrase "at least one contact" (which also appears in the Summary at col.1 1.63-64) necessarily implies that the number of contact arms is not limited to two and
To credit Perimeter's argument would mean that the requirement of a pair of contact arms would have to be read into every claim of the '900 Patent. Other claims, however, reveal that the patentee did not intend to limit the invention in this way; for example, claims 1, 7, and 21 include "a contactor having . . . a contact." '900 Patent col.6 1.5-13, col.6 1.54-61, col.10 1.3-6.

The prosecution history further suggests that the invention is not limited to a dual contact arm design. Upon initial rejection of claims 7 and 21, the Examiner wrote, "the recitation that 'at least one contact' is 'connected with one end of the spring' is confusing, because when there are two contacts (encompassed by the phrase 'at least one'), they are at opposite ends of the spring." U.S. Dep't of Commerce Patent & Trademark Office, Examiner's Action 2 (Apr. 5, 1994). The phrase "when there are two contacts" indicates that the Examiner did not view the invention as always having two contacts.

For the aforementioned reasons, the Court will not limit the contactor in claim 9 to having a pair of contact arms.

14 Also included in Perimeter's proposed construction is the notion that the contact arms are electrically conductive and elongated. (Joint Statement 3.) Neither party discusses these proposed constructions, ostensibly because they are consistent with claim 9. The contact arm(s) would have to be electrically conductive in order to make an electrical connection with the electronic receiver. See '900 Patent col.11 1.41-43. In addition, the contact arms should be elongated so they can extend outside the opening to make the electrical connection. See '900 Patent col.11 1.41-42.

Invisible Fence adds "for electrical connection with the first terminal of the battery" to its proposed construction. The Court will specifically discuss the terms "for electrical connection" and "the first terminal of the battery" infra, Parts III.B.5-6. For now, it is enough to say that the phrase "for electrical connection with the first terminal of the battery" modifies the phrase "contactor," and not "at least one contact"; therefore, we decline to include this phrase in our construction of "at least one contact."

Finally, in an attempt to support all of its proposed constructions related to "a contactor having a spring . . . and at least one contact," Perimeter cited the following language from the patentee's Amendment to the April 5, 1994, Office Action: "As described in the specification, the contactor . . . includes two elongated contact arms . . . which are interconnected by an elongated flexion spring. . . ." Amendment 11 (Sept. 8, 1994). Perimeter asserts that this comment limits claim 9 because it does not contain the following caveats: (1) that the contact arms could be separate from the spring, (2) that the spring could encompass more than an elongated flexion spring, and (3) that the contactor could have only one contact arm. The paragraph's thesis, however, clearly indicates that it was only being offered to clarify claims 4 and 20, or stated another way, since the amendment had no relationship to claim 9, the Court is not obligated to import its purported limitations into that claim's construction. Cf. Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998) (When comments "were made without reference to a particular claim[.]. . . arguments made to obtain the allowance of one claim are relevant to interpreting other claims in the same patent." (emphasis added).

iv. Summary

For the foregoing reasons, the Court construes the terms "a contactor having a spring . . . and at least one contact" and "a contactor" as follows: "An electrically-conductive component having a spring and at least one contact arm. The spring may, or may not, be interconnected to the contact arm(s)." In addition, the Court interprets the term "a spring" to mean "a spring located between the base of the battery holder and the battery for biasing the battery toward the opening." Finally we define the term "at least one contact" as "one or more electrically conductive elongated contact arms."

GO BACK
Under the inventions of the '092 and '766 patents, at least one "elongate bar" is placed behind the wall to be retrofitted. The bar is fastened by screws through the wall to a support surface, which has a speaker attached to it. The speaker is wedged between the bar and the support surface in a hole formed in the wall. This serves to create an unobtrusive appearance, with the support surface (which covers the speaker) flush against the wall. The asserted claims of the '092 patent describe a method for installing wall speakers. Claim 16 is an independent claim; claims 17-20 dependent from it. The seven claims of the '766 patent are directed to a retrofit bracket apparatus. Claim 1 is an independent claim; claims 2-7 depend from it.

Claim 16 of the '092 patent reads as follows:

A method for attaching speakers to a wall, the method comprising the steps of:

attaching at least one speaker to a support surface;

attaching at least one elongate bar to the support surface such that the bar extends across two opposite sides thereof;

forming an opening in a wall covering;

inserting the bar through the hole;

adjusting the distance between the bar and the support surface such that the wall covering is captured intermediate the bar and the support surface.

Claim 1 of the '766 patent reads as follows:

A retrofit bracket for wall mount speakers comprising:

a support surface configured for mounting at least one speaker thereto;

a least one elongate bar attached to said support surface and abutting a wall covering such that the wall covering is clampably capturable intermediate said support surface and said bar; and

adjustment means for varying the distance between said support surface and said bar;

wherein said adjustment means facilitates the accommodation of various wall covering thicknesses.

Summary judgment is appropriate if the evidence shows "that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed.R.Civ.P. 56(c). The district court determined that no material facts were in dispute and, as noted above, held that the Boston No. 2 device anticipated claim 16 of the '092 patent, claim 1 of the '766 patent, and all of the dependent claims. In so holding, the court found that the "elongate bar" limitation of the claims was found in the Boston No. 2 device.

II.

"Although a patentee can be his own lexicographer, the words of a claim will be given their ordinary meaning to one of skill in the art unless the inventor appeared to use them differently." Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2D (BNA) 1162, 1165 (Fed. Cir. 1995). As seen above, claim 16 of the '092 patent and claim 1 of the '766 patent both refer to "at least one elongate bar." According to Webster's Third New International Dictionary, the word "elongate" refers to a structure "having a form notably long in comparison to its width," while the word "bar" is defined as "a straight
In the case before us, the court misapplied the axiom and adopted a construction of "flashlight" that is at odds with the clear language of the claim and the written description. In holding that the recited "flashlight . . . is distinct from the light source . . .", the court arguably altered the patent's claim language and specifications. The proper construction, as determined by the Court, is one that remains consistent with the claim's language and the written description. This consistent construction determines the court's decision on the patent's validity.

Turning to the specifications, figures 1 and 3 of the '092 patent and of the '766 patent are identical. They both show single detached rods as elongate bars. Under the heading "SUMMARY OF THE INVENTION" the specifications of both patents state that the claimed invention "has a pair of elongate clamping bars extending across to opposite sides of the support surface and adjusably attached thereto such that a wall covering is clampingly capturable intermediate the support surface . . ." Further on, under the heading "DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT," both specifications recite that "the retrofit bracket of the present invention generally comprises . . . a plurality, preferably two, of generally parallel elongate clamping bars . . . disposed on the inside of the wall covering . . ." Based upon the dictionary definitions of the words "elongate" and "bar" and based upon the claims and the specifications of the patents, we conclude that the "at least one elongate bar" limitation of claim 16 of the '092 patent and of claim 1 of the '766 patent calls for the bar to be a discrete structural element, not simply an integrated component of a larger structure not having any of the characteristics of a "bar."

We hold that, as properly construed, the claims at issue are not anticipated by the Boston No. 2 device. The structure of the Boston No. 2 device is not in dispute. The Boston No. 2 speaker bracket consists of a continuous, integrated box, or frame, which is attached to the wall and which has the speaker fastened to it. The frame has four sides, each of which is integral with its neighbor, so that no one side is discrete, or separate. The district court found that the "elongate bar" limitation of the claims at issue was found in the Boston No. 2 device because the court viewed the sides of the frame in the Boston No. 2 bracket as elongate bars. The district court thus concluded, as a matter of claim construction, that the "elongate bar" of the claims could be found in an integrated portion of a larger structure not having any of the characteristics of a "bar." That conclusion, however, is contrary to the correct construction of the claims set forth above. Under that correct construction, a side of the continuous frame of the Boston No. 2 device cannot be an "elongate bar." Thus, there is not clear and convincing evidence that the Boston No. 2 device has "at least one elongate bar," as required by claim 16 of the '092 patent and claim 1 of the '766 patent. Accordingly, since each limitation of the asserted claims of the '092 patent and the '766 patent is not found in the Boston No. 2 device, that device does not anticipate those claims. The district court's judgment of invalidity must be reversed. The case is remanded for further proceedings consistent with this opinion.
that illuminates the face of the watch," the court construed the claim to require at least two light sources--one that illuminates an area beyond the watch face and one that illuminates only the watch face (a face illuminator). However, claim 1 recites a flashlight comprising "at least one light source." (Emphasis added). Use of the phrase "at least one" means that there could be only one or more than one. See Kistler Instrumente AG v. United States, 224 Ct. Cl. 370, 628 F.2d 1303, 1318, 211 U.S.P.Q. (BNA) 920, 920 (Ct. Cl. 1980) ("Anyone with even the most rudimentary understanding of the English language understands 'at least one piezo-electric crystal means lodged within said component means,' to mean one or more crystals."). Therefore, the court's construction is contrary to the plain language of the claim.

To give meaning to the phrase "at least one light source," we must construe claim 1 to cover a device that has only one light source or a device that has more than one light source, assuming that the "device" is a "flashlight," as that term is used in the claim. According to the written description, the flashlight 8 is a light that is bright enough "to illuminate a small room or to otherwise serve satisfactorily as a flashlight." Col. 2, ll. 46-53. The face illuminator 9, in contrast, is a light that "enables reading the time without turning on [the flashlight] 8 if desired." Col. 2, ll. 58-62. According to the written description, the flashlight 8 and the face illuminator 9 are different elements. However, the written description further explains that light from the flashlight 8 can be used to illuminate the watch face 4 in the absence of a distinct face illuminator. See col. 2, ll. 49-54 ("The brightness of lamps 8 and the disposition of lamps 8 about case 3 should be arranged to illuminate timepiece face 4 so that the watch hands can be seen in the absence of otherwise provided light and so that the time indicative numbers and dots are also then visible."). Therefore, properly construed, the flashlight limitation is met by a wrist watch whose only light source illuminates both the watch face and a significant area beyond the watch face. This definition is consistent with the term's ordinary meaning. See American Heritage Dictionary 511 (2d College ed. 1982) (defining "flashlight" as a "small, portable lamp usually powered by batteries").

Casio argues that the claim cannot cover a watch without a separate face illuminator because the preferred embodiment includes one. However, "particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments." Electro Med. Sys. S.A. v. Cooper Life Sciences, 34 F.3d 1048, 1054, 32 U.S.P.Q.2D (BNA) 1017, 1021 (Fed. Cir. 1994). Because claim 1 does not recite a face illuminator, it is broader than the embodiment referenced by Casio. Moreover, because the written description does not require that the watch include a face illuminator, this "limitation should not be read from the specification into the claim[]." Specialty Composites v. Cabot Corp., 845 F.2d 981, 987, 6 U.S.P.Q.2D (BNA) 1601, 1605 (Fed. Cir. 1988).

Casio also argues that, under our construction, claim 1 is invalid because the recited combination is obvious. This argument is premature. Casio cannot avoid a full-blown validity analysis by raising the specter of invalidity during the claim construction phase. Although the court appeared to believe that several pieces of prior art, when viewed in combination, disclose all the limitations of claim 1, it did not conduct a validity analysis. See Graham v. John Deere Co., 383 U.S. 1, 17-18, 148 U.S.P.Q. (BNA) 459, 467, 15 L. Ed. 2d 545, 86 S. Ct. 684 (1966). Specifically, it did not identify any motivation to combine the references, see In re Fine, 837 F.2d 1071, 1074, 5 U.S.P.Q.2D (BNA) 1596, 1598-99 (Fed. Cir. 1988), or consider objective evidence of nonobviousness, see Custom Accessories, Inc. v. Jeffrey-Allan Indus., Inc., 807 F.2d 955, 960, 1 U.S.P.Q.2D (BNA) 1196, 1199 (Fed. Cir. 1986). Moreover, Rhine alleges that he was denied the opportunity to conduct discovery on the secondary considerations. Therefore, we remand the case so that discovery can proceed, if necessary, and the court may fully evaluate the strength of the invalidity case.

325

8. Further Comprising a Step of Setting . . .

This phrase is found in claim 44 of the ‘575 patent.

Phrase: Further comprising a step of setting at least one of a magnitude and a duration of said pressure profile

Construction: Further comprising the step of setting a magnitude, a duration, or both, of said pressure profile.

Reasoning: The real dispute between the parties regarding this claim element is whether the shape of the predetermined pressure profile includes its magnitude and duration. As we have already resolved that issue, there is no need to further construe this claim element.
16. At Least One of the Side Edge of Both Pairs of the Side Edges

The next term to be addressed is "at least one of the side edge of both pairs of the side edges" in claim 10 of the '836 patent. Unilin states that there are at least two grooves that are identified by claim 10. (Unilin Open. Br. 29.) Therefore, Unilin states that such limitation "requires only one of the two grooves previously identified in the claim needs to have an upper lip above the groove." (Id.)

Alloc responds that the limitation is confusing and makes no sense; it therefore renders this claim indefinite under 35 U.S.C. § 112, P 2 for failure to particularly point out and distinctly claim the subject matter which the applicant regards as his invention. (Joint Charts, '836 chart, 11.) Alloc has not proposed an alternative construction.

The disputed term appears in claim 10 of the '836 patent as follows:

"wherein the panels at the side edge comprising the groove, of at least one of the side edge of both pairs of the side edges, include an upper lip above the groove, said upper lip defining at least in part an upper side of said groove, and said upper lip terminating at a distal outer end, wherein said lower lip extends distally beyond the distal outer end of the upper lip, and further wherein the recess is located in the lower lip in an area of the lower lip that is located at least partly beyond the distal outer end of the upper lip."

('836 patent, 17:46-55)(emphasis added.) Claim 10 of the '836 patent states "said panel comprising a first pair and a second pair of opposed side edges, said panel further comprising generally complementary coupling parts located at both of the pairs of said side edges." (17:16-18.) Thus, there are at least two grooves on each panel. The construction of "at least one of the side edge of both pairs of the side edges" as requiring "that only one of the two grooves previously identified in the claim needs to have an upper lip above the groove" is consistent with the language of claim 10 and, therefore, is adopted by the Court.

The district court agreed with Springs, finding claim 1 of the '940 patent and claim 1 of the '550 patent invalid. Newell, 53 U.S.P.Q.2d (BNA) at 1323-26. The court first construed the phrase "cellular pleated shade member" in claim 1 of both patents as describing "a sample of cellular pleated fabric that contains three or more cells, with at least one of those cells exhibiting the physical characteristics described in the claims." Id. at 1324-25. Armed with that construction, the court found that the Rosette anticipated the '940 patent because it met all of claim 1's limitations. Id. at 1324. The court next turned to claim 1 of the '550 patent, first noting that the Rosette did not anticipate claim 1 because the Rosette only had one attachment zone between each cell, while claim 1 required at least two. Id. at 1324-25. The court concluded, however, that it would have been obvious to one skilled in the art to apply the teachings found in the '027 patent, the use of multiple attachment zones between two cells, to the Rosette. Id. at 1325-26. The court considered, and dismissed, Newell's evidence of secondary considerations and concluded that claim 1 of the '550 patent was obvious. Id. at 1326.

B. On appeal, Newell argues that the district court's finding of invalidity of claim 1 of both patents is based on an improper claim construction of the phrase "cellular pleated shade member." Newell contends that this phrase limits the claims to a cellular shade member that is part of a complete shade, not a mere sample of shade material such as the Rosette. Therefore, Newell asserts, claim 1 of the '940 patent is not anticipated. Newell next argues that there was no evidence to support the district court's determination that claim 1 of the '550 patent was obvious because nothing suggests a motivation to modify the Rosette with the teachings of the '027 patent. Newell also cites its evidence regarding secondary considerations, such as long felt need and commercial success, as mandating a reversal of the district court's finding of obviousness.

To determine whether a patent claim is anticipated or obvious, it must first be construed. Key Pharms. v. Hercon Lab. Corp., 161 F.3d 709, 714, 48 U.S.P.Q.2d (BNA) 1911, 1915 (Fed. Cir. 1998). The district court properly construed claim 1 of the
'940 patent and claim 1 of the '550 patent to include a cellular pleated fabric that contains at least three or more cells, with at least one of those cells meeting the described claim limitations. The plain language of both claims supports the district court's construction. Claim 1 of the '940 patent requires "[a] cellular pleated shade member having a plurality of cells, at least one of the cells comprising" certain physical characteristics. '940 patent, col. 6, ll. 27-28. Claim 1 of the '550 patent has a similar requirement"[a] cellular pleated shade member having a plurality of interconnected cells, at least one of the cells comprising" certain physical characteristics. '550 patent, col. 5, ll. 53-54. Both claims only require a "member" of a cellular pleated shade, not a complete cellular pleated shade. The claims also only require one cell within this member to have the described physical characteristics.

116. Step 7. Micro-Waste contends that "at least partially compacting the particulate articles in the temperature maintenance zone" in step 7 means compaction by "passing refuse from a larger cross-sectional area microwave chamber to a smaller-cross sectional area in the temperature maintenance chamber …." micro-Waste's proposed construction cites the description of an embodiment of the device in Claim 1.

117. Micro-Waste's proposed construction cites the description of an embodiment of the device in Claim 1.

118. Industries defines the phrase, "at least partially compacting" as any degree of compressing or compacting.

119. Industries's definition is consistent with the specification, which states in its description of the process that "the articles so heated are at least slightly compacted …." To "compact" is "to press together" or "compress." WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 267. "Partially" means of or relating to a part rather than the whole; not general or total.

120. Compacting" is broader than and is therefore not limited to the embodiment cited by Micro-Waste. See Rhine, 13 F.3d at 1346.

121. "Compacting" is broader than and is therefore not limited to the embodiment cited by Micro-Waste. See Rhine, 13 F.3d at 1346.

122. The Court construes Step 7 to mean the partial compacting or compressing of the particulate articles to any degree while they are in the area where the disinfecting or sterilizing temperature is maintained.

3. At least Partially Received

Claim 1(c) of the '456 patent provides: "said cutting head assembly being structured and disposed to be at least partially received in said guide means." Defendants propose the following construction: "a portion of the cutting head assembly that goes inside the guide means." (Def. Br. at 44.) Plaintiff objects to the insertion of the word "inside." The ordinary meaning of "received" in, however, would include "to act as a receptacle or container for" and "to permit to enter." Merriam-Webster's Collegiate Dictionary available at http://www.m-w.com. Thus, the inclusion of the word "inside" does not mean that this Court would be giving the claim term something other than its ordinary meaning. This Court has not been directed to any portion of the specification or the prosecution history which would indicate a different construction. I therefore conclude that this term is construed to mean: a portion of the cutting head assembly that goes inside the guide means.

5. "Catheter at least partly formed from a pseudoelastic shape-memory alloy"

This phrase is found in independent claim 18 of the '957 Patent, and the crux of the dispute is over the proper construction of the term "catheter." The parties agree that, however "catheter" is construed, it must be made, at least in part, of a pseudoelastic shape-memory alloy. (See Amended Joint Claim Construction Statement, Ex. A at 3.)
The claim language suggests that the term catheter should be given its ordinary meaning in the field, namely "a hollow, flexible tube for insertion into a body cavity, duct or vessel to allow the passage of fluids or distend a passage way." (See, e.g., Wang Decl., Ex. G.) Medtronic, however, argues that Jervis acted as his own lexicographer and defined the term "catheter" to include "cannulas," which do not necessarily transport fluids. (See '957 Patent, 5:59-62 ("Wilson ... discloses a catheter or cannula (both being included hereinafter in the word 'catheter')...")); Wang Dec I., Ex. H (cannula, in surgical field, means "a tube to be inserted into a cavity or duct").

Dependent claim 21 of the '957 Patent, however, claims "[t]he method of claim 18 wherein the catheter is a cannula." The use of the term "cannula," is the only significant difference between the two claims. Thus, if the Court construes the term "catheter" to include a "cannula," it could be argued that dependent claim 21 is superfluous. If, however, the Court determined that a "catheter" could not include a cannula, independent claim I would be narrower than dependent claim 21. In this situation, the Court concludes that the doctrine of claim differentiation is overcome by the specification and concludes that Jervis acted as his own lexicographer and defined the term "catheter" to include "cannulas."

Gore's construction, which includes a reference to the catheter's function, is offered primarily out of a concern that the term not be construed so as to encompass a stent. (See Gore Br. at 18.) However, the specification of the '957 Patent sets forth examples of medical devices unitizing SMAs. One such example discusses catheters and cannulas. ('957 Patent, 5:59-6:57.) Another such example discusses coil stents and filters. (Id., 9:20-57.) Because of this distinction, the Court concludes that a person of ordinary skill in the art would understand from the specification that the term "catheter" is intended to be something different than a stent. As such, the Court concludes that phrase should not be construed to include a reference to the function of the "catheter."

Accordingly, the Court construes the term "catheter at least partly formed from a pseudoelastic shape-memory alloy" to mean: "a tube inserted into a cavity or duct that is made of, at least in part, a pseudoelastic shape-memory alloy."
mean the end is what you grab hold of." (Bolton Dep. at 171-72.)

P&M's expert, Charles A. Garris, Jr., 3 testified that the claim merely describes the proper positioning of the mouthpiece and nozzle so that the air flows properly through the pen, and does not require that the mouthpiece and nozzle be located on opposite extremities:

the patent specification teaches that what is important is that the air enter the housing at a location spaced from where the air exits so that the air passes through the housing, over the pen, to the outlet. . . . Nothing in the claims or specification of the '886 patent requires the mouthpiece or nozzle to be located at the exact extremity of the housing. In fact, such an interpretation would be contrary to what is shown and described with respect to the Figure 8 embodiment of the invention in which air enters through the side of the housing at an end remote from the nozzle.

(Statement of Charles A. Garris, Jr. at 2.) Rose Art's experts, Victor Reiling and Parviz Daftari, 4 testified that "end of the tubular housing" refers to one extreme end of the device and "at one end" describes "one extremity of the tubular housing and not the sides." (Statement of Victor Reiling at PP 7-8, Statement of Parviz Daftari at PP 4-5.) However, neither Mr. Reiling nor Mr. Daftari have explained the basis of their opinions and both admitted on cross-examination that neither the word "extreme" nor the word "extremity" appear in the specification of the '886 patent. (1/31/02 N.T. at 113, l. 13 - 114, l. 20 and 122, l1. 2-18.) Consequently, the Court cannot conclude that the word end is used in claim 1 to describe an integrated extremity. Based upon the intrinsic evidence contained within the patent, and the extrinsic evidence supplied by the parties, the Court construes "at one end" as "the portion of the housing where the nozzle is located or attached" and "at the other end of the housing" as "that portion of the housing where the mouthpiece is located or attached."

3 Dr. Garris is a professor of mechanical and aerospace engineering. (Statement of Charles A. Garris, Jr. at 1.)

4 Mr. Reiling and Mr. Daftari are both inventors of toys.

The Parties dispute whether one skilled in the art would understand "atrial activity" to mean only electrical signals originating in the atria or all electrical signals that could possibly be detected in the atria.

Medtronic argues that, based on the language of the patent, "atrial activity" consists of all electrical signals in the atria, including any detectable R waves from the ventricles, and noise. Guidant, on the other hand, argues that "atrial activity" has an ordinary meaning to those skilled in the art. Guidant avers that "atrial activity" refers only to electrical events that occur in the atria, specifically both normal, organized depolarizations ("P waves") and abnormal, disorganized depolarizations, which occur during atrial fibrillation. In contrast to the term "atrial activation," which encompasses just P waves, the term "atrial activity" encompasses both complete activations, normal P waves, and incomplete or disorganized activations, abnormal electrical events, that exist during atrial fibrillation.

The Court agrees with Guidant. As Guidant notes, at the Markman hearing, Medtronic's expert, Dr. David Benditt, testified that the P wave represented "the electrical signal for the atria." Tr. at 17:14-17. He also used the term "atrial activity" to refer to abnormal P waves existing during an atrial tachycardia. Tr. at 25: 12-15.

Additionally, a treatise available at the time of the '219 Patent application states that "the external reading of normal atrial electrical activity was arbitrarily termed a P wave in the early days of electrocardiography." Stephen Scheidt, M.D., Basic Electrocardiography 6 (1986). The treatise also states that during atrial fibrillation, "atrial activity is seen as small, irregular undulations in the baseline [of a printout strip]." Id. at 95. In the context of the Scheidt treatise, the term "atrial activity" refers to electrical activity generated in the atria.
The Court concludes that contemporaneous literature available to one skilled in the art limits "atrial activity" to that activity either associated with a healthy P wave or with abnormal depolarizations such as occur during atrial fibrillation. There is nothing in the specification that alters this definition. Thus, the Court concludes that "atrial activity" means electrical events that occur in the atria.

334

3. ATTACH / ATTACHMENT

Claims 1, 2, 3, 11, 15 and 16 all use the word "attachment" in conjunction with "luminal." The parties disagree as to how "attachment" or "attach" should be defined. Ravo and Nicolo urge that attach means "to make fast (as by tying or gluing)." See Plaintiffs' Brief, p. 17. Ethicon, in contrast, contends that "attach" must mean "to make immoveable with respect to."

Having reviewed the '148 Patent in its entirety, I conclude that "attach" means to make fast, as by tying or gluing. The specification itself provides that:

the bowel is attached to the central post 14, such as by tying the bowel portion to the central post 14 at the annular groove 16 with a ligation member 26.

See Col. 3, line 66 - Col. 4, line 2 (emphasis added). Thus, the specification itself defines the word. Further, the specification is consistent with the definition set forth in the dictionary. See Webster's Ninth New Collegiate Dictionary, p. 140.

Further, Ethicon's proposed definition of making something "immoveable" is at odds with the language of the '148 Patent itself. The Patent reads:

with the bowel completely immobilized and attached to the central post 14, this relative movement will cause the intussusception of the segment of the bowel to be removed as shown in FIG. 2.

See Col. 4, lines 17-20 (emphasis added). Ravo and Nicolo use the conjunctive "and" between "immobilized" and "attached." A conjunctive word joins elements. This suggests that the inventors understood "immobilized" and "attached" to mean two different things.

335

4. V-Tak

Arthrex's fourth accused device, the V-Tak, is a unitary anchor. Instead of an eyelet or enclosed passage through which the suture is threaded, the V-Tak has a notch or trough formed across the distal end of the anchor body. The suture is laid in the notch and held in place as the anchor is wedged in the bone hole. The pressure from being wedged into the hole is the only thing that keeps the suture connected to the anchor. It is not otherwise tied or fastened to the anchor. Again, the issue is whether this device meets the element of "attaching a suture to a member" or "threading the suture through a passage in the member."

Arthrex's fourth accused device, the V-Tak, is a unitary anchor. Instead of an eyelet or enclosed passage through which the suture is threaded, the V-Tak has a notch or trough formed across the distal end of the anchor body. The suture is laid in the notch and held in place as the anchor is wedged in the bone hole. The pressure from being wedged into the hole is the only thing that keeps the suture connected to the anchor. It is not otherwise tied or fastened to the anchor. Again, the issue is whether this device meets the element of "attaching a suture to a member" or "threading the suture through a passage in the member."

I did not engage in claim construction of the word "attach" on the basis that is a commonly understood term needing no further definition. The dictionary defines it as "to make fast," and gives the examples of "tying or gluing." Merriam-Webster's Collegiate Dictionary 79 (11ed. 2005). On the other hand, Smith & Nephew equates "attach" to touching or simple physical contact. It argues that because the V-Tak notch "captures" or holds the suture in place as the anchor is inserted into the bone thereby preventing the suture from changing position or falling out of the bone, the suture and the anchor are "attached." This is inconsistent with the general understanding of this term. Additionally, the patent claims are
written as a series of steps. For example, claim one requires:

forming a hole in the bone;

attaching a suture to a member;

lodging the member within the hole by pressing the member with attached suture into the hole;

and attaching tissue to the suture so that the tissue is secured against the bone.

Pls.' Ex. 1 at 10. From the order and language of the these steps, I find this claim anticipates that the suture is attached to the anchor before it is inserted into the bone hole. This clearly does not occur with the V-Tak device. Even assuming the suture is "attached" to the anchor due to pressure from the bone wall, before they are inserted into the bone hole, the suture and anchor are simply held together by the physician using the device. They are not attached or made fast to another; they are simply touching. Thus, Arthrex's motion for non-infringement as relates to its V-Tak device is granted on that basis that this device does not encompass the element of "attaching a suture to a member," which, though stated slightly differently, is common to all of '557's claims.

The Preamble

The preamble to claim 1 states as follows:

1. Claim 1
HoMedics asserts that the straight insoles lack a sheet that is "self adhesive to the skin or attachable to the skin by a self adhesive plaster." HoMedics argues that the district court did not fully construe claim 1 and argues that that claim requires the insole itself to be self-adhesive or to include a self-adhesive plaster. HoMedics contends that claim 1 does not, as the district court found, include anything that might be attached with a self-adhesive plaster because during the prosecution history the patent owner specifically disclaimed insoles to which a self-adhesive plaster might be added. Moreover, HoMedics argues that the district court's interpretation of claim 1 renders the "attachable to the skin with a self adhesive plaster" limitation meaningless because it makes everything "attachable." Thus, given a proper claim construction, HoMedics asserts, the straight insoles do not infringe claim 1.

Nikken responds that claim 1 does not require a self-adhesive and that HoMedics' straight insoles are "attachable to the skin," according to the ordinary meaning of that phrase. But even under HoMedics' proposed claim construction, Nikken argues, there was sufficient evidence for the jury to find infringement.

We agree with HoMedics that the district court erred in its reading of claim 1. The district court's limited interpretation of claim 1 recognized the disjunctive nature of the claim -- that is, that the sheet must be either "self adhesive to the skin" or "attachable to the skin by a self adhesive plaster." It is clear that the straight insoles are not self-adhesive to the skin. Consequently, the question of infringement turns on whether the straight insoles are "attachable to the skin by a self adhesive plaster."

The court did not, however, construe the individual terms in the disputed limitation. We therefore must interpret the phrase "attachable to the skin by a self adhesive plaster." Looking to the plain meaning, we find that the word "attachable" requires that the magnetic sheet itself must be capable of being attached to the skin by a self-adhesive plaster. 4 But reading the limitation broadly to include any magnetic sheet that could somehow be attached to the skin by the addition of some external means would make everything attachable and would render meaningless the "attachable" limitation. We refuse to construe a claim term so broadly. See Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1578, 40 USPQ2d 1019, 1023 (Fed. Cir. 1996) (refusing to read a limitation so broadly that it would become "meaninglessly empty").

4 Such a reading is consistent with the court's finding that the word "magnetizable," found in claim 4 of the '111 patent and also having the "-able" suffix, requires that the sheet itself be capable of being made a magnet. Summary Judgment Order at 13.

Moreover, statements made during the prosecution history, including reexamination proceedings, are relevant to determining claim scope. E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1439, 7 USPQ2d 1129, 1136 (Fed. Cir. 1988). The prosecution history limits the scope of claim terms so as to exclude any interpretation that was disclaimed during prosecution. Pall Corp. v. PTI Techs. Inc., 259 F.3d 1383, 1393, 59 USPQ2d 1763, 1770 (Fed. Cir. 2001) (citing Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir. 1995)). During reexamination of the '711 patent, the then-owner of the patent distinguished prior art references by disclaiming certain magnetic therapy devices that are not self-adhesive and that do not include self-adhesive plasters but to which self-adhesive plasters might be added. Specifically, the patent owner argued that two such prior art inventions are not "self adhesive to the skin or attachable to the skin by a self adhesive plaster compatible with the skin" because one is hung as a necklace and the other is attached by a buckle. Nikken cannot now claim a broader scope of claim 1 to include subject matter that has been disclaimed during the prosecution history. Thus, we find that the "attachable" limitation requires the magnetic sheet itself to be "attachable to the skin by a self adhesive plaster" without the addition of other means for attaching and therefore requires the magnetic sheet to include a self-adhesive plaster.
Multiquip retained Mr. Dwayne Allen and Mr. Benjamin Wiese, experts in riding power trowels, to examine the Accused Trowels. (MQ PFF [Re: Infringement] P 20). Both men concluded that all elements of claims one and two of the '740 patent are present in the Accused Trowels. (Id.). Dr. Charles Garris, an expert retained by MBW, agreed, with one exception, that all elements of claims one and two of the '740 patent are present in the Accused Trowels. (Id. P 21). The only claim element Dr. Garris argues is lacking in the Accused Trowels is: "engine means for powering said power trowel is attached to the frame means." (Id. P 22). Dr. Garris bases his opinion that this element is not met on the fact that on each of the Accused Trowels the engine is bolted to the gearbox, and it is the gearbox that is directly affixed to the frame. (MBW Resp. MQ PFF [Re: Infringement] P 23). Though this gearbox is affixed to the frame - thus causing Multiquip's experts to assert that the "engine . . . attached to the frame" element is indeed met -- Dr. Garris holds that because the engine is not directly affixed to the frame, the "engine . . . attached to the frame" element is not met. (Id. P 24). Thus, this issue of whether the Accused Trowels infringe the '740 patent hinges on whether an engine affixed to a gearbox that is affixed to the frame is either literally the same as, or equivalent to, an engine "attached to the frame."

--- Footnotes ---

1 Claim 1 of the '740 patent claims the following:

A self propelled power trowel, for finishing a concrete surface, which comprises:

- rigid frame means adapted to be disposed over said concrete surface, said rigid frame means having a front and a rear and defining a centerline from front to rear: engine means for powering said power trowel attached to the frame means;

- a pair of rotor assemblies for frictionally contacting said concrete surface and supporting said frame means thereabove, tiltably connected to the frame means and operably connected to the engine means;

- at least three dual action hydraulic cylinders, with one of said dual action hydraulic cylinders operably interconnected between the rigid frame and each rotor assembly for selectively and independently tilting each rotor assembly toward and away from the centerline of the frame, and the third dual action hydraulic cylinder operably interconnected between the rigid frame and one of the rotor assemblies for tilting said rotor assembly fore and aft parallel to said frame centerline;

- a hydraulic pump, having hydraulic fluid, operatively connected to the engine means and hydraulically connected to each of the dual action hydraulic cylinders; and

- means for selectively delivering hydraulic fluid from the hydraulic pump to each of the dual action hydraulic cylinders at variably selectable pressure.

Claim 2 of the '740 patent claims the following:

The self propelled power trowel, for finishing a concrete surface, of claim 1, wherein the means for selectively delivering hydraulic fluid from the hydraulic pump to each of the dual action hydraulic cylinders at variably selectable pressure, further comprises a plurality of proportional pressure output control valves operatively interconnected between the hydraulic pump and each of the dual action hydraulic cylinders.

--- End Footnotes ---

When evaluating a claim of patent infringement, the court engages in a two-step process. Markman v. Westview Instruments, Inc., 52 F.3d 967, 976 (Fed. Cir. 1995). The first step is to construe any disputed terms of the patent claims, and the second step is to compare the claims, once properly construed, with the accused device. Id. Typically, claim construction is a question of law for the court, id. at 977, while comparison of the construed claims to the accused device is typically an issue of fact for a jury. Bai v. L & L Wings, Inc., 160 F.3d 1350, 1353-54 (Fed. Cir. 1998). However, summary judgment for the patent holder is appropriate where no reasonable jury could find that the elements of a patent claim are absent, either literally or equivalently, from an accused device. See generally Bai, 160 F.3d 1350.
Claim construction analysis is guided by Phillips v. AWH Corp., 415 F.3d 1303, 1312-25 (Fed. Cir. 2005). Phillips recognizes that the issue of claim construction breaks down into two scenarios: those that involve "little more than the application of the widely accepted meaning of commonly understood words[,]" and those that involve "examination of terms that have a particular meaning in a field of art." Id. at 1314. For the former scenario, Phillips advises that "general purpose dictionaries may be helpful." Id. For the latter scenario, Phillips directs recourse to "the words of the claims themselves, the remainder of the specification, the prosecution history, and extrinsic evidence concerning relevant scientific principles, the meaning of technical terms, and the state of the art." Id. (quoting Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1116 (Fed. Cir.2004)).

The words of the patent's claims are given their ordinary and customary meaning that would have been attributed to them by a person of ordinary skill in the art at the time the invention was made. Phillips, 415 F.3d at 1312. Generally, in making this determination, the court should look first to the intrinsic evidence of record, such as the patent's claims, its specifications, and, if available, its prosecution history. Vitronics Corp. v. Conectoric, Inc., 90 F.3d 1576, 1582 (1996). If a review of the intrinsic evidence alone resolves all ambiguities, then the court does not turn to extrinsic evidence. Id. at 1583. However, where intrinsic evidence is insufficient to resolve the issue, the court may turn to extrinsic evidence, such as dictionaries, expert witnesses, and case law. Phillips, 415 F.3d at 1317.

In the instant case, in which the court must determine whether the word "attached" means only "directly affixed" or can also include the meaning "connected by an intervening device," it certainly appears that the court is dealing with a word of the type envisioned by the first scenario articulated in Phillips. That is, one in which determining "the ordinary meaning of claim language as understood by a person of skill in the art . . . involves little more than the application of the widely accepted meaning of commonly understood words." Phillips, 415 F.3d 1303. If the instant case is in fact such a situation, then it seems evident that the court should construe "attached" to include the fastening of a piece of equipment (such as an engine) to a fixed structure (such as a frame) through the use of an intermediary device (such as a gearbox).

The court reaches this result not only from its own understanding of the word "attached," but also through reference to the dictionary definition, as well as applicable case law. Of the many definitions for the word "attach" found in Webster's Third New International Dictionary, the iteration most relevant (based on the dictionary's proffered examples) is the fifth one: "to make fast or join (as by string or glue)." The proffered example for this definition is "attach price tags on each article." Under this definition, an item (such as a price tag) could be attached in any number of ways, including directly (such as with a stick-on tag as one commonly finds with grocery items) or through an intermediary (such as with the type of tags one typically finds attached to an article of clothing). This understanding is supported by applicable case law. In Royal Typewriter Co. v. Remington Rand, Inc., 168 F.2d 691 (2d Cir. 1948) Judge Learned Hand rejected the notion that "attached" means only "directly affixed":

However, merely as matter of interpretation of the instrument as a whole, there is no reason to circumscribe the word, "attached," in the claims to the very details of the disclosure and at least of all to the details of the figures. In point of colloquial speech no such limitation is to be implied; we speak of two objects as "attached" to each other, though they are connected by a train of links or even by a chain. Even more than in the case of the "trip bar" the infringement is well within any but a deliberately hostile interpretation of the claims.

Id. at 693. MBW maintains that this case law is inapplicable, and that reference to Judge Hand's opinion is "disingenuous," though the only reason MBW gives for its position is the age of the case. Has the meaning of the word "attached" changed in the intervening years? Not that the court is aware. In the end, MBW gives no compelling reasons why the case should be ignored. 2 The court is, of course, well aware that prior case law is not controlling when it comes to construction of terms in a patent claim. A term can vary from instance to instance depending on the facts, especially when the term is a term of art, or when it is a term that the inventor has used in an idiosyncratic manner. However, as the term "attached" is not a term of art, and as the inventor did not use it in an idiosyncratic manner, 3 the court finds that prior case law is relevant to interpreting a word's common, ordinary use and meaning.

--- Footnotes ---

2 Arguably the case cited is distinguishable from the instant case, as the intermediary component in Royal Typewriter was a screw (a common interlinking/attaching device) and the intermediary component in the instant case is a gearbox (not a common interlinking/attaching device). However, MBW makes no such argument; the court shall make no such argument.
MBW argues that the instant case is not of the kind envisioned in the first Phillips scenario, but rather of the kind envisioned in the second scenario. That is, one that involves "examination of terms that have a particular meaning in a field of art[,] or one in which the patentee has "use[d] [the] term[] idiosyncratically." Phillips, 415 F.3d at 1314. However, MBW has not argued that the word "attached" is a term of art, and MBW has failed to show that the patentee has used the word idiosyncratically -- that is to mean something other than the commonly accepted definition of the word.

MBW argues that the intrinsic evidence reveals that the patentee intended a narrow definition for the word "attached"; a definition limited only to that which is "directly affixed" or "fastened." (MBW Mem. Supp. Mot. S.J. [Re: Non-infringement] at 5). If there were evidence that the patentee had intended such a narrow definition, the court would, of course, be obliged to accept it, for "the inventor's lexicography governs" claim construction of the patent. Phillips, 415 F.3d at 1316. MBW searches for such intent mainly in two places, the patent claims themselves, and the patent specifications.

MBW points out that "[t]he claims of the '740 patent use a variety of different terms to describe and claim different connecting relationships between various elements." (MBW Mem. Supp. Mot. S.J. [Re: Non-Infringement] at 6).

For example, a pair of rotor assemblies are "tiltably connected" to the frame (claims 1 and 3; Fig. 2; Col. 7, L55-58). In contrast, the rotor assemblies are "operably connected" to the engine assembly through respective universal drive assemblies (claims 1 and 3; Col. 7, L58). At least one of three hydraulic cylinders is "operably interconnected" between the frame and a rotor assembly (claims 1 and 3; Col. 7, L59; Col. 8, L5). A pump is not illustrated in the drawings; however, the specification describes the pump as being "operatively connected" to the engine assembly and "hydraulically connected" to each hydraulic cylinder (Col. 4, L3-4; claims 3 and 4; Col. 8, L8-11). The pump is "interconnected" to the cylinders through hydraulic control valves, as well as hydraulic hoses and fittings (claims 2 and 4) (Garris [Decl., Docket 83 (hereinafter: "Garris")] P10).

The intrinsic evidence (i.e., the claims and patent specification) demonstrates that the terms "operatively connected" and "operably connected" do not require that one element must be affixed or fastened to another in a manner that results in the two components forming a unitary structure (Garris P12). The terms reflect a functional relationship between the components to one of ordinary skill in the art at the time of the invention, Id. In other words, the claimed components which are "operatively connected" and/or "operably connected" must be interrelated in a way to perform a designated function, Id.

(MBW Mem. Supp. Mot. S.J. [Re: Non-Infringement] at 6). The court concurs -- as does Multiquip -- with the foregoing analysis of the various phrases used in the claims. However, like Multiquip, the court does not find the foregoing analysis to be of any real relevance to the question at hand. The phrases MBW describes all relate to the interaction of components that operate on, or in conjunction with, one another. Those phrases explain the components, and how they interact. "Thus, the trowel rotor assemblies are 'operably connected' to the engine, because the engine drives -- or causes to 'operate' -- the rotor assemblies." (MQ Br. Opp. Mot. S.J. [Re: Non-Infringement] at 7). However, as Multiquip points out: "[o]ne would not expect to see the phrase 'operably connected' to describe a relationship between the engine and frame, because the engine does not act on, or 'operate' on, the frame[,] [t]he engine is simply . . . attached." (Id.). Therefore, it is only reasonable that there is no functional phrase describing the manner of attachment, and it would certainly be unreasonable to infer some sort of limitation on the word "attached" on the basis of a lack of a functional phrase describing such an attachment or on the existence of functional phrases elsewhere. "[N]o particular method of 'attachment' is suggested, required, or excluded by the use of phrases like 'operatively connected' in other contexts" (id.), or by the lack of the use of such a phrase in the engine/frame context. Therefore, there is nothing in the claim itself to indicate that a person of ordinary skill in the art would read the word "attached" as not encompassing all its normal meanings, but rather, limited only to "directly affixed."

Nor is there anything in the specifications that give such an indication. MBW argues that several uses of the term "attached" in the specifications do show that "attached" is limited to meaning "directly affixed." MBW points to several instances in the specifications in which the term "attached" is used to describe components that are directly affixed. (MBW Mem. Supp. Mot. S.J. [Re: Non-Infringement] at 7-9). Multiquip raises a factual question as to whether the examples cited by MBW are
in fact instances in which components are directly affixed. (MQ Br. Opp. Mot. S.J. [Re: Non-Infringement] at 9). However, ultimately it is of no consequence, nor is it necessary for the court to describe MBW's cited examples in any detail. For the sake of this analysis, the court will assume that all the instances in the specifications cited by MBW do demonstrate the use of the word "attached" to describe components directly affixed to one another. Again, the court fails to see the point of MBW's argument. No one is asserting that "attached" does not include "directly affixed." Obviously, things that are directly affixed are attached. MBW is the party that wants to show that "attached" is limited to "directly affixed"; showing that a word ("attached") used to depict one of its ordinary meanings ("directly affixed") in no way evidences an intent by the inventor to limit the word to that meaning. In the end, all MBW's argument does is persuade the court that the term "attached" includes the meaning "directly affixed" -- an issue that was never in contention.

Nothing in any of the intrinsic evidence indicates that a person of ordinary skill in the art would read the word "attached" as being limited to meaning only "directly affixed." Examination of extrinsic evidence shows that the ordinary meaning of the word "attached" includes components attached to a fixed structure via another component. Thus, the court construes the term "attached" accordingly.

1. "Attached"

This term appears in three claims with respect to two different attachments: that of the bar clamp and the master cylinder housing (claims 1 and 21) and that of the elastomeric diaphragm and the side wall of the reservoir (claim 4). Formula contends, largely based upon drawings contained in the patent, that these attachments must be direct, i.e., without any additional components intervening between the two specifically stated as being attached to one another. Although patent figures are undoubtedly pertinent to a determination of an invention's scope, they are by no means dispositive in every case. MBO Laboratories, Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1333 (Fed. Cir. 2007). Despite Formula's arguments, nothing in the specification requires that either of these attachments be direct. In fact, an example offered by Formula in support of its construction demonstrates an attachment of two components through a third, namely the attachment of the master cylinder to the handlebar via the bar clamp. Claims 1 and 21 describe this configuration as "a bar claim attached to a master cylinder housing for attaching the…housing to a bicycle handlebar." Formula perceives a functional difference between the phrase "attached to" and "attaching…to" such that the latter would permit an intermediate component but the former would not. However, without a strong indication in the specification that the two forms of the verb "attach" have two different meanings, Formula's proposed construction cannot stand. The plain language of claims 1 and 21 indicate that the word "attach" contemplates situations in which the attached components are not in direct contact with each other. Accordingly, we construe the term attached to mean a connection or joining of two components, whether or not the connection involves an intermediate component.

vi. Attached

Plaintiffs construe the term "attached" to mean "fastened or connected, by way of magnetic engagement." Defendant objects to limiting the term's meaning to fastening or connecting by magnetic engagement.

The court agrees with Plaintiffs. In the relevant claim language, the term "attached" is found in the following phrase: "a second magnetic member secured to said projection of said auxiliary spectacle frame for engaging with said first magnetic member of said primary spectacle frame and for allowing said auxiliary spectacle frame to be attached to said primary spectacle frame with only one hand by a user" (emphasis added). The references to "magnetic" members clearly imply that the term "attached," read in context, refers to magnetic attachment.

Therefore, the court construes the term "attached" as "fastened or connected, by way of magnetic engagement."
4. Attached

The term "attached" is also used by reference throughout the claims of the reexamined 097 patent and explicitly in asserted Claims 11, 27, 32, 34, 35, and 42. The dictionary definition advanced by Stant defines "attached," in relevant part, as "joined, connected; bound." Webster's Universal, Stant Ex. 103, p. 133. Similarly, Gerdes contends that the dictionary definition of "attached" is "to make fast or join." Webster's Third, Gerdes Ex. 214.

The patentee used the term "attached" in the claims of the reexamined 097 patent to describe the connection between the first flange and the outer cover and/or the housing. Nothing in the way the term is used in the claims indicates any intention to give "attached" a meaning other than its ordinary meaning. Neither of the parties dispute this finding.

In the specification of the 097 patent, however, the patentee describes the connection between the outer cover and the first flange somewhat differently. Specifically the specification states that "the outer shell 14 engages the frangible portion 60 of the disc . . . " The dictionary defines the term "engage," in relevant part "to mean" come into contact or to interlock with. "Webster's Third, Gerdes Ex. 225. As Gerdes points out, this definition is somewhat broader than that of the term "attached" in that it encompasses more possibilities for the connection between the two structures described. Similarly, during the prosecution of the reexamined 097 patent, the patentee attempted to substitute the phrase "an outer cover engaging said first flange" for the phrase "an outer cover attached to said first flange" in one claim. Compare Prosecution History for the Reexamined 097 patent, Gerdes Ex. 250, p. GE 3391 with Prosecution History for Reexamined 097 patent, Gerdes Ex. 250, p. GE 3546a. The PTO specifically held the claim with the changed language invalid because the new phrase, "an outer cover engaging said first flange" was broader than the old language and therefore was impermissible under 35 U.S.C. § 305. 3 Prosecution History of the Reexamined 097 patent, Gerdes Ex. 250, p. GE 3597. As a result, the claim remained "an outer cover attached to said first flange." Reexamined 097 patent, col. 1, 1. 53.

3 35 U.S.C. § 305(a) provides that "no proposed amended or new claim enlarging the scope of a claim of the patent will be permitted in a reexamination proceeding. . . ." In its Office Action in Reexamination of the 097 patent, the PTO explained that,

A claim presented in a reexamination "enlarges the scope" of the patent claim(s) where the claim is broader than any claim of the patent. A claim is broader in scope than the original claims if it contains within its scope any conceivable apparatus or process which would not have infringed the original patent. A claim is broadened if it is broader in any one respect, even though it may be narrower in other respects.

Prosecution History of the Reexamined 097 patent, Gerdes Ex. 250, p. GE 3597.

Gerdes correctly uses this exchange to argue that the court must give the terms "engage" and "attach" different meanings -- with "attach" being narrower than "engage." The court agrees, however, this does not mean that the court must adopt the definition of "attached" advanced by Gerdes. To the contrary, the court finds nothing in the claims, specification, or prosecution history to indicate that the patentee intended a definition as restricted as that advanced by Gerdes. If the court were to adopt Gerdes' position that something attached must be immovable, as Stant argues, it is difficult to imagine how the outer cover could be "attached to the housing in such a manner as to allow the outer cover to rotate the housing." Reexamined 097 patent, col. 4, 11. 28-31. Instead, the court finds that the ordinary meaning of the term "attached" is more narrow than that of the term "engaged," in that "attached" requires some type of joint or bond where "engaged" allows for any type of contact, with or without attachment, between the structures. Thus, applying the ordinary meaning of the term is consistent with the prosecution history of the patent.

For these reasons the court finds that the meaning of the term "attached" is "joined, connected, or bound," but not necessarily immovable.
The Court held a Markman hearing and subsequently issued a Memorandum opinion (Docket No. 138) in which the Court construed the disputed claim terms of the '981 Patent and the '306 Patent. At issued were the following claim terms of the '981 Patent and the '306 Patent: 1) "Frame"; 2) "Formed Integrally Within"; 3) "Integrally Formed Within"; 4) "Integrally Formed With"; 5) "Including"; 6) "Attached"; and 7) "Manifold". The Court construed the terms as follows:

"Frame": "the underlying structure of the cone crusher to which other constituent parts may be fitted, attached or integrated."

"Formed integrally within" and "Integrally formed within": "created or constructed within or as a part of the frame."

"Integrally formed with": "created or constructed within or in combination with the frame."

"Attached": "fastened or affixed."

"Including": "to take in or comprise as a part of a whole."

"Manifold": "a fitting or a passage that has a plurality of openings for making connections."

2. **attached is construed to mean secured or joined to the solid surface.**

Affymetrix contends that "attached" means secured to the solid surface.

Incyte contends that "attached" means covalently bonded to the surface by the 3' end of the nucleotide or nucleotide polymer.

Hyseq contends that "attached" means synthesized at a predefined region on the first surface of the solid support by bonding of the 3' end of the first monomer in the oligonucleotide to the predefined region on the first surface of the solid support prior to monomer-by-monomer synthesis of the oligonucleotide at that predefined region.

The Court adopts the ordinary and customary meaning of the term, "attached." Incyte argues that, during prosecution of the '934 patent, the PTO indicated that the claims were only enabled for arrays in which the oligonucleotides are covalently coupled to the surface. (Livornese Decl. Exh. 19 (7/12/94 Office Action) at 3). Consequently, Affymetrix withdrew claims to noncovalently attached oligonucleotides in order to obtain allowance. (See Markman hearing transcript at 402: 21-25). Affymetrix concedes that there is no new teaching added to the '305 specification compared to the '934 specification to support a non-covalent attachment. (Id. at 403:11-14). Because the Examiner's comments suggest that claims to non-covalently attached oligonucleotides would not be enabled, Incyte argues that "attached" must be construed to exclude non-covalent attachment, to avoid invalidity based on non-enablement.

In this case, however, "attached" is not reasonably susceptible to a definition that restricts it to covalent attachment. Process Control, 190 F.3d at 1357. The specification and prosecution history clearly show that Affymetrix used the term, "attached," to mean encompassing both covalent and non-covalent attachment. ('305 patent, col. 5:19-21 (stating, "Receptors may be attached, covalently or noncovalently, to a binding member, either directly or via a specific binding substance.").) The Court cannot rewrite the claims, even if necessary to avoid a finding of invalidity. Process Control, 190 F.3d at 1357. Thus, the Court rejects Incyte's importation of "covalently" to the definition of the term. Likewise, the Court declines to impose the monomer-by-monomer synthesis and 3' attachment limitations on the definition of attachment to avoid invalidity based on non-enablement.
The parties disagree whether the term "attached" indicates that the layers of the liner listed in Claim 8 must be attached to each other directly, or signifies that other layers may be inserted between them. Plaintiffs insist that all three layers named in Claim 8 must be directly adjacent to one another. Defendants, on the other hand, contend that the individual layers of the liner taught by Claim 8 need not be directly adjacent, but may have other layers inserted between them provided all of the named layers are also present.

The language of Claim 8 does not give the Court any indication of what the meaning of "attached" might be. However, because the Court construes claim terms consistently throughout a patent, it may look to the use of "attached" in other Claims for guidance. See Rexnord, 274 F.3d at 1342. Claim 1 describes a liner with layers "attached" to one another. Claim 3 teaches a liner as described in Claim 1, with an additional layer inserted in the middle. The interplay between these two claims is significant. It is a principle of patent law that dependent claims encompass all of the elements of the independent claims upon which they depend, so that a dependent claim cannot be found infringed unless the independent claim is also found to be infringed. See Wahpeton Canvas Co. v. Frontier, Inc., 870 F.2d 1546, 1553 n. 10 (Fed. Cir. 1989). Claim 3 is a variation upon Claim 1, with a particular added feature. Because the added element in Claim 3 is an additional layer, the Court must infer that Claim 1 contemplates the insertion of additional layers between its elements. By implication, "attached" does not mean directly attached or adjacent.

Therefore, the Court construes "attached" as meaning physically attached, but not necessarily directly so. Coupling this construction with the Court's interpretation of the term "comprising," Claim 8 teaches a liner that requires the named elements, but may also include additional elements inserted between the named elements while still forming a construct within the scope of the Claim.

The final disputed claim term pertains to how the straps are attached to the chest protector, as disclosed by the phrase "each adjustable strap attached at one end to the abdomen portion of the main pad and at the other end to the back portion of the shoulder guard." Plaintiff seeks a construction of this phrase in which "the straps are attached to the abdomen portion of the main pad and back portion of the shoulder guard either directly or indirectly through the other strap." (Pl.'s Br., at 19.) Plaintiff's concern is that the claim language suggests that each strap must be attached directly from the abdomen portion of the main pad, on one end of the strap, to the shoulder guard, at the other end. In Plaintiff's view, the claim should also contemplate a system in which one set of straps, attached to each side of the abdomen section of the main pad, run more or less horizontally to a connector near the center of the wearer's back; a second, Y-shaped vertical strap runs up from the connector, with each leg of the "Y" attached to the back of each shoulder guard. Hence, the connection between the main pad and the shoulder guards is made via the connector and is thus "indirect." (Id.) This type of strap arrangement, according to Plaintiff, is what is portrayed in the inventors' drawings and what was used on TAG's 200 Series chest protectors and Mizuno's Tsunami protectors. An interpretation that requires a direct connection, Plaintiff maintains, would thus improperly exclude both the preferred embodiment, and the licensed products, from the scope of the '226 Patent. (Pl.'s Reply, at 13.)

TAG does not offer its own proposed construction; instead, TAG contends that the identified claim language need not be construed by the court at all. (Def.'s Br., at 23.) In TAG's view, the language is "easily understood" as is, and Plaintiff's proposal "would merely serve to confuse a jury." (Id.) Citing no authority, TAG maintains that the court is not required to "construe each and every claim term or phrase merely because one side or the other requests a construction." (Def.'s Sur-reply, at 9.)

TAG is correct that as a general matter, only claim language that is disputed or in controversy need be construed by the
& Eng'g, Inc., 200 F.3d 795, 803 (Fed. Cir. 1999) & U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir.
1997)). The court is unaware, however, of any authority holding that one party can avoid a claim construction that is sought
by the other party, simply by declining to argue its merits or to offer an alternative proposal. Indeed, a court must often
interpret claims that are not in dispute at all, simply "to provide a proper context for the discussion of the terms that are in

More importantly, Plaintiff has sufficiently established that the identified claim language is in controversy. In the court's
view, the most "easily understood" interpretation of the language indeed is that the patent covers only chest protectors in
which each adjustable strap runs directly from the main pad to a shoulder guard. This would exclude the patentees' example
of their invention, as represented by their drawings depicting the preferred embodiment, from the scope of the patent. It is
well-settled that claims should be interpreted to cover the preferred embodiment; while it is improper to limit claims in
accordance with that embodiment, as discussed above, it is further inappropriate to interpret a claim term so as to exclude
the preferred embodiment. See Primos, Inc. v. Hunter's Specialties, Inc., 451 F.3d 841, 848 (Fed. Cir. 2006) ("While we are
mindful that we cannot import limitations from the preferred embodiments into the claim, we also should not normally
interpret a claim term to exclude a preferred embodiment."); SanDisk Corp. v. Memorex Prod's., Inc., 415 F.3d 1278, 1285
(Fed. Cir. 2005) ("A claim construction that excludes a preferred embodiment . . . 'is rarely, if ever, correct.'") (quoting
Vitronics, 90 F.3d at 1583); see also Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996) ("it is
unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of
skill in this field would read the specification in such a way.").

Moreover, as noted above, the licensed products--the TAG 200 Series and the Mizuno Tsunami--serve as extrinsic evidence
of how others skilled in the art understood the scope of the '226 Patent. Swangard and Mizuno apparently believed that
these products were covered by the '226 Patent, and given that both models employed the indirect strap system detailed
above, it is reasonable to conclude that persons skilled in the art would have interpreted the claim language as covering
chest protectors using that strap arrangement. This extrinsic evidence, combined with the intrinsic evidence provided by the
drawings of the preferred embodiment, is sufficient to support Plaintiff's proposed construction.

The court finds Plaintiff's choice of language less helpful, however. Specifically, it may be confusing to state that the "straps
are attached . . . directly or indirectly through the other strap." For there to be an "other" strap, a first strap (singular) must
be identified. In the court's view, "another strap" is preferable to "the other strap," and is consistent with the intrinsic and
extrinsic evidence noted above. The court thus concludes that the phrase "each adjustable strap attached at one end to the
abdomen portion of the main pad and at the other end to the back portion of the shoulder guard" shall be construed as "each
strap is attached to the abdomen portion of the main pad and back portion of the shoulder guard either directly, or indirectly
through another strap."

The parties place at issue the construction to be put on the language that limits the invention to a club head that has "a single
weight member formed on and attached solely to said rear wall within said cavity."

The Defendants contend that these words of the claim should be read to mean precisely what the words say. That is, that the
weight member is attached solely (i.e. only) to the rear wall (backside of the striking surface) within the cavity. Therefore,
the claim would not read on a club having the weight member attached to the peripheral mass and, therefore, not attached
solely to the rear wall.
Plaintiff states that "the written claims in the utility patents should be construed according to their plain and ordinary meaning. Because the claims are clear on their face, no further interpretation is required." Plaintiff's Opening Brief at 3. However, the Plaintiff then proceeds to argue that this Court should ignore the clear plain meaning of the words "attached solely to said rear wall." Plaintiff wishes these words to mean that in addition to 3 being attached to the rear wall, the weight member can be attached to the peripheral mass. In an effort to find some meaning for the subject limitation, Plaintiff argues that the term "formed on and attached solely to said rear wall" means that the back bar mass is formed on and attached solely to the club head's rear wall as opposed to being attached to other club structure separate from the rear wall. The Court cannot agree.

3 And, perhaps, instead of as well.

Plaintiff argues that the limitation at issue, "attached solely to said rear wall" was added to avoid the prior art in the Sugioka Patent, No. 4,602,787. Defendant argues that the limitation was added to avoid the prior art in the Winquist Patent, No. 3,814,437.

If the subject limitation were added simply to avoid Sugioka, it was drafted far more broadly than necessary. The Court should not rewrite the claim language to narrow a limitation to that which the patentee might have "needed" to avoid a particular reference. On the Sugioka avoidance theory, the patentee deliberately chose to abandon more than was necessary. He cannot rewrite the claim to recover the abandoned coverage at the present stage.

To the extent pertinent, if at all, the Court concludes that the claim limitation likely was, or at least should have been, included to avoid the Winquist reference. Winquist disclosed a single weight member which is attached to (and integral with) the peripheral mass of the club head. It would have been reasonable to distinguish the alleged invention from Winquist by limiting the claim to a club with a weight mass that is not attached to the peripheral mass, but only to the rear wall.

In any event, whatever the patentee's motivation for including the limitation at issue, the limitation is in the claim and will not be ignored.

Plaintiff argues that the claim construction espoused by the Defendant would result in a claim which did not read on any of the preferred embodiments of the invention disclosed in the patent. Plaintiff is incorrect. Furthermore, even if Plaintiff were correct, he would not prevail on the claim construction at issue.

The patent application, as filed, included disclosed embodiments in which the weight bar was integral with the peripheral mass. The limitation at issue would result in a claim which did not read on these disclosed embodiments. However, Plaintiff is not correct when he asserts that in every one of the disclosed embodiments, the weight member is integral with the peripheral mass.

In Figures 2, 3, 9, and 10, one can see that the weight bar and the peripheral mass are integral. In others, such as Figures 4-8 and 11-20, one cannot tell whether the weight bar is integral with the peripheral mass. In these figures, an expressed integral connection, shown by the absence of a line at the bottom of member 30 in Figures 2 and 3, is not present. It is, of course, possible that there is an integral connection which would not be shown on certain figures, such as Figures 4-8, because of the angle from which the drawing is made. However, this Court does not see in the figures and disclosure any intent to exclude from the disclosure club heads in which the weight bar mass is separate from the peripheral mass. Fairly and reasonably read, the patent disclosure contains embodiments which can be viewed as ones in which the weight member is other than integral with the peripheral mass.

Moreover, the Court emphasizes that even if one could read the patent disclosure so as to include only embodiments in which the weight bar was integral to the peripheral mass, the claim construction would be no different. This patentee used clear language to add a limitation which excludes from coverage a club head in which the weight member is not "attached solely to said rear wall."
Plaintiff argues that the patent examiner must have understood the term at issue to cover a club in which the weight member was integral with the peripheral mass. This contention is based upon the fact that examiner asserted that the Gorman Patent No. 5,048,835 "anticipated" the claimed invention. In the course of prosecution, the patentee never had to confront this conclusion because he was able to persuade the examiner that Gorman was not prior art.

4 Gorman would "anticipate" the claim if in Gorman there is found every limitation in the claim, including, therefore, the "attached solely to" limitation. Glaxo, Inc. v. Novopharm Ltd., 52 F.3d 1043, 1047 (Fed. Cir.), cert. denied, 516 U.S. 988, 116 S. Ct. 516, 133 L. Ed. 2d 424 (1995).

5 Plaintiff filed a Declaration Under 37 C.F.R. 1.131 in which he swore that he had reduced his invention to practice prior to the filing date of the Gorman patent.

It is true that using Gorman as an anticipation reference would be contrary to the construction that the Court places upon the subject claim language. However, it is apparent to the Court that the examiner's assertion was, simply, erroneous. To the extent that the examiner may have focused on the matter, he came to the wrong conclusion. This Court has considered, and finds most unreliable, the conclusion of the patent examiners that Gorman shows a "single weight member attached solely to the rear wall."

6 Moreover, Gorman does not disclose a club with a single weight member, but, rather, one with two or three weight members as shown in Figure 8:

In sum, the claim language at issue is interpreted to mean what it says. The weight member must be attached solely (i.e., only) to the rear wall (backside of the striking surface) and not attached also to the peripheral mass within the cavity.

1. Claim Construction

Claim construction is a question of law, which we review de novo. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed. Cir. 1998) (en banc). When construing a claim, a court should first look to the intrinsic evidence, i.e., the patent itself, its claims, written description, and, if in evidence, the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). The court may receive extrinsic evidence to educate itself about the invention and the relevant technology, but the court may not use extrinsic evidence to arrive at a claim construction that is clearly at odds with the construction mandated by the intrinsic evidence. See Key Pharms. v. Hercon Lab. Corp., 161 F.3d 709, 716, 48 U.S.P.Q.2D (BNA) 1911, 1917 (Fed. Cir. 1998). Dictionary definitions are considered to be intrinsic evidence. See Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971, 50 U.S.P.Q.2D (BNA) 1465, 1468 (Fed. Cir. 1999).
Claim construction begins with the words of the claim. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619-20, 34 U.S.P.Q.2D (BNA) 1816, 1819 (Fed. Cir. 1995). In this case, the infringement analysis centers on the construction of the "a single weight member formed on and attached solely to said rear wall within said cavity" limitation in claim 1 of the '184 patent, and in particular, the phrase "attached solely to said rear wall."

The critical terms are the words "attached," "solely," and "rear wall." The relevant definition of "attach" is to "make fast or join," Philip Babcock Gove et al., Webster's Third New International Dictionary 140 (1971), while "solely" is defined as "to the exclusion of alternate or competing things," id. at 2168. Thus, the plain meaning of "attached solely to said rear wall" is that the weight member cannot be fastened to any portion of the golf club head except the rear wall.

We must also determine whether, as Antonious argues, the term "rear wall" is properly construed to comprise the peripheral mass. The district court held that the peripheral mass is not properly considered to be part of the rear wall. We agree. Claim 1 plainly defines the rear wall and peripheral mass as separate elements. See '184 patent, col. 6, II. 47-54 ("said [iron] comprising . . . a rear wall opposite said ball striking face, . . . [and] a peripheral mass located on said rear wall at an outer extremity of said club head, said peripheral mass and said rear wall defining a centrally located cavity") (emphasis added). Therefore, because the peripheral mass is defined by the claim as being separate from, albeit located on, the rear wall, the plain meaning of "a single weight member formed on and attached solely to said rear wall" does not include a weight member fastened to the peripheral mass.

Antonious argues that the written description compels us to interpret the rear wall term as including the peripheral mass. He asserts that all of the preferred embodiments shown in the figures indicate that the weight bar is attached both to the rear wall and to the peripheral mass, and that a claim interpretation that does not include those embodiments must be incorrect. It is true that claims are normally construed to cover preferred embodiments. See Vitronics, 90 F.3d at 1583, 34 U.S.P.Q.2D (BNA) at 1578 (construing claim language so as to include the only embodiment described in the written description, where the prosecution history was not in evidence). However, Antonious's argument is unpersuasive in this case, where most of the preferred embodiments are not excluded under the plain meaning of the claim language and the limitation at issue was added during prosecution.

We agree with the district court's statement that "fairly and reasonably read, the patent disclosure contains embodiments which can be viewed as ones in which the weight member is other than integral with the peripheral mass." Spalding I at *7. 2 Thus, Antonious is incorrect in asserting that all of the preferred embodiments would be excluded from coverage by claim 1 if the claim language is interpreted to mean that the weight member cannot be fastened to any portion of the golf club head except the rear wall, and that the rear wall does not include the peripheral mass. In addition, the exclusion of some preferred embodiments by the "attached solely to said rear wall" limitation is more easily understood given the fact that Antonious added this claim language during prosecution, i.e., after he had submitted the written description, including the figures showing the preferred embodiments.

2 The district court based this conclusion on the differences in the preferred embodiments shown in the figures of the '184 patent. The court found that the preferred embodiments shown in figures 2, 3, 9 and 10 show the weight bar attached both to the rear wall and the peripheral mass, as indicated by the absence of a joint line between the weight member and the lower portion of the peripheral mass. The court found that figures 4-8 and 11-20 show the weight bar not attached to the peripheral mass, based on the presence of a line between the weight member and the lower portion of the peripheral mass.

During prosecution, the examiner rejected claims in a parent application of the '184 patent pursuant to 35 U.S.C. § 103, based on U.S. Patent No. 3,814,437 (Winquist) in view of U.S. Patent Nos. 4,602,787 (Sugioka) and 4,511,145 (Schmidt). Winquist discloses an iron-type golf club head with a peripheral mass and a single weight member (in the form of a symbol) attached both to the rear wall and the peripheral mass. Sugioka discloses a hollow metal "wood"-type golf club head with a detachable sole plate. A weight chamber is mounted on the upper surface of the sole plate and several reinforcing ribs are attached to the weight chamber and the sole plate so that the ribs come into contact with the sides of the club head when the sole plate is attached to the upper portion of the club head. In the rejection, the examiner stated that "it would have been
obvious to modify the Winquist device . . . so long as the bar connects the upper and lower surfaces of the rear cavity as shown by Winquist."

As part of his office action response, Antonious added the "attached solely to said rear wall" language. Antonious referred to this limitation only in distinguishing Sugioka, and argues now that an interpretation of this language to exclude irons where the weight member is attached to the rear wall and peripheral mass is therefore unjustified. This argument is not persuasive.

We do not disagree with Antonious's suggestion that the addition of this claim language may not have been needed in order to distinguish Sugioka. However, an applicant is free to give up more claim scope than is necessary to overcome a reference. See Bai v. L & L Wings, Inc., 160 F.3d 1350, 1356, 48 U.S.P.Q.2d (BNA) 1674, 1678-79 (Fed. Cir. 1998); see also Lemelson v. General Mills, Inc., 968 F.2d 1202, 1206, 23 U.S.P.Q.2d (BNA) 1284, 1288 (Fed. Cir. 1992) ("The prosecution history gives insight into what the applicant originally claimed as the invention, and often what the applicant gave up in order the meet the Examiner's objections."); Standard Oil Co. v. American Cyanamid Co., 774 F.2d 448, 452, 227 U.S.P.Q. (BNA) 293, 296 (Fed. Cir. 1985) (the prosecution history "limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance"). We are satisfied that, whether he needed to or not, Antonious gave up a claim scope that could include a weight bar attached to the peripheral mass and the rear wall when he added the "attached solely to said rear wall" limitation.

Antonious finally argues that the examiner's rejection pursuant to 35 U.S.C. § 102 based on U.S. Patent No. 5,048,835 (Gorman) shows that the examiner must have agreed with Antonious's proffered interpretation of the disputed claim language, because Gorman discloses a weight member attached to the peripheral mass. We are not persuaded by this argument for two reasons. First, we would not be persuaded to interpret claim 1 as including the peripheral mass as part of the rear wall even if the examiner had expressly indicated that he thought this was so, given the plain meaning of the claim language. Moreover, the examiner did not discuss the "attached solely to said rear wall" limitation with respect to Gorman, which raises the possibility that the examiner may not have considered that claim language when issuing that rejection.

Consequently, we construe the phrase "a single weight member formed on and attached solely to said rear wall" to mean that the weight member cannot be fastened to any portion of the golf club except the rear wall; we further conclude that the peripheral mass is not part of the rear wall.

b. "attached thereto and in sliding engagement therewith"

Claim language

Callicrate urges that the phrase "attached thereto and in sliding engagement therewith" means "attached to the ligature material in a manner that allows the ligature material to slide through the grommet." NAIC contrarily urges the Court to adopt the following construction: "loosely attached to the band so as to allow movement of said ligature material through said grommet." The claim language does not require the grommet to be "loosely" attached to the endless loop, nor does it otherwise qualify the way in which the grommet must be attached to the endless loop. The Court thus turns to the specification.

Specification

NAIC does not provide any argument to support its proposed inclusion of the term "loosely" into the construction of the claim language. Nevertheless, the Court notes that this interpretation is based upon the specification, which states:

The pre-attached grommet 32 must be loosely attached to the band in a manner that allows the ligature material to slip through the grommet 32 until desired tension on the body part is achieved. At such time, the grommet 32 is deformed to permanently secure the tightened band around the body part. 61
The specification is not stated in terms of a preferred embodiment, but rather states that the grommet "must be loosely attached" to the ligature material. In this way, the specification acts as a dictionary and explains how the grommet must be attached to the band. Thus, the Court construes the phrase "attached thereto and in sliding engagement therewith" to mean "loosely attached to the ligature material in a manner that allows the ligature material to slide through the grommet."

We will construe "wherein said elastomeric ear further comprises a non-elastomeric extension member attached to said distal edge" to mean "wherein the elastomeric ear further comprises a non-elastomeric extension member attached to the distal edge along a seam." This construction is supported by the claim language and the specification. The claim language, as indicated above, clearly provides that the non-elastomeric ear extension member be "attached to said distal edge." U.S. Patent No. 5,496,298, Claim 30 (emphasis added). "To" is not a technical term of art that requires a special definition. Therefore, KC's proposed construction would impermissibly broaden the scope of the claimed invention beyond what the inventor intended or a person of ordinary skill in the art would understand the claim language to mean. When KC chose the language for Claim 30, they chose the phrase " attached to" to mean "attached to the main body 48 along a seam 52." U.S. Patent No. 5,496,298, col. 5, ll. 13-14. Based on this language, we conclude that a person of ordinary skill in the art would understand that the ear extension must be attached to the distal edge along a seam. Accordingly, we will construe "wherein said elastomeric ear further comprises a non-elastomeric extension member attached to said distal edge" to mean "wherein the elastomeric ear further comprises a non-elastomeric extension member attached to the distal edge along a seam."

This question is difficult because of several competing considerations. On the one hand the specification repeatedly uses the term "attached" to mean only "affixing to the outer surface" and both "attached" and "embedded" appear in the claims, suggesting consistent use. On the other hand, construing the term to exclude embedding seems to exclude the specification's only description of the seat-based embodiment, which is a primary embodiment. Nonetheless, because several seat-based...
embodiments would still be included in the claim language, construing the claim in line with its meaning in the specification will not violate the tenet that claims must be construed to include preferred embodiments. Vitronics, 90 F.3d at 1583.

The discussion of this term requires a closer look at the caselaw. Claims must be construed in light of the specification. Phillips, 415 F.3d at 1312. A patentee may choose to be his own lexicographer and use a term in a manner other than its ordinary meaning; however, an "explicit statement of redefinition" is not always necessary if the patentee clearly expresses an intent to redefine the term. Bell Atl. Network Servs., Inc. v. Covad Commc'ns Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001). Indeed, "when a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term 'by implication.'" Id. at 1271; see Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002).

Despite Plaintiffs' arguments that the word need not be construed, this Court finds that the specification redefines "attached" by implication. There are two reasons that "attached" cannot be construed to include embedding: (1) the specification repeatedly and consistently uses the terms distinctly and with different meanings, and (2) the claims themselves differentiate attaching from embedding.

The '941 patent uses "attached" to mean only "affixed to the outside surface"; any time it refers to an actuator inside an object, it uses only the term "embedded." Two, of many examples, are reproduced below:

In a second illustrative form, small vibratory actuators can be affixed to or embedded within the throttle's handle . . . . They may be attached in a temporary fashion via small elastic straps, or they may be embedded within a small plastic housing that is specifically designed to fit precisely upon the surface of a specific location of a specific throttle handle.

('941 patent, 33:45-58) (emphasis added.)

In the preferred illustrative form, a vibratory actuator can be attached to [the] outer side of the 40 throttle handle with hook and loop fasteners or two sided adhesive foam tape (or some other readily available attachment means). . . . In a 45 second illustrative form, small vibratory actuators can be affixed to or embedded within the throttle's handle, . . . . If these motors are attached to the outer surface of the 50 throttle handle, they must be small enough to not substantially disrupt the ergonomics of the throttle handle. A preferable location would be the underside (bottom) of the throttle handle. They may be attached in a temporary fashion via small elastic straps, or they may be embedded within a 55 small plastic housing that is specifically designed to fit precisely upon the surface of a specific location of a specific throttle handle The tactile sensation actuator(s) for a flight control joystick 540 are implemented in a similar fashion to the actuators for the throttle and weapons controller 530. In the preferred illustrative form, vibratory actuators can be affixed to or embedded within the joystick's handle, such that the hand of the user, in holding the joystick, will come into direct or indirect contact with these vibratory motors. If these motors are attached to the outer surface of the joystick handle, they must be small enough to not substantially disrupt the ergonomics of the joystick handle.

('941 patent, 33:39-34:9 (emphasis added); see also '941 patent, 3:32-37, 33:45-58, 33:9-28, 33:37-34:9, 39:58-64, 40:13-14.) Thus, the specification consistently uses "attached" when it refers to an actuator affixed to the outer surface, and it consistently uses "embedded" when it refers to an actuator inside an object. This strongly suggests that, as two different words that are consistently used in different contexts, "attached" does not encompass embedding. See Bell Atl., 262 F.3d at 1271 (finding that consistent use in the specification may implicitly redefine a term); Acumed v. Stryker, 483 F.3d 800, 807 (Fed. Cir. 2007) (finding that "transverse" did not mean the same thing as "perpendicular," because if it did, there would have been no need to use both terms). Thus, the specification defines "attached" as "affixed to the outer surface of an object." This distinction is not abandoned in the claims — claim 1 uses the word "attached," but claim 10 uses the term "embedded." (‘941 patent, 43:62, 45:14-20.)

It may appear at first blush that the Court's construction reads the preferred seat embodiments out of the claims. (‘941 patent, 2:17-20 (the seat embodiment is "a primary objective of the patent"); see also ‘941 patent Abstract; Defs.' Br. at 6, Doc. No. 148.) However, while the patent only describes in detail the seat embodiment with embedded actuators (‘941 patent, 32:47-63, 4:45-50), these descriptions are merely "illustrative" and "by no means specifically imply any limitations regarding other possible . . . control input devices." (‘941 patent, 32:13-17.) When the seat-based embodiments are mentioned as a primary objective, they are not limited to embedding. (‘941 patent, 2:17-20 ("a primary objective of the present invention is to introduce a tactile feedback seating unit that can produce tactile feedback within a seat").) As such, the seat-based
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

embodiment with embedded actuators is only one sub-embodiment of many seat-based embodiments, which include attaching actuators to the surface of a seat. Consequently, claims 1, 6 and 7, which claim a seating unit, include the embodiments that attach the actuators to the seat. They only exclude the sub-embodiment that is detailed by the specification. Thus, the meaning of "attached" that is clearly set forth in the specification to exclude embedding does not violate the tenet of construction that the claims be read to include preferred embodiments. 2

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

2 The preferred embodiments of embedding of actuators in a throttle, joystick, yolk and shift knob are present in claims 8 and 10. (‘941 patent, 44:57-45:20.)
- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

While there is no doubt that construing "attached" in this manner also reads many other embodiments described in the specification out of the claims, it is the claims that define the invention, not the embodiments that are disclosed in the specification. This is a "bedrock principle" of patent law. Phillips, 415 F.3d at 1312; see also Interactive Gift Express, 256 F.3d at 1331. The claims put the person of ordinary skill in the art on notice so that she may design around the claimed invention. Athletic Alternatives v. Prince Mfg., 73 F.3d 1573, 1581 (Fed. Cir. 1996). It does not matter that the inventor may have subjectively intended to claim these embodiments. Here, the claims, read by a person of ordinary skill in the art in light of the specification, do not include these embodiments; they are disclosed, but not claimed.

Consequently, because the specification impliedly defines "attached" to mean "affixed to the exterior surface" the Court construes "attached to said pad" as "affixed to the exterior surface of the flexible pad."

351

1. Claim 1

Claim 1 of the patent states:

A variable torch apparatus comprising:

a torch portion having a fuel canister and wick element, said torch portion constructed of a segment of copper pipe which has been capped and sealed;

a vertical support portion constructed of a length of copper pipe and attached to said torch portion by a copper pipe reducer element; and

a base portion connected to said vertical support portion, said base portion constructed of copper pipe material.

'371 Patent col.4 11.11-19. Both parties state this claim creates three parts for the invention: a torch portion, a vertical support portion, and a base portion. As the following discussion shows, these three parts can be manipulated into a variety of configurations: table-top torches, lawn torches, torches with one or multiple torch portions, and torches of various heights. Thus, "all . . . variations . . . result from the combination of the three basic components," id. col.3 1.46, col.4 11.1-2, and this makes the torch a variable torch apparatus.

One of the first disagreements is over the meaning of "copper pipe." While both parties state that pipe is a "hollow body," Gardendance argues that the meaning should be limited to cylindrical pipe. Such a limitation is unreasonable because although all the patent's figures use cylindrical pipe, none of the claims limit "pipe" to only cylindrical pipe. Moreover, the specification states that those "skilled in the art" of coppersmithing can make modifications without departing from the "spirit and scope" of this invention. Id. col.4 11.3-7. Thus, the specification shows the claim terms should be construed so that a slightly modified apparatus still falls under the claim terms. Changing the shape of the pipe is a minor change.

The torch portion has a fuel canister, or "a container for holding combustible matter" and a wick element, or "a bundle of
fibers, or a loosely twisted or braided cord, tape, or tube” that draws up fuel. (Def.’s Markman Br. at 9, 12.) There is some confusion over what is "capped and sealed" in the torch portion. Gardendance proffers three possible interpretations. Gardendance’s preferred interpretation is not clear from its argument. Woodstock only asserts that "the 'copper pipe' has been closed off and covered." (Id. at 14.)

"Capped" means "something covering the top or end of a thing." http://www.onelook.com/?other=web1913&w=cap (last visited Oct. 11, 2005). "Sealed" means "to shut close." http://www.onelook.com/?other=web1913&w=seal (last visited Oct. 11, 2005). The difference in the terms appears to be that "seal" is a more complete "closing off." The specific arrangement of what is capped and what is sealed, however, comes from the specification.

The copper pipe that forms the torch portion has a pipe fitting on the bottom with a plug in it, and "this creates a vessel or fuel canister." ‘317 Patent col.2 1.61. The bottom has a "cap," and this is where the "seal" is because a seal, or a complete closing off, prevents fuel from leaking. The top of the pipe has "a standard one and one-fourth inch copper cap" that has a hole drilled for a wick. Id. col.2 11.63-64. The cap can be friction fit or soldered, with the first option being the preferred method. In either case, there remains a hole in the top for a wick. This hole can allow fuel to evaporate. Thus, the top of the tank is not completely closed off; the top is merely capped. Thus, the torch portion is capped and sealed on the bottom so that fuel does not leak, and the top is only capped.

The vertical portion is copper pipe and connects to the torch portion by a copper pipe reducer element. A copper pipe reducer element is "a part that connects two hollow copper bodies of different sizes." (Def.’s Markman Br. at 13.) Thus, the vertical portion and torch portion are not of the same diameter pipe. The parties disagree over how the copper pipe reducer element is actually formed and the meaning of "connects."

The best interpretation of the ’371 Patent is that the copper pipe reducer element does not have to be a separate piece. Woodstock argues that the copper pipe reducer element "need not be a separate and distinct item, but may simply be an integrated part of the 'torch portion' or an integrated part of the 'vertical support portion."

The best interpretation is that the element does not have to be a separate piece; the element can be one with another part of the torch, or it may be a separate element. Nothing in the claim states that the copper pipe reducer element is a separate piece from the torch portion. Also, the specification states that "it is obvious that modifications and changes . . . may be made by those skilled in the art of coppersmithing "without departing from the spirit and scope of the invention." ‘371 Patent col.4 11.4-7. Thus, the specification shows that the claim terms should be construed to allow minor modifications that do not otherwise depart from the spirit and scope of this patent. Someone versed in coppersmithing, even if it takes as much time as Gardendance suggests in its brief, could make the torch portion and copper pipe reducing element into one unit and otherwise still construct the torch covered by this patent. When those two pieces are actually one piece, that torch retains its variable nature in that a user could still create a variety of torch units, including lawn and table-top units, and units with one, two, or more torches. One has a variable torch even if the two elements are actually one element. Making the torch unit and copper pipe reducing element into one is within the claim terms, and the copper pipe reducing element may or may not be a separate piece.

vi. Two frames are attached together

Plaintiffs interpret the phrase "two frames are attached together" to mean "two eyeglasses, whether rimmed or rimless, and comprising the entirety of the auxiliary frame with the exception of the lenses and including the lens rims (if provided), the auxiliary frame magnetic members, the nose bridge, and the arms connected together as by way of a magnetic device."

Consistent with its above constructions, the court finds that the phrase "two frames are attached together" means "two eyeglass devices, which include, at least, a bridge and rims, are fastened or connected by magnetic attraction."
The district court also erred in interpreting the “attaching portion attachable to a portion of said frame of said pair of
eyeglasses” element of claim 1 of the ’726 patent as a means-plus-function element. It instructed the jury that the "attachable
portion" is "a mechanically fastened loop that goes around the nose bridge of the glasses as disclosed in the specification, or
the structural equivalent thereof." Because this claim element is also not in traditional means-plus-function form and
supplies structural, not functional, terms, the trial court erred by applying § 112, P 6 to this claim element. This error caused
the district court to incorporate unduly restrictive structural limitations into the claim.

C. ”attenuating effect of said plates is immediately called into play when said closure member is first opened“ and
”attenuating effect thereof is great during initial opening“

In describing how the plates comprising the barrier means are mounted, Claim 2 describes the positioning of the plates. The
plates are mounted

adjacent [the] closure member substantially within [the] valve body . . . and spaced from each other in the direction of
[the] flow passage when [the] closure member is in [the] closed position so that the attenuating effect of [the] plates is
immediately called into play when [the] closure member is first opened and . . . is great during initial opening of [the]
closure member, and diminishes as [the] closure member is moved toward [the] completely open position.

The parties dispute the use of the terms ”immediately," "first opened," "great" and "initial
opening" in the context of the quoted language.

NJI argues that the quoted language includes both a physical description and a description of how the attenuators function in
time. NJI contends that the physical description is limited to a) the relationship between the plates and the closure member,
b) the location of the plates within the valve body, c) the spacing of the plates in relationship to each other and d) the
direction of the plates with respect to the flow of fluid. According to NJI, the remainder of the clause describes how the
attenuating device functions temporally so that

1) ”immediately" means that there is no time lapse between the opening of the valve and the attenuation or lessening of
noise,

2) "first" in the phrase "first opened" merely emphasizes the absence of temporal delay in attenuation and

3) "great during initial opening" is used for contrast with the diminished attenuation as the valve opens farther.

Fisher argues that the quoted language is a physical description that dictates not only the relationship between the plates and
the remainder of the valve, but also the physical extension of the plates in relation to the flow of fluid. According to Fisher,
the disputed words describe how the attenuators and closure member operate together spatially so that

1) "first opened" means the smallest possible angular degree to which the closure member may rotate;

2) "immediately," in the phrase "immediately called into play" means that the attenuator functions at that small degree of
rotation; and

3) "great during initial opening" further emphasizes that the attenuator functions very effectively at that small degree of
rotation.

The terms "first," "immediately" and "initial" ordinarily connote temporal measurements, and neither the specification, nor
the prosecution history nor the expert testimony at the Markman hearing expresses a specialized meaning for any of those
terms in the patent itself or in the field of valve mechanics. Furthermore, the specification supports the temporal interpretation of those terms because the patentee uses different words such as "range" and "degree" when he intends to describe the opening of the valve in spatial terms. E.g., '510 Patent at col. 1, 1. 52 & col. 2, 11. 4, 42. This Court, therefore, adopts NJI's interpretation and construes the disputed language as a description of the valve's function in time.

355

1. Audiometer

The term "audiometer" appears in claim 6 of the '681 Patent and claim 1 of the '482 Patent. 5 Diagnostic asserts that "audiometer" should be construed as "an instrument; for measuring hearing." Benson proposes that the term "audiometer" be construed as a "a computer and a conventional audiometer."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

5 Because the parties each propose the same construction for this term as used in both Patents and because the Court's construction is supported by both Patents' specifications, the Court construes the term "audiometer" consistently.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

The dictionary definition of "audiometer" is "[a]n instrument for measuring hearing activity for pure tones of normally audible frequencies."

The American Heritage Dictionary of the English Language 121 (3d ed. 1996). Next, the Court turns to the intrinsic evidence to determine whether the ordinary meaning has been rebutted. In examining the written description of both the '681 and '482 Patents, the Court concludes that "audiometer" is referred to as "an electrically activated generator of test tones for evaluation of hearing." ('681 Patent, col. 1, 11. 13-14; '482 Patent, col. 1,11. 16-17.) This use is consistent with the term's ordinary meaning.

Benson argues, however, that Diagnostic is limited to its proposed construction because of arguments made by the patentees during the prosecution of the '681 Patent. Specifically, Benson argues that the patentees narrowed the meaning of their invention by representing that it included a conventional audiometer and a separate computer. Diagnostic, on the other hand, denies that the patentees ever defined the term "audiometer" as a conventional audiometer and a separate computer, or that it ever disavowed claim scope outside of a conventional audiometer and a separate computer.

As discussed previously, the Court rejects Benson's attempt to import structural limitations into individual claim terms based on its prosecution history estoppel argument. With respect to this term in particular, the fact that the patentees specified that its multimedia audiometer in claim 4 included a conventional audiometer and a computer does not constitute a clear and unambiguous surrender of subject matter so as to define "audiometer" in claim 6 as a conventional audiometer and a separate computer. See Middleton, Inc. v. Minn. Mining & Mfg. Co., 311 F.3d 1384, 1388 (Fed. Cir. 2002) (explaining that the disavowal of claim scope requires a clear and unambiguous surrender of subject matter). Therefore, the Court adopts the term's ordinary meaning and construes "audiometer" as "an instrument for measuring hearing."

356

"Austempering" and "Marquenching"

The meanings of "austempering" and "marquenching," two metallurgical heat treating techniques, are jointly addressed to avoid repetition because the arguments with respect each term are similar and overlapping.

Claim 1 states:
A process for forming a rotary cutting blade, comprising the steps of:

a) working a blank of boron steel to have a bevelled cutting edge; and

b) heat treating the formed blank to elevate the blank hardness to between 48 and 55 on the Rockwell Hardness Scale to thereby form a rotary cutting blade having Charpy Notch toughness of at least 15 ft.lb., wherein the heat treating step comprises austempering the formed blank.

Claim 4 states:

A process for forming a rotary cutting blade, comprising the steps of:

a) working a blank of boron steel to have a bevelled cutting edge; and

b) heat treating the formed blank to elevate the blank hardness to between 48 and 55 on the Rockwell Hardness Scale to thereby form a rotary cutting blade having Charpy Notch toughness of at least 15 ft lb, wherein the heat treating step comprises marquenching the formed blank.

Turner averrs that he owns a copy of the ASM International's Handbook II, which he has heard referred to as the "bible" of heat treating, he consults it regularly, and that when he drafted the patents he used the terms "austempering" and "marquenching" in a manner consistent with the Handbook II's definitions. (Turner Decl. P 3-4.) Fisher-Barton proffers excerpts from the Handbook I and Handbook II which define the terms. (Fisher-Barton Mem. P 4, Exs. A & B.) Handbook II defines the term "martempering" -- the patent uses the term "marquenching" -- but the two terms are used interchangeably in metallurgy. (Krauss Decl. P 8 n.1.)

Handbook II defines "austempering" as "the isothermal transformation of a ferrous alloy at a temperature below that of pearlite formation and above that of martensite formation." (Turner Decl., Ex. B at 3.) (footnotes added.) It further states that steel is austempered by being:

- heated to a temperature within the austenizing range, usually 790 to 915 [degrees] C (1450 to 1675 [degrees] F); quenched in a bath maintained at a constant temperature, usually in the range of 260 to 400 [degrees] C (500 to 750 [degrees] F); allowed to transform isothermally to bainite in this bath; and, cooled to room temperature.

(Id.) (footnote added.)

5 Martensite is a generic term for the microstructure formed by diffusion less phase transformation in which the parent and product phases have a specific crystallographic relationship. Id. at 462. "An important aspect of 'martempering' is that no transformation product other than martensite should form." Id. at 266.

6 Bainite is a transformation product that may form just above M[s]. See Id. at 267.

Handbook II defines "martempering" as:

an interrupted quench from the austenizing temperature of certain alloy, cast, tool and stainless steels. This purpose is to delay the cooling just above the martensitic transformation for a length of time to equalize the temperature throughout the piece. This will minimize the distortion, cracking, and residual stress. The term martempering is somewhat misleading and is better described as marquenching.

(Id. at 5.) The steps of "martempering" steel consist of:

quenching from the austenizing temperature into a hot fluid medium (hot oil, molten salt, molten metal or a fluidized particle bed) at a temperature usually above the martensite range (M[s] point); holding in the quenching medium until the temperature throughout the steel is substantially uniform; cooling (usually in the air) at a moderate rate to prevent large differences in temperature between the outside and the center of the section.

(Id.)

The Defendants, rely upon the patent specification, and assert that the terms "austempering" and "marquenching" have special meanings given to them by the patentee. (Defs.’ Opening Br. 9-12.) The Defendants state that although the general processes of "austempering" and "marquenching" were known in the art several decades before the patents were filed, the inventions claimed in the patents-in-suit are the specific "austempering" and "marquenching" steps required by the claims to arrive at the boron steel blades with the claimed hardness and toughness characteristics. The Defendants indicate that Fisher-Barton's proffered definitions of the terms should be rejected because they fail to read the terms in light of the rest of the claim and the specification, completely disregard the express definitions ascribed those terms in the patents, and are inconsistent with the process disclosed in the preferred embodiment. (Id. at 16.)

The Defendants rely upon the Declaration of George Krauss ("Krauss"), a university emeritus professor of the Colorado School of Mines since 1997, who holds a Science Doctorate in Metallurgy and a Master of Science from Massachusetts Institute of Technology and has been involved exclusively in metallurgy and material science since 1955 when he received his Bachelor of Science from Lehigh University. (Krauss Decl. PP 1-2.) Krauss indicates that austempering of medium carbon boron steels has been well known for many years and that austempering in general is a method of transforming austenite to lower bainite - a particularly hard and tough steel microstructure in boron steels. (Id. at P 21.) He indicates that austempering, like marquenching begins with heating the work piece to the austenitizing temperature and cooling the steel to a temperature above the martensite (M[s]) range. (Id.) Krauss states that the quenching step differs from marquenching, because in the austempering the steel is held at the quench temperature for a particular duration long past the temperature equalization of the steel in order to allow the formation of lower bainite and not martensite. (Id.)

7 Krauss has a considerable list of professional positions, achievements, honors and awards including having authored or coauthored more than 300 articles and having authored, co-authored or edited 12 books related to heat treating or tools used for metal fabrication. (Krauss Decl. P 2 and Ex. 2.) He is also the co-inventor on three U.S. patents. (Id.)

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -
The Defendants maintain that this Court should construe the "austempering" as a heat treating process in which the blades are first heated to approximately 1560 [degrees] F.; the heated blades are then quenched into a liquid salt bath at approximately 500 [degrees] F. for about 20 minutes; the quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature. This alternative process eliminates the need for further tempering. The Defendants' definition is taken from the preferred embodiment.

The Defendants maintain that this Court should interpret "marquenching," as the process whereby the formed blades are first heated to approximately 1560 [degrees] F; the heated blades are then quenched into a liquid salt bath at approximately 5000 F. for about 20 seconds; the quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature; and, the cooled blades then proceed to a tempering station where they are tempered at 3000 F. as a stress relief. This definition is taken from the description of the preferred embodiment. (See 3:66-67 & 4:1-6.)

Krauss notes that claim 4 of the patent sets forth a process for achieving hardness in boron steel to "between 48 and 55 on the Rockwell Hardness scale" and a "Charpy Notch toughness of least 15 ft. lb., wherein the treating step comprises marquenching the formed blank." (Krauss Decl. P 10.) Krauss opines that a person skilled in the art would understand that because the process claimed seeks to arrive at a particular hardness and toughness in the boron steel, "marquenching" as used in claim 4 must refer to the process that includes particular times, temperatures and quenchants that are necessary to achieve those results from boron steel. (Id.) Krauss maintains that because marquenching is not defined in claim 4 a person of ordinary skill in the art would refer to the specification to determine what process is being claimed. (Id. at P 11.) Krauss also avers that a skilled heat treater reading the patent would not understand the term "marquenching" as used in claim 4 to have as broad a definition as advanced by Fisher-Barton. (Id. at P 14.) He states that Fisher-Barton's proposed definition does not provide for achieving the specific hardness and toughness for the boron steels expressly set forth in claim 4. (Id.)

--- Footnotes ---

8 Krauss also indicates that Fisher-Barton's "marquenching" definition is problematic because it does not include a tempering stage once the blades are cooled to room temperature and a person of ordinary skill in the art would realize that a blade that is quenched according the Fisher-Barton general definition, and then air cooled without a subsequent tempering step would be of low toughness such that it would not achieve the claimed Charpy Notch toughness of at least 15 ft. lbs. (Krauss Decl. P 16.) In its responsive claim construction memorandum, Fisher-Barton agrees to include in its definition of marquenching the step of an additional tempering after cooling. (Fisher-Barton Responsive Br. 9 n.2.) Therefore, the tempering issue raised by paragraphs 16 and 17 of the Krauss Declaration is moot.

--- End Footnotes ---

Krauss avers that the M[s] temperatures for the medium boron steels that are disclosed in the patent would be known to a skilled person, "for example by using the Andrews equation from his book, Steels: Heat Treatment and Processing Principles." (Id. P 15.) He states that the appropriate M[s] temperatures are:

<table>
<thead>
<tr>
<th>Steel</th>
<th>M[s] Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>10B36</td>
<td>687 [degrees] F.</td>
</tr>
<tr>
<td>10B37</td>
<td>673 [degrees] F.</td>
</tr>
<tr>
<td>10B38</td>
<td>671 [degrees] F.</td>
</tr>
<tr>
<td>10B39</td>
<td>658 [degrees] F.</td>
</tr>
<tr>
<td>10B40</td>
<td>656 [degrees] F.</td>
</tr>
<tr>
<td>10B41</td>
<td>644 [degrees] F.</td>
</tr>
</tbody>
</table>

Krauss avers that because a person of skill in the art would recognize that the general marquenching process (i.e., as used in the context other than the patent) requires that the work piece be held above the M[s] temperature until the temperature equalizes, that the lowest possible temperature of the quench would be greater that 687 [degrees] F for 10B36, 673 [degrees] F for 10B37 and so on. (Id.) Krauss avers that "the marquenching process described in the '114 patent in column 3, lines 66-67 and column 4, lines 1-6, however, calls for the quench temperature to be approximately 500 [degrees] F., which is well above the M[s] temperature for 10B38, or any of the listed boron steels." (Id.) Therefore, Krauss avers that one of skill in that art would realize that the process disclosed in the patent departs from the general marquenching process, such that a
skilled person would understand the term "marquenching" as used in the claim to have the special meaning ascribed in the patent that achieve the claimed hardness and toughness characteristics. (Id.)

The Defendants' arguments regarding the meanings of "austempering" and "marquenching" have some initial appeal because they focus in part on intrinsic evidence, which is generally preferred over extrinsic evidence. However, Krauss's interpretation of the intrinsic evidence, upon which the Defendants rely, is extrinsic evidence. Krauss's construction of "marquenching" also centers on boron steel designations 10B36 through 10B42 but claim 4 provides for working a blank of boron steel blank but does not include designation of the boron steel type. (Compare claims 3, 7, 9 (5:21-24; 6:7-9; 6:26-28) ("wherein the blank is formed of a boron steel selected from the group consisting of 10B36, 10B37, 10B38, 10B39, 10B40, 10B41, and 10B42 steel.") Ultimately, careful consideration of the Defendants' position reveals that if accepted, the Court would be improperly importing the preferred embodiment into the claims. Furthermore, consideration of the terms in the context of the entire patent does not indicate that the patentee redefined the terms "austempering" and "marquenching." See Phillips, 415 F.3d at 1313. Therefore, the Court adopts Fisher-Barton's construction of the terms.

"Judges are free to consult dictionaries and technical treatises at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Phillips, 415 F.3d at 1322-23 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 n.6 (Fed. Cir. 1996).) The Handbook II was the starting point for the Court in construing these metallurgical terms, which are familiar to a metallurgical lay person. But, the Court has carefully considered the intrinsic evidence -- the patent claims and the rest of the specification in its analysis.

Claim 1 uses the term "austempering" as a component of the heat treatment process claimed. Claim 4 uses "marquenching" as a component of the heat treatment process claimed. Neither claim defines the term. However, each term has a commonly accepted meaning known to one skilled in the art of metallurgy.

The proposed constructions of the terms urged by the Defendants is drawn from the preferred embodiment portion of the patent. 9 However, limitations from the specification are not to be read into the claims. See Golight, Inc. v. Wal-Mart Stores, Inc., 355 F.3d 1327, 1331 (Fed. Cir. 2004). This principle was reaffirmed in Phillips, 415 F.3d at 1323, where the court recognized that the distinction between using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim can be a difficult one to apply in practice. Id. (citing Comark Commun's. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed. Cir. 1998) ("there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification.") However, the line between construing terms and importing limitations can be discerned with reasonable certainty and predictability if the Court's focus remains on understanding how a person of ordinary skill in the art would understand the claim terms. Id. "Although the specification often describes very specific embodiments of the invention, [the court] repeatedly warned against confining the claims to those embodiments," and had "expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment." Id.

9 The description of the preferred embodiment states, in pertinent part:

In one advantageous heat treating process, known as Marquenching, the formed blades are first heated to approximately 1560 [degrees] F. The heated blades are then quenched into a liquid salt bath at approximately 500 [degrees] F. for about 20 seconds. The quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature. The cooled blades then proceed to a tempering station 36 where they are tempered at 300 [degrees] degrees F. as a stress relief.

Alternatively, the formed and edged blade may be subjected to an austempering heat treating process in which the blades are first heated to approximately 1560 [degrees] F. The heated blades are then quenched into a liquid salt bath at approximately 500 [degrees] F. for about 20 minutes. The quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature. This alternative process eliminates the need for further tempering.

(3:66-67; 4:1-14.)
In this case, the specification includes only one preferred embodiment as to the "austempering" and "marquenching" processes. The Defendants' proposed construction would require importation of the preferred embodiments into the claims -- contrary to Phillips. The Defendants have not established that the claims or the specification indicate that a special definition of "marquenching" or "austempering" was used. To a great extent, the Defendants' interpretation of the terms rests on their assumption that a single blade is processed at a time. However, the patent does not embrace that assumption.

Furthermore, if the Defendants' construction of "marquenching" and "austempering" were adopted the portions of claims 8(b) and 11(b) which follow the phrase "wherein the heat treating step comprises . . . " would be superfluous. The patentee could have merely inserted the "marquenching" in claim 8(b) and "austempering" in claim 11(b). Therefore, the Defendants' proposed constructions of austempering and marquenching are rejected.

2. As used in claim 1 of the '114 patent "austempering" means: heated to a temperature within the austenitizing range, usually 790 to 915 [degrees] C (1450 [degrees] to 1675 [degrees] F); quenched in a bath maintained at a constant temperature, usually in the range of 260 [degrees] to 400 [degrees] C (500 [degrees] to 750 [degrees] F); allowed to transform isothermally to bainite in this bath; and, cooled to room temperature.

C. Infringement

1. The Chan Patent

SSL argues that the district court erred in construing the "automatically" limitation in claim 1 of the Chan patent to mean "autonomously." SSL contends that the plain meaning of "automatically" is "having a self-acting or self-regulatory mechanism," and that "automatically" does not mean "undertaken or carried out without any outside control." SSL argues that the claim only requires that desaturation and east-west stationkeeping occur simultaneously and without further manual commands from the ground; it does not preclude such maneuvers from being initiated by ground control commands. SSL further argues that Lockheed's satellites literally infringe claim 1, and that prosecution history estoppel does not preclude infringement under the doctrine of equivalents.

Lockheed responds that SSL's proposed claim construction is inconsistent with the written description, and that the district court properly concluded that the accused satellites do not infringe claim 1, either literally or under the doctrine of equivalents. Lockheed emphasizes the fact that the accused satellites require a ground operator to initiate stationkeeping maneuvers. Lockheed contends that the Chan patent does not disclose manually initiated east-west stationkeeping, and instead discloses that desaturation maneuvers are initiated by the satellite itself, not by a ground operator. Lockheed further contends that SSL failed to present any evidence of any structural equivalence under 35 U.S.C. § 112, P 6, and that the district court correctly concluded that the accused satellites do not perform the same functions as recited in the claim.

In interpreting claims, a court "should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conception Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996). Absent an express intent to impart a novel meaning, "terms in a claim are to be given their ordinary and accustomed meaning." Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1234, 1249, 48 U.S.P.Q.2D (BNA) 1117, 1121 (Fed. Cir. 1998); Carroll Touch, 15 F.3d at 1577, 27 U.S.P.Q.2D (BNA) at 1840 ("The words of a claim are generally given their ordinary and accustomed meaning, unless it appears from the specification or the file history that they were used differently by the inventor.").

As an initial matter, we do not agree with SSL's assertion that the district court erred in construing the term "automatically" to mean "autonomously." The disputed portion of claim 1 reads as follows:

[d] coupled to the determining means, means for performing any desired desaturation of the momentum/reaction wheel while automatically and simultaneously accomplishing a pre-selected compensation of the spacecraft's east-west position.

Chan patent, col. 6, ll. 40-44 (emphasis added). Given its ordinary meaning, the term "automatically" denotes that the
claimed apparatus is capable of performing east-west stationkeeping independently, without any external control. See, e.g., Webster's II New Riverside University Dictionary 140 (1988) (defining "automatic" as "1. a. Acting or operating in a manner essentially independent of external influence or control. b. Self-regulating."). The term "autonomously" has a similar ordinary meaning, likewise denoting independent operation. See id. (defining "autonomous" as "1. a. Independent. b. Self-contained."). Thus, the district court's construction is supported by the ordinary meaning of those terms.

The district court's construction is also consistent with the specification. The written description explicitly states that one of the advantages of the present invention is that "all manual east-west stationkeeping maneuvers are eliminated." Chan patent, col. 1, ll. 63-65. Moreover, the abstract indicates that the claimed invention relates to an "apparatus for autonomously performing stationkeeping maneuvers for three-axis stabilized spacecraft." Id., Abstract (emphasis added). 1 The abstract further states that "the invention autonomously performs desaturation of a momentum/reactive wheel . . . while simultaneously accomplishing the preselected compensation of the spacecraft's east-west position." Id., Abstract (emphasis added). Accordingly, given that the elimination of "all manual east-west stationkeeping maneuvers" is one of the stated advantages of the claimed apparatus, and the fact that the terms "automatically" and "autonomously" are used interchangeably in the specification, we conclude that the district court did not err in construing the term "automatically" to mean that the claimed apparatus is "capable of performing multiple, autonomous east-west changes in position over a substantial period of time without ground transmissions concerning the parameters of such movements." Space I, 1998 WL 1045304, at *6 (emphasis added).

1 Although SSL argues that it was improper for the district court to rely on the abstract in construing the claim, we have previously stated that in determining the scope of a claim, the abstract of a patent is a potentially useful source of intrinsic evidence as to the meaning of a disputed claim term. See Hill-Rom Co. v. Kinetic Concepts, Inc., 209 F.3d 1337, 1341 n.*, 54 U.S.P.Q.2D (BNA) 1437, 1440 n.1 (Fed. Cir. 2000).

1. "automatically" or "automated" (claim 1)

Flow argues that this term should be construed as "performed without manual intervention." Omax acknowledges in its Markman brief that "this is generally the ordinary meaning of the term," but argues in the joint claim chart that this phrase "should be construed against Flow depending on the circumstances." In its Markman brief, Omax proposes that the Court find this term to be invalid or adopt a narrow construction of this term: "on-the-fly, in real time."

Omax's arguments for finding the term invalid lack merit. Omax seizes on a number of apparently contradictory references to the claim term to argue that the term is indefinite and therefore the claim invalid. Flow's alleged contradictions, however, would not affect the ability of an individual of ordinary skill in the art to understand the meaning of the term as used in the patent. Moreover, it is far from apparent that Flow has ever defined the term "automatically," as used in claim 1, as anything other than "performed without manual intervention." 4 In light of Omax's acknowledgment that this is how someone of ordinary skill in the art would interpret this term, the Court adopts this construction.

4 Omax's proposed definition for this term seems far more fitting as a definition of "dynamically." This adds credence to Dr. Garris's argument that the prosecution history relied on by Omax refers to the static vs. dynamic issue, not the definition of automatically.
359

C. "... Are automatically transferred from storage to the calculating unit."

Claim 18 claims: "The method of Claim 13 wherein the number configurations for the next game having identification numbers which are displaced in a predetermined relationship from the identification numbers of the previous game are automatically transferred from storage to the calculating unit without entering the identification numbers of the selected number configurations." Defendants argue that the use of the word "automatically" in Claim 18 precludes any human intervention to initiate the transfer of the number configurations. Plaintiff disagrees. Plaintiff argues that the mere use of the word "automatically" does not foreclose any human intervention. Rather, according to Plaintiff, the language contemplates that the microprocessor automatically enters the next set of cards at the end of the previous game and/or after a new game has been "started through a key pad command." Thus, both parties agree that the disputed phrase means that the device automatically enters the next set of bingo cards at the end of a game. Plaintiff submits, however, that this automatic function can also be initiated by the player pressing a button to signal that the game is over.

Both parties cite the same definition for the word "automatically": "having a self-acting or self-regulating mechanism." See MERRIAM WEBSTER'S COLLEGIATE DICTIONARY (10th ed. 2001) (available at http://www.m-w.com/cgi-bin/dictionary). The Patent details a device that is able to determine which sheet of bingo cards follows the sheet just played, and pull that successor sheet from its memory so the player can play this sheet next. No intervention is required for the device to determine which sheet of cards is next. Nor is intervention required for the device to retrieve that sheet from the memory. In other words, the device has a "self-regulating mechanism" that enables it to complete those functions. Only the timing of these processes is initiated by human intervention. Thus, the question becomes whether the fact that this procedure is initiated by an external factor precludes it from being automatic. The court finds that it does not. The device, on its own, ascertains which sheet of bingo cards comes next and makes that sheet available for play - the player merely prompts the machine to perform this automatic function. An "automatic" garage door opener, similarly, does not sense that an automobile is ready to enter or depart a garage, but performs automatically once it is prompted to do so. Much the same, the device does not sense that a player in the bingo hall has shouted "bingo" and call up the next sheet to be played, but prepares for the next game once the player instructs the device that a new game is starting.

Plaintiff, as the patentee, was free to establish its own meaning for the word "automatically:" "Patent law permits the patentee to choose to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term that could differ in scope from that which would be afforded by its ordinary meaning." Rexnord Corp. v. Laitram Corp., Intralox, Inc., 274 F.3d 1336, 1342 (Fed. Cir. 2001). Here, rather than providing any alternative definition, Plaintiff used the word consistently with its ordinary meaning. The word "automatically" is used twice in the specifications: "the processor automatically compares the entered number with the numbers contained in each of the stored number configurations," and "the processor automatically enters the next set of cards after the previous game has ended." (151 Patent, Col; 4, lines 23-25, 54-56.) On both occasions its usage is consistent: the device performs an automatic function once it is signaled that it is time to do so, either by the player entering a number for the device to compare to the numbers on the cards being played, or by the player pressing a button signaling that a new game is beginning. Neither the language of the patent, nor the ordinary meaning of the word, suggests that a function must be performed entirely spontaneously for it to be automatic.

In conclusion, the word automatically," as used in the 151 Patent, does not preclude human intervention to trigger a process that is, in all other respects, automatic.

The parties dispute the claims "evaluating," and "about 800 bills per minute," both of which have already been construed above. The only other term the parties dispute is "automatically denominating." Having fully reviewed the parties' briefs on the motion for reconsideration and the briefs on claim construction for the '806 Patent, and having heard testimony on the term "automatically denominating" at the Markman hearing, the Court affirms the '806 Opinion.

In Glory's late 2005 motion for reconsideration, in the second half of its claim construction brief before this Court, and in
argument during the Markman hearing. Glory relies primarily on recent cases from the Federal Circuit that Glory believes invalidate the reasoning of the '806 Opinion. Glory cites to Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) and Honeywell Int'l, Inc. v. ITT Industries, Inc., 452 F.3d 1312 (Fed. Cir. 2006) to support its argument that the '806 Opinion erroneously relied too little upon the terms of the specification, and relies upon Curtiss-Wright Flow Control Corp. v. Velan, Inc. 438 F.3d 1374 (Fed. Cir. 2006) to support its argument that an inventor cannot claim prior art specifically disclaimed in its specification. While the Court respects Glory's arguments that the specification discusses the "optical sensing and correlation technique" that halts whenever a "no-call" bill is discovered, none of the cases cited by Glory refute the basic principles that a court should not import everything in the specification into the claims, or the basic principle of claim differentiation. See Phillips, 415 F.3d at 1315 ("The presence of a dependent claim that adds a particular limitation give rise to a presumption that the limitation in question is not present in the independent claim;"); Varco, L.P. v. Pason Systems USA Corp., 436 F.3d 1368, 1372 (Fed. Cir. 2006) ("In examining the specification for proper context, however, this court will not at any time import limitations from the specification into the claims."). The '806 Opinion explained why "automatically denominating" could not be limited to the specific correlation technique with halting function suggested by Glory because the dependent claims of the '806 Patent describe specific limitations on "automatically denominating" and "denominating," creating the inference that the independent claims may not be so limited. '806 Opinion at 11-13. Additionally, as stated in the '806 Opinion, Glory's own expert testified that correlation algorithms as well as various other denomination techniques were "known to and understood by those in the art well before 1999." '806 Opinion at 15. Therefore, the Court agrees with the '806 Opinion that "automatically denominating" includes any method for automatic denomination known to those skilled in the art at the time the '806 Patent was filed.

6. Claim 1 - "automatically moving"

Bradford proposes that "automatically moving" means "changing or capable of changing position independent of external influence or control other than by side structures." Defendants propose that "automatically moving" means "becoming fully erected merely upon changing the two opposing and moveable 'side structures' into an upright position and without any additional steps, including, e.g., securing a rod or bar at its end in a channel." "Automatically moving" is a further limitation on "dunnage structure" in that the dunnage structure must be operably coupled to the side structures for automatically moving into the erected and/or collapsed position. Defendants again seek to impose a substantial negative limitation on this term.

In support of their construction of "automatically moving", Defendants refer to the prosecution history of the '096 Patent in which Bradford distinguished the claimed invention from Kupersmit. Specifically, in distinguishing Kupersmit from the claimed invention, Bradford stated to the Examiner that "the Kupersmit reference clearly does not teach the benefits of the present invention which provide for rapid assembly and positioning of the dunnage structures merely upon erecting or collapsing the side walls of the container. No separate steps are required in the invention for lifting rigid bars and then securing those rigid bars at their ends with channel structures." Doc. No. 48-3, at 20. Bradford argues that Defendants' construction of this term would exclude operations that the '096 Patent explains as a normal method of operation. For instance, Bradford notes that there must be some latching and unlatching of various elements or components for the container to operate. The Court disagrees with Defendants' interpretation of the significance of Bradford's distinction between Kupersmit and the claimed invention to the Examiner.

Kupersmit teaches a collapsible container in which the dunnage is suspended from support elements which extend between the side walls. In turn, the support elements are supported by channel forming members which engage insert members on the side walls. See U.S. Patent 4,946,036 col. 3 ll. 52-63, passim, and Figure Sheet Drawing 2. In order for the Kupersmit container to collapse, the support elements must be completely lifted from the insert members on the side walls. See id. Presumably, the support elements are then stored inside of the collapsed container for return. In order to erect the container, the support elements have to be replaced in the channels. Bradford correctly argued to the Examiner that the claimed invention is distinguishable from Kupersmit because it does not require any assembly or disassembly of components to erect and collapse the container. Thus, the real distinction that Bradford made was not that the claimed invention does not require additional steps to erect and collapse the container, but that it does not require any individual assembly or disassembly of components to erect or collapse the container. For purposes of the distinction between the claimed invention and Kupersmit it is immaterial that Kupersmit teaches a channel mechanism to support the support element. It could just as easily be some
other means so long as separate assembly or disassembly of components is required to erect or collapse the container. As Bradford correctly argues, Defendants' proposed construction would preclude simple operations such as operating latching or locking mechanisms to release or engage the side walls. Locking or latching would technically comprise "additional steps" under Defendants' proposed construction, but they do not involve the separate assembly or disassembly of components of the container. Defendants' construction of "automatically moving" is overly restrictive, and, consequently, it is rejected.

Accordingly, the Court holds that "automatically moving" means "changing or capable of changing position independent of external influence or control other than by side structures."

J. Terms 11 and 12: "automatically . . . positioning"

The Court finds that it need not construe the term "automatically . . . positioning" in claims 17 and 28 of the '291 patent. These are ordinary words, used in their ordinary sense. Anyone who reads the patent claims will understand that the claimed device's central portion is positioned automatically --that is, without any further action on the part of the person implanting the device -- within the defect when the device is fully deployed. Further, as both the University and AGA conceded at oral argument, anyone who reads the patent claims will understand that "automatically positioning" modifies "opening of the second disk" in both claims. Hr'g Tr. at 237-38, 243-45. That is, there is no dispute that the thing that "automatically positions" the "joining segment" (in claim 17) or the "tubular member" (in claim 28) is the "opening of the second disk" -- i.e., the full deployment of the device.

AGA contended in the amended JCCS that for the second disk to automatically position the joining segment or tubular member within the defect, the opening of the second disk must "cause[]" the segment or member to "assume its position" within the defect. 18 Am. JCCS Sched. B at 36. In other words, AGA contended that the device's central portion cannot be in its final position -- even by happenstance -- before the second disk is opened; rather, the opening of the second disk must cause the central portion to move from a location that is not its final position to a location that is its final position. 19

18 In discussing this term at oral argument, AGA's counsel seemed to contend that opening of the second disk must cause the disk's central portion to assume a "final" position within the defect. Hr. Tr. at 234-35. The Court rejects this argument for the reasons given in the text.

19 The Court is not sure whether AGA still advocates this construction given the University's concession that "opening of the second disk" is what "automatically position[s]" the joining segment within the defect. See Hr'g Tr. at 244-45.

The Court rejects AGA's proposed construction because it is inconsistent with the words "automatically positioning" and the patent as a whole. It is clear from the specification and the patent claims that the device's central portion will already be at least roughly -- and perhaps even exactly -- in place within the defect after the first half of the device has been deployed on the defect's far side and before the second half has been deployed on the defect's near side. Yet even if, as a result of the accuracy of the deployment of the first half of the device, the device's central portion does not move at all when the second half of the device is deployed, the opening of the second half would nevertheless "automatically position" the device within the defect. That is, the opening of the second half would position the device within the defect without any further intervention. 20

20 See Webster's Third 148 ("automatic . . . 3: having a self-acting or self-regulating mechanism that performs a required act at a predetermined point in an operation . . . 4: marked by spontaneous or apparently spontaneous action: marked by action
that is unpremeditated and that arises as a really or apparently necessary reaction to or consequence of a given set of circumstances"; id. ("automatically . . . in an automatic manner: without thought or conscious intention"); AHD Third at 125 ("automatic . . . 1.a. Acting or operating in a manner essentially independent of external influence or control: an automatic light switch; a budget deficit that caused automatic spending cuts. b. Self-regulating: an automatic washing machine.").

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In such a situation, the "automatic position" assumed by the device's central portion would, by happenstance, equal the position that the device's central portion occupied before the second half of the device was deployed. But this happenstance would not change the fact that the opening of the device's second half positioned the device's central portion automatically. The Court finds that a jury will understand this without the need for any construction by the Court of the term "automatically . . . positioning."

GO BACK

363

6. automotive paint composition

The term "automotive paint composition" appears in claim 1 and claim 12. Chip-Mender asserts that it means paint composition made for use on automobiles. Sherwin-Williams contends that it means "Pigment and solvent. The pigment of the paint composition may be of any type sufficient to provide a coating property for repair or damage to a painted surface. That is to say, the pigments may provide a decorative function to contribute to opacity, color, and gloss control. In addition, pigments also provide protective qualities to the final paint composition after it has hardened. In this regard, pigments may be of any class, including white hiding pigments, extender pigments, black pigments, and any other color pigments known in the art. The automotive paint composition includes both lacquers and enamels, i.e., paint composition with a catalyst or drying agent."

Chip-Mender argues that the term "automotive" appears throughout the claims, the specification, and the file history of the '299 patent because it is part of the claimed invention. Chip-Mender complains that Sherwin-Williams' proposed construction would convert the simple "automotive paint composition" of the '299 patent into essentially any paint composition to be used on any surface. Chip-Mender accuses Sherwin-Williams of attempting to broaden the claims of the patent to read on a variety of prior art references, such as correction fluid pens.

Chip-Mender asserts that the claims and specification of the '299 patent, as well as the prosecution history, all require that the disclosed paint composition be made for or designed for use on automobiles. Chip-Mender argues that there is no suggestion in the intrinsic evidence that the claimed paint composition be made for anything other than an automobile.

In opposition, Sherwin-Williams argues that Russo admitted that he did not invent any new paint composition, and that the paint described in the '299 patent is commercially available. Thus, Sherwin-Williams asserts, Russo's amendment of the claims (following the initial rejection) by adding the terms "automotive" or "vehicle" did not distinguish over prior art paint compositions.

Sherwin-Williams also notes that the specification of the '299 patent defines the automotive paint composition generically as "pigment" and "solvent" (citing '299 patent, col. 19 2, II. 12-14), and also contains the following description, which Sherwin-Williams has incorporated into its proposed construction:

The pigment of the paint composition may be of any type sufficient to provide a coating property for repair of damage to a painted surface. That is to say, the pigments may provide a decorative function to contribute opacity, color, and gloss control. In addition, pigments may also provide protective qualities to the final paint composition after it has hardened. In this regard, pigments may [be] of any class, including white hiding pigments, extender pigments, black pigments, and any other color pigments known in the art.

Sherwin-Williams contends that although Russo argued during the prosecution that his paint composition excluded catalysts, the '299 patent discloses an "enamel" paint as an example of the claimed automotive paint composition (citing "Example 1" in the '299 patent, col. 4, ll. 41-42). Sherwin-Williams claims that enamel paints include those that harden by a catalytic reaction in which a drying agent in the paint reacts with air. Thus, Sherwin-Williams asserts, the '299 patent inherently discloses an automotive paint composition with catalysts and driers.

The court finds that "automotive paint composition" means "paint composition formulated for use on vehicles." Sherwin-Williams' proposed addition of "pigment and solvent" is unnecessary, as both claim 1 and claim 12 include the limitation "including… pigment and… solvent" immediately following the term "automotive paint composition." Thus, including "pigment and solvent" as part of the construction would be redundant.

The remainder of Sherwin-Williams' proposed construction is unnecessary. The portion of the proposed construction that is taken from the specification, col. 2, ll. 40-48, describes the decorative function and protective qualities of the pigments, and states that the pigments "may be of any class," including "any color pigments known in the art." A person skilled in the art would understand "automotive paint" to have certain decorative function and protective qualities, and to include many classes and colors.

With regard to the question whether "automotive paint" includes catalysts, the court notes that the prosecution history indicates that Russo disclaimed paint compositions including catalysts, and that the claims were allowed on that basis. Prosecution History, CM 00061, 00069-70. In addition, in discussing the viscosity of paint composition, the specification states in the "Preferred Embodiments" that "driers, typically used in paints, hinder the free flow of paint from [the] applicator." The reference in Example 1 to "enamel paint" is not explained in the patent, and neither party provides any documentary extrinsic evidence regarding the composition of "enamel paint." It appears, however, that the device described in Example 1 did not effect an acceptable repair to the chipped surface of the automobile. Thus, it is questionable whether the reference to "enamel paint" in Example 1 is of consequence in determining the proper construction of "automotive paint."

There is no indication in the claims or specification that the "automotive paint" in the '299 patent is different than ordinary automotive paint, except with regard to the use of paint of a particular viscosity range (not at issue in the present proceeding), as described in the claims and specification. It is not necessary for the court to construe "automotive paint" as anything other than "paint composition formulated for use on vehicles."

Fitness Quest contends that the claim language is too broad, and proposes revised language based chiefly on the embodiment reflected in Figure 8. Monti denies that the claim requires construction. Monti is correct.

Fitness Quest seeks to construe chiefly the term "pad assembly," adding language relating to a cushioning function. Again, Fitness Quest references primarily the preferred embodiment as reflected in Figure 8 as support for its proposed construction, injecting additional language relating to the telescoping member referenced immediately above. As this Court has exhaustively discussed, the preferred embodiment, standing alone, is not a basis for limiting the claim language. In the absence of any indication that the patentee intends the claim language to be so limited, such a construction is improper.

It is worth noting that, on the one hand, Fitness Quest objects to the use of the term "an auxiliary body support" in the prior term in Claim 28, seeking to replace it with "an additional body support," but on the other hand, leaves untouched in this term the subsequent reference to "the auxiliary body support" -- which presumably references the same feature. The confusion this approach is likely to inject into the understanding of Claim 28 is not desirable. This term does not require construction.

- 783 -
b. "auxiliary sealant"

LGD contends that the term "auxiliary sealant" means "sealant deposited in an area outside of the main sealant." D.I. 376 at Exh. I-3.

AUO's proposed construction is slightly different in that AUO contends that the term "auxiliary sealant" means "a segment of sealant that extends from the main sealant and is outside the enclosure of the main sealant." Id. Like its construction for "main sealant," CMO's construction for auxiliary sealant focuses on the functional aspect of the auxiliary sealant. Specifically, CMO defines "auxiliary sealant" as "sealant material that is not necessary for confining liquid crystal from leaking out between the substrates."

After reviewing the specification in light of the parties' arguments, the Court concludes that "auxiliary sealant" means "sealant deposited in an area outside of the main sealant." As LGD points out, AUO's construction improperly suggests that the main sealant is formed prior to the auxiliary sealant, which is contrary to the teachings of the specification which indicate that the auxiliary sealant is formed first. '374 patent, col. 3, ll. 13-15 (" . . . forming an auxiliary sealant and subsequently forming a main sealant on one of the lower and upper substrates . . .") (emphasis added). In addition, CMO's construction for the term "auxiliary sealant" fails for the same reasons discussed with respect to its proposed construction of "main sealant."

366

(6) "auxiliary spectacle frame" (claims 12, 16 and 24)

Plaintiffs argue that the phrase "auxiliary spectacle frame" means "the entirety of the auxiliary frame with the exception of the lenses. The auxiliary spectacle frame includes the lens rims (if provided), the auxiliary frame magnetic members, the nose bridge, and the arms which secure the auxiliary frame magnetic members." JS, Exh. B at 12-13.

Defendant does not dispute the components which Plaintiffs contend are included in the "auxiliary spectacle frame"; instead, Defendant argues that the auxiliary frame is limited to a frame that secures "sunglass lenses." JS, Exh. D at 5; Def.'s Opposition at 9:9-12. In support of its proposed limitation, Defendant cites to the specification of the '545 Patent at Col. 2, 11. 38-48. Def.'s Opposition at 9:12. However, there is no such limitation in that section of the specification cited by Defendant or in any other part of the '545 Patent. See Koo Decl., Exh. B at 13. As such, the Court declines to limit the auxiliary spectacle frame to one securing "sunglass lenses."

Therefore, the Court construes "auxiliary spectacle frame" to mean the entirety of the auxiliary frame with the exception of the lenses and including the lens rims (if provided), the auxiliary frame magnetic members, the nose bridge, and the arms which secure the auxiliary frame magnetic members.

367

I.

The invention claimed in the '388 patent is a strap assembly that has both stretchable and non-stretchable strap members. According to the patent's specification, in a preferred embodiment of the invention, a "resilient under strap member provides a shoulder pad having an under surface adapted to cushionably rest upon the shoulder of a wearer." '388 patent, col. 1, ll. 65-68. At the same time, an "auxiliary strap assembly is disposed above and in parallel relation to the shoulder pad." Id. at col. 1, 168 - col. 2, 1.1. The auxiliary strap assembly "includes first and second separate end sections made of a relatively non-stretchable material, and also a separate center section made of a material which is longitudinally stretchable." Id., at col. 2, ll. 2-5. The construction of the strap assembly is completed with "[f]irst and second transverse stitch means" securing "the
corresponding ends of the stretchable center section, as well as the inner ends of the first and second end sections of the auxiliary strap assembly, to the shoulder pad.” Id., at col. 2, ll. 5-9. The benefit of the strap assembly claimed in the ’388 patent is that, when it is used in an item such as a book bag, the wearer experiences cushioning without excessive bouncing of the load being carried.

II.

In November of 2005, Comfort Strapp filed suit against Targus in the Central District of California, alleging both direct infringement and inducement of infringement of independent claim 1 of the ’388 patent. The accused products were several shoulder straps designed and marketed by Targus.

Claim 1 reads as follows:

A shoulder strap assembly having a limited amount of stretchability, comprising, in combination:

- elongated resilient strap means having an under surface adapted to cushionably rest upon the shoulder of a wearer, and being adapted to support a load between its two ends;
- auxiliary strap means disposed above and in parallel relation to said elongated resilient strap means, said auxiliary strap means including first and second separate end sections made of a relatively non-stretchable material, and also including a separate center section made of material which is longitudinally stretchable;
- first and second transverse stitch means securing the inner ends of said first and second end sections of said auxiliary strap means both to the corresponding ends of said stretchable center section thereof, and to said elongated resilient strap means;
- means securing the ends of said auxiliary strap means to respective ends of said elongated resilient strap means; and
- separate load-attachment means secured to respective ends of said auxiliary strap means;

said strap assembly being responsive to the weight of a load such that the middle portion of said strap assembly between said first and second stitch means may stretch by a substantial amount, but said non-stretchable end sections of said auxiliary strap means prevent any substantial stretching of the end portions of said strap assembly.

The accused shoulder straps bear several common characteristics. Like the claimed invention, Targus's accused shoulder straps incorporate both a cushioned strap and an auxiliary strap. The auxiliary strap is made of a single unitary piece of inherently stretchable fabric that is folded over and cross-stitched to itself at each end, where it is attached to the cushioned strap.

In due course, Targus moved for summary judgment of non-infringement, arguing that its straps did not infringe claim 1 of the ’388 patent because they did not meet the claim's "auxiliary strap means" and "first and second transverse stitch means" limitations. On March 21, 2007, the district court granted Targus's motion. After construing the two limitations at issue, the court ruled that the accused straps did not infringe either limitation literally or under the doctrine of equivalents. Wleklinski v. Targus, Inc., No. 05-1143, slip op. at 1 (C.D. Cal. Mar. 21, 2007). The court therefore entered judgment in favor of Targus on Comfort Strapp's claims of direct and induced infringement. Comfort Strapp now appeals from that judgment.

III.

We have jurisdiction over Comfort Strapp's appeal pursuant to 28 U.S.C. § 1295(a)(1). On appeal, Comfort Strapp contends that the district court erred in granting summary judgment of non-infringement in favor of Targus. Comfort Strapp argues that the district court erred in construing the "auxiliary strap means" and "first and second transverse stitch means" limitations of claim 1 of the ’388 patent and that it misunderstood the structure of the accused Targus straps.

Summary judgment is only appropriate if there are no genuine issues of material fact and the movant is entitled to judgment

Because we conclude that the district court properly construed the "auxiliary strap means" limitation and that there is no genuine issue of material fact as to whether the accused straps infringe that limitation as properly construed, we affirm the district court's grant of summary judgment in favor of Targus, both as to direct infringement and inducement of infringement. Resolving the case on that basis, we do not reach the issues of the district court's construction of the "transverse stitch means" limitation and whether that limitation is met in the accused straps.

IV.

The district court construed the "auxiliary strap means" of Claim 1, which includes "first and second separate end sections made of a relatively non-stretchable material" and "a separate center section made of material which is longitudinally stretchable," to require that the "end sections and the center section be made of separate pieces of separate material." Thus, the court construed the limitations relating to the auxiliary strap means to "require three separate pieces of material that are attached to one another: a stretchable center section and two relatively non-stretchable end sections on either end of the center section. The center section must be made of a stretchable material that is different from the relatively non-stretchable material that comprises the end sections." Based upon that construction, the district court ruled that this limitation was not present in the accused straps because "the alleged center and end sections of the Targus straps are not made of different material." The court also ruled that the limitation was not met under the doctrine of equivalents, because "the unitary piece of material that comprises the Targus auxiliary strap means is the fundamental opposite of the separate pieces and different material required by the '388 Patent."

Under this claim construction, Comfort Strapp argues that, in construing the "auxiliary strap means" limitation, the district court should have consulted general purpose dictionaries, which define "separate" to mean "dissimilar in nature or identity," and "material" to mean "matter that has qualities that give it individuality and by which it may be categorized." Thus, Comfort Strapp seeks a claim construction that emphasizes the functional attributes rather than the chemical composition of the auxiliary strap means and its component sections.

On appeal, Comfort Strapp argues that, in construing the "auxiliary strap means" limitation, the district court should have consulted general purpose dictionaries, which define "separate" to mean "dissimilar in nature or identity," and "material" to mean "matter that has qualities that give it individuality and by which it may be categorized." Thus, Comfort Strapp seeks a claim construction that emphasizes the functional attributes rather than the chemical composition of the auxiliary strap means and its component sections.

Under this claim construction, Comfort Strapp urges, summary judgment of literal infringement was inappropriate because the auxiliary strap of the accused Targus straps have separate center and end sections made of different materials: the center section is made of a single-ply fabric that is longitudinally stretchable, and the end sections are made of relatively non-stretchable material because they are double-ply stitched sections. In any event, argues Comfort Strapp, the district court should not have granted summary judgment of non-infringement under the doctrine of equivalents because the single-ply center section and double-ply end sections made of the same fabric are arguably functionally equivalent to center and end sections made of different fabrics, thus creating a genuine issue of material fact properly reserved for the jury.

V.

We see no error in the district court's construction of the "auxiliary strap means" limitation of claim 1. In our view, the plain meaning of the claim language requires that the center and end sections be composed of different materials. The limitation refers to the end sections being "made of a relatively non-stretchable material" and the center section being "made of material which is longitudinally stretchable" (emphasis added). At the same time, the center and end sections are both described as being "separate" from each other. The most persuasive reading of the claim language is that the center and end sections are constructed of different materials. We reject Comfort Strapp's proposed construction as inconsistent with this plain meaning.

Markman Order

By order [138] entered June 15, 2006, this case was referred to Gale R. Peterson, as Special Master, for issues relating to
claim construction. Following briefing of the issues by the parties and a hearing, Mr. Peterson submitted his Report and Recommendation (the "R&R") [153] to the Court on April 3, 2007. Following submission of the R&R to the Court, each of the parties filed objections [154 and 155] to the R&R, as well as responses [156 and 157] to the opposing party's objections. As required by Federal Rule of Civil Procedure 53(g)(4) the Court has conducted a de novo review of all of the recommended findings to which objections have been filed. Except as set out below, the Court adopts the findings and conclusions of the R&R. Specifically, the Court adopts the proposed constructions of all terms and phrases as recommended by the R&R, except for the following phrases: "average consumer," "suitable for installation by the average consumer," "can be installed by the average consumer," and "price affordable to an average consumer" (the "'average consumer' phrases").

In defining "average consumer" in the "average consumer" phrases, the R&R suggests that because the claimed method in the patent is a "method for providing," the focus of the claim is "the objective characteristics of what is 'provided' rather than the characteristics of an actual purchaser." (R&R at 36) Based on this conclusion, the R&R proposes that these terms be construed as follows:

(1) "average consumer" to mean one without special training in stonecutting;

(2) "price affordable to an average consumer" to mean that a "pre cut" "non man made" "stone top" in accordance with other terms in the claims does not require a purchaser to incur the additional costs of engaging the services of someone skilled in stonecutting in order to install the top;

(3) "suitable for installation by the average consumer" and "can be installed by the average consumer" to mean a "pre cut" "non man made" "stone top" in accordance with other terms in the claims that is "non custom ordered" or "not custom ordered" also in accordance with other terms in the claims, and that product may be installed without requiring the services of someone with special training in stone-cutting.

(R&R at 46.) The problem with this conclusion is that, in defining what is "provided," the patent claim utilizes the characteristics of the purchaser. That is, the counter top must be one that is "pre cut non man made" stone and is "affordable to an average consumer" and is capable of being installed "by the average consumer." (‘973 Patent, col. 5, ll 27-28, 32.)

The Federal Circuit has instructed that "claim language should not be treated as meaningless," and "claims are interpreted with an eye toward giving effect to all terms in a claim." Bicon, Inc. v. Straumann Company, 441 F.3d 945, 950, 951 (Fed. Cir. 2006). The construction of these terms in the R&R violates this principle by attributing no meaning to "average consumer" beyond what is otherwise stated in the claim: "a pre cut non man made, non custom ordered stone top." (‘973 Patent, col. 5, ll. 27-28.) Plaintiff recognized something more was required to define "average consumer" in its proposed claim construction in which it proposed to define the average consumer, not in terms of the pre cut nature of the top, but in terms of the characteristics of the consumer. Plaintiff's proposed construction of "average consumer" was: "an individual that purchases supplies for a home improvement task from a retail outlet and performs the home improvement task himself or herself, regardless of whether the individual has any professional training in that task." (Joint Claim Construction Statement at A1-1.)

Consistent with the foregoing principles, the Court rejects the construction of "average consumer" in the R&R. The Court finds that Plaintiff's construction of the term "average consumer," with one exception, is consistent with the specification and does not treat a clearly stated characteristic as superfluous. The use of the word "professional" in Plaintiff's proposed definition is not warranted. First, this is a term that may require further definition. Second, the Court finds no support for imposing an additional limitation on the type of training. After reviewing the evidence, the Court concludes that the patent is intended to include tops that can be installed by consumers with no training in counter top installation. The claim provides a method for providing a top that the typical "do-it-yourself homeowner" would be able to install. (‘973 Patent, col. 2, ll. 18-19.) Therefore, the term "average consumer" shall mean "an individual that purchases supplies for a home improvement task from a retail outlet and performs the home improvement task himself or herself, regardless of whether the individual has any training in that task."
First, the Court finds that a person of ordinary skill in the art would define "axial force" as used in the claim terms to mean the force acting parallel with an axis. The two words axial, meaning "of an axis," and "force" tell the reader that the term concerns some force exerted along or around an axis. Neither party suggests that axial force could be read as "torque" or the twisting force moving around an axis. Instead, despite their different proposed constructions, both parties agree that axial force is the force moving parallel to an axis. The only dispute is to what axis "axial force" refers.

The parties disagree over the meaning of "axial force" because the drill bit contemplated in the 225 Patent contains at least two types of axes. First, there is an axis theoretically perpendicular to the well bottom which travels up the drill string. The entire drill bit rotates around that axis, and any "axial force" generated along that axis presses straight down into the well bottom. Second, there is an axis around which each of the roller cones rotates. Axial forces that press down into the well bottom at an angle determined by the angle at which the roller cone intersects the drill bit act on those axes. See Figs. 2 and 12 supra. Third, Smith contends that there is a third type of axis through each tooth on the drill bit which creates axial force that presses down into the well bottom at the angle which the tooth intersects the formation. Essentially, Haliburton argues that axial force in the 225 Patent always means the type of axial force that is parallel to the bit's axis ("downforce"). In contrast, Smith argues that axial force in the 225 Patent never means downforce, and must instead mean the axial force along the roller cones' axes ("cone axial force") and along the teeth axes.

--- Footnotes ---

7 Fig. 2 illustrates the axial force of a roller cone with the variable Fz[i]. The Fz[i] arrow illustrates axial force pressing upward into the drill bit rather than down into the earth. This is nothing more than a recognition of the equal and opposite force that Newton's Third Law of Motion requires when the cone's axial force presses down into the formation. This effect has no bearing on the Court's analysis and for ease of reference the Court will continue to refer to axial forces as pressing down into the formation.

--- End Footnotes ---

The Court finds that the language in Claim 1 could equally refer to downforce or cone axial force. Claim 1 only requires that the axial force acting on each cutting structure (roller cone) be approximately the same. Under Haliburton's construction, Claim 1 would mean that each roller cone took an approximately equal share of the downforce. Under Smith's construction, Claim 1 would mean that the cone axial forces were approximately the same. Based only on the claim language, Claim 1 does not assist proper construction of "axial force."

The Court finds that Claim 2's language suggests that "axial force" means downforce and not the cone axial forces. Claim 2 claims the drill bit described in Claim 1 where the axial force on each roller cone is roughly one third (between 31 and 35 percent) of "the total of the axial force on the bit." The phrase "the total of the axial force" suggests that the drafter contemplated one axial force acting on the bit. Moreover, if the drafter had meant that phrase to mean "the sum of the axial forces acting on each of the cones" as Smith argues, the claim would say "the total of the axial force[s]" not "the total of the axial force." One cannot sum a single thing.

The Court finds that Claim 8, by its own terms can support either Haliburton's or Smith's interpretation. Claim 8 provides a method for designing a bit including a step of "calculating the axial force acting on each tooth on each cutting structure." If one of reasonable skill in the field were to define "axis" as a line around which an object rotates, then the Court would reject Smith's assertion that each tooth has an axis because the teeth do not rotate. In that case, Claim 8 would support Haliburton's construction. However, if a person of reasonable skill in the field defined "axis" as a line dividing an object into symmetrical halves, then Smith's interpretation would be feasible. The parties have provided the Court with no evidence regarding how one reasonably skilled in the field defines "axis." Therefore, the "tooth" language does not assist the Court's interpretation. Likewise, the Claim 8 language "axial force acting on each cutting structure per revolution of the drill bit" is inconclusive for the same reasons regarding Claim 1.

Examining intrinsic evidence other than the claims, the Court finds that the 225 Patent abstract defines "axial force" as downforce. See Pandrol USA, LP v. Airboss Ry. Products, Inc., 320 F.3d 1354, 1363 n.1 (Fed. Cir. 2003) (holding that the abstract is intrinsic evidence relevant to claim construction). The 225 Patent abstract states: "roller cone drilling wherein the bit optimization process equalizes the downforce (axial force) for the cones (as nearly as possible, subject to other design
Bit performance is significantly enhanced by equalizing downforce." Even though the drafter did not use signals such as "hereafter" or "also called," the parenthetical "axial force" following the word "downforce" is strong evidence that the drafter intended "axial force" and "downforce" to have the same meaning. Members of all legal professions commonly use a parenthetical following a term to rename or provide an alternate name for the term. Thus, the Court finds that a person of ordinary skill in the field would read "downforce (axial force)" in a legal document like the 225 Patent to define "axial force" as "downforce."

However, the 225 Patent specification seemingly contradicts the abstract's "axial force" definition. Column 8 of the 225 Patent, lines 21-26, states: "there is a distinction between force balancing techniques and energy balancing. A force balanced bit uses multiple objective optimization technology, which considers weight on bit, axial force, and cone moment as separate optimization objectives." By describing "weight on bit" as a separate objective from "axial force," the specification seemingly contradicts the abstract's definition. 8

--- Footnotes ---
8 The Court reminds the reader that "weight on bit" and "downforce" have the same meaning. See Fn. 2 supra.
--- End Footnotes ---

However, the Court reads Column 8's distinction between "axial force" and "weight on bit" in light of mathematical formulas from the immediately preceding paragraph. The patent specification provides formulas describing three characteristics of each roller cone. First, WOB[i] "is the weight on bit taken by cone i." Second, "Fz[i] being the i-th cone axial force." And third, "Mz[i] being the i-th cone moment in the direction perpendicular to the i-th cone axis." Fig. 2 supra, taken from the 225 Patent, illustrates WOB[i], Fz[i], and Mz[i] on a roller cone. Because these three definitions immediately precede Column 8's distinction, are part of the same discussion as Column 8's distinction, and because the three variables (WOB[i], Fz[i], and Mz[i]) parallel the three "objectives" noted in Column 8 (weight on bit, axial force, and cone moment), the Court reads the two statements together. Thus, Column 8 distinguishes "cone axial force" from "weight on bit" and does not distinguish "axial force" from "weight on bit."

Distinguishing the axial force of a cone from "weight on bit" is consistent with the abstract's assertion that "axial force" generally means "downforce." As noted above, by its terms "axial force" generally means the force parallel to an axis, and this invention has at least two types of axes. Moreover, it is unsurprising that the drafter would need to discuss both types of axes in the specification. Generally defining "axial force" as "downforce" in the abstract does not preclude the drafter from later discussing the axial force of a roller cone. Column 8 merely discusses a second type of axial force, and it does not attempt to redefine the abstract's axial force definition.

Finally, the abstract's "axial force" definition is consistent with the claim terms and teachings of the 225 patent. As discussed above, defining "axial force" as downforce is consistent with Claims 1 and 8, and is suggested by Claim 2. Moreover, the 225 patent identifies the importance of equalizing downforce on the roller cones in at least three different places: "the present application teaches that roller cone bit designs should have equal mechanical downforce on each of the cones," Col 4., Ins. 49-51; "equalization of downforce per cone is a very important (and greatly underestimated) factor in roller cone performance," Col. 5, Ins. 10-12; and "the improved performance of balanced-downforce cones may also be partly due to reduced oscillation of the drill string," Col 5, Ins. 21-23. Thus, construing "axial force" as downforce is encouraged by the patent claims and teachings.

Therefore, the Court finds that "axial force" in the 225 Patent is synonymous with "downforce" and "weight on bit." The Court does not find that Column 8's distinction is clear enough to contradict the construction suggested by the abstract, claim language, and patent teachings. Consequently: (1) Claim 1's language "wherein approximately the same axial force is acting on each of said cutting structure" means "wherein nearly or exactly the same downforce parallel to the axis of the bit is taken by each cone;" (2) Claim 2's language "the total of the axial force on the bit" means "the weight on bit;" (3) Claim 8's language "the axial force acting on each tooth" means "the downforce parallel to the axis of the bit taken by each tooth;" and (4) Claim 8's language "the axial force acting on each cutting structure" means "downforce parallel to the axis of the bit taken by each cone."

GO BACK
a. "axial peripheral lip"

Lacks construes the axial peripheral lip to be some portion, but not all, of the rim lip. Lacks argues that an uncovered portion of the wheel surface exists between the edge of the cladding panel and the location of the structure it believes is the axial peripheral lip. Defendants construe the axial peripheral lip more broadly, arguing that it is all of the uncovered surface between the edge of the cladding panel and the edge of the tire mounting surface of the wheel rim.

1 Defendants propose this construction as an alternative to their primary argument that this phrase is indefinite. As I noted above, I will return to defendants' indefiniteness arguments later in the opinion. First, however, I must render a Markman interpretation of the disputed language. I discuss defendants' alternative construction because it assists me in this task.

My construction of "axial peripheral lip" must begin with the language of claim 1. See Phonometrics, 133 F.3d at 1464. The phrase first appears in the claim's preamble: "[a] method for providing a decorative surface on a vehicle wheel having a web portion and a peripheral rim portion for mounting a tire, said peripheral rim portion defining an axial peripheral lip circumscribing said peripheral rim portion." '809 patent, col. 10, lines 65-67 and col. 11, lines 1-2 (emphasis added). It next appears in the "forming" step: "said thin solid formed ornamental panel being shaped to cover said entire wheel face outer surface and not cover said axial peripheral lip." '809 patent, col. 11, lines 8-11 (emphasis added). It last appears in the "whereby" step: "whereby said positioning step locates said thin solid formed ornamental panel so as to be substantially flush with adjacent portions of said wheel face outer surface of said wheel such that said decorative layer readily blends with said axial peripheral lip circumscribing said peripheral rim portion." '809 patent, col. 12, lines 1-6.

These references to "axial peripheral lip" imply critical limitations on its meaning. Accordingly, after reading claim 1, it would be evident to an individual of ordinary skill in the art of cladded wheels 2 that the axial peripheral lip must be located on the wheel rim or peripheral rim portion, that it is not covered by the panel 3, that it must begin where the panel ends 4, and that it touches the edge of the decorative layer in such a way that aesthetic blending occurs.

2 See the obviousness discussion, infra, in Part IV.A.4 of this opinion for the standard I have adopted for one of ordinary skill in the art of cladded wheels.

3 My reference to "cladding panel" is purposeful. As is clear from the language of claim 1, the cladding is the sum of two elements: the ornamental panel and a decorative layer applied only to the exterior of that panel. The parties have sometimes conflated these elements, treating the panel and the layer as one and the same even though the claim language places different limitations on each. To end this confusion, I will impose some precision. In this opinion, "panel" or "cladding panel" refers to the panel element of the cladding. "Layer" or "decorative layer" refers to the layer element of the cladding. "Cladding" refers to the structure that is the combination of the panel and the decorative layer.

4 To put it another way, the cladding and the axial peripheral lip terminate along the same boundary.

The specification reinforces these limitations. It does not mention the phrase "axial peripheral lip," but does use the nearly identical phrase "peripheral lip." It reads in pertinent part: "The wheel 11 of the composite wheel 10 includes a wheel disk 18 which defines an outboard surface of the composite wheel 10, a peripheral rim portion or rim 12 with a peripheral lip 12a." '809 patent, col. 6, lines 56-60. Figures 3 and 5 of the specification clearly illustrate the location of the rim (labeled 12) and the peripheral lip (labeled 12a). These figures show that the peripheral lip structure projects out from the rim and is not covered by the cladding (labeled 20). Its shape and location, as well as its relation to other structures on the composite
wheel, correspond with claim 1's implicit limitations on the axial peripheral lip.

Even if it were not clear that the phrases "axial peripheral lip" and "peripheral lip" refer to the same structure, the prosecution history makes it clear that they do. During the course of the '809 patent's prosecution, the patent examiner concluded that the term "axial peripheral lip" did not have a "proper antecedent basis" in the specification. (Joint Ex. 189, Submission of Amendments to Patent Examiner at 5.) Lacks' patent attorney responded by proposing the following amendment to the '809 application:

The undersigned takes issue with this conclusion on the basis that it is clear to a person ordinarily skilled in the art that every wheel that is used on an automobile has a peripheral rim portion with an axial peripheral lip. Accordingly, the drawings as exemplified by Figures 3 and 4 [of the '809 patent application] identify the rim portion by reference character 12 and for the purpose of clarifying the axial peripheral lip, reference character 12a has been added to identify the axial peripheral lip. Therefore, it is respectfully suggested that the language of the claims objected to by the Examiner is supported by the specification, at least in the drawings thereof, and would certainly be within the knowledge of a person ordinarily skilled in the art.

(Id. at 6 (emphasis added).) The examiner apparently agreed to this amendment because reference numeral 12a can be found in the '809 patent in Figure 3, in Figure 5, and at col.6, line 60. Numeral 12a is the reference marker attached to "peripheral lip" in the specification. See '809 patent, col. 6, line 60. Thus the omission of "axial" from the specification text, due to poor drafting, does not prevent a person of ordinary skill in the art from concluding that the peripheral lip of the specification and the axial peripheral lip of the claim language are the same element.

In light of the claim language, the specification, and the prosecution history before me, I conclude that the intrinsic evidence of record would lead a person of ordinary skill in the art of cladded wheels to understand claim 1's axial peripheral lip to be that uncovered surface of the composite wheel that starts at the edge of the cladding, goes up and over the top of the projecting rim lip, and ends where the outer side of the rim lip merges with the tire mounting surface of the wheel rim. This is defendants' construction. I choose it because the intrinsic evidence renders it the construction a person of ordinary skill in the art would choose. See Exxon, 64 F.3d at 1556.

Having determined that the intrinsic evidence is more than adequate for the construction of "axial peripheral lip," I further conclude that the parties' extrinsic evidence regarding the meaning of "axial peripheral lip" is unnecessary and thus improper for me to consider pursuant to Vitronics. See 90 F.3d at 1583.

A. Lacks' Appeal of Summary Judgment of Noninfringement of the Asserted Claims of the '809 and '906 Patents.

On appeal Lacks argues that the district court erred in its construction of the limitations "axial peripheral lip" and "wheel face outer surface" in the '809 and '906 patents. Focusing first on "axial peripheral lip," the district court construed the term to mean "that uncovered surface of the composite wheel that starts at the edge of the cladding, goes up and over the top of the projecting rim lip, and ends where the outer side of the rim lip merges with the tire mounting surface of the wheel rim." Lacks, 55 F. Supp. 2d at 711. According to Lacks, however, "axial peripheral lip" refers only to the projecting lip at the outermost edge of the wheel rim, as this is the plain meaning of the language. For support Lacks recites the dictionary definitions of "axial" ("around an axis"), "peripheral" ("of, relating to or forming a periphery," which is defined as "the perimeter of a circle"), and "lip" ("the edge or margin of a hollow vessel or cavity," or "an edge" or "margin"), Webster's Third International Dictionary (1997). These definitions, Lacks argues, render plain the meaning of "axial peripheral lip" as "the edge at the outermost perimeter circumscribing the rim."

Lacks next points to the prosecution history, noting that the limitation was added through amendment after the examiner rejected the claims as obvious in light of U.S. Patent No. 3,726,566 ("the Beith patent"). The Beith patent taught a decorative wheel cover extending over the outermost edge of the wheel rim. To avoid Beith, Lacks added the "axial peripheral lip" limitation and also added the language about the panel blending with the lip to provide a visual impression that the decorative layer "appears to constitute an integral portion of said wheel." Lacks argues that one of ordinary skill in the art would realize that its amendment surrendered only enough subject matter to get around Beith. Therefore, Lacks
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

contends, the "axial peripheral lip" limitation only prevents the decorative cover from extending over the outermost edge of the wheel rim.

Lacks' arguments fail to persuade us that its construction is correct. First, the dictionary definitions do not provide a plain meaning. As McKechnie points out, these definitions also fit the district court's construction. Second, Lacks' amendment to overcome the Beith patent, although providing some support for Lacks' construction, does not outweigh the support for the district court's construction present in the claim language and the specification. The district court observed that the limitation appears at three points in claim 1 of the '809 patent and concluded, from this context, that the axial peripheral lip "is not covered by the panel" and "touches the edge of the decorative layer in such a way that aesthetic blending occurs." Lacks, 55 F. Supp. 2d at 710. The final point is key, because under Lacks' construction this "aesthetic blending" would have to occur between two things that are not adjacent: the outermost edge of the wheel rim and the edge of the cladding. While this is not impossible, it is unlikely and the district court's construction avoids such a problem.

The drawings also support the district court's construction. Figures 3 and 5 disclose the preferred embodiment of the '809 patent and explicitly identify a "peripheral rim portion or rim 12" and an "axial peripheral lip 12a."

[SEE FIGURE 5 AND FIGURE 3 IN ORIGINAL]

Here, the diagrams indicate two separate edges on the wheel rim, an interior one facing the center of the wheel, and an external one facing the outside. Notably, the pointer in figure 3 points to the outermost edge (supporting Lacks' construction), while the pointer in figure 5 points to the middle of the flat between the inside and outside edges. We do not think it reasonable to view one diagram as correct, but the other as erroneous. The better interpretation is that these references both refer to the larger structure the district court construed as being the "axial peripheral lip."

In sum, the weight of the intrinsic evidence supports the district court's construction and we therefore uphold the district court's construction of "axial peripheral lip."

GO BACK

372

I would reverse the district court's interpretation of "axial peripheral lip." However, as I conclude that the construction of "wheel face outer surface" compels a finding of noninfringement, I concur with the court's opinion on this issue.

The district court's claim construction of "axial peripheral lip" is unusual. Defining "axial peripheral lip" as the "uncovered surface of the composite wheel that starts at the edge of the cladding, goes up and over the top of the projecting rim lip, and ends where the outer side of the rim lip merges with the tire mounting surface of the wheel rim" (emphasis in original) literally means that the accused products must meet the claim requirement that the ornamental surface "not cover" the axial peripheral lip, since the axial peripheral lip, by the district court's definition, is uncovered. This renders the district court's finding of noninfringement somewhat opaque.

The district court's claim construction views the "axial peripheral lip" as including both some portion of the wheel wall below the innermost edge of the wheel rim (facing the center of the wheel) as well as the top of the wheel rim. This is evident from both the district court's definition given above, as well as its characterization of the defendant's ornamental panel as "terminating just shy of the tip of the lip." The parties concede that the term "axial peripheral lip" has no particular meaning in the art. The standard dictionary definition of "lip" is given as "an edge, rim, or margin," or even more specifically as the "edge or margin of a hollow vessel." Webster's 3rd New International Dictionary 1318 (1993). Here, the diagrams indicate two separate edges on the wheel rim, an interior one facing the center of the wheel, and an external one facing the outside. In this context, the "axial peripheral lip" logically refers to the external one—the one furthest from the center of the wheel. However, there is an alternative possibility: the "axial peripheral lip" could also refer to the combination of both "edges," along with the flat portion of the wheel rim in between.

Either of these definitions is inconsistent with the district court's interpretation of "axial peripheral lip," specifically the inclusion in the definition of some portion of the wheel wall below the innermost edge of the wheel rim. Both are strongly supported by the prosecution history. The claims at issue were amended in response to an office rejection for unpatentability in light of the Beith reference. Beith discloses a lip 43 "formed to grip the edge of the terminal flange 29 of the multi-

- 792 -
flanged tire mounting rim 21 and, thereby, aid in fixing the wheel cover 12 to the wheel 13. Figures 2 (see below) and 5 depict lip 43 doing precisely this--extending over and around the outer circumferential edge of the rim to "grip" the wheel.

In response to this rejection, the patentee added the requirement that the ornamental panel "not cover" the axial peripheral lip. As can be seen from Figure 2, in order to distinguish over Beith, the patentee needed to emphasize that his ornamental panel did not overlap the very outer edge of the wheel rim.

It is difficult to square the import of this amendment with a claim construction interpreting "axial peripheral lip" as including some undefined portion of the wheel wall below the interior "edge," particularly if we presume that the patentee only surrendered enough structure to get out from under Beith.

As a result, I would reverse the district court's claim construction as to "axial peripheral lip," interpreting it instead as either the outer terminal edge or, alternatively, the highest point on the wheel rim.

Genus' original proposed construction is highly constrictive, requiring that the direction of the gas flow be identical at every point in space between the gas flow apertures and the substrate surface. This construction conflicts with the plain language of the claims. Claim 1 requires that the "flow of gas generally has an axial symmetry" and claim 6 requires that there be "a flow of gas having a substantially uniform magnitude of velocity directed perpendicular to and having axial symmetry across said circular substrate." (165 patent 6:3-4; 6:26-29.) Thus, the velocity vector of the flow need not be the same at every point, as Peltzer points out in his expert report. (Peltzer Expert Report at 15.)

Peltzer also correctly points out that Genus' original proposed definition would exclude the preferred embodiment shown in Figure 4 of the patent, and it appears to this Court that it might well also exclude every apparatus that has multiple gas flow apertures. As Peltzer points out:

The velocity vector of the flow will by no means be the same at every point on a given radius on the plane immediately below the apertures -- some points will be located below a gas flow aperture, and some will be located immediately below a solid section of the surface, through which gas cannot flow. Obviously, the velocity vector will vary between two such points. However, Genus' construction would exclude such a device, because Genus requires identical velocity vectors at each point on a given radius, and that this be true "for every plane between the gas flow apertures exits and the substrate."

(Peltzer Expert Report at 16.) In addition, because the specification of the '165 patent also uses the term "axial symmetry" to describe the substrate and the configuration of the gas flow apertures, Genus' original construction is inappropriate because it cannot be used to describe the axial symmetry of anything except the flow of gas. (165 patent 2:12-15, 4:4-9.) Genus has wisely abandoned this proposed construction.

The patent specification does not define "axial symmetry." ASM's construction is an adaptation of the definition contained in the McGraw-Hill Dictionary of Scientific and Technical Terms, which defines "axial symmetry" as "Property of a geometric configuration which is unchanged when rotated about a given line." (Peltzer Expert Report at 15, and Ex. H.) Genus states in its opposition brief that it is willing to accept the McGraw-Hill definition, but objects to ASM's changes to that definition, particularly ASM's change of the language from "is unchanged" to "looks unchanged."

The McGraw-Hill definition, although useful by analogy, is somewhat unhelpful in describing a gas flow, which is not a geometric figure. Peltzer argues, however, that: "once the basic concept of axial symmetry is understood, it can be applied to gas flow. The flow described in the '165 patent is axially symmetric because, like the configuration of gas flow apertures and the substrate, it is circular in nature."

(Peltzer Expert Report at 17 (citing '165 patent, Fig. 2 and 2:47-49, 3:40-42, 5:15-16.)

Describing the gas flow as "circular" is somewhat simplistic, however. The outer perimeter of the gas flow could be
described as generally circular, but in describing the gas flow as "axially symmetric," it is also necessary to take account of the
gas flow apertures inside the outer perimeter. For the flow to be axially symmetric, each gas flow aperture would need to
have a counterpart equidistant from the center, but on the opposite side of the circle. In other words, if one drew a line in
any direction through the center of the generally circular configuration of the gas flow apertures, the apertures on one side
of the line would be a mirror image of the apertures on the other side of the line. ASM acknowledges in its reply brief that
"in the context of real objects, the key question for symmetry is whether or not one side is the mirror image of the other." (Reply Brief at 21.)

7 Figure 4 of the '165 patent, which illustrates a preferred embodiment, does not have a mirror-image configuration. The
parties agreed at oral argument, however, that Figure 4 was merely a schematic drawing that was not intended to show the
actual placement of the gas flow apertures.

In addition to the requirement of mirror-image placement of gas flow apertures, the direction and speed of the gas flow must
also be in a mirror image configuration for the gas flow to be axially symmetric. As Oldham points out:

One of ordinary skill in the art would understand that it is the velocity vectors of the gas which must be symmetrical
about the shared axis of the showerhead and the substrate . . . . One of ordinary skill in the art would know that a flow of gas
cannot be axially symmetric if the velocity vector of the gas is different at one point located at a given distance from the
axis than at another point located at the same distance from the axis in the same plane.

(Oldham Rebuttal Report at 5 (emphasis in original).) Thus, for the gas flow to be axially symmetric, the direction of the gas
flow and the speed of the gas flow must be the same on each horizontal plane for each gas flow stream that is equidistant
from the center of the generally circular configuration.

ASM's proposal to insert a visual term, "looks," into the definition opens the door to unnecessary confusion and ambiguity.
First, it is difficult to say that the flow of a presumably colorless gas has any particular "look." Second, the use of the word
"looks" would introduce some uncertainty into the definition of a precise term. To the extent that ASM is seeking to avoid
having to show, in the infringement phase of this litigation, that the gas flow is precisely axially symmetric, the claim
language itself offers some wiggle room. Claim 1 requires only that the gas flow "generally has an axial symmetry." (‘165
patent 6:3-4.) Claim 6 requires that the flow of gas have a "substantially uniform magnitude of velocity directed
perpendicular to and having axial symmetry across said circular surface." (‘165 patent 6:26-29.) If the speed of the gas flow
need only be substantially uniform at each equidistant point on a horizontal plane, then the gas flow will only generally have
axial symmetry. In addition, claim 6 requires that the gas flow apertures form "a generally circular configuration having a
radius substantially equal to a radius of said substantially circular substrate and coaxially aligned therewith," which also
limits the precision of the axial symmetry of the gas flow. (‘165 patent 6:23-26 (emphasis added).)

Accordingly, the Court will construe "axial symmetry" in accordance with its ordinary dictionary definition, with a minor
change to assist the jury's understanding of the term: "A geometric figure possesses axial symmetry if it is unchanged when
rotated about a given line, such as a circle rotated around its axis."

2. Axially Confronting Surfaces Limitation

231. Based on the claim language and the specification of the '514 patent, the phrase "annular surfaces axially confronting
each other" and as the phrase would be understood by those skilled in the pertinent art, must be construed to mean that the
surfaces are fully engaged, i.e., abutting, so that a precise axial rest position is achieved. See PP 84, 86, 91-92 supra.
Axially Spaced

The most hotly-debated issue of claim construction in this case is the meaning of the term "axially spaced". Defendant contends that the term means "on a single straight line". (Def. Brief at 10). In that regard, defendant maintains that the patent requires that the strap attachment points be fixed on, and not deviate circumferentially from, the axis "A" depicted on Figure 2 of the patent. According to defendant, the invention had to have axially-aligned attachment points in order to overcome the prior art of the Williams patent, cited in the subject patent, which utilized circumferentially-offset straps. Plaintiff, however, states that,

[t]he term 'axially spaced' means that the points are spaced along an axis, but they may also be spaced in other directions -- i.e., circumferentially along the side of the cylinder. Indeed, the term 'axially' simply is a word that modifies the term 'spaced' and means 'located . . . in the direction of an axis.'

(Pl. Brief, at 12) (citing American Heritage Dictionary, at p. 93 (1981)); (Pl. Presentation Materials at 18) (Stating that the term "axially spaced" means "spaced along an axis not in a line on an axis"). According to plaintiff, defendant wants the Court to define "axially spaced" to mean "axially aligned", a definition which the inventor rejected during the prosecution of the patent.

From studying the subject patent as a whole, it appears clear that claims 1 and 8 require the invention's three strap-attachment points to form, and be located along, a straight axis line running from the top of the bag to the bottom of the bag. Accordingly, the Court gives the term "axially spaced" its ordinary dictionary meaning: "Located on, around, or in the direction of an axis." WEBSTER'S II NEW COLLEGE DICTIONARY 79 (Houghton Mifflin 1995). An axis is "[a] straight line about which a body or geometric object rotates or may be thought to rotate," or "a center line to which parts of a structure or body may be referred." Id. To the extent that plaintiff is urging the Court to adopt a definition of "axially spaced" that would allow the attachment points to be spread around the outside of the bag circumferentially, i.e. away from the axis line depicted in the patent drawings, without any requirement that they be at least capable of alignment, the Court declines to do so. Otherwise, the term "axial" would be meaningless. Consequently, the term "axially spaced" would not apply to attachment points that are permanently circumferentially offset, such that they are incapable of being axially aligned. However, with the exception of the second or center attachment point 5, the term "axially spaced" does not require that the strap attachment points remain fixed on the axis line. Instead, as it is used in the patent, the term allows for the straps to move circumferentially off the axis, and around the circumference of the bag, during use. To hold otherwise would be to exclude the preferred embodiment of the patent, which envisions the straps moving circumferentially on either side of the attachment axis.

4 It appears that plaintiff agrees that the attachment points must at least be capable of being axially aligned. During oral argument, plaintiff's counsel stated: "Our position is that the attachment points can be axially aligned. They run on this -- on this longitudinal axis, 1, 2, 3; but they can also move circumferentially . . . ." (Oral Argument Transcript at 26).

5 It appears that the second of the three attachment points in Claims 1 and 8 must remain fixed on the axis line. There is nothing in the patent to indicate that the second securing means would ever move circumferentially off the axis line.
Claim 14 of the patent uses the term "longitudinally spaced" instead of "axially spaced." Defendant maintains that, in the instant patent, the two terms mean "exactly the same thing." (Def. Brief at 14) Plaintiff, however, contends that the term "longitudinally spaced" means "spaced lengthwise or along the long direction." (Pl. Brief at 23) The Court's view is that, since the inventor used the term "longitudinally spaced" in claim 14, and not in the other claims, where he used the term "axially spaced", the two terms were intended to have different meanings. In fact, as discussed earlier, the inventor expressly changed the terminology from "longitudinally" to "axially" in claims 1 and 8 after they were initially rejected by the patent examiner. Consequently, the Court finds that longitudinally spaced attachment points need only be spaced lengthwise along the golf bag, without regard to being positioned in relation to an axis. 6

6 See, Oral Argument Transcript at pp. 28-29.

C. Axial Direction

Finally, the court turns to the term "axial direction." Although the plaintiff originally identified the term "axial direction" as being in need of construction, (Docket No. 55 at 2), the parties in their replies instead refer to "axial flow." Both are used in the patent but "axial direction" is used in the claims whereas "axial flow" is absent from the claims but appears in the abstract, summary, and detailed descriptions of the drawings. Thus, there is no claim in the patent relating to "axial flow" but rather only a claim relating to "axial direction." Nonetheless, for present purposes, the distinction is inconsequential. The crucial term is "axial" in that this term was added so as to distinguish the '712 patent from Schink wherein the direction of the flow was helical. In the '712 patent, the liquid to be heated flows in an axial direction through the combining region. It is not necessary to engage in any sort of detailed analysis to discern the meaning of these terms; the common and ordinary meaning of the terms is clear. "Axial direction" is a direction related to, characterized, or forming an axis.

III. Analysis

The '712 patent refers to a device that heats liquids or slurries by injecting high velocity steam into the fluid. The fluid enters the heater body and the high pressure steam enters through a Mach diffuser. The steam then mixes with the liquid, thereby heating it, and the combined heated fluid exits the heater body.
Claim 1 states:

A direct contact steam injection heater comprising:

a heater body having a steam inlet, a liquid inlet, a combining region and a heated liquid discharge outlet;

the combining region having an inlet and an outlet located within the heater body in which steam and liquid are combined to generate heated liquid;

a Mach diffuser that receives the flow of steam into the heater body and discharges the steam into the liquid flowing through the combining region, wherein a coaxial channel is located between the Mach diffuser and an inlet portion of the combining region of the heater body and the Mach diffuser contains a plurality of steam diffusion holes through which the steam is discharged into the liquid flowing through the channel between the Mach diffuser and the inlet portion of the combining region; and

an adjustably positionable cover over the steam diffusion holes contained in the Mach diffuser that is movable relative to the Mach diffuser to adjustably expose one or more of the steam diffusion holes in the Mach diffuser and modulate the amount of steam discharged through the Mach diffuser into the liquid flowing through the combining region;

wherein:

the steam pressure upstream of the Mach diffuser is sufficient to create sonic choked flow conditions through the exposed diffusion holes through which steam is discharged from the Mach diffuser into the flow of liquid flowing through the channel between the Mach diffuser and the inlet portion of the combining region;

the coaxial channel has a flow area substantially less than a flow area of a downstream portion of the combining region in which the injected steam condenses; and

liquid flows through the inlet portion and the downstream portion of the combining region in an axial direction and steam flows in generally radial directions as the steam flows through the one or more steam diffusion holes in the Mach diffuser into the axial liquid flow through the channel between the Mach diffuser and the combining region of the heater body.

(Docket No. 54-2 at 7-8) (emphasis added.) The portion of the claim that is most relevant to the issues presently before the court is the last paragraph of the portion quoted above and specifically the italicized portions.

A. "Axial Direction"

As noted above, the term "axial direction" was subject to the court's prior claim construction order. (Docket No. 64 at 9-10.) In their Markman brief, the defendants requested that the court issue an order "requiring literal interpretation of the axial flow limitation of claims 1 and 16; that is, permitting no range of equivalents as to that limitation." (Docket No. 53 at 15.) In support of this request the defendants' Markman brief presented many of the same arguments they present here regarding prosecution history estoppel as a bar to an infringement claim under the doctrine of equivalents. (Docket No. 53 at 11-15.) The court construed the term as "a direction related to, characterized, or forming an axis." (Docket No. 64 at 10.)

In contending that prosecution history estoppel barred the plaintiff from proving infringement under the doctrine of equivalents, the defendants' Markman brief read more like a motion for summary judgment. Now the defendants' present summary judgment brief, wherein they contend that the plaintiff cannot prove literal infringement because the court should read the "axial direction" element of the claim as requiring entirely axial flow as soon as the liquid enters and continues through the channel between the Mach diffuser and the combining region of heater body, in many ways seems like an effort to take a second bite from the Markman apple.

If one were to read only the last paragraph of the portion of the claim quoted above, it might be reasonable to conclude that for there to be literal infringement, the flow over the Mach diffuser must be "entirely" axial. The argument could be made that if the patent sought to claim anything less than entirely axial flow, the claim would have used an adverb such as...
"predominantly" or "generally" to describe the flow, as was done with respect to the radial flow of steam from the Mach diffuser.

However, it is important to note that, as claims often are, claim 1 of the '712 patent is prefaced with the word "comprising." When used in the patent context, "comprising" is a term that is "inclusive or open-ended" and "is well understood to mean "including but not limited to" in that it "does not exclude additional unrecited elements or method steps." Abbott Labs. v. Sandoz, Inc., 544 F.3d 1341, 1360 (Fed. Cir. 2008) (quoting CIAS, Inc. v. Alliance Gaming Corp., 504 F.3d 1356, 1360 (Fed. Cir. 2007); Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1327-28 (Fed. Cir. 1999)). This is in contrast to the closed-ended, limited, and exclusive term "consisting of." CIAS, Inc., 504 F.3d at 1361. Thus, when the term "comprising" is used in a claim, infringement cannot be avoided simply because the accused device has elements in addition to those recited in the claim. Stiftung v. Renishaw PLC, 945 F.2d 1173, 1178 (Fed. Cir. 1991). However, "'[c]omprising,' while permitting additional elements not required by a claim, does not remove the limitations that are present." Power Mosfet Techs., L.L.C. v. Siemens AG, 378 F.3d 1396, 1409 (Fed. Cir. 2004).

An exception to this general understanding of the word "comprising" is found when the patentee had "clear intent" to limit the scope of the claims. ScannerTechs. Corp. v. ICOS Vision Sys., N.V., 365 F.3d 1299, 1304-05 (Fed. Cir. 2004). For example, one way a patentee's intent to limit the scope of the claims may be manifested is when "the claim is specific as to the number of elements . . . and adding elements eliminates an inherent feature . . . of the claim." InsituformTechs., Inc. v. Cat Contracting, Inc., 99 F.3d 1098, 1106 (Fed. Cir. 1996). The defendants have failed to present any evidence that the presence of any other type of flow in addition to axial flow would eliminate an inherent feature of the claim, and thus the court finds this limited exception to be inapplicable.

It is the conclusion of the court that as a consequence of the use of the open-ended term "comprising" to preface Claim 1, the "axial direction" limitation is a necessary element of the claim but the claim is not limited to only axial flow. Accordingly, the court rejects the defendants' contention that the '712 patent requires entirely axial flow from the point the liquid passes through the inlet and continues through the channel between the Mach diffuser and the combining region of heater body. The court shall now turn to the question of infringement.
face of the catalyst" to mean "during the inserting step, the support member is wrapped around the substrate such that it
covers the middle point of the substrate and does not extend to the substrate ends."

b. Construction of "Defining a Longitudinal Axis"

The relevant claim language refers to a "elongate shank" with the above mentioned oblong cross-section, "defining a
longitudinal axis." Alltrade construes the claim limitation to require a shank with a linear axis. Alltrade's construction is
grounded in the argument that a straight shank defines a linear axis. Olympia contends that the shank is capable of defining
a non-linear longitudinal axis. Olympia argues that limiting the Claim language to a shank defining a "linear" axis
improperly narrows the Claim and commits construction error by reading in words from the specification in to the Claim. At
oral argument, Olympia cited a number of cases in support of the undisputed legal proposition that it is improper to read
limitations from words or drawings in the specification into the Claim. See, e.g., Resonate Inc. v. Alteon Websystems, Inc.,
338 F.3d 1360, 1364-65 (Fed. Cir. 2003); Electro Scientific Indus.; Inc. v. Dynamic Details, Inc., 307 F.3d 1343, 1349 (Fed. Cir.
2002); GE v. Nintendo Co., 179 F.3d 1350, 1358 (Fed. Cir. 1999).

The Court notes that the limitation at issue, that the shank is linear, derives not from the words or drawings of the
specification, but directly from Claim 19. The Court finds the Claim language unambiguous, and does not find that Olympia
otherwise defined the term with precision and clarity anywhere within the patent or prosecution history. The ordinary
meaning of "axis" involves a straight line. See American Heritage Dictionary of the English Language (4th ed. 2000)
(defining axis as "[a] straight line about which a body or geometric object rotates or may be conceived to rotate.").

Without leave, Olympia submitted additional definitions of "axis" following the hearing. None change the result. The
McGraw-Hill Dictionary of Scientific and Technical Terms includes the following: "a line of symmetry for a geometric
figure." (Second Supplemental Greenspan Declaration, Ex. G28.) However, such a line would necessarily be a straight line.
definitions which explicitly or implicitly incorporate the concept of symmetry: "a central line that bisects a two-dimensional
body or figure" and "a line about which a three dimensional body or figure is symmetrical." (Second Supplemental
Greenspan Declaration, Ex. 28; emphasis supplied.) While a line may be curved or straight in common parlance (id., Ex.
29), the McGraw-Hill Dictionary of Scientific and Technical Terms defines a line in terms of a linear function; in other
words, a straight line. (Brown Declaration, Ex. D.) The Court believes that one reasonably skilled in the art would
understand the term "axis" in its technical sense.

--- Footnotes ---

3 The Court does not believe that its construction is inconsistent with Texas Digital Systems, Inc. v. Telegenix, Inc. 308 F.3d
1193, 1203 (Fed. Cir. 2002). There the Federal Circuit observed, "If more than one dictionary definition is consistent with
the use of the words in the intrinsic record, the claim terms may be construed to encompass all such terms." (Id.) The Court
does not interpret this language to compel a construction that encompasses any definition, but rather as permissive where
such multiple interpretations would be supported by the internal record.

--- End Footnotes ---

Therefore, the Court construes this claim limitation to require the shank to have a linear axis.
Watson uses the dictionary definition of "axle" and "seat" to propose an interpretation of this element as "a part or surface joined to or made a part of each arm adapted for contacting an axle." Boler asserts that the element should be interpreted as "any structure used to attach the axle to the suspension arms." Boler contends that Watson's interpretation is not consistent with the specification of the '953 patent because the specification shows an air spring or suspension spring between the axle seat and the plate affixed to the frame members. Boler also contends that the trucking industry's understanding of "axle seat" does not support Watson's proposed definition.

Claims define the invention and it is claims that are infringed, not specifications. See E.I. du Pont de Nemours & Co. v. Phillips Petroleum, 849 F.2d 1430, 1433 (Fed. Cir. 1988); SRI Int'l v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1121 (Fed. Cir. 1985). While claims are to be interpreted in light of the specification, this does not mean that everything expressed in the specification will be read into the claims. Id.; see also Johnson Worldwide Assocs., Inc. v. Zebeo Corp., 175 F.3d 985, 988 (Fed. Cir. 1999) ("Mere inferences drawn from the description of an embodiment of the invention cannot serve to limit claim terms"); Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations."). As the Federal Circuit explained in SRI Int'l:

If everything in the specification were required to be read into the claims, or if structural claims were to be limited to devices operated precisely as a specification-described embodiment is operated, there would be no need for claims. Nor could an applicant, regardless of the prior art, claim more broadly than that embodiment. Nor would a basis remain for the statutory necessity that an applicant conclude his specification with 'claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.' 775 F.2d 1107, 1121 (citations omitted).

A specification may be used to interpret what a patentee meant by a particular word or phrase in the claim. E.I. du Pont de Nemours & Co., 849 F.2d at 1433. However, it is improper to read a limitation into the claim from a specification "wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim." Id. "Where a specification does not require a limitation, that limitation should not be read from the specification into the claims." Id. (quoting Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988)) (emphasis in original).

Having reviewed the intrinsic evidence, the court concludes that the term "axle seat" is unambiguous and may be defined by the ordinary meaning of the words that make up the term. Gentex Corp. v. Donnelly Corp., 69 F.3d 527, 530 (Fed. Cir. 1995). While the specification does describe an air spring mounted on the axle seat, this description of an embodiment is not necessary to interpret or understand the meaning of the term "axle seat." Nothing in the claims or the specification leads one to conclude that the structure termed an "axle seat" must be located between an axle and an air or suspension spring. To limit the term in the manner Boler suggests would require improperly reading an "extraneous" limitation from the specification into the claims. E.I. du Pont de Nemours & Co., 849 F.2d at 1433 (an "extraneous" limitation is one that is read into a claim from a specification wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim."). Thus, the court construes element (d) in the manner Watson proposes.

THE MEANING OF THE TERM "AXLE SEAT"

The Claim Language

The court begins, as it must, with the claim language itself. Bell Comm'n's Research, Inc. v. Vitalink Comm'n's Corp., 55 F.3d 615, 619 (Fed. Cir. 1995). To support its proposed definition of "axle seat," Watson argues that the grammatical structure of claim 17 reveals that the "axle seat" is included in the device (a structure to be attached to the ends of the axle).
Watson points out that there is no mention of any suspension system component to which this "axle seat" might be connected or a part of, such as a spring or suspension arm. Further, Watson contends that the claim describes the "axle seat" in terms of its shape relative to the axle, thus suggesting its connectivity to the axle. Watson also argues that the grammatical structure of claim 18 suggests the formation of the "axle seat" through the cooperation of side plates and a profile shaped to form a connection with the axle. Watson asserts that no other component of the suspension system is mentioned as a limitation to this claim.

In response, Boler argues that Watson's proposed definition is contrary to the definition one skilled in the art would attribute to the term. To support this contention, Boler cites expert affidavits and publications of organizations in the trucking industry. Boler contends, essentially, that while a patent applicant is free to define a term differently from how one skilled in the art would understand it, Watson failed to attribute a special definition to "axle seat" in the '452 patent. Thus, Boler's argument continues, "axle seat" must be given its ordinary meaning: "a portion of the suspension system for attaching the suspension components to the axle."

As Watson points out, however, the problem with Boler's argument is that, rather than looking to the claim language first and then other intrinsic evidence to interpret the term, Boler looks first to extrinsic evidence for the meaning of a claim term and then imposes that meaning on the claims. "Relying on extrinsic evidence is 'proper only when the claim language remains genuinely ambiguous after consideration of the intrinsic evidence.' Such instances will rarely, if ever, occur." Interactive Gift Express, Inc. v. Compsure, Inc., 256 F.3d 1323, 1332 (Fed. Cir. 2001) (quoting Bell & Howell Document Mgmt. Prods. Co. v. Altek Sys., 132 F.3d 701, 706 (Fed. Cir. 1997)); see Key Pharmas. v. Hercon Lab. Corp., 161 F.3d 709, 716 (Fed. Cir. 1998) ("[i]f the meaning of the disputed claim term is clear from the intrinsic evidence—the written record --that meaning, and no other, must prevail; it cannot be altered or superseded by witness testimony or other external sources simply because one of the parties wishes it were otherwise"); Vitrionics Corp. v. Conceptronic Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) ("In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term."). "Extrinsic evidence may never be used 'for the purpose of varying or contradicting the terms in the claims.'" Interactive Gift Express, 256 F.3d at 1332 (quoting Markman, 52 F.3d at 976).

While the court does not disagree that the term "axle seat" has been attributed the meaning Boler proposes in prior art suspension systems, the court sees no reason why, in light of the intrinsic evidence, one skilled in the art would not attribute Watson's proposed meaning to the term as used in the '452 patent. Put differently, contrary to Boler's assertion that Watson did not attribute a special meaning to the term, the court concludes that it did. The claim language itself does not limit the "axle seat" to a structure for attaching suspension components to an axle. As will be discussed in more detail below, the remaining intrinsic evidence--the specification and the prosecution history--also supports Watson's proposed definition of "axle seat."

The Specification of the '452 Patent

The specification contains a written description of the invention, and of the manner and process of making and using it, so as to enable a person skilled in the art to which it pertains to make and use the invention. 35 U.S.C. § 112. Boler argues that the specification describes the "axle seat" in the '452 patent as attaching a suspension component to the axle. Col. 3, line 59-Col. 4, line 19. Further, Boler contends that Figures 1A, 1B and 2 in the '452 patent show the "axle seat" as attaching an air spring, i.e., a suspension component, to the axle. The section titled "Brief Description of the Drawings" in the '452 patent describes Figures 1A and 1B as views of "a steerable axle system" and Figure 2 as a view of "a typical steerable suspension system." This section goes on to describe Figure 3 as a view of "a steerable suspension embodying principles of the present invention." Further, immediately after the portion of the specification cited by Boler, the specification states "referring additionally now to FIGS. 3 & 4, an improved steerable axle system [] embodying principles of the present invention is representatively illustrated." Thus, it is clear that the portion of the specification cited by Boler and Figures 1A, 1B and 2 concern prior art suspension systems which do not incorporate the claimed invention.

It is undisputed that the prior art suspension systems shown in Figures 1A, 1B and 2 and discussed in the specification have connections from the axle tube to the suspension components. The invention described in the '452 patent creates a new end device that also connects to the axle. Watson argues that it is appropriate for the term "axle seat" to refer to both the device connection point and the suspension connection point. The court agrees.

The specification describes the axle seat as follows:
The device includes a king pin housing portion and an axle seat portion. The king pin housing portion and axle seat portion are combined by a unique construction and arrangement of a top plate, an outer plate, opposing side plates and the inner plate. The plates and the king pin housing portion are attached to each other as shown by conventional methods, such as by welding to thereby provide a generally hollow box-like assembly ... Inner side surfaces of the side plates are complementarily shaped relative to the outer side surface of the axle and the inner plate formed therein, which is also complementarily shaped relative to the outer side surface thereby forming the internal axle seat ... Each of the plates is attached to the axle as shown by conventional methods, such as by welding the plates to the axle, but it is to be understood that the axle seat portion may be other wise attached to the axle ... (figure references omitted)

Nowhere in this language is there any reference to the axle seat connecting suspension components. Instead, the specification describes the axle seat as a point of connection between the end device and the axle.

The Prosecution History of the '452 Patent

The '452 patent application as originally filed contained 19 claims. On July 17, 1998, the patent examiner issued an Office Action allowing claims 10-12, rejecting claims 1-9 and 13-16, and objecting to claims 17-19. Watson 2 amended claim 17 to satisfy the examiner's objection to claims 17-19.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 The court recognizes that Thomas Chalin was actually the applicant but for ease of reference the court will refer to the applicant in this opinion as Watson.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The examiner initially rejected claims 13-16 as being anticipated by U.S. Patent No. 4,733,744 issued to Jack Glaze. In response to the rejection of claims 13-16, Watson amended claim 16 to recite that the "king pin housing and said axle seat being integrally formed." In its remarks to the examiner, Watson stated the following:

"In contrast, Glaze does not show, describe, or suggest a device including an integrally formed king pin housing and axle seat, nor does Glaze disclose attaching such a device to a tubular axle. Instead, Glaze discloses a yoke or king pin housing, which is attached to axle tube 22, and a pivotable spring mounting device, which is separately attached to the axle with flange members. The yoke is separate from the spring mounting device and flange members, and is separately attached to the axle.

Thus, the yoke, spring mounting device and flange members are not included in a single device attached to each end of an axle and are not integrally formed. (figure references omitted)

Boler argues that these remarks show that Watson considered the "pivotable spring mounting device" an "axle seat," since it is "separately attached to the axle" and "separate from" the yoke. The court has noted previously, however, that Watson has acknowledged "axle seats" separate from the claimed end device in the prior art. This does not mean that Watson cannot use this term to describe the connecting point between the end device and the axle. The '452 patent discloses a new invention.

Boler also argues that the connection between the yoke and the axle described in the Glaze patent constitutes an "axle seat" under Watson's proposed definition. Thus, Boler asserts that had the term "axle seat" been given the meaning Watson proposes, Watson would not have been able to distinguish the claimed invention over the Glaze patent. Having reviewed Watson's remarks, the court concludes that Watson did not view the Glaze patent as disclosing an axle seat connection, or perhaps any connection, between the yoke and the axle tube. The specification in the Glaze patent states that "the outer end 22 is provided with an outboard yoke portion 120" thereby indicating a unitary design. Even if the Glaze design is not unitary and the yoke is somehow attached to the axle, Watson's remarks to the examiner make clear that, unlike Glaze, its application taught an integrally formed king pin housing and axle seat. In sum, Watson's remarks simply distinguish the integrally formed king pin housing and axle seat from Glaze's yoke and separate axle seat (spring mounting device.) Accordingly, the court concludes that Boler has failed to show that Watson attributed a different meaning to "axle seat" than it does now.
The examiner also rejected claims 1-9 as being obvious in light of U.S. Patent 4,693,486 issued to William Pierce and U.S. Patent 1,890,766 issued to F.J. Adams. Boler argues that in its attempt to distinguish the '452 invention from the Pierce and Adams patents, Watson argued that neither Pierce of Adams taught an integrally formed kind pin housing and axle seat. The court agrees. Boler goes on to assert that by distinguishing the Pierce and Adams patents in this manner, Watson is now precluded from contending that an "axle seat" can attach anything to an axle. However, this definition is not the one Watson is proposing here, but rather is part of a definition put forth by Watson's patent attorney, Marlin Smith, in deposition testimony. Smith's testimony is extrinsic evidence which the court need not consider. Further, while an "axle seat" may be a structure that attaches something to an axle, Watson proposes that "axle seat" be defined, in relation to the '452 patent, as "the portion of the device in contact with the outer surface of the axle." Thus, Watson is not necessarily proposing that an axle seat be defined as a structure that attaches anything to an axle. It is simply saying that in construing the language in the '452 patent, the term "axle seat" should not be limited solely to "a portion of the suspension system for attaching suspension components to the axle."

Conclusion from the Intrinsic Evidence

Having reviewed the intrinsic evidence, the court concludes that the term "axle seat" is clear and unambiguous. Boler argues that the court should look to extrinsic evidence, such as the publications of organizations in the trucking industry, the depositions of the inventor of the claimed device, Thomas Chalin, and the president of Watson and Chalin, Donald Watson, and the position of Watson in another case before this court, to interpret the term "axle seat" and other disputed terms contained in the claims at issue. Having concluded that the term "axle seat" is clear from the intrinsic record, the court will not resort to extrinsic evidence to interpret the disputed terms. Based on the intrinsic evidence, the court interprets "axle seat" as "the portion of the device in contact with the outer surface of the axle."

GO BACK

A. "BNC Connector"

Because none of the claims in either patent defines the term "BNC connector," the court must consult the remaining intrinsic evidence - the specification and the prosecution history - in construing the disputed term. If the meaning of the disputed term cannot be ascertained from the intrinsic evidence alone, the court will consult the relevant extrinsic evidence.

The summary of the invention of the '932 and '799 patent use the same language to define what is meant by "BNC connector":

    The BNC connector 38 is basically a conventional BNC connector that is typically used as an electronic connector. Because the construction of the BNC connector is, for the most part, conventional, it will not be described in detail. The connector includes a cylindrical collar 48 that is mounted on a body 50 of the connector for rotation relative thereto. The collar 48 is constructed of a conductive material. The collar includes a pair of diametrically opposite grooves or slots 52. The slots 52 spiral around the collar 48 for one quarter of the circumference of the collar.

'932 patent, col. 5, ll. 8-17 (emphasis added); '799 patent, col. 5, ll. 51-60 (emphasis added).

The prosecution history of the '932 patent shows that patent was originally rejected on July 24, 2001 as being anticipated by U.S. Patent No. 5,074,637, issued to Dan Rink on December 24, 1991 (the "Rink patent"). The prosecution history of the '799 patent shows that patent was originally rejected on March 6, 2003 for various reasons, including double patenting of the '932 patent claims. Following amendments, the '932 and '799 patents successfully issued on March 19, 2002 and October 21, 2003, respectively. The Rink patent is referenced as prior art in both the '932 and '799 patents. The Rink patent uses the term "bayonet connector," which is similar to but broader than the term "BNC connector."

Defendants argue the slots of a "conventional" BNC connector must fall within the dimensions set forth in international and United States standards. Plaintiff responds by arguing that the court should not construe "BNC connector" to incorporate specific dimensions; plaintiff notes that a leading technical dictionary defines "BNC connector" without any reference to the size of its slots: "[a] small device for connecting coaxial cables, used frequently in low-power, radio-frequency and test..."
applications. Abbreviation for bayonet Neil-Concelman connector." McGraw-Hill Dictionary of Scientific and Technical Terms 260 (6th ed. 2003). Defendants respond by arguing that persons skilled in the art of electrical connectors understand that BNC connectors - particularly conventional ones - are necessarily defined by technical standards in order to ensure compatibility amongst connectors produced by various manufacturers. Defendants argue the term "BNC connector" is a subset of the more general term "bayonet connector," and thus BNC connectors are governed by the relevant provisions of the United States Department of Defense Standards for Radio-Frequency Connector Interfaces ("U.S. standard" or "military specification") and the International Standards for Radio-Frequency Connectors ("international standard"), 3 both of which require the width of BNC connector slots to be between .091 and .097 inches. 4 Ex. D (military specification) to Defs.' Reply at 2; Ex. E (international standard) to Defs.' Reply at 5-6.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 The United States was not one of the countries that voted in favor of publication of the international standard, as amended in 1997. See Ex. G (international standard) to Pl.'s Br. at 5. Therefore, it is not clear whether BNC connectors produced and sold in the United States are governed by the international standard. This issue is irrelevant, however, because the international and U.S. standards are identical with regard to minimum and maximum slot widths for BNC connectors. Ex. D (military specification) to Defs.' Reply at 2; Ex. E (international standard) to Defs.' Reply at 5-6.

4 At oral argument, plaintiff argued these standards were not relevant to claim construction of the term "BNC connector" and should not be incorporated into the '932 and '799 patent claims. See May 4, 2005 Tr. at 77-78. Yet plaintiff had previously argued in its brief that the international standard was in fact relevant. Pl.'s Br. at 15-16; see also Auld Decl. P8 (attached to Pl.'s Br.) (inventor named on '932 and '799 patents declaring that "manufacturers commonly use technical standards, such as the International Standards for Radio-frequency Connectors ("ISRC"), to ensure that electronic parts from multiple manufacturers are capable of working in concert"). Plaintiff even proposed incorporating the international standard into the court's claim construction. Pl.'s Br. at 16, n.6. Plaintiff made this proposal because, at that time, it mistakenly believed the international standard did not set forth a maximum slot width; therefore, plaintiff thought the international standard supported its argument that BNC connectors could possess a wide variety of slot widths. Later, plaintiff realized it had incorrectly cited to an older version of the international standard and acknowledged that the international standard does indeed include maximum slot widths. See Pl.'s Notice to Correct Record at 1-2.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Defendants note that the slot width of plaintiff's commercial implementation of a BNC connector is .093 inches, approximately halfway between the minimum and maximum slot widths identified in the U.S. and international standards. Defendants cite various manufacturer definitions in support of its proposed claim construction, including one from Tyco Electronics ("Tyco"), one of the largest connector manufacturers in the world. Tyco defines "BNC Series (connector)" as:

A radio frequency connector covered by Military Specification. It has an impedance of 50 ohms, and is designed to operate in the 0 to 4 GHz frequency range. Quick connect/disconnect is featured by a pin and cam bayonet coupling. Ex. G (Tyco website) to Defs.' Reply at 3. Tyco defines "bayonet coupling (product feature)" as:

A quick coupling device for circular plug and receptacle connectors. Pins projecting from the outside of the cylindrical receptacle engage with corresponding cam slots in the bayonet plug.

Id. at 2. Defendants argue that these definitions confirm that persons skilled in the art, i.e., electrical engineers from Tyco, distinguish between a general bayonet connector and the more specific BNC connector. Defendants' argument is supported by the one of the two definitions plaintiff provided in its brief defining "BNC connector":

A type of bayonet connector used with thin coax cable used in 10Base-2 ethernet systems. BNC stands for Bayonet-Neill-Concelman. Neill and Concelman were the inventors of the connector. There are a number of other BNC type devices such as a terminator and a T-connector.

Ex. H to Pl.'s Br. (definition taken from glossary section of website devoted to cable industry) (emphasis added).
Plaintiff's own definition confirms that a BNC connector is a specific kind of bayonet connector. The Rink patent, referenced by the patent examiner in the '932 patent prosecution history and cited as prior art in both the '932 and '799 patents, confirms that the term "BNC connector" is more specific than the general term "bayonet connector." The Rink patent, entitled "Optical Fiber Connector," describes an "improved bayonet optical connector" and includes an illustration of the preferred embodiment which pictures slot widths as wide as the entire circumference of the connector, presumably wider than .097 inches, the maximum width for BNC connectors meeting U.S. and international standards. Plaintiff argues the Rink patent demonstrates that a BNC connector can have slots wider than .097 inches. This argument fails because: (1) the description of the preferred embodiment in the Rink patent makes no mention of specific dimensions; and (2) even if the illustrated slots are presumed to be wider than .097 inches, the Rink patent describes a "bayonet connector," of which there are many kinds, not a "BNC connector," which is a subset of bayonet connectors according to plaintiff's own definition.

Plaintiff attempts to conflate the terms "bayonet connector" and "BNC connector," but the court concludes, based on the intrinsic and extrinsic evidence, that the two terms have different meanings, i.e., a BNC connector is a specific type of bayonet connector. The drafters of the '932 and '799 patents were aware of the more general term "bayonet connector" used in the Rink patent and chose instead the more specific term "BNC connector." The drafters' choice of the specific term over the general term makes sense because the specific term promotes connectivity and interchangeability across different brands and products. Because of the importance of interchangeability in the field of electrical connectors, it is logical to construe the term "BNC connector," described as "conventional" in the specification, as incorporating the relevant U.S. standard for slot widths. Michael Auld, the inventor named on the '932 and '799 patents, agrees: "manufacturers commonly use technical standards, such as the International Standards for Radio-frequency Connectors ("ISRC"), to ensure that electronic parts from multiple manufacturers are capable of working in concert." Auld Decl. P8 (attached to Pl.'s Br.)

In construing the disputed patent term "BNC connector," the court has utilized the following evidence, in order of importance: (1) the '932 and '799 patents' specification, which describes a "conventional" BNC connector with "diametrically opposite grooves or slots;" (2) the '932 patent's prosecution history and cited prior art, including the Rink patent's description of a general "bayonet connector;" and, because the disputed patent term could not be ascertained from the intrinsic evidence alone, (3) the extrinsic evidence, including plaintiff's admissions, the McGraw-Hill and manufacturer definitions, and the U.S. and international standards, none of which vary or contradict the claim language. The court has also reviewed the inventor and expert testimony, although little weight has been accorded this extrinsic evidence with regard to claim construction as most of it appears self-serving and generated for the purpose of litigation.

The court construes the term "BNC connector" to mean "a type of bayonet connector with a slot or slots 5 conforming to military specification."

--- Footnotes ---

5 Although the intrinsic and extrinsic evidence demonstrates that a BNC connector always has two diametrically opposite slots, and consequently a light source adapter always has two diametrically opposite posts, the court includes the language "slot or slots" in its claim construction in order to avoid reading out certain elements of the '932 and '799 patent claims. For example, claim 19 of the '799 patent, supra p. 7, recites: "the assembly comprising a BNC connector having a cylindrical collar with a center axis, the collar having at least one slot therein that spirals around the center axis of the collar . . ." (emphasis added). Claim 1 of the '932 patent, supra pp. 5-6, recites: "the adapter comprising . . . at least one post on the external surface of the sleeve, the post being positioned to engage with a slot of a BNC connector . . ." (emphasis added).

Defendants argue "BNC connector" should also be construed to have "spiral slots." Some independent claims, such as claim 19 of the '799 patent quoted above, describe a "BNC connector having a cylindrical collar with a center axis, the collar having at least one slot therein that spirals around the center axis of the collar." See also claim 7 of the '932 patent, supra p. 6. Other independent claims, such as claim 6 of the '799 patent, describe a BNC connector slot without any mention of spiraling. See supra, p. 6; see also claim 1 of the '932 patent, supra pp. 5-6. A narrowing limitation present in one claim should not be read into other claims in which the limitation is absent, Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999); the court will not construe "BNC connector" as having spiral slots.
D. Back Portion

Plaintiff advances two, essentially identical constructions of "back portion": "the part of the shoulder guard that is opposite the front part of the shoulder guard and that extends over part of the back shoulder," (Pl.'s Br., at 17); and "the part of the shoulder guard that is opposite the front part of the shoulder guard and covers at least a portion of the back of the shoulder." (Pl.'s Reply, at 11.) TAG maintains that the proper interpretation of the term is "a part of the shoulder guard that extends from the top portion down a portion of the wearer's back shoulder such that the shoulder is covered." (Def.'s Br., at 21.) The court gleans two areas of disagreement from these competing proposals: whether the back portion of the shoulder guard is "opposite" from the "front part"; and the degree to which the back portion extends over, and covers, the shoulder.

Neither the claim nor the specification support the notion that the back portion of the shoulder guard is "opposite" the front portion. The claim simply discloses a front portion, a top portion, and a back portion; out of the three, only the front portion is further described as "adjacent the main pad." (‘226 Patent, col. 4, ll. 8-9.) According to the claims, therefore, the back portion is simply the part of the shoulder guard that is not the front portion or the top portion; and given that "front", "top", and "back" are commonly understood words, it is clear merely from the claim language that the back portion is separated from the front portion by the top portion. 15 Nor does the specification ever use the word "opposite." The only description of the back portion appears in the preferred embodiment: the back portion is described as "extending from the top portion down a portion of the wearer's back such that the shoulder is covered . . . ." (Id. col. 2, ll. 42-43.)

15 In addition, as noted, the parties agree that the "front portion" of the shoulder guard is "the foremost part of the shoulder guard that extends from the shoulder portion of the main pad," and the "top portion" is "the upper part of the shoulder guard that curves over the wearer's shoulder."

Indeed, Plaintiff cites only to extrinsic evidence to support its inclusion of the term "opposite": a dictionary definition of "back" that includes "the opposite of front" as one of many definitions. WEBSTER'S ENCYCLOPEDIC UNABRIDGED DICTIONARY 150. Plaintiff thus appears to intend the use of "opposite" merely as an explanation of "back." In the court's view, however, the term "back" is sufficiently within common knowledge that it does not have to be further defined as "opposite" the front; indeed, the meaning of "opposite" likely would itself need to be construed. Moreover, the term "opposite" might in fact function as an additional limitation to the claim, if that term were construed to exclude from coverage all shoulder guards in which the back portion was not directly, and symmetrically, opposite the front portion. 16 The court assumes that Plaintiff does not seek to impose such a limitation on its own claim, and given the lack of explicit support for the term "opposite" in the claim or the specification, the court is disinclined to do so in any event.

16 Indeed, TAG asserts that the inclusion of the term "opposite" would necessarily exclude J-shaped shoulder guards. (Def.'s Sur-reply, at 8.)
Moreover, TAG's proposed limitation necessarily depends on a determination of precisely what area of the upper back is deemed the boundary of the "shoulder." The patentees' drawings of the preferred embodiment, for example, depict a shoulder guard that extends over the wearer's shoulder and then curves down only slightly. (‘226 Patent, fig. 2.) If the term "shoulder" refers to an area that extends significantly down the a wearer's back, then the "back portion" in the drawings covers only a portion of the shoulder, consistent with Plaintiff's construction. For TAG's construction to be consistent with the drawings, the area considered as the "shoulder" would have to be much smaller. TAG, however, makes no effort to establish any particular definition of "shoulder." Plaintiff does attempt to do so with a citation to a treatise of human anatomy; but as TAG points out, it is not clear that persons skilled in the relevant art are likely to consult such materials. In any event, the court need not make an explicit determination of what constitutes a "shoulder" within the meaning of the '226 claim. Plaintiff's construction, in which only a "part" or "portion" of the shoulder is covered, does not depend upon a precise determination of the boundaries of the shoulder area; only TAG's proposed construction, in which the shoulder must be entirely covered, would require such a determination, and TAG's proposed construction again reflects an improper attempt to limit a claim term to the preferred embodiment.

Plaintiff's proposed construction, moreover, is consistent with what the patentees identified in the specification as the primary problem with existing chest protectors: they did not adequately "protect the top portion of the shoulder" from stray baseballs. (‘226 Patent, col. 1, ll. 16-17.) The shoulder guards of the ‘226 chest protector, which purported to alleviate problems with existing chest protectors, do not have to cover the entire shoulder in order to address this issue. It appears undisputed that the shoulder guards' top portions protect the top area of the wearer's shoulders, thus accomplishing the invention's primary stated purpose; the extent to which the back portions protrude down the back of the shoulder appears to have little, if any, significance in light of that purpose.

The court thus construes "back portion" as "the part of the shoulder guard that extends from the top portion and covers at least a portion of the back of the shoulder."

### II. Mode

As an initial matter, the Court notes that the parties have no dispute over claim scope with regard to the term "auto-fill mode." Both parties agree that during auto-fill mode, the flapper valves are held open to allow wellbore fluid to flow toward the surface during run in. The parties also agree that, if necessary, fluid can be pumped from the surface toward the bottom of the tubular string to clear a path for the tubular string by a process called circulation. Thus, the parties' dispute is simply over the best way to explain this mode.

Weatherford argues that its construction is necessary as a matter of law. It points out that the '336 patent is a continuation-in-part of the application that became U.S. Patent No. 6,401,824 ("the '824 patent"). During prosecution of the '336 patent, the
examiner rejected claim 33 as "not patentably distinct" from claim 11 of the '824 patent. '336 patent Office Action 8/20/2008 at 8 (Doc. No. 114-6). Claim 11 is substantially similar to claim 33 of the '336 patent, merely substituting the terms "two-way mode" and "one way mode" for the terms "auto-fill mode" and "back pressure mode." In order to overcome this rejection, the patentee filed a terminal disclaimer limiting the term of the '336 patent to coincide with the term of the '824 patent. Weatherford argues that because claim 11 of the '824 patent and claim 33 of the '336 patent are tied together by a terminal disclaimer, the two claims must be construed identically.

Weatherford's argument misunderstands the purpose of a terminal disclaimer. The judicially created doctrine of obviousness-type double patenting prevents a patentee from obtaining a patent that is an obvious variation of claims in a prior patent. See re Vogel, 422 F.2d 438, 441-42, 57 C.C.P.A. 920 (C.C.P.A. 1970). The doctrine may be overcome if the applicant files a terminal disclaimer in compliance with 37 C.F.R. 1.321(b). This provision allows an applicant to "disclaim or dedicate to the public the entire term, or any terminal part of the term, of a patent to be granted." 37 C.F.R. 1.321 (b). A terminal disclaimer "ties the affected patents together; they expire on the same date and are enforceable only during periods in which they are owned by the same person." Pharmacia Corp. v. Par Pharmaceutical, Inc., 417 F.3d 1369, 1374 (Fed. Cir. 2005) (quoting DONALD S. CHISUM, CHISUM ON PATENTS, § 9.04[5] at 9-107 (2003)).

Beyond the shared expiration date, the affected patents maintain significant attributes of individuality. A terminal disclaimer is not an admission of obviousness and raises neither presumption nor estoppel as to the merits of the rejection. Quad Envtl. Tech. Corp. v. United Sanitary Dist., 946 F.2d 870, 874 (Fed. Cir. 1991). Rather, it "simply serves the statutory function of removing the rejection of double patenting." Id. Thus, the filing of a terminal disclaimer does not require a Court to construe the claims of a terminally disclaimed patent identically with the claims of the older patent. See, e.g., Arminak & Assoc., Inc. v. Saint-Gobain Calmar, Inc., 424 F. Supp. 2d 1188, 1194 n. 1 (C.D. Cal. 2006) ("[d]espite the fact that the examiner found the two designs not patentably distinct, the Court construes the [design] patents' claims separately to reflect differences in the two designs"); Travelers Exp. Co. v. Transaction Tracking Techs., Inc., No. 03-2848, 2005 U.S. Dist. LEXIS 46009, 2005 WL 59799355 at *8 (D. Minn. May 2, 2005) (reaching the same conclusion with regard to utility patents). Thus, the Court will construe the '336 patent as separate from the '824 patent.

Having rejected Weatherford's terminal disclaimer argument, the Court begins its analysis by consulting the language of the claims at issue. Claim 33 explains that during auto-fill mode the flapper elements are in an "open position to permit fluid flow . . . toward said surface position and also to permit fluid flow in a direction away from said surface position." Thus, as the parties have agreed, auto-fill mode allows for fluid flow in two directions. Nonetheless, the focus of auto-fill mode, as explained in the specification, is in allowing wellbore fluid to automatically fill up the tubular string. See '336 patent at 2:66-3:3, 8:1-3. The flow of fluid away from the surface is described as an optional feature of auto-fill mode. See '336 patent 8:17-21. While Weatherford's proposal accurately describes "auto-fill mode," it does so by reciting an additional limitation already mentioned in the claim language. Davis-Lynch's proposal better reflects the meaning of the term "auto-fill mode" as used in the specification. Thus the Court will construe the term "auto-fill mode" as "a mode of operation wherein the tubular string (as defined herein) is allowed to automatically fill by the flow of wellbore fluid toward the surface or starting position of the wellbore." 6

6 This construction is essentially the same as Davis-Lynch's construction except that the phrase "casing string" has been replaced with the phrase "tubular string" to be consistent with the actual language of the claims at issue.

A similar approach applies with regard to "back pressure mode." Claim 33 explains that during back pressure mode the flapper elements are in a "closed position responsively to fluid flow . . . [to] prevent fluid flow . . . toward said surface position and to permit fluid flow in said direction away from said surface position." Thus, back pressure mode allows for fluid flow in only one direction. Nonetheless, the purpose of back pressure mode is to prevent cement pumped down the tubular string from re-entering the tubular string and flowing back toward the surface. '336 patent at 1:64-2:2, 2:7-10. Therefore, the Court will construe "back pressure mode" as: "A mode of operation wherein fluid flow is permitted in a direction away from the starting position of the wellbore but obstructed from flowing toward the starting position of the wellbore by flapper valves." 7

- 808 -
7 Davis-Lynch offered this proposed construction as a compromise proposal after the hearing. (Doc. No. 135.) Davis-Lynch's original proposal was: "a mode of operation wherein the flapper valves are closed by and obstruct the flow of wellbore fluid toward the surface or starting position of the wellbore." At the hearing, Weatherford argued that this original proposal was inappropriate because it stated that "the flapper valves are closed by . . . the flow of wellbore fluid." Weatherford argued that the '336 patent only discloses closing the flapper valves by some sort of spring bias, not by the flow of wellbore fluid. Because the construction adopted by the Court does not state that the flapper valves are closed by fluid flow, the Court will not address Weatherford's argument.

b. The Claim Term "Back Surface"

The court agrees with Rockwood that "back surface" as it is claimed in the '363, '183, and '129 patents must include the special characteristic of spanning the full width of the block. The shape of the block in each and every embodiment presented in the Anchor patents discloses and teaches a back portion that extends toward the sides so that two adjacent blocks in a given course of blocks have abutting back surfaces. (See Figs. 1, 3, 3A, 4, 6, 6A, 7, 9, 10, & 11 of the '363 patent.) The specification further states that, "if the desired structure is to be inwardly curving, blocks of the invention . . . may be completed by striking leg 24A or 24B with a chisel adjacent deflection 19, see FIGS. 1 and 4." ( '183 patent, col. 8, Ins. 10-15.) The court fails to see how the characteristic, "spanning the full width of the block," cannot inhere in the claim term "back surface." The specification would not address the necessity of chiseling off a portion of that "back surface" if it did not inhere in the meaning of the term that the "back surface" spanned the full width. This conclusion is reinforced by the fact that each of the preferred embodiments details a "back surface" spanning the full width of the block. Accordingly, the court construes this term to include the characteristic of "spanning the full width of the block."

a. "Back Surface"

The independent claims of the '363 patent family require a masonry block comprising "a front surface, a back surface, a top surface, and bottom surface, and first and second sides." See, e.g., '183 patent, col. 16, ll. 20-23 (emphasis added). The district court construed the "back surface" limitation to require a back surface "spanning the full width of the block." Anchor, 252 F. Supp. 2d at 847. This was error.

The ordinary meaning of the claim term "back surface" is a surface at the back of the block. See Webster's Third New International Dictionary 157 (1993) (defining "back" as "the side or surface of something that is opposite to the side that is regarded as its front or face"); id. at 2300 (defining "surface" as "the exterior or outside of an object or body"). The written description does not compel a construction different from the plain meaning of "back surface." In departing from the ordinary meaning of "back surface," the district court relied on the written description, which stated "if the desired structure is to be inwardly curving, blocks of the invention . . . may be completed by striking leg 24A or 24B with a chisel adjacent deflection 19, see FIGS. 1 and 4." Anchor, 252 F. Supp. 2d at 847 (citing '183 patent, col. 8, ll. 10-15). The district court concluded that "the specification would not address the necessity of chiseling off a portion of that 'back surface' if it did not inhere in the meaning of the term that the 'back surface' spanned the full width." Id. Contrary to the district court's analysis, we do not read this excerpt to conclude that "back surface" is necessarily limited to a back surface "spanning the full width of the block." Id. For us to do so here would be to impermissibly read a limitation into the claims from the written description. Comark, 156 F.3d at 1186 ("While . . . claims are to be interpreted in light of the specification and with a view to ascertaining the invention, it does not follow that limitations from the specification may be read into the claims." (internal quotation marks and citation omitted)). Furthermore, the parties point to nothing in the prosecution history that clearly and unmistakably disclaims a back surface that does not extend the full width of the block. Accordingly, we hold that the proper
1. "[B]ack surface tool including . . . a convexly curved second surface portion circumscribing the first surface portion." Used in '706 patent, claim 1.

"[T]he surface of the tool including . . . a second surface portion defining a convex curved outer peripheral edge surface of the insert." Used in '706 patent, claim 15.

CooperVision argues that "a 'convex[ly] curved surface' is an outward facing curved surface containing a continuous curve, or a series of flats, or a combination of one or more curves and one or more flats. A 'second surface portion circumscribing the first surface portion' is the outer peripheral edge surface." CIBA advances a competing construction of "a second surface portion that circumscribes the first surface portion and the entire second surface portion is curved outward like the exterior of a sphere so as to produce a contact lens with a rounded edge."

The parties now agree that the "convex curve" of the invention may be created by a continuous curve, or a series of flats, or a combination of curves and flats. At the hearing, the parties clarified that the remaining points of dispute are whether: 1) the flats, if any, must be small; 2) the convexly curved second surface portion must extend to the end of the insert tool; and 3) the contact lens produced must have a rounded edge. These points are now considered seriatim.

a. "Flats"

The parties apparently agree that flats mean straight segments. Turning first to claims language, claim 1 of the '706 patent recites that the back surface tool disclosed includes a "convexly curved second surface portion." Similarly, claim 15 recites: "a second surface portion defining a convexly curved outer peripheral surface." Dependant claims 17 and 18 indicate that the convex curve may also be created by a series of flats approximating a convex curve or a combination of flats and convex curves.

Looking next at the specification, the patent discloses that "[t]he second surface portion may be defined by a continuous curve . . . . Alternatively, the second surface portion may be defined by a series of small flats, or a combination of small flats and curves, which approximate a convexly curved surface." '706 patent, col. 3, ll. 43-49 (emphasis added). The invention thus permits the use of small flats to make up the curved convex shaping.

CooperVision argues that the flats may be any size, including large flats or straight segments. However, when reading the claims in light of the specification, it is clear that if flats are present, then they must be either small or very short. See '706 patent, col. 7, ll. 1-4 ("very short flats would closely simulate continuously curved convex shaping"); '706 patent, col. 3, ll. 43-49.

CooperVision opposes this interpretation, arguing that the term "small" would render the claim indefinite. A patent specification must "conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P 2. The purpose of the definiteness requirement is to "ensure that the claims delineate the scope of the invention using language that adequately notifies the public of the patentee's right to exclude. Datamize, 417 F.3d 1342, 1347 (Fed. Cir. 2005). Claims are considered indefinite when they are "not amenable to construction or are insolubly ambiguous . . . . Thus, the definiteness of claim terms depends on whether those terms can be given any reasonable meaning." Id. To make a determination of indefiniteness, "general principles of claim construction apply." Id. at 1348.

The specification makes clear that the flats must be small enough to define a continuous curve with a radius of curvature of about 0.05 mm. "706 patent, col. 3, ll. 45 - 49. Because the flats may be combined with curves to create the convexly curved outer peripheral edge surface, it is not inappropriate to describe the flats as "small," as opposed to a precise numerical measurement. Akin to the term "large," a person having ordinary skill in the art would know how small the flats must be to maintain a 0.05 mm radius of curvature. See, e.g., O'Hara Mfg. Ltd. v. Eli Lilly & Co., 1986 U.S. Dist. LEXIS 22546, 1986 WL 8391 (N.D. Ill., July 21, 1986) (holding that the word "large" is not indefinite even if it does not specify an exact amount.)
CIBA does not dispute that the convexly curved surface can be formed by a series of one or more curves, by a combination of curves, by a combination of curves and flats or by a series of small flats that approximate a continuous curve. However, CIBA’s proposed construction sounds as though the second surface portion must have a single radius of curvature or be a section from a perfect circle.

b. Extent of Convexly Curved Surface

CIBA argues that the convexly curved second surface portion must extend to the end of the entire back surface tool. Figure 8 shows that the tool has an extended flat portion which does not affect the configuration of any part of the lens. When describing the convexly curved second surface portion, the claim and specification clearly refer to the part of the tool that affects the shape of the lens. See ’706, col. 3, ll. 32 - 45.

c. Rounded Edge?

CIBA’s construction includes a separate requirement that the back surface tool "produce a contact lens with a rounded edge." Formation of a "contact lens member" appears in the last phrase of claim 1. CIBA proposes to add the term to the first phrase, thus making the last phrase superfluous. "A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so." See Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005). Accordingly, there is no basis to add the phrase, "produce a contact lens . . ." to the definition of this claim term. Similarly, Claim 15 describes the surface tool but makes no reference to the shape of the contact lens. Again, there is no basis to include the phrase "...with a rounded edge" to the definition of this claim term.

d. Definition

The court defines these disputed terms as follows:

"[B]ack surface tool including a first surface portion in the general shape of a posterior face of a contact lens and a convexly curved second surface portion circumscribing the first surface portion" and "the surface of the tool including a first surface portion in the general shape of a posterior face of a contact lens and a second surface portion defining a convex curved outer peripheral edge surface of the insert" means: Back surface tool including a first surface portion in the general shape of a posterior face of a contact lens and a second surface portion defined by an the outer peripheral edge surface of the insert. The second surface portion is an outward facing curved surface created from a continuous curve, a series of small flats (i.e., straight segments) that approximate a continuous curve, or a combination of curves and small flats that approximate a continuous curve.

F. "Backing Element"

Tessera proposes that the Court construe "backing element", as in the TI Order, to mean: "An element overlying the rear surface of the chip that is thin in comparison to its length and width and generally planar or flat (but does not need to be flexible)." See TI Order at 20. Samsung argues that the term is actually a "means plus function" claim, and should be construed according to 35 U.S.C. § 112 P 6.

The Court rejects Samsung's argument that "backing element" should be treated as a "means plus function" claim. The Court construes "backing element" to mean: "A sheetlike element overlying the rear surface of the chip." The element may be, but is not necessarily, flexible. See TI Order at 20.

3. "Backing Plate" is a Structural Support for the Screening Medium that Includes a Metal Plate.

J&L suggests that the ordinary meaning of a "backing plate" is "a support for a screening element that is made from a flat
piece of metal." J&L's Mem. in Opp'n to AFT's Infringement Mot. (Dkt. No. 39) ("Opp'n to Infringement Mot.") at 11. AFT proposes that the term instead means "a structural support for the screening medium that includes a metal plate with openings." AFT Reply to J&L's Mem. in Opp'n to AFT's Infringement Mot. (Dkt. No. 44) at 8. Thus, the parties disagree as to whether a "backing plate" must originally exist as a flat piece of metal. J&L argues it must originally be a flat plate that can be rolled where a cylindrical shape is desired; AFT argues that no such limitation exists, and it can, instead, be cast originally as a cylinder. Both parties assert that their construction finds support in the claims and specification of the '940 patent and is further confirmed by extrinsic dictionary definitions.

The '940 patent does not explicitly define "backing plate." The specification employs variations of the term, including a "backing plate" or "structural backing plate," which may exist "in either flat or cylindrical configurations," see, e.g., '940 patent, Col.5, Lns. 10-12, a "generally cylindrical structural backing plate," see id., Col. 5, Lns. 45-46, and a "backing cylinder," see, e.g., Col. 6, Lns. 45, 60-61. None of the claims refer to a "backing cylinder," though they do recite a "cylindrical structural backing plate" (claim 1) and a "screen plate . . . wherein said . . . backing plate [is] cylindrical" (claim 11). The claims do not specify whether the "backing plate" must be made from a flat piece of metal. The specification describes an embodiment of the invention wherein the "backing plate . . . comprises a perforated plate having a plurality of relatively large openings . . . ." Id., Col. 2-3 Lns. 66-67, 1-2. That same embodiment may "form[] a screen cylinder" where "the screening plate is preferably formed initially in a flat configuration . . . then rolled into a cylindrical configuration . . . . [and] the backing plate is rolled into a cylindrical shape." Id., Col. 3, Lns. 12-23 (emphasis added). The specification returns to this description of "rolling" a backing plate in numerous embodiments of the invention. See, e.g., id., Col. 6, Lns. 44-45 (relating a method of manufacture that includes the "rolling of a backing plate"); id., Col. 8, Lns. 63-67 (referencing an embodiment in which "the screening and backing plates . . . lie in a flat configuration . . . . [and t]hereafter . . . are rolled into cylindrical form."). Other embodiments describing screen cylinders, however, do not describe "rolling." See, e.g., id., Col. 5, Lns. 42-57; id., Col. 6 Lns. 53-Col. 7 Ln.11. Nevertheless, referencing the definition of "plate" found in the McGraw Hill Dictionary of Scientific and Technical Terms, J&L seeks to construe "backing plate" to require that the component originally exist as a flat piece of metal, and that, whenever a cylindrical form is desired, be rolled into such form. The Court rejects this construction.

First, the claims themselves do not limit the "backing plate" to a component originally existing as a flat metal plate. Rather, they note that the backing plate may be cylindrical and nowhere state a process, for example, rolling, by which that shape is achieved. Similarly, the specification sometimes, but not always, identifies rolling as a method of achieving a cylindrically shaped backing plate. The Court finds significance in the inconsistent drafting as to the formation of a cylindrically shaped "backing plate." Here, the prosecution history provides no basis for altering the broader scope suggested by the claims and specification as to the term "backing plate." Hence, importing J&L's proposed limitation into the claims simply based upon some described embodiments would be inappropriate.

Finally, adopting the construction proposed by J&L would yield redundancies if that definition were applied to all "plates" mentioned in the patent. For example, the specification describes one variation "[w]here a flat screen plate is desired, the two flat plates are . . . " Id., Col. 3, Ln. 5. Another description notes that ",[t]he flat backing plate may then be rolled into cylindrical form." Id., Col. 11, Lns. 24-25. Were "plate" defined as a flat piece of metal, the use of the qualifying adjective "flat" in the quoted language would be duplicative, which suggests that no such limitation is intended. Similarly, where a screen cylinder is desired, the specification states, "the screening plate is preferably formed initially in a flat configuration . . . ." Id., Col. 3, Lns. 11-12 (emphasis added). If the plate is "preferably formed" in a flat configuration, it is clearly not necessarily formed in that configuration initially. In light of these considerations, the limitations J&L proposes would yield a construction contrary to that mandated by the intrinsic evidence, and, therefore, are inappropriate. See Vitronics, 90 F.3d 1576, 1583-84. The Court instead adopts AFT's proposed construction which better comports with the intrinsic evidence. Accordingly, as used in the '940 patent, "backing plate" means a structural support for the screening medium that includes a metal plate.
8. Backlight Unit

a. The Parties' Constructions

LPL construes "backlight unit" simply as an assembly that includes at least a backlight. Both Defendants base their constructions on the premise that "backlight unit" is well known in the art as being associated with an LCD. Each defendant, however, offers a different construction for that term. Tatung proposes that it means the layers of an LCD module from the first frame to the back of the LCD panel. ViewSonic submits that it means a lighting structure including specific components, i.e., a reflector, a light guide film, a diffuser or protecting film, a prism sheet and the first frame. LPL responds that the Defendants' constructions read in the preferred embodiment, particularly that of Figure 4C of the patents.

b. The Special Master's Construction

The Special Master concludes that the term "backlight unit" is well known to one skilled in the art as relating to an LCD module. For example, in the prior art reference to Yun, a "back light unit" is described as including multiple components, such as a luminescent lamp 11, a lamp housing 12, a light 13, a reflector 14, a first prism sheet 16, a second prism sheet, a diffuser 18, and a first supporting frame 19. Yun patent, 1:16-32. Consistent with Yun, the common specification of the patents-in-suit describe a backlight unit 14 as part of an LCD device and including multiple layers, such as a protecting film 14a, first and second prism sheets 14b and 14c, a light guide 14e, diffuser 14d, a reflector 14f, and a first frame 14g. '641 patent, Fig. 4C, 4:18-26. Thus, one skilled in the art reading the claims in context of the common specification would understand that a backlight unit both relates to an LCD and includes multiple layers.

Additionally, the plain language of claim 35 requires that the backlight unit includes the first frame. '641 patent, 9:65-66. At the same time, as LPL argues, under the doctrine of claim differentiation the term "backlight unit" should not include specific components (such as those recited in dependent claims 40 and 41 of the '641 patent, namely "a reflector unit," "a light source unit," "a light guide film," "a diffuser unit," or "a prism unit," see '641 patent, 10:19-26). Finally, the Special Master does not adopt LPL's construction of "backlight unit" because it does not further define the term. It is axiomatic that a "backlight unit" would include a backlight.

Accordingly, the Special Master's claim construction is as follows:

<table>
<thead>
<tr>
<th>CLAIM TERM</th>
<th>SPECIAL MASTER CONSTRUCTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>backlight unit</td>
<td>The layers of the flat-panel display device which illuminate the flat-panel (or liquid crystal) display from behind</td>
</tr>
</tbody>
</table>

Claims 1 to 6 are at issue. Claims 2 to 6 all depend from claim 1, which reads:

1. A laryngeal-mask airway device comprising:

   a backplate defining a passage;

   an inflatable cuff, the cuff defining a distal region and a central opening at least when inflated, the cuff being attached to the backplate, the cuff being insertable through a mouth of a patient to an inserted location within the patient, an airway extending from a laryngeal inlet of the patient, through the central opening, to the passage when the cuff is inflated and at the inserted location, at least a portion of the posterior portion of a wall of the cuff in the distal region being thicker and stiffer than other portions of the cuff.
'100 patent, claim 1 (emphasis added).

On appeal, LMA argues that the district court improperly read a tube joint limitation into the claims. LMA contends that the claim language requires only that the backplate "define[s] a passage" and that the "cuff be [ ] attached to the backplate." LMA asserts that because the claims do not mention an airway tube, the claims need not clarify or explain how the airway tube will attach to the backplate.

LMA argues that the specification's repetition of the term tube joint does not justify adding it to the claims. LMA states that the "Summary of the Invention" describes "a mask attached to one end of the airway tube," and LMA asserts that this statement is broad enough to include a mask that is integrally molded to an airway tube as well as devices with a tube joint. LMA Reply Br. 7.

LMA further argues that the prosecution history weighs against the addition of a tube joint limitation. LMA explains that during the final phase of prosecution, when pursuing claims directed to a mask having a reinforced cuff, it deleted the airway tube and tube joint language from the claims. LMA reiterates that the tube joint has nothing to do with the claimed invention. LMA asserts that because the terms "airway tube" and "tube joint" were deliberately deleted, it is improper to read these limitations back into the claims.

Ambu contends that backplate is a technical term coined by the inventor, Dr. Brain. Ambu does not argue that the plain and ordinary meaning of backplate includes a tube joint, but rather that Dr. Brain acted as his own lexicographer and defined backplate as a bowl containing a passage and a tube joint, fitted between the airway tube and the inflatable cuff. Ambu places great emphasis on the specification statement that: "The backplate 52 has a one-piece, integral spoon-shape including a bowl 90 and an external tube-joint 92 oriented proximally relative to the bowl, as shown in FIGS. 5 and 6." '100 patent col.6 ll.3-5. Ambu asserts that every figure, every embodiment, and every description of the backplate in the '100 patent shows that the backplate is a separate structure from the airway tube and comprises a tube joint for connection to the airway tube. Ambu concludes that because "backplate" does not have a common meaning broader than that described in the '100 patent, the patentee must have acted as his own lexicographer. Ambu further asserts that the prosecution history does not compel excluding the tube joint limitation. Ambu contends that by deleting the tube joint language, LMA removed clarifying language from the claims, but LMA did not remove any limitation.

This is a difficult case of claim construction. We have a specification replete with discussion of a tube joint, which is the point of attachment between the mask structure and the airway tube. And we are mindful that the specification is the single best guide to the meaning of a disputed term. The preferred embodiment states that the backplate has a tube joint: It is this tube joint that connects the mask structure to the airway tube. See, e.g., '100 patent figs. 2-3. Ambu is correct that the patent does not disclose an integrally molded mask/airway tube. Certainly, it would be improper to add a tube joint limitation to the claims at issue where none appears. Kara Tech. Inc. v. Stamps.com Inc., 582 F.3d 1341, 1348 (Fed. Cir. 2009) ("The patentee is entitled to the full scope of his claims, and we will not limit him to his preferred embodiment or import a limitation from the specification into the claims."). Ambu, however, does not ask this court to import the tube joint limitation into the claims generally, but rather argues that the claim limitation "backplate" should be construed to include a tube joint.

Although it is a close case, in light of the claim language, specification, and prosecution history, we conclude that the term backplate is not so limited. The claims themselves are limited to the mask structure. The claims require "a backplate defining a passage." Claim 1 further defines that "the cuff … [is] attached to the backplate." There is no mention of the airway tube or how the backplate or mask structure would attach to the airway tube. The claims cover only a laryngeal mask airway device comprising the backplate and cuff.

Although there is ample discussion of the tube joint throughout the specification, there is only one place where the specification indicates that the tube joint is part of the backplate (in the preferred embodiment's description of Figures 5 and 6): "The backplate 52 has a one-piece, integral spoon-shape including a bowl 90 and an external tube-joint 92 oriented proximally relative to the bowl, as shown in FIGS. 5 and 6." '100 patent col.6 ll.3-5. This sentence, which as its language indicates, describes what is shown in Figures 5 and 6, is not enough to require every backplate to include a tube joint. To be his own lexicographer, a patentee must use a "special definition of the term [that] is clearly stated in the patent specification or file history." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1580 (Fed. Cir. 1996); see also CCS Fitness, Inc. v.
Brunswick Corp., 288 F.3d 1359, 1366 ("[T]he claim term will not receive its ordinary meaning if the patentee acted as his own lexicographer and clearly set forth a definition of the disputed claim term in either the specification or prosecution history."). The specification does not clearly contain such a special definition. Although the preferred embodiment includes a backplate that contains a tube joint, we do not generally limit claims to the preferred embodiment. Phillips, 415 F.3d at 1323 ("[W]e have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment."). The specification here does not clearly indicate the patentee's intent to give backplate a unique meaning different from its ordinary and customary meaning to one of skill in the art. See Helmsderfer v. Bobrick Washroom Equip., Inc., 527 F.3d 1379, 1381 (Fed. Cir. 2008) ("A patentee may act as its own lexicographer and assign to a term a unique definition that is different from its ordinary and customary meaning; however, a patentee must clearly express that intent in the written description.").

The Summary of the Invention uses the term backplate to refer to the mask structure. See '100 patent col.1 l.64 (referring to "the mask structure or backplate"). It describes the mask structure as "having a generally elliptical periphery provided with an inflatable cuff which surrounds the hollow interior of the mask into which the airway tube opens . . . ." Id. col.1 ll.59-61. It further explains that the laryngeal airway mask device comprises "a flexible airway tube and a mask attached to one end of the airway tube." Id. col.1 ll.58. This indicates that the backplate will be connected or attached to the airway tube, but does not require that connection to be formed via a tube joint. We agree with LMA that this description is broad enough to include integrally molded devices as well as devices with a tube joint. The specification does not clearly convey the patentee's intent to appoint a special meaning to the term backplate. Having concluded that the patentee did not act as his own lexicographer in this case by clearly defining a claim term, we must determine the ordinary meaning of backplate as used in these claims to one of skill in the art in light of the specification and prosecution history.

The prosecution history also indicates that the backplate is not required to have a tube joint. Just prior to issuance, the applicant deleted language concerning the airway tube and the tube joint. Reply to Office Action dated Oct. 19, 2005, at 2 (Apr. 19, 2006). The claims previously required that the backplate include a tube joint in the pharyngeal side of the mask. See, e.g., U.S. Appl. No. 09/412,954, 19 (Oct. 5, 1999); Reply to Office Action of Dec. 15, 2004, 2 (Jun. 15, 2005). The applicant deleted this requirement from the claims. See Reply to Office Action dated Oct. 19, 2005, 2 (Apr. 19, 2006). Following the amendment, the Examiner allowed the claims without any objection to or rejection of the deleted airway tube or tube joint language. See Notice of Allowance (Aug. 23, 2006). 2 Ambu asserts that LMA amended its claims in an effort to cover Ambu's recently marketed AuraOnce TM mask, which has a unitary structure lacking a tube joint. Regardless of why LMA amended its claims, we agree with LMA that it would be improper to read a tube joint limitation back into the backplate. See Kister Instrumente AG v. United States, 628 F.2d 1303, 1308, 224 Ct. Cl. 370 (Ct. Cl. 1980) ("[D]efendant's insistence upon this court's reading back into the claims limitations which were originally there and were removed during prosecution of the application through the Patent Office cannot be permitted.").

- - - - - - - - - - - - Foottnotes - - - - - - - - - - - - 

2 The Notice of Allowance contains an Examiner's amendment, but this amendment has nothing to do with the deleted tube joint limitation. The amendment clarified that the thicker and stiffer cuff reinforcement be located on the "posterior" portion of the cuff, rather than on a "first" portion of the cuff. Notice of Allowance (Aug. 23, 2006).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - 

Although there was no dictionary or treatise definition introduced for backplate, 3 there are two prior art patents also related to laryngeal mask devices which use the term. U.S. Patent No. 5,355,879 ('879 patent); U.S. Patent No. 5,305,743 ('743 patent). Both prior art patents list the same inventor as the patent at issue, Dr. Brain. Both of these patents disclose a backplate, but neither includes a tube joint. This prior art use of the term would further inform one of skill in the art as to the common meaning of the term backplate.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - 

3 The failure to introduce a dictionary definition for the disputed claim term does not preclude a conclusion that there exists a plain meaning to one of skill in the art. We will not adopt a categorical rule that absence of a dictionary definition means that the applicant must be held to have acted as his own lexicographer and is therefore constrained to the preferred embodiment.
The term backplate has a somewhat self-descriptive nature. As the prior art patents indicate it is the plate on the back. In light of the claims, specification, prosecution history, and prior art patents, we conclude that one of skill in the art would understand the claimed backplate to be "the relatively rigid mask structure surrounded by the cuff." We conclude that one of skill in the art would not conclude that the backplate must have a tube joint. We also conclude that the inventor did not act as his own lexicographer here and clearly require the backplate to have a tube joint. Because the district court's judgment of noninfringement was based on an erroneous claim construction, we vacate that judgment and remand for further proceedings.

394

1. "backsheet layer"

First Quality argues that the phrase "backsheet layer" found in Claim 1 of this patent means "a layer of material which substantially blocks the passage of liquid." (doc. 168 at 25.) In contrast, KC proposes that we construe the phrase to mean "a layer of the outer cover." (doc. 150 at 45.) In arguing for its construction, First Quality relies on the specification and expert testimony. It contends that the specification shows that "backsheet" and "backsheet layer" are used interchangeably, and indicates that said lay is substantially liquid impermeable. (doc. 168 at 25-27.) First, we must determine whether the intrinsic evidence supports First Quality's argument that "backsheet" and "backsheet layer" are used interchangeably in the patent. Then, we will determine whether the evidence supports KC or First Quality's construction.

We conclude the evidence supports First Quality's contention that "backsheet" and "backsheet layer" are used interchangeably in the patent. Claim 1 states that one part of a finished article is "a backsheet layer." U.S. Patent No. 5,286,543, Claim 1. The specification further provides, referencing Figure 3A, that the "article generally includes a backsheet layer 236, and a substantially liquid permeably topsheet layer 239 which is disposed in an adjacent facing relation with the backsheet layer." Id. at col.6, ll.10-14 (emphasis added). The specification continues stating "[i]n the shown embodiment, the topsheet and backsheet are substantially coextensive and relatively larger than the absorbent pad." Id. at col.6, ll.15-17. Indeed, a "backsheet 236 typically comprises a substantially liquid impermeable polymer film, such as polyethylene film." Id. at col.6, ll.61-63 (emphasis added). In addition, the specification includes numerous other references where "backsheet 236" is in place of "backsheet layer." Based on the preceding, we are compelled to conclude that "backsheet" and "backsheet layer" are interchangeable in the Ungpiyakul patent.

[SEE FIG. 3A IN ORIGINAL]

In support of its proposed construction, First Quality relies on two embodiments described in the specification. In one embodiment, the specification, as previously cited, provides that a "backsheet layer 236 typically comprises a substantially liquid impermeable polymer film, such as polyethylene film" and that "the backsheet may comprise a non-woven material which has been imparted with a desired level of liquid impermeability." U.S. Patent No. 5,286,543 at col.6, ll. 61-63; col.6, ll. 68-col.7, ll.1-2. In another embodiment indicated in Figure 3, the specifications states that "substrate 36 is a moving layer composed of a substantially liquid impermeable backsheet material, such as polyolefin film layer." Id. at col.5, ll.59-63. In contrast, KC principally relies on what it believes is a distinction between backsheet and backsheet layer. As we have indicated, we are not persuaded by KC's argument. Instead, we agree with First Quality's contention that the proposed limitation is supported by the claim language and the specification. Nevertheless, we believe that First Quality's construction fails to closely adhere to the language of the specification, which is readily understandable. Thus, we conclude that the intrinsic evidence neither supports First Quality nor KC's construction of the disputed claim term. We believe a person of ordinary skill in the art based on the claim language and the specification would understand "backsheet layer" to mean "a layer of substantially liquid impermeable material." Therefore, we will construe "backsheet layer" to mean "a layer of substantially liquid impermeable material."
2. "Backswept Aerodynamic Blades"

The parties agree that the term "backswept blades" should be construed as blades with an end portion angled backward (i.e., opposite the direction of rotation) from the radial direction. [Doc. 52 at 2]. Where the parties differ, however, is with respect to the term "aerodynamic." BorgWarner contends that the use of the term "aerodynamic" in this context should be construed to mean that a given blade design is suitable for air boost applications. [Doc. 62 at 12-17]. While Honeywell initially proposed a definition in the Joint Claim Construction Statement defining "aerodynamic" as allowing air to flow [Doc. 52 at 3], Honeywell now contends that the term "aerodynamic" is indefinite and incapable of being defined. [Doc. 58-2 at 14-17].

Section 112 paragraph 2 of the Patent Act requires the specification of a patent to "conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. §112, P2. "Because claims delineate the patentee's right to exclude, the patent statute requires that the scope of the claims be sufficiently definite to inform the public of the bounds of the protected invention, i.e., what subject matter is covered by the exclusive rights of the patent." Halliburton Energy Services, Inc. v. M-I LLC, 514 F.3d 1244, 1249 (Fed. Cir. 2008). The Supreme Court has stated, "[t]he statutory requirement of particularity and distinctness in claims is met only when [the claims] clearly distinguish what is claimed from what went before in the art and clearly circumscribe what is foreclosed from future enterprise." United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 236, 63 S.Ct. 165, 87 L.Ed. 232, 1943 Dec. Comm'r Pat. 758 (1942).

The Federal Circuit has applied the definiteness requirement in a variety of circumstances. For example, the Federal Circuit has held claims to be indefinite: (1) where a claim recited a means-plus-function element but failed to disclose corresponding structure in the specification, Biomedino, LLC v. Waters Techs. Corp., 490 F.3d 946, 952 (Fed. Cir. 2007); (2) where a claim included a numeric limitation but did not disclose which of several methods of measurement for that number should be used, Honeywell Int'l, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332, 1340 (Fed. Cir. 2003); and (3) where a claim contained a term that is "completely dependent on a person's subjective opinion," Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1350 (Fed. Cir. 2005). Additionally, the Federal Circuit has stated that a claim term would be indefinite if it lacked a proper antecedent basis and such basis was not otherwise present by implication or the term's meaning was not readily ascertainable. See Energizer Holdings, Inc. v. Int'l Trade Comm'n, 435 F.3d 1366, 1370-71 (Fed.Cir.2006). As the Federal Circuit has noted, "[t]he common thread in all of these cases is that claims were held indefinite only where a person of ordinary skill in the art could not determine the bounds of the claims, i.e., the claims were insolubly ambiguous." Halliburton, 514 F.3d at 1249.

Of course, the requirement of definiteness "does not compel absolute clarity." Datamize, 417 F.3d at 1347. A claim is indefinite only if it is not "amenable to construction" or is "insolubly ambiguous." See Exxon Research and Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001). "If one skilled in the art would understand the bounds of the claim when read in light of the specification, then the claim satisfies section 112 paragraph 2." Id. As the Federal Circuit has noted, "a difficult issue of claim construction does not ipso facto result in a holding of indefiniteness." Datamize, 417 F.3d at 1347. "If the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree," the claim will be deemed "sufficiently clear to avoid invalidity on indefiniteness grounds." Exxon, 265 F.3d at 1375; Halliburton, 514 F.3d at 1249-50 (noting that indefiniteness standard "is met where an accused infringer shows by clear and convincing evidence that a skilled artisan could not discern the boundaries of the claim based on the claim language, the specification, and the prosecution history, as well as her knowledge of the relevant art area"). "By finding claims indefinite only if reasonable efforts at claim construction prove futile, [the court can] accord respect to the statutory presumption of patent validity, and . . . protect the inventive contribution of patentees, even when the drafting of their patents has been less than ideal." Id. (citation omitted).

The language of the claims do not offer substantial guidance in defining the term "aerodynamic." For example, Claim 1 of the '347 Patent recites "[a] titanium centrifugal compressor wheel . . . including . . . a plurality of backswept aerodynamic blades carried on the surface of said hub and defining air passages between adjacent blades." '347 Patent, Col. 10, lines 26-32. Claim 5 of the '347 Patent recites "[a] cast titanium centrifugal compressor wheel comprising . . . a plurality of backswept aerodynamic blades, each of said blades including a leading edge, an outer edge adapted for close passage to a compressor housing, and a trailing edge, . . . wherein said blades are designed such that a single solid die insert defining the
space between adjacent blades can be inserted between adjacent blades and retracted along a radial or curved path." Id. at Col. 10, lines 45-57. The '556 Patent and '949 Patent recite similar limitations with respect to the aerodynamic blades of the compressor wheel. While the claims delineate where the "backswept aerodynamic blades" are located, what physical characteristics they possess, and what purpose they serve within the invention, the claims do not offer any standard by which the aerodynamic feature of these blades can be measured or otherwise ascertained.

Turning now to the specification, under the "Summary of the Invention," the inventors note that they sought to design a titanium compressor wheel which would have "aerodynamic efficiency, when operating at the high RPM at which titanium compressor wheels are capable of operating, … comparable to the efficiency of the complex state-of-the-art compressor wheel designs...." '347 Patent, Col. 4, lines 13-17 (emphasis added). The inventors go on to state that the prior art compressor wheels were "designed for optimum aerodynamic efficiency, and thus have narrow blade spacing and complex leading and trailing edge design (excess rake, undercutting and backsweep, complex bowing and leading edge hump and dip)." Id. at Col. 4, lines 28-32. The inventors claim that despite its simplified design, the subject compressor wheel "has an entirely satisfactory aerodynamic performance" at high RPM, and that it has a degree of aerodynamic efficiency "comparable to that of a complex compressor wheel design." Id. at Col. 4, lines 43-46, 47-50. Under the "Detailed Description of the Invention," the inventors stress that "it must be understood that the shape, contours and curvature of the blades are modified to provide a design which . . . provides aerodynamically acceptable characteristics at high RPM . . . ." Id. at Col. 6, lines 48-52.

As the specification makes clear, the purpose of the present inventions was to develop a high-strength, heat-resistant compressor wheel to achieve high RPM and high pressure ratios in turbocharging applications. '347 Patent at Col. 4, lines 8-22. The inventors specifically did not seek to improve the aerodynamic efficiency of the compressor wheel with their design; rather, the inventors intended to provide a stronger, heat-resistant titanium compressor that was comparable to the prior art in terms of aerodynamic efficiency. The experts presented by BorgWarner in this case agree that one of ordinary skill in the art "would have a bachelors degree in Mechanical Engineering, or related fields, with a minimum of 5 years of experience designing compressor wheels and an awareness of the processes by which compressor wheels are manufactured." [Declaration of Dr. Nicholas C. Baines ("Baines Decl."), Doc. 53 at P37; Thorne Decl., Doc. 55 at P27]. Honeywell has not offered any competing evidence of what would constitute ordinary skill in the art. Considering this level of skill, it is difficult to conceive that a mechanical engineer with five years or more of experience designing compressor wheels would be incapable of determining whether a particular compressor wheel was comparably aerodynamic to that of the prior art. Because "one skilled in the art would understand the bounds of the claim when read in light of the specification," Exxon, 265 F.3d at 1375, the Court concludes that the term "aerodynamic" is not indefinite.

Having determined that the term "aerodynamic" is not indefinite, the Court will now endeavor to construe the term. "Aerodynamic" is commonly defined as "designed to reduce or minimize the drag caused by air as an object moves though [sic] it or by wind that strikes and flows around an object." http://dictionary.reference.com/browse/aerodynamic (last visited February 20, 2009) (quoting American Heritage Science Dictionary (2002)). BorgWarner argues for a narrower definition, arguing that the term "aerodynamic" is used in the Patents-in-Suit to describe blades that are "shaped for use in air boost applications." [Doc. 66 at 10]. For the reasons previously stated in this opinion, the compressor wheels which are the subject of the patents-in-suit are not limited to use in air boost devices, and thus it would be inappropriate to limit the term "aerodynamic" to describing compressor wheel blades for use in air boost applications. Accordingly, the Court construes the term "backswept aerodynamic blades" to mean blades that have an end portion angled backward (i.e., opposite the direction of rotation) from the radial direction and which are designed to reduce or minimize the drag caused by air that strikes and flows around the blades.

2. "The rear end of the keyboard being disposed below the front end of the keyboard"

Claim 1 of the '489 patent also includes language defining the "backward tilted position" in which a keyboard may be oriented as "the rear end of the keyboard being disposed below the front end of the keyboard." The parties disagree as to whether "below" should be construed as referring to a measurement of (a) the bottom surface of the keyboard or (b) the key plane, the plane defined by the upper most portion of the keyboard keys. Plaintiffs' proposed construction:
The keyboard is oriented so that the tilt is sufficient to provide some negative tilt of the key plane in order to achieve the benefits of the invention.

Defendants' proposed construction:

The support device permits the bottom of a keyboard to be tilted backward (i.e., at any angle of less than 0 degrees).

Plaintiffs rightly argue that their construction finds support in the specification, where "backward tilt" is illustrated with reference to the top surface or key plane. Moreover, it is indisputable that the very purpose for the device, to provide ergonomic advantage to keyboard operators, is dependant on the negative or backward tilting of the key plane. It follows, plaintiffs argue, that "backward tilted position" should be construed with reference to the key plane.

Plaintiffs' arguments are not without appeal, but they are ultimately unpersuasive. The purpose of a patent is to define and give public notice of the patent holder's exclusive rights in the claimed invention so as to exclude other inventors and competitors from making, using or selling the invention. King Instruments Corp. v. Perego, 65 F.3d 941, 947 (Fed. Cir. 1995). A patent claim is invalid for indefiniteness if, when read in light of the specification, it does not reasonably apprise those skilled in the art of the scope of the invention. Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1342 (Fed. Cir. 2003). This definiteness requirement assures that patent claims are sufficiently precise to permit a potential competitor to determine whether or not it is infringing. Id. A claim is fatally indefinite if it is "insolubly ambiguous, and no narrowing construction can properly be adopted." Id. (quoting Exxon Research & Engineering Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001)).

Defendants observe that "keyboard" is not a part of the claimed invention and is not defined in the '489 patent. Rather, the patent describes a keyboard positioning system. Because keyboards have varying designs with different key plane configurations, defendants contend that construing "backward tilted position" in terms of the key plane results in a definition that fails to reasonably apprise potential competitors, i.e., designers, manufacturers and sellers of keyboard positioning systems, as to whether their products would be infringing.

In response to this argument, plaintiffs have, at the September 2, 2003 hearing, proposed an amended construction. Plaintiffs would have the Court read just four additional words into the claim language: "all of the rear end of the keyboard being disposed below all of the front end of the keyboard." This proposed construction is arguably superior, but remains contingent on keyboard design variables that undermine potential competitors' ability to determine whether their products would be infringing.

Defendants' proposed definition, on the other hand, is linked to the bottom surface or plane (as defined by the four feet or resting contact points on the bottom surface) of the keyboard, which is universally flat because it is designed to rest potentially on a flat support tray or support surface. If the subject claim language is construed as referring to the orientation of the bottom of the rear end of the keyboard in relation to the bottom of the front end of the keyboard, defendants contend, it reasonably apprises those skilled in the art of the scope of the patented invention. This construction is supported by Richard Benoit's second declaration:

In the furniture industry, backward tilt has always been measured by the tilt of the support surface of the keyboard, i.e., the tilt of the bottom of the keyboard. The reason is very practical. The furniture manufacturers design and market keyboard supports, not keyboards, and cannot control the tilt of the keyboard key plane.

Benoit Second Declaration, P 4. This construction is not inconsistent with the claim language and specification or the prosecution history. It represents a sensible, clarifying construction. The Court will therefore adopt defendants' proposed construction:

"Backward titled position," "defined by the rear end of the keyboard being disposed below the front of the keyboard" is construed to mean that the support device permits the bottom of a keyboard to be tilted backward (i.e., at any angle of less than 0 degrees).
Claim 1 of the '798 patent is representative of the asserted claims with respect to the use of the term "baffles." It recites:

Building modules adapted to fit together for construction of fire, sound and impact resistant security barriers and rooms for use in securing records and persons, comprising in combination, an outer shell . . . , sealant means . . . and further means disposed inside the shell for increasing its load bearing capacity comprising internal steel baffles extending inwardly from the steel shell walls.

As a preliminary matter, we agree with the panel that the term "baffles" is not means-plus-function language that invokes 35 U.S.C. § 112, paragraph 6. To be sure, the claim refers to "means disposed inside the shell for increasing its load bearing capacity," a formulation that would ordinarily be regarded as invoking the means-plus-function claim format. However, the claim specifically identifies "internal steel baffles" as structure that performs the recited function of increasing the shell's load-bearing capacity. In contrast to the "load bearing means" limitation, the reference to "baffles" does not use the word "means," and we have held that the absence of that term creates a rebuttable presumption that section 112, paragraph 6, does not apply. See Personalized Media Communns., LLC v. ITC, 161 F.3d 696, 703-04 (Fed. Cir. 1998).

Means-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function. See Watts v. XL Sys., Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000). While the baffles in the '798 patent are clearly intended to perform several functions, the term "baffles" is nonetheless structural; it is not a purely functional placeholder in which structure is filled in by the specification. See TurboCare Div. of Demag Delaval Turbomachinery Corp. v. GE, 264 F.3d 1111, 1121 (Fed. Cir. 2001) (reasoning that nothing in the specification or prosecution history suggests that the patentee used the term "compressed spring" to denote any structure that is capable of performing the specified function); Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) (construing the term "detent mechanism" to refer to particular structure, even though the term has functional connotations). The claims and the specification unmistakably establish that the "steel baffles" refer to particular physical apparatus. The claim characterizes the baffles as "extending inwardly" from the steel shell walls, which plainly implies that the baffles are structures. The specification likewise makes clear that the term "steel baffles" refers to particular internal wall structures and is not simply a general description of any structure that will perform a particular function. See, e.g., '798 patent, col. 4, ll. 25-26 ("the load bearing baffles 16 are optionally used with longer panels"); d., col. 4, ll. 49-50 (opposing panels are "compressed between the flange 35 and the baffle 26"). Because the term "baffles" is not subject to section 112, paragraph 6, we agree with the panel that the district court erred by limiting the term to corresponding structures disclosed in the specification and their equivalents. Accordingly, we must determine the correct construction of the structural term "baffles," as used in the '798 patent.

II

The first paragraph of section 112 of the Patent Act, 35 U.S.C. § 112, states that the specification

shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains . . . to make and use the same . . .

The second paragraph of section 112 provides that the specification

shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Those two paragraphs of section 112 frame the issue of claim interpretation for us. The second paragraph requires us to look to the language of the claims to determine what "the applicant regards as his invention." On the other hand, the first paragraph requires that the specification describe the invention set forth in the claims. The principal question that this case presents to us is the extent to which we should resort to and rely on a patent's specification in seeking to ascertain the proper
scope of its claims.

This is hardly a new question. The role of the specification in claim construction has been an issue in patent law decisions in this country for nearly two centuries. We addressed the relationship between the specification and the claims at some length in our en banc opinion in Markman v. Westview Instruments, Inc., 52 F.3d 967, 979-81 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). We again summarized the applicable principles in Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 (Fed. Cir. 1996), and more recently in Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111 (Fed. Cir. 2004). What we said in those cases bears restating, for the basic principles of claim construction outlined there are still applicable, and we reaffirm them today. We have also previously considered the use of dictionaries in claim construction. What we have said in that regard requires clarification.

A

It is a "bedrock principle" of patent law that "the claims of a patent define the invention to which the patentee is entitled the right to exclude." Innova, 381 F.3d at 1115; see also Vitronics, 90 F.3d at 1582 ("we look to the words of the claims themselves . . . to define the scope of the patented invention"); Markman, 52 F.3d at 980 ("The written description part of the specification itself does not delimit the right to exclude. That is the function and purpose of claims."). That principle has been recognized since at least 1836, when Congress first required that the specification include a portion in which the inventor "shall particularly specify and point out the part, improvement, or combination, which he claims as his own invention or discovery." Act of July 4, 1836, ch. 357, § 6, 5 Stat. 117, 119. In the following years, the Supreme Court made clear that the claims are "of primary importance, in the effort to ascertain precisely what it is that is patented." Merrill v. Yeomans, 94 U.S. 568, 570, 24 L. Ed. 235, 1877 Dec. Comm'r Pat. 279 (1876). Because the patentee is required to "define precisely what his invention is," the Court explained, it is "unjust to the public, as well as an evasion of the law, to construe it in a manner different from the plain import of its terms." White v. Dunbar, 119 U.S. 47, 52, 30 L. Ed. 303, 7 S. Ct. 72, 1886 Dec. Comm'r Pat. 494 (1886); see also Cont'l Paper Bag Co. v. E. Paper Bag Co., 210 U.S. 405, 419, 52 L. Ed. 1122, 28 S. Ct. 748, 1908 Dec. Comm'r Pat. 594 (1908) ("the claims measure the invention"); McCarty v. Lehigh Valley R.R. Co., 160 U.S. 110, 116, 40 L. Ed. 358, 16 S. Ct. 240, 1895 Dec. Comm'r Pat. 721 (1895) ("if we once begin to include elements not mentioned in the claim, in order to limit such claim . . . , we should never know where to stop"); Aro Mfg. Co. v. Convertible Top Replacement Co., 365 U.S. 336, 339, 5 L. Ed. 2d 592, 81 S. Ct. 599, 1961 Dec. Comm'r Pat. 635 (1961) ("the claims made in the patent are the sole measure of the grant").

We have frequently stated that the words of a claim "are generally given their ordinary and customary meaning." Vitronics, 90 F.3d at 1582; see also Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1299 (Fed. Cir. 1999); Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998). We have made clear, moreover, that the ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention, i.e., as of the effective filing date of the patent application. See Innova, 381 F.3d at 1116 ("A court construing a patent claim seeks to accord a claim the meaning it would have to a person of ordinary skill in the art at the time of the invention."); Home Diagnostics, Inc. v. LifeScan, Inc., 381 F.3d 1352, 1358 (Fed. Cir. 2004) ("customary meaning" refers to the "customary meaning in [the] art field"); Ferguson Beaveregard/Logic Controls v. Mega Sys., LLC, 350 F.3d 1327, 1338 (Fed. Cir. 2003) (claim terms "are examined through the viewing glass of a person skilled in the art"); see also PC Connector Solutions LLC v. SmartDisk Corp., 406 F.3d 1359, 1363 (Fed. Cir. 2005) (meaning of claim "must be interpreted as of [the] effective filing date" of the patent application); Schering Corp. v. Amgen Inc., 222 F.3d 1347, 1353 (Fed. Cir. 2000) (same).

The inquiry into how a person of ordinary skill in the art understands a claim term provides an objective baseline from which to begin claim interpretation. See Innova, 381 F.3d at 1116. That starting point is based on the well-settled understanding that inventors are typically persons skilled in the field of the invention and that patents are addressed to and intended to be read by others of skill in the pertinent art. See Verve, LLC v. Crane Cams, Inc., 311 F.3d 1116, 1119 (Fed. Cir. 2002) (patent documents are meant to be "a concise statement for persons in the field"); In re Nelson, 47 C.C.P.A. 1031, 280 F.2d 172, 181, 1960 Dec. Comm'r Pat. 369 (CCPA 1960) ("The descriptions in patents are not addressed to the public generally, to lawyers or to judges, but, as section 112 says, to those skilled in the art to which the invention pertains or with which it is most nearly connected.").

Importantly, the person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification. This court
explained that point well in Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477 (Fed. Cir. 1998):

It is the person of ordinary skill in the field of the invention through whose eyes the claims are construed. Such person is deemed to read the words used in the patent documents with an understanding of their meaning in the field, and to have knowledge of any special meaning and usage in the field. The inventor's words that are used to describe the invention--the inventor's lexicography--must be understood and interpreted by the court as they would be understood and interpreted by a person in that field of technology. Thus the court starts the decisionmaking process by reviewing the same resources as would that person, viz., the patent specification and the prosecution history.

See also Medrad, Inc. v. MRI Devices Corp., 401 F.3d 1313, 1319 (Fed. Cir. 2005) ("We cannot look at the ordinary meaning of the term . . . in a vacuum. Rather, we must look at the ordinary meaning in the context of the written description and the prosecution history."); V-Formation, Inc. v. Benetton Group SpA, 401 F.3d 1307, 1310 (Fed. Cir. 2005) (intrinsic record "usually provides the technological and temporal context to enable the court to ascertain the meaning of the claim to one of ordinary skill in the art at the time of the invention"); Unitherm Food Sys., Inc. v. Swift-Eckrich, Inc., 375 F.3d 1341, 1351 (Fed. Cir. 2004) (proper definition is the "definition that one of ordinary skill in the art could ascertain from the intrinsic evidence in the record").

B

In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words. See Brown v. 3M, 265 F.3d 1349, 1352 (Fed. Cir. 2001) (holding that the claims did "not require elaborate interpretation"). In such circumstances, general purpose dictionaries may be helpful. In many cases that give rise to litigation, however, determining the ordinary and customary meaning of the claim requires examination of terms that have a particular meaning in a field of art. Because the meaning of a claim term as understood by persons of skill in the art is often not immediately apparent, and because patentees frequently use terms idiosyncratically, the court looks to "those sources available to the public that show what a person of skill in the art would have understood disputed claim language to mean." Innova, 381 F.3d at 1116. Those sources include "the words of the claims themselves, the remainder of the specification, the prosecution history, and extrinsic evidence concerning relevant scientific principles, the meaning of technical terms, and the state of the art." Id.; see also Gemstar-TV Guide Int'l, Inc. v. ITC, 383 F.3d 1352, 1364 (Fed. Cir. 2004); Vitronics, 90 F.3d at 1582-83; Markman, 52 F.3d at 979-80.

1

Quite apart from the written description and the prosecution history, the claims themselves provide substantial guidance as to the meaning of particular claim terms. See Vitronics, 90 F.3d at 1582; see also ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082, 1088 (Fed. Cir. 2003) ("the context of the surrounding words of the claim also must be considered in determining the ordinary and customary meaning of those terms").

To begin with, the context in which a term is used in the asserted claim can be highly instructive. To take a simple example, the claim in this case refers to "steel baffles," which strongly implies that the term "baffles" does not inherently mean objects made of steel. This court's cases provide numerous similar examples in which the use of a term within the claim provides a firm basis for construing the term. See, e.g., Mars, Inc. v. H.J. Heinz Co., 377 F.3d 1369, 1374 (Fed. Cir. 2004) (claim term "ingredients" construed in light of the use of the term "mixture" in the same claim phrase); Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1356 (Fed. Cir. 1999) (claim term "discharge rate" construed in light of the use of the same term in another limitation of the same claim).

Other claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment as to the meaning of a claim term. Vitronics, 90 F.3d at 1582. Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001); CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1159 (Fed. Cir. 1997). Differences among claims can also be a useful guide in understanding the meaning of particular claim terms. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991). For example, the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004).
The claims, of course, do not stand alone. Rather, they are part of "a fully integrated written instrument," Markman, 52 F.3d at 978, consisting principally of a specification that concludes with the claims. For that reason, claims "must be read in view of the specification, of which they are a part." Id. at 979. As we stated in Vitronics, the specification "is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." 90 F.3d at 1582.

This court and its predecessors have long emphasized the importance of the specification in claim construction. In Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 397-98 (Ct. Cl. 1967), the Court of Claims characterized the specification as "a concordance for the claims," based on the statutory requirement that the specification "describe the manner and process of making and using" the patented invention. The Court of Customs and Patent Appeals made a similar point. See In re Fout, 675 F.2d 297, 300 (CCPA 1982) ("Claims must always be read in light of the specification. Here, the specification makes plain what the appellants did and did not invent . . . .").

Shortly after the creation of this court, Judge Rich wrote that "the descriptive part of the specification aids in ascertaining the scope and meaning of the claims inasmuch as the words of the claims must be based on the description. The specification is, thus, the primary basis for construing the claims." Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985). On numerous occasions since then, we have reaffirmed that point, stating that "the best source for understanding a technical term is the specification from which it arose, informed, as needed, by the prosecution history." Multiform Dessicants, 133 F.3d at 1478; Metabolite Labs., Inc. v. Lab. Corp. of Am. Holdings, 370 F.3d 1354, 1360 (Fed. Cir. 2004) ("In most cases, the best source for discerning the proper context of claim terms is the patent specification wherein the patent applicant describes the invention."); see also, e.g., Kinik Co. v. ITC, 362 F.3d 1359, 1365 (Fed. Cir. 2004) ("The words of patent claims have the meaning and scope with which they are used in the specification and the prosecution history."); Moba, B.V. v. Diamond Automation, Inc., 325 F.3d 1306, 1315 (Fed. Cir. 2003) ("The best indicator of claim meaning is its usage in context as understood by one of skill in the art at the time of invention.").

That principle has a long pedigree in Supreme Court decisions as well. See Hogg v. Emerson, 47 U.S. (6 How.) 437, 482, 12 L. Ed. 505 (1848) (the specification is a "component part of the patent" and "is as much to be considered with the [letters patent] in construing them, as any paper referred to in a deed or other contract"); Bates v. Coe, 98 U.S. 31, 38, 25 L. Ed. 68, 1879 Dec. Comm't Pat. 365 (1878) ("in case of doubt or ambiguity it is proper in all cases to refer back to the descriptive portions of the specification to aid in solving the doubt or in ascertaining the true intent and meaning of the language employed in the claims"); White v. Dunbar, 119 U.S. 47, 51, 30 L. Ed. 303, 7 S. Ct. 72, 1886 Dec. Comm't Pat. 494 (1886) (specification is appropriately resorted to "for the purpose of better understanding the meaning of the claim"); Schriber-Schroth Co. v. Cleveland Trust Co., 311 U.S. 211, 217, 85 L. Ed. 132, 61 S. Ct. 235, 1941 Dec. Comm't Pat. 802 (1940) ("The claims of a patent are always to be read or interpreted in light of its specifications."); United States v. Adams, 383 U.S. 39, 49, 15 L. Ed. 2d 572, 86 S. Ct. 708, 174 Ct. Cl. 1293 (1966) ("It is fundamental that claims are to be construed in the light of the specifications and both are to be read with a view to ascertaining the invention.").

The importance of the specification in claim construction derives from its statutory role. The close kinship between the written description and the claims is enforced by the statutory requirement that the specification describe the claimed invention in "full, clear, concise, and exact terms." 35 U.S.C. § 112, para. 1; see Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001) ("The claims are directed to the invention that is described in the specification; they do not have meaning removed from the context from which they arose."); see also Markman v. Westview Instruments, Inc., 517 U.S. 370, 389, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996) ("[A claim] term can be defined only in a way that comports with the instrument as a whole."). In light of the statutory directive that the inventor provide a "full" and "exact" description of the claimed invention, the specification necessarily informs the proper construction of the claims. See Merck & Co. v. Teva Pharms. USA, Inc., 347 F.3d 1367, 1371 (Fed. Cir. 2003) ("A fundamental rule of claim construction is that terms in a patent document are construed with the meaning with which they are presented in the patent document. Thus claims must be construed so as to be consistent with the specification, of which they are a part.") (citations omitted). In Renishaw, this court summarized that point succinctly:

Ultimately, the interpretation to be given a term can only be determined and confirmed with a full understanding of what the inventors actually invented and intended to envelop with the claim. The construction that stays true to the claim
language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction. 158 F.3d at 1250 (citations omitted).

Consistent with that general principle, our cases recognize that the specification may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess. In such cases, the inventor's lexicography governs. See CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). In other cases, the specification may reveal an intentional disclaimer, or disavowal, of claim scope by the inventor. In that instance as well, the inventor has dictated the correct claim scope, and the inventor's intention, as expressed in the specification, is regarded as dispositive. See SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343-44 (Fed. Cir. 2001).

The pertinence of the specification to claim construction is reinforced by the manner in which a patent is issued. The Patent and Trademark Office ("PTO") determines the scope of claims in patent applications not solely on the basis of the claim language, but upon giving claims their broadest reasonable construction "in light of the specification as it would be interpreted by one of ordinary skill in the art." In re Am. Acad. of Sci. Tech. Ctr., 367 F.3d 1359, 1364 (Fed. Cir. 2004). Indeed, the rules of the PTO require that application claims must "conform to the invention as set forth in the remainder of the specification and the terms and phrases used in the claims must find clear support or antecedent basis in the description so that the meaning of the terms in the claims may be ascertainable by reference to the description." 37 C.F.R. § 1.75(d)(1). It is therefore entirely appropriate for a court, when conducting claim construction, to rely heavily on the written description for guidance as to the meaning of the claims.

In addition to consulting the specification, we have held that a court "should also consider the patent's prosecution history, if it is in evidence." Markman, 52 F.3d at 980; see also Graham v. John Deere Co., 383 U.S. 1, 33, 15 L. Ed. 2d 545, 86 S. Ct. 684 (1966) ("An invention is construed not only in the light of the claims, but also with reference to the file wrapper or prosecution history in the Patent Office."). The prosecution history, which we have designated as part of the "intrinsic evidence," consists of the complete record of the proceedings before the PTO and includes the prior art cited during the examination of the patent. Autogiro, 384 F.2d at 399. Like the specification, the prosecution history provides evidence of how the PTO and the inventor understood the patent. See Lemelson v. Gen. Mills, Inc., 968 F.2d 1202, 1206 (Fed. Cir. 1992). Furthermore, like the specification, the prosecution history was created by the patentee in attempting to explain and obtain the patent. Yet because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes. See Inverness Med. Svitz. GmbH v. Warner Lambert Co., 309 F.3d 1373, 1380-82 (Fed. Cir. 2002) (the ambiguity of the prosecution history made it less relevant to claim construction); Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1580 (Fed. Cir. 1996) (the ambiguity of the prosecution history made it "unhelpful as an interpretive resource" for claim construction). Nonetheless, the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be. Vitronics, 90 F.3d at 1582-83; see also Chimie v. PPG Indus., Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005) ("The purpose of consulting the prosecution history in construing a claim is to 'exclude any interpretation that was disclaimed during prosecution.'"), quoting ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988); Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995).

Although we have emphasized the importance of intrinsic evidence in claim construction, we have also authorized district courts to rely on extrinsic evidence, which "consists of all evidence external to the patent and prosecution history, including expert and inventor testimony, dictionaries, and learned treatises." Markman, 52 F.3d at 980, citing Seymour v. Osborne, 78 U.S. (11 Wall.) 516, 546, 20 L. Ed. 33 (1870); see also Vitronics, 90 F.3d at 1583. However, while extrinsic evidence "can shed useful light on the relevant art," we have explained that it is "less significant than the intrinsic record in determining 'the legally operative meaning of claim language.'" C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 862 (Fed. Cir. 2004), quoting Vanderlande Indus. Nederland BV v. Int'l Trade Comm'n, 366 F.3d 1311, 1318 (Fed. Cir. 2004); see also Astrazeneca AB v. Mutual Pharm. Co., 384 F.3d 1333, 1337 (Fed. Cir. 2004).
Within the class of extrinsic evidence, the court has observed that dictionaries and treatises can be useful in claim construction. See Renishaw, 158 F.3d at 1250; Rexnord, 274 F.3d at 1344. We have especially noted the help that technical dictionaries may provide to a court "to better understand the underlying technology" and the way in which one of skill in the art might use the claim terms. Vitronics, 90 F.3d at 1584 n.6. Because dictionaries, and especially technical dictionaries, endeavor to collect the accepted meanings of terms used in various fields of science and technology, those resources have been properly recognized as among the many tools that can assist the court in determining the meaning of particular terminology to those of skill in the art of the invention. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002). Such evidence, we have held, may be considered if the court deems it helpful in determining "the true meaning of language used in the patent claims." Markman, 52 F.3d at 980.

We have also held that extrinsic evidence in the form of expert testimony can be useful to a court for a variety of purposes, such as to provide background on the technology at issue, to explain how an invention works, to ensure that the court's understanding of the technical aspects of the patent is consistent with that of a person of skill in the art, or to establish that a particular term in the patent or the prior art has a particular meaning in the pertinent field. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1308-09 (Fed. Cir. 1999); Key Pharms. v. Hercon Lab. Corp., 161 F.3d 709, 716 (Fed. Cir. 1998). However, conclusory, unsupported assertions by experts as to the definition of a claim term are not useful to a court. Similarly, a court should discount any expert testimony "that is clearly at odds with the claim construction mandated by the claims themselves, the written description, and the prosecution history, in other words, with the written record of the patent." Key Pharms., 161 F.3d at 716.

We have viewed extrinsic evidence in general as less reliable than the patent and its prosecution history in determining how to read claim terms, for several reasons. First, extrinsic evidence by definition is not part of the patent and does not have the specification's virtue of being created at the time of patent prosecution for the purpose of explaining the patent's scope and meaning. Second, while claims are construed as they would be understood by a hypothetical person of skill in the art, extrinsic publications may not be written by or for skilled artisans and therefore may not reflect the understanding of a skilled artisan in the field of the patent. Third, extrinsic evidence consisting of expert reports and testimony is generated at the time of and for the purpose of litigation and thus can suffer from bias that is not present in intrinsic evidence. The effect of that bias can be exacerbated if the expert is not one of skill in the relevant art or if the expert's opinion is offered in a form that is not subject to cross-examination. See Senmed, Inc. v. Richard-Allan Med. Indus., Inc., 888 F.2d 815, 819 n.8 (Fed. Cir. 1989). Fourth, there is a virtually unbounded universe of potential extrinsic evidence of some marginal relevance that could be brought to bear on any claim construction question. In the course of litigation, each party will naturally choose the pieces of extrinsic evidence most favorable to its cause, leaving the court with the considerable task of filtering the useful extrinsic evidence from the fluff. See Daubert v. Merrell Dow Pharm., Inc., 509 U.S. 579, 595, 125 L. Ed. 2d 469, 113 S. Ct. 2786 (1993) ("Expert evidence can be both powerful and quite misleading because of the difficulty in evaluating it."). Finally, undue reliance on extrinsic evidence poses the risk that it will be used to change the meaning of claims in derogation of the "indisputable public records consisting of the claims, the specification and the prosecution history," thereby undermining the public notice function of patents. Southwall Techs., 54 F.3d at 1578.

In sum, extrinsic evidence may be useful to the court, but it is unlikely to result in a reliable interpretation of patent claim scope unless considered in the context of the intrinsic evidence. Nonetheless, because extrinsic evidence can help educate the court regarding the field of the invention and can help the court determine what a person of ordinary skill in the art would understand claim terms to mean, it is permissible for the district court in its sound discretion to admit and use such evidence. In exercising that discretion, and in weighing all the evidence bearing on claim construction, the court should keep in mind the flaws inherent in each type of evidence and assess that evidence accordingly.

III

Although the principles outlined above have been articulated on numerous occasions, some of this court's cases have suggested a somewhat different approach to claim construction, in which the court has given greater emphasis to dictionary definitions of claim terms and has assigned a less prominent role to the specification and the prosecution history. The leading case in this line is Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002).

A

In Texas Digital, the court noted that "dictionaries, encyclopedias and treatises are particularly useful resources to assist the
court in determining the ordinary and customary meanings of claim terms." 308 F.3d at 1202. Those texts, the court explained, are "objective resources that serve as reliable sources of information on the established meanings that would have been attributed to the terms of the claims by those of skill in the art," and they "deserve no less fealty in the context of claim construction" than in any other area of law. Id. at 1203. The court added that because words often have multiple dictionary meanings, the intrinsic record must be consulted to determine which of the different possible dictionary meanings is most consistent with the use of the term in question by the inventor. If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the court stated, "the claim terms may be construed to encompass all such consistent meanings." Id.

The Texas Digital court further explained that the patent's specification and prosecution history must be consulted to determine if the patentee has used "the words [of the claim] in a manner clearly inconsistent with the ordinary meaning reflected, for example, in a dictionary definition." 308 F.3d at 1204. The court identified two circumstances in which such an inconsistency may be found. First, the court stated, "the presumption in favor of a dictionary definition will be overcome where the patentee, acting as his or her own lexicographer, has clearly set forth an explicit definition of the term different from its ordinary meaning." Id. Second, "the presumption also will be rebutted if the inventor has disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Id.

The Texas Digital court explained that it advanced the methodology set forth in that opinion in an effort to combat what this court has termed "one of the cardinal sins of patent law--reading a limitation from the written description into the claims," SciMed Life Sys., 242 F.3d at 1340. The court concluded that it is improper to consult "the written description and prosecution history as a threshold step in the claim construction process, before any effort is made to discern the ordinary and customary meanings attributed to the words themselves." Texas Digital, 308 F.3d at 1204. To do so, the court reasoned, "invites a violation of our precedent counseling against importing limitations into the claims." Id. Summarizing its analysis, the Texas Digital court stated:

By examining relevant dictionaries, encyclopedias, and treatises to ascertain possible meanings that would have been attributed to the words of the claims by those skilled in the art, and by further utilizing the intrinsic record to select from those possible meanings the one or ones most consistent with the use of the words by the inventor, the full breadth of the limitations intended by the inventor will be more accurately determined and the improper importation of unintended limitations from the written description into the claims will be more easily avoided.

Id. at 1205.

B

Although the concern expressed by the court in Texas Digital was valid, the methodology it adopted placed too much reliance on extrinsic sources such as dictionaries, treatises, and encyclopedias and too little on intrinsic sources, in particular the specification and prosecution history. While the court noted that the specification must be consulted in every case, it suggested a methodology for claim interpretation in which the specification should be consulted only after a determination is made, whether based on a dictionary, treatise, or other source, as to the ordinary meaning or meanings of the claim term in dispute. Even then, recourse to the specification is limited to determining whether the specification excludes one of the meanings derived from the dictionary, whether the presumption in favor of the dictionary definition of the claim term has been overcome by "an explicit definition of the term different from its ordinary meaning," or whether the invent or "has disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." 308 F.3d at 1204. In effect, the Texas Digital approach limits the role of the specification in claim construction to serving as a check on the dictionary meaning of a claim term if the specification requires the court to conclude that fewer than all the dictionary definitions apply, or if the specification contains a sufficiently specific alternative definition or disavowal. See, e.g., Texas Digital, 308 F.3d at 1202 ("unless compelled otherwise, a court will give a claim term the full range of its ordinary meaning"); Nystrom v. TREX Co., 374 F.3d 1105, 1111-13 (Fed. Cir. 2004) (ascertaining the "full range" of the ordinary meaning of the term "board" through a collection of dictionary definitions, and stating that those candidate definitions should be removed from consideration only if they were "disclaimed" in the written description or prosecution history); Inverness Med. Switz., 309 F.3d at 1379 (claim should be construed to encompass multiple dictionary meanings unless "the specification or prosecution history clearly demonstrates that only one of the multiple meanings was intended"). That approach, in our view, improperly restricts the role of the specification in claim

- 826 -
Assigning such a limited role to the specification, and in particular requiring that any definition of claim language in the specification be express, is inconsistent with our rulings that the specification is "the single best guide to the meaning of a disputed term," and that the specification "acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Vitronics, 90 F.3d at 1582; Irdesto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004) ("Even when guidance is not provided in explicit definitional format, the specification may define claim terms by implication such that the meaning may be found in or ascertained by a reading of the patent documents.") (citations omitted); Novartis Pharm. Corp. v. Abbott Labs., 375 F.3d 1328, 1334-35 (Fed. Cir. 2004) (same); Bell Atl. Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001) ("[A] claim term may be clearly redefined without an explicit statement of redefinition.").

The main problem with elevating the dictionary to such prominence is that it focuses the inquiry on the abstract meaning of words rather than on the meaning of claim terms within the context of the patent. Properly viewed, the "ordinary meaning" of a claim term is its meaning to the ordinary artisan after reading the entire patent. Yet heavy reliance on the dictionary divorced from the intrinsic evidence risks transforming the meaning of the claim term to the artisan into the meaning of the term in the abstract, out of its particular context, which is the specification. The patent system is based on the proposition that claims cover only the invented subject matter. As the Supreme Court has stated, "it seems to us that nothing can be more just and fair, both to the patentee and the public, than that the former should understand, and correctly describe, just what he has invented, and for what he claims a patent." Merrill v. Yeomans, 94 U.S. at 573-74. The use of a dictionary definition can conflict with that directive because the patent applicant did not create the dictionary to describe the invention. Thus, there may be a disconnect between the patentee's responsibility to claim and describe his invention, and the dictionary editors' objective of aggregating all possible definitions for particular words.

Although the Texas Digital line of cases permit the dictionary definition to be narrowed in some circumstances even when there is not an explicit disclaimer or redefinition in the specification, too often that line of cases has been improperly relied upon to condone the adoption of a dictionary definition entirely divorced from the context of the written description. The problem is that if the district court starts with the broad dictionary definition in every case and fails to fully appreciate how the specification implicitly limits that definition, the error will systematically cause the construction of the claim to be unduly expansive. The risk of systematic overbreadth is greatly reduced if the court instead focuses at the outset on how the patentee used the claim term in the claims, specification, and prosecution history, rather than starting with a broad definition and whittling it down.

Dictionaries, by their nature, provide an expansive array of definitions. General dictionaries, in particular, strive to collect all uses of particular words, from the common to the obscure. By design, general dictionaries collect the definitions of a term as used not only in a particular art field, but in many different settings. In such circumstances, it is inevitable that the multiple dictionary definitions for a term will extend beyond the "construction of the patent [that] is confirmed by the avowed understanding of the patentee, expressed by him, or on his behalf, when his application for the original patent was pending." Goodyear Dental Vulcanite Co. v. Davis, 102 U.S. 222, 227, 26 L. Ed. 149, 1881 Dec. Comm'r Pat. 131 (1880). Thus, the use of the dictionary may extend patent protection beyond what should properly be afforded by the inventor's patent. See Smith v. Snow, 294 U.S. 1, 14, 79 L. Ed. 721, 55 S. Ct. 279, 1935 Dec. Comm'r Pat. 757 (1935) ("if the claim were fairly susceptible of two constructions, that should be adopted which will secure to the patentee his actual invention") (emphasis added). For that reason, we have stated that "a general-usage dictionary cannot overcome art-specific evidence of the meaning" of a claim term. Vanderlande Indus. Nederland, 366 F.3d at 1321; see also Renishaw, 158 F.3d at 1250, quoting Liebscher v. Boothroyd, 46 C.C.P.A. 701, 258 F.2d 948, 951, 1958 Dec. Comm'r Pat. 437 (CCPA 1958) ("Indiscriminate reliance on definitions found in dictionaries can often produce absurd results. . . . One need not arbitrarily pick and choose from the various accepted definitions of a word to decide which meaning was intended as the word is used in a given claim. The subject matter, the context, etc., will more often than not lead to the correct conclusion.").

Even technical dictionaries or treatises, under certain circumstances, may suffer from some of these deficiencies. There is no guarantee that a term is used in the same way in a treatise as it would be by the patentee. In fact, discrepancies between the patent and treatises are apt to be common because the patent by its nature describes something novel. See Autogiro, 384 F.2d at 397 ("Often the invention is novel and words do not exist to describe it. The dictionary does not always keep abreast of the inventor. It cannot.").
Moreover, different dictionaries may contain somewhat different sets of definitions for the same words. A claim should not rise or fall based upon the preferences of a particular dictionary editor, or the court's independent decision, uninformed by the specification, to rely on one dictionary rather than another. Finally, the authors of dictionaries or treatises may simplify ideas to communicate them most effectively to the public and may thus choose a meaning that is not pertinent to the understanding of particular claim language. See generally Ellen P. Aprill, The Law of the Word: Dictionary Shopping in the Supreme Court, 30 Ariz. St. L.J. 275, 293-314 (1998). The resulting definitions therefore do not necessarily reflect the inventor's goal of distinctly setting forth his invention as a person of ordinary skill in that particular art would understand it.

As we have noted above, however, we do not intend to preclude the appropriate use of dictionaries. Dictionaries or comparable sources are often useful to assist in understanding the commonly understood meaning of words and have been used both by our court and the Supreme Court in claim interpretation. See Exhibit Supply Co. v. Ace Patents Corp., 315 U.S. 126, 134, 86 L. Ed. 736, 62 S. Ct. 513, 1942 Dec. Comm'r Pat. 738 (1942) (rellying on dictionaries to construe the claim term "embedded"); Weber Elec. Co. v. E.H. Freeman Elec. Co., 256 U.S. 668, 678, 65 L. Ed. 1162, 41 S. Ct. 600, 1921 Dec. Comm'r Pat. 363 (1921) (approving circuit court's use of dictionary definitions to define claim terms); Renishaw, 158 F.3d at 1247-53 (approving the use of dictionaries with proper respect for the role of intrinsic evidence). A dictionary definition has the value of being an unbiased source "accessible to the public in advance of litigation." Vitronics, 90 F.3d at 1585. As we said in Vitronics, judges are free to consult dictionaries and technical treatises at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents.

Id. at 1584 n.6.

We also acknowledge that the purpose underlying the Texas Digital line of cases--to avoid the danger of reading limitations from the specification into the claim--is sound. Moreover, we recognize that the distinction between using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim can be a difficult one to apply in practice. See Comark Communs., Inc. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed. Cir. 1998) ("there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification"). However, the line between construing terms and importing limitations can be discerned with reasonable certainty and predictability if the court's focus remains on understanding how a person of ordinary skill in the art would understand the claim terms. For instance, although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments. See, e.g., Nazomi Communications, Inc. v. ARM Holdings, PLC, 403 F.3d 1364, 1369 (Fed. Cir. 2005) (claims may embrace "different subject matter than is illustrated in the specific embodiments in the specification"); Liebel-Flarsheim, 358 F.3d at 906-08; Teleflex, 299 F.3d at 1327; SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121 (Fed. Cir. 1985). In particular, we have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment. Gemstar-TV Guide, 383 F.3d at 1366. That is not just because section 112 of the Patent Act requires that the claims themselves set forth the limits of the patent grant, but also because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments.

To avoid importing limitations from the specification into the claims, it is important to keep in mind that the purposes of the specification are to teach and enable those of skill in the art to make and use the invention and to provide a best mode for doing so. See Spectra-Physics, Inc. v. Coherent, Inc., 827 F.2d 1524, 1533 (Fed. Cir. 1987). One of the best ways to teach a person of ordinary skill in the art how to make and use the invention is to provide an example of how to practice the invention in a particular case. Much of the time, upon reading the specification in that context, it will become clear whether the patentee is setting out specific examples of the invention to accomplish those goals, or whether the patentee instead intends for the claims and the embodiments in the specification to be strictly coextensive. See SciMed Life Sys., 242 F.3d at 1341. The manner in which the patentee uses a term within the specification and claims usually will make the distinction apparent. See Snow v. Lake Shore & Mich. S. Ry. Co., 121 U.S. 617, 630, 30 L. Ed. 1004, 7 S. Ct. 1343, 1887 Dec. Comm'r Pat. 354 (1887) (it was clear from the specification that there was "nothing in the context to indicate that the patentee contemplated any alternative" embodiment to the one presented).

In the end, there will still remain some cases in which it will be hard to determine whether a person of skill in the art would
understand the embodiments to define the outer limits of the claim term or merely to be exemplary in nature. While that task may present difficulties in some cases, we nonetheless believe that attempting to resolve that problem in the context of the particular patent is likely to capture the scope of the actual invention more accurately than either strictly limiting the scope of the claims to the embodiments disclosed in the specification or divorcing the claim language from the specification.

In Vitronics, this court grappled with the same problem and set forth guidelines for reaching the correct claim construction and not imposing improper limitations on claims. 90 F.3d at 1582. The underlying goal of our decision in Vitronics was to increase the likelihood that a court will comprehend how a person of ordinary skill in the art would understand the claim terms. See id. at 1584. In that process, we recognized that there is no magic formula or catechism for conducting claim construction. Nor is the court barred from considering any particular sources or required to analyze sources in any specific sequence, as long as those sources are not used to contradict claim meaning that is unambiguous in light of the intrinsic evidence. See id. at 1583-84; Intel Corp. v. VIA Techs., Inc., 319 F.3d 1357, 1367 (Fed. Cir. 2003). For example, a judge who encounters a claim term while reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term. The sequence of steps used by the judge in consulting various sources is not important; what matters is for the court to attach the appropriate weight to be assigned to those sources in light of the statutes and policies that inform patent law. Vitronics, 90 F.3d at 1582. In Vitronics, we did not attempt to provide a rigid algorithm for claim construction, but simply attempted to explain why, in general, certain types of evidence are more valuable than others. Today, we adhere to that approach and reaffirm the approach to claim construction outlined in that case, in Markman, and in Innova. We now turn to the application of those principles to the case at bar.

IV

A

The critical language of claim 1 of the '798 patent--"further means disposed inside the shell for increasing its load bearing capacity comprising internal steel baffles extending inwardly from the steel shell walls"--imposes three clear requirements with respect to the baffles. First, the baffles must be made of steel. Second, they must be part of the load-bearing means for the wall section. Third, they must be pointed inward from the walls. Both parties, stipulating to a dictionary definition, also conceded that the term "baffles" refers to objects that check, impede, or obstruct the flow of something. The intrinsic evidence confirms that a person of skill in the art would understand that the term "baffles," as used in the '798 patent, would have that generic meaning.

The other claims of the '798 patent specify particular functions to be served by the baffles. For example, dependent claim 2 states that the baffles may be "oriented with the panel sections disposed at angles for deflecting projectiles such as bullets able to penetrate the steel plates." The inclusion of such a specific limitation on the term "baffles" in claim 2 makes it likely that the patentee did not contemplate that the term "baffles" already contained that limitation. See Dow Chem. Co. v. United States, 226 F.3d 1334, 1341-42 (Fed. Cir. 2000) (concluding that an independent claim should be given broader scope than a dependent claim to avoid rendering the dependent claim redundant). Independent claim 17 further supports that proposition. It states that baffles are placed "projecting inwardly from the outer shell at angles tending to deflect projectiles that penetrate the outer shell." That limitation would be unnecessary if persons of skill in the art understood that the baffles inherently served such a function. See TurboCare, 264 F.3d at 1123 (claim terms should not be read to contain a limitation "where another claim restricts the invention in exactly the [same] manner"). Dependent claim 6 provides an additional requirement for the baffles, stating that "the internal baffles of both outer panel sections overlap and interlock at angles providing deflector panels extending from one end of the module to the other." If the baffles recited in claim 1 were inherently placed at specific angles, or interlocked to form an intermediate barrier, claim 6 would be redundant.

The specification further supports the conclusion that persons of ordinary skill in the art would understand the baffles recited in the '798 patent to be load-bearing objects that serve to check, impede, or obstruct flow. At several points, the specification discusses positioning the baffles so as to deflect projectiles. See '798 patent, col. 2, ll. 13-15; id., col. 5, ll. 17-19. The patent states that one advantage of the invention over the prior art is that "there have not been effective ways of dealing with these powerful impact weapons with inexpensive housing." Id., col. 3, ll. 28-30. While that statement makes clear the invention envisions baffles that serve that function, it does not imply that in order to qualify as baffles within the meaning of the claims, the internal support structures must serve the projectile-deflecting function in all the embodiments of all the claims. The specification must teach and enable all the claims, and the section of the written description discussing
the use of baffles to deflect projectiles serves that purpose for claims 2, 6, 17, and 23, which specifically claim baffles that deflect projectiles. See In re Wright, 999 F.2d 1557, 1561 (Fed. Cir. 1993).

The specification discusses several other purposes served by the baffles. For example, the baffles are described as providing structural support. The patent states that one way to increase load-bearing capacity is to use "at least in part inwardly directed steel baffles 15, 16." '798 patent, col. 4, ll. 14-15. The baffle 16 is described as a "strengthening triangular baffle." Id., col. 4, line 37. Importantly, Figures 4 and 6 do not show the baffles as part of an "intermediate interlocking, but not solid, internal barrier." In those figures, the baffle 16 simply provides structural support for one of the walls, as depicted below:

GET DRAWING SHEET 1 OF 3.

GET DRAWING SHEET 2 OF 3.

Other uses for the baffles are listed in the specification as well. In Figure 7, the overlapping flanges "provide for overlapping and interlocking the baffles to produce substantially an intermediate barrier wall between the opposite wall faces":

GET DRAWING SHEET 2 OF 3.

'798 patent, col. 5, ll. 26-29. Those baffles thus create small compartments that can be filled with either sound and thermal insulation or rock and gravel to stop projectiles. Id., col. 5, ll. 29-34. By separating the interwall area in to compartments (see, e.g., compartment 55 in Figure 7), the user of the modules can choose different types of material for each compartment, so that the module can be "easily custom tailored for the specific needs of each installation." Id., col. 5, ll. 36-37. When material is placed into the wall during installation, the baffles obstruct the flow of material from one compartment to another so that this "custom tailoring" is possible.

The fact that the written description of the '798 patent sets forth multiple objectives to be served by the baffles recited in the claims confirms that the term "baffles" should not be read restrictively to require that the baffles in each case serve all of the recited functions. We have held that "the fact that a patent asserts that an invention achieves several objectives does not require that each of the claims be construed as limited to structures that are capable of achieving all of the objectives." Liebel-Flarsheim, 358 F.3d at 908; see also Resonate Inc. v. Alteon Websystems, Inc., 338 F.3d 1360, 1367 (Fed. Cir. 2003).

Although deflecting projectiles is one of the advantages of the baffles of the '798 patent, the patent does not require that the inward extending structures always be capable of performing that function. Accordingly, we conclude that a person of skill in the art would not interpret the disclosure and claims of the '798 patent to mean that a structure extending inward from one of the wall faces is a "baffle" if it is at an acute or obtuse angle, but is not a "baffle" if it is disposed at a right angle.

B

Invoking the principle that "claims should be so construed, if possible, as to sustain their validity," Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed Cir. 1999), argues that the term "baffles" should be given a restrictive meaning because if the term is not construed restrictively, the asserted claims would be invalid.

While we have acknowledged the maxim that claims should be construed to preserve their validity, we have not applied that principle broadly, and we have certainly not endorsed a regime in which validity analysis is a regular component of claim construction. See Nazomi Communications, 403 F.3d at 1368-69. Instead, we have limited the maxim to cases in which "the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous." Liebel-Flarsheim, 358 F.3d at 911; see also Generation II Orthotics, Inc. v. Medical Tech., Inc., 263 F.3d 1356, 1365 (Fed. Cir. 2001) ("Claims can only be construed to preserve their validity where the proposed claim construction is 'practicable,' is based on sound claim construction principles, and does not revise or ignore the explicit language of the claims."); Elekta Instrument S.A. v. O.U.R. Scientific Int'l, Inc., 214 F.3d 1302, 1309 (Fed. Cir. 2000) ("having concluded that the amended claim is susceptible of only one reasonable construction, we cannot construe the claim differently from its plain meaning in order to preserve its validity"); E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1434 (Fed. Cir. 1988) (rejecting argument that limitations should be added to claims to preserve the validity of the claims). In such cases, we have looked to whether it is reasonable to infer that the PTO would not have issued an invalid patent, and that the
ambiguity in the claim language should therefore be resolved in a manner that would preserve the patent's validity.

That is the rationale that gave rise to the maxim in the first place. In Klein v. Russell, 86 U.S. (19 Wall.) 433, 466, 22 L. Ed. 116 (1873), the owner of a reissued patent argued for a narrow construction of the patent, while the accused infringer argued for a broader construction. The Court noted that the law "required that the reissue should be for the same invention as the original patent." Id. Because the reissue, which was granted under the predecessor to 35 U.S.C. § 251, would have been improper under the broader construction, the Court "presumed the Commissioner did his duty" and did not issue an invalid patent. For that reason, among others, the Court construed the disputed claim language in a manner that "sustained the patent and the construction claimed by the patentee," since that "can be done consistently with the language which he has employed." Id. The applicability of the doctrine in a particular case therefore depends on the strength of the inference that the PTO would have recognized that one claim interpretation would render the claim invalid, and that the PTO would not have issued the patent assuming that to be the proper construction of the term.

In this case, unlike in Klein and other cases in which the doctrine of construing claims to preserve their validity has been invoked, the claim term at issue is not ambiguous. Thus, it can be construed without the need to consider whether one possible construction would render the claim invalid while the other would not. The doctrine of construing claims to preserve their validity, a doctrine of limited utility in any event, therefore has no applicability here.

In sum, we reject AWH's arguments in favor of a restrictive definition of the term "baffles." Because we disagree with the district court's claim construction, we reverse the summary judgment of noninfringement. In light of our decision on claim construction, it is necessary to remand the infringement claims to the district court for further proceedings.

CONCUR BY: LOURIE (In Part)

DISSENT BY: LOURIE (In Part); MAYER

DISSENT

LOURIE, Circuit Judge, concurring in part and dissenting in part, with whom NEWMAN, Circuit Judge, joins.

I fully join the portion of the court's opinion resolving the relative weights of specification and dictionaries in interpreting patent claims, in favor of the specification. I could elaborate more expansively on that topic, but Judge Bryson's opinion for the majority says it so well, there is little reason for me to repeat its truths. I also agree with the court that claims need not necessarily be limited to specific or preferred embodiments in the specification, although they are limited to what is contained in the overall disclosure of the specification.

However, I do dissent from the court's decision to reverse and remand the district court's decision. The original panel decision of this court, which implicitly decided the case based on the priorities that the en banc court has now reaffirmed, interpreted the claims in light of the specification and found that the defendant did not infringe the claims. We affirmed the district court, which had arrived at a similar conclusion. The dissent from the panel decision relied on the "dictionaries first" procedure, which the court now has decided not to follow. Thus, while the claim construction issue had to be decided by the en banc court, I see no reason for the court, having reaffirmed the principle on which the district judge and the panel originally decided the case, to send it back for further review.

The court premises its reverse-and-remand decision on the concept of claim differentiation and the reasoning that the contested term "baffle" need not fulfill all of the functions set out for it in the specification. Reasonable people can differ on those points. However, the court did not take this case en banc because the full court differed with the panel majority on those disputable criteria. It did so to resolve the claim construction issue, which it has now done so well. Having done so, I believe that it should simply affirm the district court's decision on the merits, consistently with that court's rationale and that of the panel that affirmed the district court, which it now adopts.

I will not critique in detail particular statements the majority makes in rationalizing its reversal of the district court's
I will simply point out that the specification contains no disclosure of baffles at right angles. Moreover, as the majority correctly states, a patent specification is intended to describe one's invention, and it is essential to read a specification in order to interpret the meaning of the claims. This specification makes clear that the "baffles" in this invention are angled. There is no reference to baffles that show them to be other than angled. The abstract refers to "bullet deflecting . . . baffles." Only angled baffles can deflect. It then mentions "internal baffles at angles for deflecting bullets." That could not be clearer. The specification then refers several times to baffles, often to figures in the drawings, all of which are to angled baffles. A compelling point is that the only numbered references to baffles (15, 16, 26, 27, 30, and 31) all show angled baffles.

The specification further states that steel panels "form the internal baffles at angles for deflecting bullets." It states that the baffles are "disposed at such angles that bullets which might penetrate the outer steel panels are deflected." It explains that if bullets "were to penetrate the outer steel wall, the baffles are disposed at angles which tend to deflect the bullets." There is no specific reference in this patent to a baffle that is not angled at other than 90.

While, as the majority states, the specification indicates that multiple objectives are achieved by the invention, none of the other objectives is dependent upon whether the baffles are at other than a 90 angle, whereas the constantly stated objective of deflection of bullets is dependent upon such an angle.

Finally, even though claim construction is a question of law, reviewable by this court without formal deference, I do believe that we ought to lean toward affirmance of a claim construction in the absence of a strong conviction of error. I do not have such a conviction in this case, after considering the district court's opinion and the patent specification.

For these reasons, while I wholeheartedly join the majority opinion in its discussion and resolution of the "specification v. dictionaries" issue, I would affirm the decision below.

399

iii. "baffle"

The parties dispute the meaning of the following phrase of independent Claims 17, and its dependent claims (18-24): "baffle."

</table>

PSI argues that the "baffle" should be construed as "a flat, upwardly inclined surface against which the feed flow impacts." Highland Tank retorts that the claim does not require a "flat" baffle.

PSI cites the following section of the specification in support of its argument: "The baffle is disposed in the inlet chamber and its face, which comprises a flat surface, is inclined upwardly so that it faces towards the inlet nozzle and towards the inlet end of the tank. The baffle is disposed to reduce and isolate inlet turbulence and to relatively evenly distribute the flow over the entire width of the tank. The flat surface of the baffle contributes to reduction of turbulence." '800 Patent, 1:25-32. Also, PSI cites the following section of the specification: "[T]he McCarthy et al. Baffle is corrugated which contributes turbulence, whereas the diffusion baffle of this invention has a flat surface which contributes to laminar flow." '800 Patent: 2: 45-48.

In response, Plaintiff argues that the "baffle" of Claim 17 does not need to be flat. Plaintiff implores the Court that
construction begins with interpreting the claims, and invites the court not to "read undue limitations from the specification into the claim." Specifically, Highland Tank states that the claim language does not say anything about the baffle being flat, and that the exclusion of "flat" from the actual claim language is dispositive.

While Plaintiff's exhortations are correct as general statements, they are completely inapt in this setting, as applied to this specification. Of course, the appropriate starting point in construction is always the way in which the language is used within the claim. See Pause Tech. LLC v. TiVo Inc., 419 F.3d 1326, 1331 (Fed. Cir. 2006). However, Plaintiff's second point is more nuanced. On the one hand, a court must be careful to read a claim term in the context of the entire patent. Phillips, 415 F.3d at 1313. On the other hand, though, Phillips and other Federal Circuit opinions caution against reading features of one or more enclosed embodiments into claims drafted more broadly. Id. at 1323-24; see also Callicrate v. Wadsworth Mfg., Inc., 427 F.3d 1361, 1368 (Fed. Cir. 2005). The Federal Circuit itself has described this balance as a "fine line." Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1117 (Fed. Cir. 2004).

In this instance, Highland Tank's complete jettisoning of clear and unmistakable specification language is scarcely understandable and borders on either mistake or advocacy blindness. The entire point of claim construction is to arrive at the acquired meaning of the words in the claim, and that meaning may derive from various sources, especially the particular use of that language within the patent. V-Formation, inc. v. Benetton Group SPA, 401 F.3d 1307, 1311 (Fed. Cir. 2005). Here, within the first three paragraphs, the specification contains unmistakable language that facilitates the proper understanding of the term "baffle:" "According to method of the invention [t]he baffle is disposed in the inlet chamber and its face, which comprises a flat surface . . . ." '800 Patent, 1:19-27. Where in this clear phrasing is any discussion of a "mere embodiment"? Even more aggressive language exists later in the specification, as the inventor distinguishes the McCarthy baffle: "the McCarthy et al. Baffle is corrugated, which contributes turbulence, where the diffusion baffle of this invention has a flat surface which contributes to laminar flow." '800 Patent, 2: 45-48. The Federal Circuit has explained that when the specification obviously explains that the invention, as a whole, does not include a particular feature, that feature must be deemed to be outside of the reach of the language of any individual patent claim, even where the literal language may seem sufficiently broad. Sci-Med Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343-44 (Fed. Cir. 2001).

In this matter, the unambiguous specification language acts as a dispositive indicator of the boundaries of the invention that was patented, and thus allows the court to settle upon the acquired meaning of the term "baffle": "a flat, upwardly inclined surface against which the feed flow impacts."

Moreover, Highland Tank's claim differentiation arguments are precluded by application of the precedential Fantasy Sports Properties, Inc. v. Sportsline.com, Inc., 287 F.3d 1108, 1115-16 (Fed. Cir. 2002). As in Fantasy Sports, the doctrine of claim differentiation, applied here, could only create a presumption that each claim has a different scope to the extent that differing scope is not overcome by the patentee's clear disclaimer of claim scope in the specification. Id. The doctrine of claim differentiation cannot operate to broaden claims beyond their correct scope. Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000).

In short, PSI's arguments are far more persuasive, and, correctly interpreted in light of the clear and unmistakable explanation in the specification, the term "baffle" should be construed as requiring a flat surface. This does not represent an instance where the court is reading a feature of a disclosed embodiment into a more broadly drafted claim. See, e.g., Saunders Group, Inc. v. Comfortrac, Inc., 492 F.3d 1326, 1331-35 (Fed. Cir. 2007). Rather, the inventor's own express acknowledgments in the specification clearly demand that this aspect of the claim be read in light of the specification. See Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1117 (Fed. Cir. 2004).

7. Claim 7: "baffle."

Claim 7 is construed to mean "a structure for isolating fuel leaving the pumping means from the region of the opening of the inlet to the high pressure pump."
1. "baffle having heat absorbing and insulating means thereon"

This claim term appears in claim 1 as follows:

baffle having heat absorbing and insulating means thereon in heat exchanging relationship with lower combustion chamber and the upper exhaust heat exchanging chamber to minimize a loss of heat through the baffle and to maximize the burning temperature in the fuel combustion chamber.

(The '876 patent, 8:19-24 (emphasis added)).

Hearth proposes the following construction: "an object, that includes firebrick or other heat absorber and insulator, placed in an appliance to change the direction or retard the flow of air, air fuel mixtures, or fuel gases." Travis proposes the following construction: "heat absorbing and insulating means must be on the baffle." The parties agree on the definition of "baffle" and "heat absorbing and insulating means." They dispute whether the "heat absorbing and insulating means" has to be on top of the baffle (Travis' position), or whether it can be either on top of the baffle or a part of the baffle (Hearth's position).

Based on the intrinsic evidence, the Court adopts Hearth's more precise language regarding the baffle, but concludes that the plain meaning of the claim language limits the heat absorbing and insulating means to being on the top of the baffle. Therefore, the Court construes "baffle having heat absorbing and insulating means thereon" to mean "an object placed in an appliance to change the direction or retard the flow of air, air fuel mixtures, or fuel gases, with the heat absorbing and insulating means on top of the aforesaid object."

The National Fire Protection Association defines "baffle" as "an object in an appliance to change the direction or retard the flow of air, air-fuel mixtures, and fuel gases." (Zeuli Decl., Ex. F-1.) The parties agree that this is the proper definition for baffle as used in this claim.

The claim language explicitly references the location of the heat absorbing and insulating means by using the word "thereon." "Thereon" is defined as "on or upon this, that or it." (Rossman Decl., Ex. D (American Heritage College Dictionary, 3d ed. 1997)). Thus, based on the ordinary and plain meaning of "thereon," the heat absorbing and insulating means must be located on top of the baffle.

Hearth attempts to overcome this conclusion by pointing to language in the specification that clearly contemplates two possible embodiments, where the heat absorbing and insulating means is either on top of or a part of the baffle. The specification states "[b]affle 68 includes baffle insulation and heat absorber 85 on the baffle 68 or forming part thereof for insulating the baffle . . . ." (The '876 patent, 4:24-25 (emphasis added)). Hearth argues that despite the ordinary meaning of "thereon" used in the claim, which would narrow the definition, it would be error to adopt that meaning over the language used in the written description. However, the case Hearth cites, Jack Guttmann Inc. v. Kopykake Enters, Inc. holds only that the specification may broaden the meaning of a claim term beyond its ordinary and plain meaning when the patentee chooses to be his or lexicographer "by clearly setting forth an explicit definition for a claim term that could differ in scope from that which would be afforded by its ordinary meaning." 302 F.3d 1352, 1360 (Fed. Cir. 2002).

Here, Hearth has not pointed to anywhere in the specification that the patentee used the word "thereon" to mean either "thereon" or "a part thereof." Thus, even though the specification includes language that allows for the alternative construction Hearth proposes, the patentee limited its claim by using a word, "thereon," whose ordinary and plain meaning limited it to one configuration. See Johnson & Johnston Associates Inc. v. R.E. Service Co., Inc., 285 F.3d 1046, 1052 (Fed. Cir. 2002) ("the claim requirement presupposes that a patent applicant defines his invention in the claims, not in the specification. After all, the claims, not the specification, provide the measure of the patentee's right to exclude."); Novo Nordisk of North America, Inc. v. Genentech, Inc., 77 F.3d 1364, 1369 (Fed. Cir. 1996) ("While claims are to be interpreted in light of the specification, all that appears in the specification is not necessarily within the scope of the claims and thus entitled to protection. What is not claimed, even though disclosed as part of the 'invention,' cannot be enjoined.")

This construction does not violate the doctrine of claim differentiation. Claim 11, which is dependent on claim 1, states
[t]he wood stove as defined in claim 1 wherein the base, rear and side walls have fire brick thereon to protect said walls and wherein fire brick is mounted on an upper side of the baffle to minimize the heat loss through the baffle . . . .

(The ’876 patent, 9:25-29). Hearth argues that, because this claim adds the limitation that the fire brick be mounted on the baffle, claim 1 cannot be read as requiring this same configuration because it would render claim 11 redundant. However, Travis offers the equally reasonable explanation that claim 11 does not only require that the fire brick be mounted on top of the baffle. Rather, it requires that the heat absorbing and insulating means be fire brick and that the sides of the firebox have fire brick on them. Because Travis' interpretation is a reasonable one, nothing about the language in claim 11 bars construing this term to require that the heat absorbing and insulating means be located on top of the baffle. Moreover, "[t]he doctrine of claim differentiation cannot be used to overcome the plain language of the claims themselves." Mycogen Plant Science v. Monsanto Co., 243 F.3d 1316, 1329 (Fed. Cir. 2001).

While the prosecution history does not compel this particular construction, it does not prohibit it or compel a contrary construction. According to Hearth, the examination was not focused on the location or configuration of the heat absorbing and insulating means, but rather on prior art that had insulating means but no heat absorbing means. The remarks accompanying the amendments stated

It was pointed out that the thermal means shown in the Chamberlain reference and in the Carver reference [prior art] is provided only for the purpose of insulating (preventing heat transfer). The applicants' heat absorbing and insulating means, however, provides an additional function of heat storage along with an insulation capacity.

(Zeuli Decl., Ex. M-6 at 13). Hearth maintains that it overcame this prior art by adding the heat absorbing means. In fact, Hearth argues that the prior art had insulating means located on top of the baffle, and therefore it would not have made sense to add the requirement that the heat absorbing and insulating means be on top of the baffle as a way to overcome the prior art. Thus, Hearth argues, the prosecution history narrowed the claim only by requiring that it include heat absorbing means. Even if all of Hearth's assertions are true, that only means that the prosecution history does not require Travis' construction. Importantly, however, the prosecution history does not bar it either.

a. Construing the scope of the ’395 patent claim

The patentee bears the burden of proving infringement by a preponderance of the evidence. CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1161 (Fed. Cir. 1997). To succeed in a patent infringement case, the patentee must show every limitation set forth in a patent claim is found in an accused product or process. Becton Dickinson and Company v. C.R. Bard, Inc., 922 F.2d 792, 796 (Fed. Cir. 1990). If, as Clestra contends, the claim limitation regarding a second baffle means or its equivalent set forth in claims One, Sixteen or Twenty is missing from the Fantom unit, there is no infringement. London v. Carson Pirie Scott & Company, 946 F.2d 1534, 1539 (Fed. Cir. 1991).

In relevant part, claim One reads:

1. second baffle means disposed radially outwardly of said centrifugal fan means and said first baffle means, second baffle means having inner surfaces for directing the airflow from said centrifugal fan means inwardly of said primary housing and between said first baffle means and said filter means whereby air being introduced into said housing by said centrifugal fan means will be directed radially outwardly of said centrifugal fan means and guided by said first baffle means towards said second baffle means and thereafter by said second baffle means between said first baffle means and said air filter means.

’395 pat., col. 10, 11. 20-32 (emphasis supplied). 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 In relevant part, claims Sixteen and Twenty read:
16. . . . a pair of second baffle means disposed radially outwardly on opposite sides of said centrifugal fan and within the plenum chamber, said second baffle means having at least one air deflecting surface for directing the air passing radially outwardly from said centrifugal fan inwardly of the plenum chamber and toward said filter means . . . Col. 12, 11. 35-41 (emphasis supplied).

20. . . . second air baffle means carried by said upper section of said housing so as to be oriented radially outwardly and in spaced relationship to said first said baffle means, said second air baffle means having inner surfaces for deflecting air flow from said centrifugal fan inwardly of said housing and between said first air baffle means and said filter means whereby the flow of air will be directed radially outwardly by said centrifugal fan and said first air baffle means toward said second air baffle means and thereafter by said second air baffle means between said first air baffle means and said filter means so that the flow of air is distributed across said filter means. Col. 13, 1. 25-col. 14, 1. 6 (emphasis supplied).

Clestra argues, and the court agrees, that the second baffle means is described in "means-plus-function" form as provided for in 35 U.S.C. § 112, P 6. Pursuant to that statute,

an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

"To determine whether a claim limitation is met literally, where expressed as a means for performing a stated function, the court must compare the accused structure with the disclosed structure, and must find equivalent structure as well as identity of claimed function for that structure." Pennwalt Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 934 (Fed. Cir. 1987) (en banc) (emphasis in the original). See also King Instruments Corp. v. Perego, 65 F.3d 941, 945-46 (Fed. Cir. 1995) (citation omitted), cert. denied, 517 U.S. 1188, 116 S. Ct. 1675, 134 L. Ed. 2d 778 (1996). The "means" term in a means-plus-function limitation essentially is a generic reference to the corresponding structure disclosed in the specification, so a determination of corresponding structure is a determination of the meaning of the "means" term in the claim and is also a matter of claim construction. Chiuminatta Concrete Concepts v. Cardinal Industries, 145 F.3d 1303, 1308 (Fed. Cir. 1998).

b. Does the Fantom unit infringe the '395 patent under a means-plus-function analysis?

To answer this question, the court first must provide a brief overview of the '395 patent. Again, the abstract to the '395 patent describes it as "compact centrifugal fan and filter assemblies" that provide an even flow of clean air to work environments, such as "clean rooms and clean air work stations." A blower unit provides an airflow, generally parallel with respect to a HEPA filter element, which ultimately is channeled by two separate baffles "so as to provide uniform air pressure and airflow across the filter element while reducing vibration and increasing the air flow from the fan and filter assemblies to such clean air environments."

More specifically, the blower unit directs airflow into the first baffle, which is located directly underneath it. The first baffle has "outwardly extending wall portions" that "extend outwardly" from the blower unit toward the "sidewalls of said primary housing so as to create an airflow space radially" of the blower unit between the first baffle and the sidewalls. '395 pat., col. 10, 11. 15-21. The second baffle, located on the sidewalls, has "inner surfaces for directing the airflow" from the blower unit "inwardly of said primary housing and between the inner surfaces for directing the airflow . . . inwardly of said primary housing." Id., at 11. 23-26 (emphasis supplied). Ultimately, the placement and design of the two baffles means "air being introduced into said housing" by the blower unit "will be directed radially outwardly" of the blower unit, guided by the first baffle towards the second baffle, and thereafter by the second baffle to the space between the first baffle and the HEPA filter. Id., at 11. 27-32. The description of the preferred embodiment specifically explains the function of the "side baffles"--i.e., the second baffle--as "to direct the airflow generally in an arcuate fashion downwardly and inwardly towards the HEPA filter element." '395 pat., col. 5, 11. 31-33 (emphasis supplied). The description continues that the second baffle provides "continuous arcuate surfaces to direct airflow away from the sidewalls." Id., at 11. 40. In short, the '395 patent requires an arcuate shaped second baffle, the purpose of which is to direct airflow inwardly to the HEPA filter.

At least for the purposes of this motion, the parties do not dispute that the Fantom unit contains a blower unit, first baffle, housing and a HEPA filter that correspond to the placement of those items in the '395 patent; rather, the dispute is whether
the sound dampening materials of the Fantom unit are equivalent to the second baffle described in the '395 patent. The sound dampening material, made of foam, is lined against the housing of the Fantom unit in the shape of a horizontal "L" on each side of the blower unit. The smaller part of each "L" represents the side of the Fantom unit just above its HEPA filter, while the longer part of the "L" traverses the ceiling of the unit, until it meets the blower unit. Envirco submits that these foam-shaped "L's" comprise a second baffle: like the second baffle in the '395 patent, Envirco maintains, the sound dampening material in the Fantom unit directs airflow from a first baffle "radially inwardly into the spaces between the first baffle[] and the filter[]", and then across the filter." Leader Decl. PP 9-13, Ex. B. It also notes that the description of the preferred embodiment allows that the second baffle may be composed of sound dampening material. 4 '395 pat., col. 5, 11. 41-46. Finally, Envirco claims that even without the sound dampening material, the Fantom unit still would contain a second baffle: the top and side walls of its housing, which similarly would deflect air to the base of the unit.

Clestra counters, correctly, that Envirco's latter argument is meritless. Clearly the '395 patent requires a housing and a second baffle. 5 As to Envirco's argument that the Fantom unit's "L-shaped" sound dampening material is a second baffle, Clestra responds: (1) the material "is simply flat, straight sound dampening material, not a second baffle means"; (2) according to claims One and Sixteen, the second baffle must be disposed "radially outwardly" of the blower unit or, according to claim Twenty, it must be "oriented radially and outwardly and in a spaced relationship" to the first baffle--e.g., the second baffle must be to the side, within the radius of either the fan or the first baffle; and (3) the second baffle must be arcuate. Clestra concludes that the disputed sound dampening material, which clearly is not arcuate, is not within the radius of either the fan or first baffle because it is located above the fan.

Clestra's points are well taken. The proper test under a means-plus-function analysis is "whether the differences in the accused device and any disclosed in the specification are insubstantial." Chiuminatta, 145 F.3d at 1309 (citation omitted). While it is true that the second baffle of the '395 patent may be composed of sound dampening material, it is also true that it must be disposed radially outwardly, or arcuately. The L-shaped sound dampening material in the Fantom unit simply does not meet this description: it is not the equivalent structure of the '395 patent's second baffle: it does not infringe the '395 patent under a means-plus-function analysis. Pennwalt Corp., 833 F.2d at 934.

In pre-trial proceedings the parties agreed that the second baffle is the only disputed claim element. Claim 1 of the '395 patent illustrates the asserted claims-in-suit:

1. A compact air purification apparatus for providing clean airflow to a clean air enclosure comprising a primary housing having first and second end portions and substantially closed sidewall portions, inlet and discharge openings disposed through said first and second end portions, respectively, a blower means mounted through said inlet opening so as to extend inwardly of said primary housing, said blower means having a motor drivingly connected to a centrifugal fan means, said centrifugal fan being disposed within said primary housing so as to discharge air radially outwardly with respect to said inlet opening, said centrifugal fan including a plurality of radially extending blade means, a filter means mounted within said primary housing adjacent said discharge opening so that all airflow outwardly of said primary housing through said
discharge opening passes through said filter means, a first baffle means disposed adjacent said centrifugal fan means and between said centrifugal fan means and said filter means, said first baffle means having outwardly extending wall portions which extend outwardly of said centrifugal fan means toward said sidewalls of said primary housing so as to create an airflow space radially of said centrifugal fan means between said first baffle means and said sidewalls of said primary housing, second baffle means disposed radially outwardly of said centrifugal fan means and said first baffle means, said second baffle means having inner surfaces for directing the airflow from said centrifugal fan means inwardly of said primary housing and between said first baffle means and said filter means whereby air being introduced into said housing by said centrifugal fan means will be directed radially outwardly of said centrifugal fan means and guided by said first baffle means towards said second baffle means and thereafter by said second baffle means between said first baffle means and said air filter means.

'395 patent, col. 9, line 64 - col. 10, line 32 (emphasis added).

Clestra makes the accused infringing product, the Fantom fan. The parties agree that the Fantom has a blower fan, a first baffle, a housing, and a HEPA filter covered by the claims in the '395 patent. At issue is whether the sound dampening material of the Fantom constitutes, or is equivalent to, the second baffle means of the asserted patent claims. The district court described the Fantom's sound dampening material as "L-shaped." The Fantom actually has sound dampening material covering the interior ceiling and walls of the enclosure. Thus, only when viewed as a cross-section does the Fantom's sound dampening material appear as L-shaped.

The district court construed the term "second baffle means" of the asserted claims of the '395 patent as a means-plus-function claim element under 35 U.S.C. § 112, P 6 (1994). Because the district court held that the second baffle means is a means-plus-function claim element, it looked to the specification for the corresponding structure. The district court focused its attention on one of the disclosed preferred embodiments, which included a second baffle having "continuous arcuate surfaces." '395 patent, col. 5, line 40. Therefore, the district court limited the second baffle means to only arcuate, or curved surfaces. However, the district court overlooked other disclosed embodiments such as those in Figures 2 and 3, which both contain angular baffles.

Under this claim construction, the district court performed its infringement analysis, comparing the accused Fantom product to the claims of the '395 patent. Granting Clestra's summary judgment motion, the district court held that the Fantom does not infringe because the L-shaped material in the Fantom is not arcuate. The district court also held the claims of the '395 patent not infringed under the doctrine of equivalents. Envirco appeals.

II.

This court reviews the district court's grant of Clestra's summary judgment motion de novo. See Conroy v. Reebok Int'l, Ltd., 14 F.3d 1570, 1575, 29 U.S.P.Q.2D (BNA) 1373, 1377 (Fed. Cir. 1994). Clestra may prevail on summary judgment only by showing an absence of genuine issues of material fact and entitlement to judgment as a matter of law. See Fed. R. Civ. P. 56(c). In granting Clestra's motion for summary judgment, a district court must view all evidence in a light most favorable to Envirco, and draw all reasonable inferences in Envirco's favor. See SRI Int'l v. Matsushita Elec. Corp., 775 F.2d 1107, 1116, 227 U.S.P.Q. (BNA) 577, 581 (Fed. Cir. 1985) (en banc).

The question of infringement involves a legal analysis, interpreting the scope and meaning of the claims, and a factual analysis, applying the claims to the accused device. See Cybor Corp. v. FAS Techs, Inc., 138 F.3d 1448, 1454-56, 46 U.S.P.Q.2D (BNA) 1169, 1172-75 (Fed. Cir. 1998) (en banc). This appeal asks this court to review the district court's claim construction. Specifically, this court must review whether the second baffle is a means-plus-function claim element and, therefore, whether the district court properly applied a structural limitation from the written description, that of being "arcuate," to define the scope of the claims.

Section 112, P 6 of title 35 of the United States Code allows patent applicants to claim an element of a combination functionally, without reciting structures for performing those functions. If a claim element contains the word "means" and recites a function, this court presumes that element is a means-plus-function element under § 112, P 6. See Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318, 50 U.S.P.Q.2D (BNA) 1161, 1166 (Fed. Cir. 1999). That presumption falls, however, if
the claim itself recites sufficient structure to perform the claimed function. See id.

The asserted claims of the '395 patent describe the disputed second baffle element with the term "second baffle means." The word "means," as already noted, invokes a presumption that § 112, P 6 governs the second baffle claim element. The district court recognized this rule and accorded the second baffle means-plus-function treatment. The district court, however, did not complete the triggering analysis for § 112, P 6. The district court should have determined whether the claims recite sufficient structure for performing the claimed function, thereby overcoming the presumption of § 112, P 6. See Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997) ("Where a claim recites a function, but then goes on to elaborate sufficient structure, material or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format.").

Although using the word "means" to describe the second baffle, the '395 claims also recite sufficient structure to rebut the presumption that the term is in means-plus-function form. The term "baffle" itself is a structural term. The dictionary definition of the word "baffle" is "a device (as a plate, wall or screen) to deflect, check, or regulate flow." Webster's Ninth New Collegiate Dictionary 124 (1990). Because the term "baffle" itself imparts structure, meaning a surface which deflects air, its use in the claims rebuts the presumption that § 112, P 6 applies.

Further, the claims describe the particular structure of this particular baffle ("having inner surfaces for directing airflow . . . radially outward . . . and thereafter . . . between said first baffle means and said air filter means"). This recital of structure conflicts with the statutory requirement that means-plus-function claim elements state a function "without the recital of structure." 35 U.S.C. § 112, P 6.

The recital of structure in this claim for the second baffle is similar to the claim element in Cole v. Kimberly-Clark Corp., 102 F.3d 524, 41 U.S.P.Q.2D (BNA) 1001 (Fed. Cir. 1996). In that case, this court held that the term "perforation means . . . for tearing" was not a means-plus-function clause, because the claim sufficiently described a structure (i.e., the perforation itself) to perform the function of tearing. Id. at 531. Relying on the dictionary definition for the word "perforation," the court construed the term, "perforation means . . . for tearing" to mean "perforations." Id. Likewise, in this case the claims recite sufficient structure (i.e. a baffle disposed radially outward from the centrifugal fan, with inner surfaces for directing airflow). Therefore the second baffle limitation is not a means-plus-function claim element. Because the claims recite sufficient structure, including details about the location and formational details about the second baffle, this court holds that the district court erred in construing the "second baffle means" as a means-plus-function claim element under § 112, P 6.

Because the "second baffle means" element does not qualify for § 112, P 6 treatment, it is not limited to the structure corresponding to the claimed function as "described in the specification and equivalents thereof." 35 U.S.C. § 112, P 6.

Instead, this court construes the claims with standard claim construction rules. Thus, for instance, the specification informs but does not control, the claim construction. Rather, in that process, the claim language itself governs the meaning of the claim. To acquire proper context to understand claim terms, this court also consults the specification, the prosecution history, and where relevant (and not contradictory of intrinsic evidence), extrinsic evidence. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1308-09, 51 U.S.P.Q.2D (BNA) 1161, 1167-68 (Fed. Cir. 1999); see also, Scripps Clinic v. Genentech, Inc., 927 F.2d 1565, 1580, 18 U.S.P.Q.2D (BNA) 1001, 1013 (Fed. Cir. 1991).

In this case, the "second baffle means" covers a surface for deflecting air. The claim locates the "second baffle means" inside the top and sides of the housing. This distinguishes the "second" from the "first baffle means." The location of the "second baffle means" ensures that it directs air inward from the vertical walls of the housing, beneath the first baffle means, and toward the HEPA filter. In the words of the claim, the second baffle means is "disposed radially outward of said centrifugal fan."

The descriptions and figures in the specification support the locational limitations in the claim language. The specification describes in writing and shows in figures the "second baffle means" above the first baffle means, and then wrapping around the edges of the fan enclosure. See figs. 1, 2, and 3. Ultimately, the claims (and supporting specification) show that the first and second baffles act together to direct air away from the fan, around the first baffle means, and through the HEPA filter ("guided by said first baffle means towards said second baffle means and thereafter by said second baffle means between said first baffle means and said air filter means.").

The specification depicts several embodiments of the claimed invention. One embodiment includes an arcuate second
baffle. Other embodiments include angular second baffles. Thus, while the second baffle means may be arcuate, it is not limited to an arcuate shape. In other words, the arcuate shape is within the scope of the claims, but is not a limitation on the second baffle means. Similarly, the specification discloses baffles constructed of various materials, including metal, plastic, and sound damping material. Thus, baffles made of these materials are within the scope of the claims, but the descriptive enumeration of those materials in the specification does not, per se, limit the scope of the patent's claims to one or more of those materials.

With this interpretation of the "second baffle means," the district court shall on remand proceed to resolve any factual issues in this case. Accordingly this court remands for further proceedings on infringement.

404

(a) "Bag" In ordinary usage, a bag is a container, usually flexible, for holding or carrying something. See Webster's Third New International Dictionary 162 (G. & C. Merriam Co. 1981) (defining "bag" as "a container made of paper, cloth, mesh, metal foil, plastic, or other flexible material and usu. closed on all sides except for an opening that may be closed (as by folding, pasting, tying, or sewing), being of sizes ranging from small to very large and being specially designed and treated for properly holding, storing, carrying, shipping, or distributing any material or product"); Webster's College Dictionary 103 (Random House 1992) ("bag" defined as "a container or receptacle made of some pliant material and capable of being closed at the mouth"). Describing it as a "container" implies its ability to contain or hold, and this ability normally depends on its having only one open end. This construction of "bag" is also consistent with the specification of the patent. Moreover, the inventor acknowledged in deposition testimony that he understood a "bag" to have a continuous sidewall and a closed bottom. Def.'s Ex. 28 at 149-50. In contrast, a "sleeve" is a tubular configuration, open at both ends. See Merriam-Webster's Collegiate Dictionary 1103 (10th ed. 1993) (defining "sleeve" to include "an open-ended flat or tubular packaging or cover").

Accordingly, the word "bag" as used in the '409 patent must be construed to mean a flexible container sealed on all sides but one.

405

MHB also argues that the court erred in limiting the claimed process to bags. It contends that claim 1 only requires that the end product be a bag. Claim 1, however, uses the specific term "bag," which is used in the specification in its ordinary sense, i.e., to mean "a container . . . closed on all sides except for an opening that may be closed," Webster's Third New International Dictionary, 162 (1971). Moreover, claim 1 specifies that the steps be performed on a bag.

406

A. The Parties' Proposed Construction

Plaintiff proposes the following terms construction:

1. Spaced relation to the uppermost portion of the first quantity of explosive material: There is an air-gap in the borehole between the top of the lower-most explosive material and the bag-like device above it.

2. First relatively large quantity of explosive material: The larger quantity of explosive material placed within the borehole.

3. Second relatively small quantity of explosive material: The smaller quantity of explosive material placed in the borehole.

4. Disposed or disposing: Placed, placing, or causing to be placed.
5. Bag-like device: An item similar to, or characteristic of, an inflatable body of flexible material that is made, or adapted, to perform a function. 4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 See plaintiff's memorandum, footnote 2. Plaintiff proposed this definition anticipating that the court would decline to separately define the term "bag."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In contrast, defendants propose the following:

1. Spaced relation to the uppermost portion of the first quantity of explosive material: The bag-like device is sufficiently spaced within a borehole above the top of the explosive material to form an air gap in the borehole between the bag-like device and the explosive material, with the air gap being approximately 8% to 16.7% of the borehole.

2. First relatively large quantity of explosive material: The major charge or quantity of total explosive material within the borehole.

3. Second relatively small quantity of explosive material: The minor charge or quantity of explosive material within the borehole, with the major charge being 3-5 times the quantity of the minor charge.

4. Disposed or disposing: The bag-like device while in a flat and uninflated state is placed in a particular order or place to accomplish the special effect or purpose of the device.

5. Bag-like device: A device comprised of multiple polymeric sheets sealed along the edges thereof and capable of being closed at one end which lies flat when uninflated. 5

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Defendants modified their proposed definition at the Markman hearing on July 29, 2005, after the release of Phillips by the Federal Circuit. Defendants' initial proposed construction was "a flexible device capable of being closed at one end comprised of at least one polymeric sheet sealed along the edges thereof which lies flat when uninflated, of disc-like, square, tubular, or doughnut conformation."

* * *

D. "Bag-like device"

The parties have stipulated that a "device" is "an article made, or adapted, to perform a function," and the stipulation is adopted for purposes of construction of the term at issue. In the summary of the invention, the '233 patent indicates "[t]he devices of the invention can be formed of various flexible polymeric materials including polyvinylchlorides, low density polyethylenes, and polyurethane films in selected thicknesses." (Col. 2, Lines 29-33, emphasis supplied.) The summary goes on to explain that "the selected material forming the present inflatable devices must have the capability to stretch to a degree sufficient to cause the device to be firm within the borehole and yet resist continued stretching . . . which would cause the device to fall." (Col. 2, Lines 41-47, emphasis supplied.) The "present inflatable devices can be shaped in various conformations including double-ended tubular conformations, disc-like conformations, and 'flat' square and rectangular conformations as examples." (Col. 2, Lines 47-51, emphasis supplied.)

Defendants contend that the teachings of the patent include only configurations that are comprised of polymeric "sheets" that "lie flat' when uninflated." (Def. Mem. at 13.) They cite portions of the '233 patent's description of the preferred embodiments (see Col. 8, Line 36; Col. 9, Lines 29, 57; Col. 10, Lines 7-11) 7 to show that the materials used must display
such characteristics. Defendants have pointed to no language, however, that requires the use of polymeric sheets or requires that any such sheets lie flat when uninflated. Rather, they have shown only that certain materials are suggested by the patentee. The only requirement flowing from the summary language is that the device material "have the capability to stretch . . . and yet resist continued stretching . . ." The remainder of the summary states that certain materials and conformations "can" be used.

7 Defendants represent that column 10, lines 7-11 teach that configurations that do not lie flat are "ineffective." (Def. Mem. at 13.) That portion of the '233 patent reads, "While the device [numbered on the diagram as 36] is useful, a primary teaching of the invention is that the 'flat' configurations of the present inflatable devices, such as shown in figures 6 through 9, act to function in a superior manner relative to the device 36." The cited language does not convey that non-flat configurations are ineffective.

Courts are "cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification." Lemelson v. United States, 752 F.2d 1538, 1552 (Fed. Cir. 1985). Here, defendants have cited various portions of the patent that appear to describe materials favored by the patentee. Without limiting language, however, it is not for the court to confine the components of the patent to the described examples. "A patentee may claim an invention broadly and expect enforcement of the full scope of that language absent a clear disavowal or contrary definition in the specification." Home Diagnostics, Inc. v. Lifescan, Inc., 381 F.3d 1352, 1357 (Fed. Cir. 2004). The description appearing in the summary of the patent, together with the actual language of each disputed claim appears to articulate that stretchable material of various shapes can be fashioned into an inflatable bag-like device consistent with the teaching of the '233 patent. Defendants seek restrictions not required within the corners of the patent, which contains no "clear disavowal or contrary definition" to that proposed by plaintiff. See Home Diagnostics, Inc. at 1357.

Defendants next ask the court to read the term "bag-like device" in consideration of other patents filed by plaintiff, including U.S. Patent No. 4,919,203 ("'203 patent"), which is comprised of the apparatus claims for which plaintiff initially applied in conjunction with the '233 patent methods claims. 8 (Def. Mem. at 15, citing U.S. Patent Nos. 5,000,261; 5,273,110; 6,502,631; and Def. Resp. Mem. at 11, citing U.S. Patent No. 4,919,203.) Aside from the '203 patent, defendants have not designated any of the other three patents as having a significant connection to the '233 patent or as prior art that was considered during the examination of the patent. It does not appear, then, that these three are part of the prosecution history or the intrinsic evidence. In any event, a survey of the patents cited by defendants does not reveal a clear contrary meaning to that proposed by plaintiff. See Home Diagnostics, Inc. at 1357.

8 Plaintiff filed a patent application comprising the claims of both the '203 patent and the '233 patent on March 10, 1988. The divisional application for the '233 patent was filed November 28, 1988.

Defendants argue that two of plaintiff's other patents do not "embrace" any spherical, oval, or "non-flat" conformation, and that a third employs the term "ball," evidencing plaintiff's awareness at the time of his application that playground balls were used for the same purpose as the bag-like device. Thus, defendants conclude, plaintiff made a conscious decision to exclude the spherical conformation from his application for the '233 patent. However, a "clear disavowal" of the spherical conformation is not present. See Home Diagnostics, Inc. at 1357. Moreover, defendants appear to ask the court to construct a definition of exclusion by specifying what is not described in the '233 patent. The court's task is to construe the terms before it, not to expel embodiments.

The '203 patent is directly connected to this one inasmuch as the two initially were filed in a single application. The '203 patent for apparatus claims describes an "inflatable body means," which was changed from plaintiff's initial preferred term "flexible body member." Defendants argue that "bag-like device," as it appears in the '233 patent, must have a different meaning than "body means" because plaintiff did not change the term during his prosecution of the '233 patent. They aver
that the court should presume that the different terms have different meanings. It has not been shown, however, that the term "bag-like device" of the '233 patent is inconsistent with the term "body member" of the '203 patent, and different terminology may have been selected for a myriad of reasons. While the selected words may have different meanings, it does not follow that the difference is sufficient to amount to the "clear disavowal or contrary definition" necessary to discredit the meaning gleaned from the claims and specification. See Home Diagnostics, Inc. at 1357. Plaintiff's proposed construction of "bag-like device" is in agreement with the context of the '233 patent, but the meaning suggested by defendants would impose limitations not required by the patent itself or by the prosecution history.

Defendants further argue that the characteristic of inflatability is not inherent in the term "bag-like device." The point is well taken. Given that the term often is preceded in the patent by the adjective "inflatable" it does not appear that the isolated term "bag-like" necessarily implies an inflatable device. Additionally, though defendants' proposed definition proves too restrictive, plaintiff's construction broadly encompasses any conceivable "body of flexible material." This meaning potentially reaches numerous objects not contemplated by the patent. Here, upon consultation of The American Heritage Dictionary of the English Language, the court would include in its construction an indication that "bag-like" implies that an object is a "container," rather than simply a "body," inasmuch as "container" is an integral part of the definition of "bag". This application does not run afoul of the teachings of the patent which show, at the least, that the bag-like devices must be capable of containing air or another fluid substance so as to sustain inflation. Finally, the court would supplement plaintiff's suggested construction with "having the capability to stretch," a phrase taken directly from the requirements discussed in the summary of the invention. Otherwise, plaintiff's proposed construction appears consistent with the indications of the '233 patent, and especially the description contained in the summary of the invention.

3. "BAGGAGE SCRREENER" AND "BAGGAGE SCREENING ENTITY"

Tropp's proposed construction for baggage screening entity is "an entity that screens baggage". Travel Sentry's proposed construction is "[a]ny governmental agency or non-governmental organization that screens or inspects luggage prior to being loaded aboard aircraft." Similarly, Tropp defines baggage screener as "a person who screens baggage" while Travel Sentry defines the term as "[a]ny person employed by a governmental agency or non-governmental organization that screens and inspects luggage prior to being loaded abroad aircraft."

The terms "baggage screener" and "baggage screening entity" appear in independent claims 1 and 10 of the 728 patent. While Tropp, unsurprisingly, takes issue with nearly every aspect of Travel Sentry's proposed construction of "baggage screener" and "baggage screening entity", the conflict between Tropp's and Travel Sentry's proposed constructions of "baggage screener" and "baggage screening entity" centers materially on three issues: (1) whether luggage and baggage are synonyms, (2) whether the screening is limited in scope to screening done in connection with air travel only, and (3) whether it should be further confined to screening that occurs prior to the baggage being boarded onto aircraft.

a. Whether baggage is synonymous with luggage

The words "luggage" and "baggage" appear in both patents. The 728 patent claims "a method of improving carrier baggage inspection by a baggage screening entity" and replaces all references to "luggage" and "luggage screening entity" in the 537 patent to "baggage" and "baggage screening entity" in the 728 patent. However, while the claims in the 728 patent use the word "baggage", the term "luggage" appears predominantly in the specifications of both patents, and both patents are titled "Method of Improving Airline Luggage Inspection".

The 728 patent is a continuation-in-part from the 537 patent. The written descriptions of the 728 and the 537 patents are identical in their treatment of "baggage", although the word appears sparsely in them. The "background of the invention and discussion of the prior art" sections of the 728 and 537 patents state that "[d]ue to the threat of terrorism… the TSA… announced that with respect to luggage at United States airports if a TSA baggage screener was unable to open a traveler's bag for inspection because the bag was locked, the screener would have to break the locks on the traveler's bag. Hence, travelers should leave their bags unlocked. Beginning Jan. 1, 2003 the TSA's federal workers started screening luggage at U.S. airports and when it deemed it necessary it started clipping locks on this luggage in order to open and inspect the luggage. 537 patent, col. 1, ll. 13-25. "[T]ravelers, just getting accustomed to the new security laws, may have legitimate
concerns about baggage inspections… in addition, working as a TSA luggage screener is a highly demanding and stressful job. 537 patent, col. 2, 11. 8-14. Stated differently, there is no indication from the patent's specifications or the prosecution history of either patent 3 that a person of ordinary skill in the art considers "baggage" as covering a different scope than luggage. It appears that both patents use the word "baggage" synonymously with "luggage" which impels the Court to conclude that "baggage" is not ascribed a different meaning from "luggage" within the context of the claims.

3 Interpretations made in the prosecution of a parent application can also affect related continuation in part applications arising from that same patent. See, e.g., Omega Eng'g v. Raytek Corp., 334 F.3d 1314, 1333-34 (Fed. Cir. 2003).

Additionally, the prosecution history for the 728 patent suggests that the word "luggage screening authority" was changed to "baggage screening entity" to "broaden it" to indicate that the term extended to nongovernment entities, but there is no similar argument or remarks made by Tropp indicating that "baggage" should be, and was intended to be given a different meaning from "luggage" (Def.'s Reply Br. Attach.). 4 Accordingly, "baggage screener" and "baggage screening entity" in the 728 patent are synonymous with "luggage screener" and "luggage screening entity" as used in the 537 patent.

4 Reading "baggage" and "luggage" as synonyms is supported not only by the specifications, but also by the fact that the plain meaning of the words themselves are consistent with the patents' written descriptions. Webster's Third New International Dictionary ("Webster's") defines both luggage and baggage as synonyms of the other. Webster's at 162, 1344 (2002). Oxford American Dictionary ("Oxford") defines baggage as a synonym for luggage. Oxford. at 121 (2001).

b. Scope of baggage screening

Travel Sentry argues further that "baggage screener" and "baggage screening entity" should be limited to screenings related to air travel only. This Court agrees. The claim terms of the patents and their written descriptions focus solely on the method's usefulness and applicability for improving air travel screening procedures. When the inventor acts as his own lexicographer, he controls how expansive or narrow the scope of his definition should be, though this asserted definition must be supported by the specification. See Jonsson v. Stanley Works, 903 F.2d 812, 819 (2d Cir. 1990).

Independent claims 1, 9, 14, and 18 in the 537 patent claim "a method of improving airline luggage inspection by a baggage screening entity". Independent claims 1 and 10 in the 728 patent claim "a method of improving carrier baggage inspection by a baggage screening entity", but the language in the 728 patent's specification is nearly identical to the 537 patent with respect to the invention's objectives and benefits. Thus, the specifications for both patents clearly support a finding that the field of the invention extends to air-related travel only. See, e.g., SciMed Life Sys, Inc. v. Advanced Cardiovascular Sys. Inc., 242 F.3d 1337 (Fed Cir. 2001) ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question.").

The patents-in-suit are entitled "Method of Improving Airline Luggage Inspection". In describing the field of the invention, both patents state that "[t]he field of this invention is methods of improving airline luggage inspection, and more particularly, methods of making such inspection less intrusive and more secure". 537 patent, col. 1, 11. 6-8; 728 patent, col. 1, 11. 20-22. Furthermore, the specifications in both patents identically extol the benefits of the invention to air-travelers and airport screeners and are replete with references to screening procedures and problems unique to air travel. For example, the patents discuss the benefits of the invention, which include addressing the concerns of "close to half a billion" airline travelers who pass through airports in the United States. 537 patent, col. 2, 11. 17-20; 728 patent, col. 2, 11. 33-37. The patents also state that "there is a compelling and immediate need for a method of inspecting luggage at airports that does not create a security risk and that is not damaging or aggravating to passengers." 537 patent, col. 2, 11. 21-24; 728 patent, col. 2, 11. 38-41. The laundry list of important objects and advantages of the invention focus entirely on its
usefulness in screening luggage at airports, i.e. to provide a method of screening "at airports that avoids forcible opening of luggage"; to "non-intrusively search[] passenger's luggage at airports", to provide a method of "airport luggage screening that allows the luggage screening authority to get its work done more efficiently," 537 patent, col. 2, col. 2, 11. 55-56, 60-61, 30-32; 728 patent, col. 3, 11. 5-6, 10-11, 48-50. However, notably absent from the patents' written descriptions is any discussion of screening procedures for methods outside of the air travel context; the specifications do not even imply that the procedures covered in the patents extend beyond that scope. The short of it is that both patents focus unequivocally and exclusively on the use of the invention in improving screening procedures related to air travel.

While an inventor's anticipation that an invention would be used in a particular way does not always mean that the patent's scope is applied only in that context, see Northrop Grumman Corp. v. Intel Corp., 325 F.3d 1346 (Fed Cir. 2003), it is both permissible and proper to limit the claims when a patent, read as a whole, makes clear that the claimed invention is actually narrower than the claim language implies. See Alloc, Inc. v. ITC, 342 F.3d 1361, 1370 (2d Cir. 2003). The Court need not go even that far. Here, the patents-in-suit as a whole support a construction that the terms "baggage screener" and "baggage screening entity" describe those screening procedures that take place solely in relation to air travel.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 While the 537 patent uses "luggage screener" and "luggage screening entity", as the Court has determined, these terms are synonymous with "baggage screener" and "baggage screening entity" as they appear in the 728 patent. Accordingly, the analysis regarding the scope of the screening methods and the finding that the patents cover screening procedures only in the context of air travel applies to both patents.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Travel Sentry also argues that such screening procedures should be further limited to those that occur prior to the boarding of the luggage onto aircraft. Unlike the prior limitation, this one is unsupported by the claims and the Court rejects it. The written descriptions do not specify or even imply that such screening is limited to pre-boarded luggage nor do the specifications even require that such luggage be boarded onto aircraft. The Court reaches a similar conclusion with respect to Travel Sentry's parse-out of "entity" as "a government agency or non-governmental organization" in construing the terms. Such line-drawing is, frankly, superfluous for this claim-constructing exercise. At best, the specification of either patent suggests that an entity pertains to some authority responsible for screening, but the Court does not see the utility that is (singularly) apparent to Travel Sentry in defining "entity" as a government authority or a non-government authority. More importantly, beyond burdening these terms with mere surplusage, there is no genuine dispute, no difference, between Tropp's and Travel Sentry's proposed constructions of an "entity".

Accordingly, the Court construes "baggage screener" as a person who screens baggage, and "baggage screening entity" as an "entity that screens baggage"; "baggage" is understood as a synonym for "luggage". As for the term "screening", covered is any and all screening occurring within the scope of air travel.

408

B. "a bail"

For the reasons stated below, the court construes the term "a bail" in claims 19, 22, 37, 47, 50, and 54 to mean:

a hinged band that secures the grounding clip to the electrical conductor.

Beverly asserts that the term bail should be construed to have a semicircular or hoop-like support having curved or arcuate shaped end portions based on an illustrated figure of a bail in the specification. Andrew counters that Beverly has improperly limited the bail to an illustration in the specification despite an absence of language in either the claims, specifications, or prosecution history that would suggest the limitation of a semi-circular or hoop-like shape.

The court finds that Beverly improperly imports limitations from an illustration of a preferred embodiment in the specification and rejects Beverly's construction that the bail is limited to a specific semi-circular or hoop-like shape. See
Phillips, 415 F.3d at 1323 (Fed. Cir. 2005) ("Claims may embrace 'different subject matter than is illustrated in the specific embodiments in the specification.'") (internal citations omitted). Furthermore, as Andrew points out, accepting Beverly's construction would defy the principle of claim differentiation. See Curtiss-Wright Flow Control Corp., 438 F.3d at 1380. Interpreting a bail to be limited to a semi-circular or hoop-like shape would render meaningless claim 30, which is a dependent claim to independent claim 22, and claim 30's reference to a bail with a C-shaped profile. (Ex. 3, col. 10, ln. 6-7.)

1. The Ball Projecting Wheel

The language of claim 1 requires "at least one ball projecting wheel driven rotationally by an electric motor and mounting a pneumatic tire." '325 patent at col. 4, lines 4-7 (emphasis added). Dependent claim 5 includes the same "ball projecting wheel" element as independent claim 1. See '325 patent, col. 4, lines 4-9, 19-22. Both parties agree that the "ball projecting wheel" can only project a ball with a pneumatic tire mounted thereon. However, there is a dispute whether the definition of "ball projecting wheel" itself must include a pneumatic tire. Trend argues that the proper construction of "ball projecting wheel" requires a combination of a wheel and a mounted tire because the wheel alone cannot eject the ball. Trend points out that all of the drawings in the '325 patent show a wheel or wheels having a mounted tire. See id. at figs.1-5.

Jugs claims that Trend's proposed construction is improper because independent claim 1 already provides for the fact that there is a pneumatic tire mounted on the wheel. See id. at col. 4, lines 5-6. Jugs' position is that the claims are clear that the wheel throws a ball and the wheel has a tire; a tire is thus involved in throwing the ball. Jugs argues that to add the wheel limitation into the claim again would unnecessarily lengthen and over complicate the language of claim 1.

The court finds that the intrinsic evidence supports a construction of "ball projecting wheel" that does not include the pneumatic tire limitation. Claim construction "is not an obligatory exercise in redundancy." O2 Micro Intern. Ltd. v. Beyond Innovation Tech. Co., Ltd., 521 F.3d 1351, 1362 (Fed. Cir. 2008) (citation omitted). Rather, "claim construction is a matter of resolution of disputed meanings . . . to clarify and when necessary to explain what the patentee covered by the claims, for use in the determination of infringement." Id. (citation omitted). Here, both parties agree that the "ball projecting wheel" can only project a ball with a pneumatic tire mounted thereon. (See Trend's Opening Claim Construction Br. 4; Jugs' Resp. To Trend's Supplemental Claim Construction Br. 5.) Moreover, the language of claim 1 already provides for the fact that there is a pneumatic tire mounted on the wheel. See '325 patent at col. 4, lines 5-6 ("at least one ball projecting wheel . . . mounting a pneumatic tire."). There is no reason to construe the claim to recite the pneumatic tire twice. Thus, the court construes "ball projecting wheel" to mean:

a wheel capable of projecting a ball.

3. "[B]allast Portion." 3 Used in '740 patent, claim 1; '746 patent, claims 1, 4, 7 and 8.

3 The parties agree that once the dispute regarding the definition of ballast portion is resolved, the definition of prism ballast portion will be "a ballast portion that includes the optic zone."

CooperVision contends that this term means "a portion of a ballast. A ballast being a surface contour of the lens that has a varying thickness to re-orient the lens." CIBA proposes "a surface contour of the lens that has a varying thickness to re-orient the lens and that has consecutive horizontal cross sections throughout the entire structure each of which has
substantially uniform thickness not varying by more than approximately 30 \( \mu \text{m} \) or 20% of the minimum thickness of the cross section."

The central differences between the proposed constructions are whether 1) "ballast portion" refers to a portion of a ballast rather than the portion of the lens with ballast, and 2) the entire ballast must have iso-thickness. See '903 patent, col. 6, ll. 55-61 ("The term iso-thickness means that each of the consecutive horizontal cross sections has a substantially uniform thickness not varying by more than 30 \( \mu \text{m} \) or 20% . . . ").

The patent is for a contact lens "having improved thickness and ballast arrangement." '903 patent, col. 3, ll. 6-9. The heart of the invention is a particular type of ballast with iso-thickness. When the PTO allowed the claims, the examiner stated that "[t]he prior art fails to teach a combination of all the claimed features as presented, for example, in independent claim 1, which includes a contact lens having an improved ballast that imposes a low-torque rotational correction on the lens." Notice of Allowance, 03/22/2002, p. 2, Ex. 13 to Defendant's Responsive Claim Construction Brief. Thus, the feature of an improved ballast was added to distinguish the present invention from the prior art.

The Abstract explains that "the prism ballast is provided on one or more portions of the anterior face of the lens such that the lens body has a uniform thickness of within 10% along horizontal cross-sections." See also '903 patent, col. 6, ll. 39-42. The "iso-thickness ballast surfaces are formed in at least 20% . . . and more preferably at least 100%, of at least one of the superior, intermediate, and inferior portions 40, 44, and 48 as a series of consecutive horizontal cross-sections . . . ." '903 patent, col. 6, ll. 44-50. Figure 5d gives an example of the ballast portion 102 located entirely within the inferior portion of the inner zone.

CooperVision contends that the portions of the inner zone where ballast is not specified in Figures 5a-5d contain non-iso-thickness ballast structures. It is clear from the specification and the figures that the entire inner zone need not contain ballast. Figures 5a-5d illustrate the complete and only ballast surfaces of the lens. Nothing in the specification supports CooperVision's argument that there are other ballast surfaces or portions not illustrated in the figures. Therefore, ballast portion is the portion of the lens with ballast, not simply a portion of the ballast itself. This comports with the following text from the specification:

The present invention provides that consecutive horizontal cross-sections shown in FIG. 2 that possess ballast each has a substantially uniform or iso-thickness, except in optic zone 22 and peripheral zone 24. For example, one of the cross-sections in Fig. 2 having ballast, such as D-D', has a substantially uniform thickness. Alternatively, all of the cross-sections shown in Fig. 2 that possess ballast may have a uniform thickness except in the optic zone 22 and peripheral zone 24. '903 patent, col. 7, ll. 13-21.

The specification also states that "the sections of substantially uniform thickness do not vary in thickness within one section by more than about 30 pm or 20% whichever is greater in absolute terms." '903 patent, col. 7, ll. 23-25 (emphasis added). One skilled in the art could ascertain from this description that the entire lens need not contain ballast, but the section or portion that does have ballast also has substantially uniform or iso-thickness.

That is not to say that the entire lens can only have an iso-thickness ballast arrangement. See '903 patent, col. 11, ll. 25-27. CooperVision correctly points out that the Toric Patents claim techniques useful for creating high performing lenses that contain rotational stabilization structures other than iso-thickness, such as the Meridian Width and A to B Ratio features. But even if the Meridian Width and A to B Ratio are other techniques for re-orienting the lens, whether all ballast must have iso-thickness is a separate issue.

CooperVision also relies on dependent claims 31 and 36, which add the specific limitation of a ballast portion with iso-thickness. However, claims 31 and 36 also contain limitations other than iso-thickness, so the presumption of claim differentiation does not apply.

The claim itself limits the ballast portion to those with "a series of horizontal cross-sections . . . wherein each horizontal cross-section has a substantially uniform thickness not varying by more than 30 \( \mu \text{m} \)." '746 patent, col. 12, ll. 4-13. CIBA's proposed definition, therefore is redundant, and there is no need to repeat those words in the definition of "ballast.
The court defines this term as follows:

"Ballast portion" means: The portion of the lens with ballast. Ballast is a surface contour of the lens that has elevated surfaces that interact with the blinking action of the eyelids to re-orient the lens.
The court agrees that the term "balloon" does not provide sufficient textual reference to include the sterilization process. Accordingly, the term "balloon" does not need to be construed.

b. "balloon catheter"

The term "balloon catheter" appears in claims 7 and 12. ev3 proposes that the term be construed as "a catheter that includes a balloon. A balloon catheter may or may not include a stent." Boston Scientific has not proposed an alternative construction. There is no intrinsic evidence supporting the second part of ev3’s proposed construction. The Court therefore construes "balloon catheter" as "a catheter that includes a balloon." 7

7 This construction also applies to the term "balloon catheter" in ev3’s '103 and '375 Patents.

22. "Balloon-expandable." Consistent with the independent claims of the '053 patent, 46 the prosecution history 47 and its ordinary meaning, 48 the court construes "balloon-expandable" to mean "capable of being increased from one diameter to another by inflating a balloon."

46 Claim 1, '053 patent, col. 6, ll. 2-65; claim 8, '053 patent, col. 7, ll. 9-26; claim 16, '053 patent, col. 7, ll. 46-61.

C. "Bar"

Insight contends that the term "bar," as used in claims 11, 12, 13, 17, 21, and 22, has its "plain and ordinary meaning" being "a length of solid material." Glock contends that "bar" as used in the patent has a clear and well-understood meaning to those skilled in the art. SureFire defines "bar" with reference to The American Heritage Dictionary of the English Language (4th ed. 2000) as "a relatively long, straight, rigid piece of solid material."

As used in the claims, "bar" is "a spring-loaded bar," which in claim 12 includes an "end portion," and in claim 22 "includes first and second end portions." The bar is described in one embodiment as having "a geometry that is complimentary to elongate transverse slot." 6:46-47. The bar may be long enough to extend substantially across the width of the auxiliary device and protrude through an opening, and it must be sufficiently solid or rigid to bias in response to force. 6:47-55. Based on the parties’ submissions and the use of "bar" in the patent, it is construed to mean a piece of solid material with one or two ends and with sufficient rigidity to bias in response to force.
The Court construed the disputed claim terms as follows:
"affixed" means secured
"adjusting" means its functions are: to frictionally receive the belt; to hold the belt to tighten the harness; and to release the belt to tighten it; its corresponding structures are: cam member and bar, or a bottom wall, cam bar and bar, that are described in the '889 patent at col. 1, 55-57, col. 1, ll. 63-68 to col. 2, 1-8, and at ll. col. 3, 65-68 to col. 4, 1-ll. 58, and Figures 3-5, or their equivalents
"cam member" means an eccentrically revolving part with a radial bearing surface; and
"bar" means a part that is longer than it is wide.

The parties also dispute the proper construction of the term "transparent bar." Irwin contends this term means a transparent and straight, cylindrical, rod-like piece that is considerably longer than it is wide. Orosz argues that this term means a transparent piece of material that has a curved surface.

According to Irwin, the terms bar, rod, and tube are used synonymously throughout the patent specification and that no other term or shape is used to describe the transparent bar. Irwin also asserts that the figures included with the patent specification depict a cylindrical bar.

Orosz claims that the prosecution history of the '081 patent demonstrates that both the Patent and Trademark Office and Orosz understood a transparent bar to include something less than a full cylinder. In an office action dated December 29, 1997, the patent examiner stated, "Jehn teaches how a transparent bar may be used for the purpose of projecting light onto an object." (Pl.'s App. at A0058). Figures 1, 5, 6, 7, and 8 of the Jehn Patent, Patent No. 5,446,635, disclose a half-cylinder used for projecting light onto an object.

However, the prosecution history may not be viewed as evidence of the subjective intent of the patent applicant or the patent examiner. "Representations during prosecution cannot enlarge the content of the specification"; and it is proper, instead, to rely on the specification itself for guidance in analyzing the claims. Biogen, Inc. v. Berlex Labs., Inc., 318 F.3d 1132, 1139-40 (Fed. Cir. 2003). Thus, a transparent bar is not required to be construed as something other than a cylinder simply because the prosecution history discloses that a transparent bar could be a half-cylinder.

Here, Orosz has failed to identify anything in the specification that explains a transparent bar is a piece of material with a curved surface. Instead, as Irwin argues, the specification interchangeably uses the words rod and tube with the term bar; and no other descriptive word is used. Moreover, even without referring to the specification, the ordinary meaning of the term bar is not best understood as any piece of material with a curved surface but, rather, as something that is cylindrical in shape. Accordingly, a transparent bar is construed to be a transparent and straight, cylindrical, rod-like piece that is considerably longer than it is wide.
F. Back Bar Mass (Claim 1)

Plaintiff contends that the word "bar" is to be given its ordinary dictionary definition as an object "which is longer than it is wide". See Webster's Third New International Dictionary 73-74 (1981). Alternatively, "bar" is defined as "a piece of any material long in proportion to its thickness or width." See Oxford English Dictionary 165 (compact ed. 1988).

The Defendants seek a broader definition of the word "bar" so as to exclude the requirement that the bar mass has a length greater than its width. Defendants say, for example, that a "bar" could be shaped as a square. However, the Defendants have not proposed a construction for the word "bar" that would include a square. Indeed, Defendants seem to be contending that the word "bar" should be construed to mean an object of any shape at all.

The Court does not find it appropriate to take the shape limitation inherent in the word "bar" out of the claim. The word "bar" will be given its above-quoted ordinary dictionary definition.

GO BACK

1. Construing the Claim

I find that the Dart does not infringe the third element of Claim 1. As such, I conclude that the Dart does not literally infringe on either Claim 1 or Claim 15 of the Schreiber patent.

The third element of Claim 1 reads, "barb means integrally connected to said shaft portion to aid in insertion of said shaft portion into said tissue and to lock said shaft portion into said tissue" (emphasis added). One way to make sense of a "barb means" aiding in the "insertion" of the shaft (as well as locking the shaft in place) would be to construe the "barb means" to include the pointed tip at the head of the shaft (along with the portion of the "barb means" which extends out past the shaft itself). The other way is to construe the "barb means" as a structure connected to the shaft that is swept back towards the base so that it minimally resists the insertion of the shaft (while also locking the shaft in place).

--- Footnotes ---

2 Contrary to Innovasive's assertion, this element is not presented in "means-plus-function" language. An element presented in means-plus-function language does not itself "recite a definite structure which performs the described function." Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996), cert. denied, 139 L. Ed. 2d 20, 118 S. Ct. 56 (1997). Put in the context of this case, the issue is whether the word "barb" defines a definite structure for performing the task. I conclude that it does. See Cole, 102 F.3d at 531 ("the 'perforation means . . . for tearing' element of Cole's claim fails to satisfy the statute [35 U.S. § 112, P 6 (1994)] because it describes the structure supporting the tearing functions (i.e. perforations)"). But the ultimate conclusion here - of no infringement - would hold even if I concluded that the word "barb" did not include a definite structure, since I would then be directed to refer to the specifications in the patent, which would only further buttress the ultimate conclusion.

--- End Footnotes ---

Bionx would have me read the "barb means" in the second way. This would be consistent with the idea that there can be barbs on places on the shaft other than the tip (See Appendix, figures 4, 6, and 7). But while such a construction meets the second requirement of the element in question - "locking said shaft portion into said tissue" - it does not meet the first - "aiding in insertion of said shaft portion into said tissue."

The first construction of the "barb means," as including the pointed tip, obviously provides a more plausible reading of the concept of aiding in the insertion of the shaft. If the Arrow has a pointed tip, which composes part of the "barb means," then the "barb means" plainly aids in the insertion of the rest of the Arrow. If the "barb means" is construed merely as that part of
the barb which is "swept back," then the most that can be said for the "barb means" is that it minimally resists the insertion of the shaft.

Bionx objects that I cannot read Claim 1 to include the requirement of a sharply pointed tip because Claim 9 includes that limitation, and this would make Claim 9 superfluous. Claim 9 reads in full: "The suture of claim 1 wherein said barb means comprises a flat triangular point at the end of said shaft portion opposite said base member and having a width greater than said shaft portion" (emphasis added).

Bionx is mistaken. Construing the "barb means" in the third element of Claim 1 to include the idea of a pointed end does not make Claim 9 superfluous. Claim 9 specifies that the "barb means" is to have a flat triangular head. Without that extra specification, one could imagine that the "barb means" would be, for example, conic, with the lip of the cone extending out beyond the width of the shaft (see Appendix, figure 5, number 52), or with rod-like extensions protruding beyond the edge of the shaft (like the bars depicted in Appendix, figure 7, number 62).

Indeed, rather than undermine the construction of "barb means" to include the pointed tip, Claim 9 supports the construction of the "barb means" as including the pointed tip. For if there were any question whether the "barb means" must be limited to only that part of the barb which locks the Arrow in place, that question is answered in the negative by Claim 9, which describes the "barb means" more broadly.

This construction of the concept of the "barb means" in Claim 1 to include a pointed tip is further confirmed in two ways. First, it is confirmed by comparing Claim 1 with an alternative embodiment of the Arrow, as described in Claim 16 (depicted in Figure 7). Claim 16 has the following three elements:

(a) a solid base member having a substantially flat portion for seating against an exterior surface of said tissue;

(b) a single, rigid cylindrical shaft portion upstanding from and integrally connected to said base member and having a pointed end for insertion into said tissue; and

(c) barb means positioned along said shaft portion.

(emphasis added).

In this embodiment of the Arrow, what serves "for insertion" (i.e. "aids in insertion") is simply the pointed end. This strongly suggests that the "barb means" referred to in Claim 1 - which, rather than the tip of the shaft, is said to "aid in insertion" - should be construed as comprising, in part, the pointed tip of the Arrow.

Second, the construction of the "barb means" as including the pointed tip allows Claim 1, which provides a general description of one preferred embodiment, to capture an essential feature of the Arrow, namely that it can be pushed into a meniscus in and of itself, without the need for any other devices. This feature of the Arrow was emphasized numerous times in the procedural history ("PH"). For example, Dr. Schreiber argued at one point before the Patent and Trademark Office ("PTO") that it "is crucial . . . that no unnecessary enlargement of the aperture of the tissue material through which the fastener must pass through [sic] is required." PH at 97. In other words, the Arrow can be inserted without the use of a carrying needle to bring it into position, and thus, without creating a hole in the tissue wider than the Arrow itself. On another occasion, Dr. Schreiber contrasted the Arrow with another suture which has "no teaching of a rigid shaft as claimed by the Applicant which is necessary to have the suture penetrate through the meniscus tear." PH at 42 (emphasis). While neither of these arguments mentions a pointed tip directly, they clearly indicate that the Arrow has to be capable of penetrating meniscal tissue in and of itself, and that in turn implies that the Arrow must have a pointed tip. Construing the "barb means" in Claim 1 to include the pointed tip brings this essential feature of the Arrow - already implied with the "aid in insertion" language - into the general description of Claim 1.

--------- Footnotes ---------

3 References to the Procedural History are taken from Tab C in the Affidavit of Sarah Chapin Columbia.

--------- End Footnotes ---------
For all of these reasons, I interpret the phrase "a barb means . . . to aid in insertion of said shaft" to imply that the barb means comprises not only the projection from the shaft which locks the shaft in place, but also the pointed tip of the shaft. There may be additional barbs on the shaft (as described in Claims 10-12), but they are distinct from the "barb means" described in the third element of Claim 1.

2. "barrel"

a. Parties' Positions

The parties propose the following constructions for "barrel," which is present in each of the asserted claims as well as the other two patents-in-suit. Dkt. No. 114. The primary dispute between the parties is whether the syringe barrel must be cylindrical in shape.

<table>
<thead>
<tr>
<th>RTI</th>
<th>BD</th>
</tr>
</thead>
<tbody>
<tr>
<td>The elongated part of the syringe body</td>
<td>The elongated cylindrical portion of</td>
</tr>
<tr>
<td>including a portion within which the</td>
<td>the syringe body through which the</td>
</tr>
<tr>
<td>plunger moves during injection</td>
<td>plunger moves during injection</td>
</tr>
</tbody>
</table>

RTI contends the claimed barrel could take a number of conceivable shapes and should not be limited to a cylindrical form. Dkt. No. 111 at 26-27. RTI further argues that the '224 specification specifically contemplates a non-cylindrical barrel. Id. (citing '224, 10:47-50). Moreover, the principle of claim differentiation supports RTI's broad construction as certain claims specifically contain a cylindrical limitation while others do not. Id. at 27 (citing '224, 20:22-23 (claim 25)). Finally, RTI contends that it is improper to limit the claimed barrel to the portion of the syringe through which the plunger moves. Id. Instead, some claims within the '224 and '077 Patent suggest that the term may encompass other structures through which the plunger does not move; specifically, the term may also define the front end portion of the syringe, including the nose portion and retraction mechanism. Id. at 27-28 (citing inter alia '224, 22:37-40 (claim 43) & '077, 22:13-15).

In response, BD relies on numerous dictionaries, which suggest that a barrel is limited to a cylindrical shape. Dkt. No. 112 at 30-31. BD also maintains that every figure in this family of patents shows a cylindrical barrel and expressly labels the non-cylindrical parts of the syringe as a 'nose' or 'transition zone'. Id. Thus, BD argues that the patent figures make clear that the term is limited to a cylindrical shape and does not include narrow parts in the front end of the syringe. Id. In addition, BD contends that the terms barrel, nose, and transition zone should each be given distinct meanings because they are given different names and labels throughout the patent--to do otherwise would render the different labels superfluous. Id.

b. Court's Construction

The Federal Circuit has made it clear that when the specification discloses only a single preferred embodiment, limitations from that embodiment generally should not be imported into the claim language. Phillips v. AWH Corp., 415 F.3d at 1323 (rejecting the contention that "if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment"). Limitations from the specification may be imported into the claims where it is clear that the patentee intended for the "claims and embodiments in the specification to be strictly coextensive." Id. (citing SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001)). Such intention is evidenced by the manner in which the patentee uses a term within the specification and the claims. Id. (citing Snow v. Lake Shore & M.S. Ry. Co., 121 U.S. 617, 630, 7 S. Ct. 1343, 30 L. Ed. 1004, 1887 Dec. Comm'r Pat. 354 (1887) (it was clear from the specification that there was "nothing in the context to indicate that the patentee contemplated any alternative" embodiment to the one presented)).

RTI is correct that all figures in the patents-in-suit generally depict syringes having a cylindrical barrel. The specification of the '224 Patent, however, makes it clear that the patentee contemplated alternative shapes. Specifically, the patent states that the "head of the needle holder is preferably circular but could conceivably be another shape with the retainer member correspondingly configured to conform to it." '224, 10:47-50. As the '224 Patent generally depicts a syringe having a barrel
and needle holder having similar shape, such a statement evidences the patentee's belief that both the needle holder and related barrel could have a non-circular shape. Thus, the patentee may have contemplated a non-cylindrical barrel.

Moreover, claim 25 of the '224 Patent specifically recites a "substantially cylindrical barrel," which strongly suggests that the term is not inherently cylindrical. Furthermore, the absence of this "substantially cylindrical" limitation in other claims suggests that it should not be read into claims in which it is not present. See Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003) ("when a patent claim does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim"). The Court therefore finds that the term barrel should not be limited to a cylindrical shape.

Finally, although this Court believes that the terms barrel, nose, and transition zone are generally distinct components within the patents-in-suit, the patents also suggest that the barrel may encompass some portion of the syringe through which the plunger does not move. Specifically, claim 25 of the '077 Patent recites a "barrel having a front end portion containing a retraction mechanism." If this front end portion of the claimed barrel contains the retraction mechanism, then it cannot logically also be a portion through which the plunger moves. Although the plunger will assuredly move through some portion of the barrel, this Court finds that it would be improper to limit the barrel to that portion.

Accordingly, this Court finds that "barrel" means "the elongated part of the syringe body including a portion through which the plunger moves during injection."

B. "barrier means"

NIJ argues that "barrier means" refers to any perforated structure that attenuates noise. Fisher contends that the word "barrier means" denotes a complete block to the flow of fluid so that, if a "barrier means" is perforated, fluid can flow only through the perforations.

The '510 Patent uses the phrase "barrier means" in independent claims 1, 2 and 13 as one component of a "means for attenuating fluid" (the other component being the "closure member"). Based upon the claims, this Court will therefore construe "barrier means" as any structure, other than the closure member, that attenuates the flow of fluid.

The specification corroborates this definition referring to "perforated barrier means" as "an attenuator plate or like structure" and as "any type of perforated surface capable of performing the desired attenuating function." '510 Patent at col. 1, 11. 49-50 & col. 4, 11. 36-37.

a. "basal rate profile"

i. The Parties' Proposed Construction

In the Joint Claim Construction Chart, Smiths asserts that I should construe "basal rate profile" to mean "an infusion rate with a start and stop time." (D.I. 165 at 39.) At oral argument, Smiths amended its position somewhat, stating that "basal rate profile" is a "basal rate with a start and stop time." (D.I. 269 at 42.) MiniMed argues that I should construe "basal rate profile" to mean "a series of variable liquid infusion rates." (Id.)

Smiths argues that the specification supports its construction of the term "basal rate profile." Specifically, Smiths points to a paragraph in the specification where the term "profile segment," which is described as being programmed with a "start time and a basal rate," and the term "profile" are, says Smiths, used interchangeably. (798 patent, col. 27:1-6.) Smiths also notes that the two terms are used interchangeably throughout the '798 patent. (D.I. 218 at 39, n. 22.) This, Smiths argues, supports the construction of the term "profile" as a single rate. (Id. at 39.) Lastly, Smiths argues that MiniMed's product literature
uses the term "profile" to mean a "basal rate with a start and a stop time." (D.I. 193, Ex. 35 at 136.)

MiniMed argues that, in the part of the specification cited by Smiths, the patentee merely left out the word "segment" after the word "profile." (D.I. 169 at 37, n. 3.) MiniMed further argues that, in the prosecution history, the patentee clearly indicated that the meaning of "basal rate profile" does not mean a constant basal rate. (D.I. 214 at 38-39.) Lastly, MiniMed argues that it is improper for the court to look at MiniMed's product literature in order to construe the claims. (Id.)

ii. The Court's Construction

The definition of "profile" is "a set of data . . . portraying the significant features of something . . . ." Merriam-Webster Dictionary, 928 (10th ed. 2001). The word "set" in this definition supports the construction that "basal rate profile" means multiple rates.

The prosecution history of the patent also supports this construction. In attempting to overcome the examiner's objection to Claim 12, labeled as Claim 54 in the application, the patentee stated that:

the [prior art] references only describe and disclose storing basal and bolus rates in the memory of the pump. Thus . . . [the] references do not disclose, teach or suggest an external infusion device including a memory to store at least two basal rate profiles, as recited in Claim 54.

(D.I. 207, Ex. J at 35 (emphasis added).) In this excerpt, the patentee distinguished storing "basal and bolus rates" from storing "at least two basal rate profiles." (Id.) This supports the argument that a "basal rate profile" is more than a simple "basal rate."

The section of the patent cited by Smiths is unconvincing. In that paragraph, the patentee continually uses the term "profile segments" to refer to a single basal rate. (798 patent, col. 27:1-16.) In the last sentence, however, the patentee uses the term "profile" instead of the term "profile segment." (Id. at 27:13-16.) The fact that the patentee chose the term "profile segment" leads me to believe that, the patentee intended that the term "profile" encompasses multiple segments and that the single use of the term "profile" as opposed to "profile segment" was merely an inadvertent dropping of the word "segment." 24

24 Smiths' statement that the terms "profile" and "profile segment" are used interchangeably throughout the specification is incorrect, as this appears to be the only instance of the two terms being used in such a manner.

Lastly, it is improper for Smiths to argue that literature from MiniMed's commercial embodiment of the invention should be used to construe the terms. See Vitronics, Inc., 90 F.3d at 1584 (stating that "only if there were still some genuine ambiguity in the claims, after consideration of all available intrinsic evidence, should the trial court have resorted to extrinsic evidence").

With respect to the construction of the term "basal rate," I hold that it has a plain meaning that does not include a bolus rate. Neither side has cited, nor have I found anything in the specification or prosecution history that would lead me to expand the definition to include a bolus rate. The term "basal rate profile" means "a series of variable basal rates."

422

G. "base" (claims 6, 10, and 20)
PolyVision's proposed construction
Smart's proposed construction
No construction required. Alt.: The A rigid foundation upon which the bottom part or layer of a structure. support substrate is mounted.

PolyVision contends that this term needs no construction. It offers a construction based upon the dictionary definition of
"base" in the event that construction is required. PolyVision notes that in the preferred embodiments the base as shown is numbered "14" and is the bottom part of the structure. Smart contends that the term must be construed because it serves a particular function in the invention. That is, Smart notes, the base must be rigid because all of the embodiments show the base as supporting the tension between the membrane and the flexible members. As support, Smart cites Fig. 5, which shows the invention with an inverted base and identifies the base as number "14a" without a support substrate. Smart points out, correctly, that it is obvious from this example that the base would need to be rigid, because if it were not, the membrane would not remain tensioned. Smart also notes that in describing the embodiment that includes a support substrate, the specification states that "[b]ase 14 may be metal or plastic" and that the "substrate spacer 16 may be formed of polystyrene or polyurethane foam, or glass," (Col. 3, ll. 26-29), thus indicating that the base must provide the support for the tension of the membrane and the peripheral flexible member. PolyVision counters that Smart's argument is refuted by the specification, which shows that the "base" and "flexible wall" are part of the same one-piece element.

The Court agrees with PolyVision that it would be improper to read the term "rigid" into the claim. While it is certainly true that in the embodiment shown in Fig. 5, the base must be rigid in order to provide support to maintain pressure on the membrane, the same is not necessarily true in the embodiment shown in Fig. 1. As indicated above, the specification states that the substrate spacer may be formed of polystyrene or polyurethane foam, or glass. While the Court is no expert in the area, it can see no reason why a very dense foam spacer or even a glass spacer could not provide the rigidity needed to keep the membrane tensioned, even if the base is not rigid. Accordingly, the Court concludes that no construction is required.

13. "base"

This term is used in Claim 16. Plaintiff asserts that this phrase should be construed as "curved section." Defendants assert that the term need not be construed, and the Court agrees. Because the Court see no ambiguity as to the meaning of the term "base" and because its ordinary and customary meaning is clear to one skilled in the art, the Court declines to construe the phrase as it is used in the '015 Patent.

The court adopts Simmons' construction of the term base:

The claim term "base" means the structure which supports all of the other claimed structures of the snowmobile ski, and upon which all of the other claimed structures of the snowmobile ski stand or are mounted.

According to Random House Webster's Unabridged Dictionary, "base" means "the bottom support of anything: that on which a thing stands or rests: a metal base for the table." The alternate construction proposed by Bombardier does not change the plain meaning as set forth by Simmons. The primary dispute -- whether or not the side portions are a part of the base or whether they are separate structures supported by the base -- is resolved by other language in claim 1 and does not need to be resolved at this point.

Footnotes

8 RANDOM HOUSE WEBSTER'S UNABRIDGED DICTIONARY at 172 (2d. ed. 1993).
The parties have also asked the Court to construe the word "base." The claim language is "a base removably attached and arranged to support the seat." '649 Patent, col. 6, ll. 5-7. The claim defines base as a support for the seat. In other words the "base" is the structure that props up the seat. Similarly, the '862 patent language identifies that the base is separate from the seat and is a structure upon which the seat sits.'862 Patent, col. 6, ll. 12-13.

Initially, the parties disputed the construction of the terms "base" and "slot." Truth argued that the term "base" used in the '308 patent was properly construed as meaning "a one-piece, single element, which is an integral part of the operator and which acts to support the rest of the operator, and which excludes separate but physically or imaginarily joined elements." (Mot. Markman Hearing Claim Construction at P 13.) However, Truth later conceded, in its Opening Claim Construction Brief and at oral argument, that a "base" can be comprised of more than one piece as long as those pieces were cohesive. (Truth's Opening Claim Construction Br. at 5 n.6.)

It should be noted that neither the claims nor the specification of the '308 patent state or specify that a "base" must be a single piece. The '308 patent uses the term "base" to refer to a window operator's bottom support or mounting surface. However, in none of these references does the '308 patent ever state that the bottom support or mounting surface must be composed of a single piece. Furthermore, a "base" is defined as "the bottom of something considered as its support[;] that on which something rests or stands[;] foundation." Webster's Third International Dictionary 180 (3d ed. 1986).

Based on the foregoing, "base" is construed as "the bottom support of the operator; the piece (or multiple pieces) that support the remainder of the operator and/or permit the operator to be mounted to a window frame."

Defendant asks the Court to construe the term "base" and the term "connected to the cable." Defendant argues that "base" means a supporting layer or foundation that serves to support the elements of the device, that needs not render the device free standing. Defendant further argues that "connected to the cable" means that the cable is fastened to the seat, not to a belt that is wrapped around the user. Defendant bases its argument on the definition of "base" reference in the R. Lee Rawls Markman report, as well as specific claims in the '057 patent. Defendant also introduces extrinsic evidence in the form of expert testimony by Evan R. Flavell.

As a threshold matter, the Court notes that the term "base" is the tenth disputed claim presented by the parties. This Court previously limited claim construction to a total of ten disputed claims. (Dkt. # 288). Accordingly, the Court will not construe the term "connected to the cable."

The "base" is described in the patents at issue as follows:

the machine comprises a rigid frame or base 10 having an upright U-shaped post 12 and a short horizontal leg 14 rigidly connected to post 12, e.g., by means of triangularly-shaped side corner plates 16. An elongated section 18 is hinged to leg 14 by means of a hinge 20, which is clearly shown in Fig. 9. . . . Base 10, including horizontal leg 14, corner plate 16, and base section 18 can be made of a light metal, such as aluminum or aluminum alloy, or of any other suitable material.

'057 Patent at 2:66-3:30 and '704 Patent at 3:25-55. The parties agree that the common meaning of base, something on which a thing stands or by which it is supported, correctly describes the term "base" as used in the context of this patent. However, plaintiff asks the Court to also construe the term to mean "floor-supported" frame, including all of the named components above, while defendant argues that nothing in the claim requires that the base be free standing or "floor-supported." In addition, defendant appears to argue that the term base refers only to the horizontal element that lies on the floor. Based on the intrinsic record for these patents, the Court finds that the "base" does include the components listed above, but does not require that these components be "floor-supported" as plaintiff suggests.

The language of the specifications demonstrates that the "base" is intended to include all of the components listed, not just
one piece. For example, the inventor uses the inclusive words "a rigid frame or base 10 having . . .," '057 Patent at 2:66-67 and '704 Patent at 3:25-26 (emphasis added), and "[b]ase 10 including . . .." '057 Patent at 3:27 and '704 Patent at 3:54. Moreover, in other sections of the specifications, the inventor refers to individual components of the base as "base sections." For example, the inventor first identifies section 18 as "an elongated section," then refers to it subsequently as "base section 18." '057 Patent at 3:2 and 3:29 and '704 Patent at 3:29 and 3:55.

This intent to include all of the base components in the term "base" is further evidenced by the prosecution history of the '704 Patent. In the initial patent application the frame and the base were described separately:

the machine comprises a rigid frame 10 formed by an upright U-shaped post 12 and a horizontal leg 14 rigidly connected to post 12, e.g., by means of triangularly-shaped side corner plates 16. A base 18 is hinged to leg 14 by means of a hinge 20, which is clearly shown in Fig. 9.

(Dkt. # 319, Ex. D at NAUT 003310). Accordingly, the term "base" strictly referred to the horizontal section 18, as shown in Figure 9. (Dkt. # 319, Ex. D at NAUT 003328). However, that patent application was rejected, and in response to the rejection, the definition of "base" was amended with the more inclusive language highlighted above:

the machine comprises a rigid frame or base 10 having an upright U-shaped post 12 and a short horizontal leg 14 rigidly connected to post 12, e.g., by means of triangularly-shaped side corner plates 16. An elongated section 18 is hinged to leg 14 by means of a hinge 20, which is clearly shown in Fig. 9.

(Dkt. # 319, Ex. D at NAUT 003310) (emphasis added). Thus, the definition of base was broadened to include both the horizontal and vertical components. Accordingly, this Court finds that the term "base" includes the components described in the specifications, not just the horizontal section 18.

However, the Court does not find that anything in the claims or specifications requires the "base" to be "floor-supported" as plaintiff asserts. In fact, the doctrine of claim differentiation weakens any suggestion that claim 7 includes such limitation. While the Court recognizes that the doctrine of claim differentiation is not a hard and fast rule of construction, it does create a presumption that each claim in a patent has a different scope. Claim 8 incorporates claim 7 by reference and further defines the term "base" with an additional limitation: "wherein the base is adapted to rest on a horizontal supporting surface, and the seat includes wheels engageable with the supporting surface." '057 Patent at 7:33-36 and '704 Patent at 7:62-65. If this Court were to interpret the term "base" to include the limitation "floor-supported," as plaintiff asserts, it would render claim 8 superfluous and nearly redundant of claims 7 and 1, the exception being the description of the seat including wheels engageable with the supporting surface. Plaintiff has not shown any reason sufficient to rebut the presumption that claims 1 and 7 should not be so limited in order to preserve the distinction between claims 7 and 8. Consequently, the Court declines to limit the term "base" to a "floor-supported" structure.

428

B. "Base"/"Base End"

The district court construed the term "base" in Claim 11 to refer to "the general area that lies beneath the face member of each wing or side where the flexing occurs, rather than a structurally distinguishable finite section of each wing." Trial Tr., Vol. 5 at 120. Similarly, the court construed the term "base end" in Claim 15 to mean "a general area of each side, rather than a structurally distinguishable finite section of each side." Id. Bridgeport maintains that the meaning of these terms is facially unclear, and advocates recourse to the specification to supplement the allegedly deficient claim language. Bridgeport contends that resort to the specification establishes that the "only legitimate construction of 'base end'" is "a structurally distinguishable, finite section of each of the plurality of the wings or sides."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

1 Bridgeport argues that the claim term should be "base end" in Claim 1 as well as in Claim 15, because the word "and" following "base" in Claim 1 is allegedly a typographical error introduced by the PTO. We must take the claim as we find it, however. See Cardiac Pacemakers, Inc. v. St. Jude Med., Inc., 296 F.3d 1106, 1115 (Fed. Cir. 2002) ("This court will not
We do not accept Bridgeport's premise that the use of "base" or "base end" "so deprives the claim of clarity' as to require resort to the other intrinsic evidence for a definite meaning." CCS Fitness, 288 F.3d at 1367 (quoting Johnson Worldwide, 175 F.3d at 990). Bridgeport simply asserts that the terms are unclear; it does not explain why one of ordinary skill in the art would not be able to understand what was signified by those terms. Because we do not find the terms at issue unclear, we decline to resort to the specification to supplant the ordinary meaning of those terms, and find no error in the district court's construction.

**Base member**

The Court construes "base member" as the "lowermost portion of the system that supports the arm assembly above a surface." Both parties agree that the term’s plain and ordinary meaning applies, but they disagree as to what that plain and ordinary meaning is.

Defendants proposed construction is “the portion of the display system that provides support for the display system from a surface.” Defendants proposed construction is overly broad and fails to give meaning to the term “base.” Even though Defendants agree that the plain and ordinary meaning applies, they fail to account for that meaning in their construction. See Philips, 415 F.3d at 1312–13 (words of a claim should generally be given their plain and ordinary meaning).

MASS proposes that “base member” means “the lowermost portion of the system for resting on a work surface and that supports the arm assembly above the work surface.” MASS relies on both intrinsic and extrinsic evidence for its construction. MASS claims the prosecution history limits the base to “resting on a work surface.” See MASS’s Opening Brief, Ex. C. During prosecution, the inventor stated, “this [base] is used to support the arm assembly above a work surface.” See MASS’s Opening Brief, Ex. C. During prosecution, the inventor stated, “this [base] is used to support the arm assembly above a work surface.” Id. However, the prosecution history does not reference where the base must rest; thus, MASS’s construction is incorrect in limiting base to “resting on a work surface.” MASS’s limit of “lowermost portion” incorporates “base’s” plain and ordinary meaning. The dictionary defines “base” as “1 a (1): the lower part of a wall, pier, or column considered as a separate architectural feature (2): the lower part of a complete architectural design b: the bottom of something considered as its support.” MASS’s Opening Brief, Ex. E (emphasis in original). When the base component is illustrated, the base component is shown as the lowermost portion of the system. See ‘978 patent, Figs. 1–6 (showing base 12 as the lowermost portion); 12–16 (showing base 102 as the lowermost portion); 17–18 (showing base 156 as the lowermost portion). As one of ordinary skill in the art would understand that the “base” is the lower or lowermost part of the structure, that limitation must be included. Both parties agree that the base is used to support the system. Accordingly, the Court construes “base member” as “the lowermost portion of the system that supports the arm assembly above a surface.

C. "a base member"

Defendants cite to various other patents, which would have been prior art at the time of the '448 application, for the proposition that "base member" means "an integral support structure." Because the patent specification is reasonably clear on the structure of this element, and owing to the general presumption in favor of construing claim terms using intrinsic evidence, reference to other patents or additional extrinsic evidence is unnecessary. See Key Pharms, 161 F.3d at 716. Plaintiff cites to the patent specification, in particular column 2 at line 19, for the proposition that "base member" should be construed to mean a "housing." However, that sentence states that the device "basically comprises a base or housing," thereby implying that a base member is not a housing. In addition, while the patent specification appears to use the two
terms interchangeably in some places, it also clearly distinguishes between the two in others. Compare Patent Abstract ("A toy device for a pet animal comprises a base housing having an upper wall . . . ") with Column 1, Line 27 ("The base preferably comprises a housing in which the rotatable member and drive assembly are mounted . . . ") (emphasis added). Accordingly, the Court cannot find that the specification clearly defines the term "base member" as a "housing."

Rather, the implication present throughout the patent, and the Court's understanding of the plain meaning, indicate that the term "base member" should be construed as "supporting structural unit."

2 American Heritage Dictionary defines "base," as used in the context of the '448 patent, as: "a supporting part or layer; a foundation."

"Member," in this context, is defined as: "a structural unit, such as a beam or wall."

In briefing their proposed constructions of this phrase, neither party appears to have accounted for all of the differences in language employed in Claim 11, as opposed to Claim 1. The Court, however, feels that Patentee's different choice of language to describe the base member in Claim 11 is important and must be given effect in construing the claim. The differences are subtle, but significant. To wit, in Claim 1, the base member has a lower surface for freely seating on a substantially flat surface; and that lower surface has no projections for connection to the seating surface. In Claim 11, the base member has a lower edge for freely seating on the ground; that lower edge lying in a substantially flat plane and having no protrusions projecting downward from said plane.

The Court finds that the difference between "edge" and "surface" is not significant. However, Claim 11's edge freely sits on the ground, not any substantially flat surface. The ground, which is defined as the "solid surface of the earth," while flat in places, can be significantly uneven or irregular. Accordingly, as in Claim 1, the lower edge of the device would not necessarily be flat itself. This construction, however, ignores the crucial additional phrase of Claim 11: "the lower edge lying in a substantially flat plane." Neither party has briefed the meaning of this phrase. A plane is defined as "an unbounded two-dimensional shape" or "a surface containing all the straight lines that connect any two points on it." As it is a two-dimensional shape, it is perfectly regular and flat, though not necessarily horizontal. A substantially flat plane, then, is one that is mostly horizontal. As the lower edge lies in the plane, not on it, all of the points on the lower edge must be regularized and, thus, the edge itself must be flat. The Court, therefore, finds that the lower edge must be a flat surface that lies mostly horizontal on the ground.

12 American Heritage Dictionary defines "edge," as used in the context of the '448 patent, as: "the line of intersection of two surfaces."

14 American Heritage Dictionary defines "flat" as: "having a horizontal surface without a slope, tilt, or curvature."
Claim 11 also refers to the absence of any protrusions from the lower edge, which would project downwardly from the mostly horizontal plane. Claim 1 referred to projections, not protrusions - a distinction the Court considers immaterial - but also referred to the purpose of the projections, i.e., for connection to the seating surface. No such limitation exists in Claim 11. Accordingly, the device in Claim 11 does not contain any part that protrudes out from the lower edge of the device and proceeds downward, regardless of its intended purpose.

The Court therefore construes "a base member having a lower edge for seating freely on the ground, the lower edge lying in a substantially flat plane and having no protrusions projecting downward from said plane" as "a supporting structural unit having a flat lower edge for sitting on, unsecured to, the ground in a mostly horizontal position. This unit shall have no parts extending downward from its lower edge."

3. "base of the user's fingers"

McHugh asserts that this term does not require construction, while H&B asserts that it does. Nevertheless, because there is a controversy regarding this term, this Court will construe the term "base of the user's fingers." See Markman, 517 U.S. at 374.

Claim 1 of the patent recites a hand grip comprising an elongated resilient member that is "configured to fit at a base of the user's fingers in a gap between the palm of the user's hand and the base of the user's fingers." (5:15-17.) McHugh's proposed construction for "base of the user's fingers" is "over the proximal phalanx A2 pulley region of the user's fingers." H&B's proposed construction is "the location where the palm joins the fingers."

The primary controversy regarding this term is whether "base of the user's fingers" refers to the specific location where the palm joins the fingers or whether "base" should be construed more broadly to include the entire area over the proximal phalanx A2 pulley region of the user's fingers. The location where the palm joins the fingers is within the area over the proximal phalanx A2 pulley region of the finger. (Brief at 21.) As always, the Court begins its analysis with the language of the claim itself. The claim states that the elongated resilient member is supposed to fit "at the base of the user's fingers … in a gap between a palm of the user's hand and the base of the user's fingers." (5:15-17.) Here, the claim language indicates that the gap is not a separate location apart from the base of the user's fingers or the palm of the user's hand. Instead, the gap is formed by an interaction of the fingers and the palm. This conclusion is further supported by the written description. The written description states that when users grip any equipment with a handle, the superficial transverse "metacarpal ligament, along with associated muscle and skin tissue, [is] forced over the fingers." (1:50-51.) When the skin above the superficial transverse metacarpal ligament rubs the skin near the base of the fingers, the skin "often becomes blistered or callused with repetitive use of hand-held equipment." (2:40-41.) The invention is designed to fill this gap and prevent the ligament and associated muscle and skin tissue from being forced over the fingers.

The Court finds that H&B's construction is more persuasive, as its construction is supported by the written description. The written description indicates that the patented invention "fits in the user's hand near where the palm joins the fingers." (1:43-44.) As the claim states that the elongated member is configured to fit at the base of the user's fingers, this is clear evidence that the base of the fingers is where the palm joins the fingers.

McHugh's proposed construction also provides for this placement because the location at which the palm joins the fingers is contained within the proximal phalanx A2 pulley region. However, McHugh's construction is too broad because the proximal phalanx A2 pulley region encompasses not only the location where the gap is formed, but the part of the finger above that location as well. If the member were above both the palm and the base of the fingers, it would not be able to separate the superficial transverse metacarpal ligament from the fingers. Thus, the claim language and the written description indicate that the base of the user's fingers is not a region, but rather a specific location on the hand. Most importantly, McHugh's construction is not supported by the patent claims or the intrinsic evidence of the patent.

Accordingly, the Court adopts H&B's proposed construction and construes the term "base of the user's fingers" to mean: "the location where the palm joins the fingers."
"A modular prosthesis system comprising a prosthetic base portion . . . and a stem extension . . ."

Zimmer asserts that the Federal Circuit only partially construed the term "stem extension" when it held that it encompasses both one-piece and multiple-piece stem extensions. Zimmer argues that the Federal Circuit did not construe the terms of this limitation which refer to the parts that make up the claimed "stem extension." Zimmer's proposed construction of this claim term is: "a standardized prosthesis system including a prosthetic base portion . . . and a stem extension, that are located on the same side of a joint" (emphasis added). Zimmer asserts that one of ordinary skill in the art would understand that the base portion and stem extension must be located on the same side of a joint. Zimmer states that this construction is compelled by the claim language itself, which requires that the stem extension be mounted to the base portion. 04/06/05 Zimmer Mem. at 123. Zimmer reasons that the meaning of the term "base," the claim language (base portion and stem extension are mounted together), and the specification compel this construction. Finally, Zimmer asserts that the term "base portion" is readily understandable according to its ordinary meaning as being a "supporting part of layer." Id. at 123 (quoting Webster's New Universal Unabridged Dictionary (1992)).

Howmedica asserts that Zimmer's construction is incorrect because it adds an unstated limitation. Howmedica stated, "Zimmer cannot avoid the Federal Circuit's claim construction by throwing in the terms base portion' and stem extension' and calling it a new' claim term requiring an entirely new construction." 05/06/05 Howmedica Mem. at 7. Howmedica states that the plain language of claim 1 does not require that the base portion and stem extension be located on the same side of the joint, but rather broadly recites a "modular prosthesis system." 05/06/05 Howmedica Mem at 8. Further, Howmedica states that Zimmer admitted that "the 313 patent does not claim a joint, and the term "joint" does not appear anywhere in the patent." Id. at 9 (quoting Zimmer's Statement of Undisputed Facts at P 7). Rather, Howmedica argues that claim 1 only requires "a modular prosthesis system," "a prosthetic base portion," and "a stem extension." As such, Howmedica asserts that the proper construction of this term is a "prosthesis system of standardized units" with no requirement that the base portion and stem extension be located on the same side of the joint. Transcript of Oral Proceedings Held on 06/09/05 at 3.

In construing this claim term, this Court looked first to the specification of which it is a part. One "purpose for examining the specification is to determine if the patentee has limited the scope of the claims." Watts. v. XL Sys., Inc., 232 F.3d 877, 882 (Fed. Cir. 2000). The specification reveals that claim 1 contemplates the connection between the base portion and stem extension to be one that is both "releasably fixed" and as one providing "a secure mating interlock." 313 patent, col. 5, 11. 36-36; col. 6, 11. 5-7. This connection is described in the specification as occurring at the undersurface of the base portion, whereas the other surface of the base portion is attached to an "articular surface or additional portion. 313 patent, col. 2, 11. 57-59. Additionally, the adjacent surfaces of the base portion and stem extension are in a bone cavity. 313 patent, col. 4, 11. 7-21. If the base portion and stem extension could be located on opposite sides of a joint, then the space between the two would be the joint space-where articulation occurs-rather than in a bone cavity. This would be in direct contravention of the specification. Finally, a study of the figures in the specification and in the descriptions of the embodiments in the specification show that the base portion and stem extension cannot, then, be on opposite sides of the joint, because this type of prosthetic joint requires movement between the components on either side. See Crowninshield Decl. P 27. As such, this Court adopt's Zimmer's proposed construction and construes this term as requiring "a standardized prosthesis system including a prosthetic base portion . . . and a stem extension, that are located on the same side of a joint."
10. The Parties disagree about how the base rate number is derived. Medtronic asserts that "base rate" is defined as any rate higher than the normal heart rate, determined as a function of the heart rate prior to cardioversion. It asserts that only under its definition would the device appropriately respond to a sudden reduction in cardiac rate.

Guidant argues that under Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1372 (Fed. Cir. 2003), it is appropriate to parse out the words of the term to arrive at an ordinary meaning. In doing so, Guidant argues that "base" means "the starting point or line for an action or undertaking." Webster's Ninth New Collegiate Dictionary 133 (1990). The Parties agree that the ordinary meaning of "rate" is "pacing rate." Thus, Guidant argues that "base rate" means the rate at which ventricular pacing starts, which is higher than a preselected lower rate where the pacing ends up.

Guidant asserts that Claim 1 does not state that the base rate is a determined or calculated value, as opposed to a programmed value. The claim does not mention the calculation or determination of the base rate.

As Guidant notes, although overcoming the "sudden reduction in cardiac rate" that may result from applying cardioverting electrical energy to the atria is an advantage of the invention, "advantages described in the body of the specification, if not included in the claims, are not per se limitations to the claimed invention." Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 334 F.3d 1294, 1301 (Fed. Cir. 2003) (citation omitted).

The Court agrees with Guidant. The claim refers only to a "base rate," not a method for determining the base rate. For support, Medtronic cites to the referred embodiment of the '600 Patent. The Court will not rely on these portions of the specification because it is inappropriate to import limitations from the preferred embodiment into claim construction. See Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002). Medtronic also cites to the background portion of the specification and the prosecution history to support its argument that it proffered interpretation of "base rate" is consistent with the perceived purpose of the claimed invention which is to avoid the problems associated with a sudden reduction in cardiac rate following successful cardioversion or defibrillation. The Court should not limit its claim construction based on the perceived purpose of the invention. See E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 1370 (Fed. Cir. 2003). Therefore, Medtronic's proposed limits will not be included in the Court's claim construction.

Thus, the proper interpretation of "base rate" is the rate at which ventricular pacing starts. The rate is higher than a preselected lower rate.

A.

We first turn to the "base section" limitation, which appears in all but one of the asserted claims. More particularly, "base section" is found in claims 1-3, 6, 8, 20, and 21 of the '149 patent; claims 19, 21, and 23 of the '630 patent; and claims 7, 8, 12, 13, 16, and 18 of the '317 patent. As noted, the district court construed this limitation to have a single meaning for all three of the patents-in-suit: "the bottom support structure of the snowmobile seat." Claim Construction, 2007 U.S. Dist. LEXIS 98875 at *35.

According to Boss, notwithstanding the fact that the patents' specifications are nearly identical, each patent should have a different construction for the term "base section":

The '149 Patent: "a cellular structure that forms at least part of the bottom of the seat."

The '630 Patent: "a cellular structure that forms at least part of the bottom of the seat and which can be directly or indirectly mounted to the snowmobile."

The '317 Patent: "a cellular structure that forms at least a part of the bottom of the seat and which can be mounted to other support structure that in turn can be mounted to the snowmobile."

Boss argues that the district court erred by construing "base section" identically for all three patents because "the specifications of the Boss Patents successively broaden the scope of 'base section.'" Specifically, Boss highlights that each
Yamaha counters that the district court's construction of "base section" is supported by the all three patents' claims and specifications. In addition, Yamaha points out that both the preferred and alternative embodiments indicate that the "base section" is the bottom structure that provides support. Moreover, Yamaha argues that Boss's proposed constructions import unnecessary limitations into the claims and misinterpret the patents' specifications.

We hold that the district court correctly construed "base section" as the "bottom support structure of the snowmobile seat." Contrary to Boss's arguments, the district court's construction--"bottom support structure of the snowmobile seat"--does not improperly limit "base section" to a preferred embodiment. Rather, it is in accordance with the entirety of each patents' intrinsic evidence. See, e.g., Phillips, 415 F.3d at 1314-15 (emphasizing a patent's intrinsic evidence as particularly important to claim construction); Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1370-71 (Fed. Cir. 2003) (looking to "whether the specification read as a whole suggests that the very character of the invention requires" a particular claim construction). In addition, because each patent-in-suit is derived from the same parent application and shares many common terms with its sister patents, the district court correctly interpreted "base section" consistently across all of the asserted patents. See NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2005) ("Because NTP's patents all derive from the same parent application and share many common terms, we must interpret the claims consistently across all asserted patents."); Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990) ("The '912 patent is the result of a continuation-in-part application from the original '008 application, which led to the '251 patent. Hence . . . the construction of the term 'diffuse light' contained in that patent, is relevant to an understanding of 'diffuse light' as that term is used in the '912 patent.").

We begin by looking at the claim language itself, which is instructive of the proper construction of "base section." See Phillips, 415 F.3d at 1314 ("[T]he claims themselves provide substantial guidance as to the meaning of particular claim terms."). Several claims at issue in each patent indicate that the "base section" has a "lower surface for mounting on a snowmobile" and that "a flexible seat section [is] disposed on the base section . . . on which a rider may sit." '149 patent col.9 ll.53-57; col.12 ll.31-38; see '317 patent col.10 ll.65-67; col.11 ll.19-25 (claiming that the flexible seat section, upon which the rider sits, is placed on top of the base section); '630 patent col.11 ll.41-44 (claiming that a flexible seat section is disposed on a generally rigid base section); col.12 ll.18-23 (claiming "a substantially rigid base section, supporting the flexible seat section," upon which a rider may sit). Other claims similarly state that the base section "has a bottom surface configured to abut an upper surface of the track tunnel of the snowmobile" and that "the rigid base section provides a desired shape and structure of the seat." '317 patent col.11 ll.25-29; col.12 ll.10-13, 42-46. In addition, certain unasserted claims likewise suggest that the "base section" must be the bottom structure of the seat. See, e.g., Phillips, 415 F.3d at 1314 ("unasserted [claims] can also be valuable sources of enlightenment"). For example, several such claims indicate that the "base section" includes "fasteners" to couple the seat to the body of the snowmobile. See, e.g., '317 patent col.10 ll.28-61 ("fasteners being coupled on the lower surface of the base section and configured to be coupled to the snowmobile to resist horizontal movement between the base section and the snowmobile"); '630 patent col.20 ll.5-16 ("fasteners, configured to be coupled between the base section and the snowmobile" to resist movement between the base section and the snowmobile); '149 patent col.10 ll.30-35 ("fasteners being coupled on the lower surface of the base section and configured to be coupled to the snowmobile"). The fact that the base section abuts, mounts, and fastens to the upper portion of the snowmobile body indicates that it must be the bottom of the snowmobile seat. Indeed, it would be difficult, if not impossible, to mount the base section to the top of the snowmobile, using the fasteners on the base section's bottom, if the base section was not the bottom of the snowmobile seat. Similarly, that the base section is placed underneath the flexible seat section and that it provides the shape of the snowmobile seat, certainly denotes that the base section provides support for the snowmobile seat upon which the rider sits.

While the claims provide guidance, the district court's construction of "base section" is further confirmed, and consistently explained in detail, by each patents' specification. See Phillips, 415 F.3d at 1315 (acknowledging that the specification is "always highly relevant" and usually dispositive). The patents' specifications emphasize exactly what was described in the claims--that the base section has a bottom surface that is disposed on, and abuts, the snowmobile body and an upper surface for placing a flexible seat section upon which the rider may sit. See '149 patent col.2 ll.40-45; col.4 ll.8-13; col.6 ll.33-34; see also '630 patent col.3 ll.35-36 ("The front 24, like the bottom 22, abuts the snowmobile 23."); col.4 ll.25-26 ("The seat section 60 has an upper surface 62 on which a rider may sit."); col.6 ll.3-4 ("bottom 222 disposed on the snowmobile 23");
part of the base section, the base section is therefore the bottom structure of the snowmobile seat. Logically, because both the higher and lower surfaces are higher than the lower surface, but still part of the bottom of the base section. Indeed, the "lower surface 42" forms a part of the bottom of the snowmobile seat, and another fastener on the top of the snowmobile body.

Thus, the base section is required to be the bottom structure of the snowmobile seat.

Further emphasizing that the base section is the bottom structure of the snowmobile seat, the base section consists of formed cavities that fit around various components located on the snowmobile itself, such as the gas tank, engine, and battery. '630 patent col.4 ll.14-16; '149 patent col.4 ll.58-60; '317 patent col.2 ll.2-32 (describing various indentations in the base section to "match" components on the snowmobile body). In this way, the base section can act as a "leak barrier between the snowmobile components . . . and the flexible seat section," which is placed on top of the base section. '317 patent col.2 ll.27-30; see, e.g., '630 patent col.3 ll.47-50 (explaining that the base section "does not absorb moisture or water"); '149 patent col.4 ll.25-28 (same). If the base section was not the bottom of the snowmobile seat, it would not need to be formed with cavities to "match" the shape of the snowmobile body and components; nor could it protect the flexible seat section from leaking snowmobile components.

The patents' specifications similarly reiterate that the base section is the support structure of the snowmobile seat. Specifically, each patents' specification states that the "base section . . . is substantially rigid and provides support for the seat []." '149 patent col.4 ll.22; col.6 ll.38-40; '630 patent col.3 ll.42-43; col.6 ll.7-9; '317 patent col.4 ll.5-7; col.7 ll.1-3, and "provide[s] strength and rigidity," '630 patent col.3 ll.47-48; '149 patent col.4 ll.24-26; '317 patent col.4 ll.20-22. The statement in the specification that the base section "prevents the seat from collapsing onto the snowmobile components" and "provide[s] the desired shape and structure of the seat," '317 patent col.2 ll.23-25; col.4 ll.24-26; col.4 ll.64-col.5 l.5, further suggests that the base section is required to be the bottom structure.

Boss cites several portions of the patents-in-suit, suggesting both that its proposed constructions are correct and that the district court's construction is unduly narrow. In emphasizing these excerpts, however, Boss attempts to read unnecessary limitations into the claims and misinterprets the specification.

Arguing that the "base section" should be only "at least a part of the bottom" of the snowmobile seat, Boss stresses that each patent explains that the "base section 40 has a lower surface 42 that forms at least part of the bottom 22." See, e.g., '317 Patent col.4 ll.44-45 (emphasis added); see also '149 patent col.4 ll.44-45; '630 patent col.3 ll.66-67. Boss, however, misinterprets these statements in the specifications. Tellingly, the "at least part of the bottom 22" of the snowmobile seat language does not describe the entire base section 40. Instead, as clarified in figure 4, the "at least a part of the bottom 22" language only describes the "lower surface 42." In other words, the "bottom 22" of the snowmobile seat consists of at least a "lower surface 42" of the base section, but may consist of another surface on the bottom of the base section--i.e., a surface higher than the lower surface, but still part of the bottom of the base section. Indeed, the "lower surface 42" forms a part of the bottom 22, while the higher surface, indicated by 46, forms the remaining part of the bottom 22. Thus, the higher and lower surfaces form the entire bottom of the snowmobile seat. Logically, because both the higher and lower surfaces are part of the base section, the base section is therefore the bottom structure of the snowmobile seat.
A "higher surface" should not be confused with the "upper surface" of the base section, which is exemplified by 52 and 54 in figure 4. The "upper surface" is on the top of the base section, and the rider either sits directly on the "upper surface" or on a "flexible seat section" placed on the "upper surface." See, e.g., '317 patent col.5 ll.6-23. In contrast, the "higher surface" refers to a surface higher than lower surface, but nonetheless still on the bottom of the base section. See, e.g., '317 patent fig.4. Accordingly, both the higher and lower surfaces make up the bottom of the base section, which abuts the snowmobile body.

We recognize that the patents' specifications describe item 46 in figure 4 as "additional cavities." See, e.g., '149 patent col.4 l.58. We in no way contradict this disclosure, but, because the higher surface in figure 4 is not labeled, we simply use 46 as a convenient reference.

Next, Boss cites the specification language stating that the base section, or bottom thereof, can be "directly or indirectly mounted on the snowmobile." This suggests to Boss that the base section for all patents need only be "at least a part of the bottom" of the snowmobile seat. See '630 patent col.3 ll.31-32; col.3 l.67-col.4 l.1; col.6 ll.19-21. Because this statement only appears in the '630 patent, Boss also argues that its unique construction of base section in the '630 patent is correct. This disclosure, however, does not further explain the difference between directly and indirectly mounting and does not prevent the base section from being the "bottom support structure of the snowmobile." Rather, based on the entirety of the intrinsic evidence, including these specific statements, the base section can still be indirectly mounted to the snowmobile while being the "bottom" structure of the snowmobile seat. Moreover, the other portions of the specifications, which more clearly discuss mounting the snowmobile seat to the snowmobile body, disclose using "hook-and-loop type fasteners" or the "snap type fasteners." See, e.g., '630 patent col.5 ll.10-35; col.8 ll.8-61. Not only do neither of these mounting fasteners preclude the base section from being the bottom structure, but they in fact support that the base section must be the bottom structure of the snowmobile seat. As explained, mounting the base section to the top of the snowmobile--using the fasteners on the base section's bottom--would be difficult unless the base section was the bottom of the snowmobile seat. As such, if the base section is "indirectly mounted on the snowmobile" using either of these fastener-types, the base section is nonetheless the "bottom support structure of the snowmobile seat."

Boss also points out that the '317 patent states that "the base structure can be mounted to other support structure that in turn can be mounted on the track tunnel." See '317 patent col.4 ll.14-16. According to Boss, this statement both proves its different construction for the '317 patent and that, because the base section can be mounted to an additional support structure, the base section is not necessarily the bottom support structure. Boss, however, overlooks that this statement is not inconsistent with the base section being the bottom support structure of the snowmobile seat, despite being mounted to another support structure. In fact, the cited passage suggests that the "other support structure" is not part of the snowmobile seat, but rather is part of the snowmobile body or is independent from any other part. The claim construction, however, requires the base section to be the "bottom support structure of the snowmobile seat." As such, even assuming the "other support structure" provides some support to the bottom of the seat, it is neither the bottom structure nor the support structure of the snowmobile seat. Thus, the base section remains both the bottom structure and the support structure of the snowmobile seat.

For the foregoing reasons, we hold the district court correctly construed "base section" for all three patents-in-suit to mean the "bottom support structure of the snowmobile seat." We have considered Boss's additional arguments on this issue, but find them unpersuasive.

436

A. Claim 1(a) -- "Base Unit"

Claim 1(a) describes an upright floor cleaner containing "a base unit for reciprocable translation over a floor to be cleaned." '315 Patent at 4:17-18. The parties dispute whether the "base unit" so described must include the entirety of the device's cleaning mechanism. Dyson argues that the term "base unit" should be construed as "the main part of the floor cleaner's cleaning mechanism (which includes, among other things, the motor, fan, and brushbar) that constitutes the preponderance
of the weight of the vacuum cleaner and... carries the rest of the cleaner along the floor." See Joint Claim Constr. Statement at A-1. Oreck, by contrast, asserts that "base unit" refers only to the head, or nozzle, of an upright cleaner and "can be defined as the place into which the dirt or debris is suctioned or swept." See id. Under Oreck's proposed construction, the base unit of an upright vacuum cleaner described by the '315 patent can, but need not, include parts such as the motor and fan.

Neither party suggests that the term "base unit" has a specialized meaning to people experienced in the art, and "base unit" is not defined in either the patent claims or the specification. The specification does, however, contain several descriptive references to the term "base unit." The description of the preferred embodiment states that "[t]he floor cleaning mechanism disposed within the housing of base unit 2 is not shown but may be of any conventional well-known type." '315 Patent at 2:47-50 (emphasis added). Similarly, the specification later refers to "the cleaning mechanism of base unit 2." Id. at 2:57-58. These statements evidence that the inventors intended the term "base unit" to mean that portion of the cleaning device that contains the device's cleaning mechanism. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1251-52 (Fed. Cir. 1998) (looking to specification for evidence as to intended definition of claim term). Moreover, nothing in the patent claims or the specification suggests that any portion of the cleaning mechanism could be located anywhere but in the base unit. In light of the intrinsic evidence available to the Court of the meaning intended by the inventors, the Court finds that a person of ordinary skill in the art at the time of the invention would understand the term "base unit," as used in the '315 patent, to mean the portion of an upright floor cleaner that contains the device's cleaning mechanism. 3

3 Oreck inadvertently supports this construction in its claim construction brief. Referring to Dyson's product, Oreck states that the DC14 is "unusual in that its motor and suction fan are not located within the nozzle assembly, as is customary." Oreck Claim Constr. Mem. at 5 n.4. This statement implies that it is, in fact, "customary" for an upright vacuum cleaner to have the motor and fan included within the same apparatus as the nozzle of the cleaner, which suggests that a person of ordinary skill in the art at the time of the invention would understand the nozzle assembly, or "base unit," of such a device to contain the entire cleaning mechanism, including the motor and fan.

Oreck attempts to minimize the significance of the term "base unit" to the '315 patent. It asserts that the claims and the specification simply "assume" that any upright cleaner will have a "base unit;" that "the '315 patent is not concerned with fans and motors;" and that "this claim element does not constitute an invention." Oreck Claim Constr. Mem. at 3; Oreck Supp. Mem. at 8. Although these might be accurate statements, they are not grounds for disregarding what the Court has determined is the ordinary meaning of the term "base unit." A "base unit" is one of the express structural limitations of the patent claims, and the Court cannot dismiss that limitation as unimportant or immaterial simply because it was not the primary focus of the invention. See, e.g., Bicon, Inc. v. Straumann Co., 441 F.3d 945, 950 (Fed. Cir. 2006) ("Allowing a patentee to argue that physical structures and characteristics specifically described in a claim are merely superfluous would... leav[e] examiners and the public to guess about which claim language the drafter deems necessary to his claimed invention and which language is merely superfluous, nonlimiting elaboration."); Techsearch, L.L.C. v. Intel Corp., 286 F.3d 1360, 1373 (Fed. Cir. 2002) ("We have... recognized that specific claim limitations cannot be ignored as insignificant or immaterial in determining infringement.").

The Court therefore finds that the term "base unit" in claim 1(a) means that part of the floor cleaner that contains the device's cleaning mechanism.

5. "Determining [determine] an elapsed time period based on a time at which the characteristic appeared in the signal." Used in Claims 13(d), 18, and 31; and "Measuring an elapsed time period based on a time at which the characteristic appeared in the signal." Used in Claim 27(d).

Nike states that no construction of "an elapsed time period" is necessary, and that the term should be given its plain and ordinary meaning in each of these claims. Adidas proposes measuring the time period that begins when the person starts...
moving and ends when it is determined that the person has ceased moving." There is no disagreement that some interval of
time is being determined or measured. The dispute is whether or not it must end when the characteristic of the signal
appears.

The pertinent language of Claims 13, 18, 27, and 31 is very similar so the court will refer specifically to Claim 13. That
claim describes generation of a signal after a person has begun walking or running. Paragraph (c) of Claim 13 describes
"analyzing the signal to identify a characteristic in the signal that indicates the person has initially ceased taking footsteps." '
314 patent, col. 14,11. 18-21 (emphasis added). The disputed phrase is found in paragraph (d) of Claim 13, and, logically,
"the characteristic" must refer back to "characteristic" in paragraph (c) of Claim 13. "Characteristic" is not used elsewhere in
the Claim.

Therefore, the phrase in dispute refers only to the characteristic "that indicates the person has initially ceased taking
footsteps," or, as it has been agreed, when the person has stopped stepping. There is no reference to the time the person
began stepping. The elapsed time to be measured could be from the point at which the first step was taken. But that is not
required by the claim language. It could be from the time the person stopped. Nothing in the claim language would
eliminate the second possibility, which might be found in a system which measured a set time after stopping and then started
a pulse or blood pressure monitor to determine recovery. (The time it takes the individual to return to the individual's resting
pulse rate or blood pressure.)

The specification describes both situations - measurement of time between the first and last steps, and the taking of some
action at some time interval after the point at which the characteristic which shows the person first stops. See '314 patent,
col. 11, 11. 53-62. ("a timer is stopped or another appropriate action is taken."). Additionally, the specification states that
two timers may be involved, which indicates that the "elapsed time period" measured from when the "characteristic" shows
that steps have stopped may not be related to the time the steps started. See '314 patent, col. 12, 11. 6-7 (timer stopped
when the steps started).

Adidas' strongest argument is based on statements made by the patentee to the Examiner. An Office Action mailed
September 15, 2000 rejected Claim 14 (present Claim 13) because it would have been obvious to one of ordinary skill to
combine U.S. Patent No. 5,720,200 ("Anderson") and U.S. Patent No. 5,976,083 ("Richardson") to achieve the same result.
See Office Action, 9/15/2000, Ex. K to Nike's Opening Claim Construction Brief, [Doc. # 70, Attachment # 1, pp. 18-19 of
50]. The Response to the Office Action used the phrase "and to determine an elapsed time period between when the first and
to Nike's Opening Claim Construction Brief, [Doc. # 70, Attachment # 1, p. 45 of 50]. But that does not accurately describe
Claim 13, which does not mention a first characteristic. The Response goes on to state:

the proposed combination of Anderson and Richardson does not disclose or suggest at least one controller, or any other
device, that determines an elapsed time period based upon an identified characteristic in a signal that indicates that a person
has initially ceased taking footsteps after having been walking or running.

Brief, [Doc. # 70, Attachment # 1, p. 45 of 50].

Taken together, these statements in successive paragraphs in the Response are not the most accurate exposition of the claim
language. They are also not a clear limitation on, nor a disavowal of, an embodiment of the language in Claim 13 (nor
Claims 18, 27, and 31).

The claim language and the specification indicate that the "elapsed time period" may occur before or after the
"characteristic" appears. The court will construe this claim term as follows:

Determining or measuring "an elapsed time period" based on a time at which the characteristic appeared in the signal
means: "Using the point at which the characteristic appears to determine or measure an interval of time."
A. Frame

As previously noted, in Demarini II, the district court, before reaching the question of infringement, construed the term "large-diameter impact portion." Demarini II, slip op. at 6-8. The court also found it a necessity to adopt a definition of the term "frame" or "bat frame" before reaching the issue of infringement. Id. at 6 n.1. The court adopted the interpretation "that the bat frame is the single piece with the large portion for hitting the ball at one end, tapering to the handle with a knob at the other end." Id.

DeMarini contends that the district court's construction of the claim term "frame" was improper. Specifically, DeMarini takes issue with the district court's construction of the term "frame" as modified by the term "bat" set forth in DeMarini II, i.e., "a single piece with a large portion for hitting the ball at one end, tapering to the handle with a knob at the other end." Id. DeMarini's basic position is that a "bat frame" is a hollow tube of the sort that covers the hitting end of a bat (i.e., an external shell that is large enough to hold an insert), and that an "insert" is a structure that incorporates both the handle and the portion of the hitting end of the bat that goes inside the external shell. DeMarini argues that this was how the term "frame" was construed in DeMarini I and that the district court improperly reinterpreted the term "frame" in DeMarini II. We do not agree that the district court reinterpreted the term "frame" in DeMarini II. In DeMarini I, the term "frame" was not in dispute and the district court's discussion of the term "frame" was simply to give context to the discussion of the disputed terms "gap" and "interference fit" and not to set forth a binding definition. The court did not focus its attention on the structural requirements of a bat "frame" until it came time to grapple with the issue of literal infringement of claim 15, an issue raised by DeMarini only after the court released its DeMarini I opinion.

DeMarini presents five arguments as to why its proffered definition is correct and that of the district court in DeMarini II is erroneous. First, DeMarini notes that the ordinary meaning of frame is "an open structure or rim for encasing, holding or bordering." Second, DeMarini notes that an integral relationship of the handle, the impact portion, and the tapered portion of the frame is only described as a preferred embodiment in the written description and that this written description indicates that other configurations, such as separate pieces, fall within the scope of the invention. Third, DeMarini contends that a handle cannot be a required part of the frame since the insert of the invention cannot fit inside the handle. Fourth, DeMarini notes that in view of the discourse between the Examiner and the patentee regarding U.S. Patent No. 5,219,164, issued to Peng ("Peng '164"), it is clear that the Examiner understood that the term "frame" did not require an integral handle. Fifth, and last, DeMarini notes that, in view of the fact that it never attempted to distinguish its claimed invention from the Peng '164 insert, which extends outside the axial limits of the "frame," it obviously never considered that the claim term "frame" must include an impact portion and a handle.

DeMarini's arguments fail to persuade us that its proffered definition is the correct construction for the claim term "frame" as modified by the claim term "bat." We address each of DeMarini's contentions beginning first with the argument that a handle cannot be a required part of the frame because the insert of the invention cannot fit inside the handle. The district court's definition of frame does not require the insert to fit inside the handle, it merely requires that the insert be contained within some part of the frame which consists of the impact portion, the tapering portion, and the handle portion of the bat.

As we noted above, interpreting claims requires a review of all of the intrinsic evidence: the claim language, the written description, and the prosecution history. The claim language does little to elucidate what structure is described by "bat frame," and "bat frame" is not specifically defined in the written description. Consequently, we begin our construction of the term "bat frame" by looking at the ordinary meaning of the term "frame." We deem it appropriate to use the dictionary definition proffered by DeMarini; i.e., "an open structure or rim for encasing, holding or bordering," because it is a standard dictionary definition, which Worth does not dispute. DeMarini would have us end our analysis with this definition to reach its conclusion that this term only requires that one tube be large enough to accommodate a second tube inside of it. We decline DeMarini's invitation. We cannot look at the ordinary meaning of the term "frame" in a vacuum. Rather, we must look at the ordinary meaning in the context of the written description and the prosecution history of the '398 patent to determine the proper construction of that term as modified by the claim term "bat" and as used in the claims of the '398 patent.

The written description of the '398 patent indicates that the invention particularly relates to the use of structural members inside of softball or baseball bats to improve their impact response. '398 patent, col. 1, ll. 6-11. The patent discusses prior art attempts to provide for greater impact response by constructing tubular bats using materials other than aluminum, and the high cost and difficulty of working with materials such as titanium. Id. at ll. 49-56. The patent also discloses that prior art
bats have been made using inserts, but that most of these inserts are positioned for vibration deadening purposes. Id. at ll. 57-59. In addition, the patent recognizes that there is at least one prior art bat that uses an insert in a bat to improve the "repelling action" of the bat. Id at ll. 59-62. But, the patent further discloses that the insert of that prior art bat is in "tight abutment within the tubular frame" of the bat, thus merely providing a thickened wall of the impact portion of the bat. Id. at ll. 60-68.

After its discussion of the prior art shortcomings, the patent indicates that one of the objects of the invention is to design a new bat with a simple construction. See id., col. 2, ll. 1-8. Thereafter, a preferred embodiment of the invention is described. See id., col. 2, ll. 9-23. That description includes a discussion of the external structure of the tubular bat frame, namely that it has a large-diameter impact portion, an intermediate tapering portion, and a small-diameter handle portion. The description also indicates where the tubular insert is positioned in the bat frame and the manner in which the tubular insert is suspended in the frame. Id.

The detailed description of the invention found at col. 2, l. 39, and continuing through col. 5, l. 52, which describes a manner of providing for an improved impact response according to one embodiment of the invention, notes, as does the "preferred embodiment," that the tubular bat frame has a relatively large-diameter impact portion, an intermediate tapering portion, and a relatively small-diameter handle portion. Id. at col. 2, ll. 39-49. This description then describes the insert and a manner of placing it within the frame to achieve an interference fit and obtain the leaf-spring effect and greater slugging capacity. Id. at col. 2, l. 50 - col. 3, l. 35. Other manners of achieving an interference fit by positive attachments of the insert are described at col. 4, ll. 24-60. At col. 5, ll. 33-45, the patent describes yet another embodiment of the invention in which a positive attachment of the insert to the frame may be dispensed with, while still achieving the leaf-spring effect. Thus, the detailed description of the invention discusses at great length a variety of ways of placing an insert within a bat frame to achieve greater slugging capacity through the leaf-spring effect.

Contrary to DeMarini's argument, the patent does not suggest a bat frame consisting of less than a handle, a tapered portion, and an impact portion. DeMarini points out that the patent indicates that forming the bat frame by swaging an integral, weld-free frame is only an exemplary manner of making the bat frame, and that "all permutations of component dimensions and configurations fall within the scope of the present invention." Id. at col. 3, l. 66 - col. 4, l. 23. The latter remark, however, comes just after the statement that "many permutations of bat frame, insert, and gap dimensions will work equally as well." In other words, the "components" contemplated in the "all permutations" remark clearly refers to the insert, the gap, and the bat frame as a whole--not just the handle, the taper portion, and the impact portion of the bat frame. Moreover, as for "swaging" only being an exemplary manner of constructing the bat frame, this remark only indicates that there are other methods aside from swaging that can be used to make the bat frame, i.e., that the bat frame structure need not be made in a single construction step--not that the frame does not include the handle, the tapering portion, and the impact portion.

Turning now to the prosecution history, we disagree with DeMarini that the discourse between the Examiner and the patentee regarding the U.S. Patent No. 5, 219,164 ("Peng '164 patent"), clearly shows that the Examiner understood that the term "frame" did not require an integral handle. The Peng '164 patent discloses the following with regard to its inventive bat structure: (1) an elongated handle 10, with an axial cavity formed therein; (2) a tapering tubular stem 20; (3) a generally cylindrical main body 30, with a taper section to the rear; (4) an elastic shock and vibration absorbing end piece 40; and (5) a guard piece 50. See Peng '164 patent, col. 1, ll. 4-10. The above-listed components are assembled together, with the end piece 40, the main body 30, the guard piece 50, and the handle 10 all arranged on the stem 20 to form a completed bat. This shock absorbing baseball bat structure can be seen in figure 1 immediately below.

GET DRAWING SHEET 1 OF 4.

The examiner rejected DeMarini's original claims 1 and 2 as being clearly anticipated by the Peng '164 patent under 35 U.S.C. § 102(e). Original claim 1 read:

A bat comprising:

- a hollow tubular bat frame; and an insert positioned within the frame, the insert having first and second ends adjoining the tubular fame, the insert being separated from the tubular frame by a gap along a central portion between said first and second ends.
In his rejection, the examiner did not make reference to any particular feature of the Peng '164 bat that he considered to be the "bat frame" or the "insert" in his rejection. It was only DeMarini, and not the examiner, who characterized the main body 30 as a "frame" and the tapering tubular stem 20 as an "insert." The examiner made no comment on DeMarini's naming of the parts of the Peng '164 bat. DeMarini would have us infer a meaning for the term "frame" drawn from the examiner's silence, rather than from its response to the examiner's rejection. Drawing inferences of the meaning of claim terms from an examiner's silence is not a proper basis on which to construe a patent claim, and we reject DeMarini's arguments predicated on such inferences.

DeMarini also contends that because it never argued that the Peng '164 insert distinguished the Peng '164 patent from the claimed invention by extending outside the axial limits of the "main body 30," DeMarini never considered the claim term "frame" to include an impact portion and a handle. However, just as we can draw no inference from what the examiner did not say, we can draw no inference from what DeMarini did not argue. It could just as easily be presumed from DeMarini's silence that DeMarini recognized that when the "main body 30" was connected to the handle, the "insert" of the Peng '164 bat did not extend beyond the "bat frame" of the Peng '164 bat, just as the claimed "insert" does not extend beyond the "bat frame."

In view of the ordinary definition of the term "frame" and the explanation of that term in conjunction with the term "bat" in the written description and intrinsic record, we conclude that "frame" as modified by the term "bat" and used in claims 1 and 18 means a tubular structure having a large-diameter impact portion, a tapered portion and a small-diameter handle, all of which are connected when the bat is fully constructed for its intended use. This is substantially the same definition of "bat frame" given by the district court in DeMarini II.

A. Claim Construction and Infringement

DDI challenges the summary judgment of noninfringement on the grounds that the district court construed the claims of the '156 patent erroneously. Its primary arguments relate to the appropriate reach of the term "beads" in Claim 1, which the district court construed to mean "small frozen droplets . . . which have a smooth, spherical (round or ball shaped) appearance." The district court's construction also excluded processes which produce any "irregular or odd shaped particles such as 'popcorn.'" The district court correctly found that the claim steps mentioning "beads" were limited to covering processes that produce beads and only beads. The accused process produces both spheres and irregular particles, so under this construction, the defendants do not infringe. DDI objects both to the definition of "beads" and to the district court's refusal to use the word "comprising" to extend the coverage of the claim beyond a beads-only process. As to the definition of "beads," the district court correctly noted that the written description specifically describes "beads" as having a "smooth, spherical appearance." '156 patent col.5 ll.22-23. Indeed, DDI argued to the Special Master before whom the construction issue was originally presented that a "bead" was "a small round ball or round drop." There is no error in the district court's definition of this term.

3 As described supra, the claim construction and summary judgment phases of this litigation were handled by the United States District Court for the Northern District of Georgia. "The district court" as used in this section refers to that court.

A. Construing "elongated beam"

Defendant Neway Anchorlok argues that "beam," as claimed by claim 16 of the '237 patent, should be construed to mean an integral elongated structural member in a suspension system that is similar to Figures 9-12 of the '237 patent. Referring to
those figures, Plaintiff Neway Anchorlok argues that the beam must connect the beam to the axle without additional parts, including U-bolts, brackets, sleeves, or welds. As Neway Anchorlok interprets "beam," the axle must insert through some opening or orifice in the beam. Otherwise it would not rigidly connect the axle to the beam. 3

3 Defendant Neway Anchorlok says that claim 16 cannot include elements extrinsic to the beam to affix the axle. If Neway Anchorlok's interpretation controlled, the only apparent method of rigidly affixing the beam to the axle would be through some opening similar to an orifice. See Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1358 (Fed. Cir. 1999) ("35 U.S.C. § 101 mandates that any patentable invention be useful and, accordingly, the subject matter of the claim must be operable.")

In suggesting that "beam" be interpreted to require a member similar to Figures 9-12, Defendant Neway Anchorlok runs afoul of the doctrine of claim differentiation.

The doctrine of claim differentiation is ultimately based on the common sense notion that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope. See Karlin Technologies, Inc. v. Surgical Dynamics, Inc. 177 F.3d 968, 971 (Fed. Cir. 1999) (citing Comark Communications Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998)). Thus, limitations stated in dependent claims are not normally read into the independent claim from which they depend. See id. (citing Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995)); see also Comark, 156 F.3d at 1187 ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant.") (citing Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987)). As described above, dependent claim 17 explicitly teaches:

The suspension system of claim 16 wherein said means for rigidly connecting said axle to said beam comprises an orifice in said beam which substantially surrounds said axle and is rigidly attached thereto, thereby to prevent said axle from assuming a cross-sectional shape substantially different from its unstressed shape when said torsional forces are imposed upon it. (Emphasis added.)

Dependent claim 17 thus differentiates itself from claim 16 by saying the axle is attached through an orifice.

Here, dependent claim 17 teaches the same structure that Defendant Neway Anchorlok says should be required of claim 16. If Neway Anchorlok's construction of claim 16 was accepted, the Court would be reading limitations stated in dependent claim 17 into independent claim 16, the claim upon which claim 17 depends.

Here, the specifications teach several versions of the invention. The '237 patent teaches generally:

In another form of the invention there is provided in an axle suspension system wherein external forces imposed on the vehicle to which the suspension system is attached result in a torsional force being imposed on the axle, the suspension system including a brake actuation mechanism comprised of a brake chamber, and S-cam bearing, slack adjuster, and elongated beam, a pneumatic bellows located on the beam, a hanger bracket located at one end of the beam, means for rigidly connecting the axle to the beam, and a pivot connection for resiliently connecting the beam to the hanger bracket, the improvement comprising means located on the beam for attaching said S-cam bearing directly to the beam, and means for directly attaching the brake chamber to the beam.
'237 patent, col. 5, ll. 58 - col. 6, ll. 1-5.

The '237 patent then teaches that the preferred embodiment involves attaching the axle to the beam through an orifice:

In a particularly preferred embodiment of the present invention, there is provided in a beam type axle suspension system . . . means for rigidly connecting the axle to the beam, comprising an orifice in the beam of a larger size but substantially the same shape as the axle and through which the axle, with a sleeve rigidly attached thereto, is slid or pressed.

'237 patent, col. 6, ll. 5-13.

The '237 patent specifications uses the term "beam" even though the "beam" does not have an inherent method of attaching to the axle:

"A typical trailing arm suspension 17 is shown in Figs. 5, 6 & 8 in this respect. . . . Beam 42 has a means of a rigid attachment 44 to axle 7."

'237 patent, col. 3, ll. 50-55. Before the '237 patent issued, the prior art understood the phrase "beam" to include beams that were secured to an axle by means of U-bolts.

The '237 patent specifications thus suggest more than one embodiment of the invention. Only in the preferred embodiment does the '237 patent teach that the axle is attached by sliding or pressing the axle through an orifice. In other embodiments, the '237 patent teaches a rigid connection between the beam and axle. It does not require the connection be made through the orifice described in the preferred embodiment.

Also, the '237 patent history suggests that the focus of its claim prosecution had been on its movement of the brake actuation mechanism from the axle to the beam. After the initial application was made, the Patent and Trademark Office denied the patent application on the ground that it had been anticipated by the Raidel patent, 4 among others. The claim was later allowed after the inventor argued that the Raidel patent did not suggest placement of the brake actuation mechanism on the beam and that the Raidel patent was a different kind of suspension. Importantly, none of the '237 patent history suggests that the axle's placement through an orifice in the beam was ever an important issue during the claim prosecution.

4 U.S. Patent No. 4,132,432.

- - - - - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

To summarize, claim 16 of '237 patent uses a means-plus-function format to teach a trailing arm suspension that moved the brake actuation mechanism from the axle to an elongated beam. While claim 16 describes only "an elongated beam," claim 17 of the '237 patent differentiates by teaching a "beam comprises an orifice in said beam which substantially surrounds said axle and is rigidly attached thereto."

In similar fashion, the '237 patent specifications teach several versions of the invention. Certain specifications teach a more general description of the beam. Other specifications teach a preferred embodiment that includes beams with orifices for the receipt of the axle.

In Micro Chemical, Inc. v. Great Plains Chemical Co., Inc., 194 F.3d 1250, 1257-58 (Fed. Cir. 1999), the Federal Circuit recognized that in a means-plus-function format patent, the patent should be construed through the identification of the structure in the specification which performs the recited function. The Court held that a means-plus-function claim should not be limited to a "structure from the written description beyond that necessary to perform the claimed function." Id.; see also Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999).

In this means-plus-function claim, the Court looks to the structure in the written description necessary to perform the claimed functions. While the preferred embodiment of the '237 patent includes a beam with an orifice to connect the axle to
the beam, these elements are not necessary to perform the claimed function. The doctrine of claim differentiation argues against this construction. If claim 16 of the '237 patent required the elongated beam to have an orifice in said beam which substantially surrounds said axle and is rigidly attached thereto, there was no reason for claim 17 of the '237 patent.

In claim 16 of the '237 patent, the Court construes "beam" to a mean an integral elongated structural member in a suspension system and attached at the other end by a rigid connection to an axle and equivalents thereto.

In claim 17 of the '237 patent, the Court construes "beam" to a mean an integral elongated structural member in a suspension system without any distinct means, structure, or component to attach the suspension system's axle to the beam, such as U-bolts, brackets, sleeves or welds and equivalents thereto.

(c) "Beam Transport System Configuration"

Of the four terms in this phrase, "beam" and "configuration" have already been defined. Configuration means an arrangement of elements or physical properties. In this context, configuration is modified by the preceding terms "beam transport system." Accordingly, the phrase means the arrangement of the beam transport system's physical properties. This definition dovetails nicely into the definition of the term "system," infra. 29 As Plaintiff Optivus points out, Webster's Third defines "transport" to mean "to transfer or convey from one person or place to another." (Airhart Decl. Ex. N at 230.) The Oxford English Dictionary includes a nearly identical definition. OXFORD ENGLISH DICTIONARY (2d ed. 1989). The Oxford English Dictionary defines the term "system" as "[a] set or assemblage of things connected, associated, or interdependent, so as to form a complex unity; a whole composed of parts in orderly arrangement according to some scheme or plan; rarely applied to a simple or small assemblage of things"; and "[i]n various scientific and technical uses: A group, set, or aggregate of things, natural or artificial, forming a connected or complex whole…. b. of artificial objects or appliances arranged or organized for some special purpose, as … pieces of mechanism[.]" Id. Microsoft defines the term as "any collection of component elements that work together to perform a task." (Airhart Decl. Ex. P at 250.) Of the definitions offered by the American Heritage Dictionary, the following stand out as particularly germane: "A functionally related group of elements, especially: A group of interacting mechanical or electrical components [or] … A network of related computer software, hardware, and data transmission devices." AMERICAN HERITAGE DICTIONARY (4th ed. 2000).

29 Relying exclusively on the patent specification and expert testimony, Defendant Ion Beam tries to define the term without breaking it down into constituent parts. Defendant proffers the following definition: "the set of all switching, dipole and quadrupole magnets which direct the beam from the beam source for delivery in the treatment rooms, including the beam transport apparatus, switchyard and gantries." (Ion Beam P.&A. at 26.) At first glance, it is difficult to distinguish between "beam transport apparatus," and the term Defendant is trying to define - beam transport system." As a result, the definition does not appear to adequately define the term. Moreover, the definition is overly narrow and seems to import limitations from the specification and expert testimony.

Accordingly, the entire phrase at issue - "beam transport configuration system" - is hereby held to mean "the arrangement of all the interacting elements and components used to convey the beam." 30 See id.

30 Optivus proposes "the arrangement of a system of devices to convey the beam." (Optivus P.&A. at 25.) Ion Beam, on the other hand, suggests "the set of all switching dipole & quadrupole magnets which direct the beam from the beam source for delivery in the treatment rooms, including the beam transport apparatus, switchyard and gantries." (Ion Beam P.&A. at 26.)
442

G. Beams of Light

The term "beams of light" is used in both Claims 1 and 3. While some of Pitney's representations during reexamination of the 272 patent suggest a dispute between the parties regarding the meaning of this term, Pitney now states that there is no dispute. Judge Covello found the term "a plurality of beams of light" to mean "multiple beams of light generated sequentially from one or more light sources." Pitney I, 69 F. Supp. 2d at 317. The parties agree that such "beams of light" include any type of light beam and are not limited to laser beams or diffraction limited systems. The court therefore agrees with Judge Covello's definition and does not limit "beams of light" to any particular type of light beam.

443

E. "Bearing Against Said Wall Structure Near Said Opening to Seal Said Opening"

Alaris proposes the following definition for this claim term: "the seal is situated in contact with the wall structure [of the housing] near the opening of the proximal end of the housing to make the opening fluid tight." ICU in turn proposes the following definition: "the seal presses against the wall structure near the opening to prevent leakage of fluid into the valve when the seal is in the decompressed state." At issue between the parties with respect to this term is (1) whether the verb "seal" requires that the opening be fluid tight or just that it be sufficient to prevent leakage and (2) whether this claim term refers only to when the valve is in a decompressed state.

With respect to the first issue, the applicable passage from the Common Specification makes clear that the seal in question is intended to be a fluid tight seal:

The seal in the decompressed state has a section which fills essentially completely a portion of the cavity adjacent to the opening. The seal section bears against the wall structure near the opening to seal the opening. In the compressed state, the seal section is pushed by the delivery end of the medical implement away from the opening and into the cavity. A fluid tight seal is maintained between the seal section and the wall structure as the seal is moved into the compressed estate. The seal section bears against the wall structure as the seal is moved inward into the cavity by the tip of the medical implement … A fluid tight seal is maintained over repeated opening and closing of the valve …

Id. At 3:35-57 (emphasis added). The use in two instances of the word "maintained" in describing the fluid tight nature of the seal thus makes clear that the seal described in this claim term is fluid tight at all times.

Although the claim language itself with respect to the second point is somewhat ambiguous, the above quoted passage from the Common Specification also makes clear that this claim term is not limited to the decompressed state. In particular, the assertion that "the seal section bears against the wall structure as the seal is moved inward into the cavity by the tip of the medical implement" - i.e., when the valve is in the compressed state - makes plain that this claim term is applicable to both the compressed and decompressed states.

The proper construction of "bearing against said wall structure near said opening to seal said opening" is thus "the seal is situated in contact with the wall structure [of the housing] near the opening of the proximal end of the housing to make the opening fluid tight."

444

G. "a spring bearing directly against the memory card when in place in the memory card socket for urging the replaceable memory card out of the socket" / "a spring bearing directly against the memory card"

Minerva seeks construction of the term "a spring bearing directly against the memory card when in place in the memory
card socket for urging the replaceable memory card out of the socket." Minerva argues that this term means "a spring that is compressed by the memory card when the memory card is inserted in the socket, and which pushes the memory card out of the socket." On the other hand, the defendants ask the court to construe the shorter term "a spring bearing directly against the memory card" to mean "a spring touching the memory card." Claim 93 reads in part, "said replaceable memory card socket being provided with a spring bearing directly against the memory card when in place in the memory card socket for urging the replaceable memory card out of the socket." The following sentence is the sole disclosure of a spring in the specification: "Still further, the socket 120A may be provided with a spring for urging the card 200 outwardly as soon as the card is unlatched."

The two primary differences between the parties' proposed constructions are whether the spring touches the memory card and whether the spring is compressed by the memory card. The defendants assert that the plain and ordinary meaning of "bearing" is "to support or sustain" and "directly" means "with nothing or no one between." In addition, Minerva's proposed construction is wrong, according to the defendants, because "compress" or "compressing" appears nowhere in the claims or specification.

Minerva responds that the defendants' proposed construction should be rejected because it violates the doctrine of claim differentiation. Clearstream Wastewater Sys. Inc. v. Hydro-Action Inc., 206 F.3d 1440, 1446 (Fed. Cir. 2000) ("Under the doctrine of claim differentiation, it is presumed that different words used in different claims result in a difference in meaning and scope for each of the claims."). The parties have already agreed that the term "a spring in direct contact with the replaceable memory card," used in claims 96 and 97, means "a spring touching." Minerva argues that the defendants' proposed construction would result in "a spring touching" and "a spring bearing against" having the same meaning. The plaintiff also contends that, although the patent does not contain the word "compress," compression of the spring is implicitly disclosed to one of ordinary skill in the art. The ordinary artisan allegedly understands that a spring has to be compressed before it may urge the memory card out of the socket.

The court agrees that the "bearing directly against" language requires the spring to touch the memory card. The doctrine of claim differentiation is a rebuttable presumption, and it may not be used to overcome the plain meaning of the claim language. Mycogen Plant Sci., Inc. v. Monsanto Co., 243 F.3d 1316, 1329 (Fed. Cir. 2001). The dictionary definition of "directly" is "in immediate physical contact," and the definition of "against" is "in contact with." Merriam-Webster's Collegiate Dictionary 22, 354. Nothing in the specification or claim language rebuts this plain meaning of the phrase "bearing directly against." In addition, the claim differentiation presumption is weaker when two independent claims are compared, as opposed to an independent claim and an associated dependent claim. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006) (holding that "the claim differentiation tool works best in the relationship between independent and dependent claims").

The court finds that the claim language, which requires the spring to urge the memory card out of the socket, implicitly discloses compression of the spring. Therefore, the court construes the term "a spring bearing directly against the memory card when in place in the memory card socket for urging the replaceable memory card out of the socket" to mean "a spring that is compressed and directly contacted by the memory card when the memory card is inserted in the socket, and which pushes the memory card out of the socket."

1. "Bearing Plate"

The '933 Patent makes numerous references to the term "bearing plate." See, e.g., Summary of the Invention ("The present invention is directed to a mine roof and rib support system and apparatus and generally includes a square bearing plate....") Jennmar proposes the following construction: "A plate designed to be used with a single mine roof bolt to provide mine roof support." Jennmar contends that this is an established and well-known term in the mining industry, and that "bearing plates" are distinct from header plates, roof mats and roof channels.

Excel originally proposed a fairly similar definition which primarily would have clarified that the plate could be used for roof "or rib" support, and argued that the plate could be used with one or more roof bolts. On the eve of the Markman Hearing, Excel filed a Supplemental Brief which revised its proposed definition. Excel now agrees with Jennmar that the
plate is used with a single roof bolt and that the term "bearing plate" has an established and well-known meaning within the industry. However, the parties disagree as to what that "well-known meaning" is. Excel proposes the following construction:
"A plate to be used with a single mine roof bolt to provide mine roof and rib support and having a minimum strength of 20,000 lbf (89.0KN) and as otherwise defined by ASTM standard F 432-95."

Each party presented a witness on this issue at the Markman Hearing. John Oldson, Vice President of Research and Development for Jennmar, testified that the ASTM F 432-95 standard provides grade ratings for load bearing, i.e., the amount of force a bearing plate must be able to withstand when used alone. Oldson further testified that a product which did not comply with the minimum load-bearing requirements set forth in the ASTM standard would be an "unrated bearing plate," but would still be a "bearing plate" nevertheless. Jennmar points to Figures 13 and 14 of the '933 Patent, which illustrate that all of the products tested fall far below the minimum ASTM standard. In other words, all of the examples used in the '933 Patent to illustrate the benefits of the invention involve unrated bearing plates. Similarly, Column 1 of the '933 Patent states that "bearing plates" need not be used alone but may be used "in connection with . . . a primary support member." Jennmar also introduced a products list of "bearing plates" published by Dywidag-Systems International ("DSI") (the third major supplier in this industry), in which the first three products do not meet the minimum ASTM standard, or grade rating, for load bearing.

Scott Shapkoff, Director of Technical Services for Excel testified that a "bearing plate" must be a grade-rated plate that can be used stand-alone in a primary pattern in a roof control plan. Shapkoff explained that federal regulations require bearing plates to comply with the ASTM specification and because the minimum rating in the ASTM specification is 20,000 lbf, a product that does not meet that load bearing requirement is not a "bearing plate" per se. Shapkoff testified that he is part of a team that is working to create an ASTM specification for "surface control products," which would be distinct from the specification governing bearing plates. In Shapkoff's opinion, neither the Jennmar Roof and Rib Plate nor the Excel Spider Plate are "bearing plates." Customers refer to each of these products as "pans." On cross-examination, Shapkoff conceded that Jennmar and DSI do not share or agree with his definition of "bearing plate."

After careful and deliberate consideration of the filings of the parties, the arguments of counsel, and the intrinsic and extrinsic evidence presented, the Court finds that Plaintiff's proposed definition of "bearing plate" is the correct construction, with one caveat explained in the footnote. Excel's proposed construction would improperly import into the claim a limitation on load bearing capacity which is in no respect recited or mentioned in the '933 Patent. Indeed, all of the examples in Figures 13 and 14 of the '933 Patent involve non-grade-rated products. Further, the Patent explains that a "bearing plate" may be used in connection with a "primary support member" -- it need not meet the ASTM specification on its own. Thus, the Patent clearly indicates that the inventor considers the term "bearing plate" to include non-grade-rated products. Furthermore, Excel's proposed definition would exclude Jennmar's own product from the scope of its own invention. See Hoechst Celanese Corp. v. BP Chemicals, Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996) ("it is unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specification in such a way."); MBO Laboratories, Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1333 (Fed. Cir. 2007) (such an interpretation is rarely, if ever, correct). The extrinsic evidence is far too insubstantial to overcome the patent language. Indeed, Shapkoff conceded that DSI uses the term "bearing plate" in the same manner as Jennmar and does not share Excel's proposed new, but narrower definition.

--- Footnotes ---

1 The Patent language makes clear that the invention is intended to be used to provide both roof "and rib" support. Jennmar did not explain why it omitted the reference to "rib" support.

--- End Footnotes ---
E. "the polymeric material . . . becomes flowable, tacky and adherent upon the application of heat" ('753 patent) and "the heat bondable material . . . becomes flowable, tacky and adherent upon the application of heat" ('290 patent)

38) The plain language of the claim language "the [polymeric/heat bondable] material . . . becomes flowable, tacky and adherent upon the application of heat" requires that the material bonded to the implant be transformed by the addition of heat, from being non-flowable and non-adherent at room temperature to being flowable, tacky, and adherent. It takes heat to bond in the Bonutti invention and that heat must be sufficient to cause the material to be bonded to become flowable, tacky and adherent. This claim language is consistent with the specification that teaches that heat is required to bond.

39) This claim language was added to each patent during prosecution, (D.I. 70, Ex. M at 2; D.I. 70, Ex. O at 2), to avoid the prior art Palmaz patent, (id. at 5-6), and is construed consistent with this clear and unequivocal statement in the file history. Seachange, 413 F.3d at 1372-73; Springs Window, 323 F.3d at 995; Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1325 (Fed. Cir. 2002).

40) Consistent with the claim language, the specification, and the prosecution history, the Court construes the phrase "the polymeric material . . . becomes flowable, tacky and adherent upon the application of heat" from claim 1 of the '753 patent as meaning "the polymeric material is bonded to the implant by the application of heat sufficient to cause the polymeric material to become flowable, tacky and adherent."

41) Consistent with the claim language, the specification, and the prosecution history, the Court construes the phrase "the heat bondable material . . . becomes flowable, tacky and adherent upon the application of heat" from claim 1 of the '290 patent as meaning "the heat bondable material is bonded to the tubular member by the application of heat sufficient to cause the heat bondable material to become flowable, tacky and adherent."

11 This term is found in independent claim 1 of the '736 Patent. The parties ask the Court to construe this term and the term "said inlet end of said second graft body being attachable in an overlapping relationship with said outlet end of said first graft body while inside a vessel," found in independent claims 20, 21 and 22 of the '736 Patent in the same manner.
4. "the device being capable of substantially restricting the through passage of at least one type of macromolecule therethrough"

The Court has already construed the term "device" above. At oral argument, the parties agreed that the phrase "capable of substantially restricting the through passage" requires no construction. Hence, the only remaining disputes to decide are whether the Court will read in two specific limitations—one proposed by each side. Plaintiff argues the phrase "at least one type of macromolecule" should be limited to "the at least one treating material recited previously in the respective claims." The Court refuses to read in this limitation. The Court also refuses to read in Defendants' limitation that the device "does not include a sheet of material on a stent that leaves uncovered mesh holes which allow macromolecules to freely move through them." Instead, the Court concludes that the entire phrase "the device being capable of substantially restricting the through passage of at least one type of macromolecule therethrough" requires no construction.

This phrase also appears in claims 8 and 15. However, in claim 8 the language is "capable of restricting" instead of "capable of substantially restricting" as in claim 1. Compare 22:46-47; 23:32-33. The addition of "substantially" does not affect the Court's construction because the parties again agree that the phrases should have the same construction regardless of the addition of the word "substantially."

A. Parties' Construction Arguments

Plaintiff argues the Court should construe the phrase "at least one type of macromolecule" as meaning "the at least one treating material recited previously in the respective claims." Plaintiff supports this argument by citing to various references in the specification: release medicine can be "macromolecules" (6:34-40), the macromolecular containment means serves to "keep the medicine where it is most needed" (10:46-47), "[t]his example shows unidirectional delivery of medicine from the outer surface taking advantage of macromolecular containment means of the minimally-porous sheet" (11:30-33), and "[n]ote that both the macromolecules produced by the abnormal tissue and the treating material are contained within the interstices of the plaque by the macromolecular restraint means of the invention" (11:42-47).

Defendants seek to add the limitation that the device "does not include a sheet of material on a stent that leaves uncovered mesh holes which allow macromolecules to freely move through them." Defendants' argument is that this construction follows naturally if this Court accepts the construction that "device" means "sheet," that is, if the device is a sheet that minimally restricts macromolecules then it cannot contain large uncovered mesh holes. Defendants argue the specification criticizes porous stents with uncovered mesh holes—so much so that it amounts to a disclaimer. Defendants also point to figures, including figure 8(e), that show the present invention completely wrapped around the stent with no mesh holes left uncovered.

Defendants argue the specification creates an intentional disclaimer of the claim scope. Defendants' argument is best summed up by a quote from their brief:

A sheet on a stent that leaves uncovered openings or mesh holes that allow macromolecules to freely move through them is the antithesis of the '760 invention and would frustrate Saffran's objective of blocking the migration of macromolecules away from the site of injury. As the specification states, "[t]he device itself must be substantially impermeable to macromolecules. . . ." 13:38-44 (emphasis added). This is "a critical aspect of the present invention. . . ." 14:8-10 (emphasis added). It is an "exceedingly important feature." 20:49-51 (emphasis added). A sheet on a stent that leaves open mesh holes is not within the specification's disclosure and cannot come within the proper scope of Saffran's claims. Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1367-68 (Fed. Cir. 2007) (specification's description of "critical" feature found limiting).

(Dkt. No. 102 at 17 (emphasis in original).)

B. Analysis

The Court refuses to construe "at least one type of macromolecule" in accordance with Plaintiff's construction as meaning
"the at least one treating material recited previously in the respective claims." Instead, the Court concludes that the phrase requires no construction. There is no dispute that the phrase "at least one type of macromolecule" could be the macromolecule produced by the treating material. However, the "at least one type of macromolecule" could also be a macromolecule produced by the abnormal tissue. Plaintiff even cites to the specification where it discloses both the macromolecules produced by the abnormal tissue and the macromolecules produced by the treating material. 11:42-47 ("Note that both the macromolecules produced by the abnormal tissue and the treating material are contained within the interstices of the plaque by the macromolecular restraint means of the invention."). Therefore, the Court agrees with Defendants that "macromolecule" encompasses both types of macromolecules, and the Court will not limit it to "the at least one treating material recited previously in the respective claims" as requested by Plaintiff. It is presumed that Defendants agree that the phrase needs no construction since Defendants' construction recites the language verbatim as "at least one type of macromolecule." In any event, the Court concludes the phrase needs no construction.

The Court disagrees with Defendants' disclaimer argument and thus refuses to read in Defendants' limitation that the device "does not include a sheet of material on a stent that leaves uncovered mesh holes which allow macromolecules to freely move through them." To find a disclaimer, the Court must find a "clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Liebel-Flarsheim, 358 F.3d at 906 (internal quotes omitted). Additionally, "interpreting what is meant by a word in a claim is not to be confused with adding an extraneous limitation appearing in the specification, which is improper." In re Cruciferous Sprout Litigation, 301 F.3d at 1348 (internal quotes omitted). Neither the specification nor prosecution history shows a clear intention to limit the claim scope. Nowhere in the specification does the inventor disclaim a stent that leaves uncovered mesh holes. Defendants' argument that it would be the "antithesis of the '760 invention" is not enough to find manifest exclusion or restriction. If anything, the inventor in the specification has disclosed the possibility of spraying the invention on the stent. The specification states that the "spray stream . . . forms the invention when the spray hits a solid surface." 12:64-65. While the only embodiment discussed in the specification in connection with the stent is a coat wrapped around the stent, presumably, if the inventor sprayed the invention on the stent, then as described above, the invention would be formed when the spray hit the solid surface on the stent. In that case there would be uncovered mesh holes that allow macromolecules to move freely through because the solid surfaces on a stent leave mesh holes. Thus, the Court refuses to incorporate Defendants' limitation.

Other than an extraneous limitation proposed by each party, the parties have provided no construction or alternative constructions of the meaning of the phrase "the device being capable of substantially restricting the through passage of at least one type of macromolecule therethrough." Further, much of the language in the phrase is not disputed by the parties because the parties are merely attempting to impose extraneous limitations through the interpretation of this phrase. Thus, since the Court rejects the parties' extraneous limitations and there are no other apparent conflicts or proposed constructions by the parties, the Court concludes that the phrase "the device being capable of substantially restricting the through passage of at least one type of macromolecule therethrough" needs no construction. The Court has already construed the key terms within the phrase such as "macromolecule," and given those constructions, the phrase as a whole would be understandable to a jury.

C. Coupled To

Defendant Mothers Work also raises an issue with the construction of the term "coupled to" in claims 5 and 12. The dispute is whether the phrase requires a direct connection within the nursing bra of the claimed nursing garment between the back region of the shoulder strap to the back section of the elastic chest band. The claim phrase at issue is "said back region of said shoulder strap being coupled to said back section of said elastic chest band." Defendant Mothers Work proposes the following construction: "a direct connection within the nursing bra of the claimed nursing garment between the back region of the shoulder strap to the back section of the elastic chest band (if the back region of the shoulder strap and the back section of the elastic chest band are not attached to each other, a connecting element must extend directly from one to another)."

Plaintiff contends that the back region of the shoulder strap and the back section of the elastic chest band can be connected by either a direct or indirect connection. Plaintiff claims that the term "coupled to" has no particular meaning in the clothing art. Defendant Mothers Work, however, claims that there must be a direct connection between the back region of the
shoulder strap and the back section of the elastic chest band within the nursing bra. Defendant Mothers Work also submits that the term "coupled to" requires more meaning than just "connected," since in some respect it could be said that all sections of the garment are coupled to all other sections.

Defendant Mothers Work contends that the only embodiment of the nursing garment in the '029 patent has an element that directly connects the back region of the shoulder strap and the back section of the chest band within the nursing bra which is attached to the fabric body. According to Defendant Mothers Work, the patent is devoid of any description or suggestion that the shoulder strap and elastic chest band could be coupled together indirectly through an intermediate component that is not part of the nursing bra. Moreover, Defendant Mothers Work claims that the patent describes the invention as the product of attaching a nursing bra to a separate fabric body, and so the term should be limited to those garments having a nursing bra with a direct connection within the bra from the back region of the shoulder strap to the back section of the chest band.

Defendant Mothers Work points to the cross-sectional view of figure 4 of the '029 patent, which they claim demonstrates that the only contemplated connection between the back region of the shoulder strap and the back section of the chest band is through a direct connection within the nursing bra using a connecting element. Plaintiff, however, states that the '029 patent shows a preferred embodiment of the invention with a back piece connected (as shown in figure 4), which does not serve to limit claims 5 and 12 to the preferred embodiment. According to Plaintiff, reference to a figure in the specification as being "in accordance with the present invention" operates to incorporate any feature of the figure into the claims. Plaintiff contends that implying a negative limitation for the purpose of excluding any part of the fabric body to form part of the connection between the shoulder strap and the chest band is without justification. Plaintiff also claims that the prosecution history does not limit the interpretation of the phrase "coupled to" in claims 5 and 12, as there is no mention of the coupling of the elastic chest band to the back region of the shoulder strap in the file history.

Based on the evidence set forth in the record, the Court will adopt Plaintiff's proposed construction for this term. Accordingly, in the phrase "said back region of said shoulder strap being coupled to said back section of said elastic chest band," there can be a direct or indirect connection within the nursing bra of the nursing garment between the back region of the shoulder strap to the back section of the elastic chest band.

451

1. Scope of the Claims

The language at issue here is the phrase "the free end being defined as the portion of the cap most remote from the end section of the cap" as used in independent claims 3 and 28 of the '773 patent. The dispute centers on whether the quoted language limits patent protection only to capped wheel nuts with a weld at the outermost edge of the open end, or whether it encompasses capped wheel nuts with a weld on a "free end" portion in general.

a. claim language

The plain language of the claims provides that only the free end is welded to the nut insert, at the projection formed on the nut insert where it extends out to form the circumferential edge. Claim 3 states that the cap has a "free end overlying said projection" it is this "free end" that is to be welded to the nut insert projection ("only said free end being welded to said nut insert at said projection"). Claim 3 goes on to define the free end as "the portion of the cap most remote from the end section of the cap." This description uses the word portion, not the point, most remote from the end section of the cap. This indicates that there is some flexibility in where along the "free end" portion the weld can be.

Based on the plain language of Claim 3, the "free end" is the section, or portion, of the cap that overlies the projection. The projection is where the "generally longitudinally extending surface [intersects the] shoulder." The free end is the portion of the cap most remote, or farthest from, the end section, which overlies the projection. According to the plain language of Claim 3, the weld must be on the free end at the projection. It does not have to be at the very tip of the free end.

Claim 28 is similarly worded. The free end is the same as in Claim 3, however, in Claim 28 there is a raised weld projection on the extending portion of the nut insert (this portion is flat in the Claim 3 embodiment). By the terms of Claim 28, the weld may only be at the weld projection. However, the free end may extend beyond the weld projection.
At the hearing, Defendants urged the Court to rely on dictionary definitions to define the phrase "most remote" as used in Claims 3 and 28. However, resort to extrinsic evidence is unnecessary. The words "most remote" are given their plain meaning in the claims. The dispute here is whether the free end - which is indisputably located at the end "most remote" from the end section - refers to a portion having some degree of axial length, or to the point at the very end of the open end.

b. specification

The specification is consistent with the above interpretation. "The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001).

The summary of the invention section states that "[t]he weld effectively seals against moisture entering underneath the cap by locating the weld near the lower extending edge of the cap. In addition, because the cap is welded near its lower extending edge…" [Plaintiff's Response, Exhibit A](emphasis added). This supports Plaintiff's assertion that the patent contemplates a weld along the free end portion - not necessarily at the outermost point.

The summary of the invention section also notes that the cap includes an end section and a side section, "the side section extending over the sides of the nut insert, and the side section may terminate in a free end, which free end may be either flared outwardly, flared inwardly, or not flared at all." Id. It goes on to say "the side sections terminates [sic] in a free end which free end is welded to the nut insert." Id. This language indicates that the "free end" is a portion that potentially flares out from the side section of the cap, thus, it is not limited to a specific point. Moreover, the "free end" must have some degree of axial length in order to flare. Counsel for Defendant admitted at the hearing, in response to a question by the Court, that the language of the specification stating that the free end may be flared requires that the free end be a portion with some discernable length.

The detailed description of the invention further supports this interpretation. With reference to Figure 1, the patent states "[t]he side section 36 of the cap 14 (terminates in a free edge) or skirt portion 38 which in this embodiment is flared outwardly. Hence, the cap skirt may be referred to as a cap flange or flared end." Id. This language defines the "free end" described in Claims 3 and 28. Again, it is referred to as a portion, not a particular point. Regarding Figure 3, the weld is to occur where the "cap skirt or free edge contacts the circumferential edge of the nut body." Id. The description goes on to note that "the free edge of the cap may extend slightly beyond the circumferential edge." Id. Clearly this embodiment did not envision the interpretation advanced by Defendants that requires the weld to be at the outermost point of the open end.

c. prosecution history

The prosecution history is important in identifying exactly what the '773 patent claims.

Initially, the patent examiner rejected the asserted claims as anticipated 1 by U.S. Patent No. 4,123,961 (the '961 patent) invented by Joseph Chaivre and Albert Jadach. The patent examiner rejected the claims stating:

Chaivre '961 discloses a decorative capped wheel nut (Fig. 10) comprising a nut insert (130), and a cap (132). Said nut insert comprises: a first end (102, 104) for engaging a wheel; a second end (116); polygonal sides; a shoulder (130) being a weld projection defining a circumferential edge for welding said cap thereto. Said cap comprise: a top section (124) extending longitudinally from the second end of said nut insert; a side section (132) extending over the polygonal sides of said nut insert forming a plurality of wrench flats; and a flanged free end portion (134) extending from said wrench flats laterally outward and away from said top section to overlie, generally tangentially, the edge of said nut insert so that a weld can be made by an electrical charge. Said free end extends laterally beyond said edge.

[Plaintiff's Response, Exhibit B].

--- Footnotes ---

1 "To anticipate a claim, a prior art reference must disclose every limitation of the claimed invention, either explicitly or inherently." Atlas Powder Company v. Ireco, Inc., 190 F.3d 1342, 1346 (Fed. Cir. 1999). See also 35 USC § 102. - 882 -
In response, Plaintiff filed a declaration by the inventor of the '773 patent, John Toth ("Toth"). In his declaration, Toth indicated that he had personally worked with Chaivre and Jadach on the '961 patent. Toth explained that the concept of the '961 patent was to "weld on the end of the nut insert, where the nut insert was in contact with a portion of the cap, or, in Figure 10, on the horizontal flange, where the horizontal flange was in contact with a portion of the cap." [Plaintiff's Response, Exhibit B]. Toth asserted that the '961 patent did not suggest welding at the free end of the cap flange, which he defined as "the portion of the flange farthest away from the domed cap." Id. Indeed, Toth claimed the manufacturing equipment owned by the company the inventors worked for was not even capable of welding at the free end at the time of the '961 patent.

By contrast, regarding the '773 patent, Toth stated that he discovered that "it is desirable to place the weld as close to the free end or free edge of the skirt of the cap as possible to seal the cap to the nut insert such that water cannot enter between the cap and the nut insert." Id. The reason it is desirable to place the weld in that position is to prevent corrosives "from entering between the cap and the nut insert and causing corrosion of the thin stainless steel cap." Id. Toth went on to describe that corrosion was a problem even in the Figure 10 embodiment of the '961 patent because water could enter "between the cap and the nut insert on the axially positioned, circumferential portion of the flange just to the right of the lead line to reference numeral 136." Id. According to Toth, the weld placement in the '961 patent would not have sealed the "axial or longitudinal circumferential portion between the nut insert flange 136 and the cap."

Toth's declaration is consistent with the specification of the '961 patent. The specification of the '961 patent states "[t]he present invention provides capped wheel nuts wherein the cap is welded to the nut body at points on a surface extending substantially laterally to the central axis of the nut rather than along the axial surfaces which form the major contact areas between the nut and the cap." Id. With reference to Figure 10, cited by the patent examiner as anticipating the '773 patent, the '961 patent states that "FIG. 10 illustrates an embodiment of the invention wherein a nut insert...is joined to a cap 132 by welds formed between the two at a ring 134 extending over the upper lateral surface of the nut flange 136." Id.

Following an interview in March 1990, the patent examiner indicated that "favorable consideration would be given if applicant claimed the weld only at the circumferential edge." This distinguished the '773 patent from the '961 patent, where the weld was along the top of the nut flange, before the circumferential edge.

Additionally, following another interview in April 1990, the patent examiner issued a notice of allowability for the asserted claims. During the interview, claims 3 and 28 of the '773 patent were discussed. The examiner agreed on wording to more clearly define the "free end" of the cap. Id. The examiner required the addition of the disputed language "the free end being defined as the portion of the cap most remote from the end section of the cap." [Plaintiff's Response, Exhibit B]. The examiner stated his reasons for the allowance as:

The prior art of record, in particular the reference to Chaivre et al., does not show the feature of free end portion of the cap being welded only to the circumferential edge of a shoulder. Said feature is not to be so limiting as to say that the cap cannot also be welded at another portion such as along the sides and/or the closed end. Furthermore, the prior art of record, again in particular Chaivre et al., does not disclose the cap welded to the nut at the free end of the cap as clearly defined in the claims.

Id. (emphasis original).

The prosecution history is consistent with the interpretation derived from the claim language and specification.

Undoubtedly, the '773 patent is differentiated from the '961 patent because it discloses welding only at the circumferential edge, rather than along the surface where the nut flange is in contact with the cap. This clarification was made by Toth's declaration and is made clear by the patent examiner's conclusion that favorable consideration would be given if the patent claimed welds only at the circumferential edge.

In addition, the patent examiner required that the free end be the portion farthest from the end section of the cap. However, because the patent examiner refers to the free end as a portion, it is clear that the free end may extend slightly beyond the
circumferential edge or weld projection.

 Defendants' interpretation of the prosecution history would require that the weld be at absolute outermost point of the open end of the cap. "HTG's position...thus precludes from the scope of coverage of the asserted claims wheel nuts which have any measurable extension of the skirt beyond the weld location." [Defendants' Reply, p.3](emphasis added). For this to occur, the open end of the cap would have to terminate exactly at the circumferential edge. Otherwise the "free end" would overly the circumferential edge, which Defendants argue is not contemplated by the '773 patent.

 The patent examiner did not require that the weld on the '773 patent must be at the circumferential edge and simultaneously at the point most remote from the end section of the cap. It was the patent examiner's own amendment that defined the free end as "the portion of the cap most remote from the end section of the cap."

 Taken together, the intrinsic evidence demonstrates that the free end may extend slightly beyond the circumferential edge. In his declaration, Toth stated that it was desirable to "place the weld as close to the free end...as possible." He contemplated that the weld would not always be at the absolute end of the open end of the cap. Additionally, the purpose of welding at this location is to prevent moisture from getting in between the cap and the nut insert. This was a problem in the '961 patent because the cap extended over the sides of the circumferential projection but were not sealed. The specification of the '773 patent, and Toth's declaration, make clear that the advantage of the '773 patent over the '961 patent was that "[t]he weld effectively seals against moisture entering underneath the cap." Accordingly, the free end is defined as the portion most remote from the end section of the cap, and said free end may extend slightly beyond the circumferential edge.

 With respect to Claim 3, the prosecution history, together with the plain language of the claim, and the specification, reveal that the '773 patent covers capped wheel nuts where the weld is at the circumferential edge of the nut insert and along the free end of the cap. The free end is the portion of the cap overlying the projection created by the intersection of the generally longitudinally extending surface of the nut insert and the shoulder of the nut insert. The free end may extend slightly beyond the circumferential edge. The preferred embodiments of the '773 patent support this claim construction.

 With respect to Claim 28, the patent covers capped wheel nuts where the weld is only at the weld projection and along the free end of the cap. The free end may extend slightly beyond the weld projection.

 Because the intrinsic evidence was sufficient to aid the Court in coming to a correct conclusion on the true meaning of the language employed in the '773 patent, resort to extrinsic evidence is not required.

 1. Scope of the Claims

 The language at issue here is the phrase "the free end being defined as the portion of the cap most remote from the end section of the cap" as used in independent claims 3 and 28 of the '773 patent. The dispute centers on whether the quoted language limits patent protection only to capped wheel nuts with a weld at the outermost edge of the open end, or whether it encompasses capped wheel nuts with a weld on a "free end" portion in general.

 a. claim language

 The plain language of the claims provides that only the free end is welded to the nut insert, at the projection formed on the nut insert where it extends out to form the circumferential edge. Claim 3 states that the cap has a "free end overlying said projection" it is this "free end" that is to be welded to the nut insert projection ("only said free end being welded to said nut insert at said projection"). Claim 3 goes on to define the free end as "the portion of the cap most remote from the end section of the cap." This description uses the word portion, not the point, most remote from the end section of the cap. This indicates that there is some flexibility in where along the "free end" portion the weld can be.

 Based on the plain language of Claim 3, the "free end" is the section, or portion, of the cap that overlies the projection. The projection is where the "generally longitudinally extending surface [intersects the] shoulder." The free end is the portion of the cap most remote, or farthest from, the end section, which overlies the projection. According to the plain language of
Claim 3, the weld must be on the free end at the projection. It does not have to be at the very tip of the free end.

Claim 28 is similarly worded. The free end is the same as in Claim 3, however, in Claim 28 there is a raised weld projection on the extending portion of the nut insert (this portion is flat in the Claim 3 embodiment). By the terms of Claim 28, the weld may only be at the weld projection. However, the free end may extend beyond the weld projection.

At the hearing, Defendants urged the Court to rely on dictionary definitions to define the phrase "most remote" as used in Claims 3 and 28. However, resort to extrinsic evidence is unnecessary. The words "most remote" are given their plain meaning in the claims. The dispute here is whether the free end - which is indisputably located at the end "most remote" from the end section - refers to a portion having some degree of axial length, or to the point at the very end of the open end.

b. specification

The specification is consistent with the above interpretation. "The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001).

The summary of the invention section states that "[t]he weld effectively seals against moisture entering underneath the cap by locating the weld near the lower extending edge of the cap. In addition, because the cap is welded near its lower extending edge..." [Plaintiff's Response, Exhibit A](emphasis added). This supports Plaintiff's assertion that the patent contemplates a weld along the free end portion - not necessarily at the outermost point.

The summary of the invention section also notes that the cap includes an end section and a side section, "the side section extending over the sides of the nut insert, and the side section may terminate in a free end, which free end may be either flared outwardly, flared inwardly, or not flared at all." Id. It goes on to say "the side sections terminates [sic] in a free end which free end is welded to the nut insert." Id. This language indicates that the "free end" is a portion that potentially flares out from the side section of the cap, thus, it is not limited to a specific point. Moreover, the "free end" must have some degree of axial length in order to flare. Counsel for Defendant admitted at the hearing, in response to a question by the Court, that the language of the specification stating that the free end may be flared requires that the free end be a portion with some discernable length.

The detailed description of the invention further supports this interpretation. With reference to Figure 1, the patent states "[t]he side section 36 of the cap 14 (terminates in a free edge) or skirt portion 38 which in this embodiment is flared outwardly. Hence, the cap skirt may be referred to as a cap flange or flared end." Id. This language defines the "free end" described in Claims 3 and 28. Again, it is referred to as a portion, not a particular point. Regarding Figure 3, the weld is to occur where the "cap skirt or free edge contacts the circumferential edge of the nut body." Id. The description goes on to note that "the free edge of the cap may extend slightly beyond the circumferential edge." Id. Clearly this embodiment did not envision the interpretation advanced by Defendants that requires the weld to be at the outermost point of the open end.

c. prosecution history

The prosecution history is important in identifying exactly what the '773 patent claims.

Initially, the patent examiner rejected the asserted claims as anticipated 1 by U.S. Patent No. 4,123,961 (the '961 patent) invented by Joseph Chaivre and Albert Jadach. The patent examiner rejected the claims stating:

Chaivre '961 discloses a decorative capped wheel nut (Fig. 10) comprising a nut insert (130), and a cap (132). Said nut insert comprises: a first end (102, 104) for engaging a wheel; a second end (116); polygonal sides; a shoulder (130) being a weld projection defining a circumferential edge for welding said cap thereto. Said cap comprise: a top section (124) extending longitudinally from the second end of said nut insert; a side section (132) extending over the polygonal sides of said nut insert forming a plurality of wrench flats; and a flanged free end portion (134) extending from said wrench flats laterally outward and away from said top section to overlie, generally tangentially, the edge of said nut insert so that a weld can be made by an electrical charge. Said free end extends laterally beyond said edge.

[Plaintiff's Response, Exhibit B].
In response, Plaintiff filed a declaration by the inventor of the '773 patent, John Toth ("Toth"). In his declaration, Toth indicated that he had personally worked with Chaivre and Jadach on the '961 patent. Toth explained that the concept of the '961 patent was to "weld on the end of the nut insert, where the nut insert was in contact with a portion of the cap, or, in Figure 10, on the horizontal flange, where the horizontal flange was in contact with a portion of the cap." [Plaintiff's Response, Exhibit B]. Toth asserted that the '961 patent did not suggest welding at the free end of the cap flange, which he defined as "the portion of the flange farthest away from the domed cap." Id. Indeed, Toth claimed the manufacturing equipment owned by the company the inventors worked for was not even capable of welding at the free end at the time of the '961 patent.

By contrast, regarding the '773 patent, Toth stated that he discovered that "it is desirable to place the weld as close to the free end or free edge of the skirt of the cap as possible to seal the cap to the nut insert such that water cannot enter between the cap and the nut insert." Id. The reason it is desirable to place the weld in that position is to prevent corrosives "from entering between the cap and the nut insert and causing corrosion of the thin stainless steel cap." Id. Toth went on to describe that corrosion was a problem even in the Figure 10 embodiment of the '961 patent because water could enter "between the cap and the nut insert on the axially positioned, circumferential portion of the flange just to the right of the lead line to reference numeral 136." Id. According to Toth, the weld placement in the '961 patent would not have sealed the "axial or longitudinal circumferential portion between the nut insert flange 136 and the cap."

Toth's declaration is consistent with the specification of the '961 patent. The specification of the '961 patent states "[t]he present invention provides capped wheel nuts wherein the cap is welded to the nut body at points on a surface extending substantially laterally to the central axis of the nut rather than along the axial surfaces which form the major contact areas between the nut and the cap." Id. With reference to Figure 10, cited by the patent examiner as anticipating the '773 patent, the '961 patent states that "FIG. 10 illustrates an embodiment of the invention wherein a nut insert…is joined to a cap 132 by welds formed between the two at a ring 134 extending over the upper lateral surface of the nut flange 136." Id. Following an interview in March 1990, the patent examiner indicated that "favorable consideration would be given if applicant claimed the weld only at the circumferential edge." This distinguished the '773 patent from the '961 patent, where the weld was along the top of the nut flange, before the circumferential edge.

Additionally, following another interview in April 1990, the patent examiner issued a notice of allowability for the asserted claims. During the interview, claims 3 and 28 of the '773 patent were discussed. The examiner agreed on wording to more clearly define the "free end" of the cap. Id. The examiner required the addition of the disputed language "the free end being defined as the portion of the cap most remote from the end section of the cap." [Plaintiff's Response, Exhibit B]. The examiner stated his reasons for the allowance as:

The prior art of record, in particular the reference to Chaivre et al., does not show the feature of free end portion of the cap being welded only to the circumferential edge of a shoulder. Said feature is not to be so limiting as to say that the cap cannot also be welded at another portion such as along the sides and/or the closed end. Furthermore, the prior art of record, again in particular Chaivre et al., does not disclose the cap welded to the nut at the free end of the cap as clearly defined in the claims.

Id. (emphasis original).

The prosecution history is consistent with the interpretation derived from the claim language and specification.

Undoubtedly, the '773 patent is differentiated from the '961 patent because it discloses welding only at the circumferential edge, rather than along the surface where the nut flange is in contact with the cap. This clarification was made by Toth's
declaration and is made clear by the patent examiner's conclusion that favorable consideration would be given if the patent claimed welds only at the circumferential edge.

In addition, the patent examiner required that the free end be the portion farthest from the end section of the cap. Welding at this location solves the problem of corrosion found in the '961 patent because it prevents moisture from entering under the cap. However, because the patent examiner refers to the free end as a portion, it is clear that the free end may extend slightly beyond the circumferential edge or weld projection.

Defendants' interpretation of the prosecution history would require that the weld be at absolute outermost point of the open end of the cap. "HTG's position...thus precludes from the scope of coverage of the asserted claims wheel nuts which have any measurable extension of the skirt beyond the weld location." [Defendants' Reply, p.3](emphasis added). For this to occur, the open end of the cap would have to terminate exactly at the circumferential edge. Otherwise the "free end" would overly the circumferential edge, which Defendants argue is not contemplated by the '773 patent.

The patent examiner did not require that the weld on the '773 patent must be at the circumferential edge and simultaneously at the point most remote from the end section of the cap. It was the patent examiner's own amendment that defined the free end as "the portion of the cap most remote from the end section of the cap."

Taken together, the intrinsic evidence demonstrates that the free end may extend slightly beyond the circumferential edge. In his declaration, Toth stated that it was desirable to "place the weld as close to the free end...as possible." He contemplated that the weld would not always be at the absolute end of the open end of the cap. Additionally, the purpose of welding at this location is to prevent moisture from getting in between the cap and the nut insert. This was a problem in the '961 patent because the cap extended over the sides of the circumferential projection but were not sealed. The specification of the '773 patent, and Toth's declaration, make clear that the advantage of the '773 patent over the '961 patent was that "[t]he weld effectively seals against moisture entering underneath the cap." Accordingly, the free end may extend slightly beyond the circumferential edge, but it may not extend as far as it did in the Figure 10 embodiment of the '961 patent. Otherwise, the purported advantage of the '773 patent would be lost.

With respect to Claim 3, the prosecution history, together with the plain language of the claim, and the specification, reveal that the '773 patent covers capped wheel nuts where the weld is at the circumferential edge of the nut insert and along the free end of the cap. The free end is the portion of the cap overlying the projection created by the intersection of the generally longitudinally extending surface of the nut insert and the shoulder of the nut insert. The free end may extend slightly beyond the circumferential edge. The preferred embodiments of the '773 patent support this claim construction.

With respect to Claim 28, the patent covers capped wheel nuts where the weld is only at the weld projection and along the free end of the cap. The free end may extend slightly beyond the weld projection.

Because the intrinsic evidence was sufficient to aid the Court in coming to a correct conclusion on the true meaning of the language employed in the '773 patent, resort to extrinsic evidence is not required.
13 Plaintiff contends that the parties agreed to a stipulation that "stylet" would be defined as "slender probe." Counsel for MDTech did not remember that stipulation, however, and Plaintiff used "stylet" instead of "slender probe" in its proposed construction. As it does not appear to be a point of contention, the Court does not define "stylet" for purposes of this claim construction.

In support of its argument that being "detachable" requires separation without loss or damage, MDTech relies on various case law, the specification of the "798 patent, and the dictionary definition of "detachable." The case on which MDTech primarily relies is K-2 Corp. v. Salomon S.A., 191 F.3d 1356 (Fed. Cir. 1999), in which the Federal Circuit addressed the meaning of the term "permanently affixed" as used in a patent claim describing how an in-line roller skate base was connected to the boot. Id. at 1360-61. The asserted claim in that case contained the limitation that the boot be "permanently affixed" to the base, and the issue before the Court was whether a removable screw used in the accused device met the "permanently affixed" limitation. Id. In defining "permanently affixed," the Court first considered that the patentee distinguished prior art that included a "detachable" boot, noting that the term "permanently" was added to distinguish claims from the "detachable" boot disclosed in the prior art. Id. at 1364. The Court then addressed the difference between a permanent and a removable connection, first considering what it considered a permanent rivet-made connection and a permanent single injection molded unit, and stating that:

Likewise, were an adhesive laminate used to provide the permanent connection, that permanence too could be destroyed by breaking the structure apart. Screws, unlike rivets and laminates, are meant to be unscrewed, that is, to be removed. A rivet or a laminate, to the contrary, is meant to remain permanent, unremovable unless one is bent on breaking the permanent structure apart.

Id. at 1365 (citations to the record omitted). In affirming the district court's holding that "permanently affixed" required an unremovable connection, the Federal Circuit found that the removable screw in the accused device did not meet the limitation of the asserted claim and, thus, there was no literal infringement. Id. at 1365-66.

In this case, MDTech argues that the patentee focused on the "detachable" quality of the stylet and cannula in the reusable embodiment (depicted in Fig. 1), as contrasted with the permanently affixed quality of the stylet and cannula in the single use embodiment (depicted in Fig. 5). MDTech points to the fact that the specification describes the stylet of the reusable embodiment as being "detachably engaged" within the clevis 46 of the spring guide 18, but does not use the term "detachable" in relation to the stylet of the single use embodiment. ("798 patent, col. 7, l. 41-43.) Indeed, the single use embodiment is described as being assembled like the reusable embodiment, except that the stylet in the single use embodiment is "adhesively bonded" within the recess, and the cannula mount is "similarly secured" (i.e., with adhesive) within the bore. (Id., col. 10, l. 24-27.) In addition to these arguments, MDTech also relies on a dictionary that defines "detachable" as "to separate especially from a larger mass and usually without violence or damage."

14 For the sake of clarity, the Court notes that the specification refers to the clevis 46 of the spring guide 18, but Fig. 1 appears to indicate that the clevis 46 is on the inner support rod 14, not the spring guide 18.

On the other hand, Plaintiff argues that MDTech's proposed construction is improper because there is nothing in the claim or specification that requires the limitation of "without loss or damage." Plaintiff points out that the specification, in describing the assembly of the instrument, explains that the stylet is telescopically or coaxially received within the cannula to form the needle in both the reusable and single use embodiments. ("798 patent, col. 7, l. 36-37; col. 10, l. 22-23.) Presumably, this reference indicates that, at some point, the stylet and cannula are separate and, therefore, detachable. Plaintiff argues that the claim does not specify when the stylet is capable of being decoupled or disassembled from the cannula, and that detachability does not occur during the normal operation of the instrument, but during the assembly or disassembly of the instrument. Plaintiff, however, does not address how they would be detached during disassembly. Finally, Plaintiff argues that there are dictionary definitions of "detachable" that do not include the words "without violence or damage," and that MDTech has selectively chosen a dictionary solely to support its proposed construction.
Plaintiff also contends that MDTech misses the point by focusing on how the stylet is secured to the spring guide and how the cannula is secured to the cannula mount, because this claim focuses on the stylet's relation to the cannula, not to the other parts of the instrument. The Court is not persuaded by this argument. As MDTech put it, "[i]t will be appreciated that if the cannula and stylet are secured by adhesive, the stylet is not detachable from the cannula except upon the occurrence of 'violence or damage.'" (MDTech Br. at 21.) The stylet and the cannula need not be bonded to each other to conclude that the patentee did not intend them to be "detachable," it is enough that they are bonded to the instrument when the stylet is received within the cannula.

After considering the parties' arguments, the Court concludes that MDTech has the better argument and that the term "detachable" as used in this claim requires separation "without loss or damage." The Court finds it significant that the specification only describes the stylet of the reusable embodiment as being "detachably engaged" within the clevis of the spring guide, (‘798 patent, col. 7, l. 41-43), but specifically distinguishes the assembly of the single use embodiment by describing that the stylet is "adhesively bonded" within the recess of the base. (Id., col. 10, l. 24-27.) The term "detachable" does not appear at all in the portion of the specification describing the single use embodiment. Further, "detachably" also appears in the specification in describing that the cannula mount is "detachably affixed" to the spring guide in the reusable embodiment, a connection that, in Fig. 1, is made by use of a screw thread, not a plug in or adhesively bonded connection. 16 The specification, therefore, refers to a piece being "detachably engaged" or "detachably affixed" where the piece is placed in the clevis or where a piece is connected by a screw thread; but it does not use that term when pieces are adhesively bonded or similarly secured. This distinction suggests that the patentee intended "detachable" to mean capable of removal or separation without breaking or causing damage through the necessary use of undue force.

The Court understands that the cannula mount being detachable from the spring guide is a separate feature than the stylet being detachable from the cannula; it only notes the use of the term "detachably" in that context to explore the patentee's understanding of that word's meaning as used in the '798 patent.

This conclusion is further supported by the dictionary definition of "detachable," which is: "capable of being or designed to be detached : capable of being separated or withdrawn without loss or damage." Webster's Third New International Dictionary 615 (1993) (emphasis added); see also Mirriam-Webster Online Dictionary, www.m-w.com (not defining "detachable" separately, but defining "detach" as "1: to separate especially from a larger mass and usually without violence or damage." (emphasis added)). Because the Court has relied on the same dictionaries throughout this opinion, Plaintiff's argument that MDTech has selectively used dictionaries to support its construction of this term is unavailing.

In addition, the Court notes that, although the Federal Circuit's decision in K-2 is, again, not directly controlling on this issue because it involved a different patent, specification, and prosecution history (especially prior art distinctions that are not present in this case), it nonetheless reflects a similar understanding of the general concepts of detachability and permanent affixation. Although this Court's conclusion is based on the claim language and specification of the '798 patent specifically, it is at least consistent with the notion espoused in K-2 that something is not detachable or removable if doing so requires breaking the permanent structure apart.

For the reasons stated above, therefore, the Court construes this term to be "the stylet is capable of being separated or withdrawn from the cannula without loss or damage."

In so holding, the Court recognizes that this construction may exclude claim 2's coverage of the single use embodiment of the invention illustrated in Fig. 5. Indeed, this is a consistent area of dispute between the parties and, although it arises primarily in connection with the term "releasably engaging" (addressed next), this issue is also implicated by interpretation of the term "detachable." MDTech argues that claim 2 of the '798 patent was written only to cover the reusable embodiment.
of the invention, not the single use embodiment. Specifically, MDTech contends that the use of the words "detachable" and "releasably engaging" in claim 2 demonstrates that the drafter intended this claim to cover only the reusable embodiment. According to MDTech, because the stylet and/or the cannula of the single use embodiment can be adhesively bonded or otherwise secured to the instrument, and because the cannula mount in that embodiment is connected to the spring guide with a peg and hole or adhesive connection, those pieces must be broken or subjected to undue force in order to detach or release them. MDTech argues that one skilled in the art would not understand "detachable" or "releasable" to require a user to damage or break the items in order to accomplish that task and, thus, that claim 2 is not written toward the single use embodiment.

Plaintiff counters by arguing that there is nothing in the patent that indicates that the patentee intended to give up an entire alternative embodiment when he drafted these claims, and that it would be improper to construe these claims in such a way that could produce that result. Specifically regarding the second connector means "releasably engaging" the first connector means, Plaintiff acknowledges that "the addition of an adhesive does create more of a bond," but that something adhesively bonded nonetheless can be pulled out. (Tr. at 72.) In addition, Plaintiff points out that all but one of the independent claims of the '798 patent (claim 18) use the term "releasably." As such, construing "releasably" as not covering the single use embodiment excludes all but one claim from covering that embodiment.

The Court agrees with MDTech that it is possible that claim 2 may not cover the single use embodiment and, even if the court's construction of "detachable" and "releasably engaging" produce that result, such a construction, though not the norm, is not improper. In describing the reusable embodiment, the specification clearly provides that "[b]ecause the cannula mount 58 is detachably affixed to the spring guide 18, the biopsy instrument 10 may interchangeably employ a needle having any one of several configurations well known in the art . . . " (798 patent, col. 6, l. 46-53) (emphasis added). Although the single use embodiment can employ several needle configurations, it cannot do so interchangeably, a feature of the single use embodiment which is attributed to the fact that the cannula mount is detachably affixed to the spring guide. The specification does not contain similar language in connection with the single use embodiment.

In addition, contrary to Plaintiff's assertion, each claim of a patent does not have to cover every embodiment in the patent. See Ventana Med. Sys. v. Biogenex Labs., Inc.,473 F.3d 1173, 1181-82 (Fed. Cir. 2006) ("[E]ach claim does not necessarily cover every feature disclosed in the specification"). In this case, claim 18 of the '798 patent does not include the terms "detachable" or "releasably engaging" and, therefore, the Court's construction would not exclude claim 18's coverage of the single use embodiment. In addition, as MDTech points out, '798 is a continuation-in-part and does not have to cover everything that has already been covered by the '797 patent. Indeed, none of the claims of the '797 patent contain "detachable," "releasably," or comparable terms and, therefore, would not exclude the single use embodiment. For that reason, the Court need not construe claim 2 to cover both the reusable and single use embodiments.

In addition, Plaintiff's remaining arguments are not persuasive. Plaintiff argues that the specification of the '798 patent explains that both embodiments have essentially the same operation with only small differences. (798 patent, col. 9, l. 41-60.) ("[T]he principles of operation [of the reusable and single use embodiments] are virtually identical.") Plaintiff contends that this implies that both embodiments function in a "releasably engaging" manner. As noted above, the specification also expressly states that the reusable embodiment can interchangeably employ various needle sets because the cannula mount of that embodiment is "detachably affixed" to the spring guide, a feature that is not disclosed in relation to the single use embodiment. In addition, while the specification may state that both embodiments have essentially the same operation, it also explains that:

Assembly of instrument 210 [the single use embodiment] is quite similar to assembly of instrument 10 [the reusable embodiment], as described hereinabove. However, in this instance, the proximal end 282 of the stylet 26[6] is adhesively bonded within the recess 246, and the base 262 of the cannula mount 258 is similarly secured within the bore 255a.

(Id., col. 10, l. 22-27) (emphasis added.) In addition, while the cannula of the reusable embodiment is described as being secured "in any suitable manner," (Id., col. 6, l. 35-37), the specification describes that the cannula of the single use embodiment "may there be secured by means of adhesive (not shown)." (Id., col. 10, l. 14-15.) These distinctions are crucial, and they may well remove the single use embodiment from the coverage of a claim that describes an instrument with a "detachable" stylet or a cannula mount that is "releasably engaging" with the spring guide.

Finally, Plaintiff's cite to Micro Chemical, Inc. v. Great Plains Chemical Co., Inc., 194 F.3d 1250 (Fed. Cir. 1999) is
unavailing. In that case, the Federal Circuit explained that "[w]hen multiple embodiments in the specification correspond to the claimed function, proper application of § 112, P 6 generally reads the claim element to embrace each of those embodiments." Id. at 1258. This cite, however, does not support Plaintiff's argument because it relates specifically to a means-plus-function analysis, namely a court's identification of structures in the specification that correspond to a recited function. Here, the Court is not identifying structures that correspond to the recited function in a means-plus-function clause, it is using ordinary claim construction principles to interpret a claim term, even though its construction may exclude that claim's coverage of an alternative embodiment.

The Court, therefore, is not persuaded that it must give these disputed terms a construction that results in claim 2 covering the single use embodiment.

II

A

In his challenge to the district court's construction of the '798 patent, Dr. Baran advocates a definition for the terms "detachable" and "releasably" that does not include the "without loss or damage" condition. Dr. Baran objects to that condition because it excludes the single-use embodiment from the asserted patent claim and therefore precludes his infringement claim against the BioPince, which is a single-use device.

As an initial matter, we accept Dr. Baran's assertion that the '798 patent "never discloses a stylet that is joined to a cannula." The specification indicates that the stylet 60 is attached to a support rod 14, and that the cannula 66 is attached to a spring guide 18. The full needle is then assembled by placing a coil spring "coaxially" onto the stylet and placing the cannula "telescopically" over the stylet and coil spring. The cannula remains an independent component that slides freely over the stylet.

[SEE FIG. 1 IN ORIGINAL]

The fact that the stylet is not attached to the cannula, however, is not favorable to Dr. Baran. If anything, it lends further credence to the district court's construction of "detachable" as meaning "separation without loss or damage," because the stylet and cannula as described in the specification are readily separable without loss or damage.

Of greater significance is the different language used by the patentee to distinguish the single-use embodiment from the reusable embodiment. In describing the reusable embodiment, the patent states that "the stylet 60 is received and detachably engaged within the clevis 46 of the spring guide 18. The thread 74 on the inner surface 72 of the collar 62 is engaged with the thread 56 on the spring guide 18 to secure the cannula mount 58 to the spring guide." '798 patent, col. 7, ll. 42-46. Figure 1 shows that the stylet is inserted into a notched recess on the support rod from which it can be easily removed, 1 and that the cannula is screwed onto the spring guide from which it too can be easily removed.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

1 Although the specification states that the stylet is inserted into the clevis of the "spring guide," Figure 1 clearly shows that the clevis is located on the support rod.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

By contrast, in describing the single-use embodiment, the patent states that the assembly of the device is "quite similar" except that "the stylet 262 is adhesively bonded within the recess 246, and the base 262 of the cannula mount 258 is similarly secured within the bore 255a." '798 patent, col. 10, ll. 22-27. Figure 5, which corresponds to the single-use embodiment, shows that the clevis is absent from the support rod, and that the screw threads are absent from the spring guide. Instead, the stylet and the cannula are glued permanently into the support rod and the spring guide, respectively.

- 891 -
The patentee used the term "detachably" in the specification to draw a direct contrast between the removable components of the reusable embodiment and the adhesively bonded components of the single-use embodiment. That usage effectively concedes that adhesively bonded components—including the single-use embodiment—are not "detachable" components within the meaning of the patent. We agree with the district court that "[t]his distinction suggests that the patentee intended 'detachable' to mean capable of removal or separation without breaking or causing damage through the necessary use of undue force." Baran v. Med. Device Techs., Inc., 519 F. Supp. 2d 698, 724 (N.D. Ohio 2007); see also K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1365 (Fed. Cir. 1999) ("Screws, unlike rivets and [adhesive] laminates, are meant to be unscrewed, that is, to be removed. A rivet or a laminate, to the contrary, is meant to remain permanent, unremovable unless one is bent on breaking the permanent structure apart."). Incorporating the "without loss or damage" condition into the claim construction has the additional advantage of comporting with the plain meaning of "detachable," as expressed by the several dictionary definitions cited by the district court.

We also agree with the district court that the terms "releasably" and "detachable" have the same meaning in the '798 patent. Dr. Baran argues that the use of different terms implies that they have different meanings, see CAE Screenplates Inc. v. Heinrich GmbH, 224 F.3d 1308, 1317 (Fed. Cir. 2000), but that implication is overcome where, as here, the evidence indicates that the patentee used the two terms interchangeably. See Tehrani v. Hamilton Med., Inc., 331 F.3d 1355, 1361 (Fed. Cir. 2003).

In a final attempt to bring the single-use embodiment within the scope of the asserted claim, Dr. Baran argues that the district court's claim construction improperly excluded a preferred embodiment and ignored the Summary of the Invention. There is no force to either of those arguments. It is not necessary that each claim read on every embodiment. In this instance, while claim 2 reads on only the reusable embodiment, a different claim of the '798 patent (claim 18) reads on both the single-use and the reusable embodiments., See Helmsderfer v. Bobrick Washroom Equip., Inc., 527 F.3d 1379, 1383 (Fed. Cir. 2008) ("It is often the case that different claims are directed to and cover different disclosed embodiments."); Intamin Ltd. v. Magnetar Techs., Corp., 483 F.3d 1328, 1336-37 (Fed. Cir. 2007) ("[A] claim need not cover all embodiments."). As for the excerpt from the Summary of the Invention, it simply repeats verbatim the claim language that the "stylet means is . . . detachable from the cannula" and that the "second connector . . . releasably and fixedly engages the first connector." '798 patent, col. 3, ll. 50-60. The fact that those claim terms were used in the Summary does not mean that they must be read to encompass all the embodiments of the invention.

Because we do not disturb the district court's construction of "releasably," or the related constructions of "first connector means" and "second connector means," Dr. Baran's stipulation of noninfringement of the '798 patent remains effective.

10 This term is found in independent claim 1 of the '073 Patent.
dockable to said second portion of said primary graft body while inside of a vessel to define a single flow lumen which transfers substantially all flow between said primary graft flow lumen and said secondary graft flow lumen.

('073 Patent, col. 6, II. 49-57.)

Thus, the claim language suggests that the "first end" of the "graft body" must have some additional structure that permits the first end to be coupled with or docked to the second portion of the primary graft body. Although Plaintiffs' proposed construction does not expressly refer to such a feature, they argued that the "adapted to be connected," and "being dockable" to language was intended to refer to the intraluminal aspect of the invention. (See, e.g., Tr. at 40:15-41:4, 67:6-18.) Further, all parties concur that intraluminal grafts require some type of wires. Accordingly, the Court concludes that with respect to this phrase, the "first end" of the supplemental graft body must include some form of wire structure. For the reasons discussed above in Sections B.2 and B.5, the Court also concludes that the wires must be malleable but that they need not extend entirely beyond the end of the graft body.

Finally, the Court agrees with Cook and Gore that the construction of this term must include a reference to a vessel, rather than a general reference to a "fluid containing lumen," as Plaintiffs' propose. This is because the inventors clearly defined the term "vessel" in the specification to mean "blood vessels or like ducts such as the bile duct and the ureter (which are all hereafter called 'vessels')." ('458 Patent, col. 1, II. 18-20 (emphasis added)).

Accordingly, the Court construes the term "said first end of said supplemental graft body being dockable to said second portion of said primary graft body while inside of a vessel," to mean: "The first end of the supplemental graft body includes a malleable wire structure that permits it to be intravascularly docked to or coupled with the second portion of the primary graft body."

"the combination of the hook, the hole and the pin being effective to hold the pump received by the hook to the housing"

Claims 4, 12, and 18 of the '767 Patent contain the term "the combination of the hook, the hole and the pin being effective to hold the pump received by the hook to the housing." SHURflo contends the term means "the hook, the hole, and the pin together are capable of supporting the pump that is received by the hook to the housing." Defendants contend that the term means "the functional and structural cooperation of the hook, the hole and the pin result in the pump being received by the hook being held to the housing such that eliminating any one of them causes a failure to hold the pump in the housing."

SHURflo's proposed construction would merely require that the combined elements "be capable of holding" the pump, when the claim clearly requires that the elements "be effective to hold" the pump. This construction is unduly broad because something may be capable of holding, but not be effective to hold. In addition, neither intrinsic nor extrinsic evidence supports Defendants' proposed requirement that the mechanism must fail if one element is removed. The claim language clearly says that the three combined elements are effective to hold the pump. However, this does not necessarily preclude any one element, either alone or in combination with another element, from being effective to hold the pump. SHURflo's Reply Brief, at 7-8. Thus, Defendants' proposed construction is improper.

The claim language is clear and understandable to the fact finder and does not require construction beyond its plain and ordinary meaning. See Orion, 406 F. Supp. 2d at 738 (stating that "although every word used in a claim has meaning, not every word requires construction" in declining to construe claim terms). However, the Court has resolved the parties' disputes in accordance with O2 Micro, 521 F.3d 1351, and to the extent that this claim term arises at trial, the Court instructs the parties to tailor their trial arguments to conform with this Order.

"said gussets along each of said edges being fitted together"
The parties also dispute the construction of the claim term "fitted together." Perouse's proposed construction is "positioned in one place or group." Gore's proposed construction is "interlock[ing] and contact[ing] each other."

In common parlance, two items that are "fitted together" have structures that conform to or complement one another, as evidenced by the relevant dictionary definition of "fit," 

"[t]o fashion, modify, or arrange so as to conform or correspond to something else," The Oxford English Dictionary (2d Ed.), vol.5 p.975, and the relevant dictionary definition of "together" (used following a transitive verb), "each other." The Oxford English Dictionary (2d Ed.), vol.18 p. 190. The '787 specification does not explicitly define the phrase "fitted together." However, it is clear that "fitted together" is being used in the patent according to its ordinary meaning. The gussets are described as "being fitted into each other" (787 patent col.1 11.60-61) and "interpenetrat[ing]" (787 patent col.3 1.66), and Figure 8 depicts a zipper-like arrangement of gussets, in which each gusset fits into the space between gussets on the opposing edge.

Perouse's construction of "fitted together" as "positioned in one place or group" is therefore too broad and inconsistent with the ordinary meaning and intrinsic evidence. "Gussets" that are merely "positioned in one place or group" are not "fitted together," as this term is used in the '787 patent.

The Court cannot accept Gore's proposed construction either. Gore construes "fitted together" to mean "interlock[ing] and contact[ing] each other." This construction is too narrow and improperly imports limitations from the specification into the claim. See, e.g., Phillips, 415 F.3d at 1323. Gore's "interlocking" limitation is easily dismissed, as there is no suggestion in the patent that opposing gussets lock together in any sense. While Figure 8 does depict gussets that contact each other, a drawing of a single embodiment does not limit the ordinary meaning of "fitted together," which does not require contact. See, e.g., id.; Gart v. Logitech, Inc., 254 F.3d 1334, 1342-43 (Fed. Cir. 2001) ("Such a construction would improperly add a limitation appearing in the specification and the drawings, but not appearing in the unambiguous language of the claim.").

Accordingly, the Court construes the phrase, "said gussets along each of said edges being fitted together," to mean "said gussets along each of said edges having an arrangement that conforms to the arrangement of gussets on the opposite edge, such as an arrangement in which the gussets on one edge can occupy the spaces between the gussets on the opposing edge."

The parties dispute whether the term includes an intent requirement as specified in the defendant's proposed construction, "the length and diameter of the distal portion of the guide wire tube are consciously selected with the intention of producing the results that follow." The plaintiff argues that an intent requirement would impermissibly limit the term. The defendant, on the other hand, argues that "being selected" connotes an intentional act to produce certain results and that without the intent requirement, the language in the claim would be rendered superfluous.

After considering the parties' arguments, the Court concludes that one of ordinary skill in the art would understand "being selected" according to its plain and ordinary meaning. As a result, the Court declines to construe the phrase "being selected."

At issue here are four elements in Claim 1 of the '658 patent. The first element is "said second cavity being shallower than said first cavity." This simply means that the first cavity which holds the pipe must be deeper than the second cavity which holds the tobacco. The reason for this is so the smoking pipe can be deposited into the first cavity for carrying purposes, but be long enough to put pressure on the bottom of the second cavity in order to place a small amount of tobacco in the bowl.
B. Claim Construction

The disputed element of the '251 patent is the activator mechanism for opening the umbrella -- "a latch slidably received in said barrel for selectively disengaging said catch from said barrel to release said barrel from said tube; . . . said latch being ring-shaped and being slidably received in said channel of said barrel for slidably receiving said tube therein." 40 In the February 3 Opinion, the term "ring-shaped latch" was construed as "a curved band that encircles the tube." 41 Taylor Made approves of this construction, but cites Engel Industries for the proposition that this Court should additionally consider whether the latch and the barrel in the '251 patent should be construed as "structurally distinct elements in the accused device." 42

In Engel Industries, the Federal Circuit Court of Appeals considered the patent for an air conditioning machine. 43 The patentee, Met-Coil, asserted that two specified ductal portions of the machine should be understood as a single piece in order to prove infringement. The Federal Circuit rejected this argument:

Met-Coil asserts that the second portion 24 . . . includes the return portion 26. We cannot agree since this assertion contradicts the plain language of the '641 patent. For example, the patent states, 'A second portion 24 is bent rearwardly whereby this portion 24 extends opposite a portion of the duct wall. A return portion 26 is also provided . . . .' Since a return portion is 'also provided,' they logically cannot be one and the same. 44

In conclusion, the court held as a matter of claim construction that "the claimed second portion 24 is separate and distinct from the return portion 26." 45

The dispute currently facing this Court is similar to that discussed in Engel Industries. Here, Windbrella asserts that "when the knob located outside the barrel [of the Taylor Made umbrella] is depressed, the arms of the latch extend distally towards
the inner wall of the barrel. The latch and the curved inner wall of the barrel thereby create an enclosed space which is clearly "ring-shaped." 46 Like the patentee in Engel Industries, Windbrella argues that one claimed element of the patent -- here, the latch -- "includes" part of another claimed element -- the barrel. The teaching of Engel Industries is that the structural distinctness of the latch and the barrel claimed by the '251 patent should be analyzed as a matter of claim construction. This analysis was not conducted in the February 3 Opinion.

The claims, specification, and prosecution history of the '251 patent all provide evidence that the latch and barrel must be construed as structurally distinct elements. In the claim itself, the barrel is described first, and then the latch is separately described as a structure "received in said barrel." 47 The claim then continues to refer to the latch and barrel as two distinct elements; for example, "said latch being received in said barrel and movable, together with said barrel, away from said handle." 48 The drawings in the patent's specification picture the latch and barrel as distinct devices, and also label them as such. 49 The specification's text also repeatedly refers to the latch and barrel as separate elements. 50 Finally, as explained in the February 3 Opinion, the prosecution history of the '251 patent precludes an expansive reading of the requirement for a "ring-shaped latch" because "the purpose of consulting the prosecution history in construing a claim is to 'exclude any interpretation that was disclaimed during prosecution.'" 51 A claim construction that did not require the ring-shaped latch to be structurally distinct from the barrel "might well be deemed anticipated by the Lee patent because it also includes a latch that, when depressed, closes a circle with the barrel around the tube." 52

47 '251 patent, col. 4, l. 25.
48 Id., col. 4, ll. 27-28.
49 See id., Figures 2-4 (identifying the latch as "7" and the barrel as "30").
50 See, e.g., id., col. 1, ll. 52-53 ("latch is received in the barrel and movable, together with the barrel"); col. 1, ll. 61-62 ("latch is ring-shaped, is slidably received in the channel of the barrel for slidably receiving the tube therein"); col. 3, ll. 10-11 ("latch which is ring-shaped is slidably received in the channel 35 of the barrel 30").

Windbrella's effort to promote a different claim construction fails to respond to this evidence. Windbrella cites two cases in support of its argument that "the term 'latch,' in claim 1, should be interpreted to include multiple parts that may be combined to create a ring-shape as that term has been construed." Of course, the claimed latch, like the patented elements in the cases cited by Windbrella, could indeed incorporate multiple components. 54 But under Engel, the components making up the latch cannot include the barrel, which is a "separate and distinct" element of the '251 patent.

53 Windbrella's Memorandum of Law in Opposition to Taylor Made's Motion for Reconsideration of Summary Judgment Opinion and Order ("Pl. Reconsideration Mem.") at 4 (citing CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359 (Fed. Cir. 2002); Cross Medical Prods., Inc. v. Medtronic Sofamor Danek, Inc., 424 F.3d 1293 (Fed. Cir. 2005)).
54 See, e.g., CCS Fitness, 288 F.3d at 1362 (a "reciprocating member" could be composed of a multiple components); Cross
Medical Prods., 424 F.3d at 1309 (an "anchor seat portion" could be comprised of two components, despite the depiction of a unitary structure in the specification).

55 Engel Indus., 96 F.3d at 1405.

For the reasons stated below, the court rejects Beverly's construction of "distal ends . . of the arms being structured to be urged toward each other and to lock into a common opening" in Claims 25 and 30 of the '305 patent as means plus function claims.

4 Beverly quotes a different phrase to be construed in the table of its Memorandum on page 10 under the subheading regarding its Means Plus Function argument, but discusses the above-quoted phrase in its analysis and in its Proposed Claim Construction. (Def. Mem. Ex. 6). The different phrase appears to be a typographical error, and the court construes the above-quoted phrase.5 Claim 25 reads:

A stackable line hanger being composed of a resilient material and having a generally U-shaped body with arms that grip a line, distal ends of the arms being structured to be urged toward each other and to lock into a common opening in a line support or another line hanger, the hanger having a stacking provision located in a region where said arms are joined and configured to retentively engage a second hanger supporting a second line. (Ex. 2.)

Claim 30 reads:

A stack of line hangers comprising:

a first stackable line hanger being composed of a resilient material and having a generally U-shaped body with arms which grip a line, distal ends of which the arms being structured to be urged toward each other and to lock into a common opening in a line support or another line hanger, the hanger having a stacking provision; and a second stackable line hanger configured to lock onto the stacking provision so as to support a second line. (Ex. 2.)

Beverly argues that claims 25 and 30 of the '305 patent do not identify a structure that allows the distal ends of the arms to perform the function of locking into a common opening and argues for the application of a means plus function construction to teach the way in which the arms should be structured. Beverly proposes the following means plus function construction for the phrase based on the structure described in the specification:

Arms having distal ends supporting a locking barb or equivalent structure that includes a line or contact point such that the locking barb locks against the attachment surface at two or more linear points or at a single contact point.

Arms having distal ends supporting a locking barb or equivalent structure that includes a line or contact point such that the locking barb locks against the attachment surface at two or more linear points or at a single contact point.

The locking barb further includes a notch or equivalent structure configured to lock against a lip or other surface associated with the attachment surface.

(Def. Mem. Ex. 6 at 8-9.) In essence, Beverly's proposed construction reads into claims 25 and 30 the requirement of a locking barb device at the end of the distal arms. Additionally, Beverly treats the phrase "being structured to" as a substitute for the term "means for," to argue that the claim teaches "a specified function without the recital of structure, material, or acts in support thereof within the meaning of 35 U.S.C. § 112, P 6, and thus would sufficiently rebut the strong presumption
against treating a phrase that does not use the word "means" as a means plus function clause. Andrew disputes Beverly's construction, contending that the phrase has an understood meaning in the art and thus recites a sufficient structure, see CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002).

**Beverly does not overcome the strong presumption of the inapplicability of § 112, P 6 to the disputed phrase.** See CCS Fitness, 288 F.3d at 1369. That a particular mechanism is defined in functional terms is not sufficient to convert a claim element with that term into a means plus function clause. See Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1360 (Fed. Cir. 2004). In this case, the term "to lock" may be understood to mean "to fix or join firmly by interlacing or fitting of parts into each other." (Pl. Reply Ex. 1.) The term "lock" in the context of the disputed phrase supplies a sufficient structure for construction of the claim: distal ends of the arms being structured to be urged toward each other and to fix or join firmly by interlacing or fitting of parts into each other into a common opening. See id. at 1359-60. That the phrase may cover a broad class of structures and may identify a structure by its function is not enough to convert the phrase into a means plus function clause. See id.

**462**

I. Claim 9: "the two opposite outermost side edges being thicker than the remainder of said stretched film for strengthening the outermost edges of the film"

Claim 9 is an independent claim that mirrors claim 1 but for two words. Whereas claim 1 purports to improve upon prior stretch film through folded edges, claim 9 achieves the same objective through "thicker" edges. Pliant, adhering to the plain language of the claims and the doctrine of claim differentiation, would construe claim 9 to include any means of thickening the edges other than folding, and argues that folded edges are a subset of the larger universe of thicker edges. Defendants assert that the inventor expressly disclaimed any means of thickening edges other than folded edges, and that notwithstanding the doctrine of claim differentiation, claim 9 must be construed as requiring folded edges. In the alternative, Defendants ask that I find that at the very least, claim 9 excludes edges thickened by neck down. 4

4 Neck down is the process by which a plastic film narrows as it is stretched, causing the edges to become thicker. (393 Patent, Col. 6, ll. 29-42.)

The doctrine of claim differentiation presumes that there is "a difference in meaning and scope when different words or phrases are used in separate claims." Comark Commun's. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) (quoting Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987)). If a lack of difference in meaning or scope would render a claim redundant or superfluous, the doctrine of claim differentiation presumes that the different language is significant. Id. at 1187. However, the doctrine cannot restore to claims a scope that has been shown to be unwarranted. See Tandon, 831 F.2d at 1024 ("whether or not claims differ from each other, one can not interpret a claim to be broader than what is contained in the specification and claims as filed") (citations omitted). As with all claim construction issues, I look first to the claim language, specification and the prosecution history to determine the meaning of the disputed claim terms.

When the prosecution history reveals a clear disclaimer as to the scope of a claim, that disclaimer will be binding on the claim's construction. See C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 868-70 (Fed. Cir. 2004) (limiting claim based on disclaimers in prosecution history.) See also Digital Biometrics v. Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998) (observing that the public has a right to rely on statements made during prosecution). The patent at issue in C.R. Bard involved a plug used to repair hernias. That patent included multiple claims, some of which contained an explicit limitation requiring "pleating" of the claimed plug, and some of which did not. The Court reviewed amendments submitted by the inventor during the initial prosecution and during re-examination. C.R. Bard, 388 F.3d at 866-69. During the initial prosecution, in an attempt to overcome the Examiner's rejection of multiple claims, the inventor made broad arguments that explicitly or implicitly required "pleating." Id. at 866-67. The Court refused to find that the "pleating" limitation made in those arguments necessarily applied to the claim that lacked an express pleating limitation. Id. at 867. During a subsequent re-examination, the only claims at issue did not expressly require pleating. Id. at 868. However, in an effort to distinguish prior art, the inventor once again stated that the invention was pleated. Id. This time, the Court found the comments were directed explicitly to a claim whose language lacked a "pleating" limitation. Id. at 868-69. As such, the comments limited the claim. Id.
C.R. Bard set a high bar for finding that remarks within the prosecution history constitute a clear disclaimer applicable to all claims. That standard appears to conflict with a statement in an earlier Federal Circuit case: "absent qualifying language in the remarks, arguments made to obtain the allowance of one claim are relevant to interpreting other claims in the same patent." Digital Biometrics, 149 F.3d at 1347. Digital Biometrics was rightly concerned with the notice provided by "definitive statements" in patent prosecution. Yet it failed to define the parameters of the relevance it granted these "global comments." Id. ("absent qualifying language in the remarks, arguments made to obtain the allowance of one claim are relevant to interpreting other claims in the same patent"). The only hint the case offers (aside from its own facts) is a citation to Southwall Techns., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995) (emphasis added), in which the Court made the much narrower observation that "arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary." I am persuaded to adopt the C.R. Bard standard in lieu of the Digital Biometrics-based standard in construing this claim. The Digital Biometrics standard, wherein global statements regarding the scope of the claims apply to all claims, was rejected in C.R. Bard. Cf. Swimways Corp. v. Overbreak, LLC, 354 F. Supp. 2d 637, 646 (E.D. Va. 2005) ("C.R. Bard does not stand for the principle that the use of [the] term in the claim preamble that defines a broad universe of objects . . . must somehow be construed to apply to a small subset of that broad universe"). Furthermore, I find the C.R. Bard rule a corollary to the principle that an invention is not limited to its preferred embodiment, but only to what is clearly excluded from the claims. See Fuji Photo, 386 F.3d at 1104-05.

In this case, Defendants' examples of disclaimers that would limit claim 9 to folded edges fail the C.R. Bard test. The Information Disclosure Statement states that the invention relates to a roll of stretched film "presenting two opposite side edges folded along the lateral direction to said length." A Petition to Make Special included a sworn declaration from the inventor stating that the invention "in particular, relates to a roll of stretched plastic film . . . [with] opposite side edges folded along the lateral direction." The claims were rejected once as anticipated. They were subsequently rejected, and after an amendment was filed the Examiner again rejected the claims as indefinite. After the indefiniteness rejection, the prosecuting attorney twice noted that "the claims have been amended so as to particularize . . . the two opposite, outermost side edges being folded and stretched." All of these statements were global in nature; none were directed specifically to independent claim 9. Moreover, although the Examiner only approved the patent after multiple rejections and all of the above-noted assertions by the inventor and prosecuting attorney, he nonetheless approved a patent with two independent claims, the latter of which clearly required only thicker edges. 5

5 Defendants make a decent case for the fact that claim 9 is invalid because it adds impermissible "new matter" in violation of 35 U.S.C. § 132. While this argument may ultimately prevail, it is not a matter for claim construction.

Nonetheless, I do find one limitation of claim 9 in a much clearer and targeted disclaimer found within the patent itself. The '393 patent proclaims that the invention has "strengthened tear characteristics than that presently available by the prior art." (‘393 Patent, Col. 2, ll. 23-24.) The prior art includes rolls of stretched film. (Id. at Col. 1, ll. 62-64.) Later in the specification, the patent states that "the relative spacing between first textured roller [] and second textured roller [] is selected so as to minimize the 'neck down' of the film as it is stretched between said first and second textured rollers [ ]." (Id. at Col. 6, ll. 33-37.) The parties agree that neck-down occurs when the film is stretched, and that an aspect of "neck down" is a relative thickening of the side edges of the film. Without question, the patent expressly disclaims prior art rolls and explicitly teaches that neck-down (and thereby its inherent thickening) should be minimized. Cf. SciMed, 242 F.3d at 1341 (disclaimer occurs when the specification "makes clear that the invention does not include a particular feature"). For this reason, claim 9 is construed to exclude thickening that results from "neck down."

463

2. "Below Limits for Imparting Smoke Flavoring to Food"

In addition, HISI and TPI disagree over the meaning in Claim 67 of the phrase "below limits for imparting smoke flavoring to food." TPI requests that the "limits for imparting smoke flavoring to food" be defined as "having phenolic fractions less than 2.3 ppm for vapor and 1.4 ppm for particulate." (TPI Brief 17 (emphasis removed).) TPI bases this request on Table 3 in the Background Art section of the Kowalski Patent, which identifies 2.3 ppm and 1.4 ppm as the taste recognition thresholds for the vapor and particulate phases, respectively, of wood smoke. (Kowalski Patent, Col. 11, at 1-20.) HISI responds that this table is merely part of the background art, and cannot be drawn upon to limit the claims of the Kowalski
Patent. HISI argues that "Claim 67 is a perfectly good claim without any numbers, and the lack of numbers serves a legitimate purpose." (HISI Reply 10.)

The Court here agrees with HISI that the numerical ranges described in the background art may not be read into this particular limitation. The specifications of the Kowalski Patent do not disclose a numeric limitation for "smoke flavoring" in either the smoke or the food with which the smoke is treated. The table listing the "Odor and Taste Recognition Thresholds (ppm) and Most Desirable Concentrations (ppm) of the Phenolic Fraction Isolated From the Vapor and Particulate Phases of Wood Smoke" (Kowalski Patent, Col. 11, at 1-19) is neither referenced nor commented upon at any other point in the specifications.

Furthermore, while an operable numeric range for tasteless smoke was given for the preferred embodiment of the Kowalski Patent, this was a range which was "determined empirically" for that particular embodiment of the patent. (Kowalski Patent, Col. 17, at 14-36.) The process claimed by the Kowalski Patent and disclosed in its specifications, however, is substantially broader; namely, the treatment of smoke "such that the phenols in both particulate and gaseous vapor phases are reduced to concentrations below recognition thresholds for odor and taste that impart a smoked flavor to the treated food. (Kowalski Patent, Col. 12, at 3-6.) Unlike the "heating" limitation discussed above, where the specifications uniformly disclosed a narrow operable temperature range of between 204 [degrees] and 510 [degrees] C., here the specifications disclose a range that is not numerically defined, and further disclose one particular embodiment for which numerical ranges have been determined. The claim here does not exceed the specifications of the patent, and the Court declines to add any numerical boundaries to the phrase "below limits for imparting smoke flavoring to food."

6. "Below said light box" is construed to mean "the supplemental display is at a lower position than the light box."

D. "Below The Disc" And "Beneath The Disc"

In independent claim 1, the patentees state that the disclosed device includes "a housing configured to fit within the meter below the disc." In independent claims 5 and 10, the patentees indicate that the device includes "a housing configured to fit within a meter beneath the disc." Although the parties disagree about the precise meaning of the phrases, they concur that the terms "below the disc" and "beneath the disc" are equivalent and should be given the same interpretation. CellNet contends that the terms should be construed to mean "substantially below the horizontal plane formed by the disc and beneath the disc," whereas Itron argues that they should be construed to require the disclosed housing to be "entirely below the plane formed by the disc and beneath the disc."

The Court construes the terms "below the disc" and "beneath the disc" as requiring the disclosed housing to be completely below the horizontal plane formed by the disc of the standard electric meter. This construction is consistent with both the ordinary meaning of the words "below" 15 and "beneath" and the intrinsic evidence. For example, the patentees state in the specification that their device includes a "housing 30 configured to fit within the structure of standard watthour meters below the discs thereof." 623 patent, 5:5-7. Moreover, the drawings showing the physical relationship between the housing and the meter disc (Figures 1 and 2) both indicate that the housing is positioned completely below the horizontal plane of the meter disc. Furthermore, statements made by the patentees' counsel during prosecution supports Itron's narrower interpretation of the terms:

In Keller, the circuit elements are mounted on printed circuit boards which, at least partially, slide over the meter structure to be concentrically arranged there around. The circuit elements are not contained within a housing that fits beneath the meter disk [sic].

Response to Office Action, p. 6.
There is no indication or suggestion in the intrinsic evidence that the patentees intended to claim a device whose housing is located "substantially below or beneath the horizontal plane of the meter disc." The terms "below" and "beneath" are unqualified in the '623 patent and in the prosecution history. In view of these considerations, the Court believes that a person with ordinary skill in the art would conclude that the disclosed housing of the claimed device must be located completely or entirely below the horizontal plane of the meter disc. Finally, the Court should adopt Itron's narrower interpretation of the disputed language because the parties' respective interpretations are at least equally plausible. See Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996) ("Where there is an equal choice between a broader and a narrower meaning of a claim, and there is an enabling disclosure that indicates that the applicant is at least entitled to a claim having a narrower meaning . . . the notice function of the claim . . . [is] best served by adopting the narrower meaning.").

The term "below the open top and above the drain opening to form a drain" (claim 12)

The Court construes this term to mean:

below the open top of the erosion-control housing and above the drain opening to form a drain.

The Court's construction simply clarifies what is already implicit in the claim language -- that the "open top" in the term "below the open top and above the drain opening to form a drain" is the "open top of the erosion control housing." This is clear from claim 9, upon which claim 12 depends. Claim 9 defines the claimed "erosion control housing" as "having an open top . . . ." '207 Patent col. 4:60-61. The "open top" in claim 12 is necessarily the "open top" of the erosion-control housing referred to in claim 9.

Lange asks the Court to construe this term to mean "below the open top erosion control housing and above the standpipe hole in the bottom of the erosion control housing." JCCS at 4; Def. Claim Constr. Br. at 40-41. The first portion of Lange's proposed construction is not substantially different from the construction adopted by the Court. (Lange proposes "the open top erosion control housing," whereas the Court uses the words "the open top of the erosion control housing.")

As noted above in connection with the term "drain opening." Lange is really asking the Court to construe the term "drain opening" within this longer term. According to Lange's proposed construction of this longer term, a "drain opening" is a "standpipe hole in the bottom of the erosion control housing." JCCS at 4; Def. Claim Constr. Br. at 40-41. The Court has already rejected Lange's attempt to define a "drain opening" as being a hole for the bottom of a standpipe. The term "drain opening" in this term has the meaning that the Court has already given it above.

1. Belt

Rexnord contends that "belt" means "a belt with a pitch larger than or equal to 1.5 inches." (D.I. 57 at 22.) Rexnord argues that a court should deviate from the ordinary meaning of the claim term when compelling evidence in the patent specification so indicates. (Id. at 21-22 (citing Rexnord v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001).) Rexnord argues that compelling evidence occurs if the patentee "disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Id. (quoting Laitram, 274
F.3d at 1342). For example, Rexnord notes that a patentee narrows the scope of claims by describing in the specification a narrower, specific purpose of the patent. Id.

Rexnord argues that the '680 patent requires such a narrowing of scope. According to Rexnord, the specification discloses "a radius belt 20 suitable for larger pitch (>1.5") radius belt applications . . ." ('680 patent, col. 5, 1. 28-32.) Moreover, Rexnord argues that the '680 patent has the sole and entire purpose of protecting fingers of operators from getting caught in large pitch belts. Rexnord argues that, because the specifications and purpose of the '680 patent clearly deviate from the ordinary meaning of belt, the Court should narrow the construction of the term belt accordingly.

In contrast, Habasit contends that "belt" means "radius conveyer belt without any limitation as to the size of the pitch." (D.I. 55 at 36.) Habasit argues that no language in the '680 patent disclaims coverage of small pitch belts and thus the Court should apply the ordinary meaning of belt. Habasit concedes that the patent discloses the solution in the context of large pitch belts, but insists that the Court should not import limitations from the specifications into the claim. Id. at 35 (citing Northern Telecom Ltd. v. Samsung Electronics Co., 215 F.3d 1281, 1290 (Fed. Cir. 2000)).

After considering the claim language, specification, and prosecution history of the '680 patent and the parties' respective positions, the Court agrees with Habasit's interpretation of the disputed term. The Federal Circuit cautions against limiting claims to specific embodiments in the specification. Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988). The Federal Circuit also warns against importing specifications into the claim. Northern Telecom Ltd., 215 F.3d at 1290. Despite these cautions, Rexnord asks this Court to import such a limitation. Rexnord, however, has not presented the "compelling evidence" of "clear disavowal" necessary to justify deviating from the ordinary meaning of belt. Therefore, the Court concludes that the term belt means "radius conveyer belt without any limitation as to the size of the pitch."
Gore concedes that the language of the claims does not require that the steps be performed separately and also concedes that the claim language does not require that the steps be performed in the order in which they are recited. Gore asserts, however, that the specification of the '062 Patent implicitly requires that the wire first be bent into a zig-zag pattern and then wound around a form in a coil. (See Gore 13r. at 22-24.) Gore finds support for its position in references in the specification wherein Wiktor states that the zig-zag wire is "preformed" and "subsequently" wound around a form. Gore also points the Court to references in the specification describing Figure 1. (See, e.g., '062 Patent 2:55-62, 3:1-2, 3:11-17, 3:35-38, 4:14-16, 4:52-58.)

Wiktor, however, clearly identifies Figure 1 as the "preferred embodiment." (Id., 3:52, 4:6-11.) In general, a court should not limit a disputed claim term to the preferred embodiment, even when the specification only describe a single embodiment. See Phillips, 415 F.3d at 1323 ("In particular, we have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment….That is not just because Section 112 of the Patent Act requires that the claims themselves set forth the limits of the patent grant, but also because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments.").

For example, in the Altiris case, although the specification only disclosed "a single 'preferred' embodiment," which set forth a particular order, the patentee did not state that the order was important and did not disclaim any other order of the steps. Altiris, 318 F.3d at 1371. Similarly, in this case, the specification also describes a single preferred embodiment. As in the Altiris case, however, Wiktor did not state that the order of the steps was an important feature of his invention. There also is not a clear disclaimer of any other order of the steps.

Moreover, the prosecution history submitted to the Court does not suggest that Wiktor disclaimed any other order of the steps. See, e.g., Loral Fairchild Corp. v. Sony Corp., 181 F.3d 1313, 1321 (Fed. Cir. 1999) (noting that, in addition to claim language, statements by the inventor during the prosecution history limited process claim to the sequence of the steps set forth in claim language). Finally, after noting that the figures represented the preferred embodiment, Wiktor stated that "it is understood that other applications not specifically mentioned herein are possible and no limitations in scope of this invention are intended or implied without departing from the basic principles of this invention." ('062 Patent, 4:6-11.) This language again suggests that the claims should not be limited to the disclosed preferred embodiment. See Pfizer, Inc., 457 F.3d at 1289. 7

Accordingly, the Court adopts Medtronic's proposed construction and concludes that the steps of the method claims in dispute need not be performed separately or in a particular order.

3. Language in Dispute: "being bent back toward the distal end of said catheter"

Do the tubes being "bent back toward the distal end of said catheter" mean that (1) the tubes must be bent toward (i.e., in the direction of) the distal end of the catheter or (2) the tubes be bent so that the proximal ends of the extension tubes are facing the distal end of the catheter?

Answer: The tubes being "bent back toward the distal end of said catheter" means that the tubes must be bent toward (i.e., in the direction of) the distal end of the catheter.
a). Claim Language

Claim 1 lists what components are necessary for a catheter assembly. Among those mentioned are a "pair of flexible extension tubes." The claim language says each of these tubes have three characteristics: (1) they are "bent back toward the distal end"; (2) they "form a bend having a predetermined shape"; and (3) each bend is "adapted to flex and deform from said predetermined shape in response to an external force and...to return to [the] predetermined shape in response to removal of said external force."

Both parties agree that the extension tubes should have a memorized bend and that the tubes are resilient so that their shape can be changed by force, but that once the force is removed, the tubes will return to the original shape. Thus, the only issue for the Court to decide is whether these flexible tubes must have a memorized bend of at least 180 degrees. The Court answers this question no.

The ordinary meaning of "bend" is to form a curve. For example, a wire can be bent from a straight line into a curve, or a gymnast can arch her back and place her hands on a mat to perform a "back bend" or a "back handspring." The word "bend" in claim 1 is followed by a directional modifier describing the manner in which the flexible tubes should be bent. The claim language says they should "bend back toward the distal end." The term "back" ordinarily means the rear or from where something just came and "toward" means in a specific direction (i.e., together the words "back toward" mean in the direction of the rear). Therefore, in this claim, the common meaning of the words is that the flexible tubes should curve in the direction of the rear, or the distal end. This does not mean they must curve to at least 180 degrees. Again consider a gymnast's body, this time as a flexible tube. When a gymnast performs a "back bend" reaching her arms back (toward the rear) over her head and toward the ground, her body becomes a curve, she may place her hands in a position such that her body is curved 180 degrees, or so that her body is curved 150 degrees. No matter what the exact placement of her hands she still has bent back toward the rear and caused her body to become curved. That is exactly what we have in this claim. So long as the flexible tubes are bent back toward the distal end, toward the catheter, they are not required to be at least 180 degrees, or facing the distal end of the catheter.

Furthermore, the doctrine of claim differentiation requires Claim 1 to be read without a limitation of the bend being at least 180 degrees. The claim language in Claim 8 reads, "The catheter assembly of claim 1 wherein said extension tubes are generally U-shaped." If claim 1 were meant to require a bend of at least 180 degrees, then claim 8 would conflict with claim 1 and violate the doctrine of claim differentiation. This is because claim 8 limits the bend to a shape which is generally 180 degrees, therefore it contemplates claim 1 can have a bend of potentially less than 180 degrees. Thus, in order not to have claim 8 conflict with claim 1, the tubes in claim 1 cannot be limited to a bend of at least 180 degrees.

b). Written Description

It is clear in the specification that the extension tubes must bend back toward the catheter tip in order to accomplish their purpose of making the catheter assembly more comfortable for the patient. The extension tubes are bent back toward the distal end of the catheter so that the catheter "can be accommodated in a small area around the access site on the patient's body." ( '561 patent, col. 5, lines 60-61). Furthermore, the bend in the tubes also enables patients to change clothing and move about without projections interfering. ( '561 patent, col. 5, lines 65-68 and col. 6, lines 1-3). Each of these goals can be achieved without limiting the bend of the tubes to at least 180 degrees. A bend short of 180 degrees would still provide for a patient to be able to change clothing and allow the catheter to be contained to a small area.

2. Construction of "between"

Related to the discussion of channel region is the meaning of the term "between" in claims 1, 5, 12 and 13. Defendants argue that if the channel region is to be "between" the source and drain regions, it must be bordered or surrounded directly by those regions. In other words, all three regions must be co-planar. Therefore, according to defendants, a channel region located below the source and drain regions is not "between" them. Plaintiff asserts correctly that this construction adds a limitation not specified in the '463 patent.
Nothing in the patent claims or specification indicates that the channel region has to be in the same plane as the source and drain regions. Although the only embodiment contained in the specification shows the source, drain and channel regions in the same plane (see Figure 6H), that is not necessarily the only allowable embodiment of the claim. Defendants point out that because only claims 1, 5, 12 and 13 disclose a channel region between the source and drain regions, those claims require a particular configuration of the source, drain and channel regions. Defendants are correct. These claims require a channel region located between the source and drain regions, unlike claims 8 and 14, which disclose only a semiconductor film having at least source, drain and channel regions. However, the requirement in claims 1, 5, 12 and 13 that the channel region be between the source and drain regions does not mean that the channel region must be directly beside or coplanar with the source and drain regions.

An object positioned below two other objects also may be between them. As plaintiff points out, an extension cord running from a wall-mounted television to an electrical outlet near the baseboard below also runs between the television and outlet, regardless whether it dips below both objects. The terms are not mutually exclusive. The parties agree that common definitions of the word between include "from one to the other of," "in the space that separates," "in an intermediate position in relation to two other objects" and "filling the space limited by two objects." This is consistent with the way in which the thin film transistor operates. It is undisputed that when a voltage is applied to the gate electrodes of a thin film transistor, electric charge flows from the source region through the channel region to the drain region. In this sense, the channel region lies between the source and drain regions because it is in an intermediate position with respect to the source and drain regions along the same current path. Therefore, I will not limit the term "between" to meaning that the objects at issue must be co-planar.

Even assuming that only the AL layer comprises the "channel region" in the accused products, a reasonable jury could conclude from this only that the AL layer lies between the source and drain regions. It is undisputed that when the thin film transistor is turned on in the accused products, current flows from the source region through the AH layer to the AL layer, then back through the AH layer on its way to the drain region. Because the AL layer is in an intermediate position in relation to the source and drain regions along the current path, the AL layer is between the source and drain regions. Therefore, plaintiff is entitled to summary judgment with respect to the question whether the accused products satisfy the requirement in claims 1, 5, 12 and 13 that the accused channel region be located between the source and drain regions.

3. "Between"

Excel proposes that the term "Disposed between the hole and the perimeter" means "Located between, but not including, the hole and the edge of the bearing plate." Jennmar contends that the term "between" is self-evident and does not require any further construction. The Court agrees with Jennmar. "Between" is a common word with a well-understood ordinary meaning -- located in the space that separates Point A from Point B. To the extent that Excel is attempting to argue that an object is not "between" if it touches either Point A or Point B, such argument is rejected. The Court finds that there is no need to further clarify the term "between" as the term is clear, has an ordinary meaning, and requires no construction.

The parties' first disagreement regarding the construction of claim 1 revolves around the meaning of "between" in the following sentence: "an actuating device for operating a safety unit which is mounted on a vehicle or the like and moved between a first retracted position and a second extended position . . . ." (052 Patent, col.7, ll.58-61.) The parties both contend that the plain and ordinary meaning should be given to these terms. Additionally, the plain and ordinary meaning of the term "between" is not contested by the parties: The term "between" means "from one to the other of." Webster's 9th New College Dictionary, 146. However, although the parties agree that this language means that the safety unit moves from its retracted position to its extended position, they disagree on exactly what the plain meaning of "between" is in this situation.

Specifically, Transpec claims that the word "between" suggests not only that the safety unit moves from a retracted to an
extended or deployed position, but also that it moves from the extended or deployed position back to its retracted position. In support, Transpec cites to the specification which describes an embodiment of the invention moving the attached safety unit "back and forth between its retracted and deployed positions." (’052 Patent, col.6, ll.23-25.)

Ellison disagrees with this interpretation of the word "between"; suggesting that once the safety unit is in its extended position its function is completed and the claim does not necessarily require a movement back to the retracted position. In support, Ellison contends there may be a different method of bringing the safety unit back to its retracted position other than the actuating device described in claim 1.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

2 Although in the claim construction hearing Ellison argued that this language does not necessarily require the safety unit to move to an extended position and suggested that the claim could cover a point anywhere between the two locations as in "Salisbury is 'between' Greensboro and Charlotte", the language of the claim is clear that it does, in fact, contemplate an extended or deployed position. For example, claim 1 clearly states that the safety unit moves from a first retracted position to a "second extended position." (’052 Patent, col.9, l.15.) Additionally, the specification refers to the second positions as the "deployed position[]." (’052 Patent, col.6, ll.24-25.) There is no discussion in either the patent or the specification of an intermediate position or the possibility that the safety arm is designed to stop sometime before it is fully extended or deployed to a position that is perpendicular to the bumper in the case of the crossing arm or the side of the bus in the case of the stop arm. (’052 Patent, col.3, ll.34-44.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

The use of the word "between" in claim 1 strongly suggests coverage of the movement both ways. The word "between" is actually used several times in claim 1. The additional two times "between" is used in the following manner: "between said retracted and extended positions." (’052 Patent, col.7, l.64 & col.8, l.19.) As pointed out by Transpec, if Ellison had intended the patent to cover only one direction it could have said so in the Claim. However, instead of doing so, the way "between" is used within the claim supports an interpretation that covers movement of the safety unit out fully and back again.

Further support for this interpretation is found in the specification. First, the specification's discussion of the preferred embodiment clearly anticipates movement to and from the deployed or extended positions. For example, the improved switch operating device is discussed in the specification and explained as "moving safety units of this type between their retracted and extended positions." (’052 Patent, col.3, ll.53-55.) Additionally, the specification describes a system of beam generators and beam sensors that function to deploy the safety unit, as well as to retract it. (see chart, ’052 Patent, col.5, ll.20-29.) Finally, the specification discusses the signals of the sensors and their purpose to move "the pivot arm 32 3 with its attached safety unit back and forth between its retracted and deployed positions." (’052 Patent, col.6, ll.24-25.) There is also no suggestion in the patent regarding how, if not through this device, the safety unit returns to its retracted position.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

3 The numbers inserted throughout the specification correspond to the structures depicted in the accompanying figures of the ’052 Patent.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

Additionally, in its discussion of the background of the invention, the specification cites to several other patents regarding the construction and operation of crossing arms of this type. These patents also suggest that the word "between" is commonly used in the field to describe the movement of the safety unit in and out. For example, Latta U.S. Pat. No. 4,599,518 discusses movement between a retracted and deployed position and then references the "deployment and retraction of said safety device." Similarly, in Latta U.S. Pat. No. 4,339,744, relating to a stop sign located on a school bus, "between" is used to explain the movement of the sign and then later in the language of the same claim is a discussion of movement from the retracted to deployed positions and again back to the retracted position. See also Latta U.S. Pat No. 6,138,688 (utilizing the same language in discussing the movement of a safety arm).

Thus, Ellison's contention that "between" refers only to the movement from retracted to deployed position and not back to
the retracted position is unsupported by both the language of the claim as well as the accompanying specification. There is, however, ample support for Transpec's contention that the word "between" in claim 1 refers to the movement from the retracted position to the deployed position and from the deployed position back to the retracted position. Thus, "between" will be interpreted as such and the introduction of claim 1 will be construed as follows:

1. An actuating device for operating a safety unit which is mounted on a vehicle or the like. This safety unit is moved from a retracted position to an extended or deployed position and from an extended or deployed position back to a retracted position.

473

B. "Between" weather stripping

Although Defendants contend the '998 Patent requires the screen to be in continuous frictional contact with the weather stripping, the Court does not find the word "between" requires construction in this case. Neither the claim language, the specification nor the prosecution history require that the screen be in "continuous frictional contact" with the weather stripping. The Court does not find it necessary to adopt Plaintiff's proposed construction, because the Court finds the word "between" is in its simplest form in the context of the '998 Patent.

474

B. "Between" weather stripping

Defendants' proposed construction of "between" weather stripping is: the screen fabric is extracted from the roll and slides in the screen track such that the screen fabric is in contact with fibrous pile, brush or bristle material so as to seal the gap between the walls of the screen track and the screen fabric and retain the edge of the screen fabric from lateral displacement out of the screen track. Although Defendants contend the '998 Patent requires the screen to be "in contact with" the weather stripping, which will result in the sealing of the gap between the screen wall and the screen fabric, the Court does not find the word "between" requires construction in this case. Neither the claim language, the specification nor the prosecution history require that the screen fabric be in such close contact with the screen track so as to "seal" the gap between the two. The Court does not find it necessary to adopt Plaintiff's proposed construction, because the Court finds the word "between" is in its simplest form in the context of the '998 Patent.

475

This court next examines the district court's claim interpretation. This court reviews a trial court's interpretation of patent claim terms under the requirements of Markman, 116 S. Ct. at 1395. See Wiener, 102 F.3d at 539. The first issue of disputed claim language is the meaning of "between" in claims 5 and 33-36. The district court construed the claim language as follows:

After considering the plain language of claim 5, I conclude that the phrase "movable central portion which reciprocates back and forth between the mounting frame members" means that all parts of the movable central portion, including the head members, must remain in the space bounded by the innermost edges of the mounting frame member at all times.

The district court based its interpretation on the ordinary meaning of "between" gleaned from Webster's New World Collegiate Dictionary 134 (3d ed. 1996), namely "in or through the space that separates (two things)." The entire context of the claim language, however, does not prohibit the movable central portion from extending beyond the innermost edges of the mounting frame. In context, the preposition "between" does not directly refer to the movable central portion, but instead refers generally to an action of reciprocating back and forth. In other words, the claim does not say that the movable central portion at all times remains "between the mounting frame members." Rather, the claim says that the central portion moves in a reciprocating fashion and that motion occurs between the mounting frame members. The claim does not say that the
The linear hydraulic units...are defined to be comprised of piston head members, cylinder head members, piston rod...

Turning first to the claim interpretation issue, the district court held:

claim interpretation, as to whether all parts of the Hallco drive unit do in fact transmit downward forces. Second, Foster contends that there is a genuine issue of material fact, even under the district court's

transmission of forces. Second, Foster contends that there is a genuine issue of material fact, even under the district court's

erred in interpreting the claim language "said linear hydraulic drive units transmitting downward forces from the transverse

determination of infringement in accordance with the claim construction discussed supra.

Thus, the claim language does not limit the meaning of "between" to require that the movable central portion "must remain

in the space bounded by the innermost edges of the mounting frame member at all times." The limited extrinsic evidence

also discloses no special limits on the meaning of "between" as applied to the reciprocating motion of the central portion. Therefore, this court determines that the district court unnecessarily limited its claim interpretation. The claim language "movable central portion which reciprocates back and forth between the mounting frame members" includes movable central portions which extend, and reciprocate, between and beyond the mounting frame members. Accordingly, this court vacates the district court's grant of summary judgment of non-infringement of claims 5 and 33-36, and remands for a determination of infringement in accordance with the claim construction discussed supra.

Next, appellant contends that the district court erred in granting summary judgment of non-infringement of claims 5 and 33-36 under the doctrine of equivalents. Foster alleges the district court made two separate errors in granting summary judgment. Appellant's first argument again centers on an issue of claim interpretation. Foster contends that the district court erred in interpreting the claim language "said linear hydraulic drive units transmitting downward forces from the transverse drive beams to the mounting frame members" as requiring all claimed parts of the drive units to participate in the transmission of forces. Second, Foster contends that there is a genuine issue of material fact, even under the district court's claim interpretation, as to whether all parts of the Hallco drive unit do in fact transmit downward forces.

Turning first to the claim interpretation issue, the district court held:

The linear hydraulic units...are defined to be comprised of piston head members, cylinder head members, piston rod...
end portions, and cylinder sidewall portions. If only a subset of those components were required to transmit downward forces, the limitation in the last paragraph would have expressly stated so. It did not. Accordingly, I conclude that all components of the hydraulic drive units, and not just a subset, must transmit downward forces.

In making this determination, the district court again unnecessarily limited the claim language. The claim language requires that each linear hydraulic drive unit transmit downward forces. This language requires no more than that the drive unit, taken as a whole, transmit the downward force English syntax simply does not require that all the components, or even more than one of the specified components, contribute to the transmission of forces As long as the downward forces flow from the drive units (or any portion of the drive units) downward, the claim language requires nothing more. Contrary to the opinion of the district court, the claims would need to have specified that all of the components of the hydraulic drive unit must participate in the transmittal of forces, if that was the meaning of the language. See In re Hyatt, 708 F.2d 712, 714, 218 U.S.P.Q. (BNA) 195, 197 (Fed. Cir 1983) ("A claim must be read in accordance with the precepts of English grammar."). Merely specifying the drive unit, rather than any particular component or all of the components, does not limit the portion of the drive unit which may transmit or participate in the transmission of the downward forces. The district court thus read in an additional limitation not required by the language of the claim. Accordingly, this court vacates the district court's grant of summary judgment of non-infringement under the doctrine of equivalents of claims 5 and 33-36, and remands for a determination on the merits. Having decided this issue, this court need not reach the issue of whether there was a genuine issue of material fact under the district court's erroneous claim interpretation

Foster contends that the district court also erred in granting Hallco's motion for summary judgment of non-infringement of claim 11, both literally and under the doctrine of equivalents. Foster argues that the district court erred in its interpretation of several words in the claim. According to Foster, the district court incorrectly read this claim on the accused device, and thus erred in granting summary judgment of non-infringement.

First, the district court construed the meaning of the claim language "fixed opposite end portions which are secured to the mounting frame members." With respect to this issue, the court held:

Although I agree with Foster that the cylinder does not have to "touch" the mounting frame member, I believe that the indirect connection relied on by Foster is too circuitous for the cylinder to be considered secured to the undercarriage channel member. The two are connected to portions of the conveyor frame that are at right angles to each other. All parts of the conveyor are welded or bolted to another part. Foster's argument would have them all "secured to" each other. I disagree.

The trial judge apparently interpreted the claim language with an eye to the accused device, a practice this court eschews. See SRI Int'l v. Matsushita Elec. Corp., 775 F.2d 1107, 1118, 227 U.S.P.Q. (BNA) 577, 583 (Fed. Cir 1985) The district court concluded that the two components need not be in direct contact and that the connection may be indirect, but then looked to the accused device to declare the meaning of indirect.

As the district court correctly noted, the claim does not require "secured" to mean a direct connection. Rather, the term "secured" means "to make tight or firm: FASTEN." Webster's II New Riverside University Dictionary 1055 (2d ed. 1988). Neither the specification nor the prosecution history discloses a more specialized or different meaning. Thus, the claim envisions and includes an installation which connects the opposite end portions of the drive units to the end portions of the conveyor frame, and which connects the end portions of the conveyor frame to the channel members. Although the connection is indirect, the claim requires no more than a secure fastening of the fixed opposite end portions to the mounting frame members. The district court unnecessarily restricted the meaning of this claim language.

Next, the district court construed the claim language "in," "within," and "between." Each of these claim construction issues is similar to the interpretation of "between" discussed above in relation to claims 5 and 33-36 The district court construed these words more narrowly than required by the claim language and context. The word "in" does not require that something be completely and continuously inside of something else. The word "within" does not require that something be completely and continuously within something else. Further, as discussed above in more detail, the word "between" does not require that something be completely and continuously between two things.

Nothing in the specification or the prosecution history supports such narrow readings, and no testimony was offered to suggest that these narrow interpretations are the correct meaning to one skilled in the art. Consulting the claim language again, the "between" requirement may be satisfied even if a component extends beyond the specified boundaries. In the
same way, the "in" requirement may be met by a component which is located, at least in relevant part, in the defined space, as the "within" requirement may be met by a component which located, at least in relevant part, within the defined area. Accordingly, this court vacates the district court's grant of summary judgment of non-infringement, both literal and under the doctrine of equivalents, as to claim 11 and remand for a trial on the merits.

GO BACK

476

(a) "Locating said wicket at a first station with said common header positioned between said first station and an adjacent second station."

As used in the patent, "station" refers to the physical place or location of the wicket of bags or of an individual bag. The station is a place relevant to the process in some way. That is, the bag or bags are at the "station" for a purpose in the course of the full process. See Sineath Aff. P 45. As described in the patent, the wicket of bags is located at the "first station" so the individual bags may be taken one by one and worked on. The individual bag is taken from the wicket group and moved so that, after the sample has been inserted, the pocket can be sealed at the "second station." The wicket remains at the first station until all the individual bags in it have been transferred to the second station for sealing. The individual bags will not necessarily remain very long at the second station. But what makes the location a station is not that the bag or bags rest there for any minimum amount of time, but rather that the location advances in some distinct way the method described in the patent. The patent clearly indicates that the sealing of an individual bag is done at a different location or station from the place where the bags await processing.

The other important feature expressed in this limitation is the description that the wicket's header lies "between" the two stations. The word "between" in this context has its usual meaning: that is, lying in the space or interval that separates. See Merriam-Webster's Collegiate Dictionary 109 (10th ed. 1993). To say that the header is between the stations is to say that one station is on one side of the header, and one on the other.

76 Id. at 6.

77 Id.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The court adopts Crown's proposed construction.

The parties' proposed construction are identical except Rexam's proposal elides the word "about" from the claim language. Rexam offers no support for the omission of the word "about" in its proposed construction, other than to assert that Crown's proposed construction does not clarify the meaning of the word; that the word is vague and, therefore, should be disregarded; and that the specification does not discuss an embodiment having chuck wall angles of less than 20 degrees or greater than 60 degrees. Rexam is correct that the common specification recites "between 20 [degree] and 60 [degree] in describing the embodiments illustrated in figures 4 and 5. 78 Claims 32 and 50 of the '875 patent, however, are broader than that specification language in that they recite "between about 20 [degree] and about 60 [degree]." 79 Therefore, the court rejects Rexam's more restrictive proposed construction and agrees with Crown that the claim language needs no further construction than the words of the claims themselves: "between about 20 [degree] and about 60 [degree]."

- 910 -

PUBPAT
Claims 3, 4, 13, and 21 refer to the placement of certain "resilient support members." In claims 3, 4, and 13, those support structures are placed "between said frame and said deck member." Precor urges the Court to construe this language to mean "within the vertical space between the frame and the deck." Life Fitness urges the Court to give the word "between" its ordinary meaning.

The Court concludes that the meaning of the disputed claim element is apparent on its face. "Frame" and "deck member" are clearly defined within the patent. "Between" has an ordinary meaning, and requires no further construction.

F. Between Said Lower Covering and Said Rim

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>disposed between said lower covering and said main panel at said rim</td>
<td>located above the lowering covering and within the main panel or within a void in the main panel and located integral to the outer edge of the brim</td>
<td>positioned entirely within the space above the lower covering and below the main panel of the rim</td>
</tr>
</tbody>
</table>

While claim 3 describes the location of the LED array as being within a void in the main panel, claim 4 appears to recite an alternate possible location of the LED array as being "between said lower covering and said main panel." The '831 patent's location of the LED array within the brim was a key innovation over the prior art, as it permitted the light source to remain "visually inconspicuous" when unlit. ('831 patent, Col. 2, ll. 7.; Notice of Allowability, Apx. 2, 112-13) To that end, the patent specification repeatedly describes the light source as "integratedly disposed within the main panel or fitted into a void in the main panel." (831 patent, Col. 4-5, ll. 63-1.) While the language of claim 3, the patent specification, and the prosecution history all contemplate locating the light source wholly or partially within the main panel itself, claim 4 alone appears to introduce the possibility of locating the LED array "between" the lower covering of the brim and the main panel.
Plaintiffs urge the court to construe claim 4's reference to a location "between said lower covering and said main panel" to include a location "within the main panel or within a void in the main panel." Plaintiffs' proposed construction ignores any difference in the terms "between" and "within" and would, in the court's view, functionally render claim 3 indistinct from claim 4. "The concept of claim differentiation . . . states that claims should be presumed to cover different inventions. This means that an interpretation of a claim should be avoided if it would make the claim read like another one." Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991)(quoting Autogiro Co. of America v. United States, 384 F.2d 391, 404, 181 Ct. Cl. 55 (Fed. Cir. 1967)(emphasis omitted).

While the arrangement set forth in claim 4 is not found in the specifications or embodiments, "[t]he claim language itself governs the meaning of the claim." Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365 (Fed. Cir. 2000). In its ordinary usage, "between" means "in the time, space, or interval that separates" objects. WEBSTER COLLEGIATE DICTIONARY at 109 (10th ed. 1997.) An object cannot simultaneously be "between" Point A and Point B while being located "within" Point B. Plaintiffs' construction violates the ordinary meaning of between and would render two distinct claims redundant.

The court thus concludes that Defendant's construction more accurately captures the meaning of "between," though Defendant adds undue emphasis by unnecessarily including the word "entirely." The court construes the term "disposed between said lower covering and said main panel at said rim," as: "located within the space above the lower covering and below the main panel at the rim."

1. "Between"

As noted, in the Markman order, this court construed "an elongated cuttable member horizontally mounted between two parallel guardrails" to mean that the "'elongated cuttable member' must be horizontally mounted in the space that separates two parallel guardrails." (Docket Entry No. 90, p.49). This court concluded that the "ordinary meaning of between' includes both [horizontal and vertical] limits on the space defined by two objects." (Id.). KEI had argued that the cuttable member could be above or below the guardrails when viewed from the side because the specification did not limit the term "between" to "in the space that separates" viewed both horizontally and vertically. Trinity argued that "between" meant "in the space that separates," in both the horizontal and vertical dimensions.

KEI relied on Figure 14, which shows the crash cushion embodiment viewed from above. In Figure 14, the cuttable member is located in the space defined by the parallel guardrails in the horizontal dimension. In Figure 14, however, no information is provided as to whether the cuttable member is located above or below the guardrail edges. The description of Figure 14 states:

In FIG. 14 there is shown another embodiment of guardrail 10A serving to protect vehicles from hard structures 120 such as an overpass or the like. In this embodiment, beam 130 is horizontally mounted between two parallel rails 122 and 124, each having corresponding overlapping sections 122A-122D and 124A-124C, supported by corresponding ones of the breakaway posts 126A-126D. The structure without the terminal assembly 18 and beam 130 is similar in operation and construction as that described in the aforementioned U.S. Pat No. 4,655,434 [to Bronstad].

(Docket Entry No. 65, Ex. 5, 820 Patent, col. 8, ll. 9-26). Figure 14 is the only drawing of the crash cushion embodiment and, as noted, it provides no information about whether the cuttable member is mounted between the parallel guardrails when viewed from the side, as opposed to from above. The specification states that the cuttable member must be horizontally mounted "between" the parallel guardrails, but nothing in the specification states that the cuttable member is between the guardrails when viewed from above but not when viewed from the side. The description of Figure 14 states that the embodiment is similar to the operation and construction of the device claimed in the Bronstad 434 Patent. In that patent, the term "between" describes the slotted material that is within the overlapping portions "in the space that separates" the top and bottom portions of the guardrail. That description is consistent with this court's claim construction.

The claim limitations and the prosecution history undermine KEI's reliance on Figure 14 in arguing that "between" can
During the prosecution of the 820 Patent, the examiner rejected claims directed at cutting fiber -- reinforced material as obvious in light of the Bronstad 434 Patent, a patent issued to Sicking, and U.S. Patent No. 3,596,963 issued to Phillips. The Phillips reference disclosed the use of fiber-reinforced material within guardrails. In an office action dated January 13, 2000, the examiner stated that "it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the guardrail terminal of Sicking et al in view of Bronstad by forming the guardrail from fiber reinforced material, as taught by Phillips, in order to increase the rigidity of the rail." (Docket Entry No. 148, Ex. 11, T02014). The applicants objected. With respect to the Bronstad reference, the applicants argued that it did not disclose "cutting" and that "the new claims are all directed to cutting the guardrail and thus are not properly rejectable . . . over Bronstad." (Id., T02040). With respect to the Phillips reference, the applicants argued that the examiner's rejection was improper because it did not disclose "cutting a guardrail." (Id.). The applicants limited "cuttable member" to a member that was physically mounted as part of the guardrail structure itself-horizontally mounted between the parallel guardrails -- as opposed to an additional or separate structure that could be above, below, or to the side of one of the guardrails. 24 Narrowing claim constructions argued during prosecution history to distinguish the claimed invention from prior art excludes the construction that was disclaimed, even if the examiner did not rely on the applicant's statements in allowing the claims. The Federal Circuit has rejected the argument that statements made during prosecution about features that distinguish the claimed invention from prior art should be disregarded if the features were not expressly included in the claims. See Springs Window Fashions LP v. Novo Indus., LP, 323 F.3d 989, 995-96 (Fed. Cir. 2003) ("[A] reasonable competitor, reviewing the amendments and statements made by the applicant to distinguish the claimed invention from Pluber, would conclude that the claimed invention did not cover a device like Pluber's."); see also Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1327 (Fed. Cir. 2002) (adopting a claim construction that excluded an embodiment when the prosecution history required the claim construction because of the disclaimer). The fact that "the prosecution shifted to a different focus [after the applicant amended the claims] does not blunt the impact of those remarks made to overcome the prior rejection." Desper Prods., Inc., v. QSoundLabs, Inc., 157 F.3d 1325, 1336 (Fed. Cir. 1998).25

Footnotes

24 "Absent a clear disclaimer of particular subject matter, the fact that the inventor anticipated that the invention may be used in a particular manner does not limit the scope to that narrow context." Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 334 F.3d 1294, 1301 (Fed. Cir. 2003). "[A] claim term will not carry its ordinary meaning if the intrinsic evidence shows that the patentee distinguished that term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366-67 (Fed. Cir. 2002); see also C.R. Bard v. U.S. Surgical Corp., 388 F.3d 858, 863 (Fed. Cir. 2004) (ordinary and customary meaning does not trump the intrinsic record).

25 In September 2002, KEI filed the 755 Application as a continuation of the 003 and 820 Patents. The claims in the 755 Application include claims substantially identical to the asserted claims of the 820 Patent. In one claim, the sole difference is the addition of parenthetical language broadening the "between" limitation as "an elongated cuttable member horizontally mounted between (when viewed from above) two parallel guardrails." (emphasis added). KEI does not dispute that the addition of the "when viewed from above" element broadened the scope of the 820 Patent claims. The Federal Circuit has noted that the prosecution history of a subsequently issued patent may be relevant for purposes of a related, previously granted patent. See Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1349-50 (Fed. Cir. 2004) (recognizing that "the prosecution history of one patent is relevant to an understanding of the scope of a common term in a second patent stemming from the same parent application").

Footnotes

Reexamining the claim construction under Phillips does not lead to the result KEI sought in the Markman proceeding. The specification of the 003 Patent does not use the word "between" in a way that alters its ordinary meaning or limits it to a
horizontal dimension. Phillips does not forbid the use of a dictionary to articulate the ordinary meaning so long as that meaning is not divorced from, or inconsistent with, the meaning of the claim terms in the context of the patent specification and file history. Although this court cited dictionary definitions of "between" and cited to Texas Digital, this court did not construe "between" to include all dictionary definitions of the term without regard to the context of the invention. 26

26 Both KEI and Trinity relied on dictionary definitions of "between" in their arguments during the Markman proceeding. KEI argued that the dictionary definition of a city located "between" New York and Chicago supported construing "between" as meaning "between" the guardrails if viewed from above, but not viewed from the side. This court rejected the argument and noted that the when "between" is used to describe two geographical locations on a map, the respective altitudes of the locations are ignored.

This court concludes that the claim constructions entered in September 2003 are consistent with the approach set forth in Phillips.

481

1. **Language in dispute: "bevel"**

Does "bevel" mean (1) an angle that one surface or line makes with another when they are not at right angles (i.e. not 90 degrees), or (2) a visibly sloping, slanted angle?

**Answer:** a bevel means a visibly sloping, slanted angle.

The court agrees with Defendants that in order for the second opening to be deemed "beveled," the slant must be visible to the human eye. Plaintiff notes that the specification does not refer to a visible slant, but provides that "the bevel is formed by simply cutting the desired angle of bevel through the wall of that half of the tube that forms the lumen . . . " (Col. 4, lines 5-9.) Thus, Plaintiff urges, any non-90 degree angle might qualify. If taken literally, the court notes the language appears to contemplate selection of an angle so closely resembling 90 degrees, for example 89 degrees, that it would be indistinguishable from 90 degrees to the naked eye. Plaintiff argued during the Markman hearing that if the court adopts Defendants' proposed construction, this will make the term more vague, rather than clarify the issue. The court concludes to the contrary, that if a jury is instructed that the bevel as contemplated by the patent means visibly beveled, jurors should be capable of determining whether, to the naked eye, the accused patents infringe this particular claim.

GO BACK

482

5. **"Beveled Tip Portion … Formed at an Acute Angle … to Facilitate Entry"**

The only apparent dispute over element [4] of claim 13 is the severity of the "acute angle." Plaintiff, citing his expert, suggests that "a person of ordinary skill would understand a beveled tip portion that facilitates entry to mean an angled surface of about 60 degrees or less." (Pl.'s Markman Br. at 28 n.35.) Defendants argue that importing a numerical limitation runs counter to precedent, and that the prosecution history suggests merely a preference for the angle of the cut -- one of 30 degrees, not 60.

Defendants are correct. The "beveled tip" language of the claim does not warrant importation of a numerical limitation. To the contrary, it implies that, so long as the tip "facilitate[s] entry," the angle is acute enough. The medical definition of "bevel" available during the period supports this plain language interpretation: "A surface having a sloped or slanting edge." Stedman's, at 168.
Given the purpose of the invention, see, e.g., '960 patent, col. 2:62-68, it can be inferred that any bevel, so long as it renders entry significantly easier than it would have been with a blunt tip, is encompassed by the claim. Moreover, the specification states that, "with respect to the longitudinal axis of the catheter, the bevel should be cut at an angle as acute as possible, preferably 30 [degrees] or less." '960 patent, col. 6:38-40 (emphasis added). This raises two problems for plaintiff. First, it is indicative of the fact that the term "beveled tip" has only a preferred embodiment, rather than one justifying numerical limitation of the claim. See Texas Digital, 308 F.3d at 1204-05. Second, it calls into question the assertion by plaintiff's expert that 60 degrees is the outer limit of "acuteness," which appears arbitrary in light of this significantly more acute preferred embodiment. In any event, there is no basis in the intrinsic record for such a limitation. See Invitrogen, 327 F.3d at 1371.

12 The Court disagrees with defendants insofar as they contend that any acute angle would suffice. Clearly, an angle of, say, 89 degrees would fail to comport with the spirit of the supposed invention and would probably create the same undesirable effect as a blunt tip. The bevel must "facilitate entry" into the vein.

Accordingly, "beveled tip portion" shall be construed as "a sloped edge rendering entry into a vein palpably easier than it would have been with a blunt edge."

6. Bias Exerting Mechanism

As it did for "retainer device," Aqua-Lung proposes that "bias exerting mechanism" invokes 35 U.S.C. § 112(6) because it fails to recite adequate structure to those skilled in the art. Two Forty counters that the claims describe "bias exerting mechanism" as various spring or lever structures that would not implicate any means-plus-function analysis. Despite Aqua-Lung's argument to the contrary, "bias exerting mechanism" connotes sufficient structure in the claims. Just like the addition of "detent" to "mechanism" in Greenberg or the combining of "retainer" with "device" above to provide adequate structure, "mechanism" becomes a structural term when placed with "bias exerting." See Mass. Inst. of Tech., 462 F.3d at 1354 (finding that the generic term "mechanism" typically does not connote sufficient definite structure).

Based on the claims, one purely functional term ("mechanism") is being modified by a second structural term ("bias exerting"). Claim ten of the '130 application and claim thirteen of the '609 patent provide that the "bias exerting mechanism
comprises a resilient member. "'130 application claim 10 at 37; '609 patent claim 13 at 20:57-58. Claim eleven of the '130 application and claim fourteen of the '609 patent add that "said bias exerting mechanism comprises a coil spring and a spring containment sleeve, said coil spring having one end portion engaged with said pressure responsive element and an opposite end portion mounted in said containment sleeve." '130 application claim 11 at 37; '609 patent claim 14 at 20:59-63. A slight change in claim five of the '958 patent states that "said bias exerting mechanism comprises a coil spring and a spring containment sleeve, said coil spring having one end portion engaged with said valve member and an opposite end portion mounted in said containment sleeve." Claim 5 at 18:34-38.

One skilled in the art, therefore, would understand that a spring, a spring with a spring containment sleeve, or resilient member is the derived structural connotation for the generally claimed "bias exerting mechanism." See Welker v. Bearing Co. v. PHD, Inc., 550 F.3d 1090, 1096 (Fed. Cir. 2008). Accordingly, because the inventor did not choose to express this claim element as "a means or step for performing a specified function without the recital of structure, material, or acts in support thereof," 35 U.S.C. § 112(6), means-plus-function analysis does not apply to "bias exerting mechanism."

Having determined that Section 112(6) does not apply, the next step is to construe the term. As noted above, "bias exerting mechanism" is mentioned in the claims of the '130 application and two of the patents-in-suit as a spring, a spring with a spring containment sleeve, or resilient member. See '130 application claims 10-11 at 37; '609 patent claim 13 at 20:58-59, claim 14 at 20:60-61; '958 patent claim 5 at 18:34-38. The term further occurs in one other claim of the '130 application, two other claims in the '609 patent, and two additional times in claim one of the '958 patent. See '130 application claim 12 at 37 ("said filter element is disposed between said bias exerting mechanism and said retainer device proximate said outlet opening"); '958 patent claim 1 at 18:13-15, 19-21 ("said valve member being biased toward said closed position with a bias exerting mechanism; and . . . said filter is disposed between said bias exerting mechanism and said retainer device proximate said outlet opening"); see also '609 patent claim 12 at 20:55-57, claim 16 at 21:5-7). The term does not appear in the claims of the '674 patent.

Aqua-Lung seeks to have "bias exerting mechanism" defined as: "A spring whose downstream end bears on the gas filter either directly or via a sleeve or spacer, whose upstream end is connected to or received within the filter cover and whose spring force is selected to urge the filter cover to its closed position absent gas pressure sufficient to overcome the spring force, and to permit the filter cover to open in response to gas pressure applied to the filter cover." Two Forty proposes that it be construed as "a portion of the device which exerts a force against the filter cover." Similar to their proposed definition of "retainer device," Aqua-Lung's proposed definition operates from the assumption that 35 U.S.C. 112(6) applies, and thus, is too narrow.

The specifications repeatedly identify various different springs as the "bias exerting mechanism." Referring to figure eight of the '609 patent, for example, the specification states: "The bias mechanism in the preferred form of the coil spring 102 creates a bias force against the piston 90 and the bottom of the containment sleeve 108 so as to press the upper surface 94 against the internal lip 82." 9:59-63. The spring's shape and configuration differs somewhat from embodiment to embodiment, but they all have the same basic characteristics. See '674 patent at 20:6-11 ("The embodiment of FIG. 49, or for that matter any other embodiment illustrated herein, may be modified further to provide an alternative bias exerting mechanism 102. This modification is illustrated in FIG. 49k. In this particular embodiment, the bias exerting mechanism is in the form of a Schraede valve 414 . . . .") (emphasis added); see also '130 application at 24 (referring to FIG. 32); '958 patent at 15:4-8, 44-47 (referring to FIG. 36 & 40).

While none of the specific embodiments suggest any other structure as the "bias exerting mechanism," that does not support Aqua-Lung's argument that any resulting construction must include a spring. Despite all the embodiments showcasing a spring, persons of ordinary skill in the art rarely confine their definitions of terms to the exact representations depicted in the embodiments. Phillips, 415 F.3d at 1323. The fact that only a spring is shown in the embodiments is taken into consideration when examining the patentee's entire invention. Honeywell, 452 F.3d at 1318.

Based on the intrinsic record, and similar to "retainer device," there is no additional evidence beyond the use of a spring in the embodiments to justify narrowing any definition to a spring. Agfa, 451 F.3d at 1376-77. To the contrary, reading the specification with the claims demonstrates that the embodiment is not so limited. Phillips, 415 F.3d at 1323. First, just like "retainer device," while the embodiments disclose various springs for the "bias exerting mechanism," the inventor knew the term "spring" and could have used that term in the claims instead of the much broader term, "bias exerting mechanism."

Second, the doctrine of claim differentiation supports a construction that is not limited solely to a spring. That doctrine creates a presumption against constructions that would render a claim meaningless in its entirety by making it identical in scope to another claim. Sinorgchem Co., Shandong v. Int'l Trade Comm'n, 511 F.3d 1132, 1139 (Fed. Cir. 2007). In other words, claim differentiation creates a presumption that each claim in a patent has a different scope. Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000). Here, as noted above, dependent claim ten of the '130 application and dependent claim thirteen of the '609 patent recite a “resilient member,” while all of the other claims with "bias exerting mechanism" do not. Any resulting construction, therefore, must take into consideration that a spring was not the only "bias exerting mechanism" intended by the inventor. To hold otherwise would render these dependent claims meaningless. Based on the foregoing, the Court adopts Two Forty's proposed construction of "bias exerting mechanism" to mean "a portion of the device which exerts a force against the filter cover."

F. "Biased in a Direction Normal to the Top Surface of the Housing" and "Biased to Move in a Direction Normal to the Top Surface of the Housing"

These terms are used in claims 1, 23, and 32. While SureFire does not believe a construction of these terms is necessary, Glock and Insight offer constructions that explain what a "direction normal to the top surface" means. They agree that a normal direction in this context is perpendicular to the top surface of the housing. Insight adds that the direction is upward and also adds that a perfect ninety degree angle is not required for the direction to be perpendicular.

Because relative orientation is disputed in the context of other terms, that issue will not be resolved here. The court agrees with Insight that a normal direction, in this context, means the direction that will make the biasing mechanism work, which is a perpendicular direction, but does not require a specific angle of perpendicularity. These terms are construed to mean: forced by a biasing spring or biased in a direction that is perpendicular to the top surface of the housing and forced to move, by a biasing spring, in a direction that is perpendicular to the top surface of the housing, although no specific angle of perpendicularity is required.

K. "biased to tension said membrane" (claim 20)

PolyVision's proposed construction

No construction required. Alt.: The flexible member is pushed in a direction to impart or store spring tension in that member before the attachment of the membrane to the flexible member.

As both parties acknowledge, the word "biased" does not appear in the specification or prosecution history of the '309 patent. Based upon its review of the intrinsic evidence, the Court concludes that the inventors intended this term to have the same meaning as "pretensioned." Therefore, the Court will adopt Smart's proposed construction of the term "biased", which is the same as "pretensioned."

I. PolyVision's Motion Regarding the ’309 Patent

PolyVision contends that reconsideration of the Court's construction of the claim terms "pretensioned" and "biased to tension" is required under the Federal Circuit's decision in Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361 (Fed. Cir. 2007), which, according to PolyVision, "clarified and narrowed the law on reading manufacturing limitations into product claims." (PolyVision's Br. Supp. at 2.) The Court has read Andersen and, for the reasons set forth below, disagrees with PolyVision that Andersen compels a different result.
Initially, the Court notes that, contrary to PolyVision's reading, Andersen does not appear to establish any new rule or limitation regarding incorporating "manufacturing limitations" into product claims. Rather, it applied well-established rules of construction (in fact, the same rules which this Court applied in its construction of the claims) to reach the particular result in that case. 1

1 Although PolyVision first cited Andersen in the instant motion for reconsideration, the Court notes that the decision was issued on January 26, 2007, and PolyVision had ample time to bring the decision to the Court's attention prior to its issuance of its claim construction memorandum, had it believed it important to do so.

Andersen involved two groups of patents, Group I, which covered compositions capable of being extruded into structural members, and Group II, which covered the extruded structural members themselves. The district court agreed with the defendant that the term "composite compositions" in the Group I patents were limited to materials that had previously been extruded into either pellet or linear extrudate form. However, with regard to the term "composite structural members" claimed in the Group II patents, the district court agreed with Andersen Corp. and held that the members were not limited to items made from a composite mixture that had been extruded into pellet or linear extrudate form, as claimed in the Group I patents. The Federal Circuit held that the district court erred in its construction of the Group II patents, finding that the scope of the composite structural members was limited to composite structural members in which the preparation of the composite composition includes an intermediate step of pelletization or linear extrusion. See id. at 1375. The court observed that "[t]he specification . . . indicates that the claimed physical properties of the composite structural members are attributable to the process that is used to make them, a process that includes pelletization." Id. at 1372. While the court acknowledged that claim construction would be a close question in the case before it if the intrinsic evidence were limited only to the specification, it found that the prosecution history resolved the issue with a clear disavowal of claim scope by requiring pelletization in the process of production of the structural members. See id. at 1373.

PolyVision contends that this case is distinguishable from Andersen, which limited the product claim to method of manufacture, for several reasons. First, it contends that contrary to the Court's construction, the specification discloses two embodiments shown in Figures 9 and 10 in which the membrane is attached to the support substrate rather than the flexible members. It also asserts that the specification describes an embodiment in which one end is fixed and the other is flexible, such that the membrane could be attached to the fixed end prior to the storing of spring energy rather than afterward, as required by the Court's construction. This argument fails for several reasons. First, according to the Court's construction, the pretensioning occurs by pushing or imparting spring energy to the flexible member and then attaching the membrane to the flexible member. The fact that the membrane is attached to the support substrate instead of the flexible member in Figures 9 and 10 is irrelevant because the specification explains that the compressible flexible member in Figure 9 is first pretensioned by compressing it inwardly toward the substrate, following which the membrane is affixed to the bottom of the substrate. (Col. 4, ll. 65-67 to Col. 5, ll. 1-2.) Thus, in either situation (attachment to the flexible member or the support substrate), the flexible member is pretensioned (pushed to impart spring energy prior to the attachment of the membrane). PolyVision's point regarding a fixed-end configuration is unavailing, because even in such a configuration, the flexible member would still be pretensioned prior to attachment of the membrane to either the flexible member or the support structure, as required by the invention.

Second, PolyVision argues that the ‘309 patent specification contains none of the limiting words present in the patents in Andersen, such as "necessary," "critical," or "controlling." The Court rejects this argument because, as fully set forth in the Court's claim construction memorandum, the specification establishes that pretensioning requires that tension be imparted to the flexible members prior to the attachment of the membrane. Thus, while the specification may not contain the exact words of limitation used in the patents in Andersen, the specification establishes that the flexible members must be tensioned prior to the attachment of the membrane.

PolyVision's final argument is that, unlike Andersen, the prosecution history in this case contains no clear disavowal of claim scope to a specific manufacturing process. Nothing in Andersen suggests that the prosecution history must contain a disclaimer of claim scope limiting the claims to a particular manufacturing process. The court in Andersen looked to the prosecution history only because the specification was not entirely clear with regard to the process limitation. The
prosecution history resolved this question. In this case, the absence of a disclaimer from the prosecution history is irrelevant because the specification provides sufficient guidance on the proper construction of the disputed claim language.

2. "Biasing"

Claim 9 includes "a contactor having a spring located inside the battery holder between the base of the battery holder and the battery for biasing the battery toward the opening of the battery holder. . . ." '900 Patent col.11 1.36-39 (emphasis added). Invisible Fence asserts that the term "biasing" should be construed as "mechanically biasing or urging," while Perimeter claims that the term means "exerting force in a particular direction, [i.e., the direction of the open end of the battery holder]." (Joint Statement 4.)

Invisible Fence argues that "claim 9 simply states that the spring causes the battery to be biased toward the opening, which can be as a result of a direct force applied by the spring or a reactionary force resulting from the spring." (Pl.'s Opening Br. on Claim Construction 15.) Referencing the basic principle of physics that "for every action, there is an equal and opposite reaction," Invisible Fence explains that the battery is held in place within the battery holder as a result of two opposing forces. Newton's Third Law of Physics, available at http://www.physicsclassroom.com/Class/newtlaws/U2L4a.html. While the spring exerts a force biasing the battery towards the opening, the contact simultaneously exerts a force biasing the battery in the opposite direction. Invisible Fence characterizes the force exerted by the contact as a "reactionary force resulting from the [force of the spring]."

Ultimately, this discourse about opposing forces is utterly irrelevant to the interpretation of claim 9; although other objects could be exerting forces that cause the battery to be biased away from the opening, claim 9 only concerns the spring and the force it exerts in biasing the battery toward the opening. Because the Court's duty is to give the words in the claim their ordinary meaning, see Johnson Worldwide Assocs., 175 F.3d at 989, we will not construe the language in claim 9 to encompass anything broader than what it explicitly says. Therefore, the Court construes the term "biasing," to mean "exerting force in a particular direction toward the open end of the battery holder." 8

8 In fact, Invisible Fence seemingly concedes that this is the proper construction, since its proposed construction for the term "spring" is "[a] spring for biasing the battery toward the opening . . ." See infra, Part III.B.3.

11. Biasing Force

The next term for construction is "biasing force" which appears in claims 1 through 3 and claims 6 and 7 of the '836 patent. In claim 1, the term appears as follows:

a coupling part of said panel, when engaged with a complementary coupling part of another one of said panel, configured and arranged to produce a biasing force between such coupled panels tending to urge the panels towards each other; at least one of said coupling parts including an elastically bendable portion having a relaxed unbent position, and which, when in a coupled condition, is at least partially bent out of its normal relaxed position and thereby provides said biasing force.

('836 patent, 14:7-16)(emphasis added.)

In claim 3, the term appears in the following context: "to produce a resultant biasing force maintaining the panels compressed against each other at the coupled side edges." ('836 patent, 14:62-65)(emphasis added.)
Unilin maintains that "biasing force" means "force acting within a joint that urges the panels together after coupling." (Unilin Opp'n Br. 15.) Alloc states that it has no substantial disagreement with Unilin's proposed interpretation. (Alloc Resp. Mem. 13.) Alloc states that it is clear that such force must be in effect after the panels have been joined and that the term "biasing force" does not apply to any forces that are at work during the installation or assembly of the panels. (Id.)

The parties' proposed construction of "biasing force" is consistent with the specification and claims and, therefore, is adopted. "Biasing force" means "force acting within a joint that urges the panels together after coupling."

C. Biasing Mechanism

The function of the biasing mechanism described in the various claims whether in means plus function format or not, is to bias the swing arm bi-directionally toward a median position. The biasing mechanism is described in some independent claims in a means plus function format which under 35 U.S.C. § 112(6) is construed to cover the corresponding structure described in the specification for performing the claimed function. However, in determining whether a means plus function clause invokes section 112(6), the Court must decide whether the claim recites sufficient structure to perform the claimed function. See Al-Site Corporation v. VSI International, Inc., 174 F.3d 1308 (Fed. Cir. 1, 1999). If it does, section 112(6) does not apply to limit the coverage of the claim.

In claim 1, the biasing mechanism is described as a structure comprising resilient buffer members which are in contact with the stop member when the swing arm is in the median position and compressible by the stop member by movement of the swing arm from the median position whereby the buffer member applies a biasing force to urge the swing arm to the median position. At the Markman hearing, the parties stipulated that the word "contact", as used in the claims, means "touching". Claim 9 describes the same structure as Claim 1 except that "resilient buffer members" are replaced by "resilient buffer material" and the swing arm is attached to the structure for "pivotal motion about an axis having a fixed position with respect to the structure." In Claims 13 and 14, 2 the biasing mechanism is described in means plus function format, and under section 112(6), is limited to the structure described in the specification and related drawing which turns out to be the identical structure described in Claims 1 and 9. Claim 15 describes the same biasing mechanism structure as claim 1 except that the stop member is depicted as being "carried on said structure." Claim 16 describes the same biasing mechanism structure as Claim 9 except that the stop member is depicted as being "carried on said structure." Claims 17 and 18 describe the same biasing mechanism structure in a means plus function format as Claim 14 except that the stop member is depicted as being "carried on said structure."

2 Claim 14 contains other means plus function limitations. Apart from the "biasing means" clause of Claim 14, the "drive means" clause of that claim is a means plus function limitation and includes the motor 42 and flywheel 54 to drive the post member or tool support 74. That clause therefore covers a flywheel and equivalents of that structure. Claim 18 also contains a similar "drive means" clause which should be interpreted in the same way.
argues however, that Deere is estopped by the prosecution history from contending that the claims of the '290 patent cover devices with more than two buffers. During prosecution, Deere presented a claim to the PTO with the language "at least two substantially cylindrical, resilient bodies." The examiner rejected this claim language stating:

The recitation "at least two substantially cylindrical, resilient bodies" in claim 9, line 2 is inaccurate since this implies that more than two cylindrical, resilient bodies can be present yet more than two cylindrical, resilient bodies are never shown. (Benchbook of Exhibits in Support of the Prehearing Memorandum of Deere & Company Relating to the Markman Hearing, Doc. # 31, Exhibit D at D100120.)

Deere responded by amending this claim in the following manner:

The cultivating machine of claim 2 wherein the resilient buffer members comprise [at least two] substantially cylindrical, resilient bodies [,] respectively mounted on [either side] opposite sides of one of the stop means [in] and mounting means so that [the] a portion of a circumference of each [body] of the bodies abuts the other of the stop means and mounting means.

Toro asserts that, by acquiescing in the examiner's rejection and amending the claim to remove the "at least two" language, Deere gave up the right to assert its claims against any device with more than two buffers. The Court disagrees. This amendment was not made to overcome prior art. It was made in response to a rejection based on the patentee's failure to disclose the invention he was claiming. Deere did not disclose an invention with more than two resilient buffers and therefore they were not entitled to claim such a device. This does not mean, however, that Deere may not assert its claims against a device that has more than two buffers. Accordingly, the Court will not read this limitation into the claim.

--- Footnotes ---

3 Additions are underlined and deletions are in brackets.

--- End Footnotes ---

The Court also agrees with Deere that the force being generated by the biasing mechanism or means is not limited to compressive force. Toro's reliance upon language in the specification expressing dissatisfaction with the prior art's use of a leaf spring as a biasing means in Australian Patent Application 41609/89 "due to the torsional forces applied to such biasing means" is misplaced. (See col. 2, line 40, et seq.) A careful reading of the specification in that regard reveals that what is criticized as "unsatisfactory" is not a mechanism giving rise to a torsional force, but rather the use of a leaf spring as providing the biasing force:

Australian Patent Application 41609/89 disclose the use of a leaf spring to bias the link arm to a right angle position relative to a secondary link part. However, the present inventors have found such biasing means to be unsatisfactory due to the torsional forces applied to such biasing means. (Patent '290. Col.2, line 64, et seq.)

Accordingly, the Court will not read the limitation suggested by Toro into the claim language.

2. "A liquid absorbing member comprising a bibulous material"

Dade Behring argues the term "bibulous" is an adjective which describes a property or function of a material. Dade Behring then suggests that the property or function of the material is to pull or draw liquid through the immunosorbing member. Biosite contends the "bibulous material" refers to a physical part of the assay device which is comprised of an absorbent, porous material which allows for the flow of solutions.

Starting with the language of the claim itself, the liquid absorbing member is said to be comprised of a "bibulous material." See Col. 2, lines 3-4. As the term "bibulous" has not been used in a special or unique way in the specification, it is interpreted according to its ordinary and customary meaning. 23 See Vitronics, 90 F.3d at 1582; Ekchian, 104 F.3d at 1303. Additionally, by adding extraneous limitations only found in the specification or prosecution history, the Court would be
violating a cardinal rule of claim construction by importing limitations found only in the specification into the claim. See Electro Medical Systems, 34 F.3d at 1054 ("claims are not to be interpreted by adding limitations appearing only in the specification."); Zenith Laboratories, 19 F.3d at 1422 ("It is axiomatic that terms in the specification cannot simply be read into the claims where they do not appear.").

23 Much has been made by both parties of the following specification language:

The important features of the assay device material are that they are able to absorb liquid, particularly aqueous solutions, without substantially impeding the movement of the solutes employed in the assay. In effect, the materials are bibulous; they are porous and allow the flow of solutions. . . .

See Col. 15, lines 16-22. The Court does not believe that the term "bibulous" is being used in a special or unique way in this passage in the sense that the patentee was attempting to be his own lexicographer or a special definition of the term is clearly stated in the patent specification or prosecution history. See Vitronics, 90 F.3d at 1582 ("Patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history.") The Court therefore declines to import this specification language into the claim.

The dictionary definition of "bibulous" is "readily taking up fluids or moisture." 24 See Webster's Dictionary at 212. No further gloss is required. Such words as "porous" or "absorbent" may or may not be equivalent. The important point is that for one reason or another, the patent applicant decided not to use these terms.

24 The dictionary definition is consistent with the definition adopted for "liquid absorbing zone," which has been previously found to be identical to the "liquid absorbing member." As the "liquid absorbing member" is comprised of the "bibulous material," the adopted definition of "liquid absorbing zone" proves insightful. The specification relates that the "liquid absorbing zone" "acts as a pump to pull liquid through and out of the immunosorbing zone." Col. 4, lines 67-68; see also Col. 2, lines 32-33; Col. 3, lines 18-19; Col. 14, lines 35-37; Col. 16, lines 61-62; Col. 17, lines 1-3, 21-22.

Accordingly, the Court construes "bibulous material" as any material which is able to readily take up fluids or moisture.

492

2. "Bifurcated Base Structure" and "Bifurcated Base Graft Structure" 4

The parties agree that the "bifurcated base [graft] structure" is divided at its downstream end. Cook argues that it must be "trouser" shaped. Plaintiffs and Gore argue it is either "Y-shaped" or "forked." 5 The primary dispute between the parties is whether this term should be construed to mean that the "bifurcated base [graft] structure" is an intraluminal device that contains malleable wires.

4 458 Patent. The parties ask the Court to construe this term and the term "bifurcated base graft structure," found in independent claims 1, 15, 17 and 23 of the '158 Patent in the same manner.

4 458 Patent. The parties ask the Court to construe this term and the term "bifurcated base graft structure," found in independent claims 1, 15, 17 and 23 of the '158 Patent in the same manner.
5 Plaintiffs also propose a construction that includes a requirement that the "bifurcated base structure" permits the "connection of additional grafts." The Court concludes that this feature of the "bifurcated base [graft] structure" is addressed by the manner in which the Court construes the term "a pair of connector legs."

Plaintiffs support their position that the "bifurcated base [graft] structure" is not limited to intraluminal devices by reference to the declarations submitted during the prosecution history, which describe the October 6, 1993 surgical procedure. Plaintiffs argue that these declarations refer to an "aorta-iliac bypass graft," which previously had been implanted in the patient during open surgery. Plaintiffs equate that aorto-iliac bypass graft to the "bifurcated base [graft] structure" as used in the claims. Plaintiffs also argue that because claim 1 of the '158 Patent provides that "at least one" of the bifurcated base graft structure or the second graft structure has a wire member, the Court should not construe "bifurcated base [graft] structure" to require wires in all instances. Defendants, in contrast, argue that the specification does not support a construction of the term "bifurcated base [graft] structure" that could include a traditional surgical graft, i.e. a graft without wires. Defendants also argue that the specification demonstrates that the inventors disclaimed resilient wires.

Defendants' arguments do find support in the section of the specification that describe a bifurcated device, the inventors state that when an aneurysm is located near a bifurcated artery, "it is possible to place a graft according to the present invention which has a bifurcation at its downstream end, a so-called 'trouser-graft', wholly within the primary artery." (458 Patent, col. 4 II. 18-23 (emphasis added).) That The term "bifurcated base structure" is found in independent claim 1 of the section of the specification continues, "[i]n the case of an aneurysm in the aorta, for instance, that extended into each of the iliac arteries the primary graft of the 'trouser' type would be placed in the aorta through one of the iliac arteries." (Id., col. 4, II. 25-29 (emphasis added).) These references suggest that the device in question is placed intraluminally and is not a bifurcated device already implanted in a vessel. Further support for Defendants' position is found in the section of the specification in which the inventors state that one leg of a trouser graft "will have a skirt which cannot be expanded by a balloon catheter." (Id., col. 4, II. 45-49.) This language again suggests that the "bifurcated base [graft] structure" of the claims would not encompass a traditional vascular graft. In addition, the prosecution history of the '158 Patent shows that when the inventors added the "bifurcated base graft structure" language to the claims, they referred to the portions of the specification, cited above, that describes a bifurcated device as support for that claim language. (See Prosecution History of '158 Patent, 37 CFR 1.111 Amendments dated Aug. 11, 2003 and October 30, 2003, Inventors Remarks and Support Chart.)

Plaintiffs also rely on the doctrine of claim differentiation to support their position that the "bifurcated base [graft] structure" could encompass a traditional vascular graft. Thus, by way of example, Plaintiffs argue that because dependent claim 2 of the '458 Patent recites a prosthesis "wherein said bifurcated base structure is circumferentially reinforced at locations along its length by a plurality of separate spaced apart wires," the Court should not construe the term as used in independent claim 1 of that patent to require wires. (Compare '458 Patent, col. 6, II. 12-19, with id., col. 6, II. 20-23.)

In general, the doctrine of claim differentiation recognizes "that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope." Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1369 (Fed. Cir. 2007) (quoting Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999)). Thus, there is a presumption that "[t]o the extent the absence of such difference in meaning and scope would make a claim superfluous, … the difference between claims is significant." Id. (quoting Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987)). That presumption may be overcome, however, by the written description of the patent or its prosecution history. Id.

Defendants argue that claim 1 of the '458 Patent would not be rendered superfluous if the Court were to adopt their construction, because the dependent claims of that patent contain other limitations, such as "circumferentially reinforced at locations along its length." Indeed, dependent claim 11 of the '458 Patent provides that "said graft is circumferentially reinforced at locations along its length by a plurality of separate spaced apart wires." This language refers back to the "graft which is adapted to be anchored within one of the flow lumens," limitation of independent claim 1, which appears in the second portion of the body of the claim. Plaintiffs, however, argue that it is the second portion of the bodies of the asserted
claims that incorporate the intraluminal limitation. Thus, under Plaintiffs' theory, the "circumferentially reinforced" language must be an additional limitation. Furthermore, when the Court views the term "bifurcated base [graft] structure" in light of the references in the specification that describe a bifurcated device, the Court does not find Plaintiffs' claim differentiation argument persuasive. (See '458 Patent, col. 4, ll. 18-23, 25-29, 45-49.)

Plaintiffs also propose a construction that would equate this term merely to a foundation. The term "base," however, implies that this portion of the device serves as a foundation. Therefore, the Court concludes that something additional is required to give meaning to the word structure. The Court concludes that the reinforcing wires give meaning to that word and, thus, agrees with Defendants that the term should be construed to include wires.

Finally, the Court concludes that the inventors disclaimed self-expanding wires in the specification. The inventors describe prior art intraluminal grafts as being comprised of "a sleeve in which is disposed a plurality of self expanding wire stents." ('458 Patent, col. 1, ll. 20-22.) They then state that "[t]here are a number of problems associated with such known grafts," including the "lack of precise control of the expansion of the graft in the lumen." The inventors then state that their invention is "directed to an alternative form of intraluminal grafts which provides an alternative to the known grafts." (Id., col. 1, ll. 32-42.) Thereafter, the inventors describe the wires that form part of the invention as malleable or state that the device is expanded by use of balloons. (See, e.g., id., col. 1, ll. 49, 60-63, col. 2, ll. 8-15, col. 3, ll. 8-10, col. 5, ll. 32-36, 58-60, 66-67, col. 6, ll. 5-7.) Thus, when the Court reads the claims in light of the specification, it concludes that a person of ordinary skill in the art would clearly understand that this invention requires malleable, rather than resilient, wires.

Accordingly, the Court construes the terms "bifurcated base structure" and "bifurcated base graft structure" to mean: "An intraluminal graft that has one opening at its upstream end and two openings at its downstream end and which includes at least one malleable wire."

(c) "Billowing" In general usage, to "billow" means "to swell out, puff up, etc." Webster's College Dictionary 136 (Random House 1992); "to bulge or swell out in billows (as through the action of the wind)" Webster's Third New International Dictionary 216 (G. & C. Merriam Co. 1981). The specification in the '409 patent describes a process of causing the pocket to open by means of a puff of air: "The nozzle 90 discharges an air jet blast which billows the pocket 26 such that the article 88 may be received therein." '409 patent, col. 3, lines 64-66.

"Billowing" the pocket, as the term is used in the '409 patent, must be construed to mean causing the pocket to swell or bulge open by use of a puff or gust of air. It is fair (and sensible) to conclude that, in using the word "billowing," the inventor meant to say something more than, and different from, merely "opening." The use of the particular word refers to a specific way of opening the pocket.

A. "Method of managing at least two bingo cards . . ."

Independent Claim 13 of the Patent begins with the preamble: "Method of managing at least two bingo cards which comprises: . . ." (151 Patent, Col. 6, line 9.) Plaintiff asserts that this preamble means nothing more than it says, that the invention is a method for managing at least two bingo cards." (Pf. Markman Br. at 7, 9.) Defendants, on the other hand, focus on the term "bingo cards" and insist that "bingo cards" really means "actual physical bingo cards to be played." (Def. Brief at 13.) Plaintiff counters that there is no reason to limit the term "bingo cards," and that it includes bingo cards in whichever form they happen to come, whether physical or electronic/virtual card form. (Plaintiff's Response to Defendants' Bench Memorandum, (hereinafter, "Plf. Resp. Def. Bench Mem.").) at 2-3.)

The term "bingo cards" is not plainly "so amorphous that one of skill in the art can only reconcile the claim language with the inventor's disclosure by recourse to the specification." Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). The term is subject to more than one understanding, however, and because both parties enlist support
from the specifications, the court will follow their lead. First, the court notes that the specifications expressly define a "bingo card" as "a square that is divided into a 5 x 5 matrix." (151 Patent, Col. 1, lines 24-25.) The preamble of Claim 13 arguably narrows that definition; it claims a method of managing . . . bingo cards . . . " Therefore, whether the term "bingo cards" might include any item on which the basic 5 x 5 bingo matrix is printed or any mode in which the matrix is stored, is irrelevant here because only those bingo cards that the 151 Patent method" contemplates "managing" are significant in the Claim 13 preamble.

To determine which bingo cards the 151 Patent contemplates managing, reference to the specifications is necessary. Plaintiff points to two portions of the specifications to support its argument that the reference to "bingo cards" in the Claim 13 preamble includes electronic or virtual cards. Plaintiff notes the specification language, "the processor automatically enters the next set of cards," and Figure 2, which indicates that the device will "DISPLAY CARDS." (151 Patent, Col. 4, lines 54-55; 151 Patent, Figure 2.) These references, however, do not require the conclusion that electronic or virtual cards are included because they do not identify the types of bingo cards the patented device is intended to manage at all. Instead, these provisions merely refer to the multiple number configurations that the device monitors after they are called up from the device's memory and displayed on the screen.

In numerous respects, the language of the specifications supports Defendants' contention that the 151 Patent contemplates managing physical bingo cards as opposed to virtual ones. The abstract states that the stored standard card configurations . . . correspond to physical cards . . . selected by a player." (151 Patent, Abstract.) It continues, the processor compares 'called' numbers with card configurations which correspond to the physical cards being played by the user." (Id.) The BACKGROUND OF THE INVENTION section begins by explaining that the "device . . . is capable of monitoring standard bingo cards." (151 Patent, Col. 1, lines 7-8.) It also describes the two predominant types of bingo cards" as "hard cards," made of cardboard or plastic, and "padded paper cards." (151 Patent, Col. 1, lines 32-35, 46-47.) In the section that explains the method of the invention," the first step is for the "user [to] determine whether hard or padded, paper cards are being used." (151 Patent, Col. 3, lines 49-51.) No where is it mentioned that virtual bingo cards might be managed by the device.

The potential danger here is the possibility of running afoul of the rule that, although claims are to be read in light of the specifications . . . limitations from the specifications are not to be read into the claims." Bell Atlantic Network Services, Inc., 262 F.3d at 1270. Sometimes only "a fine line" separates "reading [the] claim in light of a specification, and reading a limitation into the claim from the specification." Id. The court concludes, contrary to Plaintiff's contentions, that the line is not crossed by Defendants' interpretation. The specifications are entirely consistent in referring solely to physical cards, hard cards, or padded paper cards, whenever discussing the type of bingo cards for which the 151 Patent provides a device to manage. The Federal Circuit has explained that the written description 'can provide guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format." Id. at 1271, quoting SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337, 1344 (Fed. Cir. 2001). As a result, where a "patentee uses a claim term throughout the entire specification, in a manner consistent with only a single meaning," as Plaintiff did when referring to bingo cards to be managed by the patented device, the patentee "has defined that term' by implication." Bell Atlantic Network Services, Inc., 262 F.3d at 1270, citing Vitrinetics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). The court finds that even if the term "bingo cards" does encompass cards in formats other than the traditional printed paper, cardboard, etc., the 151 Patent does not contemplate managing them. In light of the consistency with which the specifications refer to the sub-group of bingo cards the device is designed to manage, the court would improperly expand the scope of the claims if it were to read virtual bingo cards into the claims.

495

2. "Biologically inert coating."

Consistent with the claim language and its ordinary meaning 24 and the prosecution history, 25 this court construes "biologically inert coating" to mean "a coating that is not biologically active."
4. "biopsy actuator"

Turning to the other patent in suit, the '798 patent, the first disputed term of claim 2 (the only asserted claim) is "biopsy actuator." Plaintiff's proposed construction is "a mechanism for the removal of tissue." MDTech proposes that this term be defined to mean "the automated biopsy instrument 10 having an outer casing 12; an inner support rod 14; a coil spring 16; a biopsy spring guide 18; a safety cap 20; a release lever 22; and a needle 24, as shown in Figure 1." In essence, MDTech's proposed construction defines the "biopsy actuator" as the "automated biopsy instrument" - i.e., the claimed invention.

In support of its proposed definition, MDTech relies solely on the prosecution history. According to the prosecution history, the examiner initially rejected claim 2 (originally claim 8 in the application) as being indefinite because it read "a biopsy actuator . . . further comprising . . .," even though the "biopsy actuator" itself had not been defined as having any structure. (Ex. 5 to MDTech's Br., GWB00609) (emphasis added). In response, the applicant amended the patent application by deleting "further" from the claim. (Id. at GWB00600.) MDTech seized upon comments made in the remarks to this amendment where the applicant describes the invention as "comprising a cannula 66 and a biopsy actuator 10." (Id. at GWB00606) (emphasis added). In the specification of the '798 patent, however, reference numeral 10 refers to the "automated biopsy instrument" generally. ('798 patent, col. 5, l. 29-32.) The automated instrument 10 is further described as having the "seven principle elements" that MDTech seeks to use to define the "biopsy actuator."

At the Markman hearing, counsel for MDTech argued that the applicant used reference numeral 10 to refer to the biopsy actuator in order to overcome the examiner's finding that the claim was indefinite as originally drafted. In doing so, MDTech argues that the patentee acted as his own lexicographer and defined "biopsy actuator" as "biopsy instrument," thereby incorporating all of the elements of the biopsy instrument.

As an initial matter, it is clear that MDTech's interpretation of the prosecution history is inaccurate. The applicant did not refer to the biopsy actuator using reference numeral 10 in response to the examiner's assertion that the claim was indefinite; he made that reference in the remarks section of the filing when he was providing a general description of the invention. The only mention of claim 8 (which ultimately became claim 2) in the amendment and response section was to indicate that "further" was deleted. MDTech is attempting to extrapolate a comment made in the remarks section and attribute a motivation for making that comment which is simply not there. For that reason, its interpretation must be rejected.

While the Plaintiff argues that the reference to numeral 10 in the remarks was just a mistake by the prosecuting attorney and should not be given any significance, this Court does not need to determine whether it should be characterized as a mistake, because the claim and the specification provide enough guidance for construing this term. MDTech's proposed interpretation is inconsistent with the claim and the specification and, therefore, regardless of whether the prosecuting attorney made a mistake or not, the one paragraph of the prosecution history upon which MDTech relies is given little weight compared to the rest of the intrinsic evidence that guides this Court.

It is also clear that Plaintiff's proposed definition - "a mechanism for the removal of tissue" - is too broad and essentially repeats the introductory phrase of claim 2, which is "[a]n apparatus for acquiring biopsy specimens." Plaintiff also points out that "biopsy actuator" is further defined in claim 2 under subparts d) and e), which provide:

   d) said biopsy actuator comprising a second connector means for releasably and fixedly engaging the first connector means, wherein the first connector means and the second connector means are movable as a unit during acquisition of the biopsy specimen,
e) said biopsy actuator comprising means for rapidly advancing the distal end of said cannula beyond the distal end of the stylet means to acquire a core biopsy specimen.

("798 patent, col. 14, l. 67 - col. 15, l. 8.) According to the claim language, therefore, the "biopsy actuator" includes at least a second connector means and a means for rapidly advancing the cannula. In addition, the Summary of the Invention section of the '798 patent describes the invention as "comprising a cannula and a biopsy actuator," (Id. at col 3, l. 43-44), and further explains that the biopsy actuator includes a stylet means, (Id. at col. 3, l. 47-50), a second connector, (Id. at col. 3, l. 58-63), a means for exposing the notch of the stylet and subsequently advancing the cannula over that notch, (Id. at col. 3, l. 64-67), and, in some aspects of the invention, a means for retracting the second connector (Id. at col. 4, l. 5-10) and for rapidly advancing the cannula (Id. at col. 4, l. 16-19). Further, the Detailed Description of the Invention indicates that an operator of the biopsy instrument "actuates the instrument by depressing the finger rest 96 on the release lever 22," which raises the latching projection such that "the stored energy of the biasing means or compressed coil spring 16 is released to drive the cannula 66 forward over the stationery stylet 60 and into the mass." (Id. at col. 8, l. 48-58) (emphasis added).

According to the claim and the specification, therefore, the "biopsy actuator," in descriptive terms and in the words of Plaintiff's counsel, constitutes the subparts of the biopsy instrument that make the instrument an automated rather than a manually operated device. (Tr. at 63). Although there is little in the specification that limits the biopsy actuator to something less than the entire biopsy instrument, it must be something more limited than the "apparatus" referred to in the introductory language to claim 2, and it at least does not include the cannula.

Based on the claim language and the specification, therefore, the Court defines "biopsy actuator" as "a mechanism for putting the biopsy instrument in operating motion, other than by hand." 12 This construction is also consistent with the ordinary meaning of "actuator," which is defined as "one that actuates; specifically : a mechanical device for moving or controlling something." Mirriam-Webster Online Dictionary, www.m-w.com; see also Webster's Third New International Dictionary 22 (1993) ("one that actuates; specif: any of various ... mechanisms by means of which something is moved or controlled indirectly instead of by hand.")

12 The Court rejects MDTech's belated argument, made for the first time at the close of the Markman hearing, that this definition would render the term "biopsy actuator" indefinite. The Court finds that the additional limitations placed on this term elsewhere in claim 2, where the term is first used, suffice, as construed by this Court, to provide a sufficiently definite structure to the actuating mechanism claimed.
a replaceable pliable sheet material patch having a first face for generally conformable application to the skin area on the zygomatic arch along the lower side of the orbit of a user, said patch being of sufficient extent to substantially cover the skin area on the zygomatic arch when applied to said skin area.

The second area of controversy is contained in the third sub-paragraph of claim 1, which recites

a light absorbing surface on a second face of the patch for absorbing incident light rays directed toward said skin area; said light absorbing surface being dark in color to reduce glare by substantially preventing light from reflecting from said skin area of the zygomatic arch toward the eyes of the wearer, said light absorbing surface being resistant to running caused by perspiration.

Defendant contends that the first section must be construed to cover the entire zygomatic arch, which is the arch of bone extending from the cheekbone to the side of the skull just in front of the ear, in other words, the whole of the cheekbone, including not only the under-the-orbit portion shown in Fig. 1 of the patent specifications, but also the portion of the cheekbone on the side of the face. Alternatively, defendant contends, the section must be found indefinite as a matter of law because the term "substantially cover" is not sufficiently precise to tell the person of ordinary skill in the art what he must do to avoid infringement.

Defendant's suggested construction makes no sense. Although defendant argues that the court should look to the dictionary definition of zygomatic arch, which would lead to the conclusion it proposes, the claim language, the specifications and common sense militate against doing so. The inventors claim an "under-eye" device; a patch extending beyond the eye would not be an under-eye device. The claim itself specifies that the patch is to be applied to the skin area on the zygomatic arch "along the lower side of the orbit of the user." '909 Pat., col. 3, Ins. 54-55. Also, the device is designed to prevent light from reflecting from the skin area to the wearer's eye; a side patch would be unlikely to fulfill this purpose.

The specifications start with Fig. 1, which shows a small kidney bean-shaped device located right under each eye of the wearer. Although defendant argues that "a figure cannot be relied upon for the precise dimensions of a claim limitation," Dft.'s Br., dkt. # 39, at 2, and cites Hockerson-Halberstadt, Inc. v. Avia Group Int'l, 222 F.3d 951, 956 (Fed. Cir. 2000), in support of its argument, Hockerson-Halberstadt is easily distinguishable. In that case, the court held that the patent drawings could not be used to determine measurements where the claims referred to quantitative relationships among the components of a particular device and the specifications were silent on the same relationships. "It is well established that patent drawings do not define the precise proportions of the elements and may not be relied on to show particular sizes if the specification is completely silent on the issue." Id. The court noted that "figures in a patent are not drawn to scale unless otherwise indicated." Id. In other cases, however, the Federal Circuit has approved the use of patent drawings in understanding the claims of a patent. See, e.g., CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1153 (Fed. Cir. 1997) (holding patent drawings highly relevant to understanding claims). See also Phillips v. AWH Corp. 415 F.3d 1303, 1315 (Fed. Cir. 2005) (holding specification highly relevant to claim construction analysis). Even if the claims left any doubt about where the patch is to be placed, the specifications would eliminate the doubt.

Finally, common sense and experience dictate construction of the claimed patch as one that is applied to the bony (zygomatic) arch immediately below the eye. The reason that athletes use using charcoal and other materials to black out that section is because it is the area from which light can reflect back into the athlete's eyes.

As to the second area of controversy, relating to the glare reduction requirement, defendant argues that the claim should be construed as requiring a black patch and one that is intended to be used primarily for the purpose of reducing glare to improve sight. Plaintiff counters by pointing out that nothing in claim 1 or the specifications requires an entirely black patch or even one that is mostly black. The claim provides for a surface that is "dark in color." Col. 3, In. 68. It does not specify black as the "dark color." Dependent claim 7 adds the limitation: "wherein said light absorbing surface is black." If independent claim 1 were interpreted as requiring a black patch, claim 7 would be superfluous and would not have been approved by the examiner.

Plaintiff denies that the patent requires patches that improve the user's eyesight. Plaintiff is correct. The patent claims a patch that substantially prevents light from reflecting from the zygomatic arch toward the wearer's eyes; it says nothing about improving sight. One would expect that sight would improve if protected from glare, but this is not a claim requirement.
Accordingly, for claim construction purposes, "substantial coverage" means a patch large enough to cover the skin area on the zygomatic arch when applied to said skin area; "substantial" means "largely, but not necessarily wholly, that which is specified," LNP Engineering Plastics, Inc. v. Miller Waste Mills, Inc., 275 F.3d 1347, 1354 (Fed. Cir. 2001), or approximately the same size as the patch shown in the patent drawings. In the third section of claim 1, "said skin area of the zygomatic arch" is the area under the eye; "substantially" preventing reflected light means, again, "largely, but not necessarily wholly, that which is specified." "Wherein said light absorbing surface is black" is construed to mean a patch that includes a black light-absorbing surface.

Having construed the claims, I find no problem of indefiniteness. The substantial coverage limitation is definite enough to give clear warning of what constitutes infringement; the reference to the zygomatic arch along the lower side of the orbit of a user is clear; the patent gives sufficient guidance for determining how much coverage is "substantial" as I have explained and the patent makes it clear that preventing light from reflecting into the eyes of the user will follow if the patch is about the same size as the one pictured in the specifications, dark in color and have a non-reflective surface to reduce glare.

Avon next asserts, citing the dictionary and the patent figures, that the term "blade" in claims one and nine must be interpreted to mean a broad, flat structure. Suncast does not quarrel with this interpretation. However, Avon attempts to further limit the definition of "blade" by looking to the specifications and dependent claim seven. The specification states that the blades are approximately one inch and three-quarter inches. See U.S. Patent 5,501,036, col. 3, lines 25-32. Suncast disputes this interpretation, arguing that the claim has no width requirement for the blade and that the width requirements described in claim seven cannot limit claim one. The Federal Circuit has consistently stated that limitations appearing in the specification will not be read into the claim. See Intervet America, Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989). Although the specification can be used to define a term that is already in the claim, Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1578 (Fed. Cir. 1996), Avon's interpretation adds a term, exact width, that extends beyond the limitations of the claim. It is sufficient that one of ordinary skill in the art interprets the word "blade" to mean a broad, flat structure, specifically a shape limitation. The structure could come in a variety of widths and still meet this requirement. Avon's interpretation, requiring a minimal width, unnecessarily limits the claim.

A. Claim Construction and Literal Infringement

The '848 patent has three independent claims--numbers 1, 13, and 14--and the summary judgment of noninfringement pertains to all three. The principal dispute in this case concerns the proper meaning of the claim term "blades," which is used in each of the three independent claims. Claim 1 recites "a plurality of upstanding conductive blades," claim 13 recites "a plurality of planar contact blades," and claim 14 recites "an array of separated and specially [sic, spatially?] parallel contact blades vertically mounted."

A claim must be given its ordinary meaning, absent a contrary definition in the specification or the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). The technical dictionary cited by Siemon's expert defines "blade contact" as "a solid contact with rectangular cross section, usually with a chamfered mating edge," a definition that accords with the more general definition found in the dictionary cited by the district court, which defined "blade" as "a flat, thin part or section."

The definition of "blade contact" in the art is consistent with the use of the term in the specification. The written description of the '848 patent refers to "contact blades" as "preferably planar" and as having a "generally rectangular configuration, being slightly elongated and preferably flat or planar with "tapered contact tips," a description that is distinctly at odds with the cylindrical shape of the contact pins used in the Siemon device.

Given the proper construction of "blades," it is apparent that claims 1, 13, and 14 of the '848 patent do not read on the
accused adapters. Because the evidence is undisputed that the contacts of the accused device are cylindrical, there is no
genuine issue of fact material to literal infringement. Accordingly, the district court properly granted judgment as a matter of
law that Seimon's adapters do not literally infringe the '848 patent.

500

b. "Blades" and "blade edge"

Claim 1 recites "a group of first, second, and third blades with parallel sharpened edges located between the guard and cap." 777 Patent col.4 11.6-7 (emphasis added). Claim 1 identifies each of the "first, second, and third blades" as "defining a blade edge." Id. col.4 11.7-14 (emphasis added).

Gillette asserts, and Schick does not dispute, that the term "blades" is well-known in the wet shaving art and that its plain
meaning is clear. (Pls.' Markman Br. 6.) The Court agrees. From the language of Claim 1, it is readily apparent that the
ordinary meaning of term "blades" as understood by a person of skill in the art refers to "safety razor blades."

The parties disagree, however, over the term "blade edge." Schick asserts that the term means "the entire sharpened side of a
blade lying between the sidewalls of the cartridge housing." (Defs.' Markman Br. 10.) Gillette responds that the term means
"that portion of a blade that has a sharpened surface which engages the skin and cuts hair." (Pls.' Opp'n to Defs.' Markman
Br. 12.)

The ordinary and customary meaning of the term "blade edge" appears to the Court to include any sharpened edge of the
blade. Claim 1 recites "blades with parallel sharpened edges," and there is no language in Claim 1 or in any of the other
claims that indicates that the term "blade edge" excludes any sharpened edges in whole or in part. See 777 Patent col.4 11.5-
50. Similarly, the specification recites "blades defining parallel sharpened edges arranged to pass in turn over a skin surface
being shaved." 777 Patent col.1 11.3-6. As such, at the outset, the term "blade edge" means "any sharpened edge of the
blade." This definition is supported by the extrinsic evidence as well. (See Defs.' Markman Br. 10 (quoting the American
Heritage College Dictionary (2d ed. 1982) definition of "edge" as the "usually thin, sharpened side of the blade of a cutting
instrument").)

In light of this apparent ordinary and customary meaning, both parties' proposed definitions contain unjustified limitations.
Gillette attempts to shave away portions of the blade that do not engage the skin and cut hair from the term "blade edge" by
pointing to the term "skin contacting surface" in the specification. (See Pls.' Opp'n to Defs.' Markman Br. 11-13; Markman
& Summ. J. Hr'g Tr. 10-12, Oct. 20, 2005.) However, none of the claims contain the term "skin contacting surface." And the
specification uses the terms "skin contacting surface" and "skin engaging surface" only in defining the term "exposure" but
not in defining the terms "blade edge" or "edge." See, e.g., 777 Patent col.1 11.50-53, col.2 11.2-5. Similarly, Schick's
attempt to limit the term "blade edge" to the "sharpened side of a blade lying between the sidewalls of the cartridge
housing" is not supported by either the claims or the specification. (Defs.' Markman Br. 10 (emphasis added).)

Therefore, as used in the 777 patent, the term "blade edge" means "any sharpened edge of the blade."

501

Avon further disputes the interpretation of the phrase "blade extending perpendicular to a side surface of said barrier along a
bottom portion thereof" in claim one. Avon contends that this language means that the blade must be attached directly to the
side of the vertical barrier and not from a structure attached to the barrier, such as an anchor. Suncast argues that the claim
language does not require the blade to be in direct contact with the vertical barrier. Avon avers that this cannot be so because
the word "perpendicular" implies a direct connection. The plain meaning of the word "perpendicular" is "standing at right
angles to the plane of the horizon: exactly upright" or "being at right angles to a given line or plane." Webster's Ninth New
Collegiate Dictionary ("Webster's") 876 (1985). By definition an angle is "a corner" or "the figure formed by two lines
extending from the same point." Id. at 85. Thus, "perpendicular" does imply a connection between the blade and a side
surface of the barrier. Avon cites the prosecution history to further support this interpretation. In the prosecution of the
s.1. C. Patent, Suncast stated that the blade was "integrated into a lower portion of the barrier." Def. Memo. Non-Infringement, Ex. I. "Integrate" means to unite with something else. Webster's at 628. Contrary to Suncast's contention, Avon's use of the specification and prosecution history does not add limitations to the claim. Rather, the citations help define terms that are already in the claim, a perfectly acceptable practice according to the Federal Circuit. Ethicon Endo-Surgery, 93 F.3d at 1578. Accordingly, one of ordinary skill in the art would interpret "a blade extending perpendicular to a side surface" to mean that the blade was directly connected, at a right angle to one of the barrier's side surfaces. 

Avon asserts that the claim also requires the blade to extend from the bottom of the vertical barrier based on the language "along a bottom portion thereof." The claim language does not warrant such a narrow reading. The figures in the patent even include an alternative embodiment of the edging that does not place the blades at the very bottom of the barrier, but in roughly the bottom third of the vertical barrier. See U.S. Patent No. 5,501,036, Fig. 3. Thus, "bottom portion" does not necessitate that the blades be attached at the very bottom or the end of the vertical barrier.

502

b. "Blades" and "blade edge"

Claim 1 recites "a group of first, second, and third blades with parallel sharpened edges located between the guard and cap." 777 Patent col.4 11.6-7 (emphasis added). Claim 1 identifies each of the "first, second, and third blades" as "defining a blade edge." Id. col.4 11.7-14 (emphasis added).

Gillette asserts, and Schick does not dispute, that the term "blades" is well-known in the wet shaving art and that its plain meaning is clear. (Pls.' Markman Br. 6.) The Court agrees. From the language of Claim 1, it is readily apparent that the ordinary meaning of term "blades" as understood by a person of skill in the art refers to "safety razor blades."

503

6. "blank paper"

Southwest argues that "blank paper" means "paper suitable for printing checks which contains no printed matter on it excluding watermarks or other marks or features present for security purposes," whereas 3T argues that it means "paper that is eight and one half by seven inches which may have background color or printing or distinctive watermarks or other overall indicia but which is otherwise unprinted as contrasted with preprinted forms."

Southwest provides little discussion for its proposed construction and argues that 3T's proposed construction improperly limits blank paper to a particular size. 3T argues that the specification specifically states that "any suitable blank paper of the appropriate size may be used." '405 patent, 6:59. Thus, 3T argues that the paper must be eight and one half by seven inches in order to be of an appropriate size because the printer must be designed to accommodate this size paper. '405 patent, 7:50-53. 3T also argues that the specification is in agreement with its proposed construction:

According to the present system, pre-printed forms are not necessary. Any suitable blank paper of the appropriate size may be used. The term "blank paper" is meant to preferably comprise any suitable "security paper" which may have background color or printing or distinctive watermarks or other overall indicia but which is otherwise unprinted as contrasted with preprinted forms. Data processing system 14 will automatically determine the first plurality of parameters necessary to print a particular type of financial instrument.

'405 patent, 6:58-67 (emphasis added). 3T argues that the specification provides suitable type and appropriate size requirements for the blank paper. 3T argues that Southwest improperly ignores the size requirement and focuses only on the suitability of the paper.

The Court finds that 3T's attempt to limit "blank paper" to a paper of one physical size is an improper limitation. There is no express teaching in the specification that would limit blank paper to be a particular size, and instead, the specification
provides a generic definition for blank paper. See '405 patent 6:58-67. Further, the Court notes that the parties implicitly agreed to a construction for blank paper for the '673 patent and did not limit it to a particular size. For the '673 patent the parties agreed that the phrase "printing the site specific coupon on blank paper" in the '673 patent means "printing a certificate...on paper that contains no pre-existing information," which implies that blank paper means "paper that contains no pre-existing information." Thus, the Court construes the term "blank paper" to mean "paper which may have background color or printing or distinctive watermarks or other overall indicia for security purposes but which otherwise contains no pre-existing information."

4. "Blends smoothly"

For the term "blends smoothly," Plaintiff offers "is free from irregularities such that it would not show if worn under sheer or thin clothing." For their proposed construction, Defendants offer "creating a seamless transition from the portion of the breast not covered by the device to the portion that is covered without deforming the breast." Many of the same arguments involved in the construction of "gradually tapering" are also present in the parties' proposed constructions of "blends smoothly," namely the dispute over continuous curvature and how smooth the transition from the nipple cover to the breast must be in order to "blend smoothly."

From the claims, it can be determined that it is the periphery of the nipple cover and the curved portion of the breast that are supposed to blend smoothly. See '606 patent col. 4 ll. 24-27 ("[T]he method further includes the step of bending the nipple cover on the breast such that the periphery of the cover blends smoothly with a curved portion of the breast while concealing a nipple shape"). Turning next to the specification, the gradual tapering of the nipple cover's thickness is designed so as to allow for the periphery of the cover to "blend with the breast surface (as shown in FIG. 2) for a continuous smoothness." '606 patent col. 2 ll. 37-40. According to the specification, in order to blend smoothly there should be a "continuous smoothness" in the transition from the nipple cover to the shape of the woman's breast. As noted above, "continuous" means "of or relating to a line or curve that extends without a break or irregularity." Likewise, the ordinary meaning of the term "smooth" means "having a surface free from irregularities, roughness or projections." AMERICAN HERITAGE DICTIONARY 1643 (4th ed. 2000).

The Federal Circuit has previously construed the term "smooth" under similar circumstances, and in the process provided guidance for the situation at hand. In Bausch & Lomb, Inc. v. Barnes-Hind / Hydrocurve, Inc., 796 F.2d 443, 450 (Fed. Cir. 1986), the District Court concluded that the accused devices at issue (contact lenses) were not "smooth" because extremely high levels of magnification showed that the surface of the lenses were not "smooth and unsublimated." Id. On appeal, the Federal Circuit held that "smooth means smooth enough to serve the inventor's purposes." Id. After reviewing all of the material before it, the Bausch & Lomb court found that the District Court erred in applying such a rigorous requirement for smoothness as the use of an electron microscope to determine the extent of the roughness of the edges. Id. Instead, the court found that "smooth enough to serve the inventor's purposes" meant "not to inflame or irritate the eyelid of the wearer or be perceived by him at all when in place." Id.

In the present case, the specification teaches that the inventor's purpose is to prevent the unsightliness of bra straps or erect nipples showing through thin clothing. See '606 patent col. 1 ll. 16-20. The invention attempts to accomplish this through the use of a nipple cover that blends naturally with the shape of a woman's breast. The prosecution history further shows that the purpose behind having the nipple cover and woman's breast blend smoothly is to enable the user to wear thin clothing "without showing the nipples and areola, and without showing the edges of the cover." See Pl.'s Claim Constr. Br., Exh. 3 (Remarks, March 22, 2005) P 4999.

Pulling all of the above considerations together, Federal Circuit precedent teaches that "smooth" means "smooth enough to serve the inventor's purpose." An examination of the specification and prosecution history teaches that the inventor's purpose behind the "blending smoothly" limitation in the claim is to ensure that the edges of the nipple cover itself would not be visible at the point of transition from the surface of the cover to the woman's flesh. In the present circumstances, smooth enough to serve the inventor's purpose means the transition must be smooth enough that the break cannot be seen under thin clothing.
Defendant's proposal incorporates the phrase "seamless transition" as the key element in defining "blending smoothly." The term "seamless" implies a more perfect smoothness than is required. The transition from the nipple cover to the breast need not be "seamless," just not visible when worn under thin clothing. Defendants also impermissibly attempt to import a limitation into the claim with the "without deforming the breast" language in their proposal. Neither the claims nor the specification indicate any limitation that the smooth transition must not deform the breast—the focus is instead on visibility. The Court finds Plaintiff's proposed construction to be in line with the claims, specification, prosecution history, and most importantly, Federal Circuit precedent. Accordingly, the Court adopts Plaintiff's proposed construction: "free from irregularities such that it would not show if worn under sheer or thin clothing," as the construction of the Court.

3. Blind Socket

Claims 1, 4, 6, and 11 all require the use of a blind socket at some point. Claim 1 (and dependent Claims 4 and 11) reads:

[Preamble] The method of making a butterfly valve having a cast annular body defining a central axial fluid passageway and a tubular neck portion and a diametrically positioned blind socket for receiving an end of the valve stem of the assembled valve, the steps which include:

[Step 4] inserting a valve stem replica through the stem openings in the valve disc replica and both bushings and into the socket.

Claim 6 reads:

[Preamble] The method of making a butterfly valve having an annular metallic body defining a central axial fluid passageway and an intersecting tubular neck opening and a diametrically positioned blind socket for receiving the valve stem of the assembled valve, the steps which include:

[Step 1] placing bushings loosely in the neck and socket openings.

In our claim construction opinion, we found that "blind socket" is a limitation of NIBCO's claim and that "socket," refers to a "blind socket." We also construed "blind socket" to mean "a hole that does not pass completely through a workpiece and into which an inserted part is designed to fit," and that the socket "has to be blind at the time one calls it a blind socket."

Thus, Claim 1 (and Claims 4 and 11) requires that there be a hole that does not pass completely through the workpiece and into which an inserted part is designed to fit at the time the valve stem replica is inserted through the stem openings. Clearly, this does not describe what happens in the Tyco process. In Tyco's process, the holes pass completely through the neck portions of the valve. Each alignment rod is passed through one of the holes, and neither of these holes are "blind" at the time. (McClinton 12/9/04 Dep. at p. 223). Similarly, Claim 6 requires that there be a hole that does not pass completely through the workpiece and into which an inserted part is designed to fit at the time the bushings are placed in the socket opening. And just as is the case with Claims 1, 4 and 11, neither of the socket openings are blind at the time. (McClinton 12/9/04 Dep. at p. 224).

a. "Blocking Element" (Claim 1)

76. In the '656 patent, the blocking element is a cantilever arm formed as an integral part of the lever which blocks movement of the lever.
B. "Blocks" and "Resists"

1. The claim terms and proposed constructions

Claims 1, 15, and 42 contain the terms "blocks" and "resists" and recite, in relevant part:

1. . . . a shield, comprising an air-permeable material, having left and right ends, and forward and rearward sides, wherein
the air-permeable material allows passage of gasses, but blocks passage of liquids and solids, and the shield has two lens
openings formed therein. . . .

'688 patent at 10:1-5 (emphasis added).

15. . . . a shield structure, comprising an air-permeable material, having forward and rearward sides, wherein said air-
permeable material allows passages of gasses, but resists passage of liquids and solids, said forward side has at least one
lens opening formed therein, and said forward side is operable to be releasably secured to the rearward side of the frame. . . .

Id. at 10:64 - 11:4 (emphasis added).

42. . . . a unitary body configured to fit interstitially between a pair of eyeglasses and a wearer's face, said unitary body
comprising an air-permeable material that blocks the passage of solids and liquids therethrough. . . .

Id. at 13:33-36 (emphasis added).

Preventive proposes a construction of "impedes" for the term "blocks," and "hinders" for the term "resists." Panoptx
contends that both terms should be construed to mean "stops or does not allow the passage of liquids or solids." In other
words, Panoptx would require that the shield material be impermeable to liquids and solids, while Protective would construe
the terms to mean less than an absolute barrier.

2. Plain meaning of the claim

The claim limitations recite, respectively, a "shield," a "unitary body," and a "shield structure" as the main element, and then
further recite limitations on the structure and function of that element. In each case, the main element comprises a material
possessing certain properties. Each claim limitation requires that the material both (i) permit gas to pass through, but (ii) not
permit liquids or solids to pass through. The notion that liquids or solids are not permitted to pass through is expressed by
the verbs "blocks" and "resists."

The plain meaning of both of these terms ranges from the absolute, such as, "completely blocks" or "absolutely resists," to
the passive, in which an obstacle is present, but simply slows the passage around or through the material. The fact that gases
may pass through the material indicates that the material is not impervious to all matter, but instead acts more like a filter
that stops different matter to different degrees. The fact that the invention requires at least some breach of the shield
undermines an interpretation of the claim as requiring complete blockage or absolute resistance, at least with respect to
liquids, because liquids, like the gases that are required to pass through, are fluids. One of skill in the art would not read the
claim as ruling out the possibility that a liquid would be able to wick through the material. The plain meaning with respect
to solids is different, however. If liquids are "blocked" or "resisted," one would readily infer that solids are blocked or
resisted to a greater degree, tending more towards absolute blockage. The skilled artisan would also understand this
tendency to hold for liquids as they become more viscous.

The plain meaning of "blocks" or "resists," when not used in an absolute sense, also implies an element of time. That is, the
material blocks liquids or solids from immediately traversing the material, but over time, they may in fact be able to do so.
To "resist," or to "block" the passage also carries the connotation that the substances will eventually, or gradually, pass
around or through the material.
In certain senses, the two terms are distinguishable. "Blocks" also carries the meaning of a physical barrier that prevents a direct hit. To get beyond a blocking barrier requires circumventing the barrier. In contrast, "resist" suggests that the body of the object that prevents passage ultimately allows passage through the object itself.

In short, the plain meaning of the claim encompasses the constructions proposed by both parties. Although the proposed terms differ significantly in scope, the claim language does not suggest that only one or the other is the correct construction. Note, too, that the degree of resistance offered by the material, and thus the characterization of the degree of prevention implied by "blocks" or "resists," depends on the nature of the substance coming into contact with the shield. Thus, the plain meaning of the claim limitations for both "blocks" and "resists" is that the material provides a range of protection against the passage of liquids and solids, from protection for a period of time, to protection against direct ingress, to an absolute bar to passage. See Texas Digital Systems, 308 F.3d at 1203 ("If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all such consistent meanings.").

3. Specification

The specification does not explicitly define the terms. Nor does it disclose a rate by which any substance was contemplated to pass through the shield material. The specification also does not distinguish between the degree of protection afforded against liquids and solids. Instead, the ability of the material to withstand the passage of substances is to be inferred from the stated functions and exemplary intended uses of the invention.

First, the patent specifies that the shield is to be made of material permeable to air to the extent that fogging of the lenses of the eye protection system is "inhibit[ed]." 688 patent at 2:25. The patentee further emphasizes that one function of the invention is to "permit enough air to pass through it, so that it inhibits the fogging up" of the glasses. Id. at 2:53-56. This degree of permeability notwithstanding, the system is "particularly useful for providing protection for surgeons or other medical personal from splashed liquids or solids." 4 Id. at 2:25-27. The specification continues, "[i]t is also useful for any workers who must wear some protective shield for their eyes." Id. at 2:27-29. One specific example noted by the patentee is that the invention can be used for protection from splashed bodily fluids that may carry the AIDS virus. Id. at 2:29-32.

--- Footnotes ---

4 This passage in the "Background" section is directed to both the ability of the material itself to withstand passage of substances, as well as the conformal fit of the shield to the face in serving as a protective seal.

--- End Footnotes ---

Panoptx contends that the claims must be read to "keep out all contaminants . . . like the HIV virus." The more natural reading of the specification is that the shield protects against a splash directly hitting the eye region, but does not absolutely block or resist the passage of fluids. Absolute protection against all contaminants is not required by the claims and the specification makes no such restriction. The shield "blocks" or "resists" fluid from directly entering, but nothing in the specification requires that the material be impermeable. Some materials may be capable of absolutely blocking out fluid, but the invention is not limited to such materials. The fact that the material is required to allow gas to pass through means that openings exist. The specification does not preclude the reasonable inference that fluids may wick through the material over some period of time.

To read the claims as requiring the material to "keep out all contaminants" would impermissibly import into the claims an inference based on a single embodiment. The specification introduces two broad areas of use for the eye shield system: (i) surgeons or medical personal, and (ii) any workers who must wear some protective shield. For neither application does the patentee indicate in the specification that absolute blockage is necessary, nor does the plain meaning of the claim suggest it. Such a reading is inferred by Panoptx based on a preferred embodiment that the shield is to protect from viruses carried in splashed liquids. Even if the inference as to what would satisfy the goals of the preferred embodiment were correct, without "words or expressions of manifest exclusion or restriction," the claims are not to be restricted to any single embodiment. Teleflex, 299 F.3d at 1327. Accordingly, the scope of the terms "blocks" and "resists" is not to be set by the embodiment of eyewear for a surgeon needing to prevent contamination.

Furthermore, to infer that protection from viruses requires absolute blockage is to neglect alternative means of achieving
protection that are consistent with the claims. Specifically, another limitation in these claims requires that the shield be releasable or detachable. 5 The specification teaches that "one desire" of the invention is that the shield be "low cost" so that it can be regarded as disposable. This is said to be particularly important "in a medical situation." Wearers can still be protected from contaminants that enter the material, and that might eventually pass through, by removing the shield and disposing of it. Thus, a claim interpretation that permits the shield material to be less than an absolute barrier is fully consistent with the disclosed embodiments. Pfizer, 429 F.3d at 1373 ("[I]t is necessary to consider the specification as a whole and to read all portions of the written description, if possible, in a manner that renders the patent internally consistent."). Panoptx' proposed construction reaches for a particular interpretation of how the invention should function that is neither suggested by the claims or the specification, nor required to practice the invention.

5 Claims 1 and 15 recite a "retainer for releasably securing the shield," '688 patent at 10:10, 11:5, and claim 42 requires the shield to be "adapted for releasable engagement," id. at 14:2.

4. Conclusion

The terms "blocks [the] passage of liquids and solids" and "resists passage of liquids and solids" 6 mean that the shield material "substantially blocks" or "substantially resists" the passage of liquids and solids. See Playtex Products, Inc. v. Procter & Gamble Co., 400 F.3d 901, 907 (Fed. Cir. 2005) ("The term 'substantial' is a meaningful modifier implying 'approximate' rather than 'perfect.'" (quoting Liquid Dynamics Corp. v. Vaughan Co., Inc., 355 F.3d 1361, 1368 (Fed. Cir. 2004)). An equivalent expression of the construction is that the material "stops the direct passage of, but is not impermeable to, liquids and solids." The material is not required to "block" or "resist" absolutely the passage of liquids and solids.

6 Note that "resists passage of liquids and solids" is the only construed term of claim 15. The limitation of "a seal" found in dependent claim 16 is not present and is not to be read in. Phillips, 415 F.3d at 1315 ("[T]he presence of a dependent claim that adds a particular limitation gives rise to the presumption that the limitation in question is not present in the independent claim.").

508

G. "blow-off valve"

The parties agree that "blow-off valve" means "pressure relief valve." Fox argues for the additional limitation that it is a "device that permits the discharge of fluid under pressure upon a high force impact." The phrase really at issue is "upon a high force impact," as the rest of Fox's proposed addition simply defines or restates "pressure relief valve." Fox's proposed addition or "upon a high force impact" is not supported by the '049 Patent, which states in the specification that the blow-off valve will be activated "if sufficient force from an impact or other force input is imparted." (8:12-13) Fox cites to the specification to support its argument for the limitation, but the section cited states that the blow-off valve "functions upon harsh or sudden impacts." (8:56) The valve is not limited to functioning under a "high force impact." The phrase is construed as "pressure relief valve."

509

7."blunt"
Plaintiff argues that "blunt" means "not sharp," while defendants construe it to mean "flat-surfaced." Defendants draw support for their construction from the description in the specification that the "projectile...can be shaped preparatory to being fired along a path of flight [] to the target [] with a blunt or flat end." '086 patent, 2:49-52 (emphasis added). Defendants construe this phrase to define "blunt" to mean "flat." However, the phrase might also be read to provide a range of adjectives to describe the possible shape of the "end" portion, as being either "blunt" or "flat." This second reading better comports with the ordinary meaning of "blunt, which is not "flat," but rather "not sharp." The specification also notes that the "blunt-shaped front end" is the shape of the projectile after it is reshaped from "a curvature shape." '086 patent, 4:24-25. Therefore, taking the use of "blunt" in the specification as a guide to the meaning of that term as in the claims, "blunt" is construed to mean "not sharp and not in a curvature shape." See Phillips, 415 F.3d at 1315.

510

3. Language in dispute: "blunt distal end"

Does "blunt distal end" mean (1) an end that is not sharp so that it does not cause trauma or get caught in the walls of a vessel into which the catheter is inserted, or (2) that the distal end of the tube is cut or formed in a direction generally perpendicular to the longitudinal axis of the catheter?

Answer: the court interprets "blunt distal end" to mean that the distal end of the catheter is not sharp, but it need not be perpendicular to the longitudinal axis of the catheter.

The final disputed term in claim 1 is over the description of the tip of the distal end, which the claim language describes as "blunt." Plaintiff contends that blunt means an end that is not sharp so that it does not cause trauma or get caught in the walls of a vessel into which the catheter is inserted. Defendants argue that the term blunt means that "the distal end of the tube is cut or formed in a direction generally perpendicular to the longitudinal axis of the catheter." Defendants point to the specification language which states that "the [catheter] tube terminates with a blunt distal end which is normal to the axis of the catheter," (Col. 3, lines 58-60.) Plaintiff argues that the claim is not limited to the specific embodiment described in the specification or in a drawing. Rather, Plaintiff's focus is on the explanation for which the term blunt was used in the claim, which Plaintiff explains was to ensure that the distal end would not be so sharp as to cause harm to the patient upon insertion.

The court agrees with Plaintiff that blunt is a general term and in this context indicates simply that the distal end is not sharp. Without the need to resort to a dictionary, the meaning seems plain: most knives, for example, do not have flat or straight edges, yet the adjective "blunt" is commonly used to describe knives. There is nothing in the claim language itself that indicates the distal end must be perpendicular to the axis of the lumens, and the specification clearly describes the preferred, but not the only, embodiment of the patent.

511

A. "Blunt-nosed screw" and "screw"

The parties' primary claim construction dispute concerns the meaning of the terms "screw" and "blunt-nosed screw" as used in both the '248 and '588 patent. The parties agree that the term "screw" as used in these patents means a "blunt-nosed screw."

Claim 1 of the '248 patent is representative of the manner in which the disputed terms are used in the asserted patents. It reads, with the disputed terms in italics:

1. An apparatus for controlling movement of ice and/or snow along a predetermined area of a sloping surface, said surface including a plurality of spaced, longitudinal raised portions, said raised portions extending from an elevated portion of said surface to a lower portion thereof and each being laterally separated by a base portion, wherein said raised portions are positioned a greater distance above a reference plane than said base portions, said apparatus comprising:
clamp means for detachably engaging one of said raised portions, said clamp means including a body having a longitudinal cavity for receiving said one raised portion and means for frictionally engaging an external surface of said one raised portion, said means for frictionally engaging comprising at least one blunt-nosed screw threadably interconnected to said body, said screw being extendable into said cavity to deform said external surface of said one raised portion, wherein a first of said clamp means is positionable on a first of said raised portions and a second of said clamp means is positionable on a second of said raised portions; and

a cross-member interconnectable with said clamp means, wherein a first said cross-member extends between and is interconnected with said first and second clamp means above at least one of said base portions.

The parties agree that the ordinary and customary meaning of "blunt-nosed screw" to one skilled in the art at the time of the invention is a device with a blunted forward end, a shaft or cylinder with a continuous, spirally grooved thread and a tool member connection, such as a slot to accept a driving device. The parties also agree that a unitary structure having these elements is a "blunt-nosed screw." They do not agree, however, whether a "blunt-nosed screw" is limited to a unitary structure or whether, as CFE asserts and Contek disputes, it may also be comprised of several parts.

Neither party points to any intrinsic evidence that defines or addresses, directly or indirectly, whether the ordinary and customary meaning of a "blunt-nosed screw" to one skilled in the art of metal roofing encompasses a multi-piece device. Both parties instead rely on extrinsic evidence to support their arguments.

Webster's Third New International Dictionary provides several definitions of "screw" that are potentially relevant here. The first, relied upon in part by Contek, defines a "screw" as "a simple machine of the inclined plane type consisting of a spirally grooved solid cylinder and a correspondingly grooved hollow cylinder of equal dimensions in which the applied force acts in a spiral path along the grooves while the resisting force acts along the axis of the cylinder." Webster's Third New Int'l Dictionary of the English Language Unabridged 2040 (1993); see Merriam Webster's Collegiate Dictionary 1049 (10th ed. 1995) (reciting a similar definition relied upon by Contek). Other, related definitions describe a "screw" as "a cylinder with a helical cut groove on the outer surface . . . used variously (as to fasten, apply pressure, transmit motion, or make adjustments)," and "a cylindrical fastener that is usu. pointed, that has a head with a slot or recess, that is helically or spirally threaded, and that is designed for insertion into material by rotating." Webster's Third New Int'l Dictionary at 2040. While these definitions can be read as suggesting that a "screw" is a unitary structure consisting of a spirally grooved solid cylinder, none definitively addresses this issue.

Webster's Third New International Dictionary offers an alternate definition that more closely addresses this question. This definition states that the term "screw" includes "any of several devices consisting wholly or partly of a screw." Id. (emphasis added). Under this definition, therefore, the ordinary meaning of the term "screw" includes devices that encompass both a spirally grooved solid cylinder or shaft and additional features or components.

The only evidence in the record regarding the ordinary and customary meaning of the term "screw" in the field of metal roofing is found in the declaration of Robert M. Haddock, the inventor of the '248 and '588 patents. Mr. Haddock testifies there that he has 30 years of experience in the steel and metal construction trades, including more than 15 years in the field of metal roof design and fabrication. Pls.' Markman Br., Ex. 1 [hereinafter "Haddock Decl."], P 2. Based on this experience, Mr. Haddock declares that it is well-known in the field of metal roofing that fasteners such as screws come in many different shapes, sizes and configurations, including "threaded shaft-type fasteners that are comprised of multiple components, but are designed to function as a single unit." Id. P 8. Mr. Haddock states that such threaded shaft-type, multi-component fasteners are known as "screws" and gives several examples of such devices that are common in the metal building trade. Id.

Mr. Haddock's testimony is unrebutted. Contek contends it nonetheless should be disregarded based on Federal Circuit authority holding that inventor testimony regarding the meaning of patent claims is not entitled to special deference, see Markman, 52 F.3d at 983, and that inventor testimony is entitled to little or no consideration when it is "a self-service, after the fact attempt to state what should have been part of his or her patent application." Bell & Howell Document Mgmt. Prods. Co. v. Altek Sys., 132 F.3d 701, 706 (Fed. Cir. 1997). The testimony by Mr. Haddock relied on here does not fall within this authority because it describes the state of knowledge in the field of metal roofing at the time of the invention, rather than Mr. Haddock's intent and meaning in using the term "screw" in the asserted patents. In its most recent and
comprehensive statement of evidence that district courts may properly rely upon in claim construction, the Federal Circuit specifically authorized consideration of extrinsic evidence, "including expert and inventor testimony," for the purpose of "establish[ing] that a particular term in the patent or prior art has a particular meaning in the pertinent field." Phillips, 415 F.3d at 1317, 1318. That is precisely the purpose of the inventor testimony cited here and thus it may be considered.

Contek also argues "screw" as used in the asserted patents must be construed to be a unitary structure because this construction is most consistent with the most common English usage of the term. This may be true, but the dictionary definition recited above as well as Mr. Haddock's testimony indicates that "screw" as used in the metal roofing field can also encompass multi-part fasteners that include a spirally grooved cylinder or shaft.

"[U]nless compelled otherwise, a court must give a claim term the full range of its ordinary meaning as understood by persons skilled in the relevant art." Riverwood Int'l, 324 F.3d at 1357; Rexnord, 274 F.3d at 1342. Before adopting the broadest definition of a term based on a dictionary definition or other extrinsic evidence, however, I must scrutinize the intrinsic evidence to determine if this is the most appropriate definition. Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1349 (Fed. Cir. 2005); see Phillips, 415 F.3d at 1322-23, 1324.

Having reviewed the language of the claims, the specification of the asserted patents and relevant prosecutorial history, I find no indication that the term "screw" must be limited to the narrower definition of a unitary structure. The intrinsic record suggests that "blunt-nosed screw" simply means a fastener with spirally grooved shaft and rounded end that frictionally engages the roof seam. Nothing in this record indicates a concern with whether this fastener is made up of one or multiple parts. Based on this and the extrinsic evidence cited above, I hold that the term "blunt-nosed screw" and "screw" as used in the asserted patents is not limited to a unitary structure.

My reasoning and result here is similar to that of the Federal Circuit in Free Motion Fitness, Inc. v. Cybex International, Inc., 423 F.3d 1343 (Fed. Cir. 2005), an infringement action concerning a patent for an exercise apparatus comprising a resistance assembly, two adjustable extension arms that pivot on an axis substantially parallel to the axis of rotation of a pulley at the end of each arm, and a cable linking the resistance assembly to the arms. Id. at 1345. One of the issues on appeal was the proper construction of the term "adjacent" as used in claims describing the location of the resistance assembly of the exercise machine relative to the pivot point on each of its extension arms. Id. at 1345, 1349. The court observed that the intrinsic evidence did not define the term and that it had no specialized meaning in the relevant art. Id. at 1348. It next identified two definitions of "adjacent" in Webster's Third New International Dictionary that might apply, the first being "not distant" and the second being "relatively near and having nothing of the same kind intervening." n4 Id. at 1349. The court then returned to the intrinsic record and determined that nothing in it suggested a concern with intervening pivot points or excluding any intervening pivot points. Id. Accordingly, the court adopted the broader definition of "not distant" in construing the term "adjacent." Similarly, I find no concern in the asserted patents for a unitary as opposed to a multi-part screw and therefore also adopt the broader of the possible dictionary definitions of "screw" in finding that the term is not limited to a unitary structure. n5

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n4 The choice between these definitions was material because the accused device had intervening pivot points. See id. at 1346, 1348-49.

n5 I am also guided by the Federal Circuit's decision in Riverwood International Corp. v. R.A. Jones & Co., 324 F.3d 1346 (Fed. Cir. 2003), in which the court considered whether the term "flight bars" was limited to a unitary structure or could include a plurality of pieces. The court found that the term, which was not defined in either the intrinsic or external evidence, was not limited to a unitary structure because "[n]othing in the claim language, specification, or prosecution history suggests that flight bars must be of unitary structure. The district court, consistent with our guidance that a claim term is to be given 'the full range of its ordinary meaning as understood by an artisan of ordinary skill' instructed the jury not to limit the term to the unitary structure found in the specification. We agree with that conclusion." Id. at 1358 (quoting Rexnord, 274 F.3d at 342).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

I caution the parties that this decision goes only to the construction of the disputed term "blunt-nosed screw" and in no way
finds or suggests that Contek's accused device constitutes a multi-part "blunt-nosed screw" that infringes on CFE's patents. The question of infringement is for the finder of fact, which may well find that one or more of Contek's combinations of a spirally grooved cylinder and blunt-ended ball bearing, "circle-lok" and/or "sure grip pad" does not constitute a "blunt-nosed screw" because it has other functionality or perhaps for other reasons.

512

5. "blunt projectile front end portion"

Defendants contend that "blunt" should be defined in the same way for both the '133 and '086 patents and throughout the '133 patent. Defendants argue that the blunt projectile end must be cylindrically shaped because that patent claim describes the tail portion as being "substantially cylindrically shaped" and narrower than the blunt end, implying by comparison that the blunt end is cylindrical. Defendants' proposed construction of the phrase is "a cylindrical shape with a flat-surfaced front end." Def. Br. at 16.

Plaintiff's proposed construction of "blunt" is different in each of claims 1 and 7. In claim 1, plaintiff proposes that blunt means "flattened (i.e. blunt)." Plaint. Br. at "Ex. G." However, in claim 7, plaintiff proposes that blunt means "non-sharp." Id. As noted in Part 7, supra, the ordinary meaning of "blunt" is "not sharp." Plaintiff contends that "blunt" means "not sharp" in claim 7, but does not explain why the term should be construed differently in claim 1. "Blunt projectile front end portion" is properly construed in both claims 1 and 7 to mean "a cylindrical shape with a front end that is not sharp."

513

1. "Board"

The district court construed the word "board" in independent claim 1 to mean a "piece of elongated construction material made from wood cut from a log." Claim Construction Order, 2002 U.S. Dist. LEXIS 27501 at *16. The district court held that Nystrom had limited the scope of the claim term "board" by statements in the written description that a board is cut or obtained from a log, 2002 U.S. Dist. LEXIS 27501 at * 12 (citing '831 patent, col. 2, ll. 22-23; id. at col. 2, l. 34), and statements made by Nystrom during prosecution in arguing against an obviousness rejection, id. at 8.

Nystrom argues that "board" in claim 1 is not limited to conventional wood boards that are cut from a log. He argues that the claim language "board" does not contain a description of the material from which the board is composed and that the claim should not be so limited. He contends it was error for the district court to rely on statements in the specification to limit the claim because those statements do not represent a clear disavowal of claim scope. Moreover, Nystrom asserts that there was no disavowal in the prosecution history, because his comment in response to an obviousness rejection was not intended to limit but to establish that the resin tiles disclosed in the Yoshida reference were not properly combined with the wood planks of the Zagelmeyer reference in the examiner's § 103 obviousness rejection. Thus, Nystrom argues, the comment was not such a clear and unambiguous disclaimer as to justify limiting the claim term.

TREX responds that the ordinary meaning of "board" is a piece of sawn lumber. Because the specification only disclosed a board as made of wood and cut from a log, TREX contends that the claim term "board" must be limited to wood boards cut from a log. TREX further argues that Nystrom disclaimed non-wood boards by the statements he made during prosecution in overcoming an obviousness rejection based on Yoshida and Zagelmeyer.

As this court recently articulated in our en banc decision in Phillips v. AWH Corp., "it is a 'bedrock principle' of patent law that 'the claims of a patent define the invention to which the patentee is entitled the right to exclude.'" 415 F.3d 1303, 1312 (Fed. Cir. 2005) (quoting Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1115 (Fed. Cir. 2004)). Therefore, we begin our claim construction analysis with the words of the claim. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). The words of the claim are generally given their ordinary and customary meaning. Id. at 1582. The ordinary and customary meaning of a claim term "is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." Phillips, 415 F.3d at 1313. The person of ordinary skill in the art
views the claim term in the light of the entire intrinsic record. See id. Thus, the claims "must be read in view of the specification, of which they are a part." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc). "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Phillips, 415 F.3d at 1316 (quoting Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998)). In addition to the written description, "the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor intended the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Id. at 1317. In discerning the meaning of claim terms, resort to dictionaries and treatises also may be helpful. Id. at 1318. However, "undue reliance on extrinsic evidence poses the risk that it will be used to change the meaning of claims in derogation of the 'indisputable public records consisting of the claims, the specification and the prosecution history,' thereby undermining the public notice function of patents." Id. at 1319 (quoting Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1578 (Fed. Cir. 1995)).

The claims at issue do not include any language describing the "board" as cut from a log or necessarily being made of wood. In fact, claim 16, which is similar to claim 1, covers "[a] wood decking board for use in constructing a flooring surface for exterior use, said decking board having a convex top surface, a bottom surface, opposite side edges, a variety of specialized flooring materials have been developed for interior and exterior use." '831 patent, col. 5, ll. 32-35 (emphases added). By contrast, claim 1 simply claims a "board," without restricting the term to a particular material or describing characteristics of wooden boards cut from logs. See id. at col. 4, ll. 19-21 ("A board for use in constructing a flooring surface for exterior use, said board having a top surface, a bottom surface and opposite side edges . . . .") (emphases added)). When different words or phrases are used in separate claims, a difference in meaning is presumed. Tandon Corp. v. U.S. International Trade Com., 831 F.2d 1017, 1023 (Fed. Cir. 1987). This principle of claim construction would suggest that the difference in the use of terms has significance and that "board" should not be limited to wood that is cut from a log. However, simply noting the difference in the use of claim language does not end the matter. Different terms or phrases in separate claims may be construed to cover the same subject matter where the written description and prosecution history indicate that such a reading of the terms or phrases is proper. Id. at 1023-24 (affirming the International Trade Commission's holding that "the inclusion of the term 'non-gimballed' in claim 5 did not require that claims 1 and 12 be read to encompass a gimballed first transducer").

An examination of the term "board" in the context of the written description and prosecution history of the '831 patent leads to the conclusion that the term "board" must be limited to wood cut from a log. The written description begins by noting that "[a] variety of specialized flooring materials have been developed for interior and exterior use." '831 patent, col. 1, ll. 13-14. The discussion then proceeds to the specific context of wood flooring materials for exterior use. In the context of the discussion of wood flooring materials for exterior use, the patent states, "In all conventional flooring materials known to applicant, the top and bottom horizontal surfaces of these flooring materials are flat and planar. As a result, water tends to stand on the surface of the decking material, causing it to deteriorate more quickly than it otherwise would." Id. at ll. 57-61. The discussion continues, "Further, the process used to cut such lumber from logs can produce inferior product on the outermost boards, often leading to scrap." Id. at ll. 65-67. The Background of the Invention, thus, frames the invention in the context of wood decking materials cut from logs, even though it acknowledges that other materials exist.

This context is maintained throughout the written description. For example, the written description states, "With particular reference to FIGS. 1-5, it can be seen that the convex top surface 13 is curved in the same general direction as the curvature of the growth rings GR." Id. at col. 3, ll. 25-27. The written description goes on to note that the manner of installation of conventional decking boards "leads to accelerated deterioration of the boards when exposed to weather." Id. at ll. 34-35. Similarly, the written description states, "FIG. 4 shows the relationship of the outermost boards B cut from a log L." Id. at ll. 65-66. Throughout the written description, Nystrom consistently used the term "board" to describe wood decking material cut from a log. See AquaTex Indus., Inc. v. Techniche Solutions, 419 F.3d 1374, 2005 U.S. App. LEXIS 17588, No. 05-1088 at 9 (Fed. Cir. Aug. 19, 2005) ("Here, the context of the specification 'makes clear that the patentee did not intend the term [fiberfill] to encompass' natural materials." (citation omitted)).

The prosecution history provides additional context that is consistent with the written description. In a preliminary amendment, Nystrom stated that "the particular configuration and dimensions of the board result in a uniformly superior product and reduction in waste or rejects due to bark or other flaws along the edges of the board when it is cut from near the outer circumference of a log." Prelim. Amendment at 2. In responding to a rejection, Nystrom stated,

The present invention represents a unique and significant advance in the art of exterior wood flooring. Wood floors have
been in use for hundreds of years, and except for the development of different installation techniques, i.e., the use of nails, screws, various fastening clips, and/or adhesives, very little has been done to the basic shape of the board itself.

Amendment rec'd Sept. 30, 1993, at 2. Similarly, when arguing against an obviousness rejection, Nystrom stated, "YOSIDA [sic] is clearly not concerned with materials made from wood, and especially an elongate board for exterior use and having a convex top surface when installed that will shed water and at the same time provide a surface that is suitable for supporting furniture and comfortable to walk on." Id. at 4. Although Nystrom argues that the latter statement was limited to explaining why Yoshida could not be combined with the Zagelmeyer reference, which was directed to wood, we are not convinced that the statement is so limited. Nystrom explained in the same response that "the extent of curvature used by ZAGELMEYER in his boards was such that a distinctly uneven surface resulted, giving any surface constructed from them a corduroy-like texture which would have been unsuitable for supporting furniture, and which would have produced a distinct tactile sensation of roughness or uneven surface." Id. at 3. Thus, it is clear that when Nystrom was distinguishing Yoshida from an elongate board that is suitable for supporting furniture and comfortable to walk on, he was referring to the invention and not Zagelmeyer. We need not decide, however, whether this statement represents a clear disavowal of claim scope because the context reflects Nystrom's consistent use of the term board to refer to wood decking materials cut from a log.

Nystrom contends that although some dictionaries define "board" solely in reference to its material composition, see Webster's Third International Dictionary 243 (2002) (defining "board" as "a piece of sawed lumber of little thickness but considerable surface area usu. being rectangular and of a length generally exceeding its width"), not all dictionaries are so constrained. For example, the American Heritage Dictionary of the English Language 203 (4th ed. 2000) defines "board" as "1. A long flat slab of sawed lumber; a plank. 2. A flat piece of wood or similarly rigid material adapted for a special use." Nystrom argues that the ordinary meaning of the word "board" encompasses both a piece of cut wood or sawn timber and a similarly-shaped item made of a rigid material.

However, as explained in Phillips, Nystrom is not entitled to a claim construction divorced from the context of the written description and prosecution history. The written description and prosecution history consistently use the term "board" to refer to wood decking materials cut from a log. Nystrom argues repeatedly that there is no disavowal of scope in the written description or prosecution history. Nystrom's argument is misplaced. Phillips, 415 F.3d at 1321 ("The problem is that if the district court starts with the broad dictionary definition in every case and fails to fully appreciate how the specification implicitly limits that definition, the error will systematically cause the construction of the claim to be unduly expansive."). What Phillips now counsels is that in the absence of something in the written description and/or prosecution history to provide explicit or implicit notice to the public--i.e., those of ordinary skill in the art--that the inventor intended a disputed term to cover more than the ordinary and customary meaning revealed by the context of the intrinsic record, it is improper to read the term to encompass a broader definition simply because it may be found in a dictionary, treatise, or other extrinsic source. Id.; see also Snow v. Lake Shore & Mich. S. Ry. Co., 121 U.S. 617, 629-30, 30 L. Ed. 1004, 7 S. Ct. 1343, 1887 Dec. Comm'r Pat. 354 (1887) ("It is not admissible to adopt the argument made on behalf of the appellants, that this language is to be taken as a mere recommendation by the patentee of the manner in which he prefers to arrange these parts of his machine. There is nothing in the context to indicate that the patentee contemplated any alternative for the arrangement of the piston and piston-rod.").

Our recent decision in AquaTex Industries illustrates this principle. In that case, the patentee consistently used the term "fiberfill" throughout the written description to refer to synthetic materials. Although the written description indicated that the composition of the fiberfill was not known to be critical, we held that "the context of the specification 'makes clear that the patentee did not intend the term [fiberfill] to encompass' natural materials." 2005 U.S. App. LEXIS 17588, [slip op.] at 9 (citation omitted). In particular, we noted that "none of the patents [incorporated by reference] discusses the possibility of using natural fibers as commercial fiberfill batting." 2005 U.S. App. LEXIS 17588 at *15. Although there was no disavowal of natural materials, we held that the consistent use of the term "fiberfill" to refer to synthetic materials and the extrinsic definitions supporting that interpretation led to the conclusion that a person of ordinary skill in the art would have understood the term to be limited to synthetic materials. The present case is analogous. Nystrom consistently used the term "board" to refer to wood cut from a log. Although there was no clear disavowal of claim scope, there was nothing in the intrinsic record to support the conclusion that a skilled artisan would have construed the term "board" more broadly than a piece of construction material made from wood cut from a log.

In Phillips, we held that the term "baffle" did not require any specific angle--even in view of the written description's limited disclosure of baffles oriented at right angles to the walls--because the ordinary meaning of the term "baffle," as reflected in a
dictionary definition to which the parties stipulated and as supported by the overall context of the written description, was simply "objects that check, impede, or obstruct the flow of something." 415 F.3d at 1324. In this case, both parties acknowledge the ordinary meaning of "board" as "a piece of sawed lumber." Nystrom, however, seeks to broaden the term "board" to encompass relatively obscure definitions that are not supported by the written description or prosecution history. Broadening of the ordinary meaning of a term in the absence of support in the intrinsic record indicating that such a broad meaning was intended violates the principles articulated in Phillips. Therefore, we affirm the district court's construction of the term "board."

GO BACK

514

Body

The parties dispute whether "body" means only a one piece structure or whether "body" may also refer to multiple-piece structures. The disputed instances of "body" appear in Claim 22 of the 011 Patent and Claims 10, 25, and 41 of the 077 Patent. The parties do not dispute that "body" generally means the outer structure of the syringe which houses the inner workings. Instead, the parties dispute whether the patentee has limited "body" to a one piece structure. NMT argues that "body" should be construed as "the one-piece hollow outer syringe structure that houses the syringe components and comprises a wall having an elongated barrel portion, a smaller diameter nose portion, and a transition zone in between," and RTI argues that "body" should be construed as "the hollow outer structure of the syringe that houses the components of the syringe." Although NMT points to language in the 011 and 077 patents which may indicate a manifest intent to limit "body" to a one piece structure, the Court must begin its analysis with the claim language. Teleflex, Inc., 299 F.3d at 1324.

The 011 Patent claims refer to "body" as a one piece structure in some instances and are silent in others. Claims 1 and 23 describe "a one piece body" and "a one piece hollow outer body" in several instances. 011 Patent, Col. 12, Ins. 62, 66, Col. 16, In. 12. In contrast, Claim 22 of the 011 Patent and Claims 10, 25, and 41 of the 077 Patent claim only "a syringe body" without any reference to "one piece."

Reading the claims together, the Court finds significance in the patentee's decision to include the words "one piece" in claims 1 and 23, but not in the others. Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995) (requiring Courts to examine claim terms in light of, and consistently with, one another). If the patentee had defined "body" as a one piece structure, then describing it as a one piece structure in Claims 1 and 23 would be redundant, and the inclusion of "one piece" in Claims 1 and 23 but nowhere else would be arbitrary. In contrast, if body simply meant any outer structure, then the terms "one piece" in Claims 1 and 23 would not be redundant, and the exclusion of "one piece" in the remaining claims would have meaning. The patentee must have chosen to include the words "one piece" in Claims 1 and 23, and to exclude them from the remaining claims for a reason. Based on the claim language, the only apparent reason for doing so is to limit Claims 1 and 23 to a one piece syringe body but allow the remaining claims to cover any syringe body.

However, as NMT correctly points out, the intrinsic evidence strongly points that the inventor contemplated a one piece body. For example, abstract describes a syringe with "a one piece hollow outer body." 011 Patent. Also the summary of the invention declares "the syringe structure features a one piece hollow outer body." Id. at Col. 2, Ins. 40-41. Moreover, Background of the Art section describes the number of parts which must be assembled as a "problem" with prior art. The 077 Patent's Abstract declares "a tamperproof retractable non-reusable syringe has a one piece hollow outer body with a barrel for a slidable plunger ...." The Summary of the Invention states "The invention is claimed to be a reliable tamperproof syringe having multiple tamperproof features which operates on a principle which permits low cost parts which are few in number and well suited for high speed mass production and assembly. The syringe structure features a one piece hollow outer body having a longitudinally extending wall which is stopped." Col. 3, Ins. 2-9. Additionally, the patent describes a two piece barrel (part of the body) as one problem with the prior art because it "requires at least an additional part and assembly step." Col. 1-2, Ins. 60-03. These examples indicate that the patentee considered a one piece body to be an important design consideration, and possibly part of the patent itself.

Despite the numerous references to a one piece body in the patent specification, however, the Court need not read to limit "body" to a one piece structure. Because an expert in the relevant field would not limit "body's" meaning to a one piece structure based on the word's own definition 2, the Court begins with a heavy presumption that "body" is not limited to a one piece structure. See Sunrace Roots Enter. Co., LTD, 336 F.3d at 1302 (finding a "heavy presumption" that claim terms...
carry their ordinary and customary meaning which is only rebutted if the patent "expresses an intention to impart novel meaning to [them]". The specification's statements regarding a one piece body do not overcome that heavy presumption because of the term "one piece" in Claims 1 and 23. The patentee addressed the concerns of a one piece body in Claims 1, 23, and their dependent claims by including the term "one piece." The patentee did not choose to incorporate "one piece" into the term "body" but rather chose to use the term "one piece" when it intended to so limit its patent claims. Thus, giving "body" its ordinary meaning does not read the specification's one piece concerns out of the patent, but rather recognizes the patentee's right to not be limited to the specification's terms. The specification does not overcome the heavy presumption in favor of "body's" ordinary meaning because the patentee placed any "one piece" limitations in the term "one piece."

--- Footnotes ---

2 See e.g., MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY, 128 (10th ed. 2001) (defining "body" as "the main, central, or principal part").

--- End Footnotes ---

In sum, the Court finds that "body" in the 011 and 077 Patents simply means "hollow outer structure that houses the syringe's components." Ultimately, "the claims define the scope of the right to exclude; the claim construction inquiry, therefore, begins and ends in all cases with the actual words of the claim." Teleflex, Inc., 299 F.3d at 1324. The only construction of "body" that is consistent with the 011 and 077 Patents' claim language is a structure that may be one or more pieces. This reading is consistent with the specification, despite some indications to the contrary.

---

515

1. "body"

a. Parties' Positions

The parties propose the following constructions for "body," which is present in each of the asserted claims as well as the two other patents-in-suit. Dkt. No. 114. The primary dispute between the parties is whether the syringe body must be limited to a one-piece structure.

RTI
A hollow outer structure that houses the syringe's components

BD
A one-piece hollow outer structure that houses the syringe's components

RTI contends this term should not contain a one-piece limitation because many of the claims in the '733 Patent already contain such a limitation. Dkt. No. 111 at 22. To add this limitation to the definition of body itself would render the additional claim language meaningless. Id. RTI also contends the patentee expressly used a one-piece limitation in the '733 Patent while no such limitation is generally present in the '077 or '224 Patents. Id. at 23. In fact, the patentee in the '224 patent used the limitation to differentiate between certain claims. Compare '224, 22:38-40 (claim 43), with 24:23-25 (claim 57 -- "The syringe assembly of claim 43 wherein the body comprises a one-piece barrel.")).

Judge Davis previously construed this term in connection with the '011 and '077 Patents. See RTI v. New Medical Techs., Civil Action No. 4:02-CV-34, Dkt. No. 110 at 6-9 (E.D. Tex. March 8, 2008). Judge Davis, like RTI, found significant the fact that the patentee in this family of patents included the phrase "one piece" in some claims, but not in others. Id. at 7. As such, Judge Davis found it improper to limit the term to a preferred embodiment containing only a one-piece body. Id. at 8-9.

b. Court's Construction

At the outset, this Court notes that certain terms, such as barrel, pervade all of the patents-in-suit. Because all of these patents are related--the latter patents being continuations-in-part of earlier patents and patent applications--this Court finds that terms should be construed consistently throughout absent some evidence to the contrary. In addition, the specifications
and claims of each patent within this family may provide guidance when construing such pervasive terms.

Regardless of whether collateral estoppel applies to the construction of this term, the Court finds no reason to deviate from Judge Davis’ previous construction. See Id. at 6-9. Accordingly, this Court finds that "body" means "a hollow outer structure that houses the syringe's components."

516

C. "Locking Body for Engaging Said Locking Recess"

The final phrase in dispute among the parties, which appears in the second element of claim 1, is "locking body for engaging said locking recess." ’715 patent, Col. 16, ll. 61-62. Plaintiff proposes that the phrase be construed as follows: "the portion of the locking shutter or clip that is capable of coming together with or fitting into the locking recess." Pl.'s Ex. 3 at 6. Defendants propose the following construction:

The locking body is a structure, as shown in the ’715 patent figures, that engages with, that is, locks or fastens in a fixed position into the definite and pronounced indentation (the locking recess) that serves to hold the locking body in place when in the closed position, but without covering the lip or tongue structures of the tie wings, but only when in the closed position.

Id. at 8.

Claim Construction of "Locking Body for Engaging Said Locking Recess."

The "locking body" referred to in the disputed phrase is depicted in one embodiment as item 64 in Figures 2 (open position) and 3 (closed position). The specification at Col. 6, ll. 6-17 and 23-35, explains how the locking body (item 64) of one embodiment of the invention engages (comes together with and fits into) the locking recess. Descriptions of how the locking body of other embodiments engages the locking recess appear at Col. 8, ll. 15-19 and Col. 10, ll. 52-57. The specification refers to Figures 3 and 8 as illustrations of how the locking shutter of this embodiment engages the locking recess (item 48). Other depictions of how the locking body engages the locking recess of other embodiments appear at Figures 13 and 14, 18 and 22, and 23 and 24.

The term "engage" is commonly defined as "to interlock" or, in other words, to "fit together." Pl.'s Ex. 5 at 438, 695, Random House College Dictionary. The claim, specification and plain and ordinary meaning of the phrase all support construction of the phrase "locking body for engaging said locking recess," as "the portion of the locking shutter or clip that is capable of coming together with or fitting into the locking recess." This construction is confirmed by the opinions of two persons skilled in the art. See Voudouris Decl. at P 15; Jerrold Decl. at PP 21-23.

Defendants' proposal, "the locking body is a structure, as shown in the ’715 patent figures, that engages with, that is, locks or fastens in a fixed position into the definite and pronounced indentation (the locking recess) that serves to hold the locking body in place when in the closed position, but without covering the lip or tongue structures of the tie wings, but only when in the closed position," if read into the claim language, would result in redundancy and complication, and the Federal Circuit has specifically stated that claim construction "is not an exercise in redundancy." U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997).

For example, the claim specifies that the "locking body for engaging said locking recess" engages the locking recess "without covering the labial or lingual faces of the sets of occlusal and gingival tie wings." Defendants' proposal incorporates this pre-existing limitation by requiring that the locking recess "hold the locking body in place when in the closed position, but without covering the lip or tongue structures of the tie wings, but only when in the closed position without covering the labial or lingual faces of the sets of occlusal and gingival tie wings." (Emphasis added.) It also repeats, unnecessarily, the requirement in the claim that the locking body engage the locking recess "when in closed position" such that claim 1 would read, if construed as Defendants propose, as follows: "but only when in the closed position without covering the labial or lingual faces of the sets of occlusal and gingival tie wings when in closed position." (Emphasis added). Defendants' proposal also suggests that the locking body must remain in a fixed position once it engages the locking...
recess. As noted above, this is incorrect and inconsistent with the way the specification describes how the bracket operates. Therefore, Defendants' proposal is rejected.

Accordingly, for all the foregoing reasons, the Court construes the phrase "locking body for engaging said locking recess," in accordance with its plain meaning as "the portion of the locking shutter or clip that is capable of coming together with or fitting into the locking recess."

"body pad"

Fitness Quest has proposed a 71-word construction of this two-word phrase; Monti contends that no construction is required.

Much of Fitness Quest's proposed construction of "body pad" goes to the specific function of the body pad within Claim 15. This construction is unduly limiting, in that "body pad" is used in other claims, as well.

Other claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment as to the meaning of a claim term. Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims.

Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005) (internal citations omitted).

If this Court were to impose the limitations proposed by Fitness Quest on "body pad" within Claim 15, those limitations of necessity would be imported to other claims where "body pad" is found. Neither party has argued or briefed the effect of these limitations on the other claims in the 749 Patent, but this Court is reluctant to act so broadly when it is not necessary.

In identifying the difference between the original language and its proposed construction, Fitness Quest explained at the hearing that, "[O]ne of the things that's incorporated in our construction is the concept of the body pad being angular or angled, which is not in theirs." Transcript 96. As Monti's counsel astutely noted, to identify the difference was to identify the problem with Fitness Quest's proposed construction: "In the words body pad there is no requirement that it be angularly adjustable as proposed in the construction." Transcript 104. Fitness Quest's proposed construction limits the term "body pad" beyond what is necessary to a clear understanding of the claim.

"Body pad" is not a term that requires construction. Its ordinary, customary meaning to one skilled in the art is sufficiently clear that neither Fitness Quest's proposed explosion of words nor Monti's proposed alternative construction is necessary. This Court declines to construe this term.

(i). Claim 1

What is claimed in claim 1 is as follows:

A tray insert removably disposable within a cavity of a support, the support including a rim and a lower surface defining the cavity, said tray insert comprising:

a body portion including a first surface having a plurality of pockets formed therein and a second surface adapted to be disposed adjacent said lower surface of the support; and

a coupling member disposed on said body portion, and including a protrusion having an inclined surface, said coupling member adapted to releasably and mechanically engage a recess formed in the support within the cavity of the support.
See '830 patent, col. 5, lines 49-60.

On this claim, the parties disagree as to the meaning of the term "body portion." Evenflo contends that the limitation "coupling member disposed on said body portion" is not met by its accused high chair tray inserts because its coupling mechanisms are located on the perimeter of the outer portion of the tray inserts, not the body portion. According to Evenflo, in the '830 patent, the outer portion is a separately delineated area of the tray insert. Def. Memo, pp. 7-8.

Fisher-Price contends that the "body portion" of a tray insert includes what are elsewhere identified in the patent claims as an "outer portion," an "extending portion" and a "perimeter portion." Under Fisher-Price's proposed construction, a coupling member located anywhere on the tray insert would, necessarily, be disposed on the body portion.

This Court first notes that the word "portion" is ordinarily understood as designating a part of a whole. Thus, a whole object, such as a tray insert, may be comprised of two or more portions. 5

5 It would be nonsensical for an object to be comprised of a single "portion," as there would be nothing distinguishing the part from the whole.

When the term "body" is used in connection with an inanimate object, its ordinary meaning is:

- the main, central or principal part of something as a: the nave of a church b(1): the bed or box of a vehicle on or in which the load is placed (2): the enclosed or partly enclosed part of an automobile usu. not including the hood and fenders.

WEBSTER'S THIRD NEW INT'L DICTIONARY OF THE ENGLISH LANGUAGE UNABRIDGED (1993); see also, THE AM. HERITAGE DICTIONARY OF THE ENGLISH LANGUAGE: FOURTH ED. (2002) (online at www.bartleby.com) (defining "body" as, among other things, "the passenger-and cargo-carrying part of an aircraft, ship or other vehicle").

In this regard, Fisher Price argues that were the statement "the automobile includes [a] body portion and a fender portion extending around the body portion" to appear in a patent, "no one would argue that the fender portion of the car is not also part of the body portion of the car." Pl. Reply, pp. 3-4. Hence, the "outer portion" of a tray insert must be part of its "body portion." However, this Court notes that Fisher-Price's chosen hypothetical is directly contrary to the customary definition stated above, and this argument is unavailing unless the term "body portion" is accorded something other than its ordinary meaning in the '830 patent and its prosecution history.

Upon review of the patent, this Court is satisfied that no special meaning is indicated in the claim language itself. Claim 1 suggests only a general limit on the body portion's size or dimensions vis-a-vis the support tray. The fact that the claim 1 insert tray is "removably disposable within a cavity of a support," suggests that its main part—the body portion—rests entirely within the support's cavity. Indeed, claim 1 expressly states that the body portion's second (lower) surface, 6 and the area of the body portion on which the coupling member is disposed, both rest within the cavity of the support.

6 The terms "first surface" and "second surface," used to indicate areas of the body portion, are not defined in claim 1. They are defined in the specification as the upper (first) and lower (second) surfaces. Col. 3, lines 43-45.

Additionally, this Court notes that claim 1 does not include language limiting a tray insert's composition to a body portion and a coupling member only. Thus, in this Court's view, the claim does not exclude the possibility that a tray insert meeting all the limitations of claim 1 may include additional portions or elements as well.
The Federal Circuit recently reiterated that the specification is the single best guide to the meaning of a claim term. Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005) (en banc) (citing Vitronics Corp. v. Conceptronics, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)); see also, Merck & Co. v. Teva Pharms. USA, Inc., 347 F.3d 1367, 1371 (Fed. Cir. 2003) ("[C]laims must be construed so as to be consistent with the specification, of which they are a part."). Here, because claim 1 provides limited guidance as to the construction of the term "body portion," this Court looks to the language of the specification, which must describe the claimed invention in "full, clear, concise and exact terms," 35 U.S.C. § 112, par. 1.

Based on the written descriptions and illustrations of the specification, and construing that information consistent with the patent claims, this Court concludes that the "body portion" of the claimed tray insert consists of the lower surface or floor of the tray insert's cavity, the outer wall(s) of the insert's cavity rising no further than the level of the support's rim, and any interior ridges or walls forming pockets within the insert's cavity. Furthermore, to the extent that an insert tray includes areas extending outward from its outer cavity wall(s), such areas are not part of the body portion.

In reaching this conclusion, the Court notes the following descriptions and illustrations:

In one embodiment, the liner includes an outer portion that is releasably engageable with a rim of the support. '830 patent, col. 2, lines 22-23 [emphasis supplied].

In the illustrated embodiment [Fig. 5], tray insert 200 includes a body portion 205 and an outer portion 210 extending around the body portion. Id., col. 3, lines 41-43 [emphasis supplied].

[SEE FIG. 5 IN ORIGINAL]

The body portion includes a cavity. Id., col. 3, line 51. Tray insert 250 includes a body portion 252 having a central large pocket or cavity 256 and several smaller pockets or cavities 254. Id., col. 4, lines 19-22.

Cavity insert 200 includes an extending, engagement, or side portion 230 that extends from the rear of the body portion 205 of the tray insert 200. The extending portion 230 includes a flange 232 that extends downwardly from the extending portion 230 and forms a channel 234 with the body portion 205 of the tray insert 200." Id., col. 3, lines 57-63 and Fig. 7 [emphasis supplied].

[SEE FIG. 7 IN ORIGINAL]

----------------- Footnotes ----------------

7 Liner is another term for tray insert. '830 patent, col. 3, lines 39-40. Tellingly, it is the liner, not the body portion, that includes an outer portion.

8 Use of the connector "and" indicates two distinct portions of the whole--i.e., the tray insert or liner.

9 Throughout the specification, the cavity(ies) is the only feature of the tray insert identified as being included within the "body portion."

10 The "body portion" on Figure 7 that forms a channel with the flange of the "side portion" is the outer wall of the tray insert's cavity.

----------------- End Footnotes ----------------

A further embodiment of the invention illustrated at Figures 13-17, and particularly, Figure 14, shows that "the body portion 205 of the tray insert 200 is aligned with the cavity 114 of tray 100." Id., col. 4, lines 47-49 [emphasis supplied]. The same Figure 14 shows a "side portion' 230 that extends from the rear of the 'body portion' 205 of the tray insert" (Id., col. 3, lines 58-59) [emphasis supplied] and a "'seating portion' 240 extend[ing] along the front and sides of tray insert 200" (Id., col. 5, lines 4-5), the upper surface of which is level with the upper surface of the rim of the support.
Based on the claim and specification, this Court finds that a tray insert may consist of a body portion and coupler only, or may include an outer portion, extending portion and/or seating portion. These additional portions extend from the body portion outward and engage with the rim of the support's cavity by extending over the rim or being seated adjacent or on top of the rim.

This Court is aware that, for a patent claim to be infringed, every limitation in the claim must be found in the accused device. Pfizer, Inc. V. Teva Pharms. USA, Inc., 429 F.3d 1364, 1376 (Fed. Cir. 2005) (citation omitted). As noted above, Evenflo claims its accused high chair models, the Simplicity and the Envision, do not meet the limitation of having the "coupling member disposed on said body portion." The parties have submitted a support tray and tray insert for each model for the Court's examination. Pl.'s Exs. 25A, 25B, 27A and 27B.

Upon examination of these exhibits, this Court concludes that Evenflo has raised a substantial question as to infringement of claim 1. Based on the foregoing claim construction, it finds that the body portions of the Evenflo inserts are surrounded by outer portions, and the coupling members are disposed on the perimeters of the outer portions, not the body portions.

This Court also finds that Fisher-Price has not succeeded in demonstrating that Evenflo's defense lacks substantial merit. In addition to the previously-mentioned car/fender analogy, Fisher-Price argues in its reply memorandum that because claim 1 does not recite an outer portion separate from the body portion, it is error to view them as distinct portions of a tray insert. Pl. Reply, p. 5. 12 As already noted above, while claim 1 requires the presence of a body portion and coupling member, it does not exclude the possibility that a tray insert may contain additional elements or portions. Therefore, Fisher-Price's argument in this regard is unavailing.

Finally, Fisher-Price points to dependent claim 4, which calls for: "[t]he tray insert of claim 1, wherein said body portion includes an extending portion configured to conform to engage a portion of the support rim." '830 patent, col. 5, lines 65-67. Contrary to the claim 1 phrasing, the specification description and illustrations state that an extending portion is included on the tray insert, not the body portion, and extends from the rear of the body portion over a segment of the top and outer wall of the support.

Fisher-Price urges that to construe claim 1 consistent with its dependent claim 4, one must conclude that the extending portion is included on the body portion and, because the extending portion "must necessarily be a reference to what is described in Fig. 5 as the 'outer portion,'" the outer portion and its perimeter must also be part of the body portion. Pl. Reply, p. 4.

The Court rejects Fisher-Price's underlying premise that an "extending portion" and "outer portion" are one and the same. Id. There is nothing in the claim language or specification suggesting that an extending portion 230 which "extends from the
rear of the body portion" only ('830 patent, col. 3, lines 58-59) and engages a "portion of the support rim" only (Id., claim 4) is the same as "an outer portion 210 extending around the body portion." (Id., col. 3, lines 41-43) [emphasis supplied]. Nor is there any suggestion in the '830 patent that these two portions form some larger integral portion that yet again is part of some larger whole.

Additionally, this Court notes that Fisher-Price's claim construction analysis ignores the fact that independent claims 12 and 27, both of which are also at issue here, expressly include the "outer portion" on the liner, not the body portion. Id., col. 6, lines 22-24 and col. 8, lines 2-3. To construe claim 1 as Fisher-Price suggests would be inconsistent with claims 12 and 27.

In sum, Fisher-Price has not, at this preliminary injunction stage, shown a likelihood of success on the merits as to infringement of claim 1.

This court agrees with Black & Decker's general statement of the law and therefore begins with an examination of the specific language of the claims. With regard to the second limitation, Black & Decker argues that the phrase "a boiling liquid reservoir" merely requires a reservoir or receptacle that holds liquid that -- at some point in time and at some place -- will be boiled. In other words, according to Black & Decker, the language does not require that the liquid actually be boiled in the reservoir.

This court disagrees with Black & Decker's proposed interpretation and instead finds that the limitation of "a boiling liquid reservoir defined by the base" must be construed to mean a reservoir inside which the liquid is brought to boil. This interpretation makes sense of the specific language. The limitation refers to a "boiling" liquid reservoir. Under Black & Decker's interpretation, the word "boiling" would be superfluous if the limitation did not require that the liquid actually be brought to a boil while it sits inside the reservoir. Black & Decker chose to add the phrase "boiling liquid" to modify the word "reservoir." To interpret the phrase only to mean that the water in the reservoir will be boiled at some later point in time and in a different place is an awkward and unnatural interpretation of the language. This court believes that its construction of the second limitation makes more sense of the ordinary meaning of the words used by Black & Decker.

To the extent that there is any ambiguity, this court finds that the specification provides further support for this interpretation. Specifically, the patent specification states as follows:

The present invention is embodied in a steam cooking utensil generally referenced by the numeral 10. Utensil 10 includes a base member 12 having a wall 17 defining a boiling liquid reservoir 16. A heating element 18 is mounted in reservoir 16 to provide heat to the liquid, such as water to transform the water into steam.

* * *

In operation, fluid such as water is placed into reservoir 16 and food is placed into bowl 26 onto surface. The various components of utensil 10 are assembled and electrical power is delivered to the heating element 18 to boil the water in the reservoir. The steam formed as a consequence of boiling the water passes upwardly through opening 24 in member 20 and thence through flow holes 42A-42E in food support tray 28.

Ex. A at Col 2., lines 8-13, and Col. 3, lines 53-60 (emphasis added). This language emphasizes that the water is brought to a boil "in" the reservoir and thus reinforces the court's construction of the language above.

6 In referring to the specification, this court is aware of the rule that the language of the specification cannot be used to limit the broader language of the claims but only can be used to interpret that language. However, as the Federal Circuit has recently acknowledged, "there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification." Comark, 156 F.3d at 1186-87.
Rival raises three claim construction issues on appeal. The first issue is whether the district court erroneously construed claim 1's "boiling water reservoir" limitation. Rival maintains that this limitation refers to a reservoir for storing water of any temperature, and that the court erroneously construed it to mean that the water must boil in the reservoir. Sunbeam responds that the limitation clearly refers to a reservoir for storing boiling water, because the term "boiling" modifies "water" and "water" modifies "reservoir." Sunbeam points out that both claim 1 and the written description describe an invention in which water boils in the reservoir. Sunbeam also contends that Rival's proposed construction renders the term "boiling" meaningless.

We agree with Sunbeam that the court correctly construed the limitation "boiling water reservoir." Claim 1 states:

"thermostat means . . . for switching off the heater when all the liquid in the boiling water reservoir has evaporated therefrom." See ‘412 patent, col. 5, ll. 50-51 (emphasis added). The word "therefrom" makes it clear that the expression "boiling water reservoir" means that the water boils in the reservoir. The written description also makes this clear. See, e.g., col. 1, ll. 45-46 ("boiling reservoir can therefore boil dry"); col. 2, ll. 5-6 (heated water from the boiling water reservoir"); col. 4, ll. 1-3 ("steam must travel a circuitous path to escape from the boiling water reservoir"); col. 4, ll. 32-33 ("when the water boils dry in the boiling water reservoir"). In contrast, nothing in the specification supports Rival's construction.

A. Claims at Issue

The Rival has alleged violations of the following claims set forth in patent 4,509,412:

Claim 1:

A steam cooking utensil comprising:

[A] a base;

[B] a boiling water reservoir defined by the base;

[C] a heater, mounted in the base to heat liquid in the boiling water reservoir;

[D] thermostat means, mounted in the base and coupled to the heater, for switching off the heater when all the liquid in the boiling water reservoir has evaporated therefrom;

[E] a condensate trough, defined by the base and thermally insulated from the heater; and

[F] a food tray comprising an imperforate surface and a drainage surface, said food tray supported above the reservoir and trough such that said imperforate surface is aligned with the boiling water reservoir, said drainage surface is aligned with the condensate trough, and water flows from the imperforate surface to the drainage surface into the condensate trough, said reservoir, trough and tray cooperating substantially to prevent the flow of water from the imperforate surface into the reservoir.

Claim 2:

The invention of claim 1 wherein the food tray comprises a surface shaped to facilitate radial drainage to the drainage surface and into the condensate trough.

Claim 3:
The invention in claim 1 wherein the food tray defines a central baffle, vertically aligned with the heater, said baffle operative to direct heated water back to the vicinity of the heater in order to accelerate steam formation.

Claim 6:

The invention of claim 1 wherein the imperforate surface defines a multiplicity of raised surfaces effective to facilitate radial drainage through the drainage surface into the condensate trough.

Claim 31:

A steam cooking utensil comprising:

[A] means for defining a boiling water reservoir;

[B] a heater mounted adjacent a central portion of the reservoir to heat water contained in the reservoir;

[C] means for supporting food to be steamed above the reservoir, said supporting means defining an imperforate surface above the heater; and

[D] a baffle which extends downwardly from the supporting surface over the heater, said baffle shaped to define a partially enclosed region of the supporting surface in alignment with the heater;

[E] said baffle effective to impede the outward flow of water, heated by the heater and splashed by the heater against the partially enclosed region, radially away from the partially enclosed region.

Claims 1 and 31 are independent claims. Claims 2, 3 and 6 are dependent claims, being dependent upon Claim 1.

B. Markman Hearing

On November 18, 1997, this Court held a Markman hearing. See Markman v. Westview Instruments, 52 F.3d 967 (Fed. Cir. 1995) aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). Markman sets forth a two-step process for resolving patent infringement claims. The first step requires that claim construction (determination of the meaning and scope of the claims) is an issue of law for the district judge to decide. 52 F.3d at 979. The second step is that of the jury looking at the claims and the court-determined definitions in order to determine whether an infringement of the patent took place.

Prior to the Markman hearing, this Court required the parties to brief the type of evidence to be heard at a Markman hearing, to identify any disputed language in the claims, the type of evidence used to resolve any disputes and to offer proposed definitions of the claims. The proposed definitions of both parties greatly assisted this Court during the claim construction phase.

Both Rival and Sunbeam agreed with that only "intrinsic" evidence should be used to construe the disputed claims. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Intrinsic evidence is made up of (1) the claims, 5 (2) the patent specification, and (3) the prosecution history. 6 Markman, 52 F.3d at 979. However, the claims should always be the first place a court looks to determine the scope of the claim. Vitronics, 90 F.3d at 1576.

5 The words in a claim should be given their ordinary and customary meaning. Vitronics, 90 F.3d at 1576.

6 Both parties were also required, prior to the Markman hearing to submit the prosecution history (or file wrapper) on each of their patents.
Extrinsic evidence is anything external to the patent, i.e. expert testimony, dictionaries, technical treatises and articles. Markman, 52 F.3d at 980. Even the plaintiff's product is extrinsic evidence. SRI Int'l v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1118 (Fed. Cir. 1985). Extrinsic evidence is only to be relied upon to resolve any ambiguity in a disputed claim term. CVI/Beta Ventures, Inc. v. Tura L.P., 112 F.3d 1146, 1153 (Fed. Cir. 1997); Vitronics, 90 F.3d at 1583.

The theory behind the admission of intrinsic evidence, and the exclusion of extrinsic evidence, has been explained by the Federal Circuit 7 in the following manner:

competitors are entitled to review the public record, apply established rules of claim construction, ascertain the scope of the patentee's claimed invention and, thus, design around the claimed invention . . . . Allowing the public record to be altered or changed by extrinsic evidence . . . would make this right meaningless.

Vitronics, 90 F.3d at 1583.

Even though both parties agreed that only intrinsic evidence should be used to determine the claim construction, both parties attempted to influence this Court through the use of extrinsic evidence. Defendant Sunbeam used plaintiff Rival's product in the hearing and attempted to enter into evidence Sunbeam's products. During argument before this Court, Rival referred the court to dictionary definitions and expert testimony. However, this Court did not use any of this extrinsic evidence to determine the claim construction. In fact, this Court did not go beyond the actual claim language and patents in order to construe the disputed claims in the following manner:

1. "[A] boiling water reservoir defined by the base": a receptacle that holds boiling water. The water may be at one time fresh, non-boiling water, but the water must actually come to a boil in the reservoir. To be defined by the base, the base must create or form the outline of the shape of the boiling water reservoir.

522

The second claim construction issue is whether the court properly construed claim 1's "defined by the base" limitation. Claim 1 calls for both a boiling water reservoir and a condensate trough that are "defined by the base." Rival asserts that the court erroneously construed this limitation to mean that the base "creates or forms the outline of the shape of" the boiling water reservoir and the condensate trough. Rival contends that the expression "defined by the base" means "contained within or encompassed by" the base. Rival argues that the court's construction is ambiguous and does not cover the preferred embodiment because the base's perimeter only creates or outlines a part of the boiling water reservoir's shape. Rival supports its claim construction by referring to the written description's statement that the condensate trough "need not be disposed in annular relationship to the boiling water reservoir" and that a "wide variety of shapes and arrangements can be adapted." See '412 patent, col. 4, ll. 56-57, 59-60. Sunbeam replies that the court's construction was correct because the patent consistently uses the term "defined by" to convey a relationship in which one element of the product forms the shape of another element. Sunbeam points out that claim 1 uses the expression "supported above the reservoir" to describe the position of the food tray over the reservoir, but still within the base's perimeter. See id., col. 5, ll. 54-56. Thus, Sunbeam reasons, "defined by the base" cannot mean only within the perimeter of the base. Sunbeam also contends that the court's construction is clear and does apply to the preferred embodiment because the base's inner peripheral wall outlines the boiling water reservoir's shape. See Fig. 1, element 35.

We agree with Sunbeam that the court correctly construed the expression "defined by the base" to mean that the base "creates or forms the outline of the shape of" both the condensate trough and the boiling water reservoir. The specification uses the term "define" many times. In each case, the term is used in a manner consistent with the district court's construction, viz., "to create or form the outline of the shape of." See '412 patent, col. 2, ll. 54-55 ("base 20 defines a
condensate trough 30"; col. 2, ll. 59-60 ("inner peripheral wall 35 defines an inner peripheral lip 36"); col. 2, ll. 67-68 ("outer peripheral wall 31 defines outer peripheral lip 32"); col. 3, ll. 11-14 ("heater 22 defines heater well 24 and a central recess 25"); col. 3, ll. 46-47 ("inner peripheral lip 36 defined by inner peripheral wall 35"); col. 4, ll. 4-5 ("high domed cover 60 having a bottom opening defined by a rim 61"); col. 4, ll. 66-67 ("boiling water reservoir can define a cube shape volume"); col. 5, ll. 4-9 ("food tray may be shaped to define a linear array of apertures"); col. 5, ll. 13-14 ("food tray need not define apertures at all so long as it defines a drainage surface") (emphasis added). Rival's construction would not make sense in any of these instances where the patent uses the term "define."

Moreover, and contrary to Rival's assertion, we find the court's construction of the term "defined" to be perfectly clear, for it is essentially the same as the common dictionary definition. See, e.g., Webster's II New Riverside University Dictionary 356 (1988) ("de·fine . . . 3. To delineate the outline or form of."). That the court construed the term consistently with the dictionary definition is evidence that the court used an accepted meaning. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 n.6, 39 U.S.P.Q.2d (BNA) 1573, 1578 n.6 (Fed. Cir. 1996).

Also contrary to Rival's assertion, the district court's construction does cover the preferred embodiment. As can be seen in figure 1, the specification discloses a base (20) designed such that its outer (31) and inner (35) peripheral walls create the outline and shape of both the boiling water reservoir (40) and the condensate trough (30). The specification's statement that the boiling water reservoir and condensate trough can have a variety of arrangements is not inconsistent with the court's claim construction. A variety of arrangements may exist in which the base creates the outline and shape of both the boiling water reservoir and the condensate trough. In fact, the specification itself suggests such alternative arrangements. See '412 patent, col. 4, ll. 63-68 ("the boiling water reservoir can be situated to one side of the condensate trough, or on a different horizontal plane from the condensate trough. Alternately, the boiling water reservoir can . . . define a cube shape volume central to a condensate trough of an irregular shape."). In all of the examples provided in the specification, the base would still "define" the boiling water reservoir and condensate trough under the court's construction of that term.

Said bonded diamonds exhibit a thermal characteristic such that a 950 degree C. temperature at the working surface results in a temperature of less than 750 degrees C. at the depth

The thermal characteristic language in the term is the subject of the motion for summary judgment above. Baker Hughes contends this entire phrase is indefinite. As stated in the ruling on summary judgment, the phrase is not indefinite.

ReedHycalog only proposes a construction for "bonded diamonds" as "a plurality of diamonds or diamond-like crystals joined together" and contends the rest of the phrase needs no construction. The Court agrees with ReedHycalog's proposed construction, however "diamond-like" is only included in the '662 patent's construction because only the '662 patent specification uses this term in its definition of PCD. In other words, for the '447 patent, '098 patent, and '137 patent, the Court construes "bonded diamonds" as "a plurality of diamond crystals." The Court construes "bonded diamonds" in the '662 patent as "a plurality of diamond or diamond-like crystals." The rest of the phrase needs no construction.

The Court first construes the "bonded to" limitation. Comfortex describes the "Shangri-La" product in the following manner:

The Shangri-La blind is made of an elongated strip which is wound in helical fashion, with each turn of the helix overlapping and adhesively joining preceding and succeeding turns. The joined helical strips are then cut to form an assemblage of multiple strip segments and fastened to a roller to form the completed window covering.

The strip(s) itself is formed of three narrow ribbons which are welded together ultrasonically. The center ribbon is made of an opaque fabric and the two exterior ribbons consist of relatively sheer or transparent fabrics. After the required number of turns of the helix are joined . . ., the helical assembly is split perpendicularly to the overlapped strips to form a plurality
of joined strip segments. The exterior (sheer) ribbons on the assembled segments form the front and back panels or facings of the window covering and the center (opaque) ribbons form the vanes.

Comfortex Mem. Summ. J. at 7-8 (footnote omitted). Comfortex thus avers that because the strips are made from three ribbons of fabric ultrasonically welded together, the "Shangri-La" does not have a plurality of vanes "bonded to [a] first sheet and [a] second sheet[]." Rather, Comfortex contends that given the specification and the prosecution history of the '999 patent, "bonded to" is limited to the situation where the vanes are adhesively connected to the front and rear fabric panels.

Hunter Douglas, on the other hand, asserts that the method used to produce the "Shangri-La" window covering is irrelevant. In addition, Hunter Douglas avers that the term "bonded to" is not limited to adhesives and, in fact, includes the ultrasonic weld used by Comfortex to produce the ribbons of the "Shangri-La." More importantly, Hunter Douglas challenges Comfortex's contention that the three-layer strips are connected by means of a weld; rather, Hunter Douglas contends that Comfortex actually uses an adhesive to connect the three layers of fabric comprising the strips.

Given the specifications and prosecution history of the '999 patent, however, neither Comfortex nor Hunter Douglas offer wholly satisfactory interpretations of the term "bonded." It is clear to the Court that "bonded" encompasses more than an adhesive, but does not include within its scope the weld used by Comfortex for the "Shangri-La" window covering. First, the claims themselves reveal that "bonded to" includes more than just an adhesive. Although independent claims 1 and 9 provide that the plurality of vanes are "bonded to" the first and second fabric sheets, dependent claims 7 and 11 provide that "the window covering further includes an adhesive for bonding said edge portions to said first sheet and said second sheet." Col. 18, 11. 53-55; Col. 19, 11. 15-17. It is axiomatic that "the dependent claim tail cannot wag the independent claim dog." North American Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1577 (Fed. Cir. 1993). See also Beachcombers, Int'l, Inc. v. Wildewood Creative Products, Inc., 31 F.3d 1154, 1161 (Fed. Cir. 1994)(finding interpretation of a claim that would render another claim in the patent 'superfluous' 'presumptively unreasonable.'); E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430 (Fed. Cir. 1988). Reading "bonded to" in independent claims 1 and 9 to be limited to adhesive would render claims 7 and 11 superfluous and would indeed allow the dependent claim tail to wag the independent claim dog. Consequently, "bonded to" as used in the '999 patent includes more than an adhesive.

Second, however, it is also evident from the '999 patent's specifications and prosecution history that a "bond" does not include a "weld." In the "BACKGROUND OF THE INVENTION" section, the '999 patent sets forth the following disadvantages associated with the use of a heat welding process to connect vanes to the front and back panels of fabric window coverings:

Heat-welding . . . limits the fabrics which may be utilized to thermoplastic materials. Also, heat-welding necessarily requires a melting of at least some of the fibers of the materials bonded, thus providing an uneven outer appearance along the heat-welds and producing unwanted crimps or creases in the materials, which can result in fatigue failure. Further, heat-welding is a relatively slow process which may require six or more seconds to create a bond over an extended length. This is too slow for application in high volume commercial production processes.

Col. 2, 11. 1-11.

As a result, it is an

object of [the '999 patent] to provide [a fabric light control] window covering which has a neat and uniform construction and outer appearance in all degrees of light control. In this respect a feature of the present invention is therefore adhesive bonding of the light control vanes to the sheer fabric utilizing linear application of the adhesive and, thus, a high degree of controllability of the adhesive application process and bonding of the vane.

C.2, 11. 60-68. Indeed, the advantages of using a hot-melt adhesive rather than a heat-weld were specified in the application for the '999 patent filed with the PTO on May 17, 1991. See Comfortex Book of Exhibits, Ex. 6A, at p.3, 1. 5-18 (citing same disadvantages as given above). It was also clear from that time that "the same principles [were] generally applicable to other types of liquid adhesives." Id. at p. 12, 11. 23-24.

After canceling their initial seventy-five (75) claims, Colson et al. submitted a second batch of claims, 76-236, which the
PTO rejected. Relevant for purposes of this discussion is the fact that the PTO rejected some of those claims because the welding process used by another inventor (the "Froget patent") in his window covering "fully responded to 'bonding means'" claimed in the second batch of claims. Similarly, the PTO rejected the use of an "adhesive" as claimed by Colson because replacing the welding of the Froget patent with an adhesive would have been obvious pursuant to 35 U.S.C. § 103 in light of the Froget patent and another patent (the "Corey patent"). Thus, it is clear that the PTO considered a "weld" to anticipate a "bond" yet only an obvious substitute for an "adhesive". In order to overcome the PTO's rejections, therefore, Colson had to distinguish a "bond" from a "weld" and identify a reason why substitution of an "adhesive" for a "weld" would not have been obvious to one skilled in the art.

In asserting the nonobviousness of using an adhesive as taught in the Corey patent, Colson stated that one in the fabric light control window covering industry would not look to the Corey patent because Corey was directed to "multi-cellular, collapsible shades" which are "quite distinct from a window covering of the type described and claimed in the present application . . . ." Comfortex Book Exhibits, Ex. 6D, at p. 13. Use of an adhesive as a substitute for a weld in a fabric light control window covering, therefore, would not have been obvious to one in the relevant art not because of anything inherent in an adhesive or in a weld, but rather because the subject matter of the Corey patent was too far removed from that of the '999 patent to be considered a relevant source. As previously noted, however, Colson had already distinguished a weld from an adhesive. At this point in the application process, Colson further added that Froget's weld did not anticipate the bond used in the '999 patent because if one used a weld, "the adjoining lines of connection may not always be straight." Id. at 14. Due to the fact that lines of connection are visible in fabric window coverings, Colson asserted that they must be straight in order to be aesthetically pleasing. Id. Thus, it is clear that in response to the PTO's claims that (1) a weld was responsive to "bonding means" and (2) substitution of an adhesive for a weld was obvious, Colson defined an adhesive in a way that did not include a weld, and differentiated between a bond used in the '999 patent and Froget's welding process based on the purpose and effect of the "bonded to" limitation. That is, "bonded to" must be construed broader than adhesive, yet not inclusive of affixing agents that require a process by which material used to fabricate the window covering melts at the point of connection, are difficult to apply in straight lines, or cannot be used in a commercial setting. Simply stated, given the extant facts presented here, the "bonded to" limitation does not incorporate "welded to". 4

--- Footnotes ---

4 Though Comfortex contends that it uses an ultrasonic welding process to connect the opaque material (vanes) to the translucent fabric (front and back sides or panels) rather than a heat-welding process, there is no indication in the record that ultrasonic welding should be treated any differently from heat-welding for purposes of this motion.

--- End Footnotes ---

It should be noted that the above is consistent with the conventional definitions assigned a "bond" and a "weld." Whereas to "bond" two things together means "to cause to adhere firmly" or "to hold together or solidify by or as if by means of a bond or binder", Merriam Webster's Collegiate Dictionary, (10th ed. 1996), to "weld" means "to unite (plastics) [by heating and allowing the [plastics] to flow together] by heating." Id. Clearly, Colson differentiated the procedure used in the '999 patent from one which allowed materials to flow together due to heating.

Hunter Douglas, however, alleges that Comfortex actually uses an adhesive rather than an ultrasonic weld in connecting the vane material of the "Shangri-La" to the front and back fabric sides. Hunter Douglas has made representations to this Court that its challenge is supportable and that same will be shown at later stages of the litigation. 5 This is a very serious representation and one to which the Court will give foremost consideration. With both parties contesting a critical issue of fact regarding the material used to manufacture the "Shangri-La", judgment as a matter of law cannot be entered in favor of Comfortex on the issue of literal noninfringement of the "bonded to" limitation. As a result, the Court now examines whether the "Shangri-La" window covering literally incorporates a "sheet" as that term is defined in the '999 patent.

--- Footnotes ---

5 This is at least reasonably supported in Comfortex's patent application regarding the Shangri-La Window covering where Comfortex states the following:

The adjoining edges of these portions (material ultimately forming vanes and fabric sides) may be connected by gluing,
ultrasonic welding, thermal bonding or stitching. Ultrasonic welding is the preferred method, because it is speedy and permits precision location of adjoining edges. This process also beneficially compresses the welded zone and destroys the fabric interstices, so that the joint will not be porous to subsequently applied glue lines. Thus, unsightly bleed through of the glue lines is avoided.

GO BACK

4. "Bonded to said second surface"

a. Parties' Positions

"Bonded to said second surface" is found only in the text of claim 2. Plaintiff asserts this term does not require any construction. Alternatively, Plaintiff asserts the term should be construed as indicating only that the heat sink base must be thermally connected to the fin structures.

Plaintiff
Thermally connected to the second surface

Defendants
Affixed to the second surface using a thermally-conductive bondant.

b. Court's Construction

The specification discusses using an epoxy adhesive as one way to bind the fin structures to the heat sink base. ('631 Patent at Abstract; 4:37-39). Plaintiff argues this embodiment cannot exclude other means to bind the fin structures, including means that rely on integral bonds. For example, according to Plaintiff, the specification also discusses soldering and dip brazing as viable means of bonding, even though these mechanisms create an integral bond. Plaintiff also relies on the specification, which notes that the heat sink's elements may be fashioned out of "alternative materials" ('631 Patent at 7:7), and the Abstract, which states that, in addition to a metal-filled epoxy, dip brazing and soldering "may also be employed depending on the materials selected." Finally, Plaintiff asserts Defendants' proposed construction that the bonding must be non-integral is inconsistent with the preferred embodiment, which contemplates the fin structures being "integ rally" connected to the top plate. ('631 Patent at 5:51-53).

According to Defendants, "bonded to said second surface" means the fin structures are affixed to the second surface using a bondant, whether that bondant be an epoxy, an alloy in dip brazing, or solder. Defendants assert the term does not mean extruded; rather, bonding requires the attachment of two separate parts. The Court agrees the claims in the specification confirm that a bonded substance joins the fin structures to the top plate.

There is further support for this in claim 2 where a plurality of fin structures are each bonded to said second surface. The claim further provides a top plate having a second surface for receiving fin structures. The fin structures are each bonded to said second surface. If the inventor were talking about an extruded heat sink, there would be no need for a second surface for receiving fin structures, and there would not be a plurality of fin structures bonded to the second surface. There are two separate pieces, not one piece.

Looking at the Abstract, a person of ordinary skill in the art would understand bonding to require affixing two separate pieces together. A high thermal conductivity bondant, such as metal-filled epoxy, may be used to bond the fin structures to either the plate or the fin supports. Dip brazing and soldering may also be employed depending upon the material selected.

The Court agrees with Defendants' proposed construction and construes "bonded to said second surface" to mean "affixed to the second surface using a thermally-conductive bondant."

GO BACK
A. "a polymeric material bonded to the implant" ("753 patent) and "a first component bonded to at least a portion of the tubular member" ("290 patent)

22) Heat bonding is the only form of bonding taught by the patent. The specification defines "bondable material" as "any material, suitable for use in surgical applications, which can be softened and made flowable by the application of heat, and which, when softened, will become tacky and bond to other materials and will flow to fill available space." D.I. 70, Ex. A ("753 patent") at 3:52-57.

23) The specification describes the "present invention" as involving "heat bonding," putting the public on notice that Dr. Bonutti's invention covers heat bonding, not all bonding. Honeywell Int'l., Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006) ("[T]he written description refers to the fuel filter as 'this invention' or 'the present invention' . . . . The public is entitled to take the patentee at his word and the word was that the invention is a fuel filter."); Verizon Servs., 503 F.3d at 1308 ("When a patent thus describes the features of the 'present invention' as a whole, this description limits the scope of the invention.").

24) The specification distinguishes and disfavors methods of bonding that do not involve heat. See D.I. 70, Ex. A ("753 patent") at 7:14-28; 7:34-37. Such language indicates that the claims encompass heat bonding and nothing broader. Honeywell, 452 F.3d at 1320 ("[D]erogatory statements concerning one type of material are the equivalent of disavowal of that subject matter from the scope of the patent's claims."); Scimed Life Sys., Inc. v. Advanced Cardiov. Sys., Inc. 242 F.3d 1337, 1341 (Fed. Cir. 2001) ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question.").

25) Confronted with prior art that taught bonding materials to a device using the same materials he had selected - the Palmaz '417 patent - Dr. Bonutti made arguments (D.I. 70, Ex. M at 6) and amendments to his claims (id. at 2; D.I. 70, Ex. O at 2.) to avoid that art. For claim construction purposes, these arguments and amendments are binding on Dr. Bonutti.

26) Dr. Bonutti disclaimed a device that has a polymer "placed upon" the implant by arguing that "[i]n contrast [to Dr. Palmaz' balloon-expandable stent], Applicants' implant includes a heat bondable material which is bonded to an implant by the application of heat." D.I. 70, Ex. M at 6. This argument limits his claims so as to exclude devices where a material is bonded to the device other than by the application of heat. Seachange Int'l, Inc. v. C-Cor, Inc., 413 F.3d 1361, 1372-73 (Fed. Cir. 2005) ("Where an applicant argues that a claim possesses a feature that the prior art does not possess in order to overcome a prior art rejection, the argument may serve to narrow the scope of otherwise broad claim language."); see Springs Window Fashions, 323 F.3d at 995 ("A patentee may not state during prosecution that the claims do not cover a particular device and then change position . . . ."); Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324 (Fed. Cir. 2003) ("As a basic principle of claim interpretation, prosecution disclaimer promotes the public notice function of the intrinsic evidence and protects the public's reliance on definitive statements made during prosecution.") (citation omitted); see also Computer Docking, 519 F.3d at 1379; Gillespie, 501 F.3d at 1291; Chimie, 402 F.3d at 1384.

27) MarcTec argues that it is improper to limit a product claim to a particular process of manufacture (i.e. heat bonding). The Court does not agree. Dr. Bonutti's claims are limited to heat bonding because Dr. Bonutti relied on this aspect of his invention to distinguish Palmaz and obtain his patents. See Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1373-75 (Fed. Cir. 2007) (construing claims to a composite to be limited to composites prepared using a particular process because the specification made clear that this process was an essential part of the claimed invention and the particular process was used to distinguish prior art); Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995) (construing claim to sputter-deposited dielectric layer to be limited to a layer created by a particular process where the process was used to distinguish prior art).

28) MarcTec also relies on the doctrine of claim differentiation to argue that it is improper to limit claim 1 of the '753 patent to heat bonding because such a construction would make claim 8 of the '753 patent ("The surgical device of claim 7 wherein the polymeric material is bonded to the implant by the application of heat") redundant. This argument is defeated by the specification and prosecution history.
29) "[T]he doctrine of claim differentiation cannot broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence." Wang Labs, Inc. v. Am. Online, Inc., 197 F.3d 1377, 1384 (Fed. Cir. 1999) (quoting Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998)); Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000) ("[T]he written description and prosecution history overcome any presumption arising from the doctrine of claim differentiation . . . ."). First, as discussed, the specification discloses only heat bonding. Second, claim 8 is an original claim (filed originally as claim 18, which depended from original claim 11). D.I. 91, Ex. CC at 29. It was written before Dr. Bonutti's independent claims were rejected over Palmaz and before Dr. Bonutti obtained his patent by arguing that his invention was different than Palmaz because, unlike Palmaz, "[a]pplicants' implant includes a heat bondable material which is bonded to an implant by the application of heat." D.I. 70, Ex. M at 6. That argument limited the term "bonded" in the independent claims to "heat bonded" - claim 8 was not at issue.

30) Consistent with the claim language, the specification, and the prosecution history, the Court construes the phrase "a polymeric material bonded to the implant" from claim 1 of the '753 patent as meaning "a polymeric material is bonded to the implant by the application of heat."

31) Consistent with the claim language, the specification, and the prosecution history, the Court construes "a first component bonded to at least a portion of the tubular member" from claim 1 of the '290 patent as meaning "a material is bonded to the tubular member by the application of heat."

527

The '753 and '290 patents have identical specifications and are directed to a surgical implant in which a polymeric material is bonded by heat to an expandable implant, where the polymer includes a therapeutic agent such as an antibiotic. Claim 1 is the broadest claim of the '753 patent:

1. A surgical device for implantation in a body comprising: an implant, at least a portion of which is expandable; and a polymeric material bonded to the implant, wherein the polymeric material is a thermoplastic, includes a therapeutic agent, is non-flowable and non-adherent at room temperature, and becomes flowable, tacky, and adherent upon the application of heat.

For the '290 patent, claim 1 is the broadest claim:

1. An implant for implantation in a human body comprising: a tubular member having a channel and mechanically expandable upon activation of a delivery mechanism from a contracted condition in which the tubular member has a first cross sectional size in a plane perpendicular to a longitudinal central axis of the tubular member to an expanded condition in which at least a portion of the tubular member has a second cross sectional size in a plane perpendicular to the longitudinal central axis of the tubular member, the second cross sectional size being larger than the first cross sectional size to thereby lock the tubular member against tissue in the human body; and a first component bonded to at least a portion of the tubular member and formed of a heat bondable material that includes a therapeutic agent selected from the group consisting of a tissue ingrowth promoter and an antibiotic, wherein the heat bondable material is non-flowable and nonadherent at room temperature and becomes flowable, tacky, and adherent upon the application of heat.

(Emphases added.) The claims of both patents all include the requirement of a polymeric material or heat bondable material bonded to an implant. Relying on the specification and the Applicants' arguments during prosecution, the district court construed "bonded" to mean "bonded by the application of heat."

The accused product is a drug-eluting stent having the brand name Cypher®, for implantation into patients with narrowed or blocked coronary arteries. This stent consists of an expandable, slotted metal tube that is bonded to a matrix comprised of two polymers, poly n-butyl methacrylate (PBMA) and polyethylene-co-vinyl acetate (PEVA), and a drug having the common name sirolimus, also known as rapamycin. During a portion of the manufacturing process called "solution casting," the polymers and the drug are dissolved in a volatile solvent and the resulting solution is sprayed onto the stents. The stents are then air-dried, allowing the solvent to evaporate and leaving the polymer/ drug coating "bonded" to the stents. The
solution casting process is performed at room temperature; no heat is applied. This is the basis for the judgment of noninfringement, for the district court construed the claims as requiring the application of heat. The district court explained:

Heat bonding is the only form of bonding taught by the patent[s]. The specification defines "bondable material" as "any material, suitable for use in surgical applications, which can be softened and made flowable by the application of heat, and which, when softened, will become tacky and bond to other materials and will flow to fill available space."

MarcTec argues that the asserted claims do not require the use of heat, and that the doctrine of claim differentiation undermines the district court's construction, for dependent claim 8 of the '753 patent specifically describes the polymeric material as one that "is bonded to the implant by the application of heat." MarcTec observes that the district court's construction of "bonded" renders this claim superfluous. Perhaps it does. However, as stated in Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998), "the doctrine of claim differentiation can not broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence."

The specification's discussion of bonding, in the context of the invention, is uniformly directed to heat bonding. The "Summary of the Invention" states that the components of the inventive assembly "are bond[ed] to each other by the application of heat." '753 patent, col.1 ll.66-67, col.2 ll.4, 8, 15. During prosecution of the patents, the Applicants limited the claimed "bonding" to heat bonding, in order to overcome the cited U.S. Patent 5,102,417 to Palmaz by arguing that: "In contrast [to Palmaz], Applicants' implant includes a heat bondable material which is bonded to an implant by the application of heat." [J.A. 5739.] To overcome the rejection based on Palmaz, and "[t]o highlight this distinction," the Applicants amended the claims to recite "a polymer material which is non-flowable and non-adherent at room temperature and becomes flowable, tacky, and adherent upon the application of heat." [J.A. 5739] Marc-Tec argues that the distinction from the Palmaz reference was not premised on the use of heat. MarcTec states that the distinction was between "bonding" the material to an implant, as in Applicants' invention, and having the material "placed upon" the implant, as in Palmaz. MarcTec states that the Applicants had no need to, and did not, distinguish Palmaz based on heat bonding because Palmaz lacks any teaching of bonding. The district court found that the prosecution record shows heat bonding as a condition of patentability, and not merely a preferred method of bonding. See Honeywell Int'l, Inc. v. ITT Industries, Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006) (when a patentee consistently describes a particular embodiment as his invention, "[t]he public is entitled to take the patentee at his word").

Limitations clearly adopted by the applicant during prosecution are not subject to negation during litigation, on the argument that the limitations were not really needed in order to overcome the reference. When an applicant yields claim scope in order to secure allowance of the patent, the public notice aspect of the record inhibits later retrenchment to recover what was yielded. See Norian Corp. v. Stryker Corp., 432 F.3d 1356, 1361-62 (Fed. Cir. 2005) ("[I]t frequently happens that patentees surrender more through amendment than may have been absolutely necessary to avoid particular prior art. In such cases, we have held the patentees to the scope of what they ultimately claim, and we have not allowed them to assert that claims should be interpreted as if they had surrendered only what they had to."). Prosecution history estoppel thus prevents MarcTec from recovering claim scope that includes bonding without the application of heat.

We affirm the district court's construction that "bonded" means bonded by the application of heat. Although MarcTec argues that heat is applied, it did not present evidence to avoid the grant of summary judgment. The district court's determination that no reasonable jury could find infringement, is affirmed.

II. Pergo's Cross-Motion for Reconsideration

Pergo argues that the court should reconsider its construction of "bonded wood particles."

The court determined that "bonded wood particles" does not include fibers or fiberboard. (See Order 7-11, May 12, 2006.) The court determined that fiberboard is distinct from "chipboard" or "particle board," and that wood "fiber" is distinct from wood "particles." (Id.) The court noted that the United States Department of Agriculture's Wood Handbook distinguishes
fiberboard from particleboard and fibers from particles. (Id. at 8-11.) The court noted that particleboard and medium-density fiberboard are governed by different American National Standards Institute ("ANSI") standards. (Id. at 9.) The court noted that ANSI A208.1-1999 defines particleboard as "a generic term for composite panel composed of cellulosic materials (usually wood), generally in the form of discrete pieces or particles, as distinguished from fibers, bonded together with a bonding system, which may contain additives." (Id.) This ANSI definition expressly distinguishes particles from fibers. The court acknowledged that particleboard and fiberboard may both be described as "wood-based composite panels" but concluded that the Wood Handbook and the ANSI standards show that fiberboard is not synonymous with, or a subset of, particleboard. The court noted that wood fiber is absent from the Wood Handbook's definition of "particles": "all small subdivisions of wood such as chips, curls, flakes, sawdust, shavings, slivers, strands, wafers, wood flour, and wood wool." (Id. at 10.) In light of the Wood Handbook's distinction between particles and fibers in Chapter 10, the court did not believe the omission of fiber from the definition of particle to be a careless error, as Pergo suggested. (Id.) Lastly, the court noted that the '970 patent lists "fiber board" as an item distinct from "chipboard" or "particle board," a fact that further confirms that fiberboard is not synonymous with, or a subset of, particle board. (Id. at 11.)

In its opening Markman brief, Pergo argued that the ordinary meaning of "bonded wood particles" is "small pieces or particles of wood that are bonded together by, for example, joining wood particles in the presence of a thermoplastic, glue, resin, or other bonding agent." (Pergo's Br. on Claim Construction 10-11, Jul. 23, 2004.) Pergo, however, does not say how it derived the ordinary meaning of "bonded wood particles": in fashioning its proposed definition of "bonded wood particles," Pergo did not cite to any intrinsic or extrinsic evidence. (Id.) Moreover, Pergo did not define "fibers." (See id.) Pergo emphasized that the intrinsic evidence did not contradict its construction of "bonded wood particles." (Id. at 11) ("There is no indication in the patent specifications that the patentee acted as their 'own lexicographer in explicitly setting forth a definition' of 'bonded wood particles' distinct from its ordinary meaning.").

In response to Alloc's arguments that the Wood Handbook and its expert Dr. Otto Suchsland distinguish "particleboard" from "fiberboard" and "particles" from "fibers," Pergo merely reasserted that the "ordinary meaning" -- and by "ordinary meaning" Pergo presumably relies upon its particular construction of "bonded wood particles" -- of "chipboard," "particle board," and "bonded wood particles" includes fiberboard. (See Pergo's Resp. Br. 15 & n.8, Aug. 13, 2004.) Ignoring all of the ways in which the Wood Handbook distinguished particleboard and fiberboard and particles and fibers (e.g. the separate definitions of "particle" and "fiber"), Pergo argued that the Wood Handbook's definition of "particles" could be read to include fibers, an argument that the court did not find persuasive. Pergo also cited a treatise for a definition of fiberboard that indicates it could be made of wood chips, (id. at 15), but Pergo did not explain how the court could reconcile that definition with the Wood Handbook or why the court should deem the treatise more authoritative than the Wood Handbook. Pergo did not respond to Dr. Suchsland's opinion other than to argue that the court should not consider it because "bonded wood particles" is unambiguous. (Id. at 14 n.7.) With respect to the argument that the '970 patent lists "fiber board" as an item distinct from "chipboard" or "particle board," Pergo argues-weakly, the court thinks-that the '970 patent "clarifies and makes explicit what was at least implicit: the invention covers all of these broad and overlapping categories of wood-based materials." (Pergo's Reply Br. 5, Aug. 20, 2004) The court has a healthy suspicion of assertions of "implicit meaning" as does Pergo itself. (See Pergo's Br. 8, Jul. 28, 2006)(citing CAE Screenplates, Inc. v. Heinrich Fiedler GmbH & Co. KG, 224 F.3d 1308, 1317 (Fed. Cir. 2000)("In the absence of any evidence to the contrary, we must presume that the use of these different terms in the claims connotes different meanings.").

In its motion for reconsideration, Pergo no longer argues that particleboard is the same as, or includes, fiberboard. Pergo no longer argues that the Wood Handbook's definition of "particles" supports its construction of "bonded wood particles." Instead, Pergo argues that "bonded wood particles" has a broader meaning than "particle board" and "chipboard." Pergo argues that the court's construction of "bonded wood particles" was based entirely upon the Wood Handbook, rather than on the specification, which is improper in light of Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005)(en banc). Pergo also argues that "bonded wood particles" and "particle board" have the same meaning under the court's construction of those terms, an alleged breach of claim construction principles.

Pergo's more recent arguments do not persuade the court any more than Pergo's original arguments. The methodology outlined in Phillips is no different than the methodology the court employed in its May 12, 2006 order: the court examines the intrinsic evidence--the claims themselves, the specification, and the prosecution history--and the words in the claim are given their ordinary and customary meaning that they would be given by persons experienced in the field of the invention; the court considers whether the inventor chooses to be his own lexicographer by using terms in a manner other than their ordinary meaning and whether the inventor has disavowed or disclaimed scope of coverage; if the intrinsic evidence
unambiguously describes the scope of the invention, the court does not rely upon extrinsic evidence such as expert testimony; the court may consult dictionaries, encyclopedias, and treatises as long as they are not inconsistent with the intrinsic evidence. (See Order 2-3, May 12, 2006.) Phillips does not articulate a different methodology; it reaffirms basic principles of claim construction, including the primacy of intrinsic evidence over extrinsic evidence, and clarifies that extrinsic evidence, such as technical dictionaries and treatises, may properly assist the court in construing terms but must be considered in the context of intrinsic evidence and must not contradict claim meaning that is unambiguous in light of the intrinsic evidence. See Phillips, 415 F.3d at 1312-24.

"Bonded wood particles" is a phrase found in claims 23-24, 29, 32, and 35 of the '547 patent. (See Pergo's Br. on Claim Construction 10, Jul. 23, 2004.) Pergo does not rely upon the '547 patent's specification, prosecution history, or any of its claims aside from claim 23:

23. The flooring panel of claim 21, wherein said bonded wood particles is [sic] made of a material selected from the group consisting of chipboard and particle board, each impregnated with a resin.

(Id. Ex. A.) Claim 24 is very similar to, and perhaps redundant with, claim 23:

24. The flooring panel of claim 21, wherein said bonded wood particles is [sic] made of a material comprising particle board impregnated with a resin.

(Id.) Claim 21, in turn, provides:

21. A flooring panel for use in assembling a glueless floor, said flooring panel comprising

a surface of a thermosetting laminate or a paper impregnated with a thermosetting resin said surface being bonded to a carrier of wood particles impregnated with a plastic; . . .

(Id.) (emphais added). Pergo argues that claim 23 would be meaningless unless bonded wood particles is broader than chipboard or particle board.

Even if the court were to accept Pergo's premise that "bonded wood particles" is broader than "chipboard and particle board, each impregnated with a resin," Pergo does not point to the intrinsic evidence that demonstrates how "bonded wood particles" include fibers or fiberboard. Rather than rely upon intrinsic evidence, Pergo deduces that "bonded wood particles" must include fiberboard because that is "the only other option," "the only other possibility" to the court's construction. (See Pergo's Br. 8-9, Jul. 28, 2006.) The basis for Pergo's deduction is extrinsic evidence that particle board and fiberboard are distinct. (Id. at 9)(citing "4/15/04 Issal Depo. at 122" for the proposition that "[p]ersons skilled in the art are well aware that particle board and fiberboard have for years been used as the core material for laminated flooring").

Pergo's argument is unpersuasive for a number of reasons. First, Pergo ignores intrinsic evidence that undermines its position. Claim 23 contains a "Markush group" which is "a listing of specified alternatives of a group in a patent claim, typically expressed in the form: a member selected from the group consisting of A, B, and C." (See Order 7, May 12, 2006) (citing Abbott Labs. v. Baxter Pharm. Prods., Inc., 334 F.3d 1274, 1280 (Fed. Cir. 2003).) In the example, A, B, and C are alternatively usable, but the group is closed, so that D does not fall within the claim scope. (Id.) (citing Abbott Labs., 334 F.3d at 1280-81.) Therefore, even if "bonded wood particles" otherwise included fiberboard, it does not in claim 23; in that claim, "bonded wood particles" may only be "made of a material selected from the group consisting of chipboard and particle board, each impregnated with a resin." In a prior version of its argument, Pergo acknowledged the Markush format but insisted that chipboard and particle board included fiberboard. (Pergo's Resp. Br. 15 n.8, Aug. 13, 2004.) In its motion for reconsideration, however, Pergo does not advance this argument, and in an extraordinary change in position, Pergo argues that particle board and fiberboard are distinct. (Pergo's Br. 9, Jul. 28, 2006)(citing "4/15/04 Issal Depo. at 122" for the proposition that "[p]ersons skilled in the art are well aware that particle board and fiberboard have for years been used as the core material for laminated flooing"). This concession means that fiberboard is outside the scope of claim 23. By ignoring the Markush format of claim 23, Pergo ignores intrinsic evidence that supports the court's construction and contradicts Pergo's proposed construction.

Moreover, Pergo overlooks intrinsic evidence that the court discussed in the May 12, 2006 order: the '970 patent lists "fiber
board" as an item distinct from "chipboard" or "particle board." As Pergo itself noted, in the absence of evidence to the contrary, the court presumes that the use of different terms in the claims connotes different meanings. (See Pergo's Br. 8, Jul. 28, 2006) (citing CAE Screenplates Inc., 224 F.3d at 1317.)

Pergo's argument itself only masquerades as an argument based upon intrinsic evidence. Even if the intrinsic evidence indicates that "bonded wood particles" has a different meaning (or even a broader meaning) than "particle board," Pergo relies upon no intrinsic evidence when it weakly concludes that fiberboard is "the only other possibility" to "particle board." As an initial matter, the court suggests that "bonded wood particles" may be broader than "particle board" in that it may also include "chipboard" as the intrinsic evidence suggests; or "bonded wood particles" may be broader than "chipboard and particle board, each impregnated with a resin" in that the bonding agent may be something other than resin. In any event, Pergo's extrinsic evidence does not establish that fiberboard and particle board are the only wood-based composite materials used in laminate flooring. (Pergo's Br. 9, Jul. 28, 2006.) Because Pergo's argument depends upon unpersuasive extrinsic evidence, the court need not place any greater weight on Pergo's tenuous deduction than the court placed on the clear distinction between particles and fibers in the Wood Handbook or the ANSI standards.

--- Footnotes ---

2 Although Alloc's expert Suchsland states that "chipboard" is a "confusing term" that is similar to particle board, (Suchsland Decl. P 10, Jul. 23, 2004), the terms are treated as distinct in the '547 patent.

--- End Footnotes ---

Pergo argues that the Wood Handbook does not contain the phrase "bonded wood particles" and that the Wood Handbook's definition of "particles" is too narrowly defined to include only the raw materials of particle board. (Pergo's Reply Br. 2-3, Sept. 5, 2006.) Pergo suggests that the "ordinary meaning" of "particles" includes "fibers." (Id. at 2.) As the court has already noted, however, the intrinsic evidence makes no suggestion that "particles" includes "fibers," and Pergo has not tendered any definition of "particles" or "bonded wood particles" other than its own particular definition of "bonded wood particles" that is unsupported by any intrinsic or extrinsic evidence. (See Pergo's Br. on Claim Construction 10-11, Jul. 23, 2004.) The authoritative treatise in the particular art field makes a clear distinction between particles and fibers, and Pergo does not persuade the court that the patentees used the word "particles" in a manner that ignores that distinction. Pergo is silent with respect to the different ANSI standards and the distinction between fibers and particles therein.

The court's position is further supported by the opinion of Alloc's expert, Dr. Otto Suchsland, who indicates that persons of ordinary skill in the art of using wood composite materials would understand that particles are different than fibers and that particleboard is different than fiberboard. (See Alloc's Resp. Br. Ex J, Aug. 13, 2004.)

For the reasons stated above, the court denies Pergo's motion for reconsideration.

4. "Garment Component"
The term "garment component" is found in both the method and product claims of the patents-in-suit. For example, in Claim 1 of the 779 Patent, a method claim, step (a) of the seam manufacturing process requires "placing the first garment component in an adjacent relationship to the second garment component so as to define a seam." 779 Patent at 6:30-32 (emphasis added). In Claim 20 of the 779 Patent, a product claim, the seam is defined as comprising "a first garment component having an upper and lower surface" and "a second garment component having an upper and lower surface." 779 Patent at 8:10-11, 8:18-19 (emphasis added). The 615 Patent similarly uses the term in Claims 1 and 19, method and product claims, respectively. 615 Patent at 6:31-36, 8:4-5, 8:12-13.

Taltech asks the Court to construe "garment component" to mean "a structural part of a garment, such as a front panel, yoke, rear panel, and sleeve. An interlining is not a garment component." Taltech relies on the specifications and on the opinion of Taltech's expert, Mr. Nienke. Esquel asks the Court to construe "garment component" to mean "any element of an article of clothing," including an interlining, a bonding element or thread. Esquel relies on the patent specifications, on a dictionary definition of "component," and on a technical treatise.

The Court finds Taltech's proposed construction more persuasive. Claim 6 of the 779 Patent and Claim 13 of the 615 Patent state that "... said first garment component comprises a front panel, yoke, and rear panel of a dress shirt and said second garment component comprises a shirt sleeve...." 779 Patent at 7:10-13; 615 Patent at 7:40-42 (emphasis added). The specifications state that "a pucker free garment seam 12" consists of "a first garment component 20, such as a component consisting of a dress shirt front panel 16, yoke 14, and rear panel; a second garment component 22 such as a dress shirt sleeve 12 [sic]; 4 and a bonding element 32." 779 Patent at 5:60-65; 615 Patent at 5:62-67 (emphasis added); see also Fig. 2; 779 Patent at 3:44-47; 615 Patent at 3:45-48 (defining first garment component as comprising a front panel, shirt yoke and rear panel and the second garment component as comprising a shirt sleeve). The examples of a "garment component" identified in the claims and specifications are those that Taltech includes in its proposed construction of the term. Although this is not an exhaustive list of possible garment components, nothing in the intrinsic evidence supports Esquel's broad construction of the term.

4 The patent appears to contain an error in that it should say "13" rather than "12" to refer to the shirt sleeve in the 779 Patent at 5:64 and in the 615 Patent at 5:66. See 779 Patent at 3:46-47 and 615 Patent at 3:48 ("the second garment component comprises a shirt sleeve 13.").

First, a bonding element is not a garment component. The specifications, as outlined above, separately list the bonding element as its own thing, and not as an example of a garment component. 779 Patent at 5:58-65; 615 Patent at 5:60-67; see also 779 Patent at 6:26-56 (Claim 1 separately refers to garment components and bonding elements as distinct objects); 615 Patent at 6:28-67 (same). Nothing in the intrinsic evidence indicates that the terms should be used interchangeably.

Second, an interlining is not a garment component. The specifications of the patents-in-suit state: "Interlinings are known in the art to provide stiffness to garment components." 779 Patent at 5:1-2; 615 Patent at 5:2-3 (emphasis added). This sentence only makes sense if the Court interprets interlinings and garment components to be distinct categories. Esquel's genus and species analogy, see Esquel's Responsive Brief, docket no. 111, at 12 n.6, is not persuasive because there is no evidence in the patent for the proposition that interlinings are a subset of the broader category of garment components. Esquel argues that garment components should specifically include " fusible and non-fusible interlinings ... and fusible webs or nets;" however, Esquel's interpretation is unsupported by the intrinsic evidence. Esquel relies on parts of the specification of the 779 Patent that have no bearing on the construction of the term "garment component." See Esquel's Opening Brief, docket no. 97, at 21 (citing 779 Patent at 3:51-4:3, 4:66-5:1).

Third, thread is not a garment component. Esquel argues to the contrary and relies on the characterization of "components of garments" in a technical treatise that includes interlinings and thread as examples of "components of garments." See Peyton B. Hudson, Guide to Apparel Manufacturing 51-63 (Rev. 2d ed. MEDIA Apparel, Inc. 1989) (docket no. 97, Ex. E). The Court does not rely on extrinsic evidence that is inconsistent with the intrinsic evidence. In this case, the specifications state that "the sewing thread contracts upon being laundered and pulls on opposing garment components at the garment seam which in turn causes the garment components to buckle. ...," 779 Patent at 1:22-26; 615 Patent at 1:26-29 (emphasis added). Thread acts on the garment components, indicating that it must be a distinct object. The specifications' reference to garment components as coming together at a seam and as buckling are further evidence that a garment component is a fabric panel, not thread.

To interpret the term "garment component," the Court does not rely on the expert testimony provided by Taltech. See
Nienke Decl., docket no. 96, P 28. Mr. Nienke's opinion regarding the term "garment component" is merely conclusory. See Phillips, 415 F.3d at 1318 ("[C]onclusory, unsupported assertions by experts as to the definition of a claim term are not useful to a court."). The intrinsic evidence is sufficient to support Taltech's proposed construction. Accordingly, the Court adopts Taltech's proposed construction, with modification, and construes the term "garment component" to mean "a structural part of a garment, such as a front panel, yoke, rear panel, and sleeve. A bonding element, an interlining, and thread are not garment components."

As to the '001 patent, "bonding said braid and thin foil" means that the braid and foil are attached together by an outside agent resulting in the braid and foil being permanently affixed or attached to one another. See Column 2, lines 28-30, 42-44, 56-58. The language in Column 2, lines 58-63, quoted in part in plaintiff's brief filed on 3/23/01 page 8, articulates how the bonding agent is applied. That language in Column 2, lines 58-63 does not, however, define the term "bonding said braid and thin foil."

A. THE MEANING OF "BOOK."

The first disputed term is "book." General Creation asserts that the proper construction of "book" is "a first set of two or more pages having related content." (Pls.' Br. at 12.) LeapFrog argues for a more limited construction. Specifically, that "book" be construed as "a set of written, printed pages fastened along one side and encased between protective covers." (Def.'s Br. at 25.)

Both parties have relied on various dictionary definitions of "book" to support their claim construction arguments. However, "the dictionary definitions of common words are often less useful than the patent documents themselves in establishing the usage of ordinary words in connection with the claimed subject matter." Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1299 (Fed. Cir. 1999). Indeed the court is to construe claims from the point of view of a person of "skill in the art." Intellicall, Inc., 952 F.2d at 1387. Certainly such a person would not begin by looking to a dictionary, but instead would look to the claim language and the specification in the context of the person's particular field of expertise. See Toro Co., 199 F.3d at 1299.

Thus, I must start by analyzing the claim language itself. The plain language of the claim does not specify whether the "book" has a cover. However, the plain language does imply that the pages are bound together in some fashion. The claims identify the "book" as having at least two pages containing different "written material" ( '213 patent, col. 4, 11. 40-50), that said "written material" is a "set of words" ( '213 patent col. 5, 11. 24-26), and that the "set of words" on each page combine to "comprise a story" ( '213 patent, col. 5, 11. 27-28). This sequence implies that the pages are interrelated and must be fastened together in some manner to create a story. Beyond this implication, the claim language provides little guidance as to what the inventor meant by "book."

Because the claim language sheds little light on the proper construction of "book," I must determine its ordinary meaning. "Book" must be given the ordinary meaning as determined by one of skill in the art, who in this case is a toy inventor or toy manufacturer experienced in the field of educational toys. Such a person would likely construe "book" to mean more than just a set of loose pages having related content. This is further supported by the fact that the patent is described as a "child's toy." ( '213 patent, col. 1, 1. 5.) The ordinary meaning of a "book" that a "child" would play with implies that there is a binding of the pages and a cover to protect the pages. A child could not likely play with a set of loose pages in any satisfactory manner. The pages, if not bound together and encased in some sort of cover, would be lost or destroyed. A toy inventor or manufacturer, experienced in the art of making and marketing educational toys, would not intend such an invention for children. Thus, the ordinary meaning of "book" is "a set of pages having related content, fastened along one side and encased between covers." Since this is the ordinary meaning, I must look to the specification to determine if the inventor intended a different meaning in the context of the '213 patent.

- 965 -
The specification does not indicate that the inventor intended to deviate from the ordinary meaning of "book." The language of the specification identifies that the "book" has a cover: "The book is provided with a cover 94 and a plurality of pages 96." ('213 patent, col. 2, 11. 62-63.) The language also implies that the pages are fastened together on one side: "the book 92 may be opened as shown in FIG. 4 to a particular page" ('213 patent, col. 3, 11. 29-30); "the book 92 would be opened to a particular page." ('213 patent, col. 3, 11. 49-50.) The Abstract also describes the "book" as having "a plurality of numbered pages containing parts of a story." ('213 patent, Abstract.) Identifying the pages as numbered indicates that they are somehow bound together to form a set. Further, the drawings identify the "book" as having a cover and pages fastened along one side:

[SEE FIG. 1, FIG. 2, FIG. 4 IN ORIGINAL]

The only "book" that is described in the specification and illustrated by the drawings in the '213 patent is a "book" that has a cover and is bound on one side. This confirms that "book" was used by the inventor in accordance with its ordinary meaning.

Precedent has clearly established that the specification cannot be used to limit broader claim terms. See, e.g., Johnson Worldwide Assoc., Inc. v. Zebo Corp., 175 F.3d 985, 992 (Fed. Cir. 1999); SRI Int'l v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1122 (Fed. Cir. 1985). However, this is not such a case. The claim language here is not broader than that which is set out in the specification. The claims state that the "book" is comprised of pages containing written material that, taken together, comprise a story. ('213 patent, claims 1, 2, 3, 10, 11.) If the inventor intended this invention to be loose sheets of paper with related content, he could have claimed it that way. Instead, the inventor chose to use the word "book." From the viewpoint of an educational toy inventor or manufacturer, a "book" consists of pages that are bound together and protected by a cover. The specification and the drawings confirm that this is clearly the invention the inventor intended. Thus, this construction does not impose limits on the claims drawn from the specification. Instead, any limits on the claim come from using the word "book" which has a very specific ordinary meaning. Like many patents that have been previously construed, the specification, at least in context, merely states what the invention is and what the claim describes. See, e.g., Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) ("When the preferred embodiment is described in the specification as the invention itself, the claims are not necessarily entitled to a scope broader than that embodiment."); Wang Labs., Inc., v. Am. Online, Inc., 197 F.3d 1377, 1381-83 (Fed. Cir. 1999) (narrowly construing "frame" based on the specification and the drawings); Toro Co., 199 F.3d at 1301-02 (construing "including" to mean "permanently attached" based on the specification and the drawings, despite the fact that the claim language did not contain such a limitation).

Accordingly, "book" will be construed as "a set of pages having related content, fastened along one side and encased between covers."

The second disputed term is "supplemental book." The parties have agreed that the "supplemental book" must contain content unrelated to the first book. (See Pls.' Br. at 13-14; Def.'s Br. at 31.) Therefore, for the reasons stated above, "supplemental book" will be construed as "a second set of pages having related content, fastened along one side and encased between covers, such content being unrelated to the content of the first book."

2) the word "border" means "extending along the edge;"

2) the word "border" means "extending along the edge;"
B. Claim Construction

Interface's second argument is that the district court erred in construing the "border" limitations in independent claims 1 and 8 to encompass the simple beveled edges in its accused floor panels. This argument also fails.

Claim interpretation begins, as always, with the language of the claims. Johnson Worldwide Assocs., Inc. v. Zebco Corp., 175 F.3d 985, 989, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999). "[A] court must presume that the terms in the claim mean what they say, and, unless otherwise compelled, give full effect to the ordinary and accustomed meaning of claim terms." Id. (citing Nike Inc. v. Wolverine World Wide, Inc., 43 F.3d 644, 646, 33 U.S.P.Q.2D (BNA) 1038, 1039 (Fed. Cir. 1994); E.I. du Pont de Nemours & Co. v. Phillips Petroleum, 849 F.2d 1430, 1433, 7 U.S.P.Q.2D (BNA) 1129, 1131 (Fed. Cir. 1988); Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759, 221 U.S.P.Q. (BNA) 473, 477 (Fed. Cir. 1984)). This strong presumption in favor of the ordinary meaning of claim language as understood by one of ordinary skill in the art may be overcome where: 1) the patentee has chosen to become his or her own lexicographer by clearly and explicitly defining the claim term; or 2) where the claim term would render the claim devoid of clarity such that there is "no means by which the scope of the claim may be ascertained from the language used." Bell Atl. Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268, 59 U.S.P.Q.2D (BNA) 1865, 1870 (Fed. Cir. 2001) (quoting Johnson, 175 F.3d at 990, 50 U.S.P.Q.2D (BNA) at 1610).

One ordinarily skilled in the art of raised access floor panels would understand the term "border" to refer to the area or zone forming an edge or trim framing the decorative surface of the panel. Independent claim 1 recites "a border along the edges of said panels along which said decorative surface layer is removed to expose said inner body portion." 491 patent, col. 4, l. 67 to col. 5, l. 11. Independent claim 8 recites "a border extending along the edges of said panel along which the decorative layer is removed to expose said inner layer." Id. at col. 5, l. 37 to col. 6, l. 11. Nothing in the language of these claims requires the "border" to be horizontal or formed of a single layer.

The "border" in claim 1 is formed by exposing an "inner body portion." A portion may certainly consist of one or more layers.

The "border" in claim 8 is formed by exposing "said inner layer." That language refers to the phrase "an inner layer," which first appears earlier in claim 8. 491 patent, col. 6, l. 6. 67 to col. 5, l. 11. Independent claim 8 recites "a border extending along the edges of said panel along which the decorative layer is removed to expose said inner layer." Id. at col. 5, l. 37 to col. 6, l. 11. Nothing in the language of these claims requires the "border" to be horizontal or formed of a single layer.

The "border" in claim 1 is formed by exposing an "inner body portion." A portion may certainly consist of one or more layers.

The "border" in claim 8 is formed by exposing "said inner layer." That language refers to the phrase "an inner layer," which first appears earlier in claim 8. 491 patent, col. 6, ll. 2-9 (emphasis added). The language "an inner layer" must be read in the context of the language claiming "a single visible decorative layer along the side of said floor covering also providing an inner layer contrasting with said decorative layer having a thickness substantially greater than the thickness of the decorative layer adjacent to said decorative layer along the side thereof facing said load surface. . . .

491 patent, col. 6, ll. 2-9 (emphasis added). The language "an inner layer" must be read in the context of the language claiming "a single visible decorative layer;" where the patentee meant to constrict the claim to one and only one particular layer, he said so clearly. Moreover, the reference to substantially greater thickness also suggests that the claimed inner layer may consist of one or more layers, because increasing the layers would increase the thickness. 3

Because we conclude independently that the "border" limitations in claims 1 and 8 both properly encompass one or more layers, we need not address the issue of whether Interface is bound by this court's prior determination in Tate v. Maxcess, 222 F.3d at 968, 55 U.S.P.Q.2D (BNA) at 1518-19, that the "inner body portion" and "inner layer" limitations forming the borders are co-extensive.

Like the claim language, the remainder of the specification supports construing the term "border" to include multiple layers framing the decorative paper. Of course, limitations from elsewhere in the specification will not be read in where, as here,
the claim terms are clear. See, e.g., Toro Co. v. White Consol. Indus., Inc., 266 F.3d 1367, 1371, 60 U.S.P.Q.2D (BNA) 1437, 1439 (Fed. Cir. 2000) (citing E.I. du Pont de Nemours & Co. v. Phillips Petroleum, 849 F.2d 1430, 1433, 7 U.S.P.Q.2D (BNA) 1129, 1131 (Fed. Cir. 1988) (holding that it is improper to import an extraneous limitation from elsewhere in the specification into the claim)); see also Kahn, 135 F.3d at 1476, 45 U.S.P.Q.2D (BNA) at 1611 (distinguishing means-plus-function claims from the "ordinary situation in which claims may not be limited by functions or elements disclosed in the specification, but not included in the claims themselves").

Nevertheless we note that this is not a case in which the patentee acted as his own lexicographer, and that the written description supports our construction. In pertinent part, it reads:

Rearwardly of the decorative paper, the floor covering material is provided with layers of material having a contrasting color with respect to the decorative paper.

In accordance with the present invention, the surface layer of protective material and the layer of decorative paper are cut away along the edge of the floor covering to expose the inner layers and provide a contrasting color integral border within the floor covering material itself.

491 patent col. 1, l. 65 to col. 2, l. 4 (emphasis added). This language contradicts Interface's position that the description requires construing the claimed "border" as a single, horizontal layer. Interface emphasizes the statement that "a uniform exposure of the layers of black paper is obtained." 491 patent, col. 3, ll. 53-54. This language, however, merely underscores that the border is formed by uniformly exposing multiple layers, not by exposing a single layer. Thus, the written description plainly contemplates that the claimed contrasting color border can be formed of multiple layers of material.

Interface argues that notwithstanding this language, Figures 3 and 4 of the 491 patent compel its construction of the "border" limitations. This is allegedly so because the arrow corresponding to the "integral border or edge trim 14," 491 patent, col. 2, l. 54, aims at a horizontal, single layer of exposed trim. This argument fails. Even were we to accept the proposition that the arrow in Figures 3 and 4 points only to the horizontal, single-layered portion of the border rather than to the beveled portion (which is also clearly exposed, and which is formed of multiple layers of material) additional limitations from these figures cannot be imported into the unambiguous claim language.

Contrary to Interface's next contention, nothing in the prosecution history, or elsewhere in the prior art of record, 4 renders proper a construction that limits the claimed "border" to a single, horizontal layer. Interface would have us adopt its narrow construction in order to preserve the validity of the 491 patent. It contends that the prior art would render the asserted claims obvious if they cover floor panels with simple beveled edges such as its accused products.

--- Footnotes ---

4 In construing claims, we look first to the intrinsic evidence of record -- the patent, including the claims, remainder of the specification, and, if it is in evidence, the prosecution history. Vitronics Corp. v. Conceptor Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). The court may not vary the meaning of claim language when that meaning is clear from the intrinsic evidence. Prior art cited in the prosecution history falls within the category of intrinsic evidence. Prior art the examiner failed to consider is extrinsic. In the present case, however, we will discuss all of the prior art on which Interface now seeks to rely, because none of it compels its narrow construction of the term "border."

--- End Footnotes ---

Even if this were so, where claim language is clear we must accord it full breadth even if the result is a claim that is clearly invalid. Apple Computer, Inc. v. Articulate Sys., Inc., 234 F.3d 14, 24, 57 U.S.P.Q.2D (BNA) 1057, 1064 (Fed. Cir. 2000) (explaining that claims should be read to preserve validity but only where it is possible to do so, and holding that it was impossible and that therefore the claims were simply invalid) (citing Rhine v. Casio, Inc., 183 F.3d 1342, 1345, 51 U.S.P.Q.2D (BNA) 1377, 1379 (Fed. Cir. 1999) (Where "the only claim construction that is consistent with the claim's language and the written description renders the claim invalid, then the axiom does not apply and the claim is simply invalid.")))
3. Bore

While the term "bore" appears throughout the specifications, it does not appear in the claims of either the '609 patent or the '958 patent. The term first appears as a claim element in the '674 patent. See '674 patent claim 1 at 26:45 ("a housing including a bore"), claim 13 at 27:27-29 ("a first stage regulator comprising: a housing; and a gas inlet opening located within a bore in the housing"); see also id., claim 1 at 26:46, 50, claim 13 at 27:40-41.

Aqua-Lung proposes two different definitions for the term "bore": (1) in claims one through twelve of the '674 patent, "an internal passageway that is cylindrical"; and (2) in claims thirteen through twenty-four of the '674 patent, "a threaded opening to a first stage regulator housing where the fluid flow control valve is connected." Two Forty proposes that the term be defined as "a hole or passage."

Aqua-Lung maintains that the '674 patent uses the term "bore" as a special definition given to "passageway" by the patentee that differs from the meaning it would otherwise possess. It contends that two different meanings of "bore" are needed because the '674 patent refers to two different things. In claims one through twelve, "bore" is being used as an alternative to "passageway" while in claims thirteen through twenty-four it is being used as the downstream connection point to the regulator. According to Aqua-Lung, while "passageway" in the first instance is referred to as a "bore," it does not cease being a "passageway." In the context of the individual embodiments, "passageway" is called a "bore," thereby suggesting that the latter is at least not narrower than the former. The end result, according to Aqua-Lung, is that once "passageway" is defined, then "bore" essentially must be defined accordingly.

Two Forty counters that their simple meaning of "bore" is based on the various uses of the structure in the patents. Like Aqua-Lung, Two Forty explains that "bore" is used in two different pieces of the invention. The first is the smaller insert portion of the opening hole in the connection point of the regulator. The second arises in the larger regulator in which the smaller insert is placed. According to Two Forty, regardless of what part is at issue, these two different pieces contain a "bore" that is used consistently in the patent as a hole. Two Forty contends that there just is no need to have two definitions for the same term especially when the different embodiments encompass a consistent element. The embodiments show a hole in an otherwise solid piece, whether it be in the larger or smaller insert. Two Forty, therefore, submitted a dictionary definition of the term "bore," arguing that a person of ordinary skill in the art would understand the term to mean a hole in the housing.

As noted above, the intrinsic record assists in ascertaining the meaning of "bore" to one of ordinary skill in the art because the definition found in the specification is the best guide to the meaning of the term. Phillips, 415 F.3d at 1315. A representative portion from the specification of the '609 patent states that: "The housing shaft 65 includes a threaded portion 68 which is designed to engage a bore 69 (FIG. 14) disposed within the first stage regulator housing 34." 8:54-56 (emphasis added). A representative sample of "bore" in the '958 patent provides that: "the inlet valve 60 is illustrated in a closed position wherein the upper curved surface 94 of the piston 90 is in firm contact with the annular lip 82 so as to seal the opening 80 to the bore 78." 9:64-67 (emphasis added).

Indeed, a review of the embodiments accompanying the specification reveals that a "bore" is portrayed as a circular opening or hole in the housing of two different pieces. Similarly in the specification of the '674 patent, embodiments show a first stage regulator housing with a circular hole and a smaller device with a circular opening. See 10:62-64 ("[1]he housing shaft 65 includes a threaded portion 68 which is designed to engage a bore 69 (FIG. 14) disposed within the first stage regulator housing 34") (emphasis added); 12:8-10 ("In this closed position, neither fluid, liquid nor particulate matter of any kind can pass into the bore 78 through the inlet 80.") (emphasis added).

The intrinsic record, therefore, does not support two different meanings of the term "bore." Two Forty's suggested construction is more amenable to one skilled in the art. It accurately describes "bore" in all instances of use, whether in the '609, '958, or '674 patents. Nor does the '674 patents by itself indicate a separate meaning for "bore." At least for claims one through twelve of the '674 patents, Aqua-Lung's proposed definition of "an internal passageway that is cylindrical" does not sound that much different than Two Forty's proposed definition of "a hole or passage." Two Forty's proposed definition, however, lacks the "cylindrical" qualifying element that Aqua-Lung proposed and is present in the embodiments. At the
hearing, both sides agreed that the term "bore" does bring in this cylindrical concept. Any definition, therefore, must include that defining aspect.

In short, there may be different uses of "bore" in the claims of the '674 patents, but at base the meaning remains the same. Said another way, the Court cannot import limitations from specific embodiments where "bore" is used in multiple contexts. The fact remains that whether "bore" is a cylindrical hole in the regulator or a cylindrical hole in the insert piece, it remains a cylindrical hole. Based on the foregoing, the Court construes "bore" to mean "a cylindrical hole or passage."

Claim 3 includes the word "bore," the interpretation of which is also in dispute. Claim 3 reads as follows: "A cannula as in Claim 1 in which said proximal end tube flow path is a bore and in which said distal end tube flow path is a bore having a diameter less than the diameter of said proximal end tube bore."

The court concludes that a "bore," as used in Claim 3, is a hollow tube. Neither the specifications nor the prosecution history shed light on the meaning of this term in the context of the claim, so the court relied upon the ordinary meaning of the word: an interior cylindrical opening usually running the entire or nearly the entire length of an object; the interior diameter of a tube (as of a hypodermic needle). Such a definition is consistent with that given by Sheehan, who stated that a bore is a tube, like a cannula.

Plaintiff contends that a bore, by definition, must contain an opening at the end of the tube. The court does not read that restriction into the word. The focus of the definition is on the hollowness of the tube, and not whether there is an opening or where such an opening may be located.

Arcom objects to Magistrate Judge Peebles' recommended construction of the term "bore" as "a generally cylindrical hole made by or as if by boring through the use of a rotary instrument." Arcom does not contend that the construction is technically incorrect; rather, it contends that a lay jury may find it confusing and may believe that the use of a rotary instrument is required. Arcom requests the construction be modified to read "a generally cylindrical hole," or, in the alternative, "a generally cylindrical hole, which could be made by various methods, including by a rotary instrument or by molding." Upon de novo review, the Court adopts Magistrate Judge Peebles' recommended construction.

Young's challenge to the findings of noninfringement on the '547 patent centers on the court's construction of the following limitation from claim 1: 2

a one-piece body having a sleeve part with an open rear end, a neck part, and a head part including a back adjacent said sleeve and a front, a first axial bore extending through the sleeve and neck part, a second axial bore in the head part, said first and second bores communicating with each other at an intersection and being at an angle with respect to each other, and receiving means at the front of said head part;

The claim terms "head" and "bore" are in dispute, with the meaning of the former dependent on the meaning given the latter. The district court defined "bore" as a structure that is "formed by a cylindrical wall extending from one side of the neck around to the other side of the neck." The court stated that the bore's purpose "is to receive and enclose the driven gear." The court thus ruled that the "head" was the entire enlarged area completely surrounding the bore at the end of the neck. After "hesitantly" agreeing to conduct a literal infringement analysis, the court determined that the head of Q3's DPA has a solid end structure (cap 9 in Fig. 3 of the '859 patent) and thus does not contain
an aperture at the front end of the head, as required by the "receiving means" element of the claims. The court thus granted summary judgment of no literal infringement.

2 The other asserted claims each contain a similar limitation. All call for an aperture or receiving means at the front, or distal end, of the head.

3 The parties do not dispute the court's finding that the "receiving means" is the aperture 11, shown in Fig. 1 of the '547 patent, or structural equivalents thereof.

We believe the district court's construction of the disputed claim limitation is a more natural reading of the claim language. The claim limitation calls for a head with a back adjacent the sleeve and a front, with an axial bore in the head. The plain English meaning of bore is "an internal cylindrical cavity, as of a pipe or tube," which is the definition applied by the district court. See Webster's New International Dictionary 255 (3d ed. 1968). The specification describes, and the patent figures show, a head that wraps around the driven gear and shaft, forming a cylindrical bore. For example, in the summary of the invention, Bailey states that "the head has an axial bore therein," and in the description of the preferred embodiment notes that "[the] head portion 6 is formed as a cylinder at right angles to the neck 5." In the prosecution history, he proclaims: "All of these claims call for a one-piece body having both a bore for the drive gear and a bore for the driven gear in it, the body having the equivalent of the aperture 11 at the front of the head. . . ." All of these sources indicate that the bore is a substantially cylindrical hole in the head, and not a small portion of a hole in a terminated head, as argued by Young. The claims, specification, and file history simply do not support Young's broad reading of the claims.

2. Construction of "axial bore for receiving said curvate head"

The parties agree on the meaning of "axial bore" but dispute the meaning of "for receiving said curvate head." (Defs.' Resp. Br. 17.) The crux of the parties' dispute over this term concerns the question of whether this phrase limits the size of the bottom hole of the bore such that only "top-loading" use is possible: is the bottom hole sized such that the claim is limited to devices in which the screw is inserted through the top, or does it include devices in which the screw is inserted through the bottom? Medtronic argues in favor of a construction limiting it to top-loading devices.

Medtronic begins with the "only one way" specification argument which this Court has already rejected. In the absence of language in the specification which constitutes a clear redefinition by implication, Federal Circuit law does not allow the characteristics of a preferred embodiment to be imported as claim limitations, based on a redefinition by implication theory.

Medtronic's proposed construction of this phrase also hits a wall created by the doctrine of claim differentiation. In Curtiss-Wright Flow Control Corp. v. Velan, Inc., the Federal Circuit explained the doctrine of claim differentiation as follows:

\[
\text{GO BACK}
\]

- 971 -
reading an additional limitation from a dependent claim into an independent claim would not only make that additional limitation superfluous, it might render the dependent claim invalid.

438 F.3d 1374, 1380 (Fed. Cir. 2006) (citations omitted).

The essential concept Medtronic proposes is that the axial bore must have holes of different sizes at the top and bottom ends, such that the screw head can fit in through the top but not through the bottom. The doctrine of claim differentiation, however, creates a presumption against this. Claim 21 is an independent claim. Claim 23 is a dependent claim, depending on claim 21: "The assembly of claim 21 wherein said bore includes at least two portions having different diameters." (089 Patent, col. 14, ll. 5-6.) Under the doctrine of claim differentiation, "an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright, 438 F.3d at 1380. Thus, claim 21 should not be construed as requiring a bore that includes at least two portions having different diameters. This defeats Medtronic’s proposed construction.

Moreover, the aspect of the specification Medtronic points to does not appear to have the limiting implications Defendants claim. Medtronic points to the preferred embodiment characteristic of an inwardly tapered lower chamber portion, and states: "Thus, the screw must be inserted in the top of the axial bore since it cannot fit through the tapered bottom portion." (Defs.’ Br. 25.) This inference is opposed in the declaration of Fastenetix’ expert, Dr. Crisco, who stated that the preferred embodiment "could easily be configured" so as to be bottom-loaded, and also offered some explanations of how this could be done. (Crisco Dec. P 39, 43.) The rebuttal declaration of Medtronic's expert, Dr. Gulberg, takes issue with Dr. Crisco on many points related to this issue but does not state that the preferred embodiment cannot be configured so as to be bottom-loaded. (Gulberg Dec. PP 25-26.) This Court infers from this evidence that the preferred embodiment can, in fact, be bottom-loaded. Thus, even if this Court found a basis to import characteristics of the preferred embodiment as claim limitations -- a position that has clearly been rejected -- the preferred embodiment does not appear to require top-loading.

In its responsive brief, Medtronic contends that "for receiving said curvate head" must mean that the bottom hole is too small for the screw head to go through. Medtronic offers no rationale for this assertion, and this Court does not perceive why the curvate head cannot be received from the bottom hole as well as the top one.

A. Motion for Reconsideration of Claim Construction

In an Order dated May 14, 1998, this court construed the claims of the '100 Patent as follows: 1). "Boring, when turned, a hole in bone mass" was defined as "making a cylindrical hole by the removal of material with a rotary tool." The court further held that "[a] drill means does not include a screw or a pin or a nail or a trocar tip or any other object that does not have cutting edges and flutes." (Slip Op. at 5-6). "Thread means that includes a plurality of thread flights formed in the anchor distal from said drill means end to turn into the bone mass following the drill means" was defined to include "thread means that overlap the drill means so long as a greater number of thread means are distal from the drill means." 3). "Means for securing a suture to said anchor to extend therefrom after said anchor is seated in the bone mass" was defined as "a structure having a suture permanently attached to a retention disk positioned internally within the anchor." In construing the claim this court relied on the claim itself, the specification and the prior art as revealed in the prosecution history. The court did not rely on extrinsic evidence except for a general understanding of the patent.

Mitek's Motion for Reconsideration of Claim Construction argues that the court committed errors in its construction of the terms "drill means" and "means for securing". Mitek does not request modifications of the court's definition of "thread means". Mitek argues that the question of whether or not a drill means includes a screw, a pin, a nail or a trocar tip is a question for the jury and not a question of law for the court. This court disagrees. Mitek argued and presented evidence at length to support its contention that a drill means includes a trocar tip, a pin, a nail or a screw and requested that this court construe the term "drill means" to include these devices. Only when this court disagreed with Mitek's definition did it argue that this was an issue for the jury. The conclusion that a drill means does not include objects that do not have cutting edges and flutes is fully supported by the intrinsic evidence. Further, the Federal Circuit has affirmed claim construction rulings that define functions or structures that are excluded from the coverage of a claim. See, e.g. The Gentry Gallery, Inc., v. The Berkline Corp., 134 F.3d 1473, 1477 (Fed. Cir. 1998) (term "console" construed to exclude tray unit) and General American
Transp. Corp. v. Cryo-Trans, Inc. 93 F.3d 766, 770 (Fed. Cir. 1996) (opening "adjacent" to a side was construed to exclude opening adjacent to an "end wall").

Mitek further argues that the court committed error in defining "means for securing" to exclude a freely sliding suture. As stated above, this court may properly define functions or structures that are excluded from the coverage of a claim. Mitek also argues that the court may not use the prior art to limit the range of structures that may be equivalent to the structure disclosed in a specification for performing an identified function. Once again, this court disagrees. It is well established that the prior art as cited by the applicant is part of the intrinsic evidence upon which the court must rely to construe the claims. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). The prior art relied upon by the applicant "gives clues as to what the claims do not cover." Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 399 (Ct Cl. 1967). The holding that the structure of the means for securing cannot include an eyelet is full supported by the intrinsic evidence. Therefore, Mitek's Motion to Reconsider Claim Construction is denied.

For boring, when turned, a hole in bond mass

Because the inventor did not define "boring" in the specification or the prosecution history and the claim does not impact the clarity of that term, the court below properly determined that the plain and ordinary meaning should be used in claim construction. Mitek argues that the court erred by defining the term "boring" to require the removal of material because nothing in the specification requires it, and if it was required, the claim would have used the term "boring out". Arthrex asserts that there is no suggestion in the patent that a hole may be "bored" in bone by turning in the threads of a screw-like device. The plain and ordinary meaning of "boring" includes the removal of material from the hole. See Webster's New International Dictionary 255 (3rd ed., 1971). This meaning excludes the action of a screw being turned with the material merely compressed. The prosecution history also supports Arthrex's assertion because when distinguishing his device from prior art that included a screw-like device, the inventor stated that none of the prior art involved a combination of drill means and thread means in a single anchor assembly.

In light of this construction and the absence of disputed facts, the district court properly concluded that Arthrex's anchors do not infringe because they do not perform the identical or substantially the same function of boring a hole with the same or equivalent structure disclosed in the patent.

"boss"

Claim 1 of the '936 Patent contains the term "boss." SHURflo contends that "boss" means "an area raised with respect to some other area," while Defendants contend that "boss" means "a structure residing on a flat body." The parties dispute whether a "boss" is merely a "structure" or a "raised area."

SHURflo argues that its proposed construction is consistent with the ordinary meaning of the word and the specification, which refers to "raised bosses 50." '936 Patent, col. 14:63. SHURflo argues that Defendants' proposed construction fails to take into account the raised geometry of a "boss." Defendants contend that the specification's use of the term "raised bosses" and the use of the phrase "at least one boss includes two bosses raised from the substantial planar body" in claim 7 of the '936 Patent indicate that a "boss" is not necessarily "raised." '936 Patent, col. 14:63; col. 20:61-63.

The specification's consistent use of "raised" with "boss" provides strong evidence that the patent's use of "boss" is not merely intended to be a "raised area." To construe it as such would inappropriately eliminate meaning from either the word "raised" or the word "boss," which fundamentally refers to a protrusion. Moreover, Claim 7 uses the term "raised" when referring to the term "boss" to specify that the projections extend roughly perpendicular to the "substantially planar body." '936 Patent, col. 20:57-63. In view of the claim language, the specification, and the plain and ordinary meaning of the term "boss," the Court construes the term "boss" to mean "a three dimensional body or structure extending from the planar body."
E. Claim 35

A device as in claim 31 wherein both cover portions extend across the cover.

The parties generally agree that both the limited expansion portion and the differential expansion portion of the cover reaches or stretches from one side of the device adjoining the base to the other side of the device adjoining the base. The court finds this limitation to be construed as "a device as in claim 31 wherein both the limited expansion portion and the differential expansion portion of the cover reach from one side of the device adjoining the base to the other side of the device adjoining the base."

6. Opening at the Bottom

Finally, TI Group argues that dependent claim 8, reciting that the opening for connecting, defined above, is "at the bottom of the reservoir" was construed too narrowly by the district court. The district court determined that the opening must be "in the bottom surface of the reservoir." Markman Order at 2. TI Group argues that this construction is more narrow than the ordinary and customary meaning of the term "bottom" and is inconsistent with the written description. VDO counters that the district court's construction is consistent with every drawing in the patent. As we have already discussed, the fact that the drawings are limited to a particular embodiment does not similarly limit the scope of the claims. Anchor, 340 F.3d at 1306-07. Rather, TI Group is entitled to the full breadth of claim scope supported by the words of the claims and the written description. VDO's argument again focuses on a single, narrow dictionary definition, when many equally apt, and broader, definitions are also provided. The written description does not restrict the ordinary and customary meaning of "bottom" in any respect. Therefore, we conclude that the "bottom" of the reservoir means "the lower or lowest part," Webster's at 259, of the reservoir, and is not restricted only to the bottom surface thereof.

Claim 1:

A snowmobile ski, comprising:

- a base extending in a longitudinal direction and having a bottom for moving over snow, the base also extending in a lateral direction between a first edge and a second edge thereof and having a top adapted to be connected to a snowmobile; and
- a first side portion extending in the longitudinal direction and extending downward from the first edge;
- a second side portion extending in the longitudinal direction and extending downward from the second edge; and
- a first guide rod disposed on a bottom of the first side portion; and a second guide rod disposed on a bottom of the second side portion.

's594 patent, col. 6, ll. 58-67 (emphasis added).

Claim 10:

A snowmobile ski, comprising:
a base extending in a longitudinal direction and having a bottom for moving over snow, the base also extending in a lateral direction between a first edge and a second edge thereof and having a top adapted to be connected to a snowmobile;

a first side portion extending downward from the first edge and extending in the longitudinal direction;

a second side portion extending downward from the second edge and extending in the longitudinal direction, the first and second side portions having a front and a rear and tapering downward from the base at the front and tapering upward toward the base at the rear;

a first guide rod disposed on a bottom of the first side portion; and a second guide rod disposed on a bottom of the second side portion.

Id. at col. 7, ll. 1-8 (emphasis added).

The district court construed the phrase "bottom for moving over snow" to require "flat middle and rear bottom portions that would serve to funnel snow underneath the middle portion of the ski and enhance flotation." To support this construction, the court relied on a passage found in the '594 patent's "Summary of the Invention": "Flotation is enhanced by forming the base of the ski so that as it moves across snow, the snow is funneled toward the middle portion of the ski." The court further cited a passage from the "Description of the Preferred Embodiment" where the patentee describes how a snowmobile ski "having a flat middle bottom (40), as depicted in FIG. 4, and rear bottom (60), as portrayed in FIG. 5, also aids flotation on snow." In addition, the court concluded that the prosecution history of the '594 patent required that claim coverage be limited to circumstances in which the middle and rear bottom portions of the ski are flat.

In light of its claim construction and prosecution history analyses, the court held that the claims as interpreted did not read on the accused product either literally or under the doctrine of equivalents and entered summary judgment of noninfringement for Bombardier. It also denied Simmons's request for a preliminary injunction.

At the outset, we note that the parties are in contention about the claim language the district court should have construed in this dispute. Simmons asserts that it was only necessary for the court to construe the word "bottom," while Bombardier successfully urged construction of the phrase "bottom for moving over snow." The court properly determined that the limitation in dispute was "bottom for moving over snow" because the word "bottom" in this particular instance finds context in the surrounding words. See Hockerson-Halberstadt, Inc. v. Converse Inc., 183 F.3d 1369, 1374 (Fed. Cir. 1999) (surrounding words of disputed claim language must also be considered in determining the ordinary and customary meaning of that language). However, the court erred in abandoning its quest for a common meaning for an individual word that is part of a phrase that lacks a common meaning. Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1372 (Fed. Cir. 2003).

Simmons argues that the court improperly narrowed the scope of claims 1 and 10 by limiting the claimed snowmobile ski to a particular shape, i.e., flat in the middle and rear portions. It contends that "bottom" as used in the limitation at issue has an ordinary and customary meaning of "the underside." The American Heritage College Dictionary 163 (3d ed. 1993). Simmons also argues that the court erroneously imported limitations from the written description into the claims and misapplied the prosecution history as limiting the scope of the claims at issue. Bombardier defends the court's claim construction and noninfringement analysis asserting that the written description and prosecution history of the '594 patent require that the claim language be restricted to a snowmobile ski with a certain shape.

The analytical focus of claim construction must begin and remain centered on the language of the claims, for it is that language that the patentee chose to use to "particularly point[] out and distinctly claim[] the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, ¶ 2 (2000). Claim language is given its plain, ordinary, or accustomed meaning to one of ordinary skill in the relevant art, unless the applicant has imparted a novel meaning to the language. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002).

The district court erred in incorporating limitations of the preferred embodiment into the "bottom for moving over snow" claim limitation. Its consultation of the written description and prosecution history before making any effort to discern the ordinary and customary meanings attributed to the language of the claims was premature. Tex. Digital Sys. v. Telegenix, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002). The court also erred in concluding that Simmons had implicitly defined the limitation at issue. A basic canon of claim construction is that one may not read a limitation into a claim from the written
Contrary to the court's conclusion, the specification does not show that Simmons implicitly defined the claim language at issue or restricted claims 1 and 10 to the preferred embodiment. Nothing in the intrinsic evidence suggests that the middle bottom (40) or the rear bottom (60) should be limited to being flat. The flat middle and rear bottom limitation is simply not present in claims 1 or 10, thus the language of the asserted claims does not limit them to that requirement. Moreover, neither the specification nor the prosecution history includes an expression of manifest exclusion or restriction demonstrating intent to limit the middle bottom (40) or the rear bottom (60) to being flat. Although the specification describes only one embodiment of the middle bottom (40) and the rear bottom (60), no "clear statements of scope" limit those details to having an underside that is flat.

The court's requirement that the "bottom for moving over snow" limitation of claims 1 and 10 be flat in the middle and rear portions impermissibly reads limitations from the specification into the claims. Because the patentee did not deviate from the accustomed meaning of the disputed language we construe the limitation "bottom," in context with its surrounding language in claims 1 and 10, to mean "the underside for moving over snow." Accordingly, we vacate the court's grant of summary judgment of noninfringement in favor of Bombardier and remand for further proceedings consistent with this opinion.

The parties' first dispute focuses upon the clause "being disposed at a bottom of said walls and within said body and extending between said first and second ends thereof." At the Hearing, the parties agreed that the court should construe "at a bottom of said walls" as "the lowest part" and "within said body" as "inside the dump body." See, e.g., TI Group Auto. Sys. (N. Am.), Inc., 375 F.3d 1126, 1135-36 (equating "within" with "inside"). 11

The parties offer competing constructions of the clause "extending between said first and second ends thereof." HECO construes the clause as "the conveyor . . . is located entirely within the end walls, i.e., no part of the conveyor extends beyond the end walls of the dump body." JCCC at 4. Cives and Monroe do not believe the clause needs construing. Alternatively, they construe the clause as "the conveyor extends from the front wall to the back wall.

The court construes "extending between said first and second ends thereof" as "extends from the front wall to the back wall." HECO's proposed construction is too restrictive. Nothing in the clause requires that the conveyor be located entirely within the first and second ends of the dump body. In common usage, "extending between" is not necessarily used restrictively. For example, Interstate 80 "extends between" Iowa City and Chicago. This does not necessarily mean that Interstate 80 is entirely located between Iowa City and Chicago. Indeed, Interstate 80 stretches from coast to coast.

The specification makes clear that a person of ordinary skill in the art at the time of the invention would not necessarily construe "extends between" restrictively. For example, the specification states:
The hoist means 32 includes hydraulic cylinder means 90 shown in FIG. 2 which extends between the chassis 14 and the dump body 16 with the hydraulic cylinder means 90 being disposed preferably forwardly relative to the dump body 16 so that the conveyor means 34 extends through the second end 20 of the dump body 16 with sufficient clearance between the cylinder 90 and the conveyor means 34 to permit unimpeded hoisting of the dump body 16.

'389 patent, col.5, ll.61-66, col.6, ll.1-2 (italics added). In other words, in a preferred embodiment of the invention, the conveyor means is not located entirely between the first and second walls, but instead extends through the second (front) end of the dump body. Indeed, Figure 3 shows a conveyor extending through and slightly past the front end wall:

GET DRAWING SHEET 2 OF 4

'389 Patent, fig.3. The Federal Circuit Court of Appeals has repeatedly held that a claim interpretation that excludes a preferred embodiment "is rarely, if ever, correct." See, e. g., MBO Labs., Inc. v. Becton, Dickinson & Co., No. 2006-1062, 474 F.3d 1323, 2007 WL 163068, at *8 (Jan. 24, 2007) (quoting On-Line Techs., Inc. v. Bodenseewerk Perkin-Elmer GmbH, 386 F.3d 1133, 1138 (Fed. Cir. 2004)). HECO does not explain how its proposed construction is an exception to this general rule, and thus the court declines to adopt such construction.

The court recognizes that the claim also states that the conveyor means is "within said body" and "in ordinary and customary usage, what is not outside is inside." TI Group, 375 F.3d at 1136. In this patent, however, the specification makes clear that the requirement that the conveyor means be inside the dump body does not mean that the conveyor means must be entirely within the dump body. Were the court to adopt HECO's proposed construction, the court would wrongly infuse an additional restriction that the claim language does not contain. The patentee did not claim that "no part of the conveyor extends beyond the end walls of the dump body." Indeed, the specification indicates otherwise.

In sum, the court construes "being disposed at a bottom of said walls and within said body and extending between said first and second ends thereof" as "being disposed at the lowest part and inside the dump body and extending from the front wall to the back wall."

GO BACK

548

At trial, the parties disagreed as to the meaning of one particular limitation within the asserted claims: "bottom plane." Specifically, the parties disputed whether the "bottom plane" of the groove in the claimed screen plate includes a bottom physical surface. According to CAE, the district court erred when it concluded that the limitation does require a physical surface. CAE argues that the trial court improperly read limitations from the patent's preferred embodiment into the claims and misconstrued the patent's prosecution history. Had the court focused on the language of the specification and the patent drawings, CAE continues, it would have avoided this error, and held that the disputed term imparts no physical surface requirement.

Claim construction starts with the language of the claim itself. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996); see also Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1344, 47 U.S.P.Q.2D (BNA) 1418, 1424 (Fed. Cir. 1998) ("The actual words of the claim are the controlling focus.") (citing Thermalloy, Inc. v. Aavid Eng'g, Inc., 121 F.3d 691, 693, 43 U.S.P.Q.2D (BNA) 1846, 1848 (Fed. Cir. 1997). Claim 1 provides for grooves in the surface of the screen plate that include a "bottom plane." The claim further provides for an "upstream side plane" and "downstream side plane" for the grooves, at different orientations to the envelope surface. These side planes, along with the bottom plane, "form" the contours of the grooves. The bottom plane of the grooves further include "perforations."

This language supports the interpretation adopted by the district court. The language specifies the orientation of the two side planes, the upstream side plane being "substantially perpendicular to the envelope surface of the screen plate" and the downstream side plane as forming "a 60-5 angle against the envelope surface." This description confirms that the terms refer to the structural walls of the grooves. Given this character of the side planes, there is little reason to believe that the third component "forming" the groove, the bottom plane, does not also refer to a groove structure, particularly when all three groove components include the term "plane." See Phonometrics, Inc. v. Northern Telecom, Inc., 133 F.3d 1459, 1465, 45 U.S.P.Q.2D (BNA) 1421, 1426 (Fed. Cir. 1998) ("A word or phrase used consistently throughout a patent claim should
be interpreted consistently"). In some cases, a claim term can be given a different meaning in the various claims of the same patent, when a patent so provides. See Georgia-Pacific Corp. v. United States Gypsum Co., 195 F.3d 1322, 1331, 52 U.S.P.Q.2D (BNA) 1590, 1598 (Fed. Cir. 1999) (citations omitted). But here, we agree with the district court that it makes little sense to provide "perforations" in the "bottom plane" unless the plane refers to at least some physical structure.

The written description and figures further support this structural interpretation of the groove components. The description notes that one can adjust the turbulence force on the screened pulp by "changing the geometrics of the sidewalls of the grooves." In each of Figures 2a, 2b and 3, the invention includes a physical structure at the bottom of the plate's grooves.

CAE asserts that other text in the written description suggests that the bottom plane does not include any physical surface. Specifically, CAE notes the description of "the bottom plane of the groove" as "at least as wide as the diameter or width of the perforations." Any such suggestion, however, is belied by the patent's prosecution history. The patent examiner rejected claim 1 as originally filed, which provided for "[a] screen plate, wherein the perforations of the screen plate are disposed at the bottom of grooves the direction of which substantially deviates from the flow direction of the pulp to be screened." According to the examiner, the claim was "clearly anticipated" by United States Patent No. 4,276,159. The examiner also cited the Canadian '322 patent.

In response, on May 7, 1984, the applicant canceled all the original claims and introduced claim 13, the predecessor to the claim subsequently issued as claim 1. Unlike original claim 1, claim 13 referred specifically to the "bottom plane," rather than the broader "bottom" of the groove. The "bottom plane" language had been included in original claim 3, which depended from claim 1. In the absence of any evidence to the contrary, we must presume that the use of these different terms in the claims connotes different meanings. See Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987). Here, this suggests that "bottom plane" refers to a surface lying within the more general "bottom" of the groove.

This interpretation is also consistent with other prosecution history in the file wrapper. On May 10, 1984, the applicant distinguished claim 13 from the Frykhult patent, which disclosed a plate with a bottom consisting of the gap between two side planes. The applicant contended specifically that "nothing in this reference teaches the use of perforations at the bottom of the recesses as stated in claim 13." One can only reasonably understand this amendment as suggesting that the claimed invention, in contrast to the Frykhult reference, has perforations in a physical structure constituting the bottom plane of the grooves.

Given this overwhelming clarity of the intrinsic evidence, we conclude that the district court's interpretation of the limitation "bottom plane" is correct, and adopt it as our own. We further conclude that the district court properly ignored CAE's proffered extrinsic evidence on this issue, the testimony of Mr. Frejborg. In our decision in Vitronics, we held that when the intrinsic evidence is unambiguous, it is improper for a court to rely on extrinsic evidence such as expert testimony when construing disputed claim limitations. See Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1577. As we explained,

in most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances, it is improper to rely on extrinsic evidence. In those cases where the public record unambiguously describes the scope of the patented invention, reliance on any extrinsic evidence is improper. The claims, specification, and file history, rather than extrinsic evidence, constitute the public record of the patentee's claim, a record on which the public is entitled to rely. In other words, competitors are entitled to review the public record, apply the established rules of claim construction, ascertain the scope of the patentee's claimed invention and, thus, design around the claimed invention. Allowing the public record to be altered or changed by extrinsic evidence introduced at trial, such as expert testimony, would make this right meaningless.

Id. (citations omitted); see also Georgia-Pacific, 195 F.3d at 1332, 52 U.S.P.Q.2D (BNA) at 1598. In Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1309, 51 U.S.P.Q.2D (BNA) 1161, 1169 (Fed. Cir. 1999), we stated that "had the district court relied upon the extrinsic evidence to contradict the claim construction unambiguously apparent from the intrinsic evidence it would have been error." Here, of course, there was no such reliance, and the district court did not commit any error. Because there is no genuine "ambiguity" in the intrinsic record relevant to this case, we conclude that the district court did not rely on the extrinsic evidence and properly ignored the proffered Frejborg testimony.

Applying the proper understanding of the meaning of "bottom plane" to the accused plates, it is clear that the district court
was correct in granting summary judgment of no literal infringement. The accused plates do not include any physical structure as part of their grooves' "bottom plane." Accordingly, no reasonable jury could find that the plates literally infringe the asserted claim.

549

A. Claim Construction:

Claim 1 of the 321 patent requires "a bottom sole attached to the bottom of said upper sole and including one or more inverted cups dispersed therein . . ." (Id., col. 4, ln. 67-col. 5, ln. 1). Similarly, Claim 1 of the 046 patent requires "a bottom sole attached to the bottom of said upper sole and including an angularly displaced inverted cup dispersed therein . . ." (Id., col. 8, lns. 60-62). The parties dispute the meaning and scope of the term "bottom sole." Construction of the common term "bottom sole" is addressed first because it applies to both of the asserted claims and all accused shoe models. Thus, disposition of this motion for summary judgment hinges upon the construction of this critical term.

Nike contends that the term "bottom sole" should be construed to mean "the outsole, which is the part of the shoe that contacts the ground and is also the lowest part of the sole." Nike argues that the intrinsic evidence demonstrates that the patentee uses "bottom sole" consistently with the accepted meaning of outsole in the shoe design art. In addition, Nike asserts that its proffered meaning is consistent with the ordinary dictionary definition of the term "bottom."

Lawlor counters that the term "bottom sole" is properly construed to mean "a part of the shoe sole attached to the bottom of the upper sole." Lawlor argues that the term "bottom sole" is used in both patents in a relative manner, rather than in an absolute sense, and was deliberately created by the patentee as a relational term to describe a functional feature different from what existed in the prior art. According to Lawlor, the "bottom sole" of the inventions is unlike a traditional outsole which is just a thin layer of rubber that absorbs little shock during a running or walking footstep. While the "bottom sole" taught in both patents may include a traditional outsole, neither the specification or the knowledge of one of ordinary skill in the art limits the "bottom sole" only to the outsole. Rather, the term "bottom sole" is used to describe a functional feature that acts in concert with an upper sole to provide enhanced shock absorption and dispersion.

In construing the scope and meaning of patent claim terms, a court looks first to the evidence intrinsic to the patent such as the claims, the specification, and the prosecution history. AstraZeneca v. Mutual Pharmaceutical, 384 F.3d 1333, 1336-37 (Fed. Cir. 2004). Of course at the onset, a court considers "the claim language itself to define the scope of the patented invention", and thereafter, the patent's specification "when the claim language itself lacks sufficient clarity to ascertain the scope of the claims." Chimie v. PPG Indus. Inc., 402 F.3d 1371, 1377 (Fed. Cir. 2005). The specification is also consulted "to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning." Id. Further, to give proper effect to disputed technical terms, the terms are interpreted as having the meaning that they would be given by a person of ordinary skill in the relevant art. AstraZeneca, 384 F.3d at 1336-37. Finally, the prosecution history, if in evidence, is examined "to discern the applicant's express acquiescence with or distinction of the prior art as further indication of the scope of the claims." Id.

Upon a review of the intrinsic evidence I conclude that the disputed term "bottom sole" should be construed in accordance with the definition proposed by Nike. The reasons for my conclusion follow:

First: in the 046 patent's "Background of the Invention" and "Detailed Description of Preferred Embodiments", the term "bottom sole" (numbered 14) is consistently described alternatively as either the "outersole" or "outsole". (See 046 patent, col. 2, lns. 47-50; col. 3, lns. 34-35; col. 4, lns. 63-66; col. 6, lns. 63-66; col. 7, lns. 5-9; and col. 8, lns. 34-36). For example, the Background of the Invention states that "the present invention has overcome the basic shortcomings of the prior art by providing [a] . . . shoe sole which utilizes one or more inverted cups dispersed within the outersole or bottom sole." (Id., col. 1, lns. 37-41). In the Detailed Description of the Preferred Embodiments, the "rubber bottom sole" of the present invention is again described alternatively as the outsole, and further narrates that "ribs or other patterns" may be "provided on the bottom surface of the outsole" to "enhance gripping contact between the shoe sole and the ground." (Id., col. 4, lns. 43-59).

Second: the reciprocal use of "bottom sole" and "outsole" in the 046 patent does not support the proposition that the "bottom sole" functions alternatively as an outsole and that therefore "bottom sole" should be construed as different from an outsole.
Rather, the two terms are synonymous, and are used to describe and define the same structure numbered 14 in the 046 patent and its Figures. It is readily evident that the terms "bottom sole" and "outsole" are used interchangeably throughout the specification, and thus should be construed in the same manner. See Tate Access Floors Inc. et al., v. Maxcess Tech. Inc., 222 F.3d 958, 967-969 (Fed. Cir. 2000) (construing disputed claim terms in the same manner because the terms are readily used interchangeably in the specification).

Third: Figures 15-16 and 19-24 of the 046 patent each depict the bottom sole or outsole 14 as the ground-engaging part of the shoe sole. Further, in The Running Shoe Book, the outsole is described as the portion of the sole making contact with the ground. See Peter R. Cavanagh, The Running Shoe Book, p. 98; Figures 5.1a, B.1b. 1

Fourth: the specification of the 321 patent describes "bottom sole" (numbered 12) as being the ground-engaging part of the shoe. The specification refers to bottom sole 12 as "a rubber bottom sole" or a "hard rubber bottom sole." (See e.g. 321 patent, col. 3, In. 8; col. 4, In. 15, In. 38). In particular, Figures 3, 4 and 6 of the 321 patent each depict the bottom sole as the part of the shoe sole contacting the ground.

Fifth: the 321 patent describes the bottom surface (numbered 26) of bottom sole 12 as being "primarily flat", and states that "alternatively, however, ribs or other patterns for enhancing gripping contact between the shoe and the ground may be provided on surface 26." (321 patent, col. 3, Ins. 46-49). Contrary to Lawlor's assertion, this phrase does not support the construction that bottom sole 12 can act either as an outsole or as a flat surface to which a treaded outsole could be affixed. The phrase, read in the context of the entire specification, does not lend itself to providing for such a broad reading of the term "bottom sole". Indeed, the specification does not teach, even by way of implication, that another sole could be affixed to the bottom surface 26 of bottom sole 12. It is apparent that the invention of the 321 patent contemplates bottom sole 12 as being the ground-contacting sole, which may either be flat or contain patterns for enhancing ground gripping.

Sixth: as argued by Nike, during prosecution of the 321 patent, it is evident that both the patent examiner and Lawlor understood that bottom sole 12 referred to the outsole of a shoe. For example, when rejecting all the original claims as obvious under 35 U.S.C. § 103, the examiner equated bottom sole 12 to the combined outsoles of prior art references Hogg, U.S. Pat. No. 2,424,463 and Denu, U.S. Pat. No. 4,130,947. [See 321 Patent Prosecution History, Office Action dated 10/12/83 at pp. 2-3; and Office Action dated 04/19/84 at pp. 3-4]. The Hogg reference shows an outer sole of a shoe having rubber suction cups and skid-resisting ribs; and the Denu reference describes a hard rubber outsole containing ribs on its underside for gripping, with spaces between them. In attempting to distinguish these references in subsequent responses, Lawlor similarly characterized the Hogg and Denu outsoles as the "bottom sole layer" and "bottom outer sole layer", respectively, in comparing them to his claimed bottom sole.

Seventh: construing the term "bottom sole" as outsole is consistent with the ordinary meaning of the term "bottom". "When examining a claim, a court must presume that the terms in a claim mean what they say, and unless otherwise compelled, give full effect to the ordinary and accustomed meaning of claim terms." Johnson Worldwide Assocs. Inc. v. Zebo Corp., 175 F.3d 985, 989 (Fed. Cir. 1999). To do so, the Federal Circuit cases "emphasize the use of technical and general usage dictionaries in determining the ordinary meaning." Astrazeneca, 384 F.3d at 1337. Further, if patent claim language has an ordinary and accustomed meaning in the art, there is a heavy presumption that the inventor intended that meaning to apply. Bell Atl. Network Servs., Inc. v. Covad Communs. Group, Inc., 262 F.3d 1258, 1269-70 (Fed. Cir. 2001). Thus, unless the inventor has manifested an express intent to depart from that meaning, the ordinary meaning applies. Telefex Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002); see also Optical Disc Corp. v. Del Mar Avionics, 208 F.3d 1324, 1334 (Fed. Cir. 2000) ("Without evidence in the patent, specification of an express intent to import a novel meaning to a claim term, the term takes on its ordinary meaning.").

The accepted meaning in the shoe design art denotes the term "bottoms" as: "the underface of the shoe sole which extends
from the toe to the heel breast." American Society for Testing and Materials (ASTM), Standard Definitions of Terms Relating to Athletic Shoes and Biomechanics F 869-86 (Re-approved 1994). The term "outsole" is described in ASTM as: "the bottom sole thickness. The surface of which is exposed to wear." Id. In Merriam-Webster's Collegiate Dictionary, (11th ed. 2003), the term "bottom" is characterized as: "the underside of something" and "the lowest part or place."

Nothing in the 321 patent and the 046 patent, or the patents' prosecution history, demonstrates that Lawlor intended to deviate from the ordinary and accustomed meaning of "bottom sole". Nor is there any express language showing that Lawlor, in using the term "bottom sole", intended to refer to anything other than the lowest part of a shoe sole.

Hence, in the instant case, "bottom sole" is properly construed as "outsole" which refers to the part of a shoe sole that engages and contacts the ground. Accordingly, "bottom sole" as used in the asserted Claim 1 of the 321 patent and asserted Claim 1 of the 046 patent is construed to mean the outsole of a shoe, which is the part of the shoe that contacts the ground and is also the lowest part of the sole.

2. Claim Construction of the Term "bow"

The parties also disagree over the terms, "bow," "bow-shaped" and "bowed section" as used in claim 1 of the '741 patent.

The claims at issue contain the following limitation:

a backrest . . . wherein said backrest comprises a frame having a pair of spaced-apart, bow-shaped side members, each of said side members having a lower section and an upper section, wherein each of said upper sections extends from one of said respective lower sections so as to form a pair of first bowed sections at substantially a lumbar region of said backrest, wherein said first bowed sections have a generally convex-shaped forwardly facing contour, and wherein said upper section of each side member further extends laterally outwardly from said lower section . . . . [Emphasis added]

Defendants contend that the written description and drawings indicate that "bow" means that the sides of the backrest frame form an arch with a discrete upper section and a discrete lower section. In particular, defendants argue that the written description defines the bowed section as a discrete section of the backrest frame and that the drawings illustrate a backrest frame that has a section extending above the "peak" of the bow and a section extending below the "peak" of the bow. According to defendants, every embodiment of the patent shows a discrete lower section extending below the bowed section.

Plaintiff argues that defendants are reading limitations into the claims; specifically, that defendants are reading the word "discrete" into the claims. Plaintiff contends that the proper reading of "bowed section" is the section formed by at least a portion of the upper section and at least a portion of the lower section.

A reading of the language of the claim itself reveals the proper meaning of "bow." The claim recites "each of said upper sections extends from one of said respective lower sections so as to form a pair of first bowed sections . . . ." '741 Patent, col. 22, ll. 45-47. Therefore, the bowed section of the backrest frame side members is that portion of the frame created by the connection of an upper section and a lower section. It is neither uncommon nor improper in patent claim drafting to define structures in such ways. The use of the terms "upper section" and "lower section" allow the claim drafter to then further describe other characteristics and limitations within the same or a dependent claim. For instance, dependent claim 6 recites, "The seating structure of claim 1 wherein said frame further comprises a top member extending between and connecting said upper sections of said side members and a bottom member extending between and connecting said lower sections of said side members." Id., cols. 22:66-23:3 (emphasis added). Without using the terms "lower section" and "upper section" it would be impractical to describe where the "top member" or "bottom member" is placed.

Moreover, the use of "bowed" in "bowed sections" provides a limitation to the interaction of the upper and lower sections. Arguably, a chair having a backrest with side members wherein the lower and upper sections came together to form a sharp point (perhaps a 90 [degree] angle), would not infringe the patent claim because the formation created by the connection of the upper and lower sections must be "bowed," which the claim defines as "a generally convex-shaped forwardly facing contour." See id., col. 22, ll. 49-50. Thus, the "bowed section" must be "curved." Accordingly, contrary to defendants'
argument, the use of the terms "bowed section," "upper section" and "lower section" within the claim do not require there to be "discrete" sections so as to avoid having superfluous claim language. Rather, as properly construed, each term holds meaning. In sum, the bowed section of the backrest frame side members is the curved portion of the frame created by the connection of an upper section and a lower section.

551
The word "bows" means "members that are either curved or straight and have any cross-sectional shape."

552
11. "[B]racing itself on the wiper blade:" 11 "Supporting itself on both the support element and wiper strip." Although claim 1 refers to bracing on both wiper strip (20) and support element (16), the inventive nature of the '434 patent, illuminated by the intrinsic record, does not require that such bracing be simultaneous. (See col. 1:52-2:17)

553
The '210 patent consistently refers to a "bracket" it means or member that is mounted to the wheelchair frame. Words used in a claim are to be given their ordinary meaning, unless it appears that the inventor used them differently. Jonsson v. Stanley Works, 903 F.2d 812 (Fed. Cir. 1990). Contrary to plaintiffs' present assertions that the word "bracket" refers to any connecting point creating a straight line transfer of forces, there is no evidence that the use of "bracket" in any of the claims was intended to invoke this special and uncommon meaning. Webster's Unabridged Third New International Dictionary defines bracket as a "member that projects from a wall, pier, or other structure, and is usually designed to support a vertical load or to strengthen an angle." Especially in light of the drawings in the '210 patent, 1 we are convinced that the words "bracket," "bracket means," and "bracket member" in the '210 patent claims describe a rigid fixture, which can be mounted in a stationary position at a fixed point on the wheelchair frame in order to establish a fixed angular relationship between the occupant lap and rear wheelchair restraint belts.

554
2. CLAIM CONSTRUCTION OF THE CLAIMS ONE AND EIGHTEENTH

To rule on the Motion, the Court must first construe two phrases: (1) "each said element comprising three or more strands interwoven to form a braided element," recited in claim 1 of the '021 Patent; and (2) "said conductive elements comprising at least three individual strands woven together in a braid-like fashion," recited in claim 18 of the '021 Patent.
The parties dispute the "ordinary and customary meaning." Phillips, 415 F.3d at 1312, of the term "braid." Defendant offers the testimony Dr. Abdel-Fattah M. Seyam ("Dr. Seyam"), to show that a "braid" is "formed by intertwining three or more yarns in such a way that no two yarns are twisted around one another." (Declaration of Dr. Seyam in support of Motion ("Seyam Decl.").) Plaintiff argues that this definition is underinclusive, and that Dr. Seyam's definition is not one of a "person of ordinary skill in the art" of the patent because Dr. Seyam declared that his definition is that of "a person of ordinary skill in the textile arts" rather than an expert in electro-mechanical deterrent devices. But the Court finds that in construing terms like "braid," "weave," "knit," and "mesh," the testimony of a textile engineer is highly instructive. Additionally, the Court finds that Dr. Seyam has demonstrated skill and expertise in the field of mechanical engineering as well as textile engineering. (See Supplemental Declaration of Dr. Seyam in support of Reply ("Suppl. Seyam Decl.") P 1, 4.) If the Court were to find that a POSIT in this case must be skilled in mechanical engineering, Dr. Seyam would still be qualified. If, on the other hand, the Court were to find that because '021 Patent focuses on the textile nature of the conductive elements, a POSIT must be skilled in textile engineering, then the Court would have to discount the testimony of Plaintiff's own expert, Dr. James Williams Jones ("Dr. Jones"), because while Dr. Jones is a mechanical engineer, he is not a textile engineer.

But the Court need not make such a finding to reach a decision here. Even when the Court fully considers the testimony of Dr. Jones, the evidence weighs in favor of Dr. Seyam's definition of "braid." This conclusion is based in part on the fact that in Dr. Jones's declaration, he "only considered whether there is at least . . . a dispute on the issues raised by [Defendant's] motion" because Plaintiffs counsel informed Dr. Jones that "the test is whether there is or is not a 'genuine factual dispute' with respect to infringement." (Dr. Jones's Declaration in support of Plaintiff's Opposition ("Jones Decl.") P 4.) But as noted, the analysis for summary adjudication of noninfringement is a two step inquiry. The first step is claim construction. Cybor Corp., 138 F.3d at 1454. And of course, judges, not juries, construe claims. Markman, 517 U.S. at 372. Accordingly, the issue of "whether there is a genuine dispute about the proper definition of a the [sic] claim phrase 'braided element,'" (Jones Decl. 4:1-2), is relevant only to the extent that an affirmative answer means that the Court must resolve the dispute. The Court's resolution of this dispute, after careful consideration of the evidence presented, is a finding that Dr. Seyam's testimony is the most credible and most relevant to the claim construction of the '021 Patent, and that a "braid" in the context of the '021 Patent is therefore three or more wire strands woven together in a way that no two wire strands are twisted around one another.

Plaintiff also argues that the exclusion of "mesh weaves" in the claim language means that all other meshes are included in the claim language. This argument fails. The term "mesh" means that there are open spaces between strands, and braids, weaves, and knits can all be "mesh." (Suppl. Seyam Decl. P 10.) The mesh exclusion language in claims 1 and 18 simply exclude mesh, or open, braid-like weaves. If the Court were to construe the mesh exclusion language to include all other types of mesh arrangements, then the terms "braid-like" and "braided" would become meaningless. See ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082, 1088-90 (Fed. Cir. 2003) ("the context of the surrounding words of the claim also must be considered in determining the ordinary and customary meaning of those terms"). Accordingly, the Court cannot find that the exclusion of mesh equates to the inclusion of all non-mesh arrangements.

Thus, in determining whether the New Bird Jolt infringes the '021 Patent, the Court construes "braid" in the '021 Patent to mean "three or more wire strands woven together in a way that no two wire strands are twisted around one another." The first and eighteenth claims require that the conductive elements have two limitations: (1) at least three strands; (2) that are woven tightly together into a braid or in a braid-like manner.

**B. "Braking Means"**

Defendants argue that the '346 patent must be construed as a means plus function patent under 35 U.S.C. § 112, P 6. It is undisputed that the '346 patent uses the phrase "braking means." A presumption arises when the term "means" is used in a patent. Unidynamics Corp. v. Automatic Products International, 157 F.3d 1311, 1319 (Fed Cir. 1998). Plaintiff argues that it has overcome the presumption of a means plus function analysis because the claims recite sufficient structure, relying upon Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1364-66 (Fed. Cir. 2000) and Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996).
In deciding whether the presumption has been overcome, the court should determine "whether the claims recite sufficient structure for performing the claimed function...." Envirco, 209 F.3d at 1365. The claims at issue all include the term "braking means" and a description of the function that the braking means perform in the apparatus, without a description of any structure in those claims. See Claims 1, 2, 6, 11, and 13. 4 This Court concludes that unlike Cole and Envirco, the claims of the patent at issue do not disclose sufficient structure to overcome the presumption of a means plus function patent.

4 For example, in Claim 1: "braking means, responsive to the absence of said exhaust pressure, for preventing said rotor from rotating;" in Claim 2: "braking means for enabling said rotor to rotate in said housing in response to said exhaust pressure and for inhibiting said rotor from rotating in the absence of said exhaust pressure;" in Claim 6: "braking means, responsive to said predetermined exhaust pressure, for enabling said rotor to rotate in said internal cavity and, in the absence of said predetermined exhaust pressure, for inhibiting said rotor from rotating;" in Claim 11: "braking means for automatically enabling said rotor to rotate in said housing in response to said exhaust pressure and for automatically inhibiting said rotor from rotating in the absence of said exhaust pressure;" and in Claim 13: "braking means, responsive to the absence of said exhaust pressure, for automatically preventing said rotor from rotating." See '346 Patent, col. 6-8.

In Cole the claim language at issue described the structure of the perforation in the claim itself. Cole 102 F.3d at 530 ("perforation means extending from the leg band means to the waist band means through the outer impermeable layer means for tearing the outer impermeable layer means for removing the training brief in case of an accident by the user"). The Federal Circuit concluded that this claim overcame the presumption because it contained structure (term "perforation" itself recites structure) performing the tearing function and the location of the structure.Id. In Envirco, the Federal Circuit reached a similar conclusion with regard to a claim element of a "second baffle means." The Court stated:

The term "baffle" itself is a structural term. The dictionary definition of the word "baffle" is "a device (as a plate, wall or screen) to deflect, check, or regulate flow." Webster's Ninth New Collegiate Dictionary 124 (1990). Because the term "baffle" itself imparts structure, meaning a surface which deflects air, its use in the claims rebuts the presumption that § 112, P 6 applies. Further, the claims describe the particular structure of this particular baffle ("having inner surfaces for directing airflow … radially outward … and thereafter … between said first baffle means and said air filter means").

Envirco, 209 F.3d at 1365. As described above, the claims in the '346 Patent do not contain a description of structure as do the patents involved in Cole and Envirco.

In the '346 Patent, the use of the verb "braking" to describe the means is another distinction between this case and Cole and Envirco. "Braking" is defined in the dictionary as "to retard or stop by a brake." Merriam-Webster's Collegiate Dictionary 138 (10th ed. 1996). This definition describes a function, not a structure. Plaintiff urges this Court to substitute the noun form "brake," in order to construe the claim as containing sufficient structure. For the same reasons that the Court agreed with Plaintiff that the term "only" cannot be read to modify "responsive to exhaust pressure," the Court will not substitute the term "brake" into the "braking means" elements of the claims in the '346 Patent. Even if the Court did construe the term to mean a "brake," the term "brake" by itself does not contain sufficient structure. The decisions in Cole and Envirco did not rely solely on the fact that "perforation" and "baffle" were nouns indicating structure, but rather that the claim language described either additional structure or its location.

Plaintiff argues that the Court should look to several dependent claims of the patent, including Claims 4, 5, 8, 9, 10, to find the necessary structure. It is true that these claims describe a rotary apparatus according to independent claims 2 and 6, which "includes" a brake pad (Claims 4 and 8), spring (Claims 5 and 9) and a predetermined number of guide holes (Claim 10). However, Plaintiff does not provide any legal precedent (other than the cases cited above) allowing this Court to rely upon language in dependent claims for corresponding structure to overcome a means plus function presumption. Rather, as Defendant argues, dependent claims must be construed to include all limitations of the independent claims incorporated therein. Therefore, if the independent claims fail to contain sufficient structure to rebut the presumption that they are in means plus function format, the dependent claims cannot "save" such claims from being means plus functions claims.
In addition, the dependent claims in the '346 patent use the term "includes" to describe the brake pad and spring. "Including" and "includes" are considered open terms, meaning other structure is needed to perform the function. See Altiris, 318 F.3d at 1376 ("claim language uses "including"--an open term--which suggests that the two sets of "commands" are not sufficient structure; rather, something else is needed").

Finally, while the specifications of the '346 Patent provide sufficient structure of a braking mechanism consisting of a brake pad having a number of guide holes in which guide pins are received with springs placed over the guide pins, the structure required to overcome the presumption of means plus function format must be in the claim itself. See '346 Patent, col 3; Envirco, 209 F.3d at 1365.

9. "A breath guard"

For the term "a breath guard," Foodie proposes "a barrier, such as distance, space, or solid materials, that provides protection from contaminants originating from a human's mouth or nose." Jamba Juice offers "a protective piece positioned between the customer and the customer service station to reduce the likelihood of ingredient contamination by the customer." Before analyzing the substance of the parties' different interpretations, it is important to note the parties have agreed on substantial parts of the term's definition, including use of the term "barrier." The parties also agree on the breath guard's purpose. As noted by Foodie, "the specification references the purpose of the breath guard is to reduce the likelihood of ingredient contamination during periods of consumer discourse and beverage preparation." Pl.'s Open. Markman Br. 29. Finally, the parties agreed that the "breath guard" should be positioned between the customer and the customer service station. See Transcript of Markman Hearing at 61, Foodie Partners v. Jamba Juice Co., Civ. No. 2:06-cv-12 (E.D. Tex. 2007).

6 While they did not initially propose "barrier" in their construction, at the Markman hearing, Jamba Juice made it clear that they felt a breath guard meant a "physical barrier." See Transcript of Markman Hearing at 56, Foodie Partners v. Jamba Juice Co., Civ. No. 2:06-cv-12 (E.D. Tex. 2007). On the other hand, Foodie's proposed definition uses "barrier," though as they pushed for the inclusion of space or distance in the definition of "breath guard" at the Markman hearing, Foodie's counsel later back-tracked from "barrier," saying "maybe barrier is not the most appropriate term, but I was just thinking as we were sitting here maybe it would be more appropriate to say 'mechanism such as distance or space or solid materials that provide protection.'" Counsel's second proposition was largely presented after argument over whether "barrier" included physical space, and was only offered off-the-cuff as an alternative to account for any ambiguity of whether "barrier" might include physical space. Regardless of whether "barrier" can include physical space/distance, the Court finds that "barrier" is the best term for this definition.

The dispute between the parties resides largely on the nature and positioning of the "breath guard." Regarding the nature of the breath guard, the dispute centers around whether or not the guard itself is a tangible object, or if something such as distance or air could qualify as a barrier for purposes of a breath guard. Foodie advances a number of arguments to support an interpretation that air or distance qualify as a "breath guard" under the patent. First, Foodie claims that inclusion of the term "breath" as a modifier for "guard" indicates the purpose is to guard against exhaled air during breathing or sneezing, and therefore distance or space would be an acceptable guard. Second, Foodie argues that the Ask.com Online Dictionary definition of "guard" is "something that gives protection; a safeguard," which they claim, as understood by one of ordinary skill in the art, would include distance or a wall—anything that would provide protection from bodily contaminants. Finally, Foodie references various health and safety standards as supporting extrinsic evidence, including the California Health and Safety Code and the National Sanitation Foundation Standard No. 2. 7 Foodie claims their interpretation of allowing space or distance to be included as a barrier is specifically based on the California Health and Safety Code's provisions allowing space and distance to qualify as contaminant-reduction mechanisms. Foodie also claims it chose the California code because it has a reputation as being one of the most stringent in the industry, and therefore one of ordinary skill in the art would understand that space or distance would satisfy the purpose of a "breath guard."
In response, Jamba Juice argues that the standards cited by Foodie are not uniform throughout the country, and that they are merely citing an alternative to an actual breath guard, not something that should be used to interpret the term. Instead, Jamba Juice turns to the patent's specifications in arguing that space and distance are not covered by the patent's reference to a "breath guard." As referenced in the patent, the most detailed information regarding a "breath guard" states that "a consumer breath guard 2.40 is attached to the [customer service station] to reduce likelihood of ingredient contamination during periods of consumer discourse and beverage preparation." '448 patent col. 6 l. 23-26. Jamba Juice argues that because the term "attached" is included, the patent specifically requires that a "breath guard" be something tangible—something that can actually be attached to the customer service station. In response, Foodie counters that this section would be a preferred embodiment, but that it does not preclude space or distance. Looking at both the ordinary meaning of the term, and the term's use and description in the specification, the Court agrees with Jamba Juice that a "breath guard," as referenced in the '448 patent, does not include space or distance.

As noted above, the parties both included "barrier" either in their construction, or argued for its inclusion at the Markman hearing. The definition of the term "barrier" includes "a material object or set of objects that separates, keeps apart, demarcates, or serves as a unit or barricade," WEBSTER'S 3D NEW INT'L DICTIONARY 179 (3d ed. 1961), and also "any natural bar or obstacle" and "anything that restrains or obstructs progress, access." Dictionary.com, http://dictionary.reference.com/browse/barrier. The first definition above would seem to negate any possibility of distance or space being included, while an argument could be made that distance or space would be a "natural bar" or "anything that … obstructs" under the second and third definitions. However, in order to "attach" something to the customer service station, as noted in the patent, it would take some liberal stretching of the meaning of attach to believe that air or space or distance, all essentially intangible, could somehow be attached to the customer service station. The Court agrees with Foodie that the specification is only delineating a preferred embodiment and is therefore not absolutely dispositive. Nonetheless, the specification offers clear support that the "breath guard" is meant to be limited to tangible objects that can actually be attached to the customer service station. The entire focus of the patent is to conserve space through the various measures it outlines, which makes arguing that distance should be included as a possible "breath guard" a counterintuitive exercise. Finally, the Court agrees with Jamba Juice's argument that many of the standards that Foodie cites are offering space or distance as an alternative to a breath guard, not a breath guard in itself. Accordingly, the Court must reject Foodie's proposition that "breath guard" includes distance or space, and finds that the barrier aspect of the "breath guard" was meant to include only tangible objects protecting ingredients from human contamination.

With the above considerations in mind, the Court construes the term "breath guard" to mean "a protective barrier positioned between the customer and the customer service station to reduce the likelihood of ingredient contamination by the customer."
(Patent at 2:6-7, 3:55-59.) That definition of "breathable" is further supported by plaintiff's response to the initial rejection of its patent application by the United States Patent and Trademark Office ("PTO"), by which plaintiff amended this claim to add "breathable" before "torso pad member." The Court believes that defining "breathable" in this manner would be useful to the jury. Accordingly, the Court construes the term "breathable" as used in Claim 11 of the Patent to mean allowing air or moisture to flow through.

Plaintiff does take issue with defendant's additional proposed limitation requiring that the flow of air or moisture be throughout [the torso pad member's] whole area. Defendant bases this portion of its proposed construction on the Patent's prosecution history, in particular the aforementioned response by plaintiff to the PTO. Defendant argues that plaintiff itself added this limitation in seeking to distinguish prior art (the Bassett patent) in order to overcome the PTO's rejection of this claim of the Patent. The Court does not agree, however, that plaintiff's response compels a construction of this term with the proposed limitation.

In rejecting the initial application, the PTO examiner stated as follows:

[The claims] are rejected under 35 U.S.C. 102(b) as being anticipated by Bassett et al. (US 5,781,935). Bassett et al. (hereinafter Bassett) discloses a protective shoulder pad (20) that includes a foam body having a hard rigid layer (36) being positioned between first and second breathable layers of foam material (38, 42) in a sandwich configuration and has a breathable fabric layer (34, 45) that is secured about the periphery of the pad, col. 3, lines 1 - col. 4, line 15 and as shown in figure 4. Further, the hard rigid inner layer includes spaced openings/perforations therethrough as shown in figure 5 which can inherently be made of plastic. Furthermore, the first and second foam layers are breathable with openings that align with the perforation of the inner layer, col. 4, lines 11-15.

Plaintiff amended its claim to add "breathable" to describe "torso pad member," and it responded to the PTO as follows:

[The claims] stand rejected under 102(b) as being anticipated by Bassett et al (Bassett). In response, [the claims have] been amended. . . . Because the claims as amended recite a breathable protective pad, this rejection should be overcome.

The amended claims continue to recite first and second layers of breathable foam, a breathable fabric layer and a hard layer having spaced apart openings. Now, as amended, the claims further emphasize the breathability of the pad as a whole. More specifically, [the claim] has been amended to explicitly recite a breathable protective pad that allows air or moisture to flow throughout the pad's area.

The object of the Bassett patent is to provide a pad that cushions not only the wearer but also another person/player coming into contact with the wearer. Col. 1, lines 3-51. Breathability and moisture transfer across the pad are not contemplated. In fact, the Bassett patent discloses the opposite: a nonbreathable pad incapable of air and moisture transfer across the pad's area.

Bassett discloses a nonbreathable pad having layers of nonbreathable materials. Padding layers 38 and 42 are disclosed as being closed cell type foam, such as VNS, which does not allow air and moisture transfer. The layer 34 is disclosed as being extremely durable and water-resistant and is applied across the exterior surfaces of the outer and inner layers. Col. 3, lines 49-52. As the detailed description goes on to state, "[b]y fully coating the pad, all surfaces would be sealed and impervious to external penetrants [sic] as water and sweat." Col. 3, lines 52-54 (emphasis added).

At col. 4, lines 11-15, the Bassett patent contemplates including "cutouts for ventilation or attachment or accessories." As this portion of the disclosure makes clear, such cutouts are not made to provide overall breathability and moisture transfer. In fact, modifying the Bassett pad to include a cutout that would allow air and moisture transfer across the pad's area would effectively eliminate the pad because the pad would become one big cutout. Instead, as the disclosure states, the cutouts allow for straps, hooks and attachment of other pad accessories through the cutout. Nothing suggests that the cutouts would make the padding breathable. Put another way, the cutout will allow ventilation through the cutout only, but the padding still would not provide any air or moisture transfer. As discussed above, the padding is explicitly disclosed as being sealed and impervious to water and sweat.

Accordingly, because Applicant's breathable pad that allows air and moisture transfer therethrough is not disclosed or suggested by the Bassett patent, the rejection should be overcome.
The PTO examiner then allowed the Patent's claims and amended the record, stating as follows:

[The claims] are allowable because the prior art does not teach or suggest the recitation therein including a football shoulder pad having a breathable torso pad that has a front portion, a back portion and a shoulder portion such that first and second layers of breathable foam layers are secured on opposing surfaces of a hard inner layer in a laminate configuration with the hard inner layer having spaced apart openings therethrough to allow air to flow through the torso pad.

Defendant argues that in distinguishing the Bassett prior art, plaintiff limited its claim by the use in its response of the phrases "breathability of the pad as a whole;" "allows air and moisture to flow throughout the pad's area;" and "[b]reathability and moisture transfer across the pad" (bold type in original). The Court does not agree, however, that plaintiff's response clearly shows an intent to disclaim patent scope in this manner. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed. Cir. 2003) (statements in prosecution history disavowing claim scope must be both "so clear as to show reasonable clarity and deliberateness" and "so unmistakable as to be unambiguous evidence of disclaimer"). Plaintiff certainly did not disclaim any claim scope explicitly in its response. A review of the entirety of the examiner's rejection and plaintiff's response suggests that plaintiff was seeking to overcome the rejection by pointing out that the Bassett shoulder pads (as opposed merely to the hard layer with cutouts) were not breathable (due to the use of VNS material and a sealant) and were not intended to be so (cutouts were not for breathability of the pad, pad was intended to be impervious); while plaintiff's own shoulder pads or torso pad members (as opposed merely to one or more layers of the pads or members) were breathable. Plaintiff's response does not suggest that plaintiff intended any additional spatial or areal limitation to its claim requiring that the torso pad member (and not merely one or more layers) be breathable.

Moreover, plaintiff also amended its claim to include the requirement of openings in the hard layer to allow airflow "substantially throughout" the torso pad member's area. That amendment supports the conclusion that plaintiff intended no other additional limitations not found in the language of the claim itself.

The Court thus rejects defendant's proposed limitation requiring that the flow of air or moisture be throughout the torso pad member's "whole area." The Court construes "breathable" in Claim 11 to mean allowing air or moisture to flow through.

The '810 patent does not define "breathable" or "moisture transfer." However, the specification employs the term "breathable" in the context of permeability to moisture vapor. "An object of the present invention," the specification reads, "is to provide . . . a more breathable liner. . . . This object . . . is realized by providing a lining system having lining materials which act as a moisture transferring system. Moisture vapors are transferred through the liner from one side to the other side." (810 Patent, col. 1, lines 37-47.) "Breathable" is also used in contradistinction to "waterproof." For instance, the patent refers to "a waterproof/breathable membrane," which it defines as a membrane permeable to moisture vapor in one direction, but impervious to moisture or moisture vapor in the other. (Id. at col. 5, lines 52-62; see also col. 4, lines 59-61; col. 8, lines 43-49. Thus, the Court defines "breathable" as "permeable to water vapor.")

Honda argues that this phrase should be construed as "a second volume for breather gas situated near the intake system on the side approximately opposite to the first breather chamber relative to the axis of the cylinder bore".

Honda argues that this phrase should be construed as "a second volume for breather gas situated near the intake system on the side approximately opposite to the first breather chamber relative to the axis of the cylinder bore." Coast argues that the phrase should be construed to mean "a second enclosed space that collects breather gas from the crank chamber to facilitate separation of oil from breather gas is situated near the intake system and is on the side of the engine body opposite, relative to the axis of the cylinder bore, a first enclosed space that collects breather gas from the crank chamber to facilitate separation of oil from breather gas." Although the parties have presented the entire phrase to the Court for construction, it is evident from their proposed constructions that they dispute the meaning of the term "breather chamber," as well as the
meaning of the term "on the side approximately opposite."

With respect to the "breather chamber" dispute, Honda argues that Coast's proposed construction improperly includes a functional limitation. In general, "[a]n invention claimed in purely structural terms generally resists functional limitation." Toro Co. v. White Consolidated Indus., Inc., 266 F.3d 1367, 1371 (Fed. Cir. 2001). Relying on Toro, Coast responds that including the function of the breather chamber is proper, because the function of the breather chamber is inherent in its structure. In Toro, the Federal Circuit construed a disputed claim term to require "a unitary cover and ring." Id. As part of the claim construction process, the court relied on the fact that the specification stated that an advantage of the invention was that the "unitary cover and ring design" could restrict the size of an air inlet "without having the operator manually insert or remove a replaceable ring," i.e. an automatic placement function. Id. The court, however, did not utilize that function in its construction of the term, because the function was inherent to the structure. Simply put, the "automatic placement" function was embraced within the construction of the term, because the ring was permanently attached to the cover in a unitary design, i.e. it did not need to be inserted or removed. Id.

In this case, the disputed phrase is couched in structural terms. Although Honda suggests that the term should be construed to mean a "volume," the Court finds that Coast's proposed construction of an "enclosed space" more accurately reflects the plain meaning of the term "chamber." See, e.g., Webster's at 225 ("a natural or artificial enclosed space or cavity"). Although, the inventors describe the function of the breather chamber throughout the specification, a review of the detailed description of the preferred embodiment demonstrates that there are numerous components within the breather chamber, such as labyrinth walls, that help to facilitate the separation of oil from breather gas. The functional limitation Coast seeks to add to the construction of the term "breather chamber" is not necessarily inherent to its structure, and Coast's reliance on Toro is inapposite. To the extent there is any function inherent in the structure of the breather chamber, the Court concludes Honda's view of that function is more apt, i.e. the chamber is an enclosure for breather gas.

The parties also dispute the meaning of "on the side." The claim language states that the "second breather chamber is placed in the vicinity of the intake system on the side approximately opposite to the first breather chamber relative to the axis bore." Coast argues that the claim language is ambiguous because there is no antecedent basis for "the side," leaving one to "wonder, 'the side of what?'" (Opp. Br. at 13:10-11.) The Court finds the claim language to be ambiguous and looks to the specification for guidance.

The specification states that the "engine block 25 of the engine body 11 includes a first breather chamber 64, a first through passage 65, a second breather chamber 66, a second through passage 67, and a communicating passage 68[.]" ('215 Patent at 5:17-20.) Referring to Figures 3 and 4 of the '215 Patent, the inventors state that the "first breather chamber … is placed at a position that is approximately 180 degrees away from the position corresponding to the … intake system 39 along the circumferential direction of the … cylinder bore 16. … The second breather chamber is placed in the vicinity of the intake system 39 on the side approximately opposite to the first breather chamber 64 relative to the axis of the cylinder bore 16," (Id. at 5:22-31.) Referring back to the figures, the two breather chambers are located on opposite sides of the engine body. These specification references and the figures, therefore, illuminate the meaning of the term "on the side," as it is used in the claims, and the Court adopts this aspect of Coast's proposed construction.

Accordingly, the Court construes the term "a second breather chamber placed in the vicinity of the intake system on the side approximately opposite to the first breather chamber relative to the axis of the cylinder bore" to mean: "a second enclosed space for breather gas situated near the intake system on the side of the engine body approximately across the axis of the cylinder bore from the first enclosed space for breather gas."

8. "bridging portion"

a. Parties' Positions

The parties propose the following constructions for "bridging portion," which is present in claim 1 and in the '224 Patent. Dkt. No. 114. The primary dispute between the parties is whether the bridging portion must be limited to a ridge-like structure.
RTI contends that BD's construction improperly limits the invention to a preferred embodiment. Dkt. No. 111 at 28. While the embodiment in Figure 8 admittedly depicts a raised ridge between facing surfaces, RTI argues that nothing in the specification limits the bridging portion to such a structure. Id. Instead, the specification states that the bridging portion may be joined to needle holder by a tack weld, or "by providing any other form of frangible bridging portion that holds the separable ring member and needle holder together." Id. at 28-29 (citing '733, 9:37-40).

In response, BD argues that the specification defines the bridging portion as a "small ridge" or "raised portion" joining facing surfaces. Dkt. No. 112 at 27 (citing '733, 3:43 and '077, 10:38-39). While the bridging portion may admittedly be made of various materials, BD contends that it must have some definable structure, which the patent identifies as a ridge on one of the facing surfaces. Id.

b. Court's Construction

The specification describes the bridging portion as a ridge-like structure that may take the form of a single "very small raised portion" or a "series of horizontally spaced apart raised portions." While the preferred embodiment describes the bridging portion as such ridge-like structures, the Court finds no evidence that the patentee intended to limit the term to that structure. See Phillips, 415 F.3d at 1323 (claims should not be limited to particular embodiments unless the inventor has indicated such a narrow construction). Additionally, the bridging portion is part of an embodiment depicted in Figure 8, which the specification distinguishes from those embodiments depicted in Figures 1-3. See '733, 9:7-17. It is thus apparent that Figures 1-3 do not contain the claimed bridging portion, as the adjoining surfaces of the retainer member and needle holder in those embodiments are flush with one another. Thus, if two surfaces are completely flush with one another they cannot logically be joined by a bridging portion. As such, the claimed bridging portion, whatever the form it takes, must be a distinguishable structure that both joins the two components and provides some separation between them. The separation may take the form of a "small gap between them all around" ('733, 9:30-31) as depicted in Figure 8. Conversely, the bridging portion could take the form of a "frangible web" (Dkt. No 111 at 29), the gaps of which separate the two surfaces.

Accordingly, as the Court previously ruled, the term "bridging portion" means "a structure that spans the gap between and connects the retainer member and needle holder."

561

4. "Bringing, Respectively"

The first step of the method taught by Claim 1 is "(a) bringing, respectively, said corresponding contact surfaces of said electrically conductive terminals into contacting relationship with said corresponding contact surfaces of said conductor elements."

Thomson construes "bringing, respectively" to mean "the article and the device are brought face to face and then into physical contact in a direction that has at least one component of "normal" (perpendicular) motion." Thomson's Prop. Or. Thomson argues first that "bringing" is indefinite or a technical term. To save the term, Thomson argues that the normal motion limitation must be imposed either by reference to the specification or by operation of law under 35 U.S.C. § 112 P 6. The ALJ rejected Thomson's contention, and the Commission allowed the ALJ's construction to stand. This Court also finds no reason to read in the directional limitation Thomson suggests.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 Gentry Gallery Inc. v. Berkline Corp., 134 F.3d 1473, 1479 (Fed. Cir. 1998) is distinguishable. In Gentry, the court narrowed a broad claim to the scope of the disclosure based on a series of considerations concerning the patent's purpose.
and the inventor's objective intent, which are not present in this case. Moreover, Thomson's general step-plus-function argument must be rejected. The very authority Thomson relies on does not support the argument. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1583 (Fed. Cir. 1997) ("If we were to construe every process claim containing steps described by an 'ing' verb . . . into a step-plus-function limitation, we would be limiting process claims in a manner never intended by Congress.").

As for the term "respectively," Innovatron would have this mean only that the corresponding contact surfaces are brought together correspondingly -- with the contacts meeting A to A, B to B, etc. Within the sentence, however, the adverb "respectively" modifies the verb "bringing" to impose two limitations on how the surfaces are brought together: (1) both the article's terminals and the device's elements are "brought," i.e., force is applied to both so that they move toward each other; and (2) the motion is not simultaneous -- the removable article's terminals are first "brought" followed by the bringing of the device's elements to create the "contacting relationship." The specification confirms this reading because this is how the bringing step is accomplished in the preferred embodiment. If resort to extrinsic evidence is appropriate, the dictionary definition also supports this reading. See WEBSTER'S II NEW RIVERSIDE UNIVERSITY DICTIONARY [hereafter "WEBSTER'S II"] 1001 (1994) (defining "respectively" as "singly in the order indicated or mentioned").

The term "bringing, respectively," as used in step (a) of Claim 1, is construed to mean that force is applied to both the removable article and the device's electrically conductive elements such that the removable article is moved first followed by motion of the device's conductive elements until they are brought into a contacting relationship. No directional limitation on how these movements are accomplished is imposed by the term "bringing, respectively."

The '167 patent, like the '015 patent, describes a disposable container lid that is primarily used with beverage containers. The '167 patent is an "improvement" patent. "The '167 patent discloses an improved self-forming hinge element for the access strip and an improved retainer construction for holding the access strip open to allow drinking." See Bailey, 1998 WL 4726 **1 (Fed. Cir. 1998). The '167 patent has nine claims, but not all of them are asserted against Dart. Claim 1 is the only independent claim of the '167 patent. It reads as follows:

1. In a container lid of the type composed of a thin, resilient, thermoplastic polymeric sheet material and comprising a central portion of a size and shape to overlie the open end of a container, a rim-engaging means integral with the periphery of said central portion and being adapted to releasably secure the lid to the rim of a container and a pair of spaced apart tear impressions extending inwardly from the edge of said rim-engaging means and terminating at spaced apart locations within said central portion, thereby to define therebetween an access strip, the improvement which comprises: a self-forming hinge element for said access strip comprising a molded-in depression on said central portion, said depression defining an essentially vertical depending straight wall bridging the interior ends of said tear impressions.

The claim language "essentially vertical depending straight wall" is not in dispute. The Federal Circuit has previously construed "essentially vertical" as "vertical or a few degrees from vertical." See Bailey v. Dunkin Donuts, Inc., 1998 U.S. App. LEXIS 1175, *6, 1998 WL 4726 at *4. Moreover, the parties agree that the term "depending straight wall" should be given its plain and ordinary meaning. The term "depending" means "hanging or inclining downwards." 4 Oxford English Dictionary 475 (2d ed.1989). In this case, the term "depending" is understood in relation to the horizontal plane of the surface of the central portion. In addition, the term "straight" should be given its ordinary meaning. "Straight" means "not crooked; free from curvature, bending, or angularity." 16 Oxford English Dictionary 817 (2d ed.1989). Finally, the term "wall" in the claim was intended by Bailey to be given its ordinary meaning, and, therefore, I determine "wall" to mean "a perpendicular surface forming an enclosure or barrier." 19 Oxford English Dictionary 848 (2d ed.1989).

The gravamen of the dispute between the parties is the phrase "bridging the interior ends of said tear impressions." While
both parties agree that I should construe the word "bridging" according to its ordinary meaning, they cannot agree on what that definition requires. Dart argues that the word "bridging" requires that the tear impressions physically extend to touch or intersect the essentially vertical depending straight wall hinge element. Bailey argues that the term "bridging" does not require that the tear impressions touch the wall of the hinge element.

Bailey's expert, Dr. Grossman, found support for Bailey's construction in the specification, which describes an embodiment in which the tear impressions "can run to or into" the wall. The use of the permissive word "can," rather than a mandatory word such as "must," suggested to Dr. Grossman that the tear impressions may run to or into the wall, but are not required to do so. The magistrate judge adopted Bailey's position:

Examining the term bridging, the ordinary meaning of bridging does not require that the component being bridged, i.e., the interior ends of the tear impressions, touch or physically intersect with the component doing the bridging, i.e., the vertical depending straight wall. Ordinarily, the term bridge simply means "a structure carrying a pathway or roadway over a depression or obstacle." Such a definition does not directly imply, let alone require, that the obstacle being bridged intersect the actual bridge. To create this implication, let alone this requirement, would necessitate more specific and particular language in the claim. For example, claim 1 could describe the vertical depending straight wall as "bridging and touching the interior ends of the tear impressions." Unfortunately for Dart, however, claim 1 does not contain such language but simply uses the term bridging.

See Bailey I, 980 F. Supp. at 578.

Upon reconsideration, I conclude that one skilled in the art would understand the term "bridging" to require the tear impressions to intersect or touch the essentially vertical depending straight wall. The verb form "bridging," as opposed to the noun examined by the magistrate judge, is defined:

"22. to make a bridge or passage over; span: The road bridged the river. 23. to join by or as if by a bridge: a fallen tree bridging the two porches."

Random House Webster's Unabridged Dictionary 261 (2d ed. 1997). 9 Bailey's counsel disagrees, however, that "bridging" requires the joining of the tear impressions. Instead, Bailey's counsel argued at the hearing that joining was permissible, but all that is required by the '167 patent is that the vertical wall be "between" the tear impressions. Tr. 5, p. 70, l. 4-6. 10 Bailey's argument seeks to limit the word "bridging" to simply mean "spanning." While it is true that all bridges must span whatever it is they bridge (e.g., the river or the area between the two porches), it is also true that bridges must touch either side of what it is they bridge (e.g., the banks of the river or the porches). The most accurate way of expressing these truths is the verb "to join." Thus, the essentially vertical depending wall must "join" the pair of spaced apart tear impressions.

9 I have relied generally on the Oxford English Dictionary for the definition of disputed terms. Here, I rely on the Random House Webster's Unabridged Dictionary because that was the source provided to me by Bailey. Bailey's Brief After Markman Hearing, Ex. 2.

10 The following conversation took place at the Markman hearing:

The Court: [The wall] may join, but it may just be between?

Counsel: Yes, exactly right.

Tr. 5, p. 70, l. 4-6.

Therefore, in the case of one continuous line, the tear impression must touch or intersect the vertically depending straight wall. When the tear impression consists of a plurality of spaced-apart, relatively short impressions, a small space separating the wall from the last impression may be appropriate. Such a space must be small enough that the tear impression retains its
essential feature of touching the wall, bearing in mind that the tear impression is formed by a series of intermittent impressions and spaces. 11

--- Footnotes ---

11 This conclusion is consistent with my ruling above that a small space may exist between the first impression and the outer edge. Both of these rulings recognize that the "tear impression" consists of "impressions" and "spaces" between them. Thus, the tear impression does not necessarily begin at the first "impression" or end at the last "impression." Instead, there may be a small space beginning or ending the structure termed "tear impression."

--- End Footnotes ---

2. "Bristle"

Plaintiffs and defendants dispute whether the term "bristle" means a single fiber having two ends or, rather, a portion of a single fiber having a "tip" located some distance from the brush's core and a "base" located at the brush's core. Plaintiffs urge the former construction and defendants the latter. Plaintiff's construction of the term "bristle" is the more plausible.

Although the language of claim 1 sheds no light on the proper interpretation of the term "bristle," the specification describes bristles as fibers with two ends. In describing the insertion of the bristles between the metal loops of the twisted iron core, the specification depicts the bristles as constituting single fibers, not portions of a single fiber: "In effect, when the bristles are implanted between the turns of the core, there is a softening of the bristles due to the deformation of the cross-section of the bristle, which is all the more noticeable when bristles used comprise capillary tubes." ( '622 patent, col. 3, ln. 68 to col. 4, lns. 1-4) (emphasis added). Thus, the patent refers to the fibers as bristles even prior to their insertion into the metal core where they subsequently are "bent" at their midway point. The specification uses the term bristle in a similar fashion in its description of the drawings: "FIGS. 3 and 4, respectively, represent a profile and top view of a rake delivering the bristle tufts intended, in conjunction with the core, to constitute the brush." ( '622 patent, col 4, lns. 41-43) (emphasis added). The patent further explains that, when situated within the rake-like device prior to their insertion in the core, "the bristles 3 are disposed in regular bundles 6 within successive mutually parallel teeth 7 of a rake-shaped device 8 from which they project laterally by substantially the same distance on either side." ( '622 patent, col. 5, lns. 1-4) (emphasis added). With the bristles thus situated, the rake-shaped device is brought near the twisted wire 2b until the bundles 6 each penetrate with one of their ends into a loop 5 perpendicular to the median line of the twisted wire 2b until the wire comes to occupy a median position in relation to the bundles 6 of the bristles which then project from the latter on either side by a practically identical distance.

( '622 patent, col. 5, lns. 8-15) (emphasis added). Stated differently, the bristles are inserted into the metal loops constituting the core until the core is roughly in the middle of the bristle tufts. If the core sits at the middle of the bristle bundles, a bristle must be the entire fiber and not just a portion of it.

Defendants, however, point to the language of claim 7 in support of their two-bristles-for-one-fiber theory. Claim 7 discloses a brush according to claims 1 or 6, wherein each bristle of at least part of the set of bristles of the brush comprises on its surface at least one capillary channel extending substantially from its base as far as its tip.

( '622 patent, col. 6, lns. 42-45) Defendants argue that if a bristle is a single fiber with two ends, the ends would be indistinguishable and it would be nonsensical to refer to one end as a base and the other as a tip. Thus, they conclude that a bristle is the portion of a fiber extending from the core (its base) to its tip. This is an unwarranted conclusion. Claim 7 discloses a mascara brush with capillary channels disposed on the surface of its bristles. Its use of the word "base" is necessitated by the fact that the brush's twisted wire core interrupts the capillary channel's progress across the surface of the bristle. "Base" is merely a convenient way of expressing that the capillary channels extend (for all practical purposes) only
as far as the wire core, where their capillary action is thwarted by the wire core that deforms the bristle's cross section. (See ’622 patent, col. 3 ln. 68 to col. 4, Ins. 1-3) ("In effect, when the bristles are implanted between the turns of the core, there is a softening of the bristles due to the deformation of the cross-section of the bristle . . . .").

Accordingly, the court shall construe the term "bristle" to mean a single fiber having two ends.

1. "A Brush for the Application of Mascara to the Eyelashes"

Both parties agree that this phrase forms the preamble of claim 1. Plaintiffs urge the court to give this preamble the effect of a claim limitation. Specifically, they argue that it refers to "a brush that takes up mascara formula from a container and then transfers the formula to the eyelashes while simultaneously separating and combing the lashes." (D.I. 272 at 15) Defendants, on the other hand, argue that this preamble is not a claim limitation at all. Defendants argue in the alternative that the preamble limits the claim only to a brush intended for use in "making up" the eyelashes with mascara.

The question of whether to give the preamble the effect of a claim limitation "can be resolved only on review of the entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989). Courts construe claim preambles consistent with the general principles of claim construction. If, after reviewing the patent as a whole, the claim preamble is "necessary to give life, meaning, and vitality" to the claim then the claim preamble should be construed as if in the balance of the claim." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999). When the drafter chooses to use both the preamble and the claim body to define the invention, "the invention so defined, and not some other, is the one the patent protects." See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995). If, on the other hand, the body of the claim sets forth the complete invention and the preamble offers no distinct definition of any of the claimed invention's limitations, "but rather merely states . . . the purpose or intended use of the invention, then the preamble is of no significance to claim construction." Id.

In the present case, the preamble must be read as a limitation upon the claim. This conclusion is confirmed by a review of the patent as a whole. First, and most obviously, the patent title, "Brush for the Application of Mascara to the Eyelashes," indicates that the inventor intended the patent to cover only mascara brushes. Second, the specification is replete with references to brushes used in applying mascara. In short, the patent as a whole is directed to a particular type of brush -- specifically, a brush designed to solve the problem of uneven mascara application on the eyelashes. The preamble gives meaning to claim 1 by indicating the kind of brush the inventor designed to remedy this problem: only those brushes structurally suited for placing mascara on the eyelashes. Without benefit of the preamble, it is conceivable, for instance, that claim 1 could be construed to cover brushes not designed to place mascara on the eyelashes (for instance, brushes with purely industrial applications). 2 To read claim 1 in such a fashion "would be divorced from reality." Corning Glass, 868 F.2d at 1257. Therefore, the court shall give the preamble to claim 1 the effect of a claim limitation.

2 At one point during the prosecution history, patents disclosing brushes used in cleaning metal parts and boiler tubes were offered (and rejected) as prior art references. (See D.I. 275 at SA 570-71)

Having determined that the preamble serves as a structural limitation on claim 1, it is now necessary to determine the scope of that limitation. Plaintiffs argue that the preamble refers to a brush that takes up mascara formula from a container, transfers the formula to the eyelashes, while simultaneously separating and combing the lashes. The simple phrase, "[a] brush for the application of mascara to the eyelashes" does not warrant such a narrow reading. Contrary to plaintiffs' assertions, neither the preamble nor claim 1 refers to a particular method in which the mascara brush must be used. Nor does it make any mention of other mascara components, such as a mascara container. Indeed, reference to claim 17 of the '622 patent, which discloses a mascara applicator comprising several components, confirms that the preamble to claim one refers only to mascara brushes and not to the process or components of mascara application. Claim 17 reads, in pertinent part, as
In a mascara applicator including a mascara reservoir, a detachable cap adapted to said reservoir, a stem integral with said cap and a brush depending therefrom, said stem and brush penetrating into said reservoir through a substantially circular opening surrounded by a wiping lip . . . .

(Reexamination Certif. B1 '622 patent, col. 2, ins. 8-13) It would be improper to read the more sparsely worded claim 1 as narrowly as the more detailed claim 17. Where some claims are broad and others narrow, the narrow claim limitations cannot be read into the broad claims. See Marsh-McBirney, Inc. v. Montedoro-Whitney Corp., 882 F.2d 498, 504 (Fed. Cir. 1989).

Consequently, the court shall construe the preamble of claim 1 to mean a brush used to place mascara on the eyelashes.

12. "brush track"

This term is found in Claim 16. The parties are nearly in agreement on the construction of this term, with relatively minor differences in their proposed constructions. Plaintiff offers the following: "the area of the commutator bar, including any carbon block bonded thereto, which is slidingly engaged by the brushes of the motor or generator." Defendants, on the other hand, assert that the disputed term means "the area of the commutator bar which is slidingly engaged by the brushes of the dynamoelectric device." As found in the prosecution history of the '015 Patent, Plaintiff's patent counsel explained to the Patent Examiner that "[t]he brush track is that area of the commutator bar which is slidingly engaged by the brushes of the dynamoelectric device." Buckingham Decl., Ex. B at J00199. Defendants' prosed construction tracks this language exactly. Plaintiff's construction, while similar, adds reference to the "carbon block" that may be bonded to the commutator bar. The Court agrees, however, with Defendants' assertion that whether a carbon block has been bonded to the commutator bar is not relevant to the definition of "brush track." Therefore, the Court shall construe "brush track" as "the area of the commutator bar which is slidingly engaged by the brushes of the dynamoelectric device."

II. "Buckling"

Plaintiff next argues that the proper construction of "buckling" is "the planned failure or collapse of a column wall resulting in redistribution or lessening of the load carried by the column." 25 Plaintiff points to the language of the '111 and '527 patents which states that "buckled columns offer little resistance to deformation, thus removing pressure from the hip bone area." 26 Defendants rely on a Mechanics of Materials manual and the Random House dictionary to define "buckling" as "lateral bending of a portion of a column, or the change in primary loading of a portion of a column from axial compression to lateral bending." 27 Defendants also point to a Final Office Action by the USPTO in a Reexamination of Patent '111, in which the USPTO rejected Plaintiff's proposed definition of the term and noted that "the term buckling . . . is defined as bending." 28

--- Footnotes ---

26 Id.
27Defs.’ Markman Ex. M, at M-12.
28 Id.
Again, the Court finds that Plaintiff's intrinsic evidence, rather than Defendants' extrinsic evidence, provides the proper ordinary and accustomed meaning as understood by one of ordinary skill in the art. Specifically, the Court notes that bending, as defined by Defendants, does not necessarily result in a lessening of a load as a person of ordinary skill in the art would understand Plaintiff's use of the term "buckling" upon a careful reading of Plaintiff's patents. As to Defendants' intrinsic evidence, the Court notes that the USPTO's reexamination definition appears to be vague and overbroad. Defendants argued at the Markman hearing that one understood definition of buckling defines the term as lateral bending of a portion of a column. However, the USPTO states only that the term means "bending." This lack of clarity in the examination history, combined with the specification language describing buckled columns, leads the Court to accept Plaintiff's preferred definition.

C. As Properly Construed, the Claims of the '434 Patent Are Not Infringed

Claims in the '631 Patent require a bearing surface "built up with a hard facing." Baker Hughes contends "built up" means "raised or built up, or increasing surface height." ReedHycalog contends "built up" means "appreciably raised." A lay jury will understand the term "built up" and therefore the term requires no construction.

We find that the district court defined "bulbous" as used in claims 1 and 45 too narrowly. The district court defined "bulbous" as non-cylindrical device with rounded edges. The written description defines bulbous more broadly.

The distal end portion of the bulbous element 28 is preferably generally rounded on its exterior surface (as illustrated in order to facilitate pressing the element into and through softened body material while minimizing the risk of mechanical perforation. The bulbous element 18 can alternatively have other shapes as desired, including oblong or eccentric with respect to the axis of the fiber optic 22 or even generally crescent shaped. Such an eccentric or oblong shape can be rotated to generate an even larger channel through an obstruction. A crescent-shaped element also allows for viewing past the element.

Although the patent does not define the term "bulbous" with great specificity, the above-quoted passage is consistent with the generally understood meaning of the term as "bulb-shaped, bulging," Random House Unabridged Dictionary 274 (2d ed. 1993), or "resembling a bulb; rounded," Webster's II New Riverside University Dictionary 207 (1984). In order to infringe, the accused device thus must have an element mounted on the distal end region of the laser energy transmitting conduit that is enlarged vis-a-vis the conduit and has a generally rounded distal end. Based on the evidence in the record, we conclude that there is at least a triable issue of fact as to whether SLT's SFB 1.0 probe is bulbous under this definition.
Application of the above principles here compels the conclusion that STX is entitled to judgment as a matter of law because Brine/SLI has failed to counter the evidence presented by STX demonstrating that the Raptor lacrosse head does not infringe claims 1 and 9 of the '434 patent as herein construed. Similarly, there is no evidence in the record demonstrating that the Raptor lacrosse head infringes claims 2, 3, and 8 of the patent.

Brine/SLI has alleged that STX's Raptor lacrosse head infringes claims 1, 2, 3, 8, and 9 of the '434 patent. Of these claims, claims 1 and 9 are the only independent claims. As such, claims 1 and 9 represent the minimum number of elements required to infringe the '434 patent. Each of the claims contain the limitation that the sidewalls of the lacrosse head must "have a bottom edge thereof extending outwardly such as generally to define a bulge in the bottom" of the sidewall, "generally about midway of the length of [the] sidewall."

STX contends that the Raptor lacrosse head does not infringe the '434 patent because it does not have the characteristic "bulge" feature denoted in claims 1 and 9 of the '434 patent. At issue is the meaning of the term "bulge." Adverting to the specification, claim language, testimony of the inventors of the '434 patent and a dictionary definition, STX argues that the "bulge" limitation is properly defined as a "swelling" or "belly" protruding from the bottom sidewalls. STX argues that the specification of the patent clearly defines "bulge" as "an outward extension of the bottom edge." STX describes the accused product, the Raptor head, as having sidewalls with a continuous "curve" as opposed to a protuberance or swelling in the bottom sidewalls.

Brine/SLI asserts that there is no distinction between a "curve" and a "bulge" and that the Raptor design is the same as the '434 patent design. In support, Brine/SLI cites the definition of "bulge" given in one dictionary: an "outward curve." Instead of focusing particularly on defining the term "bulge," Brine/SLI focuses on defining words in the specification associated with demarcating the limitation of the "bulge" design:

Nowhere in the specification or claims of the '434 patent do the inventors apply a special or unique meaning to the words "extends," as used in the specification, or "extending", as recited in claim 1 of the '434 patent, to define the word "bulge." Consequently, the word "extending" as used in claims 1 and 9 of the '434 patent has the ordinary meaning as construed by someone skilled in the art. The word "extend," as used in the '434 patent to define "bulge," obviously means, "to stretch or spread out to full length; to expand the area or scope . . . ." It is also apparent from the '434 specification, that the word "bulge" does not have a special meaning contrary to its ordinary meaning, which includes . . . "protruding part; an outward curve or swelling."

I have carefully considered and evaluated the claim language and the specification. I have also reviewed the prosecution history, interrogatories, and deposition testimony cited by the parties in support of their respective positions. I conclude that the meaning of the term "bulge" is clear when read in light of the claims and specification together. "Bulge" as used in claims 1 and 9 comports with the ordinary and plain meaning of the term, as it would be understood by one of ordinary skill in the art. Furthermore, it is clear from the patent as a whole that "bulge" has an even more distinct and finite meaning as it relates to the invention. First, the "bulge" is in the bottom sidewall as described in claims 1 and 9. The "bulge" begins about midway in the bottom sidewall. Claim 5 places further limitations on the bulging feature. The height of the sidewalls at the midpoint of the bulge is 1.15 - 1.5 times the height of the sidewall at the throat end. Clearly, the bulging feature creates a swelling near the midpoint of the lacrosse head and in the bottom sidewalls. As a matter of law, the "bulge" limitation in the '434 patent is not simply a "curve" but is a curve-like protuberance.

As described in the specification, the "bulge" design was a move away from the design where the ball pocket was in the throat area. The '434 patent design was to create a ball pocket nearer the lip portion of the head. This novel design was viewed by the inventor as facilitating the advanced playing skills of lacrosse players who play and pass the ball using wrist-flicking movements as opposed to the old method of fall arm swings. The '434 patent design is intended to keep the ball from leaving the head too soon, thus enabling the player to exercise greater control in directing the ball when propelling it.

The prior art reviewed during patent prosecution supports these conclusions. In an "Information Disclosure Statement" the following references were cited:

Brine '737 is illustrative of lacrosse stick head frames in which the upper and lower edges of the side walls are substantially parallel . . . .
Brine '248 and '260 are illustrative of lacrosse sticks having typical rearwardly-disposed ball pockets...

Brine '666 and '260 show a lacrosse stick head frame in which the side walls are provided with greater height from the throat area than from the lip area...

See Brine's Response, '434 Patent File Wrapper. Further, during patent prosecution, the original title of the patent was changed from "A Lacrosse Head" to "Lacrosse Stick Head With Bulged Side Walls" to reflect the distinct bulging feature. Id.

The intrinsic evidence alone is enough to resolve the meaning of the term "bulge." Nevertheless, the testimony of Peter Brine, Jr. and William Brine III, the inventors of the '434 patent, also supports the court's interpretation. William Brine III defined "bulge" as

[A] bulge starts on a defined plane and goes down, and comes back up to somewhere near that plane; and a curve doesn't necessarily have to do that.

He testified further that Brine used the term "bulge" "by what the dictionary said." Id. He also offered this construction:

In order to shift the ball pocket forward in the head, a lowering of the sidewall in the center is needed. This bending of the lower line of the sidewall forms a bulge that extends outwardly from the imaginary plane between the shaft and the scoop.

Peter Brine offered the following construction:

Q: What was the invention of the 434 patent?
A: This was a stick that -- rather a lacrosse head that had a belly or a bulge in the sidewall, bottom of the sidewall.

* * *

Q: And what is your understanding of the term "Bulge"?
A: An outcropping . . . . An outcropping off of a line.

After preliminary claim construction briefing, the parties agree that the only term necessary for the court to construe is "bulk volume." As an example, claim 14 of the '694 patent states:

14. A method for making expanded graphite from lamellar graphite comprising:
   a) providing lamellar graphite particles having at least a minimal purity;
   b) intercalating the lamellar graphite particles with an expandable graphite intercalation method;
   c) expanding the graphite intercalation compound to exfoliate the graphite particles; and
   d) air milling the exfoliated graphite particles to further delaminate them to create an exfoliated graphite product having a surface area to mass ratio of at least 18 m\(^2\)/g and a bulk volume of at least 20 ml/g.

II. Analysis

a court to use when performing claim construction. Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc). The words of the claims in a patent are to be given the ordinary and customary meaning that would have been attributed to them by a person of ordinary skill in the art at the time the invention was made. Id. at 1312-13. The person of ordinary skill in the art is deemed to have read the term in the context of entire patent, including the claims themselves, the specification, and the prosecution history. Id. at 1313. The claims, specification, and prosecution history are so-called intrinsic evidence.

Extrinsic evidence is everything "external to the patent and prosecution history, including expert and inventor testimony, dictionaries, and learned treatises." Id. at 1317. Review of technical dictionaries and treatises can be helpful to the court in understanding the technology of the invention and can assist the court in determining the meaning of terms to those of skill in the art of the invention. Id. at 1318. Where extrinsic evidence conflicts with the intrinsic evidence of the patent, however, the intrinsic evidence controls. Id.

The requirement that claim language be sufficiently definite arises from 35 U.S.C. § 112 P 2 which states: "The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." If a person of ordinary skill in the art can reasonably understand the claim when read in light of the specification, the claim is not indefinite. Marley Mouldings, 417 F.3d at 1359 ("The statute is satisfied if a person skilled in the field of the invention would reasonably understand the claim when read in the context of the specification."). "When a claim 'is not insolubly ambiguous, it is not invalid for indefiniteness."' Id. at 1361 (quoting Bancorp Servs., L.L.C. v. Hartford Life Ins. Co., 359 F.3d 1367, 1372 (Fed. Cir. 2004)). The Federal Circuit has recently emphasized that the court must keep in mind the presumption of validity when determining whether a claim in invalid for indefiniteness:

    In this regard it is important to note that an issued patent is entitled to a statutory presumption of validity. See 35 U.S.C. § 282 (2000). "By finding claims indefinite only if reasonable efforts at claim construction prove futile, we accord respect to the statutory presumption of validity and we protect the inventive contribution of patentees, even when the drafting of their patents has been less than ideal." Exxon Research & Eng'r v. U.S., 265 F.3d 1371, 1375 (Fed. Cir. 2001) (citation omitted). In this way we also follow the requirement that clear and convincing evidence be shown to invalidate a patent. See Budde v. Harley-Davidson, Inc., 250 F.3d 1369, 1376 (Fed. Cir. 2001).

Datamize, 417 F.3d at 1347-48.

Timcal argues that the term "bulk volume" as used in the '694 patent is indefinite, rendering the claims invalid, because the patent does not specify the method used to measure bulk volume. According to Timcal, the calculation of bulk volume depends on the method used to determine it, and because no method of measuring bulk density is specified in the patent, the term is devoid of meaning. Thus, Timcal argues that the claims of the '694 patent which include a bulk volume limitation are indefinite. In order to be sufficiently definite, Timcal argues, the patent would need to specify: (1) whether it refers to "loose bulk density," "tapped bulk density," or "packed bulk density"; and (2) the precise procedures for measuring the bulk density such as the type of measuring instrument and the method of adding material to that instrument among other things.

Superior argues that, although no method of measuring bulk density is provided in the patent itself, a person of ordinary skill in the art would understand how to measure it. Superior argues that "bulk density" has a recognized meaning in the graphite processing industry: loose bulk density measured using the Scott volumeter. 1

--- Footnotes ---

1 In its initial claim construction contention, Superior proposed a broader definition of bulk volume, "the physical measurement of the volume to unit mass ratio of the air milled graphite which physical property is the mathematical inverse of the measured bulk density (mass to unit volume ratio) value." In response to Timcal's contention that the term is indefinite, Superior provided a narrower construction, loose bulk density measured using the Scott volumeter. Since the
dispute in this case involves the view of one of ordinary skill in the art, the court finds that it is appropriate to consider Superior's narrower proposed construction.

A. Intrinsic Evidence

If a claim term is unambiguous after reviewing the intrinsic evidence (i.e., the claims, the specification, and the prosecution history of the patent), the court need not consider extrinsic evidence, such as the expert declarations submitted by the parties. Intel Corp. v. VIA Technologies, Inc., 319 F.3d 1357, 1367 (Fed. Cir. 2003) (holding that if a claim not indefinite after construed it in light of the intrinsic evidence, "reference to extrinsic evidence is improper"). Thus, the court will first review the claims, specification, and prosecution history of the '694 patent.

In this case, at least to a lay person, the intrinsic evidence provides little guidance as to the meaning of "bulk volume." The claims themselves indicate that bulk volume is a ratio of volume per unit mass (or more specifically ml/g). The specification indicates that bulk volume is the inverse of bulk density. '694 Patent, Col. 4, 11. 2-3 ("a bulk volume of approximately 20 ml/g (or a bulk density of 0.050 g/cc"). 2 The prosecution history provides little additional information, except that the bulk density as used in the '694 patent is not the "true density." See Ex. B, Tab 18 to Timcal's Preliminary Claim Construction Contentions.

B. Person of Ordinary Skill in the Art

Since the intrinsic evidence does not resolve the issue, the court must review the extrinsic evidence submitted by the parties to determine whether the failure to specify a method for determining bulk volume renders the claims indefinite. The court views this evidence to determine how a person of ordinary skill in the art would have interpreted this term. In doing so, it is helpful to determine the description of a person of ordinary skill in the art.

Timcal states that a person of ordinary skill in the art has at least a four-year college degree in a field that is related to graphite or its uses and has at least four years of experience working with graphite. Alternatively, Timcal states that a person can possess ordinary skill if he does not have a four-year degree but has a combination of equivalent education and experience. Timcal's Response at 4 n.6. Superior simply states that a person of ordinary skill in the art is a person experienced in the field of processing graphite through education, experience, or both. Superior's Response at 4. Since the parties' definitions are consistent for the most part and the court agrees with them, the court need not comment further on the qualifications of a person of ordinary skill except to note that, since the '694 patent relates to processing graphite, some experience or knowledge as to graphite processing is necessary to be a person of ordinary skill in the art. That having been said, since Timcal has the burden to prove indefiniteness by clear and convincing evidence, the court will review Timcal's evidence first.

C. Extrinsic Evidence Upon Which Timcal Relies

Timcal argues that the term "bulk volume" is devoid of meaning without reference to the method of measuring it. In support of its argument, Timcal relies on the declaration of Dr. John Fischer ("Dr. Fischer"). Ex. L to Timcal's Response. Dr. Fischer has a doctorate degree in nuclear science and engineering and is currently a professor of materials science and engineering at the University of Pennsylvania. Dr. Fischer declared that Superior's proposed definition for "bulk volume" could include both loose bulk volume and tapped bulk volume. After reviewing the intrinsic evidence of the '694 patent, Dr. Fischer concluded that nothing in it informed those of skill in the art as to which was intended.

Dr. Fischer relied in part on the Patent Application No. 09/213,544 ("the ‘544 application"). Ex. D to Timcal's Preliminary
Claim Construction Contentions. As part of that application, the applicant included a table which showed testing data for various samples and reported, among other properties, the Scott density (g/cm³), bulk volume (g/cm³), and tap density (g/cm³). Dr. Fischer declared that the bulk volume measurement reported in the '544 application is significantly different from the tap density reported. Other than the '544 application, Dr. Fischer reviewed only the intrinsic evidence of the '694 patent in making his declaration.

3 It is curious that this application used the same units of measure for bulk volume and tap density. Bulk volume should have been the inverse.

Timcal relies on several ASTM standards to show that "numerous other detailed standards [besides the Scott method] also exist for how to measure specific types of 'bulk volume/bulk density' of carbon and graphite materials." Timcal's Response at 9 (citing its Ex. O). Dr. Fischer did not reference any of these standards in his declaration, and thus Timcal has not provided any evidence that these standards are used to measure bulk density in the field of the '694 patent.

A review of the specification of the '694 patent and the ASTM procedures cited by Timcal shows that it is unlikely that any of these standards apply to testing the type of product disclosed in the '694 patent. First, some of the standards are directed toward testing metal powders. See ASTM Standard B703-05, Standard Test Method for Apparent Density of Powders Using Arnold Meter, at 1 n. 1 ("This test method is under the jurisdiction of ASTM Committee B09 on Metal Powders and Metal Powder Products and is the direct responsibility of Subcommittee B09.02 on Base Metal Powders."); ASTM Standard B527-93, Standard Test Method for Determination of Tap Density of Metallic Powders and Compounds (emphasis added). It is well-known, however, that carbon (and therefore graphite) is nonmetallic. See Webster's Ninth New Collegiate Dictionary 206 (1985) (defining carbon as "a nonmetallic chiefly tetravalent element . . . "); Phillips, 415 F.3d at 1314 ("In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words. In such circumstances, general purpose dictionaries may be helpful.") (citation omitted). While the court recognizes the possibility that graphite (despite its technical classification as a nonmetal) might be used in some powder metallurgy applications, Timcal has provided no evidence that the product of the claimed process in the '694 patent could be so used.

Other ASTM standards cited by Timcal require a particle size that is inconsistent with the disclosure of the '694 patent. ASTM Standard D2854-96, Standard Test Method for Apparent Density of Activated Carbon states: "This test method covers the determination of the apparent density of granular activated carbon. For the purposes of this test method, granulated activated carbon is defined as a minimum of 90% being larger than 80 mesh." Eighty mesh corresponds to a 177 micron opening. Perry's Chemical Engineers' Handbook 21-15 Tbl.21-6 (6th ed. 1984). Yet the '694 patent teaches that after air milling, the product has a preferred mean particle size of 30 microns. See '694 patent, col. 3, 11 30-31. A person of ordinary skill in the art would not believe that bulk density should be measured by a procedure used for particles more than six times the preferred size disclosed in the patent, particularly when the patent teaches that the method results in product with a high surface area to mass ratio. See '694 patent, col. 1, 11 14-15. The same holds true for ASTM Standard C357-94, Standard Test Method for Bulk Density of Granular Refractory Materials, which states: "This test method covers a procedure for determining the bulk density of granular refractory materials, commercial products which usually have particles that are retained on a 0.265-in. (6.7 mm) or coarser sieve." That size sieve corresponds to 6730 microns, over 200 times larger than the preferred particle size disclosed in the patent. Perry's Chemical Engineers' Handbook 21-15 Tbl. 21-6.

The remaining standards cited by Timcal appear to apply to products different from the claimed invention. ASTM Standard C1039-85, Standard Test Methods for Apparent Porosity, Apparent Specific Gravity, and Bulk Density of Graphite Electrodes, at 1 ("These test methods cover the determination of . . . bulk density of cores taken from graphite electrodes manufactured for use in electric arc furnaces."); ASTM Standard C914-95, Standard Test Method for Bulk Density and Volume of Solid Refractories by Wax Immersion; ASTM Standard C838-96, Standard Test Method for Bulk Density of As-Manufactured Carbon and Graphite Shapes (emphasis added). In short, while the ASTM standards cited by Timcal show that there are multiple methods of determining bulk density, they do not show that there are multiple methods of determining bulk density in the field of the invention of the '694 patent.
The only remaining evidence provided by Timcal relates to the Scott method for determining bulk volume. This evidence includes: Superior's internal procedure which uses a Scott volumeter, Ex. I to Timcal's Preliminary Claim Construction Contentions; Superior's customer Eveready used the Scott method in testing Superior's product, Id. at Ex. E; ASTM has a standard test method (albeit for metal powders) for testing apparent density using a Scott volumeter, Id. at Ex. M, N. Therefore, the only credible evidence that Timcal has provided to support its indefiniteness argument is Dr. Fischer's declaration in which he states that a person of ordinary skill in the art cannot tell whether the patent refers to loose bulk density or tap bulk density.

C. Extrinsic Evidence Upon Which Superior Relies

Superior argues that a person of ordinary skill in the art would read bulk density as loose bulk density measured using a Scott volumeter. In support of this position, Superior relies on an industry standard publication and two declarations. First, Superior relies on the National Electrical Manufacturers Association ("NEMA") Standards Publication CG 2-1196, Powdered Graphite. NEMA Pub. CG 2-1196, Ex. 13 to Superior's Responsive Claim Construction Brief. The publication states: "This Standard covers terminology and test methods for those physical properties and chemical properties relevant to the material characterization of powdered graphite, generally less than 75 microns, used in the electrical industry." Id. at 1. It defines bulk density as "Apparent density. The mass, under specified conditions, of a unit volume of a powder including its pore volume and inter-particle voids." Id. at 2. The publication includes a method for determining "bulk density" using the "Scott volume method," and separate methods for determining "compressed density" and "tap density." Id. at 6, 9.

Unlike the ASTM standards cited by Timcal, the NEMA standard applies to powder graphite of the particle size taught in the '694 patent.

Superior next cites to the declaration of Sim Henry ("Henry"), who worked in the graphite processing industry for twelve years. Henry declared that, as General Manager at Dixon Southwestern Graphite, he was responsible for International Standards Organization ("ISO") 9000 certification for the graphite processing plant. That process required the plant to maintain quality assurance procedures, including testing for bulk density. Based on his experiences in the graphite processing industry, Henry declared that he and others of ordinary skill would equate bulk density as used in the '694 patent to Scott density, that is, loose bulk density measured using a Scott volume machine. He declared that this density would be measured after the graphite had been air milled, and that, if the powder had settled prior to testing, it would be reconditioned to its just-processed state by fluffing. He declared that if a tapped density measurement was intended, the word "tap" or "tapped" would expressly be used. Henry did not refer to any evidence other than his own experience and the '694 patent in making his declaration.

Finally, Superior provided the declaration of David Derwin ("Derwin"), one of the named inventors of the '694 patent. Derwin has been at Superior for over 30 years. He is currently a group leader in Superior's graphite technology area. Derwin declared that persons of skill in this art area would interpret "bulk density" as used in the '694 patent to be the loose density of the product immediately after processing and would have equated "bulk density" to the Scott density. Derwin declared that Superior's internal method for determining bulk volume is equivalent to the method described in the NEMA publication. Finally, Derwin declared that although differences in the procedure used to measure the bulk density could cause the results to vary (as they did when Eveready tested a Superior product using a different size screen and a plastic scoop instead of a paint brush), the variance did not affect whether the product fell within the scope of the claims of the '694 patent. Derwin relied on his own experience, the NEMA standard, and Superior's in-house procedure for measuring bulk density in making his declaration.

D. Analysis of the Extrinsic Evidence

Because Superior's patent is presumed valid, Timcal has the burden of proof to show that bulk density (and thereby bulk volume) is not amenable to construction. Timcal has not met that burden.

Honeywell International, Inc. v. International Trade Commission, 341 F.3d 1332 (Fed. Cir. 2003), relied upon by Timcal, is instructive in reviewing Timcal's arguments that the term "bulk volume" is indefinite. In Honeywell, the patent-in-suit was for a polyethylene terephthalate ("PET") yarn used as reinforcement in automobile tires. Id. at 1334. The claims required a specific melting point elevation ("MPE") of the yarn produced by the claimed process. Id. at 1335. The written description did not disclose the method of preparing the PET yarn specimen for testing, although four methods of preparing a sample
were known to those of skill in the art at the time of the invention. Id. at 1336. The sample preparation method selected mattered a great deal; only one of the four methods resulted in the accused product falling into the MPE range claimed. Id.

The Federal Circuit reviewed whether "MPE" could be construed as "any one method," "all methods," or "the ball method," the method used by the patentee. Id. at 1339. First, the court rejected the patentee's proposed construction of the ball method, the only method that resulted in infringement, because the other three methods were well-documented in publications and prior art and because the ball method, although perhaps known, was unpublished. Id. at 1340-41. Next, the court reviewed the "any one method" construction under which the claims would be satisfied if the MPE fell within the claimed range using any one of the four methods. Id. at 1339. The court rejected this approach because the sample would fall into or out of the claimed range depending on the method chosen, and the court held that such a construction would not give competitors sufficient notice of the scope of the claims. Id. at 1341. Finally, the court rejected the "all methods" construction, under which the accused product would infringe only if it fell within the claimed range when tested using all four methods, because such a construction would render the invention inoperable. Id. at 1339, 1341.

As will be discussed below, the instant case is distinguishable from Honeywell. Timcal has made two arguments that the term "bulk volume" is indefinite: (1) the term "bulk volume" could refer to either tap bulk volume or loose bulk volume, and (2) Timcal did not specify the precise equipment for measuring bulk volume.

1. Loose or Tap Density

Timcal argues that there are two recognized methods of determining bulk density: tap bulk density and loose bulk density. 4 Tap density is measured after tapping a container of powder; tapping causes the powder to settle and results in a higher density. See Ex. 13 to Superior's Response. In the NEMA procedure for tap density, the density is measured after tapping "for a one-minute period or until no further decrease of the volume of the powder takes place," whereas the NEMA procedure for bulk density requires a person to "avoid any jarring or vibration that can compact the powder." Id. at 7, 11. Timcal relies on sample results provided in the '544 application, which show that testing of samples of graphite powder would have a bulk volume of at least 20 ml/g when measured using a loose bulk volume test but would have a significantly lower bulk volume when measured using the tap test. Ex. D to Timcal's Preliminary Claim Construction Contentions, at Fig. 4. These results show that the tap density can be more than three times greater than the bulk density. Id. Because of the wide variation in result between tap and loose bulk density, if a competitor used one test, it might believe its product was infringing, but if the competitor used the other test, it might believe the product was not infringing. Based on this, the court agrees that if Timcal is correct that a person of ordinary skill in the art could not discern whether the claims refer to loose bulk density or tap bulk density, the claims would be indefinite.

4 Timcal also mentions other types of bulk density measurements in its briefs such as packed bulk density. Since Timcal's expert, Dr. Fischer, opined only about tap and loose bulk density in any detail, the court considers these two types of bulk density measurements.

In support of its position, Timcal relies on its expert, Dr. Fischer, who declared that Superior's proposed definition in its Preliminary Claim Construction Brief would encompass both loose and tapped bulk density, that the intrinsic evidence of the patent does not indicate which method to use, and that given the variation of values of loose and tapped bulk density and the lack of guidance in the intrinsic evidence of the patent, one of ordinary skill in the art could not determine whether a product met the bulk volume limitation of the claims of the '694 patent. Dr. Fischer relied only on the '544 application (Ex. D to Timcal's Preliminary Claim Construction Contentions), the intrinsic record of the patent, and his knowledge. The court notes that while Dr. Fischer has impressive academic credentials, his level of practical experience with the type of process and product disclosed in the '694 patent is unclear.

On the other hand, Superior relies on the declarations of Henry and Derwin, one of the named inventors. Both declared that a person of ordinary skill in the art would have equated bulk density as used in the '694 patent with a loose density measured using a Scott volumeter and that a person of ordinary skill in the art would not have understood bulk density to refer to tap density unless the word "tap" or "tapped" was explicitly used. Ex. 11 to Superior's Response at 3-5; Ex. 12 to
Superior's Response at 3, 6.

The Federal Circuit has held that"it is particularly inappropriate to consider inventor testimony obtained in the context of litigation in assessing validity under section 112, paragraph 2, in view of the absence of probative value of such testimony." Solomon v. Kimberly-Clark Corp., 216 F.3d 1372, 1379 (Fed. Cir. 2000) (holding that the inventor's deposition testimony could not be used to invalidate the patent claims). Thus, the court finds that Derwin's declaration is of little, if any, probative value in determining whether the claims are definite.

Henry, however, has significant experience in materials testing in a graphite processing plant. His declaration, although based primarily on his own experience working in the field, is consistent with the NEMA publication that referred to loose bulk density only as bulk density and provided a separate procedure for tap density. Because the court finds both the NEMA publication and Henry's declaration persuasive, it holds that a person of ordinary skill in the art would read the term "bulk density" as referring to loose bulk density only.

2. Equipment for Measuring Bulk Volume

Timcal also argues that the term "bulk volume" is indefinite because the patent does not disclose the precise equipment used for measuring it. Specifically, Timcal relies on data from tests performed by Superior and Eveready. These data showed that when measuring loose bulk density using a Scott volumeter, variables in measurement technique such as type of sieve and brush make a difference in the result. Timcal, however, has not provided any evidence that any such differences are determinative of infringement. The tests performed by both Superior and Eveready resulted in a bulk volume of at least 20 ml/g as required by the claims of the '694 patent. Ex. E to Timcal's Preliminary Claim Construction Contentions.

Additionally, the variations in the test results between Superior's tests and Eveready's tests occurred because Eveready used a scoop instead of a paint brush to push the material through the screen and because Eveready used a size 18 mesh screen instead of a size 35-40 mesh screen. The ASTM method cited by Timcal requires a 16 mesh screen and a one-inch wide nylon brush. Ex. M to Timcal's Response. The NEMA standard uses a one-or two-inch wide paint brush and does not specify the size of the screen. Ex. 13 to Superior's Response. Thus, there is no evidence that it is acceptable in the industry to use a scoop instead of a brush to move the powder across the screen and into the volumeter. While it may be acceptable to use various size screens to measure bulk density using a Scott volumeter, there is no evidence as to how much of the difference in results between Superior's method and Eveready's method was attributable to the scoop and how much was attributable to the screen. In any event, since all of the results fell within the scope of the bulk volume required by the patent claims, the court finds that Superior's failure to specify the precise equipment used to test bulk density does not render the term "bulk volume" indefinite.

Since the term "bulk volume" is not "insolubly ambiguous" and can properly be given a narrowing construction, the court holds that the term "bulk volume" as used in the '694 patent is not indefinite. As part of this determination, the court reiterates that the patent is entitled to a presumption of validity and Timcal had the burden to show by clear and convincing evidence that the term "bulk volume" as used in the '694 patent is indefinite. After reviewing all of the evidence in detail, Timcal has not met that burden.

Thus, the court construes "bulk volume" as the mathematical inverse of bulk density, and "bulk density" as the mass of a unit volume of graphite powder including its pore volume and inter-particle voids, measured in its loose state using a Scott volumeter. Unlike the proposed construction in Honeywell which would have limited the claim scope to one method even though there were four known methods, this construction does not improperly redraft the claims because a person of ordinary skill in the art would find that bulk density as used in the '694 patent refers only to one method of testing, loose bulk density using a Scott volumeter. See Honeywell, 341 F.3d at 1341.

III. Conclusion

For the foregoing reasons, the term "bulk volume" as used in the '694 patent is amenable to construction and is not indefinite. The court construes "bulk volume" as the mathematical inverse of bulk density, and "bulk density" as the mass of a unit volume of a powder including its pore volume and inter-particle voids, measured in its loose state using a Scott volumeter.
Construction of all of the patented claims turns on a construction of the term "bulkhead." Transportation Seating contends that a "bulkhead" refers to any boxlike structure and that because American Seating's A.R.M. products contain a boxlike structure for receiving the anchor mechanism that the products fall within the claim language describing a "bulkhead." American Seating contends that the term "bulkhead" refers to a boxlike structure of substantial horizontal and vertical length which functions as a partition. The specification language at issue did not employ any definition of the term "bulkhead." However, it explained that term by referring to assembly D, which was marked on the various drawings contained in the patent. Assembly D, within those drawings, depicts a bulkhead of substantial size which acts as a partition. The specification also explained the term "bulkhead" in referring to one of the chief purposes of the patent--which was to prevent tripping hazards associated with the exposed mechanisms of the prior art (which included an exposed mounting plate, anchor and retractor housing) when the mechanisms were not deployed. The suggestion that the "bulkhead" and "bulkhead" assembly could be as small as the exposed mechanisms utilized in the prior art would defeat the purpose of the invention because it would substitute tripping over and tangling in the bulkhead for tripping over and tangling in the prior art's exposed mechanisms, including the anchor member, retractor housing and mounting plate. This construction of the term "bulkhead" is also confirmed by the file history. The file history, as explained in this Opinion, shows that deliberate changes were made to the claim language for the purpose of distinguishing the patent claims from the claims in the Ditch patent. The point of this distinction was the function of this invention in preventing tripping by concealing previously open anchor and locking mechanisms within a bulkhead. Given this file history, the prosecution history confirms American Seating's reading of the term "bulkhead" as referring to a structure of substantial, three-dimensional size which defeats tripping by enclosing in a partitioned manner the front locking mechanisms including anchor member and belt assemblies.

While the above construction is unambiguous and does not require reference to extrinsic evidence, the Court also determines that the extrinsic evidence on record supports this construction of the term "bulkhead." Of the dictionary definitions proffered by the parties, the most pertinent definitions are those definitions utilized within the transportation sectors, which definitions support American Seating's understanding of the term as meaning a bulkhead of substantial three-dimensional size which functions as a partition. The expert testimony of John Adelsperger, contained in his Declaration and Supplementary Declaration, also supports this interpretation of the term "bulkhead" by American Seating and further supports the conclusion that the A.R.M. products do not utilize a "bulkhead" as so defined.

The district court construed the term bulkhead to mean "a structure of substantial, three-dimensional size which defeats tripping by enclosing in a partitioned manner the front locking mechanisms including anchor member and belt assemblies." TSI argues that this definition is erroneous because it relies on a misinterpretation of the file history, improperly imports limitations from the written description into the claim, fails to consider the doctrine of claim differentiation, and is improperly based on extrinsic expert witness testimony. According to TSI, "bulkhead" should mean "a stationary housing and a slideable anchor relative to the housing."

To determine the proper meaning of the disputed claim terms, we look first to the language of the claims. Allen Eng'g Corp. v. Bartell Indus., 299 F.3d 1336, 1344, 63 USPQ2d 1769, 1772 (Fed. Cir. 2002) ("The words of the claims themselves define the scope of the invention, and are given their ordinary and customary meaning, unless the patentee has chosen to use terms in some other manner."). Claim 24 requires that the bulkhead "stow" an anchor member "retracted in a non-operating position." Similarly, claim 31 requires that the bulkhead have a "stationary housing" that contains a movable anchor "substantially within said housing" when the anchor member is in a "retracted position." Thus, the plain language of the claims indicates that a bulkhead is a structure for stowing or containing.

We look next to the specification to further understand the meaning of the term bulkhead. Id. (stating that "the specification is 'the single best guide to the meaning of a disputed term'") (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 USPQ2d 1573, 1577 (Fed. Cir. 1996)). The specification of the '325 patent does not specifically define "bulkhead," although the term is used repeatedly when describing the invention. For example, a "front anchor bulkhead" is shown in Figures 1-3, 6 and 7 of the '325 patent as element D. These figures show the bulkhead as having a box-like housing 52,
which contains a slidable anchor 54 having an attached belt assembly. The written description describes bulkhead D as follows:

A front anchor bulkhead, designated generally as D, is carried near a front portion of the securement area for securing the front of the wheelchair. There is a front wheelchair attachment assembly, designated generally as E, for attaching the wheelchair to the front bulkhead. It will be noted at this point, that barrier B and front anchor bulkhead D extend away from side wall 16a of the vehicle transversely to a longitudinal axis 50 of vehicle 11. As can best be seen in FIGS. 1, 3, and 6-7A, front anchor bulkhead D includes a housing 52 with suitable reinforcement in which a slidable anchor 54 is enclosed and stored. Slidable anchor 54 has a deployed position (FIG. 6) and a stored position (FIG. 7). In the stored position, a retractable crank/belt assembly, designated generally as 56, is stowed away. In the deployed position of FIG. 6, the belt/crank assembly 56 includes a retractable attachment belt 58 which is anchored to the wheelchair, as can best be seen in FIG. 1. When the belt/crank assembly is stowed, it can be seen that the anchor 54 and belt/crank assembly 56 are stored away clearly out of a position in which a regular passenger may trip over the structure.

'325 Patent, col. 4, l. 59 - col. 5, l. 12 (emphasized added). Thus, the description in the specification of the bulkhead is consistent with the language of the claims requiring the bulkhead to stow or substantially contain the anchor assembly.

Based on the plain language of the claims and the specification of the '325 patent, we conclude that claim 24 requires as a bulkhead a structure that can stow the claimed anchor member. Similarly, we conclude that claim 31 requires as a bulkhead a structure with a housing that can contain the claimed anchor member substantially within the housing. We see nothing in the prosecution history that is contrary to these meanings.

b. Bulkhead

The ordinary meaning of the term "bulkhead" is "a vertical partition generally extending the full width of a car and usually used to restrain lading." See The Cyclopedia, at 40. This is how the term bulkhead is used in the '575 Patent.

The bulkhead assembly in the '575 Patent is mounted above the draft sill assembly that is at approximately the same height as the wheels. The bulkhead assembly is connected to the upper side sills that are on the outside of the center beam and are at approximately the same height as the top of the center beam. The result is that the bulkhead extends the vertical length of the car.

The bulkhead assembly called for in the preferred embodiment is to be one of conventional design at the time of the '575 Patent. According to the Cyclopedia, bulkheads are usually used to restrain lading. A bulkhead assembly of conventional design as called for in the preferred embodiment of the '575 Patent would be something that performs the usual functions of a bulkhead including restraining lading.

Additionally, in the summary of the invention in the '575 Patent, bulkheads are discussed as standard features of center beam cars. Standard features generally perform the feature's usual function, and for bulkheads this is to restrain lading.

Finally, as the bulkheads in the '575 Patent are to be of conventional design and are part of the standard features of a center beam flat car, the bulkheads are construed as extending the full width of the car because that is what a bulkhead ordinarily does. See Findings of Fact, PP 111-112, 119, 122, 139-141.

E. "Bump Rails"

Element (g) in claim 18 requires:
a pair of horizontal bump rails adapted for connection with the trailer flat bed in parallel spaced relation below said pair of guide rail means, respectively, each of said bump rails extending laterally outwardly from said trailer flat bed in spaced relation below the associated guide rail means and below the lower edge portion of the associated carriage vertical wall.

Defendants argue that this element should be construed by importing some details from the specification, but defendants have not identified any ambiguities in this element that would require construction, let alone the delicate task of turning to the specification for guidance without importing details into the claim. See generally Phillips v. AWH Corp., 415 F.3d at 1323 (cautioning against this common mistake in claim construction). No interpretation is needed.

1. "burner pan"

This term appears in all of the asserted claims in both the '726 and '068 patents. Travis proposes the following construction: "a substantially flat metal plate having a gas inlet aperture, and which may or may not have perpendicular perimeter sides." Hearth proposes the following construction: "a broad, shallow, open metal container having perpendicular perimeter sides and a base used to receive a gas-air mixture to be burned." The dispute over this claim term comes down to whether the "pan" must include perimeter sides (Hearth's position) or can either include perimeter sides or be totally flat (Travis' position). The Court agrees with Travis' position and therefore construes the term to mean "a substantially flat metal plate having a gas inlet aperture, and which may or may not have perpendicular perimeter sides." Further, the Court finds that this term can be construed based solely on the intrinsic evidence without resorting to extrinsic evidence.

Independent claim 1 of the '726 patent reads, in relevant part:

A burner assembly for burning a fuel gas from a gas source, comprising:

a burner pan with a fuel gas inlet aperture therein;

and a burner body having upper and lower portions, the lower portion of the burner body being sealably connected to the burner pan forming an interior gas distribution chamber therebetween . . . .

(The '726 patent, 11:25-31 (emphasis added); see also independent claim 13, 12:24-30 (identical language)).

Another portion of independent claim 13 of '726 patent describing the burner body reads "wherein the burner pan has a base spaced apart from the burner body and a plurality of distribution fences projecting from the base . . . ." (Id., 12:46-48 (emphasis added)).

Independent claim 20 of the '726 patent reads, in relevant part:

A burner assembly for burning a fuel gas from a gas source, comprising:

a burner pan with a base having a fuel gas inlet aperture therein, and a distribution fence attached to the base of the burner pan, the distribution fence projecting away from the base;

and a burner body having upper and lower portions, the burner body being connected to the burner pan integrally forming an interior gas distribution chamber therebetween . . . .

(Id., 13:28-37 (emphasis added)).

Independent claim 1 of the '068 patent reads, in relevant part:

A burner assembly for burning a fuel gas from a gas source, comprising:

a burner pan with a fuel gas inlet aperture therein;
a spacer extending away from the burner pan;
and a burner body having upper and lower portions, the lower portion of the burner body extending at least partially into the burner pan.

(The '068 patent, 11:32-38 (emphasis added)).

Independent claim 15 of the '068 patent reads, in relevant part:

A burner assembly for burning a fuel gas from a gas source, comprising:

a burner pan with a fuel gas inlet aperture therein, the burner pan having a base;

a spacer extending away from the base of the burner pan;

a burner body having upper and lower portions, the burner body being coupled to the spacer with the lower portion of the burner body being spaced apart from the base of the burner pan by the spacer . . . .

(Id., 12:40-48 (emphasis added)).

Independent claim 23 of the '068 patent reads, in relevant part:

A burner assembly for burning a fuel gas from a gas source, comprising:

a burner pan with a base having a fuel gas inlet aperture therein;

a distribution fence sealably coupled at a bottom portion to the base of the burner pan, the distribution fence projecting away from the base;

and a burner body having upper and lower portions, the burner body being spaced apart from the burner pan integrally forming an interior gas distribution chamber therebetween . . . .

(Id., 13:31-42 (emphasis added)).

As shown by the above claim language, the burner pan is sometimes referred to as having a base, which arguably implies that it also has perimeter sides, but other times it is not referred to as consisting of a base. None of the claim language quoted above explicitly refers to perimeter sides. At the most, the claim language referring to a "base" of the burner requires that the pan have a base; it does not likewise require that the pan have perimeter sides.

Some of the passages quoted above refer to a "distribution fence" attached to or projecting away from the base of the burner pan. This language, however, does not require construing burner pan as having perimeter sides. The "distribution fence" does not refer to perimeter sides. The specification makes clear that "distribution fences" are not "perimeter fences." Both patents' description of figure 20 refer to both perimeter fences and distribution fences. It states "[t]he distribution fences 318 and the perimeter fence 316 provide a sealed area around the combustion air holes." (The '726 patent, 10:60-62; the '068 patent, 10:65-67). The distribution fences are generally the internal fences that divide the interior gas distribution chamber into sub-chambers. For instance, claim 13 of the '726 patent and claim 3 of the '068 patent refer to "the distribution fences dividing the interior gas distribution chamber into separate chamber portions." (The '726 patent, 12:50-52; the '068 patent, 11:66-12:1; see also claims 14 and 26 of the '726 patent, 12:55-56, 14:18-20, and claims 27-29 of the '068 patent, 14:22-40). There is only one reference in the claim language to perimeter sides, which appears in a dependent claim and therefore does not require construing burner pan as necessarily always having perimeter sides. (See the '726 patent, claim 25, the '068 patent, claim 30).

Travis admits that the language in claim 1 of the '068 that the burner body "extends at least partially into the burner pan" does imply a pan that had depth, which further implies a pan that has perimeter sides. Travis contends, however, that this
represents only one embodiment of the invention. Other embodiments do not include such a limitation. The Court agrees. None of the other independent claims quoted above include such language. To construe burner pan as requiring perimeter sides would be improperly importing a limitation from one independent claim into a different independent claim. See D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed. Cir. 1985) ("Where some claims are broad and others narrow, the narrow claim limitations cannot be read into the broad"). Hearth's contention that, as a general matter, a term must be construed consistently in all the claims is correct. However, that principle does not mean that the limitation in claim 1 of the '068 patent must be applied to all of the independent claims.

Figure 5 and the specification language describing figure 5 provide further support for this conclusion. The specification states "[a]s best seen in FIG. 5, the burner pan 26 is a substantially flat metal plate having a gas inlet aperture 32 . . . ." (The '726 patent, 4:17-18; the '068 patent, 4:21-22). Thus, the specification teaches that a burner pan does not necessarily have perimeter sides. The Court is not persuaded by Hearth's attempt to describe figure 5 as necessarily representing a burner pan with perimeter sides. The Court finds that figure 5 is not necessarily meant to be specific regarding the exact dimensions of the pan in relation to the air holes in the center of the pan. Moreover, the figure is drawn to be viewed at an angle; because it is not clear from the illustration what the exact angle is, it is difficult to determine what the dimensions should be even if the illustration were meant to provide exact dimensions.

Other specification language cited by Hearth does not require a contrary construction. According to Hearth, figures 17-20 show a burner pan with perimeter sides. The specification states:

- the burner pan 214 has a shallow pan configuration formed by a base 216 and a plurality of perimeter fences 224 connected to the perimeter of the base 216 and projecting upwardly away from the base. . . . The illustrated perimeter fences 224 form sidewalls that are integrally connected to the base 216. In alternate embodiments, the perimeter fences 224 can be separate structures securely attached to the base 216. . . .

  The burner pan 314 of the illustrated embodiment includes the perimeter fences 316 . . . .

(The '068 patent, 7:66-8:2; 8:8-11 describing figure 18; 10:52-54 describing figure 20). While this language does suggest that the pan consists of the base together with the perimeter fences, it also contemplates that the fences could be separate structures attached to the base. Moreover, this language represents only one embodiment of the invention.

The prosecution history does not compel a contrary construction. Hearth contends that, in the prosecution proceedings, Travis disavowed a burner pan that had anything other than upwardly extending sides. In other words, Hearth contends that Travis limited its burner pan to a pan with upwardly extending sides. Claim 1 of the '068 patent, as originally filed did not include the "extending into the burner pan" language. Instead it stated "the lower potion of the burner body being sealably connected to the burner pan forming an interior gas distribution chamber . . . ." (Travis Markman Exhibit 4 (hereinafter "Ex. 4") at 101). According to Hearth, this allowed for a burner pan with sides extending either up or down. The claim was rejected as anticipated by the prior art in the "Shimek '743 patent," which patented a portable gas burner. Hearth asserts that the Shimek '743 patent claimed a flat plate or base with downward leg extension. (Zeuli Decl., Ex. K (hereinafter "Ex. K"), figure 4 and 3:54-58). When Travis amended the claim language to have its invention be patentable over the Shimek '743 patent, Travis inserted the "extending . . . into the burner pan" language. (Ex. 4 at 101). The remarks accompanying this amendment stated that this claim was amended:

  to clarify that the burner assembly includes a spacer extending away from the burner pan, and the burner body has a lower portion extending at least partially into the burner pan. The burner body's lower portion is sealably connected to the spacer and is supported apart from the burner pan by the spacer forming an interior gas distribution chamber between the burner pan and the burner body. Shimek '743 does not disclose, teach, or suggest a burner assembly having a burner pan, a spacer extending away from the burner pan, and a burner body with the lower portion as recited in the claim 1 as amended.

(Ex. 4 at 97 (emphasis added)).

Amending claim 1 to include the "extending into the burner pan" language cannot be said to constitute a clear and unambiguous disavowal of a pan without perimeter sides. Notably, Travis did not insert this same language into the independent claims 15 or 23 of the '068 patent. Further, Travis did not state that its burner pan was necessarily different than the burner base or plate in Shimek '743. Nothing in the prosecution proceedings specifically described the burner pan.
Rather, Travis stated that Shimek '743 did not contain the combination of elements that the invention in the '068 patent contained, namely a burner assembly with 1) a burner pan, 2) a spacer extending away from the burner pan, and 3) a burner body with a lower portion that extended into the burner pan, among other aspects of the burner body. The final "and" in the quotation above supports this conclusion. Hearth's contention that Travis distinguished its invention from Shimek '743 because Shimek did not contain any of these elements would make sense only if the final "and" were instead an "or." In short, despite Hearth's contention otherwise, Travis did not make any explicit statement in the prosecution proceedings that it was limiting its burner pan to a pan with upwardly extending perimeter sides.

A. "Burning a Smoking Material at 250 [degrees] to 400 [degrees] C"

TPI first requests that "burning a smoking material at 250 [degrees] to 400 [degrees] C" be interpreted as claiming "the production of smoke at a beneficial temperature through the burning of a smoking material unless such smoking material cannot produce any smoke at temperatures of 400 [degrees] C or less, or the equivalent thereof." (TPI Brief 41.) In particular, TPI argues that this claimed temperature range of 250 [degrees] to 400 [degrees] C pertains to the temperature of the smoking material itself. It contends that any given material can "burn" only at one specific temperature, just as the only temperature at which water boils is 100 [degrees] C. The specific burning temperature of wood, according to TPI's expert testimony and treatises, varies from 200 [degrees] to 500 [degrees] C depending on the type of wood or wood product. TPI contends that adopting its proposed construction would mean that "unless a smoking material was used that did not combust or smoke at 400 [degrees] C or less, the resulting gas produced would contain, at least in part, gas produced that literally infringes the Yamaoka claim range." (TPI Brief 16).

HISI, on the other hand, argues that the phrase "burning a smoking material at 250 [degrees] to 400 [degrees]" means that the smoking material is to be burned in a medium heated to between 250 [degrees] and 400 [degrees]. They base their arguments on the syntax of the claim, the language of the specifications, the prior statements of TPI officers, and expert testimony on the practice and feasibility of measuring the temperature of smoke-producing materials.

The Court will first examine the language and syntax of the claim itself. See Eastman Kodak, 114 F.3d at 1552. Here, the syntax of the claims indicates that the 250 [degrees] to 400 [degrees] temperature range likely refers to the temperature of the medium, not the temperature of the material. In Eastman Kodak, the Federal Circuit held that where the word "at" modified the transitive verbs "crystallizing," "polycondensing," and "passing" in a process patent, it "refer[ed] to the process temperature of the heating medium, rather than the temperature of the polymer itself." 114 F.3d at 1553; see also Chef America, 358 F.3d at 1374 (distinguishing between "heating to" a certain temperature and "heating at" a certain temperature). This is very similar to the case here, where "at" modifies the transitive verb "burning," and instructs the person doing the burning to perform the process in a particular way, namely at 250 [degrees] to 400 [degrees] C.

The Court recognizes, however, that just as in Eastman Kodak, "[t]he claim language alone . . . does not settle the claim interpretation issue." 114 F.3d at 1554. The interpretation proposed by TPI, while less likely than HISI's interpretation, is not implausible. Thus, the Court turns to the specifications of the patent for additional guidance.

Unfortunately, the specifications of the Yamaoka Patent are also ambiguous. Some of the language in the specifications seems to confirm HISI's position that the stated temperature range refers to the temperature of the medium and not the material. The description of the preferred embodiment of the patent, for example, describes how "[a] temperature sensor-controller is fitted to the smoke generating chamber to direct and control the temperature therein." (Yamaoka Patent, Col. 5, at 17-20). This indicates that it is the temperature of the smoke generating chamber that is to be controlled, not the temperature of the smoking material itself.

At the same time, however, the specifications also state that the "thermostat-controlled heater" installed on the bottom of the combustion chamber "controls the production of smoke by measuring the combustion temperature." (Yamaoka Patent, Col. 4, at 21-24). Given the location of the heater directly beneath the smoking material and the phrase "combustion temperature," this specification seems to indicate that it is the temperature of the smoking material, and not the temperature of the medium, that is to be regulated by the Yamaoka Patent. Other language in the specifications is unhelpful, and can be read to support either of these two interpretations.
Because some ambiguity still remains after examining the intrinsic evidence, the Court will now turn to the extrinsic evidence for additional guidance. The extrinsic evidence in this case proves decisive. It shows (1) that people of ordinary skill in the art believed that the Yamaoka patent's temperature range referred to the temperature of the medium, not the material; and (2) that the temperature of the smoking material is not typically measured, nor is it easy to do so. Given this unrefuted evidence, the Court concludes that the 250 [degrees] to 400 [degrees] C temperature limitation of the Yamaoka Patent refers to the temperature of the medium, not the temperature of the smoking material.

First, TPI officers' own past interpretation of the claim language indicates that people of ordinary skill in the art interpreted the Yamaoka patent's claimed temperature range as referring to the temperature of the heating apparatus rather than the temperature of the smoking material. While attempting to obtain patent insurance in 2000, Richard Friend, Vice President of TPI, and someone with years of experience in the industry, stated in reference to "the Yamaoka smoke machine" that the "problem with the original design was that it took a long period of time to reach the desired temperature" and that "[a] system that . . . could combust wood at a constant high temperature was strongly desired." (HISI Am. Opp., Ex. 8). The "desired temperature" is not the temperature of the smoking material, but the temperature of the smoke machine itself.

Similarly, in a 2003 letter urging the Philippines Bureau of Patents to reject Kowalski's patent application, Friend stated that this new machine "enabled commercialization of the Yamaoka patent[ . . . ] by applying heat at high temperatures (360 [degrees]-400 [degrees]C) to thermally decompose the sawdust and thereby generate smoke." (Defs.' Ex. 10.) Again, the temperature that Friend emphasizes here as a unique feature of the Yamaoka Patent is not the temperature of the combustion itself, but the temperature that the device is "applying" to that smoking material. These statements show that at least one person skilled in the art actually believed that the temperatures referenced in the Yamaoka process referred to the temperatures of the combustion chamber, and not the temperature of the wood or sawdust.

Second, HISI provides expert testimony that measuring the temperature of the smoking material itself is not the actual practice of people in the industry, and moreover, may not even be technologically feasible. In his expert report, Dr. Joseph Maga states that "members of the food smoking industry do not measure the actual temperatures of the sawdust or wood in their production of smoke for treating food commercially." (HISI Am. Opp., Ex. 13, P 13.) Rather, he believes that "the temperatures stated in the Yamaoka patent's claim would be read by commercial producers of smoke for treating food as the temperature at which the heating unit is to be operated, as opposed to the actual temperatures of the sawdust." (HISI Am. Opp., Ex. 13, P 12.) In addition, TPI's expert, Dr. Kumazawa, admitted in his deposition that "sawdust temperature is very difficult to measure" (HISI Am. Opp., Ex. 12, at 34:8-9.) Another of TPI's experts, Dr. Hagadone, similarly indicated in his deposition that the sawdust temperature would be difficult to measure in a Yamaoka smoke machine, although he thought that perhaps it could be done "if you had some kind of transmitter device, like a Martian land[er]." (HISI Am. Opp., Ex. 11, at 175:10-11.) This sort of transmitter device, however, is nowhere mentioned in the Yamaoka Patent, leading to the conclusion that the temperature limitation claimed in the patent refers instead to the temperature of the medium.

Accordingly, the Court concludes that "a person of ordinary skill in the art in question at the time of the invention," Phillips v. AWH, 415 F.3d 1303, 1312 (Fed. Cir. 2005), would have interpreted the Yamaoka Patent's temperature limitation to refer to the temperature of the heating medium, and not the temperature of the smoking material.

TPI also requests that the Court construe the Yamaoka Patent's literally claimed temperature range of 250 [degrees] to 400 [degrees] as extending beyond the stated numerical boundaries to include any "beneficial temperature," (TPI Brief 41). While TPI contends that it is not estopped from asserting this broader range by its prosecution history, it does not provide any affirmative reason as to why "250 [degrees] to 400 [degrees]" should be construed as "beneficial temperature." The language of the claimed numerical range is plain and unambiguous. The Court therefore rejects TPI's proposed claim construction and finds that "burning a smoking material at 250 [degrees] to 400 [degrees] C" means burning a smoking material in a chamber or other medium heated to a temperature between 250 [degrees] and 400 [degrees] C.
27. The plastic washing machine basket of claim 25, wherein the basket lacks burrs at the apertures.

The '909 patent, Claim 27 (emphasis added).

ii. The parties' definitions and arguments. The parties' proffered definitions of this term are the following, with bold font indicating differences between their definitions. Again, the authority on which each party relies for its construction is shown just below that party's definition.

In its initial Markman brief, Maytag asserts that the invention in the '909 patent eliminates the problems with burrs that form on the inside surface of the washing machine basket, when using other production methods and designs, by forming the apertures in the basket during the molding operation, instead of in a subsequent manufacturing step requiring perforation of the basket. Maytag contends that its construction of "burrs at the apertures" is consistent with the only references to such "burrs" in the specification, which identifies them as sharp or jagged edges on the inner surface of the sidewall formed by perforating the apertures in a post-molding manufacturing step. Maytag contends that Electrolux's construction is strained, because it arguably would include any irregularity on the inner or outer surface of the sidewall, including irregularities that have nothing to do with punching or drilling holes. Thus, Maytag contends that Electrolux has construed the claim term without regard for the meaningful context provided by the patent specification. Maytag also argues that Electrolux's construction makes Claim 27 a nullity, if "burrs" means any irregularity on the surface of the basket. Maytag contends that Electrolux's construction also flies in the face of extrinsic testimony from Electrolux's own witnesses.

Electrolux, on the other hand, contends in its initial brief that there are only two references to "burrs" in the patent, one in Claim 27, and one in the Background Of The Invention, neither of which provides any guidance, and that there is little support for a meaning for this term in the file history. Even so, Electrolux contends that its construction is consistent with commonly understood meanings of the term drawn, for instance, from standard dictionary definitions of "burrs." Electrolux contends that Maytag's construction is faulty, because it attempts to limit the location of the "burrs" to the inner surface of the sidewall, which is not warranted by the claim language or specification, and it attempts to limit the meaning of "burrs" to rough edges formed by perforating, cutting, or drilling, when such limitations do not exist in either the patent or the understanding in the art.

In its rebuttal brief, Maytag argues that Electrolux's construction misses the mark for two reasons: it improperly includes all irregularities, roughness, and projections, which ignores the context of the term in the patent and the understanding of one of ordinary skill in the art, because all molded baskets, whatever method is used to mold them, would necessarily have some type of irregularity, roughness, or projection, but what matters is that the claimed burrs are those discussed in the specification as formed in the prior art by punching or drilling. In its rebuttal brief, on the other hand, Electrolux reiterates its arguments that Maytag's construction improperly limits the manner in which the burrs are formed and the location of such burrs. Electrolux admits that the part of the Background Of The Invention cited by Maytag supports the idea that a burr can be formed by perforation, but argues that this part does not stand for the proposition that a burr must be formed in that manner. Indeed, Electrolux contends that Maytag is misconstruing this term in the same way that Maytag accused
Electrolux of misconstructing "grooves" by importing a process limitation into the claim. Electrolux also reiterates that nothing in Claim 27 or the specification imposes any limitation on the location of the burrs to the inner surface of the washing machine basket. Electrolux also contends that additional parts of the testimony of its witnesses not submitted by Maytag actually undercut Maytag's construction.

iii. Analysis. Beginning with the words of Claim 27, see Nystrom, 424 F.3d at 1142 (construction begins with the words of the patent); Biagro, 423 F.3d at 1302 (same). It is plain that the claim language itself does not support a limitation on the location of the "burrs" to the inner surface of the washing machine basket, as Maytag asserts, or even to the inner or outer surfaces of the washing machine basket, as Electrolux contends. Rather, the claim specifies that the burrs are located "at the apertures." See the '909 patent, Claim 27. The "apertures" in question are, in turn, those defined in Claim 25, the independent claim from which Claim 27 depends. Claim 25 claims "said sidewall including inner and outer surfaces having spaced apertures extending therethrough with the outer surface being beveled at the apertures." Id., Claim 25 (emphasis added). Thus, while the apertures pass through the inner and outer surfaces of the sidewall, id., the "burrs" in Claim 27 are "at the apertures," rather than on the inner or outer surfaces of the sidewall. Id., Claim 27 (emphasis added). This location of the "burrs," specifically, "at the apertures," seems to the court to be unambiguous, so that, to construe it further might be to construe the claim term with greater specificity than is warranted by the claim language. See PPG Indus., 156 F.3d at 1355 (the task of the court is to "define[] the claim with whatever specificity and precision is warranted by the language of the claim and the evidence bearing on the proper construction")

Turning to the specification, see Phillips, 415 F.3d at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"), the court finds that the one reference to the "burrs" in the Background Of The Invention n11 is not to the contrary concerning the location of the "burrs." That reference states, "Alternatively, it has also been proposed to mold a plastic washing machine basket as a unitary structure and then perforate the holes during a subsequent manufacturing step. This method leaves burrs and sharp edges that would result in damage to garments washed in the basket." '909 patent, col. 1, 11.26-33. This snippet from the Background Of The Invention is silent about the location of the "burrs"; it certainly does not suggest that the "burrs" are located only on the inner surface of the sidewall, or on both inner and outer surfaces. Plainly, it does not state or contradict the location of the "burrs" as "at the apertures," which is the location expressly and unambiguously claimed in Claim 27. Thus, the court finds nothing in the intrinsic evidence to contradict its construction of the location of the "burrs" as "at the apertures."

n11 The court will assume, for the sake of argument, as Maytag has, that the Background Of The Invention is part of the "specification" of the invention, just as the Detailed Description Of The Invention clearly is.

Therefore, based on the plain language of the claim and the little insight provided by the specification, the court concludes that the "burrs" are unambiguously claimed to be located "at the apertures."

Unfortunately, the court finds that the language of Claim 27, and the language of the independent claim from which it depends, Claim 25, do not shed any light on the meaning of "burrs." The court also finds that the specification is largely unhelpful as to the nature of the "burrs," but not because it is merely silent on the question. Electrolux is correct that the reference to "burrs" in the Background Of The Invention merely suggests that "perforating holes . . . leaves burrs," but it does not suggest that "burrs" mean only flaws left by "perforating holes." Rather, in context, this reference to "burrs" in the Background Of The Invention indicates that "burrs" are one kind of flaw left by "perforating holes," another is "sharp edges." '909 patent, col. 1, ll. 26-33. Furthermore, to read "burrs" as limited to flaws created by "perforating holes," if one could read the reference in the Background Of The Invention that way, would also be to import, improperly, a limitation from the specification into the claim term. See Playtex Prods., Inc., 400 F.3d at 906 ("The court must take care in its analysis, when locating in the written description the context for a disputed term, not to import a limitation from that written description. It must use the written description for enlightenment and not to read a limitation from the specification [into the construction of the term].") (citing Comark Comms., 156 F.3d at 1186-87). Therefore, based on the plain language of the claim and the little insight provided by the specification, the court concludes the "burrs" are not formed exclusively by "perforating holes," such that any reference to formation only by "perforating" is inappropriate.

Thus, the remaining issue is, what is the nature of a "burr," if it is not a flaw formed exclusively by "perforating"? The court can find nothing, and the parties have pointed to nothing, in the words of Claim 27 or any other claim in the patent that illuminates the meaning of "burrs." See Nystrom, 424 F.3d at 1142 (construction begins with the words of the patent); Biagro, 423 F.3d at 1302 (same). The few references in the specification cited by the parties are only slightly more
illuminating. See Phillips, 415 F.3d at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"). What the reference to "burrs" in the Background Of The Invention may suggest is that "burrs" means something different from "sharp edges," or the reference to "burrs and sharp edges" left by perforation would be redundant. '909 patent, col. 1, ll. 29 (emphasis added). The other reference cited by the parties, this one from the Detailed Description, states, "Since holes 44 are recessed within the teardrop-shaped grooves 50, any edges on the holes 44 will be prevented from snagging clothes placed in basket 2." The '909 patent, col. 6, ll. 64-67. However, this reference does not mention any kind of flaw that could be taken to mean a "burr," because it simply refers to "any edges on the holes."

Having exhausted the possibilities of intrinsic evidence, the court turns to standard dictionary definitions for assistance. See Free Motion Fitness, Inc., 423 F.3d at 1348 ("Phillips confirms that courts may "'rely on dictionary definitions when construing claim terms'" and that 'dictionaries... are often useful to assist in understanding the commonly understood meaning of words.") (quoting Phillips, 415 F.3d at 1322, in turn quoting Vitronics Corp., 90 F.3d at 1584 n.6). Indeed, the court finds that it is possible to construe "burrs" simply "by applying the widely accepted meaning of [this] commonly understood word[.""] Network Commerce, Inc., 422 F.3d at 1359. Maytag nominates the following definition from WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY, 300: "a thin ridge or area of roughness produced in cutting or shaping metal (as in drilling, turning or blanking)." Electrolux nominates the following definition from AMERICAN HERITAGE DICTIONARY, 258, definition 1, n.1: "a rough edge or area remaining on material, such as metal, after it has been cast, cut, or drilled." These definitions do not differ significantly, but neither do they directly support the respective constructions of "burrs" offered by the parties citing them. Nowhere in Maytag's dictionary definition is there any reference to a "burr" as a "sharp or jagged edge," as in Maytag's proffered construction, and nowhere in Electrolux's dictionary definition is there reference to "burrs" as "irregularities... or projections," as in Electrolux's proffered construction.

What both dictionary definitions do support, however, is the construction of "burrs" as "rough areas... remaining after material is shaped, cut, cast, or drilled." The court does not believe that adopting such a construction of "burrs" would constitute giving that term "its broadest dictionary definition or the aggregate of multiple dictionary definitions," but would, instead, be "the most appropriate [dictionary] definition" after "scrutinizing the intrinsic evidence." Free Motion Fitness, Inc., 423 F.3d at 1349 (citing Phillips, 415 F.3d at 1320-24). Specifically, this construction is not an "aggregate" of the parties' nominated definitions, but a recognition of the extent to which those nominated definitions overlap. For example, both nominated definitions refer to "rough areas." Although both nominated definitions then also identify a particular kind of "rough area," either a "thin ridge" or "a rough edge," such specificity is not warranted by any language in Claim 27 or elsewhere in the patent. See PPG Indus., 156 F.3d at 1355 (the task of the court is to "define[] the claim with whatever specificity and precision is warranted by the language of the claim and the evidence bearing on the proper construction"). Both nominated definitions also refer to the "rough area" as "produced in" or "remaining on" material; thus, both suggest results of a formation process, albeit one from the "cause" perspective (Maytag's nominee from WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY, 300: "a thin ridge or area of roughness produced in cutting or shaping metal (as in drilling, turning or blanking)" (emphasis added)) and one from the "effect" perspective (Electrolux's nominee from AMERICAN HERITAGE DICTIONARY, 258, definition 1, n.1: "a rough edge or area remaining on material, such as metal, after it has been cast, cut, or drilled" (emphasis added)). Similarly, "shaping" includes the other dictionary identifications of the method of producing the "burrs," specifically, "turning or blanking," "drilling," "cutting," or "casting." "Shaping" also includes the method of creating "burrs" in the sole reference to "burrs" in the Background Of The Invention ("perforating"), as well as the claimed method of forming washing machine baskets in the patent ("molding"). For the same reason, including "drilling" and "cutting" in the construction is appropriate, because those terms are also consistent with the method of creating "burrs" in the sole reference to "burrs" in the Background Of The Invention ("perforating"), while including "casting" in the construction is appropriate, because it is consistent with the claimed method of forming washing machine baskets ("molding").

Maytag's concern that construction of "burrs" simply as "rough areas" could encompass any irregularities on the surface of the washing machine basket is unfounded. That concern is eliminated by the language of the claim itself, which specifies that the "burrs" (i.e., "rough areas remaining after material is shaped, cut, cast, or drilled") are "at the apertures" through the sidewall of the washing machine basket, see the '909 patent, Claim 27 ("burrs at the apertures"); see also id., Claim 25 (the apertures are through the sidewall), not elsewhere on the inner or outer surfaces of the washing machine basket. Therefore, the court concludes that the appropriate construction of "burrs at the apertures," in light of the intrinsic evidence and extrinsic standard dictionary definitions, is the following: "Rough areas at the apertures remaining after material is shaped, cut, cast, or drilled."
The term bushing is used throughout the claims and specification for the '988 Patent. While the parties agree that bushing must be construed as a hollow cylinder in accordance with its ordinary meaning, they dispute whether the patent limits the type of material used to construct the bushing.

The claim language of the '988 Patent does not specify that the bushing must be composed of certain material. See e.g. Pl's Markman Br. Ex. E. col. 7 ll. 21-22 ("a bushing"). This accords with the ordinary meaning of bushing as being made from metal or other material. Id. at Ex. I. The patent specification to the '988 Patent states that a plastic bushing might be advantageous to avoid frictional contact between the support block and the tilter shaft. Id. at col. 5 ll. 17-32. Yet, the applicant decided not to claim the material of the bushing in the patent. Therefore, Innovative argues the claimed invention should not be construed narrowly as a non-metalic bushing. Defendants, on the other hand, contend that the bushing must be made of a non-metalic material because the applicant disavowed metal bushings in the '988 patent specifications by stating the advantages of plastic.

The patent applicant's decision to claim a bushing without limiting the construction material shows an intention to cover all material for bushings. Therefore, the court will construe "bushing" to mean "a hollow cylinder," without limiting the material of its construction, in accordance with the general rule of construction that limitations in the specification are not to be read into the patent claims. Prima Tek II, 412 F.3d at 1289.

4. "business office device"

The next disputed term "business office device" appears in various claims of the '289, '120 and '618 Patents. Ricoh proposes the following construction:

A business office device is an intelligent module of an office machine system that includes a device engine for carrying out the mechanical operations of the office machine system, and its own communication capability that enables it to communicate intelligently with other modules of the office machine system, or with other devices. The intelligent business office device makes use of an intelligent communication protocol.

(Chart at 13). Pitney asserts that "business office device" is "a copier, printer or facsimile or other business office equipment." (Id.).

The Court finds that the intrinsic evidence, particularly the claims in this instance, provides a straightforward definition for this term which is consistent with Pitney's proposed construction. As the Federal Circuit noted in Phillips, the claim in which the term appears and other claims of a patent, including both asserted and unasserted claims, can serve as "valuable sources of enlightenment as to the meaning of the claim term." Phillips, 415 F.3d at 1314. Claim 1 of the '289 Patent reads:

A method, comprising the steps of:
storing semi-static state data in a business office device, the semi-static state data including data which may change infrequently over a life of the business office device;

initiating communication between the business office device and a computer, by the business office;

transmitting the semi-static state data from the business office device to the computer; and

receiving the semi-static state data by the computer.

'289 Patent, Claim 1. Notably, dependent claims 4 through 6 further recite:

4. A method according to claim 1, wherein: the business office device is a copier . . .

5. A method according to claim 1, wherein: the business office device is a facsimile machine . . .

6. A method according to claim 1, wherein: the business office device is a printer . . .

Id., Claims 4-6. Thus, the plain language of the claims appearing in the '289 Patent clearly defines copiers, facsimiles and printers as examples of a "business office device." This language is consistent with Pitney's construction.

Additionally, Pitney's construction is further supported by the specification. In the Background of the Invention, the patentee states:

The present invention relates to a method and apparatus for communicating and controlling various types of business office equipment or devices transparently and uniformly. The types of business equipment could be copiers, facsimiles and/or printers.

The creation of business office devices such as a copier, facsimile or printer requires activities assigned to various groups which must be integrated into at a certain time.

Id., col. 1, ll. 15-23 (emphases added). Support for this construction is further found in the Abstract which describes the claimed invention as "[a] method and apparatus for controlling and communicating with business office devices, such as copiers, facsimiles and/or printers." Id., Abstract. In light of the intrinsic evidence, the Court finds that the patentee acted as his own lexicographer with respect to the term "business office device" by setting forth a clear definition in the specification.

Ricoh argues that Pitney's proposition is incorrect because: 1) the prosecution history supports its construction which includes language regarding intelligent modules and communication, (Chart at 13-14); and 2) by adopting Pitney's construction, the Court would not maintain integrity between the Court's definitions. (Tr. of Markman Hr'g at 44-45). With respect to Ricoh's first argument, the Federal Circuit clearly indicated that the specification is usually dispositive and "the single best guide to the meaning of a disputed term." Phillips, 415 F.3d at 1315. The Court remains mindful that "because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes." Id. at 1317. In this case, the Court relies heavily upon the specification as opposed to the prosecution history in defining this term since it provides a clear definition for "business office device" -- one that is consistent with Pitney's construction.

The Court further rejects Ricoh's second argument as a basis for adopting its proposed construction. Ricoh argues that integrity between the Court's constructions is not maintained because the "business office device" must be "just the engine" of a device, rather than the device as a whole. (Tr. of Markman Hr'g at 44:14-45:1). Ricoh, however, fails to provide any basis for limiting the construction to "just the engine" when the claims and specification clearly indicates otherwise. Consequently, the Court concludes that a "business office device" means "a copier, printer or facsimile or other business office equipment."

GO BACK
The '091 patent refers to several patents as prior art. The prior art consists of numerous methods and devices for shucking the clams, extracting or removing the clam meat, cleaning or washing the meat, separating the viscera from the tongue portion and cutting or chopping the tongue into small portions. According to plaintiff's patent specification, however, "none of these references disclose using the tongue or foot of the clam as a one-piece food product."

To remedy this perceived deficiency, plaintiff's patent discloses a method for cleaning and preparing clam tongues, by "butterflying" the tongues into "cutlets," and passing them through a mechanical meat tenderizer. In particular, plaintiff made the following claims in his patent:

1. A method for preparing a one-piece clam tongue for consumption, which comprises extracting the clam from its shell, removing the viscera from said tongue, separating the tongue from any remaining flesh, butterflying said tongue and passing it through a mechanical meat tenderizer to provide thereby a tender, edible one-piece clam cutlet.

2. The process of claim 1 wherein said tongue is washed with water prior to said butterflying step.

3. The process of claim 1 wherein said tongue is cut along one of its vertical edges to form the butterfly cutlet.

4. The process of claim 1 wherein said tongue is cut along one of its horizontal edges to form the butterfly cutlet.

5. The process of claim 1 wherein said tongue is tenderized and then subsequently butterflied.

6. The process of claim 1 wherein said tongue is butterflied first and then tenderized by a mechanical tenderizer.

7. A method for providing a one-piece clam cutlet which comprises sequentially:
   (a) extracting substantially all the clam flesh from its shell;
   (b) separating any viscera from any edible meat parts of the extracted clam;
   (c) discarding the extracted viscera;
   (d) washing the remaining meat parts of the clam to remove sand and other debris;
   (e) separating the meat parts into the tongue, the mantles, the siphons and the adductor muscles;
   (f) bisecting said tongue in a manner whereby the bisected pieces are connected at a folding edges; and
   (g) passing said tongue through a mechanical meat tenderizer.

8. The process of claim 7 wherein said tongue is washed with water prior to said butterflying step.

9. The process of claim 7 wherein said tongue is cut along one of its vertical edges to form the butterfly cutlet.

10. The process of claim 7 wherein said tongue is cut along one of its horizontal edges to form the butterfly cutlet.

11. The process of claim 7 wherein said butterflying step includes separating the butterflied portions into two separate parts.

The '091 patent does not claim a particular tenderizer apparatus or device, but instead refers to previous patents for mechanical meat tenderizer blades. Plaintiff does not have a protected patent interest in the mechanical tenderizer blades.

*   *   *
B. Literal Infringement

The heart of the parties' dispute regarding infringement centers on the meaning of the terms "butterflying" and "bisecting" as contained in the patent claims. Claim 1 states that the patented method includes a step in which the tongue is "butterflied." Claim 7, the only other independent claim, describes sequentially a process including a step in which the tongue is "bisected ... in a manner whereby the bisected pieces are connected at a folding edge." Throughout the patent specification, the two terms are used interchangeably, and the dependent claims to claim 7 refer to the "butterflying step" of claim 7. "Butterflying" is in turn defined as occurring when "the feet are bisected leaving the two parts connected by a narrow part along one edge of the foot," and "is intended to include one or two-pieced tongues where the tongue is cut in half and either separated or maintained as a single piece." I conclude that claims 1 and 7 are referring to the same step when they use the term "butterflying" and "bisecting."

Aside from the explanations stated above, the patent specification and claims do not contain a detailed definition of the term "butterflying." The specification does contain, however, several figures depicting the anatomy of a clam, the clam tongue after being separated from the other organs, and a picture of the tongue after being butterflied or bisected in different ways. As depicted in Figure 2, the intact clam tongue is roughly triangular in shape, and is pictured with its flat surface facing the viewer. Forming the sides of the triangle in the figures is a short straightish edge (referred to as the "horizontal" edge), a longer straightish edge (the "vertical" edge), and a long, quite curved edge. When the clam is butterflied, a cut is made through the tongue, on a plane parallel to the flat surfaces of the clam, leaving either the vertical or the horizontal edges intact. The resulting thinner "flaps" are spread out, but remain connected at either the vertical or the horizontal edge (Figures 3 and 4, respectively). The patent specification states that instead of leaving the edge intact, the resulting "flaps" can also be separated into two distinct pieces (Figure 5). As described in the specification, "the butterfly cutlet consists of two mirror image sections ... connected by a focal portion."

Based on the patent claims and specification, including the figures just described, I determine that, to someone skilled in the art of processing and preparing seafood, the term "butterflying" means cutting the clam tongue in half along the plane parallel to the flat surfaces of the tongue, and either leaving the resulting portions connected along one edge, or separating the portions into distinct pieces. I determine, as well, that the scope of plaintiff's patent claims is limited by the requirement that the clam tongue be butterflied as part of the patented process.

Plaintiff argues that the patent specification contains statements that support a broader interpretation of the scope of plaintiff's patent. In the section describing the figures and the "preferred embodiment" of the process, plaintiff stated that the clam tongue could be butterflied along the horizontal or vertical edge, and that, "if desirable, the tongue can be cut into two distinct parts or used as a single piece rather than butterfly." The specification also states that "the tongue to be ultimately used can be (1) two or more portions of tongue, (2) one piece not butterflied or (3) the preferred butterflied as shown in drawing." In his opposition to defendant's motion for summary judgment, plaintiff suggests that the patent covers clam tongues that are not butterflied, and argues that, at the least, the specification supports construing claims 1 and 7 to include any step by which a clam tongue is "cut[] in half with or without a connecting edge."

Plaintiff's argument is not persuasive. Claims 1 and 7 both state, as a limitation to the claims, that the process involves a step in which the tongue is butterflied or bisected leaving a connecting edge. Neither of the claims states that the tongue could be left in one piece and also not butterflied. As noted in Part III, above, the claim language, not the specification, defines the scope of the patent. See, e.g., Markman v. Westview Instruments, Inc., 52 F.3d 967, 980 (Fed. Cir. 1995) ("The written description part of the specification itself does not delimit the right to exclude. That is the function and purpose of claims."). Where, as here, the plaintiff states an express limitation in the claims (that the tongue be butterflied), the plaintiff cannot "avoid that claim limitation in a later infringement suit by pointing to one paragraph in his specification stating an alternative that lacks that limitation, and thus interpret the claim contrary to its plain meaning." Unique Concepts, 939 F.2d at 1562.

My examination of the claims, in light of the specification, convinces me that the terms "butterflying" and "bisecting" (as used in claim 7) are to be understood as having the meaning stated above, namely, cutting the tongue in half, parallel to the flat surfaces, and either leaving the "mirror image" portions connected at one edge or separating them. Although the latter option might not ordinarily be understood as the result of butterflying (because the pieces are not connected), I conclude that the specification and the claims themselves plainly include this as part of the claim limitations.
This is not the case, however, with the definition urged on the court by plaintiff. The statements cited by plaintiff run contrary to the repeated descriptions in the specification and in every single one of the claims that the process includes a butterflying step as I have construed such a step. Under the trimming step performed by defendant, the tongue is cut on a plane perpendicular to the flat surfaces, and the piece near the rough edge of the tongue is removed and discarded. This step plainly does not fall within the definition of butterflying as that term is used in the claims of the '091 patent.

Rome disputes the trial court's construction of claims 1 and 7 of United States Patent No. 4,715,091 (the 091 patent). The court construed both method of preparation claims to require "butterflying" or its synonym "bisecting." "'Butterflying,' means cutting the clam tongue in half along the plane parallel to the flat surfaces of the tongue, and either leaving the resulting portions connected along one edge, or separating the portions into distinct pieces," the court interpreted. Id. at 103. We agree and adopt the court's claim construction and attendant reasoning.

13. button

This term appears in claims 1 and 5 of the '754 patent. The plaintiff proposes "the button used by the user to input cognitive selections into the system. The button is not part of a keyboard or numeric keypad." The defendant asserts that this term is indefinite. Alternatively, the defendant's construction is "a button with which the user can initiate the generation of the block location information and the character identification information by the working platform." Although the written description includes an embodiment that utilizes a button as the defendant's construction suggests, those passages of the written description are not limiting. In light of specification, including the claims of the '754 patent, the court concludes the term "button" means "a button for making entries."

A. "buttress material"

The parties dispute the meaning of the term "buttress material" as it appears in claims 37, 41, and 45 of the '748 Patent. Synovis contends that the jury can easily grasp the meaning of the term and therefore no construction is necessary. Alternatively, if the Court decides to construe the term, Synovis asserts that that the term "buttress material" should be construed as "material useful for reinforcing a seam." (Joint Proposed Claim Construction Statement ("Joint Statement") at 4.) Gore, on the other hand, asserts that the Court should construe "buttress material" as "biomaterial formed from animal tissue designed to be used in a surgical procedure to reinforce a staple line." (Id.) The parties' dispute therefore centers on whether the term "buttress material" is limited to "biomaterial formed from animal tissue."

In support of its construction, Synovis points to the specification of the '748 Patent, beginning with the description of the Technical Field, which states:

In one aspect, the invention relates to surgical staplers, including circular staplers. In another aspect, the invention relates to surgical stapling procedures that include the use of buttress and reinforcing materials formed of stabilized tissues and polymeric [3] materials. In yet another aspect, the invention relates to the preparation and use of preformed heterologous tissues for implantation within the body.

(‘748 Patent c. 1, 11: 5-12.) In addition, Synovis points to portions of the specification that explain, for example, that "a variety of references teach the preparation of 'buttress,' or 'pledget' or 'reinforcing' materials for use in combination with conventional surgical staplers." (Id., c. 2, 11: 7-10.) Synovis asserts that the specification shows that "buttress" and "reinforce" have similar meanings. Synovis further maintains that the '748 Patent uses "buttress material" to mean "material
useful for reinforcing a seam." (See '748 Patent c. 6, 11:11-14 ("FIG. 4 shows a cross-section view of the overall process of creating a reinforced stapled connection for tubular tissue . . ."). Finally, Synovis argues that Gore's proposed construction departs from the language of the claim and would improperly limit the claims to a single disclosed embodiment.

--- Footnotes ---

3 Polymeric refers to plastic materials.

--- End Footnotes ---

Gore asserts that the term "buttress material" is explicitly defined in the specification as being composed of "biomaterial formed from animal tissue." Gore contends that this definition is mandated by the description of the invention which Gore contends describes only the use of biomaterial. In addition, Gore asserts that the inventors consistently describe the use of animal tissue in buttress material throughout the patent, and particularly that the written description focuses exclusively on the use of animal tissue.

The term "buttress material" appears in the claim language of claims 37, 41, and 45 simply as "buttress material" and is not expressly limited to "biomaterial formed from animal tissue." Gore does not dispute that the claim language lacks an express limitation to "biomaterial formed from animal tissue," but instead asserts that the specification provides an explicit definition of "buttress material." In support, Gore points to a portion of the Detailed Description of the specification, which reads: "Circular stapler buttress material is composed of biomaterial which is typically bovine pericardium sheet fixed onto a preformed shape using a tanning solution." ('748 Patent c. 7, 11: 5-6.) The patent specification "may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess." Phillips, 415 F.3d at 1316. Here, however, when viewing the patent in its entirety, the Court finds that the specification does not transform the plain meaning of "buttress material" to be limited to "biomaterial formed from animal tissue." First, the language cited by Gore reveals that "bovine pericardium" is only an example of a buttress material and that the patentee contemplated the use of additional materials. The use of the word "typically" immediately preceding "bovine pericardium" underscores the notion that "bovine pericardium" was not meant to be the exclusive material for "buttress material." In addition, the Background of the Invention portion of the specification references three patents that disclose non-woven polyethylene as a buttress material. (See '748 Patent c. 2, 11: 10-12; Mayer Decl. P 2, Ex. B at c. 2, 11: 41; P 3, Ex. C at c. 2, 11: 42-43; P 4, Ex. D at c. 3, 11: 29-30.)

--- Footnotes ---

4 Gore argues that these patents were not incorporated by reference, are not part of the patent's written description, and thus do not aid in claim interpretation. The Court disagrees. Even if the patents were not incorporated by reference, they are listed on the first page of the patent under "References Cited." The Court concludes that these patents can shed light on claim interpretation. See, e.g., Arthur A. Collins, Inc. v. N. Telecom Ltd., 216 F.3d 1042, 1045 (Fed. Cir. 2000) ("When prior art that sheds light on the meaning of a term is cited by the patentee, it can have particular value as a guide to the proper construction of the term, because it may indicate not only the meaning of the term to persons skilled in the art, but also that the patentee intended to adopt that meaning.").

--- End Footnotes ---

Claim differentiation further suggests that the patentee did not intend to limit "buttress material" in claims 37, 41, and 45 to "biomaterial formed from animal tissue." "Differences among claims can also be a useful guide in understanding the meaning of particular claim terms." Phillips, 415 F.3d at 1314. Here, claim 1 of the '748 Patent contains the term "buttress material" as it is appears in independent claims 37, 41, and 45. ("748 Patent c. 12, 11: 27.) Claim 2, which is dependent on claim 1, reads in part: "A combination according to claim 1 wherein the buttress material comprises preformed animal tissue." (Id., c. 12, 11: 49-50.) Thus, it is presumed that the patentee did not intend for the "buttress material" in independent claim 1 to be limited to animal tissue. 5 See, e.g., Phillips, 415 F.3d at 1315 (noting that "the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim"). In addition, because claims 37, 41, and 45 also lack the "preformed animal tissue" limitation, it is presumed that the patentee did not intend for those claims to be so limited.
Defendant Gerber manufactures and sells a line of spill-proof cups and replacement valves. The valves in its cups are curved inwardly such that they are convex to the interior of the cup and the direction of flow of the liquid.

The '457 patent was issued on September 12, 2000. It includes a single independent claim.

1. An article through which or from which a drinking liquid is taken by a consumer, the article having a spout provided with a valve comprising a membrane of resiliently flexible material, said membrane being provided with at least one split adapted such that the liquid may be drawn from or through said article by the sole application of a predetermined level of suction in the region of said valve, characterized in that the membrane has a normal condition in which it is dished inwardly of the article, opposite the direction through which the drinking liquid is taken in use of the article and is adapted to close up by returning to the normal inwardly dished condition under its own resilience when such suction is removed.

The claims submitted in the application that ultimately led to the granting of the '457 patent ("'457 application") contained no reference to operation by the sole application of suction. The original claims were rejected on the basis of anticipation and obviousness. Plaintiff added the language related to operation by the sole application of suction in an effort to overcome the prior art, particularly the Coy patent.

United States Patent No. 5,186,347 to Freeman ("Freeman patent") is prior art to the '457 patent. The Freeman patent teaches a flat valve operable by suction for use in a drinking cup.

United States Patent No. 5,071,017 to Stull ("Stull patent") is prior art to the '457 patent. The Stull patent teaches a variety of valves, including inwardly dished valves for use in squeeze bottles.

United States Patent No. 5,213,236 to Brown ("Brown patent") is prior art to the '457 patent. The Brown patent relates to a dispensing package for fluid products such as liquid soaps and particularly to a valve in such a product.

The valve includes a marginal flange, a valve head with a discharge orifice therein, and a connector sleeve having one end connected to the valve flange and the opposite end connects with the valve head adjacent a marginal end thereof. The connector sleeve has a resiliently flexible construction, such that when pressure within the container raises above a predetermined amount, the valve head shifts outwardly in a manner which causes the connector sleeve to double over and extend rollingly.

Brown patent abstract. Figure 10 depicts a preferred embodiment of the Brown valve.
preferred embodiment.

GET DRAWING SHEET 3 OF 3

Prior to trial the Court rejected defendant's summary judgment motion to find that Lampe anticipates the '457 patent. The basis for denying the motion was that the element of operation by "sole application of a predetermined level of suction" was not expressly disclosed in Lampe.

The Court also addressed the issue of obviousness in the summary judgment order:

The issue here is whether it would have been obvious to one of ordinary skill in the art to combine the convex-to-flow valve from the squeeze bottle prior art of Brown and Lampe with the teachings of trainer cup prior art to produce the suction operated vessel of the '457 patent. The evidence presented on this motion is insufficient to find by clear and convincing evidence that this combination was obvious as a matter of law. While defendant Gerber has compared the invention with the prior art it has provided virtually no evidence relevant to the motivation to combine, or to overcome objective evidence of non-obviousness. Concerning the motivation to combine, Brown and Lampe each teach away from creating a pressure differential by operation of suction teaching instead to increase internal pressure by squeezing the container.

…Evidence provided by plaintiff suggests that she has successfully licensed the invention to others and that defendant Playtex copied the invention for use in its competing products. Defendant Gerber offers nothing to counter this evidence or to suggest alternative reasons for the invention's success other than its novelty. While defendants may be able to demonstrate obviousness at trial, the evidence presently before the Court presents factual issues which preclude summary judgment.

The Court subsequently construed this element and instructed the jury as follows:

As used in claim 1 of the '457 patent the phrase "adapted such that liquid may be drawn from or through said article by sole application of suction" means that it is possible for the user to draw the drink from the vessel using only suction.

The jury found the '457 patent anticipated. In overturning the jury verdict of anticipation the Court of Appeals noted that facts had not been sufficient to establish that the Brown valve was necessarily operable by suction. The Court remanded for a jury determination on the issue of obviousness.

C. Calculating/Determining

Claim 1 and Claim 9 contain disputed limitations which refer to the calculation of the rate of blood flow. Although the
language used in each limitation is slightly different -- the former refers to "calculating" while the latter refers to "determining" -- both parties agree that the meaning of each limitation is the same. However, the parties do not agree what the meaning is. Plaintiff would interpret "calculating/determining" to mean: "(1) the actual access blood flow using the measured amount of distinguishable blood characteristic (for example, flow = 600 ml/minute), (2) a number related to the flow rate from which flow rate can be determined, or (3) determining whether the flow rate is above or below a predetermined threshold (for example flow >/= 600 ml/minute)." (Pl's Reply Brief at 13). In contrast, defendant suggests the proper construction would be limited to: "determining a number representing the amount of flow of blood in the line per unit time without using a recirculation calculation, and using the equations set forth in the specification." (Def's Opening Brief at Exh. 1).

Nothing in the record, however, suggests that the terms "calculating" or "determining," as used in patent '989, mean anything other than, "to determine by mathematical equation." See WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY (1991).

4 The relevant, disputed limitation in Claim 1 reads as follows: "calculating the rate of flow of said shunt blood flow in said arterio-venous shunt from said measured amount of distinguishable blood characteristic." The relevant, disputed limitation in Claim 9 reads as follows: "determining the rate of patient blood flow in said shunt from the measured amount of said changed parameter."

While defendant asserts that representations made by plaintiff to the PTO now prevent plaintiff from relying on the plain language of the claim limitations, the Court is unpersuaded by this argument. Defendant relies heavily on a representation made by plaintiff to the PTO in which plaintiff stated:

[Recirculation and blood flow] are unrelated quantities, for shunt recirculation can only occur when the patient is connected to a hemodialysis machine through intake (arterial) and delivery (venous) lines. . . . Line blood flow, however, is a cardiovascular system quantity. It is the flow of blood, in mL/min, inside a patient, and a functioning shunt in a patient will always conduct such flow, whether a patient is connected to the dialyzer or not.

(Specification, Ex. B at FH 989 0143). Specifically, defendant emphasizes plaintiff's statement that recirculation and blood flow "are unrelated quantities" in support of its position that the "calculations/determinations" anticipated by patent '989 do not, and cannot, rely on recirculation measurements in any way.

This emphasis, however, distorts the meaning and context of plaintiff's statement. As plaintiff stated in oral argument, the PTO was concerned that prior art which calculated recirculation in shunts rendered the '989 patent obvious. In response to this concern, plaintiff carefully explained to the PTO that the '989 patent device calculated, as an ultimate computation, blood flow -- a rate distinct from, or "unrelated" to -- recirculation rate. However, in making this distinction clear to the PTO, at no time did plaintiff disavow the device's possible reliance on a recirculation rate in calculating its ultimate blood flow determination.

Defendant also asserts that the equations set forth in the specification are the equations contemplated by the '989 patent. The intrinsic evidence cited by defendant in support of this argument, however, is comprised of nothing more than references taken out of context and puffed up to support defendant's position. While plaintiff did proffer various dilution equations in the specification to illustrate the preferred embodiments of their device calculations, no statements in the prosecution history suggest that plaintiff, or the PTO, intended to limit the blood flow calculation to the preferred embodiment equations. See Rhine, 183 F.3d at 1346.

After careful consideration, we reject NMT's arguments. We discern no error in the district court's construction of the "mixing and "changing" limitations or in its findings that those limitations are met by NMT's Delta H method. However, as far as the "calculating" and "determining" limitations are concerned, we believe that the district court's construction was too broad.
In construing patent claims, we look to the intrinsic evidence of record — the claims, the specification, and, if in evidence, the prosecution history. Vitronics Corp. v. Conцепtronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). "One purpose for examining the specification is to determine if the patentee has limited the scope of the claims." Watts v. XL Sys., Inc., 232 F.3d 877, 882, 56 U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 2000). The '989 patent describes the determination of shunt blood flow with reference to specific equations. See, e.g., '989 pat., col. 1, II. 56-61 ("Blood flow, Q, measured by the dilution method . . . is given by Q=V/S (Eq. 1)."); see also id. at col. 2, II. 31, 34, 57, 67 (setting forth alternative equations 2-5); id. at col. 3, II. 2, 24, 33 (setting forth alternative equations 6-8). Moreover, the "SUMMARY OF THE INVENTION" section of the patent teaches that "the blood flow relationships are calculated in accordance with the foregoing equations." Id. at col. 4, II. 26-27. There is no description of "calculating" or "determining" blood flow that does not require the use of at least one of the disclosed equations. Moreover, no language in the specification indicates that the invention encompasses other methods of "calculating" or "determining" blood flow.

The prosecution history also may be "of critical significance in determining the meaning of the claims." Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577. During prosecution of the '989 patent, in response to an Office Action rejecting the pending claims, Transonic identified several "primary features of the invention." Included in these features is "the calculation of shunt blood flow (line blood flow) from the sample via dilution principles as is taught in the present application." As discussed above, the only "calculation . . . via dilution principles" taught in the specification of the '989 patent revolves around the disclosed equations. In the same response, Transonic argued that the disclosed equations are critical to achieving the purpose of the invention and are novel over the prior art:

"The purpose of the invention is to measure shunt (blood line) blood flow, and for this purpose the application sets out the flow relationships which permit calculation of the line blood flow from other measurements. These relationships are not taught in the prior art. . . ."

Moreover, Transonic distinguished a prior art reference by explaining that, "in the present invention[,] shunt flow is calculated from a dialysis flow and a concentration curve measurement." Taken together, these statements indicate that the disclosed equations are part of the claimed invention, play an important role in achieving the objects of the invention, and help to distinguish the invention from the prior art. By describing the invention in these terms, Transonic disclaimed any interpretations of the terms "calculating" and "determining" that do not reflect the stated significance of the disclosed equations to the invention as a whole. See Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir. 1995) ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution.").

The intrinsic evidence of the '989 patent -- the claim language, the specification and the prosecution history -- leads us to conclude that the claim terms "calculating" and "determining" must be construed as requiring the use of at least one of the equations set forth in the specification of the '989 patent. Because the district court's determination that Transonic had established a likelihood of success on the issue of infringement was founded on an overly broad construction of these terms, we vacate the preliminary injunction and remand for further proceedings consistent with this opinion.

588

The first disputed term, "caliper," is generally understood in the automotive industry to be "a structure composed of those housing portions that engage about the brake disk and contain a brake application unit." See Pall, 181 F.3d at 1309 (recognizing that technical terms are taken to have the meaning that they would ordinarily have in the field of the invention). Defendants attempt to add a functional limitation to this essentially structural definition, namely that the caliper is a structure that absorbs the brake reaction force generated by the brake application unit. Yet, because the '445 patent claims do not expressly require that the caliper absorb the brake reaction force, such a functional limitation should not be imported into the patent claims from the specification. See Burke, 183 F.3d at 1340.

589
1. "Cam"

The term "cam," which is undefined in the patent specification, appears in claim 6 of the '830 patent. Claim 6 reads in pertinent part, "when a latch bolt is present in said strike, to thereby rotate said latch monitor lever arm from a home position to which it is biased, said rotation being a cam extending from said latch monitor lever arm into gradual contact with a switch button on a microswitch. . . ." ('830 patent, col. 9, lines 6-11.)

Because the claim term "cam" is undefined by the inventor, all three parties have fashioned their proposed construction by tailoring dictionary definitions to the specifications and preferred embodiments contained in the patent. Rutherford recommends "a projecting part of a wheel or other moving piece so shaped as to give alternative or variable motion to another piece against which it acts." Security Door advocates "a disk or cylinder having an irregular shape such that its motion, usually rotary, gives to a part or parts in contact with it a specific rocking or reciprocating motion." Vanguard offers "an eccentric wheel mounted on a rotating shaft and used to produce variable or reciprocating motion in another engaged or contacted part."

Rutherford's proposed definition is drawn verbatim from Dictionary.com. Merriam-Webster Online Dictionary defines "cam" as "a rotating or sliding piece (as an eccentric wheel or cylinder with an irregular shape) in a mechanical linkage used especially in transforming rotary motion into linear motion or vice versa."

While all three defendants put forward different phraseology, the words have similar import. Therefore, within the context of the claims and specifications of the '830 patent, the Court will define the term "cam" as "a cylinder or eccentric wheel having an irregular form such that its motion, usually rotary, gives to a part or parts in contact with it a specific rocking or reciprocating motion."

GO BACK

590

The Court construed the disputed claim terms as follows:

"affixed" means secured
"adjusting" means its functions are: to frictionally receive the belt; to hold the belt to tighten the harness; and to release the belt to tighten it; its corresponding structures are: cam member and bar, or a bottom wall, cam bar and bar, that are described in the '889 patent at col. 1, 55-57, col. 1, ll. 63-68 to col. 2, 1-8, and at ll. col. 3, 65-68 to col. 4, 1-ll. ll. 58, and Figures 3-5, or their equivalents

"cam member" means an eccentrically revolving part with a radial bearing surface; and
"bar" means a part that is longer than it is wide.

GO BACK

591

3. Claim 8 ("cam members")

Claim 8 (and all dependent claims) of the '286 Patent invokes the term "cam members" as follows:

An ultrasonic instrument according to claim 7, further including an actuator tube slidably positioned about the vibration
coupler, a distal end of the actuator tube including a cam slot configured to receive cam members formed on the clamp member, the actuator tube being moveable between advanced and retracted positions about the vibration coupler in response to actuation of the handle assembly to effect movement of the clamp member between the open and closed positions.

'286 Patent, Claim 8 (emphasis added). Plaintiff's proposed construction of this term is: "The parts on the clamp (followers) that are imparted motion by the cam slots," while defendant proposes: "Protrusions (followers) the motion of which is controlled by movement of the 'slots' with which they are engaged."

The Court will construe this term as: "The follower parts of the cam mechanism that are imparted motion by the cam slots and whose motion is guided by the cam slots." The issues are the same as those discussed above with respect to "camming members" in the '050 Patent Claims 11 and 12. For the reasons discussed above, defendant's proposed use of the words "protrusions" and "controlled" is inappropriate because there is no basis in the claim or specification for importing such terms into the claim construction. Additionally, as earlier discussed, the words "impart" and "guide" best describe the interaction and engagement between the cam slots and cam members.

Moreover, the use of the word "protrusions" would be improper given that the patentees used that term elsewhere in the specifications, and therefore knew how to use it to describe this claim term, if they had so desired. See '286 Patent, 5:16-18 ("Protrusions project outwardly from sidewalls of swivel member and extend through cam slots of movable handle) (emphasis added), 5:48-50 ("In the open position, moveable handle is spaced rearwardly from stationary handle portion and protrusions are positioned in the lower proximal portion of cam slots.") (emphasis added).

592

2. Claim 8 ("cam slot")

Claim 8 (and all dependent claims) of the '286 Patent uses the term "cam slot" in the following context:

An ultrasonic instrument according to claim 7, further including an actuator tube slidably positioned about the vibration coupler, a distal end of the actuator tube including a cam slot configured to receive cam members formed on the clamp member, the actuator tube being moveable between advanced and retracted positions about the vibration coupler in response to actuation of the handle assembly to effect movement of the clamp member between the open and closed positions.

'286 Patent, Claim 8 (emphasis added). Plaintiff seeks to construe this term as "[an] opening or groove that imparts motion to the camming member," while defendant proposes, "narrow opening or groove that engages and controls the motion of the camming members."

The Court adopts the following construction: "opening or groove that imparts motion to and guides the camming member."

The Court refers to its discussion above regarding a similar term in the '050 Patent, and concludes that the '286 Patent claim language itself and the specifications support the finding that this construction reflects the ordinary and customary meaning of this claim term. See '286 Claim 8, 4:21-23, 5:51-54, 6:9-18; see also Markman Tr. 52-53, 59, 107-08 (discussion with counsel regarding the translation of movement from the cam slots to the camming members). As noted above, it would be inappropriate to import defendant's proposed limiting terms "narrow" and "control." Additionally, as noted above, the terms "impart" and "guide" most accurately describe the interaction between the cam slot and the camming member.

593

I. "Cam Slot" in the '286 Patent

Tyco seeks clarification of the Court's construction of the term "cam slot" in the '286 patent (construed as "opening or groove that imparts motion to and guides the camming member"), querying why the construction omitted the words "the motion of" whereas those words were included in the constructions of "slots" in the related '050 and '544 patents. The Court's constructions of "slots" in the '050 and '544 patents were: "openings or grooves that impart motion to and guide the motion of the camming members" (id. at 11) (emphasis added), and "opening or groove (or pair of openings or grooves) that imparts motion to and guides the motion of the camming member" (id. at 30) (emphasis added).
Defendant Ethicon believes that the Court's construction of "cam slot" in the '286 patent "has essentially the same meaning as that for the similar terms in the 050 and 544 patents," Ethicon Opp. [Doc. # 66] at 12, but does not object to adding "the motion of" to the Court's construction of this claim term.

For the sake of consistency, because the Court already concluded that use of the words "impart" and "guide" "accurately describe the interaction between the camming members and the slots," see Claim Construction at 12, the Court amends its construction of the term "cam slot" in the '286 patent to: "opening or groove that imparts motion to and guides the motion of the camming member."

C. Whether "Camera," As Used In The Patents-In-Suit, Is Limited To A Still Camera And A Self-Contained Device

1. The '219 patent, claim 1: "in an electronic camera …"

The parties present two issues related to the construction of the phrase "in an electronic camera." The first issue is whether the term "camera" is limited to a "still picture" camera and the second issue is whether the term "camera" is limited to a self-contained device.

With respect to the still picture issue, Canon contends that the term "camera," as used in claim 1 of '219 patent should be construed to mean an "apparatus that takes a digital still picture (not movie)." (D.I. 426 at 18.) Canon contends that the '219 patent, as described in its specification, clearly relates only to still cameras.

St. Clair contends that the patent only requires that the camera be capable of taking still pictures. (D.I. 519 at 25.) In other words, St. Clair contends that a camera with both motion picture and still image capabilities is within the scope of the '219 patent.

Reviewing the parties' arguments in light of the claim language and specification of the '219 patent, the Court concludes that the term "electronic camera" is not limited to a camera with only still picture capabilities. Rather, the only requirement imposed by the '219 patent is that the camera be capable of taking still pictures and the camera's capability for motion pictures does not preclude it from the scope of the patent. The Court's conclusions are supported by both the language of the claim and the specification of the '219 patent. As the Court previously discussed, neither the specification nor the language of the claims imposes a still picture limitation on the patented invention and the specification expressly contemplates the camera's capability to take both still and motion pictures. The specification discusses taking approximately 20 images in a one second period and using formats reserved for motion pictures. Accordingly, the Court declines to limit the term "camera" in the manner proposed by Canon.

With respect to the second issue, concerning whether the phrase "in an electronic camera" is limited to a self-contained device, St. Clair contends that the Court should construe the phrase "in an electronic camera" as "in a self-contained portable electronic camera the components of which are contained in a single housing." (D.I. 427.) In support of its contention, St. Clair contends that the ordinary meaning of the word "camera" relates to a device that is self-contained in a single housing, and that this ordinary meaning is not altered by the claim language or the specification of the patent.

In response, Canon contends that the word "camera," as used in the '219 patent, can described a self-contained device in a single housing, but it is not required to be construed as a self-contained device. Canon contends that to hold otherwise would ignore the plain meaning of the patent and read out two of its preferred embodiments. Further, Canon contends that, under the standard announced in Microsoft v. Multi-Tech Systems, Inc., 357 F.3d 1340 (Fed. Cir. 2004), the failure to include a limitation related to the camera housing in the patent indicates an intent not to incorporate such a limitation. Canon requests the Court to construe "camera" to mean, in relevant part, "an apparatus, which is self-contained or formed of several physically separate parts that can be connected to one another."

The Court concludes that the term "camera" should be construed in accordance with its plain meaning to be a self-contained device in a single housing unit. The ordinary, dictionary definition of camera is "a lightproof box fitted with a lens through
the aperture of which the image of an object is recorded on a light-sensitive material." (D.I. 486, Ex. 32.) The Court finds
this definition relates to a self-contained device in a single housing.

Canon contends, however, that the Court should not rely on the ordinary meaning of the term "camera" as a self-contained
device, because the claims concern "digital cameras." In the context of digital cameras, Canon contends that the term
"camera" would not relate only to a self-contained camera. By way of example, Canon directs the Court to prior art digital
cameras that were not self-contained, such as the Tessera 2K and Dycam Model 1. (See D.I. 494 at PP 10-15.)

The fact that digital cameras existed which were not self-contained does not, in the Court's view, mean that the Court should
depart from the ordinary and plain meaning of the word "camera" as a self-contained unit. Stated another way, Canon has
demonstrated that there are digital cameras with physically separate components, but Cannon has not established that the
patentees in this case intended to depart from the general usage of the term "camera."

As for Canon's reliance on the Microsoft decision that the term "camera" must include devices with physically separate
parts unless the patent claims or specification detail their exclusion, the Court concludes that the facts of Microsoft are
distinguishable from the facts in this case. In Microsoft, the Federal Circuit held that a patent disclosing a "speaker phone"
did not limit the described "speaker phone" to a particular physical housing. In reaching this conclusion, the Federal Circuit
pointed out that the patent referred to the component parts of the speaker phone, a microphone and a speaker, as distinct
parts. Unlike Microsoft, here the component parts of the patented device are not parts that are ordinarily independent and
are not repeatedly described in the patent as independent parts. Compare United States Patent No. 5,764,627, claim 2
(describing the claimed speaker phone as a "deskset microphone operable for receiving the local analog voice signals and a
deskset speaker operable for playing the remote analog voice signals") with the '219 patent, claim 16 (describing the
claimed camera as comprised of a shutter mechanism, an array of discrete light sensing pixel elements, a pixel multiplexing
means, an analog to digital converter means, a memory means, an output data control means, and a logic means).

Canon also contends that the ordinary meaning of the term "camera" to mean a self-contained device should not be used,
because such a definition would exclude the preferred embodiments described in the patent. Specifically, Canon directs the
Court to two embodiments described in the specification, one relating to external control and processing and the other
relating to external activation, and contends that these preferred embodiments must include separate physical components.

Considering the preferred embodiments in the context of the patent, the Court is not persuaded by Canon's argument. In the
first disputed embodiment, the specification discloses an alternative embodiment that adds an auxiliary input/output
interface to allow external control and monitor of timing and control signals internal to the camera. According to the
specification, this auxiliary interface also allows image data to be "routed past or around the compression processor out to
any additional internal or external device." '219 patent, col. 9, 11. 5-9. Although this embodiment references external
features that are separate components, these external features are offered in addition to the features of the single camera
body. Stated another way, the auxiliary input/output channel describes the possible outward expansion of the camera's
internal capabilities, but it is not a substitute for the camera's internal processing capabilities. As Figure 7 of the
specification illustrates, the camera still contains all of the internal circuits that allow processing within the camera. As such,
the external components are not clearly part of the described "camera," and the use of external components in this preferred
embodiment does not demonstrate that the inventors disavowed the plain meaning of the term "camera" as a single housing
unit.

The Court's reasoning is the same with respect to Canon's reference to the second preferred embodiment, the external
activation described in the specification of the '219 patent. The described external activation is not integral or exclusive to
the described "camera," and therefore, in the Court's view, it does not require the Court to depart from the common usage
of the word "camera."

The conclusion that the inventors did not depart from this common meaning and usage of the word "camera" is further
supported by references within the specification and the file history that demonstrate the inventors sought to create a
portable, self-contained unit in a single housing. For example, the stated objective of the invention is to "provide an
electronic still camera that is efficient in design and permits extended periods of portable operation." '219 patent, col. 2, 11.
59-61. As described in the prosecution history of the related '459 patent, "the principle advantages of Applicants' claimed
improved electronic still camera" as "a less costly, more compact and more efficient design." (See, e.g., D.I. 521, Ex. 69 at
St. Clair 00083.) In the Court's view, these statements take on particular significance when one considers that "cameras"
involving a multiple of separate parts and a separate computer were well-known in the prior art. Indeed, during the prosecution of the '219 patent, the inventors of the claimed invention sought to expressly distinguish the prior art by stating that "the claimed device instead stores a plurality of computer-ready digitized images on removable mass memory in the device housing." (See D.I. 486, Ex. 34 at St. Clair 01433 (emphasis added); see generally D.I. 486, Ex. 35.)

In sum, the Court will adopt the ordinary meaning of the term "camera" as it relates to camera structure. In addition, the Court has previously determined that the term "camera" is not limited to a device which takes only still pictures. Accordingly, the Court construes the term "camera" to mean "a self-contained, portable electronic camera, with the capability to take still pictures, the components of which are contained in a single housing." Thus, the Court concludes the phrase "in an electronic camera," as used in claim 1 of the '219 patent, means "in a self-contained, portable electronic camera, with the capability to take still pictures, the components of which are contained in a single housing."

B. Camera Base

The preambles to all six claims contain the language "[a] remote control apparatus for a rotating camera base..." Lectrolarm argues that the preambles are limitations of the claims and proposes that "camera base" should be construed to mean "television camera base." The Defendants argue that the preambles are not limitations of the claims, and would interpret "camera base" to mean "a base capable of supporting a camera." n6

n6 If the preambles are not claim limitations, as the Defendants argue, it is not clear why the Defendants have proposed a definition for the preambles.

"A claim preamble has the import that the claim as a whole suggests for it. If the claim preamble, when read in the context of the entire claim, recites limitations of the claim, or, if the claim preamble is necessary to give life, meaning, and vitality to the claim, then the claim preamble should be construed as if in the balance of the claim." Pitney Bowes v. Hewlett Packard, 182 F.3d 1298, 1305 (Fed. Cir. 1999) (internal quotes and citations omitted); see also In re Paulsen, 30 F.3d 1475, 1479 (Fed. Cir. 1994) ("terms appearing in a preamble may be deemed limitations of a claim when they give meaning to the claim and properly define the invention"). The preambles to claims one through six of the '088 patent give meaning to the claims. For example, claim two recites "an input means for inputting the operating data for the automatic operation of said rotating camera base." U.S. Patent No. 4,974,088, Column 11:38-45. The words "said rotating camera base" refer back to the "camera base" in the preamble, and are only properly understood if the accompanying description of the camera base in the preamble is read as a limitation of the claim. All six of the claims include the language "said rotating camera base" referring the reader back to the description of the rotating camera base in the claims' preambles.

Because the preambles are limitations of the claims, the court must construe the disputed language. The plain language of the term "camera base" is "camera base." Neither the specification nor the prosecution history indicates that the patentees desired a different definition of this term. The Defendants have identified no reference to the base of the apparatus in the specification that contemplates any use other than in conjunction with a camera.

The Defendants attempt to use the specification to support their view by arguing that the "'088 Patent does not describe any aspect of the camera itself, apart from the existence of zoom, focus, and iris motors. Instead the focus of the '088 Patent is the base itself and the control box, not what is on the camera base." (D.'s Br. at 46.) As the title of the invention states, the patent is for a "Television Camera Base." U.S Patent No. 4,974,088 (emphasis added). Patenting an invention for a base for television cameras does not require discussing the details of the television cameras that will be mounted on that base.

The inventors, by the plain language used in the claims, limited patent '088 to bases for cameras. Nothing in the specification or prosecution history indicates otherwise. The court sees no reason to use a definition other than the plain meaning of the words and construes "camera base" to mean "television camera base."
The Court construes "camera mechanism" to mean "the functional components of the motion detector camera." Defendants' proposed construction limits the camera to a film-camera, a limitation the Court has already rejected. Defendants' proposed construction also includes the limitation that the camera mechanism "includes a stand-alone [off-the-shelf] camera that can be used independently when removed from the housing of the motion detector camera." Defendants argue the Court should adopt this limitation because Plaintiffs do not argue against it, nothing in the claims excludes off-the-shelf cameras, and Figure 7 depicts such a camera. The specification does not describe the camera mechanism in Figure 7 as an off-the-shelf camera. The claim does not address whether the camera mechanism can be an off-the-shelf camera. Defendants do not present any reason that the jury should specifically be instructed that the camera can be an off-the-shelf camera. Accordingly, the Court rejects this limitation of Defendants' construction.

2. Claims 11 and 12 ("camming members")

Claims 11 and 12 of the '050 Patent use the term "camming members" as follows: "The surgical instrument of claim 1, wherein the clamp member includes a pair of pivot pins and pair of camming members spaced from the pivot pins," see '050 Patent, Claim 11 (emphasis added), and "The surgical instrument of claim 1, wherein the actuator tube includes a pair of slots engageable with a pair of camming members of the clamp member," see '050 Patent Claim, 12 (emphasis added). Plaintiff proposes construing the term as: "The parts on the clamp (followers) that are imparted motion by the cam slots" and defendant proposes: "Protrusions (followers) the motion of which is controlled by movement of the "slots" with which they are engaged."

The main issues in dispute appear to be: (1) defendant's use of the word "protrusions" to describe the "camming members" and (2) the parties' disagreement concerning the type of movement and/or control imparted by the cam slots to the camming members.

As to the first issue, the use of the word "protrusions" is inappropriate because that word is not invoked in the claim or the specifications. In fact, the patentees did use the word "protrusions" elsewhere in the patent, thus suggesting that if they had wished to use that term here, they knew how to do so. See e.g., '050 Patent 10:47-50, 12:24-26. Thus the Court will not import such a limitation into the claim absent any basis for such a limitation in the intrinsic evidence. As to the second issue, defendant acknowledges both that a "cam" is a well-known structure in the art, see Def. Claim Construction Br. at 27; Houser Decl. [Doc. # 41, Ex. 8] at P7, and that definitions for "cam" "almost uniformly refer to the cam as being a structure which communicates or imparts motion to a 'follower','' see Def. Claim Construction Br. at 27. Plaintiff agrees that a "cam" imparts motion to a "follower." See Pl. Reply Br. at 7. There is no basis for defendant's proposed use of "controlled" in either the claims or the specifications. n3

n3 Although the plain language of the claims and specifications is determinative on this issue and therefore resort to extrinsic evidence is neither necessary nor appropriate, the Court notes that plaintiff's expert testified that many factors can influence the movement of the cam followers, indicating that the "cam slots" do not definitively "control" the movement of the cam members. See Markman Tr. 56, 59.

Lastly, there was much discussion at the Markman hearing regarding the type of motion imparted by the cam slots to the camming members. Counsel appeared to be in agreement that a cam is a mechanism that effects the translation of motion, for example, the translation of linear motion into rotary motion. With respect to the cam mechanism in the patents at issue here, counsel also appeared to be in agreement that the cam slots impart that translated motion to the camming members and guide the motion of the camming members as the camming members engage with the surface of the cam slots. See Markman Tr. at 52-53, 59, 107-08. Accordingly, this concept is incorporated into the Court's construction of "camming members" as: "The follower parts of the cam mechanism that are imparted motion by the cam slots and whose motion is
The Kellenberger Patent concerns an absorbent composite or core for an absorbent article. More specifically, the absorbent composite consists of a matrix of fibers and superabsorbent material that is designed to absorb fluids, but dramatically reduce the thickness and weight of an absorbent article.

Here, we are asked to construe two commonly used verbs, "can" and "has". KC suggests that "can" and "has" should be given their common usage definition, "capable of" and "possesses", respectively. (doc. 150 at pg. 64.) In contrast, First Quality proposes that we construe "can" and "has" to mean "the superabsorbent material is 'specifically selected based on its having the' claimed properties." (doc. 168 at pg. 34.) Essentially, First Quality argues that we should construe said verbs to mean "selected". In support of its construction, First Quality cites to portions of the prosecution history it alleges indicate that KC intended "can" and "has" to have an "unconventional meaning." (doc. 168 at pg. 38.) KC denies First Quality's characterization of the prosecution history, and also argues that First Quality is improperly trying to include a method step or intent into the patent claims. (doc. 197 at pgs. 32-40.) We agree.

By seeking to construe "can" and "has" to mean "selected", First Quality improperly seeks to add a process limitation into an apparatus claim. Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1344 (Fed. Cir. 2008)(citations omitted) ("Courts must generally take care to avoid reading process limitations into an apparatus claim...because the process by which a product is made is irrelevant to the question of whether that product infringes a pure apparatus claim."). "Selected" assumes a process or method of selection. Here, Claims 1, 20, 30, 41 and 42 are apparatus claims. They have no process limitations. The claims do not represent an intention to patent a method or process of selection. Instead, these claims indicate the patentees intention of patenting an apparatus that has specific superabsorbent properties. Furthermore, we find nothing in the specification, claims or patent history that would indicate that KC intended to give "can" and "has" unconventional, special definitions. Based on this reasoning, we conclude that "can" and "has" will be given their ordinary meaning. Thus, "can" and "has" mean "capable of" and "possesses", respectively.

4. "Wherein the memory alloy element can be extruded from the hollow placement device by the guide wire"

This disputed phrase appears in independent claim 1 and in dependent claims 2, 3, 4, 5 and 22 of the '141 Patent. 5 Claim 1 reads, in pertinent part:

A medical device for insertion into a mammalian body, the device comprising (a) a hollow placement device; (b) a memory alloy element formed at least partly from pseudo-elastic shape memory alloy, …; and (c) a guide wire; the memory alloy element being within the hollow placement device, and the placement device being guideable by the guide wire, …, wherein the memory alloy element can be extruded from the hollow placement device by the guide wire ….

(See '141 Patent, 10:6-11:20.)
derives its antecedent basis from subsection (c) of the claim. The plain language of the claim suggests that the term "a guide wire" should mean what it says, i.e., a wire that is used to guide a device. Medtronic, however, argues that the specification and prosecution history demonstrate that Jervis did not intend for the term to be restricted to a "wire," but rather that he intended the term to be construed broadly enough to encompass a catheter. As support for this argument, Medtronic notes that Jervis describes Figure 7 as disclosing "a guide catheter, a transport catheter, and compacted wire coil stent according to the present invention." ('141 Patent, 3:21-22.)

Medtronic's argument also is supported by the prosecution history of the '141 Patent, during which Jervis appealed a final rejection and in his appeal brief referred to element 104 of Figure 7 as a "guide wire." (Declaration of Ellen J. Wang in Support of Medtronic's Claim Construction Brief ("Wang Decl."), Ex. F at 11.) The specification of the '141 Patent refers to element 104 as a "transport catheter." ('141 Patent, 9:28.) Thus, these references support Medtronic's argument that "a guide wire" need not be construed to literally encompass a "wire," and that it should be construed more broadly.

Gore argues that this term should be construed to include a reference to the fact that the guide wire "is also used to guide the hollow placement device into a mammalian body." However, the clause that immediately precedes the disputed "wherein" phrase provides that "the memory alloy element being within the hollow placement device, and the placement device being guidable by the guide wire…." This clause therefore explains that the guide wire is used to guide the hollow placement device. The Court concludes there is no need to include such a limitation in the disputed phrase.

Accordingly, the Court construes the phrase "wherein the memory alloy element can be extruded from the hollow placement device by the guide wire," to mean: "the device or memory alloy element is forced out of the hollow placement device by the guide wire, which is a device that assists in positioning another device."

3. "electrothrombosis can be performed"

The parties dispute the proper construction of the phrase "electrothrombosis can be performed." There are three aspects to the dispute. One aspect of the dispute is whether the performance of electrothrombosis is a requirement of Claim 1 or whether Claim 1 is practiced if some other method of forming a thrombus is used. The second aspect of the dispute is whether, if performance of electrothrombosis is a required element, must it be carried through to complete occlusion or does partial occlusion meet the claim. Finally, although not raised by the parties, the meaning of the phrase "can be performed" raises a construction issue. The language of the Claim resolves all of these issues.

17 In the Supplemental Joint Claim Construction Chart, The Regents' Proposed Construction state, "The '962 patent makes clear that the invention can be practiced to form an occlusion with or without electrothrombosis."

18 In the Supplemental Joint Claim Construction Chart, Defendants' Proposed Construction state, "Electrothrombosis can start and carry through to completion."

Claim 1 is an apparatus claim. The apparatus is a catheter wire. The catheter wire comprises two elements. The first element is a core wire and the second element is a detachable coil. Although the language of Claim 1 imposes limitations on these two elements, neither occlusion nor electrothrombosis-partial or complete are limitations on the apparatus disclosed in Claim 1. There is no disclosure in Claim 1 of formation of an occlusion as an element of the claim. Indeed, there is no disclosure in Claim 1 of electrothrombosis being performed.

The disputed phrase appears in a "so that clause:"

- 1032 -
shape such that on its advancement out of the distal end of a microcatheter and into a cavity it will change from being straight to its prebiased spiral or helical shape so that on the application of current to said detachable coil disposed in the cavity, electrothrombosis can be performed and at least one portion of said distal portion electrolytically disintegrated to detach said detachable coil from said main body.

A "so that clause" introduces a functional description of the results from the use of an apparatus. See In re Michlin, 256 F.2d 317, 320, 45 C.C.P.A. 1028, 1958 Dec. Comm'r Pat. 408 (C.C.P.A. 1958.) Thus, a "so that clause" is equivalent to a "whereby clause" in a method claim. A "whereby clause" in a method claim that merely states the results of the limitations in the claim adds nothing to the substance of the claim. See Lockheed Martin Corp. v. Space Systems/Loral, Inc., 324 F.3d 1308, 1319 (Fed. Cir. 2003). To be consistent, the Court finds that in an apparatus claim, a "so that clause" which is followed by a description of the desired results from the use of the apparatus, does not impose a limitation on the apparatus. Accordingly, with respect to Claim 1, the phrase "so that . . . electrothrombosis can be performed" merely describes the intended results from use of the apparatus but does not impose a limitation that those results in fact take place.

19 A different conclusion might be reached in a method claim which recites the electrothrombosis as a step in the method.

The Court declines to construe the claim as requiring an occlusion by electricity or by some other means or as requiring electrothrombosis—initiated or carried through to completion. To the extent the dispute is over the word "can," the Court construes it to mean is "able to."

The Court construes "electrothrombosis can be performed" to mean:

electrothrombosis is able to be performed.

3. Claims 3 and 5

The parties have asked the Court to construe the term "position . . . relative to the housing can be varied" which appears in dependent claims 3 and 5. Claim 3 claims an "apparatus as claimed in claim 2 wherein the position of the nozzle (4) relative to the housing can be varied." ('886 patent, col. 4, ll. 20-21.) Claim 5 claims an "apparatus as claimed in claim 4 wherein the position of the mouthpiece (3) relative to the housing can be varied." ('886 patent, col. 4, ll. 24-25.) P&M maintains that the plain and ordinary meaning of this term is that the location of the mouthpiece [or nozzle] and the housing can differ with respect to one another. (Pls. Opening Mem. at 22.) Rose Art maintains that the term means that the nozzle and the mouthpiece can move up or down the longitudinal axis of the housing in order to accommodate different lengths of nibs (for the nozzle) and different lengths of pens (for the mouthpiece.) (Def.'s Pre-Markman Hr'g Br. at 28-31.)

Rose Art's construction of the disputed term is supported by the specification which states that:

the end walls 10, 17 of the barrel together define end stops for the pen 9, variations in pen length being accommodated by the position of the mouthpiece 3 on the barrel 2. As mentioned above, the position of the nozzle 4 relative to the barrel 2 can be varied simply by turning the nozzle about the cooperating threads to ensure that the nib 15 is always correctly located with respect to the orifice 6. By this means variations in the nib lengths of different felt tipped pens can be accommodated.

('886 patent, col. 3, ll. 3-8.) However, the claim language is clear on its face and, therefore, the Court can only consider the specification to determine if the construction must deviate from the clear language of the claim. Interactive Gift Exp., 256 F.3d at 1332. Adoption of the construction urged by Rose Art would impermissibly restrict the construction of the term to one of the preferred embodiments described by the specification. Rodime, 174 F.3d at 1303. Consequently, the disputed term is construed to mean that "the locations of the mouthpiece [or nozzle] and housing can differ with respect to one another." Since the intrinsic evidence with regard to this term is not ambiguous, the Court did not consider the extrinsic
evidence submitted by the parties with respect to this term.

1. "a cannula mount affixing the cannula to the guide"

Plaintiff proposes that this term should be construed to mean "anything that affixes or connects the cannula to the guide." MDTech's proposed construction is "a support which attaches the cutting cannula to the guide in a secured manner." At oral argument, counsel for MDTech agreed that the word "cutting," which Plaintiff found objectionable, could be removed from MDTech's proposed definition, and further agreed that "structure" could be substituted for "support" in the proposed definition. (Trans. at 92 - 93.) The only real dispute between the two proposed constructions, therefore, is whether the "cannula mount" can be "anything," as Plaintiff proposes, or whether it must be a "support" or "structure," as MDTech argues it should.

A cannula mount, depicted as item 58 in the Fig. 1 embodiment, is shown to the right. The Fig. 1 embodiment depicts the cannula mount 58 configured to receive the cannula 66 at one end near its conical head 64 and to attach to the guide 18 at the other end by engaging the cannula mount's internal threaded portion 72 (the female thread) with the external threaded portion 56 (the male thread) of the guide 18. In other words, the cannula mount in this illustration joins the cannula to the guide by securing the cannula on one end and having a screw-like connection with the guide on the other.

In the Fig. 5 embodiment shown to the right, the cannula mount 258 receives the cannula 266 on one end and plugs into the guide 218 by inserting the base 262 into a bore 255a in the guide. The specification explains that the cannula mount 258 is adhesively bonded within the bore 255a. (‘797 patent, col. 9, 38 - 43.)

Plaintiff argues that both embodiments show the cannula mount joining the cannula and the guide and, therefore, that the mount can be "anything" that affixes these two components together. In addition, Plaintiff argues that defining this term as requiring a support or structure is impermissibly interpreting it as means plus function claim.

MDTech, on the other hand, argues that the word "anything" gives too broad of a construction to this term, and that "anything" could include glue, velcro or other materials that can attach or affix components and that are not themselves structures. MDTech argues that such a construction is in conflict with both the intrinsic and extrinsic sources to which the Court may refer. First, MDTech points to language in the detailed description of the invention, explaining that "the proximal end 282 of the stylet 262 [sic] is adhesively bonded within the recess, and the base 262 of the cannula mount 258 is similarly secured within the bore 255a." (‘797 patent, col. 9, l. 40-43). MDTech argues that, if the cannula mount can be secured with adhesive, the cannula mount itself cannot be adhesive and, therefore, it cannot be just "anything."

In addition, MDTech argues that the prosecution history reveals that this claim was amended to add the phrase "cannula mount" in order to obtain allowance of the claim. Prior to the examiner's amendment, the claim read, "a guide having means affixing the cannula thereto." (MDTech Claim Construction Brief, Doc. 54, Ex. 4, at GWB 00086.) The examiner's amendment changed that language to its current form. (Id., at GWB 00068.) MDTech argues that the reason for the change was the submission of additional prior art references, one of which (the Portner patent) showed a guide directly gripping the cannula, as opposed to having a structure joining the two components. The change, MDTech argues, was meant to incorporate some structure that attached the guide to the cannula rather than having them directly attached or bonded together. Plaintiff offers no alternative explanation for this amendment.

Finally, MDTech argues that a common dictionary definition of the noun "mount" is "FRAME, SUPPORT: as a material (cardboard) on which a picture is mounted." (MDTech Br., Ex. 6.); see also Mirriam-Webster Online Dictionary, www.m-w.com (same). MDTech points out that this definition is consistent with the Fig. 1 and Fig. 5 embodiments, both of which refer to a support structure that attaches the cannula to the guide.
The Court agrees with MDTech that, based on the specification, prosecution history, and dictionary definition, "cannula mount" cannot simply mean "anything." Rather, the Court concludes that this language contemplates and, thus, claims a piece or structure which is independent from the structures which are the guide and the cannula, and serves the function of connecting the two other structures. Thus, the Court construes "a cannula mount affixing the cannula to the guide" to mean "a structure or support which attaches or connects the cannula to the guide." 7

7 The Court is not persuaded by Plaintiff's argument that defining this term as requiring a structure or support is the equivalent of improperly construing it as a means-plus-function claim. The Court is not holding that the structure or support must only be the structures identified in Fig. 1 and Fig. 5 as the cannula mounts (58 and 258), as would be the effect of a finding that it is a means-plus-function claim. The holding is merely that it must have some structure and cannot be just "anything.

A Definition of "Cantilevered"

Here the parties and their experts dispute the term "cantilevered." Defendant argues that cantilevered means that one end of each rod is fixed while the other is free, with the fixed end supporting the free end Plaintiff argues that cantilevered means that one end of the rod supports the other, so that both ends of the rods can be free Accordingly, this Court must construe the term cantilevered as used in the '057 and '704 patents.

The parties put forward different dictionary definitions of cantilevered that support each of their respective positions. Dictionaries and technical treatises may be considered along with the intrinsic evidence when determining the ordinary meaning of claim terms. Texas Digital Sys. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002).

Plaintiff puts forward a contrary definition of "cantilever" from the American Heritage Dictionary (1986) "1. A projecting beam or other structure supported only at one end. 2. A beam or other member projecting beyond a fulcrum and supported by a balancing member or a downward force behind the fulcrum." (Rawls Decl. Ex. B at 2.) 1 Plaintiff urges the Court to adopt both definitions, but rests its arguments of the merits solely on the second Because the secondary general dictionary definition refers to a rod extending beyond a fulcrum, Plaintiff argues it encompasses a design where both rod-ends are free. In effect, Plaintiff claims that cantilevered means any beam or rod placed or balanced on a fulcrum. (See Rawls Decl at 8.)

1 Plaintiff claims this is a definition of "cantilevered." However, the definition is for the word "cantilever," and the definition itself merely reflects that "-ed" may be added to the word "cantilever."

The parties dispute how to resolve the conflicting dictionary definitions. The Court does not find, after close examination, that the dueling expert reports on the definitions resolve the matter. Defendant claims that a scientific dictionary definition "trumps" a general dictionary definition Defendant is correct that the Federal Circuit has cautioned against the use of non-scientific dictionary definitions, lest dictionary definitions be converted into technical terms of art having legal, not linguistic significance Dow Chem. 257 F.3d at 1372. At the same time, the Federal Circuit has "never held that non-scientific dictionaries cannot be used to determine the ordinary meaning of claim language." Id at 1373 However, to the extent that
there is a difference between the general and technical definitions of a word, if the word is used in "a technical context to describe a component of a mechanical apparatus," then "a technical dictionary is therefore a better source to inform the meaning of the term to a skilled artisan in this case" Transclean Corp., 290 F.3d at 1375.

"Cantilevered" is used in the '057 and '704 patents in a technical context to describe a component of a mechanical apparatus, and therefore this Court gives priority to the technical dictionary definition. Moreover, the Court is skeptical of the secondary definition from the American Heritage Dictionary that Plaintiff proposes as the appropriate claim construction. First, a contemporaneous general dictionary does not include the broad secondary definition. Webster's Ninth New Collegiate Dictionary (1986) only contains the first definition listed in the American Heritage Dictionary "A projecting beam or other structure supported only at one end." Second, the Court believes that Plaintiff's proposed reading of the secondary definition is incorrect. The primary general dictionary definition is clearly in accord with the common understanding of a cantilever, such as a diving board or a construction crane, where an extending beam is supported by a counterbalancing force on the other end. Plaintiff's interpretation of the secondary definition of the American Heritage Dictionary would reduce the word "cantilever" to mean any rod placed or balanced on a fulcrum. Under Plaintiff's reading, a balance scale would be a cantilever because one end of the bar of the scale supports the other to create a balance. (See Rawls Decl. at 8.) However, a scale can be described "a beam that is supported freely in the center." Webster's Ninth New Collegiate Dictionary at 1047. The Court concludes that even under the general dictionary definition of cantilever, Plaintiff's proposed claim construction is incorrect. In addition, the Court finds that Plaintiff's proposed construction does not fit with the intrinsic record, as described below.

B Intrinsic Evidence

The Court looks to the intrinsic record to identify which of the different possible dictionary meanings of the claim terms at issue is most consistent with the use of the words by the inventor Texas Digital Sys, 308 F.3d at 1203. If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all such consistent meanings. Id. When claims are amenable to more than one construction, they should, when reasonably possible, be interpreted so as to preserve their validity. Process Control Corp v HydReclaim Corp., 190 F.3d 1350, 1356 (Fed. Cir. 1999), cert. denied, 529 U.S. 1037, 146 L. Ed. 2d 346, 120 S. Ct. 1531 (2000).

The parties put forward two principal arguments on intrinsic evidence supporting their respective dictionary definitions and proposed claim construction of cantilevered. Defendant argues that language in claims dependent on Claim 12 indicates that one end of the rod mentioned in Claim 12 is fixed (an "antecedent problem") Plaintiff argues that adopting Defendant's definition leads to redundant language in the claims (a "surplusage problem")

1. The Antecedent Problem

Defendant argues that Claim 15, which is dependent on Claim 12, demonstrates that the term "cantilevered fashion" implies that one end is fixed and the other end is free. Claim 15 claims: "The exercising machine of claim 12 including a guide member for the cable mounted on the base near the fixed ends of the rods." (057 patent, claim 15, col. 8 ll. 1-3) (emphasis added) Defendant points to the language in Claim 15 regarding "the fixed ends of the rod" as intrinsic evidence supporting its proposed definition.

When a dependent claim states an invention in relation to an independent claim by adding a new component, it does so by using "a" as an antecedent Patent & Trademark Office, Manual of Patent Examining Procedure § 2173.05(e) (2001). For example, dependent Claim 15 adds a limitation to independent Claim 12 by adding "a guide member for the cable mounted on the base near the fixed ends of the rods" The "guide member" is not described in Claim 12, but rather is added by Claim 15. However, when a dependent claim refers back to elements already disclosed in the dependent claim, it uses "the" or "said" as an antecedent. Id Thus, when dependent Claim 15 mentions "the cable" used to connect to "the rods," it is referring back to "the cable" and "the rods" already disclosed and described by Claim 12.

Because Claim 15 recites "the fixed ends of the rods," it is expected that Claim 12 disclosed and described "fixed ends" to the rods However, "fixed ends" is not recited in Claim 12. Although the actual term "fixed ends" is not mentioned in Claim 12, the term "fixed ends" could be considered to be implicit in "cantilevered fashion," because the definition of cantilever that Defendant puts forward requires "fixed ends." Should Plaintiff's proposed construction be adopted, then it appears that dependent Claim 15 may be invalid as indefinite. See id. Claim 15 should not refer to "the fixed ends" unless "the fixed
ends" are described in independent Claim 12. If Plaintiff's proposed definition were correct, then the patent should read "a fixed end" or simply "fixed ends." The phrasing of dependent Claim 15 is evidence in support of Defendant's proposed construction.

It would be error, as Plaintiff points out, to actually import a limitation of dependent Claim 15 to independent Claim 12 D.M I., Inc. v. Deere & Co., 755 F.2d 1570, 1573 (Fed Cir. 1985) The prohibition of importing limitations does not bar the Court from concluding that the antecedent problem identified by Defendant supports their proposed claim construction, although it clearly does not decide the matter.

2. The Surplusage Problem

Courts should not construe a patent claim term such that it renders other terms in the claim mere surplusage or reads such other terms out of the claim. Texas Instruments v. United States Int'l Trade Comm'n, 988 F.2d 1165, 1171 (Fed Cir. 1993). However, this canon of construction is not absolute, and patents may in fact be drafted and construed such that surplusage exists. See Pickholtz v. Rainbow Techs., Inc, 284 F 3d 1365, 1373 (Fed Cir. 2002).

Plaintiff argues that Defendant's proposed claim construction would render other terms of the claim superfluous or redundant -- a "surplusage" problem. Specifically, if a cantilever has "one fixed end and one free" as Defendant proposes, then the language of Claims 1, 19, and 25 of the '057 patent and Claims 1 and 12 of the '704 patent describing fixed and free ends are arguably redundant if Defendant's proposed definition is correct, Plaintiff argues, these claims describing the mounting of the rods should only read "in a cantilevered fashion," because all cantilevers under Defendant's definition have a fixed and a free end. Defendant admits that its definition could result in redundancy, but argues that Plaintiff's proposed definition also leads to surplusage -- "There is no getting around the fact that the claims of the '057 patent are unnecessarily repetitive." (Def.'s Resp. at 10)

Both of the proposed definitions result in possible surplusage. Defendant's proposed construction does threaten to make those claims that describe a rod's fixed end and free end into surplusage. However, this criticism is partially tempered by the fact that the language of the claims indicates specific modifications to the fixed end. For example, Claims 19 and 25 of the '057 patent describe the lower ends of the rods as being "rigidly affixed to the post." Claim 12 of both the '704 and '057 patents describes one end of the rod "being attached to said base." The additional specification that the fixed end of the rod is "affixed to the post" or "attached to said base" makes the claim language more specific, not redundant. Moreover, Plaintiff's proposed construction results in surplusage as well. Plaintiff's proposed construction would cover all rods mounted on a base, since it does not matter under its definition of cantilever specifically where the rods are mounted, either in the center or at an end. This makes the term "cantilevered" into surplusage because it would mean effectively nothing more than "attached" or "mounted on." The surplusage problem does not compel use of Plaintiff's definition over Defendant's. 2

Footnotes

2 The primary general dictionary definition -- which neither party proposes as the proper construction -- is probably the least problematic in terms of creating surplusage. However, it does not resolve the antecedent problem nor the preference in this case for a technical definition.

End Footnotes

C. Construing "cantilevered fashion"

The above analysis leads this Court to conclude that the term "cantilever" is appropriately construed in accordance with Defendant's proposed definition: "A beam or member securely fixed at one end and hanging free at the other end." This proposed definition includes the BowFlex as disclosed in the patent specification. The BowFlex rods and those of the preferred embodiment have one end free, and are attached to a fulcrum near the other end, the tip of which is bolted to the base. The preference for a technical definition in this matter, as well as the considerations raised by the antecedent and surplusage arguments, clearly favors Defendant's proposed construction over Plaintiff's. It is clear to the Court that the claim language and intrinsic evidence describe rods mounted on a base with one fixed end and one free end, and not rods balanced or attached to a base in their center.
The district court construed "cantilever" to mean: "A beam or member securely fixed at one end and hanging free at the other end" and stated that "cantilevered fashion" means that "one end of the resilient rod is fixed and the other is free." The district court relied heavily on dictionary definitions in reaching its claim construction. The record contains the dictionary definitions shown below, although the district court considered only the first three:

A beam or member securely fixed at one end and hanging free at the other end.

1. A projecting beam or other structure supported only at one end.

2. A beam or other member projecting beyond a fulcrum and supported by a balancing member or a downward force behind the fulcrum.

(Civ. Eng.). A beam or girder fixed at one end and free at the other.

A cantilever beam is fixed (no rotation) at one end.

Marks' Standard Handbook for Mech. Eng'rs (9th ed.).

A beam supported at one end and supporting a load along its length or at its free end . . . . Familiar examples are the symmetrical paired cantilevers of a seesaw or teeterboard, the beam in a chemical balance, and the unsymmetrical cantilever in the overhang of a roof.

These definitions of "cantilever" include a beam fixed at one end and also a beam with two free ends in double (or "paired") cantilevers. The district court gave priority to the McGraw-Hill Dictionary of Scientific & Technical Terms. The district court also considered the language of claim 15: "The exercising machine of claim 12 including a guide member for the cable mounted on the base near the fixed ends of the rods." The district court concluded that claim 15 supports an interpretation of claim 12 that requires rods with fixed ends. The district court did not rely on the record expert testimony.

At the outset, the district court erred by failing to recognize that the term at issue is not simply "cantilevered" but "in cantilevered fashion." The latter phrase does not mean a literal cantilever, but only a structure that is similar to or in accordance with the principles of a cantilever. Thus the claim language does not require a literal cantilever. Even a literal cantilever, however, need not have only one fixed end.

In requiring the "fixed end" limitation, the district court erred by improperly importing that limitation from the specification and a few selected dictionaries. A cantilever with one fixed end is not the only possible cantilevered structure. The secondary definition in the American Heritage Dictionary is a "beam or other member projecting beyond a fulcrum and supported by a balancing member or a downward force." Drawings of a cantilevered bridge and a hammerhead crane, each showing a cantilever having two free ends, accompany that definition.
If "multiple, potentially consistent, dictionary definitions exist for the claim terms in question," a court must consider "the rest of the intrinsic record for further context and guidance." Brookhill-Wilk 1, LLC. v. Intuitive Surgical, Inc., 334 F.3d 1294, 1300 (Fed. Cir. 2003). "When a term has multiple dictionary definitions, we must consult the intrinsic record 'to identify which of the different possible dictionary meanings of the claim terms in issue is the most consistent with the use of the words by the inventor.'" Tehrani v. Hamilton Medical, Inc., 331 F.3d 1355, 1361 (Fed. Cir. 2003) (quoting Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002)). A trial court must construe claims "consistently with the scientific and technical context in which it is used in the patent." AFG Indus., Inc. v. Cardinal IG Co., 239 F.3d 1239, 1248 (Fed. Cir. 2001).

The district court's construction is incorrect, based on the full context of the claim language. Taken in context, "in cantilevered fashion" includes the "double cantilever" definition, i.e., a structure in which a beam projects on both sides beyond its support.

Claim 12 also has the limitation "one end of each of the rods being free" (emphasis added). This language may also encompass a rod with two free ends. A rod with two free ends literally includes "one end . . . free." Thus, this limitation requires only at least one free end.

The language of claim 15 does not suggest that claim 12 must include a fixed end limitation. Claim 15 states: "The exercising machine of claim 12 including a guide member for the cable mounted on the base near the fixed ends of the rods." In the first place, claim 15 does not explicitly add a limitation to claim 12 that one end of the rods is fixed. More important, claim 15 is a dependent claim with a narrower scope than claim 12 in any event. The trial court noted that the specification of the '057 patent only contains embodiments with rods having one free end and one fixed end. The specification performs a different role from the claims. The specification, among other roles, describes an enabled embodiment of the invention. The claims, on the other hand, recite the outer boundaries of the scope encompassed by the invention. By definition, therefore, the claims may encompass more than the embodiment or embodiments described in the specification. The claims, after all, recite boundaries, not the only characteristics and features of the invention. Thus, a construing court may not limit the claims to the disclosed embodiments without a clear disclaimer in the intrinsic record that limits the invention to these embodiments and nothing more.

The term cantilever appears only once in any form outside the claims: "These holes receive respective cantilevered resilient rods or arms 44, the free ends of which extend upward from retainer 36 and base 10." '057 patent, col. 3, ll. 43-45. That descriptive statement in the specification does not preclude a cantilevered structure with two free ends.

Claim differentiation also weakens any suggestion that claim 12 must include the "fixed end" limitation. While claim 12 contains no express "fixed end" limitation, "fixed end" limitations appear in independent claims 1, 19, and 25. Claims 1, 19, and 25 describe an end of the rod as "secured in a fixed position" or "rigidly affixed" and the other end as "free." If "cantilevered" meant one fixed end and one free end, the recitations of fixed and free ends in claims 1, 19, and 25 would be surplusage. The district court's construction improperly renders claim terms superfluous and reads limitations of claim 15 and of the preferred embodiment into the claim. Although it is true that "no canon of claim construction is absolute in its application," Renishaw PLC, v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1248 (Fed. Cir. 1998), and that surplusage may exist in some claims, see Pickholtz v. Rainbow Techs., Inc., 284 F.3d 1365, 1373 (Fed. Cir. 2002), these principles show error in the district court's construction.

This court therefore construes the limitation "in cantilevered fashion with one end of each of the rods being free" to mean that the rods are mounted with one or both ends free such that the rods have the structure of a single or double cantilever. In the circumstances, we think that the appropriate disposition of this case is to remand it to the district court for reconsideration in light of this opinion.

1. "Cantilevered"

Plaintiff contends that the term "cantilevered leg" means "a leg that extends outwardly and under a space that exists between the leg, the arm, and the rail." (Plf. Brief at 5). Similarly, plaintiff argues that a "cantilevered [] arm" is "an arm extending
outwardly and over a space existing between the leg, the arm, and the rail." (Plf. Brief at 10). Defendants maintain that the term "cantilevered" should be given its ordinary and accustomed meaning of being supported only at one end. (Def. Brief at 11-12).

In ordinary usage, the term "cantilever" refers to "[a] projecting structure, as a beam, supported at one end" or "[a] structural member, as a beam, that projects beyond a fulcrum and is supported by a balancing member or a downward force behind the fulcrum." WEBSTER'S II NEW COLLEGE DICTIONARY at 163 (1995 ed.); see also MERRIAM WEBSTER'S COLLEGIATE DICTIONARY at 168 (10th ed. 1993) (defining "cantilever" as "a projecting beam or member supported at only one end"). Thus, it is not the creation or definition of a space that characterizes a cantilevered object. Rather, the defining characteristic is that the object is supported only at one end.

The specification does not indicate that any contrary usage of the term was intended. The description in Figure 2, a cross-sectional view of the embedded railway system, defines the cantilevered leg and arm in terms of their relation to the main body of the gauge insert:

"Referring still to FIG. 2, the leg 340 of the gauge insert 300 extends in a cantilever arrangement from the rail side 322 of the main body 320. . . .

* * * *

Referring still to FIG. 2, the resilient arm 380 extends in a cantilever arrangement upwardly from the main body 320 and in the same direction as the leg 340."

(Plf. Brief, Exh. 1, col. 4, ln. 10-12 & 33-35). This language suggests that the term "cantilever" was used to describe the manner in which the leg and arm project outward from, and are supported by, the main body of the insert. The fact that this arrangement creates a space between the leg and the arm is incidental.

Nevertheless, plaintiff insists that the prosecution history reveals that a different usage was intended. The inventors originally claimed the leg of the insert as "an elongated leg projecting from said main body toward said rail . . . ." and the arm as "an elongated resilient leg projecting from said main body toward said rail and upwardly toward the head of said rail . . . ." The patent examiner noted that this language was too broad and was anticipated by the earlier Grant Patent. (U.S. Patent No. 4,606,498) (Id., Exh. 3, Office Action Summary of Sept. 13, 1995 P 7). The Grant insert was contoured to fit snugly against the rail and base. (Id., Exh. 4, col. 3, ln. 50). The examiner suggested that "additional positively recited structural limitations to the claims detailing . . . in particular the free end cantilever arrangement of the legs and arms . . . may receive favorable consideration . . . ." (Id., Exh. 3, Office Action Summary of Sept. 13, 1995 P 14) (emphasis in original). The applicants therefore added the term "cantilever" to the claim language and noted that "in contrast, the legs and arms of Grant are not cantilevered, but are portions of a mass that also form the main body." (Id., Exh. 3, Amend. of Jan. 16, 1996, Remarks P 4 at 13).

The Court is not convinced that this prosecution history requires a different construction of the term "cantilevered." The applicants sought to distinguish the Grant Patent based on the relation of the leg and arm to the body of the insert--not on their relation to the rail. The fact that the applicants did not refer to the leg and arm as a "free end cantilevers," as suggested by the examiner, is irrelevant. At best, the modifier was redundant, as a cantilever must necessarily have a free end.

Moreover, plaintiff's proposed construction would effectively render the term "cantilever" meaningless. Even without this term, the leg and arm of the insert would still define a space between one another and the rail. The Court must give meaning to all the terms of the claim. Exxon Chemical Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 1557 (Fed. Cir. 1995), cert. denied, 518 U.S. 1020, 116 S. Ct. 2554, 135 L. Ed. 2d 1073 (1996). Accordingly, a "cantilevered leg" and "cantilevered arm" must be defined as a leg or arm that is supported by the main body of the insert and has a free end.
This claim term is the logical starting point for claim construction because the definition of "cap" will influence the definition of all of the other terms that the Court needs to construe.

The Defendants' proposed construction of "cap" is "a removable cover that completely covers a beverage container or drinking container." Sunbeam's proposed construction is "a removable structure adapted to mount to the end of a container to cover the end of the container to some extent." Thus, the parties' dispute focuses on the extent to which the "cap" must cover the beverage container.

1. Words of the Claims

The language of Claim 4 of the '592 patent describes the following claim:

a beverage container having an open top portion and a closed bottom portion;

a first removable cover for selectively covering said top portion of said container, said first cover adapted to be removably mountable on and off a blender and comprising an adapter portion for mounting said container on a blender; and

a second removable cover for selectively covering said open top portion of said container, said second cover comprising a cap, and wherein said first and second covers are interchangeable on said container.

'592 Patent at 20:53-63 (emphasis added).

2. Specification and Prosecution History

The specification describes the function of the cap, which is also referred to as a "removable cap." Id. at 11:39-59. The cap is described, in context of its use as an appurtenance to a single-serving beverage container, as follows:

The single serving beverage container 38 (shown also in FIG. 19) is slightly tapered along its length, and preferably is sized to fit into a user's hand as well as a typical beverage holder in automobiles. A removable cap 198 (FIG. 2) is provided that may be screwed onto the male threads 196. The removable cap 198 may include a drinking hole, and/or may include a closure tab to avoid spillage.

To use the single serving beverage container 38, the cap 198 is removed (if present), and beverage ingredients are placed in the single serving beverage container 38. The agitator collar 190 is then screwed onto the male threads 196. . . . The single serving beverage container 38 and the agitator collar 190 are then inverted (FIG. 19) and installed on the blender base 32. The beverage ingredients may then be mixed and/or blended by the blender base 32. The agitator collar 190 and the single serving beverage container 38 are then removed, inverted, and the agitator collar is screwed off of the single serving beverage container. The cap 198 may then be screwed onto the single serving beverage container 38, and the single serving beverage container is ready for use.

Id. The specification implies that the cap is intended to be used to facilitate drinking, because drinking is the standard use for beverage containers. However, it is also conceivable that a cap could be used to store the beverage and prevent spillage.

Neither party discusses any prosecution history surrounding the term "cap." The term does not appear to have engendered any dispute during prosecution of the '592 patent. Indeed, this is common to all of the claim terms containing the word "cap." See Pl. Memo, at 12 ("[T]here is nothing in the prosecution history of either patent-in-suit that changes the ordinary meaning of "drinking cap having a drinking hole."); id. at 15 ("[A]gain, there is nothing in the prosecution history of the patents that changes the ordinary meaning of the term 'drinking cap.'"). See also Def. Memo, at 9 ("The '592 Patent file history does not appear to modify the definition of 'cap' from Defendants' position."); id. at 12 (finding no history relevant to the term "drinking cap having a drinking hole"); id. at 19 (noting the lack of history pertinent to the term "cap configured for . . . drinking from the container").

3. Extrinsic Evidence

The only extrinsic evidence in the record is a dictionary definition of "cap," submitted by the Defendants to attack
Sunbeam's construction. Although Sunbeam complains that the dictionary is from 2010, as opposed to 2001, which is the date the initial patent application was filed, there is no reason to believe the definition of "cap" has changed since then. The lay definition of "cap" proffered by the Defendants is "[a] protective cover or seal, especially one that closes off an end or a tip: a bottle cap; a 35-millimeter lens cap." Def. Exh. 1 at 3. Sunbeam, in its reply, sets forth a definition of "cover" (which is used synonymously with "cap" throughout the patents) as "something that is placed over or about another thing," and lists "lid" and "top" as synonyms.

4. Proper Construction of "Cap"

The Defendants have adduced no reason to construe "cap," one of the more basic nouns in the English language. There is nothing about any of the claim language that would require "cap" to be defined differently in different contexts. Thus, as to this claim term, no construction is required — no benefit to claim scope or clarity would accrue from defining a cap in terms of synonyms such as "lid" or "cover." Cf. Tesco Corp., F. Supp. 2d, 2010 U.S. Dist. LEXIS 36434, 2010 WL 1443540, at *5. And, to adopt a construction that favored either partial or complete coverage of the container would be to effectively rewrite the patent, which is not within the Court's province in claim construction.

607

608

12. Capable of Being Mounted; Capable of Being Fixed

"Capable of being" does not require construction, particularly because both of the terms "mounted" and "fixed" have stipulated constructions.
18. "Capable of being compressed onto." The court finds that no construction of this phrase is required, as no substitute terms could be clearer than the phrase itself.

4. "The interior portion of the plate is capable of being deflected relative to the peripheral portions in a direction substantially perpendicular to the major axis of the shoe"

This claim term is sometimes referred to as the "relative deflection" feature, and it occurs as a result of relative restraint, discussed above. Akeva proposes the following definition: "a plate portion can deflect as compared to a portion that is closer to the center of the plate, caused at least in part by the relative restraint." (Akeva's Markman Br. at 13.)

adidas proposes that the term be construed as

the interior portion of the plate is susceptible to undergoing an action wherein the position of the interior portion is changed through normal use from its normal unflexed state (in which the interior portion is elevated relative to the periphery of the plate) into a position in which the interior portion is bent downward with respect to the periphery of the plate.

(adidas' Proposed Cl. Construction Order at 2.)

adidas argues that "capable of being deflected" cannot take on its plain and ordinary meaning of "susceptible to changing its position to become curved or turned downward" because the specification discusses it in a very specific way. The plate is capable of changing position from a "normal, unflexed state" to a deflected position. The "normal, unflexed state" is one in which the plate's interior is elevated relative to the periphery, or is in a convex (domed) or arched position. This means, adidas contends, that the plate is convex and deflects to a position of concave. Otherwise, if the plate began in a concave shape, it could not be further deflected.

The plain and ordinary meaning of "deflected" as an adjective is "curved or turned downward." Webster's Third New Int'l Dictionary 592 (1986). The idea of "turning" an object would appear more appropriate in the context of the deflection of a projectile or moving object. "Curved" is more appropriate to a stationary object.

The court notes, first, that Akeva's definition is incorrect because the plain meaning of the term should require the center of the plate to deflect compared to the periphery. Plaintiff offers no evidence to refute this construction, adidas' argument that the plate must begin in a convex shape and deflect to a concave shape is also problematic. To begin with, a concave plate made of a flexible material (such as rubber) could be further deflected. More importantly, even if it is true that the specification discloses no other forms in discussing deflection, this would not be enough to warrant limiting the term unless there had also been a redefinition, disclaimer, or disavowal of claim scope with respect to this term. A specification need not discuss all possible embodiments of the invention, and simply because an embodiment is not discussed is not enough to exclude that embodiment from the scope of the invention. See Liebel-Flarsheim, 358 F.3d at 906 ("This court has expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as

- 1043 -

PUBPAT
being limited to that embodiment."); Alloc, Inc. v. ITC, 342 F.3d 1361, 1370 (Fed. Cir. 2003) ("It is impermissible to read the one and only disclosed embodiment into a claim without other indicia that the patentee so intended to limit the invention."). A disclosure of only one embodiment may only be enough to limit the claim terms if the court can find that the patentee "demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Liebel-Flarsheim, 358 F.3d at 906 (internal quotations omitted). Here, while it may be true that the specification only discusses a flexible plate that begins in a convex shape and deflects to a concave shape, the specification does not show any clear intent to limit the flexible plate to this shape.

The latter portion of this claim term "in a direction substantially perpendicular to the major axis of the shoe" specifies the direction of deflection. As an initial matter, and although the dictionary definition of "deflected" includes the direction "downward," the court will afford greater weight to the direction specified in the claim term itself. Next, the wording of this portion of the claim term is identical to the wording in the relative restraint term, except that the word "the" precedes "major axis" instead of the word "a." With regard to "in a direction substantially perpendicular," the court must construe this term the same way that it defined it regarding relative restraint. See Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998) (noting the rule that "the same word appearing in the same claim should be interpreted consistently"). The parties are in agreement about the meaning of "the major axis of the shoe," as discussed above. Thus, the court must interpret this claim term according to its plain and ordinary meaning.

The relative deflection term will be construed as "the portions of the flexible plate close to the center are able to be curved, as compared to the peripheral portions of the flexible plate, in any direction that is substantially at a right angle to a heel-toe axis of the shoe, including the medial-to-lateral and vertical directions."

20. "Capable of being . . . forcibly expanded." Consistent with its ordinary meaning, 41 the court construes this phrase to mean "capable of increasing from one diameter to another by application of force to overcome the resistance to expand."

-- Footnotes --

41 See Stedman's Medical Dictionary 1696 (27th ed. 2002) (defining "expandable stent" as "increasing its diameter"); American Heritage Dictionary 522-23 (2d ed. 1984) (defining "forcibly" as "effected through the use of force" and "force" as "power made operative against resistance"); id. at 476 (defining "expand" as "to increase the size . . . of").

-- End Footnotes --

E. "Capable of Deflection"

"Capable of deflection" is found in claim 1 of the '486 patent and claim 7 of the '677 patent. Hysitron asserts that "capable of deflection" means the "central plate is capable of deviation from a starting position between the conductive surfaces of the drive plates." Joint Claim Construction Statement at 23-24. MTS asserts that "capable of deflection means "capable of being bent or deformed."

The intrinsic evidence supports Hysitron's construction. The specification teaches that "the central plate under force, moves closer or further away from one or the other of the outer most substrate." '486 patent, col. 10:12-14. The specification also states that the metal mass of the central plate is "displaceable within the frame opening when the five substrates are sandwiched together." I.d., col. 5:49-51. The value in the invention is the ability of the central plate to deflect or displace relative to the drive plates. MTS argues that the L-shaped springs "act as 'hinges' which bend or flex to allow the central plate to deflect within the openings formed by the insulating substrates while maintaining the outer portion of the central plate generally parallel to the drive plates." MTS's Markman Br. at 49. This construction relies on the distinct L-shape springs that are mentioned only in the preferred embodiment. See '486 patent, col. 5:47-49. Because the patent is not
confined to the preferred embodiment, MTS's argument is unpersuasive. The Court construes "capable of deflection" to mean "the central plate is capable of deviation from a starting position between the conductive surfaces of the drive plates."

...Wherein the actuating mechanism is capable of electronically switching between the first mode and the second mode to set and release the brake without manual readjustment of the gearing means... whereby the actuating mechanism can electrically set the wheel brake device and then electrically release the brake device, or vice versa, without having to manually reset the gearing means...

A. "Simulated Capsule-Like Medicament"

This phrase appears at the beginning and the end of Claim 1, and is used the same way in each instance. The parties are essentially in agreement that the ordinary meaning of this phrase is "a medicinal form that imitates, resembles, or suggests in form or appearance a gelatin shell containing medicine." This is essentially the definition derived from Webster's Third New International Dictionary (1961), an extrinsic source to which the Court may properly turn.

Defendant argues, however, that "capsule-like" is effectively defined in the specification and the prosecution history of the '524 patent as meaning "similar to a hard gelatin capsule". Defendant's sole argument with regard to the specification is that "the only capsules disclosed or referred to in the '524 patent are hard gelatin capsules with overlapping separable halves... [having] an overlap where the one capsule half fits inside the other, and a visible raised portion" (Defendant Bayer Corporation's Markman Brief at 25 - 26), so that when the phrase "capsule-like" appears in the '524 patent, it must mean "similar to a hard gelatin capsule".

Defendant would have the Court place too much weight on indirect references in the specification to "hard gelatin capsules". The claims do not specifically state that the claimed medicament is intended to simulate a "hard gelatin capsule," and the specification does not do so either. "Capsule" has a clear, ordinary meaning, as the parties agree, so that there is no...
understood by an ordinary person skilled in the art of pharmaceutics to mean "like a hard gelatin capsule." Defendant's definition, and the prosecution history does not require such a definition, the Court would only apply a different definition if there were clear evidence that the term would have a meaning other than the ordinary meaning for one skilled in the art of the patent. Here, defendant offers expert testimony as extrinsic evidence that "capsule-like" would be defined as meaning specifically "hard gelatin capsule" for purposes of the claims. The finished product resulting from the process described in Claim I may very broadly resemble a hard gelatin capsule, as a cylindrical caplet is coated with gelatin layers of different colors, but the claim terms and the specification do not define the specific phrase "simulated capsule-like" to mean only medicaments that simulate the hard gelatin capsules to which the specification makes reference.

Defendant argues that "capsule" is given a particular definition by the prosecution history. The first application by the patentee of the '524 patent, Mr. Berta, was rejected by the PTO, and in order to escape rejection, he filed an amended version of his claims, along with remarks explaining the changes and the manner in which they distinguished this patent from the 1898 Richards patent and thus warranted granting of this patent; these remarks are now part of the prosecution history. In these remarks, the patentee states that "the change in thickness at the end of the outer gelatinous coating accompanied by the changing color makes it appear that rather than a coated caplet, the medicament is actually a hollow, hard gelatin capsule."

This phrasing in the prosecution history is not enough to limit the construction of the disputed terms in the claims, however, because, under clear Federal Circuit precedent, the prosecution history cannot be used to enlarge, vary, or diminish the limitations in the claim language, unless the patentee has disclaimed or disavowed a certain scope or definition for the purpose of escaping rejection by the PTO. In this case, the phrase "simulated capsule-like medicament" appears in both the original application by the patentee and the amended application, and the remarks in the amended application state that it is the new language, regarding the color dichotomy and the seam resulting from the overlapping of the layers of gelatin, that has been added in order to avoid rejection. The patentee did not amend the wording of the phrase "simulated capsule-like medicament."

In addition, the seven pages of remarks accompanying the newly worded claims describe how the claim terms, as amended, disclose an invention which is different than the invention disclosed in the Richards patent. The remarks specifically emphasize a change in color and a change in thickness as elements which set the claimed invention off from the older patent, but they do not state that the claimed invention is distinct from the Richards patent by virtue of resembling a "hard gelatin capsule." The description quoted by defendant is made in passing, in a single place in the remarks. Elsewhere in the remarks, the patentee says simply that the appearance of the medicament provides an "illusion that the medicament is actually a capsule," and that it "would fool the viewer into believing that it was, in fact, a capsule." The patentee did not disclaim or disavow other possible types of capsules by making a single reference to a "hollow, hard gelatin capsule," given that in several other places the patentee represented that the general illusion of a "capsule" was sufficient to achieve the effect required for his claimed invention. Since the patentee did not endeavor to escape rejection by arguing to the PTO that his invention was limited to a medicament specifically simulating a "hard gelatin capsule," and he did not 'clearly disavow' coverage of simulated capsules other than simulated hard gelatin capsules, he did not limit the '524 patent to such type of medicament, and the Court will not read that limitation into the claims from the prosecution history. See, e.g., York Products, 99 F.3d at 1572. The phrase "simulated capsule-like medicament" will be construed to have its ordinary meaning.

In this case, where the term has a clear ordinary meaning, the specification does not provide an explicit alternative definition, and the prosecution history does not require such a definition, the Court would only apply a different definition for the term if there were clear evidence that the term would have a meaning other than the ordinary meaning for one skilled in the art of the patent. Here, defendant offers expert testimony as extrinsic evidence that "capsule-like" would be understood by an ordinary person skilled in the art of pharmaceutics to mean "like a hard gelatin capsule." Defendant's
witness, Dr. Gilbert Banker, did not provide an interpretation of the term "capsule" from the perspective of pharmaceutics, however. Rather, Banker offered his own opinion of how one skilled in the art would understand the phrase "simulated capsule-like medicament" in light of the other remarks in the specification and the prosecution history. Asked to give his understanding of the phrase, Banker remarked, "We have a hard gelatin capsule. There are, by the way, soft gelatin capsules, but they are not at issue here. This patent is clearly related to hard gelatin capsules… It was made clear in the specification that we were dealing with hard gelatin capsules." Markman Hearing on Patent Claim Construction, transcript at 148 - 149.

Having testified that hard gelatin capsules have strictly circular cross-sections, Banker then also testified that the United States Pharmacopeia, a standard reference work in the field, refers to flat, pancake-shaped caplets as "capsule-shapes." Id. at 205. He agreed that this definition is "a general definition… that people use," id. Having defined "cylindrical" as meaning "shaped like a hard gelatin capsule," Banker was asked, "Capsule-shaped then does not necessarily mean cylindrical?", and he replied, "That's right." Id. at 210. Banker thus conceded that there are other common capsule forms aside from hard gelatin capsules, and that the phrase "capsule-shaped" is commonly used to refer to a shape other than that of a hard gelatin capsule. The expert testimony was therefore not conclusive on whether "simulated capsule-like" would be understood by one of ordinary skill in the art of pharmaceutics, but rather offered his own construction of the term based upon limitations that he perceived as implicit in the intrinsic evidence of the '524 patent. As a matter of law, claim construction is the duty of the court. Here, the Court does not agree with Banker's assessment that the patent, using the regular rules of claim construction, is "clearly" limited to hard gelatin capsules. The disputed phrase is not ambiguous in the claim, the specification does not lay out a particular definition for the phrase, and the prosecution history does not indicate that the patentee disavowed claims to medicaments defined by the phrase as commonly understood. Therefore, the Court will assign the plain, ordinary meaning to the phrase "simulated capsule-like."}

--- Footnotes ---

1 It may be that the '524 patent, read as a whole, discloses only medicaments that turn out to resemble hard gelatin capsules, but that fact would not, by itself, mean that the specific phrase "simulated capsule-like medicament" is limited to such a narrow definition.

--- End Footnotes ---

IV. CONCLUSION

The Court concludes that the disputed terms have the following meanings:

1. "Simulated capsule-like medicament" shall mean "a medicinal form that imitates, resembles, or suggests in form or appearance a gelatin shell enclosing medicine."

The Court construes this term to mean:

A bracket (1) into which the lower end of the leg support fits and (2) that prevents significant downward or lateral movement of the lower end of the leg support.

This construction is consistent with the construction adopted in Forest Group, 2007 U.S. Dist. LEXIS 10487, at *10 (construing "capturing bracket" as "a bracket into which the lower end of the leg support may be positionally fixed to prevent movement downward below the bracket or laterally in any direction").

Warner asks for a construction that wrongly disregards the word "capturing." Joint Markman Subm. at 3. Forest asks for a
construction that wrongly includes language about how the bracket functions when a fastener breaks. Id. This particular term, however, has nothing to do with fasteners. The language about fasteners that Forest advocates relates to a limitation expressed in the last sentence of Claim 1, not to this particular term. Accordingly, the Court adopts neither party's proposed construction of the term "capturing bracket."

Instead, the Court construes "capturing bracket" consistently with the patent claims, drawings, and written description, and with the ordinary meaning of the words. The patent drawings depict a U-shaped bracket into which the lower end of the leg support fits. 1 Figs. 1, 2, & 3. The written description states that the leg-support end "is shaped or contoured . . . to fit within capturing bracket 48." '515 Pat. col. 3:4-6. The description also states that if the nut-and-bolt assembly connecting the capturing bracket and the leg-support end breaks, "capturing bracket 48 will still hold leg support lower end 46 in place." Id. col. 3:11-12. Finally, the ordinary meaning of the word "capture" is to "seize" -- that is, to hold in place. See, e.g., Am. Heritage Dictionary of the English Language 278 (4th ed. 2000). The Court's construction is based on all of this evidence.

617

B. "Said Mounting Including a Capturing Bracket for Engaging the Lower End of Said Leg Support"

One of the improvements contained in the '515 Patent is the addition of the "capturing bracket" on the rear vertical support, which bracket receives and holds the leg support. In the embodiment figures contained in the '515 Patent and on the stilts shown to the Court, the capturing bracket is a small structure that is enclosed on three sides and the bottom. The fourth, open side of the capturing bracket is attached on the rear vertical support. The leg support is placed into the capturing bracket and, in all the embodiments, a bolt or other fastener is placed through the sides of the capturing bracket and through the lower end of the leg support. The Court construes the term "said mounting including a capturing bracket for engaging the lower end of said leg support" to mean "the mounting includes a bracket into which the lower end of the leg support may be positionally fixed to prevent movement downward below the bracket or laterally in any direction."

618

A. The "Electronic Multi-Function Card" Limitation

1. Law of the Case

"Once a case has been decided on appeal, the rule adopted is to be applied, right or wrong, absent exceptional circumstances, in the disposition of the lawsuit." Gindes v. United States, 740 F.2d 947, 949 (Fed. Cir. 1984) (quoting Schwartz v. NMS Indus., Inc., 575 F.2d 553, 554 (5th Cir. 1978)). E-Pass argues that the district court disobeyed the mandate of this court by entering summary judgment in favor of the defendants as to the subject of the prior appeal, the "electronic multi-function card" limitation of claim 1 of the '311 patent. It further argues that the district court disobeyed our mandate when it elaborated upon our claim construction in E-Pass I in light of the teachings of this court's en banc decision in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc). We disagree as to each of these contentions.

a. Summary Judgment

E-Pass's first argument rests in substantial part on our statement in E-Pass I that "issues of material fact remain in dispute as to both literal and doctrine of equivalents infringement under the proper construction" of the term "card." E-Pass I, 343 F.3d at 1365. That statement, however, must be read in context. As the very same sentence announced, we vacated the grant of summary judgment and remanded to the district court for further proceedings. Id. By vacating, we signaled that, although the district court's prior decision rested upon erroneous grounds, a proper claim construction might support a judgment (summary or otherwise) in favor of either party, depending on the evidence and argument submitted to the district court on remand and considered by the district court in the first instance. Cf. Communities for Equity v. Mich. High Sch. Athletic Ass'n, 459 F.3d 676, 680 (6th Cir. 2006) (noting that when the Supreme Court grants a writ of certiorari, vacates, and remands, it "does not indicate, nor even suggest, that the lower court's decision was erroneous").
The balance of our opinion in E-Pass I supports this interpretation. We discussed in detail the claim construction of the term "card" and the district court's error in construing "card" to mean a card with the precise dimensions of a standard credit card. E-Pass I, 343 F.3d at 1367-71. At the conclusion of this discussion, we emphasized that "under the correct construction of 'card' in this context . . . it may or may not be that the accused Palm Pilot devices literally infringe." Id. at 1371. Indeed, we could not have intended to foreclose a summary judgment of noninfringement because the record did not yet contain the evidence that the parties would put forward in support of their infringement and noninfringement contentions under the proper construction.

Accordingly, the district court correctly concluded that it had the authority to entertain the defendants' motions for summary judgment on remand. SJ Order, slip op. at 11, 12; see also Liquid Dynamics Corp. v. Vaughan Co., Inc., 449 F.3d 1209, 1220 (Fed. Cir. 2006) ("Issues not decided by the court in a prior proceeding are not covered by the law-of-the-case doctrine."). As the district court observed, we did not in E-Pass I "inten[d] . . . to preclude [the district court] from hearing a complete summary judgment motion as to the Palm VII on remand." n1 SJ Order, slip op. at 12. As we discuss next, the district court on remand properly undertook a thorough and thoughtful analysis of the infringement issues, and in so doing, it followed our claim construction in E-Pass I.

--- Footnotes ---

n1 Of course, the decision in E-Pass I does not constitute law of the case as to parties and accused devices that were not yet part of the litigation when that decision issued. See Jamesbury Corp. v. Litton Indus. Prods., Inc., 586 F.2d 917, 920 (2d Cir. 1978) (noting that "because the present case involves a different defendant . . . the earlier decision . . . is n[ot] 'law of the case'").

--- End Footnotes ---

b. Claim Construction

In E-Pass I, we addressed the question of whether the district court had improperly added a dimensional limitation to the claim. See 343 F.3d at 1368-69. We concluded that a dimensional limitation was not warranted and overturned a claim construction that improperly limited the claim to encompass only devices having exact credit card dimensions. Id. at 1368. We went on to hold that "the ordinary meaning of the word 'card' . . ., as used in the phrase 'electronic multi-function card,' is the proper construction." Id. at 1370-71. From this, we articulated a definition of "card" -- namely, a "flat rectangular piece of stiff material" -- derived from several general-purpose dictionaries. See id. at 1367-68.

Following our decision in E-Pass I and prior to the district court's ruling on remand, our court, sitting en banc, decided Phillips. 415 F.3d at 1303. In its brief, Visa argues that the district court was "at liberty to reconstrue 'card'" because Phillips "supersedes the 3Com panel decision." Visa Br. at 19-20. This is an overstatement. A claim construction articulated by a prior panel decision of this court ordinarily remains the law of the case unless it is in conflict with a subsequent decision by this court sitting en banc or by the Supreme Court. See Cal. Fed. Bank v. United States, 395 F.3d 1263, 1274-75 (Fed. Cir. 2005) (declining to revisit earlier ruling where intervening en banc decision was not in direct conflict, and where Supreme Court analysis of the same issue controlled); see also United States v. Moran, 393 F.3d 1, 7 (1st Cir. 2004) ([A] legal decision made at one stage of a criminal or civil proceeding should remain the law of that case throughout the litigation, unless and until the decision is modified or overruled . . . ."). Here, we see no conflict between the guidance provided in Phillips and the claim construction we articulated in E-Pass I. As we discuss below, see infra Part II.A.2, the district court correctly applied our construction as the governing definition of "card."

Nonetheless, any articulated definition of a claim term ultimately must relate to the infringement questions that it is intended to answer. See Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322, 1326 (Fed. Cir. 2006) ("[T]he legal function of giving meaning to claim terms always takes place in the context of a specific accused infringing device or process."). The definition of "card" that we articulated in E-Pass I described the properties of a "card" relevant to the accused devices, and it thereby sufficed to determine the question of infringement. Thus, the district court's observation that not every "flat rectangular piece of stiff material" is a "card," see SJ Order, slip op. at 26, was not strictly necessary to its holding.

Even so, the district court's observation was correct. For example, no reasonable jury, if properly instructed, would conclude
that a 4’x8’x 1/2” piece of plywood or a plate glass window infringes the "card" limitation of ’311 patent claim 1. See id. The specification of the ’311 patent makes it clear that a "card," as used in the patent's claims, is something a user will "carry about." See, e.g., ’311 patent, col. 1, l. 44. Although not a precise restriction on size or portability, the attributes of being able to be "carried about" and of not having protruding buttons, keyboards, antennae, indented display screens, or hinged covers are characteristics that a complete claim construction of "card" can be expected to embrace.

Moreover, we reiterated in Phillips the paramount importance to claim construction of the language of the claims themselves. See Phillips, 415 F.3d at 1312; see also Vitronics Corp. v. Conceptor, Inc., 90 F.3d 1576, 1582 ("[W]e look to the words of the claims themselves . . . to define the scope of the patented invention."). This case hinges on the construction of a term that not only bears one of its ordinary meanings, but is a straightforward name for an everyday object. Most members of a jury are likely to have at least one "card" in the sense of the ’311 patent in their pockets, wallets, or purses. The district court implicitly recognized this observation when it boiled the infringement inquiry down to a "straightforward question -- using the plain meaning of the word 'card,' can any of the accused devices be considered to be a 'card'?" SJ Order, slip op. at 33.

2. First Card

Webster's defines "card" as ",(6) (a) : a flat stiff usually small and rectangular piece of material (as paper, cardboard, or plastic) usually bearing information …" WEBSTER'S at 186. Fiala seeks to define the term "first card" as "a first card of any outline shape." (Pl. Reply at 9.) SVS disputes that construction, claiming that it is an alteration of the ordinary meaning of "card." All of the preferred embodiments display a card in the shape of a rectangle. (See Def. Resp. at 4.) As discussed above, this fact will not limit the ordinary meaning of the word. The preferred embodiments demonstrate simply that a card usually takes a shape similar to that of a rectangle.

That a card is "usually … rectangular," however, implies that there are some instances in which it is not. Because a "card," as that term is normally understood, can have a number of different outline shapes, the court will not strictly limit the claim to cover only rectangular cards. Having reviewed the claim language, specification, and prosecution history, the court defines "a first card generally defining a plane" as "a first card of any outline shape and generally defining a plane."

1. "Card Moving Mechanism"

VendingData argues the term "card-moving mechanism" requires claim construction. VendingData acknowledges that the term is not used in the patent description but asserts claim construction of this term is required because the specification discusses "a first card mover," a "second card mover," "a third card mover," and "card moving pickoff assemblies." VendingData argues that a review of the prosecution history of the ’258 patent and its parent ’035 application demonstrates the patentee defined the term "card moving mechanism" as one that required a "bi-directional movement of cards." VendingData points to the claim Examiner's statements rejection of claims 12, 17, 21, and 23 of the ’035 application and the applicant's responses to support its argument the term "card moving mechanism" must be construed to include direction changes in the event of a jam. VendingData also argues that because the patentee distinguished the term "card moving mechanism" from prior art, he acted as his own lexicographer and defined the term to include direction changes in the event of a jam.

Therefore, the presumption of ordinary meaning has been overcome and the court should construe the term "card moving mechanism" to mean:

a mechanism that moves cards and, in the event of a jammed shuffle, changes the direction of normal card movement.
VendingData advances an alternative construction for the term "card moving mechanism" asserting the claim should be interpreted as a "means-plus-function" element or as equivalent to "means for moving cards" under the provisions of 35 U.S.C. § 112, P 6. As a means-plus-function element, VendingData urges the court to construe the term "card moving mechanism" to mean:

card moving pickoff assemblies 182, 184 and 186 or their equivalents, i.e., the center pickoff assembly 182, including a pickoff roller 190 carrying at least two sticky pickoff fingers or tabs 191 one hundred eighty-degrees apart.

A review of this specification does not support VendingData's argument that the claim is limited as VendingData suggests. VendingData points to specification language discussing "a first card mover," "a second card mover," "a third card mover," and "card moving pickoff assembly" to support its argument "'card moving mechanism' described in the specification is one that is for individual reengaging and moving cards from the top of the stack of cards in a magazine horizontally to another magazine." (Defendants' brief at 10: 15-17.) However, as Shuffle Master points out, defendants do not argue that the phrase "card moving mechanism" should be limited to mechanisms that move cards "from the top of the stack of cards." The court finds no support in the intrinsic evidence the patentee acted as his own lexicographer to define the term "card moving mechanism" as a mechanism that "in the event of a jammed shuffle, changes the direction of normal card movement" as VendingData argues. Moreover, VendingData's suggested construction of the term to include "a mechanism that moves cards" is consistent with ordinary meaning.

Finally, VendingData's citation to a portion of the specification that describes one example of the invention in which three mechanisms are used to move individual cards from the tops of three stacks of cards using devices known as pickoff assemblies is merely a reference to a specific example or preferred embodiment. It would be error, however, to limit the claim's scope by "importing a characteristic of a disclosed or preferred embodiment into that term." Generation II Orthotics, Inc., v. Medical Tech., Inc., 263 F.3d 1356, 1367 (Fed. Cir. 2001). Federal Circuit authority makes it "clear that an applicant is not required to describe in the specification every conceivable and possible future embodiment of its invention." Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344. Or, as the Federal Circuit has stated:

"If structural claims were to be limited to devices operated precisely as a specification-described embodiment is operated, there would be no need for claims. Nor could an applicant, regardless of the prior art, claim more broadly than that embodiment." Id. In short, it is the claims that measure the invention, as informed by the specification. As we noted long ago: "Specifications teach. Claims claim."

In short, the cited portions of the specification VendingData relies on does not support a limitation of the claims as VendingData suggests. It merely describes one example of the invention and does not establish that the patentee has acted as his own lexicographer to explicitly define the term as VendingData would have the court construe it, or that the patentee has disavowed or described the scope of coverage by using words or expressions that manifest exclusion or restriction. The court finds the specification does not limit the scope of the claims. The court also finds the prosecution history does not limit the scope of the claims and that the term "card moving mechanism" is not written as a means-plus-function claim element. The term "card moving mechanism" describes a structure, not a "means for" performing the function of moving cards. Therefore, the restrictions of 35 U.S.C. § 112 P 6 do not apply. Watts v. X.L. Sys., Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000).

A. '472 Claim 1: "cardioverting device"

The principal dispute over the term "cardioverting device" in Claim 1 of the '472 patent is whether the term is limited to atrial cardioverting devices, as St. Jude contends, or whether the term includes both ventricular and atrial devices, as CPI argues. The court agrees with CPI that the term "cardioverting device" as used in the claim without limitation includes both atrial and ventricular devices.
The claim construction process begins with the claim language itself. As a starting point, the court gives claim terms their ordinary and accustomed meaning as understood by one of ordinary skill in the field of invention. Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 955 (Fed. Cir. 2000). Neither Claim 1 of the '472 patent nor any of the other '472 claims uses the word "atrium" or "atrial." Looking exclusively at the claim itself, there is no basis for adding the limiting adjective "atrial" to the construction of the more general term "cardioverting device." 4

The claim term's ordinary and accustomed meaning in the art, however, serves initially only as a default meaning. The Federal Circuit has explained:

The patentee may act as a lexicographer and ascribe a different, or modified, meaning to the term. See Multiform Desicants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477, 45 U.S.P.Q.2D (BNA) 1429, 1432 (Fed. Cir. 1998) (observing that an inventor, acting as a lexicographer, may bestow "a special meaning to a term in order to convey a character or property or nuance relevant to the particular invention"); Intellecall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1388, 21 U.S.P.Q.2D (BNA) 1383, 1386 [(Fed. Cir. 1992)]. The court, therefore, must examine a patent's specification and prosecution history to determine whether the patentee has given the term an unconventional meaning. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) 1573 at 1577 (holding that "it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning [because the specification] acts as a dictionary when it expressly defines terms . . . or when it defines terms by implication" (emphasis added)); Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir. 1995) (determining that "arguments and amendments made during the prosecution of a patent application . . . as well as the specification and other claims must be examined to determine the meaning of terms in a claim" (emphasis added)). If the patentee has not done so, the term's ordinary and accustomed meaning controls. See York Prods., Inc. v. Central Tractor Farm Family Ctr., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D (BNA) 1619, 1622 (Fed. Cir. 1996) ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning.").

Id. Under these rules of claim construction, the court must examine the specification and the prosecution history to determine whether the patentee explicitly or implicitly defined "cardioverting device" to refer only to atrial devices.

The specification does not explicitly limit the phrase "cardioverting device" to atrial devices. St. Jude argues that the '472 patent specification nevertheless at least implicitly defines the term "cardioverting device" to include only atrial devices. There are several examples of potentially limiting language in the written description of the '472 patent. For example, the Abstract describes "An externally controlled implantable electronic device for delivering a cardioverting pulse of energy to the atrium of an ailing heart." The specification also states that the invention "relates to an atrial device designed to be implanted under the skin of patients who frequently suffer from bouts of atrial fibrillation, flutter or tachycardia," '472 Patent, col. 1, ll. 46-49; that "it is one object of the present invention to provide a device which will enable to [sic] cardioversion of a heart undergoing atrial fibrillation, flutter or tachycardia, without hospitalization," '472 Patent, col. 2, ll. 59-62; that "Yet another object of the present invention is to provide a method for cardioverting a heart suffering from an atrial malfunctioning, wherein cardioversion is initiated by a physician or by the wearer while in a state of consciousness,"
Beyond the repeated use of the words "atrial" and "atrium" in the specification, there is no doubt that the two disclosed embodiments (shown in Figures 1 through 3 and discussed in detail in the specification) are designed to treat only atrial arrhythmias. The specification does not describe an embodiment of the invention that is designed to function as a ventricular defibrillator.

There is obviously some tension between the narrower '472 specification language and the broader '472 claim language. The Federal Circuit, however, has repeatedly cautioned against limiting the scope of a claim to a preferred embodiment or to specific examples disclosed in the specification. See, e.g., Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1302-03 (Fed. Cir. 1997) (holding that the district court erred in interpreting the phrase "conductive liquid-like medium" as being limited to liquids having a conductivity similar to the examples listed in the specification). The fact that the written description focuses on characteristics and functions of the disclosed embodiments does not prevent the patentee from claiming an invention broader than the disclosed embodiments. See Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) ("claims are not to be interpreted by adding limitations appearing only in the specification"); SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121 (Fed. Cir. 1985) (en banc) ("If everything in the specification were required to be read into the claims, or if structural claims were to be limited to devices operated precisely as a specification-described embodiment is operated, there would be no need for claims.").

In this case, the difference between the broad term "heart" and more specific references to only the atra or to only the ventricles is clear to anyone skilled in the art. The deliberate use of the broader terms "heart" and "cardioverting device" in the claims, when contrasted with the narrower language in the specification, indicates an intentional choice by the patentee to reach beyond the embodiments described in the specification. In this respect, the language of Claim 1 itself is broad, but it is not ambiguous. Cf. Sedima, S.P.R.L. v. Imrex Co., 473 U.S. 479, 499, 87 L. Ed. 2d 346, 105 S. Ct. 3275 (1985) (rejecting attempt to narrow deliberately broad language in civil RICO statute: "The fact that RICO has been applied in situations not expressly anticipated by Congress does not demonstrate ambiguity. It demonstrates breadth.") quoting Haroco, Inc. v. American National Bank & Trust Co., 747 F.2d 384, 398 (7th Cir. 1984), aff'd, 473 U.S. 606, 87 L. Ed. 2d 437, 105 S. Ct. 3291 (1985). Construing the term "cardioverting device" to reach both atrial and ventricular devices is consistent with the rest of the language in Claim 1 of the '472 patent. As explained by CPI: "The invention of [Claim 1 of] the '472 patent is the ability to externally program the amount of energy to be delivered by a cardioverting device. Whether the device treats the atrium or the ventricle has no bearing on the external programmability of energy levels that the inventors had invented." Pl. Reply Br. at 29.

The prosecution history of the '472 patent also indicates that both the patentee and the patent examiner were fully aware of the differences between atrial and ventricular devices and that the claim language was intentionally drafted to reach beyond atrial cardioverting devices. First, the claims of the '750 patent, a related "parent" application cited in the '472 patent, distinguished between atrial cardioverters (claims 1-25, 29) and cardioverting devices generally (claim 26). Ex. 110, '750 Patent, col. 8, ll. 58 to col. 14, ll. 22. The claims of the '472 patent contain no similar limit. Second, during the prosecution of the claims in the '472 patent application, the examiner applied ventricular prior art. Ex. 14, '472 Pros. Hist., at CPI 005590-92. These examples from the prosecution history show that the drafters were fully aware of the differences between atrial cardioverters, ventricular cardioverters, and cardioverters generally, and that the examiner did not consider ventricular devices irrelevant to the '472 claims.

CPI contends that the court should also consider as relevant intrinsic evidence (1) an amendment that was made to the '472 patent title during claims prosecution which eliminated the word "atrial," and (2) the granting of a term extension for the '472 patent based on a ventricular device in 1992. During prosecution of the '472 patent, the drafters changed the patent title from "Command Atrial Cardioverter" to "Cardioverting Device with Stored Energy Selecting Means and Discharge Initiating Means, and Related Method." Pl. Br. at 31-32. This change was made after the patent examiner raised an objection that the original title and statements of invention were "not commensurate with the claimed subject matter." Ex. 14, '472 Pros. Hist., at CPI 005590.

The court is reluctant to give much weight to the title change because the Federal Circuit has noted the "near irrelevancy of the patent title to claim construction" and has stated that "an amendment of the patent title during prosecution should not be regarded as having the same or similar effect as an amendment of the claims themselves by the applicant." Pitney Bowes,
Inc. v. Hewlett-Packard Co., 182 F.3d at 1312 (concluding that the district court attached too much weight in its claim construction to the patent title and to the amendment of that title). In any event, the title change certainly does not support defendants' effort to construe the claim language narrowly to exclude devices that treat ventricular conditions.

The application for an extension of the '472 patent term explicitly stated that the approved product treated ventricular tachycardia and ventricular fibrillation and that Claim 1 covered the product. Plaintiffs contend that the extension could not have been granted unless the Patent Office agreed that the '472 patent claims could reach ventricular cardioverters. Pl. Reply Br. at 36; Ex. 14, '472 Pros. Hist., Request for Extension of Patent Term. However, it is not clear where an application for a patent term extension fits in the interpretive hierarchy. Certainly the device descriptions in a patent extension application cannot be read to amend the claims or specification of the original patent document. The patent term extension is consistent with the clear language of Claim 1, but the claim language itself is by far the most important evidence that supports plaintiffs' interpretation of "cardioverting device." 5

--- Footnotes ---

5 CPI also contends the court should consider evidence of licenses and royalty payments among manufacturers of cardioverting devices. CPI believes this evidence will show that defendants have construed the claims of CPI's patents as covering the defendants' devices. CPI has not offered any specific case support for using such evidence in construing ambiguous claim language, and the court has not considered such evidence for two principal reasons. First, under Markman, it is clear that evidence relevant to claim construction should be publicly available evidence. See 52 F.3d at 978-79, 987 (discussing the importance of the public record). Other inventors are entitled to know the scope of the claims and may try to design around those claims. See Vitronics, 90 F.3d at 1583. If evidence of licensing agreements and royalty payments (which are often confidential) were deemed relevant to claim construction, the scope of claims could not be known without access to private, often highly confidential information from multiple sources in an industry. Second, as the evidence in this case suggests, an industry may operate on the basis of a complex web of cross-licensing agreements negotiated on the basis of a complicated matrix of business considerations and legal risks. The fact that licenses have been negotiated and royalties paid offers little or nothing of probative value as to how claim language should be construed when a court is finally called upon to provide a definitive construction.

--- End Footnotes ---

Defendants have cited several statements made by the inventors and patentees during the prosecution of a parent application to the continuation application that actually resulted in the '472 patent. Defendants argue that these statements, like the language of the '472 specification, limit the scope of the '472 patent claims to atrial cardioverting devices. Def. Br. at 23-24. The cited statements include the following:

The broad invention disclosed in the parent and instant applications relates to an implanted electronic device which is manually operable from external to the skin of the wearer, for accomplishing atrial cardioversion. Never before has such a device been conceived, and it is therefore the firm belief and opinion of the applicants that their broad invention is patentable over the prior art.

Ex. 118 at 8 (remarks supporting an amendment to the claims and description in patent application Serial No. 641,381, dated December 17, 1975) (emphasis added). 6 Similarly:

Because these two types of fibrillation are so different, ventricular defibrillation and atrial defibrillation are not suited for indiscriminate comparison. It is on this basis that the application of the Schuder et al article is deemed improper.

In the February 23, 1977 Action, it is alleged that an obvious step would be to combine the teachings of a Schuder et al article, admittedly directed to ventricular defibrillation, with a Charms patent, which suggested atrial defibrillation. This combination is untenable for two basic reasons. First, even if the references were to be combined, the man having ordinary skill in the art would have evolved a fully automatic implantable atrial defibrillator; based upon his awareness of ventricular defibrillation technology, he would not have considered a non-automatic approach.

Ex. 119 at 2 (response to patent examiner, dated June 22, 1977) (emphasis in original).
The above-identified application relates to a non-automatic atrial defibrillator. This device is in every way practical and realistic. The wearer is able to recognize when he is experiencing atrial fibrillation; and he, himself, can initiate a defibrillating procedure. Or, if he chooses, the individual can consult with his physician, discuss his suspected arrhythmia, and decide either to, or not to, initiate a defibrillating procedure. While ventricular defibrillation is a necessity to save a life, and while a reaction to ventricular fibrillation must be immediate, atrial defibrillation is an elective procedure.

Accordingly, the invention described in the above-identified application involves far more than merely borrowing from the art of ventricular defibrillation. The concept of a fully-implantable non-automatic atrial defibrillator can be thought of as an accommodation to a heart patient; with such a device, defibrillation can be accomplished at home, without the inconvenience of repeated visits to a physician.

Ex. 111, P 11 (Declaration of Mieczyslaw Mirowski, dated June 8, 1977).

For the reasons set forth in my October 28, 1976 Declaration and those set forth in the foregoing paragraphs, I am of the firm belief that an implantable non-automatic ventricular defibrillator is unrealistic and totally impractical, because not useful by the suffering individual himself, and because the suffering individual is not likely to experience ventricular fibrillation in the presence of one skilled in medicine and aware that the individual wears an implanted defibrillator.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

6 The continuation application that resulted in the '472 patent was filed on August 9, 1979.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

While statements made during the prosecution of a parent application are part of the prosecution history and relevant to interpreting claims in a subsequent daughter application, see Wang Laboratories, Inc. v. America Online, Inc., 197 F.3d 1377, 1383-84 (Fed. Cir. 1999), they form only part of the interpretive backdrop. In this case, the parent application, Serial No. 641,381, was abandoned. Significantly, at least some of the claims in the abandoned parent application referred explicitly to the "atrium" and to devices for converting "supra-ventricular" cardiac arrhythmias. Ex. 118 at 3-7.

Defendants are correct to point out through the inventors' statements that the devices disclosed in the abandoned parent application (as well as the devices in Figure 1 and Figure 3 of the '472 patent) are not suited for ventricular defibrillation. However, the removal of all references to the words "atrium," "atrial," and "supra-ventricular" in the claims of the '472 patent indicates a deliberate intent to broaden the claims over those in the abandoned parent application. The statements made in support of the abandoned parent application do not limit the unambiguous language in the claims of the '472 patent.

7

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

7 In contrast to the claims in the abandoned parent application, the claims in the '472 patent also make no explicit reference to a "non-automatic" or "manually operated" device. In fact, the claims of the '472 patent were specifically amended during prosecution to replace the phrase "implantable non-automatic converting device" with the more general term "cardioverting device." Ex. 14, '472 Pros. Hist., at CPI 005600-07.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Nevertheless, defendants have cited Federal Circuit decisions that are difficult to reconcile with the cases suggesting that a claim may be broader than the specific embodiment disclosed in a specification. For example, in Gentry Gallery, Inc. v. Berkline Corp., 134 F.3d 1473, 1480 (Fed. Cir. 1998), the court wrote that "claims may be no broader than the supporting disclosure, and therefore . . . a narrow disclosure will limit claim breadth." In Gentry Gallery, however, the court was deciding an issue of validity and held invalid broad claims that reached beyond the disclosure. In Laitram Corp. v. Morehouse Industries, Inc., 143 F.3d 1456, 1462-63 (Fed. Cir. 1998), the court rejected a number of arguments by a patentee who sought a broad claim interpretation: "It is entirely proper to 'use the specification in order to determine what
the inventor meant by terms and phrases in the claims.’ * * * While claims are not necessarily limited by the written description, it is relevant that nothing in the written description suggests that the driving surfaces can be anything but flat.”

In North American Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1576-77 (Fed. Cir. 1993), the court noted that the written description requirement of 35 U.S.C. § 112, ¶ 1 warranted a claim construction limited to the disclosures in the specification. See also Modine Manufacturing Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) (“when the preferred embodiment is described in the specification as the invention itself, the claims are not necessarily entitled to a scope broader than that embodiment”).

In the present case, however, both the deliberate use of broad language in the claims and the prosecution history show a clear choice to write claims that would apply to the entire heart, including the ventricles. To the extent that the broad claim language raises issues of validity, those issues may be addressed later in the case. They would not support an artificially narrowed reading of the deliberately broad claim language applying to the entire heart. The court therefore intends to define “cardioverting device” for the jury as “a device capable of correcting high-rate arrhythmic heart conditions by applying non-pacing electrical shocks to the heart. Such heart conditions include atrial arrhythmias and/or ventricular arrhythmias.” For essentially the same reasons, the terms (1) "cardioverting a heart" and "cardioverting the heart" in Claim 18 of the '472 patent, and (2) "cardioverting device" in Claim 1 of the '191 patent will be defined to include both atrial and ventricular cardioversion. See '472 Patent, col. 10, ll. 62-63; col. 12, ll. 6-8; '191 Patent, col. 8, l. 56.

A. "carriage"

The parties' proposed constructions are as follows:

TK

a movable part of a seat belt tension sensor that has an enclosed hole in it for receiving a portion of the seat belt webbing and moves a distance that corresponds to the amount of tension applied to the seat belt webbing

CTS

a belt carrying component in a stationary housing, provided with an open space for receiving belt webbing relative to the stationary housing in response to tension applied to the webbing

Despite both parties rather verbose interpretations, the dispute regarding this term centers on two issues: (1) the meaning of an opening in the carriage, whether opening refers to a defined hole within the carriage or simply an open space; and (2) whether a carriage is required to be encompassed "in a housing." Each issue is addressed in turn.

CTS argues that a "carriage" with an opening adapted to receive the webbing of the seat belt refers to an open space, not necessarily a hole defined by the carriage. However, TK says that it is the very fact that the '944 "carriage" defines a hole for receiving the seat belt webbing that allowed its claims to go forward in light of prior art, namely U.S. Patent No. 5,996,421 to Hubsy ("Husby").

The Court agrees with TK. In the prosecution history of the '944 patent, "carriage" was determined to mean "a movable part of a machine for supporting some other movable object or part." Plaintiff's Markman Brief, Ex. 4 (7/18/2005 Office Action at 4). Throughout claim 19 and the specification, the patent refers to the opening as "openings in" specific structural elements. In using the language "opening in," the specification rejects the use of simply an open space, as such a use is unconstrained within a specific structure and may only be defined by the outer limits of two or more structural entities such as the open space between the slide [40] and bracket plate [22] of Husby. It is clear from the specification, the drawings, and most prominently the prosecution history, that the specification was drafted to limit the use of the term opening to that of a hole defined by the carriage. The dictionary definition of "hole" describes an "opening through something." MERRIAM-WEBSTER COLLEGIATE DICTIONARY 575 (9th Ed. 1985). Here, the opening is for the carriage to receive the seat belt webbing. Thus, "carriage" shall be interpreted as urged by TK.
The more critical question with respect to the construction of "carriage" is whether the carriage must be contained within a housing as CTS contends. Notably, the term "a housing" is not found in either claim 19 or other relevant claims in the '944 patent. It is, however, found in the description of the "exemplary seat belt tension sensor," i.e., a preferred embodiment. See Col. 4 ll. 33-35 ("an exemplary seat belt tension sensor comprises an assembly of an anchor plate, a housing . . ."). Col. 5 ll. 18-20 (a carriage . . . wherein openings in the first portion i.e. openings in the anchor plate and housing . . .), and Col. 5 ll. 48-51 ("[t]he bunching of webbing within the opening generates lateral forces against the sides for the opening in the housing and/or anchor plate . . .").

CTS contends that without the housing, described in the preferred embodiment, the '944 patent would have a carriage moving a distance relative to no claimed component in the invention. This assertion is without merit. Claim 19 clearly sets forth that the carriage "is adapted to move relative to "a first portion of the seat belt tension sensor," Col. 11 ll. 6-7. Thus, there is a reference point relative to the carriage-the first portion of the seat belt tension sensor.

Moreover, the term "carriage" is defined as moving, in a crash event, relative to an "anchor plate," the "anchor plate and the housing," and the "anchor plate and/or the housing." See Col. 4 ll. 47; Col. 4 ll. 50-52; Col. 4 ll. 62-63; Col. 5 ll. 2-5. Never does the specification exclusively measure the movement of the carriage in a crash event relative to a housing alone. Thus, CTS's contentions that the carriage would be moving a distance relative to no claimed portion of the invention without the inclusion of a housing is misplaced as the motion of the carriage is also or exclusively measured relative to the anchor plate. Col. 4 ll. 50-52.

Further, in every instance in which the claim term "carriage" appears as referenced within a "housing" is within the specification's description of its preferred embodiment. Simply because the specification describes only one embodiment of the invention does not mean that the claims should automatically be limited to that embodiment. The portions of the specification in which the preferred embodiment is not described, including the claims themselves, use the open ended term housing and/or anchor plate indicating an invention similar which does not include a housing, would also be covered by the '944 patent. Col. 6 ll. 3; Col. 7 ll. 4; Col. 7 ll. 14-15; Col. 7 ll. 28. Put simply, this is not a situation where the preferred embodiment is the invention.

Notable also is that claim 19 does not recite a seat belt tension sensor, but rather "a carriage of a seat belt tension sensor." The claim language focuses on the structure and operation of the carriage component in relation to other seat belt tension sensor components (i.e., an adjacent first portion, spring(s) and the seat belt webbing). Details relating to other aspects of the range of seat belt tension sensors in which such a carriage may be employed were not specified, and therefore should not be used to limit claim 19. Thus, "carriage" should not be further limited to a carriage that is located in a sensor that has a stationary housing. The claim uses the generic term "carriage" without reference to the overall structure of the sensor or the specific location of the carriage relative to other components of the sensor. This gives support for the assertion that the "carriage" was not intended to be limited by the the particular sensor design described in the preferred embodiment. The carriage must have an opening for receiving the seat belt webbing and must be mounted so as to move relative to a first portion of the sensor, against the force of at least one spring, and by an amount that is responsive to tension applied to the seat belt. The width of the carriage opening must be sufficiently smaller than that of the adjacent first portion opening to prevent the webbing from rubbing against the sides of the adjacent opening. The claim language requires nothing further in respect to the carriage. Interjecting the requirement of a housing when the claim is silent in this regard would be inconsistent with the claim language as a whole, and would improperly import extraneous limitations from the specification apart from the need to construe recited claim language.

Additionally, the carriage is illustrated in the preferred embodiment as having an anchor plate attached to a housing adjacent to the carriage. In other embodiments (Figs. 15a, 15b and 16a, 16b), substantial portions of the carriage extend outside of the housing 104. By illustrating various carriages in the context of embodiments that include both an anchor plate and a housing, "carriage" cannot be interpreted to exclude carriages utilized in seat belt tension sensors that do not have an outer housing.

Finally, "the prosecution history provides evidence of how the PTO and the inventor understood the patent." Phillips, 415 F.3d at 1329. Application claim 19, which was renumbered and issued as independent claim 13, is similar to application claim 25, which issued as claim 19. Both claims recite a carriage adapted to move relative to a first portion in opposition to at least one spring acting between them. Application claim 19 was rejected as anticipated by Husby, and application claim
25 was rejected as obvious in view of Husby and a second reference. (Ex. 4, 7/18/05 Office Action at pp. 2-4.). As explained below, the way in which the rejection was resolved demonstrates that "carriage" is not limited to a carriage within a housing.

Key features of Husby are depicted in Figures 5 and 6 of the Husby patent and are set forth below:

As the figures show, Husby discloses a belt tension sensor which includes an anchor plate ("hold-down bracket 22") having an opening 43 in which slide 40 moves vertically. The belt loop 45 extends through the opening 43 and wraps around the slide 40, pulling the slide 40 in an upward direction when tension is applied to the belt. The upward travel of the slide 40 compresses a flexible resistor 35 on spring 36. This results in a change in the resistance of the resistor that can be detected by a controller and correlated to the applied belt tension. (Husby, Col. 3, I. 28-Col. 4, I. 40.)

Although the Husby sensor does not have a stationary housing, the examiner found that the Husby slide corresponded to the claimed "carriage" of application claims 19 and 25. (Ex. 4, 7/18/05 Office Action at pp. 2 and 4.) The applicant had suggested that the slide of Husby does not correspond to the claimed "carriage" because it does not have "an opening adapted to receive the webbing of a seat belt" but rather provides an outer surface around which the seat belt is looped. (Ex. 6, 5/11/05 Amendment and Reply at p. 9.) To this the examiner responded:

First, applicant argues that element 41 is not a "carriage". It is noted that Applicant does not provide a definition of what a "carriage" is. Looking to the dictionary (Merriam Webster's Collegiate Dictionary, 10th edition), the closest definition that would apply to this usage is "a movable part of a machine for supporting some other movable object or part". The slide of Husby (element 40, which includes sides 41; seen in Figures 2-4) is clearly a movable part which supports another movable part (the seat belt).

(Ex. 4, 7/18/2005 Office Action at p. 4.) Thus, the examiner understood "carriage" to refer to a movable part that supports the movable seat belt, without requiring that the carriage be located within a housing. The examiner's explanation of the term "carriage" in the prosecution history corresponds to TK's proposed interpretation and is consistent with the other language of the allowed paradigm claim relevant to this term. The applicant did not take issue with this usage of the term "carriage" by the examiner. The applicant did not amend the claim to require a housing or further define the claimed carriage to require that it be located within a stationary housing. The applicant instead continued to distinguish the slide of Husby on the basis that it lacks the claimed "opening adapted to receive the webbing of the seat belt." (Ex. 7, 10/18/05 Reply at pp. 2-4.) The examiner eventually accepted that argument and allowed the claims to issue. In sum, the prosecution history file supports TK's contentions that the meaning of the term "carriage" does not require it be encompassed in a housing as shown in the preferred embodiment.

--- Footnotes ---

8 The applicant did not distinguish Husby on the basis that Husby lacks an outer housing or a carriage surrounded by such a housing.

--- End Footnotes ---

In the end, the Court adopts TK's construction of "carriage." The Court is satisfied that one having ordinary skill in the relevant art at the time of the invention would not have assumed that the carriage was to be encompassed in a housing. Carriage shall be interpreted held to mean "a moveable part of a seat belt tension sensor that has an enclosed hole in it for receiving a portion of seat belt webbing and moves a distance that corresponds to the amount of tension applied to the seat belt webbing."

3. "Carried on [the] Intermediate Portion"

Bridgeport next contends that summary judgment on claims 4, 5, and 7 of Patent '050 and claims 5, 8, and 9 of Patent '164 is warranted because Bridgeport's adaptor has raised steps at either end of the intermediate portion, meaning that the adaptor is...
not "carried on" the intermediate portion of the connector. These claims provide, in pertinent part, as follows:

The quick connect fitting of claim 2 wherein said connector has a flange and shoulder with an 12 intermediate portion there between with said adaptor carried on said intermediate portion and held in position by said flange and shoulder.

(Doc. 83, Exs. A, B (emphasis added)). According to the dictionary definition, to "carry" is "to sustain the weight or burden of" or to "bear." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 343. Thus, the court will construe "carried on" to mean that the weight of the adaptor is supported in some manner by the intermediate portion of the connector, defined in the claims as that part of the connector between the flange and shoulder. 13

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

12 In claims 5 and 9 of Patent '164, the word "an" is replaced with "smooth." (Doc. 83, Ex. A).

13 To the extent that Bridgeport argues that the phrase "carried on" requires the adaptor to contact the entire intermediate portion of the connector, this interpretation defies plain meaning and common sense. A ship may "carry" cargo without that cargo covering the entire surface of the vessel and a person may "carry" a blanket without draping the blanket evenly over his or her skin. See WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 343. "Carried on" means that the weight of the adaptor is supported in some fashion by all or part of the intermediate portion of the connector.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Under this construction, Bridgeport's demand for summary judgment on these claims clearly lacks merit. The steps of the Bridgeport connector admittedly fall between the flange and the shoulder of its connectors, meaning that they constitute part of the intermediate portion of the connector. Because the weight of the adaptor rests on these steps, a reasonable jury could find that the Bridgeport adaptor is "carried on [the] intermediate portion" of its connector, rendering summary judgment on these claims improper.

GO BACK

624

Propet argues that the district court erred in its construction of the claims of the '895 patent and that, under the correct construction, its shoes cannot infringe. The claims 3 of the '895 patent are reproduced below, with emphasis added to the limitations at issue in this appeal:

1. An Athletic Shoe comprising a sole having a midsole formed of a resilient force-absorbing material,

An outsole mounted below the midsole, said outsole being formed of a durable material for contact with a surface,

an upper mounted on the sole, the upper having a counter forming a heel cup having exterior sidewalls with lower edges,

a support band carried on the upper rim of the midsole and secured about the sidewalls of the heel cup,

said band extending upwardly and merging with the vertical midspan of the heel cup for supporting and stabilizing the heel cup relative to the sole during contact of the sole onto the surface when in use,

said midsole comprising a forefoot portion and heel portion means, said heel portion means being pyramid shaped in lateral cross section with a lower rim having opposite sides which flare outwardly to locations which lie sufficiently laterally beyond the lower edges of the heel cup for substantially stabilizing the shoe during initial contact on the surface along one side of the sole,

the opposite sides of the lower rim of the heel portion means having a lateral width greater than the lateral width of the heel cup midspan, and

the midsole and support band having wall means which inclines upwardly from the lower rim of the heel portion means
to the heel cup midspan for resisting flexing of the sidewalls of the heel cup relative to the sole during said initial contact on the surface along one side of the sole.

2. An athletic shoe as in claim 1 in which the support band extends forward from the heel cup and merges with the opposite sides of the upper above the midsole for providing support between said opposite sides and the midsole.

3. An athletic shoe as in claim 2 in which the support band is integral with the midsole.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

3 Claim 1 was the only claim amended during reexamination.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

When the district court construed the claims of the '895 patent, it noted that both HHI and Propet relied on our decision in Converse, the '895 patent, and the Reexamination Certificate to advance their positions on claim construction. Claim Construction Order at 2-3. The court noted that, according to HHI, under the correct claim construction, the support band and the midsole may be either one integral piece or two separate pieces. The court observed that, Propet, on the other hand, took the position that the scope of the patent is narrower and that the support band and midsole must be two, separately defined pieces. Id. It noted that, according to Propet, HHI's patent "encompasses only shoes that have a clearly-defined pyramid-shaped midsole and a separate, well-defined heel band." Claim Construction Order, at 3 (emphasis in original). After considering the '895 patent, the Reexamination Certificate, and our decision in Converse, the court concluded that the '895 patent is not limited to a two-piece construction. It construed the patent's claims as follows: "Thus, the support band and the midsole may be unitary or in two separate parts. While the patent clearly requires a pyramid-shaped midsole, this shape need not be visible, if the pieces are merged." Claim Construction Order, at 5.

On appeal, Propet argues that the district court erred in construing the claims of the '895 patent. It asserts that the district court's claim construction is inconsistent with our decision in Converse and the prosecution history of the '895 patent, and that the district court's claim construction erases meaningful limitations from claim 1. Propet contends that the claims only cover a sole that has a two-piece construction, i.e., a pyramid-shaped midsole and a separate support band. Specifically, it asserts that the correct construction requires that the pyramid-shaped midsole be visible to the naked eye in a lateral cross section of the sole. Based on this claim construction, Propet argues that because its shoes have a one-piece construction, they can never have a visible pyramid-shaped midsole and, therefore, as a matter of law, cannot infringe the '895 patent. We do not agree with Propet. We think that the district court properly construed the claims of the '895 patent.

As a preliminary matter, we note that Converse did not address the issue of claim construction that is currently before us: whether the claims of the '895 patent require that the midsole and support band be made of two separate pieces so that the pyramid shape of the midsole is visible to the naked eye in a lateral cross section of the sole. In Converse, the question before the court was whether HHI had impermissibly broadened its claims during reexamination. 183 F.3d at 1370, 51 USPQ2d at 1519. In answering that question, we relied on the figures shown below:

Fig. A

[SEE FIGURE IN ORIGINAL]

Fig. B

[SEE FIGURE IN ORIGINAL]

We noted that according to Converse, claim 1, as amended during reexamination, had been impermissibly broadened because original claim 1 only covered the Fig. B configuration, while the amended claim covered both the Fig. A configuration and the Fig. B configuration. Id. at 1373, 51 USPQ2d at 1520. In rejecting that argument, we noted that HHI amended claim 1 during reexamination to recite that the "heal portion means is 'pyramid shaped in lateral cross section with a lower rim having opposite sides which flare outwardly.'" Id. at 1374, 51 USPQ2d at 1522. We concluded that, by reason of this additional limitation, the amended claim covers only the Fig. B configuration. Id. We observed that the amended claim
does not cover Fig. A because not only is the midsole 32 of Fig. A not "pyramid shaped" as the amended claim requires, but the lower rim does not "flare outwardly." Id. at 1375, 51 USPQ2d at 1522.

Converse, at most, requires us to construe claim 1 so that the "heel portion means" of the midsole is pyramid shaped in a lateral cross section, with a lower rim having opposite sides which flare outwardly. Nothing in Converse requires us to limit claim 1 to a sole in which the pyramid shape is visible to the naked eye in a lateral cross section or to a sole that has a two-piece construction, i.e., a pyramid-shaped midsole and a separate support band. To the contrary, in Converse, we noted that the specification states that "the support band can be formed 'integral with the upper rim of the midsole' as shown in Fig. 6, or can be 'a separate piece which is secured as by fusion to the sole during manufacture.'" Id. at 1371, 51 USPQ2d at 1519. Therefore, our decision in Converse would tend to support the district court's claim construction.

The claim language, the specification, and the prosecution history also support the district court's claim construction. As we have stated, "the claims define the scope of the right to exclude; the claim construction inquiry, therefore, begins and ends in all cases with the actual words of the claim." Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1248, 48 USPQ2d 1117, 1120 (Fed. Cir. 1998). Put another way, "the language of the claim frames and ultimately resolves all issues of claim interpretation." Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023, 43 USPQ2d 1545, 1548 (Fed. Cir. 1997). In this case, nothing in the language of the claims requires us to limit the claims to only a two-piece construction, i.e., a pyramid-shaped midsole and a separate support band. In addition, nothing in the language of the claims requires that the pyramid shape of the midsole be visible to the naked eye in a lateral cross section of the sole. To the contrary, the claim language supports both a one-piece and a two-piece construction. For example, claim 3 states: "An athletic shoe as in claim 2 in which the support band is integral with the midsole." Since claim 3 depends from claim 1, claim 1 is conceivably broader and could cover both a one-piece and a two-piece construction.

The specification also supports the district court's construction. Nothing in the specification limits the claimed invention to either a one piece or a two-piece construction. The specification supports both constructions. The specification states that the support band can be formed "integral with the upper rim of the midsole," as shown in Fig. 6, or can be "a separate piece which is secured as by fusion to the sole during manufacture." '895 patent, col. 3, II. 14-25. At the same time, nothing in the specification requires us to limit the claimed invention to a sole in which the pyramid shape is visible to the naked eye in a lateral cross section of the sole. In fact, the specification states: "the lateral sides of the pyramid are not shown in the cross section of Fig. 6 because in the preferred embodiment they merge with the support band." '895 patent, col. 3, II. 10-11.

The prosecution history also supports our conclusion. Nothing in the prosecution history limits the patent claims to a two-piece construction, or requires that the pyramid shape of the midsole be visible to the naked eye.

Finally, we do not agree with Propet's claim construction because its construction would exclude the preferred embodiment, i.e., the one-piece construction, from the scope of the claims. A claim construction that excludes from its scope a preferred embodiment "is rarely, if ever, correct . . . ." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583, 39 USPQ2d 1573, 1578 (Fed. Cir. 1996).

In short, we agree with the district court's claim construction that "the support band and the midsole may be unitary or in two separate parts" and that "while the patent clearly requires a pyramid-shaped midsole, this shape need not be visible, if the pieces are merged." See Claim Construction Order at 5.

Based on its claim construction, the district court gave the jury the following claim construction instruction: "I have previously determined that the '895 patent is subject to two permissible constructions: the support band and the midsole may be either two separate pieces, or merged into one piece." We note that this instruction was incomplete because although the court construed the claims as requiring "a pyramid-shaped midsole, [which] . . . need not be visible, if the pieces are merged," the court did not include this requirement in its instruction. See Claim Construction Order at 4-5. Propet, however, did not object to the court's incomplete instruction. See Fed. R. Civ. P. 51 (stating that a party must object to an error in a jury instruction before the jury retires in order to preserve the claim of error on appeal); see also City of Springfield v. Kibbe, 480 U.S. 257, 258-60, 94 L. Ed. 2d 293, 107 S. Ct. 1114 (1987). Moreover, in the district court, Propet's sole argument in support of its JMOl motion was that the district court erred in construing claim 1 as not requiring that the support band and the midsole be two separate pieces. In addition, in the district court, Propet never argued that given the district court's claim construction, the jury's verdict of infringement was not supported by substantial evidence. Propet also does not make any of these arguments on appeal. It merely advances the claim construction argument that we have rejected.
Under these circumstances, we affirm the district court's denial of Propet's motion for JMOL. 4

4 We also reject Propet's argument that its shoes cannot infringe the '895 patent if the shoe shown in Fig. A in Converse does not infringe the patent. In Converse, we could tell from looking at Fig. A that not only was the midsole 32 of the shoe shown in Fig. A not "pyramid shaped," as claim 1 of the '895 patent requires, but also that the lower rim did not "flare outwardly." 183 F.3d at 1375, 51 USPQ2d at 1522. Accordingly, we concluded that claim 1 did not cover the shoe shown in Fig. A. Id. In contrast, as we have noted, Propet has not even argued, much less shown, that substantial evidence does not support the jury's verdict of infringement in this case.

Propet argues that if we find that claim 1 covers a one-piece shoe sole, as we have, then the claims of the '895 patent are invalid in view of certain prior art. It relies on the following prior art references in support of its argument: U.S. Patent No. 3,952,358 to Fuknoka, U.S. Patent No. 4,150,455 to Fuknoka, and South African Design Registration No. 78/1124 to Halberstadt. We disagree. Propet has not shown by clear and convincing evidence that any of these references anticipates or renders obvious the claims of the '895 patent. See WMS Gaming Inc. v. Int'l Game Tech., 184 F.3d 1339, 1355, 51 USPQ2d 1385, 1396-97 (Fed. Cir. 1999) (stating that because an issued patent is presumed to be valid, the evidentiary burden to show facts supporting a conclusion of invalidity is clear and convincing evidence).

Porta Stor argues that the district court erred in not construing the phrases "carrier frame" and "around" in claim 29 to have the same meaning as they undisputedly have in claim 1, namely a four-sided rectangular shaped frame that completely surrounds the container on all four sides.

We begin our claim construction analysis with the words of the claims themselves. See Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc). We are not limited to considering just the language of claim 29 because "[o]ther claims of the patent in question, both asserted and unasserted, [are] valuable sources of enlightenment as to the meaning of a claim term." Id. at 1314. In this case, the term "carrier frame" in claim 29 also appears in claim 1 where it is specifically described as including "right and left longitudinal elements" adjacent to "front and rear transverse elements." '062 patent col.6 ll.64-65, col.7 ll.1-2. The parties agree that the structure described as a "carrier frame" in claim 1 is "a four-sided or rectangular-shaped carrier frame" that surrounds the container on all sides. Claim Construction Order, 2006 U.S. Dist. LEXIS 36486 at *4. We apply a "presumption that the same terms appearing in different portions of the claims should be given the same meaning unless it is clear from the specification and prosecution history that the terms have different meanings at different portions of the claims." Fin Control Sys. Pty., Ltd. v. OAM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001); see also, e.g., Phillips, 415 F.3d at 1314; Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001). PODS has pointed to no evidence in the specification or the prosecution history that the term "carrier frame" in claim 29 has any meaning other than the uncontested meaning in claim 1. To the contrary, the only embodiments disclosed in the specification are four-sided. Also, as discussed in the next section, during prosecution the Dousset prior art patent was distinguished on the ground that the '062 patent claimed a rectangular-shaped frame, thus suggesting that all claims were limited to a four-sided device. See Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995) "[A]rguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary."). We therefore conclude that the term "carrier frame" in claim 29, as in claim 1, requires "a four-sided or rectangular shape." See Claim Construction Order, 2006 U.S. Dist. LEXIS 36486 at *4.

As PODS itself notes, in a claim that "recites a four-sided 'carrier frame'...placing that four-sided carrier frame 'around the container' would result in 'all four sides' of the carrier frame being 'around the container." Appellee's Br. at 24-25. Thus, since we construe the term "carrier frame" in claim 29 to require a four-sided structure, we necessarily construe the term "around" to require the frame to be on all sides of the container. This construction is confirmed by the ordinary meaning of
"around," which in this context is defined as "along the outer edge or boundary of...on all sides of...so as to encircle or enclose...about." Webster's Third New International Dictionary 120 (2002) (emphases added).

1. "A carrier portion interconnecting the plurality of user interface key caps" (Claim 6)

a. The Parties' Proposed Constructions

Motorola's Proposal: "Material filling or bridging the area between two adjacent user interface key caps."

VTech's Proposal: "Material between the key caps which connects the key caps contained in the keypad."

b. Discussion

Motorola asserts that the main dispute between the parties regarding this phrase is whether the "carrier portion" must connect all key caps on a keypad. VTech asserts that its construction does not require all keys to be connected. Motorola's construction comports with the intrinsic evidence and shows that a carrier portion must connect at least two key caps. The Court agrees that connection of all key caps on the keypad is unnecessary.

The use of a carrier portion to interconnect adjacent user interface key caps was one of the elements of the invention claimed in the '349 patent, as the patent's specification and figures make clear. (See, e.g., '349, 2:3-17). Figure 2 identifies the "carrier portion[s]," by number (211 & 213), as areas connecting adjacent key caps on the keypad. ('349, 2:18-23; see also Fig. 3 (311 & 313)). In each of the exemplary embodiments, the carrier portions are defined in relation to the adjacent or neighboring key caps. For example, in Figure 2, "the '7' key cap 210, the '0' key cap 212 and the '9' key cap 214 [are] flexibly coupled by intermediate carrier portions 211 and 213." ('349, 2:21-23). The "carrier portion" is material that connects the narrow area between these adjacent key caps, thus "interconnecting" them. ('349, 2:3-50).

While the carrier portion in a certain embodiment may connect all of the key caps on the keypad (316, 318, 311, 313, 330 in Figure 3), the claims and the specification make clear that this is not a requirement. In another embodiment, each of the plurality of user interface key caps are coupled to the carrier by a flexible carrier portion disposed along not more than one side of the corresponding user interface key cap, wherein other sides of each of the user interface key caps are separated from neighboring key caps and/or carrier portions by a space. ('349, 2:11-18). This is shown in Figure 2, which shows rows of interconnected key caps that are not connected to one another.

That being said, the Court is not convinced, as urged by Motorola, that the material fills or bridges the area between two key caps. Requiring "filling" or "bridging" a space, without requiring a connection, is not supported by the intrinsic record. The words "filling" and "bridging" are not found in the specification in the discussion of "carriers" and "carrier portion." Rather, the specification uses the words "interconnecting" and "flexibly coupled." (See, e.g., '349, 2:5-7; 2:22, 2:41, 4:54).

c. The Court's Construction

Accordingly, the Court construes the term "carrier portion interconnecting the plurality of user interface key caps" to mean: "material connecting at least two user interface key caps."

GO BACK

2. Carrier Sheet

Avery's proposed definition for the carrier sheet is: "A paper, polymer film, or combination thereof upon which a number of additional layers of a laminate are at least temporarily disposed." Whitlam proposed: "A paper, polymer film or combination..."
sheet that is transparent and between 0.25 and 10.0 mils thick inclusive and is placed in contact with the 'another adhesive layer' to serve as a release liner.' Whitlam's proposed limitations on thickness and transparency are taken verbatim from column 11, lines 31 through 67 of both patents. The relevant portions of these lines read: "The carrier sheet can be comprised of paper, polymer film, or a combination thereof...It is preferred, however, that the carrier sheet be transparent, to permit visibility of the ink or graphics layer...The carrier sheet typically has a thickness of about 0.25 to about 10 mils." Whitlam thus seeks to limit a claim by using the language of the specification, a practice which has consistently been found inappropriate. See RF Delaware, Inc. v. Pacific Keystone Technologies, Inc., 326 F.3d 1255, 1263 (Fed. Cir. 2003)("When a claim is expressed in general descriptive words, it typically will not be limited to a numerical range that may appear in the written description as referring to a particular embodiment"). For this reason, the Court adopts the following definition of a carrier sheet: "A paper, polymer film, or combination thereof upon which a number of additional layers of a laminate are at least temporarily disposed."

II. Carrier Web

3M's proposed definition of "carrier web" is "generally planar material that carries, can carry or that has carried another material that is releasable from the web." Avery proposes defining "carrier web" as "sheeting material that carries or can carry another material." The Court finds that both proposed definitions are too limited.

Claim 1 describes the carrier web only as "at least one surface." The "at least" language indicates a broad, rather than narrow, definition of carrier web. The language of the specification, which repeatedly emphasizes the flexibility of the claimed invention definition, further supports a broad definition of the term. For example, the specification lists multiple uses for the carrier web, some of which might require a non-sheeting carrier web. (See col. 2 11. 44-55.) Additionally, the embodiments make clear that the carrier web can be 'any web...that is capable of being embossed." (Col. 3 11. 58-59 (emphasis added.).) The web "can have any dimensions required for the sequential formation of a complex topography." (Col. 4 11. 7-9 (emphasis added.).) While the carrier web may frequently take the form of a liner sheet that is relatively planar (see col. 3 1. 60 - col. 4 1. 6 and col. 7 11. 44 - col. 8 1. 67), the embodiments make clear that a web may be different than a liner (see col. 5 1. 5 (distinguishing web 10 and liner 20)). Because, "neither the plain text of the claims, the specification, nor the file wrapper justifies the imposition of [these] negative limitation[s]," Omega Eng'g v. Raytek Corp., 334 F.3d 1314, 1333 (Fed. Cir. 2003), the Court declines to limit the definition of carrier web either to sheeting or to generally planar material.

In the same vein, the Court finds it inappropriate to limit the definition of carrier web to carrying material that is releasable from the web. Although the patent clearly contemplates such a use, nothing in the claim or specification language requires restricting the carried material to releasable material. To the contrary, the patent's reference to the carrier web as the end product (col. 2 1. 27), and emphasis that a "wide variety" of materials may be introduced into the web (col. 2,11. 22-23), indicates that the carrier web is intended to carry a broad range of materials for any number of purposes. The Court therefore declines to impose a limitation on the carrier web relating to the type of material carried.

Finally, the Court finds that an item that is once a carrier web is always a carrier web. Wallpaper removed from the wall does not cease to be wallpaper, even though it cannot be reused as wallpaper. Similarly, a candy wrapper removed from the candy remains a candy wrapper, although it would be difficult to use it to wrap another piece of candy. Therefore, a carrier web that has been removed from whatever other material it has been connected to does not cease to be a carrier web -- regardless of whether it can or will be reused for its intended purpose.

Based on the above discussion, the Court finds that carrier web is properly defined, in this case, as a "material with at least one surface that carries, can carry, or has carried another material."
Comaper's proposed construction of "case" is "a structure for containing and holding something." (Pl.'s Constr. Mem. at 2; Pl.'s Reply Mem. at 2.) According to Comaper, although the intrinsic record does not specifically define the term "case", elements of the intrinsic record use the term consistent with its construction. (Pl.'s Constr. Mem. at 2.) Comaper further argues that the functionality of the air movement device is consistent with its interpretation of the term case being "a structure for holding something." Id. at 3. Comaper suggests that the ordinary meaning of the term "case" supports its position, as the relevant dictionary definitions of "case" comport with its interpretation. Id. at 4. In response, Antec argues that Comaper's definition is overbroad because it includes a term (structure) that is broader than the object that term seeks to define (case). (Defs.' Reply. Mem. at 9-10.)

The interpretation that Antec offers for "case" is "an enclosure with six or more sides that is capable of being pressurized and which does not contain a drive." (Defs.' Constr. Mem. at 5.) Antec supports this position by first claiming that the "plain and ordinary meaning" of the word requires that a "case" be an enclosure. Id. at 5. Secondly, Antec submits that the specifications and drawings show that the case is a housing that is capable of being pressurized, therefore supporting its interpretation. Id. at 6-7. Finally, Antec contends the prosecution history shows that Comaper disclaimed a device that could house both a cooling device and a drive in the same case. Id. at 8. Based on the position of the parties, the Court must determine whether or not the term "case" should be interpreted as an enclosure.

The Court concludes that "case" means "a structure for containing and holding something." This term is construed in accordance with the claim and specification, and dictated by its ordinary and customary meaning. 1 Claim construction "begins and ends in all cases with the actual words of the claim," which, absent a special definition delineated in the specification or prosecution history by the patent applicant, are given their "ordinary and accustomed meaning." Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1248, 1249 (Fed. Cir. 1998). The "ordinary" meaning is determined according to an objective standard: "The focus is on the objective test of what one of ordinary skill in the art at the time of the invention would have understood the term to mean." Markman, 52 F.3d at 986. Applying this standard, it is clear that the term case is not an enclosure. When examining both Claims 1 and 12, it is clear that the terms "structure for holding something" is a reasonable construction of the term "case".

1 If the court cannot determine the ordinary meaning of the claim terms, it must consider the specification to determine whether the patentee provided a distinct definition for a term, or used any terms in a manner inconsistent with their ordinary meaning. See Vitronics, 90 F.3d at 1582. The Court agrees with Comaper's proposed construction because it is supported by the ordinary meaning of the claim language.

The specifications also support this construction. The specification states that "many variations of the case design exist and may be practiced within the scope of the invention." '955 Patent col. 2, ln. 63-65. Limitations from the specification may not be read into the claim. Liquid Dynamics Corp. v. Vaughan Co., 355 F.3d 1361, 1368 (Fed. Cir. 2004) (citing Comark Communs v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998)). Moreover, the specification states that the disclosed embodiment is a mere example of the term "case".

Claims can never be read in isolation, but rather "must be read in view of the specification, of which they are a part." Markman, 52 F.3d at 979. Nevertheless, while courts can look to the written descriptions in the specification to define a term already in a claim limitation, courts cannot read a limitation into a claim from the written description. See Renishaw, 158 F.3d at 1248. Courts should not narrow the meaning of the claim terms on the basis of the contents of the specification, by assigning a meaning to the claim terms other than their ordinary meaning, unless either the patentee has explicitly set forth a special, novel definition for a term, or else the "terms chosen by the patentee so deprive the claim of clarity that there is no means by which the scope of the claim may be ascertained from the language used." Johnson Worldwide Assoc., Inc. v. Zebraco Corp., 175 F.3d 985, 990 (Fed. Cir. 1999). There is nothing in the specification that requires the "case" to be an enclosure.

GO BACK
With regard to the term "case" in the '955 patent, the district court construed it to mean "a structure for containing and holding something." 2 Claim Construction Order, 2006 U.S. Dist. LEXIS 67363, 2006 WL 2709382, at *6. Antec argues that the district court's claim construction is too broad, and that a "case" requires at least some type of enclosure. We disagree. While the embodiment disclosed in the '955 patent includes a six-sided rectangular enclosure, this court has repeatedly cautioned against limiting claims to a preferred embodiment. See, e.g., Linear Tech. Corp. v. Int'l Trade Comm'n, 566 F.3d 1049, 1058 (Fed. Cir. 2009); Comark Communs. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). The patent specification does not assign or suggest a particular definition to the term "case." Therefore, in determining the ordinary and customary meaning of the claim term as viewed by a person of ordinary skill in the art, it is appropriate to consult a general dictionary definition of the word for guidance. See Phillips v. AWH Corp., 415 F.3d 1049, 1058 (Fed. Cir. 2005) (en banc). A "case" is generally defined, relevant to its use in the '955 patent, as "a box or receptacle to contain or hold something." Webster's Third New International Dictionary 346 (2002). The district court's construction of "case" as "a structure for containing and holding something" is thus appropriate.

Defendant's device is used with a Foley catheter, which a medical professional passes through the patient's urethra to the bladder. Plaintiff's expert previously conceded a Foley catheter is not a percutaneous catheter. (Frankhouser Depo., at 207:9-11.) Even here, plaintiff concedes that a percutaneous catheter enters the patient only "by piercing the skin," which defendant's device does not. (Opp., at 20.)

In the Court's claim construction of "catheter," it meant a percutaneous catheter. In light of plaintiff's claim construction briefs equating "percutaneous catheter" with a catheter inserted through the skin, the Court found it unnecessary to mention "percutaneous catheter" explicitly in the Order on claim construction. The Court also rejects plaintiff's argument that "through the skin" is broad enough to encompass inserting a catheter through a natural orifice of the body. 3 Because a percutaneous catheter pierces the skin of a patient, the ordinary way of inserting the Foley catheter into the patient (i.e., through the urethra) does not create a genuine issue of fact on material infringement.
3 Plaintiff bases this argument on an inapplicable analogy to throwing a rock through an open or closed window. The throwing of rocks is unrelated to the Court's analysis of the medical technology issues in the present litigation.

Even though a Foley catheter is not ordinarily inserted "through the skin of a patient," however, plaintiff nonetheless argues for literal infringement because defendant's device can be used for suprapubic catheterization. In suprapubic catheterization, a needle pierces the skin and abdominal wall to insert the Foley catheter into the bladder. (Layton Decla. P 40.) Plaintiff bases this allegation of literal infringement on a passing statement in defendant's patent application that its device "may be adapted to retain . . . suprapubic catheters." (Pl. Exhibit 519, at 8.) Plaintiff also claims that one size of Foley catheter that can be used with defendant's device is capable of percutaneous introduction into the bladder. (Opp., at 22.) The Court finds this evidence to be speculative and insufficient to create a genuine issue of fact on non-infringement.

Similarly, plaintiff cannot avoid summary judgment of non-infringement through the application of the doctrine of equivalents. "A patent applicant may limit the scope of any equivalents of the invention by statements in the specification that disclaim coverage of subject matter." Frank's Casing Crew & Rental Tools, Inc. v. Weatherford Int'l Inc., 389 F.3d 1370, 1376 (Fed. Cir. 2004). In its Order on claim construction, the Court observed that Federal Circuit precedent authorized the Court to limit the construction of terms "when the scope of the invention is clearly stated in the specification, and is described as the advantage and distinction of the invention[.]"] On Demand Mach. Corp. v. Ingram Indus., Inc., 442 F.3d 1331, 1340 (Fed. Cir. 2006). Here, the specification limits the scope of plaintiff's device to percutaneous catheterization and describes the benefits of plaintiff's device in relation to percutaneous catheterization. Plaintiff cannot now assert that its device is equivalent to a device designed for a catheter not inserted percutaneously.

Therefore, summary judgment is appropriate wherever a "catheter" is claimed, including all contested claims of the 676 patent. Plaintiff claims "catheter" is recited, but not required, in all asserted claims of the 892 patent. 4 As with "radially extending member," plaintiff's argument contradicts its final infringement contentions and violates Patent Local Rule 3.7. In light of the claims' extensive description of the anchoring system and/or retainer designed to hold the catheter in place (consistent with the requirements of percutaneous catheterization), the Court finds the reference to "catheter" in the claim preamble "is necessary to give life, meaning and vitality to the claim". Therefore, for procedural and substantive reasons, summary judgment is appropriate on all asserted claims of the 892 patent.

4 "Catheter" does not appear in the asserted claims of the 230 patent.
Therefore the term catheter must mean only that portion of the catheter assembly intended to be placed into the body and not the entire apparatus which contains other parts as described by the claim.

A syringe contains a needle and a dispensing tube. We commonly describe the "needle" as the portion of the syringe from the tip up to the dispensing tube. Although on each person the portion of the needle that goes into the flesh may vary, the needle is still considered to be the part of the syringe that could possibly enter the skin. Similarly, the term "catheter" is that portion of the catheter assembly which is intended to be inserted into the patient.

b). Written Description

The specification is consistent with defining "catheter" as that portion of the catheter assembly which is intended to be inserted into the body. The background of the invention section supports construing the word "catheter" as the tube intended to be inserted into the patient. In this section it describes that "catheters" are "routinely allowed to remain in patients" for weeks or months. ( '561 patent, col. 1, lines 32-34). Additionally, the background section explains the potential problems with catheters including the potential for them to become dislodged or cause pain or discomfort in patients because of continual movement within the vein. ( '561 patent, col. 2, lines 1-5).

The summary of the invention also supports construing the word "catheter" as the tube intended to be placed into the patient's body. The summary provides that the primary object of the invention is "to provide an improved dual-lumen catheter-connecting system which permits the catheter to remain relatively stable during the entire time the catheter remains inserted in the patient." ( '561 patent, col. 2, lines 34-38). (Emphasis added). Furthermore, throughout the summary of the invention, reference is made to a catheter which is inserted into the patient's vein. For example: "... improves the comfort level of the patient in whom the catheter is inserted" ( '561 patent, col. 2, lines 42-43); "regardless of the particular vein into which the catheter is inserted" ( '561 patent, col. 2, lines 54-55); and "the catheter is inserted in a jugular vein" ( '561 patent, col. 3, lines 3-5).

c). Dictionary Definition

The dictionary definition of "catheter" lends even more support to constructing "catheter" to mean the portion of the assembly intended to be inserted into the patient. Webster's II New Riverside University Dictionary defines "catheter" as "a slender, flexible tube inserted into a bodily channel, as a vein..." (Webster's II New Riverside University Dictionary 238 (1994)).

In addition, a medical dictionary definition is also consistent with this construction. Stedman's Medical Dictionary defines "catheter" as "a tubular instrument to allow passage of fluid from or into a body cavity." (Stedman's Medical Dictionary 292 (26th ed. 1995)). The "catheter" is the tube inserted into the patient which makes it possible to extract fluid from or pass fluid into body cavities.

B. Catheter

Smith & Nephew proposes that "catheter" should be construed to mean "a long flexible tube." ArthroCare would interpret "catheter" to mean "a long flexible tube that can bend around the inner wall of the annulus fibrosus." The parties agree that the specification controls the definition of "catheter" because the patentees acted as their own lexicographer. The specification explicitly defines "catheter:"

"[t]he catheter is not necessarily a traditional medical catheter... but is a defined term for the purposes of this specification. 'Catheter' has been selected as the operant word to describe this part of the apparatus, as the apparatus is a long flexible tube... ."

U.S. Patent No. 5,980,504, Column 5:51-57. The parties' dispute centers on whether the word "catheter" should be construed to have an additional flexibility requirement such that it could be bent around the inner wall of the annulus.
The claims recite no catheter flexibility requirements, and the claims must be read to contemplate methods of practicing the invention that do not involve bending the catheter around the inner wall of the annulus. Every word in a claim is presumed to add meaning, and the claim should not be read so as to render any of the claim language superfluous. Exxon Chem. Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 1557 (Fed. Cir. 1995). Claim 1 describes advancing the functional element of the catheter "through the nucleus pulposus to the inner wall of the annulus." Claim 10 describes advancing the "distal end of the catheter through the nucleus pulposus and adjacent the inner wall of the annulus such that the catheter conforms sufficiently to the inner wall." For every word in Claim 10 to have meaning, Claim 1 must envision methods of practicing the invention that do not involve "conforming" the catheter to the inner wall of the annulus. If the invention can be practiced without bending the catheter around the inner wall of the annulus, there is no reason to require that the catheter be capable of bending to such a degree.

ArthroCare argues that the patentees implicitly defined "catheter" as something that can be bent around the inner wall of the annulus because the specification consistently describes the catheter as bending to that degree. The summary of the invention, detailed description, abstract, and several of the drawings all involve a catheter bending around the inner wall of the annulus. This repeated use is not enough to imply a flexibility requirement in the definition of "catheter." The Federal Circuit has stated that "when a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term 'by implication.'" Bell Atlantic, 262 F.3d at 1271 (citing Vitronics, 90 F.3d at 1582). "Catheter," however, is not used in all portions of the specification in a manner consistent with a definition requiring sufficient flexibility to bend around the inner wall of the annulus.

The specification describes catheters that are "actively steerable." A physician can bend these catheters by applying force at various points along the device's length using mandrels located inside the catheter. U.S. Patent No. 5,980,504, Column 11:33-12:67. When these catheters are used to practice the invention, the inner wall of the annulus plays no role in bending them.

The specification also describes catheters that contain segments with differing levels of flexibility. "Such a catheter will have two or more different radii of curvature in different segments of the catheter under the same bending force." U.S. Patent No. 5,980,504, Column 13:28-30. A catheter that is bent around the inner wall of the annulus will have a single radius of curvature. A catheter with multiple radii of curvature will not necessarily be flexible enough to bend around the inner wall of the annulus at all places along its length.

ArthroCare also argues that the specification distinguishes prior art that involved flexible catheters. The specification discusses prior art that was "rigid" or "somewhat more flexible [than rigid]." U.S. Patent No. 5,980,504, Column 3:9-39. That prior art could be practiced with catheters described as "somewhat more flexible" does not imply that the current invention only avoids the prior art if it is practiced with a catheter so flexible that it can bend around the inner wall of the annulus.

The court has found no specific requirement of flexibility indicated in the patent claims, specification, or prosecution history. The patentees clearly intended to define the term catheter, and they did so in plain, simple language. The court sees no reason to use a definition other than the one chosen by the patentees and construes catheter to be "a long flexible tube."

1. Language in dispute: "catheter"

Does "catheter" mean (1) only that portion of the catheter assembly intended to be inserted into the patient's vein, or (2) a tubular device for withdrawing fluids from, or introducing fluids into, a cavity of the body, such as a blood vessel?

Answer: "catheter" means a tubular device for withdrawing fluids from, or introducing fluids into, a cavity of the body, such as a blood vessel.

Claim 34 begins with the components of a dual-lumen catheter assembly: a catheter, connecting means, and a pair of internal curving passageways. As Judge Denlow noted, the claim language appears to support the construction proposed by Plaintiff because it says that a catheter assembly requires a catheter and other items. Judge Denlow concluded therefore that
the term catheter logically means only that portion of the assembly intended to be placed into the body and not the entire apparatus which contains other parts as described by the claim. Arrow Int'l, 160 F. Supp.2d at 946.

This court respectfully disagrees with Judge Denlow's conclusion on this issue. Defendants' proposed construction does not contradict the claim language and, in this court's view, makes more logical sense. If Plaintiff were correct that the term catheter only refers to the portion of the tube intended to be inserted into the patient, then the meaning of that term would differ from patient to patient, even if the same catheter assembly is used. As Defendants point out, some patients are smaller than others, and the length of the tube that is inserted into the body will by necessity differ from one patient to another. Plaintiff does not dispute this; he argues that it is nevertheless acceptable to define a term in reference to its particular usage in different contexts. While this may be true, the court does not find anything in the claim language or the specification indicating that the term should be construed so fluidly.

Defendants point out that the description of the invention contemplates a catheter extending from the distal to the proximal end. (Defs.' Brief at 14.) Specifically, Defendants point out that claims 34, 38 and 42 recite, respectively, a catheter assembly and blood treatment system, each comprising a "dual-lumen catheter," and "connecting means attached to the proximal end of said catheter [with passageways curving back toward] the distal end of said catheter." Claims 35 and 39 recite a "connecting means [that] comprises a connector fastened to the proximal end of the catheter." (‘561 Patent, Ex. B to Second Amended Complaint, Col. 11, lines 24-32 and 61-65 and Col. 12, lines 1-4;Defs.' Brief at 13-14.) They argue that if the location of the proximal end of the catheter changes based on each individual patient, then the location of the connecting means would change as well, since it is described in claim 34 as attached to the proximal end. (Id., Col. 11, line 15.) The court agrees that such a fluid definition is hard to reconcile with the specific language in the claim that the proximal end is attached to a connecting means. If Plaintiff's proposed construction were adopted, then the term "connecting means" would likely have to include a portion of the catheter tube, perhaps a significant portion, depending on the size of the patient.

Plaintiff points out that the background of the invention section describes that catheters are "typically allowed to remain in patients for several weeks, and sometimes for several months." (Id., Col. 1, lines 32-34.) Additionally, the background section explains the potential problems with catheters including the potential for them to become dislodged or cause pain or discomfort in patients because of continual movement within the vein. (Id., Col. 2, lines 1-5.) Plaintiff argues that these statements indicate that the catheter is something which is wholly inside of the patient. The court notes, however, several devices which are commonly described as being inserted inside a person, but a portion of which almost always remain outside of the person's body. Thermometers, otoscopes, and intravenous devices are inserted into persons, often with portions remaining external to the body.

Plaintiff points out that the summary of the invention states that the primary object of the invention is "to provide an improved dual-lumen catheter-connecting system which permits the catheter to remain relatively stable during the entire time the catheter remains inserted in the patient." (Col. 2, lines 34-38.) Once again, the court is not convinced this supports his proposed definition of the claim term. The fact that a portion of the catheter protrudes from the patient's body would not defeat Plaintiff's goal of ensuring stability when a portion of a catheter has been inserted into the patient.

Finally, the court believes Defendants' proposed definition makes the most logical sense. Imagine an embodiment of the '561 patent on display for examination by health care providers. How would a manufacturer's representative describe the product to a potential user? Where would she say the proximal end of the catheter is? How would she describe the tube that is inserted into the patient? It simply makes more sense to describe the catheter as extending from the distal end, the end that is first inserted into the patient's body, to the proximal end, where the connecting means attaches the catheter to the remainder of the apparatus. For these reasons the court adopts Defendants' proposed claim term.
A. No Integral Connection Requirement

Claims 1, 13, and 25 provide, respectively: "A catheter for detecting changes in pressure within a body comprising . . . a structure for detecting changes in fluid pressure;" 7 "An interuterine pressure catheter comprising . . . a pressure detection device;" 8 and "A pressure catheter for detecting changes in pressure within a body comprising . . . a pressure detection device." 9

Clinical Innovations argues that these claim terms should be construed to mean:

The claimed catheter (i.e., elongated tube) is a "pressure catheter." That is, the catheter itself must be capable of detecting changes in pressure. Accordingly, the recited elongated tube of the catheter must be integrated with the recited structure for detecting changes in fluid pressure, such as by being sealed to that tube or to another integrated part of the catheter. The claim excludes any catheter with an elongated tube that can be readily connected to, or disconnected from, the pressure detecting structure. 10

Utah Medical argues that they should be construed to mean:

A catheter that is used to detect pressure changes within a body. The claim does not require an integral connection between the elongated tube and the structure for detecting changes in fluid pressure. 11

Clinical Innovations argues that its interpretation is supported by the language of the claims 1, 13, and 25, by claim differentiation, by the claim preamble, and because, in the specification for a balloon configuration, the elongated tube is permanently attached to the inner tube.
Utah Medical argues that Clinical Innovations' asserted "integral connection" and "permanently connected" or sealed constructions are not supported by plain language of the claims or the specifications, by claims construction rules or claim differentiation, and is undermined by Clinical Innovations' act in marketing a "non-integrated" catheter under the '524 patent.

The parties make a similar argument regarding the housing in dependent claims 2, 15, and 29, providing, respectively: "The catheter of claim 1, further including a housing;" "The interuterine catheter of claim 13, further including a housing;" "the pressure catheter of claim 25, further including a housing."

Clinical Innovations argues that these claims should be construed to mean:

The claimed catheter (i.e. elongated tube) must include a housing. That is, the housing must be permanently connected to the elongated tube (or to a structure that includes the elongated tube), such as by being "sealed" to that tubing or to another integrated part of the catheter. In other words, the housing is effectively and physically an integrated part of the same structure as the elongated tube. The claim language excluded catheters that can be readily connected to, or disconnect from, the housing. 12

--- Footnotes ---

12 Id., at 3.

--- End Footnotes ---

Utah Medical argues that they should be construed to mean:

A housing which is in fluid communication with the fluid channel has a port. The claim does not require an integral connection between the elongated tube and the housing. 13

--- Footnotes ---

13 Id.

--- End Footnotes ---

The Court finds that nowhere in the claims, specification, or preambles is the "integral" requirement sought to be added by Clinical Innovations found. Nor is the Court persuaded by Clinical Innovations' argument that because dependent claims 3, 16, and 30 (which depend from claims 1, 13, and 25) include "venting cap configured for attachment to said housing" that if the pressure detector and housing could be attached and detached, they would include similar language.

The Court finds Clinical Innovations' "integral connection" and "permanently connected" arguments to be unpersuasive. The Court agrees with Utah Medical that the claims do "not require an integral connection between the elongated tube and the structure for detecting changes in fluid pressure" and do "not require an integral connection between the elongated tube and the housing."

--- Footnotes ---

The Court disagree with Utah Medical that the claims do "not require an integral connection between the elongated tube and the structure for detecting changes in fluid pressure" and do "not require an integral connection between the elongated tube and the housing."

--- End Footnotes ---

1. A Catheter Having A Working End (Claim 1, '803 Patent; Claim 1, '433 Patent)

Vnus argues "catheter," as found in the term "a catheter having a working end" should be construed as "a tubular, flexible, surgical instrument that is inserted into a cavity of the body, including, but not limited to, a sheath," and argues "working end," as found in the subject term, should be construed as "direction toward the treatment site in the patient (contrast with connecting end)." Defendants argue "a catheter having a working end" should be construed as "a hollow, tubular instrument pre-assembled with electrodes capable of applying energy at the end of the instrument proximate the treatment site."
3 The parties' respective constructions as set forth herein are taken from the Amended Patent Local Rule 4-3(b) Chart, filed October 23, 2006. Any brackets contained in such constructions as set forth herein are in the original.

The Court, for the reasons stated by Vnus, finds "a catheter having a working end" is properly construed as "a tubular, flexible, surgical instrument, including, but not limited to, a sheath, having an end directed toward the treatment site in the patient." 4

4 The Court has not adopted the additional language proposed by Vnus, specifically, "that is inserted into a cavity of the body"; such language is a proposed construction of "into the hollow anatomical structure," which is not one of the ten disputed terms before the Court.

Vnus argues "catheter" and "having a working end," as found in the term "a catheter having a working end with an energy application device at the working end," should be construed as set forth above with respect to the first disputed term, and additionally argues the phrase "energy application device," as set forth in the subject term, should be construed as "a device for delivering energy, such energy includes, but is not limited to, RF energy, microwaves, ultrasound, direct current, circulating heated fluid, radiant light and lasers." Defendants argue "a catheter having a working end" should be construed as "a hollow, tubular instrument pre-assembled with electrodes capable of applying energy at the end of the instrument proximate the treatment site."

The Court, for the reasons stated by Vnus, finds "a catheter having a working end with an energy application device at the working end" is properly construed as "a tubular, flexible, surgical instrument, including, but not limited to, a sheath, having an end directed toward the treatment site in the patient, with a device at that end for delivering energy, such energy including, but not limited to, RF energy, microwaves, ultrasound, direct current, circulating heated fluid, radiant light, laser, and thermal energy." 5

5 For the reasons stated above with respect to the first disputed term, the Court has not adopted Vnus' proposed additional language, specifically, "that is inserted into a cavity of the body." The Court has added "thermal energy" to Vnus' proposed construction. See '084 Patent, col. 7, II. 58-59.

The '958 Patent

The district court also found infringement of the '958 patent by tanks sold by Custom after November 22, 1988, the date of patent issuance. Custom states that the district court ignored a claim element that is not present in the accused tanks, and
that claim 1 is not infringed.

Infringement analysis is conducted in two steps. First the claims are construed as a matter of law, even though it is necessary to resolve a dispute concerning the meaning or scope of the claims or any term of the claims. Claim construction is decided de novo on appeal. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2d (BNA) 1321, 1329 (Fed. Cir. 1995) (en banc). The trier of fact then determines whether the accused device is within the scope of the claims as construed. Markman, 52 F.3d at 976, 34 U.S.P.Q.2d (BNA) at 1326.

Claim 1 of the '958 patent requires "a bend in said bottom plate radiating from said discharge opening in a direction extending away from said one edge." Claim 1 also requires that the bend is configured so that when the convergent gap is closed "liquid in said tank will be caused by gravity to flow into said bend and along said bend to said discharge opening."

The district court construed claim 1 to mean that "the direction of the bend in the tank bottom is not part of the claim limitation of the '958 patent," and therefore that the "bend" can be in the shape of either an inverted V, i.e., a bend extending upwardly into the tank; or a V, where the bend extends downwardly forming a trough. Thus the accused tanks, all of which had a divergent gap structure, were found to infringe although their bend in the bottom was bent in the shape of the inverted V, instead of the V-shaped trough that was illustrated in the specification. A trough-shape is required to achieve the gravity flow of liquid "into said bend and along said bend," as the claim states.

Hoover argues that liquid can flow by gravity "into" an upwardly extending bend if the meaning of the word "into" is taken to include "in the direction of" or "so as to strike." The experts at trial offered opposing views. However, none of the drawings of the '958 patent shows an upwardly extending (inverted V) bend, and the possibility that the bend might be so configured is not mentioned in the specification. Hoover directs us to nothing in the specification, prosecution history, or prior art to suggest other than the ordinary meaning of liquid flowing "into and along" the bend in the bottom of the tank. We conclude that claim 1 of the '958 patent requires the bend in the bottom of the tank to extend in the downward direction, to form a trough whereby gravity will cause liquid to flow into and along the bend to the discharge opening. Consequently, a tank whose bottom has only an upwardly extending bend, as the district court found Custom's accused tanks to have, does not infringe claim 1 of the '958 patent.

The district court's finding of infringement was based upon an incorrect construction of the claim. On correct construction, we have been directed to no potential finding or inference that could support a holding of infringement by tanks that do not have the structure whereby liquid flows into and along the bend in the bottom. The finding of infringement of claim 1 must be reversed.

The '958 patent has three claims, claim 1 being directed to a tank of specific structure and claims 2 and 3 to methods of constructing tanks. The district court did not indicate which of the claims he found infringed. Custom argues that Hoover offered no evidence at trial that any of the accused tanks were built by the methods of claims 2 and 3, and urges that the district court found only claim 1 infringed. Hoover argues that its evidence shows Custom manufactured and sold tanks "with structures materially identical to that described in claim 1, and built in accordance with the methods described in claims 2 and 3." The district court's opinion discusses only the structure of the tanks alleged to infringe the '958 patent and not their method of manufacture, although the court found "the patent" infringed. In the absence of findings relating to the method claims, we are unable to review the decision with respect to claims 2 and 3. On remand, the district court may consider whether claims 2 and 3 are infringed, based on our interpretation of claim 1.

7. causing contact with the work platform two or more times

This phrase appears in claim 10 of the '283 patent. The plaintiff's proposed construction is "contacting the work platform two or more times, each contact being at a location on the work platform." The defendant argues that the term is indefinite, but alternatively offers a construction of "causing two or more coexisting physical contacts with the work platform." The crux of the disagreement is whether the contact times must occur simultaneously or whether such contact times can occur independently of one another.
In support of its position, the defendant cites to amendments and arguments that were made by the patentees during the prosecution of separate, related patents. The plaintiff supports its position with excerpts from the specification that suggest the claimed invention is capable of detecting and transmitting the location of an object in a continuous fashion. See, e.g., '874 patent at 9:18-21. The defendant's prosecution history arguments are misplaced because it appears that the patentees' statements during prosecution were directed at different claim limitations. See Elkay, 192 F.3d at 980 ("When multiple patents derive from the same initial application, the prosecution history regarding a claim limitation in any patent that has issued applies with equal force to subsequently issued patents that contain the same claim limitation." (emphasis added)). Therefore, the court concludes that this phrase means "causing contact with the work platform two or more times."

8. causing contact with the work platform two or more times in a particular sequence

This phrase appears in claims 11 and 12 of the '283 patent. The plaintiff proposes a construction of "contacting the work platform two or more times in a particular sequence, each contact being at a location on the work platform." The defendant counters with "causing two or more coexisting physical contacts with the work platform in a particular positional sequence on the work platform." The crux of the argument is whether the "particular sequence" is limited to a simultaneous positional arrangement of the objects on the work platform, or whether the "particular sequence" more broadly includes a temporal relationship, such as the sequential contacting of objects on the work platform. For the above reasons, the court concludes this term means "causing contact with the work platform two or more times in a particular sequence."

C. "Causing" Language in Claim 8 of the '142 Patent

In its October 30, 2009 order, the court denied the motion for summary judgment of invalidity of claim 8 of the '142 Patent due to anticipation by the Ashpole reference. Claim 8 of the '142 Patent contains the following limitation: "wherein the expandable outer surface is sufficiently rigid to deform the target tissue into the shape of the expandable outer surface, causing the predetermined asymmetric isodose curves to penetrate the target tissue to a prescribed depth." '142 Patent 10:13-17. SenoRx argued that Ashpole inherently disclosed this claim limitation because the balloon in Ashpole is sufficiently rigid to deform the target tissue. This court nonetheless denied summary judgment because the limitation requires both sufficient rigidity to deform and that such deformation would cause penetration to a prescribed depth. Not recognizing the latter requirement would read the language "causing the predetermined asymmetric isodose curves to penetrate the target tissue to a prescribed depth" out of the claim.

Unfortunately, the language in the court's earlier order, which stated that the specified rigidity must be used towards the claim's stated purpose, may have caused some confusion to the parties regarding the court's meaning. To clarify, the court does not hold that the rigidity in the balloon in Ashpole must have been recognized and used for the same purpose as the patented invention in order to anticipate the invention. The Federal Circuit has clearly rejected the contention that inherent anticipation requires recognition in the prior art. Schering Corp. v. Geneva Pharmaceuticals, Inc., 339 F.3d 1373, 1377 (Fed. Cir. 2003); see also Titanium Metals Corp. of America v. Banner, 778 F.2d 775, 782 (Fed. Cir. 1985) ("Congress has not seen fit to permit the patenting of an old alloy, known to others through a printed publication, by one who has discovered its corrosion resistance or other useful properties"). This is a natural result of the patent law principle, "that which would literally infringe if later in time anticipates if earlier." Schering, at 1379 (quoting Bristol-Myers Squibb Co. v. Ben Venue Labs., Inc., 246 F.3d 1368, 1378 (Fed. Cir. 2001)). Regardless of whether a person having ordinary skill in the art would have recognized that the balloon in Ashpole had sufficiently rigidity to deform target tissue, Ashpole anticipates claim 8 of the '142 Patent if it meets each and every claim limitation.

Now both parties move for supplemental claim construction of the term "causing" in claim 8 of the '142 Patent. Hologic contends that "causing" should be construed to mean "with the purpose of allowing," while SenoRx contends that "causing"
should be construed as "which would allow." As discussed above, anticipation does not require recognition of purpose in the prior art. Therefore, the court declines to adopt Hologic's proposed construction. However, SenoRx's proposed construction could be read to suggest a distinction between the phrase "which would allow" (passive language - allowing an event to occur) and the word "causing" (active language - producing an event or result). Because the court finds that the plain meaning of "causing" would be easily understood by the jury and would be more clear than construing the term as "which would allow," the court also declines to adopt SenoRx's proposed construction.

### 642

4. "cavity" or "cavity for holding electronic components"

<table>
<thead>
<tr>
<th>Plaintiff's Construction</th>
<th>Defendants' Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>A hollow area within a structure.</td>
<td>A formation in the underside of the raised periphery surrounding the game board, not on the playing surface, that holds the batteries, wires, and/or two lasers, not used for holding playing pieces.</td>
</tr>
</tbody>
</table>

a. Innovention's Proposed Construction

Innovention does not offer much to advance its argument that "cavity" should be construed so broadly. It simply notes that "cavity" is distinct from "game piece" and is cited in claim 1, which provides that:

The invention claimed is:

1. A board game, comprising:

   a game board having a playing surface and a cavity for holding electronic components.

b. Defendants' Proposed Construction

The defendants insist that their proposed construction of "cavity" is consistent with the claim language, as well as the specification and preferred embodiment's (Figure 5's) emphasis on the importance of the raised border, which has battery compartments and wiring that interconnects a battery and lasers. The defendants say that the invention differentiates "cavity" from "space" because the space on the surface of the game board is not illustrated or described as being configured or dimensioned to hold battery compartments or wiring. The defendants also point out that "cavity" and "space" are used in close proximity to each other within the same claims, which makes clear that the terms must be construed as having different meanings.

c. The Court's Construction

The "cavity" limitation appears in independent claims 1 and 25, which specify only that the "cavity" is "for holding electronic components" and further suggests that it is located on the game board. See Claim 1 ("A board game, comprising: a game board having a playing surface and a cavity for holding electronic components.") A person of ordinary skill in the art would agree with the ordinary meaning of the term "cavity" that it is something, as defined by the claims, that holds electronic components. However, that fails to fully define what "cavity" means in the context of the invention. Accordingly, the Court is informed by the specification and the preferred embodiment. The Court finds the plaintiff's proposed construction is too broad and the defendants' proposed construction is most consistent with the claim language and the specification, with the exception that the defendants' asserted limitations "not used for holding playing pieces" is unnecessary and fails to elucidate the meaning of "cavity." Accordingly, the Court adopts a modified version of the defendants' proposed construction of "cavity": "A hollow space in the raised periphery surrounding the playing surface that holds batteries and wires."
12 The specification and preferred embodiment (Figure 5) suggest a possible use for "cavity":

lower section 13 of game board 11 reveals cavity 26 that is defined by the sections 16, 17, 18 of raised boarder 15. Cavity 26 provides one or more battery compartments 27. The cavity 26 can be used for containing wiring 28 that interconnects a battery (or batteries) and lasers 21, 22 so that power supplied by a batter that occupies battery compartment 27 can be used to power the lasers 21, 22.

Nike argues that this term does not need any construction and that the word should be given its ordinary meaning. Adidas states that the term "cavity" must be construed because the inventors acted as lexicographers in defining "cavity." Adidas proposes "a cavity is an open area extending through the sole that is defined as the space between a top heel portion and a bottom heel portion, both portions extending continuously from the medial to the lateral side."

The parties have agreed that the term "medial" means inside (of the foot) and the term "lateral" means outside (of the foot). The parties also agreed at the hearing that "cavity" means "void" or "open space." The only dispute is whether the cavity must be bounded at the top and bottom.

Adidas asserts that the patentee provided a special definition of cavity: "A cavity in sole 106 is defined by the space between heel plate 104 and base 110 that is not occupied by support elements 108." 796 patent, col. 6, 11. 63-65. But this is just a clever appropriation of the word "defined" to imply that the patentee was interpreting the meaning of the word "cavity," rather than delineating the boundaries of the cavity in a preferred embodiment.

Neither the claim nor the specification limit "cavity" to a void with a physical structure at the top and the bottom. The parties agree that one side of the cavity is bounded by the bottom of the heel plate - the part on which the heel rests. The rest of the claim language defines the other limits of the cavity - "said cavity extending from a medial side to a lateral side of said footwear to define an open area extending through said sole." Nothing in the claim, the specification, or the prosecution history indicates that "cavity" has to be re-defined to explain this language or to further delineate the limits of the cavity.

The court will define this term as follows:

"Cavity" means: "an open space."

As to the remaining disputes about the shape of the patented device, Medtronic's construction is again too narrow. Medtronic would limit the apparatus to a three-dimensional, disk shape with parallel upper and lower surfaces and with an aperture going through the entire device running in a north-south direction. But the patent requires neither a disk shape nor parallel upper and lower surfaces. It simply mandates a shape with three surfaces (upper, lower, and outer). The terms "first and second longitudinal directions" mean simply opposing directions, and not anything more specific, such as 180-degree angles. A "cavity" is simply an opening in the aperture -- regardless of whether the aperture is fully enclosed -- which houses the cam member and whose width is larger than the opening of aperture to prevent the cam member from falling out.
With respect to the proper construction of the cavity element of the patent claims, both parties rest on the arguments in their summary judgment papers. According to Centricut, the 425 patent claims a cavity, which necessarily has an open outer end and a closed inner end. 7 Centricut further argues that the distinction it draws between a cavity (with an open outer (or front) end and a closed inner (or back) end) and a through-hole or bore (with an open outer end and an open inner end) is supported by the 425 patent itself, which uses the term "cavity" to describe the recess filled by a sleeved emissive insert and the term "bore" to describe certain open passageways, elsewhere in the electrode, designed to permit the flow of gas or water. See, e.g., 425 patent, col. 4, ll. 64-66, col. 5, ll. 50-52. According to Esab, Centricut's proposed construction is unavailing because: (1) the distinction between a blind cavity (i.e., one with a single opening) and a cavity with more than one opening is immaterial when, as here, the cavities in question are both completely filled (with an emissive insert); (2) Centricut limits the term cavity to include only blind cavities by impermissibly treating as a claim limitation a physical characteristic drawn from one of the preferred illustrative embodiments in the specification; and (3) Centricut's distinction between a cavity and a bore ignores the dictionary definition of "bore" as "an interior lengthwise cylindrical cavity."

The term "cavity," as used in the 425 patent, encompasses both blind cavities and those with openings at both ends. The relevant claims in the patent all disclose a metallic holder with a front end and a cavity in the front end. See 425 patent, col. 7, ll. 27-28, ll. 48-48, col. 8, ll. 29-36. In other words, a cavity is an open space formed (and subsequently filled) in the front end of the metallic holder. 8 Whether such an opening continues through to the back end or terminates somewhere short of the back end is not asserted in the claim. See Vitronics, 90 F.3d at 1582 (explaining that proper claim construction takes into account the words of the claim "both asserted and nonasserted) (citation omitted). The plain language of the patent does not limit the claim to blind cavities. Because the relevant claims recite the element of a cavity in the front end, and because a holder with a through-hole meets the limitation of having a cavity in its front end, the cavity element may not be construed with the additional limitation urged by Centricut, which it reads into the claim from other parts of the patent. See Kraft Foods, 203 F.3d at 1366 (limitation appearing only elsewhere in the patent may not be read into the claim). In short, for purposes of construing the 425 patent, the term "cavity" includes both blind cavities and through-holes. 9

A definition of the term "cavity" that refers exclusively to the front end of the electrode is entirely consistent with the electrode's function, given that the front end is the part of the electrode to which the electrical arc attaches.

While there is some logic to Centricut's argument that the patent specification uses the term cavity to describe the space filled by the emissive insert and the term bore to describe a cylindrical passageway open on both ends, the force of that argument is substantially diminished by the fact that the cavities in the specification are all filled while the bores identified in the specification remain open for the transmission of gas or water. In other words, to the extent the 425 patent includes a meaningful distinction between cavities and bores, the distinction is based not on the number of openings (one versus two), but, instead, on whether the space has been filled (as with the cavities) or remains open (as with the bores).
a. "cavity"; "phosphor layer"

LG argues that its constructions for the above terms comport with representations made by the patentee during prosecution of the '500 patent. See Ex. 11, 14, & 15 to Defs.' Opening Claim Construction Brief. While representations made to the examiner may, in certain circumstances, operate to limit scope, this is not such a circumstance. As suggested by Hitachi, the '500 patent repeatedly and expressly contains "uninterrupted," "continuous," etc., limitations, whereas, the '563 patent does not. Furthermore, the patentee suggests that any such limiting statements were specifically directed towards the claims of the '500 patent. See Ex. 10 to Pl.'s Opening Claim Construction Brief. Indeed, the prosecution history indicates that the purported disclaimers were directed to a claim that was subsequently omitted from the '563 patent. "When the purported disclaimers are directed to specific claim terms that have been omitted or materially altered in subsequent applications (rather than to the invention itself), those disclaimers do not apply." Saunders Group, Inc. v. Comfortrac, Inc., 492 F.3d 1326, 1333 (Fed. Cir. 2007). Finally, for the same reasoning as discussed above with respect to "strip[e]-shaped phosphors," the court declines to impose any additional limitations on "cavity" or "phosphor layer."

Accordingly, the court gives the above disputed terms their plain meaning and rejects the limitations proposed by the defendants.

647

b. The second disputed term in Claim 7: "Cavity cover member spaced about an end of the mold core"

i. Claim language. The second disputed term in Claim 7 of the '809 patent is "cavity cover member spaced about an end of the mold core." In its tentative draft ruling, provided to the parties prior to the Markman hearing, the court concluded that this term, among many others, was not "ripe" for construction, because Electrolux had not shown that the term was "in dispute" for infringement or for any other purpose. However, following the hearing, the court revised that conclusion, and found above, in Section II.A.1.b., beginning on page 36, that this term is also "in dispute" at this time for purposes of infringement. Therefore, the court must now construe this term, as well.

Claim 7, with the disputed term italicized, states the following:

7. A method of making an integral, smooth and uniformly constructed plastic washing machine basket having a base wall including a peripheral portion from which extends an annular sidewall that diverges radially outwardly to a terminal edge in an apparatus including a mold core, cavity sidewall members spaced about the mold core which carry core pins each having a beveled tip portion adapted to abut the mold core during a molding operation and a cavity cover member spaced about an end of the mold core and abutting the cavity sidewall members so as to define a cavity between the mold core and both the cavity cover member and the cavity sidewall members comprising:

injecting a plastic material to fill the cavity while flowing around the beveled tip portion of each of the core pins to form a plastic washing machine basket having sidewalls provided with a plurality of spaced beveled apertures; and ejecting the washing machine basket from the apparatus by separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core.

The '809 patent, Claim 7 (emphasis added).

ii. The parties' definitions and arguments. The parties' proffered definitions of this term are shown below, with bold font indicating differences between their definitions. Also, the authority on which each party relies for its definition is shown just below that party's definition.

"CAVITY COVER MEMBER SPACED ABOUT AN END OF THE MOLD CORE"

Maytag's Definition
"a section of the mold extending about and spaced from an end of the mold core"

Electrolux's Definition
"a cover that is adapted to abut the cavity sidewall members when the molding apparatus is in a closed mold"
Maytag did not offer any argument in support of its construction of this term in its opening brief, because Maytag asserted that it is not in dispute for infringement purposes. However, in its rebuttal brief, Maytag argued that this term should be left to its plain and ordinary meaning, as informed by the patent specification. Maytag also argued that Electrolux's proposed definition is flawed, because it renders claim language superfluous and injects limitations from the preferred embodiment of the specification into the claims. Somewhat more specifically, Maytag asserts that Electrolux's insertion of "to abut the cavity sidewall members when the molding apparatus is in a closed position" is improper, because Claim 7 already includes essentially this same language, so that Claim 7 is rendered partially superfluous. Maytag also asserts that Electrolux's insertion of "is spaced from the cavity sidewall members when the molding apparatus is in an open mold position" inserts language not in Claim 7, but in Claim 11, so that Electrolux is attempting to import limitations from one claim into another, which violates the requirement that claims having different terms are presumed to have different scopes. Moreover, Maytag points out that Electrolux acknowledges that its proposed construction comes directly from the specification, but importing limitations from the specification that are not found in the claim is not appropriate.

In its rebuttal brief, Electrolux contends that its construction of this term is proper, because it fits the illustrations and specification, which show that the "cavity cover member" covers a cavity, not just that it is any end of the cavity, whether or not it covers an opening, as Maytag's definition suggests. Electrolux also contends that the specification and claims clearly define the "cavity cover member" with reference to its location in the "open" and "closed" mold positions and require that the "cavity cover member" touch the sidewall members only in the "closed" mold position, but not touch them when it is in the "open" mold position.

In its surrebuttal brief, Maytag asserts that this term need not be construed, because Electrolux's representative, Michael Griffith, admitted that the accused process includes this limitation. Electrolux, however, contends that this term is in dispute and that Maytag's criticism of Electrolux's definition is wrong, because the specification explicitly defines "cavity cover member" in the context of the "open" and "closed" mold positions, citing the '809 patent, col. 5, ll. 7-20. Electrolux asserts that its definition incorporates this definition from the specification. Electrolux also asserts that claim differentiation does not require the court to ignore the limitations on a term that are apparent from the specification.

The parties also addressed the construction of this term at the Markman hearing oral arguments. Electrolux again asserted that its definition is correct, because it is drawn straight from the specification. Electrolux also argued that it is not enough to note differences among claims, because differences may cover the same thing, if they are consistent with the specification. Maytag countered that the specification discloses only the preferred embodiment, not a definition of all claim terms for all purposes, such that the specification should not be imported into the claim definition.

iii. Analysis. Beginning once again with the words of Claim 7, see Nystrom, 424 F.3d at 1142 (construction begins with the words of the patent); Biagro, 423 F.3d at 1302 (same), it is plain from the claim language itself that the "cavity cover member" is part of the apparatus for molding a plastic washing machine basket. See the '809 patent, Claim 7 (claiming "[a] method of making [a] . . . plastic washing machine basket . . . in an apparatus including a mold core, cavity sidewall members . . . , and a cavity cover member. . . .") (emphasis added). It is also plain that the claim language itself states that the "cavity cover member" is (1) "spaced about an end of the mold core," and (2) "abuts the cavity sidewall members," with the result (3) that the "cavity cover member" "defines a cavity between the mold core and both the cavity cover member and the cavity sidewall members." The '809 patent, Claim 7. Maytag's definition is, thus, incomplete, in that it leaves out the second requirement that the cavity cover member abut the cavity sidewall members, as well as the third requirement that the
cavity cover member define a cavity. Maytag's definition is also erroneous--or at least misleading--because it transforms the claim language "spaced about an end of the mold core" into "extending about and spaced from an end of the mold core." The court finds nothing ambiguous about "spaced about" that warrants redefining it as "extending about and spaced from," even assuming that the proffered redefinition is accurate.

Similarly, Electrolux's definition does not comport with the claim language, because it imports limitations from the specification concerning "open" and "closed" mold positions that are found nowhere in Claim 7. Rather, such limitations are expressly claimed in Claim 11. Thus, while Electrolux's definition clearly "aligns" with the description in the specification--indeed, is drawn directly from the specification--it does not "stay[] true to the claim [7] language." Phillips, 415 F.3d at 1316 (quoting Renishaw PLC, 158 F.3d at 1250); see also Nystrom, 424 F.3d at 1142 (quoting this portion of Phillips). It also improperly imports into Claim 7 limitations subsequently claimed in Claim 11, which would render Claim 11 superfluous. See Merck & Co., 395 F.3d at 1372 ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."); Power Mosfet Techs., L.L.C., 378 F.3d at 1410 (stating that interpretations of claims rendering claim terms superfluous is generally disfavored).

Indeed, the court concludes that the claim term "cavity cover member," in the context of Claim 7, is unambiguous: It means "a part of the apparatus for molding a plastic washing machine basket that is spaced about an end of the mold core and abutting the cavity sidewall members so as to define a cavity between the mold core and both the cavity cover member and the cavity sidewall members." This definition is not only consistent with the language of Claim 7, but consistent with the specification, to the extent that Claim 7 claims particular limitations for the "cavity cover member" among other limitations stated in the specification and claimed elsewhere in the claims of the '809 patent. See Phillips, 415 F.3d at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"). Specifically, the specification identifies the "cavity cover member" as part of the molding apparatus, see the '809 patent, col. 3, ll. 39-44 ("The molding apparatus 60 further includes . . . a cavity cover member 102. . . ."), that is spaced about the end of the mold core, see id. at col. 3, ll. 44-45 ("a cavity cover member 102 . . . extending about an end of the mold core 90. . . ."), that abuts the cavity sidewall members, see id. at col. 3, ll. 44-47 ("a cavity cover member 102 . . . abutting cavity sidewall members 99. . . ."); col. 5, ll. 7-10 ("Cavity cover member 102 includes an annular flange portion 202 which is adapted to abut cavity sidewall members 99 . . .."); and, as a result, defines a cavity between the mold core and both the cavity cover member and the cavity sidewall members. See id. at col. 3, ll. 47-53 (defining "a second space therebetwen" the cavity cover member and the mold core and explaining that plastic material is injected "within the spaces between mold core 90 and both cavity cover member 102 and cavity sidewall members 99"); col. 5, ll. 36-39 (also explaining that plastic material is injected "into the spaced defined between the mold core 90 and both cover insert 105 of cavity cover member 102 and cavity sidewall members 99").

In short, the court finds that "cavity cover member" in Claim 7 unambiguously means "a part of the molding apparatus that is spaced about an end of the mold core and abutting the cavity sidewall members so as to define a cavity between the mold core and both the cavity cover member and the cavity sidewall members." No further construction of this term is required.

**Turn-Key** argues that the limitation "cavity situated internally to the boundaries of the parting surface" must be construed as referring to "at least one product molding cavity that is surrounded by the parting surface." Pl's Opening Brief at 8. Defendants, conversely, assert that the "cavity" is a space that is surrounded by a parting surface in all directions (i.e., all directions in the plane of that parting surface). In so arguing, they specifically object to Turn-Key's inclusion of the cavity walls of the mold which form the cavity into the definition of "cavity." KM, MC & Concord's Brief at 5; Pl's Opening Brief at 8. Turn-Key, by contrast, objects to Defendants' description of the cavity as being surrounded in the "plane of that parting surface" on the grounds that this wording leads to the "erroneous conclusion that the parting surface is only in one plane." Pl's Opening Brief at 8. The Court finds that Defendants' briefs do not make any argument about the cavity being surrounded in the "plane of that parting surface" and as such, considers this interpretation to be waived. Consequently, the only dispute concerns whether the cavity walls should be included in the definition of the term "cavity."

The Court construes "cavity" according to its ordinary and customary meaning, thus signifying a hollow space, Random
House Webster's College Dictionary at 209, and specifically construes "cavity" within the context of the '998 patent as a hollow space that is surrounded by a parting surface. In keeping with this interpretation, the Court declines to construe the "cavity" to include the cavity walls which actually form the hollow space. Nothing in the specification suggests that Sorenson, as patentee, intended to define "cavity" in his own terms rather than by its ordinary, customary meaning.

E. "Cell"

"Cell(s)" is (are) used in claims: 28 of the '303 Patent; 51 of the '018 Patent, 56-58, 61, 63, 65-66, 68-70 of the '381 Patent. 96 Medinol asserts that "cell" and "cells" mean "an arrangement of structural elements that defines an enclosed space." 97 Guidant proposes the following definition for these terms: "A first and second loop at the two longitudinal ends and a first and second flexible link that define a small enclosed space." 98

The plain meaning of "cell" is, as the Cordis court found, an arrangement of structural elements that defines an enclosed space. 99 Guidant's suggested construction cannot be adopted because it is overly restrictive. This definition only relates to the preferred embodiment depicted in Figures 7 and 8, and excludes the preferred embodiment reflected in Figures 1-4. Specifically, Figure 4 contemplates a cell that has four loops at the longitudinal ends, two interior longitudinal loops, and two flexible links. 100 The text of the patent itself indicates that Figures 4, 7, and 8 collectively represent two different "preferred embodiments" of the invention. 101 Accordingly, to restrict the term "cell" to the manner in which it is represented for purposes of Figures 7 and 8 would improperly exclude another preferred embodiment of the invention. 102 Accordingly, the term "cell" is defined as an arrangement of structural elements that defines an enclosed space.
2. "Cell analysis instrument" (claim 21)

Cytyc contends that a "cell analysis instrument" is "a device, not including a microscope station, that performs measurements or analysis of at least one cell feature on a specimen preparation, such as a specimen slide." TriPath's proposed definition is, "an instrument that automatically conducts a detailed assessment or examination of one or more cells to determine its nature or essential features." The disagreement centers on three issues. First, whether a cell analysis instrument is or includes a microscope station; second, whether it performs "measurements"; and third, whether it conducts assessments automatically or requires human input.

The above discussion of "microscope station" resolves the first issue. A "cell analysis instrument" is not, and does not include, a microscope station. Therefore, the remainder of this section will focus on the second and third issues.

The claims provide little guidance as to whether the cell analysis instrument performs measurements. Claim 21 states that the cell analysis instrument produces "analysis", but does not provide any further details. 969 patent at col. 14, 1. 33. Similarly, claim 24 states that the cell analysis instrument produces "analysis data." Id. at col. 14, 1. 49.

The specification is more helpful. As mentioned above, the specification lists examples of four types of cell analysis instruments. Id. at col. 9, 11. 25-30. The only type that it describes in detail is a particular brand of laser scanning cytometer, the CompuCyte LSC(tm) ("LSC"). Id. at col. 9, 1. 27.

The description states that the LSC can scan slides stained with fluorescent dyes to measure the constituents and morphology of cells on the slide and generate a computer database file containing a set of constituent values, morphology values and slide position values of every cell found by it on the slide.

Id. at col. 9, 11. 39-44 (emphasis added). This passage indicates that the patentee intended a cell analysis instrument to conduct measurements.

Moreover, the sentence introducing the four types of cell analysis instruments begins, "There are at least four types of instruments." Id. at col. 9, 11. 35 (emphasis added). The words "at least" make clear that the four listed types are examples; they are not the outer limits of the claims. The patentee does not define any specific method of analysis that the claimed "cell analysis instruments" must use. Therefore, to interpret "cell analysis instrument" as one that does not perform measurements would not only contradict the example in the preferred embodiment, but would improperly limit the scope of the claim. See Phillips, 415 F.3d at 1323 (warning against confining the claims to the embodiments in the specification when those embodiments are merely "exemplary in nature").

The claims are silent as to whether a "cell analysis instrument" operates automatically or requires human input. Again, the description of the LSC provides the only detailed example of a how a cell analysis instrument functions. The LSC clearly allows some human interaction. For example, the user may move the slide to view areas of interest and annotate the positions of specific cells while the slide is on the stage. Id. at col.9, 11. 61-62; col. 10, 11. 2-4. However, it does not appear that human interaction is required in order for the LSC to perform the analysis. Another embodiment specifically automates the movement of the microscope to locations of interest. Id. at col. 10, 11. 6-14.

Since much of the description of the LSC is written in the passive voice, it is difficult to discern whether a machine or a human is conducting the analysis. See id. at col. 9, 1. 34 -- col. 10, 1. 5. However, the specification is clear that the purpose of the "cell analysis instrument" is to perform "analysis", an activity that can be conducted with or without human interaction. The claims and the specification do not restrict the methods by which the "cell analysis instrument" can perform its analysis. Thus, I will not read into the claims a limitation that a "cell analysis instrument" must conduct analysis either automatically or with human input.

In sum, a "cell analysis instrument" is a device, not including a microscope station, that performs measurement or analysis...
of at least one cell feature on a specimen preparation, such as a specimen slide.

652

c. Center Beam

The Court concludes, and the parties agree that the ordinary meaning of "center beam" is a structure that runs lengthwise in a rail car and serves two functions. First, it strengthens the bed of the car allowing for the use of a lighter underframe. Second, it provides a structure to secure the load to the car. See Pl. Reply Ex. 1, at P 7; Def. Opp. Ex. 1, at P 13.

Claims 1 and 2 of the '575 Patent discuss a vertical center beam assembly that extends the length of the car between the bulkheads. The preferred embodiment also states that the center beam assembly extends along the longitudinal centerline of the rail car.

Additionally, the summary of prior art in the '575 Patent discusses how one advantage center beam flat cars enjoy over other rail cars is that center beam flat cars are lighter because of the center beam. The '575 Patent uses the same type of center beam that had been used in previous center beam flat cars resulting in the center beam of the '575 Patent strengthening the bed of the rail car and allowing a lighter underframe to be used.

The summary of prior art discusses how lumber is stacked on both sides of the center beam in standard center beam flat cars. The '575 Patent has the same type of center beam, and the center beam is to be used the same way that it was used in standard center beam flat cars. The result is that the center beam in the '575 Patent is a structure to which the load being carried can be attached. See Findings of Fact, PP 111-112, 119-120, 124, 136, 139-142.

653

C. Center of Gravity (Claim 1)

The term "center of gravity" is not used to mean the single point (in a three dimensional sense) at which the club head is balanced along the x, y, and z axis. Rather, in context, the term is used to mean the point on the striking face of the club at which the club head would be balanced on a pivot. The true three dimensional center of gravity point would, necessarily, be to the rear of the club striking face since the striking face is, by definition, a planar surface at the front of the club. Therefore, the true three dimensional center of gravity would have to be somewhere behind the striking face -- either inside a part of the club or in a cavity behind the rear wall of the striking surface.

There may well be problems with the patentee's use of the term "center of gravity." In the disclosure, he uses the term "center of gravity" and "center of percussion" as if these refer to the same point. However, the terms are not synonymous.

The Court construes the claim language "center of gravity" in the claim to have the ordinary, in context, meaning of that particular term. That is, the point on the striking face of the club head at which the club head would be in static balance on a pivot point and not the literal three dimensional center of gravity. The center of gravity apparently cannot be at the center of percussion. The Court is not now deciding any issue which might be presented by virtue of any misuse of the terms "center of gravity" and "center of percussion."

9 It appears that the center of gravity (defined in static context) and the center of percussion (defined in dynamic context) may never be at the same place since the movement of the club head will cause the center of percussion to be closer to the toe than the center of gravity.

--------- Footnotes ---------

9 It appears that the center of gravity (defined in static context) and the center of percussion (defined in dynamic context) may never be at the same place since the movement of the club head will cause the center of percussion to be closer to the toe than the center of gravity.

--------- End Footnotes ---------

GO BACK

- 1084 -
As is the case with all the disputed terms and phrases, the parties disagree in the first instance as to whether construction is necessary. Saint Gobain maintains that no construction is necessary, while Xinyi, on the other hand, urges that the term "centering" be construed to mean that the glazing is centered so that "a gap of even width remains all around the glazing." Saint Gobain responds that Xinyi's proposed construction is improper for at least three reasons: (1) it is contrary to the plain language of the claim itself; (2) its adoption would improperly import limitations from the specification; and (3) it is based upon a limitation found in the specification that relates not to the reissue patent now at issue, but to the earlier original-issue patent, which subsequently was expanded by the reissue patent in a way that rendered the specification language cited by Xinyi (which includes the proposed limitation) inapposite. Finding each of Saint Gobain's counterarguments meritorious, the Court rejects Xinyi's proposed construction and concludes that no construction is necessary.

Claim 14 teaches "[a] method of centering a glazing upon a mounting bracket." According to the claim language, the glazing has "a surface with a periphery for receiving a spacer," with the "periphery including a glazing edge[.]") The method of "centering" taught by claim 14 consists of "providing a glazing that has a spacer on at least a portion of its periphery," with the spacer having a lip portion extending beyond the edge of the glazing. When the glazing is placed in the mounting bracket, the "lip portion of the spacer contacts said bracket to provide a force for centering said glazing thereon, which force is sufficient to maintain centering of the glazing on the bracket and to provide a gap between said glazing edge and the bracket along said portion of said periphery of the glazing." According to Saint Gobain, the language at the end of the claim - "along said portion of said periphery of the glazing" - is of paramount importance because it defines the "centering" function performed by the lip portion of the spacer. Specifically, when read as a whole, the claim language indicates that "centering" occurs only along the portion of the periphery of the glazing to which the spacer is attached.

Xinyi concedes that claim 14 does not require that the glazing have a spacer along its entire periphery but, as the claim language clearly specifies, only on "at least a portion" thereof. Nevertheless, Xinyi argues that "centering" must be construed as requiring "a gap of even width all around the glazing," i.e., that the glazing must be centered uniformly along all four sides, irrespective of whether all four sides have a spacer. In support of this construction, Xinyi cites the specification, which provides that "[d]uring insertion of the glazing into the window frame, glazing is automatically centered, so that a gap of even width remains all around the glazing." (Col. 3:13-15.) Xinyi claims that here the patentee acted as his own lexicographer by setting forth a specific definition for "centering."

A patentee may act as his own lexicographer by specifically defining terms of a claim contrary to their ordinary meaning. Abraxis Bioscience, Inc. v. Mayne Pharma (USA) Inc., 467 F.3d 1370, 1376 (Fed. Cir. 2006) (quoting Chef Am., Inc. v. Lamb-Weston, Inc., 358 F.3d 1371, 1374 (Fed. Cir. 2004)). "Interpretation of descriptive statements in a patent's written description is a difficult task, as an inherent tension exists as to whether a statement is a clear lexicographic definition or a description of a preferred embodiment." E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 1369 (Fed. Cir. 2003). In such situations, the court aims "to interpret claims 'in view of the specification' without unnecessarily importing limitations from the specification into the claims." Id. (citing Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1204-05 (Fed. Cir. 2002)). "When a patentee acts as his own lexicographer in redefining the meaning of particular claim terms away from their ordinary meaning, he must clearly express that intent in the written description." Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1370-71 (Fed. Cir. 2005) (citing Bell Atl. Network Servs. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001)). The statement of intent in the specification "must have sufficient clarity to put one reasonably skilled in the art on notice that the inventor intended to redefine the claim term." Id. (citations omitted).

Saint Gobain explains that '395 patent is a reissue patent and that the statement from the specification cited by Xinyi relates to the claims in the original patent, not the reissue. The original is U.S. Patent No. 5,519,979 ("the '979 patent"), issued May 28, 1996. It is undisputed that the specification of the '979 patent includes the exact same statement. ('979 patent, Defs.' Ex. B, Col. 3:15-17.) This is crucial because, according to Saint Gobain, the specification language Xinyi claims supplies the definition of "centering" actually addresses the claims of the earlier original patent (which also appear in the reissue patent but are not asserted in this case). The claims in the '979 patent were much narrower than those of the reissue patent. The '979 patent described a glazing with a spacer on substantially its entire periphery (Id., Col. 4:58-64), while the pertinent claims of the '395 reissue patent describe a glazing with a spacer on at least a portion of its periphery. ('395 reissue patent,
Col. 6:16-21.) Saint Gobain's clear purpose in seeking the reissue patent was to expand the claims to cover a broader invention; specifically, to claim a glazing with a lip on only a portion of its periphery (i.e., on one or more of the four sides) rather than on substantially the entire periphery (i.e., on all four sides only).

2 Claim 1 of the '979 patent is exactly the same as claim 1 of the '395 reissue patent. Claim 1 is not asserted in this case.

Xinyi attempts to bolster its proposed construction by citing prosecution history, but it cites the history of the '979 patent, not the '395 reissue. (Defs.' Claim Constr. Mem., Doc. No. 98, at 6, 8-9; Tr. of Nov. 21, 2008 Markman Hearing, Doc. No. 105, 35:15-21, 67:4-5, 80:13-18.) Under the circumstances presented, this evidence merely reinforces Saint Gobain's explanation. Indeed, Xinyi's references to the prosecution history illustrate that this limitation set forth in the specification -- describing the "gap of even width all around the glazing" -- relates to the '979 patent, which required that the spacer be present on all four sides of the glazing, and does not apply to the asserted claims of the '395 reissue patent (which did not appear in the '979 patent). These facts (particularly the '979 specification and the '979 prosecution history) illustrate rather vividly that Xinyi's proposed construction relates to the earlier invention, which had a spacer with a lip on substantially the entire periphery. And while the '395 reissue patent encompasses such an invention, it is not so limited. Indeed, the motivation for obtaining the '395 reissue patent was to claim a broader version of the earlier invention, one that did not require a spacer on all four sides and, correspondingly, did not provide for centering on all four sides either.

Furthermore, the prosecution history also demonstrates that the term "centering" possessed an ordinary meaning to a person of ordinary skill in the art before the '979 patent was issued, independent of any effort by the applicant to define the term in the specification. The examiner's remarks evince a fluent analysis of the "centering" function as it related to both the patent being examined (the '979 patent) and the prior art. (See, e.g., Def.'s Ex. E, 76-77, 80.) Indeed, the examiner's initial rejection was based at least in part upon his conclusion that the prior art already disclosed a lip having "an inherent tendency to center the glazings [. . .]." (Id. at 80.) Saint Gobain responded by amending the claims to provide more specificity and argued that the prior art did not, in fact, disclose an invention that performed the centering function. (Id. at 83-87.) The examiner accepted this argument and allowed the claims. (Id. at 91.) Not once during this discourse is it indicated, or even implied, that the "centering" under discussion is "centering" as expressly defined by the applicant, rather than as its plain and ordinary meaning was understood by the examiner. Nor does the prosecution history reveal any convincing evidence that the ordinary meaning of the term necessarily required that the centering function occur on all four sides of the glazing (even though the claimed invention in fact may have provided for such centering since at the time the claims called for a spacer on substantially entire the periphery of the glazing).

Xinyi's only response to this argument is that none of the historical context (in particular, the expansion of the claims from the '979 patent to the '395 reissue patent) makes any difference. Xinyi argues that the only relevant change from the '979 patent to the '395 reissue patent was the position of the spacer, not the nature or location of the centering. Xinyi takes the position that if Saint Gobain wanted to change the '979 patent to provide for centering only on the portion of the periphery having a spacer, rather than around the entire periphery, it could have, but needed to do so expressly.

The Court disagrees. The term "centering" had an ordinary meaning to one of skill in the art before it was used by Saint Gobain, first in the '979 patent and, later, in the '395 reissue patent. That ordinary meaning was intended to govern the use of the term throughout. None of the evidence cited by Xinyi persuasively establishes that Saint Gobain's use of the term "centering" was intended to represent a departure from that ordinary meaning. Indeed, the specification lacks any evidence of a clear expression of an intention by the inventor to redefine the term "centering." Likewise, the claim language itself makes no mention of the need for "a gap of even width all around the glazing." Xinyi's argument always returns to this specification language, which Saint Gobain has demonstrated relates directly to the claims originally present in the '979 patent which, although part of the '395 reissue patent, are not asserted in this action.

Moreover, even if the specification language did relate specifically to the '395 patent, the absence of any such language from the claims themselves clearly demonstrates that the inventor never intended the claims to be so limited. As the Federal Circuit has frequently admonished, it is improper to "at any time import limitations from the specification into the claims." CollegeNet, Inc. v. Apply Yourself, Inc., 418 F.3d 1225, 1231 (Fed. Cir. 2005) (citing Teleflex, Inc. v. Ficosa N. Am. Corp.,
299 F.3d 1313, 1326 (Fed. Cir. 2002)). Specifically, the Federal Circuit "has consistently adhered to the proposition that courts cannot alter what the patentee has chosen to claim as his invention, that limitations appearing in the specification will not be read into claims, and that interpreting what is meant by a word in a claim 'is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.'" Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) (quoting E.I. Du Pont De Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988)). Having concluded that the inventor did not use the specification to specifically define "centering" in the manner Xinyi suggests, the Court finds that adopting Xinyi's proposed construction, which is based entirely upon a single statement in the specification, would be inappropriate.

The interpretation of the evidence advocated by Xinyi amounts to a contention that in order to achieve its purpose in obtaining the '395 reissue patent, Saint Gobain was required to go back and delete the language concerning "a gap of even width all around the glazing" from the specification, or else be required to produce an invention that performed the centering function on all four sides of the glazing notwithstanding the absence of a spacer (which all agree is what performs the centering function) from as many as three of the four sides. Neither the law nor the relevant facts support such an interpretation. The claim term to which the specification language is particularly relevant remains a part of the reissue patent; it is simply not at issue in this litigation. Saint Gobain had no reason to believe that such language would somehow limit its reissue claims by infecting those claim terms with teachings that did not apply to those claims and limited them in ways Saint Gobain did not intend. Most importantly, under such circumstances, a person of skill in the art would not understand such a limitation -- which Xinyi insists must inform the understanding of the term "centering" -- to be consistent with the ordinary meaning of that term.

In light of all the intrinsic evidence, the Court finds that the patentee did not act as his own lexicographer with respect to the term "centering," and, furthermore, that adoption of Xinyi's proposed construction of "centering" would entail improperly importing a limitation from the specification into the claim. The plain and ordinary claim language satisfactorily describes the centering function and, under the circumstances, in the absence of countervailing evidence in the specification or prosecution history, that language must control. See DSW, Inc. v. Shoe Pavilion, Inc., 537 F.3d 1342, 1347 (Fed. Cir. 2008) (citing Northern Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1295 (Fed. Cir. 2000)). Accordingly, the Court declines Xinyi's proposal and instead finds that no construction is necessary.

655 e. "central drainage aperture"

The term "central drainage aperture" appears in claims 9 and 10 of the '712 Patent. Baldwin asserts that the phrase has a meaning readily understood by one of skill in the art and construction is not necessary. Baldwin asserts that this term should be construed as "an opening in the second end cap at the base of a sloped interior surface that allows water and other contaminants to flow out from the open filter interior." Baldwin argues that because the term "drainage" modifies "aperture," the claimed aperture must include some limitation beyond simply being an opening. Baldwin points to the several portions of the patent specification that it contends set forth the overall arrangement that makes the bottom end cap opening a drainage aperture. In addition, Baldwin claims that the patent applicant disavowed any construction of drainage aperture that would broadly cover any opening in an end cap. In particular, Baldwin argues that the applicant did so to overcome inefficient drainage of the prior art. Baldwin also directs the Court to certain statements made in a patent application from which the '712 Patent claims priority describing the prior art and certain drainage structures therein. 12

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

11 The terms "drainage aperture" and "aperture" appear in claim 1 of the '366 Patent and claim 1 of the '009 Patent, respectively. Baldwin proposes that the terms be construed consistently.

12 Such statements include:

Exhibits 1-3 of the Declaration show an end cap with an angled surface angled toward an aperture. However, . . . the interior surface is not angled from an outside edge toward the central drainage aperture and is not constructed and arranged to funnel moisture to a central drainage aperture.
Exhibit 4 shows . . . the bottom cover G shown in Exhibit 1 . . . Further the interior surface is not angled from the outside edge toward a central aperture.

Exhibit 6-8 . . . Again, these exhibits do not show an end cap with an interior surface angled from an outside edge toward a central drainage aperture.

Upon examination of the intrinsic evidence, the Court determines that one of the ordinary skill in the art would define "drainage aperture" without reference to the slope or configuration of the surrounding end cap surface. Instead, one skilled in the art would understand that the "drainage aperture" and surrounding surface are separate and distinct. Looking first to the language of the claims, the Court discerns that there is no ambiguity in the term "drainage aperture"—it is simply a hole or an opening in the second end cap. See '712 Patent, claim 9 ("said second end cap includes a central drainage aperture"); id., claim 10 ("said second end cap has: a central drainage aperture"). Neither claim contains language regarding the slope or configuration of the internal surface of the second end cap that surrounds the "drainage aperture." Instead, the claims recite only the "central drainage aperture." The specification reinforces the separate nature of the "drainage aperture" and the surrounding interior surface:

The second end cap preferably has a central drainage aperture and an interior surface constructed and arranged to funnel moisture, collected on the interior surface of the second end cap, to the central drainage aperture.

'B712 Patent, col. 3, ll. 37-41; '366 Patent, col. 3, ll. 56-59. The use of the word "and" in the above example demonstrates that the drainage aperture and the interior surface are separate structures.

Baldwin suggests that the claim term "drainage aperture" must be construed to include the surrounding internal surface of the second end cap because the only embodiment described in the specification is of a drainage aperture being at the base of a sloping surface. The Court rejects this suggestion. It would be improper to read into the claim the structure of the interior surface described in this specific embodiment. 13 See Phillips, 415 F.3d at 1323 (noting that the Federal Circuit has "expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment"); Playtex, 400 F.3d at 908 ("Claims of a patent may only be limited to a preferred embodiment by the express declaration of the patentee.").

The second end cap preferably has a central drainage aperture and an interior surface constructed and arranged to funnel moisture, collected on the interior surface of the second end cap, to the central drainage aperture.

'B712 Patent, col. 3, ll. 37-41; '366 Patent, col. 3, ll. 56-59. The use of the word "and" in the above example demonstrates that the drainage aperture and the interior surface are separate structures.

Baldwin suggests that the claim term "drainage aperture" must be construed to include the surrounding internal surface of the second end cap because the only embodiment described in the specification is of a drainage aperture being at the base of a sloping surface. The Court rejects this suggestion. It would be improper to read into the claim the structure of the interior surface described in this specific embodiment. 13 See Phillips, 415 F.3d at 1323 (noting that the Federal Circuit has "expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment"); Playtex, 400 F.3d at 908 ("Claims of a patent may only be limited to a preferred embodiment by the express declaration of the patentee.").

The Court notes that the specification describes additional functions of the interior surface, yet such features are not read into the construction of the drainage aperture. For example, "[i]n some embodiments recessed, radial troughs extending outwardly and upwardly from central aperture 96 can be used to facilitate this flow. . . . An advantage to troughs 99 is that should a leaf or other large particulate material become positioned over central aperture 96, water can still flow into and through aperture 96 by means of the troughs." '712, col. 6, ll. 52-65; see also '366 Patent, col. 8, ll. 47-62; '009 Patent, col. 8, ll. 50-65.

Baldwin's disavowal arguments are also unavailing. First, Baldwin has not demonstrated that a sloped interior surface is necessary to achieve significant drainage. The Court notes that the filter is installed vertically. Thus, water will filter out through the bottom end cap through the drainage aperture even without a sloped interior surface. Second, Baldwin relies on remarks made during the prosecution of a related application that eventually matured into U.S. Patent No. 5,612,992. At the time the remarks were made, however, the pending claims included both a central drainage aperture and an interior surface "being angled from the outer region toward the central drainage aperture." Because those claims describe structure different from that of claims 9 and 10 of the '712 Patent, which do not recite the surface surrounding the aperture, the remarks are not

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

14 Moreover, the Court notes that both the '366 and '009 Patents contain dependent claims that contain limitations describing the structural surface surrounding the aperture as being "angled" or "an inner funnel." See '366 Patent, claim 3; '009 Patent, claim 15. Thus, it is presumed that the patentee did not intend for the drainage aperture to include the inner surface limitation in the independent claims. See Phillips, 415 F.3d at 1315 ("the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim").

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In sum, the Court concludes that the intrinsic evidence does not support Baldwin's proposed construction. Accordingly, the Court declines to construe to claim language.

GO BACK

656

The only issue on appeal is whether the district court correctly construed the term "central longitudinal groove" to require that the width of the groove must be less than the combined width of the fins. Claim construction is a question of law, see Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996), that we review de novo on appeal, see Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed Cir. 1998) (en banc). Proper claim construction entails an analysis of a patent record's intrinsic evidence—the claim language, the written description, and the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582-83, 39 U.S.P.Q.2D (BNA) 1573, 1576-77 (Fed. Cir. 1996). If the meaning of a claim is unambiguous from the intrinsic evidence, then a court may not rely on extrinsic evidence for purposes of claim construction. See Key Pharm., Inc. v. Heron Labs. Corp., 161 F.3d 709, 716, 48 U.S.P.Q.2D (BNA) 1911, 1917 (Fed. Cir. 1998) (explaining that a court may receive extrinsic evidence to educate itself about the underlying technology, but it cannot use extrinsic evidence "to arrive at a claim construction that is clearly at odds with the claim construction mandated by the [intrinsic evidence]").

Claim construction analysis begins with the claim language itself. See Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971, 50 U.S.P.Q.2D (BNA) 1465, 1467 (Fed. Cir. 1999); Renishaw PLC v. Marposs Societa per Azioni, 158 F.3d 1243, 1248, 48 U.S.P.Q.2D (BNA) 1117, 1120 (Fed. Cir. 1998). As a starting point, the court gives claim terms their ordinary and accustomed meaning as understood by one of ordinary skill in the art. See Hoechst Celanese Corp. v. BP Chems., Ltd., 78 F.3d 1575, 1578, 38 U.S.P.Q.2D (BNA) 1126, 1129 (Fed. Cir. 1996) (stating that the court assigns a claim term the meaning "that it would be given by persons experienced in the field of invention"); Markman, 52 F.3d at 980, 34 U.S.P.Q.2D (BNA) at 1330. Here, the relevant claim language recites a "central longitudinal groove in the underside of the heel part extending forwardly through the heel part into the underside of the sole part to divide the lower surface of the heel part into a pair of fins." Col. 5, ll. 45-58. Thus, our analysis focuses on the word "groove" in the term "central longitudinal groove." The ordinary and accustomed meaning of "groove," as the district court correctly found, is a "relatively long and narrow structure."

The claim term's ordinary and accustomed meaning initially serves as a default meaning because the patentee may act as a lexicographer and ascribe a different, or modified, meaning to the term. See Multiform Desicants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477, 45 U.S.P.Q.2D (BNA) 1429, 1432 (Fed. Cir. 1998) (observing that an inventor, acting as a lexicographer, may bestow "a special meaning to a term in order to convey a character or property or nuance relevant to the particular invention"); Intelecall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1388, 21 U.S.P.Q.2D (BNA) 1383, 1674 (Fed. Cir. 1994). The court, therefore, must examine a patent's specification and prosecution history to determine whether the patentee has given the term an unconventional meaning. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577 (holding that "it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning [because the specification] acts as a dictionary when it expressly defines terms . . . or when it defines terms by implication" (emphasis added)); Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir. 1995) (determining that "arguments and amendments made during the prosecution of a patent application . . . as well as the specification and other claims must be examined to determine the
meaning of terms in a claim" (emphasis added)). If the patentee has not done so, the term's ordinary and accustomed meaning controls. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D (BNA) 1619, 1622 (Fed. Cir. 1996) ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning.").

The written description of the '792 patent supports the district court's initial interpretation of groove as a long and narrow structure. The written description teaches an inverted groove that divides a heel lengthwise and forms fins on each side. It thus follows that the width of the fins is inversely proportional to the width of the groove. The written description also explains that the claimed invention improves shock absorption stability because "a large part of the total heel area is deployed in shock absorption, [resulting] in a very good cushioning effect." Col. 4, ll. 36-38 Thus, a narrow groove complemented by a wide pair of fins is consonant with the purpose of the invention. Cf. Renishaw Plc, v. Marposs Societa' Per Azioni, 158 F.3d 1243 at 1250, 48 U.S.P.Q.2D (BNA) at 1122 (reasoning that a claim interpretation that aligns with the purpose of the invention is likely to be correct).

Review of the prosecution history, however, reveals that the inventor disclaimed a particular interpretation of groove, thereby modifying the term's ordinary meaning. See CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1158, 42 U.S.P.Q.2D (BNA) 1577, 1585 (Fed. Cir. 1997) (observing that statements made during prosecution commit the inventor to a particular meaning of a claim term that is binding during litigation); Southwall Techs., 54 F.3d at 1576, 34 U.S.P.Q.2D (BNA) at 1676 ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution."). During prosecution of the '792 patent, the inventor submitted drawings comparing the features of the claimed invention to a hypothetical combination of the prior art Lombard and Bowerman patents. The inventor then distinguished the prior art by arguing that the claimed invention "provides a much narrower groove for a totally different purpose, namely . . . to involve as much of the underneath surface of the footwear as possible in a cushioning and supporting function." Flowing from this statement is the inventor's clear disavowal of footwear having a groove width greater than that disclosed in the prior art. The Lombard patent, in turn, teaches a shoe with a groove width greater than the combined width of the two fins. Thus, the district court correctly held that the inventor necessarily defined the central longitudinal groove as requiring a width that must be less than the combined width of the two fins.

On appeal, HHI asserts that the district court incorrectly analyzed the prosecution history. HHI contends that a reasonable competitor would understand that the inventor's "much narrower groove" statement was an erroneous statement rather than a disavowal of a particular width relationship because the statement was made in reference to drawings submitted during prosecution, and the specification contains figures depicting a groove that is wider than the fins.

HHI's argument is unavailing. The '792 patent is devoid of any indication that the proportions of the groove and fins are drawn to scale. HHI's argument thus hinges on an inference drawn from certain figures about the quantitative relationship between the respective widths of the groove and fins. Under our precedent, however, it is well established that patent drawings do not define the precise proportions of the elements and may not be relied on to show particular sizes if the specification is completely silent on the issue. See In re Wright, 569 F.2d 1124, 1127, 193 U.S.P.Q. (BNA) 322, 335 (CCPA 1977) ("Absent any written description in the specification of quantitative values, arguments based on measurement of a drawing are of little value."); In re Olson, 41 C.C.P.A. 871, 212 F.2d 590, 592, 101 U.S.P.Q. (BNA) 401, 402 (CCPA 1954); cf. Manual of Patent Examining Procedure § 2125 (1998). Thus, in the present case, a reasonable competitor, being aware that figures in a patent are not drawn to scale unless otherwise indicated, would understand the arguments in the prosecution history as clearly disclaiming a groove having a width greater than the combined width of the two fins.

HHI's argument therefore reduces to a request for a mulligan that would erase from the prosecution history the inventor's disavowal of a particular aspect of a claim term's meaning. Such an argument is inimical to the public notice function provided by the prosecution history. The prosecution history constitutes a public record of the patentee's representations concerning the scope and meaning of the claims, and competitors are entitled to rely on those representations when ascertaining the degree of lawful conduct, such as designing around the claimed invention. See Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1577; Lemelson v. General Mills, Inc., 968 F.2d 1202, 1208, 23 U.S.P.Q.2D (BNA) 1284, 1289 (Fed. Cir. 1992). In the present case, the inventor's statements about groove width are part of the prosecution history and form the totality of the public record upon which competitors rely. See Elkay Mfg. Co. v. Ebcio Mfg. Co., 192 F.3d 973, 979, 52 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1999) (stating that the totality of the prosecution history must be considered and reasoning that it is "irrelevant whether [the inventor] relinquished [a] potential claim construction in an amendment to the claim or in an argument to overcome or distinguish a reference"). Were we to accept HHI's position, we would undercut

- 1090 -
the public’s reliance on a statement that was in the public record and upon which reasonable competitors formed their
business strategies.

HHI further cites Intervet Am. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 12 U.S.P.Q.2D (BNA) 1474 (Fed. Cir. 1989), for the
proposition that erroneous statements made during prosecution do not affect claim construction analysis. Intervet is
inapposite to this case and does not support HHI's cause. In Intervet, the patentee, responding to an office action, amended
three claims to include the term "single administration." Id. at 1053-54, 12 U.S.P.Q.2D (BNA) at 1476-77. Then, in the
remarks accompanying the amendment, the patentee made an unqualified statement that the "claims are restricted to a single
vaccination." See id. at 1054, 12 U.S.P.Q.2D (BNA) at 1477. On appeal, the issue was whether claims without the term
"single administration" nonetheless included that limitation because of the patentee's remarks. See id. This court held that
the remarks were clearly erroneous and did not apply to all the claims, but were limited to only those claims that included
the term "single administration." See id. Thus, although not invoking the exact terminology, we implicitly reasoned that a
reasonable competitor would perceive the remarks as erroneous and understand them as applying only to the amended
claims. The court also concluded that, to the extent the examiner may have relied on those remarks in allowing all the
claims to issue, such confusion was likely cured by subsequent communications between the examiner and the patentee. See
id.

The present circumstances are distinct from Intervet. Here, unlike Intervet, no conspicuous error exists. The term "central
longitudinal groove" is present in all three claims of the '792 patent. Thus the inventor's statements and submitted drawings
concerning groove width apply with uniform force to all the claims. See Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d
1335, 1348, 47 U.S.P.Q.2D (BNA) 1418, 1427 (Fed. Cir. 1998) ("Absent qualifying language in the remarks, arguments
made to obtain the allowance of one claim are relevant to interpreting other claims in the same patent.") Accordingly, a
reasonable competitor reading the '792 patent's prosecution history would have no reason to believe that a mistake was
made or that the inventor meant anything other than what he said. Also, unlike Intervet, the '792 patent issued immediately
after the inventor's arguments regarding the prior art; consequently, the examiner continued to understand that the groove in
the '792 patent was narrower than the one in the Lombard patent.

CONCLUSION

Because we hold that during the prosecution of the '792 patent, the inventor disclaimed a groove width greater than the
combined width of the fins, we affirm the district court's claim construction.

657

In this case, the claim limitations at issue in Claim 10 consist of an exercise and play apparatus comprising:

(1) "an inflatable, substantially horizontally oriented bottom wall having an upper surface, a lower surface and a
perimeter";

(2) the upper and lower surfaces [of the bottom wall] being spaced apart throughout the bottom wall by a distance
sufficient to generate a trampoline effect based on air pressure between the upper and lower surfaces";

(3) "an inflatable, substantially vertically oriented sidewall extending upwardly from and continuously along the upper
surface of the bottom wall";

(4) "said sidewall defining a continuous perimeter of an enclosed, upwardly open central play area on said bottom wall
around said play area"; and

(5) "[said sidewall] extending upwardly from said bottom wall to provide a cushioned perimeter wall around said play
area, the sidewall having a height and thickness selected to retain, as well as cushion the impact of users jumping on the
upper surface of the bottom wall."

[Second] Decl. of David N. Makous, Exh. E at 63-64.
The Court has already determined that the term "substantially horizontally oriented" is something that "lies relatively flat." September 19, 1997 Order at 18. The Court has also determined that the phrase "upwardly open central play area" is properly interpreted to define the area where "one or more users can . . . enter the play area and jump, bounce, or crawl on the bottom wall." September 19, 1997 Order at 18. The Court has further noted that the perimeter of the play area in the '738 patent is explicitly defined by the sidewall, which "extend[s] upwardly from the outermost bottom wall compartment or section 20." September 19, 1997 Order at 19. Finally, the Court has held that the bottom wall and the sidewall of the '738 patent cooperate to define the play area. September 19, 1997 Order at 19.

1. Claim Language

The disputed language from claim 1 reads as follows: "a stationery optical scanning head located between said feed and stacking stations for scanning a preselected segment of a central portion of each bill . . . " '196 Patent, Col. 31, ll. 55-60. Glory asks this Court to construe the claim such that the "central portion" from which the "preselected segment" is taken is at the "geometric center" of the bill.

Claim 1 describes not one predetermined segment or one central portion, but "a predetermined segment" in "a central portion" of the bill. Standing alone, a claim containing the article "a" or "an" means "at least one." See Crystal Semiconductor Corp., 246 F.3d at 1347. Glory correctly states that the use of the phrase "said predetermined segment of a bill" later in claim 1 implies one predetermined segment per type of bill, but that does not necessarily lead to an inference that the preselected segment for the bill must be at the geometric center of the bill. The use of "said predetermined segment" alone does not limit the central portion to the geometric center of the bill.

Cummins also points to the existence of dependent claim 8 as support that "central portion" does not limit the scanned segment solely to the geometric center of the bill. The context of the surrounding words in a claim must be considered in determining the ordinary and customary meaning of a term. See ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082, 1088 (Fed. Cir. 2003). One such context is the presence of a dependent claim adding a particular limitation, which "gives rise to a presumption that the limitation in question is not present in the independent claim." Phillips, 415 F.3d at 1314-15; see also Wenger Mfg., Inc. v. Coating Mach. Sys. 239 F.3d 1225, 1233 (Fed. Cir. 2001). Claim 8 describes: "The currency counting and evaluation device of claim 1 wherein said preselected segment of each bill is located in the central region of the bill." '196 Patent, Col. 32, Claim 8. If a dependent claim provides an additional limitation of a more specific location for a preselected segment, it can be inferred that the independent claim 1 does not provide such a limitation on location. Otherwise, claim 8 would become superfluous. The use of "central region" in claim 8 implies that there is a subset of "central portion" that is the "central region." Unfortunately, this claim alone does not clarify the relative size of either of these terms in relation to the size of the bill. The claim language, standing alone, does not allow the Court to determine the meaning of "central portion."

2. Specification

A person of ordinary skill in the art reads a claim term not only in the context of a claim, but also in the context of the patent and its specification. Phillips, 415 F.3d at 1313. In reviewing the specification of the '196 Patent, the Court finds that the specification is ambiguous. Both parties have focused on one area of the specification discussing the "central portion":

In the case of U.S. currency, for instance, it has been determined that the central, approximately two-inch portion of currency bills, as scanned across the central section of the narrow dimension of the bill, provides sufficient data for distinguishing among the various U.S. currency denominations on the basis of the correlation technique used in this invention. Accordingly, the optical encoder can be used to control the scanning process so that reflectance samples are taken for a set period of time and only after a certain period of time has elapsed since the borderline has been detected, thereby restricting the scanning to the desired central portion of the narrow dimension of the bill.

'196 Patent Col. 7 11. 29-42. Glory argues that this section suggests that the patent is limited to the two-inch portion that is at the center of the bill. Glory Const. Br. at 2. But the specification describes the central portion as approximately two inches "as scanned across the central section of the narrow dimension." That implies that the central portion is either in a different
direction from, or a subset of, the central section, but does not give a sense of whether that is necessarily at or around the geometric center.

In the paragraph preceding the above-quoted text, the specification explains why the "central, two-inch portion" is important - because the distance between the borderline of U.S. currency are "an absolute reference point" approximately two-inches apart, while the distance between the borderline and the actual edge of the bill may differ from bill to bill "due to the relatively large range of tolerances permitted during printing and cutting of currency bills." Col. 7 ll. 5-17. This explanation clarifies that the "central portion" is a narrow strip measured between the borderlines of the narrow dimension of the bill, while "central section" defines where on the horizontal dimension of the bill the machine will scan.

Glory relies upon the drawings accompanying the patent's specification as evidence that the patent holders intended that the invention scan only the geometric center of the bills. It is true that the figures accompanying the patent's preferred embodiment depict scanning in the geometric center of the bill. A preferred embodiment, however, is just that - a preference. See Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed. Cir. 1986) ("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification."). While a claim cannot be construed as something that is excluded by the language of the specification, the specification - like the claim language - does not necessarily lead to a conclusion about the meaning of "central portion."

3. Prosecution and Subsequent Patents

Finally, while neither party relies upon the prosecution history of the '196 Patent to support claim construction, Glory argues - and the '196 Opinion agreed - that the Court could consider the specification of a subsequent, continuation-in-part patent to in interpreting the meaning of terms in the '196 Patent. The subsequent patent, No. 6,381,354 (the "'354 Patent") covers currency counting devices for foreign bills, and states in relevant part:

In adapting . . . U.S. Patent No. 5,295,196 to optimize the scanning of currencies from countries other than the United States, it is first noted that while it has been found that scanning along the central portion of the green side of U.S. bills provides good patterns to discriminate between the different U.S. denominations, foreign bills may require scanning along segments located in locations other than the center . . . it may be . . . desirable to scan German marks. . . along a segment 1 inch (2.54 cm) to the left of center along the top face of a bill while it may be desirable to scan British pounds along a segment 1.5 inches (3.81 cm) to the right of center.

The '196 Opinion relied upon the recent opinion from the Federal Circuit, Microsoft Corp. v. Multi-Tech Systems to draw an inference that the language in the 354 Patent limited the claims of the '196 Patent to the "geometric center". In Microsoft, the Federal Circuit reviewed statements made during the prosecution of a subsequent, related patent in construing the claims of an earlier patent. Microsoft, 357 F.3d at 1349-50. Glory suggests that the statements about the '196 Patent made in the specification of the '354 Patent can be used to interpret the terms of the '196 Patent. Cummins urges this Court to discredit all arguments using Microsoft because that case relied upon the prosecution history of a subsequent patent in which the patent specification was identical to the specification of the earlier patent, and is therefore distinguishable from the patents at issue in this case.

It is the statement about the '196 Patent in the '354 Patent specification that convinces this Court that the term "central portion" means at or near the geometric center of the bill. As Cummins points out, the facts of this case can be distinguished from those in Microsoft because the relevant statement is in the specification rather than the PTO prosecution. But the Microsoft court's logic-that a patentee's considered statement about the scope of an earlier patent in an official proceeding on a later patent is relevant to determining the scope of the earlier patent - applies with equal, if not more, force to statements made in a later specification. Unlike a statement before the PTO, made in order to get the PTO to accept an application, a specification is directed to all practitioners skilled in the art in the field. 35 U.S.C. § 112. Thus, the patentee has even more incentive to "exercise care in characterizing the scope of its invention" in a subsequent specification as it does when describing an earlier invention during prosecution. Microsoft, 357 F.3d at 1350. The fact that Cummins described the '196 Patent as scanning the center in the specification rather than in prosecution proceedings does not render the description irrelevant to construing the scope of the '196 Claims.
The Microsoft case's holding also does not hinge on the fact that the specifications of the two patents in that case were identical. The court's conclusion that "any statement of the patentee in the prosecution of a related application as to the scope of the invention [is] relevant to claim construction" does not rely upon identical specifications. Id. at 1350. Moreover, the body of precedent in Microsoft relied upon Jonsson v. Stanley Works, 903 F.2d 812 (Fed. Cir. 1990) and Wang Lab., Inc. v. America Online, Inc., 197 F.3d 1377 (Fed. Cir. 1999), both of which used the prosecution histories of Continuation-in-Part patents. Neither of those cases relied upon the existence of common specifications, but rather relied upon the existence of common subject matter.

Finally, the purpose served in the Microsoft holding by the common specification is not present in this case. In the usual case, the term in a related patent with identical specification is used as an inference that the patent holder intended the two terms to have the same meaning. In this case no inference is required, because the patent holder directly described the term "central portion" in the '196 Patent as being in the center, and distinguished the continuation-in-part '354 Patent because it would cover devices that scan "along segments located in sections other than the center." In the face of that direct evidence, the circumstantial inference that would be drawn from a common specification is not necessary.

Therefore, the Court finds that the term "central portion" as used in the '196 Patent means scanning at or near the geometric center of the bill.

2. Claims 16-19

The parties dispute the construction of two different phrases found in Claim 16: "centrifugal unit" and "channels extending radially in the base". Claim 16 reads:

A centrifugal unit comprising a centrifugal component and a plurality of tubes, said unit to turn around an axis to separate the components of a liquid, blood in particular, with such plurality of tubes displaying a single tubular component wherein said unit includes:

- a base in the form of a disk;
- an external cylindrical wall extending from the base;
- an internal cylindrical wall extending from the base and separated by the external wall so as to define a ring-shaped separation chamber among each other;
- a tubular housing almost extending co-axially to said rotating axis from the base to receive an end of a tubular unit; and
- a plurality of channels extending radially in the base of the centrifugal unit, with each channel providing communication between a respective tube of the tubular unit and the separation chamber, with the centrifugal unit having a radius between 25 and 50 mm and a height between 75 and 125% of the radius.

(emphasis added).

a. "Centrifugal Unit"

The phrase "centrifugal unit" appears in each of the 22 claims of the '983 patent. In nearly all of those claims, the parties agree that "centrifugal unit" should be construed as referring exclusively to the vessel in which the centrifugation takes place. The parties disagree, however, with respect to how the phrase should be construed in Claim 16 (and dependent Claims 17-19).

The general rule of thumb in claim construction is that:

same terms appearing in different portions of the claims should be given the same meaning unless its clear from the
specification and prosecution history that the terms have different meanings.

Frank's Casing Crew & Rental Tools, Inc. v. Weatherford Int'l, Inc., 389 F.3d 1370, 1377 (Fed. Cir. 2004). Here, rather atypically, both parties advocate for the exception to that general rule. Defendants Baxter and Fenwal contend that in Claims 16-19, the phrase "centrifugal unit" refers, not only to the vessel, but also to the accompanying tubing. With respect to the first of the three instances in which "centrifugal unit" is used in Claim 16, Plaintiff Haemonetics agrees with the defendants. In the later two occurrences, however, Haemonetics asserts that "centrifugal unit" should be construed consistent with the usage of the phrase in all other claims.

Claim 16 begins with the phrase: "[a] centrifugal unit comprising a centrifugal component and a plurality of tubes …" The plain language of that first line defines "centrifugal unit", as the combination of both the vessel and the tubing. Accordingly, the defendants assert that the phrase adopts a specific meaning throughout Claim 16 (and its dependent claims) that is different than the definition in the earlier claims. The plaintiff does not dispute that interpretation of the phrase as it is used in the first line of the claim and the Court agrees.

The more difficult question is whether the second and third usages of "centrifugal unit" in Claim 16 should be interpreted in a manner consistent with the first line or with the usage of the phrase in Claims 1-15. As an initial matter, Haemonetics provides little or no explanation for why the same phrase, "centrifugal unit", would be used to describe both the whole device (both the vessel and the tubes) as well as merely the vessel component. Haemonetics simply allows that "[u]nfortunately, in making this amendment, the applicant failed to note that it was now using the same phrase, centrifugal unit, to refer to two different concepts". In effect, Haemonetics asserts that within Claim 16, the term "centrifugal unit" is a synecdoche, i.e. a word that describes both the whole and a part of the whole.

2 For example, "wheels" is a word that means "car" as well as indispensable components of the car.

While the Court is unconvinced by the tenuous explanation for why the same phrase would have two different meanings within the same Claim, Haemonetics's alternative argument is compelling. The second and third references to "centrifugal unit" in Claim 16 are juxtaposed to the phrase: "having a radius between 25 and 50 mm and a height between 75 and 125% of the radius." Neither party challenges the application of those dimensions to the "centrifugal unit" described in Claim 16. The question is the exact meaning of the term "centrifugal unit". Those precise dimensions (described identically) are found in all of the patent's independent claims. With the exception of Claim 16, the parties agree that the dimensions refer to the height and radius of the vessel. Accordingly, Haemonetics convincingly contends that such dimensions necessarily refer to the same object and, thus, "centrifugal unit" refers to the vessel alone.

The defendants assert that the same dimensions should apply in Claim 16 to the combined vessel and tubing. The Court is skeptical. In essence, the defendants would require that identical dimensions be interpreted differently in Claim 16 than in the other claims. Because the vessel and tubing together are, a fortiori, larger than the vessel alone, the defendants' proposed construction would yield an absurdity. The Court declines to adopt such an awkward construction.

While the defendants correctly contend that avoidance of a nonsensical result of a particular construct is not the Court's responsibility, in this case, the Court's conclusion is compelled not only by logic but also by the claim language. See Chef America, Inc. v. Lamb-Weston, Inc., 358 F.3d 1371, 1375 (Fed. Cir. 2004) (holding that a claim that the dough be heated "to" a particular temperature range meant that the dough itself, and not merely the air in the oven, had to be heated to that temperature despite the fact that it would result in an unusable product).

In this case, contrary to the facts in Chef America, Inc., there are clear indicators in the text of the claim itself (i.e. the identical dimensions) which persuades the Court that "centrifugal unit" should be interpreted, in the body of Claim 16 and the dependent claims, in the same manner as in the prior claims. The patent consistently refers to "centrifugal unit" with respect to those, measurements and the drawings indicate that the measurement is intended to apply to the same structure throughout the patent.
Accordingly, with the exception of its use in the first line of Claim 16 in which "centrifugal unit" is defined as comprising various components, the phrase "centrifugal unit", as used in Claim 16 and its dependent claims, will be construed as referring exclusively to the vessel itself. This is consistent with the use of the same phrase in Claims 1-15.

Claim 16 claims a centrifugal unit that includes a centrifugal component, which the parties agree refers to the vessel, and a plurality of tubes. It reads as follows:

A centrifugal unit comprising a centrifugal component and a plurality of tubes, said unit to turn around an axis to separate the components of a liquid, blood in particular, with such plurality of tubes displaying a single tubular component wherein said unit includes:

- a base in the form of a disk;
- an external cylindrical wall extending from the base;
- an internal cylindrical wall extending from the base and separated by the external wall so as to define a ring-shaped separation chamber among each other;
- a tubular housing almost extending coaxially to said rotating axis from the base to receive an end of a tubular unit; and
- a plurality of channels extending radially in the base of the centrifugal unit, with each channel providing communication between a respective tube of the tubular unit and the separation chamber, with the centrifugal unit having a radius between 25 and 50 mm and a height between 75 and 125% of the radius.

Id. claim 16 (emphases added).

On August 16, 2007, the district court issued a claim construction order and construed the term "centrifugal unit" as used in claim 16. The court held, and the parties agreed, that "centrifugal unit" as used in the claim's first line means "the combination of both the vessel and the tubing." Haemonetics Corp. v. Baxter Healthcare Corp., 517 F. Supp. 2d 514, 518 (D. Mass. 2007). Nevertheless, the court construed the claim's remaining two references to "centrifugal unit," including the final one in the context of the "height" and "radius" limitations, to mean only the vessel. Id. at 519-20. The court relied on claim 16's use of identical dimensions to the patent's other independent claims, which the parties agreed used "centrifugal unit" to refer exclusively to the vessel. Id. at 519. The court reasoned that, because the vessel and the tubing together are always larger than the vessel alone, giving "centrifugal unit" a construction that includes the tubing in the context of the dimensional limitations "would yield an absurdity." Id.

Following claim construction, the case proceeded to trial before a jury. At the close of evidence, the district court granted without opinion Haemonetics's motion for JMOL that claim 16 was not indefinite. The jury then found claim 16 infringed and not invalid, and awarded Haemonetics over $11.3 million in lost profits damages and over $4.3 million in reasonable royalty damages. The district court denied Fenwal's motions for JMOL on anticipation and obviousness without opinion, then entered a permanent injunction to begin on December 1, 2010, and finally ordered Fenwal to pay a 10% royalty on sales of the infringing kits made after the jury verdict of infringement.

Fenwal timely appealed. We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1).

DISCUSSION

I.

We begin with the district court's construction of the claim term "centrifugal unit." Claim construction is an issue of law, Markman v. Westview Instruments, Inc., 52 F.3d 967, 977-78 (Fed. Cir. 1995) (en banc), which this court reviews de novo, Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1454-55 (Fed. Cir. 1998) (en banc). The words of a claim are generally given their ordinary and customary meaning as understood by a person of ordinary skill in the relevant art at the time of the
Fenwal argues that the district court erred in construing "centrifugal unit" in the body of claim 16 to refer to just the vessel when the plain language of the claim's preamble defines the unit as comprising a vessel and a plurality of tubes. According to Fenwal, the district court's construction violates black letter claim construction law by either rendering superfluous "comprising a centrifugal component" or rendering "centrifugal unit" redundant with "centrifugal component." Instead, Fenwal asserts, "centrifugal unit" should be construed to refer to the vessel and its associated tubing throughout claim 16, a construction that tracks the specification's description of such an embodiment at column 3, lines 21 through 22, and which accomplishes the invention's goal of creating a small, portable apheresis machine.

Haemonetics responds that the specification makes clear that "centrifugal unit" in the context of the dimensional limitations refers to the vessel alone, as Fenwal concedes for claims 1 and 20. To reconcile this construction with claim 16's first use of the term, which expressly defines "centrifugal unit" as comprising a centrifugal component and a plurality of tubes, Haemonetics asserts that the claim preamble does no more than state the claimed invention's intended field of use. Conversely, Haemonetics argues that Fenwal's construction of "centrifugal unit" in the body of claim 16 to include the tubing nonsensically alters the unit's dimensional limitations; excludes every embodiment in the specification; and ignores that the invention's goals, i.e., small size, light weight, and economic disposability, depend on the vessel having the claimed height and radius range.

We agree with Fenwal. Patent claims function to delineate the precise scope of a claimed invention and to give notice to the public, including potential competitors, of the patentee's right to exclude. Bicon, Inc. v. Straumann Co., 441 F.3d 945, 950 (Fed. Cir. 2006). This notice function would be undermined, however, if courts construed claims so as to render physical structures and characteristics specifically described in those claims superfluous. Id.; see also Elekta Instrument S.A. v. O.U.R. Scientific Int'l, Inc., 214 F.3d 1302, 1307 (Fed. Cir. 2000) (holding that the claim language "extending between latitudes 30 [degrees] -45 [degrees]" did not include latitudes between 14 [degrees] and 43 [degrees] because that would "render[] the reference to 30 [degrees] superfluous"). As such, we construe claims with an eye toward giving effect to all of their terms, Bicon, 441 F.3d at 950, even if it renders the claims inoperable or invalid, see Chef Am., Inc. v. Lamb-Weston, Inc., 358 F.3d 1371, 1374 (Fed. Cir. 2004) ("[W]here, as here, claims are susceptible to only one reasonable interpretation and that interpretation results in a nonsensical construction of the claim as a whole, the claim must be invalidated." (quoting Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1357 (Fed. Cir. 1999))); Elekta Instrument, 214 F.3d at 1309 (same).

In this case, claim 16's beginning and, in our view, controlling language could hardly be clearer. Claim 16 states: "A centrifugal unit comprising a centrifugal component and a plurality of tubes . . . ." It does not merely state the intended field of use in a preamble, as Haemonetics argues. Rather, it unambiguously defines "centrifugal unit" as "comprising" two structural components: a centrifugal component and a plurality of tubes. The claim then further recites, not the centrifugal component and not a centrifugal unit, but "the centrifugal unit" as "having a radius between 25 and 50 mm and a height between 75 and 125% of the radius." Reading "the centrifugal unit" in the context of the dimensional limitations to refer exclusively to the vessel, as the district court did, ignores the antecedent basis for "the centrifugal unit," see Process Control, 190 F.3d at 1356-57, and fails to give effect to the claim language "comprising a centrifugal component," see Bicon, 441 F.3d at 950.

Furthermore, the specification defines "centrifugal unit" in the context of the height and radius limitations in two different embodiments, one that tracks the language of claim 1, in which the parties agree that "centrifugal unit" refers to the vessel alone, and one that tracks the language of claim 16. Specifically, the specification describes a "first embodiment" in which a centrifugal device "includes a centrifugal unit with a center and a rotation axis." 983 patent col.2 ll.50-53. In this embodiment, which tracks the language of claim 1, a plurality of tubes connects to the centrifugal unit, and the "centrifugal unit has a radius between 25 and 50 mm and a height between 75 and 125% of the radius." Id. col.2 ll.53-65. The specification also describes "another embodiment" in which a centrifugal unit "includes a centrifugal component and a plurality of tubes," tracking the language of claim 16. Id. col.3 ll.20-22 (emphasis added). Again, the "centrifugal unit has a radius between 25 and 50 mm and a height between 75 and 125% of the radius." Id. col.3 ll.33-35.

The patentee's inconsistent use of identical height and radius limitations for two different embodiments thus indicates that "the centrifugal unit" in the context of the dimensional limitations must have different meanings in the context of different claims. Compare Process Control, 190 F.3d at 1356-57 (holding that "a discharge rate" and "the discharge rate" in the same
claim maintained the same meaning because the written description did not clearly redefine the term in the different contexts so as to put one skilled in the art on notice, with Epcos Gas Sys., Inc. v. Bauer Compressors, Inc., 279 F.3d 1022, 1031 (Fed. Cir. 2002) (construing the term "substantially" differently in the same claim in the context of language of approximation --"substantially constant"--versus language of magnitude--"substantially below"). In other words, the description of two embodiments with each tracking the language of different independent claims most reasonably supports a construction in which "centrifugal unit" has one meaning in claim 1 and another in claim 16. See Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322, 1327-29 (Fed. Cir. 2006) (holding that the claim term "gap" had different meanings in different claims based on those claims' different geometrical contexts).

Haemonetics argues, and the district court concluded, that because the vessel with the tubing is larger than the vessel alone, construing "centrifugal unit" in the context of the dimensional limitations to include the tubing "would yield an absurdity." Haemonetics, 517 F. Supp. 2d at 519. Maybe so, but we do not redraft claims to contradict their plain language in order to avoid a nonsensical result. See, e.g., Elekta Instrument, 214 F.3d at 1309. Cf. Ultimax Cement Mfg. Corp. v. CTS Cement Mfg. Corp., 587 F.3d 1339, 1348 (Fed. Cir. 2009) (holding that construing "soluble calcium sulfate anhydride" to mean "soluble anhydrous calcium sulfate" did not rewrite the claim but "merely restate[d] its plain meaning" in light of the specification and the knowledge in the art).

Claim 16 defines "centrifugal unit" to include a plurality of tubes and defines the dimensional limitations of that centrifugal unit. An "error" may have occurred in drafting claim 16, as Haemonetics's counsel indicated during the district court's claim construction hearing, J.A. 923, but it is what the patentee claimed and what the public is entitled to rely on. See Process Control, 190 F.3d at 1357 ("Where, as here, the claim is susceptible to only one reasonable construction, . . . we must construe the claims based on the patentee's version of the claim as he himself drafted it."); Hoganas AB v. Dresser Indus., Inc., 9 F.3d 948, 951 (Fed. Cir. 1993) ("It would not be appropriate for us now to interpret the claim differently just to cure a drafting error. . . . That would unduly interfere with the function of claims in putting competitors on notice of the scope of the claimed invention.").

We thus reverse the district court's claim construction and hold that "centrifugal unit" in claim 16 consistently means a vessel and a plurality of tubes, irrespective of its meaning in claim 1.

II.

Related to the construction of "centrifugal unit" in claim 16, Fenwal also appeals the district court's grant of JMOL that claim 16 was not indefinite. As with claim construction, we review a decision on indefiniteness de novo. Datamize, LLC v. PlumeTree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005).

The Patent Act requires that a patent's specification "conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P. 2. "Because the claims perform the fundamental function of delineating the scope of the invention, the purpose of the definiteness requirement is to ensure that the claims delineate the scope of the invention using language that adequately notifies the public of the patentee's right to exclude." Datamize, 417 F.3d at 1347 (internal citations omitted).

Yet, because claim construction frequently poses difficult questions over which reasonable minds may disagree, proof of indefiniteness must meet "an exacting standard." Halliburton Energy Servs., Inc. v. M-I LLC, 514 F.3d 1244, 1249 (Fed. Cir. 2008). "Only claims 'not amenable to construction' or 'insolubly ambiguous' are indefinite." Id. at 1250 (quoting Datamize, 417 F.3d at 1347). A claim is not indefinite merely because parties disagree concerning its construction. An accused infringer must thus demonstrate by clear and convincing evidence that one of ordinary skill in the relevant art could not discern the boundaries of the claim based on the claim language, the specification, the prosecution history, and the knowledge in the relevant art. Id. at 1249-50.

The district court held that claim 16 is not indefinite as a matter of law but did not provide a reason for its conclusion. Fenwal argues that the court erred in that conclusion and that claim 16 is indefinite because the terms "radius" and "height" used to define the centrifugal unit can be measured at several different places, and the patent does not disclose which is correct. Fenwal, however, rests its argument exclusively on the district court's erroneous construction of "centrifugal unit" in the context of the dimensional limitations to refer to the vessel alone. Specifically, Fenwal points to conflicting evidence at trial regarding whether one skilled in the art would understand "radius" and "height" to refer to the interior dimensions of
the vessel, as Fenwal argued, or the exterior dimensions of the vessel, as Haemonetics argued. While Fenwal does identify in passing additional radius and height measurements that include the tubing, Fenwal does not argue or point to any evidence indicating whether or not including the tubing in the construction of "centrifugal unit" makes the radius and height measurements discernable to one of skill in the art and where around the tubing the measurements are to be made.

Haemonetics also argues the issue of indefiniteness based only on the district court's incorrect claim construction. As a result, this court lacks any evidence in the record or any argument by the parties directed to where the height or radius are to be measured when the centrifugal unit includes not only the circular vessel but also the off-set, question mark-shaped tubes. Given the change in the unit's shape in claim 16 under this court's construction of "centrifugal unit" and the absence of any basis on which to decide the issue in the first instance, we vacate the district court's grant of JMOL and remand for a determination of the meaning of "radius" and "height" under the correct claim construction of "centrifugal unit" and of whether claim 16 is definite.

8) "Plasma Chamber"

MKS contends that the term "plasma chamber" means "a structure that confines a plasma." (D.I. 103 at 7). MKS further contends that, in the context of the '628 Patent a "plasma chamber" must include "a means for ingress and egress of gases." (D.I. 118 at 21). Advanced Energy contends that the term "plasma chamber" means "a structure that contains or confines a plasma, and is of no specific shape." (D.I. 110 at 29).

In construing the term "plasma chamber," the Court has considered the patent specification and prosecution history. (See D.I. 104, Ex. A col. 2 ln. 46-54, col. 4 ln. 16-24, 35-44, Figure 3 (118), col. 9 ln. 28). Based on a review of these sources, the Court concludes that the context of the patent requires that a plasma chamber include a means for ingress and egress of gases. Accordingly, the Court construes the term "plasma chamber" to mean a structure, with a means for ingress and egress of gases, that contains a plasma.

11. "Chamfer." Absent any definition in the specification or claims, "chamfer" shall be given its ordinary meaning. Therefore, a "chamfer" is an "inclined surface."

12. "A chamfer adjacent to said cavity." Consistent with the specification and claims, "adjacent to" shall be given its ordinary dictionary meaning. Therefore, "a chamfer adjacent to said cavity" shall mean "a chamfer close to, next to, or adjoining said cavity." 2

2 Defendant argues that plaintiff's definition is incorrect because Figures 7-9 of the '682 patent show a chamfer next to or adjoining the cavity. Absent any limiting language in the specification or claims, however, a patentee is not limited to the embodiments shown in the figures.

Chamfer Backrake Angle

The term "chamfer backrake angle" appears in claims in the '715 Patent. Baker Hughes contends "chamfer backrake angle" means:
The angle of the beveled area or cut off edge at the periphery of the central portion of the cutting face as measured backward from a line placed perpendicular (at a ninety degree angle) to the formation to be cut by the cutter in the intended direction of drill bit rotation.

ReedHycalog contends "chamfer backrake angle" means "the negative angle (expressed as a positive number), between a line oriented perpendicular to the subterranean formation to be engaged by a cutter and the portion(s) of the chamfer that engages the formation during drilling, measured in the direction of intended bit rotation." Baker Hughes's construction defines "chamfer" and combines that definition with its construction of "effective cutting face backrake angle." ReedHycalog's construction does not define chamfer but modifies its construction of "effective cutting face backrake angle" to apply to the "chamfer." Thus, the parties' dispute centers on whether "chamfer" needs construction.

A lay jury can understand "chamfer" and does not need it defined. The '715 Patent figures also clearly show the chamfer, and a further definition would not help the jury. Fig. 11 of the '715 Patent, annotated and displayed in Appendix C, shows the chamfer backrake angle, labeled $\beta_1$. '715 Patent col. 10:36-37 (defining "chamfer backrake angle" as $\beta_1$).

As shown, the chamfer backrake angle is the angle between the portion of the chamfer that engages the formation and a line perpendicular to the formation. ReedHycalog's construction is correct, and the Court adopts a modified construction. Thus, "chamfer backrake angle" means "the angle between a line oriented perpendicular to the subterranean formation to be engaged by a cutter and the portion(s) of the chamfer that engages the formation during drilling, measured in the direction of intended bit rotation, labeled $\beta_1$ in Fig. 11 of the '715 Patent." 4

664

II. The District Court's Claim Construction

We turn next to the district court's construction of the claims of the '886 patent. Claim construction is a matter of law which we review without deference. Nazomi Commc'ns, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1371 (Fed. Cir. 2005). When exercising the power to review claim construction, this court determines the meaning and scope of the relevant claim language and decides whether the district court's determination of the meaning and scope of the relevant claim language is coterminous with that construction. Where it is not, the district court has erred in its construction of the claims. Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1115 (Fed. Cir. 2004). However, in reviewing a district court's claim construction, this court takes into account the views of the trial judge. Nazomi, 403 F.3d at 1371. Though we review those views and the record de novo, "common sense dictates that the trial judge's view will carry weight." Id. (quoting Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1454 (Fed. Cir. 1998) (Plager, J., concurring)).

The district court issued its claim construction order on April 11, 2008. At issue in this appeal are independent claim 17 and dependent claim 19 of the '886 patent. The district court construed these claims as follows:

Claim 17 of the '886 patent/886 Patent
A shoulder supported harness assembly for supporting percussion instruments, comprising:
- a shoulder supported carrier structure for supporting percussion instruments having changeable or adjustable shoulder supporting members for securing said structure on the

Construction
A harness device that allows the user to support a percussion instrument.
- The piece of the device that connects on the user's back to the back member and which then sits on the user's shoulders and performs the function of supporting the balance of the
shoulders of a user; and device while allowing the user to adjust the upper section of the device relative to the lower section and to replace, remove or substitute the shoulder supporting members with other shoulder supporting members of different sizes.

a back member that spans across and is secured to each of the shoulder supporting members. A back bar that spans across the user’s back to connect to each end of the shoulder supporting members.

Claim 19 of the ’886 patent

The securing mechanism from claim 17 wherein the securing mechanism locks the orientation of the shoulder supporting members and the back member.

Construction
